Introduction : This study was conducted to clarify the effect of 3-month exercise on blood pressure during exercise and bathing after the exercise. **Method :** Sixty-one community-dwelling frail elderly people (70.0±5.3 years, G group) and sixty-six middle-aged people at risk of cardio-metabolic disease (61.6±7.5 years, S group) participated in the study. Subjects were randomized to combined exercise and bathing intervention group (A), exercise group (B), and bathing intervention group (C). The A and B groups performed 90-min exercise (mainly resistance training, slight aerobic exercise was added in B group) twice a week for 3 months, and the A and C groups had additional hot bathing. Blood pressure was measured before and after the exercise, and after bathing. After 3 months, we evaluated the effects of the intervention. Of the participants, 26 men and 61 women were included in analyses. **Results :** At baseline, systolic blood pressure (SBP) significantly slightly increased by exercise only in A-G group (3.4mmHg). By bathing, SBP significantly decreased only in C group (-8.6mmHg), and diastolic blood pressure (DBP) significantly decreased in C group (-5.3mmHg) and A-G group (-4.9mmHg). After the 3-month intervention, the blood pressure was not increased by the exercise. While hypotensive response of bathing after the exercise tended to small in the A group, hypotensive response of bathing tended to increased in the C-G group (SBP: -9.6→-15.7mmHg, DBP: -3.6→-8.0mmHg). **Conclusion :** The exercise before bathing reduced a hypotensive response of bathing. Although the only bathing

intervention had no effect to prevent hypotension by bathing, the resistance training might improve hypotension after bathing. **Keywords :** exercise, bathing, blood pressure, randomized controlled trial, hypotension

OP23 325-C-6

NIGERIA: IMPLICATIONS FOR GLOBAL AGING AND PATTERNS OF NON-COMMUNICABLE DISEASES

Austin AGHO¹, Kristine A. MULHORN² (1. Health and Rehabilitation Sciences, Indiana University School of Health and Rehabilitation Sciences Indiana University Purdue, USA; 2. Health Administration, College of Nursing and Health Professions Drexel University, USA)

Introduction : The authors present a demographic analysis of a high population, low-income country with specific focus on global aging and chronic disease patterns. The Population Reference Bureau reports that non-communicable diseases (NCD) such as heart disease, lung disease, cancer, and diabetes are now the leading causes of death in much of the world (PRB, 2012). **Method :** The authors examine the patterns of non-communicable disease by age and gender. The capacity of Nigeria to address and respond to the risk factors associated with the increasing rates of non-communicable diseases will also be examined. **Results :** The impact of non-communicable diseases is more pronounced in low and middle income countries than in high-income countries because of differences in the availability of advanced medical technology. Like most countries in sub-Saharan Africa, Nigeria has a high proportion of deaths attributable to non-communicable diseases. Reasons for the high rates of non-communicable deaths in Nigeria include a high prevalence of physical inactivity, high rate of tobacco use, high prevalence of overweight, and a high prevalence of raised total cholesterol. **Conclusion :** As the most populous country in Africa with a relatively high fertility rate, the population of Nigeria is expected to soar to 400 million by 2050. Unless proactive measures are implemented to prevent premature deaths from non-communicable diseases, socio-economic development and political stability in Nigeria will be negatively impacted. **Keywords :** Nigeria; non-communicable diseases (NCDs); middle and low-income countries

OP23 326-C-1

PREVALENCE OF OBESITY AND ABDOMINAL OBESITY AMONG TURKISH ELDERLY LIVING IN AN URBAN AREA

Reyhan UCKU¹, Hatice SIMSEK¹, Reci MESERI², Simge YILMAZ¹ (1. Public Health, Dokuz Eylul University, Turkey; 2. Nutrition and Dietetics, Ege University, Turkey)

Introduction : Obesity is a risk factor for cardiovascular diseases (CVDs) and diabetes mellitus(DM).Some studies have shown that abdominal obesity (AO) is a better predictor of CVDs and DM than obesity. The objective of this study was to determine the prevalence of obesity and abdominal obesity in older people; an additional aim was to examine the correlation between different anthropometric measures of obesity. **Method :** In this cross-sectional study,2502 community-dwelling older people (aged 65 and over) of the Heart of Balçova (BAK) Project were included. Body mass index(BMI), waist circumference (WC), waist hip ratio (WHR), waist height ratio(WHtR) were calculated. Participants who had a BMI≥30.0kg/m² were considered as obese. Abdominal obesity was evaluated by WC, WHR, and WHtR. Pearson correlation analysis was used. **Results :** Mean age

of participants was 71.9±5.4(65-94) years; 61.1% were women. The prevalence of obesity was higher in women(60.6%) than in men(30.0%). For abdominal obesity, prevalences were 31.3% (WC), 77.8% (WHR), 91.2% (WHtR) in men; in women 72.5%,57.1%,95.3%,respectively. In men, all prevalences decreased after 75 years of age. In women, obesity prevalence decreased with age; prevalence of abdominal obesity as WC was lowest among those aged 80 years or more,but AO prevalences as WHR and WHtR were the highest in the 80+ age group. Positive and significant correlations were found between anthropometric measures and correlation coefficients were higher in men than in women. In both sexes, the lowest correlation was found between BMI and WHR. On the other hand, the highest correlation was between WC and WHtR. Conclusion: The obesity prevalence was high in the urban elderly and was higher in women than men. Keywords : prevalence, obesity, abdominal obesity

OP23 326-C-2

INSULIN RESISTANCE AS ONE OF INDICATORS FOR METABOLIC SYNDROME AND ITS ASSOCIATED FACTORS IN INDONESIAN ELDERLY

Arya Govinda ROOSHEROE (*Internal medicine, Division of Geriatric Faculty of Medicine, Univeristy of Indonesia - Cipto Mangunkusumo Hospital, Indonesia*)

Introduction : To obtain factors that are associated with insulin resistance in Indonesian elderly. Method : A cross sectional study was conducted at the Geriatric Outpatient Clinic of Cipto Mangunkusumo Hopital in 172 elderly patients. Data on subject characteristics (age and sex), body mass index, total body fat, peripheral subcutaneous fat, trunk subcutaneous fat, waist circumference, carbohydrate and fiber intake, physical activity, and 25(OH)D concentration were collected. Sample size was calculated in accordance with the formula of sample size on hypothesis testing for difference of two proportions and hypothesis testing for difference of mean of two independent groups. Significance level of 95% and power of 80% were used. Chi-square analysis and independent t-test were performed. Logistic regression analysis was conducted to recognize the most affecting variables for insulin resistance. P<0.05 was considered as the significance level. Results : We found that the prevalence of insulin resistance among elderly in our study was 25%. Bivariate analysis showed that there was a significant association of age and body mass index with insulin resistance in elderly. There were also significant differences of mean on fat mass, fat mass (%), waist circumference, peripheral subcutaneous fat, trunk subcutaneous fat, which were significantly higher in insulin-resistance group compared to the non-insulin resistance group. Results of multivariate analysis demonstrated that only several factors were correlated to insulin resistance in elderly, that were peripheral subcutaneous fat (OR 1.09; 95% CI 1.05-1.15) and trunk subcutaneous fat (OR 0.93; 95% CI 0.87-0.99). Conclusion : Peripheral subcutaneous fat and trunk subcutaneous fat are associated with insulin resistance in elderly. Keywords : insulin resistance, elderly

OP23 326-C-3

A LONGITUDINAL ANALYSIS OF SERUM ADIPONECTIN LEVELS IN RELATION TO LIPID PROFILES IN POSTMENOPAUSAL WOMEN IN TAIWAN

Chi-Ling CHEN¹, Keh-Sung TSAI², Wei-Shiung YANG¹, Shih-Te TU³, Jin-Shang WU⁴, Tai TONG-YUAN⁵ (*1. Graduate Institute of Clinical Medicine, College of Medicine, National Taiwan University, Taiwan; 2. Department of Laboratory Medicine, National Taiwan University Hospital, Taiwan; 3. Division of Endocrinology and*

Metabolism, Changhua Christian Hospital, Taiwan; 4. Department of Family Medicine, National Cheng Kung University, Taiwan; 5. Geriatrics, Taipei Jen-Chi Relief Institution, Taiwan)

Introduction : Serum adiponectin levels were shown to have profound influences on many aspects of human physiology, in addition to their effects on energy homeostasis. We aim to investigate the association between trends of serum adiponectin levels with changes of lipid profiles in postmenopausal women in Taiwan. Method : We used 201 postmenopausal women who participated in a two-year multicenter randomized double-blind placebo-control trial on the efficacy of BMD by the treatment of isoflavones and were free of hyperlipidemia at baseline for current analysis. The serum adiponectin and lipid profiles were measured at baseline, 48 and 96 weeks after randomization. Generalized estimating equations (GEE) model was used to investigate the longitudinal trends of lipid profiles in relation to adiponectin. Results : Adiponectin levels at baseline were positively associated with higher HDL-C levels at baseline ($\beta = 0.468$, $SE = 0.135$, $p = 0.001$), and inversely related to triglyceride levels ($\beta = -1.893$, $SE = 0.609$, $p = 0.002$), after the adjustment of age, isoflavon treatment, habitual alcohol consumption, BMI, history of diabetes and hypertension as well as average total mets spent and total calories consumed. In the GEE model with time, age, isoflavon treatment, history of diabetes and hypertension, average total mets spent ,total calories consumed and BMI, there was a statistically significant positive association between the trend of serum adiponectin levels and trend of HDL-C ($\beta = 0.491$, $SE = 0.095$, $p < 0.001$). The inverse association with triglyceride trends remained significant ($\beta = -2.039$, $SE = 0.528$, $p < 0.001$). Conclusion : This longitudinal analysis showed that higher adiponectin levels may protect the atherosclerosis process in postmenopausal women through increasing HDL-C and lowering triglyceride. Keywords : Adiponectin, lipid profiles

OP23 326-C-4

IMPACT OF REMOVABLE DENTAL PROSTHESES ON QUALITY OF LIFE OF MEXICAN ELDERS

Roberto Carlos CASTREJON-PEREZ¹, S. Aida BORGES-YANEZ² (*1. Epidemiologia Geriatrica, Instituto Nacional de Geriatria, Mexico, Mexico; 2. Dental Public Health, National Autonomous University of Mexico, Mexico*)

Introduction : Poor oral health status has a negative impact on quality of life of elders. Aim: To evaluate the impact of the functional status of removable partial or complete dental prostheses (RDP) on Quality of Life (QoL) of elders living in Mexico City. Method : Analysis of baseline data of the Coyoacan Cohort, a study carried out in a representative sample of people ≥70 years old residing in one district of Mexico City (N=32000). 821 persons were interviewed and dental examined. Independent Variables: functionality of RDP (retention, stability, occlusion), hygiene of RPD, utilization of RDP when sleeping, xerostomia, utilization of dental services. Covariables: age, gender, marital status, illiteracy, self-perception (SP) of general health, SP of oral health and SP of socioeconomic status. Dependent variable: Oral Health Related Quality of Life using a Mexican abbreviated version of the Oral Health Impact Profile (OHIP-EE-14). The dependent variable was dichotomized and a logistic regression model (LRM) was carried out. Results : Mean age was 79±7 years; 53.9% were women, 473 (57.5%) used RDP, 312 (66%) of RDP were nonfunctional. The OHIP-EE-14 median value was 4, mean=7±8.7. The LRM showed that illiterate persons, those perceiving their general health as fair or bad, those perceiving their oral health worse than persons of the same age, those using their RPDs while sleeping and those using nonfunctional prostheses have higher risk of negative

impacts on QoL. Conclusion : Nonfunctional RPDs have impact on QoL of elder people, self-perception of oral health and utilization of RPDs while sleeping were also associated. Keywords : Oral Health, Quality of Life, Dental prostheses

OP23 413-C NUTRITION

OP23 413-C-1 INCREASED RISK FOR NUTRITIONAL STATUS DETERIORATION AMONG ELDERLY CAREGIVERS

Yael KATZ¹, Michal MEIRSON², Adi DUVDEVANY³, Yulia KHAIKIN¹, Hillel VARDI⁴, Danit Rivka SHAHAR⁴ (1. Nutrition and Diet Department, Dorot Geriatric Medical Center, Israel; 2. Prolonged Mechanical Ventilation, Dorot Geriatric Medical Center, Israel; 3. Nutrition and Diet Department, Reuth Medical Center, Israel; 4. Department of Epidemiology and Health Services Evaluation, Ben-Gurion University of the Negev, Israel)

Introduction : Primary family caregivers of frail elderly are at increased risk for nutritional, functional and health-status deterioration. Data on caregiving dietary intake and nutritional status are scarce. Objectives: To compare the nutritional-status of elderly caregivers and non-caregivers and conceptualize a model predicting nutritional deterioration. Method : Participants were recruited from a geriatric nursing home and a community day-center. Nutritional status, dietary intake, health and functional status were assessed using personal interview. Results : We recruited 86 participants, 40 caregivers and 46 age-matched non-caregivers, mean age 75±7y. Caregivers had significantly higher intake of bread, fats, sugar and fruits and lower intake of vegetables, cereals and milk compared with the non-caregivers. Caregivers consumed more energy and sodium and less vitamins and minerals, higher percentage reported weight-loss, lack of appetite, disability in their daily physical and social functions and higher risk for depression compared with non-caregivers. Caregivers who lost more weight in the last year were older, had fewer children, higher depression rates and poorer appetite compared with caregivers who did not lose weight. Men were at higher risk for weight loss. The conceptual model suggests a cascade of event starting with caregiving, depression, and decreased appetite resulting in nutritional and health-status deterioration. Conclusion : We showed low diet quality in caregivers compared with their non-caregivers counterparts. These differences may stem from lack of time and attention for cooking for a single person, stress and lack of resources. Future studies should include larger sample sizes, evaluate more thoroughly the differences between genders and provide data for future interventions. Keywords : caregivers, diet, nutrition

OP23 413-C-2 ASSOCIATION OF NUTRITIONAL STATUS AND FUNCTIONAL CAPACITY AMONG HOSPITALIZED GERIATRIC PATIENTS IN MALAYSIA

Sakinah HARITH, Sze Lin TAN (School of Health Sciences, Universiti Sains Malaysia, Malaysia)

Introduction : Malnutrition can cause a decline in functional capacity and increased morbidity and mortality of geriatric patients. The aim of this study was to determine the association of nutritional status and functional capacity among geriatric patients at general hospitals in Malaysia. Method : A cross-sectional study was conducted at medical wards of four general hospitals from each of the region in Peninsular Malaysia from January 2011 to January 2012. A questionnaire-based interview was used to collect sociodemographic characteristics, health-

related behaviors, and clinical data. The patient's nutritional status was determined by the Mini Nutritional Assessment short-form (MNA-SF). The assessment of functional capacity was done by using the Activities of Daily Living (ADL) and Instrumental Activities of Daily Living (IADL) questionnaires. Anthropometric measurements were also taken using standard procedures. Results : A total of 305 geriatric patients (male, n=156; female, n=149) aged 65 years and above (mean age=72.67±5.62) were recruited. The findings showed that 16.1% of the patients were malnourished, and 58.4% were at risk of malnutrition. The overall prevalence of functional impairment was 85.9% and 65.2% according to ADL and IADL assessment respectively. Multivariable analysis revealed that nutritional status was a significant risk factor for impaired functional capacity. Indicators of functional capacity (ADL and IADL variables) were significantly more deteriorated in malnourished patients. Conclusion : Nutritional status is associated with the impaired functional capacity of geriatric patients at their hospital admission. Keywords : nutritional status, functional capacity, geriatric patients

OP23 413-C-3 IMPACT OF MALNUTRITION ON CO-MORBIDITIES, BONE METABOLISM AND OUTCOMES IN OLDER ADULTS WITH HIP FRACTURE

Alexander A. FISHER¹, Wichat SRIKUSALANUKUL², Michael W. DAVIS¹ (1. Geriatric Medicine, The Canberra hospital and Australian National University Medical School, Australia; 2. Geriatric Medicine, Canberra Hospital, Australia)

Introduction : Age-related changes in body composition increase the risk of chronic diseases and osteoporotic fractures. This study aimed to evaluate the relationship between nutritional status and clinical and laboratory characteristics in older patients with hip fracture (HF). Method : In 284 consecutive patients with non-pathological HF clinical data were recorded and serum concentrations of leptin, adiponectin, resistin, 25(OH)vitamin D, PTH, parameters of bone turnover, mineral, vitamin B12, folate and iron metabolism, renal, liver and thyroid functions were measured. Results : Malnutrition (serum leptin <6.5 ng/ml in females and <4 ng/ml in males) was diagnosed in 33.8%, vitamin D insufficiency (<50nmol/l) in 80.3%, low transferrin saturation (<20%) in 88.8%, low vitamin B12 (<250pmol/l) in 28.2% and low folate (<11nmol/l) in 15.6%.The malnourished group was older (83.6 vs. 81.2 years), had a significantly higher proportion of institutionalised subjects (43.9% vs. 23.2%) and persons with chronic neurological diseases (42.9% vs.27.4%) including dementia (34.0% vs. 22.8%)(all p<0.03). This group had significantly higher mean urinary excretion of deoxypyridinoline (14.6 vs.11.5 nmol/mmol), and type I collagen cross-linked N-telopeptide (222.7 vs. 126.9 nmol/mmol) and a higher prevalence of excess bone resorption (88.8% vs.69.3%, p<0.003). In multivariate regression (log)leptin was associated positively with osteocalcin and haemoglobin and negatively with age, glomerular filtration rate and adiponectin. Malnutrition was associated with post-operative myocardial injury (34.4% vs.22.9%), need of institutionalisation (60.7% vs. 41.9%), and in-hospital death (8.3% vs.3.2%) (all p<0.05). Conclusion : In older patients with hip fracture malnutrition is very common, multifactorial, interrelated with chronic diseases, excess bone resorption and poorer outcomes and needs targeted treatments. Keywords : malnutrition, co-morbidities, bone metabolism, hip fracture

OP23 413-C-4 BENEFITS OF A PILOT INTERVENTION BASED ON MODIFICATION OF NUTRITIONAL RISK FACTORS IN HOSPITAL-AT-HOME OLDER PATIENTS

Miquel Angel MAS¹, Sara GAMEZ², Veronica DELGADO², Josep Anton GONZALEZ-ARES³, Sebastia SANTA EUGENIA¹ (1. Department of Geriatric Medicine and Palliative Care, Badalona Serveis Assistencials, Spain; 2. Home Care Unit, Badalona Serveis Assistencials, Spain; 3. Research Unit, Badalona Serveis Assistencials, Spain)

Introduction : After acute illness it is crucial to identify nutritional risk factors in order to minimize comorbidities. Home care is an opportunity to manage nutritional risk. **Method :** A prospective pilot study was developed in Hospital-at-Home (HaH) patients. During the admission assessment, Mini-Nutritional Assessment (MNA) tool was used for the identification of main nutritional risk factors. We considered modifiable nutritional risk factors: acute cognitive impairment, polypharmacy, anorexia, immobility, feeding dependency, insufficient consume of protein/fiber/ water, incomplete meals and bad nutritional status perception. A specific protocol defined multidisciplinary strategies for the modification of risk factors during the intervention. We analyzed the response to the intervention reassessing nutritional risk with MNA at discharge. **Results :** We included 121 patients admitted consecutively during one year (age 83; female 67%; Early Discharge 60%; Diagnostic group: Medical 51%). **Evolution (%) of main nutritional risk factors was** (admission/discharge): acute cognitive impairment (16/0), anorexia (52/16), immobility (53/18), insufficient consume of protein (25/6)/fiber (6/3)/water (75/50) and incomplete meals (30/18). **Evolution of nutritional status (admission/discharge) was:** Malnutrition 29/14; Risk 63/ 49.5; Normal status 8/36.5. Nutritional risk factors reduction, better mobility and pressure ulcers resolution were significantly associated with improvement of Malnutrition patients at the end of the intervention. **Conclusion :** The modification of nutritional risk factors was related with improvement of nutritional status of HaH patients with malnutrition. Monitoring the evolution of risk factors of malnutrition using MNA is an innovative approach. More research is needed to confirm these descriptive data. **Keywords :** Nutritional risk, Mini-Nutritional Assessment (MNA), Hospital-at-Home

OP23 414-C **ONCOLOGY & VISUAL FUNCTION**

OP23 414-C-1 **VISION LOSS IS ASSOCIATED WITH CLINICALLY RELEVANT SYMPTOMS OF DEPRESSION AND ANXIETY IN COMMUNITY-LIVING OLDER ADULTS**

Gertrudis I.J.M. KEMPEN, G.A. Rixt ZIJLSTRA (Department of Health Services Research / CAPHRI, Maastricht University, Netherlands)

Introduction : Low vision is associated with several negative outcomes including mental health problems. Although associations between vision loss and symptoms of depression were studied frequently, less is known about symptoms of anxiety among older persons with low vision and the co-occurrence of symptoms of anxiety and depression. This study examined the association of low vision with clinically relevant symptoms of anxiety and depression among community-living older adults seeking vision rehabilitation services. **Method :** Differences in the prevalence of clinically relevant symptoms of anxiety and depression (assessed with the HADS) between 148 persons with low vision seeking vision rehabilitation services and a reference sample from the general population (n=5,279), all ≥ 57 years, were compared. **Results :** 14.9% of the older persons with vision loss had clinically relevant symptoms of anxiety and 14.2% had

clinically relevant symptoms of depression. These percentages were at least as twice as high as in the reference sample ($p < .01$). Patterns were similar for males and females but different according to age, i.e. younger older persons with vision loss reported more frequently symptoms than those in the reference sample. The percentage of older persons with vision loss and both clinically relevant symptoms of anxiety and depression was 9.5% while this percentage was 2.4% in the reference sample ($p < .01$). **Conclusion :** Vision loss is substantially associated with clinically relevant symptoms of anxiety and depression. Healthcare professionals may improve their quality of care and the quality of life of their clients as they take such information into account in their intervention work. **Keywords :** Depression, Anxiety, Quality of life

OP23 414-C-2 **THE POTENTIAL ROLE OF AMYLOID β IN THE PATHOGENESIS OF AGE-RELATED MACULAR DEGENERATION**

Victor Vladimirovich ERMILOV (Department of Forensic medicine and Pathology, Volgograd State Medical University, Russia)

Introduction : Age-related macular degeneration (AMD) is the leading cause of blindness and the pathogenesis of the condition is largely unknown. The appearance of amyloid β in eye tissues is related with development of some gerontophthalmological diseases. **Method :** With the help of selective methods of revealing amyloid and its types and by performing electron microscopy, we have investigated 111 enucleated eyes of people over 60 years of age. All of them had been first ophthalmologically investigated when alive with the diagnosis of AMD and for the second time morphologically, when expired. **Results:** In all the cases we found morphological signs of AMD. Comparative analysis of morphologic changes in tissues of the macular and paramacular areas of the fundus oculi and of the incidence of amyloid β incorporations in them permitted us to propose that accumulation of local senile amyloid is conducive to development and aggravation of AMD. A relationship between the degree of retinal pigment epithelium degeneration and accumulation of amyloid β in the fundus oculi was revealed. Ultrastructural studies of Bruch's membrane in the macular region have shown that amyloid fibrils are localised in inner collagenous zones of Bruch's membrane with fragments of degrading RPE cells closely attached to them. **Conclusion :** The authors put forward a hypothesis of the pathogenesis of some stages of AMD, in which the principal role in the formation of amyloid β , is played by degenerative cells of pigment epithelium. **Keywords :** Amyloidosis, eye, AMD

OP23 414-C-3 **EXPLORATION OF THE EXPERIENCES AND DECISION MAKING OF OLDER PEOPLE WITH CANCER**

Heather LANE¹, Sue-Anne MCLACHLAN², Jennifer PHILIP¹ (1. Centre for Palliative Care, St Vincent's Hospital (Melbourne), Australia; 2. Department of Oncology, St Vincent's Hospital (Melbourne), Australia)

Introduction : Australian society is aging and as cancer incidence increases with age, the care of older people with cancer is a growing concern. The majority of literature around cancer care, however, focuses on a younger population. The aim of this study was to explore the experiences, decision making and the impact of age on older people with cancer. **Method :** In this qualitative research, semi structured interviews were conducted with 10 older people with cancer. Interviews were audiotaped and transcribed. Consecutive interviews were continued until saturation of themes occurred. A

thematic analysis was undertaken, which was reviewed by a second investigator with points of divergence compared, discussed and consensus reached. Results : The interviewees simultaneously felt younger than their chronological age and had an awareness of age bought on by physical symptoms and having encountered losses. They spontaneously brought up thoughts about their own mortality. Interviewees generally followed their doctors advice with little questioning. When the patients chose not to follow the doctor's advice, they favoured an approach with goals of comfort over life prolongation, because they were aware of their limited life expectancy. When considering treatment options views and needs of family were central. Conclusion : Healthcare professionals need to be mindful that older people tend to follow medical advice with little questioning and therefore initiate opportunities for discussion and negotiation of treatment goals. The importance of the broader social network should be recognised and older people offered the opportunity to involve these people in healthcare discussions. Keywords : decision making, older people, cancer

OP23 414-C-4

EXPLORATION OF THE EXPERIENCES AND VIEWS OF HEALTHCARE PROFESSIONALS CARING FOR OLDER PEOPLE WITH CANCER

Heather LANE¹, Sue-Anne MCLACHLAN², Jennifer PHILIP¹
(1. Centre for Palliative Care, St Vincent's Hospital (Melbourne), Australia; 2. Department of Oncology, St Vincent's Hospital Melbourne, Australia)

Introduction : Australian society is aging and as cancer incidence increases with age, the care of older people with cancer is a growing concern. The aim of this study was to explore the experiences and views of healthcare professionals caring for older people with cancer. Method : In this qualitative research, semi structured interviews were conducted with 18 healthcare professionals working in cancer care. Purposive sampling was used. Interviews were audiotaped and transcribed, and continued until saturation of themes occurred. A thematic analysis was undertaken and reviewed by a second investigator with points of divergence discussed and consensus reached. Results : The overarching theme to emerge was competing tensions in decision making for older people with cancer. An increase in the age at which patients are considered "old", to between 70 and 80 years, was reported. A tension between avoiding causing harm through treatment toxicity whilst not undertreating on the basis of age, was a consistent challenge. Age was a factor in treatment decisions, although often comorbidities or functional status deficits were sort to legitimise treatment limitations. Tensions existed in family involvement; at times family were forgotten in treatment discussions, whilst at other times they became the decision makers and the patient's voice lost. Conclusion : Tensions exist for health professionals in incorporating age and family into treatment decisions. Explicit discussion about the influence of age may aid in determining its role in decision making. A careful balance to family involvement in decision making is required, ensuring the older person is enabled to express their views and wishes. Keywords : decision making, healthcare professionals, cancer

Oncology, Institut Bergonie, France)

Introduction : Nutrition support is recommended for undernourished patients but no specific recommendations exist for those at risk. Method : MNA was used to screen patients >70y old with a solid tumour for whom chemotherapy was prescribed. Patients at risk for malnutrition (MNA 17-23.5) were proposed a randomised controlled trial during their treatment to evaluate a diet counselling intervention (DIG) consisting in face to face talk targeting main nutritional symptoms, compared to usual care. Patients in usual care group (UCG) received dietician advices if prescribed by oncologist. The main outcome was 1-year mortality. Results : Among 771 screened patients 338 were randomised: mean age of 78.6y (5.0), 51.6% male, mean MNA 20.2 (2.1). Distribution of cancer types was similar in the two groups; the most frequent were colon (22.3%), lymphoma (15.1%), lung (10.4%) and pancreas (16.9%). This was a first line chemotherapy in 83.8%. Death occurred during the first year in 142 without difference according to intervention (p=0.96). Grade 3 infections occurred more frequently in ICG than in DIG: 17 patients (10.8%) with 20 episodes compared to 7 (4.4%) with 9 episodes, p=0.03. Artificial nutrition was given to 15 patients in ICG compared to 8 in DIG, p=0.11. Similar rates of weight loss were observed for both groups (42.1%). Evolution of cancer disease was also similar. Conclusion : Despite a lack of effect on mortality, early diet counselling may be efficient in the prevention of severe infections in older patients with cancer receiving chemotherapy. Funding: Programme Hospitalier de Recherche Clinique 2006 ; Ligue contre le Cancer, AMGEN Keywords : nutrition , randomized control trial

OP23 414-C-6

PROGNOSTIC POTENTIAL AND TUMOR GROWTH INHIBITING EFFECT OF AGE-RELATED PLASMA ADVANCED GLYCATION END PRODUCTS IN NON SMALL CELL LUNG CARCINOMA

Andreas SIMM¹, Hans-stefan HOFMANN², Babet BARTLING¹
(1. Cardiothoracic Surgery, University Hospital Halle (Saale), Germany; 2. Department of Thoracic Surgery, Hospital Barmherzige Bruder Regensburg, Germany)

Introduction : The plasma fluorescence related to the standard fluorescence of advanced glycation end products (AGEs) is a simple measurable blood parameter for aging and distinct diseases but its importance in human cancer, including non-small cell lung carcinoma (NSCLC), is unknown. Method : Plasma samples of 70 NSCLC patients who underwent resection surgery of the tumor were analyzed for the distinct AGE-related fluorescence at 370 nm excitation/440 nm emission. In a retrospective study, we tested the prognostic relevance of this AGE-related plasma fluorescence. Results : The effect of circulating AGEs on the NSCLC growth was studied experimentally in vitro and in vivo. NSCLC patients with high (> median) AGE-related

plasma fluorescence were characterized by a later reoccurrence of the tumor after curative surgery and a higher survival rate compared with patients with low plasma fluorescence (25% versus 47% 5-y survival, $P = 0.011$). Treating NSCLC cell spheroids with patients' plasma showed an inverse correlation between the growth of spheroids in vitro and the individual AGE-related fluorescence of each plasma sample. To confirm the impact of circulating AGEs on the NSCLC progression, we studied the NSCLC growth in mice whose circulating AGE level was elevated by AGE-rich diet. In vivo tumorigenicity assays demonstrated that mice with higher levels of circulating AGEs developed smaller tumors than mice with normal AGE levels. Conclusion : The AGE-related plasma fluorescence has prognostic relevance for NSCLC patients in whom the tumor growth-inhibiting effect of circulating AGEs might play a critical role. Keywords : protein glycation, tumor survival, antagonistic pleiotropy

MAJOR DEPRESSIVE DISORDER IN ELDERLY:
DIAGNOSIS, TREATMENT AND FUTURE PERSPECTIVES**
Pinhas DANNON (*Psychiatry, Beer Yaakov MHC & Tel Aviv University, Israel*)

Introduction : Major depressive disorder (MDD) is a mood disorder characterized by severe affective and neurovegetative symptoms together. It is a common disorder seen in a quarter of consecutively admitted depressed patients and is often associated with severe symptomatology, increased suicide risk, poor acute response to antidepressants and poor acute and long-term treatment outcome. The question of the optimal duration of pharmacotherapy in order to prevent relapse and improve long-term (i.e., 5-year) outcome is a focus of current investigation. Method : This presentation will review currently recommended treatment strategies for the acute continuation and maintenance phases of therapy. Results : In particular, it will address the role of newer-generation antidepressants, the use of mood stabilizers and indications for electroconvulsive therapy. Conclusion : Other possible treatment strategies such as transcranial magnetic stimulation, vagus nerve stimulation, Deep brain stimulation and glucocorticoid receptor antagonists will be discussed in elderly. Keywords : MDD, ECT, treatment

Disease Prevention, National Institute for Health and Welfare,
Finland; 3. Department of Chronic Disease Prevention, Institute for
Health and Welfare, Finland; 4. Aging Research Center, Karolinska
Institutet and Stockholm University, Sweden; 5. Institute of Clinical
Medicine/Neurology, University of Eastern Finland and Department of
Neurology, Kuopio University Hospital, Finland*)

Introduction : Depression is a risk factor for dementia, although the association may be age-dependent. It can also be a prodrome for Alzheimer's disease. Both dementia and depression are associated with higher mortality. Method : We assessed the association between late-life depression symptoms (mean age 71.1 years), assessed with

Center for Epidemiologic Studies Depression Scale (CESD) and Beck Depression inventory, and dementia and mortality during 8.3-year follow-up in a population-based sample ($n=2000$) from Eastern Finland. Data on confounders (age, sex, bmi, health status, chronic diseases, smoking, alcohol use, apolipoprotein E genotype), mortality and depression was available for 1114 participants with Beck assessment and 1174 participants with CESD assessment. During the follow-up, 738 participants died and 852 participants attended second cognitive assessment. Sixty-two new incident dementia cases occurred during the follow-up. Results : CESD and Beck scores were correlated ($r=0.53$, $P<0.001$). According to Beck cut-offs, 75% had no depression, 15.6% had mild and 9.4% had moderate/severe depression. According to CESD cutoffs, 67.6% had no depression, 30.3 had mild and 2.1% had major depression. Proportion of overall agreement for categorical ratings was 0.69. Continuous or categorical CESD or Beck scores were not related to risk of dementia. In the unadjusted analyses, one-unit increase in Beck or CESD score increased the risk of death by 3% (95%CI 1.01-1.05), but the association was abolished after adjusting for confounders (1.00, 0.98-1.02). Beck/CESD categories were not related to mortality when confounders were taken into account. Conclusion : Late-life depressive symptoms were related to small increase in mortality, but this was entirely due to confounding. Keywords : Depressive symptoms, Dementia, Mortality

NHS Trusts, United Kingdom*)

Introduction : Symptoms of depression [DS] in older people are associated with high morbidity, functional decline, and reduced quality of life. A better understanding of the complexity of DS may allow earlier preventive measures. Method : The Survey of Health, Ageing and Retirement in Europe (SHARE) is an ongoing longitudinal study of individuals aged ≥ 50 years in 14 countries. Using cross-sectional data we investigated if DS assessed by EURO-D scale were associated with: ability to rise from chair without using arms [CS](performed in those < 75 years), walking speed [WS](performed in those ≥ 75 years), and grip strength[GS]. Results : 30,268 participants, 54.2%=women, median age=64.8 (IQR=58.4-72.9) years were studied. DS (24.5%) were positively correlated with age. More DS were seen in women (30.9 vs 17.0%; OR=2.2; 95%CI=2.1-2.3; $p<0.001$), cognitively impaired (35.6 vs 19.9%; OR=2.5; 95%CI=2.3-2.6; $p<0.001$), vision impaired (38.3 vs 19.1%;OR=2.6; 95%CI=2.5-2.8; $p<0.001$), and hearing impaired (37.0 vs 21.8%; OR=2.1; 95%CI=2.0-2.2; $p<0.001$). Those unable to perform the CS (20.5%) had more DS (34.5% vs 19.1%; OR=2.2;95%CI=2.1-2.4; $p<0.001$). Compared to the highest sex-specific quartile of GS, the lowest quartile GS had more DS (34.8% vs 16.5%; OR=2.7;95%CI=2.5-2.9; $p<0.001$). Compared to the highest sex-specific quartile of WS, the lowest quartile WS had more DS (35.1% vs 19.6%; OR=2.3;95%CI=1.8-2.8; $p<0.001$). CS, GS and WS remained independently significantly associated with DS after adjustment for age, gender, country, current anti-depressive treatment and impairment of cognition, vision, and hearing. Conclusion : These

cross-sectional data show that the prevalence of DS is high and significantly associated with CS, GS and WS. Prospective data from SHARE will determine if these functional tests can predict DS in subsequent waves. Keywords : depression, functional tests, multinational study

OP23 417-C-4

DEPRESSION BELIEFS CORRELATES IN A GROUP OF MEXICAN ELDERLY

Mario PEREZ-ZEPEDA¹, Carmen GARCIA-PENA², Xochitl DUQUE-ALARCON³, Victoria ARANGO-LOPERA⁴ (1. *Clinical and Epidemiological Research, Instituto Nacional de Geriatria, Mexico*; 2. *Unidad de Investigacion Epidemiologica y en Servicios de Salud, IMSS, Mexico*; 3. *Mental Health, Health Minister, Mexico*; 4. *Education, Instituto Nacional de Geriatria, Mexico*)

Introduction : Despite high prevalence, and negative effects in quality of life, there is still a low proportion of elderly seeking for help when facing depression. Data from Garcia-Pena et al report that only 25% of elderly receive appropriate care. Different beliefs about depression could impact identification and help seeking of this problem, but also to treatment adherence. The aim of this study is to determine those variables associated with depression beliefs in a group of Mexican elderly. Method : Cross-sectional study was done, asking: 1.- Do you think depression is a normal process? 2.- Do you think depression is a disease? 3.- Do you think depression is a lifetime disease? 3.- Would you discuss your depressive symptoms with a physician?. Subjects belong to the largest social and health security system in the country. Results : 2,240 subjects were interviewed, mean age of 73.16 (SD 7.02), 67.19% of women and a mean scholarship years of 4.88 (4.38). 1,187 subjects believed that depression was part of aging (52.99%), 65.98% also believed that was a disease (1,478), 800 (35.71%) subjects having both beliefs. 30.04% of the subjects believed that was a lifetime disease, and 64.46% (n=1,444) would discuss depression with physicians. Higher age, male gender, low scholarship and been married was associated with negative depression beliefs. Conclusion : Multiple factors may impact depression beliefs. We found similar results to other populations, with the exception of a large proportion of subjects thinking as depression both as a disease and aging; equiparating both phenomena. Keywords : Depression beliefs, mental health literacy, aging beliefs

OP23 417-C-5

DEVELOPMENT OF A QUANTITATIVE ASSESSMENT SYSTEM USING DOPPLER ULTRASOUND FOR DYSPHAGIA

Baekhee LEE¹, Meekyung SUH², Hyewon LEE¹, Giltae YANG³, Saewon HONG⁴, Youngho LEE⁴, Duklyul NA², Heecheon YOU¹ (1. *Department of Industrial and Management Engineering, POSTECH, Korea*; 2. *Department of Neurology, Sungkyunkwan University School of Medicine, Samsung Medical Center, Korea*; 3. *R&D Research, SEED Technology, Korea*; 4. *R&D Department, Digital ECHO, Korea*)

Introduction : Dysphagia is the disorder related to difficulty in swallowing occurred in patients with neurologic diseases such as stroke and its prevalence is higher among people more than 65 years. The existing diagnosis methods of dysphagia such as Videofluoroscopic Swallowing Study and Fiberoptic Endoscopic Evaluation of Swallowing provide qualitative assessment and are limited due to radiation exposure and invasiveness, respectively. The present study developed a portable swallowing assessment device using Doppler ultrasound and a quantitative methodology for assessment of swallowing. Method : The swallowing assessment system calculates

five measures (peak amplitude, duration, number of peaks, peak interval, and impulse) using three parameters (starting time, ending time, and peak amplitude of swallowing) extracted from ultrasound swallowing signals. Swallowing signals of normal controls were compared with those of patients with dysphagia to examine the validity of the assessment system. Signals were collected over the pharynx for dry saliva, thin liquid (water; 1, 3, 9 ml), and thick liquid (beverage with thickener; 1, 3, 9 ml) conditions administered at random. Results : The number of swallowing peaks of normal controls was found less varied (1 or 2) than that of dysphagia patients (1 to 12). Of the swallowing measures, swallowing amplitude was found most sensitive by showing that its value of normal controls was 2~3 times higher than that of dysphagia patients for all the swallowing. Conclusion : The proposed swallowing assessment system can be useful for quantitative and real-time diagnosis of dysphagia. Future research is needed to develop a diagnosis model which evaluates the type and severity of dysphagia. Keywords : Dysphagia, Doppler ultrasound, Quantitative assessment system

LONG TERM CARE I

OP23 418-S-1

DEVELOPMENT AND PSYCHOMETRIC EVALUATION OF A QUESTIONNAIRE TO MEASURE NUTRITIONAL KNOWLEDGE OF NURSES IN LONG-TERM CARE

Silvia SCHONHERR¹, Ruud J.G. HALFENS², Christa LOHRMANN¹ (1. *Department of Nursing Science, Medical University of Graz, Austria*; 2. *Department of Health Service Research, School for Public Health and Primary care, Maastricht University, Netherlands*)

Introduction : Malnutrition is an internationally common health care phenomenon entailing serious consequences for those who are affected. Lack of knowledge among nursing staff is often discussed as a reason for deficits in nutritional practice across health care institutions. A valid and reliable tool is necessary to adequately assess knowledge of nutritional care and to further develop and refine nutritional education. Therefore the aim of this study was to develop and test the psychometric properties of a questionnaire aimed at assessing knowledge of nutritional care among nurses in long-term care. Method : The items of the questionnaire were derived from extensive literature review. Content validity was evaluated in a double Delphi procedure with eight international experts in nutritional care. Construct validity, item difficulty and discrimination index of the final scale were tested in a convenience sample of 1152 nurses. Results : The Knowledge of Nutritional Nursing Care - Geriatric (KoNN-G) Questionnaire consists of 20-items with five answer possibilities as well as the possibility 'I don't know' reflecting six dimensions. The Item-Content Validity Index (I-CVI) ranged from 0.75 to 1.00, and the Scale-Content Validity Index Average (S-CVI/Ave) was 0.91. The analyses of pre-defined groups showed significant differences in knowledge among participants with various levels of education and expertise. The difficulty index of the items ranged from 26.1-87.2 with a mean of 59.3. The item discrimination ranged from 0.05-0.59 with a mean of 0.34. Conclusion : The KoNN-G Questionnaire shows acceptable psychometric properties and can be applied to measure nutritional knowledge of nurses in long-term care. Keywords : questionnaire, nutritional knowledge, long-term care

OP23 418-S-2

THE RELATIONSHIP BETWEEN QUALITY OF CARE AND CARE PRACTICE ORGANIZATION IN EUROPEAN LONG-TERM CARE FACILITIES

Henriette G. VAN DER ROEST, Dinnus H.M. FRIJTERS (EMGO+

Institute, Department of General Practice and Elderly Care Medicine,
VU University Medical Center, Netherlands)

Introduction : Care practice in long-term care differs across countries and facilities. Until recently no international study in Europe has been executed to explore intercultural differences in long-term care organization and services. In the SHELTER study we explored differences between European long-term care facilities and the relationship between country specific organizational characteristics of long-term health care and quality of care. Method : The SHELTER study had a longitudinal design. Data collection took place in 59 long-term care facilities in eight European countries. Trained nurses collected data at baseline, after six, and 12 months. At baseline 4156 patients were included. Patient health status was comprehensively assessed with the interRAI-LTCF, of which quality indicators (QIs), case-mix indexes, and validated scales on patient functioning can be calculated. At baseline additional information on structure and process characteristics (e.g. size, staff formation, education) of the participating long-term care facilities was gathered with the use of a specially designed form. Results : Quality and organization of care varied widely across facilities. Facility location and (not) for profit status explained 28% of the variance found in communication decline among the population, whereas the ratio of housekeeping staff and working in a multidisciplinary team explained 51% of the variance found for ADL decline following an improvement. Variance in antipsychotic use was for 20% explained by the presence of special care units and the ratio of nurse aides in the facilities. Conclusion : Quality of care seems to be related to organizational characteristics, but needs to be studied more thoroughly. Keywords : quality of care, care practice organization, long-term care

OP23 418-S-3 STUDY ON KOREAN ORIENTAL MEDICINE AND AGING

Moon Mi JUNG, Young Shin WON (*Graduate School, Yonsei University, Korea*)

Introduction : This research focuses on the effects of Korean oriental medicine concepts on the aging of seniors, particularly in regards to ways which these concepts can help seniors overcome their injuries. Method : In accordance with the concepts of aging defined by the ancient Heo-jun Korean oriental medicine textbook based on the teachings of Dong-i-bo-gam, and the oldest Chinese-based literature based on the teachings of the Hwang-jae-nae-gyeong. Results : In the Dong-i-bo-gam the vital activities of people are comprised of the concepts known as Jeong(精), Gi(氣) and Shin(神). In regards to aging, the concept of Jeong was found to be the main key component. It was also found that aging is one of the main factors for the weakening of one's Lifeblood(精血). The Dong-i-bo-gam concluded that in order to remedy senior illnesses and control the aging process we need a method that can address the insufficiency of Jeong by increasing one's body energy. Conclusion : In the 'Thousand Year Publication' within the Hwang-jae-nae-gyeong it was written that for people in their sixties, the weakening of mood is a major factor for senior health and aging and contributes to symptoms of depression, becoming bedridden, excessive crying and nose mucus. The literature also points out that human life, lifespan, health and longevity rely heavily on such factors as the transformation between 'yin and yang,' adaptation to the changing of the four seasons, and food ingestion. If these factors are considered and one does not overwork, it was found that one may extend one's natural lifespan and be healthier overall. Keywords : Aging, Seniors, Korean Oriental Medicine

OP23 419-S WORK, LABOR AND EMPLOYMENT I

OP23 419-S-1 THE END OF A WORKING CAREER: THE COMBINED EFFECTS OF INDIVIDUAL TRAJECTORIES AND RETIREMENT REFORMS

Jim OGG, Sylvie RENAUT (*Unite des Recherches sur le Vieillissement, Caisse Nationale d'assurance Vieillesse, France*)

Introduction : In France, the objective set by the Lisbon agreement in 2000 to achieve 50% of active workers between the ages of 55 and 64 by 2010 has not been achieved. In order to contribute to a greater understanding of the reluctance of older French workers to prolong their careers, the research examines individual motives for preretirement or working beyond retirement age. Method : The data source is the Gender and Generations Survey (France). Panel data from three waves (2005, 2008, 2011) are examined for a sub-sample of respondents aged between 45 et 64 who were employed in the labour market in 2005 and who envisaged retirement within three years. Forty qualitative interviews were undertaken in 2012 to explore the link between motives for retirement, employer's policies towards senior workers and recent legal retirement reforms. Results : Retirement reforms, individual career and family trajectories and employer policies combine to create greater uncertainties regarding the timing of retirement for current generations of workers in the second part of their career. The timing of retirement is also gender specific. Incentives to encourage older workers to remain in the labour market remain unpopular. Conclusion : The results suggest that for many French older workers, there is an absence of measures that could encourage older workers to remain longer in the labour market, such as high quality working conditions and attractive remuneration. Socio-demographic transformations, such as the rise in recomposed families, may have a greater impact in the short term in keeping older workers in the labour market. Keywords : retirement, reforms, France

OP23 419-S-2 PENSION REFORM AND POTENTIAL OCCUPATION OF ELDERLY POPULATION IN UKRAINE

Nataliia PROKOPENKO (*Social Gerontology, State Institute of Gerontology of the Ukrainian Academy of Medical Sciences, Ukraine*)

Introduction : The study deals with the global issues relative pension reforms in Ukraine and worldwide. Method : Analyzed was an interrelationship between the demographic changes-related increase of retirement age and economics. Results : In conditions of economics transformation the presence of disproportion between the demand for manpower and its supply by profession is a significant factor, which limits employment opportunities of senior age persons. The results obtained showed that in the industry with an employment of over one quarter of working pensioners there is a significant reduction of the demand for manpower and, consequently, the elderly workers may occupy mainly unskilled and poorly-paid positions. Analyzed were changes in occupational employment of the elderly subjects during 1999-2010 (the longitudinal study). The results obtained showed that having higher motivation to work the "young" pensioners (pre-pensioners in 1999) vs. "old" pensioners (pensioners who continued working in 1999) worked half of the years after having reached the retirement age. The author has outlined the main factors limiting occupation of older people. Second, measures for maintaining their economic activity are proposed. Conclusion : In view of the plans to increase retirement age it is expedient and necessary to use capabilities of the elderly persons; this needs to be supported by the related legal

norms, which would ensure stable employment of the elderly workers according to their motivations and capabilities. Keywords : demographic prognosis, retirement age, older worker, occupation challenges

OP23 419-S-3

NEW ATTEMPT OF IDEAL SECOND LIFE WITH A SENSE OF FULFILLMENT IN COMMUNITY-DWELLING SENIORS: TO ACHIEVE 'AGING IN PLACE'

Kouji SHIBASAKI¹, Katsuya IJIMA¹, Hiroto MUROHASHI¹, Ikuko SUGAWARA², Naomi YATOMI¹, Nobuhiro MAEDA¹, Hiroko AKIYAMA¹, Jun GOTO¹, Yuichi HIROSE¹, Mikihiro OIDA¹, Yoshihiko SATO¹, Tetsuo TSUJI¹, Minoru KAMATA¹ (1. Institute of Gerontology, The University of Tokyo, Japan; 2. Institute of Social Science, The University of Tokyo, Japan)

Introduction : In Japan with increasing aging, a decline in the physical activity of many workers due to decreased frequency to go outside after retirement at the age of 60 or older is a major social concern. We explore their ideal second life with a sense of fulfillment through we offer the retired seniors restarting some works. Here, we objectively investigate whether our attempt is effective to increase their physical activity. Method : Subjects were 11 retired community-dwelling seniors aged 60 or older (Average age: 68.7±5.5, 7 males). They chose favorite jobs under the coordination of our institution. Step count, metabolic equivalents (METs) and calorie consumption were calculated using wristband-typed active mass meter as physical activity. Geriatric depression scale (GDS) was also measured to research psychological effect. All values were compared between before and after working. Results : They were employed as English teacher, cleaning staff of welfare facilities and so on. Before working, step counts, METs, calorie consumption and GDS were 4495±3132, 1.29±0.09, 1961±508 and 4.3±3.4, respectively. All variable were significantly improved to 6243±4450, 1.32±0.11, 2305±462 and 2.9±2.5, respectively after 6 months of starting work. Intriguing, even in holidays without working, a significant increase in these parameters of their physical activity was found. Conclusion : These beneficial observations suggest that it attributes to not only increase physical activity but also improve depressive mood by re-employment, suggesting that it leads to achievement of 'Aging in Place'. Keywords: second life, aging, physical activity

OP23 419-S-4

RECENT DEVELOPMENTS IN EMPLOYMENT POLICIES FOR OLDER WORKERS IN JAPAN

Koichi HIRAOKA (Sociology, Ochanomizu University, Japan)

Introduction : This study aims to clarify recent developments in employment policies for older workers in Japan, specifically focusing on the revision of the Law for the Stabilization of Employment of Older Workers in Japan in 2012, to analyze the background factors behind these developments, and to assess to what extent these developments will help achieve the objectives of providing adequate employment opportunities for older workers. Method : Review of academic literature; examination of documents published by the government, labor unions, and employer's associations; analysis of statistics on labor market situations of older workers. Results : Recent government policy has laid much stress on strengthening the employer's obligation to extend employment to the age of 65, while maintaining the legal minimum age of mandatory retirement at 60 and extending the scope of choice in employment arrangements for employees aged 60 to 64. The main reason for this development was the rise to 65 in the minimum age for entitlement to the public pension

scheme stipulated by the pension reforms in 1994 and 2000. Conclusion : It is highly likely that the government policy to strengthen the employer's obligation to extend employment to the age of 65 will achieve its objective. However, in order to provide more employment opportunities for persons aged 65 and over and to improve the quality of employment for older workers, more government efforts in the area of lifelong training, public employment service, support for employers, and so on, as well as concerted efforts by social partners, are needed. Keywords : older worker, employment policy, Japan

OP23 419-S-5

EMPLOYMENT STATUS AND HEALTH AMONG OLDER ADULTS IN SOUTH KOREA AND UNITED STATES

Hongsoo KIM¹, Young-Il JUNG¹, Min-Kyoung RHEE², Iris CHI² (1. Graduate School of Public Health, Seoul National University, Korea; 2. School of Social Work, University of Southern California, USA)

Introduction : The aim of this study was to examine the relationships between employment status and multiple health outcomes among people aged 50 or older in Korea and the U.S. using comparable datasets. Method : The sample included 4,972 Koreans and 15,889 Americans from the KLoSA (Korean Longitudinal Study of Aging) and HRS (Health and Retirement Study) datasets in 2006, respectively. Employment status was categorized as follows: currently working; unemployed and looking for job; and retired. Physical and mental health among people by employment status was examined within and between the countries. Results : More than half(54.9%) of the Korean respondents were working, about 38.7% were retired, and 6.4% were unemployed; the majority of the American respondents were retired(59.5%), 36.7% were working, and 4.5% were unemployed. Overall, physical health measured by ADL and IADL dependency rates was lower, but mental health measured by the prevalence of depressive symptoms was higher among Koreans than their counterparts. While adjusting for socio-demographic covariates, compared to the working group, the Korean unemployed group had a higher prevalence of depressive symptoms, while the American unemployed group had a higher IADL dependency rate. The retirees' physical and mental health was lower than the working group in both countries. Conclusion : Job status may affect physical and mental health in later life, but the patterns and mechanisms of the relationships may differ across countries with different cultural contexts and social systems. Further cross-cultural studies are necessary on the complex relationships between work and health in order to support policies for healthy and active aging. Keywords : Employment, Health, Cross-cultural studies

OP23 420-C

GERIATRIC ASSESSMENT II

OP23 420-C-1

TRANSLATION AND VALIDATION OF THE MANDARIN VERSION OF COMPREHENSIVE GERIATRIC ASSESSMENT QUESTIONNAIRE AMONG ELDERLY PATIENTS IN MALAYSIA

Sze Lin TAN, Sakinah HARITH (Dietetics Programme, School of Health Sciences, Universiti Sains Malaysia, Malaysia)

Introduction : The study aimed to translate and validate the Comprehensive Geriatric Assessment questionnaire in Mandarin language among elderly patients in Malaysia. Method : The questionnaire contains items on sociodemographic characteristics,

medical condition, quality of life (36-Item Short-Form Health Survey), nutritional status (Mini Nutritional Assessment Short Form), functional capacity (Basic and Instrumental Activities of Daily Living), and depression status (Geriatric Depression Scale Short Form). The forward and backward translation process of the original English version questionnaire was done by 3 independent linguistic translators and validated its content by an expert team of 5 geriatricians, dietitian, nurse and lecturer. The Mandarin version of the questionnaire was tested for face validity in 10 over 65 year old elderly patients admitted to medical wards in Hospital Universiti Sains Malaysia, Malaysia. The internal consistency reliability and construct validity were evaluated in a group of 192 elderly patients (mean age 73.1 years) at four general hospitals from each of the region in Peninsular Malaysia from January 2011 to January 2012. The questionnaire was administered through face-to-face interviews with patients. Results : Minor amendments were made after the content and face validity tests. The internal consistency reliability was good as the Cronbach's alpha of most of the domains was above 0.70, ranging from 0.71 to 0.93 with only one exception (MNA-SF, Cronbach's alpha 0.62). Factor loading of all domains were loaded satisfactorily above 0.40, ranging from 0.42 to 0.92. Conclusion : The Mandarin version of the Comprehensive Geriatric Assessment questionnaire showed evidence of satisfactory internal consistency reliability and construct validity in Malaysian geriatric patients. Keywords : Comprehensive Geriatric Assessment, validation, geriatric patients

OP23 420-C-2 SIMPLE TOOL TO ASSES FUNCTIONALITY IN OUT PATIENT SETTING

Vijay KUMAR, Prasun CHATTERJEE, A.B. DEY (*Geriatric Medicine, Aiims, India*)

Introduction : Functionality matters most for the vulnerable community specially for 75 + population. Gait speed assessment by 'Timed-up-go (TUG) score' 'hand grip strength' are two safe, easy to perform and well validated tool in busy outpatient clinic for this patients ,helps to predict about frailty ,disability and mortality. Method: Patients aged 75 years or more, attending the Geriatric Medicine OPD of AIIMS, underwent a detailed clinical evaluation after taking proper consent; detail history had been taken about history of previous falls., poly-pharmacy, comorbidities and previous hospitalization. Functional capacity was assessed by TUG score (3 metre), hand-grip strength (American standard), depression and cognitive function were assessed by MINICOG and GDS respectively. Then data were analysed in SPSS. Results : Out of a total of 123 (75+) patients only 19.5% were females; a major 72.3% had slow gait speed (TUG score more than 20) ; and 27.64% patients had poor hand grip (predicted for their BMI) Patients with past history of hospitalization had better TUG score (P=0.003) and hand grip strength (P=0.001). Out of 89 patients with impaired TUG, 86.51% had impaired IADL, 75.28% had impaired ADL, 66.29% patients had depression, and 65.16% had poor self reported health status. Out of the 34 patients with poor hand grip, all of them had impaired IADL, 88.23% had impaired ADL, 73.52% had depression and 67.64% had poor self reported health status. Conclusion : Abnormal TUG score and hand grip strength are invariably associated with various parameters of functional impairment in "75+" age group. These tests are non-invasive, easy, safe. Keywords : TUG score, hand grip, geriatric assesment

OP23 420-C-3 CLINICAL CHANGES IN OLDER PATIENTS DURING HOSPITALIZATION: RESPONSIVENESS OF THE MDS

INTERRAI ACUTE CARE INSTRUMENT

Nathalie Isabelle Helena WELLENS¹, Geert VERBEKE², Johan FLAMAING³, Philip MOONS¹, Steven BOONEN³, Jos TOURNOY³, Koen MILISEN¹ (*1. Department of Public Health, Center for Health Services and Nursing Research, KU Leuven, Belgium; 2. Department of Public Health, Interuniversity Institute for Biostatistics and Statistical Bioinformatics, KU Leuven, Belgium; 3. Geriatric Medicine, University Hospitals Leuven, Department of Clinical and Experimental Medicine, KU Leuven, Belgium*)

Introduction : Patient functioning can be highly unstable within the hospital stay of an older person. We evaluated the ability of the Minimum Data Set interRAI Acute Care, a comprehensive geriatric assessment system, to detect those clinical changes. Method : An explorative secondary data-analysis compared prospectively collected data at three points in time: pre-hospitalization, upon admission, and at discharge. The interRAI AC assessment was performed serially in 256 geriatric inpatients (83.2±5.2 years; 60% female) by clinicians of multiple disciplines in nine geriatric and eight non-geriatric wards of nine acute hospitals. Responsiveness (i.e. the capacity to detect changes within patients) was evaluated for the output scales on five domains: ADL, cognition, communication, depressive symptoms, and pain. Results : Significant differences in clinical status were found for all five domains, based on Friedman test. Post-hoc tests revealed differences between each assessment period, except for cognition and communication from admission to discharge and for depressive symptoms from pre-admission to discharge. The Guyatt's Responsiveness Index showed a good to excellent capacity to detect longitudinal changes during hospitalization for the areas of cognition, communication, and pain, as well as substantial performance for ADL and depressive symptoms. Conclusion : In older inpatients, fluctuations in ADL, cognition, communication, depressive symptoms, and pain can be captured with the interRAI AC output scales, enabling clinicians to evaluate longitudinal changes from admission to discharge and to provide a comparison with patient status before the acute onset of the illness. Our results support the use of these scales in both geriatric and non-geriatric wards. Keywords : comprehensive geriatric assessment, interRAI Acute Care, validation studies

OP23 420-C-4 THE LOGIC OF GERIATRICS

Patrik EKLUND¹, Milla IMMONEN², Tuula PETAKOSKI-HULT², Heidi SIMILA² (*1. Department of Computing Science, Umea University, Sweden; 2. Technical Research Centre of Finland, VTT, Finland*)

Introduction : Assessment scales as information entities are poorly equipped with rigorous typing of data. This disables the gap between logic and guidelines not only within geriatric assessment but also more generally within municipal and regional decision-making in elderly care. Logic is, on the one hand, a carrier of information, and, on the other hand, it includes mechanisms for rigorous logical inference which underlies decision-making. Method : We propose a logical ontology for assessment scales, in a broad sense, so that such a framework becomes based on a typing system where also uncertainty is canonically integrated. One of the main questions is where uncertainty actually resides, and how they are canonically retrieved rather than amalgamated in ad hoc approaches. Results : Our presentation is illuminated using traditional assessment scales e.g. as represented by a typical set of assessment scales which usually includes some ADL scales combined with suitable cognitive scales, or combination scales. Non-cognitive signs and BPSD oriented scales are also poorly typed with respect to information and information

structures. We also consider scales and scopes of risk factors related to falls. Conclusion : Gerontological conditions and circumstances is about information and knowledge and in this paper we focus on the information part. We have therefore provided examples on how gerontological data can be properly typed so as to open up possibilities e.g. for comparative studies and development of regional and national repositories involving gerontological data and information. Keywords : assessment, ontology, decision-making

VALIDITY OF A NEW PRIMARY CARE TOOL FOR THE IDENTIFICATION OF FRAILTY IN OLDER PERSONS: THE EASYCARE-TWO-STEP OLDER PERSONS SCREENING

Janneke Van KEMPEN¹, Rene MELIS¹, Henk SCHERS², Ian PHILP³, Marcel OLDE RIKKERT¹ (1. *Geriatrics, Radboud University Nijmegen Medical Centre, Netherlands*; 2. *Department of Primary and Community Care, Radboud University Nijmegen Medical Centre, Netherlands*; 3. *EASY-Care International Research and Development, Warwick Medical School, The University of Warwick, United Kingdom*)

Introduction : The first step in improving care for elderly is efficient identification of the elderly who will benefit integrated care: frail older persons. Existing frailty instruments are not developed nor validated in primary care. We developed the Easycare-TOS (Two-step Older persons Screening). The first step consists of the general practitioner's (GP) frailty judgement based on prior knowledge. If this judgement was uncertain, additional EASYcare-data on health and psychosocial aspects were collected by a primary care nurse. Here we present large population validity data on Easycare-TOS. Method : We compared the Easycare-TOS' frailty judgment with the results of related constructs (construct validity). Furthermore, we measured functional status of the participants 12 months after the Easycare-TOS baseline assessment (prognostic validity). Results : 587 elderly from 6 GP practices were included (77 ± 5 years; 56% female). According to Easycare-TOS 39.4% participants were frail. Easycare-TOS showed better correlation with the Frailty Index ($r=0.62$) than with the Fried frailty criteria ($r=0.52$). Moderate to good correlations were found with: multimorbidity (0.50), (I)ADL disabilities (0.53), mobility (0.55), cognition (0.31), mental wellbeing (0.38) and social context (0.28). Easycare-TOS frailty was associated with a significantly higher risk on mortality (OR 10.25), hospital admission (OR 1.90) and ADL decline (OR 3.58) after 12 months. After correction for age, sex, education, multimorbidity and (I)ADL disabilities Easycare-TOS frailty remained an independent predictor for functional decline (OR 2.03). Conclusion : This study shows that Easycare-TOS has good construct and prognostic validity. This makes Easycare-TOS a suitable instrument for the identification of frailty in primary care. Keywords : EASYcare, Frailty assessment

GERIATRIC ASSESSMENT III

OP23 421-C-1

INTRARATER REPRODUCIBILITY AND VALIDITY OF NINTENDO WII BALANCE TESTS IN OLDER ADULTS

Martin Grønbech JØRGENSEN¹, Uffe LAESSOE², Carsten HENDRIKSEN³, Ole NIELSEN¹, Per AAGAARD⁴ (1. *Department of Geriatrics, Aalborg University Hospital, Denmark*; 2. *Physiotherapy Department, University College of Northern Denmark, Denmark*; 3. *Department of Integrated Health Care, Bispebjerg University Hospital, Denmark*; 4. *Institute of Sports Science and Clinical Biomechanics, University of Southern Denmark,*

Denmark)

Introduction : Objective evaluation of balance control in older adults can be achieved thru force plate (FP) analysis. The FP technique, however, is often expensive, immobile and technically difficult to operate. The Nintendo Wii board, on the other hand, is an easy-to-use, portable and low-cost force platform, which contains bioelectric features similar to a FP. The aims of the current study were (1) to examine intrarater reproducibility of the Nintendo Wii Agility and Stillness tests and (2) explore concurrent validity of these tests against conventional FP analysis. Method : Within day Wii test-retest reproducibility was examined in 30 older adults (age 71.8 ± 5.1 yrs.), expressed by Intra-class correlation coefficients (ICC), coefficient of variance (CV) and 95% limits of agreement (LOA). Concurrent validity was determined by relating selected FP measures to obtained Nintendo Wii test-scores. Results : Averaging three trials in the Stillness Test yielded a test-retest ICC of 0.86 (CI 0.74-0.93), CV of 6.4%, LOA of 11.0 and LOA% of 17.9. For test-retest of the Agility Test, ICC was 0.73 (0.50-0.86), CV 5.3%, LOA 1.8 and LOA% 14.6. No systematic test-retest differences were found in the Stillness test, however Agility test scores differed between test-retest ($p<0.05$). Moderate-to-strong relationships ($r=0.65-0.82$, $p<0.01$) were observed between Stillness test scores and selected force plate variables. Conclusion : The Wii Stillness Test demonstrated a high intra-rater reproducibility and strong outcome validity when evaluated against force plate analysis. For the Wii Agility Test, a systematic test-retest difference was observed, suggesting a longer familiarization procedure is needed for this type of test. Keywords : Nintendo Wii, Reproducibility, Postural Balance

OP23 421-C-2

STATIONARY GERIATRIC EARLY REHABILITATION IS WELL KNOWN AND WELL ORGANIZED IN MANY COUNTRIES. BUT IS IT SUFFICIENTLY IN OUTCOME FOR PATIENTS FROM ALL ASSIGNING SPECIALIST DEPARTMENTS? AN OUTCOME TRIAL

Christian ANGLEITNER¹, Petra HEISE¹, Stefan TRAUSSNIGG², Inge REITER², Peter GOLMAYER¹ (1. *Department of Geriatrics and Remobilisation, Hospital of the Sisters of Charity Ried, Austria*; 2. *Institute of Physical Medicine and Rehabilitation, Hospital of the Sisters of Charity Ried, Austria*)

Introduction : Stationary geriatric early rehabilitation is very well implemented and sufficiently standardized in many countries. But is it possible to reach for all patients no matter from which department they come from a sufficient therapeutic progress in functional outcome? Method : The retrospective study includes all the patients from 2008 to 2011 with our department took over from the neurologic, traumatologic, orthopaedic and internal departments. The development was measured with the FIM (functional independence measure). The take over FIM was taken inside 72 hours after arriving and the discharge FIM was taken inside the last 48 hours before leaving. Results : The study contains 1,295 patients, 396 orthopaedic patients with an average age of 74.83 years, a residence time from 15.95 days and a FIM development from 101 to 115 points; 375 traumatological patients with an average age of 81.44 years, a residence time from 18.77 days and a FIM development from 82 to 103 points; 363 neurological patients with an average age of 75.88 years, a residence time from 21.08 days and a FIM development from 73 to 91 points as well as 161 cardio logical/internal patients with an average age of 80.17 years a residence time from 17.54 days and a FIM development from 81 to 96 points. The Fim development of all patient groups is 1.24 (+/- 0.16 points) per therapeutic day. Conclusion : It is possibly to

obtain a sufficient functional progress for all patients in stationary early geriatric rehabilitation independently from witch specialist department they were overtaken from. Keywords : stationary geriatric early rehabilitation, functional outcome, FIM,

OP23 421-C-3

EVALUATING QUALITY OF CARE OF OLDER COGNITIVELY IMPAIRED PATIENTS PRESENTING TO EMERGENCY DEPARTMENTS

Linda Maria SCHNITKER¹, Melinda MARTIN-KHAN¹, Ellen BURKETT², Elizabeth BEATTIE³, Len GRAY¹ (1. *The Centre for Research in Geriatric Medicine, The University of Queensland, Australia*; 2. *The Princess Alexandra Hospital, Emergency Service, Queensland Health, Australia*; 3. *School of Nursing, Queensland University of Technology, Australia*)

Introduction : This study examined the quality of care received by cognitively impaired older persons in emergency departments. Method: The medical records of 273 patients aged 75 years and over were reviewed from November 2010 - February 2011 to evaluate quality of emergency care represented by a published quality indicator set. Results : Records containing evidence of an attempt to carry out a cognitive assessment was identified in 150 records. A formal screening tool was used in 22 cases. The lack of routine appraisal of cognitive function precluded the further assessment of quality of care in 127 records. In 54 cases there was documented evidence of cognitive impairment. Our review of quality of care for older ED patients with cognitive impairment indicated that: 1) Of the 54 patients with cognitive impairment, 30 patients had no documented evidence of the presence or absence of an acute change in cognitive function from baseline; 2) Of 26 patients discharged home with a pre-existing cognitive impairment (i.e. no acute change from baseline), 15 had no documented evidence of the presence or absence of previous consideration of this issue by a health care provider. 3) 12 of the 21 discharged patients, who screened positive for cognitive issues for the first time, were not referred for outpatient evaluation. Conclusion : These findings suggests that the majority of older persons presenting to emergency departments are not receiving a formal cognitive assessment and over half of older ED patients with cognitive impairment do not receive quality of care according to quality indicators for geriatric emergency. Keywords : Emergency Department, Cognitive Impairment, Quality Indicators

OP23 421-C-4

RISK STRATIFICATION AND ON-SITE GERIATRIC ASSESSMENT IN AN EMERGENCY DEPARTMENT REDUCES FUNCTIONAL DECLINE - PRELIMINARY RESULTS

Chik Loon FOO, Vivian Wing Yin SIU, Hou ANG, Madeline Wl PHUAH (*Emergency Department, Tan Tock Seng Hospital, Singapore*)

Introduction : To examine the benefits of providing geriatric assessment to at-risk elders prior to Emergency Department (ED) discharge. Method : This is a prospective pragmatic ED study from 4th July 2011 to 13th September 2012. Patients 65 years-and-above with a Triage Risk Screening Tool (TRST) score 2-or-more were recruited prior to discharge. Allocation was performed by last-digit of their national identity number. Control group (odd) received standard ED care. Intervention group (even) received geriatric assessment and intervention. At 9 months, functional scores, unscheduled ED reattendance and hospitalisation were obtained via telephone and electronic medical records. Results : There were 468 and 239 patients

in the control and intervention groups respectively. There was no difference in age, gender, race and function at baseline. 83.3% of patients in the intervention group had hidden needs that required attention; 20.5% declined. Common interventions included geriatric clinic referral (28.5%) and physiotherapy review (18.8%). At 9 months, there was a trend towards reduced ED reattendance (57.8% vs. 51.6%, $p=0.32$) and hospitalisations (51.0% vs. 42.9%, $p=0.19$) in the intervention group. The intervention group also showed significant improvement in function at 9 months compared to the control group (Basic Activities of Daily Living, BADL -0.70 vs +0.41, $p<0.01$; Instrumental Activities of Daily Living, IADL -0.79 vs +1.50, $p<0.01$). Conclusion : Risk stratification followed by on-site geriatric assessment in the ED resulted in a promising trend towards reduced ED reattendance and hospitalisation rates, as well as significant improvement in function. Keywords : Emergency department, Geriatric screening, Geriatric assessment

COMORBIDITIES AND TREATMENT-LIMITING DECISION AMONG OLDER PATIENTS DYING IN EMERGENCY DEPARTMENT: IS THERE AN ASSOCIATION?

Laure de DECKER¹, Jehanne-Marie de BOISJOLLY-BONNEFOI², Pierre-marie ROY², Cedric ANNWEILER³, Olivier BEAUCHET³ (1. *Geriatrics, Nantes University Hospital, France*; 2. *Emergency Department, Angers University Hospital, France*; 3. *Neuroscience and Geriatrics, Angers University Hospital, France*)

Introduction : It has been shown that older patients treated in the Emergency Departments (EDs) have a higher risk of death compared to younger adults, and that 78% of those dying have a treatment-limiting decision. In addition, older patients treated in EDs have an accumulation of chronic diseases. The aim of this study was to determine whether the score on the Kaplan Feinstein Index (KFI) was associated with the treatment-limiting decision among older patients dying in ED. Method : All patients who died in ED of Angers University Hospital, France, between April 2008 and September 2009 were retrospectively included in this cross-sectional study. One hundred eighty-four patients who died in ED were included in this study (mean age 86.1±6 years; 52 % female). Results : Among them, a treatment-limiting decision was taken in 78.8% (n=145 patients). Multiple logistic regression model showed that long stay in ED before death ($P=0.029$), and neurologic ($P<0.001$), infectious ($P=0.043$) and respiratory ($P=0.021$) organs failures were significantly associated with a treatment-limiting decision. Conclusion : Our findings showed that, unlike acute diseases, the severity of comorbidities measured with KFI was not significantly associated with a treatment-limiting decision. Further research is needed to corroborate our findings. Keywords : treatment-limiting decision; comorbidities; emergency department; older adults

RISK FACTORS OF FALLS

OP23 422-C-1

FALLS AND HIP FRACTURE ISSUES IN BRAZIL, PERSPECTIVES FROM AN ORTHOGERIATRIC SERVICE

Luiz Eugenio GARCEZ LEME¹, Mariana DECKERS LEME² (1. *Ortopedia e Traumatologia - Orthogeriatrics, Universidade de Sao Paulo, Brazil*; 2. *Internal Medicine, Hospital das Clinicas da Faculdade de Medicina da Universidade de Sao Paulo, Brazil*)

Introduction : In Brazil, the overall incidence of falls over 60 in the city of Sao Paulo is 28.6% , reaching 40% among those aged over 80

years . Also osteopenia and osteoporosis over 70 are significant in men (from 33.3 to 57.4% and from 6.4 to 16.1%) and especially in women (from 36.6 to 56.5 % and from 22.2 to 33.2%) . Fracture rates are high and, nationwide in 2012; over 46 thousand people over 60 were hospitalized for hip fracture with an average of nine days of hospitalization and hospital mortality rate of 4.9%, higher by 7.6% among over 80 years . Mortality rates at one year are similar to the international average 23% (women) and over 60% (men). Method : The Orthogeriatric Group (OG) of our hospital (HCFMUSP) began in 1997. The group promoted an interdisciplinary and education orientation. A practical model of clinical evaluation of orthopedic surgery in older people is used. The initial goals are to improve patient care, build a gerontological culture among orthopedic surgeons and encourage other surgical groups to similar structures. Results : In these 15 years aside a decrease in hospital mortality we saw an increase in patient and health professionals' satisfaction. Furthermore, this model proved to be an important academic tool for training all health professionals, mainly residents in geriatrics and in orthopedics, and a new promising field for scientific research for evaluating frailty and cost-benefit models of care. Conclusion : The co-management model of care in hip fractures show to be a valuable resource in Brazil. Keywords : Geriatrics, Falls, Hip Fracture

OP23 422-C-2

FALLS ARE ASSOCIATED WITH DECREASED GRIP STRENGTH, SLOWER WALKING SPEED AND INABILITY TO STAND FROM CHAIR WITHOUT USING ARMS IN A LARGE EUROPEAN AGEING STUDY

Mette Lindholm ERIKSEN¹, Tahir MASUD², Jesper RYG³, Sonja VESTERGAARD¹, Karen ANDERSEN-RANBERG¹ (1. Danish Ageing Research Center, University of Southern Denmark, Denmark; 2. Geriatric Medicine, Nottingham University Hospital NHS Trusts, United Kingdom; 3. Geriatric Medicine, Odense University Hospital, Denmark)

Introduction : Falls in older people are associated with much morbidity, reduced quality of life and institutionalization. Better prediction of falls risk may allow earlier preventative measures. The Survey of Health, Ageing and Retirement in Europe (SHARE) is an ongoing longitudinal study of individuals aged ≥ 50 years in 14 countries. Method : Using cross-sectional data from SHARE wave 2 we investigated if three commonly used functional tests were associated with falls: ability to perform chair stand test (rising from chair without using arms, performed in those < 75 years)[CS], walking speed[WS] (performed in those > 75 years) and grip strength[GS]. Results : 31,043 participants, 54.1% = women, median age = 64.9 (IQR = 58.4-73.2) years were studied. Falls were reported by 4.1% and were positively correlated with age (spearman's rho 0.137, $p < 0.001$). Women had more falls (5.4 vs 2.6%; OR = 2.1; 95% CI = 1.9-2.4; $p < 0.001$). Those unable to perform the CS (19.9%) had more falls (6.8% vs 1.7%; OR = 5.7; 95% CI = 4.6-7.0; $p < 0.001$). Compared to the highest sex-specific quartile of GS, those with lowest quartile GS had more falls (7.6% vs 1.4%; OR = 1.8; 95% CI = 1.7-1.9; $p < 0.001$). Compared to the highest sex-specific quartile of WS, those with the lowest quartile WS had more falls (10.2% vs 4.3%; OR = 2.5; 95% CI = 1.7-3.7; $p < 0.001$). CS, GS and WS remained independently significantly associated with falls after adjustment for age, gender, and country. Conclusion : These cross-sectional data show that falls are significantly associated with CS, GS and WS. Prospective data are now planned from SHARE to determine if these functional tests can predict falls in subsequent waves. Keywords : falls, functional test, multi-national study

OP23 422-C-3

BALANCE IMPAIRMENT, COGNITIVE DECLINE AND FALLS IN OLDER ADULTS: PRINCIPAL COMPONENTS ANALYSIS MAY IDENTIFY THE BEST COMBINATION AT RISK OF FALLS

Jean-Baptiste MIGNARDOT¹, Olivier BEAUCHET², Cedric ANNWEILER², Thibault DESCHAMPS¹, Christophe CORNU¹ (1. Laboratory 'Motricite, Interactions, Performance' (UPRES EA 4334), University of Nantes, France; 2. Department of Neuroscience, Division of Geriatric Medicine, UPRES EA 4638, UNAM, Angers University Hospital, Angers, France)

Introduction : Cognitive decline and balance impairment have been both related to high risk of falls in older adults. There is a complex interplay between risk factors explaining that the identification of risk for falling is multifactorial and depends on the type of combination of risk factors. The objective of this study was to identify variables associated with falls among older adults without (Cognitive healthy individual [CHI]) and with cognitive decline (i.e., Mild cognitive decline [MCI], mild and moderated dementia) by using the principal components analysis (PCA) technique. Method : Based on a cross-sectional prospective design, 620 older adults (mean age 77 ± 8 years; 51.8% women) were recruited in Angers University Hospital. Clinical risk factors of falls and posturographic variables using a force platform balance were measured. The prevalence of falls differed between groups (32.4% in CHI, 27.1% in MCI, 48% in demented individual). Results : PCA identified three significant eigenvectors (i.e., dynamic postural - PC1 - , cognitive-physical - PC2 - and static antero posterior tilt variables - PC3) that represented 40% of variance. Related-postural (i.e., PC1 and PC2) and cognitive-physical variables discriminated significantly fallers from non-fallers ($p < 0.001$ and $P < 0.05$). Significant differences between CHI, MCI and dementia are also observed on PC1, PC2 and PC3 ($p < 0.05$). Conclusion : The findings confirm the prerequisite to differentiate the dementia status when aspiring to estimate accurately the falling risk. The PCA also allows to derive a "general postural factor" from the first "postural control" eigenvector, essential to data reduction of multivariable statistical models and their measure quality. Keywords : Falls prevention, Cognitive decline, Principal Components Analysis

OP23 422-C-4

ARE GAIT DISORDERS AN INDEPENDENT RISK FACTOR OF DEATH IN DEMENTED PATIENTS?

Moustapha DRAME, Dragos CIOCAN, Rachid MAHMOUDI, Francois BLANCHARD, Damien JOLLY, Jean-luc NOVELLA (Department of Geriatrics and Internal Medicine, Reims University Hospitals, France)

Introduction : The aim of the study was to determine if gait disorders are an independent predictive factor of death in demented subjects. Method : A prospective, multi-centre cohort study, including demented subjects aged 75 years or older, hospitalised through the emergency room was set up in nine French hospitals. They all underwent CGA in the first week of hospitalisation. Gait disorders were defined by a timed up and go test greater than 20 seconds. Relationship between gait disorders and death within the first year of follow up was determined using a Cox regression model, after adjustment for baseline characteristics. Results : The 589 subjects of this study were 86 ± 6 years with a majority of women (69%). Gait disorders rate was 86% ($n = 507$). Overall death rate within the first year was 46% ($n = 210$). Factors predictive of death were: gait disorders (HR = 1.65, 95% CI = 1.04-2.61); age (HR = 1.54, 95% CI = 1.6-2.04); and history of hospital admission (HR = 1.51, 95% CI = 1.15-2.0). Sex, denutrition, and

depression did not prove significance. Conclusion : When adjusted for CGA variables, gait disorders are an independent risk factor for death in demented subjects. When hospitalised, physiotherapy should be implemented as early as possible. Keywords : gait disorders, dementia, elderly

OP23 422-C-5

ASSOCIATION OF DEPRESSIVE SYMPTOMS WITH RECURRENT FALLS: A CROSS-SECTIONAL ELDERLY POPULATION BASED STUDY

Cyrille LAUNAY¹, Cedric ANNWEILER², Laure DE DECKER¹, Anastasiia KABESHOVA¹, Bruno FANTINO², Olivier BEAUCHET² (1. Geriatrics, Angers University Hospital, France, 2. Neuroscience and Geriatrics, Angers University Hospital, France)

Introduction : Screening of depressive symptoms is recommended in recurrent fallers. Compared to the 30-item and 15-item Geriatric Depression Scales (GDS), the 4-item GDS is easier to administer and quicker to perform. Our aim was to examine the association between abnormal 4-item GDS score and recurrent falls in community-dwelling older adults. Method : Based on a cross-sectional design, 2,594 community-dwellers (mean age 72.1±5.4years; 49.8% women) were recruited in health examination centers of French health insurance of Lyon, France. The 4-item GDS score (abnormal if score≥1) and recurrent falls (i.e., 2 or more falls in the past year) were used as main outcomes. Results : A total of 19.0% (n=494) participants were recurrent fallers in the cross-sectional study. Abnormal 4-item GDS score was more prevalent among recurrent fallers compared to non-recurrent fallers (44.7% versus 25.0%, with P<0.001), and was significantly associated with recurrent falls (Odd ratio (OR)=1.82 with P<0.001 for full model; OR=1.86 with P<0.001 for stepwise backward model). Conclusion : The current cross-sectional study shows an association between abnormal 4-item GDS score and recurrent falls. Based on these results, we suggest that recurrent falls risk assessment should involve a systematic screening of depressive symptoms using the 4-item GDS. Keywords : accidental falls; depression; screening; older adults

OP23 422-C-6

RISK FACTORS FOR SINGLE AND RECURRENT FALLS: A PROSPECTIVE STUDY OF COMMUNITY DWELLING ELDERLY WITHOUT COGNITIVE IMPAIRMENT

Tai-Yin WU¹, Kuan-Liang KUO², Wai-Kuen WONG², Wei-Chu CHIE³, Rong-Sen YANG⁴, Chen-Kun LIAW⁵ (1. Family Medicine, Taipei City Hospital, Renai Branch, Taiwan; 2. Department of Family Medicine, Taipei City Hospital, Renai Branch, Taiwan; 3. Institute of Epidemiology and Preventive Medicine and Department of Public Health, National Taiwan University, Taiwan; 4. Department of Orthopedics, College of Medicine, National Taiwan University Hospital, Taiwan; 5. Department of Orthopedics, Shin Kong Wu Ho-Su Memorial Hospital, Taiwan)

Introduction : An initial evaluation for an older people who falls was whether he/she fell two or more times in the prior 12 months. Different screening strategies were suggested for single and recurrent fallers. However, little is known whether the risk factors differed. We wish to study the factors associated with falls among community dwelling elders. Method : This is a cohort study conducted in a community hospital in Taiwan. Six hundred seventy one participants were randomly selected from the health examinees of the annual Senior Citizens Health Examination. Participants were interviewed with a detailed questionnaire. Participants were followed up with telephone interview one year later. The main outcome was falls in the prior 12

months. Results : The mean age of the 653 completers was 75.6± 6.4 years. Half (48.7%) were females. In multivariate model, blurred vision (adjusted odds ratio (aOR): 1.93, 95% confidence interval (CI): 1.02-3.67), minimal outdoor activities (aOR: 2.28, 95% CI: 1.06-4.88), overactive thyroid/parathyroid (aOR: 3.49, 95% CI: 1.29-9.50) were associated with single falls. For recurrent falls, frailty (aOR: 2.81, 95% CI: 1.11-7.09), decreased body height in adulthood (aOR: 3.15, 95% CI: 1.52-6.54) and taking sedatives/hypnotics (aOR: 4.23, 95% CI: 2.06-8.67) were the risk factors, while hypercholesterolemia (aOR: 0.37, 95% CI: 0.16-0.88) was inversely associated with recurrent falls. Previous falls (aOR: 2.64, 95% CI: 1.44-4.84 for single falls; aOR: 5.26, 95% CI: 2.61-10.60 for recurrent falls) was associated with all falls. Conclusion : Different risk profiles existed between single and recurrent fallers. Risk stratification and different interventional strategies should be developed. Keywords : falls, old age, risk factors

GERIATRIC NURSING

OP23 423-C-1

CROSS-NATIONAL COLLABORATION BETWEEN AUSTRALIA AND CHINA IN DEMENTIA CARE EDUCATION FOR HEALTH PROFESSIONALS

Lily Dongxia XIAO¹, Guoping HE², Jan PATERSON¹, Yao WANG², Anita DE BELLIS¹, Xiuhua WANG², Craig WHITEHEAD³, Zaijin JIAN⁴, Owen DAVIES³, Youyuan LI⁴, Kuanbao YAO⁵ (1. School of Nursing & Midwifery, Flinders University, Australia; 2. School of Nursing, Central South University, China; 3. Rehabilitation & Aged Care, School of Medicine, Repatriation General Hospital; Flinders University, Australia; 4. Department of Geriatrics, The Second Xiangya Hospital of Central South University, China; 5. Maternity and Child Care and Community Health Office, Health Department of Hunan Province, China)

Introduction : China has a large proportion of the world's population with dementia. The estimated number of people with dementia in China was 5.54 million in 2005 and will reach 27 million in 2050. Most people with dementia live at home as caring for older people has been viewed as a family responsibility. While health professionals in community care settings have a crucial role to play in meeting the complex care needs of people with dementia, they are largely underprepared for this role. Method : The aim of this project was to provide dementia care education for health professionals in primary care settings in Hunan Province in China through academic collaboration between Australia and China. A dementia care program for trainers with follow-up programs to support them to train their colleagues (trainees) was developed, implemented and evaluated. Evidence-based dementia care and knowledge translation frameworks informed the program design. A mixed-methods design was applied to program evaluation. Results : Eighty health professionals from 33 health care organisations participated in a 3-day program for trainers. The project team will assist the trainers to train their colleagues over a 6-month period. It is anticipated that up to 1400 health professionals will benefit from the dementia care education. A pre- and post-test of knowledge and teaching in dementia care from the trainer group revealed positive outcomes. Findings from the trainee group will be available on the completion of the project in May 2013. Conclusion : The cross-national collaboration has generated synergy in the development of health workforce in dementia care in China. Keywords: Dementia care, international collaboration, knowledge translation

THE IMPACT OF A NEWLY DEVELOPED MULTI-DISCIPLINARY PROTOCOL FOR WEANING FROM ENTERAL TO ORAL NUTRITION ON WEIGHT MAINTENANCE

Inbar SHMILOVITZ¹, Orly BERGERZON-BITON¹, Yulia GINZBURG¹, Irina ZWECKER-LAZAR¹, Hagar WECHSLER¹, Danit SHACHAR², Dror WASSERMAN¹ (1. Bayit Balev Hospital, Bayit Balev Hospital, Israel; 2. The S. Daniel Abraham International Center for Health and Nutrition and department of Epidemiology a, Ben-Gurion University of the Negev, Israel)

Introduction : Weaning from enteral nutrition is challenging in weight maintenance and prevention of nutritional status deterioration. An evidence-based guideline for weaning elderly patients from enteral nutrition is lacking. Our objective was to evaluate the efficacy of a newly developed multidisciplinary protocol for weaning elderly patients from enteral to oral nutrition and its impact on weight and nutritional status. **Method :** A newly developed protocol was developed based on Buchholz 1995 and tested longitudinally on elderly patients in sub-acute care hospital. Three distinct groups were formed among participants: patients weaned by the protocol, patients weaned without the protocol and patients with self withdrawal of the feeding tube. Data was collected retrospectively from the medical charts of all (n=67) patients, average age 73.4 years, who were successfully weaned from enteral feeding from November 1, 2004 to November 17, 2010. **Results :** The percentage of patients weaned from enteral nutrition who gained or maintained weight was higher in the group weaned by the protocol (81.3%) than that of the group weaned without the protocol (63.6%). Only 25% of the patients weaned by self removal gained or maintained weight (p=0.046). **Conclusion :** We showed that the newly developed weaning protocol was effective in maintaining patients' weight. **Keywords :** Enteral nutrition, weaning, Multidisciplinary

NON-IMAGING CLINICAL ASSESSMENT OF IMPAIRED SWALLOWING IN COMMUNITY DWELLING ELDERLY IN TAIWAN

Miao-Yen CHEN (Department of Nursing, School of Nursing, National Taipei University of Nursing and Health Sciences, Taiwan)

Introduction : Impaired swallowing is common in elderly patients as well as those with neurological disorders and degenerative diseases. Convenient and accurate assessments should be available to community dwelling elderly in order to diagnose and provide early management and care of swallowing difficulties. **Method :** The study adopted a survey method and recruited 216 community-dwelling elderly over 65 years of age in northern Taiwan; Researchers used tools including a swallowing test, questionnaire, water test, peripheral arterial pulse oximeter, and laryngeal S-EMG to assess participant swallowing functions and the prevalence of impaired swallowing. **Results :** We found a 9.5% prevalence of impaired swallowing based on swallow questionnaire and water test results; Age correlated negatively with swallowing speed; A one-way ANOVA showed a significant difference in swallowing speed among the four age groups (F=6.478, p<.00); A post-hoc Scheffe comparison showed significant differences in swallowing time between the 60-69 and 70-79 year old groups and 60-69 and 80-89 year old groups; Multiple regression of impaired swallowing on various independent variables demonstrated a significant standardized coefficient of 0.163 for age (t=2.328; p=.021); Logistic regression demonstrated a significant Wals test value for age (p=.007); The Kappa value was 0.307 for agreement analysis between impaired swallowing and SaO2 value reduction of more than

2%. **Conclusion :** Swallowing function deteriorates with age. Results of this study provide an assessment of the prevalence of impaired swallowing in community dwelling elderly in Taiwan. Results can help guide clinical nurses to enhance their objective assessment of impaired swallowing in order to improve patient quality of life. **Keywords :** Community-dwelling elderly, swallowing impairments, swallow assessment.

OP23 423-C-4

EMOLLIENT THERAPY FOR MANAGING DRY SKIN IN OLDER PEOPLE

Helen Yue-Lai CHAN¹, Diana Tze-Fan LEE¹, Susanna Sau-Ha CHAN², Maggie Wai-chi TSUNG² (1. The Nethersole School of Nursing, The Chinese University of Hong Kong., Hong Kong; 2. Nursing, Cheshire Home, Shatin, Hong Kong)

Introduction : Changes in skin due to ageing alter its function and pose older adults more susceptible to xerosis and skin breakdown. These not only cause discomforts that affect their quality of life, but may also lead to complications that resulted in increased care burden and cost. This study aimed to investigate the effects of emollient therapy on improving skin hydration among geriatric patients. **Method :** This was a quasi-experimental study for comparing two skin care regimens in geriatric wards over 8 weeks. For the intervention group, emulsifying ointment was used for bathing and a mixture of emollients was applied to body daily. For the control group, commercial bodywash of individual participant was used for bathing and aqueous cream was applied to body daily. Skin hydration was assessed by means of the Overall Dry Skin Score (ODS) and skin sensor at baseline and every two weeks. **Results :** Sixty-two participants, with a mean age of 81.6 years, completed the study. All of them were dependent in activities of daily living. The ODS of the intervention group was significantly lower than that of the control group at week 8. Readings of the hydration sensor over different body parts were increasing over the study period, but statistical difference was only noted in left hands. **Conclusion :** Findings suggest that emollient therapy was effective in improving the skin hydration of geriatric patients over 8 weeks. However, caution should be taken in interpreting the findings due to the small sample size. **Keywords :** Older people, Dry skin, Nursing care

EPIDEMIOLOGY OF AGING II

OP23 424-C-1

AGE MAY NOT BE A MAJOR RISK FACTOR FOR CHRONIC DISEASES

Gabriel Ioan PRADA¹, Ioana ALEXA², Raluca NACU³, Eliza TAPELEA³, Speranta PRADA³, Irina IGNAT³, Ioana FITA³ (1. Clinical Department, 'Ana Aslan' National Institute of Gerontology and Geriatrics, 'Carol Davila' University of Medicine, Romania; 2. Clinical Department of Geriatrics, 'Gr.T. Popa' University of Medicine and Pharmacy, Romania; 3. Clinical Department, 'Ana Aslan' National Institute of Gerontology and Geriatrics, Romania)

Introduction : Most textbooks consider 'age' as major and non-modifiable risk factor for chronic diseases. Aim of the study is to demonstrate that not age by itself is a risk factor. **Method :** At least five current accepted definitions of age are presented: chronological, psychological, social, biologic and demographic age. All these ages could be considered mainly outcomes rather than risk factors for diseases, except chronological age. The last type of age is most of the time considered the major risk factor for chronic diseases. **Results :**

Authors review several papers that demonstrate that vascular risk factors for dementia are risk factors for this disease if they are present around the age of 50, and not if they appear in older people. Consequently, there is a certain time of exposure to these factors required before they can make their effect obvious. Several other papers regarding frequency of dementia (prevalence and incidence) are presented and they show a certain trend, different at very advanced ages as compared to 'young-olds', that supports the same idea. Conclusion : Authors present a new concept, valid for most medical specialties. According to this, not age ('chronological') is the real risk factor for chronic diseases, but the time of exposure to risk factors (other than age). This new concept offers a series of advantages, amongst them being the fact that one can move one risk factor from non-modifiable category (age - nobody can change the passage of time, i.e. chronological age) into modifiable group offering a proactive approach. Other advantages are presented. Keywords : age, risk factor, chronic diseases

OP23 424-C-2

CARDIO-VASCULAR RISK FACTORS OF CERN EMPLOYEES AT THE TIME OF RETIREMENT: TREND OVER 25 YEARS

Francois R. HERRMANN¹, Veronique FASSNACHT², Gabriel GOLD¹, Dina ZEKRY³ (1. Internal medicine, rehabilitation and geriatrics, Geneva University Hospitals, Switzerland; 2. Medical Service, CERN - European Council for Nuclear Research, Switzerland; 3. Geneva University Hospitals, Internal medicine, rehabilitation and geriatrics, Switzerland)

Introduction : To describe, over time and across professional categories, the trends of selected cardio-vascular risk factors and related biological parameters in a population who benefited from long term working contract and shared the same access to health care (same medical follow-up and health care insurance). Method : Data collected routinely over 25 years were anonymously merged from 2 sources: the health medical service and the human resources of a large international organization. Using ANOVA, linear and logistic regression we quantify the effect of age, 5 years time period and 4 professional categories (pc1. manual work, crafts, trades; pc2. office and administrative; pc3. technical; pc4. scientific & engineering). Inclusion criteria were: male aged between 60 and 70.0 years, employed as staff. Only the last medical exam before retiring was considered for analysis. Results : 2040 employees meet the inclusion criteria (pc1: 22.7%, pc2: 4.7%, pc3: 42.1% and pc4: 30.5%). The evolution at the time of retirement of anthropometric variables, smoking status and blood pressure parameters will be presented. Conclusion : Despite work stability and an equivalent access to health care, a health gradient was observed with scientists having the lowest prevalence in most cardio-vascular risk factors. Keywords : retiree, health status, cardio-vascular risk factors

OP23 424-C-3

IMPACT OF METABOLIC SYNDROME ON THE PROGRESSION OF ATHEROSCLEROSIS IN JAPANESE OLD SUBJECTS - SONIC STUDY

Chikako NAKAMA¹, Kei KAMIDE¹, Ryosuke OGURO¹, Tatsuo KAWAI¹, Hiroshi KUSUNOKI¹, Mitsuru OHISHI¹, Yukie MASUI², Kazunori IKEBE³, Yasuyuki GONDO³, Hiromi RAKUGI¹ (1. Department of Geriatric Medicine and Nephrology, Osaka University Graduate School of Medicine, Japan; 2. Tokyo Metropolitan Institute of Gerontology, Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Japan; 3. Department of Removable Prosthodontics, Osaka University Graduate School of

Dentistry, Japan; 4. Department of Clinical Thanatology and Geriatric Behavioral Science, Osaka University Graduate School of Human Sciences, Japan)

Introduction : Metabolic syndrome (Mets) is known to be a risk of cardiovascular (CV) events in the general population. However, there are few reports about influence of age on the relationship between Mets and CV events. It is reported that carotid intimal-medial thickness (IMT) measured by ultrasonography is a surrogate marker to predict CV events. The aim of this study is to clarify the impact of Mets on the progression of atherosclerosis and CV events in old subjects. Method : 384 with age around 70 years (70±1, 47% male) and 490 with age around 80 years (80±1, 48% male) in Japanese general population were included. We made a diagnosis of Mets according to Japanese criteria and performed the carotid ultrasonography. We assessed associations between Mets, carotid IMT and past history of CV events. Results : 79 people (20.6%) in 70 years and 118 people(24.1%) in 80 years were diagnosed as Mets. Mean-IMT(mm) and max IMT(mm) were 0.84±0.17, 1.49±0.92 in Mets and 0.78±0.16, 1.28±0.80 in non-Mets in age around 70 years (p<0.01, p=0.04, respectively) and 0.92±0.18, 1.82±0.89 in Mets and 0.88±0.18, 1.64±0.80 in non-Mets in age around 80 years (p=0.03, p=0.03). The prevalence of stroke history was significantly higher in Mets in age around 70 years (p=0.04), whereas there was no significant association in age around 80 years. Conclusion : Mets is a risk of the progression of atherosclerosis even in old subjects. However, the impact of Mets on CV events may be stronger in subjects with age around 70 than 80. Keywords : Metabolic syndrome, carotid intimal-medial thickness (IMT), cardiovascular events

OP23 424-C-4

LIVING WITH GERIATRIC SYNDROMES - AN OBSTACLE AGAINST ACTIVE AGEING FOR THE COMMUNITY DWELLING ELDERLY POPULATION

Prasun CHATTERJEE, Ramesh KANDEL, Akash Kumar AMBASHTHA, Swapnil S JATHAR, Vijay GURJAR, Shagufta KHATOON, Kavita YEDLAE, Arghya BANDHOPADHYAY, P.C. DAS, A.B. DEY (Department of Geriatric Medicine, All India Institute of Medical Sciences, India)

Introduction : Geriatric syndrome like falls, frailty, depression, dementia, malnutrition and urinary incontinence, are associated with substantial morbidity, disability for the elderly population all over the World. The objective of this study was to look for the prevalence of geriatric syndromes in community dwelling elderly population from developing country, various predisposing factors and association with co-morbidities of old age and also their impact on quality of life. Method : A cross-sectional study, 972 community dwelling older persons (age 60 and above) were assessed from Delhi and NCR (both rural and urban) for socio-demographic factors, co-morbidities, geriatric syndromes. The inter-relationship between these factors was statistically analyzed. Results : : 81% of study subjects had one or more geriatric syndrome with male predominance and increases with extreme ageing [P=0 CI= 5.88(1.79-19.3)] .Prevalence of Geriatric syndrome was significantly high in illiterate population [p=0 95% CI=15.93(9.10 to 27.9)] and patient from lower socioeconomic status[p=0,95%CI= 7.15 (4.149 to 12.33)] . Older subjects with positive health perception suffer significantly less [p=0.735, 95% CI=-.936 (0.638-1.37)] with such syndrome .Among the various comorbidities, paralysis [p=0 95% CI 4.827 (1.495 -15.57)], pallor [p=0, 95% CI 3.80(2.36-6.14)], showed statistically significant association with this syndrome. Smoking (current or past) [p=0 95% CI 1.737 (1.205-0.505)] and abuse [p=0, 3.57 (0.469-27.23)] were also

predisposing factor. It significantly [$p=0$] affects QOL for 80+ patient in all domain. Conclusion : Geriatric syndromes are widely prevalent in ageing community elders, with well recognized predictors and associations, also compromise QOL and prevent active ageing. Keywords : Geriatric syndrome, quality of life, extreme aging

OP23 424-C-5

ASSOCIATION BETWEEN PRIMARY LIFETIME OCCUPATION AND COGNITIVE FUNCTION IN ELDERLY KOREANS

Hyorim LEE, Jee Won PARK, Sung-II CHO (*Graduate School of Public Health and Institute of Health and Environment, Seoul National University, Korea*)

Introduction : This study analyzes which cognitive function is preserved through primary occupation in elderly people and examines the association between primary occupation and cognitive ability with K-MMSE (Korean version of the Mini-Mental State Examination). Method : This study used subjects from Korean Longitudinal Study of Aging (KLoSA) aged over 55 years and the total study population is 3,985. Regression was performed to identify the association between K-MMSE sub-scores and primary occupations. Adjustment was made for confounders such as gender, age, marital status, education level, depression, smoke, and income in the analysis. Results : Manager/professionals as primary occupation showed higher scores at memory, language, and spatiality domains ($p<0.05$), while service/sales workers had high scores at language section ($p=0.01$). Elementary workers showed better scores at command domain ($p=0.01$). When this study analyzed the complexity of job with data, people, and thing, the data group showed higher scores at memory, language, and spatiality domains ($p<0.05$). Also white collar had better scores at language and spatiality section ($p=0.002$) than blue collar. Conclusion : This study reflects a relationship between primary lifetime occupation and cognitive ability in elderly people. Hence, investigation of the primary lifetime occupation may suggest a standard of which cognitive ability is developed and preserved in elderly people. Keywords : primary occupation, cognitive function, K-MMSE

AMINOFF SUFFERING SYNDROME AND PAIN IN END-STAGE DEMENTIA

Bechor Zvi AMINOFF (*Geriatrics, Geriatric Division, Sheba Medical Center, Tel-Hashomer & Minerva Center at Tel-Aviv University, Israel*)

Introduction : To study possible interrelations between Aminoff Suffering Syndrome (ASS) and pain in end-stage dementia (ESD). Method : In a cohort study, 200 ESD patients with a 6-month follow-up period were evaluated by the Mini-Suffering State Examination (MSSE) scale (1999). The MSSE scale is available in English, Hebrew, Dutch and Spanish, and covers 10 items (range 0-10). Based on clinical experience, the following items were included in the MSSE: Not calm, screams, pain, decubitus ulcers, malnutrition, eating disorders, invasive action, unstable medical condition, suffering according to medical opinion, and suffering according to family opinion. The correlation of high MSSE scores with shorter survival periods and, irreversible and intractable aggravation of suffering and medical condition until demise has been defined as ASS. The results of clinical experience with this scale were presented at world and

regional congresses in Berlin (1999), Jerusalem (2000), Vancouver (2001), Stockholm (2002), Tokyo (2003), Las Vegas (2004), Rio-de-Janeiro (2005), Madrid (2006), Saint-Petersburg (2007), Trondheim (2008), Paris (2009), Honolulu (2010), Athens (2011) and in Copenhagen (2012). Results : On the day of admission to the Geriatric Department, 10.5% of ESD patients were diagnosed with pain (21/200) and 89.5% (179/200) were free from pain. Patients diagnosed with ASS and pain had a higher MSSE scale score (7.0 ± 2.4) than those without pain (4.0 ± 2.2), with a significant difference ($P < 0.0001$). Conclusion : Pain contributes to higher suffering and the development of ASS in ESD. Keywords : Suffering, pain, end-stage dementia

OP23 425-C-2

DIABETIC PATIENTS WITH JAPANESE WERNER SYNDROME EXHIBIT HIGH INCIDENCE OF CANCER

Shunichiro ONISHI, Minoru TAKEMOTO, Ryouichi ISHIBASHI, Peng HE, Takahiro ISHIKAWA, Emiko OKABE, Masaki FUJIMOTO, Harukiyo KAWAMURA, Kazuki KOBAYASHI, Koutaro YOKOTE (*Clinical Cell Biology and Medicine, Chiba university, Japan*)

Introduction : Werner syndrome (WS), a representative type of progeroid syndrome, is caused by mutation of the WNR gene (WNR). Since WS patients often have diabetes and malignant tumors, we initiated a nation-wide epidemiological survey in Japan to understand the current relationship between diabetes and malignant tumors among WS patients. Method : We sent 6000 questionnaire survey sheets to hospitals with more than 200 beds and detailed clinical data for 163 cases were obtained. The WS patients were divided into the following 2 groups: patients with ($n = 102$) and without ($n = 61$) diabetes. We examined the correlation among epithelial tumors (cancer) and non-epithelial tumors and diabetes using the chi-square test. Results : The morbidity rate of cancer and non-epithelial tumors were 11.7% and 19.0%, respectively. There was no significant difference in the morbidity rates of non-epithelial tumors in patients with or without diabetes. However, the prevalence of cancer was significantly higher in patients with diabetes (16.6%) than in those without (4.9%). Conclusion : It has recently been reported that WNR might act as a tumor suppressor. Diabetic patients are prone to developing malignant tumors, and insulin resistance has been proposed as one of the reasons for the high prevalence of cancer in diabetic patients. Diabetes with WS is usually caused by high insulin resistance, which may be one of the contributing factors for cancer development but not for non-epithelial tumors. This might be significant for understanding the mechanism of cancer and for the development of new therapeutic methods in the future. Keywords : Werner syndrome, diabetes, malignant tumors

OP23 425-C-3

ORTHOPAEDIC REVOLVING DOOR - SYSTEM, PATIENT OR SOCIAL FACTOR -

Edmund Kwok Yiu SHA, Elaine Yee Lan CHENG, Edward Man Fuk LEUNG (*Medicine & Geriatrics, United Christian Hospital, Hong Kong*)

Introduction : Hip fracture is a potential devastating condition for older people. Despite recent advances in management including early surgery, improve surgical technique and early mobilization, fracture hip still is an important cause of morbidity, mortality or institutionalization in elderly. Method : United Christian Hospital has pioneered the development of Joint Orthopedic Services for Geriatric Hip Fracture patients since 1990 to optimize the management of

elderly patients suffering from hip fracture. The Integrated Discharge Support Program (IDSP) was a pilot program in Hong Kong launched four years ago by the Labor and Welfare Bureau to coordinate and support the discharge of high risk elderly from the hospital. Enhanced support services including transitional home care services, rehabilitation at the Geriatric day hospital and telephone hotline were available upon hospital discharge. Elderly suffering from hip fracture was one of the target groups. Results : From 3/2008 to 9/2011, 1673 community dwelling elders with mean age of 81.3 had been admitted to United Christian Hospital due to hip fracture were managed by Ortho-Geriatric team and received support from IDSP. 384 patients (23%) were discharged directly back home. Nevertheless, 144 patients (9.4%) were unplanned readmission to hospital within 28 days of hospital discharge, majority due to medical causes. Conclusion : Further strengthening of post-discharge support service is required to reduce post-operative clinical problems and reduce early re-admission. Keywords : Hip Fracture, Re-admission

OP23 425-C-4

PREDICTORS OF LATE MORTALITY IN ELDERLY PATIENTS VISITING TO EMERGENCY DEPARTMENT OF A TERTIARY CARE HOSPITAL OF INDIA

P.C. DAS, Prasun CHATTERGEE, Prakash KUMAR, A.B. DEY
(Geriatric Medicine, All India Institute of Medical Sciences, New Delhi, India)

Introduction : The area of geriatric emergency care remains largely underdeveloped as it is seen as unrewarding in older patients with multiple comorbidities and geriatric syndromes. The current study examines the prevalence of comorbidities and predictors of all cause mortality at within year of emergency visit. Method : : Patients aged sixty or above attending the emergency services of AIIMS hospital, Delhi were the subjects of the study. Patients were treated as per standard protocol after extensive assessment. They were followed up with telephonic interview at 1 year of index visit to emergency and collected data on mortality. Results : 1643 older subjects who attended the AIIMS Emergency department were studied between 1.1.2009 and 30.06.2011. They included 919 males and 724 females. 90% of them had one or more co-morbidities. Hypertension and diabetes were the most frequent co-morbidities. One year after the index emergency visit, telephonic follow up on mortality, showed 683 (48.51%) died and 235 (14.30%) could not be traced. Death within one year increased significantly with age (60-69=46.37%, 70-79=48.73%, ≥80 =57.06% p=0.037. After multivariable adjustment, including all predictors in the model, the strong predictor of 1 year mortality were coma (Hazards ratio- 2.519), cancer (HR-2.12), chronic liver disease (HR-1.521), extreme of ageing (HR-1.537), physical inactivity (HR- 1.274), chronic renal failure (HR-1.712) and, respiratory failure (HR-2.448). Conclusion : Emergency Department visit is a serious event in the life of older persons indicating very high likelihood of death or severe disability in next one year. Keywords : mortality, Elderly, Emergency

OP23 425-C-5

NURSING HOMES FACING END OF LIFE

Yoram MAARAVI¹, Adir SHAULOV², Alan RUBINOV³, Meir FRANKEL³, Mayer BREZIS⁴ (1. Division of Geriatrics and Rehabilitation, Hadassah-Hebrew University Medical Centers, Israel; 2. Department of Medicine, Hadassah-Hebrew University Medical Centers, Israel; 3. Department of Emergency Medicine, Hadassah-Hebrew University Medical Centers, Israel; 4. Center for Clinical Quality & Safety, Hadassah-Hebrew University Medical Centers, Israel)

Introduction : Quality of care at end of life (EOL) faces many patients dying with suboptimal palliative care, no knowledge about their preferences, burdensome transitions and overuse of life-prolonging options. Method : We surveyed 30 nursing care facilities in the Jerusalem district. We asked about eliciting and respecting patient's preferences for EOL, and about pain care and tube feeding - using interviews and questionnaires of 135 healthcare providers, administrators and social workers. Results : At most sites, patient's preferences for EOL care remain unknown for the majority of residents and are not routinely elicited. Preferences are sometimes discussed with families at their request or when patient's health deteriorates. Healthcare proxies for EOL decisions are rarely designated. Even when known, patient's preferences are often not respected, communicated or honored during transfer to other providers. In many sites, allowing a patient to die peacefully at the nursing facility is the exception. Pain control appears suboptimal and the use of opiates is limited. Feeding tubes are commonly inserted because of aspiration, malnutrition or caregivers shortage, often against family's wishes and despite dubious effectiveness. Barriers to EOL anticipation include perceived demoralizing impact on patients, presumptions on opinions, sanctity of life, doubts about value of advance directives, misconceptions on regulation and fear of litigation or losing clients. Providers admit being poorly equipped, staffed and trained for EOL care. Most of them would not wish for themselves life-prolonging options they provide to patients. Conclusion : Considerable barriers impair the quality of EOL care, at multiple conceptual, psychological, organizational, financial and tactical levels. Keywords : end of life, palliative care, nursing homes

HEALTH PROMOTION AND DISEASE PREVENTION II

OP23 426-C-1

SOCIAL GRADIENT POTENTIAL IN NON-COMMUNICABLE DISEASE MANAGEMENT

Ana RAMOVŠ¹, Bozidar VOLJC¹, Joze RAMOVŠ², Blaz SVAB², Tina LIPAR¹ (1. Medical Gerontology, Anton Trstenjak Institute for Gerontology and Intergenerational Relations, Slovenia. 2. Social Gerontology, Anton Trstenjak Institute for Gerontology and Intergenerational Relations, Slovenia)

Introduction : Health, disease management and life expectancy of people depend on their socio-economic status; in other words, social gradient, which is usually perceived negatively, causing health inequalities. Vice versa, the tension between upper and lower poles of social gradient can be the energy directed in strengthening health, disease management and diminishing health disparity. Based on this hypothesis we performed an experiment, co-financed by European Commission. Method : Participants: patients with chronic hypertension aged 65-75, 3 study groups of 12-15 patients (first one in a city, second in Slovene periphery, third in Serbian metropolis), equally divided between those with lower educational level and poor disease management (lower gradient) and higher gradient; half men, half women. Physical and psychosocial parameters important in treating hypertension were measured before and after work with participants. Teaching plan and methods: 10 two-hour meetings weekly, intensive social learning from good experiences with physical, mental and social protective factors in day-to-day lifestyle of participants; supervised by two facilitators, trained in methods of group social learning. We monitored the unused positive potential of social gradient knowledge transfer and good experiences among group members. Results : The majority of participants (regardless their social gradient) from all three groups improved their lifestyle and hypertension management.

Conclusion : Finishing the program two groups voluntarily continue to meet monthly in self-help groups for hypertension management, which reinforces behavioral and perceptual changes. Based on these conclusions we developed a model for self-help groups for patients with hypertension, supervised by trained volunteer multipliers. Keywords : social gradient, chronic disease management

OP23 426-C-2

NOROVIRUS GASTROENTERITIS IS AN IMPORTANT VACCINE PREVENTABLE DISEASE AMONG ELDERLY

Lisa LINDSAY¹, Pierre VAN DAMME², Thomas VERSTRAETEN¹
(1. Pharmacovigilance and Epidemiology Services, P95, Belgium;
2. Faculty of Medicine and Health Sciences, Center for the Evaluation of Vaccination, University of Antwerp, Belgium)

Introduction : In high income countries (HIC) the elderly account for a substantial proportion of all-cause acute gastroenteritis hospitalizations and the majority of deaths, with norovirus an important cause. A new vaccine against norovirus has shown potential to prevent disease in a challenge study. We summarize the vaccine preventable disease burden related to norovirus among the elderly. Method : Review of studies published in English between 2007-2012 concerning norovirus epidemiology among elderly (≥ 65 years) in HIC. Results : Estimates of morbidity and mortality vary widely by methodology used and level of norovirus activity. Norovirus mortality estimates range from 1 to 30 per million person-years among elderly in HIC. On average, 10-20% of acute gastroenteritis hospitalizations are due to norovirus, with peaks over 30% during outbreaks. Between 0.1 and 1.0 norovirus-related hospitalizations occur per 1,000 individuals. With every hospitalization representing 12 medical visits, a yearly 1 to 12 medical visits for norovirus can be expected to occur among 1,000 elderly in HIC. Extrapolating to a global elderly population of 180 million in HIC results in an average 1.2 million norovirus medical visits, 90,000 hospitalizations and nearly 3,000 norovirus deaths per year potentially targeted through vaccination. During seasons with high norovirus activity, the burden of norovirus can be twice as large. Conclusion : A safe and effective norovirus vaccine would have the potential to prevent a considerable burden of disease among the elderly in high income countries. The burden of norovirus illness will further increase with longer life-expectancy and higher usage of long-term care facilities. Keywords : norovirus, gastroenteritis, vaccine

OP23 426-C-3

PEPTIDES GEROPROTECTORS IN THE PREVENTION OF AGEING ASSOCIATED PATHOLOGIES

Vladimir KHAVINSON, Galina RYZHAK, Lenar KOZLOV, Olga MIKHAILOVA (Biogerontology, Saint Petersburg Institute of Bioregulation and Gerontology, Russia)

Introduction : Ageing of population cause major concerns in many countries Russia included. During recent 10 years the number of population over working age in Russia increased by 2 mln. people and reached 31.8 mln. (22%). Considerable growth of the share of elderly people leads to increased number of pathologies (ARD, osteoporosis, arthritis; different brain degenerative diseases; diabetes mellitus; cardio-vascular diseases etc.). These diseases need long-term in-patient treatment based on application of a great number of medications creating a vital social-economic challenge. Method : An evidence-based real means to improve health and quality of life, reduce death rate and enhance human vital resource due to preventive application of a complex of peptide bioregulators (24 types) has been designed at the Saint Petersburg Institute of Bioregulation and Gerontology. A 35-year long experimental studies evidenced

normalization of the main organism functions, reduction of tumors occurrence and increase in mean life span by 20-30%. Results : Long-term application to humans showed that they contributed to the improvement of brain, endocrine, cardio-vascular, respiratory systems, gastro-intestinal tract, cartilaginous tissue and resulted in almost 2-fold reduction of death rate in the groups of patients aged 60-74 year during 15 years period of observation in collaboration with the Institute of Gerontology of the Ukrainian Academy of Medical Science. Conclusion : One of the attempts to maintain health and life quality would be implementation of the Programme "Prevention of age-related pathology and enhancement of vital resource of the organism" developed at the Institute of Bioregulation and Gerontology. Keywords : aging, quality of life, bioregulators

OP23 426-C-4

POOR NUTRITIONAL STATUS PREDICTS ADVERSE CLINICAL OUTCOMES AT 12 - 18 MONTHS IN ACUTE AND SUB-ACUTE OLDER PATIENTS

Karen Elizabeth CHARLTON (School of Health Sciences, University of Wollongong, Australia)

Introduction : Older malnourished patients experience increased length of hospital stay and greater morbidity compared to their well nourished counterparts. This study aimed to assess whether nutritional status at hospital admission predicted clinical outcomes at 12-18 months follow-up. Method : A retrospective analysis was undertaken in patients aged 65+ y admitted to acute (N = 2076) and sub-acute (N = 2602) hospitals in regional Australia between 2003 and 2008. Nutritional status was determined by Mini Nutritional Assessment (MNA). Outcomes included hospital readmission rate, total Length of Stay (LOS), change in level of care at discharge, and mortality. Major Disease Classification and age were controlled for in cox proportional hazards regression models. Results : Over half (54 %) of patients were at risk of malnutrition at admission, while 30-34% were malnourished. Well-nourished patients were more likely to be discharged home rather than to institutional care, and had significantly shorter hospital LOS. Follow-up data was available for 476 acute and 774 sub-acute patients. In acute patients, those at risk of malnutrition were 2.46 (95%CI: 1.36, 4.45; $p=0.003$) times more likely to have a poor clinical outcome (mortality/discharge to higher level of care), while malnourished patients had a 3.57 (95%CI: 1.94, 6.59; $p=0.000$) times higher risk. Similarly, in sub-acute patients, hazard rate for death in the malnourished group was 3.41 (95% CI: 1.07-10.87; $P=0.038$) times the well nourished group. Conclusion : Malnutrition carries a substantially greater risk of death and/or loss of dependency in older adults. Interventions to improve their nutritional status, both during and after hospital admissions are required. Keywords : malnutrition, mortality, length of stay

OP23 426-C-5

ASSOCIATION BETWEEN DURATION OF PYREXIA AND BACTERIAL INFECTION IN ELDERLY PATIENTS

Yasuhiro HAKAMATA (General Internal Medicine, Shizuoka General Hospital, Japan)

Introduction : Prolonged pyrexia can be life-threatening in elderly patients with bacteria. Therefore, it is necessary to determine the factors contributing to prolonged pyrexia. Method : Between April 2010 and March 2012, we enrolled 108 patients with bacteremia and studied the association between their clinical characteristics and the duration of pyrexia. The duration of pyrexia was used as a predictor of serious bacterial infections. Results : We encountered 108 positive bacterial blood cultures from a total of 580 inpatients. Urinary tract

infections were the most common form of bacterial infections (28.7%), followed by aspiration pneumonia (14.6%) and vertebral osteomyelitis (10.2%). There was no significant difference with regard to the duration of pyrexia among patients with infectious diseases. However, pyretic patients with cerebro-vascular diseases or those with vertebral osteomyelitis had longer febrile periods as compared to patients with other infectious diseases (5.37 vs. 3.28 days; $P = 0.011$) and (7.27 vs. 4.10 days; $P = 0.020$), respectively. Staphylococcus species were the most commonly isolated bacteria (33.3%), followed by Escherichia coli (27.8%) and Staphylococcus aureus (MSSA; 7.4% and MRSA; 3.7%). There was no significant association between the febrile period and underlying diseases such as diabetes or heart disease, which induce an immunocompromised state. The patients were divided into three groups on the basis of their age: < 65 years, 65-75 years, and > 75 years. We found that the duration of pyrexia was the shortest in the last group. Conclusion : The duration of pyrexia may be indicative of bacterial infections in the elderly with cerebro-vascular diseases or vertebral osteomyelitis. Keywords : duration of pyrexia, cerebro-vascular disease, osteomyelitis

OP24 101-S-1 TRANSNATIONAL AGEING, CARE NEEDS AND THE WELFARE STATE

Emilia K.M. FORSSELL (*Social Sciences, Ersta Skondal University College, Sweden*)

Introduction : There is still little knowledge about the impact of local social welfare policies (including concrete social work) on transnational contexts. In this presentation, the role of the Swedish welfare state in transnational migration contexts involving older people in need of care is discussed. Method : A pilot study about experiences and perspectives among social workers/care managers in the state elderly care sector was conducted in nine different municipalities in the county of Stockholm. The study was designed in a classically qualitative, descriptive and interpretive manner. Seven individual interviews and two focus group interviews focused on experiences in dealing with needs assessment of older people moving between countries and/or receiving care also from family members in transnational social networks. Results : Different examples are given of encounters between the welfare state and everyday transnational life where care needs are met through a combination of public elderly care, efforts by members in informal networks and by the older people themselves travelling across national borders. Care managers may have a comprehensive knowledge of the transnational mobility of older care users, and over time they develop practice according to individual professional experience. However, their awareness of their own role in transnational contexts seems to remain limited. Conclusion: Older transmigrants are dependent on the care managers' professional autonomy and ability to take advantage of the legislation's scope for individual assessments and special solutions. But transmigrancy is something of a blind spot in the welfare state social work context, and it challenges the perceptions of older persons guiding social care practice. Keywords : Needs assessors, Older transmigrants

OP24 101-S-2 THE EFFECTS OF SUPPORT GROUPS ON FAMILY

CAREGIVERS OF ELDERLY IN NEED OF NURSING CARE Ayelet BERG-WARMAN, Michal LARON, Jenny BRODSKY, Shirli RESNIZKI, Tal SPALTER (*Aging, Myers-JDC-Brookdale Institute, Israel*)

Introduction : As part of the effort to support family caregivers, the National Insurance Institute initiated and funded a national project in Israel to support family members caring for elders living in the community. The project comprised support and knowledge. The study goal was to evaluate the effects of these support groups on the participants. Method : Analyzing computerized logs for all 75 groups on all 12-week sessions; telephone interviews using structured questionnaires with a sample of 370 out of the 1,200 participants at the beginning and six weeks after intervention. Caregivers' burden was measured using Zarit 12-item scale. Results : The main contribution of the groups was emotional support and the opportunity to meet with caregivers coping with similar problems. The groups contributed to self-efficacy and a reduced sense of depression and loneliness. The contribution was higher among offspring compared to spouses. Relieving caregivers' burden was not significant. Participants improved their caregiving skills. Communication with care receiver improved, as well. Conclusion : Short-term support groups are an effective instrument to support family caregivers and equip them with tools to cope with the burden. Keywords : Family caregivers, Support groups

OP24 101-S-3 COMPARING THE EFFECTS OF AN INTERNET-BASED SUPPORT GROUP AND FACE-TO-FACE SUPPORT GROUPS FOR FAMILY CAREGIVERS OF ELDERLY IN NEED OF NURSING CARE

Ayelet BERG-WARMAN, Michal LARON, Jenny BRODSKY, Shirli RESNIZKI, Tal SPALTER (*Aging, Myers-JDC-Brookdale Institute, Israel*)

Introduction : As part of the effort to support family caregivers, the National Insurance Institute initiated and funded a national project in Israel to support family members caring for elders living in the community. The project comprised support and knowledge. One of the groups was Internet-based, using website and text technology. The study aims to compare the effects of the internet-based group and the face-to-face support groups. Method : Analyzing computerized logs for all 75 groups on all 12-week sessions; telephone interviews with a sample of 370 out of the 1,200 participants, at the beginning and six weeks after intervention. Burden was measured using Zarit 12-item scale. Results : The main contribution of the groups was emotional support and the opportunity to share with caregivers coping with similar problems, in both the Internet and face-to-face groups. The groups contributed to self-efficacy and a reduced sense of depression and loneliness. In the Internet group, satisfaction with the ability to share feelings with others was lower. Technical problems prevented many participants from entering the forum and taking part in the discussions. Relieving caregivers' burden was not significant in both Internet and face-to-face groups. Conclusion : An Internet-based support group is an equally effective instrument as a face-to-face support group in supporting family caregivers. Consideration should be given to minimizing the barriers of technical problems to enable participation in the forum. Keywords : Family caregivers, Internet-based Support Groups

OP24 101-S-4 NEEDS ASSESSORS IN ELDERLY CARE MEETS IMMIGRANT FAMILIES. THE WELFARE STATE

RECONSIDERED

Emilia FORSSELL¹, Anna OLAISON², Sandra TORRES³ (1. *Social Sciences, Ersta Skondal University College, Sweden*; 2. *Social Work Department, Linjoping University, Sweden*; 3. *Department of Sociology, Uppsala University, Sweden*)

Introduction : In Sweden, social workers doing need assessment in the publicly financed elderly care sector decide about care services to older people. In doing so they are expected to depart from an individual-based understanding of needs and not from the family-based understanding that is customary in other parts of the world. This point of departure is challenged now that the ethnic and cultural diversity of Sweden's older population has increased. In this presentation we will present data from a project that aims to fill the research gap that exists on the literature on need. **Method :** Empirical data about needs assessors' experiences and concrete work was collected through 12 focus group interviews with 60 needs assessors from seven municipalities in Sweden. In addition, case documentation regarding 110 older immigrants and 110 older Swedish-born has been compiled. The material has been analyzed through thematic analysis (focus groups) and content analysis (case documents). **Results :** The findings show that assessing the needs of older migrants can be a tricky business especially when dealing with late-in-life migrants whose understandings can be so different from the individualism that permeates need assessment regulation in Sweden and whose relatives lack a foothold in the labor market and regard the formalization of their informal caregiving duties as a potential source of income. **Conclusion :** In assessing the care needs of these migrants, Swedish welfare state representatives need to renegotiate and thus question the taken for granted assumptions about care and filial obligation that lay at the core of need assessment guidelines. **Keywords :** Needs assessors, Late-in-life immigrants, welfare state

OP24 101-S-5

DEPRESSION IN CAREGIVERS OF OLDER ADULTS WITH SEVERE MENTAL ILLNESS

Sharon CUMMINGS¹, Nancy P. KROPF² (1. *Social Work, University of Tennessee-Nashville, USA*; 2. *School of Social Work, Georgia State University, USA*)

Introduction : Approximately one million older persons have a severe mental illness (SMI) and this number is expected to double by the year 2030 (Cohen, 2003). Family support and care is critical to enhance care provision for older SMI individuals as up to one half of people with SMI live with a family member (Lefley, 2003). This study sought to investigate psychological distress and depression among caregivers of older adults with SMI. **Method :** A cross-sectional research design was employed with caregivers of community-dwelling older clients (55 years+) who had a psychiatric diagnosis (e.g. schizophrenia, bipolar disorder). Caregivers were surveyed with a total sample of 96 caregivers. Data were collected on subjective and objective burden, client symptoms, social support, psychological distress and caregiver rewards. **Results :** Most caregivers were white women, and the majority were in contact with their SMI family member several times a week. Caregivers were primarily adult children or siblings, and most had modest incomes (<\$30,000). Caregivers reported low to moderate subjective burden and moderate rewards. A substantial portion (25%) of the caregivers scored in the clinical range for depression. Results of regression analysis indicated that lower income, poorer caregiver health and higher subjective burden were predictive of caregiver depression, $F(3,81) = 10.8, p < .001; R^2 = .26$. **Conclusion :** Assessment of caregivers of older SMI clients is critical to maintain the functioning of both clients and caregivers. Additional research is

required to clarify the emotional and practical needs of those providing care for the growing population of older persons with SMI. **Keywords:** Caregiving; Severe Mental Illness

OP24 102-S-1

SPIRITUALITY IN OLDER PERSONS: THE INFLUENCE OF HOSPITALIZATION

Liliana SOUSA, Gorete PEREIRA (*Health Sciences, University of Aveiro, Portugal*)

Introduction : Spirituality is the personal search for meaning and purpose in life which assumes particular relevance in old age. Hospitalization in old age is a period of high anxiety, and spirituality has shown to be a relevant coping strategy. This study compares old person's spirituality at hospital admission and discharge, analysing the influence of socio-demographic variables, pathology and period of hospitalization. **Method :** The sample comprises 250 participants (≥ 65 years old), 50.4% female. The Scale of Spirituality, 5 points Likert scale, comprising 5 items was administered by interview at admission and discharge. **Results :** Main findings suggest that: i) 57% of participants show a similar mean of spirituality when comparing admission and discharge, 22.5% maintain low spirituality and 22.5% maintain high spirituality; ii) 43% reveal alterations in their spirituality, 21.9% shows decreasing of spirituality between admission and discharge and 20.8% shows increase. Those participants living in couple tend to show increase in their spirituality. **Conclusion :** The hospitalization may have different impacts in the spirituality of old persons, what should be considered by practitioners when delivering care. **Keywords :** Spirituality, hospitalization, ageing.

OP24 102-S-2

CONSTRUCTING FAMILY INTEGRITY IN LATER LIFE: THE CASE OF OLDER DEMENTIA CAREGIVERS

Liliana SOUSA, Sara GUERRA, Marta PATRAO, Daniela FIGUEIREDO (*Health Sciences, University of Aveiro, Portugal*)

Introduction : Family integrity is a normal developmental challenge for older people influenced by factors within the family system, and constitutes a developmental approach to older people that also involves their families. Family integrity is the positive outcome, revealing overall satisfaction with life; family disconnection (dissatisfaction with some family relations) and alienation (sense of family estrangement) constitute the negative routes. This study aims to contribute to a better understanding of how the experience of caring for a relative with dementia can influence the development of a sense of family integrity in older caregivers. **Method :** An exploratory cross-sectional qualitative study was performed on 26 participants, 16 of whom were women, Mage = 74.11 (SD: 7.4). A semi-structured interview was carried out and subjected to content analysis. **Results :** The main findings suggest that old caregivers of a relative with dementia at home mainly face "difficulty in achieving projects" and "decrease of their reciprocity". The hierarchisation of the two most frequently mentioned categories according to the pathway shows: (a) family integrity: 1) "difficulty in achieving life projects"; 2) "decrease in the frequency of family contacts"; (b) family disconnection: 1) "increase in the frequency of family contacts"; 2) "difficulty in achieving life projects"; (c) family alienation: 1) "decrease in caregiver's reciprocity"; 2) "difficulty in achieving life projects and "difficulty in solving family conflicts". **Conclusion :** More attention

needs to be paid to research and practice regarding old age and older caregivers' developmental issues. Keywords : Families in later life; family integrity; family disconnection/alienation; dementia caregiving

OP24 102-S-3
CULTURAL AND SOCIAL BARRIERS OF OLDER TURKISH MIGRANTS IN USING HEALTH CARE AND SOCIAL SERVICES

Nilufer Korkmaz YAYLAGUL¹, Suzan YAZICI¹, George W. LEESON² (1. GERONTOLOGY, AKDENIZ UNIVERSITY, Turkey; 2. Oxford University Institute of population ageing (OIA), Oxford University Institute of population ageing (OIA), United Kingdom)

Introduction : A great deal of research on the access of migrants to health care and social services in Europe shows that their level of access is less than that of the native population. It is in this context that the main aim of this research is that older Turkish migrants, who are in general not well integrated into the host country, are disadvantaged with respect to their access to and use of health and social services. This research identifies the cultural and social barriers which lead to this disadvantaged position of older Turkish immigrants in two selected European countries. Method : 20 semi structured interviews with first generation older Turkish migrants have been conducted each in Denmark and United Kingdom. Results : The results show that generally older Turkish immigrants have poor health conditions and do not use health care services and social services effectively. Subjective and objective conditions such as the cultural, economic and social capital of older immigrants produce this disadvantaged situation. Conclusion : The research reveals that older Turkish immigrants develop new (coping) strategies in the host country and that these strategies have created a new lifestyle. These life styles include access to health care and social services but by an indirect way and less than the native population. Keywords : cultural and social barriers, health care, social service, older immigrants

OP24 102-S-4
THE QUALITY OF FLEMISH SENIOR ADVISORY BOARD COMMITTEES (SAC'S)

Els Daniella MESSELIS (*Elderly Studies, Tax and Social College - HUB, Belgium*)

Introduction : The decree concerning the policy participation of seniors has been accepted by the Flemish Parliament (April 2004). An implementation decree has never been developed ever since. In spring 2004, a research was organized in co-operation with Gaby Jennes and the students of the Senior Consultants' Training of the Tax and Social College - HUB. Its goal was to keep track of the functioning of the local SAC's. Method : 130 presidents (52%), from all over the country, were selected and questioned by random sample. In 2010, the research was redone by questioning 173 presidents. Results : The call for participation is not a temporary phenomenon. SAC's are well spread and their number has been risen spectacularly (from 75% in 2004 up to 88% in 2010). The presidents' profile was unilateral and still is: they're still most male, average age 70. The female presidents were scarce but have become less scarce. According to the majority of the presidents, loneliness was and still is the most important problem that seniors in Flanders experience. According to the presidents, the main reason of existence of the SAC is to act as the 'mouthpiece' and 'sounding board' of elder people. In reality however, the presidents conclude that their committee still often organizes festivities. The committee is also experiencing many internal and external problems. Especially the call for 'more education' has become bigger and bigger. Conclusion : Conclusion: although many positive evolutions, the

problem is not the existence as such but the structural inbedding and the quality of the functioning. Keywords : quality advisory committees

OP24 102-S-5
A STUDY ON THE IMPACTS OF DIGITAL LIFE ON THE QUALITY OF LIFE AMONG BABY-BOOM GENERATION IN KOREA

Chung Sun PARK¹, Meeryoung KIM², Soon-Jae KWON³ (1. Department of Family Welfare, Daegu University, Korea; 2. Department of Community Development and Welfare, Daegu University, Korea; 3. Department of Management, Daegu University, Korea)

Introduction : The impacts of the digital life of the baby-boomers on digital life satisfaction and overall life satisfaction are examined in this study. Since the baby-boomers have experienced the emergence and expansion of the digital devices in a very short time, some of them showed difficulty in adapting to new lifestyles, and even felt a high stress. Therefore, our study on the impacts of digital life on the quality of life among baby-boomers would suggest the direction of welfare policies for baby-boomers who took more than 15% of the population. Method : The total of 400 men and women of baby-boom generation were surveyed across the country. Results : The findings are as follows; the possession and the buying intention of digital devices was found out to be very strong; however, the actual buying behaviors for new devices were not seen frequently. The capability to utilize digital devices was strongly related to the respondent's socio-economic status. The participation rate in digital-related activity was related to the possession and the buying intention of digital devices, and the capability of the digital device utilization. The digital life satisfaction was strongly influenced by the possession and the buying intention of digital devices, capability of the digital device utilization, and accessibility to the device. Conclusion : Thus, for the enhancement of quality of life of baby-boomers, the education program or services should be systematically established. Policies were proposed to remodel the existing senior centers, which might be a good starting point for redesigning the digital life for baby-boomers. Keywords : baby-boomer, digital life, welfare policy

SOCIAL SUPPORT AND HEALTH

OP24 103-S-1
DISCUSSION NETWORKS, PHYSICIAN VISITS, AND NON-CONVENTIONAL MEDICINE USE AMONG OLDER ADULTS

Markus SCHAFFER (*Sociology, University of Toronto, Canada*)

Introduction : Building from the premise that network ties influence why and how older adults seek health care, this study examines whether different types of close relations predict two distinct forms of care utilization. On the basis of theory and past research, we expect that conventional care largely reflects social control processes typically associated with romantic partnership, but that non-conventional treatment is driven by exposure to information that resides largely outside the confines of kin relations. Method : Analyses are conducted with a national sample of older American adults aged 57-84 (n = 3005), the National Social Life Health and Aging Project (NSHAP). Social networks were assessed with name-generator methods during an in-home interview. Health care utilization was also measured during the interview. Hypotheses were tested using multivariate linear, logistic, and negative binomial regression. Results : Consistent with hypotheses, partnered men who are very likely to discuss health with a partner had a greater number of physician visits

in the past year, net of their health status and other relevant factors. On the other hand, the use of complementary and alternative medicine was predicted not by spousal or other family relationships, but by having non-kin ties with whom a respondent could discuss health. Conclusion: For many older Americans, a diversified health care portfolio involves both institutional obeisance and the ability to venture outside the mainstream and exert autonomy and self-expression. Results suggest that understanding the relational undercurrents of care utilization requires attention to diverse forms of social relations and to diverse expressions of care utilization. Keywords : social networks, health care, complementary and alternative medicine

OP24 103-S-2

INSTITUTIONAL STATUS VERSES SOCIAL STATUS IN ELDERLY PATIENTS/ YOUNGER PHYSICIANS INTERACTION AND COMMUNICATION IN LIBYA

Mayouf Ali MAYOUF¹, Li WEI² (1. English Department, University of Sebha, Liberia; 2. Chair of Applied Linguistics, Birkbeck College, University of London, United Kingdom)

Introduction : This research investigates how elderly patients in Libya interact and communicate institutionally with younger physicians. Method : Naturally occurring conversations between three elderly patients and their younger physicians were tape-recorded separately. The subjects were also interviewed. Conversation Analysis combined with social constructionist theories was employed as a method of data analysis. Results : The analysis of the interviews shows that elderly patients and their younger physicians (subjects) perceive each other socially rather than institutionally. Younger physicians insist that they cannot practice their institutional concessions when the patients are elderly. They cannot produce interruption, overlap or verbal refusal. In comparison, elderly subjects suggest that they perceive their younger physicians like their younger sons. The analysis of the naturally occurring conversations reveals that elderly patients and younger physicians summon each other as social actors (son/hajj or uncle) rather than institutional ones (doctor/sir). Elderly patients and younger physicians could not raise sex-related topics or directly name sexual organs (e.g. rectum) related to the elderly patient's case. Moreover, elderly patients employed social wordings such as proverbs and religious expressions when describing their medical cases to younger physicians. The conversations' exchange of turns was not thoroughly task-oriented. Rather, elderly patients address their younger physicians with social conversations (e.g. where are you from? Who is your cousin? Where do you live?). Elderly patient interactants manipulated the conversations' time-span. Furthermore, they employed the least preferable repair strategy. Conclusion : This research concludes that elderly patients in Libya interact and communicate with their younger physicians in accordance to their social construction which shows prevalence over the institutional hierarchy of the interactants. Keywords : social status, elderly patients

OP24 103-S-3

STRESS, RESILIENCE AND SUBJECTIVE WELLBEING: SINGAPORE LONGITUDINAL AGEING STUDIES

Tze Pin NG, May Li LIM, Xinyi GWEE (Gerontology Research Programme, National University of Singapore, Singapore)

Introduction : The negative effects of adverse life events on wellbeing vary among the elderly. Psychological resilience is a buffering factor against life event stress that reflects the ability to adapt to difficult or challenging life experiences and maintain a sense of wellbeing despite adversities. Research examining the effect of resilience in moderating the negative effect of adverse life events on subjective wellbeing

among the elderly is lacking. Method : In this study, we investigated the associations of adverse life events and resilience (measured by the Connor-Davidson Resilience Scale) with subjective wellbeing (measured by health-related QoL, Subjective Successful Ageing Rating, Satisfaction with Life Scale, Geriatric Depression Scale) among a population sample of 442 older adults aged 60 and above. ANOVA tests for the main and interaction effects of resilience and adverse life events were performed. Results : Increased number of adverse life events and decreasing resilience levels were associated (main effects) with poorer health-related QoL, successful ageing rating, life satisfaction and higher levels of depressive symptoms. Resilience significantly moderated the impact of life events on mental health functioning [$F(2,431)=6.59, p=0.002$] and depressive symptoms [$F(2,431)=13.15, p<0.001$]. Conclusion : Resilience moderated the effects of adverse life events on subjective wellbeing among the elderly, and may be a key to successful ageing. Keywords : Resilience, wellbeing, stress

OP24 103-S-4

EXPLORING LINKS BETWEEN SOCIAL EXCLUSION AND HEALTH OF OLDER CHINESE IN SHANGHAI, CHINA

Hongmei TONG, Daniel LAI (Faculty of Social Work, University of Calgary, Canada)

Introduction : Research has identified social exclusion as one important social determinant of health in later life. However, no research has examined the role of social exclusion in health of older Chinese despite that China has the largest aging population. Method : A stratified proportional random sample of 419 Chinese aged 60 years and older from three communities in Shanghai were invited to complete a structured survey. Physical and mental health was measured by a Chinese version of SF-12. Social exclusion was represented by variables related to material resources, social relation, civic participation, housing condition, basic services and neighborhood. Bivariate correlation and hierarchical multiple regression analysis were used. Results : Over 30% of the respondents reported experiencing two or more forms of social exclusion. Material resources, social relation, civic participation, basic services and neighborhood were significantly related to less favorable physical health while social exclusion related to material resources, social relation, civic participation, and basic services were correlated with less favorable mental health. When controlled for the demographics variables, significant associations were found between less favorable mental health and social exclusion related to material resources, social relation, and civic participation, while unfavorable physical health was significantly related to exclusion in social relation, civic participation, basic services and neighborhood. Conclusion : The findings indicated the potential effects of social exclusion on health of the aging population in China. For achieving a healthy aging society, there is a need to develop policies and programs to address the key social exclusion areas. Keywords : Older Chinese, Social exclusion, Health

OP24 103-S-5

SOCIAL AND PSYCHOLOGICAL STRESS: RISK FACTORS FOR ACCELERATED CELLULAR AGING AMONG AFRICAN AMERICAN MEN?

David H. CHAE¹, Karen D. LINCOLN², Robert J. TAYLOR³ (1. Behavioral Sciences and Health Education, Emory University, USA; 2. School of Social Work, University of Southern California, USA; 3. School of Social Work, University of Michigan, USA)

Introduction : African American men experience earlier onset and faster progression of aging-related disease outcomes compared to their

White counterparts. The disproportionate experience of social stressors, including negative interactions that are racially motivated, in addition to the psychological challenges facing African American men may contribute to accelerated aging in this population. This study examined racial discrimination, depressive mood, and anxiety in relation to leukocyte telomere length (LTL), an indicator of general systemic aging at the cellular level that has been associated with several aging-related health outcomes. Method : Cross-sectional observational study of 92 African American midlife men between 30-50 years of age. OLS regressions predicting LTL assayed from finger prick dried blood spots. Racial discrimination, depressive mood, and anxiety assessed through self-reported survey. Results : Greater anxiety was associated with shorter LTL ($b=-0.029$, $SE=0.014$, $p<0.05$). Although there were no main effects of racial discrimination or depression, there was a significant interaction between the two predicting LTL ($b=0.011$, $SE=0.005$, $p<0.05$). Plots of predicted values showed that there was little relationship between racial discrimination and LTL among those with high levels of depression, but a strong inverse association among those with low levels of depression. Conclusion : Our findings indicate that anxiety may contribute to accelerated biological aging among African American men, as measured by LTL. Among those with lower levels of depression, racial discrimination may constitute an added source of stress that leads to LTL shortening. Results from this study highlight the importance of considering both social and psychological sources of stress that impact aging among African American men. Keywords : African Americans, psychosocial stress, telomere length

OP24 103-S-6

HEALTH AND LIVING ARRANGEMENTS OF OLDER ADULTS IN SOUTH KOREA: IS LIVING NEAR CHILDREN A DISTINCT CATEGORY?

Borin KIM, Jersey LIANG (*Health Management and Policy, School of Public Health, University of Michigan, USA*)

Introduction : This study investigates the effects of health conditions on living arrangements of older Koreans. It focuses on living near children as a category which is distinct from co-residence with and living away from children. Method : Data were obtained from the 2006 and 2008 Korean Longitudinal Study of Ageing, and our sample restricted to older adults over 60 years old with at least one living child ($n=5,209$). We used multinomial logit regressions, and controlled for age, gender, education, rural residency, income, homeownership, marital status, number of children, whether or not having a son or having non-married child, social relations, and religious affiliation. Results : The proportions of living near children among Korean elders were 28% among the married and 17% among the unmarried. While unmarried elders with more functional limitations tended to live with children rather than live near or away from them, married elders with chronic diseases were more likely to live near children rather than live away from them. Conclusion : As a number of Korean elders living separately from children has significantly increased in recent years, policy concerns have arisen over whether this transition in living arrangements reflects a weakening of traditional family support. This study, however, demonstrated that older people with physical health problems still tend to live with or near their adult children. Living near children may be a substitute for co-residence in South Korea, where cultural norm of filial piety and the tendency to value privacy and independence coexist. Keywords : Living near children, Health

TECHNOLOGY IN LATER LIFE

OP24 105-S-1

WHAT DOES TELECARE CONTRIBUTE TO AGEING-ENVIRONMENT INTERACTIONS? EARLY FINDINGS FROM A STUDY OF OLDER PEOPLE AND THEIR CARING NETWORKS IN TWO LOCALITIES IN ENGLAND.

Sue YEANDLE (*Sociology and Social Policy, University of Leeds, United Kingdom*)

Introduction : This paper presents early findings from the 'AKTIVE' project (2011-14), which explores the lives of frail older people living at home in two contrasting locations in England. AKTIVE (url here?) is investigating what happens to older people and their caring networks (family members, neighbours, professional carers) when a package of telecare support (alarms, alerts, sensors and GPS monitoring devices) is installed in their home or provided for them to use when leaving their home environment. Method : The study uses 'Everyday Life Analysis', an innovative social scientific method involving repeat research visits to older people over 9-12 months, deploying ethnographic, biographical and observational approaches. This aims to gain understanding of the circumstances, lives, aspirations and reactions of frail older people, and to assess how far members of their caring network engage with and respond to the telecare technology installed to support them. Results : The paper analyses case material from the study, focusing on how older people with a range of needs use and respond to the telecare packages in place. It focuses on the challenges they and their carers face in using the telecare effectively to help them adjust to increasing mental and physical frailty, and on how this varies according to their differing needs, contexts and personal preferences. Conclusion : The paper concludes with some preliminary policy recommendations, based on dialogue with the study's consortium of experts, who include experts in design, ergonomics and assistive technology, clinicians and telecare manufacturers / commissioners, working with social scientists based at Leeds and Oxford Universities. Keywords : Telecare Networks Care

OP24 105-S-2

CORRELATES OF AND BARRIERS TO INTERNET USE AMONG THE ELDERLY

Janet CHANG, Carolyn MCALLISTER, Rosemary MCCASLIN (*Social Work, California State University San Bernardino, USA*)

Introduction : The study objectives were to examine correlates of current Internet use and barriers to using the Internet among older adults, frequency of Internet use, comfort level, and training needs for Internet use. Method : Data were collected from 567 participants, aged 60 to 92, residing in a southern county in California, using self-administered questionnaires. A convenient sample was employed and participants were recruited from various locations including community agencies, churches, supermarkets, etc. in Spring, 2012. Results : Over 58% of the participants reported they were using the Internet, and 85% of users indicated they were either "very comfortable," or "comfortable" using the Internet. When the non-Internet users were asked what prevented Internet use, lack of knowledge (61%) and lack of access (47%) were the most frequently cited. Logistic regression analysis was conducted to determine predictors of current Internet use. The results revealed that home internet access (19 times more likely), internet use at work (5.5 times more likely), age (elders in their 60's were 2.8 times more likely than in 70's or 80's), education, and ethnicity (Latinos were 40% less likely to use), were statistically significant in predicting the status of current Internet use, while income and marital status did not significantly contribute. Conclusion : The study findings suggest that Internet use among the elderly is increasing, except in older elders with lower

levels of income and education. Human service professionals need to strategize how to continue to reach out and serve non-Internet using elders and computer savvy elders in a technologically dominated human services field. Keywords : Internet Use Elderly

OP24 105-S-3

WHY DO FAMILY CAREGIVERS USE INFORMATION ONLINE? AN EXPLANATORY MODEL OF EHEALTH INFORMATION BEHAVIOR

Chiu Mei Lee TERESA (*Department of Rehabilitation Sciences, Hong Kong Polytechnic University, Hong Kong*)

Introduction : Empirical studies showed that some family caregivers used the Internet to access health information while some did not. The information behavior theories conceptualize the relationship of information source and information users. This study aimed to explore under what circumstances family caregivers would use information online. Method : A critical qualitative research was conducted with a sample of 46 family caregivers who took care of a person with dementia. The caregivers were provided the opportunity to access information and contact a therapist via the Internet. Both service users and non-users were interviewed to describe what happened when they sought and used the online services. Main themes were identified using a grounded theory analysis procedure and a substantive theorizing process. Results : Four paths of usage behavior were represented in a conceptual model of information users, information sources, and Internet-mediated support. Two paths represented the behavior of users who reached the information source by 1) browsing the information posted on the Internet, or 2) interacting with a therapist online. Two paths explained why some caregivers did not use the Internet to reach the information source. 1) They were satisfied with the information from the immediate family and social circle, or 2) they reached the information source directly without the Internet. Each path of (non)-usage consisted of different types of access barriers. Conclusion : A model of ehealth information behavior which can be used to design and evaluate Internet support services is proposed in this study. How the model has been applied to enhance ehealth practice will be discussed. Keywords : information behavior, family caregiver, ehealth innovation

OP24 105-S-4

BOOMER MATTERS: ADDRESSING THE NEEDS OF AGING BABY-BOOMERS

Deborah O'CONNOR¹, Heather WHITEFORD², Elizabeth KELSON³
(1. *Social Work, University of British Columbia, Canada*; 2. *Family Services, Family Services of Greater Vancouver, Canada*; 3. *Interdisciplinary Studies, University of British Columbia, Canada*)

Introduction : The face of aging in Western countries is changing as the baby-boomer generation begins to enter old age. With a reputation for being more active and vocal, rising divorce rates in middle age, and increased reliance upon technology, there is some reason to suspect that their needs as they enter old age will be different from preceding cohorts. This study explores needs and experiences of baby-boomers seeking counseling in a Community Centre. Method : Survey data, indepth personal interviews with program counselors, and telephone and personal interviews with 20 older adults who sought personal counseling at a local Community Centre were examined for themes. Results : Reasons for seeking intervention for boomers are collapsed into three main categories: family care issues including care of aging parents and difficulties with adult children often resulting in situations of abuse; partnering issues including learning to live single and negotiating a changing dating scene; and issues related to body image,

sexuality and physical abilities. Conclusion : Implications of findings include: the need to develop sexual health programs aimed at this generation; the importance of providing the space for boomers to examine their relationships with adult children as a step toward preventing elder abuse; proactive steps to help individuals challenge ageist societal beliefs about personal appearance and signs of aging; and the importance of groups for dealing with issues of loss and age-related changes. Keywords : Baby-boomer needs; sexual health; family relationships

HUMAN RELATIONSHIP, INDIVIDUALIZATION AND SATISFACTION WITH LIFE OF ELDERLY WOMEN IN KOREA: BASED ON A SURVEY RESEARCH

Young-hee SHIM (*Law School, Hanyang University, Korea*)

Introduction : This paper tried to study human relationship and satisfaction with life among elderly women from the perspective of individualization. This paper attempted to approach the elderly women not from the double jeopardy perspective, but from individualization perspective, that is from human relationship or identity perspective. Method : In order to do it, I conducted a survey with a structured questionnaire to 320 elderly people living in a central district of Seoul from August 24 to 25, 2011. Results : The research findings are as follows: Contrary to the double jeopardy assumption that elderly women are unhappy, this study reveals that elderly women are more satisfied with friends and community activities even though their satisfaction with married life is lower than elderly men. In a sense elderly women try to compensate their dissatisfaction with married life with their relationship with children on the one hand and new friends from welfare centers on the other. And the new friends from the welfare centers are related with individualization in the second modernity. Conclusion : The meaning of these findings is that for elderly women in Korea both the family (particularly children) of the first modernity and the friends of the second modernity are important. This can be considered as a unique phenomenon found in Korea, different from the Western one where even the family takes the forms of liberal individualization of second modernity. In this sense it can be said that individualization of Korean elderly women are different from that of the West. Keywords : family relationship, friend relationship, satisfaction with life,

WORK AND RETIREMENT

OP24 106-S-1

MARKET TRANSITION AND DISTRIBUTION OF RETIREMENT INCOME: THE CASE OF CHINA

Haowei WANG (*Sociology of TsingHua University, Sociology of TsingHua University, China*)

Introduction : This paper is concerned with the impact of the market-oriented reform on income distribution among aged people in China. The market-oriented reform in the 1990s has transformed the structure of the retirement income from pension to social insurance in order to release the burden of enterprises and make the market play its role in the distribution of the retirement income. China's change in retirement income of aged population provides a case to test a general belief that the transformation from the redistributive economic system to the market economic system is good to immediate producer rather than redistributors and is good to social, human, and cultural capital rather than political. Method : This examination of changes in distribution of retirement income relies on the data of China General Social Survey.

A sample of 1,728 people aged 60 were identified from the dataset and stepwise regression was used to compare personal retirement income before the reform to that after the reform, and compare the impact of some major social capital variables on the retirement income in different periods. Results : The findings are 1) those who registered as urban resident, employed in public sectors, and held a managerial position before retirement tend to obtain retirement income much higher than those who lived in rural areas, employed in private sectors and held non-managerial positions prior retirement; 2) market transition failed to narrow the retirement gap between producers and redistributors. Conclusion : This may imply that market transition does not automatically lead to more income equal in retirement-income distribution. Keywords : Retirement Income; Market Transition; Income Inequality

OP24 106-S-2

THE APPLICATION OF WORK ABILITY THEORY AND MEASUREMENT FOR AGEING WORKFORCES IN AUSTRALIA AND SINGAPORE

Philip TAYLOR¹, Ruth WILLIAMS², Christopher MCLOUGHLIN²
(1. Director, Graduate Studies, Monash University, Australia;
2. School of Business and Economics, Monash University, Australia)

Introduction : Levels of work ability are predictive of occupational injury, morbidity, mortality and early labour market withdrawal. Testing the utility of the work ability construct in organisational settings assists in identifying areas of the psycho-social work environment that require modification. The Work Ability Survey (WAS) is a robust instrument which measures personal and organisational capacity and comprises of several sub-scales such as workers' physical and psychological health, intrinsic and extrinsic work benefits, respect, and relationships with supervisors. Method : This paper considers levels of work ability among four case organisations; two in Australia, funded by the New South Wales Office for Ageing and two in Singapore, funded by the Singapore Government Ministry of Manpower. The two Australian surveys administered online and via self-completion, included 412 employees from a finance sector organisation and 238 from a health care sector organisation. The two self-completion surveys in Singapore included 303 employees from a hospitality sector organisation and 218 from a government transport. Results : Comparisons according to gender, age, occupation level, department and business unit, indicate key issues prevalent across all four case organisations concerning perceptions of lack of support from immediate supervisors, and workplace discrimination concerning barriers to promotion and job advancement. Additional analysis elicited counterintuitive results in relation to older age categories on the autonomy and work/life balance sub-scales, which may be influenced by cultural background. Conclusion : It is concluded that issues related to relationships with supervisors and management are prevalent organisational risk factors which can be measured and compared across industries, sectors and cultural contexts. Keywords : work ability, older workers

OP24 106-S-3

THE IMPACT OF PSYCHOSOCIAL WORKING CONDITIONS ON EXPECTED AND DESIRED RETIREMENT AGES IN A REPRESENTATIVE SAMPLE OF SWEDISH WORKERS

Martin HYDE, Holendro SINGH, Hugo WESTERLUND
(Epidemiology, Stress Research Institute, Sweden)

Introduction : Governments throughout the industrialised world are seeking to extend the working lives of their populations. However, relatively little is known about how the work environment affects

people's aspirations or expectations of working longer. Method : The data are drawn from the first 3 waves of the biennial Swedish Longitudinal Occupational Study of Health (SLOSH). The 4th wave will be added in November. This is a nationally representative longitudinal study (N = 26,000). Respondents were asked at what age they would like to retire and at what age they expected to retire. The psychosocial work environment was measured using a modified version of the Demand Control Model. Linear regression was used and all analyses were adjusted for socio-demographic factors. Results : At baseline poor psychosocial working conditions were associated with a lower desired age of retirement and a wider gap between expected and desired age of retirement. However there was no statistically significant association with expected age of retirement. There was no statistically significant relationship between change in psychosocial work environment between paired waves and change in expected or desired age of retirement or the difference between them. However for the subsample of respondents who were in work at all three waves (N = 2240) accumulated exposure to poor psychosocial working conditions has a statistically significant independent impact on the discrepancy between expected and desired retirement age. Conclusion: The results suggest that improving the quality of the psychosocial work environment could increase people's willingness to work until later in life. Keywords : Psychosocial, Retirement, Sweden

OP24 106-S-4

THE ECONOMIC CONSEQUENCES OF RETIRING TO CAREGIVE

Lynn MCCDONALD¹, Peter DONHAUE², Tamara SUSSMAN³, Tal SPALTER⁴ (1. Faculty of Social Work, University of Toronto, Canada; 2. School of social work, Renison University College affiliated with the University of Waterloo, Canada; 3. School of social work, McGill University, Canada; 4. Social Work, University of Toronto, Canada)

Introduction : To determine the economic consequences of retiring to caregive when the caregiving is over. Method : As part of a larger study of involuntary retirement and its impact on income, in-depth interviews were carried out with 24 caregivers who self-identified as retiring to caregive and who represented different points along the caregiving, retirement, post-caregiving continuum. Results : Findings from the analysis are organized into an analytical model according to caregiving-retirement-post caregiving trajectories and indicate: the transition into early retirement took two routes; the caregiving process was wrought with financial distress; at the conclusion of the caregiving, the "crisis" caregivers lived in abject poverty while the "planners" reported adequate income; post caregiving survival strategies included attempts at work re-entry, juggling debts, bartering services and pawning belongings; the caregiving, retirement, post caregiving trajectories were influenced by irreconcilable social norms about women that fluctuated over time. Conclusion : Greater understanding of the intersection of caregiver and retirement trajectories over time is necessary for planning financial supports for caregivers who retire. Although the caregiving may be over, the continued intervention of professionals is warranted to avoid the distressing economic consequences of retiring to caregive. Keywords : Life course, retirement, caregiving continuum.

ACTIVE AGING & AGING WELL

OP24 107-R-1

EFFECTIVE MEANS TO MAINTAIN BIORGANISM'S OPTIMAL VITAL ACTIVITIES AND PREVENT AGEING

Sergey IVANENKO, Elena TERESHINA (*Gerontology, WWMA AG, Worldwide Medical Assistance, Switzerland*)

Introduction : WWMA AG conducts fundamental scientific and applied researches aimed at creation of a system of effective means to maintain biorganism's optimal vital activities and prevent ageing. Theoretical works concern the origin and evolution of metabolic schemes at the cell and multicellular organism levels; metabolic system's homeostasis self-regulation and self-maintenance mechanisms; epigenetic regulation of functional system homeostasis mechanisms; ageing mechanisms. **Method :** We consider the human organism to be a thermodynamic system that converts the energy of glucose (partially oxidized substance) through certain metabolic pathways into the energy of fatty acids (highly reduced substance). Ageing is a process of permanent intracellular deposition of fat in extra-adipose tissues that triggers inflammation and oxidative stress and forces cells to convert into the adipose-like phenotype. Endogenous fatty acid synthesis and accumulation complete the "rotation" of the conjugate redox system that supervises proton flows and regulates respiration, proliferation, and energy consumption. That is the reason of age-associated diseases. **Results :** Our system offers a number of means to maintain the organism's homeostasis stationarity that allows us to delivery effective prophylaxis and treatment of age-associated diseases: metabolic disorders (dyslipidemia, diabetes mellitus type 2), cardio-vascular and neuro-degenerative diseases, cancers as results of stationarity disorders in tissues due to immune system suppression in middle and late ontogeny, infectious diseases caused by viruses, bacteria, or fungi typically found in elderly people. **Conclusion :** In addition, our system prolongs human reproductive period and active longevity with high quality of life within the limit of human life expectancy as a species. **Keywords :** Ageing, quality, longevity

OP24 107-R-2

ACTIVE AGEING : A POLITICAL FRAMEWORK AT THE CROSSROAD OF INTERNATIONAL ORGANIZATIONS AND SCIENTIFIC LITERATURE

Thibault MOULAERT¹, Jean-Philippe VIRIOT DURANDAL² (*1. IACCHOS, National Fund for Scientific Research & Université Catholique de Louvain, Belgium; 2. GEPECS, Université Paris Descartes, France*)

Introduction : Active ageing may be considered as one of the leading notion for policy makers to rethink ageing population since 1990's. Usually, literature insists on the importance of World Health Organization framework of 2002 and Walker is often referred in literature as one of the leader for theoretical explanations. They both present a holistic version of active ageing. **Method :** We analyze 24 texts from international organizations (World Bank, OECD, European Commission, United Nations and World Health Organization) and track "active ageing" in 17 Anglophone databases and 7 Francophone databases. **Results :** First we will show how, historically, "active ageing" started emerging in scientific literature. Second, by focusing onto the action of World Health Organization and of European Commission, we will show how international organizations play an important role in transforming the theoretical ideas (the concept or the notion of "active ageing") into a political framework for public policies (a "referentiel d'action publique" in French sociological literature). This will permit us to discuss some of Chris Phillipson's perspectives on globalization and ageing. Third, we will come back the scientific literature to show how "active ageing" receives plural definitions and, in particular, how different it has been at least until 2011 for Anglophone and Francophone literatures. **Conclusion :** In

conclusion, we propose to assess the future development of "active ageing" through the emergence of a new critic, more present in Anglophone literature, but also present in Francophone one. **Keywords :** active ageing, international organizations, scientific literature

OP24 107-R-3

DEVELOPING EVIDENCE-BASED POLICY IN AGEING WELL

Peter ORPIN¹, Judi WALKER², Kim BOYER³ (*1. Rural Health, University of Tasmania Private Bag 103, Australia; 2. School of Rural Health, Monash University, Australia; 3. Rural Health, University of Tasmania, Australia*)

Introduction : Population ageing has driven an increasing government interest in policies and practices to support ageing well. However, the complexity of interacting factors influencing the quality of the ageing experience means that ensuring that such policy and practice initiatives are evidence based presents a major challenge for policy makers. The purpose of this project was to construct a policy design framework to assist policy makers in this task. **Method :** The project involved the critical analysis of a broad range of ageing well policy documents. **Results :** While these initiatives showed a robust use of evidence in understanding the challenges of an ageing population and identifying the factors associated with ageing well, the strategic responses to these issues were notable for their lack of an evidence base. The complex and context specific nature of factors influencing the ageing experience both complicate the process of identifying appropriate evidence and limit the utility and transferability of any identified research evidence and/or models. Also, such evidence remains relatively scarce because, while it can only really be generated within the real world practice context, bureaucratic and political processes and timelines are relatively un-supportive of reflective and evaluative practice. **Conclusion :** We argue for an acknowledgement that complex policy initiatives, to a large extent, need to 'learn by doing'. We propose utilising a program logic framework to identify relevant mid-level theoretical evidence in the initial design stage but to build on that evidence and refine both policy and practice through rigorous and continuous quality improvement evaluation. **Keywords :** Ageing Well Policy Evidence-based

OP24 107-R-4

CREATIVE ACTIVITY AS THE AGED PERSON DEVELOPMENT POTENTIAL

Janna GLOZMAN¹, Valentina NAUMOVA² (*1. Psychology, Moscow State University, Russia; 2. Psychology, Vitis Bering Kamchatka State University, Russia*)

Introduction : Contemporary gerontopsychology views the ageing as a continuing development where involutory change is combined with new progressive formations. The last lead to emotional well-being, personality growth, openness to new, intention for self-development, independence, ability to organize own life. The personality of a creative individual is tolerant to ageing (E.F. Rybalko, 2001). An art-therapy program was developed based on the psychological understanding of personality as a system of human ? environment relationship and of creative work as specifically human, personal way of activity based upon projective and symbolic communication (A.I. Kopytin, 2010). **Method :** Purpose in Life test by J. C. Crumbaugh and L. T. Maholic (in D.A. Leontyev's adaptation); measure of individual reflexiveness by A.V. Karpov, V.V. Ponomaryova; survival test by D.A. Leontyev, E.I. Rasskazova; «Creative hobby questionnaire» by A.I. Kopytin. **Results :** The results prove significant differences after

art-therapy in survival indices: reduced inner tension, pleasure from own activities. The individual reflexiveness development facilitates the process of life reframing, re-estimation of relationships with surrounding world and own life awareness. The Purpose in Life test confirms the tendency towards personal activity, emotional intensity, determination of life purpose and life perception, ability to continue living in the present. The results of «Creative hobby questionnaire» show the transformation of quality of elderly people's life through their life reframing, intensification of emotional sensitivity, sensory activation, interpersonal communication. It provides an opportunity for meaningful and awarding life. Conclusion: The study proves that the art-methods influence person's creative activity, provide successive ageing. Psychological model of personal growth is proposed. Keywords : Aging, personality, creativity

OP24 107-R-5 ACTIVITY ENGAGEMENT AND HEALTHY AGING

Carolyn BAUM (*Program in Occupational Therapy, Washington University School of Medicine, USA*)

Introduction : Biological changes may limit older adult's participation in activity. In addition they are increasingly challenged with chronic diseases. Older adults may eventually lose the ability to perform activities as they used to, but their capacity to engage in activities and derive a sense of wellbeing from them still exists. This paper introduces a simple valid measure of activity participation that can be used to document changes in activity participation as people age and experience chronic health conditions. Method : Common data elements in approved studies provided 460 people age 55-100 living in the community. Sixty four percent were female, 86% Caucasian, 14% African American, and 36% lived alone. The Activity Card Sort (ACS) is a validated and culturally appropriate tool that measures instrumental leisure, fitness and social activities. For the purpose of this study, the activities were coded as those performed at home and those performed in the community. Results : Older adults under 65 spend less time in home and community activities than those 75-80. Between 65-75 years, they increase activities in both. The number of chronic diseases does not impact home and community activities, but their perception of health does. Older adults with more education are more active in community and home activities. There no differences in male and female home activities, but men engage in more community activities. Conclusion : The data demonstrate the usefulness of the ACS for clinical and research purposes. There are 8 culturally valid versions of the ACS that can be used in global studies. Keywords : activity engagement, activity pattern, healthy aging

OP24 107-R-6 UNDERSTANDING DECISIONS NOT TO VOLUNTEER AMONG KOREAN OLDER ADULTS

Hae Jung SHIN¹, Ellen L. CSIKAI², Nan Sook PARK³, Lucinda L. ROFF⁴ (*1. Director, Gwangmyeong Social Welfare Center, Korea; 2. Professor, School of Social Work, The University of Alabama, USA; 3. Assistant Professor, School of Social Work, University of South Florida, USA; 4. Professor Emerita and Interim Dean, School of Social Work, The University of Alabama, USA*)

Introduction : Volunteerism has long been seen as a positive civic engagement activity for people of all ages in the Western countries, but is a relatively new phenomenon in Korea. Governmental policies have recently encouraged volunteerism among older adults and in turn this has led to increased development of volunteer programs by social workers and project directors at social welfare and senior centers, especially in larger Korean communities. However despite this

attention, the volunteer participation rate remains low among Korean older adults. Method : In this phenomenological qualitative study, data were collected through in-depth, semi-structured interviews with a total 30 community-dwelling older adults, ages 60-75 (20 current volunteers and 10 non-volunteers) in two metropolitan cities in Korea. The focus of results presented here was limited to older non-volunteers' perceptions about volunteering and factors that may influence decisions not to volunteer. Results : Four salient themes related to decisions to not volunteer emerged from the data: Little information about volunteering such as lack of awareness and not seeking out information; little understanding and misconceptions of volunteer policies; lack of confidence in abilities related to perceptions of work required and health status; and preference toward enjoying leisure activities. Participants also indicated that policies providing payment (stipend) may be an important factor that could facilitate an initial decision to volunteer. Conclusion : The results suggested that strategies to increase awareness of volunteer opportunities and positive aspects of volunteerism were needed. Also, governmental and community agency policies and corresponding financial incentives to enhance recruitment of older volunteers must be further developed. Keywords : Older volunteer, senior volunteerism, volunteer decisions

OP24 123-C HYPERTENSION

OP24 123-C-1 BLOOD PRESSURE AND CARDIOVASCULAR DISEASE IN OCTOGENARIANS: LILACS NZ

Ruth TEH¹, Robert N. DOUGHTY², Carol WHAM³, Ngaire KERSE¹ (*1. General Practice and Primary Health Care, University of Auckland, New Zealand; 2. Dept Medicine, University of Auckland, New Zealand; 3. Institute of Food Nutrition and Human Health, Massey University, New Zealand*)

Introduction : Studies reported a paradoxical effect of higher blood pressure (BP) on risk of cardiovascular disease (CVD) in older adults. This paper aims to examine the association between BP, CVD and sodium intake in octogenarians. Method : The Life and Living to Advanced Age, New Zealand (LiLACS NZ) is a cohort study that recruited 421 Maaori aged 80-90 and 516 NonMaaori aged 85 (n=937) living in the North Island, New Zealand. CVD and hypertension were ascertained through a standardised questionnaire, general practice medical records, a national hospitalisation registry and physical assessment. Medications were classified using World Health Organisation-Anatomical Therapeutic Chemical Classification. Results : The median (IQR) for systolic/diastolic BP was 146(31)/80(17)mmHg. Sixty-eight percent of the participants were on BP-lowering medication, 21% had SBP/DBP $\geq 140/\geq 90$, 43% had SBP/DBP $\geq 140/<90$. Overall, 86% had hypertension, 65% had clinically manifest CVD. In nonMaaori, controlling for socio-demographic factors, traditional CVD risk factors, BP-lowering medication and sodium intake, a higher BP was associated with higher odds of having stroke ($p<0.05$) but a lower odds of having CHF ($p<0.01$). There was no association between BP and CVD, stroke or CHF in Maaori. The mean (SD) sodium intake was 2495(1024)mg/day. Sodium intake was not statistically different between those with and without CVD, stroke or CHF, and was not associated with BP. Conclusion : In this cross-sectional analysis, elevated BP is an independent risk factor for stroke but associated with a lower risk for CHF; sodium intake did not moderate these relationships. The effect of BP on stroke and CHF in LiLACS NZ are ethnic-specific. Keywords : Aged, cardiovascular disease, blood pressure

**OP24 123-C-2
TRENDS IN HYPERTENSION TREATMENT AMONG
TURKISH STROKE SURVIVOR**

Vildan BINAY SAFER¹, Umut SAFER², Ilker TASCI², Fusun KOSEOGLU¹, Huseyin DORUK² (1. *Physical Medicine and Rehabilitation, Ankara Physical Medicine and Rehabilitation Training and Research Hospital, Turkey*; 2. *Geriatrics, Gulhane School of Medicine, Turkey*)

Introduction : The incidence of stroke is declining in western countries, largely due to achievements in attaining target blood pressure lowering. However, overall rate of stroke remains high due to the aging of the population. Prospective clinical studies in recent years have demonstrated that all classes of antihypertensive agents may not be the same in the prevention of stroke. In the present study, we evaluated the antihypertensive use with respect to age among first-ever stroke survivors. **Method :** Stroke survivors who were recruited to a rehabilitation program between January 2009 and December 2010 were retrospectively examined in this single center study. Demographic data, etiology of stroke, duration of stroke, acute stroke care center, comorbid diseases and recent routine blood tests were recorded. **Results :** A total of 1002 patients with a history of recent stroke were screened. Among them 879 hypertensive subjects with stroke fulfilled the inclusion criteria and underwent assessment. Mean age of participants <65 and ≥65 years was 55.83±7.29 and 75.60±6.48, respectively. There were no significant differences regarding the ratio of untreated hypertensive cases, mono or combine antihypertensive treatment, and history of diabetes mellitus, peripheral arterial disease or dyslipidemia between these two age groups. Ischemic heart disease (31.3% vs.21.5%, p=0.002) and beta-blocker (45.2% vs. 37.2%, p=0.026) use were more frequent among the elderly participants. **Conclusion :** We found higher rates of beta blocker use among Turkish elderly stroke survivors. While this might be associated with a previously diagnosed ischemic heart disease, the results suggest that more potent antihypertensives had been used at relatively lower rates among these. **Keywords :** stroke, hypertension, elderly

**OP24 123-C-3
LONG-TERM EFFECT OF PERSONAL ANXIETY ON RISK
OF AN ARTERIAL HYPERTENSION AND STROKE IN
FEMALE POPULATION IN RUSSIA**

Valery GAFAROV, Dmitriy PANOV, Elena GROMOVA, Igor GAGULIN, Almira GAFAROVA (*Laboratory of psychological and sociological issues of internal diseases, Institute of Internal Medicine SB RAMS, Russia*)

Introduction : The aim is determine the influence of personal anxiety on risk of an arterial hypertension (AH) and stroke in female population of 25-64 years in Russia. **Method :** Under the third screening of the WHO 'MONICA-psychosocial' program random representative sample of women aged 25-64 years (n=870) were surveyed in Novosibirsk in 1994. Levels of personal anxiety were measured at the baseline examination by means of Spilberger's test. From 1995 to 2010 women were followed for the incidence of AH and stroke. Cox proportional regression was used for relative risk (HR) assessment. **Results :** High level of anxiety (HLA) in studied cohort revealed in 60.4% of women. HR of development of AH in women with HLA during the first 5 years of study was in 2.38-fold higher (95.0%CI:1.137-4.993;p<0.05), over 10 years it was 1.85 (95.0%CI:1.075-3.194;p<0.05) and HR was 1.46 (95.0%CI:1.023-2.079;p<0.05) over 16 years of follow-up compared to those with lower anxiety levels. Depending on the age groups the risk of AH incidence within 10 years was highest in older group with HLA aged

55-64 years (HR=10.2; 95.0%CI:1.244-83.609, p<0.05). HR of stroke incidence was in 3.5-fold higher (95.0%CI:1.020-12.015; p<0.05) in women with HLA than without it over 16 years of study. There were also tendencies of increasing stroke incidence in older age groups with HLA. **Conclusion :** There is high prevalence of HLA in Russian female population aged 25-64. During 16 years of follow-up women with HLA have significantly higher risk of AH and stroke especially in older age groups. **Keywords :** anxiety, hypertension, stroke

**OP24 123-C-4
MANAGING HYPERTENSION: OLDER SLAVIC
IMMIGRANT'S USE OF ETHNOMEDICINE**

Catherine VAN SON¹, Ambartsum M. OGANOV² (1. *College of Nursing, Washington State University, USA*; 2. *College of Pharmacy, Washington State University, USA*)

Introduction : Older immigrants from the former Soviet Union (FSU) find compliance to western medicine in the USA difficult. An understanding of the factors influencing compliance and approaches used by older immigrants is critical if hypertension is to be effectively managed. **Method :** Using a qualitative descriptive study, 25 older Slavic immigrant women were interviewed. Several themes related to adherence to prescribed recommendations for hypertension were described. **Results :** The theme regarding ethnomedicine use is presented in this paper. All of the participants talked about their distrust of western medicine and the various ethnomedicine remedies they used to manage their hypertension. Some of these remedies included herbs such as rosehips, yarrow, hawthorn, fennel, and dill. Dietary remedies were lemon, beets and raspberries. On occasion mumiyo was used, as were pharmaceuticals such as (Validol and Enap) from the FSU, mustard plaster and hot or cold water treatments. Most used and preferred their ethnomedicine to western pharmaceuticals prescribed by their physician. None of the participants reported that their hypertension was well managed and described an episodic and random approach to hypertension control. **Conclusion :** A complicated non-systematic approach to hypertension management with ethno and western medicine is used by older Slavic immigrant women. Healthcare providers are unaware of the herbal, dietary and foreign pharmaceuticals being used in combination with or in lieu of the western medications they are prescribing. Healthcare providers must be attentive to ethnomedicine use and provide more information about western medications and the harmful effects of combining remedies without consultation. **Keywords :** Hypertension, Immigrants, ethnomedicine

**OP24 123-C-5
BLOOD PRESSURE (BP) INCREASE OVER 2 YEARS IS
BENEFICIAL TO SURVIVAL IN THE OLDEST OLD: 7-YEAR
FOLLOW-UP STUDY IN 3397 OLDER ADULTS**

Jenny S.W. LEE¹, Tung-Wai AU YEUNG², Jason LEUNG³, Timothy KWOK⁴, Jean WOO⁴ (1. *Medicine and Geriatrics, The S H Ho Centre of Gerontology and Geriatrics The Chinese University of Hong Kong, China*; 2. *Geriatrics, The S H Ho Centre of Gerontology and Geriatrics, The Chinese University of Hong Kong, China*; 3. *The Jockey Club Centre of Osteoporosis Care and Control, The Chinese University of Hong Kong, China*; 4. *Medicine and Therapeutics, The Chinese University of Hong Kong, China*)

Introduction : Epidemiological studies have shown that hypertension treatment may not be as beneficial for those ≥80 years old, and that BP with the best survival rate in the oldest old was higher than the 140/90 recommendation. We examine whether an increase in BP over time may also be associated with survival benefit in very old age. **Method :**

3397 adults ≥ 65 years were examined for demographic, medical conditions, and BP in two assessments two years apart. Hazard ratio of systolic BP (SBP) and diastolic BP (DPB) changes between the visits were examined with respect to 7-year mortality, in those < 80 and ≥ 80 years old. Results : 239(13.8%)men and 272(16.2%)women were ≥ 80 years old, with 331(19.2%)(men) and 152(9.1%)(women) dead by March 2012. The very old had significantly lower DBP than those < 80 years. In women only, the oldest had higher SBP than those < 80 . The very old had significantly larger DBP drop since baseline but a larger SBP drop was noticed only in women. In very old men, an increase of 5mmHg in SBP and DBP at the 2-year visit was associated with a 6% and 11% respective increase in survival, and DBP ≤ 60 mmHg was associated with 81% higher mortality risk. No difference in survival was noted in men < 80 years old or in women. Conclusion : In the oldest old, both increases in SBP and DBP over time were associated with survival benefit. Low DPB(≤ 60 mmHg) was associated with higher mortality. This raises the question of whether increased BP should be subjected to pharmacological control in this age group. Keywords : Hypertension, very old, survival

ADVANTAGEOUS APPROACH USING 'WEARABLE BLOOD PRESSURE SENSOR' TO ACHIEVE APPROPRIATE BLOOD PRESSURE CONTROL WITH CONSIDERATION FOR VERY SHORT-TERM VARIABILITY IN ELDERLY**

Katsuya IJIMA¹, Guillaume LOPEZ², Masaki SHUZO³, Ichiro YAMADA², Shintaro YANAGIMOTO⁴, Yasushi IMAI⁵, Tsukasa INAJIMA⁵, Naoki YAHAGI⁶, Masahiro AKISHITA⁷, Yasuyoshi OUCHI⁷ (1. Institute of Gerontology, Department of Geriatric Medicine, University of Tokyo, Japan; 2. Graduate School of Frontier Sciences, University of Tokyo, Japan; 3. Graduate School of Frontier Sciences, University of Tokyo, Faculty of Engineering, Kanagawa University, Japan; 4. Division for Health Service Promotion, University of Tokyo, Japan; 5. Department of Cardiovascular Medicine, University of Tokyo Hospital, Japan; 6. Department of Emergent Medicine, University of Tokyo Hospital, Japan; 7. Department of Geriatric Medicine, University of Tokyo, Japan)

Introduction : Excessive blood pressure variability (BPV) due to aging leads to aggravate hypertensive target organ damage due to a decline in multi-organ blood flow. Both disturbed baroreflex function and arterial stiffening make the management of hemodynamics more difficult. The arterial wall is stiffened by various pathogenic conditions including calcification. In the clinical settings, it has been frequently seen that the elderly have rapidly BP elevation and decline, leading to orthostatic disorders, post-urination syncope and various geriatric syndromes due to relative brain ischemia. We usually measure their BP using cuff-inflation with a single point mainly. However, this traditional ways have limits to detect the very short-term BPV in detail. Method : Here, we developed an advantageous approach of continuous systolic BP (sBP) monitoring in the elderly, using a newly developed device 'wearable BP sensor', without a cuff-stress. Beat-to-beat sBP is calculated using the basic concept of pulse wave velocity method. Results : The wearable BP sensor could reflect continuous sBP, heart rate (HR), their very close changes and double product (sBP X HR) as a major indicator of cardiac load. Elderly patients with excessive BPV were equipped with the device under free activity including sitting, standing, walking, climbing stairs and toilet. We could achieve the accurate and delicate sBP control using numerous detailed BPV data for each elderly patient. In addition, we could confirm the appropriate efficacy of anti-hypertensive drugs. Conclusion : Our new challenge using this wearable BP sensor might

approach the potential to improve the quality of anti-hypertensive treatment strategy with consideration for very short-term BPV. Keywords : excessive blood pressure variability, wearable BP sensing, accurate and delicate BP control

HEALTH PROMOTION AND DISEASE PREVENTION FOR ELDERLY PEOPLE IN SOUTH KOREA**

Won-Chul LEE (School of Medicine, The Catholic University of Korea, Korea)

Introduction : The high prevalence of the major diseases and sharp rising health care expenditure among the elderly in Korea has perceived as a critical public health and social problem, which incurred from the rapid aging compared to other countries. Method : The efforts for Health Promotion and Disease Prevention of the elderly can be stratified by three different phases: primary, secondary and tertiary phases. In Korea, It is very important to make the best use of medical check-ups and cancer screening programs because the government has taken good initiative to develop and support them as national screening program which means the cost is free. Results : Especially, the national health check-up for the transitional aging program targeting the people at the age of 66 is also providing life style improvement tools. If the target population is extended to older ages, it will greatly contribute to their health promotion. Patients who were diagnosed with hypertension or diabetes under the national medical check-up program would be referred to 'Hypertension-Diabetes Registration and Education Program' managed by the local governments. In this way, they will be connected to and managed by the primary physicians. The patients could take continuous medication for 365 days long during a year, and the life style intervention education which will lead to better disease control and prevention of complications. Conclusion : Even patients missed the above mentioned preventive measures and disabled consequently, he or she would become eligible for the National Long-term care plan. When the long-time discussed 'Healthcare Service Law' is passed, more healthcare service providers will be able to participate in the primary life style improvement activities. However, the effectiveness of these preventive activities, the size of medical cost savings and the rise of healthy life expectancy should be constantly evaluated as well as the potential harms caused by the same activities.

A SUCCESS STORY ABOUT HOME CARE SERVICES IN KOREA: THE GOOD HEART**

Seung-Gug KIM (The Good Heart, Korea)

Introduction : Professional social workers of the non-profit social service organizations survived the competitive long-term care services market and entered into a new story in the Korean home care sector. This presentation will share a success story of the Good Heart which has become the top home care service provider in Korea over the last three years.

ZEN AND THE ART OF RESPONDING TO REVIEWER**

CRITICISM

Bob KNIGHT (*Gerontology, University of Southern California, USA*)

Dr Knight will discuss ways to understand and respond effectively to reviewer critiques of papers in order to do a good revision of the manuscript. These include handling one's personal response to the critiques, responding to all suggestions for revision, and handling errors made by reviewers. Elements of the cover letter to the editor are also discussed.

OP24 220-S-2

PUBLISH OR PERISH: OPTIMIZING SUCCESS FOR INTERNATIONAL SUBMISSIONS

Merril SILVERSTEIN (*Department of Sociology and School of Social Work, Syracuse University, USA*)

In this talk Dr. Silverstein will discuss strategies that international scholars can use to optimize the success of their manuscripts submitted for publication in social and behavioral science journals. This review will describe the process of editorial decision making, discuss the importance of meeting journal expectations, and outline common deficiencies found in manuscripts, particularly those submitted by non-native English speaking authors.

OP24 220-S-3

PICKING AND WRITING FOR A JOURNAL

Stephen KRITCHEVSKY (*Gerontology and Geriatrics, Wake Forest University School of Medicine, USA*)

Dr. Kritchevsky will present strategies for finding the best journal for communicating one's scholarly work to a gerontological audience. He will present 5 considerations in choosing a journal, and provide an editor's perspective on how submission to the Journal of Gerontology Medical Sciences are triaged and managed. Common mistakes in the preparation of articles that reduce the chances for acceptance will also be presented.

SOCIAL INDICATOR FOR THE CARE AND RESPECT FOR ELDERLY PEOPLE IN HONG KONG SAR, CHINA

Paul T.M. SHEA, Daniel K.H. KWOK, H.K. MAK, C.C. WONG (*Youth Elderly Care Movement, China*)

Introduction : The study is to examine the public attitudes towards the elderly people in Hong Kong, by constructing a care and respect indicator with three dimensions namely affective, cognitive and behavioral. Method : 1200 questionnaires were distributed in three districts to secondary schools, district councils and non-government organizations from 1st October to 30th December 2011 in Hong Kong SAR, China. 1055 questionnaires were returned and the response rate was 87.9%. The participants were all Chinese in Hong Kong. The questionnaire consists of 12 questions covering affective, behaviour and cognitive element concerning care and respects towards elderly in Hong Kong. Results : The mean scores of affective, behavioral and cognitive components are 59.00, 51.41 and 47.77 respectively. The composite score of the Social Indicator for Care and Respect Attitude towards Elderly in Hong Kong in 2011 is 52.73. Single persons (score 53.66) are significantly more willing to live with elderly people than married persons (score 41.67). When comparing with students (score 64), housewives (score 65), and technical workers (score 66.7), people

working at managerial or professional level (score 58) are less willing to share the responsibility to take care of elderly parents. Conclusion : The study reveals that the respectful attitudes to elderly in Hong Kong is mainly in affective and The behaviour and cognitive component of respectful attitude are relatively weak among Hong Kong Chinese. Keywords : Elderly, Care, Respect, Chinese, Indicator

OP24 405-S-2

SUPPORTING STAKEHOLDERS IN INTERPRETER-MEDIATED COGNITIVE ASSESSMENTS

Jean TINNEY¹, Elizabeth CYARTO², Betty HARALAMBOUS¹, Sook Meng LEE³, Rachel PURCHASE⁴, Emiliano ZUCCHI⁵, Victoria RAYNER⁶, Dina LOGIUDICE⁷ (*1. Service Development and Evaluation, National Ageing Research Institute Poplar Rd, Australia; 2. Health Promotion, National Ageing Research Institute Poplar Road, Australia; 3. Aged Care Assessment Service, Western Health, Australia; 4. Service Development and Evaluation, National Ageing Research Institute, Australia; 5. Transcultural and Language Service, Northern Health, Australia; 6. Research, Orygen Youth Health, Australia; 7. Aged Care Health, Melbourne Health, Australia*)

Introduction : Social justice and equity of access to care can be compromised by the communication gaps which frequently occur during interpreter-assisted cognitive assessments. In multicultural Australia there is a shortage of interpreters in many languages, even in metropolitan areas, and there are barriers to access to services with appropriate interpreters. Recent developments in telehealth have improved access for some people, but there has been little research exploring the use of videoconferencing in mental health interviews. Method : This project aimed to explore clinician, family member and interpreter perceptions of their experience of a multicultural cognitive assessment; develop interpreter and clinician guidelines and a training DVD; and pilot the use of videoconferencing in interpreted cognitive assessments. Stage 1 methods include a literature review and scoping of current training and accreditation for interpreters in mental health; a demographic survey and focus groups and interviews with stakeholders; and analysis of findings. Stage 2 includes videoconferencing of interpreter-assisted cognitive assessments with the interpreter at a separate location, and the development of guidelines and training DVD to assist both clinicians and interpreters. Results : Project findings highlight the differing perceptions and challenges for all stakeholders in the multicultural cognitive interview, and will contribute to greater understanding between all parties. Videoconferencing methods in multicultural cognitive assessments warrant further exploration. Conclusion : The new guidelines and training materials will educate and support clinicians as well as interpreters, enabling improved collaboration between these groups of professionals. This will improve the experience for patients and their families, and contribute to better diagnosis and care planning. Keywords : interpreters; cognitive assessments

OP24 405-S-3

SOCIAL SUPPORT AND WELL-BEING OF OLDER ADULTS IN EASTERN ASIA: A SYSTEMATIC REVIEW

Vivian W.Q. LOU¹, Nan LU² (*1. Social Work & Social Administration, Sau Po Centre on Aging, The University of Hong Kong, Hong Kong; 2. Social Work & Social Administration, The University of Hong Kong, Hong Kong*)

Introduction : This study aimed to critically review empirical studies on social support and well-being among older adults in five Eastern Asian countries/communities - The People's Republic of China, Hong Kong, Chinese Taipei, Japan, and South Korea. Focuses were put on

the conceptualization and constructs of social support and its relationships with physical and psychological well-being. The roles played by gender and the Asian cultural context were also examined. Method : Key words such as social support and well-being were used to search the articles in four electronic databases, supplemented by Internet searches. After further screening by six inclusion criteria, 46 studies were analyzed. Results : We found that a large proportion of the studies were atheoretical. Findings revealed that: 1) operational definitions of social support varied, mainly because many studies used secondary data; 2) the findings on the role of the three dimensions of social support on well-being of older adults in Eastern Asia were inconclusive; 3) the role of gender was not consistent; 4) cultural specific conceptualization of social support was identified in some of the studies, which showed promise in reflecting the intergenerational family context in Asia. Conclusion : In East Asia context, theories on social support and well-being did not play significant roles in guiding the operationalization of measurements. The themes identified should be considered by future researchers to advance cultural-specific knowledge building in Asian and cross-cultural literature on social support and physical and psychological well-being of older adults. Keywords : social support, well-being, Eastern Asia

HEALTH STATUS AND SOCIAL RELATIONSHIP OF GERIATRIC POPULATION IN DHARAN, SUNSARI, NEPAL

Suman Bahadur SINGH¹, Baikuntha Raj ADHIKARI², Sailesh BHATTARAI¹, Vijay Kumar KHANAL¹, Shyam Sundar BUDHATHOKI¹ (1. School of Public Health and Community Medicine, B.P. Koirala Institute of Health Sciences (BPKIHS), Dharan, Nepal; 2. Psychiatry, B.P. Koirala Institute of Health Sciences (BPKIHS), Dharan, Nepal)

Introduction : On-going economic development and consequent change in family structure, makes the growing elderly population lose their relevance in their own house and they start feeling lonely and depressed. Despite the strong family ties in Nepal, the position of a large number of old people has become vulnerable. Morbidity and loneliness among elderly is a serious challenge to the limited available health services. Method : Cross-sectional study was done in Dharan Municipality of Sunsari district of Nepal. The sample size constituted 570 elderly persons of 60 years and above. House to house visit was done in each ward of Dharan to collect data by interview technique, using pre tested semi-structured questionnaire. Geriatric depression scale and University of California, Los Angeles (UCLA) loneliness scale were used. Results : Half of the elderly persons were in the age group of 60-69 years. About 36 % of the respondents were widowed. There were 45% persons engaging in some form of occupation. About 86% of them were living in non-nuclear families. Almost half (49.2%) of the respondents were found to be financially independent. About 66 % of the respondents rated their health status as fair. Around 93 % of them had complaint about health. Musculoskeletal problem (62%), eye problem (59%), and hypertension (39.3%) were common health problems. Mild depression (29.5%) and severe depression (14.8%) were prevalent. High level of loneliness was recorded among 16 % of them. Conclusion : Complaints about health were common among the elderly population of Dharan. They were living with depression and loneliness. Keywords : Health, Social Relationship, Geriatrics, Nepal

OP24 405-S-5

PERCEPTION OF THE COMPETENCIES AND EDUCATIONAL NEEDS OF THE HEALTH CARE WORKERS IN LONG-TERM CARE FACILITIES IN KOREA

Hyun Ju NAM, Hyun Sook KIM (*Department of Social Welfare,*

Korea National University of Transportation, Korea)

Introduction : This study aims to explore the health care workers in long-term care facilities how they recognize their own task performance competency, and suggests what types of continuing education and training program would be required to improve it. Method : The subjects of this study were 238 health care workers who work at long-term care facilities in Korea. Data were collected using structured questionnaires by self-report method, and analyzed using PASW Statistics 18.0 for Windows. Results : 80% of the subjects said that they needed education either 'somewhat' or 'strongly'. In the degree of perception of one's task performance competency, the care worker's 'basic nursing care skills', and 'work ethics and attitudes' were considered the most confident domains while 'Dying and hospice care skills', and 'service use support' were the least. In the educational needs of long-term care, the subjects chose 'first-aid training', and 'care skills for Alzheimer disease patients' the most highly ranked skills, while 'service use support', 'house chores and ADL support' were ranked the lowest. When comparing the degree of perception on task performance competency with the degree of educational needs, the area that showed statistically the most significant differences were 'first aid training' and 'dying and hospice care skills'. Conclusion : As these results suggest, educations needed most for health care workers in long-term care facilities are the first aid and hospice palliative care skills: implementing and establishing continuing education systems to enhance care worker's task performance competency are needed. Keywords : Health Care Worker, Educational Need Assessment, Long-term care

SOCIAL POLICY AND SOCIAL WELFARE

OP24 412-S-1

THE RELATIONSHIP BETWEEN HEALTH LITERACY AND SELF-MANAGEMENT

Suman BUDHWANI (*Institute of Health Policy, Management, & Evaluation, University of Toronto Ryerson University Health System Performance Research Network (HSPRN), Canada*)

Introduction : Self-management is advocated by policy makers as the foundational process that will enable the shift in the focus of health care systems from acute care to chronic disease management, particularly for older adults. In essence, self-management assumes clients will play an active role in managing their own care within the community, enabled through education and partnerships with health care providers. What is overlooked is the role of health literacy, a subcategory of the social determinant of health focused on literacy. The objective of this study was to examine the relationship between health literacy and self-management. Method : Data for the analyses was derived from the International Adult Literacy and Skills Survey 2003. Utilizing crosstab and correlational statistical analyses, health literacy was treated as both a dependent variable and an independent variable. Results : As the dependent variable, health literacy was found to be affected by participants' age, income, reading activities, and their prior use of a computer and/or Internet. As the independent variable, health literacy's effects were seen in the ability of participants to successfully obtain health information from the Internet, in their ability to learn by watching and/or getting advice from others, and in their self-efficacy or confidence levels, the three main dimensions operationalizing successful self-management. Conclusion : Hence, this analysis demonstrates that health literacy is a significant component of successful self-management in clients and that its significant role should be addressed in policies relating to self-management,

particularly those concerning older adults who are generally less likely to be health literate. Keywords : health literacy, self-management, social determinants of health

OP24 412-S-2

FALLING BETWEEN THE CRACKS: THE INTERSECTION OF AGE AND GENDER IN ORGANISATIONAL POLICYMAKING

Phillip TAYLOR¹, Erin LYNN², Ruth WILLIAMS² (1. Director, Graduate Studies, Monash University, Australia; 2. School of Business and Economics, Monash University, Australia)

Introduction : Older women are increasingly forming a significant proportion of the paid workforce but understanding of their place in organisational policymaking is lacking. This paper will consider the intersection of age and gender within three Australian industry sectors: financial services, state and emergency services, and university education. Method : 95 interviews were conducted, comprising of 56 Human Resource (HR) managers across the three aforementioned sectors and 39 key external stakeholders, including trade unions, advocacy groups for women, advocacy groups for seniors, pension fund consultants, government agencies, job recruitment agencies, public policy think tanks, board members and industry bodies. Results: Interviews revealed a significant disjunction between the two sets of interviewees in terms of understanding of the specific needs and aspirations of older women, particularly in relation to the key issues concerning: the increased caring responsibilities of the 'Sandwich Generation', denied professional development opportunities, inadequate pension fund balances and reluctance to assert themselves in the workplace. It was found that HR managers, in contrast to key external stakeholders, were generally unable to articulate how different equity agendas could be combined. Age and gender were treated as two operationally distinct categories by HR managers and seldom integrated in their application. Conclusion : It is concluded that older women are misunderstood as an entity at the workplace level, generally falling between the cracks of current HR policy and practice. Keywords : older women, policy

COMPARATIVE HEALTH AND SOCIAL POLICIES FOR AGEING SOCIETIES IN ASIA

Kai Hong PHUA¹, Lee Gan GOH², Mui Teng YAP³, Leng Leng THANG⁴, Tania Tze Lin NG¹ (1. Lee Kuan Yew School of Public Policy, National University of Singapore, Singapore; 2. Yong Loo Lin School of Medicine, National University of Singapore, Singapore; 3. Institute of Policy Studies, National University of Singapore, Singapore; 4. Faculty of Arts and Social Science, National University of Singapore, Singapore)

Introduction : This study aims to take stock and monitor the policy trends and issues in health and social care systems in rapidly ageing Asia. Taking a comparative approach, we will examine the extent of public-private-people participation in health and social care in Singapore, Japan and Hong Kong. Method : Comparative Trends Analysis: The study will synthesize information into a narrative form that concentrates on the interpretation and analysis of policy discourses, reforms or innovations, processes and reaction to emergent trends, and impact on interest groups and society at large. Results : 1) Definitions of health and related social needs 2) Delineations of responsibilities and target populations 3) Coordination between agencies - government, community, voluntary and private organizations 4) More data for planning and evaluation necessary for efficient resource mobilization and measurement of impact such as

equity and effectiveness of programs 5) Linkages between resource inputs, processes and program outputs and outcomes. Conclusion : This study aims to derive lessons and best practices from the experience of more aged cities for their potential for transferability to other fast-developing ageing cities throughout Asia. This is hope to improve caregiving for the elderly across the continuum of care in Asian countries with diverse systems of provision, financing and regulation. Keywords : Ageing, Public-Private Partnership

OP27 110-R-4

SAFETY OF URBAN AREAS ACCORDING TO THE PERCEPTION OF OLDER ADULTS LIVING IN SOUTHERN BRAZIL

Patricia MORSCH¹, Iride Cristofoli CABERLON¹, Joel Hirtz Do Nascimento NAVARRO², Andre RIBEIRO¹, Angelo Jose G. BOS¹ (1. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil; 2. Estudante de Fisioterapia, Centro Universitario Metodista, do IPA, Brazil)

Introduction : The fast population aging in developing countries as Brazil is getting public health concerns. Older adults would receive the necessary attention to their specific needs. Thus it is important to understand the perception of older adults about the safety of urban area because this may be a determinant of their social relationships and daily interactions assuring an active aging. Objectives: To show the perception of older adults, living in Southern Brazil, about the safety of urban areas. Method : This study is a result of the research 'Older Adults' Profile in RS' involving 7316 older adults from 59 different cities. They answered a questionnaire based on the WHO report "Global Age-Friendly Cities: A Guide". Participant answered about the difficulty to leaving home, their perception on public places and about the barriers they encounter to walk in public spaces. Results : Twenty 20% said that lack of safety is the greatest difficulty to leaving home, 18% indicated unsafe environments as the main barrier to transition on public streets and 26% considered public places unsafe. Conclusion : With an unsafe environment older adults who will prefer to stay inside their homes preventing an active aging status. Studies that show this problem can serve as a foundation for building a Brazil urbanely welcoming for older adults. Keywords : Friendly cities, Active aging, Urban safety

OP24 412-S-5

ANATOMY OF INDIA'S AGEING POLICIES

Bhaskaran NAYAR (Ageing Studies, Centre for Gerontological Studies, India)

Introduction : India currently accounts for 112 million old people, which is second in the world. India enacted an ageing policy in 1999 and this has been revised in 2011. The paper examines the dynamics of implementing the first policy and the circumstances leading to the revision of that policy.)Method : The different action programmes in the policy of 1999 are analyzed in terms of their implementation strategies. Reasons for success/failure of this effort are examined.)Results : Only minor items in the policy have been implemented such as slight enhancement of pension, concession in train journeys and income tax and the like. Major items like family/health/social security and protection from abuse/neglect have not been implemented. These have been sidelined by government because they involve huge expenditure which the government is not willing to meet. This is because ageing is not a priority item for government. Also welfare of the old is in part the responsibility of the Indian States. The latter are always clamouring for grants from government of India for implementing these ageing programmes. A third reason is the lack of a

powerful NGOs lobby. The net result is that the much proclaimed ageing policy of 1999 did not have impact on the ageing population and government had to make a revised policy.)Conclusion : For a successful ageing policy the concerted efforts of all the three agencies - Government of India, State Governments and NGOs is necessary. The paper has brought this out in great detail from the perspective of political will. Keywords : Ageing,policies,iplementation strategies

Introduction : Falls are a significant cause of harm to older people. To prevent falls, a range of strategies should be put into place for all older people. After falls prevention strategies are in place and after the assessment process is undertaken, those factors identified as contributing to a patient's risk of falling can be addressed in an individualized plan for daily care focused on prevention falls. Since the most important World Congress of Gerontology and Geriatrics is going to be held and a lot of experts get together, the round table on the meaningful topic such as fall prevention in older people would be worthwhile. Method : The panel of experts, expected to participate in IAGG 2013, is comprised of both the countries of Asia and Australia. Aims of the round table meeting is 1) To present each country's strategies of fall prevention in older people and summarize them, 2) To formulate evidence-based and, where possible, clinical practice recommendations on the assessment of older people and prevention of falls in older people based on the best consensus available to the panel of experts. Results : After meeting, we will put our consensus containing a summary of each country's recommendations and good practice points into shape of a report. Conclusion : This could be relevant to health care professional who share in caring for those who are vulnerable or at risk of falling and supplement the clinical knowledge, competence and experience applied by health professionals. Keywords : fall, elderly, prevention

OP24 425-C-2

PREVENTION OF FALLS BY COMPLEX COURSE OBSTACLE NEGOTIATION EXERCISE IN JAPANESE ELDERLY

Hidegori ARAI (Department of Human Health Sciences, Kyoto University Graduate School of Medicine, Japan)

We evaluated whether a complex course obstacle negotiation exercise (CC), a 24-week exercise program, can reduce falls and fractures in older adults, as compared with a simple course obstacle negotiation exercise (SC). This trial was carried out in older adults, aged 75 years and above in Japan. Total 157 participants were randomized into the CC group (n = 78) and the SC group (n = 79), and the intervention was done for 24 weeks. The outcome measure was the number of falls and fracture rates in the two groups for 12 months after the exercise class. Two participants (2.8%) in the CC group and 19 (26.0%) in the SC group experienced falls during 12 months. During the 12-month follow-up period after the intervention, the incidence rate ratio (IRR) of falls in the SC group against the CC group was 9.37 (95% CI = 2.26-38.77). One participant (1.4%) in the CC group and eight (10.9%) in the SC group had experienced fractures during 12 months after the exercise class. The IRR of fractures in the SC group compared with the CC group was 7.89 (95% CI = 1.01-61.49). The results of the present trial show that the participants who received individualized obstacle avoidance training under complex tasks combined with a traditional intervention had a lower incidence rate of falls and fractures during the 12 months after the intervention. We also present data showing the association of global brain atrophy on falls and physical performance in the elderly.

OP24 425-C-3

EPIDEMIOLOGY OF FALLS IN THE COMMUNITY DWELLING ELDERLY IN CHINA

Piu CHAN (Faculty of Geriatrics, Capital Medical University, China)

Falls have significant impact on physical and psychological health in elderly and are highly associated with mortality, hospitalization and quality of life. Ministry of Health (MOH) of China has recently published the first Fall Prevention Guideline. However there were few longitudinal studies of falls in community-based cohorts. To prevent the first and recurrent falls in elderly. Using data from our longitudinal community cohort study in Beijing, the prevalence and incidence of falls and recurrent falls was investigated in people older than 55 and the data were compared with reports from other areas of China. The prevalence of falls and recurrent falls in elderly people over 65 in Beijing is 7.06% and 19.27%, respectively, at the one follow-up survey. When control for age, gender and intervention effect, living urban districts, living alone, diabetes, depression, eye diseases, mental health problem, or taking more than 4 types of medication are significantly associated with increased risk for fall. Environmental conditions including having stair-rail problem, darker hallway or room lighting increase risk for fall. A general community educational intervention is negatively associated with fall (OR=0.81, p=0.0480). Tinetti's Balance score is a good predictor for fall.

OP24 425-C-4

RESEARCH IN FALLS PREVENTION AMONG OLDER COMMUNITY DWELLING PEOPLE IN AUSTRALIA: RESULTS AND TRANSLATION ISSUES

Keith HILL (School of Physiotherapy, Curtin University, Australia)

According to the 2012 Cochrane review of falls prevention among older people in the community setting (Gillespie et al, 2012), 25 of the reported randomised controlled trials conducted world-wide have occurred in Australia. These have included a number of studies of general older samples, as well as a number investigating effective interventions in specific high falls risk groups such as older people

presenting to Emergency Departments after a fall, or people returning home from hospital after hip fracture rehabilitation. This presentation will provide a snapshot of the successful and non-successful randomised controlled trials conducted in Australia that have contributed to our current understanding of effective interventions in falls prevention. The presentation will include brief reference to the lack of change in national indicators of fall related hospitalisations over the past 15 years, and suggest future directions for research in this area.

OP24 425-C-5

FALLS PREVENTION AMONG THE COMMUNITY DWELLING ELDERLY PEOPLE IN HONG KONG

Bernard Ming-Hei KONG (*The Hong Kong Geriatrics Society, Hong Kong*)

Studies in Hong Kong reveal that the prevalence of falls and recurrent falls in elderly people over 65 is 20% and 6 % respectively. According to the Hospital Authority, there were 32,636 elders admitted to hospital after falls in 2008, of which, 28,539 resulted in fractures and 198 died subsequently. Fall prevention program is highly advocated in the community but the best outcomes are those with fall risk. RCT of Tai Chi and resistant exercise on general public 65-74 shows no difference in balance, flexibility or number of falls. Most study population are recruited from hospital acute and emergency departments but there are small sample coming from local health centres with sub-optimal pick up rate. Programs varies from out-patient clinic, geriatric day hospital, health education, exercise class, balance training, Tai Chi, case management program to more sophisticated multi-disciplinary intervention. This presentation covers studies on fall prevention in the community, patients' expectation and the pit falls on current fall prevention in Hong Kong.

OP24 425-C-6

FALL PREVENTION FOR COMMUNITY-DWELLING OLDER PEOPLE IN TAIWAN

Liang-Kung CHEN (*Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taiwan*)

Taiwan has become an aging country in 1993 and is estimated to become an aged country in 2017, which makes Taiwan one of the fastest aging countries in the world. Rapid population aging may pose special challenges to the health care systems and the societies. Amongst, fall is an important issue and deserves special attentions in the communities. A previous study in Taiwan showed the effectiveness of home visit fall prevention for community-dwelling older people, and the fall prevention program should be individualized according to their needs. Moreover, a community-based Tai-Chi program is effective in preventing decline of functional balance, gait, and fear of falling. However, Tai-Chi did not show significant effectiveness in reducing falls. Nevertheless, a combined Tai Chi plus education significantly reduced the risk of falls and shortened the intervention period for fall prevention. Multi-level community-based intervention program is considered more effective than a single intervention program. A recent large-scaled prospective study confirmed that multifactorial fall prevention program significantly improved physical function and fall incidence. However, the control group composed of education and recommendations also reduced incidence of falls without exercise program. In conclusion, effectiveness of fall prevention among community-dwelling elderly in Taiwan is dependent on multifactorial intervention with or without exercises. Exercises and Tai Chi significantly improved physical function, balance, and fear of falling but not incidence of falls. Further

prospective randomized-controlled trial for community-based fall prevention program is of great benefits.

SOCIAL NETWORK AND SOCIAL SUPPORT II

OP24 505-S-1

AN EMPIRICAL TYPOLOGY OF SOCIAL NETWORKS AND PHYSICAL AND MENTAL HEALTH AMONG KOREAN OLDER ADULTS IN THE U.S.

Nan Sook PARK¹, Yuri JANG², Beom S. LEE³, Jung Eun KO⁴, William E. HALEY⁴, David A. CHIRIBOGA⁵ (*1. School of Social Work, University of South Florida, USA; 2. School of Social Work, The University of Texas at Austin, USA; 3. Department of Mental Health Law & Policy and Department of Economics, University of South Florida, USA; 4. School of Aging Studies, University of South Florida, USA; 5. Department of Child and Family Studies, University of South Florida, USA*)

Introduction : We developed an empirical typology of the social networks evident in older Korean immigrants in the U.S. and examined the relationship of the social network types to self-rating of health and depressive symptoms. **Method :** The sample consisted of 1,092 community-dwelling older Korean immigrants in two geographic locations in the United States: Florida and New York. Typological analyses of social networks were based on social network characteristics (marital status, living arrangement, the number and frequency of contact with close family/relatives, the number and frequency of contact with close friends, and attendance of religious meetings and organized group meetings). We examined the associations between the social network types and background variables and the effects of social network types on self-rating of health and depressive symptoms. **Results :** Six social network types were identified using latent profile analyses: diverse, distant/diverse, family/co-residence, family/congregate, distant/restricted, and restricted. At the bivariate level, the social network types were significantly associated with background characteristics and health/mental health. In multivariate models, individuals categorized as embedded in diverse networks or in family networks tended to average higher ratings on health and lower levels of depressive symptoms. **Conclusion :** We confirmed the presence of robust social network types that have previously been reported in cross-cultural studies including diverse, family, and restricted types. Surprisingly, there was no distinct type specific to a network of friends, which is one of the most robust network types in cross-cultural studies. The social network types identified in the presented study may provide implications for understanding cultural differences embedded in social networks. **Keywords :** Typology of social networks, health, mental

OP24 505-S-2

LONELINESS, DEPRESSION AND SOCIAL SUPPORT IMPACTS ON THE WELLBEING OF OLDER PEOPLE

Charles WALDEGRAVE (*Social Policy Research Unit, Family Centre, New Zealand*)

Aim: This presentation will provide results from the New Zealand Longitudinal Study of Ageing (NZLSA). The specific aim of this paper will be to explore the relationships between loneliness, depression and social support respectively, and together, with quality of life and wellbeing. **Methods:** Amartya Sen's capabilities approach has formed the conceptual basis of the theoretical framework of this research programme (Sen, 1999). An extensive survey of a national random sample of 3,317 older New Zealand citizens aged between 50

to 84 years was carried out in the second half of 2010. The survey questionnaire included scales on loneliness (De Jong Gierveld Loneliness Scale), Depression (CES-D-10) and social support (Social Provisions Scale). These variables were tested for statistical associations with wellbeing and quality of life measures, including CASP 12, and WHOQoL 8. Findings: The results demonstrated highly significant relationships between each domain scale and wellbeing. Higher loneliness and depression scores were strongly associated with lower wellbeing scores, whereas higher social support scores were strongly associated with higher levels of wellbeing. We estimated a linear regression of wellbeing and the results showed a highly significant relationship for the whole model. Relevance: The results are relevant in that they demonstrate the important associations these three domains have with wellbeing. Serious problems arise if older people become socially isolated. The results point to the need for practical planning, policy and service responses to be designed to overcome the problems of social exclusion and the social causes of depression. Keywords : Loneliness, Depression, Wellbeing

OP24 505-S-3
DYNAMIC SOCIAL CAPITAL AND MENTAL HEALTH IN LATE LIFE

Tal SPALTER¹, Ariela LOWENSTEIN², Noah LEWIN-EPSTEIN³
(1. *Social Work, University of Toronto, Canada*; 2. *Center for Research & Study of Aging, University of Haifa, Israel*; 3. *Sociology and Anthropology, Tel-Aviv University, Israel*)

Introduction : The concept of social capital (SOC) encompasses a network that comprises different types of social ties, the resources that flow in the network and the potential or practical accessibility of these resources to the pivotal person. The impact of different types of SOC and their changing patterns in later life on changes in elders' mental health is at the core of this study. Method : Analyses were performed on two waves' data from the Cross-Sectional and Longitudinal Aging Study (CALAS) in Israel. Cluster analysis and linear regression models were estimated in order to test study hypotheses. Results : Findings show a hierarchy of five types of SOC. "Diverse" and "Local, Supported" types of SOC in comparison to the "Limited" type, lower significantly the chance of decreased mental health along the aging process above and beyond socio-demographics and functioning. Continuity in solid SOC and change for a better type of SOC also lower the likelihood of decline in mental health in comparison to continuity in slack SOC, however, not beyond socio-demographics and functioning. Conclusion : The productivity of elders' social capital is high when it moderates the impairment of mental health. That means that social ties, their mutually exchanged resources and their availability to the elderly throughout late life, constitute an important element in the evaluation of elders' subjective well-being. Keywords : Social Capital, Mental Health

OP24 505-S-4
SOCIAL SUPPORT ON CHANGES OF INSTRUMENTAL ACTIVITIES OF DAILY LIVING IN OLDER ADULTS IN TAIWAN: RESULTS OF A NATIONAL LONGITUDINAL STUDY

Wen-Chun LIAO¹, Chi-Rong LI¹, Chiu-Yueh HSIAO¹, Hua-Shan WU¹, Meng-Chih LEE² (1. *Nursing, Chung Shan Medical University, Taiwan*; 2. *Medicine, Chung Shan Medical University, Taiwan*)

Introduction : Cross-sectional studies have shown that social support and social engagement are predictors of disability among the elderly. The purposes of this study were to investigate the progress and the associations between social support and changes of IADL function in

community dwelling elderly in Taiwan over a 10 year period. Method : This is a prospective cohort study by using data of the Taiwan Longitudinal Study in Aging (TLISA) from 1996, 1999, 2003, and 2007. IADL disability was defined as difficulties in either grocery shopping or using telephone. 1742 elders (60-70 years) without IADL disability at baseline were included. Perceived social support including instrumental (1 item) and emotional (2 items) and social engagement including being a member of any association, or providing instrumental and emotional support to others were assessed at each waves. GEE model was used to examine the associations between social support and changes of IADL disability. Results : Among these elders in 1996, 84.7% received instrumental social support, 85% received emotional social support, and 10.8% providing instrumental social support. Otherwise, 5% engaged in volunteering, and 44.9% being a member of association. The GEE model showed providing instrumental (OR=0.599, p=.003) and emotional social support (OR=0.281, p=.007), being a member of an association (OR=0.666, p=.001), and engaging in volunteering (OR=0.462, p=.008) were associated with low probability of IADL disability; received more emotional social support had high risk of IADL disability. Conclusion: IADL disability is associated with less engagement in volunteering or providing support to others. Keywords : social support, instrumental activities of daily living, longitudinal

OP24 505-S-5
SOCIAL SUPPORT NETWORK AS A MECHANISM BEHIND THE RELATIONSHIP BETWEEN PROTEIN-ENERGY INTAKE AND PHYSICAL FUNCTION IN COMMUNITY-DWELLING FRAIL OLDER ADULTS

Chang-O KIM (*Department of District Health Care Service, Gangbuk-gu Community Health Center, Korea*)

Introduction : Protein-energy malnutrition is a major cause of functional decline in the elderly and is clearly an important component of frailty. However, information about social support network is rarely reported and no such comprehensive studies have yet been published. In this study, we attempt to examine the hypothesis that the association between protein-energy intake and physical function in frail older adults was mediated by social support network. Method : A total 87 frail older adults were participated in this cross sectional study from National Home Healthcare Services in Gangbuk-gu, Seoul, South Korea. Associations among three variables were tested by multiple regression analyses: protein-energy intake (independent variable), Wenger's network typology (possible mediator), and physical function (outcome variable). All analyses were adjusted for age, gender, education, household income, and number of chronic diseases. Results: Participants with a higher level of protein-energy intake (assessed by mean adequacy ratio, MAR) was associated with increased physical function (assessed by Physical Functioning, PF) ($\beta=0.05$; $p=.023$). Participants with locally integrated network type were associated with increased PF ($\beta=2.98$; $p=.010$) and MAR ($\beta=11.8$; $p=.029$). After additional adjustment for locally integrated network type in the first equation, a previously significant relation between MAR and PF was attenuated ($\beta=0.04$; $p=.079$), indicating the mediator effect of social support network. Conclusion : Findings are consistent with the hypothesis that the relationship between protein-energy intake and physical function is mediated through social support network in frail older adults living in community. Understanding factors that determine geriatric function in the community setting requires investigations that combine physiologic and psychosocial factors. Keywords : social support network, frailty, mediator

OP24 505-S-6

CHANGING ATTITUDES TOWARD SUPPORTING OLDER PARENTS IN KOREA AND JAPAN

Yoshiko SOMEYA (*Sociology, Tokyo Woman's Christian University, Japan*)

Introduction : Although supporting older parents by children is a strong tradition in East Asia, it has been changing according to drastic social changes. Filial piety is a strong tradition in Korea, however, there are significant differences between generations. This research investigates the changing attitudes toward supporting older parents among young women in Korea and Japan. Method : In order to investigate the young female attitudes toward supporting older parents, group interviews and questionnaire researches were conducted at Korean and Japanese universities from 2010 to 2011. Six group interviews were conducted at 2 Korean universities and 209 questionnaires at 4 Korean universities and those of 211 at Tokyo Woman's Christian University were collected. Results : As for living arrangements, both Korean and Japanese female students are not willing to live with parents-in-law, but it is acceptable to live with their own parents. The most favorable living arrangement is living nearby own parents. The largest difference among two countries is providing financial supports. Korean female students are willing to give financial supports to their parents even soon after start working, but not Japanese students. Korean's are more seriously thinking how to support their parents in the future than Japanese ones. Conclusion : Research results show that Korean female students have the strong idea of filial piety than those of Japanese. This is caused not only from the cultural tradition but from the financial independency of elderly people resulted from pension maturity. It is quite similar to the previous elderly generation in Japan. Keywords : family support, care, living arrangement

OP24 511-S-1 SMART SKIRTING BOARD: COGNITIVE ESTIMULATION, MEDITATION AND ALZHEIMER

Joaquim Parra MARUJO¹, Vasco Manuel FERNANDES², Maria Guilhermina Martins MOUTINHO³ (*1. Gerontology and Psychology Transpersonal, Unitranspessoal, Portugal; 2. Gerontology and Psychology Transpersonal, Residencia S. Pedro, Portugal; 3. Imunologia, Instituto Superior de Ciencias da Saude Egas Moniz, Portugal*)

Introduction : The Smart Skirting Board have a width of 15cm and height of 20-30 cm; has been placed above the ankle line (8-12cm above ground level) to facilitate movement without the wheelchair's hand rims touching the wall, thus preventing damage to the walls and simultaneously avoiding injury to the user's hands. These specific measurements accommodate the installed technology; the Snoezelen System, CD player, Video Camera, Microphone and Motion Detectors. The system has a voice device that allows for a conversation to take place in real time and a video camera that allows for motion detection inside the room and protection of the individual's privacy considering it has been placed 15 cm above ground level. The evening presence light ensures that when the elderly person wakes up at night he does not feel disorientated. It has an in-built music system for the elderly person to hear the radio, a CD player for relaxation CDS with voice instruction and music designed to promote reminiscence which is intended to stimulate memories and is equipped with one or more energy points for charging electronic equipment, such as mobile phones. The Snoezelen system, placed at the top improves memory,

verbal skills, concentration, sociability, mood and well-being. Method: Smart Skirting Board to cognitive estimation, meditation and alzheimer . Results : All people that participated (45) had positive results. Conclusion : Through the Snoezelen system built into the skirting board, brain stimulation is achieved, improving the elderly person's attention span, memory, mood, verbal skills and concentration. Keywords : meditation, cognitive estimation, alzheimer

OP24 511-S-2 ENHANCING RELATIONSHIP BETWEEN OLDER PEOPLE AND STUDENT NURSES THROUGH THE DEVELOPMENT OF A RADIO PLAY

Khim HORTON (*School of Health and Social Care, University of Surrey, United Kingdom*)

Introduction : The aim of this paper is to discuss how empathy and understanding between older people and student nurses can be enhanced through a collaboration involving the creation of a radio play and to determine the potential usefulness of intergenerational working and learning. Method : Adopting a case study approach, researchers aim to raise awareness and stimulate dialogue around a range of issues affecting both the lives of older people and student nurses through the development of a radio play. Over a four-month period comprising three four-hour workshop sessions, a convenience sample of seven older people and seven student nurses participated. Data collection also included Pre and Post empathy measures from student nurses; a focus group conducted with students at the last session; and field notes made during all sessions. Descriptive statistically analyses of Pre and post empathy measures were conducted. Qualitative data were analysed thematically. Results : This innovative approach to working with older people and student nurses has led to a greater understanding and empathy towards one another and a sense of awareness of the lived experiences of individuals. The social participation of older people and student nurses has generated positive approach and understanding towards ageing. Conclusion : The development of a radio play and the processes involved illustrated that intergenerational learning and collaboration can lead to a greater empathetic understanding of the meaning of ageing. The voices of older people and student nurses together is something new and may never been heard before in this way. Keywords : ageing, radio play, empathy

OP24 511-S-3 THE REGENERATIVE COMMUNITY AS LEVERAGE FOR CULTURAL CHANGE

Pnina GUTMAN-FRISH (*Eshel, JDC, Israel*)

Introduction : Cultural change is the common and representative term for a concept based on values of respect/fairness/self-determination, and choice in life. Changes in homes for the elderly might require changes in organizational procedures, especially in relationships at all levels. This model answers the need for change in the relationships and the discourse patterns between the institution's staff, residents, and families. The home for the aged is no longer viewed as a place governed by the typical hierarchical medical model, but as a "community": a partnership of people with equal rights. Method : Building a community through daily meetings, based on several principles: interpersonal relationships are the cornerstone of cultural change, attention to wishes and desires as they relate to physical and cognitive needs, every elderly person is entitled for self-determination, communality is the opposite of institutionalization, development and growth should be promoted even in old age. Creating a "community-developer" post whose goal is to engage the entire institution. It

requires abilities for leadership, involvement, and advocacy in order to lead the change. Results : Fourteen homes joined the project, following concentrated training program. The residents' community turned into an active-social hub and a source of occupation and therapy. Daily life got renewed meaning and purpose. Each resident was perceived as a complete entity with physical/mental/spiritual/social/emotional needs, while putting emphasis on the contribution of every individual. Conclusion : An empowering/loving/nurturing culture among people residing in institutions will allow them to be healthier, happier, and more active. Giving people back control over their lives emphasizes elements of partnership/communality. Keywords : culture-change, community, partnership

OP24 511-S-4

AGE MANAGEMENT IN A CHANGING WORLD - GOOD PRACTICES FROM EUROPE AND AN NEW EUROPEAN RESEARCH PROGRAMME

Gerhard NAEGELE (*Gerontology, TU Dortmund University, Germany*)

Introduction : Corporate personnel policies are highly affected by the demographic change and the ageing of the workforce. Worldwide companies have to adapt constantly to stay innovative and competitive. This leads to the need of implementing age-management measures not only for an ageing workforce but also for all employees in all stages of life or with different cultural or ethnic background. The paper firstly presents endeavours of companies which have been awarded as good practice in corporate age-management within the framework of 'Best employers Award for workers over 60 - international' organized by the American Association of Retired persons focusing on EU member states. The author was member of the international Jury. Secondly the paper presents current research activities on 'innovative solutions' in order to 'extend working lifes' and to rise the employment rate of older workers in Europe, aided by life long learning. The respective research will be carried through within the framework of a project called 'Mobilising the potential of active ageing in Europe' (MOPACT) which will be carried out by a European research Consortium between 2013 to 2016. The author is work-package leader for the workpackage 'employment'. Method : The paper will present key results and research assumptions. Results : The paper will present transferable 'good practices' in age management with a special focus for stakeholders and endusers. Conclusion : Conclusions for national and international policies are expected. Keywords : Age management, Active Ageing, good practice

OP24 511-S-5

SHARED NARRATIVES IN COMMUNITY INTERVENTIONS: THE CASE OF THE LOWER NGAU TAU KOK SENIOR COMMUNITY IN HONG KONG

Lin JIANG (*Graduate School of Social Work, University of Denver, USA*)

Introduction : The case history reported here investigates the combined use of community work and shared narrative strategies in a setting in which older adults from a collective society experienced weakened social support and loss of a sense of community due to larger societal changes. This study is based on an intervention project with older adults at the Sheng Kung Hui Welfare Council Ngau Tau Kok Community Center in Hong Kong. Method : The intervention was implemented in the form of new community organization, staffed by social workers, social work students, residents, volunteers, scholars, and government officers. Residents were assisted by staff with the development of personal and neighborhood oral histories. These

histories were shared in larger gatherings and annotated. The histories are archived, shared, and occasionally revised. Interviews, observation, and narrative analysis techniques were used to extract the interpretive framework. Results : The participants reported strengthened sense of community and feelings of social support in their work with staff to conduct project together. The special knowledge of the social workers around social support and contextual issues was critical to success. An extracted interpretive framework found that the combined approach had significant effects at the individual, community, and social levels. Conclusion : The author postulates lessons for practice and poses important questions within an interpretive framework that addresses the effective use of shared narratives in the resolution of senior community problems. Suggestions are made for effective use of the strategy, particularly when supplemented with social media. Keywords: shared narratives, community intervention

OP24 520-S

ACTIVE AGEING

OP24 520-S-1

DIMENSIONS AND DETERMINANTS OF PRODUCTIVE AGING IN THE ELDERLY

Jacqueline WALLEN, Hyeun CHUNG (*Family Science, University of Maryland, College Park, USA*)

Introduction : World populations are aging rapidly, raising fears that countries will not have sufficient resources to meet the needs of their elderly citizens. Often the contributions that elders make to society are ignored. This study investigates the dimensions and determinants of productive aging in the elderly. Dimensions of productive aging studied are: engaging in paid work, engaging in unpaid or volunteer work, and engaging in self-care. Method : The study uses data from the 2010 Health and Retirement Study, a longitudinal panel study that surveys a representative sample of Americans over the age of 50 every two years. The sample for this study includes 10,695 respondents 65 and over. Descriptive statistics are presented for the entire sample and by age group (65-74, 75-84, and 85 or older). Regression analysis is used to explore the relationships of the following independent variables to productivity in each of the three areas: age, gender, race, being married, education, self-reported health status, and fewer depressive symptoms. Results : Each of the independent variables has a statistically significant relationship with engaging in paid work and engaging in self-care. Together, they explain a significant amount of variance in those dependent variables. Findings for unpaid work differ. Only marital status is significantly related to unpaid work. Conclusion: Elderly Americans make significant contributions to society, throughout their lives, though rates of participation are lowest in the 85+ age group. Education, health, and depression influence paid work and self-care and can be improved. More research is needed on predictors of unpaid work in the elderly. Keywords : Producting aging

OP24 520-S-2

THE ATTITUDE OF THE ELDERLY TOWARD AGEING IN JAPAN'S COMMUNITY SPORTS CLUBS

Tzu Yu LIN¹, Seiichi SAKUNO² (*1. Graduate school of sport sciences, Waseda University, Japan; 2. Faculty of sport sciences, Waseda University, Japan*)

Introduction : The population of Japanese elderly reached a new peak of thirty million people in 2012. Previous studies from various disciplines have indicated that sports can benefit the elderly. However, information about how community sports clubs affect the elderly member's attitudes toward ageing is limited. This study thus aimed at

determining how Japanese elderly members in a community sports club coped with their ageing status. Differences between the various socio-demographic groups will also be investigated. Method : This study utilized a survey, comprised of three sets of questionnaires, to examine the integration of ageing attitude, self-rated health assessment, and the influence of participating in sports activities. The study involved around 500 subjects in 8 community sports clubs, as well as 25 interviewees in urban and rural areas of Japan. Results : This study demonstrated that the number of sports activities the elderly participated in was related to their attitude toward ageing. They are able to maintain a positive attitude and react well toward changes in their daily living situation through engaging in sports. An ANOVA indicated significant differences for participants with higher educational levels, females, and younger elderly. Participating in clubs was frequently a significant factor for a positive ageing attitude, wellness, and supportive communication network. Participants with more positive ageing attitudes tended to show a more well-developed sense of self-actualization. Conclusion : This study concluded that while the elderly varied in their attitudes toward ageing, engaging sports activities gave them a more positive overall approach to living. Keywords : positive ageing attitude, community sports club

OP24 520-S-3

UNDERSTANDINGS OF ACTIVE AGEING IN ASIAN CONTEXT: THE PERSPECTIVES OF OLDER THAI PEOPLE
Kattika THANAKWANG, Sang-arun ISARAMALAI, Urai HATTHAKIT (*Faculty of Nursing, Prince of Songkla University, Thailand*)

Introduction : Active ageing is an important aspect facilitating to life quality for older adults. Research on active ageing has grown over recent decades but the knowledge continues to be based overwhelmingly on Western studies. However, Asian elders may have a distinctly different perspective from Westerners concerning the meaning of active ageing. Specifically, little is known about the ways in which older persons view or define active ageing in Asian context. This study, therefore, focused on the views of the characteristics and components of active ageing among older Thai people. Method : Using qualitative research methods, in-depth interviews and focus group discussions were conducted with 64 community-dwelling adults aged 60 and over. Participants were recruited from four provinces at the four regions (i.e., North, Northeast, Central, and South) of Thailand. Data were analyzed using thematic analysis. Results : This study helped build an understanding of what active ageing means by asking older persons themselves. For these older Thai adults, six themes of active ageing were defined as (1) being self-reliance, (2) being physically and mentally active, (3) maintaining healthy lifestyles, (4) being active engaged with society, (5) growing spirituality, and (6) managing life security. Conclusion : The perceptions of active ageing among the Thai elderly are multidimensional involving health, social participation, and security in life that are the three key pillars of active ageing suggested by World Health Organization. Specifically, active ageing appears to have both intrapersonal and interpersonal that is a culturally specific nature of older Thai people. Keywords : active ageing, Thai elders, qualitative study, culture, Asian context

OP24 520-S-4

SOCIAL-STRUCTURAL LAG IN THE DESIGN OF GERONTECHNOLOGIES
Alexander - PEINE, Louis NEVEN (*Copernicus Institute of Sustainable Development, Utrecht University, Netherlands*)

Introduction : In a recent paper, we have revisited Lawton's classic distinction between individual and social-structural lag to show that a social-structural lag perspective has a number of implications for designing Gerontechnologies. In particular, we have demonstrated that a social-structural lag perspective asks for design processes that are informed by an imagery of pro-active older technology users. In this paper, we explore empirical evidence for these claims. Method : More specifically, we have conducted 30 open interviews with key personnel in 12 design projects. We explored the methods used to involve older technology users, and applied an open coding scheme to understand the imagery of older users that has informed the projects. Results : It was striking that, although most projects started with a broad and active imagery of older persons, such images became gradually replaced by ideas of frail and ill older technology users. This suggests that incorporating an imagery of active older technology users is posed with significant difficulties. We zoom in on one such difficulty: an imagery of frail and ill older technology users seems to fit nicely with existing methods to address and specify user needs as an input for product design. We explore in more detail this affinity between the methodological repertoire of user involvement and ideas about frail older persons. Conclusion : We conclude that doing justice to the full breadth of gerontological insights into later life asks for rethinking the methodological repertoire to elicit user needs innovation. We specify design implications of this perspective. Keywords : active ageing, Gerontechnology, social-structural lag

OP24 520-S-5

A COMPARATIVE STUDY ON SOCIAL SUPPORT FOR ADOPTING SPORT ACTIVITIES IN JAPANESE OLDER ADULTS
Daichi SONODA¹, Makoto CHOGAHARA², Megumi TANI¹, Kei HIKOJI³, Yuki MATSUMURA¹ (*1. Graduate School of Human Development, Kobe University, Japan; 2. Faculty of Human Development, Kobe University, Japan; 3. Faculty of Education, Wakayama University, Japan*)

Introduction : In recent years, the rate of aging has been more and more increasing in Japan, and it is considered that participating in any physical and sport activities are very important for healthy lifestyle among older adults. The purpose of this study was to examine the age differences of the social support which encouraged older adults in adopting sport activities. Method : A questionnaire survey was conducted in 2009 on 3,002 adult people who were chosen by random sampling in Takarazuka city in Japan. The number of valid response was 1,351(45%). The survey contained the intentions to play sports activities, the physical activity status, and their own needs to play the sports activities. Results : In all responses, the number of respondents who intended to adopt new sport (i.e. adopters) was 783, whereas those who intended to adhere to play the sports which they had already played (adherers) was 387. Using the SPSS Text Analysis for Surveys, we classified adopters' needs(the 730 linguistic data) into 9 support categories: "informational", "instructional", "financial", "equipment", "time", "friendship", "program", "motivational", and "dealing with difficulties". Compared by age, the informational support tended to be more needed by 60s and elder respondents than 20s to 50s. Conclusion: In this study, the concrete social support information to adopt sport activities were extracted from over 700 free answers. Moreover especially for older adults, the informational support by community like circulars and local newspapers will be the trigger to adopt sport activities. Keywords : social support, adoption

OP24 520-S-6

THE PRESENT SITUATION OF THE DEVELOPMENT OF

THE RURAL OLD-AGE ROOM RESEARCH, LICUN IN SHANDONG PROVINCE AS AN EXAMPLE

Yanfang MAO (*Institute of Gerontology, Renmin university of China, China*)

Introduction : Our country is gradually stepping into the senile society, the aging of the rural population has more than speed and the old urban area, but affected by various factors, the rural areas pension guarantee measures is not perfect, the existing measures in the process of implementing appeared many loopholes, traditional endowment way also suffered serious impact. In this study, the author mainly utilizes the interview method, observation method and the literature material method to Lijiabairang village endowment room development to carry on the investigation, and describes and analyzes the Lijiabairang village endowment room this between community endowment and family pension mode between endowment with current situation and existing significance and problems, and the endowment way and Wenzhou Qiujiann village 'one yuan room' is compared, This paper puts forward some policy Suggestions with pertinence, but also in the community and the home village changed the situation endowment room development trend was predicted. **Method :** Interview method, Observation Method and the Literature Material Method. **Results :** From the investigation, we found that: first, the presence of endowment room has a very important practical significance; Second, endowment room there is also some problems; Third, in the policy implementation process, the government should provide guidance and certain preferential policies. **Conclusion :** This kind of housing pattern in Lijiabairang village has its realistic significance, along with the rural labor resource continuous outflow, the concentration of the elderly live will be conducive to the development of rural elderly community service, medical services and other services for the elderly measures. **Keywords :** Endowment room; Community endowment; Family endowment; Rural endowment

OP24 521-S AGEING AND CAPABILITY & ABILITY

OP24 521-S-1 VALIDATION OF TWO MOTION SENSORS TO ASSESS DAILY PHYSICAL ACTIVITY IN INSTITUTIONALIZED ELDERLY

Sofie MARTIEN, Jan SEGHERS, Filip BOEN, Christophe DELECLUSE (*Department of Kinesiology, KU Leuven - Faculty of Kinesiology and Rehabilitation Sciences, Belgium*)

Introduction : In order to design or to evaluate physical activity interventions in older adults, it is important that we can accurately measure the amount of physical activity. However, the measurement of physical activity in institutionalized elderly is a challenge as they are less active and perform activities at very low intensities. The purpose of this study was to determine the validity of a piezoelectric pedometer and an activity monitor in measuring steps during daily life activities in a sample of institutionalized elderly. In addition, the influence of walking speed, walking aids and body mass index on step count accuracy was examined. **Method :** Sixty-eight nursing home residents (54 women, 14 men), instrumented with two hip- and ankle-worn pedometers New Lifestyles 2000 (NL, New Lifestyles, USA) and an activity monitor Sensewear Mini (SW, BodyMedia, USA), performed three activities of daily living. Simultaneously, the actual steps were tallied by an investigator. **Results :** The number of steps recorded by the SW and NL were significantly lower than the actual steps. The SW and ankle-worn NL counted 10.4% and 79.2% of the steps performed by the subjects, respectively. Regarding the accuracy

of the ankle-worn pedometer, walking speed was a significant predictor and explained 41.6% of the variance in percent error. The threshold speed, obtained by a ROC curve, was set at 2.35 km/h, providing percent error scores within $\pm 5\%$. **Conclusion :** The results from this study showed that the ankle-worn piezoelectric pedometer was most accurate for counting steps in institutionalized elderly, especially at walking speeds above 2.35 km/h. **Keywords :** step counters, validity, institutionalized elderly

OP24 521-S-2 THE ROLE OF TOPOLOGICAL PROPERTIES IN REASONING AGING

Danqi ZHUANG (*Psychology, Beijing Normal University, China*)

Introduction : Topological theory proposed by Chenlin regarded the nature of the topological properties as a one-to-one unchanged transformation, and the aware of the topological properties occurred in the early stages of visual perception. His research of bees' visual sense showed that animals could perceive the graphical changes in topological properties as well, and indicate this perception as a primitive and basic ability in visual system. Reasoning ability, as one of the primary mental abilities, declines with increased age in old adults which have been found in many studies. However, the differences between the topological and geometric properties of the test items were not concerned. According to topological theory, the elderly will be more sensitive to the graphics with topological properties than those with geometric properties and may have better performance in reasoning test task including the former. **Method :** Two types of graphics reasoning test items, which either topological properties or geometric properties changed, were designed in this study. A total of three age groups included 31 children, 31 undergraduate university students and 19 old people participated in the experiment. **Results :** 1 With age increased, old adults' scores were the lowest in both types of items and the undergraduate students performed best. 2 Old adults' performances in topological transform items were significantly higher than that in geometric ones, which was also found in child group. Meanwhile, there was no difference between the scores of two types of items in undergraduate students. **Conclusion:** The relatively original visual perception develops faster and decays slower. **Keywords :** Reasoning ability Ageing Topological properties Geometric properties

OP24 521-S-3 CAN BRAIN TRAINING WITH VIDEOGAMES IMPROVE ATTENTIONAL FUNCTIONS IN OLDER ADULTS?

Soledad BALLESTEROS¹, Julia MAYAS¹, Fabrice B.R. PARMENTIER², Pilar ANDRES² (*1. Dept. of Basic Psychology II, Universidad Nacional de Educacion a Distancia, Spain; 2. Dept. of Psychology, University of the Balearic Islands, Spain*)

Introduction : A major goal of recent research in ageing has been to examine cognitive plasticity in older adults and its capacity to counteract cognitive decline. The aim of our study was to investigate whether or not older adults could benefit from brain training with videogames in a cross-modal oddball task measuring distraction and alertness. **Method :** Two groups of healthy older adults from the European AGNES project participated in the present study. The experimental group received 20 1-hour videogame training sessions in our laboratory while the control group did not receive the treatment, but attended meetings with the other members of the study several times during the study. Both groups were tested before and after treatment or an equivalent period of time without training. The experimental group practiced a commercially available brain-training

package (Lumosity) involving problem solving, mental calculation, working memory and attention tasks. Results : The results showed a significant reduction of distraction and an increase of alertness in the experimental group and no variation in the control group. Conclusion : The suppression of irrelevant information to concentrate on the relevant task is a central cognitive mechanism. The prefrontal cortex, involved in this process, deteriorates early with aging. The results of the present study suggest that brain training may transfer to cognitive performance on attentional tasks and may contribute to successful ageing. Keywords : Brain training, Cognition, Healthy ageing

OP24 521-S-4

TRAJECTORIES OF EYESIGHT IN OLDER PEOPLE IN THE UK: THE ROLE OF AGE AND SOCIAL POSITION

Jennifer WHILLANS, James NAZROO (*Cathie Marsh Centre for Census and Survey Research (CCSR), University of Manchester, United Kingdom*)

Introduction : Visual impairment becomes more prevalent with age. Rather than a uniform decline in visual acuity with age, the strength and direction of change varies between people. Analyses that posit multiple trajectories allow for a more specific description of the developmental course of vision change and its relationship with social position. Method : The analysis uses the responses of 2,956 respondents, aged 60 years and over, followed over eight years (five observations) as part of the English Longitudinal Study of Ageing (ELSA). At each observation respondents self-reported their visual acuity, creating a 4-state response variable. Optimal matching, hierarchical clustering, and multinomial logistic regression were used to describe the sequential data, produce a typology of vision trajectories, and examine the socio-demographic characteristics associated with different trajectories. Results : Eight distinctive trajectories were identified: There were three trajectories of stable vision, three of deterioration, and two of improvement. The probability of reporting different vision trajectories varies with a change in age; however, the magnitude of change is associated with social position. Social position, measured by wealth and subjective social status (SSS), had a notable effect on the likeliness of reporting different trajectories of vision and revealed considerable social inequalities. The highest quintiles of both wealth and SSS were likely to report stable excellent vision or stable good vision more than any other trajectory, irrespective of age; while those in the lowest quintiles were more distributed across clusters, even for the youngest age group. Conclusion : The analysis provides evidence in support of the diversity of the older population in terms of health outcomes, specifically visual acuity. Keywords : visual acuity, trajectory

OP24 521-S-5

“MORE AND MORE, I HAVE THE FEELING THAT I HAVE BEEN PASSED OVER BY THE TIMES.” PERCEIVED OBSOLESCENCE, COGNITIVE IMPAIRMENT, AND THE ABILITY TO MANAGE EVERYDAY TECHNOLOGIES

Laura I. SCHMIDT¹, Hans-Werner WAHL², Herbert PLISCHKE³
(1. *Network Aging Research, Heidelberg University, Germany*; 2. *Department of Psychological Ageing Research, Heidelberg University, Germany*; 3. *Generation Research Program, Human Science Center, LMU Munich, Germany*)

Introduction : Contrary to widely held opinions, older adults' general attitudes towards technology have found to be relatively positive. Compared to younger ages, however, older adults reveal more difficulties in learning a new technology, need more time to get used to new devices and report higher frustration. The current project aimed

to better understand the role of overall cognitive status for technology performance. Method : In particular, the use of a blood pressure meter, an age-friendly mobile phone and an e-book reader was assessed in cognitively healthy participants and participants with mild cognitive impairment (MCI, MMSE-Score: 24-28). Besides a multidimensional cognitive assessment including visuo-spatial abilities and working memory, perceived obsolescence was considered as part of a set of additional psychological constructs that also contained self-efficacy and technology attitudes. Technology performance was video-taped and coded according to relevant categories (e.g., number of mistakes) with high interrater agreement (95%). Results : Preliminary data analysis relies on 129 video sequences of 43 participants aged 60 to 88 years (22 cognitive healthy; 21 with MCI). As expected, participants with MCI needed more time for task completion, made more mistakes, and reported lower usability of the devices. Significant positive correlations between successful handling and both working memory and visuo-spatial abilities, but also with self-efficacy were found. While controlling for age, participants higher in obsolescence committed more errors and needed more time for the tasks across all three devices. Conclusion : Findings suggest that a combined cognitive aging, self-efficacy and obsolescence perspective is in place to understand variation in technology use in later life. Keywords : technology performance, perceived obsolescence, cognitive impairment.

DEVELOPMENTAL CHANGE

OP24 522-S-1

ADVERSE GROWTH IN MIDDLE-AGED AND OLDER ADULTS AFTER OPEN-HEART SURGERY: A LONG-TERM FOLLOW-UP

Amy Lee AI¹, Daniel HALL², Kenneth PARGAMENT³, Terrence TICE⁴, Hyejin KIM¹ (1. *College of Social Work, Florida State University, USA*; 2. *VA Pittsburgh Healthcare System, University of Pittsburgh, USA*; 3. *Department of Psychology, Bowling Green State University, USA*; 4. *Professor Emeritus of Philosophy, University of Michigan, USA*)

Introduction : In certain Asian cultures, crises offer opportunities for advancement. Despite the growing knowledge of posttraumatic growth, only a few studies have examined personal growth in the context of cardiac health. Similarly, longitudinal research is lacking on the implications of religion/spirituality for patients with advanced cardiac diseases. This U.S. study aims to explore effects of preoperative religious coping on long-term postoperative personal growth and potential mediation effects. Method : Analyses capitalized on a preoperative survey and medical indices from the Society of Thoracic Surgeons' National Database of patients undergoing cardiac surgery. Participants in the current follow-up study completed a mailed survey 30 months after surgery. Hierarchical regression analysis was performed to evaluate the extent to which preoperative use of religious coping predicted growth at follow-up, after controlling for key demographics, medical indices, mental health, and protective factors. Results : Predictors of posttraumatic growth at follow-up were positive religious coping and a living status without a partner. Medical indices, optimistic expectations, social support, and other religious factors were unrelated to posttraumatic growth. Including religious factors diminished effects of gender, age, and race. Including perceived spiritual support completely eliminated the role of positive religious coping, indicating mediation. Conclusion : Preoperative positive religious coping may have a long-term effect on postoperative personal growth, explainable by higher spiritual connections as a part

of significance-making. These results suggest that spirituality may play a favorable role in cardiac patients' posttraumatic growth after surviving a life-altering operation. The elimination of demographic effects may help explain certain previously mixed findings. Keywords: religious and secular reverence, cardiovascular diseases and open-heart surgery, hospital length of stay

OP24 522-S-2

EMOTION DECODING IN AGEING: UNCERTAINTY AS THE UNDERLYING DIMENSION OF AGE-RELATED DIFFERENCES IN DECODING BASIC EMOTIONS FROM DYNAMIC VISUAL CUES

Despina MORAITOU¹, Georgia PAPANTONIOU², Pantelis GINOS¹, Theofilos GKINOPOULOS³, Daphni KOTSELIDOU¹, Magdalini NIGRITINOI¹ (1. School of Psychology, Aristotle University of Thessaloniki, Greece; 2. Department of Early Childhood Education, University of Ioannina, Greece; 3. School of Psychology, Panteion University, Greece)

Introduction : Emotion recognition is vital to everyday life. However, numerous studies have found that older adults are less adept at identifying emotions, compared to younger adults. The aim of the present study was to identify the pattern of age differences in the ability to decode basic emotions from naturalistic visual emotional displays. Method : The sample comprised a total of 208 adults from Greece, aged from 18 to 86 years. Participants were examined using an emotion evaluation test which was designed to examine a person's ability to visually identify six emotions and discriminate these from neutral expressions, when they are portrayed dynamically by professional actors. To find the pattern of age differences in emotion decoding, structural equation modeling (SEM) techniques were applied to the data. Results : The structural model of emotion evaluation that was finally confirmed indicated that decoding of five emotions is taking place along the broad affective dimension of 'uncertainty'. On the other hand, this model indicated that happiness decoding is the only ability that does not follow the same pattern. The addition of age into the model as a covariate showed that age negatively affects the ability to distinguish emotional from non-emotional cues and to decode all the basic emotions except happiness. Conclusion : The pattern in which emotion decoding from visual cues is affected by normal ageing is formulated according to the rate of uncertainty that either is related to difficulties in recognizing subtle differences in negatively-valenced emotional displays or is inherent to a specific emotion. Keywords : affect, emotion recognition, lifespan development

OP24 522-S-3

A PATH MODEL OF WISDOM: ROLE OF AGE AND CULTURE

Seungyoung KIM¹, Bob G. KNIGHT² (1. The Davis School of Gerontology, University of Southern California, USA; 2. The Davis School of Gerontology / Department of Psychology, University of Southern California, USA)

Introduction : As the concept of wisdom has become a subject of growing scientific interest, researchers have been interested in individual differences in the conception of wisdom, such as age and cultural differences. To explore how age and culture affect wisdom, and how those effects are related to life satisfaction, we tested a wisdom path model. Method : We investigated the roles of age, culture, and openness to experience in development of wisdom, as well as the impact of wisdom on life satisfaction. We also examined how emotion regulation mediates the effect of wisdom on life satisfaction.

98 older adult (range 58-96) and 96 younger adult (range 19-39) Korean immigrants participated in a survey. Wisdom was measured by the Korean version of The Three Dimensional Wisdom Scale (3D-WS-K), which refined 3D-WS (Ardelt, 2003) to be more applicable to Korean culture. The 3D-WS-K consists of Cognitive Flexibility, Viewpoint Relativism, and Empathic Modesty factors. Results : The proposed path model yielded a good fit, $\chi^2/df = 1.874$, CFI=.948, RMSEA=.067. We found that age was positively associated with Empathic Modesty, which in turn led to higher emotion regulation and life satisfaction. Biculturalism had direct and indirect relationships with Viewpoint Relativism. The indirect correlation was mediated by openness to experience. Wisdom had not only a direct effect on life satisfaction, but also had an indirect effect mediated by emotion regulation. Conclusion : These findings suggest that age develops certain components of wisdom, but not all components of wisdom. High involvement in diverse cultures may help to have an open-mind, resulting in increased wisdom. Keywords : wisdom, age, culture

OP24 522-S-4

SUCCESSFUL AGING, ACTIVE AGEING AND HUMAN RIGHTS: TOWARD AN AGENDA CROSSING SCIENCE AND LAW

Jose Ferreira ALVES¹, Susan B SOMERS², Lia Susana DAICHMAN³, Fernanda FARINHA⁴ (1. School of Psychology, Department of Basic Psychology, University of Minho, Portugal; 2. Secretary General of INPEA, INPEA- IAGG, USA; 3. ILC - Argentina, President, ILC, Argentina; 4. Retired, Ex-Vice president Probation services Ex-Deputy secretary of General Prosecutor Service, Portugal)

Introduction : The meaning of the concept of successful aging is varied, depending on the bio psychosocial factors taking into account. One of the most fruitful ways to guide our look to successful aging is through developmental theory, namely adult developmental theory, as was stated by Ryff (1982, 1989). Looking to successful aging just as successful living - as it is done often - is missing the unique positive psychological and developmental challenges and tasks of adult life and old age. This view that looks to adult life and old age as periods of positive opportunities to continue human development is sometimes called eudaemonic to differentiate it from hedonic view. These last view looks into quality of life, life satisfaction, happiness as synonymous or indicators of successful aging. These could be obviously important outcomes but when they are not linked to the achievement of a sense of purpose in life, or to sense of growth, they miss the opportunity to construct positive and constructive views for old age. These view of successful aging and so the experience of eudaemonic well-being was empirically associated with significant lower levels of biological risk indicators for illness (Ryff, Singer, & Love, 2004). Method : Literature review confronting different definitions of successful aging. Results : Human rights are based on the respect for human development possibilities. Conclusion : Will discuss a new agenda for research and practice that crosses scientific evidence and law, namely the need to ground the rights of older persons with the right to age successfully. Keywords : successful aging, human rights, psycho-social development

OP24 522-S-5

FROM THE BEGINNING UNTIL NOW? THE TRANSFORMATION IN OLDER ADULTS' LEARNING PROCESS

Yahui LEE, Chun-ting YEH, Ching-yi LU (Department of Adult and Continuing Education, National Chung-Cheng University, Taiwan)

Introduction : Learning is an essential element which contributes to

successful aging. More and more older adults participate in various learning activities in Taiwan. But what is the transformation in older adults' learning process? Method : To answer this question, we conduct one-to-one semi-structured interviews with 32 adults between 52-82 years of age, 64.13 years on average. Results : The findings of this study are identified: (1) the interviewees' learning styles are transitioned, and the transition may be occurred among formal, informal and non-formal learning; (2) the role and learning attitudes have changed, from learner to teacher, and from passive learning to active learning; (3) interviewees' learning may be based on ancient experiences, combined new experiences, disturbed by old or new experiences. Conclusion : The implications of the results for enhancing older adults learning are discussed. Specific future applications for older adult learners, educators, programs are proposed. Keywords : older adult learners, older adult learning, transformative learning

OP24 523-S HEALTH PROMOTION I

OP24 523-S-1 NATURE AS THE MOST IMPORTANT COPING STRATEGY AMONG CANCER PATIENTS - A SWEDISH SURVEY

Fereshteh AHMADI, Nader AHMADI (*Department of Social Work and Psychology, University of Gavle, Sweden*)

Introduction : The authors have conducted a quantitative survey to examine the extent to which the results obtained in a qualitative study among cancer patients in Sweden are applicable to a wider population of cancer patients in this country. In addition to questions relating to the former qualitative study, this survey also references the RCOPE questionnaire (designed by Kenneth I Pargament) in the design of the new quantitative study. Method : In this study, questionnaires were distributed among persons diagnosed with cancer; 2355 people responded. The majority of the responders (71%) were 59+. Results : The results show that nature has been the most important coping method among cancer patients in Sweden. The highest mean value (2.9) is the factor 'nature has been an important resource to you so that you could deal with your illnesses'. Two out of three respondents (68 percent) affirm that this method helped them feel significantly better during or after illness. The second highest average (2.8) is the factor 'listening to "natural music" (birdsong and the wind).' Two out of three respondents (66 percent) answered that this coping method significantly helped them feel better during illness. The third highest average (2.7) is the factor 'to walk or engage in any activity outdoors gives you a spiritual sense'. Conclusion : This survey concerning the role of nature as the most important coping method for cancer patients confirms the result obtained from the previous qualitative studies. Keywords : Religious coping, spirituality, nature as a coping method

OP24 523-S-2 EFFECTIVE POPULATION HEALTH INTERVENTIONS FOR THE PRIMARY PREVENTION OF MUSCULOSKELETAL CONDITIONS IN OLDER PEOPLE

Lynne PARKINSON¹, Melissa HARRIS² (*1. Health CRN, CQ University, Australia; 2. Research Centre for Gender, Health and Ageing, University Of Newcastle, Australia*)

Introduction : This rapid review asked the question: What types of health promotion and prevention programs for primary prevention of musculoskeletal conditions are most likely to be effective in preventing osteoarthritis and osteoporosis in older people, leading to a reduction in the associated burden of disease from these conditions? Method : Systematic reviews and meta-analyses were identified

through a series of systematic literature searches using databases relevant to health and medicine, reference lists of identified articles, and key web-based sources of information regarding the primary prevention of musculoskeletal conditions. Results : The key recommendations for older people were: Supplementation with vitamin D and/or calcium should be encouraged for all people over 45 years of age for primary prevention of OP. Dietary intervention programs for older people could involve tailored approaches which include face-to-face education or counselling, telephone contacts or computer-tailored information. Physical activity programs for primary prevention of OP and OA in older people could include aerobics, weight bearing and resistance exercises. Obesity prevention programs for older people might include intensive and long-term intervention implementation, including group sessions designed to promote behavioural changes. Conclusion : More high quality research is needed to: develop effective interventions that promote a 'healthy older lifestyle'; explore demographically appropriate prevention programs; and examine calcium and/or Vitamin D intakes of people in at-risk groups. The quantity and quality of evidence to support programs for primary prevention of OA and OP in at-risk groups is limited. Keywords : musculoskeletal, health promotion, prevention

OP24 523-S-3 INTERVENTION BY MILK INGESTION AND PHYSICAL ACTIVITIES FOR THE FRAIL ELDERLY IN COMMUNITY

Kuninori SHIWAKU, Rumi MANIWA, Masayuki YAMASAKI, Mamiko IWAMOTO, Toshimi YONEYAMA (*Environmental & Preventive Medicine, Shimane University, School of Medicine, Japan*)

Introduction : As the abilities of physical and daily life tend to fall by aging, and nutrition improvement is important in elderly. Effects of nutrition improvement for elderly has verified on the seriously malnutrition elderly in a hospital, but there is little evidence for elderly in community. We conducted the intervention by milk ingestion based on physical activities program for the frail elderly in community. Method : Subjects were 45 elderly people (73.7±5.7 years old) who participated in the preventive program for three months in Izumo City, and were divided into two groups of 22 milk intervention subjects and 23 control subjects. The milk intervention group was provided with milk (180 ml/day) by door-to-door delivery, and the parameters of nutrition and anthropometric were investigated before and after intervention. Results : BMI, HDL-cholesterol and hemoglobin were significantly improved in the milk intervention group, but no significant effects in the control. The intervention group had significant health-effects of BMI, albumin, HDL-cholesterol, hemoglobin, HbA1c and essential amino acids/nonessential-amino-acid ratio, compared with the control group. As physical activities in the control group before intervention was poorer than the intervention group, the control group improved significantly by the physical activities program. Conclusion : Daily milk ingestion based on physical activities program makes an improvement of nutrient state in frail elderly in community. Keywords : interventional study, milk ingestion, physical activities

OP24 523-S-4 PROMOTABLE, PERSON-CENTRED APPROACHES OF GERONTOLOGICAL REHABILITATION IN FINLAND

Aila PIKKARAINEN (*School of Health and Social Studies, The University of Applied Sciences Jyväskylä, Finland*)

Introduction : New concepts and approaches are needed to specify person-centred gerontological rehabilitation, that is worth promoting. The Development Project of Co-operative Rehabilitation for Aged

Rehabilitees (IKKU 2009-2013) for the Social Insurance Institution of Finland was launched in 2009. The aim was to maintain the functioning, independence and meaningful living of people aged 74+ in a home-centred lifestyle and to enhance their participation in society by developing gerontological rehabilitation services alongside five rehabilitation centres and eighteen municipalities. Method : Forty-eight outpatient or institutional courses were implemented, an average of eight aged rehabilitees with musculoskeletal symptoms were selected by a contact in municipalities. The main intervention promoted a person-centred approach in a group-based rehabilitation process, supported by peer group members. This study describes the perceived rehabilitation approaches witnessed by the older rehabilitees. The method was co-operative action research, in which the researcher observed selected parts of three courses in each centre in 2009-2012. Information was drawn from 101 observed rehabilitation days, focusing on themes of client-centred, goal-orientated and multi-actuator practice. Results : Based on the researcher's inductive analysis, four pre-constructed approaches were evaluated in focus-group discussions with multi-professional teams in the project's rehabilitation centres. Based on this two-step data analysis, gerontological rehabilitation approaches can be examined as a restarted, reformed, innovative, and abandoned approach. These phases may be individual, consecutive, overlapping or recurrent depending on the rehabilitee's individual situation. Conclusion : Effective, person-centred gerontological rehabilitation seeks to redesign each client's age-identity, and support cohort participation and individual life courses with the support of peer rehabilitees. Keywords : Gerontological rehabilitation, action research, health promotion

OP24 523-S-5

OLDER PERSONS UNDERSTANDING OF HIV INFECTION IN GARANKUWA COMMUNITY, SOUTH AFRICA

Eucebious LEKALAKALA-MOKGELE (*School of Health Care Sciences, University of Limpopo, South Africa*)

Introduction : Infections with human immunodeficiency virus (HIV) and its resultant acquired immunodeficiency syndrome (AIDS) is a worldwide problem affecting individuals of all ages. Evidence suggests that HIV infection among the older population is on the increase as more than 10% of HIV infections are found in adults aged 50 years and older. Reasons for the increase may be related to the older persons' level of understanding of the risks of infection. This study looks at understanding of the risk of HIV infection among the older persons of Garankuwa community in South Africa. Method : Methods: Six focus group interviews yielded qualitative data that were analysed for the study. Participants were purposively selected. Ethical consideration: Participation was voluntary, with options of withdrawing from the study at any time during the process of data collection. Participants were given assurance of confidentiality, and anonymity in reporting the findings. NVivo qualitative data analysis package was used to analyse the data. Results : Themes extracted from the findings were mainly categorised into knowledge of transmission, culture and age specific strategies, symptom recognition, "them-and-us" expression for HIV/AIDS. Conclusion : Older persons in the studied community showed limited understanding of HIV/AIDS risk of infection, and were of the belief that put them at a distance from HIV/AIDS infection and its effects. Recommendations were provided to include the older persons in HIV/AIDS prevention and treatment strategies. Keywords : older persons, HIV/AIDS risk factors

OP24 523-S-6

A STRATEGIC PLAN TO ENGAGE OLDER ADULTS IN

MORE PHYSICAL ACTIVITY: ADVANTAGES OF NORDIC WALKING

Elisaveta KACHAN (*Department of demography of aging, Saint Petersburg Institute of Bioregulation and Gerontology, Russia*)

Introduction : Regular and moderate exercise by older adults can help delay, or prevent, the onset of disabilities and many chronic diseases, reduce risk of falls and fractures, improve mood and relieve depression, increase mental acuity, and in a way increase life expectancy. However, many older adults are not as physically active as they could and should be. Method : Taking into account the experience of the northern countries we've launched a study to analyze the reasons to evade physical activity, search for education strategies to inform older adults about the personal benefits of active aging and teach them how to practice NW, as well as at designing guidelines for adoption of NW as physical activity for geriatric and day care centres. In our study participated 250 adults aged 65+, who came for 2 weeks course at the geriatric sanatorium. Each person was subjected to the interview on the onset of his/her course and after four weeks of practicing NW with an instructor. Results : The available results suggest that Nordic Walking is a natural and safe, yet intensive, form of physical activity that can be widely used by older adults as it is cheap and affordable, easy to practice and safe, it allows overcoming main reasons to sedentary lifestyles and is very promising from the point of view of motivation and involvement. Conclusion : Nordic walking, allowing being healthy and active even for an elderly person, due to its functionality, safety and availability, helps to involve elderly people into the process of health and social relationships maintenance. Keywords : Physical activity, moderate exercise, Nordic walking

OP25 101-S-1

OLDER WOMEN, LIVING ALONE, WITH PERSISTENT MUSCULOSKELETAL PAIN - A SURVEY STUDY

Sara CEDERBOM¹, Anne SODERLUND², Eva DENISON², Petra VON HEIDEKEN WAGERT² (*1. School of Health, Care and Social Welfare, Department of Neurobiology, Care Sciences and Society, Malardalens University, Karolinska Institutet, Sweden; 2. School of Health, Care and Social Welfare, Malardalens University, Sweden*)

Introduction : Pain is a common health problem among the older population. It is well-known that women are affected by pain to a greater extent than men in all age groups. Women who live with pain report more pain-related problems than men, and they also report lower quality of life compared to men who are living with pain. A specifically vulnerable group among elderly persons with pain are women who live alone. They often become dependent on others to manage their daily life. Research about older women in pain in general exists but knowledge about this particular group who is living alone is very scarce. Aim: The aim of this investigation was to study how older women who are living alone with support from home help services experience persistent musculoskeletal pain, how they manage their pain and rate their well-being (morale). Method : Method: The study had a cross-sectional, descriptive design and included 60 community-dwelling women age ≥ 65 years. Results : Results: The women reported using several pain management methods. They rated low self-efficacy in daily activities and they perceived themselves not as

physically active as they wanted to be. The women also reported low degree of well-being (morale) and high degree of disability. Conclusion : The results indicate that persistent musculoskeletal pain and pain-related problems may influence the women's daily life and well-being negatively. Further results and conclusions will be presented at the conference. Keywords : older women, living alone, pain

OP25 101-S-2

EFFECTS OF THE STANFORD CHRONIC PAIN SELF-MANAGEMENT PROGRAMME (CPSMP) IN OLDER ADULTS: A RANDOMIZED CONTROLLED TRIAL

Mimi MEHLSSEN¹, Lisbeth FROSTHOLM², Lea DUNKERLEY³, Per FINK²

(1. Department of Psychology, Aarhus University, Denmark; 2. Research Clinic for Functional Disorders and Psychosomatics, Aarhus University Hospital, Denmark; 3. The Danish Committee for Health Education, The Danish Committee for Health Education, Denmark)

Introduction : CPSMP is a patient education program consisting of six 2½ hour weekly sessions. Two instructors teach a group of 8-16 persons about managing pain. Instructors are chronic pain patients themselves. The program is highly structured and manualized. Beneficial effects of CPSMP, e.g. on pain, self-efficacy, and well being, have been reported but only in younger patients (<60 yrs). The study aimed to examine the effect of CPSMP in younger and older patients on pain, functional limitations, and psychological adaptation. Method : A total of 418 pain patients enrolled in the RCT (27% men). Of these 215 (51%) were randomized to intervention. Participants were divided into 146 older patients age 60+ (mean 68.4) and 272 younger patients (mean 46.9). Questionnaire data were collected before randomization and immediately after CPSMP. Self-reported pain, functional limitations, pain catastrophizing, somatic symptoms, anxiety, depression, and self efficacy were measured. Results : At baseline the intervention group did not differ from the control group on pain, functional limitation, distress or sociodemographic parameters. The old patients had lived more years with pain, had more somatic symptoms, and used medicine more frequently but were less depressed than the young (p<0.05). In the young patients a significant effect of CPSMP was found in functional limitations, pain-catastrophizing, somatic symptoms, and depression (F:4.52-8.31, p<0.05) but not on pain, anxiety, or self-efficacy. However there were no significant effects of CPSMP in older patients. Conclusion : Although the CPSMP appears to have a positive effect in younger adults, it may not be suited for older patients with chronic pain. Keywords : Chronic pain, self-management, patient education

OP25 101-S-3

DESCRIBING OLDER ADULTS' PSYCHOSOCIAL FACTORS, DRIVING HABITS, AND COMMUNITY PARTICIPATION

Bong-Keun JUNG¹, Carolyn Mary BAUM² (1. Occupational Therapy, Soon Chun Hyang University, Korea; 2. Occupational Therapy, Washington University in St. Louis, USA)

Introduction : The objective of this study were to a) characterize the older drivers' psychosocial factors related to the driving, b) identify the relationship between psychosocial factors and the older drivers' participation in daily activities, and c) compare older driver's self-awareness of driving situation and a third party observer's view of the older adult's quality of driving. Method : A new psychosocial assessment battery, initially called the Driving Performance Questionnaire (DPQ), was developed to identify characteristics of

older American driver's and caregivers' psychosocial factors. A pilot study was conducted on healthy older drivers and caregivers. Results : No significant differences were found between drivers' version and caregivers' version in healthy older adults. Female participants showed lower scores of self-efficacy and lower driven miles than male participants. Self-efficacy and impulsivity were associated with participants' driving habits. Conclusion : The Driving Performance Questionnaire appears to measure older drivers' psychosocial status and its effect on driving quality. Further work will establish its validity and its performance in a population who are at risk for driving problems. Keywords : Geriatric assessments of automobile driving, psychosocial influences on older adults' driving, Driving habits of elderly

OP25 104-S

ELDER ABUSE I

OP25 104-S-1

ADDRESSING ELDER ABUSE IN THE ISRAELI HEALTH CARE SYSTEM : A COMPREHENSIVE PROGRAM

Barbara LANG (Department of Social Services, Ministry of Health, Israel)

Introduction : In 2003 the Ministry of Health published policy guidelines regarding the treatment of elder abuse within the healthcare system. Since then a comprehensive plan has been implemented. The healthcare system is unique in its ability to identify and treat elder abuse. It is a system that sees 97% of the elderly, is not stigmatic, by its nature is multidisciplinary and is able to both perform physicals and question the elderly in an unobtrusive manner. Method : 1. Forming of elder abuse committees in: regional health departments, general hospitals, health funds, nursing homes and psychiatric hospitals. 2. Funding of social workers in hospitals and health funds to coordinate the identification and treatment of elder abuse. 3. Seven week training sessions for committee members. 4. One/two day training sessions for doctors, nurses, social workers, physiotherapists and occupational therapists. 5. Development of training manuals and a training film. 6. Establishing forums for coordinators to discuss in-house training, present case studies, address obstacles both within the healthcare system and with other agencies. Results : There is a heightened awareness of elder abuse within the healthcare system. Elder abuse committees have been established for in-house training as well as a framework to report to and consult with regarding cases of suspected abuse. During the last five years the identification of abused elderly by the healthcare system has doubled annually. Conclusion : Policy guidelines were established in 2003 while this program was implemented in 2005. Results show that while guidelines are essential, a comprehensive plan is necessary in order to implement them. Keywords : elder abuse, healthcare

OP25 104-S-2

MIND THE GAP: IMPROVING CRIMINAL JUSTICE AGENCIES AND SOCIAL SUPPORT AGENCIES RESPONSES TO INTIMATE PARTNER VIOLENCE AGAINST OLDER WOMEN

Bridget L. PENHALE (School of Nursing Sciences, Faculty of Medicine and Health Sciences, University of East Anglia, United Kingdom)

Introduction : This EU-funded (Daphne III programme) study on Intimate Partner Violence (IPV) and Older women includes partners from Austria, Germany, Great Britain, Hungary, Poland, and Portugal. The project is running for two years from March 2011 and addresses

the issue of how to improve responses by criminal justice and social support agencies to intimate partner violence against older women. Until now, comparatively little has been known about this issue and this project helps to address that knowledge deficit. This work builds on previous work in the area of intimate partner violence and older women, specifically a study undertaken between 2009-2011. Method : The first phase of the study consisted of analysis of case files held by the police and other criminal justice agencies in each country. Phase two consists of the development of guidance and training material for criminal justice agencies. The final phase consists of the development of guidance and PR and awareness raising material in conjunction with social support agencies. Results : The case file analysis was undertaken in 7 different police forces across England and Wales and 150 cases were analysed across a number of different fields. The workshops with criminal justice and social support agency representatives consisted of experts from both countries, who contributed to the development of guidance, training and PR materials concerning IPVoW. The results of the case file analysis will be presented and work undertaken in the subsequent phases of the project will be described and discussed. Conclusion : The presentation will discuss findings about this important but neglected topic. Keywords : elder abuse, intimate partner violence, older women

OP25 104-S-3

PREVALENCE AND PSYCHOLOGICAL IMPACTS OF CRIMINAL VICTIMIZATION EXPERIENCED BY OLDER CHINESE

Nan QIN, Elsie YAN (*Dept of Social Work and Social Administration, the University of Hong Kong, Hong Kong*)

Introduction : Victimization experience has severe impact on victims' psychological well-being, especially for older victims who may be vulnerable and susceptible to these detrimental consequences. This study examines the prevalence and psychological impact of victimization by common crime and domestic violence among older Chinese. Method : A representative sample of 453 older adults aged 60 or above was recruited from urban communities of Kunming city, Yunnan province using multistage sampling method. Participants were individually interviewed and provided information on their demographic characteristics, neighborhood disorder measured by the Perceived Neighborhood Disorder Scale, victimization by common crime (VCC) measured by a 7-item checklist, victimization by domestic violence (VDV) measured by the Potential Harmful Behavior scale and mental health measured by GHQ-12. Results : Results showed that 252 participants (55.6%) experienced one or more types of VCC in the past, with being stolen and being cheated/conned being the most common, and attack and rape/sexual assault the least common. Only 22 participants (4.9%) reported VDV, with caregiver's threatening to hit or hurt them and verbal aggression being the most prevalent, and threatening with nursing home placement and withholding food the least prevalent. Moreover, 17 participants (3.8%) experienced both VCC and VDV. Regression analyses indicated that VCC was significantly associated with poorer mental health ($\beta = .12, p < .01$) independent of gender, age, education, household finance, household size, living arrangement, physical health, social networks and neighborhood disorder. Contrary to our expectation, VDV was not significant in the model ($p = .397$). Conclusion : Research, practical and policy implications are discussed. Keywords : victimization, older Chinese, mental health

OP25 104-S-4

ADDRESSING ELDER ABUSE AND NEGLECT- LEADING SOCIETAL CHANGE IN ISRAEL

Sara ALON (*Eshel, JDC-ESHEL (Association for planning development of services for the aged), Israel*)

Introduction : Elder abuse and neglect have been recognized as a social problem in Israel in the last decade. Addressing elder abuse and neglect requires multi-dimensional, multi-system actions: formulating policy, raising awareness, developing social responses and constructing an array of services. JDC-ESHEL (Association for Planning and Development of Services for the Aged), in conjunction with the governmental ministries, municipalities and NGO's, developed and implemented multi-system actions to address elder abuse and neglect. Method : 1. Raising awareness: media campaign; conferences for professionals, for older adults, producing and disseminating materials and videotapes. 2. Research and Knowledge development : a. the national survey on elder abuse; b. developing risk assessment tool; c. evaluation study of a community model for intervention; d. producing manuals for intervention in cases of elder abuse. 3. Developing services: a. Establishment of specialized units within municipal social services; b. establishing multi-disciplinary teams; c. helpline ; d. legal counseling for victims of abuse. 4. Training professionals and volunteers 5. Policy: a. protocols for identifying and reporting elder abuse within health care system; b. policy changes concerning elder abuse within social services. Results : General public, older adults and professionals are aware of elder abuse; increase in numbers of identified cases; coordination between governmental ministries and organizations is enhanced. Conclusion : Since the revelation of the phenomenon, Israel has made a considerable progress in its attempts to confront elder abuse and neglect. Progress had been made in the scientific area, policies, legal and organizational spheres. Keywords : Elder abuse, policy, programs responding elder abuse

OP25 104-S-5

REGULATING CARE WORK: HOME, ELDERCARE, AND THE INVISIBLE WORKFORCE

Peggie SMITH (*Law, Washington University School of Law in St. Louis, USA*)

Introduction : A growing number of households are paying care givers to provide in-home care to aging family members with long-term care needs. The demand for home-care services is so strong that home care ranks among the top three industry sectors where employment is projected to grow the fastest in the United States. Despite this projection, however, a labor shortage exists that has left families and policymakers wondering who will care for an increasingly elderly population. Described as a "crisis" by experts, the shortage of workers is closely linked to low wages and demanding job conditions that not only disadvantage workers but also compromises the quality of services provided to elderly persons. As many as fifty percent of all workers quit their jobs every year. A worker's departure can have devastating consequences for elderly clients who must adjust to a new worker and who may experience service disruptions that can lead to hospitalization. Method : I investigate the "crisis" in the home-care industry and consider its implications for the provision quality care by examining the status of home-care workers in labor and employment law. Results : The research reveals that federal and state laws define home care as a form of domestic service. So defined, workers are denied fundamental labor relating to wages and hours, and health and safety, and collective bargaining rights. Conclusion : Providing workers with basic labor rights is essential to attracting and retaining qualified workers and improving the quality of care for elderly home-care recipients. Keywords : eldercare, homecare, employment

OP25 104-S-6

TAMING ELDER ABUSE IN KENYA - ENGAGING GOVERNMENT FOR LEGAL REDRESS

Erastus Maina ITUME¹, Theresa OBATH² (1. *Advocacy & HIV, HelpAge Kenya, Kenya*; 2. *Chairman, Board, HelpAge Kenya, Kenya*)

Introduction : The status of rights of older persons and their protection from violence and abuse in Kenya experienced a new dawn with the promulgation of a new constitution with aging-supportive Bill of Rights in August 2010. Such reality provoked HelpAge Kenya's to steer a much awaited process of seeking justice and retribution for victims of elder abuse. Method : To inform the process, HelpAge carried out a study on of elder abuse in Western and Coast Regions of Kenya rated most notorious. The study was done in May-June 2012 and was intended to inform on the ongoing processes of engaging government and legal stakeholders including the Chief Justice, Attorney General and Director of Public Prosecutions to expedite retributive justice for victims and enact an Elder Abuse Justice Act for Kenya. The study on status of Elder Abuse involved interviews with victims, relatives, government administrators, youth leaders, security personnel and community members. Results : 1. Older women are the most targeted due to vulnerability 2. Misconceptions among youth and society 3. Neglect of elderly 4. Lack of elder abuse legal frameworks. Conclusion : 1. Legal mitigation for victims, families and relative and rescue for victims 2. Security and rescue to all displaced older people. 3. Enhancing community policing and integrating ageing in the programme. 4. Civic and constitutional education on older people's rights. Empower older people to have a voice and protect their rights. 5. Develop programs which seek to strengthen family structures. Keywords : Elder Abuse Justice

OP25 105-S HEALTH PROMOTION II

OP25 105-S-1 SENIOR CENTERS - IMPROVING THE HEALTH AND WELL-BEING OF OLDER ADULTS

Manoj Pahlaj PARDASANI (*Graduate School of Social Service, Fordham University, USA*)

Introduction : Since their advent in 1943, a network of 11,000 senior centers in the United States have played a vital role in community-based services for older adults by providing opportunities for recreation, socializing, volunteering, advocating for their concerns, as well as access to information and referral services, education, and nutrition and health services (DFTA, 2002; NISC, 2005; Turner, 2004). As an integral component of the continuum of long term care, senior centers aim to promote healthy aging, enhance independence and self-reliance, reduce hospitalizations, and improve the well-being of our aging cohort (AoA, 2000; Krout, 1998; Leest, 1995; NISC, 2005; Pardasani, 2004). The purpose of this presentation is to report on a large study that evaluated the impact of participation in senior centers on the health and wellbeing of older adults - specifically social support, isolation, mental health, life satisfaction and quality of life. Method : The study followed 1,000 new participants at sixteen (16) senior centers in New York City over the course of one year to assess changes in their overall perception of health, life satisfaction and well-being as they engaged in senior center programs and services. The study utilized a quasi-experimental, longitudinal design divided into three phases of data collection. A combination of focus groups and in-depth, individual interviews were utilized for data collection. Results : Preliminary results demonstrate the positive impact of senior centers on the health and lives of older adults and their contribution to healthy aging. Conclusion : Practice and policy implications for communities

worldwide will be shared. Keywords : senior centers, health, quality of life

OP25 105-S-2 EFFECTIVENESS OF A NURSING CONSULTING INTERVENTION IN OLDER PEOPLE WITH MOBILITY IMPAIRMENT - A PROSPECTIVE LONGITUDINAL STUDY

Steve STRUPEIT¹, Arne BUSS¹, Karin WOLF-OSTERMANN² (1. *Life Sciences, HAW Hamburg - University of Applied Science, Germany*; 2. *Nursing Science, ASH Berlin, Germany*)

Introduction : Mobility impairment can lead to care dependency and institutionalization in elderly people. There is a need of special educational programs to obtain and facilitate mobility and quality of life in those affected. Method : Aim of this study was to examine the effect of nursing consulting on mobility and quality of life. A mono-centered, prospective longitudinal study, with a (non-equivalent) control group pretest-posttest design was conducted in a geriatric rehabilitation facility and living environments of the patients after discharge. Intervention consisted of consulting home visits including follow-up phone calls. Primary outcomes were quality of life and functional status. Secondary outcome was self-efficacy. Data were collected at admission, at discharge and at 6 months follow-up. Results: Participants in the intervention group showed a higher increase in functional status compared to the control group. The intervention did not have an effect on quality of life, except from social domain. Conclusion : Findings of this study suggest that nursing consulting seems to improve functional status whereas quality of life was almost not affected. Further studies are needed using rigorous research methods. Keywords : mobility, quality of life, nursing consultation

OP25 105-S-3 MENTAL HEALTH STATUS AND CANCER RISK: SIX YEARS FOLLOW-UP OF THE SINGAPORE LONGITUDINAL AGEING STUDIES COHORT

Min Jun JIANG¹, Ai Zhen JIN², Liang FENG¹, Ma Shwe Zin NYUNT¹, Lei FENG¹, Kuan Yew CHOW², Tze Pin NG¹ (1. *Department of Psychological Medicine, National University of Singapore, Singapore*; 2. *National Disease Registry Office, Ministry of Health, Singapore*)

Introduction : There is widespread perception but limited evidence that psychological factors play a role in the development of cancer. We investigated whether poor self-reported mental health status was associated with cancer incidence risk in a Singaporean elderly population. Method : In this prospective cohort study, 2620 cancer-free subjects aged 55 and above were followed up for 6 years. Poor mental health status at enrolment was determined by lowest tertile scores on SF-12 MCS and hazard ratio (HR) and 95% confidence interval (95%CI) of association with incident cancer was evaluated using Cox proportional hazards regression. Results : Participants with poor mental health status was associated with an elevated risk of overall cancer incidence (HR=1.42, 95%CI: 1.02, 1.97), controlling for age, gender, BMI, living condition and smoking. Conclusion : Poor mental health status in elderly population was associated with increased incidence of cancer. Psychological support intervention to improve mental status of elderly persons may possibly be protective against cancer risk. Keywords : Ageing, Cancer, Incidence

OP25 105-S-4 RESEARCH ON THE 18-WEEK LEARNING PROGRAM OF PROMOTING HOLISTIC HEALTH FOR THE ELDERLY IN

TAIWAN

Meilan CHEN¹, Yingsun HUNG² (1. Institute of Health Industry Management, Ching Kuo Institute of Management and Health, Taiwan; 2. Department of Senior Citizen Service in Management, Ching Kuo Institute of Management and Health, Taiwan)

Introduction : The elderly in Taiwan have several ways to participate in the lifelong education. In New Taipei city, there are more than 300 learning programs for the elderly to attend. This means that Taiwanese society and government pay more attention to help the elder to get the better living quality. This study examines the learning need and influence factors for promoting the holistic health of the elderly. **Method :** The 30 participants' age were over 58. These old people included middle-aged, young-old and middle-old individuals. The researcher, also the role of instructor of the learning program, created this program with multiple teaching materials. By means of participating in the 18-week learning program, the participants reach the goal of holistic health. In this study, we use observation and interview to probe the learning need and how the learning program influence factors for promoting the holistic health. **Results :** The quantitative studies analyses indicated: (1) For the physical aspect, by learning yoga, anti-ageing, dietary plan and food nutrition, these participants were conscious of the importance of their health promotion. (2) For the psychological and spiritual aspect, by learning basic computer skill to record their own life stories, reading and health promotion, these participants realized the meaning of life. (3) For the social aspect, by learning volunteering, environmental protection issue, retirement financial plan, these participants were more successful in ageing. **Conclusion :** The results reveal that the elderly emphasize health care of the body and then they can participate more in other to reach the goal of promoting holistic health. **Keywords :** holistic health, the elderly, learning program

OP25 105-S-5

GERIATRIC INCLUSIVE ART AND LENGTH OF STAY IN ACUTE CARE UNIT: A CASE-CONTROL PILOT STUDY

Olivier BEAUCHET¹, Samantha REMONDIERE², Laure DE DECKER³, Florence REPUSSARD², Frederique DECAVEL⁴, Cedric ANNWEILER¹ (1. Neuroscience and Geriatrics, Angers University Hospital, France; 2. Geriatrics, Angers University Hospital, France; 3. Geriatrics, Nantes University Hospital, France; 4. Nursing Department, Angers University Hospital, France)

Introduction : Although emotional well-being is known to improve health status amongst older community-dwellers, its effect in geriatric acute care units has not been examined yet. The Geriatric Inclusive Art (GIA) uses painting to make inpatients aware of their abilities through an improvement of emotional well-being. We performed a pilot case-control study to determine whether a GIA session performed amongst inpatients hospitalized in a geriatric acute care unit could reduce the length of hospital stay (LHS). **Method :** Between December 27th 2010 and December 14th 2011, 93 inpatients (mean age 83.9±6.2years, 53.8% women) who benefited from one session of GIA and 95 paired control inpatients (mean age 85.4±5.6years, 51.6% women) hospitalized in the geriatric acute care of Angers University Hospital (France) were prospectively included. The LHS was assessed using the administrative registry of Angers University Hospital. Participation at one GIA session was defined as painting a picture under the supervision of a moderator and a nurse. **Results :** There were no significant differences for the baseline characteristics between cases and matched controls. Multiple linear regression model showed that attending one GIA session (P=0.023) and a higher BMI (P=0.031) were associated with a shorter LHS, whereas hospitalisation during fall

was associated with a longer LHS (P=0.020). **Conclusion :** Participation in one GIA session was associated with shorter LHS in our study. We suggest that painting improved emotional well-being amongst inpatients. This positive affect might act as a starter of awareness of inpatients' abilities leading to better functioning and thus accelerating the discharge. **Keywords :** art therapy; Geriatric Inclusive Art; acute care unit; length of hospital stay; older inpatients

OP25 105-S-6

DETERMINANTS OF INTENTION TO UNDERTAKE PHYSICAL ACTIVITY AMONG COMMUNITY DWELLING SOUTH ASIANS AGED 60 AND OVER

Maria HORNE¹, Richard EMSLEY², Adrine WOODHAM¹, Colin COX³, Alison WEARDEN⁴ (1. School of Nursing, Midwifery & Social Work, The University of Manchester, United Kingdom; 2. School of Community Based-Medicine, The University of Manchester, United Kingdom; 3. Public Health Manchester, Manchester City Council, United Kingdom; 4. School of Psychological Sciences, The University of Manchester, United Kingdom)

Introduction : Regular physical activity (PA) reduces functional disability, improves mental health and reduces the risks of premature death from heart-disease, stroke and type-2 diabetes. However, PA levels decline with age with only 19% of people aged 65-74 and 6% of those aged 75+ achieving the recommended targets for PA in the UK. PA levels are even lower for ethnic minority groups. South Asian (SA) older people are less likely to exercise compared to their Caucasian peers. They also experience greater levels of heart-disease, stroke, type-2 diabetes and mental health problems, conditions that can be prevented or improved through taking regular PA. Evidence on effective interventions tailored to minority groups needs remains inadequate. Establishing the determinants of PA intention will help to develop culturally appropriate interventions to increase uptake and adherence of PA among SA older adults. **Method :** A cross-sectional survey, underpinned by the Theory of Planned Behavior (TPB), with 305 of community-dwelling SA aged ≥60 to determine the prevalence and relative strength of attitudes related to PA-uptake. Multiple regression analyses will be undertaken to identify factors (e.g. gender/ethnicity/co-morbidity) independently have an effect on behaviour. Analysis of TPB will also be based on structural equation modelling (SEM), using Mplus 6.1. **Results :** We are currently undertaking the survey. This will be complete by the end of February 2013. **Conclusion :** Using theoretical frameworks, such as the TPB, are a useful starting point to look at behavioral change mechanisms which can be used to develop culturally sensitive PA interventions to increase PA levels. **Keywords :** Healthy ageing; minority groups, physical activity

RESEARCH TRADITIONS INFORMING INQUIRY ON INDIGENOUS ELDERS

Kathryn L. BRAUN, Colette V. BROWNE, Lana Sue KAOPUA, Bum Jung KIM, Noreen MOKUAU (Ha Kupuna Center for Native Hawaiian Elders, University of Hawaii, USA)

Introduction : Although indigenous people (including Native American, Alaska Natives, Native Hawaiians, First Nations, Maori, and Aboriginal Australians) have lower life expectancies than dominant populations in their countries, increasing numbers of indigenous people are living longer. Research on indigenous elders is

increasing, albeit still limited, and is informed by a number of research traditions and assumptions. Method : This paper reviews the research traditions that inform inquiry on indigenous elders. Conceptual perspectives for framing indigenous gerontology also will be reviewed, including the life course perspective, cumulative advantage and disadvantage research, cultural/historical trauma, and cultural competence/safety. Results : Much of the early research drew on cultural anthropology and ethnography, using participant observation, interviews, and focus groups to learn about the world view and cultural values of elders in indigenous communities. Quantitative researchers have mined survey data to compare characteristics of indigenous populations to non-indigenous groups, and these findings have revealed the significant health, social, and economic disparities experienced by indigenous elders. Survey researchers have translated and psychometrically tested standardized instruments for use in indigenous populations, and findings have furthered our knowledge about indigenous elders, as well as about the “fit” (or lack thereof) of these tools with indigenous populations. More recently, efforts have extended to “decolonizing” research methods and engaging with indigenous elders as research partners. Conceptual perspectives for framing indigenous gerontology also will be reviewed, including the life course perspective, cumulative advantage and disadvantage research, cultural/historical trauma, and cultural competence/safety. Conclusion : The paper concludes with policy directions and recommendations for future research with indigenous elders. Keywords : international aging, native aging

OP25 106-S-2

PROTOTYPES OF OLDER CHARACTERS IN UK AND TAIWANESE TV ADVERTISEMENTS: A GROUNDED THEORY ANALYSIS

Chin-hui CHEN (*Department of Modern Languages, National Pingtung university, Taiwan*)

Introduction : This study was aimed to explore prototypes of older characters as represented in UK and Taiwanese TV advertisements so as to understand how stereotypes of older age are reproduced or challenged for marketing purposes and how different or similar portrayals of older people are in Eastern and Western media contexts. Method : The grounded theory method was employed to approach the data (including 1731 UK and 2318 Taiwanese TV adverts recorded over a year between January/2007- January/2008). All older characters deemed to be aged 50 and over (UK= 61; TW=124) were systematically compared and the identified differences were labelled. 9 main prototypes as well as their subtypes emerged as the results. Results : The 9 main prototypes (shared by the two corpuses of data) were coded as 'Competent', 'Conservative and Traditional', 'Engaged in Female-Male Relations', 'Golden Ager', 'Humorous', 'Unwell and Declining in Health', 'Incompetent', 'Engaged in Intergenerational Relations', and 'Vulnerable'. Conclusion : The constant comparisons revealed that there were certain character types (or the subcategories) rather unique to or primarily derived from either Taiwanese or UK TV adverts. For example, being engaged in intergenerational relations, showing vulnerability (including declining health), asexual marital life and being conservative or serious were features more likely observed in Taiwanese TV adverts. Certain counter-stereotypical portrayals, such as interests in pursuing romance could only be identified in the UK dataset. The research findings were transformed into a number of hypotheses for further verification in future research on media representations of older people, using quantitative approaches (e.g. content analysis). Keywords : media representations, age stereotypes, cross-cultural comparisons

OP25 106-S-3

THE IMPORTANCE OF COMMUNITY PARTNERSHIP IN CROSS CULTURAL RESEARCH

Shoba NAYAR¹, Valerie WRIGHT-ST.CLAIR², Hagnyun KIM³, Audrey CHUNG⁴, Hu CHONGBAU⁵, Jeet SUCHDEV⁶ (1. *Centre for Migrant and Refugee Research, AUT University, New Zealand;* 2. *Research Cluster for Active Ageing, AUT University, New Zealand;* 3. *Occupational Science and Therapy, AUT University, New Zealand;* 4. *Advisor of Ethnic Reference Group, Waitemata Police District, New Zealand;* 5. *Auckland Chinese Seniors Group, Chinese Community Organisation, New Zealand;* 6. *Chairperson, Bhartiya Samaj Charitable Trust, New Zealand*)

Introduction : Doing culturally sensitive cross-cultural research is fraught with ethical and methodological concerns; particularly when the investigating researchers are not members of the participating ethnic communities. This paper explores the challenges and benefits of engaging with Indian, Chinese and Korean elder migrant communities in a New Zealand study. Method : Guided by a key informant, the researchers presented their proposed plan to relevant community leaders. Next, meetings between individual community leaders and researchers took place within nominated community settings. Finally, in preparation for the study, research assistants from within each ethnic community were appointed to the research team. The actual study involved collecting data across focus groups and individual interviews in accordance with culturally appropriate frameworks, including choice of language, social etiquette and environmental setting. Results : Challenges to engaging in community partnership included the amount of time required to establish relationships and simultaneously manage the organisation of data collection across three different ethnic communities; working in unfamiliar languages; and preparing community leaders and research assistants to undertake research processes. Benefits were access and welcome into the participant communities, and the richness of data collected as a result of establishing a research framework in which participants felt comfortable to engage in and express themselves. Conclusion : Researchers do not necessarily need to belong to specific ethnic communities in order to engage in rigorous and respectful research. However, fundamental to cross cultural research, is ensuring that sound community partnerships are nurtured throughout the process, from engagement through to data collection, analysis and sharing of results. Keywords : Cross-cultural, Older immigrants, Partnership

OP25 106-S-4

COMPARISON OF ATTITUDES AND BELIEFS ABOUT DEMENTIA AND OTHER CHRONIC DISEASES IN AUSTRALIANS AND SOUTH KOREANS

Sarang KIM, Kerry A; SARGENT-COX, Kaarin J ;ANSTEY (*Centre for Research on Ageing, Health and Wellbeing, The Australian National University, Australia*)

Introduction : Dementia is the third leading cause of death in Australia (9th in Korean Women). However, it is not being treated and recognised as a chronic disease and is often seen as a part of normal ageing. The purpose of this study was to explore and compare people's understanding and beliefs on dementia in comparison with other chronic diseases in Australia and Korea. In addition, the study aimed to examine dementia stigma and literacy between the two cultures of Australia and Korea to increase understanding of cultural influences in how people define, perceive, and respond to dementia and chronic disease. Method : 244 participants aged 18 to 64 years (122 Australian and 122 Korean) completed the anonymous online survey. The dementia literacy questionnaire and the dementia stigma as well as

attitude on chronic diseases questionnaire were administered. Results : Results showed that Australians are both highly concerned about developing dementia and think that they are highly likely to develop it whereas Koreans are highly concerned but do not think they are likely to develop dementia when compared to other chronic diseases. There were no significant differences in ability to recognise dementia symptoms in a vignette and in levels of dementia stigma between Australians and Koreans. Conclusion : Previously research has shown that racial minority groups had poor dementia literacy in comparison to majority group. However, this racial difference was not present in this study when both groups were majority racial groups in their countries. However, attitudes towards dementia were different between Australians and Koreans. Keywords : Dementia, Literacy, Stigma

OP25 106-S-5

CULTURAL COMPETENCY AND CAREGIVER TRAININGS

Im Ja CHOI¹, Judy BERRY² (1. *Executive Director, Penn Asian Senior Services, USA*; 2. *Executive Director, Lakeview Ranch, Inc. and Dementia Care Foundation, USA*)

Introduction : "Cultural Competency and Caregiver Trainings" examines the cross cultural project between Penn Asian Senior Services (PASSi) and the Dementia Care Foundation to offer Asian immigrants caregiver trainings on Dementia. We will discuss the barriers in delivering care to Asian immigrants and how collaborative trainings can overcome these barriers, enhance health outcomes, and improve elderly immigrants' quality of life. Method : PASSi received funding from Independence Blue Cross Foundation in August 2012 to launch a cross-cultural Alzheimer caregiver training program based on the Lakeview Ranch Model of Specialized Dementia Care™. Judy Berry taught 141 home health aides and family caregivers in 5 Asian languages. PASSi's multilingual community coordinators and nurse educators were key to facilitating the cross cultural training. Founded in 2004, PASSi is a nonprofit home healthcare and vocational training agency in Pennsylvania focused on Asian immigrants. PASSi currently serves over 360 clients in 7 Asian languages. Judy Berry founded Lakeview Ranch Inc. in 1999 where she developed the Lakeview Ranch Model of Specialized Dementia Care™. This nationally recognized model restores dignity, choice and quality of life to Dementia/Alzheimer's patients, eliminates dementia related aggressive behavior, and reduces psychotropic drug use. Im Ja Choi, founder and Executive Director of PASSi, and Judy Berry, founder of Lakeview Ranch, Inc., are national winners of the Robert Wood Johnson Community Health Leader Award. Results : The trainings improved caregivers' understanding of Alzheimer/dementia symptoms and changed their initial approach and interaction with patients. Conclusion : We will discuss how the trainings enhanced overall health outcomes and reduced health care costs. Keywords : cross-culture, Alzheimer's, Asian

OP25 106-S-6

CRITICAL INVESTIGATION OF THE POLITICAL IDEOLOGY INHERENT IN THE SUCCESSFUL AGING MODEL OF JAPAN

Heekyoung KIM (*Department of Anthropology, Seoul National University, Korea*)

Introduction : In the 1990s, the Japanese government struggling with social problems caused by population aging adopted the traditional way of aging in Nagano as an aging-well model. In general western models, old people are often portrayed as active consumers who purchase anti-aging medicines to preserve their youth and enjoy their

later lives. In the case of Japan, however, the elderly carried the exact opposite image. The Japanese government portrayed the public image of Nagano elders as if they engaged in farming all their life and were reluctant to go to clinics because of their tendency toward frugality and hard work. This study critically examined the political backgrounds as to why the traditional way of life of Nagano elders was considered as a successful aging model by the Japanese government and the implications therefrom. Method : By analyzing government documents and statistical data, this study tried to evaluate the welfare policy for the elderly and carried out ethnographic fieldwork in the Nagano area to show the real life of its old people. Results : The Japanese government's strategy for coping with the population aging was to minimize social expenses particularly medical expenses of the elderly. The Nagano model was chosen because it met such political intention of the government, i.e., passing the weight of responsibility from the government to the individual families. Conclusion : It is important to note that successful aging is not just an academic theme, a consumer discourse or a popular image but rather a political ideology which compels old people to lead a certain way of life. Keywords : successful aging, Nagano, Population aging

LONG TERM CARE II

OP25 107-S-1

IS THERE REALLY ALZHEIMER? CAREGIVERS' PERCEPTIONS

Nutthita PETCHPRAPAI (*Institute of Nursing, Suranaree University of Technology, Thailand*)

Introduction : Alzheimer is a common disease among older adults that leads them totally depend on their caregivers. Method : This study was aimed to explore the extent of Alzheimer through perceptions of their caregivers. Data were collected by using the Symptoms of Alzheimer Checklist developed by the Deputy of Mental Health, Ministry of Public Health, Thailand. Data were collected by face to face interview caregivers from three setting; a tertiary hospital, nursing home and in community. Results : Participants were 133 older adults, 60-95 years of age (mean = 75.31, SD = 7.953), most were men (67.7%), married (51.9%) and suffering from at least one chronic disease (91%). The most frequently reported chronic diseases were hypertension (49.6%) and diabetes (32.1%). Caregivers reported that 65 older adults were at risk of Alzheimer whereas only 28 were normal. The extent of Alzheimer was significantly different among participants from those three settings ($F = 7.802, p < .05$). The highest risk was found in participants admitted in the hospital. Conclusion : Hospitalized older adults as well as those resided on Government nursing home were at higher risk of Alzheimer. It is recommended that brain training activities for those older adults should promote. Keywords : Alzheimer; Caregiver

OP25 107-S-2

FOREIGN DOMESTIC WORKERS CAN EASE THE BURDEN OF CAREGIVING: THE SINGAPORE SURVEY ON INFORMAL CAREGIVING

Truls ØSTBYE, Rahul MALHOTRA, Chetna MALHOTRA, Chandima ARAMBEPOLA, Angelique CHAN (*Program in Health Services and Systems Research, Duke-NUS Graduate Medical School, Singapore*)

Introduction : With an aging population, shrinking family size and high female workforce participation, many families in Singapore employ foreign domestic workers (FDWs) to help care for their

elderly. This study assesses the moderating effect of instrumental support by a FDW on the impact of four types of impairments (physical function, memory, behavior and mood) among older persons on their primary informal caregivers (CG). Method : Data from a national survey of 1,190 Singaporeans aged 75+ receiving human assistance for activity of daily living limitations and their CGs was used. A modified version of the Caregiver Reaction Assessment (CRA) assessed the impact of caregiving in four domains: schedule and health, finances, lack of family support and esteem. Linear regression models, one for each CRA domain, adjusting for older person and CG characteristics, with interaction terms of the four impairment severity scores with FDW support, were developed. Results : FDW instrumental support, reported for 50.0% of the older adults, reduced, or even reversed, the negative impact of physical impairment on schedule and health ($p=0.05$), of memory impairment on schedule and health ($p<0.0001$) and lack of family support ($p=0.03$), and of behavior impairment on lack of family support ($p=0.05$) and esteem ($p=0.008$). Conclusion : Provision of FDW support is beneficial for informal caregivers of older adults, the benefit increasing with an increase in older person impairment severity. Given its aging population, the number of FDWs in Singapore is likely to increase. This has policy implications for immigration patterns into Singapore, and training of and support networks for FDWs. Keywords: caregivers; frail elderly; activities of daily living

OP25 107-S-3

EXPLORING NURSING ASSISTANTS' ROLES IN THE PROCESS OF PAIN MANAGEMENT FOR COGNITIVELY IMPAIRED NURSING HOME RESIDENTS: A QUALITATIVE STUDY

Liu JUSTINA YAT WA (School of Nursing, The Hong Kong Polytechnic University, Hong Kong)

Introduction : Nursing assistants provide most of the direct care to residents and represent the major taskforce in nursing homes. They may develop specialized knowledge of residents' pain experience and be able to play both a pivotal role in pain assessment and possibly a supporting role in pain treatment. Currently, there is a lack of research into nursing assistants' functions in pain management. Method : This study aims to explore nursing assistants' roles during the actual process of pain management (assessment, reporting, implementation of pain-relieving interventions and re-assessment) for cognitively impaired home residents with pain. This study used a descriptive and exploratory qualitative approach. Semi-structured interviews were carried between May and September 2010 with 49 nursing assistants from 12 nursing homes in Hong Kong with various amounts of experience in caring for residents in pain. Results : Analysis of interview transcripts revealed four roles of nursing assistants in the pain management process: (1) pain assessor, (2) reporter, (3) subordinate implementing prescribed medications and (4) instigator implementing non-pharmacological interventions. Conclusion : This study highlighted the importance of nursing assistants in successful pain assessment and identified the possible supporting roles of them in other aspects of pain management. However, due to the scope of practice of nursing assistants, their functions in different processes of pain management were continually undervalued by other healthcare professionals. Therefore, adequate training was suggested to ensure that nursing assistants have sufficient knowledge and skills to execute their duties in pain assessment and other aspects of pain management for residents. Keywords : nursing assistants, nursing homes, pain management.

OP25 107-S-4

NEW MODEL OF EMPOWERMENT COMMUNITY CARE FOR THE HIGH-RISK FRAIL ELDERLY: THE EMPOWERMENT COMMUNITY CARE PROGRAM

Leung SIU HUNG¹, Yau PIK SU¹, Chan PUI FONG², Chin CHUEN FUN², Chiu LING TAI², Chau YEUK SZE², Karn KIN YI², Lam SHUK YIN², Tsang SUK YEE², Yu LAI CHUN², Wong YUK YING² (1. Nursing Service Division, Kowloon East Cluster, United Christian Hospital, Hong Kong; 2. Community Nursing Service, Kowloon East Cluster, United Christian Hospital, Hong Kong)

Introduction : Nearly 30% of patients aged over 65 having 3 or more hospital admissions are common in Hong Kong. The Empowerment Community Care Program was an intensive nursing community care under protocol driven, Case Management model and "Level of Care Triage model" for empowerment of frail elders and caregivers' self efficacy and prevention of the unplanned readmission. Method : This was retrospective review study. Patient under this program were recruited from 1st October, 2011 to 31st March, 2012. Descriptive data of patients' demographics, disease and care categories, nursing care time, Empowerment score (a set of Key Performance Indicators for evaluating the effectiveness of community nurses in chronic disease home care management), hospital readmission rate were analyzed. Results : Three hundred and nine cases were recruited. Mean age was 74.7 years old. Majority were suffering from DM, cardiovascular, respiratory disease provided protocol driven specific nursing care by designated community case managers under the "Level of Care Triage model". Mean home care intervention was 7.4 and more than 50 minutes tailor-made care were provided on each care. The overall empowerment score was improved by 96%. For comparison with ordinary care, the unplanned readmission was by reduced 8.2% and the satisfactory recovery rate increased by 12.4%. Conclusion : This program demonstrated the crucial role of community nurses in enhancing patient self chronic disease empowerment and reducing unplanned readmission in post discharged frail elderly. Keywords : Self care empowerment, community nurse

OP25 107-S-5

PHYSICAL RESTRAINTS (PR) AND THEIR AVAILABILITY IN LONG-TERM-GERIATRIC-CARE-HOMES

Uwe BRUCKER (Deputy Manager, Institute for The Improvement of The Living Conditions of Persons with Impairment of DLS(PEA e.V.), Germany)

Introduction : Physical restraints (bedrails, belts, fixed-tables, braked wheelchairs near a table) are commonly used in long-term-care-geriatric-facilities. The reasons given by the carers are internationally comparable: safety-measure like prevention from falls; fear of liabilities, controlling disruptive behaviour. The ratio of the daily restraint-ratio presents considerable variation among facilities both between and within countries. Main target-groups of physical restraints are persons suffering from dementia. With the available evidence it is disputable whether PR use can be legitimated in reference of challenging behaviour, reducing the risk of falling or fall-related injuries. Observational studies have suggested that PR go along with serious side effects from severe injuries to mortality. Method : Clinical controlled trials almost include interventions like different educational programs for the staff; organizational interventions or the provision of potential (Technical) alternatives for preventing and reducing physical restraints (PR) in long-term geriatric care. The burden of educational programs both in terms of training and time seem to be high compared with the results of the reduction. In Germany a combination of different approaches seem to be successful: educational programs, a conventional management approach

complemented by the judge who must legalize the PR in LTC-facilities (in Germany) can lead to a change of attitudes towards PR. Results : A pronounced reduction of PR in educational/technical interventions of 20 percent maximum in the intervention group; and a considerable increased reduction up to 80-90 percent with the management approach and the judge. Conclusion : Better quality of life for the residents and their families and increased staff satisfaction. Keywords: Physical Restraints; Long-Term-Geriatric-Care; Avoiding approaches

OP25 107-S-6

HEMOCARE FOR OLDER PEOPLE IN 10 ASEAN COUNTRIES

Hyunse CHO (President, HelpAge Korea, Korea)

Introduction : It is estimated that the proportion of older persons in South-East Asia will triple between 2000 and 2050. This causes a growing need for welfare and health services for older persons. However, the responsibilities for the care of older persons by family are getting weaker due to trends of nuclear families, prevailing migration, and participation of women in the work while coverage of the care services is limited by governments. Homecare is one of the community based programs to reduce the above risks. Method : HelpAge Korea firstly initiated Homecare Programme in 1987 and took a lead role for its institutionalization in 1993. Based on the Korean experience, HelpAge Korea and HelpAge International shared the Korean model with 10 ASEAN countries under the project of 'Homecare for Older People in ASEAN countries' supported by ASEAN-ROK Special Cooperation Fund from April 2003 to May 2012. Results : As a result of the project, in Phase 1, under its objective of Model Development, 9 countries developed their adapted Homecare model successfully. In Phase 2, under its objective of Model Expansion, Homecare was expanded into other areas by replicating the model in 5 countries. In Phase 3, for the Institutionalization of Homecare Program, the national guideline of Homecare was successfully accepted in 4 countries. Conclusion : In this presentation, the result and impact of Homecare project will be shared to raise awareness of ageing issue and importance of supporting older persons with community-based service in developing countries. Keywords : Homecare, Community Based Care, Volunteer

Centre for Education and Research on Ageing and Anzac Research Institute, Concord Hospital and University of Sydney, Australia; 5. Dept of Tissue Pathology and Diagnostic Oncology, Royal Prince Alfred Hospital, Australia)

Introduction : Paracetamol (APAP) induced hepatotoxicity is associated with inflammation and opening of mitochondrial membrane

permeability transition pores through the intrinsic cell death pathway. We assessed the effects of old age on these processes. Method : Young adult (6±1 months) and old (26±2 months) male Fisher 344 rats were injected intraperitoneally with 800mg/kg APAP (Young n=9, Old n=9) or saline (Young n=8, Old n=5) four hours prior to euthanasia. Serum alanine aminotransferase (ALT) and liver histology indicated the degree of hepatotoxicity. Serum inflammatory markers (RANTES, IL-10, TNF-alpha, GRO-KC, INF-gamma, IL-1b, IL-6, IL-4) were measured via Multiplex assays. Kupffer cells were counted on liver sections, and phagocytic activity assessed by recovery of 500nm microspheres after single pass hepatic perfusion. Hepatic expression of proteins involved in the intrinsic cell death pathway (cytosolic and mitochondrial BAX, BID) were assessed by immunoblot. Results : Serum ALT was less elevated in APAP treated old rats than young (p<0.05). In APAP treated old rats, IL-10 was higher than other groups (p<0.005). Kupffer cell numbers were higher in old than young controls (p<0.05), but did not differ significantly with treatment. No difference in phagocytic function was observed with age or treatment. Cytosolic BAX and BID were >2 times lower in old than young rats regardless of treatment (p<0.05). No significant difference was observed in mitochondrial BAX and BID between age and treatment groups. Conclusion : Our preliminary results suggest reduced inflammatory response in old rats may provide a mechanism for protection against APAP toxicity and old rats have lowered reserve for the intrinsic death pathway. Keywords : Paracetamol, Hepatotoxicity, Inflammation.

AGEING-ASSOCIATED MODIFICATION OF EXPRESSION OF CALPAINS AND CALPASTATINS IN HUMAN LYMPHOCYTES - PRELIMINARY RESULTS FROM THE POLISH - ITALIAN "CALPACENT" PROJECT

Jacek M. WITKOWSKI¹, Anna MIKOSIK¹, Ewa BRYL¹, Jerzy FOERSTER², Calogero CARUSO³, Giuseppina COLONNA-ROMANO³ (1. Pathophysiology, Medical University of Gdansk, Poland; 2. Clinical and Social Gerontology, Medical University of Gdansk, Poland; 3. Pathobiology and Medical and Forensic Biotechnologies, University of Palermo, Italy)

Introduction : The calpain-calpastatin system (CCS) of limited, regulatory, strongly Ca²⁺-dependent intracellular proteolysis consists of two ubiquitous cysteine proteases: μ - and m-calpains as well as of their endogenous intracellular inhibitors - calpastatins. The activity of CCS is implicated in various functions of activated cells, including notably control over apoptosis. We were the first to show that hyperactivity of μ -calpain lies behind escape from apoptosis exhibited by human chronic B-cell leukemia (B-CLL) cells, that total μ -calpain activity increases in the non-leukemic T cells of old mice and later, that the endogenous activity of the enzyme (but not its expression) is elevated in the CD4+ lymphocytes of elderly humans. Method : In the current international CALPACENT project, we aim at comparison of expression and activities of the members of the CCS system in various populations of human peripheral blood lymphocytes in Polish and Italian (Sicilian) centenarians, elderly and young cohorts. Results : Our preliminary results suggest the existence of differences in the expression of CCS members between the different lymphocyte populations (including the CD4+, CD8+, CD19+ and chosen subpopulations of these) both within and between the age groups. As a surprising finding we report here that m-calpain (nominally requiring millimolar concentrations of Ca²⁺ for its activity and considered to be expressed predominantly in the muscle) is also relatively strongly and variably expressed in various types of human blood lymphocytes derived from healthy people of different age. Conclusion : Concluding, the calpain-calpastatin system seems to be disturbed in the

lymphocytes of elderly and centenarians, possibly impacting on their immune performance. Keywords : calpains, calpastatins, lymphocytes

INDUCTION OF CELL DIFFERENTIATION AS
GEROPROTECTIVE MECHANISM OF PEPTIDES IN
NEURO-IMMUNE-ENDOCRINE ORGANS**

Vladimir KHAVINSON, Natalia LINKOVA, Svetlana TARNOVSKAYA, Valeriia PRONYAEVA, Svetlana TROFIMOVA (Biogerontology, Saint Petersburg Institute of Bioregulation and Gerontology, Russia)

Introduction : Cell differentiation is the most important process in ontogenesis. During aging a cell loses its capability to differentiate. This process is accompanied by decreasing functional activity of immune, nervous and endocrine system. Method : Peptide Lys-Glu has been identified to stimulate the differentiation of CD34+ human embryonic stem cells into CD14+ cells (myelocyte), CD3+cells (T-lymphocytes progenitors) CD4+cells (T-helpers) and CD8+ cells (cytotoxic T lymphocytes). Results : The ability to differentiate into different types of tissues depending on injected peptides was found in the culture of pluripotent *Xenopus laevis* cells. Peptide Ala-Glu-Asp-Gly stimulates the origin of nervous tissue, peptide Lys-Glu-Asp-Pro stimulates the origin of epidermis, mesenchymal tissue and somites. In elder cultures of human pancreatic cells peptide Lys-Glu-Asp-Trp normalizes the expression of differential factors Rtf1a, Rpbjl, Pdx1, Pax6 in β -cells, Foxa2, NKx2.2 in α -cells, Pax4 in pancreatic cells up to the expression observed in younger cultures. In retinal cells peptide Lys(H-Glu-OH) induces the expression of differential factors in different types of neurons: Brn3, Marth5, Chx10, Vsx1, Pax6, Math1, Prox1. Conclusion : Thus, the peptides induce cell differentiation in thymus, pancreas and retina depending on their structures, this can be one of the major mechanisms of their geroprotective effects in the neuro-immune-endocrine system. Keywords : geroprotective peptides, cell differentiation, thymus, pancreas, retina

AGING-ASSOCIATED INFLAMMATION IN HEALTHY
INDIVIDUALS AND WERNER SYNDROME**

Makoto GOTO¹, Masanobu SUGIMOTO², Yasuhiro FURUICHI², Masaaki MATSUURA³, Yuichi ISHIKAWA⁴, Sachiko IWAKI-EGAWA⁵, Yasuhiro WATANABE⁵ (1. Rheumatology, Tokyo Women's Medical University, Japan; 2. Molecular Biology, GeneCare Institute, Japan; 3. Cancer Genomics, Cancer Institute, Japan; 4. Pathology, Cancer Institute, Japan; 5. Life Sciences, Hokkaido Pharmaceutical University, Japan)

Introduction : Although the fundamental mechanism(s) of human aging remains unclear, the significant contribution of minor, low-grade, systemic inflammation mainly monitored by highly sensitive CRP (hsCRP) to aging has been proposed as inflammaging. Werner syndrome (WS; MIM#27770): the representative progeroid syndrome without apparent systemic inflammation has been extensively studied as the natural model of human aging. Method : To study the inflammatory condition associated with human aging, both hsCRP and matrix metalloproteinase-9 (MMP-9) were examined in the sera collected from 217 healthy Japanese individuals (ages between 1 and 100 y.o.) and 41 mutation-proven Japanese WS patients (ages between 32 and 70 y.o.). Both hsCRP and MMP9 were assayed by ELISA. Results : Both serum levels of hsCRP and MMP-9 increased significantly ($p<0.001$, $p=0.003$, respectively) with normal aging from both sexes. The serum hsCRP significantly elevated in WS compared with age-matched normal population ($p<0.001$) and normal elderly

population (ages between 71 and 100 y.o.) ($p<0.001$). The serum MMP-9 level in WS did not change significantly compared either with age-matched normal population nor normal elderly population. Conclusion : Although both normal aging and WS were associated with minor inflammation:inflammaging, the inflammatory parameters such as serum hsCRP and MMP-9 changed differently between normal aging and WS. Keywords : CRP, inflammaging, Werner syndrome

AGING AND DISEASES**

**OP25 119-B-1
CRITICAL SLOWING DOWN OF RECOVERY RATE
FOLLOWING A PERTURBATION IS AN EARLY WARNING
SIGN FOR CLOSENESS TO CRITICAL TRANSITIONS IN
AGE-RELATED, CHRONIC DISEASES**

Joep LAGRO¹, Jurgen CLAASSEN¹, Rene MELIS¹, Vasilis DAKOS², Bernard FIKKERS³, Marten SCHEFFER⁴, Marcel OLDE RIKKERT¹ (1. Geriatrics, Radboud University Nijmegen, Medical Centre, Netherlands; 2. Integrative Ecology Group, Estacion Biologica de Donana, Spain; 3. Intensive Care Medicine, Radboud University Nijmegen, Medical Centre, Netherlands; 4. Department of Aquatic Ecology and Water Quality Management, Wageningen University, Netherlands)

Introduction : Recently solid evidence was delivered in systems biology and ecology that validated Critical Slowing Down (CSD) of recovery following a light perturbation of complex systems as early warning signal of being near to a critical transition or tipping point. Here we present evidence and examples of CSD as early warnings of critical transitions in the geriatric context. Method : 1. We analyzed mortality data of 238 consecutive patients after a visit to our falls clinic, at which we measured bloodpressure(BP) recovery rate following a supine-standing maneuver. 2. Additionally, a focus group was organized of 11 internationally reknowned experts from medicine/psychology ($n=5$), ecology/mathematical biology ($n=6$), a systematic and a realist literature review were carried out to collect other empirical data and examples of CSD. Results : ad 1. First minute CSD in systolic BP recovery, resulting in BPs less than 80% from baseline was a powerful independent predictor of mortality: hazard ratio:3.00 (95% confidence interval:1.17-7.68). Ad 2. Similarly, increased recovery time of: fluid depletion by thirsting, dysbalance by pull-test, cardiac depolarization by electrocardiac pacing, minute-ventilation during weaning, immobility by hospitalizing frail elderly, are early warning signs for: recurrent dehydration, falling, atrial/ventricular tachycardia, recurrent tube-dependency, and mortality. Conclusion : Critical slowing down of recovery rate may be used to scale complex organ-systems from robust to fragile, and may be used as early warning signs for closeness to a critical transition in multiple, age related, chronic diseases. These early warnings may be used more frequently in geriatrics by applying recent innovations in digitalized monitoring systems that greatly facilitate time-series-analyses. Keywords : Critical slowing down, tipping points

ACCELERATED IN VIVO AND IN VITRO TELOMERE LOSS
IN WERNER SYNDROME**

Naoshi ISHIKAWA¹, Ken-ichi NAKAMURA¹, Naotaka SHIMOMURA¹, Junko AIDA¹, Makoto GOTO², Yuichi ISHIKAWA³, Masaaki MATSUURA⁴, Atsushi HATAMOCHI⁵, Kaiyo TAKUBO¹ (1. Research Team for Geriatric Pathology, Tokyo Metropolitan Institute of Gerontology, Japan; 2. Department Medical Technology, Faculty of Medical Engineering, Toin University of Yokohama, Japan

3. Department of Pathology, Cancer Institute, The Japanese Foundation for Cancer Research, Japan; 4. Bioinformatics Group, Genome Center, The Japanese Foundation for Cancer Research, Japan; 5. Department of Dermatology, Dokkyo University School of Medicine, Japan)

Introduction : Werner syndrome (WS) is an autosomal recessive disorder characterized by premature onset of major geriatric diseases. Many data pertaining to the accelerated telomere loss in cultured cells derived from WS have been accumulated. However, there have been few definitive data on in vivo telomere shortening in WS. Furthermore, only limited numbers of WS cell strains have been analyzed in vitro experiments. Method : 1) We measured terminal restriction fragment (TRF) lengths of 10 skin samples collected from surgically amputated extremities of 8 WS patients aged between 30 and 61 years because of skin ulceration. 2) 11 fibroblast strains were established from WS patients skin aged between 38 and 57. We measured telomere lengths of these samples, and determined maximum population doubling level (PDL). Results : 1) Regression analyses indicated that the TRF length of epidermis in WS patients was significantly shorter (corresponding to 26 years older) than that in controls ($p < 0.001$). We also found that TRF lengths in muscle adjacent to the examined epidermis were significantly shorter than those of controls ($p = 0.047$). 2) The maximum PDLs in WS fibroblasts were significantly smaller than those in controls ($p < 0.0001$), and showed remarkable individual difference among the strains. Conclusion : These data demonstrate accelerated in vivo telomere loss in WS patients for the first time, and considerable individual variance of telomere lengths among the WS patients and WS derived cell strains; suggesting that abnormal telomere erosion is one of the major causes of early but variable onset time of age-related symptoms and malignancies in WS. Keywords : telomere; Werner syndrome; segmental progeroid syndrome

OP25 119-B-3

THE THERAPEUTIC EFFECTS OF ICARRIN ON AMYLOID- β BURDEN IN A MOUSE MODEL OF ALZHEIMER'S DISEASE

Lan ZHANG, Lin LI (Pharmacology, Xuan-Wu Hospital of Capital Medical University, China)

Introduction : To investigate the effect and pharmacological mechanism of Icarrin(ICA), which is the main component extracted from a traditional Chinese Epimedium herb, on A β production in AD-like APP transgenic mice. Method : PDAPPV7171 transgenic (Tg) mice were randomly divided into model group and ICA treated (at doses 30 and 100 $\mu\text{mol/kg/d}$) groups. ICA was orally administered to Tg mice with an age range 4-10 months. The burden of A β was measured by ELISA and immunohistochemistry. The amyloid senile plaques were detected by Congo red staining and Bielschowsky silver staining. The expression of APP and BACE-1 were measured by immunohistochemistry and Western blot. The co-expression of A β with amyloid fibers was detected by applying double labeled immunofluorescence. Results : Orally administered ICA decreased the number of amyloid senile plaques in hippocampus of Tg mice. The immunohistochemical examination of brain sections stained with polyclonal anti-A β antibody showed reduced A β burden, and A β levels were also decreased in the insoluble fractions of brain homogenates, as determined by ELISA. The expression of APP and BACE-1 in hippocampus was significantly decreased in ICA treated groups. Conclusion : ICA could reduced the A β burden and plaque deposits in the hippocampus of APP transgenic mice through depressing the expression of APP and BACE-1. Icarrin may have a

promising application prospect in treatment of AD. Keywords : Alzheimer's disease (AD), β -amyloid, Icarrin

OP25 119-B-4

THE QUALITY OF REPORTS OF PHYSIOTHERAPY RANDOMISED CONTROLLED TRIALS IN GERONTOLOGY

Catherine SHERRINGTON¹, Anne MOSELEY¹, Mark ELKINS², Lee JANER³, Julia HUSH⁴ (1. Musculoskeletal Division, The George Institute for Global Health, Australia; 2. Department of Respiratory Medicine, Royal Prince Alfred Hospital, Australia; 3. Physiotherapy Student, Faculty of Health Sciences, The University of Sydney, Australia; 4. Discipline of Physiotherapy, Department of Health Professions, Macquarie University, Australia)

Introduction : The Physiotherapy Evidence Database (PEDro, www.pedro.org.au) is a free, online evidence resource which indexes reports of randomised controlled trials, systematic reviews and clinical practice guidelines in physiotherapy. The quality of reports of trials in gerontology compared to other areas of physiotherapy is not known. This study aims to assess the quality of trial reports in gerontology as compared to other areas of physiotherapy. Method : All reports of randomised controlled trials indexed on PEDro on 9 November 2011 were extracted. Data included citation details, language of publication, codes for area of physiotherapy and the PEDro scale. Multiple linear and logistic regressions were used to determine which factors were associated with the total PEDro score and individual PEDro scale items. Results : A total of 14,910 trial reports were included in the analysis. Gerontology was the third most common subdiscipline (2426 trials, 16%) and had the third highest mean total PEDro score (4.97 out of 10, SD 1.53). Multivariate linear regression showed trials in gerontology and a number of other subdisciplines were associated with higher total PEDro scores but explained little of the variance (R^2 of full model = 0.11, $p < 0.001$). Multiple logistic regression showed trials in gerontology were associated with reports of achieving the following PEDro scale items: eligibility criteria and source specified (OR 1.45), random allocation (1.49), baseline comparability (1.55), blinding of subjects (0.58), blinding of assessors (1.18), intention-to-treat analysis (1.24). Conclusion : There is potential to improve the quality of reports of randomised controlled trials in gerontology physiotherapy. Keywords : evidence based practice, physiotherapy, randomised controlled trials

CONSENSUS OF GERIATRIC SYNDROMES IN ASIAN-PACIFIC GERIATRICS SOCIETIES

Chang Won WON¹, Hyung Joon YOO², Chang Oh KIM³, Sung Hoon YU⁴, Jong Lull YOON⁵, Geriatric Syndrome Committee, Korean Geriatric Society (1. Dept. of Family Medicine, College of Medicine, Kyung Hee University, Korea; 2. Division of Endocrinology and Metabolism, Hallym University College of Medicine, Korea; 3. Division of Geriatrics, Department of Internal Medicine, Severance hospital, Yonsei University College of Medicine, Korea; 4. Division of Endocrinology and Metabolism, Hallym University College of Medicine, Korea; 5. Dept. of Family Medicine and Geriatrics, College of Medicine, Hallym University, Korea)

Introduction : Geriatric syndrome is a complex clinical conditions that are common in older persons and do not fit into discrete disease or syndrome categories. It seems to be a result of the accumulation of impairments in multiple systems and share common predisposing factors with other geriatric syndromes. Geriatric syndrome is important in elderly as it is associated with multiple comorbidities and poor outcomes such as increased disabilities and decreased quality of

life. However the geriatric syndrome is not universally defined yet. Method : We made a survey of definition and diagnostic criteria for some geriatric syndromes in Asian-Pacific geriatrics societies; Geriatrics societies of Korea, Japan, Taiwan, China, Hong Kong, Indonesia, India, Singapor, Philiphine, Australia were surveyed. The questionnaire asked about the components of geriatric syndromes. Results : Dementia, incontinence, delirium, falls were accepted as geriatric syndromes in all those 10 countries. Depression, hearing impairment, visual impairment, immobility, gait disturbance, pressure ulcer, sarcopenia, malnutrition were accepted as geriatric syndromes in 9 of the 10 countries. Conclusion : The resulting informations from the questionnaire help us better understand the consensus in concepts of geriatric syndromes in Asian-Pacific geriatric societies. Keywords : geriatric syndrome, Asian-Pacific

OP25 120-S ADAPTATION AND SUCCESSFUL AGEING

OP25 120-S-1 EVOLUTION OF A RESOURCE GROUP FOR HEALTHY AGING: THE PHILIPPINE EXPERIENCE

Lydia Tolentino MANAHAN (*College of Nursing, University of the Philippines Manila, Philippines*)

Introduction : The increasing number of older persons has been seen as a threat to the resources of the individual, the family, and the community. The purpose of this study was to explore the factors that will motivate a social group of older persons into becoming a resource group for healthy aging. Method : This study is explorative in nature. The investigator participated and observed in the socialization of a group of ten older persons who were mostly nurses and whose age ranges from 69 to 86. Results : Similarities of their previous career experience draw them together. Learning and mobility incorporated to the socialization made the group more cohesive and participative in the activities. Initially, their social support function is directed toward satisfying individual needs and maintaining solidarity. As the months went on, their social support function is gearing towards fulfillment of the task of becoming a resource to one another. Their togetherness has developed in them communication of positive effect, sense of belonging or social integration, and elements of reciprocity. Lastly, having a place that will allow them to socialize freely was also essential. Conclusion : This study is still ongoing, however, several constructs can explain the motivation in this group of older persons. A socialization group can be a good venue in helping them to become more healthy and productive in their old age. They themselves can become resources not only for themselves but also for others. The socialization group approach might be a better way in deriving culturally appropriate interventions for older persons.

Keywords : resource group, healthy aging, motivation

OP25 120-S-2 TRANSITIONING THROUGH LIFE STAGES: SIMILARITIES & DIFFERENCES IN SELF-PERCEPTIONS OF AGEING BETWEEN YOUNG & OLD IN TWO DIFFERING CULTURES

Natasha GINNIVAN (*Centre for Research on Ageing Health & Wellbeing, Australian National University, Australia*)

Introduction : This qualitative study examined cultural differences in perceptions of ageing between a predominantly Western and individualist culture (Australia), and a culture which is predominantly collectivist in its social organisation (The Philippines). Intergenerational contact, older role models, media portrayal of older people, self-efficacy and the importance of faith in later life were

discussed. Method : Focus groups were carried out on older (60-95, n=23) and younger people (20-35, n = 25) in both Australia and The Philippines. Nvivo 9 software with a grounded theory framework for analysis was used to extract the emergent themes from the transcripts. Results : Results showed that younger participants in both cultures viewed older people as potential role models in their ability to stay engaged through family and volunteer roles. Older individuals in the Philippines were more invested in their family roles as grandparents than in Australia. Overall, the younger and older participants in both cultures agreed that older people are less represented in the media, with the older Filipinos more inclined to report more positive representation of elders in their media than the Australians did. Both younger & older participants in the Philippines felt that faith was very important in the later stages of life whereas both younger & older participants in Australia acknowledged that it was important for some, but not as prevalent in Australian culture. Conclusion : The findings suggest that a collectivist culture may provide a more cohesive frame of reference for the social role of an older person than does an individualist culture. Keywords : Culture, Ageing, Collectivist

OP25 120-S-3 LIVING LONG VS LIVING ADAPTED: THE SITUATION OF POST RETIREMENT ADAPTATION OF ELDERLY IN KERALA, INDIA

Jacob John KATTAKAYAM (*Dept of Sociology, University of Kerala, Centre for Gerontological Studies, India*)

Introduction : The proportion of those above 60 years in Kerala is increasing and is much above the all-India figure of 8.2 percent. Though Kerala has advanced in education, healthcare, mortality, living standard, health, literacy and education, comparable to many developed nations, it is yet to evolve a social welfare strategy sensitive to the predicaments of its aged. The present study captures the situation of social adaptation of the elderly who have retired from active economic life in Kerala. Method : Both qualitative (in-depth interviews and observation) and quantitative (covering 300 elderly at random) data were used. A conceptual framework has been developed for analysis. Results : The post retirement adaptation of the elderly depends on various factors such as position after the retirement, age, gender, educational level, and marital status. Besides, health condition, type of family, income after retirement, length of life after retirement, preparation for retirement, participation in social activities and attitudes towards retirement too have a bearing on their adaptation. The increasing longevity in the state has intensified the problem. High percentage of lifestyle diseases, low mental health status, lack of social security and welfare measures for the elderly are major issues of concern. Conclusion : The elderly have problems of adaptation in their post retirement life, both within and outside their family. The changing social structural and cultural matrix and changed social statuses affect their adaptation. Economic factors are at the root of almost all other adaptation problems. Adaptation problems are visible in different age groups but in varying degrees. Keywords : longevity, retirement, adaptation

OP25 120-S-5 THE GLOBAL AND DIMENSIONAL RATINGS OF SUCCESSFUL AGEING

Xinyi GWEE¹, Shwe Zin NYUNT¹, Ee Heok KUA¹, Dilip V JESTE², Rajeev KUMAR³, Tze Pin NG¹ (*1. Department of Psychological Medicine, National University of Singapore, Singapore; 2. Department of Psychiatry, University of California, San Diego, USA; 3. Academic Unit of Psychological Medicine, Australian National University Medical School, Australia*)

Introduction : Dimension-specific formulations of successful ageing objectively defined by researchers have been criticized for failing to incorporate subjective perspectives of older adults themselves. More older adults tend to rate themselves as 'successful agers' from subjective appraisal, whereas fewer were rated as successful agers when objectively-defined criteria were applied. The objective of this study was to examine the construct validity of a self-rated analogue scale of successful ageing (SA) in an elderly Singaporean population. **Method :** Using a cross-sectional study design, data was collected from 500 community-dwelling Singaporeans aged 65 and over. Self-rated SA on an analogue scale from one to 10 (1=least successful to 10=most successful) was correlated to measures of 5 criterion-based specific dimensions of successful ageing (physical health and function, mental well-being, social engagement, psychological well-being and spirituality/religiosity), as well as outcome measures (life satisfaction and quality of life). **Results :** The constructed validity of a self-rated analogue scale of successful ageing in an elderly Singaporean population was supported. The 5 dimension-specific measures SA accounted for 16.7% of the variance in self-rated SA. Self-rated SA best predicted life satisfaction ($R^2=0.26$) than any of the dimension-specific measures of SA (R^2 range from 0.05 to 0.17). Self-reported SA was also independent of age, gender and medical comorbidity. **Conclusion :** A self-rated successful ageing analogue scale is a more comprehensive and sensitive measure of successful ageing, encompassing the spectrum of underlying dimensions of successful ageing. **Keywords :** successful ageing; self-rated analogue scale

OP25 120-S-6

MEDIATING ROLE OF SOCIAL SUPPORT IN THE RELATIONSHIP BETWEEN ACCULTURATIVE STRESS AND MENTAL PROBLEM AMONG AGED IMMIGRANTS

Jae Eun LEE¹, Jung Hye SUNG², Ji-young LEE³, James PERKINS¹
(1. *RTRN DCC, Jackson State University, USA*; 2. *Epidemiology and Biostatistics, Jackson State University, USA*; 3. *Psychology, University of Pittsburgh, USA*)

Introduction : Despite some evidences of an association of acculturative stress with mental problems, limited attempt has been made to investigate the role of social support in the relationship between acculturative stress and mental problems. Using data of 501 immigrants aged 60+ from the National Latino and Asian Study, this study aimed to determine both the association between mental problem and acculturative stress, and the role of social support in the association of mental problem with acculturative stress. **Method :** Acculturative Stress was defined by the sum of 9 items designed to measure the stress felt as a result of adapting one's own culture with a host culture. Family cohesion (FC) was measured by asking about the extent of agreement for each 15 statements describing emotional support, belongings, loyalty, respect etc. A dichotomized mental problem (no vs. 1 or more) was used for the analysis. Mediating role of social support was determined by the change of statistical significance in the relation between mental problem and acculturative stress within the hierarchical regression models controlling for potential covariates. **Results :** The hierarchical regression analyses demonstrated that mental problem was significantly associated with acculturative stress ($p=0.0477$) but the significant relationship disappeared after controlling for family cohesion and social network ($p=3266$). This pattern persisted only among Latino aged immigrants. **Conclusion :** The findings suggested the acculturative stress was indirectly associated with mental problem through family cohesion and social network. One implication of these findings is that social programs enhancing social support may reduce mental problem among Latino immigrants experiencing high acculturative stress. **Keywords :**

mental problem, acculturative stress, social support, immigrants

THE ASSOCIATION BETWEEN AVERAGE DAILY STEPS AND LIFE-SPACE MOBILITY AMONG OLDER PEOPLE

Li-Tang TSAI, Erja PORTEGIJS, Merja RANTAKOKKO, Anne VILJANEN, Johanna ERONEN, Milla SAAJANAHO, Taina RANTANEN (*Gerontology Research Center and Department of Health Sciences, University of Jyväskylä, Finland*)

Introduction : Life-space mobility refers to the size of the spatial area (bedroom, home, outside home, neighbourhood, town, distant locations) a person purposely moves through in daily life, taking into account the frequency and need of assistance for that travel. We examined the association between average daily steps and life-space mobility among older people. **Method :** The analyses are based on cross-sectional data of 176 community dwelling men and women aged 75-90 who took part in the substudy of Life-Space Mobility in Old Age (LISPE) project in Jyväskylä, Finland. Participants wore an accelerometer (Hookie "AM20 Activity Meter") for 7 days. For this study, the average daily step count was used. Life-space mobility was assessed with Life-Space Assessment (LSA) questionnaire. Composite score was calculated, reflecting distance, frequency and independence of movement. It ranges from 0 to 120 with higher scores indicating larger life-space. **Results :** Men ($n=64$) walked on average 2958 steps (Standard Deviation, SD 3198) and women ($n=112$) 2673 steps (SD 2421) daily. Life-space composite score was significantly higher for men (Mean 78, SD 18) than for women (Mean 67, SD 18, $p<.001$). Spearman correlation analysis showed that average daily steps accounted for about 25% of the variation in Life-Space composite score for women, while among men the corresponding proportion was 7%. **Conclusion :** Women, who walk more, have larger life-space, while the life-space of men may depend more on other modes of transportation. **Keywords :** Life-space mobility, habitual walking

OP25 121-S-2

MINIMISING THE IMPACT OF CHRONIC PAIN IN LATER LIFE: A MIXED METHODS STUDY

Jane RICHARDSON¹, Andrew MOORE¹, Kelvin JORDAN¹, Julius SIM¹, Miriam BERNARD² (1. *Arthritis Research UK Primary Care Centre, Keele University, United Kingdom*; 2. *School of Public Policy and Professional Practice, Keele University, United Kingdom*)

Introduction : Chronic musculoskeletal pain impacts on older people's health and well-being, and is associated with increased use of healthcare and a decline in quality of life. However, many older people with chronic conditions describe themselves as healthy. This research adopted a salutogenic perspective - looking at factors that support health - to examine how older people can be helped to age well with pain, by exploring why some older people remain painfree, others experience interference from pain, and others have pain but no interference. **Method :** A mixed methods study integrated quantitative analysis of a longitudinal survey with semi-structured interviews. Responses to survey questions were used to create three groups: 'No pain', 'Pain with no interference', and 'Pain with interference'. Sixty interviews were carried out, stratified by pain group, age and gender. **Results :** Participants in the 'No pain' and the 'Pain with no interference' groups talked more about the role of social and physical activity, and 'involvement', in comparison to those in the 'Pain with interference' group. Comparison of expected to reported interference

suggested that these factors were important for participants who reported minimal interference from their pain. Conclusion : For older people with pain, social activity, physical activity and involvement are not simply outcomes of living with minimal interference from pain. They are lifestyle factors that contribute to living well and are also factors that give meaning to participants' lives. Through a more nuanced understanding and appreciation of the importance of these dimensions, clinicians can better support older people to live well with musculoskeletal pain. Keywords : chronic pain, salutogenesis, activity

OP25 121-S-3

NATIONAL STUDY OF CHRONIC DISEASE SELF-MANAGEMENT AMONG OLDER ADULTS: SIX-MONTH OUTCOME FINDINGS

Marcia ORY¹, Sangnam AHN², Matthew SMITH³, Luohua JIANG⁴, Kate LORIG⁵, Nancy WHITELAW⁶ (1. Department of Health Promotion & Community Health Sciences, Texas A&M University Health Science Center, School of Rural Public Health, USA; 2. Division of Health Systems Management and Policy, University of Memphis School of Public Health, USA; 3. Department of Health Promotion and Behavior, University of Georgia, School of Public Health, USA; 4. Department of Epidemiology and Biostatistics, Texas A&M University Health Science Center, School of Rural Public Health, USA; 5. Department of Medicine, Stanford University, USA; 6. National Council on Aging, USA)

Introduction : Concomitant with the aging of America, the older adult population is increasingly suffering from one or more chronic illnesses and living with such conditions for longer periods of time. The Chronic Disease Self-Management Program (CDSMP) helps older adults better cope with chronic disease-related symptomatology and improve their lifestyle behaviors and related health outcomes. Nevertheless, the long-term effectiveness of this evidence-based program has not been examined in a large-scale national dissemination. Method : We identified the baseline characteristics of CDSMP participants aged 65 years or older (n=687, mean age=74.8) who were part of a national study associated with a major U.S. initiative sponsored by the Administration on Aging from 2010 to 2012. Assessments were conducted 6 months (n=572) after enrollment in the program. Linear and generalized linear mixed models were performed to assess changes in primary and secondary outcomes, controlling the key socio-demographics and chronic conditions. Results : All primary outcomes (i.e., social/role activities limitation, depression, communication with doctors) significantly improved from baseline to 6-month assessments. Additionally, study participants reported improvements in self-assessed health status, fatigue, pain, shortness of breath, sleep problem, and unhealthy physical days. Conclusion : The current study showed the national delivery of CDSMP improved health outcomes and lifestyle behaviors among older adults. While further studies are warranted to investigate the effectiveness of CDSMP to save healthcare costs, primary care physicians including geriatricians should consider referral to CDSMP to improve patients' health and lifestyle behaviors. Keywords : Chronic Disease Self-Management Programs, Evidence-Based Programs, Lifestyle Behaviors

NUTRITIONAL ASSESSMENT OF ELDERLY INDIAN DIABETICS : A BIOCHEMICAL AND SOCIO-BEHAVIORAL ANALYSIS

Rishi Kumar NIGAM¹, Parul RISHI² (1. Pathology & Clinical Biochemistry, Rajeev Gandhi College, India; 2. Management, NITTR, India)

Introduction : Prevalence of Diabetes mellitus has reached epidemic proportions globally of which developing Countries are likely to bear maximum burnt in 21st century. Along with this, elderly population is also gaining very sizable proportion and is going to increase in future. Aging causes physical, physiological, and psychological changes which leads to changed needs and require constant and regular health supervision and the diabetes, a metabolic disorder in conjunction adds to various health problems. Looking at their specialized nutritional and psychosocial needs, the study of elderly diabetics was done to assess their nutritional status and psychosocial behavior. Method : For a case controlled study, 45 diabetic elderly (age < 60 years) of both the genders was selected from various areas through geriatric health camps held in Bhopal city of India along with control group of 45 non-diabetic elderly. To compare nutritional status and health assessment, mini nutritional assessment chart and anthropometrics measures like BMI, and waist circumference were used. Biochemical parameters like serum protein, cholesterol and HbA1c were assessed and correlated with anthropometric and behavioral measures (Geriatric Depression Scale) in both the groups. Results : Results analyzed in line with Indian lifestyle and dietary habits shows that 77% of diabetic elderly have high waist circumference and 63% are overweight or obese, 82% suffers from hypercholesterolemia quite higher to control group. A positive correlation with HbA1c and depression score (r = -0.988) was found. Conclusion : Elderly Indian diabetics are having central obesity with higher cholesterol levels and are likely to be more prone to depression. Keywords : Elderly Indian, Diabetics, Nutritional status, Behavioral analysis

OP25 121-S-5

DEPRESSION CARE MANAGEMENT PROGRAMME IN PRIMARY CARE SETTING: A PILOT STUDY

Angela Yee Man LEUNG¹, Daniel Wai Sing CHU², Alison YUNG³, Josephine WONG⁴, Andrew C K LAW⁴ (1. School of Nursing, The University of Hong Kong, China; 2. Family Medicine and Primary Health Care, Hong Kong East Cluster, Hospital Authority, China; 3. Continuing Care, St. James' Settlement, China; 4. Department of Psychiatry, The University of Hong Kong, China)

Introduction : Older adults with chronic illness were reported with depressive symptoms but many of them did not receive essential treatment and care. Depression care management programme was piloted in a primary care clinic from March 2010 to October 2010 in Hong Kong. This study reported the effects of this DCM programme on patients' health-related quality of life, mental health and social network. Method : A quasi-experimental design, using SF-12 Health Survey, Depression, Anxiety, Stress Scale (DASS) and Lubben Social Network Scale (C-LSNS). T-test was used to measure the difference between pre-intervention and post-intervention tests. Results : A total of 34 subjects completed the pre-intervention and post-intervention questionnaires. Majority (79.4%) of the subjects was female and mean age (SD) was 63.26 (10.73). 24% had diabetes and 59% had hypertension. Mental health component of SF-12 changed significantly after the intervention (mean difference (m.d.) = 13.42, p < 0.001). Depression was reduced significantly after the intervention (m.d. = -9.59, p < 0.001). Similar pattern occurred in anxiety and stress. Social network was also improved after the intervention (m.d. = 4.06, p < 0.05). Conclusion : DCM programme seemed to improve participants' mental health and social network. Study with larger sample is warranted to show the actual effects of this programme. Keywords : depression, care management, mental health, primary care

OP25 121-S-6

WALKING EXERCISE RCT FOR OLDER KOREAN-

AMERICAN IMMIGRANTS: EFFECTS ON WALKING, DEPRESSIVE SYMPTOMS, STRESS, AND CARDIOVASCULAR BIOMARKERS

Mo-Kyung SIN¹, Brandon IBARRA², Thomas TAE³, Kelly BIETTE⁴, Patrick MURPHY³ (1. *Psychosocial and Community Health, Seattle University, USA*; 2. *Nursing, Harborview Medical Center, USA*; 3. *Nursing, Seattle University, USA*; 4. *Science and Engineering, Seattle University, USA*)

Introduction : Cardiovascular risk factors such as physical inactivity and depression are highly prevalent among older Korean American immigrants (KAIs). Despite well-known benefits of walking to cardiovascular health, no structured walking exercise program has been formally tested in this group. Our pilot RCT assessed the effects of a Walking Exercise Program (WEP) for older KAIs on walking behavior (steps count) via pedometer, self-reported depressive symptoms (CESD-10), stress (serum cortisol) and CVD biomarkers (serum hs-CRP and fibrinogen). **Method :** Seventy older KAIs recruited from a Korean senior center and a Korean church were randomly assigned to a 12-week WEP or usual activity control group in a 3:2 ratio. The WEP included daily pedometer use, buddy system, monthly coffee card, weekly call for goal setting, and physical activity consultation. **Results :** The dominant participants (mean age: 73 (60-87) were female, married and exercising ≥ 3 /wk in the past week. WEP KAIs maintained the CDC recommended exercise guidelines and good mental health status over 12 weeks. There were no significant differences between and within groups in measures at baseline or 12 weeks. **Conclusion :** All KAIs in this study were regular participants of a Korean senior center and a Korean Catholic church (Silver College for seniors) and thus were functionally independent and motivated. Further, social networking among Koreans in the Senior Center and church within a well-established Korean community may have been protective for their mental health. Future studies should incorporate longer-term follow-up, strength exercise, daily step measures in both groups, and recruitment of participants with a broader baseline status range. **Keywords :** depression, serum biomarkers, walking.

OP25 122-S HEALTH PROMOTION IV

OP25 122-S-1 THE POSSIBILITIES FOR ENSURING OVERALL RESIDUAL CAPACITY THE ELDERLY PEOPLE IN THE INFORMATION WORLD

Olena Sergiivna TOMAREVSKA, Oleksandr Anatoliyovych POLIAKOV (*Laboratory of Occupational-Labour Rehabilitation, Institute of Gerontology of Ukraine, Ukraine*)

Introduction : The rapid development information technologies have coincided remarkably with increasing percentage of elderly people. However, these two trends are contradictory to each other. Meanwhile the increasing number of elderly people mainly cannot fully use the advantages information technology. **Method :** The purpose of study was determination the physiological possibilities to ensure overall residual capacity elderly people. We had analyze of physical and mental performance, cognitive and psycho-physiological functions, the parameters physiological and ergonomic possibilities 120 people aged 60 - 89 years. It was established physiological value of functional and reliability performance. The comparison group was young, healthy people under 30 years. **Results :** It was found that people after 60 years, have got the residual working capacity at 47.54% compared to young people. The overall residual capacity was dependent also on the professional labor component 17.04%, social component 15.31%, age-

related diseases 12.74%, physical activity 12.73%, dietary intake and habits 10.53%. The best indicators of the overall residual capacity in people aged after 60 years were identified with the values body mass index above 25 kg/m². The state psycho-physiological and cognitive functions were significant relationship associated with parameters physical activity and external respiration. In people over 60 years found an increasing the time of the visual-motor reaction, which is by 50% more than the people under 30 years and depending from the level of ergonomic equipment. **Conclusion :** The results has being show the feasibility of gerontechnology improvement of working and living conditions in according with the typological characteristics for implementing residual capacity of elderly subjects. **Keywords :** capacity , elderly people

OP25 122-S-2 AGING AND PHYSIOLOGICAL ASPECTS OF THE PEOPLE LABOR ACTIVITY

Oleksandr Anatoliyovych POLIAKOV (*Laboratory of Occupational-Labour Rehabilitation, Institute of Gerontology of Ukraine, Ukraine*)

Introduction : Aging of labor resources an increase in life expectancy after retirement, and biomedical feasibility of manageable labor for elderly have all made the problem of increasing the retirement age rather urgent. The aim of the investigation is dedicated to clarifying of physiological aspects of labor activity in subjects of a different gender and age with the purpose of a theoretical background of rational usage of human professional working capacity. **Method :** We have examined the physical, mental and professional capacity to work, functional age of men and women (994 persons) aged 20-79 years with occupational experience of 5 to 44 years. **Results :** It was found that the age decrease of working performance of the person takes place owing to a cumulative effect of aging of separate elements of functional systems of human organism. Thus the decrease of integrated indexes of professional working capacity has non-linear nature. So, for persons who are engaged of an intellectual labor activity the indexes of physical working capacity are reliably slashed on boundary 40, and psychomotor performance on boundary 50 years. In case of workers (of physical work) psychomotor indexes are degraded after 40 years, and physical working capacity indexes after 50 years. **Conclusion :** The factors limiting capacity for work of the workers of high age are established. In experiment the age differences in dynamics of mental work capacity: namely low speed, low reliability and high fatigability of elderly subjects are detected. The method of application of an estimation of working capacity of the elderly subjects is proposed. **Keywords :** the elderly workers, working activity, evaluation of working capacity

OP25 122-S-3 PREDICTING CANCER LITERACY AMONG KOREAN AMERICAN IMMIGRANTS USING ANDERSEN'S HEALTH BEHAVIOR MODEL

Hee Yun LEE, Jihye PARK (*School of Social Work, University of Minnesota, Twin Cities, USA*)

Introduction : Poor cancer literacy is associated with poor adherence to recommended cancer screening practice and increased hospitalization. Low cancer literacy is specifically observed among immigrant populations with low economic and educational status. However, research investigating what factors are associated with cancer literacy among immigrant populations is sparse. To address this knowledge gap, this study investigates the level of cancer literacy and influential predictors of cancer literacy among Korean immigrants. **Method :** Using a quota sampling strategy, 407 Korean American immigrants

were recruited in the New York metropolitan area. Participants were 202 females and 205 males and age ranged from 50 to 92 (mean=57.2). Stein et al.'s 12-item cancer risk statements were employed to measure cancer literacy and the Anderson's Health Behavior Model guided the study. As for data analyses, ordinary least squares (OLS) regression analyses were used. Results : Cancer literacy level of Korean American immigrants was much lower than that reported in the study of non-Latino whites and other racial/ethnic minorities. The mean score of cancer literacy in the current sample was 3.91 (SD=2.28), indicating that on average, these Korean American participants answered four out of twelve items correctly. The results from the multiple regression models indicated that age, having a primary physician, and education were predictors of cancer literacy among predisposing factors. predictors. Conclusion : It is critical that public health education and community interventions should focus on Korean American immigrants. Furthermore, public health interventions should target particular effort at equipping health professionals to improve cancer literacy among racial/ethnic minorities and immigrants. Keywords : Cancer literacy, Korean immigrants, and health disparity

OP25 122-S-4 FIT AS A FIDDLE: IMPACTS ON HEALTH AND WELLBEING

Bernadette BARTLAM¹, Julius SIM¹, Mo RAY², Nicola SMITH³
(1. Primary Care & Health Sciences, Keele University, United Kingdom; 2. Center for Social Gerontology, Keele University, United Kingdom; 3. Policy & Research, Ecorys UK, United Kingdom)

Introduction : This paper presents findings from the evaluation of the Fit as a Fiddle programme examining the impacts on the health and wellbeing of the older people taking part. It focuses specifically on outcomes around three strands: physical activity, healthy eating and mental wellbeing. It draws on data from a self-completion survey covering a variety of domains, including sociodemographic details, general health and wellbeing, limiting long-standing illness, daily activities and participation in the programme, together with a number of in-depth case studies. Method : The analysis focuses on changes in the survey results between the start and end of involvement in fit as a fiddle ('timepoint 1' and 'timepoint 2', respectively), and during follow-up surveys conducted three months later ('timepoint 3'). A low cut off for significance of $p \leq .01$ was chosen to restrict the probability of Type 1 error. Results : There were 2189 responses to the survey from a sample of 881: 859 responses were at the start of involvement in fit as a fiddle, 816 were at the end, and 514 were responses at least three months after last involvement. Conclusion : Fit as a Fiddle has had clear positive impacts on the physical health and the mental wellbeing of the older people taking part. These improvements span all three of the programme strands and were statistically significant. These findings are particularly important in light of the fact that almost half of the older people taking part reported a limiting long-standing illness, and the majority were living alone. Keywords : Active ageing, participation, health and wellbeing

OP25 122-S-5 SELF-REPORTED HYPOGLYCEMIA AND IMPACT ON QUALITY OF LIFE AMONG OLDER PATIENTS WITH TYPE 2 DIABETES MELLITUS IN COMMUNITY

Weibo LU (Health Training Center, Pudong Institutes for Health Development, China)

Introduction : This study evaluated the rate of self-reported hypoglycemia, level of quality of life, and examined the association of

hypoglycemia and the quality of life. Method : Methods: Totally 203 older type 2 diabetes patients from May 2012 to November 2012 were included in the study. The Diabetes Patients' Quality of Life in China (DSQL) and self-designed questionnaire was used to examine the rate of self-reported hypoglycemia and the quality of life. Results : Results: The rate of self-reported hypoglycemia in the past one year was 22.2% and past one month was 12.8%; the score of DSQL was 41.9±8.6 and the rates of hypoglycemia was closely correlated with patient quality of life. Conclusion : Conclusion: Overall, the quality of life of older patients with type 2 diabetes was in a medium level, there was a correlation between the rates of hypoglycemia and the quality of life. Keywords : hypoglycemia; QOL; diabetes

OP25 122-S-6 PERCEPTIONS OF HEALTH CARE AND CROSS-BORDER MEDICINE AMONG ELDERLY TURKISH MIGRANTS IN DENMARK

Anne Leonora BLAAKILDE¹, Suzan YAZICI², Signe Gronwald PETERSEN³ (1. Center for Healthy Aging, Dept. of Ethnology, University of Copenhagen, Denmark; 2. Gerontology, Akdeniz University, Turkey; 3. Dept. of Ethnology, University of Copenhagen, Center for Healthy Aging, Denmark)

Introduction : Epidemiological studies have shown a large proportion of cross-border health care practises among Turkish migrants living in Denmark, and this has been a cause of worry regarding their compliance to the Danish health care provisions. The Turkish population in Denmark represents more illness than ethnic Danes. The objective of this study is to qualitatively investigate the cross-border use of health care services and medicine used by Turkish migrants living in Denmark. Method : 30 Turkish migrants both sexes aged 54-80 were interviewed in their own homes applying ethnographic methodology. The interviews were conducted primarily in Turkish and simultaneously translated to both English and Danish dependent on the linguistic capacities of the interviewees. Results : The interviewees indicated that while in Turkey they hardly buy medicine prescribed in Denmark, even though it might be cheaper in Turkey. They are aware not to mix medical products or use medical variations, and they seem to be rather authoritative not only towards the Danish doctors, but towards the Western medicalization regime. Conclusion : The qualitative study revealed that the Turkish informants in Denmark are more authoritative towards the Danish (and Western) medicalization regime than expected, which means that they do not mix health care practises, neither regarding health service visits nor medicine consume. In this group, cross-border health care practises do not seem to be a problem concerning compliance to the Danish health care system. Keywords : Migration, Ethnicity, Health Care Practices, Medicine Use

OP25 218-S WORKSHOP ON "BALANCED LIFE PLANNING FOR KOREANS"

OP25 218-S-1 THE LEVEL AND THE EFFECT ON THE INEQUALITY OF THE RETIREMENT PREPAREDNESS

Kyungha PARK (Korea Labor Force Development Institute for the aged, Korea)

The research attempts to explain the inequality of the retirement preparedness. This research focuses on the inequality level of retirement readiness among people and factors influencing retirement readiness. In viewpoint of life course perspective, this study examines

how the factors related to income inequality affects retirement preparedness in Korea. Finally, this study will discuss the necessary alternatives of the life planning policy based on life course perspective.

OP25 218-S-2

THE NEED FOR AGE-SEGMENTED LIFE PLANNING EDUCATION PROGRAMS

Kyoung Young JANG (*Retirement Research Center, Samsung Life Insurance, Korea*)

This presentation examines why age-segmented “life planning” financial education programs are needed in South Korea, the one of the most rapidly aging countries in the world. We will introduce the growing need for life planning education programs, and offer suggestions about how best to develop and deliver an age-specific curriculum. The presentation also includes examples of “life planning” and financial education programs in other countries.

OP25 219-B

AGING IN THE ELDERLY

OP25 219-B-1

AGE RELATED SKIN DETERIORATION, INTERNAL ORGANS AGING AND POSSIBILITY OF AGE REVERSAL

Valery CHUPRIN¹, William Alexander MIHAJLOVIC² (*1. Age Reversal, Aging Away, USA; 2. CS, New York Institute of Technology, USA*)

Introduction : Age associated morphological changes of the skin are an early and apparent manifestation of aging. Our work pays particular attention to the skin-environment interactions and positive or negative influence of such interactions on acceleration or deceleration of the overall aging process. Our work investigates the relationship between the three processes of the organism: i. The progressive observable age caused skin breakdown, ii. The decay of internal organs functional capacity manifested through an array of well documented diseases, and iii. The terminal process of stoppage of all physiological processes known as death. One of the aims of our work is to establish the direct link between the above three phenomena and recommend age reversal human skin treatment. Method : We approach the aging problem by devoting particular attention to the dissipative energy nature of living matter, the substance of human body, the thermodynamics and energy dissipation processes at the body-environment interface skin level. Results : We demonstrate that human organism may build up reinforced capability of self-restoration and rejuvenation. Conclusion : Protecting the integument of the human body and proper maintenance of the same, from the outside an inside, is the essential component of anti aging and aging reversal. Keywords : Anti aging, age reversal, dissipative structure, longevity, skin, entegument, thermodynamics

OP25 219-B-2

THE NUTRITIONAL PROFILE OF OLDER MEN LIVING IN SYDNEY, AUSTRALIA: A PRELIMINARY ANALYSIS OF DATA FROM THE CONCORD HEALTH AND AGEING IN MEN PROJECT (CHAMP)

Rosilene Ventura Ribeiro WAERN¹, Robert G. CUMMING², Vasikaran NAGANATHAN¹, Fiona BLYTH¹, Margaret ALLMAN-FARINELLI³, Jean REID¹, Vasant HIRANI¹ (*1. University of Sydney, Centre for Education and Research on Ageing, Australia; 2. University of Sydney, School of Public Health, Australia; 3. University of Sydney, School of Molecular Sciences, Australia*)

Introduction : Nutrition is important for older adults' health, yet research on the nutritional status of older men is limited. This study aims to describe nutrient intakes and determine whether men aged ≥ 75 participating in the CHAMP cohort study are meeting their dietary requirements. Method : Sociodemographic and nutritional data (detailed diet histories) of 220 men were obtained by interviews. Nutritional analysis was conducted using FoodWorksPro software. Individual nutrients (protein, calcium, iron, zinc, vitamins A, C and D) were compared to Australian Nutrient Reference Values (NRV). Results : Participants' mean age was 81.4 (SD 4.3). Mean energy intake was 9603 KJ (SD 3101), which was distributed as: protein 19.0% (SD 4.1), carbohydrate 37.8% (SD 8.5), total fat 36.8% (SD 9.4) and alcohol 2.7% (SD 4.6), which unlike saturated fat 12.9% (SD 4.0), is in line with the NRV. Nearly all men met the NRVs for iron, vitamin C and zinc (96%, 98%, 68% respectively) but for dietary fibre, vitamin D, vitamin A and calcium only 40%, 2%, 29%, and 23%, respectively met the NRVs. The main food sources for nutrients of importance were: beef (protein, zinc); milk (calcium, vitamin D, vitamin A); breakfast cereals (iron); and vegetables (dietary fibre, vitamin C). Men aged ≥ 85 years showed higher protein, calcium, iron and zinc intakes compared to those aged 75-79. There were no significant associations between country of birth, occupation and education status and any macro- or micronutrients. Conclusion : These preliminary results provide a snapshot of the nutritional status of men aged ≥ 75 years in Australia. Diet-disease relationships will be explored in detail once data collection is complete. Keywords : Nutrition profile, Older men, Nutritional status

OP25 219-B-3

BODY COMPOSITION AND SEX CONTRIBUTE TO INSULIN RESISTANCE IN THE NUAGE COHORT OF ELDERLY PEOPLE

Joane MATTA¹, Nancy MAYO², Isabelle J. DIONNE³, Helene PAYETTE⁴, Pierrette GAUDREAU⁵, Tamas FULOP⁶, Daniel TESSIER⁶, Katherine GRAY-DONALD⁷, Bryna SHATENSTEIN⁸, Jose A. MORAIS⁹ (*1. McGill Nutrition and Food Science Centre, McGill University, Canada; 2. Clinical Epidemiology, McGill University, Canada; 3. Kinesiology, Sherbrooke University, Canada; 4. Nutrition, Sherbrooke University, Canada; 5. Endocrinology, University of Montreal, Canada; 6. Division of Geriatric Medicine, Sherbrooke University, Canada; 7. School of Dietetics and Human Nutrition, McGill University, Canada; 8. Nutrition, University of Montreal, Canada; 9. Geriatric Medicine, McGill University, Canada*)

Introduction : Aging is associated with increased fat and reduced lean masses, mainly muscle. The reduced muscle mass has been implicated in the risk of developing insulin resistance (IR), which is a challenge to ascertain due to the lack of cut-off scores. The objective was to identify subjects with IR over a 3-year period and compare them to controls in regard to body composition and several baseline characteristics. Method : Participants: 649 non-diabetic participants of the Quebec Longitudinal Study on Nutrition and Successful Aging (NuAge) Study with the complete dataset. Muscle mass index (MMI; kg/height in m²) and % body fat were derived from DXA and bio-impedance analysis. IR was estimated based on the HOMA-IR score. Physical activity was assessed by the PASE questionnaire. Protein intakes and sources were obtained from three 24h-food recalls and analyzed with the CANDAT software. Developmental trajectories were used to determine insulin sensitivity status. Logistic regression analyses served to determine baseline predictors. Results : Seven group-based trajectories were identified and good posterior probabilities were obtained for determination of insulin sensitive versus subjects with IR. The logistic regression identified 3

independent significant predictors of IR: MMI= [OR (95% CI): 1.72 (1.26-2.3)]; %body fat [OR (95%CI): 1.18 (1.12-1.25)]; sex [OR for women versus men (95%CI): 0.145 (0.04-0.45)]. Conclusion : Higher muscle mass and % body fat contribute to higher odds of IR with aging, whereas being female decreases this risk. Our determination of IR status remains a probabilistic approach but addresses one of the challenges in determining IR subjects in epidemiological studies. Keywords : Determining insulin resistance; body composition; predictors of insulin resistance

OP25 219-B-4

ACCELEROMETER DETERMINED PHYSICAL ACTIVITY, LEAN MASS, AND LEG STRENGTH IN COMMUNITY-DWELLING OLDER ADULTS

Nabil CHHERAWALA¹, Dawn DORE¹, David SCOTT², Tania WINZENBERG¹, Graeme JONES¹ (1. *Musculo-skeletal, Menzies Research Institute of Tasmania, Australia*; 2. *Musculo-skeletal, University of Melbourne, Australia*)

Introduction : Conflicting associations have been reported for objectively-assessed physical activity (PA) with muscle mass and strength in older adults. We aimed to examine the association between accelerometer-determined PA, lean mass and leg strength in community dwelling older adults. Method : 636 community-dwelling volunteers aged 53 - 84 (mean: 66yr ± 7.1, 49% male) were randomly recruited to participate in this cross-sectional study. Body composition was assessed using dual-energy x-ray absorptiometry. Leg strength was measured by dynamometer. PA was measured using Actigraph GT1M accelerometers worn for 7 consecutive days. Total time was calculated for sedentary, light, moderate, and vigorous PA, using the Freedson equation. Results : Sedentary minutes were negatively associated with lean mass percentage (B=-0.07%, 95% CI -0.1 to -0.03). This association was stronger in men (B= -0.1%, 95%CI -0.2 to -0.05). There was a dose-response positive relationship between activity intensity with lean mass and leg strength, after adjustment for age and sex. For every 10 minute increase in activity, lean mass percentage increased by 0.2% (CI 95% 0.1 to 0.2), 0.7% (CI 95% 0.5 to 0.8), and 1.9% (CI 95% 0.9 to 2.9) for light, moderate, and vigorous intensity, respectively. For every 10 minutes increase in activity, leg strength increased by 0.42kg (CI 95% 0.06 to 0.80), 1.6kg (CI 95% 0.6 to 2.7), and 7.5kg (CI 95% 0.9 to 14.1). Conclusion : Accelerometer-determined PA-intensity is positively associated with lean mass and leg strength in a dose-response fashion suggesting it is intensity and not simply the amount of activity that is important for the prevention of sarcopenia. Keywords : Accelerometer, strength, lean mass

OP25 219-B-5

USE OF SELENIUM AGAINST TOTAL KNEE ARTHROPLASTY SURGERY TO MAINTAIN LOW LEVEL OF FREE RADICALS

Irma RUSLINA¹, Marina MOELIONO², Satomi KAMEO³, Kenji KOBAYASHI³, Kenji SHIRAKURA⁴, Hiroshi KOYAMA³ (1. *Physical Medicine and Rehabilitation Department, Faculty of Medicine, Padjadjaran University, Indonesia*; 2. *Physical Medicine and Rehabilitation Dept, Hasan Sadikin General Hospital, Faculty of Medicine, Padjadjaran University, Indonesia*; 3. *Dept of Public Health, Grad. School of Med., Gunma Univ., Japan*; 4. *Dept of Rehabilitation Medicine, Grad. School of Med., Gunma Univ., Japan*)

Introduction : Selenium is essential trace element, and circulating in the plasma in the form of albumin, selenoprotein P and glutathione peroxidase (GPx). Major surgeries produce reactive oxygen species which induce inflammatory the anti-inflammatory reactions, such as

induction of a series of antioxidant proteins including GPx. Method : Venous blood was taken to measure for total plasma Se concentration, plasma GPx activity and albumin concentration before and at one week after the surgery. Se speciation by using High-Performance Liquid Chromatography paired with Inductively Coupled Plasma-Mass Spectrometry (HPLC/ICP-MS) with DRC (dynamic reaction cell) Mode and western blot analysis. Results : albumin and total plasma Se concentrations significantly decreased, and plasma GPx activity significantly increased. Increasing GPx distribution area in Se speciation and western blot analysis shows higher expression of GPx after surgery. Conclusion : Selenium might be used in acute phase response of Total Knee arthroplasty surgery. It was showed by redistribution of Selenium to GPx form. The source of Selenium could be from albumin, selenoprotein P, or both. Keywords : Selenium, Glutathione peroxidase (GPx), surgery

OP25 219-B-6

EXAMINING THE RELATIONSHIP BETWEEN THERAPEUTIC SELF-CARE AND ADVERSE EVENTS FOR HOME CARE CLIENTS IN CANADA

Winnie SUN, Diane DORAN (*Lawrence S. Bloomberg Faculty of Nursing, University of Toronto, Canada*)

Introduction : In an era of a rapidly increasing number of older people who require home care services, clients must possess or develop self-care ability in order to manage their health safety in their homes. The purpose of this research study is to investigate the relationship between therapeutic self-care and adverse outcomes, and the role of self-care in supporting home care safety. Method : This research study is a retrospective cohort design and utilized secondary data to test the hypotheses about the causal relationship between therapeutic self-care ability, and the frequency and types of adverse events experienced by home care clients using secondary data sources housed at the Institute of Clinical and Evaluative Sciences in Ontario, Canada. Results : Using logistic regression analysis, the relationship between home care clients' therapeutic self-care ability was examined in relation to two types of adverse events: (1) use of health care resources, including emergency room visits and unplanned hospital readmissions; (2) safety outcomes, including client falls; unintended weight loss; urinary tract infection; decline in activities of daily living; new pressure ulcer or ulcer deterioration; compliance/adherence with medication; and decline in caregiver conditions. The study results provided a better understanding of the nature of relationships between therapeutic self-care ability, and the prevalence and incidence of safety outcomes for the older home care clients. Conclusion : This study provides implications to health professionals about the need to focus on improving client self-care functioning, as well as providing evidence for policy formulation related to the importance of home care services in supporting chronic disease management. Keywords : Home care safety

OP25 220-S-1

TASKS PERFORMED BY MIGRANT CARE WORKERS WHEN CARE RECIPIENTS ARE HOSPITALIZED

Esther IECOVICH (*Sociology of Health & Gerontology, Ben Gurion University of the Negev, Israel*)

Introduction : Advanced age is connected with more hospitalizations and bed days. There is an increasing shortage in nursing manpower to meet the intensive and extensive needs of frail older persons in

hospitals. In addition, family members are less available to spend many hours to provide personal care and surveillance to their hospitalized family members. Therefore, there is a growing trend to hire paid care workers who are supposed to perform these tasks. Method : The study was conducted in two general hospitals; one governmental and one non-governmental in Israel and included patients who were hospitalized in internal and geriatric wards. 535 dyads of primary caregivers whose family older patients were hospitalized and their migrant care workers were recruited and were face-to face interviewed. Results : The majority of the patients were disabled women, unmarried who lived alone. Most paid care workers were female Filipinos and most primary caregivers were adult children. A moderate level of congruence was found between the two caregivers with regard to the perceived roles of the care workers in the hospitals. The more there was congruence the more involved were the paid care workers in providing care to the older patients. More involvement was found in the non-governmental hospital and in the geriatric wards. The tasks performed by the paid workers included: personal care, surveillance, companion and cooperation with the nursing staff. Conclusion : Paid care workers are becoming a significant factor in assuring quality of care to frail older people in hospitals. There is need for policies and guidelines with this regard. Keywords : Hospital departments, frails, care provision

OP25 220-S-2

PARADOXICAL IDENTIFICATIONS AND CONTESTED REPRESENTATIONS OF A FAMILY RESPONSIBILITY LAW: THE CASE OF SINGAPORE'S MAINTENANCE OF PARENTS ACT OF 1995

Philip A. ROZARIO, Lorin KAY (*School of Social Work, Adelphi University, USA*)

Introduction : The duty to look after one's parents in their old age stems from the cultural notion that filial responsibility is virtuous. Societal responses to the increasing demands of an aging population are predicated upon a number of factors including the political, economic and cultural contexts of a specific society. Singapore's Maintenance of Parents Act (MPA) stipulates that parents over the age of 60 years who are unable to adequately provide for themselves financially may apply to the Tribunal for an order that their children pay a monthly allowance. Method : In this paper, we consider a number of key issues using paradox as a sensitizing concept to uncover conflicting tensions that are often inherent in development of family responsibility law. Our data comprise parliamentary debates and government reports regarding the enactment of the MPA in Singapore in 1995. Following that, we seek to interrogate five themes that emerged from our codes. Results : In doing so, we address and examine certain underlying assumptions regarding the nature of older parent-adult children relationships, the notion of accountability, and whether family responsibility law can be a safety net. Conclusion : Despite the cultural rhetorics of filial piety, we highlight the political economic underpinnings of the development of family responsibility law in Singapore. Although parliamentarians unanimously agreed that children should be morally responsible for their aging parents, they disagreed on society's role in ensuring the fulfillment of this obligation. Indeed, the moral groundings of filial duties remain incredibly controversial. Keywords : Singapore, paradox, filial responsibility laws

OP25 220-S-3

OLDER ADULTS' SELF-ESTEEM AND PERSON-CENTERED THERAPY: A LONGITUDINAL STUDY WITH FOLLOW-UP

Sofia VON HUMBOLDT, Isabel LEAL (*Research Unit in Psychology*

and Health, R&D, ISPA-Instituto Universitario, Portugal)

Objectives: A higher SE is suggested by a reduced difference between ideal and real self. The present pilot study was designed to investigate if a brief eight-session individual person-centered therapy (PCT) intervention on older adults can promote their self-esteem (SE), as compared with a control group (waiting list). We hypothesized that participants randomized to PCT would report improvements in SE from pre- to post-intervention compared to those not attending PCT sessions. Method: We recruited 81 persons aged between 65-82 years (M=71.9 SD=4.77) and randomized 40 to PCT and 41 to control group. Measures were completed, including demographics and the Self-esteem Scale (SES) at the baseline, post-treatment and at the 12-month follow-up. Results: Findings indicated that individual PCT with older adults may improve their SE. The difference between ideal self and real self, evidenced at follow-up (M=1.251, SD=.524) by the participants who had undergone PCT, was significantly lower (41.3%) in comparison to the baseline score (M=2.131, SD=.799). Significant differences between the intervention group and the control group were found in the post- intervention (F(1) = 34.939, p < 0.01) and follow-up (F(1) = 34.595, p < 0.01). During these three assessments there were no significant differences in the waiting list participants and results revealed no significant between group differences in any socio-demographic variable (P's>.05). Conclusions: Results suggest that PCT is beneficial for improving SE. Clinical practice and program development in health care context may benefit from including PCT for reducing health disparities and for aging well. Keywords : Person-centered therapy, control group, follow-up, older adults, self-esteem.

OP25 220-S-4

ATTENTION FROM VOLUNTEERS AND PROFESSIONAL CARE PROVIDERS FOR LIFE QUESTIONS IN THE ELDERLY

Els Daniella MESSELIS (*Elderly Studies, Tax and Social College - HUB, Belgium*)

Introduction : During group meetings (Spring 2011), volunteers as well as professional care providers reflected on life questions. These meetings were conducted by students of the Training for Senior Consultants (Hogere Leergangen voor Fiscale en Sociale Wetenschappen HUB, Brussel). They used two letters (concerning the topic 'attention' or 'loss of sense') from the book 'Met Ouderen in gesprek over Levensvragen' from the 'Expertisenetwerk Levensvragen en Ouderen'. These meetings were afterwards evaluated by the participants. Method : 25 group meetings, mainly in older people's homes, took place. In total, 174 respondents participated. The participants filled in a self developed, short written questionnaire. The questionnaire has been proven to be reliable and valid. She is consisting of 10 judgments in which they had to give their opinion by means of a 5 point schedule (entirely agree- agree - I don't know - disagree- completely disagree). Results : Some results: 'I find it really important to discuss life questions of the elderly' (95%) 'I feel myself competent to cope with life questions of the elderly' (69%) 'I get sufficient space (65%) and time (53%) from my organization to discuss life questions of the elderly'. Conclusion : Having attention for life questions in the elderly has become important. Sticking points however are: the lack of time and space to do so and feeling insufficiently competent. Education, super- en intervisie could be the solution. Keywords : life questions elderly

OP25 220-S-5

CHANGING CULTURE AFFILIATION AND IDENTITY IN A LONGITUDINAL STUDY OF OLDER NEW ZEALANDERS

Brendan Stewart STEVENSON (*Psychology, Massey University, New Zealand*)

Introduction : The use of ethnicity and culture to divide national populations into sub-groups and comparing outcome measures (particularly socioeconomic status and health) is widespread. The use of ethnicity in this way presupposes ethnic categories that are mutually exclusive, stable, and have differing physical, behavioral or historical characteristics. **Method :** The Health, Work, & Retirement Study and the Independence, Contribution, and Connection Study (comprising four waves of longitudinal data collected in 2006, 2008, 2010, and 2012, with around 1900 individuals present in all four waves) is well placed to examine this issue being nationally representative of older New Zealanders and over-sampling the Maori indigenous population. Using measures of ethnic identity (allowing multiple categories), engagement (MEIM-R), and Maori Cultural Identity, an examination of how individuals moved between ethnic categories and how measures of health, wellbeing and SES were related to participants ethnicity and cultural identity will be undertaken. **Results :** Preliminary findings indicate a small but significant group moving between ethnic groups, and the likelihood of shifting ethnic groups is different for Maori compared to non-Maori. Differences in health, SES, and wellbeing between Maori and non-Maori and between stable and dynamic cultural affiliations will be presented and discussed. **Conclusion :** It is important for researchers and policy makers to understand the dynamics of individual ethnic/cultural affiliation when ascribing measured characteristics to these groups. This work will more clearly highlight how outcome measures are related to a construct as fluid as ethnicity and culture. **Keywords :** Maori Longitudinal Identity Health

THE DISTRIBUTION OF HEALTH LITERACY IN THE SOCIAL NETWORKS OF OLDER PEOPLE

Michelle EDWARDS, Aelwyn WILLIAMS (*Centre for Innovative Ageing, Swansea University, United Kingdom*)

Introduction : Health literacy involves abilities in finding, understanding, appraising and communicating health information in order to engage with the demands of different health contexts. Older people tend to have poorer health literacy and consequently they experience more adverse health outcomes in terms of physical and mental health functioning. Health literacy is part-cognitive skill and part-social skill and can be distributed amongst family, friendship and other social networks. This study aims to explain the 'distributed' nature of health literacy and identify how older people living with a long term condition draw on their social network for support with health literacy related tasks. **Method :** A longitudinal qualitative interview study including 80 participants (aged 65+) with a long-term health condition (diabetes or depression) recruited from a large population study of the health and well-being of older people in Wales, UK (CFAS Wales II). The transcripts and were analysed using the 'Framework' approach. **Results :** The results from phase one interviews explain how older people draw on health literacy mediators within their social network to self-manage their condition and engage with health/social care service support. Differences are identified in levels of social support for health literacy based on different types of social networks. **Conclusion :** Social support is essential for older people to engage with health literacy tasks that promote and manage health. Identifying differences in health literacy support in different

social network types may help in designing and targeting appropriate community level health literacy interventions. **Keywords :** Health literacy, social support, Social networks

OP25 221-S-2
PERSPECTIVES ON HEALTHY AGING AMONG THAI ELDERLY: A QUALITATIVE STUDY

Kattika THANAKWANG (*Institute of Nursing, Suranaree University of Technology, Thailand*)

Introduction : As culture influences individuals' thinking, belief, and behaviors, how people conceptualize healthy aging and its components may differ markedly from one culture to another. Most prior research on healthy aging has typically focused on Western populations; however, there is a lack of consensus and no single well-accepted definition of healthy aging. The purpose of this qualitative study was to provide in-depth understanding of the views of healthy aging among Thai elderly and to explore the ways that contribute to healthy aging. **Method :** Data were collected using focus groups and in-depth interviews in four selected provinces of Thailand. Potential participants were persons aged 60 years and over, dwelling in the community selected. The sample of potential participants was purposively drawn to include the elderly on the basis of a maximum variation approach. A total of 160 healthy elders participated in this study. Data were analyzed using content analysis. **Results :** The results revealed that Thai elderly described being healthy as the result of multiple components involving physical, mental, and social well-being. Healthy aging was viewed as an absence of serious diseases, having functional independence, a positive psycho-emotional outlook, and making a social contribution. The factors considered to contribute to healthy aging included activities promoting physical and psychological health as well as active engagement in social activities. **Conclusion :** Understanding how the elderly define healthy aging and identifying its most important components and factors that contribute to being healthy provides insight into possible policy implications and interventions to promote health and well-being among Thai elderly. **Keywords :** healthy aging, health promotion, elderly perspective, Thailand

OP25 221-S-3
ADJUSTMENT TO AGING: A CROSS-NATIONAL VALIDATION STUDY FOR ADJUSTMENT TO AGING SCALE

Sofia VON HUMBOLDT, Isabel LEAL (*Research Unit in Psychology and Health, R&D, ISPA-Instituto Universitario, Portugal*)

Aims: Adjustment to aging (AtA), is a multifactor adjustment process with implications on quality of life and well-being of aging adults. This study aims to develop and validate a scale to assess the factors that older adults recognized as determinant for their AtA, adding a cross-cultural comparative perspective towards aging well. **Methods:** Measures were completed, including demographics and the proposed original set of 127 items. Complete data was available for 709 older adults aged between 74-102 years (M=82.4 SD=6.45). Factor exploratory and confirmatory factor analyses were run for dimension reduction and for exploring the factorial structure. **Results:** The 33-items AtA 8-factor scale showed overall good psychometric properties (in terms of factorial, convergent, discriminant and criterion validity, as well as reliability and sensitivity). The sampling adequacy was confirmed (KMO=0.789) and the total variance explained by this eight-factor structure was 74.55%. Eight factors resulted from ATAS-33: (a) Accomplishment, creativity and challenges; (b) body and health; (c) stability and comfort; (d) interpersonal attachment and

intimacy; (e) autonomy, mobility and safety; (f) spirituality, existential and personal beliefs; (g) zest and humour; and (h) simplification and relaxation. All factorial weights were statistically significant ($p < .05$). Conclusions: We present a valid and reliable 33-items/eight factor scale for estimation of AtA in a multicultural elderly population. Results emphasize that communication approaches in clinical practice and program development may benefit from clearly understanding AtA as an important component for reducing health disparities and for aging well, across cultures. Keywords : Adjustment to aging, aging well, older adults, validation

OP25 221-S-4

PREVENTIVE BEHAVIOR AND SOCIAL INEQUALITIES IN GERMANY: A COHORT-BASED STUDY OF MIDDLE-AGED PEOPLE

Peter ENSTE, Sebastian MERKEL (*Institute for Work and Technology, Westfaelische Hochschule, Germany*)

Introduction : Several studies show a link between the social status and the state of health. The aim of our research was the question, if this coherence can be transferred to the preventive behavior. Therefore we suggest the hypothesis that social inequalities are mirrored in the individual preventive behavior of middle-aged people. Method : We developed a questionnaire and did a pre-test with 50 respondents. The questionnaire consists of 25 items and two open questions. For six items we used a six-point Likert-scale, for the remaining 19 a two-point scale. We conducted a telephone survey with randomly chosen respondents. Our control-sample size was $n=1.093$. Results : The results show that the preventive behavior can be distinguished in five types differing in the degree of the various measures and activities. The factors income and personal responsibility play a major role and have effects on the preventive measures. Furthermore we proved cohesion between subjective state of health and the preventive behavior. Conclusion : Social inequalities exist in terms of preventive measures and are closely linked a persons' income. Without a doubt it has been proven that physical activities affect the state of health. To dispose inequalities in terms of health, people have to be stimulated to perform activities. Because of the fact that inactive persons often have only few monetary resources available, new target group-specific offers and alternative financing models (e.g. voluntarism) have to be developed. Keywords : Prevention, Social inequalities

OP25 221-S-5

OLDER CANCER PATIENTS' NEEDS OF INFORMATION

Berit Kjaerside NIELSEN¹, Mimi MEHLSSEN¹, Anders Bonde JENSEN², Robert ZACHARIAE¹ (*1. Psychology, Unit for Psychooncology and Health Psychology, Aarhus University Hospital, Aarhus University, Denmark; 2. Oncology Department, Aarhus University Hospital, Denmark*)

Introduction : Quality of physician-patient communication seems to decline with increasing patient-age. Possibly older patients demand less information, but physicians may also pay less attention to older patients' needs for information. Studies have shown that older patients want information, but are less likely to participate in treatment decisions. To prevent older patients from being underserved, knowledge about older patients' preferences for information about treatment and care is needed. The aim was to describe older cancer patients' information needs and satisfaction with information. Method: Participants were 106 older cancer patients (66-91 yrs.). They were compared to 166 younger patients (18-65 yrs.). Participants' completed questionnaires about information-seeking and the EORTC-information questionnaire. Results : Old and young patients did not

differ in wishes for amount of information and decision involvement ($\chi^2=1.15$, ns). Among older patients, 48% were passive information-seekers compared to 33% of the young ($p=0.01$). Fewer older patients had searched for information about their disease, treatment, life style, and psychological issues but they were as interested in rehabilitation, home care or legal questions as young. Among older patients 18% were dissatisfied with amount of information and 20% did not evaluate it helpful. Dissatisfied patients also reported receiving less information about disease, medical tests and treatment ($p < 0.05$) and they tended to be active information-seekers ($p=0.058$). Conclusion : Many older cancer patients may not search for information but they are interested in equal amounts of information as young in areas relevant to their life situation. A potentially dissatisfied subgroup could be active information-seekers who have not received sufficient information. Keywords : Cancer, Information, Agedifferences

OP25 221-S-6

"WE ARE DIFFERENT" CULTURAL LITERACY: CERVICAL CANCER SCREENING AND OLDER WOMEN OF MEXICAN-AMERICAN ANCESTRY LIVING IN THE U.S.

Bertha Eloisa FLORES¹, Lyda AREVALO-FLECHAS², Sara GILL³, Gayle ACTON⁴, Heather BECKER⁴, Sharon BROWN⁴, Michael MACKERT⁵ (*1. Family and community Health, University of Texas Health Science Center San Antonio, USA; 2. St. David's School of Nursing, Texas State University, USA; 3. Family and Community, University of Texas Health Science Center San Antonio, USA; 4. School of Nursing, The University of Texas at Austin, USA; 5. College of Communication, Advertising and Public Relations, The University of Texas at Austin, USA*)

Introduction : Approximately 90 million people in the U.S. lack basic literacy skills, which affect health behaviors and underutilization of preventive care services. Cancer is now the leading cause of death among Hispanics in the U.S. Cervical cancer is a preventable and treatable disease yet few older Hispanic women seek screening and continue to be a high-risk group for cervical cancer with a 50% higher mortality rate than non-Hispanic whites. Method : Thirty women participated in focus group and/or individual interviews conducted in English and/or Spanish. Women 50 years and older were recruited from purposeful convenience. Audio taped, semi-structured interviews were conducted following a moderator guide based on major headings from Zarcadoolas et al. (2005) health literacy model. Transcripts were analyzed using qualitative content analysis and matrices developed. A major theme elucidated under the heading of cultural literacy was: "We are different". Results : All participants reported that Mexican-American core values can be deterrants to cervicla cancer screening. Familismo or family first leaves little time for self-care. Furthermore, cultural literacy was interwoven across all health literacy domains. Conclusion : Hispanics in the U.S. represent 50 million people. Few studies have explored the association between cervical cancer screening and health literacy among older women of Mexican-American ancestry. Hispanic core values of marianismo (Hispanic female characteristics), machismo (Hispanic male characteristics), and familismo (family first) are woven throughout all aspects of health literacy. Culture must be addressed in education efforts aimed at improving cervical cancer screening, decreasing mortality rates and improving quality of life for this population of older women. Keywords : Cultural Literacy, Mexican-American, Cervical Cancer Screening

SARCOPENIA IN RESIDENTIAL AGED CARE: PREVALENCE AND RISK FACTORS

Timothy Robert HENWOOD¹, Justin W1 KEOGH², Hugh SENIOR³, William JORDON² (1. School of Nursing and Midwifery, University of Queensland, Australia; 2. Faculty of Health Sciences and Medicine, Bond University, Australia; 3. Discipline of General Practice, University of Queensland, Australia)

Introduction : The loss of muscle mass and function (muscle strength and/or physical performance) with normal ageing, referred to as sarcopenia, has significant negative health outcomes for older adults. This study will be the first to investigate the prevalence and risk factors to sarcopenia among older Australians residing in residential aged care. Method : This project is underway and data will be finalised for presentation at the June Congress. Two hundred and seventy three older adults residing in residential aged care facilities in Queensland, Australia have been randomised to the study. Facility residents were identified as eligible, or ineligible if with a pacemaker, behavioural problems or medical/other barrier to participation, or if terminal. To inform prevalence of sarcopenia, muscle mass, strength and physical performance will be measured. To inform risk factors to sarcopenia, a number of demographic, functional, clinical and biochemical variables will be collected. Sarcopenia prevalence will be reported overall and within subgroups defined by level of care. Regression modelling will be used to determine sarcopenic risk factors. Results : Of the 709 residents, 328 were deemed ineligible (pacemaker 3%, behavioural 31%, medical/other 58% and terminal 8%) the remaining 381 were randomised to participating or not. Of these 29% are low care, 58% high care and 13% in a secure dementia ward. Conclusion : It is hypothesised all participants will be sarcopenic with the level of sarcopenia increasing in line with the level of care. In addition, it is hypothesised risk factors will include age, physical activity levels, morbidity and time since admission. Keywords : Sarcopenia, Muscle mass, Residential aged care, Frailty

ALTERATION OF SKELETAL MUSCLE VISCOELASTICITY WITH AGING AND CANCER USING ARFI IMAGING. CAPARFI STUDY

Isabelle BOURDEL-MARCHASSON¹, Sophie C REGUEME¹, Nora FRULIO², Florent MAIRE², Jessica DURRIEU¹, Herve TRILLAUD² (1. Geriatrics, CHU Bordeaux, France; 2. Pole d'imagerie Medicale, CHU Bordeaux, France)

Introduction : Exacerbated by cancer and treatments, sarcopenia impairs muscle function is likely impaired. Viscoelastic muscle properties can be quantified by ARFI (Acoustic Radiation Force Impulse) imaging. This study aimed to investigate whether ARFI measurements could be helpful for sarcopenia screening. Method : To evaluate the reproducibility of the ARFI measurements, fifty healthy volunteers, all independent and healthy: 20 young adults (18-30yr) and 30 older adults (≥ 70yr). These volunteers were compared to patients aged 70 and older with cancer undergoing curative treatments (n=3 until now). ARFI measurements consisted in measure the shear wave velocity (m.s-1) on the Rectus Femoris (RF), Tibialis anterior (TA), and Soleus (SOL) muscles in both relaxed and contracted conditions. The contracted condition corresponded to 20-30% of the maximal isometric voluntary contraction. Among additional assessments clinical examination and physical capacities (e.g. Short Physical Performance Battery) were evaluated. Results : Results demonstrate a high reproducibility of shear wave velocity measures in both relaxed and contracted conditions. As compared to young adults, older

volunteers presented lower shear wave velocities in both relaxed and contracted conditions but only for RF muscle (p<.05). This was consistent with the lower maximal voluntary force for RF muscle in healthy older volunteers (p<.025). It is interesting to note that older patients with cancer presented lower ARFI and force values as compared to older volunteers. Conclusion : From these results, ARFI method appears highly reliable within skeletal muscle tissue and may be helpful for sarcopenia screening. Sponsor: University hospital of Bordeaux. Financial support: PHRC 2010, InCA; NCT n°001484821. Keywords : cancer, muscle, echography

OP25 222-C-3

PREVALENCE, SEVERITY AND DETERMINANTS OF FUNCTIONAL LIMITATIONS IN OLDER ADULTS WITH JOINT PAIN AND COMORBIDITY: RESULTS OF A CROSS-SECTIONAL STUDY

Lotte A.H. HERMSEN¹, Stephanie S. LEONE¹, Martin SMALBRUGGE¹, Henriette E VAN DER HORST¹, Joost DEKKER² (1. General Practice and Elderly Care Medicine and the EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 2. Rehabilitation Medicine and the EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands)

Introduction : Older adults with joint pain and comorbidity may be especially at risk of becoming functionally impaired. Therefore, the purpose of this study was to gain more insight into the scope of functional limitations and potentially amenable determinants that negatively influence functioning in this defined group. Method : This cross-sectional study included older adults (≥65) with joint pain and comorbidity (n=407). According to the ICF model, we studied the prevalence and severity of limitations in (i) Physical Functioning (PF), (ii) Activities of Daily Living (ADL), (iii) Instrumental Activities of Daily Living (IADL) and (iv) Participation. Also, potentially amenable determinants (i.e. several physical and psychosocial determinants) were identified in these four measures, by using multivariate regression analyses. Results : Prevalence rates of limitations in PF, ADL, IADL and participation were 66%, 31%, 61% and 64% respectively. Of the physical determinants, frailty was consistently related to all four functional measures, whereas other determinants contributed specifically to poor PF (i.e. pain in spine/lower-extremity, higher BMI), IADL limitations (i.e. higher pain severity, history of falls) and participation restrictions (i.e. pain in spine). The psychosocial determinants were especially related to poor PF (i.e. passive coping, lower self-efficacy, poor general health perception) and participation restrictions (i.e. depression, lower self-efficacy, less social support). More specific relations were found between depression and ADL limitations and passive coping and IADL limitations. Conclusion : Older adults with joint pain and comorbidity reported substantial functional limitations. Despite some variation in related determinants across the functional measures, especially frailty and the psychosocial determinants seemed importantly related to functional limitations. Keywords : Joint pain, comorbidity, functioning, disability, general practice

OP25 222-C-4

A HIGH-PROTEIN DIET, SUPPLIED THROUGH LEAN RED MEAT, COMBINED WITH RESISTANCE TRAINING, ENHANCES MUSCLE MASS AND STRENGTH AND REDUCES INFLAMMATION IN ELDERLY WOMEN

Robin M. DALY¹, Stella O'CONNELL¹, Niamh L. MUNDELL¹, Carley A. GRIMES¹, David W. DUNSTAN², Caryl A. NOWSON¹ (1. School of Exercise and Nutrition Sciences, Deakin University,

Australia; 2. *Physical Activity and Behavioural Epidemiology, Baker IDI Heart and Diabetes Institute, Australia)*

Introduction : Physical inactivity, poor nutrition and low-grade systemic inflammation all contribute to age-related muscle loss, impaired function and disability. In this 4-month RCT, we investigated whether increasing dietary protein could enhance the effects of progressive resistance training (PRT) on muscle mass and function and reduce inflammation in the elderly. **Method :** Women (n=100) aged 60-90 years residing in retirement villages were randomised to: PRT plus red meat or PRT alone (RT). The RT+Meat group were supplied with 220g/d (raw weight) of lean red meat to be consumed 6 days/week, to achieve a protein intake of 1.3 g/kg/d. The RT group received pasta/rice. All women undertook PRT twice weekly and received 1000 IU/d vitamin D3. **Results :** Ninety-one percent completed the study and compliance with the red meat and carbohydrate foods averaged 81% and 100%, respectively. Mean dietary protein intakes were greater in the RT+Meat versus RT group (1.3 vs 1.1 g/kg/d. P<0.01). After 4 months, the RT+Meat group had greater gains in lean mass (net benefit 0.45 kg) and muscle strength (net benefit 14%) (both P<0.05). The RT+Meat also had a 10% greater increase in serum IGF-1 (P<0.05) and a 16% greater reduction in the pro-inflammatory marker IL-6 (P<0.05). **Conclusion :** A dietary protein intake of 1.3 g/kg/d achieved by increasing lean red meat was safe and effective for enhancing the effects of PRT on muscle mass and strength and reducing inflammation in elderly women. These findings indicate that older women require a higher dietary protein intake to maximise the anabolic response to resistance training. **Keywords :** dietary protein, exercise, sarcopenia, inflammation, elderly, randomised controlled trial

OP25 222-C-5

OBJECTIVE ASSESSMENT OF SPASTIC HYPERTONIA IN HAND DEXTERITY USING A NOVEL DIGITAL DEVICE

Sunghoon Ivan LEE¹, Hassan GHASEMZADEH¹, Andrew YEW², Ruth GETACHEW², Jon KIMBALL², Nima GHALEHSARI², Brian H. PAAK², Jordan Hayward GARST³, Mehrdad RAZAGHY², Marie ESPINAL², Daniel C. LU³, Majid SARRAFZADEH¹ (1. *Computer Science Department, UCLA, USA*; 2. *Department of Neurosurgery, UCLA, USA*; 3. *Department of Neurosurgery and Department of Orthopedic Surgery, UCLA, USA*)

Introduction : Spastic hypertonia (SH) is a motor disorder characterized by exaggerated tendon jerk reflexes, and is a common symptom associated with spinal cord injuries. Current assessment methods for SH rely on subjective examination. We utilize an inexpensive and lightweight handgrip device, previously designed by the authors, to objectively quantify SH in patients with cervical spondylotic myelopathy. We aim to verify that (i) the introduced handgrip can accurately assess the degree of SH, and that (ii) the assessment correlates to changes in motor function following surgical decompression. **Method :** This is a pilot study with 10 patients (mean age 58.2 ± 13.5). Patients were tasked to adjust their handgrip force to trace a sinusoidal target curve. The test was performed preoperatively and postoperatively following surgical decompression. Spastic reflexes were investigated when patients increase their grip strength. First, the signals were examined for SH using a machine learning algorithm. If SH is noted, a dynamic time warping was performed to further analyze the signals. The results were compared against patient's reported Oswestry Disability Index (ODI), a validated functional questionnaire. **Results :** The mean accuracy of detecting the appearance of SH was 99.56%. Among many parameters generated by the analysis, the velocity of muscle recovery from a spastic motor movement showed a

strong linear correlation to the patient's postoperative ODI (p-value = 0.029). **Conclusion :** Our preliminary results show that the handgrip can accurately quantify the level of SH. Such knowledge may be useful in an outpatient setting to assess the need for surgical intervention and evaluate postoperative results. **Keywords :** Spastic hypertonia, Handgrip device, Cervical Spondylotic Myelopathy

OP25 222-C-6

FALL REDUCTION IN AN ACE UNIT - A MODEL FOR QUALITY IMPROVEMENT

Theodore T. SUH (*Family & Community Medicine, UT Health Science Center in San Antonio, USA*)

Introduction : Falls are a common problem in hospitalized older adults, with one-third of hospital falls resulting in injuries such as fractures, head/ soft tissue trauma, increased comorbidity, loss of independence and greater hospital costs. Risk factors for falls in the hospital include gait instability, confusion, urinary incontinence/ frequency, previous falls and use of certain medications. **Method :** At the beginning of this study, the 10-bed ACE Unit at Christus Santa Rosa Hospital-City Centre in San Antonio had the highest fall rate in the hospital at just over 10/ 1000 bed days. The ACE Team goal was to lower the fall rate using a multi-component intervention, consisting of differentiating very high from high fall risk patients, hourly rounding and mobile computer terminals for nurses, mandatory use of bed alarms for very high fall risk patients and a free lunch incentive for ACE Unit nurses at the end of a month without falls. **Results :** This intervention began on March 1, 2011. For over 4 consecutive months (March-June), there were no falls in the ACE Unit. After a few falls in the last few months of 2011, there was a 6 month stretch where there were no falls in the ACE Unit. The estimated cost to implement this change was \$850, plus \$100 monthly to maintain it. Projected savings from each prevented fall were \$12,800, with total annual cost savings >\$300,000. **Conclusion :** Differentiating those at highest risk for falls is essential. There are potentially large cost savings to hospitals from the prevention of falls and resulting injuries. **Keywords :** falls, ACE Unit, multi-component intervention, cost savings

SEARCH FILTERS: FACILITATING ACCESS TO THE EVIDENCE

Jennifer TIEMAN¹, Raechel DAMARELL², Sarah HAYMAN¹ (1. *Palliative and Supportive Services, Flinders University, Australia*; 2. *Flinders Filters, Flinders University, Australia*)

Introduction : Ensuring the use of what is known to be effective in practice remains a challenging problem for health and social systems. A fundamental pre-requisite to the use of evidence in gerontology and geriatrics is the ability to find the relevant literature. However, individuals are challenged by the complexities of bibliographic databases and of search formulation. Search filters represent an innovative solution to the problem of literature retrieval by enabling brokered access to the underlying evidence base for rapid utilisation. A search filter is an experimentally developed search strategy with a known retrieval effectiveness. **Method :** The methodology for search filter construction comprises four phases: 1. Selection and construction of a gold standard set of references of known relevance to the topic of interest 2. Term identification 3. Filter development through individual and combined term testing, and 4. Filter translation and validation for open use in PubMed. **Results :** A palliative care search filter and a

residential aged care search filter have been developed and the findings published. The development of a dementia search filter is currently in process. PubMed translations for the palliative care and aged care search filters mean that automated searches for this literature can be run through the CareSearch website at www.caresearch.com.au. Conclusion : Specialist search filters that automatically retrieve relevant literature for a number of core gerontology issues including palliative care, residential aged care and dementia are available. Clinicians, researchers and academics can utilize these search filters to access the underlying evidence base. Keywords : search filters; evidence based practice; knowledge translation

GUIDELINES FOR THE IMPLEMENTATION OF ASSISTIVE TECHNOLOGIES FOR AUTONOMY

Juliette SABLIER¹, Lionel BEN-AHMED¹, Bertrand BOUDIN¹, Catherine BRIAND², Filippo FABRI³, Nicolas FRANCK⁴, Sylvain GIROUX⁵, Mark HEPWORTH⁶, Wendy OLPHERT⁶, Helene PIGOT⁵, Emmanuel STIP⁷, Vincent RIALLE¹ (*1. AGIM Laboratory, University Joseph Fourier, France; 2. Psychiatry, Center for Studies on rehabilitation, recovery and social inclusion (CERRIS) Fernand Seguin Research Center Mental Health Institute University of Montreal, Canada; 3. Fondamental Electronics Institute, University of Paris Orsay, France; 4. Psychiatry, Psychiatric Hospital 'Le Vinatier' University of Lyon, France; 5. Computer Science, DOMUS Laboratory Science Faculty of University of Sherbrooke, Canada; 6. Information Science, Loughborough University, United Kingdom; 7. Psychiatry, Fernand Seguin Research Center Mental Health Institute University of Montreal, Canada*)

Introduction : Most of studies about the implementation of New Technology of Information and Communication (NTIC) for autonomy leads to conclusion that human support is a core feature of acceptance. Nevertheless, this recommendation is not widely followed by emerging projects involving elderly, nor people with cognitive disabilities. No clear nor easy-to-implement guidelines have been proposed yet. Method : We compared the results of five international studies (HOST, ESTIMA, BEA, ReadApps, Mobus-DoPill) involving elderly and patients with dementia and schizophrenia and caregivers. Devices tested were as various as GPS-based tracking system, daily activities manager, smart pills dispenser, social network, implemented in smartphones or tactile tablets. All participants share comparable characteristics regarding acceptance of NTIC as they are not the customers targeted by the designers of these devices. Furthermore, schizophrenia and dementia groups share comparable cognitive disabilities regarding executive functioning impacting their autonomy. Results : Despite the differences between the participants and the materials of these studies, all lead to the conclusion that NTIC are unusable if strong follow-up is not provided to help the persons to take advantage of the device. Conclusion : Framed by seven basic principles, including reliability and collaboration with a caregiver, eight stages are proposed, from defining needs by co-design process, to reinforcements of acquired skills. These guidelines should be replicated in order to be enhanced and validated. This will be tested in HOST-phase 2. In accordance with ethical principles, these guidelines should help to make NTIC more accessible to people segregated because of particular -better than impaired- cognitive skills. Keywords: Cognitive disabilities, New Technology for Information and Communication, Assistive Technology for Autonomy

OP25 225-R-3

AN EXPLORATORY STUDY ON THE CHARACTERISTICS OF THE ELDERLY INTERNET ADDICTION

Jeonghyeun KO (*Digital Inclusion Policy Division, National Information Society Agency, Korea*)

Introduction : As more seniors use the internet, so the issue of the internet addiction among seniors will be surfacing shortly, even though it is not yet. Elderly people could be more drawn to the internet and more vulnerable to internet addiction because of their physical, mental, financial, social conditions. But there are rarely studies on this issue so far. So this study is aimed at investigating the characteristics of the elderly people's internet addiction and helping them not be addicted to the internet and make good use of it as their leisure activities. Method : The researcher used Korea Internet Addiction Proneness Scale for Adults(KS-A) which was developed by National Information Society Agency. Data for this study were obtained by senior internet users who learn and teach how to use the internet in the senior community centers by way of online survey. Results : The results of this study are as following: First, the internet addiction rate in the elderly is 7.7%, which is same as overall Korean internet addiction rate in 2011. Second, low income, single and couple elderly households are more prone to the internet addiction. Third, seniors who feel more satisfaction in relationship with family and others and less stress and loneliness are less vulnerable to internet addiction. Conclusion : The researcher is able to confirm that the elderly could be as addicted to the internet as the young and they have plausible conditions vulnerable to the internet addiction. So it is required we pay new attention to senior internet addiction problem in advance. Keywords : senior internet addiction

OP25 225-R-4

STRATEGIES OF INDIVIDUAL PENSION INSURANCE BEHAVIOR: THE CASE OF RUSSIA

Yulia LEZHNINA (*Department of Applied Economics, National Research University Higher School of Economics, Russia*)

Introduction : Over the last decade the Russian pension system has undergone significant changes, including the transition from the distribution principles (PAYG) to the mixed ones (PAYG notional account with fully funded pillar). This transition requires not only adjustment of pension insurance institutions that is implemented by the state, but also population adapting to the new conditions. Its success depends on the willingness of the population and business to play by the newly created 'rules of the game': to save, create corporate funds, etc. In these circumstances it is important to understand what resources are expected to be available after reaching the retirement age by today's working age Russians. Method : Content of the report is based on the results of the empirical analysis carried out on representative survey "Russian Longitudinal Monitoring Survey, RLMS (2010 and 2011). Results : Despite the fundamental change in the institutional environment almost all Russians (89%) continue to rely on state pensions and employment (69%). So they do not plan to adjust their individual strategies to the new reality (they plan to behave as current retirees and response to problem areas in case of need). Not more than a third part of Russians addresses to 'insurance' instruments in the form of savings, private pension schemes, corporate foundations. Traditional mechanisms such as children's support (15%) and auxiliary facilities (17%) do not become an obsolete arrangement. Conclusion : In this case, the strategies of the population can be classified and underlie the evaluation of state social policies implementation, as it is shown in the report. Keywords : pension insurance behavior

OP25 225-R-5

R&D POLICY OF THE KOREAN GOVERNMENT FOR THE

AGEING SOCIETY

Jiyoung SUH (*Policy for the Public Research, Science & Technology Policy Institute, Korea*)

Introduction : Korean Government established “The 2nd Plan for Ageing Society and Population 2011-2015” at 2010. It pursues the paradigm change in political direction. While the former has stressed on the QoL of the ‘Senior’ and support the disadvantaged class, the later on the QoL of Ageing ‘Society’ and enhance the social sustainability. Although the extension of the political spectrum from the individual senior to the social structure, the interest of the Science and Technology Policy stays at the level of the R&D for the devices for the seniors, which contribute to compensate their physical and mental vulnerability. This research reviews the R&D activities of the Korean Government, which accomplish under the aim of preparing of the Ageing Society, and examine whether it reflects the paradigm change of the national policy. **Method :** The relevant R&D projects for the Ageing Society in the period 2004~2011, financially supported by Korean Government, were analyzed. The search engine of the National Science & Technology Information System was used as a search tool. **Results :** Its representative research projects are the diagnosis and control of the senile diseases. The projects are oriented towards the expansion of the accessibility through the using the assistive technology. On the other hand the macroscopic design for the new society construction is very limited, for example the work conditions or traffic system. **Conclusion :** The S&T policy should extend the R&D spectrum from the improvement the physical capability of the seniors to the building the future society. **Keywords :** Ageing Society, S&T Policy, R&D

WORKSHOP: CRITICAL EVALUATION AND OFFICE MANAGEMENT OF AGING FOOT AND RELATED MUSCULOSKELETAL DISORDERS

OP25 227-C-1

ANATOMICAL AND BIOMECHANICAL CHANGES ASSOCIATED WITH AGING AND THEIR CONTRIBUTION TO FOOT PAIN

Mooyeon OH-PARK (*Physical Medicine & Rehabilitation, Kessler Foundation, USA*)

Introduction : Foot pain is highly prevalent among the elderly and is associated with disability in instrumental activities of daily living undermining the independence of the population. Older individuals have multiple co-existing pathologies and identifying the causal pathologies responsible for the patient’s pain is a challenging task. **Method :** Considering the basic principle of foot pain that the location of pathology coincides with the location of the pain and tenderness, detailed knowledge of anatomy and its change with aging is prerequisite to make an accurate diagnosis. **Results :** Biomechanical deficit often serves as an exacerbating factor for foot pain. Developing an ability to recognize potential abnormal biomechanics will allow clinicians to address the fundamental issues of foot pain in older adults with satisfactory outcomes. With aging, number of structural and functional changes of foot occur; widening of forefoot relative to hindfoot, atrophy of plantar heel and metatarsal fat pad, toe deformities from intrinsic foot muscle weakness, and inflexible heel cord. **Conclusion :** This session intends to discuss 1) how each of the above mentioned changes contributes to painful conditions of the foot in older adults, and to attain and 2) abnormal biomechanics that can exacerbate the foot pain. **Keywords :** Rehabilitation, foot pain, biomechanics

OP25 227-C-2

FOOTWEAR AND FOOT ORTHOSIS IN AGING FOOT

Heui Je BANG (*Physical Medicine and Rehabilitation, Medical College, Chungbuk National University, Korea*)

Footwear and foot orthosis are widely utilized as non operative management for foot pain in elderly. However, there are limited practice guidelines for the footwear and the foot orthosis for aging population. This workshop intends to provide the helpful tip to choose the proper footwear and understand the designs of the foot orthosis specific to foot pathologies in the elderly. Foot pain is commonly associated with and often aggravated by faulty footwear. The design of the outsole is often attributed to the forefoot pain and can affect the balance in elderly. Understanding basic principles of orthotics increase the compliance and decrease the failure of the orthosis in this population. The temporary orthosis can be tried in office prior to prescribe the definitive one. The basic biomechanics of different types of foot and foot ankle orthosis will be reviewed for the specific foot disorder during this session. The participants will practice in office tryout, recognize the common pitfalls related to the foot orthosis and learn trouble shooting with case examples. **Keywords :** Aging Foot

OP25 227-C-3

FOCUSED HISTORY AND SYSTEMATIC APPROACH TO PHYSICAL EXAMINATION FOR FOOT PAIN IN THE ELDERLY

Jungsoo LEE (*Department of Rehabilitation Medicine, Uijeonbu St. Mary's Hospital, The Catholic University of Korea, Korea*)

Multiple foot pathologies may coexist in many older adults. Therefore, they may complain of the constellation of symptoms and signs. It imposes a diagnostic challenge to the clinicians teasing out the condition responsible for foot pain. Therefore, history and physical examination are even more emphasized than the imaging studies, which need to be interpreted carefully in relevance to history of the patients. The characteristics and nature of the pain can allude to the etiologies of foot pain, such as neuropathic versus musculoskeletal causes. Association with the footwear or previous orthosis should be always explored not just to identify the pathologies but to manage it successfully by changing the footwear or modifying the foot orthosis. Systemic approach to physical examination includes inspection (foot posture, the callus pattern and footwear etc.), palpation on the different anatomic landmark by region, neurovascular examination (including tapping the peripheral nerve for local pathology), range of motion of the different joints (including ankle and subtalar joints), and trying temporary insoles in shoe for diagnostic purpose. In this session, the participants will practice systematic physical examination, in association with the knowledge of focused history taking and biomechanical characteristics of aging foot, for foot pain in aging population. **Keywords :** foot pain

OP25 227-C-4

CRITICAL EVALUATION AND OFFICE MANAGEMENT OF AGING FOOT AND RELATED MUSCULOSKELETAL DISORDERS

Mooyeon OH-PARK¹, Heui Je BANG², Jung Soo LEE³, Se Won LEE⁴
(1. *Department of Physical Medicine and Rehabilitation, Kessler Institute of Rehabilitation/Kessler Foundation Research, USA*; 2. *Department of Physical Medicine and Rehabilitation, Medical College, Chungbuk National University, Korea*; 3. *Department of Physical Medicine and Rehabilitation, Medical College, Catholic University of Korea, Korea*; 4. *Physical Medicine and Rehabilitation, Montefiore Medical Center/Albert Einstein College of Medicine, USA*)

Introduction : Foot pain is highly prevalent among the elderly and is associated with disability in instrumental activities of daily living, which undermines the population's independence in the community. It has been reported that the elderly often demonstrate multiple foot disorders, all of which may or may not be associated with pain. In order to successfully treat foot pain, it is crucial for practitioners to accurately identify the precise pathologies accountable for the pain. This diagnostic process requires an understanding of how age-related anatomic and biomechanical changes contribute to foot pain, skills in physical examination, and knowledge of the interaction between footwear/foot orthosis and the aging foot. As a non-operative treatment, foot orthosis (FO) and footwear has been widely utilized for foot pain in elderly. However, there have been limited practice guidelines helpful for clinicians' decision-making with regard to type (customized versus prefabricated), materials, and designs for FO and footwear specific to foot pathologies in the elderly. This workshop intends to provide an educational opportunity to attain knowledge of age related changes in the foot, to refine diagnostic skills for foot pain, and to improve knowledge of orthotic/pedorthic management specific to this population. **Conclusion :** This workshop will be a hands-on small group session supervised by workshop faculty where participants will practice physical examination skills, evaluate unsuccessful orthoses (using samples of 'failed' orthoses), and apply simple, in-office accessible orthotic/pedorthic modifications. **Keywords :** aging foot, pain, orthoses

INTERNET & COMPUTER UTILIZATION

OP25 320-S-1

THE USE OF THE THEORY OF PLANNED BEHAVIOR TO STUDY THE FACTORS AFFECTING THE INTENTIONS OF USING THE INTERNET BY ELDERLY PEOPLE

Lili XIE (*The School of Sociology and Population Studies, Renmin University of China, China*)

Introduction : I hope to explore factors that affect the elderly's use of the internet from attitudes, subjective norm and perceived behavioral control, through framework of the theory of planned behavior. By doing so, I want to know more about the problems of older adults' using of the internet, and give some suggestion based on the discoveries. **Method :** I choose 10 older adults as main study object and 10 for supplementary information, and use case interview, participative observation and internet research to collect information of attitudes, subjective norms, perceived behavioral control and difficulties in using internet. This study investigates the process of changing of intention, focusing on what has directed their changing mind. **Results :** As the study suggests, older adults' intention to use the internet is influenced by attitudes, subjective norms and perceived behavioral control, however, at different degrees owing to unique personality, past experience and environment. Attitude towards using the internet is influenced by perceived ease of learning, perceived usefulness, trust and fear of the internet; subjective norms mainly comes from children, grandchildren and peer groups; perceived behavioral control results from self-efficacy, perceived controllability, past experience, social support and internet design. **Conclusion :** In the study, I discover that if children, institutions and living community provide the related hardware and technology support, older adults are able to be trained to use computer and enjoy surfing the internet. Net forum is a good place to cultivate the interest, and it's a new source of social support. **Keywords :** the theory of planned behavior ; internet using ; influences; elderly

OP25 320-S-2

INTERGENERATIONAL POTENTIAL FOR INCREASING E-LITERACY OF THE POPULATION 50 + IN SLOVENIA

Ksenija RAMOVŠ¹, Joze RAMOVŠ², Mateja ZABUKOVEC², Maja RANT² (*1. Social Gerontology, Anton Trstenjak Institute of Gerontology, Slovenia; 2. Social Gerontology, Anton Trstenjak Institute for Gerontology and Intergenerational Relations, Slovenia*)

Introduction : Slovenia is by the use of internet in EU and globally in the best fourth, by e-literacy of people over 50 years lags far behind: 72 % of people does not use computer. With the transition to e-commerce (banking, government, etc.) there is a risk that more than quarter of total population will be deprived from active participation due to ICT illiteracy. In the national survey of needs, abilities and attitudes of the population 50 +, was found that 20% wished to learn how to use ICT. Others should still be motivated and the most effective example is when knowing somebody, who successfully became ICT literate. **Method :** Based on these facts and on own 20-year experience with introducing of intergenerational volunteering, at national gerontological Institute we developed an effective model of mass ICT literacy, by the principle that an adolescent, from 15 to 18, in organized way become companion with an older person when learning the use of computer. For successfully intergenerational knowing, socializing and communicating, a short training course (three two-hour) for participants of young and older generations is provided. Companionship couples are monitored by the programme supervisor in a remote way. **Results :** The model was developed using the method of action research and has proven to be quite realistic and effective: students in one year successfully taught the older 'students' the use of computer, internet and e-mail. **Conclusion :** At the end for students and the elderly the best gain is the knowledge about the distant generation positively and successful intergenerational communication. **Keywords:** intergenerational potential, e-literacy

OP25 320-S-3

"I DO NOT USE, DO NOT TRUST INTERNET" MEDIA LITERACY: CERVICAL CANCER SCREENING AND OLDER WOMEN OF MEXICAN-AMERICAN ANCESTRY

Bertha Eloisa FLORES¹, Gayle ACTON², Lyda AREVALO-FLECHAS², Sara GILL³, Heather BECKER², Sharon BROWN², Michael MACKERT⁴ (*1. Family and community Health, University of Texas Health Science Center San Antonio, USA; 2. School of Nursing, The University of Texas at Austin, USA; 3. School of Nursing, University of Texas Health Science Center San Antonio, USA; 4. College of Communication, Advertising and Public Relations, The University of Texas at Austin, USA*)

Introduction : People in the U.S. lack basic literacy skills, including navigating the Internet. Cancer is now the leading cause of death among Hispanics. Cervical cancer is a preventable disease through screening yet few older Hispanic women seek screening and continue to be a high-risk group for cervical cancer with a 50% higher mortality rate than non-Hispanic whites. **Method :** Thirty women participated in focus group and/or individual interviews conducted in English and/or Spanish. During discussion, participants were presented two internet brochures. Women 50 years and older were recruited from purposeful convenience. Audio taped, semi-structured interviews were conducted following a moderator guide based on major headings from Zarcadoolas et al. (2005) health literacy model. Transcripts were analyzed using qualitative content analysis and matrices developed. A major theme elucidated under the heading of media literacy was: learning from Internet brochures. **Results :** Women in the study did not use the Internet. Participants reported that they did not [trust or like the

Internet]. Participants were not willing to learn how use the computer. Women reported preference for platicas or small group discussion. Conclusion : Current research reports that 53% of older Americans use the Internet (Pew Report, 2010). These research findings differ from the present research in which none of the participants used the Internet to obtain information. Best practices to reach all populations may include a variety of strategies, which are culturally and linguistically congruent. The Internet does not fit all. Keywords : Media Literacy, Internet, Mexican-American

OP25 320-S-4

IMPACTS OF TECHNOLOGICAL CHANGES, FROM 1980 TO 1990, ON AN ELDERLY GROUP OF JOURNALISTS IN BRAZIL

Maria Ligia PAGENOTTO¹, Sonia Amps FUENTES², Flaminia LUDOVICI¹, Ilza Maria T. De Almeida FERRAZ¹, Elisabeth F. MERCADANTE¹ (1. Gerontology, Pontificia Universidade Catolica de Sao Paulo, Brazil; 2. Psicologia Clinica, Pontificia Universidade Catolica de Sao Paulo, Brazil)

Introduction : With the availability and expansion of computer use in the 80's, journalists from the typing era were required to start using computers. This obliged them to learn new skills, and to work with programs of increasing complexity, with multiple images and sounds to better capture data. Method : This study investigates the impacts that these technological advances had on journalists from this period, that now are sixty years and older. To address this, six elderly journalists were interviewed with semi structured surveys. Results : Respondents indicated that they feel excluded from current editorial activities as they are stereotyped as old; however they can immerse themselves in journalism as free lancers. Regardless, respondents recognize the benefits of online journalism, especially when they are aware of the latest software and navigational tools, which favors immediate contact with peers. Conclusion : Technological advances have changed the way journalism is conducted, requiring new skills and abilities, where one needs to be up to date on new technologies for faster processing of data and materials online, which requires effective production and efficient analysis and communication. Articulation of these results will provide important insights for professional to happily age in a professional environment. Keywords : technological impacts, elderly group journalists

DIGITALIZED LIFE AND HEALTHY AGING: CONFLICTS AND CHALLENGES IN DEVELOPING WORLD PERSPECTIVE

Dilek ASLAN (Public Health, Hacettepe University, Faculty of Medicine and Turkish Geriatrics Society, Turkey)

Introduction : Demographic change globally has many health/disease outcomes which countries should overcome for a healthy community. As expected, disease prevention and health promotion facilities will play crucial role in maintaining well being of the individuals including elderly people from birth to death. However, the precautions vary between countries by their economic and social development status. Not only in developed countries, but in transition countries population aging has been a significant case since decades as well. The needs of trained personnel at all level include all those who work with older persons namely: health professionals, formal care givers, volunteers, family members as well as the older persons themselves. This need has been highlighted both in the Vienna and the Madrid International Plans of Action on Ageing. This presentation aims to evaluate the concept of "Digitalized Life and Healthy Aging" with Conflicts and Challenges in

Developing World Perspective. Method : Scientific databases were reviewed in the aim of the presentation. Results : The main headings will be "Health and digitalization: where do they cross over?", Conflicts and challenges; does globalization have influences?" and also "Recommended solutions for healthy aging" to review and analyze some national and international attempts. Various aspects of digitalization including research needs from the elderly perspective will be discussed in this regard. Conclusion : Digitalization should be used to improve elderly health. Scientific research is needed for this category for future work. Keywords : Aged, Digitalization, Global Health

OP25 320-S-6

WEB BASED QUALITY IMPROVEMENT SYSTEM DEVELOPMENT OF HOME HEALTH CARE FOR THE OLDER ADULTS

Hyun-sook CHANG (Department of Elderly Welfare, NAMSEOUL UNIVERSITY, Korea)

Introduction : In 2008 new introduced Korea public long-term care insurance system. New qualification system of long-term care workers about 1 million. There was not computerized management system so more than 16,000 home based long-term care institutions' caregivers are having note down their service record. Method : 1. Research equipments as server and accessory and DB management s/w by Internet Data Center placed on outsourcing, terminal units (small notebook personal computers) with wireless Internet for home care workers to input data, education equipment as portable beam projector and movie camera, personal computers built up completion 2. Construction and operation of server and clients network as homepage(www.qlongtermcare.or.kr) , System module development of homecare beneficiary services and safety management for the elderly (fall down prevention, safely bathing etc.) 3. Based on internet server-client network, input service data into up-load representative modules via terminal units by homecare workers. Results : Research on actual condition survey for homecare needed the elderly(302 elderly people nationwide), Average age 80.3 years, Female elderly 76.5%, illiteracy 24.5%, Care level: Grade I(severe case): 6.0%, Grade II: 8.3%, Grade III: 76.2%, Cognitive level: decision making<defects of short term memory<forget date, ADL function level: bathing<out of the room<dressing<meal assistance2. Research on actual condition survey for homecare workers' field education needs level (169 homecare workers nationwide): Access Internet 57%, Average age 52years, Female workers 98%. Conclusion : Web based quality management system for the beneficiary older adults could be effective management system at the home based long-term care institutions in Korea. Keywords : Web Based quality improvement system, Older adults, Home health care

A STUDY ON POSITIVE AND NEGATIVE FACTORS FOR ADOPTING OUTDOOR RECREATIONAL SPORTS ACTIVITY OF THE MIDDLE-AGED AND OLDER ADULTS

Yuki MATSUMURA¹, Makoto CHOGAHARA², Megumi TANI¹, Kei HIKOJI³, Daichi SONODA¹ (1. Graduate School of Human Development, Kobe University, Japan; 2. Faculty of Human Development, Kobe University, Japan; 3. Faculty of Education, Wakayama University, Japan)

Introduction : In recent years, outdoor recreational sports (ORS)

activities have occupied an important position in sports at home and abroad. And, the percentage rate of action of intention in ORS activity was high. However, the percentage rate of action in ORS activity was only 4%. The rate was lower than other sports. It's necessary to clarify the factor to enable ORS activity. The purpose of this study was to explore positive and negative factors for applicants for adopting ORS activity of the middle-aged and older adults. Method : A questionnaire survey was conducted in 2009 on 1,316 middle-aged and older adults who were chosen by random sampling in Japan. The number of respondents who intended to play ORS was 266 (marine sports, 40. Outdoor sports, 204. Winter sports, 22.). Then, in the series of phrase extraction and themes analysis, the 266 linguistic data were categorized into 24 categories on positive factors and 19 categories on negative factors. Afterwards, we conducted correspondence analysis, with sport status, positive and negative factors as variables. Results : As a result of the correspondence analysis, respondents who intended to play outdoor sports showed a tendency to respond "Family" and "Traffic & Access" in positive factors. And, respondents who intended to play marine sports showed a tendency to respond "Work" and "Child-care & Care" in negative factors. Conclusion : The study showed to clarify characteristics of the positive factor and negative factor for applicants for stating ORS activity in each outdoor recreational sports. Keywords : outdoor recreational sports, positive and negative factors, middle-aged and older adults

OP25 321-S-2

THE MULTIDIMENSIONAL BENEFITS OF PARTICIPATION IN MASTERS SPORTS: A CASE STUDY OF THE 'MASTERS KOSHIEEN'

Kei HIKOJI¹, Makoto CHOGAHARA², Megumi TANI³, Daichi SONODA³, Yuki MATSUMURA³, Akira OKADA⁴, Yoshihiro TAKADA², Nobuhiro ISHIZAWA⁵ (1. Faculty of Education, Wakayama University, Japan; 2. Faculty of Human Development, Kobe University, Japan; 3. Faculty of Human Development, Graduate School, Kobe University, Japan; 4. Department of Human Life Environments, Konan Women's University, Japan; 5. Department of Sport Education, Hokkaido University of Education, Japan)

Introduction : The purpose of this study is to explore the multidimensional benefits experienced by Masters Sports participants from a case of the Masters Koshien. This study focused on the Masters Koshien to collect qualitative data regarding detailed description of subjective benefits of the event participants and investigated what kind of benefits do the masters sports participants obtain substantially. Method : Survey interviews were conducted and 1,878 linguistic data items were collected from 304 participants of the 2008 Masters Koshien, our action research program. And the thematic analysis model was used for data analysis. Results : In the series of thematic analysis, 21 benefits of masters sports were extracted and divided into 4 different dimensions of benefits: individual benefits, community benefits, social benefits, and educational benefits. It was suggested that this study could reveal three additional benefits that previous studies have not been explored such as community benefits, social benefits, and educational benefits of masters sports. Conclusion : The Masters Koshien is different from open masters sport events in which adults enjoy competing in sports, and which have been a major style of masters sport event. The Masters Koshien brings about benefits unique to mecca-like masters sport events. In addition, the Masters Koshien is an alumni membership sport event, which means that it is not an open masters sport event. Keywords : Masters Sports, Benefits of Sports and Physical Activities, Masters Sports Promotion

OP25 321-S-3

COMPARING CANADIAN AND KOREAN OLDER ADULTS' LEISURE TIME USE AND MEANING OF LIFE

David KAUFMAN¹, Mi Ok CHANG² (1. Education, Simon Fraser University, Canada; 2. Education, Tongmyong University, Korea)

Introduction : The quality of life for older adults has become critically important and is related to how they spend their leisure time in daily life. The purpose of this study was to compare the leisure time use and meaning of life of older adults in Canadian and Korean urban settings. Method : Participants in the study consisted of over 300 volunteers in both Canada and Korea, aged 55 and over, and already retired or only working part-time. A questionnaire was developed consisting of three parts: personal background, measurement of leisure time activities, and meaning of life. The questionnaire was distributed to older adults in both countries with a cover letter and consent form. Data were collected by undergraduate students as well as at community and seniors' centers. A stamped self-addressed envelope also was included for ease of return of the completed questionnaire. The duration of the data collection was about three months in both countries. Results : In Canada, the study found that older adults spent more time overall in active leisure rather than passive leisure. However, more time was spent in particular passive leisure time activities. Age and work status were factors related to leisure time use in both active and passive leisure time activities. Income was found to be related to active leisure time use while education was related to passive leisure. The Korean results are currently being analyzed and will be reported at the conference as well as a comparison between the two countries. Conclusion : Conclusions will be reported at the conference. Keywords : seniors, older adults, leisure time

OP25 321-S-4

RESEARCH ON THE RELATIONSHIP BETWEEN SPIRITUAL HEALTH AND ENVIRONMENTAL LITERACY FOR THE ELDERLY

Ying-Tsun HUNG¹, Mei-Lan CHEN², Hsiu-Lan CHEN³ (1. Department of Senior Citizen Service Management, Ching Kuo Institute of Management and Health, Taiwan; 2. Institute of Health Industry Management, Ching Kuo Institute of Management and Health, Taiwan; 3. Department of Elderly Welfare & Social Work, Toko University, Taiwan)

Introduction : This study focuses on the spiritual health and environmental literacy of elderly, and dimensions of spiritual health can be divided into four aspects: individuals and self, communities, environment and transcendence. According to the research of Hung(2009), it discovered that many old people didn't know how to express their environmental sense and love of nature. Therefore, it's important to find out the relationship of environmental literacy and spiritual health for the elderly. Method : The research uses the questionnaire survey procedure. It will conduct in the Senior Learning University in Taiwan. The available sample for the study is over 500 copies. Results : Spirituality integrates critical factors of individuals' other dimensions, such as physical, psychological, emotional and social aspects. From the theory of deep ecology and eco-psychology, they emphasis the humankind and environment are interdependent. From nature and environment, elderly connect themselves from higher power and get spiritual growth. The environmental literacy were included cognition, affection, skill and behavior. From this study, we will know the learning needs of old people and their living style. Secondly, There were significant correlations between spiritual health and environmental literacy. Elderly should learn more environmental knowledge and do more effort to protect our nature. it is important to

guide old people to combine the spirituality, ecology, environmental literacy and environmental protection. Conclusion : It is important to enhance the old adults' environmental literacy and spiritual health. Some suggestions are given to the senior learning organizations. Keywords : elderly, environmental literacy, spiritual health

OP25 321-S-5

THE DEVELOPMENT OF QUALITY OF SPORT FOR LIFE (QOSL) INDEX FOR ASSESSING THE MULTIDIMENSIONAL PHYSICAL ACTIVITY INVOLVEMENT IN JAPANESE OLDER ADULTS

Makoto CHOGAHARA¹, Kei HIKOJI², Megumi TANI³, Daichi SONODA³, Yuki MATSUMURA³ (1. Faculty of Human Development, Kobe University, Japan; 2. Faculty of Education, Wakayama University, Japan; 3. Graduate School of Human Development, Kobe University, Japan)

Introduction : As the proportion of elderly in the population continues to increase, the needs and potential of physical activity involvement have diversified. The purpose of this study was to develop the Quality of Sport for Life (QOSL) Index specific to the physical activity contexts of Japanese older adults. Method : After the content validity was tested, a series of confirmatory factor analyses was conducted to test a hypothesized multidimensional model using 1073 survey response from community-dwelling adults aged 50 and older in 2008 and 2009. Results : Three separate analyses of age groups (i.e., fifties, sixties, and seventies and older) demonstrated that three dimension of sport orientation: health, leisure and competition were independent domains, and factor subscales revealed adequate internal consistency. Moreover, the criterion validity tests indicated that impacts of these three dimensions on sport-related dependent variables changed according to the age groups. Conclusion : In the past, physical activity programs for the elderly were designed to primarily maintain health, and as a result, the frequency, duration, intensity and continuity of activities were emphasized, but there was not much interest in the qualitative dimensions such as level of specialization, skill and achievement within these activities. The study findings supported the importance of a multidimensional conceptualization and assessment that takes into account not only health orientation but also the leisure pursuit and mastery orientation, in order to comprehend the physical activity world of older adults and to assist the enrichment of active ageing in the future. Keywords : Sport, Scale Development, Japanese Elderly

OP25 321-S-6

“LEARNING” IS THE WAY OUT: EXPERIENCES IN THE JOURNEY OF AGING

Chun-Ting YEH, Yahui LEE, Ching-Yi LU (Department of Adult and Continuing Education, National Chung-Cheng University, Taiwan)

Introduction : Aging is considered to be an inevitable journey. To understand what people do as they face the aging problems. Method : We adopt a qualitative research and conduct semi-structured interviews with 16 adults. The interviewees are from 52 to 74 years old and 61.75 years old on average. Results : We find the interviewees use the strategy of “learning” in the journey of aging. They gain the experiences and knowledge to deal with aging through learning, such as from books, intergenerational learning programs, peer sharing, etc. The interviewees indicate that they are transformed and have more positive perspectives for later life through learning with other generations. Conclusion : We find that for some interviewees, “learning” itself is not the main purpose, but to have fun through the participation. Keywords : aging, learning strategy

LIFE COURSE CHANGE

OP25 322-S-1

HOW DO EARLIER LIFE EXPERIENCES IMPACT ON THE DEVELOPMENT OF RESILIENCE?

Gill WINDLE, Gill WINDLE (Dementia Services Development Centre, Bangor University, United Kingdom)

Introduction : This research explores the development of resilience, and how it affects the interpretation of ill-health in later life. It examines how new vulnerabilities or strengths emerge over the life course. Understanding the influence of life course experiences is important and rarely addressed. Method : In-depth interviews are undertaken with 15 people aged 65+, who are sampled from an existing longitudinal cohort study. Their quantitative data suggests that they demonstrate resilience (i.e. high subjective well-being despite a physical health problem and associated functional limitations). Data is transcribed and analysed in NIVO 9 using interpretive phenomenological analysis. Results : Taking a life course perspective, qualitative exploration addresses life histories; the meaning and impact of life experiences, the extent to which these experiences may have enabled a positive adaptation to ill-health in later life, or which experiences may be a barrier to adaptation, and how these experiences may shape the development of resilience. It explores within a life course perspective whether ‘steeling effects’ can be identified. Conclusion : This research contributes new knowledge on the development of resilience across the life course, and how earlier life experiences facilitate understandings of a prolonged and significant exposure to an adversity, such as chronic illness. Keywords : Resilience; qualitative; life-course

OP25 322-S-2

DEMOGRAPHIC CHANGES IN CHINA AND SWEDEN. LIFE HISTORY PERSPECTIVE ON CARING

Stina Mariana JOHANSSON¹, Shengli CHENG² (1. Department of Social Work, Umea University, Sweden; 2. Department of Social Work, Shandong University, China)

Introduction : The one-child policy in China and economic growth, improved the standard of living. Rapid migrations into urban areas change the deep traditions of intergenerational care. It is still unknown for researchers how the Chinese demographic transition into an ageing society, has affected the citizen's personal lives. In Sweden this transformation and the building of a supporting welfare structure has preceded extremely slow. Method : Life histories collected in China and Sweden describing the variety of factors on the elderly whose lives are affected by this transformation, passages and liminalities, events, linked lives, continuity and adaptation. Results : Old rural Swedish women's life stories make it clear that caring is multifaceted and complex and the entrance into labor market was a central theme in their stories (Snellman 2010). This transition was passed in last century with a shift in women's caring role from being a family obligation to a partly public concern. With the nuclearizing of family and the young population migrating to urban areas in China, the traditional mode of elderly support and care faces increasing challenges. Conclusion : In the paper the results from Sweden and China will be compared. Life stories of elderly will show us how social structure factors and personal factors interact in people's lives and how their needs of social services are expressed at a personal level, and how social policy responded to this impact. Keywords : life histories, demographic transition, caregiving, China, Sweden

OP25 322-S-3

CHILDHOOD MISFORTUNE, PERSONALITY, AND ACUTE MYOCARDIAL INFARCTION: DOES PERSONALITY MEDIATE RISK OF ACUTE MYOCARDIAL INFARCTION?

Patricia M. MORTON¹, Nicholas A. TURIANO², Daniel K. MROCZEK³, Kenneth F. FERRARO¹ (1. *Sociology, Center on Aging and the Life Course, Purdue University, USA*; 2. *Psychiatry, University of Rochester Medical Center, USA*; 3. *Human Development & Family Studies, Center on Aging and the Life Course, Purdue University, USA*)

Introduction : Previous research has discovered a link between childhood experiences and adult health, but the mechanisms underlying this relationship are the subject of much debate. To elucidate this relationship, we investigated the pathway from childhood misfortune to risk of acute myocardial infarction (AMI) via personality. Method : Longitudinal data were drawn from the National Survey of Midlife Development in the United States, which sampled 3,302 men and women aged 25-74. The Big-5 personality traits and multiple measures of childhood misfortune (including child abuse, family structure, financial strain, and poor health) were used in a series of proportional hazards models to assess whether personality mediated the effect of both additive and specific domains of childhood misfortune on AMI risk. Results : Among the Big-5 personality traits, only neuroticism was a significant mediator. Neuroticism mediated the effect of additive childhood misfortune on adult AMI risk, but no mediation effects were observed for specific domains of childhood misfortune. Conclusion : By linking childhood misfortune to personality, findings reveal that childhood misfortune may be formative in the development of personality, which, in turn, can be consequential to health in later life. Keywords : Childhood Misfortune, Personality, Acute Myocardial Infarction

SOCIAL CHANGE IN 20 CENTURY'S ASIA AND LIFE COURSE OF THE ELDERLY: FOCUSING ON CHILDBIRTH AND CHILDCARE NETWORKS IN FIVE SOCIETIES

Mari YAMANE¹, Sang Ook HONG², Keong-Suk PARK³, Dong Hui LI⁴, Itaru NAGASAKA⁵, Yukiko NAKASUJI⁶ (1. *Home Economics Education, Aichi University of Education, Japan*; 2. *Human Ecology and Kinesiology, Yeungnam University, Korea*; 3. *Social Sciences, Seoul National University, Korea*; 4. *Japanese Language, Dalian University of Foreign Languages, China*; 5. *Graduate School of Integrated Arts and Sciences, Hiroshima University, Japan*; 6. *Regional and Social System, Aichi University of Education, Japan*)

Introduction : The purpose of this study is to explore life course of the elderly in East and Southeast Asia focusing on family events and considering it in relation to social change in 20th century. The focus of this presentation is on changing process in childbirth and childcare networks. Method : Research method is questionnaire survey. We hold questionnaire survey on life course in 5 areas, 4 countries during the year 2009. The objects are people who were born during 1920th to 1940th. We corrected 223 cases in Dalian (China), 100 cases in Seoul (Korea), 97 cases in Daegu (Korea), 81 cases in Ilocos (Philippines), 81 cases in Nagoya (Japan). Results : Major findings are as follow. (1) We observed Multiple professionalization processes in childbirth support; from midwife to medical doctor in Nagoya and Dalian, from relative to medical doctor in Seoul and Daegu, from traditional midwife to medical midwife in Ilocos. (2) In Seoul, Daegu and Nagoya data, child care network had concentrated to mother of children, whereas in Dalian and Ilocos data, the tendency of multiple

parenting had continued. Conclusion : We should consider the meanings of these results in relation to historical change. Medicalization process of childbirth in colonial modernity would be important point to view in order to consider the different paths of childbirth support. Basic family-relative system before modernization, changes in family and gender role under industrialization, those under socialism would be indispensable factors in order to consider the difference in childcare networks. Keywords : lifecourse, Asia, network

OP25 322-S-5

A ROUGH JOURNEY: IS IT DIFFICULT TO BECOME OF ELDERLY OR TO SURVIVE AS AN ELDERLY IN KOREA?

Seung-Eun CHA¹, Jinhee KIM², Jung-Yeon SON³, Elaine ANDERSON² (1. *Dept. of Child, Family and Welfare, The University of Suwon, Korea*; 2. *Dept. Family Science, University of Maryland, USA*; 3. *Institute of Aging, Seoul National University, Korea*)

Introduction : More elderly Koreans live alone, independently than ever before. The purpose of this study is to understand psychological challenges of older Koreans by investigating the patterns of changes in depression. We intend to study the most vulnerable age and relevant factors of depression. Method : Using the data from the two waves (t1, 2006 and t2, 2008) of KLoSA (Korean Longitudinal Survey for Aged), we employed 3,320 cases (female: 54%) of elderly respondents who were in their age of 65-85 in 2006 and participated in both waves. Results : Preliminary results show that the levels of depression were highest between ages of 75-80 on average for both waves (t1 and t2) with the sample. Over the two year period (from t1 to t2), about 45% of all elderly who responded to both waves report that the level of depression increased while 30% report decrease in the levels of depression. Further, the increase in depression was significantly associated with reduced financial resources and health. Additionally, widowhood explained the increase of depression. Additional analysis will be conducted to examine whether financial resources, health, family structure, and social supports as well as their interactions are associated with increase, decrease or no change in depression levels over two-year period. Conclusion : Further, elderly are at high risk in terms of mental health, those who have high levels of depression in both waves will be examined. The results will provide implications for policy makers regarding the mental health status of elderly and potential programs and policies in Korea. Keywords : depression, social determinants, mental health, life course change

OP25 322-S-6

LIFE COURSE INDICES FOR SOCIAL DETERMINANTS OF HEALTH AND QUALITY OF LIFE AMONG KOREAN ELDERLY

Jiae LEE¹, Soong-Nang JANG², Sung-Il CHO¹ (1. *Department of Epidemiology, Graduate School of Public Health, Seoul National University, Korea*; 2. *Red Cross College of Nursing, Chung-Ang University, Korea*)

Introduction : This study investigated the indicator of social economic status (SES) that affects the elderly's health and quality of their life by life course approach. Method : The subjects were the Korean elderly aged 60 or more, and 1000 households from 10 survey regions based on the population census (2007) were randomly selected by stratified multi-stage sampling. Selected households were examined by using interview methods to assess individual background, SES during each stage of life course, health status, functional abilities, and quality of life. Data was analyzed by ANCOVA test in condition of the data adjusted by age, present economic status, types of family structure and other variables. Results : There is a sex difference regarding subjective

economic status in life course; decreased in fifties in men, but sixties in women. Living condition from early childhood to late mid life is found to be significantly associated with the satisfaction level of present life in the elderly at sixties. Of SES by childhood, educational status is found to be the significant factor of the satisfaction level of present subjective health and quality of life(QoL). Experience of meal skipping is considered an important determinant of childhood SES in both elderly men and women. The first job status affects in both elderly men and women significantly. Especially in elderly women, subjective health status and life satisfaction has big differences by the latest job status of the spouse. Conclusion : The important SES indicators that affect health status of the elderly have differences by characteristics of life course, sex, and age. Keywords : Life course approach, Social economic status, Life satisfaction

OP25 420-S-1
THE EFFECTS OF ASSISTIVE TECHNOLOGY INTERVENTIONS ON USERS AND THEIR INFORMAL CAREGIVERS

Ben MORTENSON¹, Louise DEMERS², Jeffrey JUTAI³, Frank DURUYTER⁴, James LENKER⁵, Marcus FUHRER⁶ (1. Gerontology Research Centre, Simon Fraser University, Canada; 2. Rehabilitation, University of Montreal, Canada; 3. Interdisciplinary School of Health Sciences, University of Ottawa, Canada; 4. Surgery, Duke University, USA; 5. Rehabilitation Science, University at Buffalo, USA; 6. Eunice Kennedy Shriver National Institute of Child Health and Human Development, National Institute of Health, USA)

Introduction : Some randomized control trials (RCTs) have found assistive technology interventions are beneficial for users, but no experimental research has examined their effects on users' informal caregivers. Therefore a study was undertaken to determine the feasibility of an inclusive, dyadic approach to assistive technology (AT) provision by testing if it effective in 1) improving AT users' activity performance, and 2) decreasing their caregivers' sense of burden. Method : A delayed-intervention, RCT was conducted in the homes of community-dwelling participants. Eighty-eight individuals participated in the study (44 dyads). The intervention involved: 1) a detailed in-home assessment, 2) identification of an activity that was problematic for both the caregiver and AT user, 3) negotiation of an AT focused intervention plan, and 4) implementation of this plan, including device provision, training and home modifications. The primary quantitative outcome measure for AT users was the Life H and the primary quantitative outcome measure for caregivers was the Caregiver Assistive Technology Outcome Measure (CATOM). Results: Following the intervention assistance users experienced significantly increased satisfaction with activity performance (Life H). Likewise, informal caregivers experienced significantly decreased burden with the dyad-identified, problematic activity (CATOM). Conclusion : This is the first experimental study to demonstrate that provision of AT decreases caregiver burden. The findings should help health-care providers to advocate for better funding of AT provision and related services. This study lays the groundwork for future research in this area. Keywords : assistive technology, informal caregivers, randomized control trial

OP25 420-S-2
USE OF COMMUNITY-BASED LONG-TERM CARE SERVICES BY FAMILY CAREGIVERS TO OLDER JAPANESE ADULTS

Tomoko WAKUI¹, Emily M AGREE², Tami SAITO³, Ichiro KAI⁴ (1. Population, Family and Reproductive Health, Johns Hopkins Bloomberg School of Public Health, USA; 2. Department of Sociology, Johns Hopkins University, USA; 3. Department of Social Science, National Center for Geriatrics and Gerontology, Japan; 4. Emeritus Professor of Social Gerontology, The University of Tokyo, Japan)

Introduction : The number of community dwelling elderly who require long-term care has increased in recent years, but most research has focused on the transition from community-based care to nursing-homes. The current paper is focused on differences in the pattern of community-based service utilization by caregiver-care recipient relationship, which helps to understand potential care substitution patterns between formal and informal care. Method : We conducted a longitudinal study of family caregivers (n=2510) in 17 municipalities in northwestern Japan in 2010. Information was obtained on use of three types of community-based services: home-health (times/ week), day-care (days/ week), and short-stay services (days/ 3 months). A negative binomial regression model was used to examine utilization differences by care demands (including ADL needs and dementia); caregiving situation; and caregiver relationship. The most common relationship is daughter-in-law (30.2%), followed by daughter (21.2%), wife (21%), son (15.7%), husband (7.9%) and other (4.1%). Results : Results showed that ADL dependent care-recipients were more likely to use home-health and short-stay services, but care-recipients with cognitive impairment were more likely to use day-care and short-stay services. After controlling for care demands and caregiving situation, married daughter, son, and daughter-in-law caregivers were more likely to use day-care services, compared to wives. Husbands and single sons were more likely to use home-health care. Conclusion : These results suggest that more efficient long-term care services will take into account the needs and preferences of family caregivers as well as the needs of older care-recipients. Keywords : Caregiver, Long-term Care, Community-based service

OP25 420-S-3
PROFESSIONAL CARE PROVIDERS AND STAKEHOLDERS' VIEWS OF BEST PRACTICE IN THE CARE FOR PERSONS WITH DEMENTIA IN SWEDEN

Christina BOKBERG¹, Gerd AHLSTROM¹, Ingalill R HALLBERG¹, Staffan KARLSSON¹, Ann-christin JANLOV² (1. Department of Health Sciences, Faculty of medicine, Lund University, Sweden; 2. School of Health and Society, Kristianstad University, Sweden)

Introduction : Dementia implies progressive loss of mental and physical functions during the trajectory of the disease (Porter & Kaplan, 2012). Persons with dementia need involvement of various and several care providers throughout the stages of dementia, and more knowledge is needed about best practice strategies in this complexity of care (Gurner, 2001). The aim of the study was to explore professional care providers and stakeholders' views of best practice in concepts of information, collaboration and communication in the care for persons with dementia in Sweden. Method : The study had a qualitative approach based on three focus group interviews with a variation among participants regarding professions and workplaces to represent different types of care for persons with dementia from diagnosis to end of life care. The transcribed verbatim was analyzed with qualitative content analysis. Preliminary results: In early stages primary health care specialized in dementia had close collaboration, training and mentoring, with memory clinic and home care. In the later stages the person with dementia had less frequent contacts with primary health care. Day care played an important role in information delivery of the disease, in collaboration with home and institutional

care. In the latest stage the family had an important role as a proxy for the person with dementia about desires in the care. Conclusion : A well-functioning network in professional care seems to have an impact on persons with dementia to remain at home despite loss of mental and physical functions. On the behalf of RightTimePlaceCare consortium. <http://www.righttimeplacecare.eu>. Keywords : Persons with dementia, professional care providers, best practice

OP25 420-S-4

AGING ATTRIBUTIONS AND FAMILISM INFLUENCE LONG-TERM CARE PLACEMENT DECISIONS BY SPOUSAL CAREGIVERS OF OLDER ADULTS

Lynn ZHU¹, Alan SALMON², Sandra HOBSON² (1. Department of Epidemiology and Biostatistics, Western University, Canada; 2. Faculty of Health Sciences, Western University, Canada)

Introduction : A significant number of older adults on the wait-list for long-term care (LTC) in Canada are those with a live-in caregiver and care needs low enough to be adequately supported in the homes with supportive services. Why are low needs older adults with live-in caregivers opting for LTC placement? This study aimed to uncover whether spousal caregivers' views about the aging process influence the institutionalization of loved ones. Method : A mixed methods approach was used to collect data from 40 spousal caregivers of community dwelling individuals above the age of 70. Participants completed the Aging Perceptions Questionnaire and the Revised Familism Scale. They also recommended a course of action (i.e., caregiving at home or LTC placement) for older adults described by vignettes representing the varying levels of care needed by individuals on the Province of Ontario's LTC waitlist. Semi-structured interviews were conducted to determine reasons for the recommended actions. Results : Spouses who believe themselves to have less control over the negative consequences of their own aging recommended LTC more frequently ($R^2 = -0.279$). Qualitative interviews revealed placement decisions are influenced by the needs of care recipients, caregivers' physical ability and gender, socio-cultural beliefs about caregiving (familism), access to home care services, and personal experiences of LTC institutions. Conclusion : Results suggest a balanced consideration of the physical needs and cultural beliefs of informal caregivers is required by health professionals and policymakers when addressing the allocation of home care support services or institutional placement of older adults. Keywords : family caregiver, long-term care placement, aging attribution

OP25 420-S-5

A MANAGEMENT PLAN FOR DEMENTIA PATIENTS' CARE: THE MIRANDOLA DEMENTIA SPECIAL CARE UNIT EXPERIENCE

Andrea FABBO¹, Agata MALAGOLI², Marina TURCI³, Giacomo MENABUE⁴, Annarita GUERZONI⁴, Flavia ORSI⁵, Annalisa BONORA⁴ (1. Primary Care, Ausl Modena and Cisa Alzheimer Special Care Unit, Italy; 2. Nursing School, University of Ferrarat, Italy; 3. Primary Care- Alzheimer Special Care Unit Mirandola, Ausl Modena, Italy; 4. Cisa Mirandola Alzheimer Special Care Unit, Asp Unione Comuni Modenesi Area Nord, Italy; 5. Cisa Mirandola, Asp Unione Comuni Modenesi Area Nord, Italy)

Introduction : The main problem in dementia illness that caregivers have to afford usually concerns the management of behavioral problems. The Mirandola dementia care unit provides temporary admissions to dementia patients to study problems and find proper solutions especially working with non pharmacological strategies like gentle care, occupational therapy and multisensory stimulation.

Method : The analysis of benefits was based on a multidimensional evaluation of patients obtained by comparing the data at the entrance, at discharge and at periodic follow-ups (6, 12, and 18 months after discharge). Among other data we measured the NPI scores (Neuropsychiatric Inventory) and the consumption of sedative drugs. Patients had moderate-severe dementia diagnosis and behavior disorders for an NPI score higher than 24 at the entrance. The study was developed on 63 cases. Results : 71% of the people hospitalized in the NA was discharged with a domiciliary project. The comparison made between the average NPI scores obtained at the entrance (44.66) shows a significant reduction in behavioral disorders at discharge (30.45, $p < 0.05$) which was maintained at a distance of 6 (28.81; $t = 3.663$, $p < 0.05$) and 12 months (21.29, $t = 2.743$, $p < 0.05$). Conclusion: These outcomes suggest that it is possible to plan a home care for dementia patients in their average and late stage with behavioral disorders. This is promoted in the dementia care unit by the prevention of situations that can generate agitation and aggression in these people. These benefits seem to last even after a period of 12 months after discharge. Keywords : dementia, BPSD, sensory stimulation

OP25 420-S-6

CAPABILITY AND CARERS' WELLBEING: USING INTERNET FORUMS FOR RESEARCH WITH INFORMAL CAREGIVERS

Christine STEPHENS¹, Barbara HORRELL¹, Mary BREHENY², Fiona ALPASS¹ (1. School of Psychology, Massey University, New Zealand; 2. School of Health and Social Services, Massey University, New Zealand)

Introduction : The capability approach which contains three central concepts - capability, functioning and agency - provided the theoretical framework for a study of the wellbeing of informal caregivers of older people. The study was designed to work with carers as co-researchers to identify what they consider important for maintaining their wellbeing throughout the caregiving process. Method : A researcher set up a forum on the world wide web. Participants were recruited through other internet discussion forums and through websites for older people's organisations. The researcher initiated discussion through weekly questions based around different themes (based on the capability framework). Through the forum participants interacted and introduced additional topics for discussion. Over three months, 60 carers discussed caring for their spouses, parents, grandparents and non-family members. Results : The carers' stories about caring illustrate the complex relationships associated with caregiving. The comments were analysed to reveal a set of capabilities which impact the carers' ability to be healthy. The contradictory importance of emotions was highlighted across the set of capabilities. Carers described emotional attachment that influenced their decision to provide care and also affected the freedom to fulfil their own needs. Guilt about negative emotions was expressed, suggesting that caring involves putting one's own feelings aside. Conclusion : The focus on emotions in the caregivers' stories has led to the next stage of the research. The use of an online method provided the opportunity to contextualise caregiving and to test the internet as a vehicle for participatory research with a difficult to reach population. Keywords : caregiving, capability approach, internet,

THE RELATIONSHIP BETWEEN USUAL MEMORY

COMPENSATION BEHAVIORS AND PROSPECTIVE MEMORY PERFORMANCES WITH USING MEMO PAPERS AMONG ELDERLY PEOPLE

Nozomi RENGE¹, Yasuyuki GONDO², Yoshiko ISHIOKA², Ikuyo KUROKAWA³, Madoka KAWASAKI², Peter RENDELL⁴
(1. Maritime Sciences, Human Sciences, Kobe University, Osaka University, Japan; 2. Human Sciences, Osaka University, Japan; 3. Osaka Prefecture, Osaka Prefecture, Japan; 4. Faculty of Arts and Sciences, Australian Catholic University, Australia)

Introduction : Prospective Memory (PM) is important in maintaining healthy and safe independent living. It is essential for people to prevent from causing PM failures by memory strategies. Dixon et al. (2001) made the Memory Compensation Questionnaire (MCQ). Almost elderly people usually use some external aid such as memo. However it is unknown whether usual memory compensation behaviors affect on PM performance. The purpose of the present study is to reveal the relationship between usual memory compensation behaviors and prospective memory performance under it is possible for elderly people to use memo papers. **Method :** The experiments were conducted with 151 elderly people (M = 68.06, SD = 5.20). They were required to answer the MCQ and conduct Virtual Week (VW, PC version; Rendell & Craik, 2000) as PM measure. VW is a PC version of a board game on which participants move around with roll of a dice and are required to make choices about daily activities and remember to carry out lifelike activities (PM tasks). **Results :** Partial correlation coefficients between MCQ Scales and VW Performances were performed. The results showed that the elderly people who usually used more reliance strategy and time strategy in daily life performed worse. **Conclusion :** Even if they could make free use of memo papers, the elderly people who usually used more reliance strategy and time strategy in daily life made more PM failures. It may be suggested that whether they tried to perform the everyday PM tasks by themselves influenced on the performance. **Keywords :** memory compensation behavior, prospective memory, memory failure

OP25 421-S-3 IS WORKING LATER IN LIFE GOOD OR BAD FOR MEMORY FUNCTIONING

Kandauda WICKRAMA (*Human Development and Family Science, University of Georgia, USA*)

Introduction : During the past decade, which is overlapped with the current economic recession, older Americans seem to have reversed a century-long trend toward early retirement. Many have been forced to postpone their retirement even beyond age 65 (Pynoos & Liebig, 2009). Thus, further examination and the extension of recent findings about the consequences of working in older age would be useful for the formulation and implementation of public health programs and policies for the rapidly increasing older American population. **Objectives of the Study.** To examine the influence of work status on subsequent memory trajectories in later years. **Method :** We used a subsample of 8,165 older adults who participated in the Health and Retirement Study and were 65 years or older in 2002 to examine work status and memory functioning after controlling for age, other demographic characteristics, and initial health. **Results :** We present results of growth curve analyses. Our results indicate that retired and non-working older adults show steeper declines in immediate memory compared to older adults working full-time after controlling for age. However, work status of older adults does not appear to influence their delayed memory trajectories. **Conclusion :** The findings from these growth curve analyses support the hypothesis that working late in life helps to impede immediate memory declines that often occur in later

years. **Keywords :** work memory aging

OP25 421-S-4 THE EFFECTS OF A 10 WEEKS INTEGRATED EXERCISE TRAINING ON FUNCTIONAL FITNESS OF COMMUNITY-DWELLING OLDER ADULTS

Hsin-Hung HO¹, Shao-Hsi CHANG², Pei-Hsin FANG¹, Pei-Ming CHAN³ (1. Department of Physical Education, National Taiwan Normal University, Taiwan; 2. Graduate Institute of Sport, Leisure & Hospitality Management, National Taiwan Normal University, Taiwan; 3. Office of Student Affairs, Ying Qiao Taipei Public Elementary School, Taiwan)

Introduction : Aging populations increase the prevalence of health problems among the elderly. Integrated exercise training may contribute positively to health and development in this population. **Method :** Thirty elderly staying at homes in Taipei City participated in this quasi-experimental study. Experimental group participants joined 10 training sessions over a 10 weeks period, while the control group did not. Both groups submitted responses to the same functional fitness test, distributed prior to and after the intervention. **Results :** The experimental group showed a significant difference (p<.05) between pre- and post-intervention frailty. The control group showed no significant change in frailty between the two periods. Also, change in experimental group frailty was more significant than in the control group (p<.05). **Conclusion :** Integrated exercise training can increase functional fitness of Community-dwelling elderly. Thus, such may be applied in Community-dwelling facilities. To enhance the physical and mental health of Community-dwelling elderly, the authors suggest including information on integrated exercise training in health promote education programs that will enhance healthcare staff and elderly fitness instructor understanding of integrated exercise training advantages and methods. **Keywords :** Integrated exercise, Elderly, Functional Fitness

OP25 421-S-5 10-YEAR COMMUNITY INTERVENTION FOR FRAILTY PREVENTION AND ITS IMPACT UPON HEALTHY AGING IN JAPAN. 4. IMPACT ON LONG-TERM CARE INSURANCE STATISTICS

Yu NOFUJI, Hiroto YOSHIDA, Mariko NISHI, Hiroshi MURAYAMA, Hidenori AMANO, Yu TANIGUCHI, Eri MATSUO, Taro FUKAYA, Yoshinori FUJIWARA, Shoji SHINKAI (*Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : We examined the impact of the 10-year community intervention for frailty prevention on the Long-Term Care Insurance (LTCI) statistics in Kusatsu, Japan. **Method :** First, the incidence rate of disability under the LTCI program for each year during 2001-09 in Kusatsu was calculated as follows; incidence rate = number of people newly certified for long-term care need in the year / (number of primary insured - number of people previously certified for Long-Term Care need). We observed the secular trend by two age class (young-old; 65-74 years, old-old; 75- years). Second, the annual certification rates under the LTCI (= number of people certified for long-term care need / number of primary insured aged ≥65 years) during 2001-09 for Kusatsu, Gunma prefecture and whole nation were compared by age class using the LTCI national data. **Results :** Although the incidence rate of disability under the LTCI program for young-old population in Kusatsu remained unchanged, that for old-old population decreased over the period (from the peak value of 12.2 per 100 person-year in 2002 to 6.0 in 2009). The secular trend in certification rate for LTCI

for young-old population in Kusatsu was similar to that seen in Gunma prefecture and whole nation. By contrast, that for old-old in Kusatsu (increased from 21.4% to 23.6% during the period) differed significantly from that of Gunma prefecture (21.5-28.0%) and whole nation (24.2-29.4%). Conclusion : The incidence rate of disability under the LTCI program for old-old population in Kusatsu decreased during the intervention period, suggesting that the 10-year community intervention effectively delayed the late onset of disability. Keywords : Long-Term Care Insurance , frailty, community intervention

OP25 421-S-6
PHYSICAL ACTIVITY AND AGING: SUBJECTIVE REASONS TO BE INACTIVE

Elisaveta KACHAN¹, Kseniya IVKO² (1. Saint Petersburg Institute of Bioregulation and Gerontology, Russia; 2. Saint Petersburg Institute of Bioregulation and Gerontology, Kazakhstan)

Introduction : Although regular physical activity is a proven way to prolong independent living and enhance quality of life, very low physical activity levels typical for older individuals remain of particular concern. In order to find ways to encourage elderly people to be more physically active, we studied reasons of their inactivity. Method : Having developed a simple and relatively short questionnaire intended to reveal whether our respondents considered themselves to be active or not, and what were the main reasons of their inactivity in their judgement, we asked 70 residents of the Saint Petersburg city social day-care centers and visitors of the geriatric sanatorium aged 65+. Results : All respondents were aware of their being relatively inactive, but only 35% confessed to being almost absolutely inactive. Most of them explained they felt sick or suffered pains (35%), 26% told they were afraid to fall or get injured, 22% had no time or space for being active and 17% mentioned other reasons (felt lonely, had no friends). The results of our survey revealed that the real level of physical activity of our respondents didn't correspond to their subjective perception, yet the majority of them were ready to be more active if we'd advise them simple, safe and available means to do this. Conclusion : These data may help to develop educational strategies to inform older adults about the personal benefits of active aging and teach them how to practice simple physical activities (for example, Nordic Walking), as well as to design guidelines for geriatric and day care centers. Keywords : regular physical activity, inactivity

LONG TERM CARE V

OP25 422-S-1
HOW TO IMPROVE LONG-TERM CARE SERVICE THROUGH CHINA'S HEALTH REFORM

Yan LIN (PKU China Center for Health Economic Research, China)

Introduction : Both medical care and long-term care are of great importance for elderly people, and they are closely related in many aspects. However, medical care is administered by the Ministry of Health, while long-term care services are under the administration of the Ministry of Civil Affairs in China. The current health care reform hasn't paid enough attention to its coordination and integration with long-term care services. How can china's health reform respond to the increasing needs for long-term care in an aging society? Method : This paper reviewed the five major tasks in china's health reform and the current situation of long-term care service delivery, trying to explore ways that can improve long-term care through health reform. Results : We found that the low access to affordable and high quality medical care is a major obstacle for elderly people to realize "aging in place",

which forced them to choose institutional care. Conclusion : Integrated care is the future trend for providing efficiency and high-quality care for the elderly. The Ministry of Health can contribute to long-term care service in the following aspects: 1. Community health service center; 2. Multiple sites registration of physicians; 3. Essential drug policy; 4. Health information technology; 5. Long-term care insurance. Keywords : medical care , long-term care, integrated care

OP25 422-S-2
THE MOBILITY AND INDEPENDENT LIVING IN ELDERLY STUDY (MILES): STUDY DESIGN AND BASELINE CHARACTERISTICS

Tushar SINGH¹, Jane A. CAULEY¹, Pawan Kumar SHARMA², Clareann H. BUNKER¹, Jammy RAJESH², Anne B. NEWMAN¹ (1. Department of Epidemiology, University of Pittsburgh, USA; 2. Community Medicine, MediCiti Institute of Medical Sciences, India)

Introduction : Demographic increase in the older population is most rapid in developing countries and will have major impact on public health. Indian population is not well described, but evidence suggests that the current demographic transition provides a unique opportunity to better understand future disability. To accomplish this, we established a longitudinal cohort study - Mobility and Independent Living in Elders Study (MILES), in a rural population of older Indians. Method : We enrolled a random sample of 564 men and women aged 60+ from Medchal Mandal region in Andhra Pradesh state. Baseline visit consisted of two separate clinic visits for measurements of blood pressure, anthropometry, short physical performance battery, 400-meter walk, grip strength, ankle-arm index, cognitive examination, peripheral quantitative computerized tomography, knee x-ray, carotid ultrasound, blood draw and a comprehensive interview. Annual follow-up visits are planned to collect information on incident disability and disease. Results : According to preliminary data analysis from the first clinic visit, median age of the participants was 66 years (60-92); median body mass index, 21.7 kg/m²; median gait speed, 0.67 m/s and median grip strength 17 kg; 55% self-reported their health status as fair or poor and 13% reported falling >1 times in past 12 months. Conclusion : Preliminary data estimates suggest a much frailer population in this cohort compared to US subjects age 66 years. MILES will provide estimates of global burden of disease and disability and their risk factors in older adults, and findings from the study will be used to identify potential interventions to prevent disability appropriate in this rural population of Indians. Keywords : aging, disability

OP25 422-S-3
A 10-YEAR COMMUNITY INTERVENTION FOR FRAILTY PREVENTION AND ITS IMPACT UPON HEALTHY AGING IN JAPAN. 1. STUDY DESIGN AND PROCESS EVALUATION

Shoji SHINKAI, Hiroto YOSHIDA, Mariko NISHI, Yu TANIGUCHI, Yu NOFUJI, Eri MATSUO, Hiroshi MURAYAMA, Hidenori AMANO, Taro FUKAYA, Yoshinori FUJIWARA (Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : To date there has been no study on community-based intervention for healthy aging. We have conducted a 10-year community intervention for frailty prevention in a local municipality in Japan. Method : Study site was Kusatsu, Gunma Prefecture. The target population was all residents aged 65 years and over. This study was conducted with tight collaboration of municipal public health staffs. For primary prevention of frailty, we stressed the importance of physical activity, nutrition and social participation through various activities. For its secondary prevention, we introduced the

comprehensive geriatric assessment to the routine health check-ups, through which high-risk persons were screened and encouraged to participate in long-term care prevention class. The class was targeted on improvement of physical, mental and social functioning. We collected data through Long-Term Care Insurance System and conducted biannual monitoring surveys over the intervention period. Results : The municipal staffs shared the common aim with us and conducted routine works in terms of healthy aging. Although the attendance rate to annual health check-ups has remained at 30-40%, over 70% of the target population appeared at least once during 10 years. The response rate to the biannual monitoring survey has been high (over 90%) over the period. Many residents joined the surveys as interviewers, through which they recognized the issue of aged community. After long-term care prevention class, participants were motivated to continue the class by themselves. Conclusion : The municipal staffs could share the strategy for frailty prevention. Older people became acclimated to the concept of healthy aging and improved their self-care ability. Keywords : Healthy aging, Community intervention, Study design

OP25 422-S-4

A 10-YEAR COMMUNITY INTERVENTION FOR FRAILTY PREVENTION AND ITS IMPACT UPON HEALTHY AGING IN JAPAN. 3. IMPACT ON FUNCTIONAL HEALTH OF THE TARGET POPULATION

Yu TANIGUCHI, Hiroto YOSHIDA, Mariko NISHI, Hiroshi MURAYAMA, Hidenori AMANO, Yu NOFUJI, Eri MATSUO, Taro FUKAYA, Yoshinori FUJIWARA, Shoji SHINKAI (*Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : We previously reported a 10-year community intervention for frailty prevention. This study aimed to examine its impact upon functional health of the target population. Method : We conducted biannually the monitoring survey with interview method during the 10-year period (2001-11) in local municipality in Japan. The eligible subjects were all residents aged 70 and older, and we observed the secular trend in functional health. Functional health was evaluated by life-space mobility, higher-order functional capacity and healthy life expectancy. For the analysis we determined the proportions of those who had highest life-space mobility or who showed full score in each subscale (IADL, intellectual activity and social role) of the TMIG-Index of Competence. We also calculated healthy life expectancy at the age of 70 years with the Sullivan method. Results : The response rates to monitoring surveys have been very high (range: 91.1-98.8%). The proportion of those who had highest life-space mobility increased from 80.8% to 86.9% for men and from 63.7% to 74.3% for women. The proportions of men who showed full score in IADL, intellectual activity and social role increased from 72.9% to 80.8%, 64.2% to 64.7% and 55.0% to 58.8%, respectively. The corresponding values for women were 66.5% to 76.3%, 49.0% to 57.2%, and 51.5% to 58.3%, respectively. We found the extension of healthy life expectancy during the period: about 0.5 year for men and 1.2 year for women. Conclusion : The functional health of the target population was significantly improved during the intervention period. However, the causality remains inconclusive because of no control area. Keywords : community intervention, frailty, functional health, healthy aging.

OP25 423-S-1

LEARNING FROM EACH OTHER - USING CASE REVIEWS TO SOLVE PROBLEMS OF RESIDENTS WITH DEMENTIA LIVING IN A NURSING HOME

Martina ROES (*Institute for Quality and Case Management, University of Applied Sciences, Germany*)

Introduction : Interventions are active, thus we have to consider how interventions can lead to 'real' change. Four layers seem to be important for a successful implementation (Pawson 2006): the individual capacities of the key actors; the interpersonal relationships supporting the intervention; the institutional setting and the infra-structural system. Method : According to Yin (2009) a case study design should have five components; this study used standard techniques for posing research questions and defining the unit of analysis. The study design was focused on exploration and description. The unit of analysis was (1) a 'narrative', (2) using flow charts and the nursing process to structure the thick description plus (3) the integration of a multiprofessional guideline about mobility and safety of residents with dementia. Results : Nurses could easily provide 'thick descriptions about their residents' without checking the documentation system; too draw a flow chart to analyse the process which lead to a problem (like falling or wrong medication etc.) was difficult as well to structure their stories using the nursing process. Interesting was, that the addition of the guideline did not confuse the discussion, but helped to clarify the 'stories' and shaped the understanding why quality measures are important. Conclusion : All steps together supported the reflective ability of the nurses (individual capacities); supported the change into an evidence based practice (institutional setting). The participants reached also a better understanding of the importance of evidence based results and how to customize them for their practice (infra-structural system). Thus 3 out of 4 layers were addressed. Keywords : implementation, case review, multiprofessional guideline

OP25 423-S-2

THE EFFECTIVENESS OF DYADIC INTERVENTIONS FOR PEOPLE WITH DEMENTIA AND THEIR CAREGIVERS

Heehyul MOON¹, Kathryn ADAMS² (*1. Institute on Aging, University of North Carolina, USA; 2. Mandel School of Applied Social Sciences, Case Western Reserve University, USA*)

Introduction : The need for dyadic intervention is enhanced with increasing numbers of older adults with early-stage dementia. The purpose of this paper is to review the effects of dyadic interventions on caregivers (CGs) and care recipients (CRs) at the early stage of dementia. Method : Four databases, AgeLine, Medline, EBSCO, and PyscINFO were searched and relevant literature from 2000 onwards was reviewed. Results : The twelve studies identified used a variety of intervention approaches including support group, counseling, cognitive stimulation, skill training, and notebook-keeping. This review suggests that intervention programs for early-stage dementia caregiving dyads were feasible and well accepted by participants. The reviewed studies provided rich evidence of the significance of mutual understanding and communication to partners' well-being and relationship quality within the caregiving process. Conclusion : The findings suggest that these intervention approaches improved cognitive function of the CRs, social relations, and the relationship between the primary CG and the CR, although evidence of long-term effectiveness is lacking. Keywords : Dyadic, dementia, intervention

OP25 423-S-3

CARE RECIPIENT AND FAMILY CAREGIVER PERCEPTIONS OF EVERYDAY CARE IN EARLY-STAGE DEMENTIA: THE EFFECT OF INCONGRUENCE ON

QUALITY OF LIFE AND THE MEDIATING EFFECTS OF RELATIONSHIP STRAIN

Heehyul MOON¹, Aloen TOWNSEND² (1. Institute on Aging, University of North Carolina- Chapel Hill, USA; 2. Mandel School of Applied Social Sciences, Case Western Reserve University, USA)

Introduction : Few studies have examined the differences between CRs with early-stage dementia and family caregivers (CGs) in their perspectives about CRs' daily care, and the effect on CGs' and CRs' QoL. The objectives of this study were to examine the extent to which CGs and CRs have incongruence about CRs': 1) decision-making involvement (DMI), for everyday care, 2) preferences/values (VP) for social relations. In addition, the study examined 3) the effects of incongruence on VP and DMI on both CG and CR QoL. Furthermore, this study examined 4) the mediating effect on the associations between incongruence and quality of life. Method : A convenience sample of 205 dyads of CRs with early-stage dementia and family CGs were interviewed in-person. Incongruence between CGs and CRs on DMI and VP was measured by absolute differences and directions of differences. Two-level multilevel modeling with HLM6 was used to test the effects of incongruence on both CG and CR QoL, and the mediating effects of relationship strain on the associations between incongruence and QoL. Results : CGs rated CRs' involvement in decision making as significantly lower than CRs did. CGs also reported that CRs valued maintaining social relations significantly less than CRs reported. Multilevel analysis revealed that less incongruence on VP was associated with better QoL. However, this study found no mediating effect of relationship strain on the associations between incongruence and QoL. Conclusion : This study recognizes the substantial incongruence about care between CGs and CRs and the direct effects between incongruence on VP and QoL and between relationship strain and QoL. Keywords : dyadic, early-stage dementia, quality of life

OP25 423-S-4

A 10-YEAR COMMUNITY INTERVENTION FOR FRAILTY PREVENTION AND ITS IMPACT UPON HEALTHY AGING IN JAPAN. 2. IMPACT OF ANNUAL HEALTH CHECK-UPS WITH CGA ON HEALTHY AGING

Eri MATSUO, Mariko NISHI, Shoji SHINKAI, Hiroto YOSIDA, Yu TANIGUCHI, Yu NOFUJI, Hiroshi MURAYAMA, Hidenori AMANO, Tarou FUKAYA, Yoshinori FUJIWARA (Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : We previously reported the 10-year community intervention for frailty prevention in Japan. The present study aimed to evaluate the impact of annual health check-ups with comprehensive geriatric assessment (CGA) on healthy aging. Method : 656 residents aged 70 and older who lived in Kusatsu and had no mobility limitation as of 2001 were enrolled in this study. They were classified into three groups according to the number of annual health check-ups they received during 2002-05 (No-attendance, 0; Low attendance, 1-2; High attendance, 3-4 times) and then followed up from April 2006 to March 2010. Outcome measures were death and loss of active life [death or incidence of Long-Term Care Insurance (LTCI) need]. In the analysis for loss of active life, we excluded 128 subjects who had been certified under LTCI prior to the follow-up. Kaplan-Meier survival curves for three groups were compared by the log rank test. Cox proportional-hazard models were used to adjust for age, sex, comorbidity and mobility. Results : The mortality for "No-attendance" group was higher than that for "Low" or "High attendance" group (log-rank test, $P=0.02$). Similar association was observed for loss of active life,

although the difference among the three groups did not reach statistical significance ($P=0.20$). Multivariate analysis showed marginally negative associations between the numbers of health check-ups and risk of mortality and loss of active life (P for trend =0.20 and 0.06, respectively). Conclusion : The health check-ups with CGA was marginally associated with subsequent mortality and loss of active life, suggesting a beneficial effect on healthy aging. Keywords : health check-ups, mortality, loss of active life

OP25 423-S-5

THE ROLE OF SELF-EFFICACY OVER-TIME FOR MAINTAINING LIFESTYLE PHYSICAL ACTIVITY PROGRAM AMONG OLDER KOREANS

Kyung-choon LIM (College of Nursing, Sungshin Women's University, Korea)

Introduction : Self efficacy (SE) has been shown to be related directly to physical activity (PA) as well as to be a reliable predictor of PA maintenance over time in older adults. The purpose of this study was to explore the role of SE for maintaining participation in PA among community-dwelling older Koreans based on social cognitive theory. Method : This was a cross-sectional descriptive study with convenience sampling. 132 older adults in S city participated in the survey. Data were collected from the elderly who completed a questionnaire asking about their general characteristics, PA, and SE. Using SPSS 18.0 program, data were analyzed. Results : The mean age was 72.8(\pm 4.49), ranged 65 - 85 years old. Among 132 subjects, 63.6% were female. The most preferred PA was walking. The subjects who showed higher SE were more involved in all PA in terms of frequency ($t=2.27$, $p=.025$), duration ($t=2.31$, $p=.022$), calorie expenditure ($t=4.30$, $p<.001$) than those who showed lower SE. Also, The subjects who showed higher SE were more involved in moderate or vigorous activities in terms of frequency ($t=3.29$, $p=.001$) and calorie expenditure ($t=3.72$, $p<.001$) than those who showed lower SE. However, the time for moderate or vigorous activities did not show significant difference statistically ($t=-0.38$, $p=.705$). Conclusion : This study help understand SE that is doing critical roles for keeping older Koreans participate in PA program on a regular basis. This information will be useful when designing future intervention studies to promote and maintain PA in all Koreans. Keywords : aged, physical activity, self-efficacy

MARRIAGE IN LATER LIFE

OP25 511-S-1

'I'M STILL HERE, I'M STILL LIVING, I'VE GOT A LIFE TO LIVE': THE TRANSITION TO WIDOWHOOD IN LATER LIFE

Linda ISHERWOOD¹, Debra KING¹, Mary LUSZCZ² (1. National Institute of Labour Studies, Flinders University, Australia; 2. Flinders Centre for Ageing Studies, Flinders University, Australia)

Introduction : There are increasing numbers of older widowed adults living alone in the community. Social resources (social networks, support and activities) are vital in aiding adjustment to spousal loss. However, there has been limited research exploring how and why social resources change during the transition to widowhood in later life. Method : Semi-structured interviews were conducted with 20 widowed older adults (10 men and 10 women) aged 85 to 96 years. Participants were asked about their relationships with others, the exchange of social support, and participation in social activities in the transition to widowhood. The interview data were analysed

thematically using framework analysis. Life course theory provided the theoretical framework for the study. Results : Three themes relating to the transition to widowhood in later life were identified. "The transition to widowhood" describes the different transitional phases experienced pre- and post-widowhood. "The ebb and flow of the social network" explores the changing patterns of contact and support with the social network during these stages in the transition. "Life goes on" examines how social resources aid the establishment of a fulfilling life as an older widowed person. Conclusion : The transition to widowhood in later life brought considerable change to social networks, support and activities. The transition to widowhood was also found to be gendered. Male participants reported smaller social networks, received limited informal support and were less socially active during widowhood than female participants. The stronger social resources possessed by older widowed women may assist them in better meeting the challenges associated with spousal bereavement. Keywords : widowhood , social resources, gender

OP25 511-S-2

MARITAL ATTACHMENT STABILITY AND ITS RELATIONSHIP WITH SPOUSAL SUPPORT AMONG OLDER ADULTS

Yan WANG, Dahua WANG, Xiaoyan ZHAI (*School of Psychology, Beijing Normal University, China*)

Introduction : Adult attachment studies have proceeded on the assumption that attachment is relatively stable and can affect psychological development in the future, especially the interpersonal processes. This longitudinal study aimed at exploring the (in)stability of marital attachment and its relationship with spousal support among older adults. Method : There were 75 community-dwelling old adults, with age ranging from 60 to 84 years old at the first time of investigation, who were assessed twice across 3 years. The Older Adults' Marital Attachment Scale includes three dimensions, i.e. security, anxiety, and avoidance, and it was used to measure marital attachment at both of the time points. At the second time of assessment the participants were asked to report life events happened during last 3 years, and its practical as well as psychological effects. Additionally, the participants finished the Spousal Support Questionnaire, which measured the practical and emotional support received, and the satisfaction level of the two kinds of supports while encountering the life. Results : The results showed that three attachment dimensions were weakly stable over the 3 years. By controlling the practical and psychological effects of the life events, the results indicated that the participants who received more practical and emotional supports from their spouses would report more security 3 years later. Meanwhile, the participants, who received more emotional supports from their spouses and were more satisfied the supports, reported less avoidance after 3 years. Conclusion : Marital attachment dimensions were weakly stable over among older adults. In addition, the spousal support was an important predictor of the change of marital attachment. Keywords : marital attachment; spousal support; older adults

OP25 511-S-3

UNDERSTANDING REMARRIAGE IN LATER LIFE: COMPARISONS WITH LONG-TERM FIRST MARRIAGES

Teresa M. COONEY, Christine M. PROULX, Linley A. SNYDER-RIVAS (*Human Development and Family Studies, University of Missouri, USA*)

Introduction : A sizeable portion of married older adults in developed nations today are in remarriages, largely due to increased divorce. Most research on remarriage focuses on younger couples with minor

children and employs relatively small, convenience samples. Little is known about marital processes and relations in remarriages involving middle-aged and older adults, especially based on representative data from which wide-scale generalizations can be made. This study expands knowledge and understanding of mid-to-late life remarriages by considering them in comparison to first-unions. The study examines both positive (e.g., support) and negative (e.g., strain) relational features of first and higher-order unions. Within-group analyses also are conducted to determine whether the same factors (e.g., health, socioeconomic status) influence marital quality within remarriages as in first marriages. Of particular interest is how union duration shapes marital dynamics in remarriages as compared to first marriages. Method : Data are from the 2005-2006 National Social Life, Health, and Aging Project (NSHAP), which includes 4,400 U. S. adults, ages 57 to 85. All analyses are conducted separately for males and females because of established gender differences in marriage. Results : Analyses are conducted with a currently-married subsample (average age = mid 60s) that includes 556 respondents who are remarried (mean duration ~ 21 years) and 1235 who are in first unions (mean duration ~ 44 years). Relationship outcomes include marital happiness, support and strain, emotional satisfaction, physical pleasure, and time spent with spouse. Conclusion : Expanding knowledge of remarriage in later life is critical because marital quality contributes significantly to health and wellbeing. Keywords : remarriage; marital dynamics

TELECOUNSELING FOR THE LINGUISTICALLY ISOLATED: A PILOT STUDY WITH OLDER KOREAN IMMIGRANTS IN THE UNITED STATES

Yuri JANG¹, David A. CHIRIBOGA², Victor MOLINARI³, Soonhee ROH⁴, Yeddi PARK⁵, Songuei KWON⁶, Hyunhwa CHA⁷ (*1. School of Social Work, The University of Texas at Austin, USA; 2. Department of Child and Family Studies, University of South Florida, USA; 3. School of Aging Studies, University of South Florida, USA; 4. Department of Social Work, University of South Dakota, USA; 5. Silver School of Social Work, University of New York, USA; 6. Psychiatry and Addiction Department, Flushing Hospital, USA; 7. Psychiatry and Addiction Department, Hamilton Madison House, USA*)

Introduction : Responding to the critical needs of the linguistically isolated, this pilot study tested the use of telehealth technology in providing access to culturally and linguistically appropriate mental health services. The goal of the study was to explore the feasibility and preliminary efficacy of a telecounseling program in the client's native language. Method : Using a small sample of older Korean immigrants living in a low income housing facility in Orlando, Florida, who had concerns about depressive moods (n = 14), the pilot telecounseling program was implemented via videoconferencing, whereby four weekly sessions were conducted by four Korean mental health counselors based in New York. Results : Twelve participants completed all four sessions (completion rate of 86%). The mean score of the PHQ-9 at the immediate-post assessment (M = 8.50, SD = 2.27) was lower than that at the pre-assessment (M = 11.6, SD = 2.14), and the difference was statistically significant (t = 13.1, p < .001). The PHQ-9 scores at the 3-month follow-up averaged 9.25 (SD = 2.00), which was significantly higher than the mean at the post-assessment (t = 2.46, p < .05) but still lower than that at the pre-assessment (t = 10.5, p < .001). The findings indicated that depressive symptom severity was reduced upon immediate completion of the program. At the 3-

month follow-up, benefits waned, but the participants' depressive symptom scores remained significantly lower than those at the initial assessment. Conclusion : The findings support the value of telecounseling for the linguistically isolated and suggest further efforts to extend such programs. Keywords : telecounseling, depressive symptoms, linguistically isolated populations

OP25 512-S-2

LONELINESS AMONGST ETHNIC MINORITY ELDERLY: PRELIMINARY RESULTS OF A SURVEY IN ENGLAND AND WALES

Christina VICTOR¹, Vanessa BURHOLT² (1. School of Health Sciences and Social Care, Brunel University, United Kingdom; 2. Centre for Innovative Ageing, Swansea University, United Kingdom)

Introduction : For those aged 65+ in Britain research has consistently reported the prevalence of loneliness at approximately 8-10% but there is only limited evidence examining the prevalence of loneliness amongst older people from ethnic minorities. Method : We report the prevalence of loneliness, measured using both a self-report question and the de Jong Gierveld scale, for those aged 40-64 and 65+ years using data from a direct interview survey of 1200 people from the key minority groups growing old in Britain (200 participants each from the Indian, Pakistani, Bangladeshi, African Caribbean, and Chinese populations). We draw explicit comparisons for these groups with the prevalence of loneliness reported for the general population and with older people in their countries of origin as well as adults from these communities aged 40-64 years. Results : Preliminary analysis demonstrates an overall loneliness prevalence of 15% among minority elders and 11% for the mid-life group. For those aged 65+ the highest rate of loneliness at 24% was demonstrated by the Chinese population with only those from the Indian population, at 7%, reporting a prevalence of loneliness which approximated to the national norm. For those in the mid life group the prevalence of loneliness showed much less variation ranging from 3% (Indian group) to 7%. Conclusion : Rates of loneliness are elevated amongst minority elders but approximate to the national norm for those in mid-life. Keywords : Loneliness ethnic minority elders

OP25 512-S-3

UNDERSTANDING THE PARADOX OF SOCIAL ISOLATION AND SOCIAL INTEGRATION FOR OLDER ASIAN IMMIGRANTS IN NEW ZEALAND

Valerie WRIGHT-ST. CLAIR¹, Shoba NAYAR² (1. Research Cluster for Active Ageing, AUT University, New Zealand; 2. Centre for Migrant and Refugee Research, AUT University, New Zealand)

Introduction : New Zealand research of older Asian immigrants suggests poorer post-migration health outcomes associated with declining social networks and social support. Such outcomes hold social and economic implications for supporting an ageing, culturally diverse population. This study explored how Indian, Chinese and Korean elder migrants contribute to New Zealand society. Method : This grounded theory study included Indian, Chinese and Korean men and women, aged 60 or over. Through purposive sampling 74 participants for 9 focus groups across the three communities were recruited. Up to a further 30 individual interviews (10 with each community) were recruited using theoretical sampling. Semi-structured interviews in language of choice were audio recorded, transcribed verbatim, and translated where relevant to English for analysis. Questions explored how participants contributed to community and the impact on their wellbeing. Data were analysed

using grounded theory methods. Ethics approval was obtained from Auckland University of Technology Ethics Committee. Results : Participants noted a range of ways in which they facilitated their social integration. For example by volunteering at local organisations and engaging in social groups established for elders within specific ethnic communities. However, barriers were identified such as language and public transport, which increased the potential for social isolation, thus diminishing wellbeing. This was particularly so for the Chinese and Korean communities. Conclusion : Post-migration, participants report both social integration and social isolation as being part of their settlement experience. However, fundamentally the ways in which participants engaged in civic society contributed to both their self-reported wellbeing as well as the good of New Zealand society. Keywords : Older immigrants, Ethnic diversity, Social participation

OP25 512-S-4

IMMIGRATION AND AGING IN THE CITY OF SAO PAULO: PROFILE OF A GROUP OF KOREAN ELDERLY PEOPLE

Hee Jeung HONG, Beltrina CORTE (Gerontology, PUC University, Brazil)

Introduction : Sao Paulo accounts for nearly 90% of the Korean population in Brazil. The history of the first elderly Korean immigrants in Brazil has February 12th in 1963 as an official mark, and currently there are no studies regarding these early immigrants. This study has a quantitative approach aiming to comparatively track the profile of an elderly immigrant Korean group located in Sao Paulo among men and women. Method : A semistructured survey with closed-ended questions and a single open-ended question was carried out. A total of 155 respondents, 120 females and 35 males, which are Koreans and over 65s. Results : Throughout gathered data analysis, the elderly Korean longevity was noted, with 44% are aged between 70 and 79 years and 35% between 80 and 85 years. 59.2% were widows and 18.2% were widowers, indicating an old age feminization in the Korean community. It was found, incidences of Hypertension (39.5%), Diabetes (22.2%), Cardiovascular Diseases (21%), Osteoarthritis (18.6%) and Hypercholesterolemia (16.2%). 55.6% of women were hypertensive. Diabetes and heart disease ranked second, prevailing in 28.3% of women and 12% of men. Private health plans are the choice of 45%, while 9% of seniors reported usage of public health service. Conclusion : The gathered data contributes to the formulation of guidelines for social and educational actions targeted to this specific group that are broad, informative and inclusive, since these individuals exclude themselves from government initiatives for the country elderly population, either by unawareness or communication difficulties. Keywords : Korean Immigrants/ Aging/ Elderly

LONG TERM CARE VII

OP25 520-S-1

PAIN AND WANDERING BEHAVIORS IN NURSING HOME RESIDENTS WITH DEMENTIA

Hyochol AHN, Ann HORGAS (Adult and Elderly Nursing, University of Florida College of Nursing, USA)

Introduction : Nursing home residents with dementia have cognitive and communicative impairments that impair effective verbalization of pain. Thus, many older nursing home residents with dementia are under-treated for pain, a fact that may contribute to behavioral problems. The purpose of this study is to (a) to describe the prevalence of pain and wandering behaviors, and (b) to examine the relationship between pain and wandering behaviors in nursing home residents with dementia. Method : This is a secondary analysis of the nursing home

Minimum Data Set from the state of Florida, U.S., during calendar year 2009. Selection criteria were applied to ascertain data from nursing home residents older than 65 years old with Alzheimer's disease or other dementia. Data from comatose residents were excluded. The sample consisted of 56,577 nursing home residents with dementia (67.7% female; Mean age = 84 ± 7 years). Results : Among 56,577 nursing home residents with dementia, the prevalence of pain is 36.9% ($n = 20,858$) and wandering behaviors is 9.0% ($n = 5,114$). For the bivariate relationship between pain and wandering behaviors, pain is negatively correlated with wandering behaviors (Spearman's correlation = -0.090). In multivariate ordinal logistic regression, pain is still negatively associated with the frequency of wandering behaviors ($OR = .75$, $p = .000$), after controlling for covariates (e.g., cognitive impairment, ADL impairment, and sociodemographics). Conclusion : This study suggests pain is negatively related to locomotive behaviors. This result suggests that effective pain management may help to promote mobility in persons with dementia. Keywords : Pain, Wandering behaviors, Nursing home

OP25 520-S-2

CHANGES IN PHYSICAL PERFORMANCE, QUALITY OF LIFE AND PAIN AMONG THE ELDERLY PARTICIPATING IN GROUP REHABILITATION

Minna-Liisa LUOMA¹, Mariitta VAARA¹, Susanna MUKKILA²
(1. Functional Capacity Unit, National Institute for Health and Welfare, Finland; 2. Minimum Income Unit, National Institute for Health and Welfare, Finland)

Introduction : Multidisciplinary gerontological rehabilitation is intended to maintain functioning and enhance the independence and meaningful life of older people living at home. Therefore reducing pain and symptoms of depression as well as promoting functional capacity and quality of life (QoL) are the central aims of the rehabilitation of elderly. The aim of this study is to evaluate changes in pain, symptoms of depression, functional capacity and QoL, among the participants of the rehabilitation courses. Intervention was targeted to elderly whose coping at home was threatened because of decreasing functional capacity due to muscular-skeletal disease. Method : QoL was evaluated by using WHO-QOL BREF and SF36, pain by using the Visual Analogue Scale (VAS), depression by using GDS, and functional capacity was measured by using SPPB. Both QoL and physical performance were measured at baseline after 6 and 12 months. Statistical significance was measured by using t-tests ($p < 0.05$). Results : The mean age of participants ($n=376$) was 79.5 years (range 74-97). After six months the quality of life of 63-72 % of the participants was maintained the same or increased, depending on QOL questionnaire and domain. Physical performance was maintained or increased for 73 % of participants. The severity of pain and symptoms of depression decreased. Most changes maintained in 12 months follow-up. Conclusion : Results indicate that the elderly benefit from gerontological rehabilitation in terms of improved physical performance and quality of life leading to reduction in pain and in the symptoms of depression. Keywords : Rehabilitation, Functional Capacity, Quality of Life

HEALTH STATUS AND HEALTH DETERMINANTS OF RESIDENTS AND STAFF IN GERMAN NURSING HOMES- HEALTH PROMOTION RESEARCH IN LONG- TERM CARE

Annett HORN, Thomas KLEINA, Doris SCHAEFFER (Health Services Research and Nursing Research, University of Bielefeld, Germany)

Introduction : Health promotion (HP) for the oldest-old population is more established on the international research agenda than in Germany, although the demographic trend shows that the number of frail elderly has risen during the last years and will rise further in Germany. This has led to enormous changes in institutions of long-term care (LTC). Nursing homes (NH) have to implement health promoting activities for residents and staff. But there is a lack of knowledge about health status and health determinants for both target groups although that is needed for developing HP-programs. Method : Based on data collected in 8 German NHs the health status, functional independency, handicaps and health risks of residents were analyzed as well as the health status and working conditions of the employees. For this purpose standardized validated instruments were used to collect data of 807 residents and 297 employees. Results : The results stress out the high level of physical and cognitive impairment among the users of institutional LTC facilities and show that time pressure and workload have a strong influence on the health status and well-being of NH staff. Conclusion : Based on the results specific HP interventions should be designed, implemented and evaluated for both groups, residents and staff, considering characteristics of the setting. That's the central aim of the program line "Health Promoting Long-Term Care" conducted by the LBIHPR, Vienna in scientific collaboration with the University of Bielefeld. Keywords : Health Promotion, Long-term Care, Survey

A COMPARATIVE ANALYSIS ON THE IMPACT OF WIDOWHOOD ON AGED MEN AND WOMEN'S LONG-TERM CARE ARRANGEMENT: EVIDENCE FROM THE CHINA HEALTH AND RETIREMENT LONGITUDINAL STUDY, PILOT

Yan LIN (PKU China Center for Health Economic Research, China)

Introduction : Spouse loss is a crucial event in aged life that exposes the elderly widows to various psychological and social challenges. Their long-term care provision will be influenced most directly. However, women are more likely to experience widowhood than men. The 5th national population census of China indicates that 70% are women among those widowed elderly. Method : This paper uses data from the China Health and Retirement Longitudinal Study, examines the living arrangement and care provision of widowed men and women, and their physical functioning and psychological capacity, exploring their different long-term care needs and providing implications for community care service delivery design. Comparison has been made between different genders and regions, and also with other Asian and western countries to analyze the influence of different social context. Results : The result indicates that elderly women encounter more serious problems in their care-receiving after widowed than men. Widowed women are in a worse situation both physically and psychologically than their counterpart, while their care resources are even less than widowed men, and also they have less probability to remarry after widowhood. Rural widows are in the most disadvantaged situation. Conclusion : The long-term care service in the future should therefore allocate more resources to widowed women, and target their special needs. Keywords : widowhood, long-term care, gender

OP25 520-S-5

A COMPARISON OF USERS AND PROVISIONS OF LONG-TERM CARE IN RURAL AND URBAN MUNICIPALITIES IN JAPAN AND SWEDEN

Marten LAGERGREN¹, Noriko KURUBE² (1. SNAC, Stockholm Gerontology Research Center, Sweden; 2. Dep. of Management of Health Care and Social Services, Nihon Fukushi University, Japan)

Introduction : Japan and Sweden both have national systems of LTC for older persons that aim to provide equal, equitable and universal access, although they have chosen different social political solutions to achieve this goal. The aim of this study was to establish whether there are similarities and differences in users and provisions of LTC between rural and urban municipalities in the two countries and if these urban/rural differences seem to have similar patterns and causes.

Method : The comparisons were made using individual-based data describing disability and provisions of LTC collected from nine municipalities in each country grouping them into three types of municipalities: large city urban, midsize urban and rural. **Results :** The main results is that LTC recipients in large city urban areas in both countries are on average significantly less disabled than those from midsize or rural municipalities. In both countries costs per user of LTC was lower in the large urban municipality than in the rural municipalities (10% and 14% resp.). However, standardized for level of disability the per capita costs were higher in the large city urban municipalities (4 %). **Conclusion :** A possible explanation for this is that in the large city urban municipalities a lower proportion of old persons live in extended family. This increases the propensity for old frail persons in these municipalities to apply for LTC. Since the proportion of older persons living in the extended family is decreasing in Japan the result shows what kind of LTC development to expect. **Keywords :** LTC comparison provision

**OP25 520-S-6
PROMOTING PHYSICAL ACTIVITY OF NURSING HOME RESIDENTS: COMPARISON OF INTERVENTION SUPPLY AND PARTICIPATION IN DEMENTIA CARE AND TRADITIONAL CARE UNITS**

Kerstin KOEHLER, Rebecca PALM, Christian SCHWAB, Sabine BARTHOLOMEYCZIK, Bernhard HOLLE (*Witten, German Center for Neurodegenerative Diseases (DZNE), Germany*)

Introduction : There is evidence that physical activity interventions (PAIs) improve physical functioning and cognitive abilities of nursing home residents with dementia. To better meet their needs nursing homes (NHs) establish more and more special care units (SPUs). It is anticipated that PAI supply and participation differs between SPUs and traditional care units (TCUs). **Method :** Aim of this study is to investigate PAI supply and participation in German NHs with regard to differences between SCUs and TCUs. Data is derived from the survey 'DemenzMonitor', an annually repeated measurement using a multi-level questionnaire collecting data on the level of NHs (n=47), living units (n=97) and residents (n=1672). Data are analyzed descriptively using chi-square to test for significance. **Results :** 87% of the NHs (n=39) include PAIs as an important component of their written care concepts. Supply of PAIs in the SCUs (n=40) and TCUs (n=57) does not differ distinctly. SCUs offer more 'social' events (e.g. ballroom dance) while TCUs promote a more 'sportive' agenda (e.g. gymnastics). Resident participation in PAIs is slightly higher in SCUs (80%) than in TCUs (72%). Considering the amount of time spent on PAIs, involvement in both groups is low. 46% of the residents moved less than 30 minutes a week. **Conclusion :** In German NHs the awareness for the importance of promoting PAIs is high. A majority of residents participates but only spends a limited amount of time. In view of the investigated topics there are few differences between SCUs and TCUs. **Keywords :** nursing home, physical activity, dementia

GENDER DIFFERENCES IN TRAJECTORIES OVER TIME QUALITY OF LIFE AND DEPRESSION AMONG PEOPLE WITH CORONARY HEART DISEASE (CHD)**

Paola ZANINOTTO (*Epidemiology and Public Health, UCL, United Kingdom*)

Introduction : The aim of this study is to explore gender differences in trajectories of quality of life and depression among people with coronary heart disease (CHD) over four year time (2002-03 to 2005-05). **Method :** The data come from the first three waves of the English Longitudinal Study of Ageing (ELSA) which is a panel study of people aged 50 and over living in private households in England. The main outcome measures are quality of life measured using CASP-19 and depressive symptoms measured using CESD-8. The main exposure is self-reported CHD in the two years preceding the baseline interview. **Results :** Trajectories over time of quality of life had a different shape from trajectories of depressive symptoms after the onset of CHD. Men's quality of life declined over time and no changes in depressive symptoms were found. Women's quality of life declined only between baseline and four year follow-up, while in the same period their risk of having depressive symptoms reduced. It was found that women reported the same quality of life as men at baseline, and higher quality of life at years two and four of follow-up independent of other covariates. Women reported higher odds of having depressive symptoms than men at baseline and two year follow-up but not at four year follow-up. **Conclusion :** Differently shaped trajectories over time of quality of life and depressive symptoms in men and women following the onset of CHD were found. Women had better quality of life than men and their risk of depression decreased over time. **Keywords :** Quality of life, depression, CHD

**OP25 521-C-2
MANY ELDERLY WITH HEART FAILURE USE CONTRAINDICATED DRUGS: A POPULATION BASED STUDY**

Catherine GIROUARD¹, Jeanne-Francoise KAYIBANDA¹, Jean-Pierre GREGOIRE¹, Paul POIRIER², Jocelyne MOISAN¹ (*1. Faculte de Pharmacie, Universite Laval, Canada; 2. Cardiology, Institut Universitaire de Cardiologie et de Pneumologie de Quebec, Canada*)

Introduction : As much as 12% of people over 80 have heart failure (HF). Drugs causing fluid retention (corticosteroids, NSAIDs, dihydropyridines type calcium channel-blockers (CCB) and thiazolinediones) or decreasing the contractile function (class I antiarrhythmic agent, carbamazepine and tricyclic antidepressants) are contraindicated after an HF diagnosis. The use of those drugs in elderly patients and the temporal variation of this use after HF diagnosis are unknown. The objective of this study is to determine, in a population of elderly, at time of a first HF diagnosis and at months 3, 6, 12, 36 and 60 thereafter the proportion of patients using 0, 1, 2, 3, 4, 5, 6 or 7 contraindicated drugs. **Method :** Population-based inception cohort study including all individuals aged 65 and older who received a first HF diagnosis between 2000 and 2009. Data come from the Quebec health insurance board database, the Quebec registry of hospitalizations and the death registry. We calculated the proportion of patients using 0, 1, 2, 3, 4, 5, 6 or 7 contraindicated drugs for each of our 5 time periods. **Results :** At time of HF diagnosis, 70% of the 145,608 individuals included in the cohort (mean age 78.6 years) had 0 contraindicated drugs, 25% had 1, 5% had 2, and 1% had 3. These figures were 76%, 21%, 3% and 0% at 3 months. No further change was observed past three months. **Conclusion :** Almost the third of HF elderly are exposed to contraindicated drugs. Interventions have to be

implemented to improve drug use in HF elderly patients. Keywords : Quality of treatment, contraindicated drugs, Heart failure in elderly patients

OP25 521-C-3

IMPACT OF TRANSCATHETER AORTIC VALVE REPLACEMENT ON QUALITY OF LIFE AND FUNCTIONAL OUTCOMES

Caroline A. KIM, Suraj P. RASANIA, Dae H. KIM (*Division of Gerontology, Beth Israel Deaconess Medical Center, Harvard Medical School, USA*)

Introduction : Transcatheter aortic valve replacement (TAVR) has been shown to improve survival in high-risk patients with severe aortic stenosis. However, its impact on quality of life and functional status has not been summarized. Method : We conducted a meta-analysis to evaluate the impact of TAVR on the following measures of quality of life and functional status: the New York Heart Association (NYHA) functional class and the Short-Form physical component summary (SF PCS) and mental component summary (SF MCS). We used random-effects model to estimate the mean (95% confidence interval) change in primary outcomes over 6 months and 12 months in patients who received TAVR, surgical aortic valve replacement (SAVR), or conservative treatment (CT). Results : In 39 studies that included 5057 TAVR, 498 SAVR, and 257 CT patients, there was a statistically and clinically meaningful improvement in TAVR patients: NYHA class (-1.4 points [-1.5,-1.2] over 6 months and -1.4 [-1.6,-1.2] over 12 months), SF PCS (9.3 [5.2,13.4] and 8.9 [5.1,12.8]), and SF MCS (5.9 [2.6,9.2] and 4.6 [2.3,6.8]). These were comparable to the corresponding improvements in SAVR patients: the NYHA class (-1.7 [-1.8,-1.5] and -1.3 [-2.1,-0.6]), SF PCS (7.1 [5.5,8.7] and 5.7 [4.0,7.4]), and SF MCS (3.9 [2.1,5.6] and 4.4 [2.6,6.3]). There was no meaningful improvement in CT patients. However, data should be interpreted with caution because they were obtained from survivors. Conclusion : In high-risk patients with severe aortic stenosis who survived the procedure, TAVR seems to provide clinically meaningful improvement in quality of life and functional status over 1 year. Keywords : TAVR, aortic stenosis, quality of life

INNOVATIVE BUSINESS MODELS FOR THE ELDERLY CARE SERVICE INDUSTRY IN TAIWAN

Chuang-Chun CHIOU (*Industrial Engineering & Technology, Human Resourc, Dayeh University, Taiwan*)

Introduction : Global aging is occurring at a speed never seen before. With the recent advance of Information and Communication Technology (ICT) development, there are many innovative ICT applications that can be embedded for the care service. However innovative technologies must be matched with innovative business models. An innovative business model can bring about lower costs, higher quality, and greater accessibility. In addition, the framework of business model can serve as an important tool for entrepreneurship. Method : This paper intends to apply a business model analysis methodology in order to better understand the holistic approaches of these care service providers and facilitate the service providers to position themselves in the most valuable position in the elderly care service industry. Results : A business model framework is used to design the innovative services for the elderly in Taiwan. Conclusion : With business model analysis, the companies can systematically

design new ways of doing business profitably. Furthermore, it can encourage companies to develop innovative services needed for an aging society in the near future. Keywords : business model, innovation, elderly care service

OP25 522-S-2

PUBLIC INSTITUTIONAL CARE, PUBLIC HOME CARE AND CHILDREN PROVIDING PERSONAL CARE TO THEIR DEPENDENT PARENTS

Thijs VAN DEN BROEK, Pearl A. DYKSTRA (*Sociology, Erasmus University Rotterdam, Netherlands*)

Introduction : Many scholars have studied whether intergenerational support from adult children to dependent older parents is crowded out in countries with generous public long-term care arrangements. Country level public care generosity, however, is typically measured in a broad way, for instance in terms of the proportion of employees working in the social services sector. Such a measure does not distinguish different forms of public care, which is unfortunate because there are reasons to believe they might have differential implications for intergenerational exchanges. We focus on intergenerational personal care. When public institutional care is widely available, the necessity and opportunities for children to provide personal care to parents are reduced. Public home care does not reduce the opportunities or the necessity for informal care. Home care eligibility criteria are typically designed to encourage informal caregivers to step up. Thus, we expect to find that public home care does not serve as a substitute for informal care but rather complements it. Our hypothesis is that widely available public institutional care crowds out intergenerational care and that public home care crowds in intergenerational care. Method : Multilevel logistic regression analyses of SHARE panel data enriched with country level indicators from the MULTILINKS database. Results : Receiving public home care is associated with a greater probability of a child providing personal care, as expected. No effect of the availability of public institutional care on intergenerational care was found. Conclusion : Different forms of public care need to be distinguished when investigating the relationship between public care and intergenerational personal care. Keywords : long-term care, crowding out, intergenerational care

OP25 522-S-3

DELIVERING HEALTH CARE AT HOME: CHALLENGES AT THE INTERSECTION OF THE PUBLIC AND THE PRIVATE SPHERES

Anne MARTIN-MATTHEWS¹, Joanie SIMS-GOULD², Catherine CRAVEN² (*1. Sociology, The University of British Columbia, Canada; 2. Centre for Hip Health and Mobility, The University of British Columbia, Canada*)

Introduction : The delivery of home or domiciliary care services to elderly people in Canada occurs at the intersection of the public and the private spheres. The presumed availability of family ('informal' or unpaid) carers to supplement the labour of paid carers is foundational to the delivery of home care services. We examine the perspectives of agency managers and unregulated workers, and of elderly clients and family carers in identifying the key opportunities and challenges of these 'shared care' expectations. Method : We conducted in-depth interviews with 19 managers, 118 home support/personal care workers, 83 elderly clients and 58 family carers in British Columbia, Canada. Comparative data from 72 home care workers in two other Canadian provinces inform our analyses. Results : For managers and workers, and older clients and family carers, presumptions of availability of unpaid carers relate both to scope of services (Including

worker training) and scheduling of services (including worker continuity). Our findings align substantially with the Canadian Home Care Association's guiding principles of home care within an integrated care system, and recognition of family carers as vital players in care delivery. Conclusion : Many of the current conditions of the labour of home support (the 'unregulated' work of home care) are inconsistent with their full partnering within an integrated health care system. The conditions of work are the conditions of care. Thus, home 'care' can only be fully integrated with acute and primary care systems when the nature and characteristics of home care 'work' (scopes of practice, training, wage equity) are fundamentally changed. Keywords : home care, paid/unpaid care, care workers

OP25 522-S-4
IS CARING FOR YOUR ELDERLY PARENTS HARMFUL TO YOUR PSYCHOLOGICAL HEALTH? - EMPIRICAL EVIDENCE IN SOUTH KOREA

Hee Seung LEE, Douglas A. WOLF (*Public Administration and International Affairs, Center for Policy Research, Syracuse University, USA*)

Introduction : This study examines mental health outcomes of Korean adult children providing help to their elderly parents who have difficulties in activities of daily living (ADL). It argues that the caregiving activity itself might not be the only trigger of stress or overload in the relationship between adult children and parents. In addition to caregiving behavior, the physical need of care recipients may function as a separate stressor and have a significant harmful effect on the mental health of adult children caregivers. Method : Using the 2006 and 2008 waves of the Korean Longitudinal Study of Aging (KLoSA), this study estimates ordered probit model for self-assessed depression symptoms measured in the Center for Epidemiological Studies-Depression instrument (CES-D). The sample is composed of 5,300 people, who have at least one of living parents. Results : This study found that adult children with parents who need help in ADL tend to be more depressed compared to people who have parents without those need. However, caregiving behavior itself does not significantly affect depression symptom after controlling for care receivers' need and other conditions. Conclusion : Long term care policies that directly target the conditions of care recipients might be more effective than other alternative approaches if they aim to improve the mental health of caregiver. In terms of caregiver depression, policy designs should consider giving higher priority to targeting the care-recipient than the caregiver. Keywords : Family caregiving, Mental health, Long term care

OP25 522-S-5
CAREGIVING NEEDS FOR CHINESE SENIORS LIVING WITH HEART DISEASE OR STROKE

Lichun Willa LIU (*Sociology and Equity Studies, University of Toronto, Canada*)

Introduction : Canada is experiencing population aging. The aging Canadian population is also becoming increasingly diverse. Chinese seniors make up a large share of the Canada's ethnic minority senior population. Funded by the Heart and Stroke Foundation of Canada (2012), this paper examines the service gaps, needs, and barriers encountered by Chinese seniors living with heart disease or stroke and their family caregivers, as well as the strategies they utilized in self-care and self-management. Method : Mixed research methods were used in data collection, which included focus groups (n=9), individual interviews (n=8), and an open-ended email survey (n=10). Sixty-two informants participated in the study, including 26 survivors of

cardiovascular diseases, 19 family caregivers, and 17 health care providers from the Greater Toronto Areas and five other regions in Ontario, Canada. Results : Data analysis highlighted findings in the following areas: 1. Insufficient Chinese-speaking family doctors and specialists lead to long waiting time and cause delay in treatment. 2. Due to language barriers, many survivors sought health information and medical advice from "non-professionals" sources in Chinese. 3. Many recent immigrants used traditional Chinese herbal medicine alongside prescribed Western medicine, which may affect the efficacy of the prescribed medicine and mislead the doctors in diagnosis. 4. Self-management and self-care practices include physical exercises on a daily basis, eating healthy food and maintaining a healthy lifestyle, actively seeking health information from various sources, and developing a positive/optimistic outlook. Conclusion : Improved integration and coordination of care services are needed and more ethnically and linguistically appropriate programs were recommended. Keywords : caregiving for seniors

PERSPECTIVES OF LONG-TERM CARE IN BRAZIL
Maria Tereza Marsillac PASINATO (*Policies and Licensing of Health Insurance and Plans Office, ANS, Brazil*)

Introduction : The main questions refer to the way the current social security systems have dealt with the complexity of the new demands imposed by the process of population aging; and how to articulate long-term care policies with the current framework of the Brazilian social security system. Method : The paper analyze the situation of the Brazilian elders both in socioeconomic and familial terms. Based on the information of the Household Sample Survey (PNAD) and according to the degree of functional and instrumental limitation to perform ADL, three categories of Brazilian elders over 65 were defined: with functional limitations; with instrumental limitations and without limitations. We analyze the three categories in terms of health, family arrangements, poverty and its impact for the social security system. Results : The encompassing transformations observed in the Brazilian society, such as the verticalization of families, the increase in women's participation in the labor market and population aging bring into the policymakers' agenda the question of providing care for elders with instrumental and/or functional limitations. This group is substantial, representing approximately ¾ of female elders aged 80 years and over. Conclusion : It is necessary to rediscuss and redefine a series of parameters of the current Brazilian social security system. The precarious balance of the system needs to be analyzed in the light of demographic, social and economic trends forecast for the next 20 or 30 years. Only after the restructuring of the system is it possible to consider the incorporation of this new and latent demand (LTC) from the Brazilian society. Keywords : Brazilian social security system, public policy, aging

OP26 101-S-2
HOW TO COMPARE THE PERFORMANCE OF THREE EUROPEAN LONG TERM CARE SYSTEMS BY USING THE BALANCED SCORECARD FRAMEWORK

Samir HENNI¹, Bruno FANTINO², Christophe GERMAIN³, Olivier BEAUCHET² (*1. Geriatry, Hospital Center Francis Robert and Aime Jallot, France; 2. Geriatry, Hospital University Center of*

Angers, France; 3. Vice Dean - Academic Director, Audencia school of management, France)

Introduction : The economic context is characterized by a decline in revenues of the state and an increase in deficits and debt. Even if this context has an impact on healthcare systems, it is not sufficient to limit the thinking to the economic dimension to evaluate healthcare systems performance. In fact, the only measure of the efficiency of financial indicators, leads to a 'management by the mirror.' It is therefore necessary to adopt a more balanced and forward-looking. A tool for performance evaluation, called Balanced ScoreCard (BSC) seems appropriate mainly because it measures criteria for recognition and anticipation. Thus, the aim of our study was to compare systems of care for elderly in France, Germany and the UK using the BSC approach. Method : We aggregated values of each country for the four dimensions of BSC (financial, customer/user/patient, internal process and organizational learning). We select the best value among the three studied countries and we calculated the percentage difference between the value of each country and the reference value of each indicator. Results : We found that French system of care for elderly people is quite efficient compared to the resources allocated and results recorded. Furthermore, France system approaches evenly the four dimensions of BSC compared to the other countries. Limitations: the multidimensional nature of our comparison (three countries compared according four dimensions). Conclusion : The research shows that the theory and the concept of the BSC, initially designed for industries in the private sector may be applied in the context of healthcare systems to compare healthcare performance across organizations, sectors and countries. Keywords : European long term care , BSC Balanced Scorecard, efficiency health system

**OP26 101-S-3
AN EVALUATION OF RECENT SOCIAL POLICY INNOVATIONS IN SOUTH KOREA**

Hee Seung LEE, Douglas A. WOLF (*Public Administration and International Affairs, Center for Policy Research, Syracuse University, USA*)

Introduction : Care for the elderly involves shared responsibilities between the family and the state. Various policies have been enacted in developed countries in order to organize elder care efficiently and effectively. In 2008, South Korea launched two new policies, a Basic Old-Age Pension (BOAP) which provides means-tested income support for the bottom 60 percent of the population, and a Long Term Care Insurance (LTCI) program which provides universal social insurance similar to that provided in Germany and Japan. This study investigates the effect of both policies on subjective wellbeing of the older population. Method : We use data from the first and second waves of the Korean Longitudinal Study of Aging (KLoSA), a nationally representative panel study of the older population in South Korea. The 2006 data represent the "pre-treatment," and the 2008 data do the "post-treatment" situations; we use regression and random-imputation methods to create comparison groups for purposes of inferring program impacts. Subjective wellbeing is measured in three ways-general life satisfaction, satisfaction with health and satisfaction with economic status. Results : The findings of this study suggest that two life satisfaction measures are increased in response to the BOAP and LTCI programs. LTCI alone significantly improves one of three subjective wellbeing outcomes. Combined policies of both LTCI and BOAP significantly increase two subjective wellbeing outcomes. Conclusion : Korean old people with middle or low wealth status are benefited most from the two policy innovations in terms of general life satisfaction and satisfaction with economic satisfaction. **OP26 101-S-4
MONITORING IN LONG-TERM CARE- PILOT PROJECT ON ELDER ABUSE (MILCEA)**

Uwe BRUCKER, Andrea DR. KIMMEL, Nadine SCHEMPP (*Long-term-care insurance, Medical Advisory Service of the German Long-Term-Care-Insurances (MDS e.V.), Germany*)

Introduction : The MILCEA-Project (funded by the European Commission) developed a Monitoring-System for the prevention of elder abuse in long-term-care-settings. As the part of people aged 65 years and older is growing all over Europe also elder abuse will grow as a public health and societal problem. Elderly particularly in later and end of life are in the risk of becoming frail. The increasing dependency make people in need of long-term nursing care vulnerable to maltreatment. Monitoring Elder Abuse refers to a constant observation and evaluation of the care giving process in order to detect either a risk situation in elder abuse or an actual case of abuse. The function of a monitoring system thus is prevention of elder abuse and protection of the (potential) victim. Method : The MILCEA-Project held focus-discussions on five national experts' level: function and elements of a monitoring system in preventing elder abuse were defined, indicators and risk factors were fixed. After analysing (force field analysis) existing national monitoring structures for identifying and recording elder abuse, key actors of the existing structures, their deficiencies and the lack of structures were identified. Finally the prerequisites of a monitoring system for European countries are given as recommendations how to improve existing monitoring systems. Results : Findings for a framework of a monitoring system: Basic requirements must be realized both on political and on organizational level. Conclusion : Awareness and knowledge of elder abuse must be given, the realization of positive view of old age is a political and societal task. Keywords : elder abuse; monitoring; prevention

**OP26 101-S-5
HORIZONTAL AND VERTICAL PARTNERSHIP WORKING IN LONG-TERM HEALTH AND SOCIAL CARE SYSTEM**

Hengliem Lisa CHEN (*School of Education and Social Work, University of Sussex, United Kingdom*)

Introduction : Fragmented care was a matter of concern in many long-term care system for older people. This suggests that partnership in the care system should be recognised as a vital component if quality of care in long-term care is to be promoted. Although partnership is not an entirely new phenomenon; there is as yet no widely accepted model in operation. What this study hopes to achieve is to outline the approaches that each country has adopted and the difficulties that they are facing. Method : It uses qualitative data from England, the Netherlands and Taiwan. Interviews were undertaken with care recipients and their cluster of relevant care actors at micro-, meso- and macro-level. A total of 143 participants (48 in England, 43 in the Netherlands and 52 in Taiwan) were included in the analysis. Results : One of the important findings was that the Netherlands but not the other two countries seemed to have higher degree shared goals for making efficient partnership more feasible. The Dutch partnership model clearly provided greater consultation within a care system based on fewer power barriers and a more transparent care strategy between the actors from top to bottom. Taiwan and especially England, however, had cooperation difficulties between various departments, especially between health care and social care. These were demonstrated in the difficulties faced in professional practice and service delivery. Conclusion : It is not sufficient to focus only on

addressing the challenge of the horizontal or vertical partnership in the long-term care system, because both issues are strongly interlinked. Keywords : Partnership, , long-term care, cross-national comparison

INTERGENERATIONAL RELATIONSHIP I

OP26 102-S-1

CHANGES IN VALUE AND BEHAVIOR IN INTERGENERATIONAL TRANSFERS WITHIN FAMILIES IN TRANSITIONAL CHINA

Zhiyong LIN (*Department of Sociology, Tsinghua University, China*)

Introduction : This study examines the impact of rapid economic and social changes on intergenerational transfers in Chinese families in contemporary China. Method : Hypotheses under the paradigm of “solidarity-conflict” were proposed and tested with the data collected from the project of Financial and Society Survey in 2011. Scale construction method was used to identify socio-economic and cultural factors affecting intergenerational transfers within families and ANOVA was employed to compare three geographical areas that respectively represented different levels of development. Results : Findings from the analyses indicate that (1) values, filial norms and other cultural practice concerning families, parents and children have experienced great changes across China; (2) although intergenerational ambivalence is prevalent, ambivalence between dependence and autonomy and between personal expectations and societal norms is various across three areas examined. Conclusion : The findings suggest that further research attention should be given to the contradictions between traditional cultural factors and intergenerational transfers rather than solely following the normative approach of over-emphasizing the intergenerational “solidarity-conflict” paradigm. Modern societies with dynamics of change have a tendency to the devaluation of the elderly and the subsequent loss of normative force over their posterity. This phenomenon is especially obvious in transitional regions in China. Keywords : Social Transition, Intergenerational Transfers, Intergenerational Ambivalence

OP26 102-S-2

ATTITUDE TOWARDS OLDER ADULTS AND PERSPECTIVE ON ELDERLY CARE AMONG COLLEGE STUDENTS IN CHINA

Jing TAN, Kathleen BAILEY (*Social Work, Bridgewater State University, USA*)

Introduction : China has the largest net aging population in the world along with a rapid aging pace. Historically, the family has been the source of support and care for their elders, and filial piety has been a fundamental tenet in Chinese culture. However, increased geographic mobility and reduced family size have made more adult children unavailable for elder care. Very little empirical research has examined the attitudes and perspectives among college students in China towards older adults and elderly care. Method : A mixed method approach was used with both quantitative and qualitative data collection. A convenience sample (N= 380) was collected through anonymous, self-administered survey questionnaires. In addition three one-hour long English focus groups were conducted. Survey data were inputted and analyzed using SPSS. Focus groups were transcribed and analyzed using content analysis methods. Results : Quantitative data reported that the ASD scores are neutral, and indicate there are gender differences in perspectives on future elderly care for their parents. Qualitative data suggested that traditional Chinese obligations to live with one’s parents throughout life are not as prominent today. In

addition, the nursing home business has developed and this option has seemingly become more popular among Chinese families with ageing adults. Conclusion : Findings from this study provide important and meaningful information for gerontological educators, service providers, and policy makers. With the one-child policy in place for a generation, China is facing an ever-growing need for trained professional service providers such as social workers to address the needs of older adults. Keywords : Attitude towards Older Adults, elderly care, China

OP26 102-S-3

SELF-RATED HEALTH TRAJECTORIES AMONG RURAL CHINESE OLDER ADULTS: THE ROLE OF INTERGENERATIONAL RELATIONSHIP

Nan LU¹, Vivian, W.Q. LOU², Iris CHI³ (*1. Department of Social Work & Social Administration, The University of Hong Kong, Hong Kong; 2. Department of Social Work & Social Administration, Sau Po Centre on Ageing, The University of Hong Kong, Hong Kong; 3. School of Social Work, University of Southern California, USA*)

Introduction : Self-rated health is an important predictor of adverse health outcomes (e.g. mortality) and health service use. It can be used as an effective and economic instrument to measure the health of rural Chinese older adults, which is the largest aged population in the world. However, little is known about the patterns of change trajectories of self-rated health of rural Chinese older adults. Method : The data was derived from the longitudinal study named as “The well-being of older people in Anhui Province”. The data from the 2001, 2003 and 2006 waves were included in the analysis. Multiple imputation was implemented to handle the sample attrition. General growth mixture modeling was used to investigate the number of latent classes of self-rated health trajectories as well as the antecedents of class memberships. Results : Two types of self-rated health trajectories were identified. The first is good but declining self-rated health group. The second is poor and declining self-rated health group. We found that the memberships were significantly associated with annual household income, IADLs, disease and intergenerational relationship. Conclusion: The empirical findings suggested that rural families play central roles in promoting self-rated health trajectories of rural older adults. New policies should be developed to support rural families to care for their older parents, with a particular focus on improving family relationships across generations. Keywords : self-rated health trajectories, intergenerational relationship, rural China

OP26 102-S-4

THE CHANGING PATTERNS IN LIVING ARRANGEMENTS AND THEIR IMPACTS ON INTERGENERATIONAL TRANSFERS IN CHINA

Taichang CHEN (*School of Public Administration, Renmin University of China, China*)

Introduction : Living arrangements are vital to intergenerational transfers and welfare in old age, particularly in China which lacks social security system that provides universal coverage. Recent empirical evidence shows that co-residence with children in China has declined over time as a result of increased financial independence, changing norms, and land and housing reforms. It is not yet clear how intergenerational transfer is affected by this trend of living away from children. Method : This study seeks to extend current understanding of the dynamics of living arrangements among older Chinese by exploring two sets of nationally representative survey data that were conducted by the China Research Center on Ageing in 2000 and 2006 respectively, covering 20,000 samples aged 60 and over. Instead of

binary variable, coresident or not, used in previous analyses, this study introduces trichotomous variable (live in the same household, live in the same city, not live in the same city) to measure potential effects of living arrangements (distance from children) on adult children's transfer behaviours. Results : The results suggest that living close to children, rather than co-residing with them, has become an important way of providing old-age support. However, such changes in living arrangements do not necessarily constrain intergenerational transfer capacity and make old parents worse-off. Weak evidences have been found that, generally, parents live far from children receive more intergenerational transfers. Conclusion : The family unit and traditional family support in old-age seem likely to continue to be the essential pillar of the old-age security, particularly in rural areas. Keywords : living arrangement, intergenerational transfers, China

OP26 102-S-5
FACTORS INFLUENCING SUICIDAL IDEATION AND SUICIDAL ATTEMPTS OF OLDER PERSONS : FOCUSING ON EFFECT OF POVERTY AND EMPLOYMENT STATUS

Geum Sun BYUN, Seung Jae AHN (*Institute of Social Welfare, Seoul National University, Korea*)

Introduction : This study explore factors influencing the suicidal ideation and the suicidal attempts of older persons in Korea. Korea ranked the highest suicide rate in old age among OECD countries (83 older people suicide per 100 thousand persons in 2010). Combined with population ageing, elderly suicide became a prior social problem to solve with urgent social intervention. Many articles indicated that economic shift like poverty and job loss effects people's drastic act and most old people sustain serious economic insecurity for ageing. But much of researches have been tried to find the factors of old age suicide from psychological reasons, like depression only. This study focus on the effect of economic situations and employment status on the older persons' suicidal ideation and attempts. Method : Using 2 years accumulated data from the KWPS(Korea Welfare Panel Study), this study examined what makes older person think and try to suicide. Ordinary least squares(OLS) and panel data analysis are used in this research. Results : Controlling for demographic characters, self-esteem and depression, absolute poverty, material hardship, and job loss experience positively affects on suicidal ideation and suicidal attempts. In contrast, annual household income level and relative poverty do not have a significant association with suicidal ideation and suicidal attempts. Conclusion : These results show that improving the old-age income security can be one of important solution to reduce elderly suicide rate. So the government need to concentrate on income security as well as psychological treatment program in social intervention for older persons in the grip of sever situation. Keywords : elderly suicidal ideation, old-age poverty, old-age labor participation

INTERGENERATIONAL RELATIONSHIP II

OP26 103-S-1
ELDERLY'S PERCEPTION ON INTERGENERATIONAL RELATIONSHIP: A CASE OF RURAL INDIA

Dhananjay W. BANSOD (*Population Research Centre, Institute for Social and Economic Change, India*)

Introduction : The paper focuses on care and support elderly gets in the family and their perceptions towards the younger generation in rural Maharashtra. Issues like situation of the aged in the context of respect and care, how the aged and their subsequent generation perceive ageing, elderly's views and opinions about the young generation have

been explored in this study. Further, the impact of various socio-economic characteristics on the perceptions of the elderly towards the younger generation is discussed in detail. Method : Data for this study was collected from the rural Maharashtra using semi structured interview schedule. 600 males and females were interviewed; systematic sampling technique was used for data collection. Multivariate analysis is used to examine the impact of predictor variables on the perceptions of the elderly about the younger generation. Results : More than one third of the elderly in rural area are not getting proper care and support from their children/family. Age, sex, type of family, standard of living, and economic status are the significant variables to the family support. A majority of the elderly respondents perceive ageing as a problem as they cannot do the work they used to do it earlier and also their family member's consider them as a burden for the family. The results show that elderly people living alone with their spouses develop a more negative perception towards the younger generation than those living with their children. Conclusion : The study highlights the need for company of either married or unmarried children to make the elderly feel more secure. Keywords : Elderly, younger generation, perception,

OP26 103-S-2
LIKE FATHER, LIKE SON: INTERGENERATIONAL RELATIONS, KOREAN PATRIARCHY, AND AMBIVALENCE

Allen J. KIM, Judith TREAS (*Sociology, University of California, Irvine, USA*)

Introduction : In the South Korean press and Korean-American communities, patriarchal norms are criticized for causing distant and dysfunctional family relationships, particularly between fathers and children. Father School (FS) is a large, transnational, men's movement which aims to convert traditional fathers into caring dads--consistent with the Western "new father" ideal. FS participants illustrate the implications of cultural change for father-son relations in adulthood. Method : Drawing on observational research conducted at FS events in U.S. immigrant communities and South Korean community, prison, and military settings, this paper analyzes how men make sense of their relations with their fathers in light of changing cultural expectations. Based on a content analysis of 100 personal letters that middle-aged workshop participants wrote to their own aging fathers, we identify recurrent themes in men's accounts of the painful emotional legacy of their fathers' traditional masculinity. Results : While describing the negative aspects of their relationships with their fathers, informants also point to this experience as motivating their desire to act differently toward their own children. A comparison of South Korean and U.S. FS participants show that immigrants experience an additional burden. Immigrants feel guilty about not being available to care for aging parents. Conclusion : Although Korean men reject the patriarchal values which undermined their personal relationships with their fathers, even U.S. immigrants embrace traditional filial values which emphasize their responsibility for aging parents. Consistent with the time-and-place paradigm of life course theory, this study shows that the content and meaning of intergenerational relationships are contingent on historical era and cultural context. Keywords : Intergenerational Relationships, Korean Families, Fatherhood

OP26 103-S-3
WHY WOULD FILIAL OBLIGATION REMAIN A STRONG NORMATIVE VALUE AMONG MODERN CHINESE WOMEN?

Patricia O'NEILL (*Sociology/ Oxford Institute of Population Ageing, University of Oxford, United Kingdom*)

Introduction : Unlike in the past, many Chinese women today are likely to be educated, employed, financially self sufficient and making their own decisions. Domination by and dependency on the family has diminished to a great extent. Yet, daughters' commitment to the filial tradition of caregiving has largely remained. This research seeks to understand why Chinese daughters are still willing to undertake family caregiving activities considering their modern lifestyles and attitudes and to examine the shift in the practical discharge of traditional filial obligations. **Method :** Fifty five Chinese women born between 1946 and 1980 participated in semi-structured, in depth interviews in Hong Kong and Singapore. Thematic analysis was performed on the transcribed data. **Results :** Framing rules provide the normative structure in which adult Chinese daughters are expected to care for ageing parents and in-laws. Feeling rules and emotion work determine their willingness to do so. The core belief in duty has not fundamentally changed from the parent's generation. However, the manner in which filial obligation is discharged has. Growing reliance on foreign domestic helpers as well as nursing homes appears to be inevitable. **Conclusion :** With a rapidly ageing Asian population and inadequate pension and retirement schemes, pressure on daughters to continue care giving activities is strong. Enduring social norms and cultural expectations suggest daughters will likely continue to care for ageing parents, but perhaps not in-laws. Fewer women, due to low fertility, and demands on time, combined with a modification of feeling rules, suggests the manner in which caregiving activities are carried out may be evolving into a new cultural paradigm. **Keywords :** filial obligation

OP26 104-S

IMPACT OF POPULATION AGEING

OP26 104-S-1

COMPARATIVE STUDY ON HEALTH OF OLDER PERSONS IN SELECTED COUNTRIES IN THE WESTERN PACIFIC REGION

Julie E. BYLES¹, John HALL², Cate D'ESTE² (1. *Research Centre for Gender, Health and Ageing, The University of Newcastle, Australia;* 2. *Centre for Clinical Epidemiology and Biostatistics, The University of Newcastle, Australia*)

Introduction : The Western Pacific Region is geographically vast, culturally diverse, and ageing at different rates across its 37 countries. Fifteen percent of the 1.8 billion people in the WPR are aged ≥60 years, representing 30% of the world's older population. The age of the region's population, and life expectancies, are increasing rapidly, particularly in lower income countries. Governments, health care providers and communities require information to strategically plan for changing needs of their populations. **Method :** Data on older people, obtained from international databases including World Health Organization, United Nations, and country specific surveys of older people such as SAGE (China), INDEPTH (Vietnam) and KLOSA (South Korea), were compared for selected countries across the Western Pacific Region. **Results :** Primary health data on self-rated health, health conditions, physical functioning, health behaviours, and sociodemographic data will be presented for selected countries. Results are adjusted for population differences in age and sex, and also include cross-country comparison of associations between health status and socio-demographic factors. Additional fact sheets prepared for each country provide information on population trends, life expectancy, and burden of disease (DALYs). A meta-survey of data sources across the region identifies gaps in data coverage and a lack of recent studies to monitor the progress and impact of population ageing in many settings. **Conclusion :** This paper provides insights into the health of persons aged 60 years and over in the Western Pacific

Region. These data are an important regional resource for development of policy, practice and research related to ageing and health. **Keywords:** health status, cross-country, population ageing

OP26 104-S-2

GENDER IMBALANCE AT BIRTH AND PARENTS' ANXIETY ABOUT OLD AGE IN CHINA

Yoshihiko KADOYA, Ting YIN (*Institute of Social and Economic Research, Osaka University, Japan*)

Introduction : Chinese parents prefer to have sons as they depend on their sons for support in old age, according to most of the literature. This paper uses the Preference Parameters Study, which randomly interviewed individuals in six major cities in China in 2011, to present empirical evidence about the possible cause of the problematic gender imbalance at birth in China. **Method :** From the dataset, this paper compares sons' and daughters' commitment to parental care from a selection of respondents who were married, aged 20-70, had at least one living parent, and had no missing answers to the interview questions. **Results :** Chinese sons (and their wives) are more likely, compared to daughters (and their husbands), to be primary caregivers for parents. The paper concludes that parents' dependency on their children would not necessarily decrease with the development of social security, although children with highly educated spouses appear to present an exception. **Conclusion :** The current study supports the initial claim found in literature; however, no evidence is found that the development of a social security system is to be the solution. **Keywords :** gender imbalance, son preference, anxiety about old age

OP26 104-S-3

WORK-CARE RECONCILIATION FOR CARERS OF OLDER PEOPLE IN CONTRASTING WELFARE SYSTEMS: DEVELOPMENTS IN EMPLOYMENT LAW, PUBLIC POLICY AND ORGANISATIONAL PRACTICE

Sue YEANDLE¹, Janet FAST² (1. *Sociology and Social Policy, University of Leeds, United Kingdom;* 2. *Human Ecology, University of Alberta, Canada*)

Introduction : This paper draws attention to work-care reconciliation developments affecting family carers of older people in Europe, East Asia, Australia and North America. Highlighting common contextual factors high/ rising levels of female employment; population ageing and policy concerns about care deficits; and the emergence of NGOs advocating on behalf of 'working carers' - the paper considers policy convergence and differentiation in different welfare systems. **Method :** Using secondary analysis of statistical data on carers, highlighting evidence from qualitative studies, and contextualising this material in comparative analysis of legislation, policies and debates, the paper explores the pace, direction and varieties of change observable in 8 societies. It asks how far employers are drawing carers of older people into the remit of their wellbeing and work-life balance agendas, and examines how governments have responded to the challenge of supporting carers to remain at work. **Results :** Drawing on Yeandle's edited collection with Kroger (Policy Press, 2013) which explored developments in East Asia, the Nordic countries and two liberal democracies as well as Fast's recent Canadian workplace survey and interviews with HR professionals about support for carers, the paper also highlights emerging policy and practice in Canada and the USA. **Conclusion :** In conclusion, the authors reflect on their work with employer forums of various kinds, and ask, how far has workplace support for carers of older people crept up organisational agendas? Do carers and older people benefit from these changes? Do these developments help carers combine work and care without detriment to

their jobs, careers and family commitments? Keywords : carers; work-life; older people

OP26 106-S HETEROGENEITY AMONG OLDER PERSONS

OP26 106-S-1

POPULATION AGEING IN RUSSIA: GENDER DIFFERENCES
Gayane SAFAROVA¹, Lenar KOZLOV², Anna SAFAROVA¹
(1. Laboratory of Theoretical Economy, Saint-Petersburg Institute for Economics and Mathematics, Russian Academy of Sciences, Russia; 2. Laboratory of the Demography of Ageing, Saint-Petersburg Institute of Bioregulation and Gerontology, Russia)

Introduction : Population ageing is a triumph and a challenge for development in the 21st century. The population of Russia is rapidly ageing, and with ageing progress the need for thorough analysis of this process increases. Demographic development of Russia is characterized by high mortality difference by sex and significant imbalance between males and females in age composition. The paper aims at analysing gender differences in ageing development in the Russian Federation since the beginning of the 1990s. Method : Changes in number and percentage of the elderly (60+) and the number of males per 1000 females in older age groups are considered. Special attention is given to gender gap in life expectancy at older ages. Regional aspect is touched on, and comparisons with developed European countries are made. The paper is based on censuses (including the last 2010 census) and data on vital events. Results : It is shown that ageing process in Russia is characterized by significant imbalance between males and females in population age structure (the number of females at older age groups is higher than the number of males; the proportion of population 60+ for females is higher than that for males). Male life expectancy is lower than female one, leading to high prevalence of widowhood, the latter increasing with age. Gender imbalance in Russia has been more marked than in developed European countries. Conclusion : Measures to adapt economy and social infrastructure of Russia to the ageing society should be elaborated. Without taking account of gender differences, they are doomed to be ineffective. Keywords : population ageing, demographic aspects, gender differences

OP26 106-S-2 CULTURAL DIFFERENCES IN OLDER PEOPLE'S RELATIONSHIPS WITH THEIR ADULT CHILDREN

Xiaoping LIN¹, Christina BRYANT², Briony DOW¹, Jennifer BOLDERO³ (1. Health Promotion, National Ageing Research Institute, Australia; 2. Psychology, University of Melbourne & Royal Women's Hospital, Australia; 3. Psychology, University of Melbourne, Australia)

Introduction : Based on the solidarity-conflict model (Bengtson, Giarrusso, Mabry, & Silverstein, 2002), this study explored the complexity of older people's relationships with their adult children from the older person's perspective. In the context of increasing cultural diversity in Australia, the study focused on cultural differences in these relationships, in particular, those between older Australian-born individuals and older Chinese immigrants. Method : A total of 122 community-dwelling older people (60 Australian-born and 62 Chinese-born people) were interviewed in the study. The interviews collected demographic data (e.g. age, gender, and financial situation), and information on intergenerational relationships (e.g. living arrangements, frequency of contact, patterns of intergenerational exchanges, and filial expectation). Results : The study revealed

complex cultural differences in older people's relationships with adult children. Compared to older Australian-born individuals, older Chinese immigrants were more likely to live with their children and had higher filial expectation. However, more than half (65%) of the Chinese participants (65%) did not live with their children, and among them, most (93%) were satisfied with such arrangement. Among the Chinese participants who did live with their children (n=22), more than 60% payed board or shared expenses with their children. Conclusion : The study found complex cultural differences in older people's relationships with adult children. In particular, it found evidence that suggests important changes in the traditional practices that reflect filial piety in older Chinese immigrants' relationships with their adult children. These findings provide valuable insights for future aged care provision in multicultural countries like Australia. Keywords: intergenerational relationships

OP26 106-S-3 REGIONAL DIFFERENCES IN POPULATION AGEING (THE CASE OF THE VALENCIAN COMMUNITY)

Carles SIMO¹, Gaiane SAFAROVA² (1. Sociology and Sociological Anthropology, University of Valencia, Spain; 2. Institute for Economics and Mathematics, Russian Academy of Sciences, Russia)

Introduction : With ageing development the need for thorough analysis of this process increases, especially for like Spain that may be considered as rather "old" countries. The Valencian Community (VC) is the fourth country's region in terms of population size and consists of three parts: Alicante, Castellon and Valencia having different population size and demographic indicators. The paper aims to make a comparative analysis of ageing development in the regions of VC since the beginning of the 1990s. Method : Changes in age structure by major age groups are considered, and a number of ageing characteristics are computed for VC and its regions. Ageing indicators for VC are compared with those for Spain as a whole. Both conventional measures, including proportions of the elderly in the total population, ageing index, old age dependency rate, parent support ratio, and prospective measures that take account of remaining years of life (proportion of persons in age groups with remaining life expectancy (RLE) equal to or less than 15 years, prospective old age dependency rate and population average remaining years of life) are examined. The paper is based on censuses and micro-data on vital events. Results : Substantial regional differences in values of ageing indicators have been found. Values of traditional measures are shown to be smaller than those of corresponding prospective measures. Conclusion : The study is revealing similarities and diversities in dynamics of ageing indicators for VC and Spain, and inside VC. Results obtained may contribute to the management, administration and planning of social programmes related to population ageing. Keywords : Population ageing, regional differences, prospective measures

OP26 106-S-5 GRANDPARENTS AND GRANDCHILDREN IN SITUATIONS OF DIVORCE: THE ROLE OF THE MIDDLE GENERATION IN THE INTERGENERATIONAL CONTACT

Anne Carolina RAMOS (Department of Education, Federal University of Rio Grande do Sul, Brazil)

Introduction : In childhood, relations between grandparents and grandchildren are heavily determined by the middle generation. It is usually the children's parents who make it possible to build a bridge between these two non-adjacent generations, which may involve a strong preference for the mother's side of the family, increasing

distance or even complete breakdown in intergenerational contact, especially when families break up and are reconstituted. Method : This study examines how the relations between grandparents and grandchildren happen in nuclear, single parents and reconstituted families from the perspective of thirty-six Brazilian children aged between seven and ten years from the city of Porto Alegre, in the South region of Brazil. Results : In their reports, they tell us about the importance of the ties created by the middle generation in intergenerational interaction and show us how the divorce of their parents can lead to significant consequences in the quality and intensity of contact with their grandparents. Conclusion : When the ties between these two generations weaken and break down, children can symbolically divest them of the role of grandparents. This shows that children have great power in the process of inclusion and exclusion of family members and that it is not enough for grandparents to consider themselves grandparents. For this relation to establish itself, the grandchildren too must consider themselves grandchildren, which floors the idea that adults have the last word, giving new perspectives to the intergenerational studies.

AGEING AND DISABILITY II

OP26 113-S-1
AN ANALYSIS OF INEQUALITY OF PUBLIC SPHERE AND HEALTH STATUS OF AGING COMMUNITIES IN KHUZISTAN PROVINCE, IRAN

Abdolrahim ASADOLLAHI¹, Laleh Fani SABERI², Ali Hosein HOSEINZADEH³ (1. Australian Centre for Quality of Life, Deakin University, Australia; 2. Community Health, Mazandaran University of Medical Sciences, Iran; 3. Sociology, Shahid Chamran University of Ahwaz, Iran)

Introduction : Increasing aged population (3.1%) as compared with natural growth in the Iranian population (1.2%) is a problematic issue. The literature acclaims that physical disabilities and health problems in the late life have a significant relationship with social participation of the elderly and their cohesive actions in the society. Method : This study illustrates social participation as an indicator of social cohesion in the Iranian background, as well as its factors and obstacles especially among the elderly. The scale of aged participation (SAP) was constructed according to the selected theories of four basic items and its 35 sub-items. The study was carried out in 2010 and the sample of population comprised the aged communities from five selected cities of Khuzistan province in southwest Iran, namely, Ahwaz, Behbahan, the Mah-Shahr Port, Dezful, and Abadan. The research studied 768 samples of urban and rural aged citizens, chosen using the cluster-ratio sampling method. Results : The findings revealed that social participation was low while social cohesion was poor. There were significant relationships with burgess, high literacy, ethnicity, living with children, feminine, growth of welfare, having the chronic disease of respiratory disorder, social alienation, cost of participation, reduction in benefits of participation, and growth of their children's and new generation's income. Conclusion : The social Sphere and health status of aged samples were moderated by their engaging in the community level. Keywords : Social Cohesion, Health Status, Participation, Aging, Khuzistan Province, Iran

OP26 113-S-2
FACTORS ASSOCIATED WITH MACRONUTRIENT INTAKE IN A COHORT OF ADVANCED AGE: LILACS NZ

Carol WHAM¹, Ruth TEH², Simon MOYES², Ngaire KERSE² (1. Human Health and Physiology, Massey University, New Zealand;

2. Department of General Practice & Primary Health Care, University of Auckland, New Zealand)

Introduction : Understanding the nutritional status of people in advanced age is an essential component of addressing health and well being. Method : In the Life and Living in Advanced Age: a Cohort Study in New Zealand 578 Maori and non Maori octogenarians completed two 24 hour multiple pass recalls of food intake. A t-test or Mann-Whitney U test was used to determine whether macro-nutrient intake differed by social or cultural factors. Results : For Maori (n=216) the mean (SD) energy intake was 1564±589 kcal (carbohydrate 44±9%; protein 17±4%; fat 39±9%). Those with a role in Maori organisations compared to those with no role had a lower % intake of CHO (39.8±7.5 versus 44.8±8.7) (p=0.002) and a higher % intake of protein (17.4±4 versus 16.3±3.7) (p=0.04) and fat (42.5±8.1 versus 40.8±9) (p=0.004). Maori who converse in Te Reo compared to those who don't had a higher % fat intake (40.8±9 versus 37.4±8.3) (p=0.02). For nonMaori (n=362) the mean (SD) energy intake was 1739±557 kcal (CHO 45±8%; protein 16±3%; fat 37±7%). Those who live alone compared to those who live with others had a lower % fat intake (35.2±7.9 versus 38.0±7.0) p=0.02. NonMaori participants who receive superannuation compared to those who receive superannuation plus other income tended to have a higher % CHO intake (46.5±7.3 versus 44.7±8.5) p=0.07. Conclusion : Maori who are more embedded in their culture eat more protein and fat related to their traditional diet. Among nonMaori those with more income eat less carbohydrate. Dietary intakes are in part associated with cultural practices and financial resources. Keywords : macronutrients, culture, New Zealand

OP26 113-S-3
LONGITUDINAL DYNAMICS IN INDICATORS OF FRAILTY: PATTERNS AND PREDICTORS

Oleg ZASLAVSKY¹, Barbara COCHRANE², Hilaire THOMPSON³, Nancy Fugate WOODS³, Jerald HERTING⁴, Andrea LACROIX⁵ (1. Departments of Nursing, University of Haifa, Israel; 2. Family and Child Nursing, University of Washington, USA; 3. Biobehavioral Nursing and Health Systems, University of Washington, USA; 4. School of Sociology, University of Washington, USA; 5. Public Health Science Division, Fred Hutchinson Cancer Research Center, USA)

Introduction : Despite a long conceptual and operational history in research and publications, both frailty and mechanisms of its development are still poorly understood. A detailed description of trajectories of frailty indicators is needed to provide insights on longitudinal dynamics involved in the development of frailty. The purpose of this study was to: 1. Describe longitudinal (~10 years) trajectories of change in musculoskeletal and neuro-cognitive indicators of frailty in older women enrolled in the Women's Health Initiative (WHI). 2. Estimate the extent to which baseline factors (e.g., demographic characteristics, health status and behaviors) were associated with a likelihood of membership in the derived longitudinal trajectories. Method : We used longitudinal data from a subset of older (≥65 years at baseline) WHI Clinical Trial participants (N=19,891). Latent class growth models were used to estimate longitudinal dynamics in indicators of frailty and ordered logit models were applied to estimate the effects of baseline predictors on these trajectories. Results : The study findings demonstrated a high degree of heterogeneity in longitudinal dynamics of individual frailty criteria. However within specific criteria, elderly women maintained fairly similar patterns of functioning over time. Age, socio-demographic variables, health status, health behavior, environmental factors and personality traits were important determinants of individual frailty

criteria, but their effect on the frailty phenotype was complex and mostly criterion specific. Conclusion : The results of the study might help to identify distinct groups among aging women with potentially modifiable risks of adverse health outcomes and guide future interventions. Keywords : frailty, longitudinal modeling, women's health initiative

OP26 113-S-4

WORK ABILITY IN MIDLIFE AND SELF-RATED HEALTH: A 28-YEAR LONGITUDINAL STUDY

Jorma SEITSAMO¹, Mikaela B. VON BONSDORFF², Monika VON BONSDORFF² (1. *Promotion of Work Ability and Health, FIOH, Finland*; 2. *Finnish Gerontological Research Centre, University of Jyväskylä, Finland*)

Introduction : The main objective of this study was to examine longitudinally the associations between the work ability of middle-aged occupationally active employees and their self-rated health (SRH) over the retirement years. Method : The study sample constitutes of a cohort of middle-aged Finnish municipal workers (n=6257). The study started in 1981, and over the follow-up, 2220 persons deceased. In 2009, a total of 3092 persons responded to the final questionnaire (the response rate was 75%). The measure of SRH was constructed from the following item: 'Compared to your friends of the same age, how is your health?' The responses were classified as better, the same, and worse. General linear models with repeated measures was used to assess the effects of work ability index (WAI) and co-variables (functioning, activity, diseases, health behaviours, gender, age, marital status, and socio-economic status) on health. Results : The results showed that WAI was a strong predictor of later-life SRH. If a person had an excellent work ability the odds of reporting good health was 4-fold (among men OR=4.4, 95% CI 3.4 - 5.8, among women OR=3.80, 95% CI 3 - 4.8) compared to the odds of a person with poor work ability having good health during the retirement years. Even an increase from poor work ability to moderate doubled the odds of good health. Conclusion : The strong connection between work ability and SRH suggests that promotion of work ability during occupationally active years may have positive impacts on health and well-being far beyond retirement transition. Keywords : aging health retirement

OP26 113-S-5

SELF-NEGLECT AMONG THE ELDERLY: A COMPARATION BETWEEN TWO EUROPEAN COUNTRIES

Adina Carmen ILIE¹, Papaioannou Emmanouil STAMOS², Ovidiu ALEXA³, Ioana Dana ALEXA¹ (1. *Department of Geriatrics, Faculty of Medicine, University of Medicine and Pharmacy 'Gr.T.Popa', Romania*; 2. *Faculty of Medicine, University of Turku, Finland*; 3. *Department of Trauma, Faculty of Medicine, 'Gr. T. Popa' University of Medicine and Pharmacy, Romania*)

Introduction : Self-neglect is the inability to provide for oneself the basic needs. The self-neglected refuses to adequately feed, water, shelter, or clothe himself, refusing medications or medical care and personal safety measures. This paper reports the partial results of a study which aims to compare medical, social, psychological and behavioral self-neglected elderly hospitalized in two geriatric units from Greece and Romania. Method : In this study we included patients over 65 years hospitalized in our clinic and who presented signs of self-neglect (on clinical exam and anamnesis). To determine the degree of self-neglect, all patients were assessed using data from their medical files and questionnaires that included comprehensive geriatric assessment tools, economic and social details, psychological and

behavioral elements. Results : Data obtained from 66 patients during 12 month period has been analyzed. The demographic data were comparable in both groups. We observed an increased rate of cognitive disorders, depression and family dysfunction in both groups and an increased rate of alcoholism and low income in the Romanian group. Conclusion : There are various factors involved in self-neglect in elders including socioeconomic and are related with the quality of social services. Understanding the disorder and the risk factors will develop the proper procedures to use in the prevention and treatment. This subject has an increased importance because self-neglect is cited as marker for increased mortality independent of cognitive function or physical shape. Keywords : elderly, self-neglect, abuse

OP26 113-S-6

CROSS-NATIONAL DIFFERENCES IN OLDER ADULTS PHYSICAL FUNCTIONING: RESULTS FROM HRS, ELSA AND SHARE STUDIES OF AGEING

Paola ZANINOTTO¹, Omar PACCAGNELLA², Giovanna BOCCUZZO² (1. *Department of Epidemiology and Public Health, University College of London, United Kingdom*; 2. *Department of Statistical Sciences, University of Padua, Italy*)

Introduction : Disability has a multidimensional structure making difficult to define and to measure in practice. One approach is using reliable indicators of individual's functional status of everyday life such as limitations with activities of daily living (ADL). This paper aims at exploring and comparing the presence and severity of physical functioning among older adults living in the England, United States and mainland Europe and seeking to explain country differences. Method : Data come from the English Longitudinal Study of Ageing (ELSA), the Health and Retirement Study (HRS) and the Survey of Health and Retirement in Europe (SHARE). The statistical solution we adopt is written as a system of equations, jointly analysing the presence of any disability and its severity. Results : After full adjustment, compared to the US, older people living in: - England and Belgium are more likely to have one or more limitations with ADLs, but less likely on the severity; - Germany and Poland are more likely to have ADLs, but no difference in severity; - The Netherlands, Italy, Denmark, Greece and Czech Republic are less likely to have ADLs, but no difference in severity; - Sweden, France, Switzerland and Ireland are as likely to have ADLs, but less likely on the severity; - Spain are as likely on the presence, but more likely on the severity. Conclusion : Country differences are more important comparing the presence of any disability rather than their severity. Unobservable components affecting the onset of a limitation are correlated with unobservable factors influencing the severity of such limitation. Keywords : ADL, Cross-country comparisons, Sample selection

AGING TOXICOLOGY

OP26 119-B-1

EFFECT OF ACRYLAMIDE AND ITS METABOLITE GLYCIDAMIDE ON ENDOTHELIAL CELL VIABILITY AND SENESENCE IN-VITRO

Nicolas GROSSIN, Francois MALADRY, Cyril SELLIER, Rodrigo LORENZI, Maite DAROUX, Eric BOULANGER (*Aging Biology, Lille2 University, France*)

Introduction : Cellular senescence is characterized by a limited ability of cells to divide when cultured in vitro. Many compounds in food can induce an earlier vascular senescence. Acrylamide (AAM) is a recent discovery in food, as a Maillard reaction product. After ingestion, 30%

of AAM are metabolized to glycidamide (GA). AAM and GA have been described as carcinogenic, reprotoxic and neurotoxic in laboratory animals. However, the vascular toxicity of AAM and GA has never been studied. The aim was to assess the effects of AAM and GA on endothelial viability and senescence in-vitro. Method : All experiments were performed on Human Umbilical Vein Endothelial Cells (HUVECs). Cell death induction was assessed by double labelling (flow cytometry) with DiOC6(3) (apoptosis) and propidium iodide (necrosis) in presence of AAM (0.1-100 mM) or GA (0.5-10mM). To evaluate cellular senescence, activity of β -galactosidase (X-gal or C12FDG metabolisation) was measured in HUVECs cultured for 3 months with AAM or GA (10 or 100 μ M). Telomere shortening was measured by qPCR and telomerase activity by a TRAP method. Results : AAM and GA (0-100mM) induced HUVEC apoptosis and necrosis ($p < 0.05$) in a dose-dependent manner. The extended culture with lower doses of AAM or GA (0-100 μ M) reduced cell division ($p < 0.01$). The activity of β -galactosidase was increased by AAM or GA ($p < 0.05$). Telomere shortening was accelerated by AAM or GA ($p < 0.05$), in association with the inhibition of telomerase activity. Conclusion : Low doses on chronic exposure induce an accelerated senescence. The chronic exposure to dietary AAM may accelerate vascular aging. Keywords : Dietary Maillard products, Endothelial cell, Senescence

OP26 119-B-2 EFFECTS OF DIETARY N ϵ -CARBOXYMETHYLLYSINE ON ARTERIAL AGING IN MOUSE MODEL

Nicolas GROSSIN¹, Florent AUGER², Frederic TESSIER³,
Celine NIQUET-LERIDON³, Nicolas DURIEUX²,
Rodrigo LORENZI¹, Maite DAROUX¹, Eric BOULANGER¹ (1. *Aging
Biology, Lille2 University, France*; 2. *Imaging Platform/IMPRT,
Lille2 University, France*; 3. *Unite de Recherche EGEAL, Institut
Polytechnique Lasalle-Beauvais, France*)

Introduction : Arterial aging is accelerated by endogenous but also exogenous factors. Advanced glycation end-products (AGEs) are endogenously produced but are also present in food. N ϵ -Carboxymethyllysine (CML) is described as a potent endogenous endothelial activator but is also a major dietary AGE. The present work aimed at investigating the effects of dietary CML intake on aortic aging in a mouse model. Method : C57Bl/6j male mice were fed with an unglycated bovine serum albumin (BSA)-enriched standard diet (controls) or received CML-glycated BSA diets (50, 100 or 200 μ gCML/g) for 3, 6 or 9 months. Aortic endothelium-dependent and -independent relaxation was measured in isolated organ chambers. CML deposition, receptor for AGEs (RAGE) and vascular cell adhesion molecule-1 (VCAM-1) expression were measured. Arterial stiffness was quantified by aortic pulse wave velocity (PWV) measurement via magnetic resonance imaging (MRI). Aortic wall surface (Masson's trichrome) and elastin disruption (orcein) were analyzed. Results : Endothelial dysfunction was evidenced after 9 months of CML-diet (200 μ gCML/g) by reduction of endothelium-dependent relaxation ($p < 0.05$), by CML deposition ($p < 0.01$), and by RAGE and VCAM-1 ($p < 0.05$) overexpression in the aorta wall. Compared to control diet, CML-diet exposure during 9 months was followed by a dose-dependent increase of PWV ($p < 0.05$) and by a decrease of endothelium-independent relaxation ($p < 0.05$). The aortic wall was thickened and elastin disrupted to a greater extent in all the CML-fed mice ($p < 0.05$). Conclusion : Chronic CML ingestion induced endothelial dysfunction and arterial rigidity, and it is concluded that its dietary intake is associated with accelerated arterial aging. Keywords : Glycation, Nutrition, Vascular aging

OP26 119-B-3 CONJUGATE REDOX SYSTEM, PROTON FLOWS AND MECHANISM OF OXIDATIVE STRESS IN AGING© 2012

Elena TERESHINA, Sergey IVANENKO (*Gerontology, WWMA AG,
Switzerland*)

Introduction : Emerged evidence argues mitochondrion role as a trigger of oxidative stress. Method : Searching for a mechanism responsible for the cellular redox balance in aerobic organisms allowed us to reveal a conjugate redox system (CRS) consisted of three components: methyl group oxidation as a proton donor, oxygen molecule as proton acceptor and an amino group as bifunctional donor-acceptor. Results : CRS controls one-carbon compounds transfer system and methylation, arginine-ornithine cycle, glutathione redox state, mitochondrion functioning, phosphate group and oxygen molecule distribution. Glucose is a main proton donor in the human cell. Protons obtained in pentose phosphate cycle are distributed among CRS and fatty acid synthesis. The last is a major proton accumulator. Aging is followed by the diminishing of water/fat ratio in tissues that indicates the process of intracellular fatty acids and proton accumulation. The more fatty acids accumulate the less is the rotation of CRS that leads to inactivation of mitochondrion proton pump, switching from respiration to glycolysis, disturbances in bioamines and polyamines production, nitric oxide/peroxide balance, demethylation and deacetylation, and finally to rejection of glucose penetrating into the cell. Conclusion : The aim of investigation was screening of metabolites capable to influence CRS for maintaining its "rotation". The CRS modeling allowed us to consider the "detoxification" pathway and its components as candidates for possible therapeutic action. Their efficacy as immunomodulators, anticancer and antiatherogenic agents was verified in the laboratory and clinical trials. Keywords : proton flow, fatty acids, ageing

OP26 119-B-4 GENOTOXIC AND EPIGENETIC MODIFICATIONS IN BLOOD LYMPHOCYTES EXPOSED IN VITRO TO URBAN AIR POLLUTION PARTICULATE MATTER: INFLUENCE OF AGE

Bertrand FOUGERE¹, Sylvain BILLET², Capucine LEPERS²,
Perrine MARTIN², Lucie ARMAND², Helene BULCKAEN¹,
Francoise ROY SAINT-GEORGES³, Anthony VERDIN²,
Pierre GOSSET⁴, Pirouz SHIRALI² (1. *Service de Geriatrie, Groupe

Pneumologie, Groupe Hospitalier de l'Institut Catholique de Lille,
France*; 4. *Laboratoire d'Anatomie Pathologique, Groupe Hospitalier
de l'Institut Catholique de Lille, France*)

Introduction : The fine air pollution Particulate Matter (PM2.5) is of public health concern. However, even if everybody can suffer the consequences of chronic exposure to atmospheric pollution, some populations are more fragile. Among them, the elderly are suspected to have a greater sensitivity to chemicals. The mechanisms usually described in PM2.5 toxicity can not explain all of the early events involved in carcinogenesis. Some genotoxic and epigenetic events are implied in both cellular aging and carcinogenesis such as telomere shortening or aberrant methylation of genes promoters. Method : To enhance the knowledge about the influence of age in biological response, blood lymphocytes were sampled from three age classes: 25-30, 50-55, and 75-80 years. Early markers participating in multistep process of carcinogenesis were then analyzed. 90 blood samples were collected (30/age class). The lymphocytes were isolated by Ficoll,

stimulated by phytohemagglutinine, and exposed to urban PM2.5. Results : Oncogenic markers, that may also be implicated in senescence, like telomerase activity and methylation of P16INK4A promoter, were modulated in the lymphocytes exposed to PM2.5. Even if telomerase activity increase was constant between the three age classes, methylation of P16INK4A promoter was significantly higher in 75-80 years group. Conclusion : Age influences biological response to some environmental factors. In this study, several markers of tumorigenicity of airborne PM seemed to be exacerbated in the oldest age class, possibly due to less efficient repair mechanisms. This could contribute to explain the greater sensitivity of the elderly previously described in epidemiological studies. Investigations in the role of ageing have to be deepened. Keywords : Epigenetic ; Cancer ; Geriatrics

Introduction : In paracetamol overdose, conjugation pathways that form non-toxic products are saturated, leading to formation of a toxic metabolite N-acetyl-p-benzo-quinone imine (NAPQI) by Cytochrome P450 2E1 (CYP2E1). With excessive NAPQI levels, NAD(P)H quinone oxidoreductase (NQO1) activity and glutathione stores are exhausted resulting in hepatotoxicity. The effect of ageing on this process has not been well characterised. We assessed age-related changes in the degree of hepatotoxicity and hepatic metabolism following a toxic dose of paracetamol in ageing male Fischer 344 rats. Method : Young (6±1 months) and old (26±2 months) rats were treated with 800mg/kg paracetamol (young n=8, old n=5) or saline (young n=9, old n=9) intraperitoneally four hours before euthanasia. Serum alanine aminotransferase (ALT) and liver histology were assessed to indicate the degree of hepatotoxicity. Serum metabolites, creatinine and hepatic CYP2E1 protein expression and activity, NQO1 activity, UDP-glucuronosyltransferase 1A6 (UGT1A6) mRNA expression and glutathione were measured. Results : Paracetamol treated old rats had less elevation of serum ALT and higher serum paracetamol and paracetamol glucuronide levels than young (p<0.05). Old control rats had 2 fold lower CYP2E1 activity and 4 fold higher NQO1 activity than young (p<0.05). The same trends were observed in paracetamol treated animals. Hepatic glutathione was 50-60% lower in paracetamol treated rats (p<0.05), with no difference with age. UGT1A6 mRNA expression did not change with age or treatment. Compared to other groups, paracetamol treated old rats had higher serum creatinine (p<0.05). Conclusion : Our results suggest pharmacokinetic changes occur in old age that decrease susceptibility to paracetamol-induced hepatotoxicity but may increase risk of

nephrotoxicity. Keywords : Paracetamol, Pharmacokinetics, Toxicity

OP26 119-B-6

ACCELERATED IMMUNOLOGICAL AGEING INDUCED BY IONIZING RADIATION AND ITS MODULATION BY NOVEL COMPOSITIONS OF MEDICINAL HERBS

Sung-Kee JO, Hae-Ran PARK, Uhee JUNG (Radiation Biotechnology Research Division, Korea Atomic Energy Research Institute, Korea)

Introduction : The imbalance of helper Th1- and Th2-related immune responses is the most interesting ageing-related change in immunity. Although ionizing radiation (IR) is known to induce senescence, there have been little data on IR-induced immunological ageing. Method : We investigated chronic effects on immune responses after ionizing radiation (IR) exposure (5Gy) in C57BL/6 mice in comparison with those of old mice. Also we evaluated the modulation of IR-induced immunological ageing by herbal compositions. Results : At 6 months after irradiation, spleen lymphocyte proliferation declined similarly to that of 18-months-old mice. In irradiated mice, Th1-related response (IFN- γ , IgG2a) was lower and Th2-related response (IL-4, IL-5, IgG1, IgE) was higher compared to the normal control mice of same age, showing similarity to those of old normal mice. The levels of IL-12p70, IL-12 receptors, and p-STAT4 were lower in the irradiated mice. The decrease of NK cell activity was noticeable in the irradiated mice showing lower values than those of old mice. Next herbal compositions were evaluated for the modulation of IR-induced immunological ageing. HemoHIM, developed to protect the immune system against acute IR, ameliorated the persistent immunological imbalance in fractionated-IR exposed mice by regulating IL-12/pSTAT4/SOCS3 pathway. WAH-2, designed to reduce IR-induced senescence, also restored NK cell activity, enhanced Th1 responses and suppressed Th2 responses. Conclusion : IR accelerated the immunological ageing with respect to immune cell activity and Th1/Th2 balance. Herbal compositions (HemoHIM, WAH2) modulated IR-induced immunological ageing and could be good recommendations to alleviate the long-term complications after radiotherapy and the immunomodulation for the elderly and the weak. Keywords : radiation, immune, ageing, medicinal herbs

SPIRITUALITY AND RELIGION

OP26 120-S-1

GEROTRASCENDENCE AND THE ROLE OF SPIRITUALITY IN LATE LIFE

Loretta BREWER (Social Work, Arkansas State University, USA)

Introduction : The theory of gerotranscendence articulated by Tornstam, uses the term transcendence, to convey the concept of "breaking through old boundaries...when moving on to a new stage of life" (2005, p. 46). Indicators associated with gerotranscendence have distinctly spiritual connotation and include feelings of cosmic communion with the spirit of the universe; a redefinition of time, space, life, and death; and a redefinition of the self as well as decreased interest in social interaction and material things. Tornstam maintains that the movement toward gerotranscendence is continuous and that the degree of transcendence increases throughout the life span. Method : This paper draws examples of gerotranscendence from a qualitative study conducted in Okinawa, Japan. Results : It may be that the elders of Okinawa have experienced gerotranscendence in greater numbers than other cultures due to the extended life span among that population. They serve as living links in a chain that connects past, present, and future generations. This important role

contributes not only to their individual strength and stability in late life, but also to that of their families and communities. Conclusion : Spirituality and religious beliefs can serve as sources of great comfort and hope in late life. Health and human services professionals as well as pastors, priests, and other spiritual leaders have a responsibility to help elders maximize these benefits. Spiritual assessment can assist in understanding the role of spirituality in the daily lives of elders and reveal strengths that can be used to assist younger generations as they strive to cope with developmental challenges. Keywords : gerotranscendence, spirituality, elders

GEROTRASCENDENCE, GENERATIVITY, RELIGIOSITY, AND SPIRITUAL WELL-BEING IN OLD AGE

Takeshi NAKAGAWA¹, Yukie MASUI², Yasuyuki GONDO¹, Megumi TABUCHI³, Madoka OGAWA², Yoshiko ISHIOKA¹, Yukiko TATSUHIRA¹, Marina KOZONO¹, Kazunori IKEBE⁴, Kei KAMIDE⁵, Yasumichi ARAI⁶, Ryutaro TAKAHASHI⁷ (1. Graduate School of Human Sciences, Osaka University, Japan; 2. Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan; 3. Department of Psychological Science, Kwansai Gakuin University, Japan; 4. Graduate School of Dentistry, Osaka University, Japan; 5. Graduate School of Medicine, Osaka University, Japan; 6. School of Medicine, Keio University, Japan; 7. Research on Social and Human Sciences, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : Little is known about whether a spiritual development occurs in old age. Recent theorists suggest that the developmental constructs of Erikson's generativity and Tornstam's gerotranscendence could bridge psychosocial and spiritual development. However, previous studies indicate generativity rather than gerotranscendence is related with religiosity. This study examined the relationship among gerotranscendence, generativity, religiosity, and spiritual well-being in old age. Method : 973 participants aged 78 - 82 years were interviewed at sites near their home. Gerotranscendence was measured with the Japanese Gerotranscendence Scale Revised, generativity was assessed with the Loyola Generativity Short Scale, and spiritual well-being was measured with the Spiritual Well-being Scale. Aspects of religiosity included church/synagogue attendance, prayer or meditation, and temple/shrine attendance. Responses to items of religiosity were yes or no. Results : Among the eight subfactors of gerotranscendence, four factors mostly related with the cosmic dimension of gerotranscendence were significantly predicted by generativity and religiosity, whereas the remaining factors mostly related with the self-dimension were not. Next, the former factors of gerotranscendence, generativity, and religiosity were chosen as independent variables, and multiple regression analyses on spiritual well-being showed that the interaction between prayer or meditation and basic affirmation was marginally significant, and that the interaction between temple/shrine attendance and awareness of "arigatasa" and "okage" was significant. The subfactors were positively related with spiritual well-being among religious people, whereas the relationship was not significant among non-religious people. Conclusion : The study indicates that part of the cosmic dimension of gerotranscendence can be promoted by religiosity. Predictors of the self-dimension should be further examined. Keywords : gerotranscendence, generativity, religiosity

OP26 120-S-3

TESTING THE FAMILY SPIRITUALITY-PSYCHOLOGICAL WELL-BEING MODEL

Suksun KIM (Nursing, George Mason University, USA)

Introduction : There is growing evidence of the benefits of spirituality for elders. However, few researchers have examined the extent to which spirituality in elders and their caregivers many have reciprocal benefits on psychological well-being in the context of family caregiving. The purpose of this research was to test the newly developed family spirituality-psychological well-being model to explore how spirituality influences psychological well-being between elders and caregivers in the context of Korean family caregiving. Method : 157 Korean, elder-family caregiver dyads were participated in this cross-sectional, correlational design study. The ICC and APIM linear mixed modeling were used for data analysis. Results : Hypotheses derived from the family spirituality-psychological well-being model were tested. There is a significant interdependence within elder-caregiver dyads in terms of spirituality and psychological well-being. The person's own spirituality is a strong predictor of psychological well-being for both elders and caregivers (i.e., actor effects). However, partner effects were partially supported in that a higher level of caregivers' spirituality was positively associated with elders' greater psychological well-being (presence of a partner effect), but a higher level of elders' spirituality did not influence caregivers' greater psychological well-being (lack of a partner effects). Conclusion : Understanding spirituality within a family provides insights into developing holistic nursing interventions that may enhance the well-being of both elders and caregivers. Future research should explore the family interdependence effect to search for the best way to improve the well-being of elderly individuals as well as their family caregivers because elders' well-being is influenced by caregivers' well-being and vice versa. Keywords : Family Interdependence, Spirituality, Psychological Well-Being

OP26 120-S-4

THE EFFECT OF MEDITATION ON QUALITY OF LIFE AND MENTAL HEALTH OF MONGOLIAN OLDER PEOPLE

Zandi NYAMJAV¹, Soyolmaa PUNTSAG², Oyunkhand RAGCHAA³, Chimedragchaa CHIMEDTSEREN⁴ (1. Department of Training, Research and Foreign Affairs, National Gerontology Center, Mongolia; 2. Department of Healthcare Service, National Gerontology Center, Mongolia; 3. Administration, National Gerontology Center, Mongolia; 4. Administration, Corporation of Traditional Medicine, Science, Technology and Production, Mongolia)

Introduction : In Mongolia, due fertility fall and increase of population aged 60 and over in the next 20 years (2007-2025) the percentage share of older persons will be increasing from 5.8% to 10.8%; thus, the increase may be reaching 25.1% in 2050. In today's ageing accelerating world, it is significantly important to improve the quality of life and mental health of older persons and find out tools which will promote to maintain them. Method : In this study were chosen 2000 elderly from 5 regions of Mongolia, aged 60 and above for men and 55 and above for women. The outcome measures were estimated by internationally recognized GDT (Geriatric Depression Test) to assess depression, Spielberg Hanin test to reveal anxiety, Mini Mental State examination test to evaluate the cognitive status and Short-Form Health Survey (SF-36) to assess the quality of life (QOL) of older persons. Results : Before the meditation class, people with low level of anxiety occupied 10.0 percent, people with medium level - 76.0 percent, and people with high level - 14.0 percent. But after meditation class the percentage of people with low level of anxiety increased to 46.0, people with medium level of anxiety reduced to 54.0 percent, while people with high level of anxiety were not identified. Meditation gives direct effect on reduction of anxiety level. ($r=0.593$; $p<0.001$). Conclusion : Meditation gives positive effect on mental health of people, indirectly improves their quality of life. In particularly it reduces anxiety level by 29.8 percent (Determination coefficient

=0.298). Keywords : anxiety, meditation, mental health

OP26 120-S-5

RELIGIOUS INVOLVEMENT AS A PREDICTOR OF SOCIAL AND PSYCHOLOGICAL WELL-BEING IN OLDER PEOPLE. RESULTS FROM THE CRACOW STUDY ON THE RELATIONSHIP BETWEEN RELIGIOUS PRACTICES AND QUALITY OF LIFE IN OLDER

Barbara WOZNIAK, Katarzyna ZAWISZA (*Chair of Epidemiology and Preventive Medicine, Jagiellonian University Medical College, Poland*)

Introduction : Religious involvement may reduce psychological distress and increase physical, psychological and social well-being in several ways, e.g. by generating high levels of social resources and by providing specific cognitive resources that are useful in coping with stressors. The aim of presented research was to verify hypotheses on the relationship between religiosity and social and psychological well-being in older age. Method : The sample population consisted of 367 randomly selected older Roman Catholics. Data was collected using a structured questionnaire. Religiosity was measured by assessing religious practice, beliefs, experiences, coping and support. Components of health were assessed including physical and mental health as well as social functioning. In the statistical analyses Hierarchical Cluster Analysis and regression analysis were performed. In the second stage of the study semi-structured in-depth interviews were conducted. Results : Significant relationships were observed between analyzed dimensions of religiosity and each of the studied aspects of health status in older age. Relationships were significant mainly in women. In-depth interviews showed that religion is an important strategy of adaptation to older age, particularly with respect to coping with stressful life events and age-related losses. Religious coping and provision of meaning resulted in better adaptation to illness, disability and bereavement. Prayer and daily spiritual experience buffered individuals from psychological stress. Surprisingly, church-based social support didn't play a role in supplementation of social resources in the population under study. Conclusion : Religious involvement is a significant determinant of certain health status dimensions, first of all mental health. Keywords : older people, religiosity, health

LONG TERM CARE X

OP26 121-S-1

THE INFLUENCE OF CAREGIVING ON SLEEP QUALITY IN MID AND LATER LIFE

Sara ARBER¹, Robert MEADOWS² (*1. Centre for Research on Ageing and Gender (CRAG), University of Surrey, United Kingdom; 2. Sociology, University of Surrey, United Kingdom*)

Introduction : The impact of providing care for older or disabled relatives has been widely studied, but limited attention has been paid to how caregiving influences the sleep quality of carers using large-scale nationally representative surveys. This paper examines how caregiving is associated with sleep quality in mid-life and in later life. Method : The paper analyses the British 'Understanding Society' survey for 2009 to compare of older people (n=7200, aged >65) with those aged 45-64 (n=13100). We analyse how number of hours of co-resident and non-resident caregiving per week is associated with self-reported sleep quality using nested logistic regression models that included gender, age, marital status, hours of caregiving, education, income, housing tenure, employment status, self-perceived health and

health limitations. Results : Co-resident caregiving is strongly linked to poor sleep. In mid-life, there is a linear association of hours spent caregiving with poorer quality sleep, which becomes attenuated following adjustment for employment status and health status of caregiver. However, above age 65, primarily those caregiving for more than 100 hours per week have worse sleep compared to non-caregivers, which is barely moderated following adjustment for co-variants. Women's sleep was more adversely affected by caregiving than men's, especially in mid-life. Non-resident caregiving was not associated with sleep quality. Conclusion : Practitioners need to recognise the adverse effects of co-resident caregiving on the sleep of caregivers, and provide support to facilitate sleep or assist caregiving at night. 1. 'SomnIA, Sleep in Ageing', New Dynamics of Ageing initiative, supported by AHRC, BBSRC, EPSRC, ESRC and MRC (RES-339-25-0009). Keywords : Impact of care-giving, sleep quality, UK

A TALE OF TWO STUDIES OF DEMENTIA AND THE BENEFITS OF EXERCISE

Christine NEVILLE¹, Linda TERP¹, Timothy HENWOOD¹, Elizabeth BEATTIE³ (*1. School of Nursing and Midwifery, The University of Queensland, Australia; 2. School of Nursing, University of Washington, USA; 3. School of Nursing and Midwifery, Queensland University of Technology, Australia*)

Introduction : The trajectory of dementia makes it difficult for affected persons to maintain adequate levels of physical activity. Physical inactivity is associated with decline in cognitive, functional and physical health which in turn complicates care provision and increases mortality. These studies report on how two exercise programs improved health outcomes. Method : Study 1 was a randomized controlled trial of 153 people with dementia who resided in their family home. Participants were assigned to either a combined exercise and caregiver training program or routine medical care. Study 2 was a smaller scale, longitudinal design for 25 people with dementia who resided in aged care facilities and participated in an aquatic exercise program. Both studies involved family members with physical performance, depression and behavioural and psychological symptoms of dementia (BPSD) evaluated. Rate of institutionalization due to BPSD (Study 1) and level of psychological distress (Study 2) were also examined. Focus groups elicited participant experiences. Results : Both studies reported improvement in physical performance (p=.01) and depression (p=.02). The frequency of BPSD was reduced [Chi Square(3, n=10) = 16.91, p=0.001] and caregiver reaction to BPSD improved [Chi Square (3, n=10) = 16.86, p=0.001]. In Study One there was less institutionalization due to BPSD (19% vs 50%). In Study Two, the participants had reduced psychological distress [Chi Square (3, n=8) = 8.66, p<0.05]. Participants related that the benefits outweighed the effort required. Conclusion : Dementia presents many challenges and innovative interventions are required for effective responses. Dementia-specific exercise interventions that produce positive health outcomes are one such response. Keywords : dementia, exercise, long term care

OP26 121-S-3

QUALITY OF CARE IN LONG-TERM CARE FACILITIES IN BANGKOK AND METROPOLIS

Siriphan - SASAT¹, Miel W. RIBBE², Carol O. LONG³ (*1. Faculty of Nursing, Chulalongkorn University, Thailand; 2. Department of Nursing Home Medicine, VU University Medical Centre, Netherlands; 3. College of Nursing and Healthcare Innovation, Arizona State University, USA*)

Introduction : The number of care-dependent older persons residing in Thailand is expected to increase in the coming decades. The quality of care in long-term facilities (LTCF) is unknown. The aims of this study were to describe the demographic information of LTCFs and their administrators and to assess the quality of care in LTCF in Bangkok, Thailand, and surrounding metropolis. **Method :** Thirty-seven administrators out of 118 LTCs in Bangkok and metropolis representing a wide range of care settings agreed to participate in this study. Research instruments consisted of demographic information about LTCFs' administrators, a Facilities Questionnaire, and the Quality of Care Assessment Instrument. This descriptive study analyzed the primary characteristics of these facilities, their administrator and quality of care. **Results :** The findings revealed that 81 percent of facilities administrators were female with primary responsibility for overall facility administration and development. Sixty-five percent of facilities (n=24) were private nursing homes ranging in bed size from 3-338 (=60.3; SD=78.5) and costing from 13,000-60,000 baht/month (=24,166.7; SD=11,392.7). The average number of residents in each facility was 36.6 (SD=51.4) and 62.8 percent of the residents were female. The number of staff ranged from 3- 568 (=67.4; SD=194.1) providing an array of services. The quality of care in LTCFs was reported to be 'good' (=3.83; SD=1.18). Structural indicators were found to have the highest average score, follow by outcome and process. **Conclusion :** These findings provide a foundation of the existing quality of care for care improvement in further research and policy planning. **Keywords :** Quality of Care, Long-term Care Facilities

OP26 121-S-4

CULTURAL COMPETENCY AND LONG-TERM CARE

Judy BERRY¹, Im Ja CHOP (1. *Executive Director, Lakeview Ranch, Inc. and Dementia Care Foundation, USA*; 2. *Executive Director and Foundation, Penn Asian Senior Services, USA*)

Introduction : "Cultural Competency and Long-Term Care" examines the long-term caregiver training project between Penn Asian Senior Services (PASSi) and the Dementia Care Foundation to offer Asian immigrants caregiver trainings on Dementia. We will discuss cross-culture barriers in delivering long-term care to Asian immigrants and how collaborative trainings can overcome these barriers, enhance health outcomes, and improve elderly immigrants' quality of life. Founded in 2004, PASSi is a nonprofit home healthcare and vocational training agency in Pennsylvania focused on Asian immigrants. PASSi currently serves over 360 clients in 7 Asian languages. Judy Berry founded Lakeview Ranch Inc. in 1999 where she developed the Lakeview Ranch Model of Specialized Dementia Care.™ This nationally recognized model restores dignity, choice and quality of life to Dementia/Alzheimer's patients, eliminates dementia related aggressive behavior, and reduces psychotropic drug use. Im Ja Choi, founder and Executive Director of PASSi, and Judy Berry, founder of Lakeview Ranch, Inc., are national winners of the Robert Wood Johnson Community Health Leader Award. **Method :** PASSi received funding from Independence Blue Cross Foundation in August 2012 to launch an Alzheimer caregiver training program based on the Lakeview Ranch Model of Specialized Dementia Care.™. Judy Berry taught 141 home health aides and family caregivers in 5 Asian languages. PASSi's multilingual community coordinators and nurse educators were key to facilitating the caregiver training. **Results :** The trainings improved caregivers' understanding of Alzheimer/dementia symptoms and changed their initial approach and interaction with patients. **Conclusion :** We will discuss how the trainings improved long-term care for elderly Asian immigrants with Alzheimer's/dementia. **Keywords :** long-term care, care-giving,

dementia

RECONCILING WORK AND ELDER CARE: IMPACTS ON HEALTH

Fiona ALPASS, Christine STEPHENS, Brendan STEVENSON
(*School of Psychology, Massey University, New Zealand*)

Introduction : Unpaid family carers are an essential yet overlooked part of the health care system. Caregivers save billions in health care expenditure each year, improve patient outcomes, and reduce unnecessary re-hospitalisations and residential care placements. There are 480,000 individuals in New Zealand who provide care for someone who is ill or disabled and 65% of these carers are also in paid employment. Care of elders in particular is a key factor in determining whether older workers are able to remain in the workforce. The reconciliation of paid work and informal elder care is problematic for many carers and impacts on their health status and well-being. **Method :** This study examines the impact of combining paid work and care of older family members on the health of carers over time using four waves of data from the Health, Work and Retirement study (N=1853, aged 55-70 at baseline). **Results :** Involvement in caregiving for an older family member at any one time over the six-year survey period was generally related to poorer health. Overall workers were in better health than non-workers. However, there was mixed support for an interaction between caregiving and work on health outcomes. Health trajectories are presented and discussed in relation to work and care transitions over time. **Conclusion :** Understanding the impact of work and elder care on carer health outcomes is important as a first step for the development of interventions at carer, employer, and policy levels. **Keywords :** caregiving work health

OP26 122-S-2

PATIENTS' EXPERIENCES AND THEIR SATISFACTION WITH HOME HEALTH CARE NURSING IN JAPAN

Yasuko OGATA¹, Kayo OTOSAKA², Michio HASHIMOTO³
(1. *Department of Gerontological Nursing and Health Care System, Graduate School of Health Care Sciences, Tokyo Medical and Dental University, Japan*; 2. *Kouhoku, Home-Visit Nursing Care Station, Japan*; 3. *Department of Medical Risk Management, Yokohama City University Hospital, Japan*)

Introduction : In Japan, home-visit nursing care station (Station) is an important resource to care for the elderly. However, there are no common tools/quality indicators based on patients' experiences of care to evaluate this care quality. We examined the relationship between care recipients' experiences and their satisfaction with home health care nursing. **Method :** A postal mail survey was conducted using our original questionnaire regarding patients' care experiences. The questionnaire was sent to 423 patients receiving nursing care in 6 Stations. In the questionnaire, patients or their family members were asked the frequencies and satisfaction of their care experiences. Descriptive statistics and statistical relationships between patients' care experiences and the satisfaction were calculated. **Results :** 229 patients or family members (54.1%) from 6 Stations responded. Only 17% of the participants were patients. The average age of 229 patients was 77.7 years old and 54.1% of them were women. The average satisfaction score was 91.1. The satisfaction score was significantly higher in those who were frequently well cared for than in those who were less frequently well cared for or those with no well care

experience group. Conclusion : Patient experiences of care were related to patient outcome such as satisfaction. Patients' care experience can be used to evaluate care quality. A common tool to evaluate patients' experience of home health care in Japan is needed in future studies. Keywords : patients' experience, quality evaluation, home health nursing

THE DEVELOPMENT AND IMPLEMENTATION OF ACCREDITATION OF RESIDENTIAL CARE HOMES - A TEN YEAR EXPERIENCE IN HONG KONG

Edward M.F. LEUNG¹, Yuk Har Stella CHEUNG¹, Alice Dick Wah CHIU² (1. Research and Development Division, Hong Kong Association of Gerontology, Hong Kong; 2. Quality Development Division, Hong Kong Association of Gerontology, Hong Kong)

Introduction : Hong Kong Association of Gerontology (HKAG) initiated the 2-year Pilot Project on Accreditation System in 2002 in which formulated a set of culturally appropriate service standards and accreditation mechanism for aged care homes after studying international systems through overseas visits, literature review and 39 aged care homes joined in pilot study. The Pilot Project was completed in October 2004. Afterward the Residential Aged Care Accreditation Scheme (RACAS) was launched on a self-financing basis in March 2005 with the aim to improve the quality of residential homes. Method: Under the Scheme, residential homes participate on a voluntary basis, peer review, and process-and-outcome-focused. They would be impartially accredited on-site based on 40 objective criteria by professional assessors. Apart from assessing the quality of the services rendered by the aged homes, assessors would give suggestions for improvement and follow-up the implementation of such suggestions. RACAS runs for five years cycle. In the first year, an overall assessment would be performed and annual reviews in the interim to maintain their quality. Results : In the 10 years from 2002, over 100 aged care homes, which were about 14% of the 700 aged care homes in Hong Kong, had joined and completed accreditation under RACAS, which is evidence that accreditation could improve the quality of their services and this serves as a benchmark for the public in identifying reliable elderly homes. Conclusion : In May 2008, the service standards of RACAS were granted accreditation status by the International Society for Quality in Health Care to the work of RACAS. Keywords : accreditation , quality, aged

OP26 122-S-4

AN ANALYSIS ON DEMENTIA CARE IN AGED CARE HOMES UNDERGOING ACCREDITATION IN HONG KONG

Edward M.F. LEUNG¹, Yuk Har Stella CHEUNG¹, Alice Dick Wah CHIU², Polly Po Yee PAU³ (1. Research and Development Division, Hong Kong Association of Gerontology, Hong Kong; 2. Quality Development Division, Hong Kong Association of Gerontology, Hong Kong; 3. Accreditation Division, Hong Kong Association of Gerontology, Hong Kong)

Introduction : As the population ageing, there is an increasing the number of dementia elders worldwide. According to Report of Census and Statistics carried out by Hong Kong Government in 2009, 31.6% of residents in aged home were reported with dementia. A small scale study done in 40 residential homes during March to April in 2012 by Residential Aged Care Accreditation Scheme (RACAS) reported that 1632 residents (total: 4796) were diagnosed of dementia, that is 34%. Including other suspect cases or cases without properly diagnosis of dementia, the percentages could increase to 46.9%. It definitely showed that there is a great demand. Method : RACAS has been

launched since 2005 with the aim to improve quality care of aged homes. For the past 7 years, a retrospective study was done to analyze 74 accredited homes which joined accreditation from 2005 to 2012 that accreditation could help them to improve their care by setting up dementia care protocol, environment modification, safe medication management, least restraint policy, safe environment, wandering prevention facilities and making referral to specialist when necessary. Results : 74 aged homes showed satisfactory performance in above five aspects mentioned. However, there are two areas need to pay more attention namely; prevention of residents missing and maintaining a safe environment for cognitive impaired residents and emotional residents. Conclusion : Therefore, aged homes should be more aware to equip themselves to face increasing demand of dementia elders and accreditation can help operators of aged home to continue to improve quality care to safeguard our frail elders. Keywords : Dementia, aged, home

OP26 122-S-5

THE EFFECT OF ACCREDITATION (RACAS) ON QUALITY IN AGED CARE HOMES IN HONG KONG

Edward M.F. LEUNG¹, Yuk Har Stella CHEUNG¹, Alice Dick Wah CHIU² (1. Research and Development Division, Hong Kong Association of Gerontology, Hong Kong; 2. Quality Development Division, Hong Kong Association of Gerontology, Hong Kong)

Introduction : The Residential Aged Care Accreditation Scheme (RACAS) was devised by Hong Kong Association of Gerontology in 2005 with the aim is to raise the service quality of aged care homes through education, construction of a conceptual framework, and actual practice. A 5- year review project was carried out in 2010 to assess the effectiveness of accredited homes quality improvement measures. Method : The review by means of literature review in international trends in long term care services, collect and analysis of comments from stakeholders and review opinion survey results from accredited homes. Also, the aim of this study is to review the achievements of accredited residential homes between 2005 and 2010, and the degree of compliance of 19 aged homes, which had completed the 5-year accreditation cycle, to the monitoring 7 selected performance indicators by drawing reference to local and international monitoring instruments on nursing care as follows: toilet training, incidents of falls and related injuries, weight loss, use of restraints, incidents of bedsores, mishaps in dispensing medicine, and provision of rehabilitation plans. Results : The majority of the accredited aged homes considered that accreditation could help greatly in improving their service quality especially in service and care process. Conclusion: Studies have shown that good quality control measures delivered in Aged homes can promote and enhance residents' quality of life. Keywords : quality, care , accreditation

OP26 122-S-6

CLIENTS AND INFORMAL CAREGIVERS' PERSPECTIVES OF HOME CARE SAFETY IN RELATION TO SELF-CARE AND CAREGIVING ACTIVITIES

Winnie SUN, Diane DORAN (Lawrence S. Bloomberg Faculty of Nursing, University of Toronto, Canada)

Introduction : In an era of a rapidly increasing number of older people who require home care services, clients must possess or develop therapeutic self-care ability in order to manage their health safety in their homes. Therapeutic self-care is the ability to take medications as prescribed, to recognize and manage symptoms that may be experienced such as pain, to perform and adjust regular activities of daily living, and to manage changes in condition. Method : This

qualitative research study utilized one-on-one, in-depth, semi-structured interviews with the clients and their informal caregivers recruited from one home care agency in Ontario, Canada. The goal of the interviews was to gain a better understanding of the relationship between client's self-care ability and home care safety outcomes, and the role of self-care and caregiving activities in supporting home care safety in relation to chronic disease management. Results : Older home care clients (over the age of 65) and their informal caregivers were asked to describe the safety challenges and concerns in their homes, and to identify the role for home care services to provide support for self-care and disease management. Qualitative description was the method of approach used to guide the interviews that generated themes about clients and their caregivers' perspectives of home care safety in relation to self-care and caregiving activities. Conclusion : The study findings provided insight into the safety problems related to therapeutic self-care, and the role of home care services in improving client's self-care ability to reduce safety related risks and burden for older home care recipients. Keywords : Home Care Safety

OP26 123-C-1

HAND GRIP STRENGTH AS A PREDICTOR OF LOSS OF FUNCTIONAL CAPACITY AND MALNUTRITION AMONG GERIATRIC PATIENTS IN KELANTAN, MALAYSIA

Sze Lin TAN¹, Syamimi AHMAD², Sakinah HARITH¹ (1. *Dietetics Programme, School of Health Sciences, Universiti Sains Malaysia, Malaysia*; 2. *Nutrition Programme, School of Health Sciences, Universiti Sains Malaysia, Malaysia*)

Introduction : Impaired muscle strength is associated with many detrimental outcomes in geriatric patients. This study aimed to identify the relationship between the hand grip strength and the functional capacity and nutritional status among geriatric medical patients in general hospitals of Malaysia. Method : A cross-sectional study was conducted at the medical wards of two government hospitals in Kelantan, Malaysia from February to June 2012. A questionnaire-based interview was used to obtain patient's information on sociodemographic characteristics and health condition information. The hand grip strength (HGS) was measured with a grip strength dynamometer. The Barthel Index of Activities of Daily Living (ADL) was used to assess functional status. The nutritional status was assessed by anthropometric measures included weight, height, body mass index (BMI), mid-upper arm circumference (MUAC) and calf circumference (CC). Results : A total of 157 geriatric patients (male, n = 78; female, n = 79) aged 60 years and above (mean age = 70.21±6.09 years) were recruited. The maximum HGS of males and females were 25.00±7.12 kg and 14.26±4.91 kg respectively (p<0.001). The HGS was positively correlated with ADL, BMI, MUAC and CC, while negatively correlated with age for both gender (p<0.05). Multivariable analysis revealed that lower HGS predicted a decline in both ADL and BMI. Conclusion : Hand grip strength is a good predictor for the decline in functional capacity and malnutrition among geriatric medical patients during their hospital stay. Keywords : hand grip strength, functional capacity, malnutrition

OP26 123-C-2

FINGER TAPPING TASK AS AN INDEPENDENT PROGNOSTIC FACTOR FOR POOR FUNCTIONAL OUTCOME IN KOREAN ELDERLY POPULATION

Jae-Seong SHIM¹, Kwang-II KIM², Jae-Young LIM¹, Ki-Woong KIM³, Nam-Jong PAIK¹ (1. *Department of Rehabilitation and Physical*

Medicine, Seoul National University Bundang Hospital, Korea; 2. *Division of Geriatrics, Department of Internal Medicine, Seoul National University Bundang Hospital, Korea*; 3. *Neuropsychiatry, Seoul National University Bundang Hospital, Korea*)

Introduction : The decline in physical performance has been documented as a risk factor for death and disability. Although the age-related changes in finger tapping ability have been described, no studies on the prognostic implications of finger tapping task have been reported among community-dwelling elderly people. Method : Total of 433 participants (227 men and 206 women) aged over 65 years were enrolled who participated in the Korean Longitudinal Study on Health and Aging (KLoSHA). According to the finger tapping task result, participants were divided into two groups (fast tapping group and slow tapping group). We analyzed the interaction between delay in motor speed measured by finger tapping task and 5-year poor functional outcome, defined as short physical performance battery (SPPB) scores of 9 or less or mortality over the follow-up period. Results : Significant increase in risk of poor functional outcome was observed in slow tapping group, compared with fast tapping group, even after covariate adjustment using multiple logistic regression analysis (odds ratio, 2.211; 95% CI, 1.367 to 3.575). Moreover, survival analysis showed significant difference between slow and fast tapping groups (p=0.002, log rank test). Conclusion : We conclude that finger tapping task is an independent prognostic factor for poor functional outcome in the elderly population. Keywords : Finger Tapping Task, Functional outcome, Physical Performance

OP26 123-C-3

AN INNOVATIVE ELASTIC BAND EXERCISE PROGRAM FOR THE WHEELCHAIR-BOUND SENIORS

Kuei-Min CHEN¹, Wei-Shyuan TSENG², Ya-Hui CHANG¹, Hsin-Ting HUANG¹, Chun-Huw LI³ (1. *College of Nursing, Kaohsiung Medical University, Taiwan*; 2. *Center for Continuing Education and Social Resources, Kaohsiung Medical University, Taiwan*; 3. *Department of Nursing, Yuhing Junior College of Health Care and Management, Taiwan*)

Introduction : Progressive resistance exercise using elastic bands can increase muscle strength and size in seniors. This study aimed to develop and appraise the feasibility of an elastic band exercise program for the wheelchair-bound seniors. Method : Descriptive evaluation survey was applied. Phase I (expert consultation): a program evaluation survey was sent to 12 experts to develop an elastic band exercise program, called the Wheelchair-bound Senior Elastic Band (WSEB). Phase II (user appraisal): a feasibility appraisal survey was administered to 10 wheelchair-bound seniors through individual interviews after four weeks of the WSEB. Participants rated the level of simplicity, safety, appropriateness, and helpfulness of the program on a 10-point Cantril ladder scale. Further, they reflected on their experiences with the WSEB through four open-ended questions. Results : Experts had consistent and positive feedback about the WSEB, and only minor changes were made to the program. The average ratings of the participants on the four evaluation criteria ranged from 9.22 to 9.78, indicating that the program was feasible, safe, appropriate, and helpful to the wheelchair-bound seniors. Participants suggested practicing the WSEB three times per week and 40 minutes per session in a group of 15-20 people. Conclusion : The finalized WSEB has two levels: the basic and the advanced WSEB. It is suggested that the basic level to be taught first, practice it until participants are familiar with those exercises, and then move on to the advanced level. The WSEB is feasible to the wheelchair-bound seniors. Keywords : Complementary therapy, Elastic band,

Wheelchair-bound seniors

A POST-HOSPITAL HOME EXERCISE PROGRAM IMPROVED MOBILITY BUT INCREASED FALLS IN OLDER PEOPLE: A RANDOMISED CONTROLLED TRIAL

Catherine SHERRINGTON¹, Stephen LORD², Constance VOGLER³, Jacqueline C.T. CLOSE⁴, Kirsten HOWARD⁵, Catherine DEAN⁶, Lindy CLEMSON⁷, Elizabeth BARRACLOUGH¹, Elisabeth RAMSAY², Sandra O'ROURKE¹, Robert CUMMING⁵ (1. *The George Institute for Global Health, University of Sydney, Australia*; 2. *Neuroscience Research Australia, University of New South Wales, Australia*; 3. *Royal North Shore Hospital, University of Sydney, Australia*; 4. *Prince of Wales Clinical School, University of New South Wales, Australia*; 5. *School of Public Health, University of Sydney, Australia*; 6. *Department of Health Professions, Macquarie University, Australia*; 7. *Discipline of Occupational Therapy, University of Sydney, Australia*)

Introduction : This study aimed to investigate the effects of a home-based exercise program on mobility and falls among older people after recent hospital stays. **Method :** A randomised controlled trial with intervention and usual-care control groups was conducted. Participants were 340 older people after recent hospital stays who had completed all hospital-related treatments and were cognitively and physically able to safely complete a home exercise program. For the intervention group, an individualised home exercise program, based on the Weight-bearing Exercise for Better Balance (WEBB) program, was established and progressed during ten home visits from a physiotherapist. Participants were asked to exercise at home 3-6 times per week for the 12-month study period. **Results :** Participants had an average age of 81.2 years (SD 8.0), an average of 6.8 health conditions (SD 2.7), were prescribed an average of 7.5 medications (SD 3.3) and 70% had fallen in the past year. At 12-months, performance-based mobility measured on lower extremity Summary Performance Score (primary outcome, n=312) was significantly better in the intervention group than the control group (between-group difference after adjusting for baseline performance 0.13, 95% CI 0.04 to 0.21, p = 0.004). During the 12-month study period, 168 people (49% of participants) experienced 300 falls. The intervention group had a higher fall rate than the control group (incidence rate ratio 1.43, 95% CI 1.07 to 1.93, p = 0.017, primary outcome, n=340). **Conclusion :** This approach to home exercise prescription in people after recent hospital stays improved mobility but increased falls. **Keywords :** exercise, falls, mobility

OP26 123-C-5

EFFECTIVENESS OF FASTING CALORIE RESTRICTION IN IMPROVEMENT OF METABOLIC, NUTRITIONAL AND PSYCHOSOCIAL PARAMETERS AMONG HEALTHY OLDER ADULTS MEN

Suzana SHAHAR¹, Nur Islami Fahmi TENG¹, Norlela Mohd HUSIN¹, Che Suhaili CHE TAHA¹, Norfadilah RAJAB², Zahara Abdul MANAF¹, Sai Krupa DAS³, Wan Zurinah WAN NGAH⁴ (1. *School of Healthcare Sciences, Universiti Kebangsaan Malaysia, Malaysia*; 2. *School of Diagnostic and Applied Science, Universiti Kebangsaan Malaysia, Malaysia*; 3. *Jean Mayer USDA Human Nutrition Research Center on Aging, Tuft University, USA*; 4. *Biomedical Science, Universiti Kebangsaan Malaysia Medical Centre, Malaysia*)

Introduction : Calorie restriction and intermittent fasting are two dietary interventions that can extend lifespan and improve aging. Religious fasting also suggested having similar benefit; however, such studies are still scarce. Thus, an intervention study on the FCR

(Fasting and Calorie Restriction) was carried out on 25 healthy older adult men [50-70 years, body mass index (BMI) 23.0-29.9 kg/m²] in Klang Valley, Malaysia. **Method :** Subjects were randomized into either FCR (a reduction of 300-500 kcal/day combined with two days/week of Muslim Sunnah Fasting) or Control (CO). Metabolic, nutritional, mood and depression assessments were ascertained at baseline, weeks 6 and 12. Blood samples were analyzed for lipid profile, DNA damage and malondialdehyde (MDA). **Results :** Energy intake, body weight, BMI, % body fat, blood pressure, total cholesterol, LDL-C and MDA decreased significantly in FCR group as compared to CO. The ratio of TC/ HDL-C and DNA rejoining cells improved significantly in FCR (p<0.05 for all parameters). Analysis of Healthy Eating Index (HEI) showed a significant main effect (p<0.05) for the score of fat, saturated fat and cholesterol, with food variability also decreased in FCR group. Significant decreased in tension, anger, confusion and total mood disturbance and improvements in vigor were observed in participants in the FCR group compared to those in the control group (p<0.05 for all parameters). **Conclusion :** There is a need to further examine the mechanism of FCR and its long term effect on food variability and micronutrient status. **Keywords :** Fasting, Metabolic, Nutritional

OP26 123-C-6

MOBILIZING OLDER ADULTS IN ACUTE CARE: EVIDENCE-BASED CARE AND PERSPECTIVES ON IMPLEMENTATION

Janet Prvu BETTGER¹, Yvette WEST², Angela ADAMS³ (1. *School of Nursing, Duke University, USA*; 2. *Advanced Clinical Practice, Duke University Health System, USA*; 3. *Adult Health Medicine and Psychiatry, Durham Regional Hospital, Duke University Health System, USA*)

Introduction : More than 50% of complications experienced by older adults after an acute hospitalization are mobility-related. Evidence of effective multidisciplinary strategies is unclear. This study's purpose was to conduct a systematic review of the literature of hospital-based interventions that addressed the broader concept of mobility (bed-level to ambulation) and examine acute care nurses' perspectives of the barriers/facilitators to implementing evidence-based mobility protocols. **Method :** Three databases (CINAHL, MEDLINE, and Cochrane) were searched to identify studies that examined the benefits and harms of multidisciplinary strategies that addressed mobility among hospitalized older adults. Findings were disseminated as part of training for the Duke-NICHE program (Nurses Improving Care of Healthsystem Elders) and 43 nurses reported barriers/facilitators to implementing evidence-based protocols. Nurses' perspectives were compared to related literature published in the last decade. **Results :** Fifteen interventions that included ≥2 disciplines and examined outcomes of older adults were identified. Published mobility protocols or interventions without process or outcome data were reviewed for content and comparison of strategies. Nursing and physical therapy were the most common disciplines for implementation. Few studies used the same physical function/mobility outcome measure. A trend toward improved ambulation/physical function and decreased length of stay was found for intervention recipients. Barriers most commonly reported by nurses included documentation of care, time and personnel. Patient motivation was reported as an important aspect of increasing mobilization. **Conclusion :** Moderate evidence exists for multidisciplinary strategies to increase mobilization and decrease length of hospital stay for older adults. Nurse-reported barriers will take creative strategies and support from hospital leadership to overcome. **Keywords :** mobility, nursing, evidence-based practice

FAMILY AND CARE GIVING

OP26 210-R-1
BURDEN, SOCIAL SUPPORT, OBLIGATION OF FILIAL PIETY AND PSYCHOLOGICAL WELLBEING AMONG CHINESE CAREGIVER OF FRAIL ELDERLY

Yong TANG (*Social Work Department, Law School, Shen Zhen University, China*)

Introduction : The number of oldest old people in China has increased in recent years, which has been a challenge to family structure and government budget. Specifically, the purpose of the current study is twofold. Firstly, the author will explore the possible linkage between the caregiver burden and the psychological wellbeing of the adult child caregiver. Secondly, the study seeks to identify the key factors affecting the relationship between caregiver burden and psychological wellbeing. Method : The sampling frame was adult child caregivers whose parents aged over 80, resided permanently in the urban districts of Guangzhou. A total of 316 adult children respondents completed interviews. The study used four scales: OFPS, RISS, ZBI and ABS. Results : There are three main findings. Firstly, as predicted, caregiver burden affects psychological wellbeing negatively. Public assistance is urgently needed to ensure that the family will not be overstrained by the burden of old age support. Secondly, the analysis shows that there is no association between obligation of filial piety and psychological wellbeing of caregivers. Thirdly, as predicted, obligation of filial piety has positive impact on caregiver burden. Conclusion : The primary purpose of the current study was to explore the subjective and culturally specific meaning of caregiver burden, with specific focus on filial piety. As an adult child caregiver, he/she might have to shoulder many aspects of stressors and burden. The conflicts might be arising between filial value and filial practice among adult child caregivers. Gender issues of caregivers also need to be paid attention in the study. Keywords : Psychological wellbeing, caregiver burden, adult child caregiver

OP26 210-R-2
PERSONALISED SOCIAL CARE SUPPORT AND FAMILY CARERS - WHOSE NEEDS, WHOSE RIGHTS, WHOSE SUPPORT?

Caroline GLENDINNING, Wendy MITCHELL, Jenni BROOKS (*Social Policy Research Unit (SPRU), University of York, United Kingdom*)

Introduction : English adult social care aspires to give older people choice and control so they can receive flexible, personalised care. Family carers also have rights, to assessment of their needs and support for care-giving roles. A newly completed study examines how current practice recognises the separate needs and rights of older people, and family carers, while at the same time supporting the interdependencies on which care-giving rests. It also investigated whether practice is consistent with the (possibly different) wishes of older people and carers, regarding the latter's roles. Method : The study involved: A survey of local authority policies and practice. Interviews and focus groups with managers and practitioners responsible for conducting assessments and arranging social care support. Separate, simultaneous interviews with 'pairs' of older people and their family carers. Results : The study will generate evidence of how managers and practitioners balance and reconcile the different needs and interests of older people and family carers. It will also illustrate how far practice is consistent with the wishes of older people and carers regarding the latter's roles and responsibilities. Conclusion :

The study will generate evidence of how managers and practitioners balance and reconcile the different needs and interests of older people and family carers. It will also illustrate how far practice is consistent with the wishes of older people and carers regarding the latter's roles and responsibilities. Keywords : family care, choice

OP26 210-R-3
GRANDPARENT CAREGIVERS: AN AFRICAN FAMILY CARE MODEL

Robert Martin CHAZIN, Manoj PARDASANI (*Graduate School of Social Service, Fordham University, USA*)

Introduction : An estimated 2.5 million people are living with HIV in Tanzania today (UNDP, 2009). Orphans International Tanzania (OIT) operates a unique family preservation and support program (the Family Care Program) which aims to maintain orphaned children in home environments with access to education, basic medical care and good nutrition. Utilizing a strategic international agency-community NGO partnership and an internationally recognized family support model, comprehensive services are provided to children and their caregivers. Nearly all of the caregivers of the orphaned children served by this program are elderly, kinship related grandmothers. This presentation will describe the program and our qualitative approach in evaluating the grandparent caregivers' assessment of the program's strengths and limitations. We will describe our study findings concerning the grandparents' perceptions of the effectiveness of this family preservation program, in supporting their ability to provide family care to the orphans and other children in their families. We will describe specific ways in which the grandparent caregivers perceive the program as helping their children and themselves. We will conclude with a discussion of Implications for replication in other communities impacted by HIV/AIDS with elderly relations caring for orphaned and or vulnerable children. Method : Qualitative study of a unique Family Care Program designed to support grandparents' care of biologically related grandchildren orphaned by AIDS. Results : Study supported the effectiveness of this program in maintaining grandparent caregivers and their families. Conclusion : Program evaluation supported the effectiveness of this program in the goal of contributing to grandparent and family maintenance. Keywords : grandparent family AIDSj orphans

OP26 210-R-4
THE EFFICACY OF SUPPORT GROUPS FOR KINSHIP CAREGIVERS

Deborah June MONAHAN, Carrie Jefferson SMITH (*Social Work, Syracuse University, USA*)

Introduction : Grandparent kinship caregivers are often instrumental in reducing the number of children who enter the foster care system as a consequence of providing family care. This caregiving reinforces emotional bonds between the generations and reinforces positive gains in children whose lives aren't disrupted by out-of-home placement. Support groups are often used by grandparent kinship caregivers to learn how to provide supportive care to their grandchildren, in the absence of the parent care. Method : In this study funded by the Children's Bureau, U.S. Dept. of Health and Human Services, grandparent kinship caregivers were surveyed (N=92) to assess the efficacy of their support group experience. Their perception of burden as also assessed to determine the hours per day care was provided, whether they had 'time for themselves', and the clarity of their caregiving role in the family. Results : The mean age of kinship caregivers was 59.93 years, 95% were female, 62% were non-White, 33% were married, 35% had at least a high school education, and 46%

reported Social Security as their income. Seventy-five percent of the sample attended at least three support group sessions and were satisfied with their experiences. Sixty-five percent reported that they didn't have enough time for themselves as a result of the care they provided and 46% reported that they had role strain. Conclusion : Support group attendance helped kinship caregivers understand their care responsibility and network with others to develop resources to provide care. Support groups are useful in providing knowledge about community resources and sustaining family relationships. Keywords : kinship caregivers

ISSUES GAY MEN FACE AT TIMES OF BEREAVEMENT: A CASE STUDY OF AN OLDER GAY MAN'S NARRATIVE OF LOSING HIS PARTNER

Yiu Tung SUEN (*Department of Sociology, Chinese University of Hong Kong, Hong Kong*)

Introduction : The specific issues gay men face when they experience bereavement are often ignored. Even when such issues are discussed, they often remain largely theoretical and there is a lack of detailed first-person accounts. This paper addresses this gap, and presents a case study of an older gay man, Sam's, narrative of losing his partner. Through Sam's story, this paper illustrates and raises awareness of some specific issues gay men face at times of bereavement. Method : The data presented in this paper are drawn from a qualitative study into older gay men's experience of singlehood in England. Sam was one of the participants in the study. He was 56 at the time of interview and lived on his own in the north of England. Results : A life course perspective is applied to understand Sam's narrative, touching upon such issues as a hidden past shadowed by the criminalization of homosexuality, disenfranchised grief, a sudden need to come out of the closet, and the perceived difficulty of re-entering a relationship. Conclusion : This paper illustrates how a heteronormative model of conceptualizing bereavement is inadequate. Academic theorizing of bereavement and those who provide bereavement services need to take into account the specific needs of gay men. Keywords : older gay men, sexualities, diversity

OP26 210-R-6

WIDOW DISCRIMINATION AND FAMILY CARE-GIVING IN INDIA

Yoshihiko KADOYA, Ting YIN (*Institute of Social and Economic Research, Osaka University, Japan*)

Introduction : The purpose of this research is to address the lack of a region-wide view analysis of widow discrimination in India, the home of 47 million widows. Method : This study analyzed the household data collected in face-to-face interviews from January to March of 2011 in six major Indian cities including Delhi, Mumbai, Bangalore, Chennai, Kolkata, and Hyderabad. Results : It was revealed that widow discrimination does not prevail across the nation. That is, this research did not deny the existence of traditional widow discrimination in some areas, but demonstrated that this phenomenon does not represent the whole nation if we focus on the widow's old age and the treatment by their family. Conclusion : Certainly, this research has some limitations, including the fact that the observations came only from cities. However, this is pioneering research, and more significantly, it addresses the lack of a region-wide view analysis of widow discrimination in India with an aging population. Further research may be needed to understand how widows are treated in families in rural India. Keywords : Widow discrimination, Family Care-Giving, Micro-data Analysis

OP26 211-R-1

TEACHING FUNCTIONAL ASSESSMENT TO MEDICAL STUDENTS: WHY NOT PLAYING GAMES?

Philippe HUBER, Abdelmalek SABER, Yves SCHNELLMANN, Gabriel GOLD (*Internal Medicine, Rehabilitation, and Geriatrics, University Hospitals of Geneva, Switzerland*)

Introduction : Nowadays, most physicians take care of a growing aging population suffering from multiple chronic diseases and disabilities. Therefore, a good knowledge of functional assessment is required, and this topic should be addressed in the pregraduate medical curriculum. Method : We report our 10-year experience with a seminar on functional assessment using an "aging game" as a pedagogic vector. This seminar is organized by geriatricians, occupational therapists and physiotherapists. First, medical students are exposed to various situations where they experiment disabilities and try to elaborate compensatory strategies. Then, they reflect on a challenging discharge project by analyzing a written clinical case. This written case gives the opportunity to reflect on functional assessment, on the importance of a multidisciplinary approach, and on the implication of various actors of the health care system in the community. Finally, students are introduced to the use of validated functional assessment instruments. Results : Evaluation indicated that this pedagogical approach is much valued by the students and foster the acquisition of knowledge in functional assessment. Conclusion : This seminar shows a good efficacy in introducing medical students to the difficult concept of functional assessment. Moreover, this seminar can easily be adapted to the training of other health care professionals. Keywords : medical education, functional assessment, multidisciplinary approach

OP26 211-R-3

ENABLING GREATER ACCESS TO IT FOR THE ELDERLY IN SINGAPORE: LOCATING BOURDIEU'S PRACTICE THEORY IN GERONTOLOGICAL RESEARCH

Kevin Siah-Yeow TAN (*School of Human Development & Social Services, SIM University, Singapore*)

Introduction : In a rapidly globalizing world where the Internet and accompanying forms of information technology and social media have now become accessible to many, it also important to note that such accessibility has not been uniform nor equal. This is often the case among members of the elderly population who possess lower levels of education and income. At the same time, such seniors may also experience ergonomic challenges to the use of information technology when interacting with onscreen user interfaces on websites and other e-services online. Method : This paper seeks to examine the applicability of Pierre Bourdieu's Practice theory for the purposes of further theoretical contributions towards the discipline of gerontology. The concepts of habitus and field, as employed by Bourdieu's Practice Theory, will be introduced as viable concepts in comprehending and elucidating how the elderly, particularly the less privileged, experience challenges in their access to information technology as a result of their differential access to cultural, social, economic and bodily capital. Results : Based on an ongoing multidisciplinary research project on e-service usability design for the elderly in Singapore, this paper will situate the relevance and effectiveness of Pierre Bourdieu's practice theory in an applied and contextualized setting for future gerontological research and theory-building. Conclusion : This paper proposes that Pierre Bourdieu's Practice Theory can enable a useful and systematic theoretical framework to understand the social-cultural,

economic and corporeal factors that influence the accessibility of information technology for the elderly. Keywords : e-services, theory, Bourdieu

PALLIATIVE CARE LAW AND CAR INSURANCE LAW IN LUXEMBOURG : A MODEL OF BETTER INTEGRATED CARE FOR ELDERLY

Jean-Claude LENERS¹, Nathalie RAUSCH² (1. *LTCF, Geriatrics and Hospice Care Unit, Luxembourg*; 2. *CEO Long Term Care Insurance Luxembourg, Head of CEO Department, Luxembourg*)

Introduction : The aim of this first national study was to find out where and how often palliative care and care insurance plans were applied to senior residents regardless their living situations. The physician must compulsory fill out the main medical reason for all elderly clients receiving both. Method : Complete results have been collected through the Ministry of Social Affairs including all people above 70 years over a period of 2 years . The results have been categorized in 4 domains: home, hospital, long term care facilities and home. Results : The number of allocated specific palliative and dependency care plans was 2024. These plans included 16,4 hours of assistance per elderly patient and per week. Less than 10% were delivered in the hospice (12 beds unit), 35 % in nursing homes and the remaining at home . Mean age was 75,3 years; the gender ratio was 2,9 versus 1 (comparing female and male) and the overall first diagnosis was neuro-psychiatric disorders (41%) , followed by cardio-pulmonary pathologies, cancer diseases . Statistical data on lengths and types of care plans showed 69% lasting less than one year; 26% for 18 months and the remaining for more than a 1,5 years. (details will be shown in the graphics). Conclusion : In conclusion, a new double care plan for dependent and palliative elderly residents was a major cornerstone in their quality of life . But only 4% of this population cohort had a deposed living-will, which by law has been fully legitimized and stands above ethical considerations of the physicians. Keywords : palliative care plans

OP26 211-R-5

COST OF HEALTHCARE SERVICES OF ELDERLY ADULTS WITH CANCER IN THEIR LAST SIX MONTHS

Netta BENTUR¹, Shirli RESNIZKY¹, Sophia EILAT-TSANANI², Ran BALICER³ (1. *Center for Research on Aging, MYERS-JDC Brookdale Institute, Israel*; 2. *North District, Clalit Health Services, Israel*; 3. *Research and Planning Center, Clalit Health Services, Israel*)

Introduction : Although studies have demonstrated the contribution of palliative care to the quality and lower cost of end-of-life care, only a small minority of cancer patients received it. To demonstrate its advantages to decision-makers and service suppliers, we conducted a study examining the quality and cost of care of patients who received and did not received home-hospice care. This presentation shows the difference in cost of care between recipients of home hospice (RHH) and non-recipients (NRHH). Method : An analysis of the administrative data on 429 deceased people with metastasized cancer in one district of an Israeli HMO. Results : The average age of the deceased patients was 70, 67% were 65+, 56% were men. In the last six months of life, the average cost of care per patient was 15,700\$ and in the final two months 6,380\$ - 47% of the total average cost in the last six months. About 68% of the expenses in the last six months were incurred for general hospitalization, and the remainder 32% for community care, home-hospice, medication, day-hospital treatments and inpatient-hospice. The cost for the RHHs was 26% lower than for NRHHs; 42% lower in the last two months. Hospitalization contributed 24% to the cost for RHHs and 64% for NRHHs.

Conclusion : Every effort should be made to expand home-hospice services especially during that last two months of life in order to improve the quality of their care and reduce costs. Keywords : End-of-Life, Cost-of-Care, Hospice-Care

OP26 211-R-6

IDENTIFYING BEST PRACTICES OF COMMUNITY CARE DELIVERY ACROSS 6 EUROPEAN COUNTRIES FOR CARE-DEPENDENT COMMUNITY DWELLING ELDERLY BY BENCHMARKING THE COST-EFFECTIVENESS, DESIGN OF A FP7 PROJECT

Henriette VAN DER ROEST¹, Graziano ONDER², Anja DECLERCQ³, Vjenka GARMS-HOMOLOVA⁴, Palmi JONSSON⁵, Harriet FINNE-SOVERI⁶, Jan SMIT⁷, Jeni BREMNER⁸, Hein VAN HOUT⁹ (1. *General Practice and Elderly Care Medicine, VU Univesity Medical Center, Netherlands*; 2. *Centro Medicina dell'Invecchiamento (CEMI), Universita Cattolica del Sacro Cuore, Italy*; 3. *LUCAS, KU Leuven, Belgium*; 4. *Health Service Research, Hochschule fur Technik und Wirtschaft Berlin, Germany*; 5. *Icelandic Gerontological Research Institute, Landspítali University Hospital, Iceland*; 6. *RAI registers, National Institute for Health and Welfare, Finland*; 7. *Department for Research and Education, Stichting GGZinGeest, Netherlands*; 8. *Directotote, European Health Management Association, Ireland*; 9. *General Practice and Elderly Care Medicine, VU University medical center, Netherlands*)

Introduction : CONTEXT The need for cost effective health systems is imperative in the context of increas-ing care demands of a rapidly aging population and a shrinking working force. High quality community care may prevent costly institutionalisation. There is ample evidence on what type of community care provides best outcomes against reasonable costs. AIM: to identify best practices of community care for care-dependent elderly by benchmarking their cost-effectiveness, taking into account costs of care utilisation and quality of care of European community care organisations. Method : APPROACH IBenC capitalises on a standardised instrument (interRAI-HC) that is widely used across Europe in routine care to assess patient outcomes, care use and quality of care. Building on existing patient data from the FP5 project AdHOC (n=4010) and new data (n≥2750) a novel method to benchmark community care organisations will be established: a summary measure for quality of care is developed and care utilisation registration in inter-RAI-HC is validated to estimate costs from a societal perspective. These measures are inte-grated into the cost-quality of care ratio, enabling benchmarking of community care practices on country and organisation levels. To enable an in-depth interpretation of best practices, the contexts and characteristics of community care organisations will be described rigorously. Results : CONSORTIUM 8 partners from 6 EU coutries. Conclusion : IMPACT The results will support policymakers in health care on evidence based decision-making regarding best practice models of cost effective community care delivery. IBenC may contribute to public health by enabling longer independent living of the elderly. Keywords : benchmarking, best community practice

OP26 211-R-7

ISSUES IN MIXED METHOD RESEARCH IN AGING WITH RACIAL/ETHIC ELDERS

Colette V. BROWNE¹, Noreen K. MOKUAU¹, Kathryn L. BRAUN², Lana S. KA`OPUA¹, Bum Jung KIM¹ (1. *School of Social Work, University of Hawaii at Manoa, USA*; 2. *Office of Public Health Studies, University of Hawaii at Manoa, USA*)

Introduction : Mixed method research design often involves some combination of qualitative and quantitative approaches to research. Mixed methods can be especially useful with racial/ethnic older adult populations as we strive to better identify, understand, and alleviate/eliminate the serious social and health disparities some groups continue to face in the US. Researchers use mixed methods to enrich the understanding of an experience or issue through the confirmation of conclusions, the extension of knowledge, or by initiating new ways of thinking about the subject. **Method :** This oral panel discussion will present a research model developed by Ha Kupuna, National Resource Center for Native Hawaiian Elders, at the University of Hawaii in Honolulu. We used a mixed method design to investigate the health and long-term care needs and preferences of a Native Hawaiians, the indigenous people of Hawaii. The rationale for this study design is presented, along with a number of definitional, paradigmatic and methodological issues. **Results :** The research model is described along with the advantages and disadvantages of study approaches, which included a Systematic Data review, a Key Informant study, Secondary Data analysis of the US Census and State of Hawaii Department of Health, and focus group study of elders (kupuna), and family caregivers. **Methods used for the integration of data,** along with key results, and the challenges of this method, are presented. **Conclusion :** Mixed method designs such as the one presented by this panel are viewed as being able to generate more complete data and enhanced insights than with the use of one research method. **Keywords :** Racial/Ethnic elders, quantitative and qualitative research design, health disparities

OP26 219-B
CALORIC RESTRICTION AND DIETARY RESTRICTION

OP26 219-B-1
A STUDY OF CHANGES IN BODY COMPOSITION, METABOLIC PROFILE, MORPHOLOGY AND SECRETORY STATUS OF ISLET β/α CELL DURING MIDDLE ADULTHOOD AND LATER ADULTHOOD WITH HIGH-FAT AND CALORIE RESTRICT DIET

Qian Qian SUN, Shuang WANG (*Department of Geriatrics, West China Hospital, Sichuan University, China*)

Introduction : To observe the changes of body composition, metabolic profile and islet morphology and secretory status of islet β/α cell with high-fat diet (HFD, 5.86Kcal/kg) and calorie restrict diet (CRD, 1.6 Kcal/kg) from 14-16mon to 18-20mon. **Method :** Male SD rat (14-16 months, n=15 each) was divided into normal diet (ND), HFD and CRD. At 0, 8, 16week, body weight (BW), visceral fat, body fat ratio were measured as body composition, blood was collected to detect TG, TC, FFA, FBG and insulin. HOMA-IR, HOMA- β and ISI were calculated according to fasting glucose and insulin level. Level of insulin and glucagon in islet were assessed by immunohistochemistry, and the area of α/β -cell was measured by MOD. **Results :** 1. At 16 weeks, BW, visceral fat, body fat ratio, TG, FFA, fasting glucose and insulin were significantly increased in group of HFD, HOMA-IR increased while ISI decreased. Insulin within islet was increased, (P<0.05). 2. Comparing with ND and HFD, BW, body composition (P<0.05), FFA, TC, HOMA-IR, ISI were improved at 16 weeks in CRD. Levels of glucagon within islet were dramatically decreased at 8week (P<0.05). **Conclusion :** 1. FFA was the earliest and strongest impact factor in both HFD and CRD which connected with insulin sensitivity tightly from middle adulthood to later adulthood. 2. Change of TC, and glucagon within islet was earlier in group of CRD than HFD. While insulin level in both serum and islet were increased by

HFD.3.It was speculated that β cell was influenced firstly by HFD, whereas α cell by CRD. **Keywords :** High-fat-diet; Caloric restricted diet; insulin resistance; FFA; glucagon; insulin

OP26 219-B-2
A STUDY OF HIGH-FAT OR CALORIE RESTRICT DIET INDUCED AUTOPHAGY IN ISLET CELLS DURING MIDDLE ADULTHOOD AND LATER ADULTHOOD

Qian Qian SUN¹, Wang SHUANG² (*1. Geriatric, West China Hospital, China; 2. Department of Geriatrics, West China Hospital, Sichuan University, China*)

Introduction : To observe the changes of autophagy and apoptosis in islet with high-fat diet (HFD, 5.86Kcal/kg) and calorie restrict diet (CRD, 1.6 Kcal/kg) from middle adulthood to later adulthood. **Method:** male SD rat (14-16 months, n=15 each) was divided into normal diet (ND), HFD and CRD. At 0, 8, 16week, body weight (BW), visceral fat(vF), body fat ratio were measured as body composition, blood was collected to detect TG, TC, FFA, FBG and insulin. HOMA-IR, HOMA- β and ISI were calculated according to fasting glucose and insulin level. Level of insulin, glucagon, apoptosis index in islet were assessed by immunohistochemistry, expression of LC3B and LAMP2 were assayed by western blot. **Results :** 1. At 16 weeks, BW, vF, body fat ratio, TG, FFA, fasting glucose, insulin and AI, LC3B and LAMP2 were significantly increased in HFD group, HOMA-IR increased while ISI decreased. 2. Comparing with ND and HFD, BW, vF, body fat ratio (P<0.05), FFA, TC, HOMA-IR, ISI were improved at 16 weeks in CRD. Levels of insulin, glucagon and AI index within islet were dramatically decreased, whereas LC3B and LAMP2 were significantly increased (P<0.05). **Conclusion :** 1. Both HFD and CRD can activate autophagy in rat islet, but only HFD induced autophagy accompanied with high level of apoptosis. 2. FFA was the earliest and most common initial factor which impact on apoptosis and autophagy in islet in both HFD and CRD, as well as the high level of insulin and glucagon. **Keywords :** apoptosis, autophagy, islet cell

OP26 219-B-3
THE EFFECT OF AN ENTERAL FORMULA CONTAINING PREBIOTICS ON INTESTINAL ENVIRONMENTS IN AGED F344 RATS

Kinya ASHIDA¹, Saori OGAWA¹, Tomoko HAYAKAWA², Takenori MATSUDA², Taketo YAMAJI¹, Takeshi TAKAHASHI¹, Hiroyasu AKATSU³, Mitsuo MARUYAMA² (*1. Food Science Research Laboratories, R&D Division, Meiji Co., Ltd., Japan; 2. Department of Mechanism of Aging, Research Institute, National Center for Geriatrics and Gerontology, Japan; 3. Choju Medical Institute, Fukushima Hospital, Japan*)

Introduction : Elderly patients on enteral nutrition are generally known to have less number of bifidobacteria in their intestines and consequently worse intestinal environments than healthy adults. Therefore, we studied the effects of an enteral formula containing two types of prebiotics, galacto-oligosaccharides and Profec(R) (bifidogenic growth stimulator derived from milk whey culture with Propionibacterium freudenreichi ET-3) on intestinal environments in aged 24-mo-old F344 rats. **Method :** Two-mo-old and 24-mo-old male F344 rats fitted gastric feeding tubes were divided into the control and prebiotics groups and fed on the standard formula (Meiji MEIBALANCE(R) 1.0) and the prebiotics formula (Meiji YH-Flore), respectively, for 13 days. The formulas were infused at the dose of 30 kcal/day/head on the first feeding day and 60 kcal/day/head on the following days. The quantitative characterization of fecal bacteria was

determined by real-time PCR analysis. The cecal short-chain fatty acids (SCFAs) were analyzed by HPLC. Results : The feeding of the control formula decreased the concentrations of bifidobacteria to one hundredth in aged rats but not in young rats. On the other hands, the prebiotics formula increased the concentrations of bifidobacteria in both young and aged animals. Additionally, the prebiotics formula increased the concentrations of total SCFAs in the cecal contents and cecal wall weight and decreased the pH value of the cecal contents compared to the control formula regardless of their aging. Conclusion : These data potentially indicate the intervention of prebiotics could be beneficial for the improvement of intestinal environments in elderly patients. Keywords : prebiotics, bifidobacteria, aged rats

OP26 219-B-4

EFFECT OF ALTERNATE DAY DIET FROM OLD ON THE CHANGES OF MUSCLE WEIGHT AND FIBER SIZE

Keiko ODERA, Ryoya TAKAHASHI (*Department of Biochemistry, Faculty of Pharmaceutical Sciences, Toho University, Japan*)

Introduction : Dietary restriction (DR) from weaning or young adult stages in rodents throughout their usual life span has been shown to prolong longevity and lower or delay the occurrence of many late-onset diseases. However, the effects of DR performed at middle age or later have not been well investigated. We previously found that DR initiated even relatively late in life can restore animal's youthful conditions. Dietary restriction, however, might increase the risk of loss of muscle mass associated during aging, especially in old age. We therefore investigated the effects of DR from old on the change of muscle weight and fiber size. Method : DR was performed by every-other-day (EOD) feeding on weekdays. The regimen was started at 28 months of age and continued for about 3 months. Results : The body weight of the old rats was reduced by about 35% at the end of the experiment. Although the weights of soleus (SOL) and gastrocnemius (GC) muscles in control rats were decreased during the three-month DR, no effect of DR was observed in the weights of these muscles. The number and area of type II fibers of SOL and GC muscles were also decreased with age but again DR did not affect these changes. Conclusion : DR from old was shown to have no apparent negative effect on the age-associated degenerative loss of skeletal muscle mass (sarcopenia) in rats. Keywords : dietary restriction, sarcopenia, myosin

OP26 219-B-5

EFFECTS OF AGING AND LIFELONG DIETARY RESTRICTION ON HISTONE MODIFICATIONS AND GENE EXPRESSION IN RAT KIDNEY

Kyojiro KAWAKAMI, Hideko NAKAMOTO, Shizuo KATAMOTO, Sataro GOTO (*Inst. of Health and Sports Sci. & Med., Juntendo Univ. Grad. Sch., Japan*)

Introduction : Histone modification is important mechanism of epigenetic that regulates gene expression, DNA replication, DNA repair and so on. Possible implication of epigenetics in aging has remained unclear. Method : We have studied effect of aging and dietary restriction (DR) on histone modification and mRNA expression in rat kidney. Histone modification was analyzed by Western blot using specific antibody against acetyl-histone H3 at lysine 9 (H3K9). Messenger RNA expression was analyzed by real-time quantitative RT-PCR. In addition, the relationship between histone modification and active chromatin was studied by chromatin immunoprecipitation and quantitative PCR (ChIP-qPCR) method. Results : Acetylation of H3K9 was increased with aging. While young DR rats showed higher level of the modification than ad libitum (AL) fed animals, but old DR animals showed lower level than AL fed ones. We found mRNA level

of transforming growth factor beta 1 (Tgfb1) a cytokine was increased with aging but DR lowered the change. ChIP-qPCR analysis with acetyl-H3K9 antibody and amplified Tgfb1 promoter region showed that young DR is higher than other 3 groups, whereas the level for old AL animals was higher than the young AL animals. Conclusion : It is known that aged rats often suffer from nephropathy, and inflammation is considered as one of the causes of its pathology. Messenger RNA expression of Tgfb1 was increased only in old AL, however, ChIP-qPCR of acetyl-histone H3 lysine 9 didn't relate to mRNA expression. Further analysis is needed to make possible causal link of histone modification and mRNA expression. Keywords : histone, dietary restriction, epigenetics

OP26 219-B-6

TRANSCRIPTIONAL BIOMARKERS OF AGING AND MODULATION BY DIETARY INTERVENTIONS

Jamie L. BARGER (*LifeGen Technologies, LLC, USA*)

Introduction : Studies using whole-genome transcriptional profiling have identified thousands of genes that are changed in expression with age. However, most of these age-related changes are not universal, but instead are specific to the genetic background of the organism being studied. Thus, there is great interest in identifying robust transcriptional biomarkers of age as these genes can be used to screen for interventions which slow the aging process. Method : We used gene expression profiling to identify transcripts that were consistently changed in expression with age in mice (5 vs. 28-30 months of age). The effect of aging was measured in seven strains of mice and in three tissues (brain, heart, and skeletal muscle). Following RTPCR confirmation of the microarray data, 10-12 genes were identified as robust transcriptional biomarkers (depending on the tissue). Results : Interestingly, there was minimal overlap of the biomarkers among the tissues, suggesting that the effects of aging are tissue specific at the individual gene level. However one gene was consistently changed with age in all three tissues studied. We then used these panels of biomarkers as screening tools to assess if dietary interventions (including a calorie restricted diet or natural compounds) were able to oppose age-related changes in these biomarkers. Conclusion : The results show that calorie restriction is able to oppose aspects of aging in some tissues and that consumption of specific natural compounds may oppose the aging process in other tissues. Keywords : aging nutrition calorie restriction nutrigenomics biomarkers

STATE OF AGED HEALTH AND ITS SOCIAL DETERMINANTS IN URBAN INDIA

Sanjeev MAHAJAN (*Sociology, N.A.S. Post-graduate College, Meerut-250001 (India), India*)

Introduction : Aging is a normal, natural, physiological, psychological and social process and has been a source of curiosity and fear from time immemorial. This has not only profound personal implications for the individual but also implications for the society. Aging processes, though are inherent and inevitable, they are independent of stresses, trauma, or diseases and are neither identical nor do they progress at the same pace in all persons. Rapidly growing population of the aged in India, their health status and problems has made this section of society highly vulnerable. Hence, a major issue of societal concern is the health status of the aged. The present paper aims to find out the state of health of the aged and its social determinants. Method : Empirical

evidence collected from 300 aged by administering a interview schedule in a metropolitan city, named Meerut in Uttar Pradesh state of India. Results : Females have better state of health than males. Social determinants are found to affect the health status of the aged. Conclusion : Marital status is not found to affect the health status of the aged. However, factors like income (both of the aged and that of family), type and size of family, caste, religion and residential background that matter in the state of health of the aged. Those with comparatively high income, living in joint families of medium size, belonging to high or middle range caste, Hindus and having rural background are found to have excellent/very good health. Keywords : Aged care, Geriatric sociology, Social determinants

OP26 220-S-2

ARE HEALTH EXAMINATIONS USED MORE FREQUENTLY BY HEALTHY ELDERLY INDIVIDUALS THAN BY UNHEALTHY ELDERLY INDIVIDUALS?

Hui-Chuan HSU¹, Wen-Chiung CHANG², Dih-Ling LUH³, Ling-Yen PAN⁴ (1. Department of Health Care Administration, Asia University, Taiwan; 2. Institute of Health Policy and Management, National Taiwan University, Taiwan; 3. School of Public Health, Chung Shan Medical University, Taiwan; 4. Bureau of Health Promotion, Department of Health, Taiwan)

Introduction : This study examined the use and the trajectory of general health examinations and the relationships among health, healthy lifestyles, and general health examinations among elderly Taiwanese. Method : The study evaluated a 5-wave panel set of elderly Taiwanese and included 2,984 respondents (for a total of 11,936 observations) in the analysis. Health was defined as the lagged (previous wave effect) and the changes in chronic diseases and physical function difficulties. Healthy lifestyle was defined as the collection of healthy behaviors, including not smoking, drinking alcohol in moderation, and engaging in regular exercise. We applied a hierarchical linear model with repeated measurements and controlled the time-constant and time-varying covariates. Results : The use of health examinations increased over time. Elderly with more chronic diseases were more likely to undergo health examinations, but the rate of change declined over time. Having physical function disabilities was not a significant factor in the frequency of health examinations. Elderly subjects who engaged in regular exercise were more likely to undergo health examinations, but other health-related behaviors did not have a significant effect on the rate. Conclusion : For elderly Taiwanese, the use of health examinations is more likely to be a response to poorer health rather than a part of a healthy lifestyle. Taiwan's healthcare policy should encourage older adults to monitor their own health by undergoing routine general health examinations before morbidity becomes severe. Keywords : health examination, health behavior, preventive medicine

OP26 220-S-4

HEALTH AND FUNCTIONING OF COMMUNITY DWELLING OLDER ADULTS IN CHINA AND KOREA

Eun-Kyoung Othelia LEE¹, Jungui LEE², Qingwen XU³ (1. Social Work, University of North Carolina Charlotte, USA; 2. Division of Policy Research, Gyeonggido Family & Women's Research Institute, Korea; 3. Social Work, Tulane University, USA)

Introduction : Population aging is occurring at an unprecedented pace in China and Korea. The purpose of this study is to describe the state of health and functional limitations of community dwelling older persons in China and Korea, to explore the factors that are associated with functional limitations. Method : Community dwelling adults aged

65 and older (n=11,449) were drawn from Chinese Longitudinal Healthy Longevity Survey. The comparable Korean sample (n=4,152) was drawn from Wave I of the Korean Longitudinal Study on Aging. Hierarchical multiple regression analysis was undertaken to assess the unique explanatory contribution of socio-demographics, chronic health conditions, cognition, lifestyle factors (e. g., smoking, drinking, and exercise), and social engagement on functional limitations. Results : Common predictors of ADL and IADL limitations in both Chinese and Koreans were being old, being women, having more years of schooling, being currently unmarried, reporting more number of chronic diseases, and manifesting lower cognition. Income and employment status is significant for Koreans only. Lifestyle factors of drinking and absence of exercise were significant predictors of poor ADL and IADL for Koreans, while prevalence of smoking and social/leisure activities were more significant for Chinese. The final model explained 31% of ADL and 38% of IADL in Korean sample. The final model for Chinese explained only 24% of ADL (R²=.24, F=208.3, p<.001) but explained twice that amount (55%) of IADL (R²=.55, F=805.4, p<.001). Conclusion : Our comparative approach explained how the potential demand for care and support varies between two countries regarding the prevalence of functional limitations. Keywords : Functioning, lifestyle, health, South Korea, China

PSYCHOLOGICAL ASPECTS OF AGEING (ATTITUDE)

OP26 221-S-1

IS IT POSSIBLE TO BE A MIGRANT AND HEALTHY AT THE SAME TIME?

Suzan YAZICI¹, Nilufer Korkmaz YAYLAGUL¹, Anne Leonora BLAAKILDE², Allan KRASNIK², Signe Gronwald PETERSEN², Signe Smith NIELSEN², Caglar ARSLANER¹ (1. Gerontology, Akdeniz University, Turkey; 2. Gerontology, Center for Healthy Aging, Denmark)

Introduction : The "healthy migrant effect" is unfortunately not seen anymore. On the contrary, many studies show that the health status of the migrants is worse than the native population. Health promotion initiatives aiming an active lifestyle among the elderly are becoming more frequent as obesity and other lifestyle related problems become more prominent in developed countries. As the immigrants are less active, they become overweight and have more diseases compared to the native population; their need to access health promotion activities is much more evident. Barriers such as language and communication, lack of knowledge about the system and cultural factors are some of the reasons affecting the migrant's access to available services. Method : 20 semi structured interviews with first generation migrants have been conducted each in Denmark and UK. Results : In general the Turkish immigrant had a sedentary life style and many health problems. They were blaming their previous work and living conditions, the country of residence basically as a reason for this. Conclusion : Being an immigrant and spending the life in an other country than the country of birth might be a predictor of poor health even in the absence of any previous illness. Keywords : health, immigrant elderly, activity

OP26 221-S-2

PERSONAL ANXIETY IN OLDER WOMEN AND ITS ASSOCIATION WITH AWARENESS AND ATTITUDE TOWARDS THE HEALTH: WHO "MONICA" EPIDEMIOLOGICAL STUDY

Valery GAFAROV, Dmitriy PANOV, Elena GROMOVA, Igor

GAGULIN, Almira GAFAROVA (*Laboratory of Psychological and Sociological Issues of Internal Diseases, Institute of Internal Medicine SB RAMS, Russia*)

Introduction : We aimed to study prevalence of personal anxiety and its association with awareness and attitude towards the health in female population aged 25-64 years in Russia. **Method :** Under the third screening of the WHO 'MONICA-psychosocial' program random representative sample of women aged 25-64 years (n=870) were surveyed in Novosibirsk in 1994. Levels of personal anxiety were measured at the baseline examination by means of Spilberger's test. **Results :** High level of personal anxiety (HLA) in female population of 25-64 years was 60.4 %. Women in older group 55-64 years have lower prevalence of HLA (57.1%) compared to those in younger groups as 25-34 and 35-44 years (64% and 69.5%, respectively; $\chi^2=15.05$, $p=0.02$). There was growth of poor health assessments as «not quiet well» and «sick» in 1.5-3 times in women with HLA. More than 92% of women with HLA have complaints to health ($\chi^2=38.33$, $p<0.001$), but consider their care about the health is not enough. There was a higher share of women with HLA who tried unsuccessfully to quit smoking compared to lower level of anxiety (10.7% and 3.9%, respectively; $\chi^2=11.25$, $p<0.05$). Women with HLA in 2-times less likely to follow the diet ($\chi^2=20.87$, $p<0.001$). Individuals with HLA assess their physical activity for their age more passive ($\chi^2=18.13$, $p<0.01$) and rarely spend their leisure time physically actively. **Conclusion :** Despite high prevalence of anxiety in Russian female population older women have lower HLA rates compared younger ones. HLA more likely associated with poor self-rated health, higher rates of health complaints and negative behavioral habits. **Keywords :** anxiety, awareness, women

OP26 221-S-3

EFFECTIVENESS OF YOUNG POLES' EDUCATION IN RESPECT OF VIEWING OLD AGE AND ATTITUDES TOWARDS THE ELDERLY

Alina ZUREK, Tomasz FRACKOWIAK (*Dept. of Psychology, University of Wroclaw, Poland*)

Introduction : Preparation of children for old age occurs in the natural educational environment, a family. However, the model of a Polish family changing from the multigenerational family to a family of two generations often does not allow a young person to experience a closer contact with an elderly person and become acquainted with the specificity of old age. In this situation it's necessary to acquire knowledge about old age and gain experience through intergenerational meetings. Such an opportunity was created by a campaign addressed at Polish children and young people, the subject of which was old age and aging. The aim of this paper is to assess the effectiveness of the educational program in the respect of positive perception of old age and positive attitudes of the younger generation of Poles towards the elderly. **Method :** The participants of the research comprised more than 150 children and young people and their parents taking part in the program. The research was conducted before the beginning of the campaign and after its ending. The tools used were created by the authors of this paper with a view to evaluate the effectiveness of the educational activities on the perception of old age and attitudes of the younger generations towards the elderly. **Results :** The paper presented shows the results of the ex-ante, mid-term, and ex-post evaluation. **Conclusion :** Benefits of the educational program are positive attitudes of children and young people to age and ageing. **Keywords :** education, attitude, ageing

OP26 221-S-4

SELF BODY IMAGE AS AN INDICATOR OF HEALTH AND QUALITY OF LIFE AMONG WOMEN IN A GERIATRICS CLINIC OF A UNIVERSITY HOSPITAL IN BRAZIL

Laura Brenner ROCHA, Irenio GOMES, Newton Luiz TERRA (*Institute of Geriatrics and Gerontology, IGG PUCRS, Brazil*)

Introduction : Body image is a perception that the individual has towards its own appearance and body functioning and it may vary along the lifespan. A better body image perception is associated with a lesser frequency of overweight and obesity in the elderly. **Method :** The sample contained 58 patients of the Geriatrics clinic from May to August 2010. BMI was calculated using Quetelet Index. Body image satisfaction was measured through Stunkard Nine Figure Scale(SNFS). **Results :** The prevalence of overweight/obesity was 62.1%. The age of the sample was from 60 to 94 (average age of 74 ± 7.8) and 31% over 80. Figures 4 and 5 of SNFS were the most frequently chosen (24.1% and 25.9%) as their real appearance. Figures 3 and 4 were the most chosen for ideal body figure (29.3% and 25.9%). The score obtained most frequently was 0, 1 and 2 (29.3%, 27.6% and 29.3% respectively). Almost fifty-one percent (50.9%) of the patients were not satisfied with their weight. 29.9% of the patients were satisfied with their body image. 51.9% said they were satisfied with their weight but not with their image. 13% of the overweight the normal weight patients were satisfied with their weight, whereas 10% and 11% of the overweight and obese patients respectively were not satisfied. There was a significant association between these two variables with a $p\leq 0.05$. **Conclusion :** Self Body image showed a significant association with BMI. Body image instead of body weight should be analyzed for well being and health perception specially in the elderly. **Keywords :** body image elderly nutrition

OP26 221-S-5

THE EFFECTS OF SERIOUS GAME ('PALDOGANGSAN 2') ON THE KOREAN ELDERLY IN SOUTH KOREA: THE ROLE OF AGE AND HEALTH STATUS

Joonhee AHN¹, Kyungsik KIM², Seongsuk OH², Jinho AHN³ (*1. Dept. of Social Welfare for the Elderly, Hoseo University, Korea; 2. Dept. of Game Engineering, Hoseo University, Korea; 3. Dept. of Electrical Engineering, Hoseo University, Korea*)

Introduction : Research has maintained that playing games via internet or video games can be utilized as a major leisure activity among the elderly and help improve their certain cognitive functions. However extant research studies have not considered how the effects of playing games can be different depending on the age groups (the young old (65-75 years old), the old old (75-85 years old), the oldest old (85 years old and older)) and various health status. A serious game for the elderly named 'Paldokangsan2' has been developed in Korea in 2012, a walking game for two people using controllers of armrests and footboards with PC. In 'Paldokangsan 2', walking while remembering/choosing healthy food was implemented as main game activities. This preliminary research aimed to examine the multifarious effects of playing 'Paldokangsan2' among the Korean elderly in Korea. **Method :** Data were collected from a survey of approximately 219 community-dwelling Koreans (age ≥ 65) who agreed to play the game (10-25 minutes) and complete a survey questionnaire post-game play. **Results :** Results showed that the young old and the old old perceived that playing the game would assist their memory functions more than the oldest old. The old old participants evaluated that the game play would improve their levels of concentration more than the young old or the oldest old. Physically healthy participants expressed that their sense of vitality improved after playing the game more than their counter part. **Conclusion :** It is critical to specify the targeted

group with age or health status when developing serious games for the elderly. Keywords : serious game, cognitive effects, Korean elderly

OP26 308-C-1 IMPACT OF HIGH RISK MEDICINES ON HOSPITALISATION AND MORTALITY IN PEOPLE WITH AND WITHOUT ALZHEIMER'S DISEASE

Danijela GNJIDIC¹, Sarah HILMER², Sirpa HARTIKAINEN³, Anna-Maija TOLPPANEN³, Heidi TAIPALE³, Marjaana KOPONEN³, Simon BELL⁴ (1. Faculty of Pharmacy, University of Sydney, Australia; 2. Royal North Shore Hospital, University of Sydney, Australia; 3. Kuopio Research Centre of Geriatric Care, University of Eastern Finland, Finland; 4. Quality Use of Medicines and Pharmacy Research Centre, University of South Australia, Australia)

Introduction : There is a lack of data in relation to possible negative outcomes associated with use of anticholinergic and sedative medicines in older persons with Alzheimer's disease (AD). This study aimed to investigate the relationship between use of anticholinergic and sedative medicines and hospitalisation and mortality in persons with AD in Finland. Method : Community-dwelling people (n=16,603) with AD on December 31, 2005 were identified by the Social Insurance Institution. For each person with AD, a comparison person matched in terms of age, sex, and region of residence was identified. Records of reimbursed medicines purchased from 1st September-31st December 2005 were extracted from the Finnish National Prescription Register. High-risk prescribing was defined using the Drug Burden Index (DBI), a dose-normalised measure of exposure to anticholinergic and sedative medicines. Mortality and hospitalisation data over one-year were extracted. Cox and logistic regression analyses were used to investigate the relationship of DBI exposure with outcomes. Results : For every unit increase in DBI, the adjusted hazard ratio (HR) for mortality was 1.20 (95% confidence intervals [CI]: 1.09-1.32) among persons with AD, and 1.43 (95%CI: 1.27-1.62) for persons without AD. For every unit increase in DBI, the odds ratio (OR) for being hospitalised in persons with AD was 1.38 (95%CI: 1.31-1.46) compared with an adjusted OR of 1.83 (95%CI: 1.71-1.95) among persons without AD. Conclusion : These data imply a dose-response relationship of higher DBI exposure with hospitalisation and mortality in both persons with and without AD, with a greater relative risk among persons without AD. Keywords : drug utilisation, Alzheimer's disease, clinical outcomes.

OP26 308-C-2 DEMENTIA DISORDERS AND DRUG THERAPY IN THE SWEDISH DEMENTIA REGISTRY (SVEDEM): A NATIONWIDE STUDY OF OVER 7 000 PATIENTS

Kristina JOHNELL¹, Dorota RELIGA², Maria ERIKSDOTTER³ (1. Aging Research Center, Karolinska Institutet, Sweden; 2. Alzheimer's Disease Research Center, Karolinska Institutet, Sweden; 3. Section of Clinical Geriatrics, NVS Department, Karolinska Institutet, Sweden)

Introduction : We aimed to study whether there are differences between dementia disorders and the use of anti-dementia drugs and antipsychotics (neuroleptics) in a large population of dementia patients. Method : Information about dementia disorders was obtained from the national Swedish Dementia Registry (SveDem) 2007-2010 (n=7 570). Multivariate logistic regression analysis was performed to investigate the association between dementia disorders and the use of

anti-dementia drugs and antipsychotics, after adjustment for age, sex, residential setting, living alone, MMSE score and number of other drugs (a proxy for overall co-morbidity). Results : More than 80% of the Alzheimer's disease (AD) and 86% of dementia with Lewy bodies (DLB) patients used anti-dementia drugs. Women were more likely than men to be treated with cholinesterase inhibitors. A higher MMSE score was positively associated with use of cholinesterase inhibitors, but negatively associated with NMDA receptor antagonists and antipsychotics. The use of antipsychotics in all dementia patients was 6%, but in DLB, the use of antipsychotics was higher (16%), with an adjusted odds ratio of 4.2 compared to AD patients. Conclusion : Use of anti-dementia drugs in AD was in agreement with Swedish guidelines. However, use of antipsychotics in patients with DLB was high, which might be worrying given the susceptibility of DLB patients to antipsychotics. Keywords : dementia, national dementia registry, drug treatment

OP26 308-C-3 ANTI-PSYCHOTIC MEDICATION USE IN RESIDENTS WITH DEMENTIA: CORRELATES OF SUCH USE IN 8 COUNTRIES

Andrea D. FOEBEL¹, Rossella LIPEROTI², Graziano ONDER³, Givoanni GAMBASSI², Roberto BERNABEI² (1. School of Public Health and Health Systems, University of Waterloo, Canada; 2. Centro Medicina dell'Invecchiamento, Università Cattolica del Sacro Cuore, Italy)

Introduction : Among people with dementia, use of both conventional and atypical antipsychotic (AP) medications has been linked to increased risk of stroke and death. These findings led to new recommendations that AP use be avoided in such populations. However, AP use continues to be a mainstay in the treatment of the behavioural and psychological symptoms in these patients. The potential correlates of such continued use has not been well studied. Method : This cross-sectional study used data from the SHELTER study. This study used the interRAI Long-Term Care Facility instrument to collect comprehensive resident data from over 4,000 older individuals in 57 long-term care facilities in 7 European countries and Israel. Multivariate logistic regression analysis was used to identify potential correlates of any AP use among residents with dementia. Results : Among the 2,091 residents with dementia, the prevalence of AP use was 32% (n=662) and varied by country. Those with no AP use were younger, less functionally impaired, had fewer psychotic symptoms and delirium, and were less physically restrained. The strongest correlate of AP use was the presence of behavioural problems, and other factors found to be associated to AP use were: moderate functional impairment, severe cognitive impairment, presence of psychotic symptoms, concurrent use of anxiolytics and hypnotics, and presence of a geriatrician in the facility. Conclusion : This study systematically shows that AP use is still prevalent among residents with dementia and may be largely driven by behavioural symptoms. Reconciling such use with current recommendations for this vulnerable population deserves clinical and policy attention. Keywords : Anti-Psychotic Medications, Dementia, Long-Term Care

OP26 308-C-4 HYPOVITAMINOSIS D AND COGNITIVE FUNCTION: THE PAVULLO STUDY

Alberto CASTAGNA¹, Andrea TOSCHI¹, Simona MOSCARDINI¹, Andrea FABBO², Andrea SPANO¹ (1. Distretto Di Pavullo Nel Frignano, Ausl Di Modena, Italy; 2. Progetto Demenze, Ausl Di Modena, Italy)

Introduction : Aging is associated with a large increase in the

prevalence of hypovitaminosis D. Hypovitaminosis D is associated with cognitive decline in the elderly, but the issue of causality remains unresolved. The aim of the present study is to examine the association between 25-hydroxyvitamin D (25(OH)D) and cognitive function (MMSE) in Italian elderly participating in the Pavullo Study. Method : We studied the association between 25(OH)D and cognitive function (MMSE) in 38 (F 79% age 80,7± 6,21 years) consecutive elderly patients attending our Geriatric Outpatient Clinic reporting memory impairment. We performed a comprehensive cognitive assessments, medical examinations, physical performance measures and provided blood samples. Results : In our population hypovitaminosis D was present in 100%; 35 patients (92,1%) had a serum 25(OH)D less than 20 ng/ml; 3 (7,9%) patients between 20 and 30 ng/ml. After adjustment for age, gender, systolic blood pressure, education level, cardiovascular diseases, and antihypertensive therapy, a significant association was observed between 25(OH)D and cognitive status ($r=0,341;P=0,036$). MMSE appears significantly higher in subjects with 25(OH)D >10 ng/ml than in those with 25(OH)D <10 ng/ml (21,23±7,07 vs 16,3±6,15; $P=0,028$). Conclusion : Our results showed a relationship between 25(OH)D and cognitive impairment, suggesting that 25(OH)D could be involved in the onset of dementia. Clearly, an association between low 25(OH)D status and cognitive impairment does not establish that 25(OH)D inadequacy causes cognitive deterioration. Additional investigation of this clinical observation, particularly with intervention studies, is clearly desirable. Keywords : Vitamin D, Dementia, Older Adults

OP26 308-C-5

DISCLOSURE OF A DIAGNOSIS OF DEMENTIA; A SYSTEMATIC REVIEW ON PREFERENCES OF PERSONS WITH AND WITHOUT DEMENTIA

Pim VAN DEN DUNGEN (*General Practice and Elderly Care Medicine, VU University Medical Center Amsterdam EMGO+ Institute for Health and Care Research, Netherlands*)

Introduction : It is not clear whether the reluctance to disclose a dementia diagnosis that many physicians experience is in accordance with their patients' preferences. What are preferences regarding disclosure of the general population, individuals with dementia, their relatives and physicians? Our objective was to review preferences of individuals, with and without dementia, regarding disclosure of a (potential future) diagnosis of dementia, and to explore arguments in favour of, and against disclosure. Method : Systematic search in Pubmed, Embase and Psycinfo. Two authors assessed relevance and quality, and independently extracted data of retrieved studies. Results : We included 23 articles: the median percentage in favour of disclosure was 92% (range 76%-98%) in the 8 studies investigating preferences of the general population. The median percentage in favour of disclosure was 88% (range 69%- 100%) in 8 studies in patients with dementia or referred to a memory clinic. The median percentage in favour of disclosure was 92% (range 58%-98%) in 8 studies on preferences of relatives of individuals with dementia. The 2 studies among physicians, showed 72% respectively 77% favouring disclosure if they were to develop dementia. Main reasons for disclosure were 'to plan the future' and 'the right to know'; the main reason against was 'fear of getting upset'. Conclusion : The vast majority of individuals, regardless of the presence of cognitive impairment, preferred to be informed about a diagnosis of dementia. Physicians preferred not to know relatively often. Early openness about possible dementia may help people to prepare for what is to come. Keywords : dementia, disclosure, patient preferences

OP26 308-C-6

THE SYSTEM COMPLEXITY THEORY AND INTERVENTION OF VARIOUS KINDS OF COGNITIVE IMPAIRMENTS

Yongxing MA, Yue ZHU, Zhanshun WANG, Chuanfu WANG, Peifang LU, Yue-Di GU (*Department of Aging, Antiaging and Cognitive Function, Shanghai Institute of Gerontology and Geriatrics, Affiliated Huadong Hospital, Shanghai Medical Collage, Fudan University, China*)

Introduction : 1. The Various Kinds of cognitive Impairments($n=2666$, ≥ 65 yrs) were as following: AAMI:860 cases, 32. 26%; MCI: 782 cases, 29. 33%; Dementia: 157 cases(AD 88, VD 39 and MD30) 5 89%; Normal cognitive function (NCF): 867 subjects, 32. 52%; 2. We found that cognitive impairment in the aged and presaged is intimately correlated with free radical metabolism, microcirculatory disturbance, hyperlipemia, arteriosclerosis, hypertension, coronary heart disease, diabetes mellitus, cerebrovascular disease, chronic bronchitis and emphysema, chronic renal failure, lower PaO₂, and quantitative MRI of hippocampal formation, etc. Method : 3. The frequency of APOE ϵ 4 of: (1) AAMI: No significant difference between the allele frequency of APOE ϵ 4 in AAMI (6. 89%, 58/842) and control group (7. 04%, 56/796). (2) MCI : ①APOE ϵ 4 in MCI9.12% (56/614), control group 6.44% (87/1350) ($X^2=4.48,P<0.05$);②APOE ϵ 2: MCI7.33% (45/614), control group 5.26%(71/1350) ($X^2=3.25,P>0.05$);③APOE ϵ 3: MCI83.55% (513/614), control group88.30%(1192/1350) ($X^2=8.30,P<0.01$)④APOE ϵ 4, APOE ϵ 2, APOE ϵ 3 allele frequency: $X^2=8.31,P<0.05$; (3)AD: APOE ϵ 4 allele frequency of AD and controls were 21. 0% (86/410)and 7. 75%(31/400), The allele frequency of APOE ϵ 2, 3 and 4 in the AD group was 6. 8%, 72. 2% and 21. 0% respectively and 6. 3%, 86. 0% and 7. 7% in controls, $X^2=29. 5, P<0. 001$. Results : 4. We have performed double blind trail of huperzine (702 cases), aniracetam (622 cases),R. S. C. (sea products; 700 cases) and certain other traditional Chinese drugs to treat cognitive impairment including VD (MID), AD and "VD+AD". Huperzine and aniracetam were found to be effective to increase the MQ score in memory impairment in the aged and presaged and mild or moderate dementia (VD, AD, VD+AD). Conclusion : 5. The mechanisms of cognitive impairment in the aged is multiple and complex. The measures for intervention of cognitive impairment in the aged must be comprehensive too. Keywords : Cognitive Impairment AAMI MCI Dementia Normal Cognitive Function

OP26 308-C-7

AMINOFF SUFFERING SYNDROME AND ANTI-ENTROPY DEFICIENCY PHENOMENON IN ADVANCED DEMENTIA

Bechor Zvi AMINOFF (*Geriatrics, Geriatric Division, Sheba Medical Center, Tel-Hashomer & Minerva Center at Tel-Aviv University, Israel*)

Introduction : To study possible interrelations between Aminoff Suffering Syndrome (ASS) and anti-entropy deficiency in advanced dementia. Method : A cohort study of 71 patients (28 females, 43 males), with very advanced dementia, who died in our ward during the study period. The intense suffering level of these end-stage dementia patients was evaluated by the Mini-Suffering State Examination (MSSE) scale (1999). Results : On the last day of life 71.8% of dying dementia patients with ASS were not calm, 71.4% had decubitus ulcers, 94.4% suffered from malnutrition, 95.8% had eating disorders, 90.1% experienced invasive procedures, and 90.1% were in an

unstable medical condition. Suffering level in advanced dementia has a significant correlation with short survival, advancing age, more severe illness, malnutrition, the existence of decubitus ulcers, and the administration of medications. Conclusion : Established correlations between ASS and advanced dementia could be explained by anti-entropy deficiency. A decreased level of human anti-entropy is a measure of disorder, a process of aging, and a source of torment to the patient. Keywords : Suffering, anti-entropy, dementia

OP26 310-R EDUCATION

OP26 310-R-1 USE OF THE CORNELL SCALE FOR DEPRESSION IN DEMENTIA (CSDD) IN NURSING HOMES

Yun-Hee JEON¹, Zhixin LIU², Lee-Fay LOW², Daniel O'CONNOR³, Lynn CHENOWETH⁴, Henry BRODATY⁵, Elizabeth BEATTIE⁶, Tanya DAVISON⁷ (1. Nursing, The University of Sydney, Australia; 2. Dementia Collaborative Research Centre, School of Psychiatry Faculty of Medicine The University of New South Wales, Australia; 3. Department of Old Age Psychiatry, Monash University, Australia; 4. Faculty of Nursing, Midwifery and Health, The University of Technology Sydney, Australia; 5. Dementia Collaborative Research Centre, School of Psychiatry University of New South Wales, Australia; 6. Dementia Collaborative Research Centre (DCRC), Queensland University of Technology, Australia; 7. Aged Mental Health Research Unit, Monash University, Australia)

Introduction : Despite its high prevalence in the elderly, depression is often under-detected, under-diagnosed and under-treated, particularly in nursing homes (NHs), where limited resources and workforce capacity further interfere with adequate assessment and management of depression. The Cornell Scale for Depression in Dementia (CSDD) has been widely utilised for this population, but problems exist concerning the implementation of CSDD in the NH context. Our research aims to identify the best assessment process to ensure appropriate care and management of depression in NHs. This paper focuses on Phase 1 of the study that examined our existing NH databases containing CSDD data. Method : We analysed a total pooled sample size of 556 from four studies, using descriptive statistics and Item Response Theory (IRT), to identify patterns of responses and non-responses for the frequencies of items marked 'unable to score' and 'missing', and patterns of responses (items) that are closely linked to severity of depression. Results : Notwithstanding the uniqueness of the individual studies pooled together, common patterns were identified and, through further analysis using the IRT model, shorter versions of CSDD were developed and validated using a recent nursing home study (n=115). Conclusion : The shorter versions will be tested for validity using data from Phase 2 where we compare newly collected depression assessment results using CSDD and the Geriatric Depression Scale, both rated by NH staff, against a formal diagnosis of depression by expert clinicians (n=100). The results, combined with key stakeholder consultations, will contribute to the development of a suite of recommended best-practices depression assessments in NHs. Keywords : Depression, Assessment, Nursing homes

OP26 310-R-2 WHAT IS THE QUALITY OF END-OF-LIFE CARE OF THOSE SUFFERING FROM ADVANCED DEMENTIA?

Netta BENTUR¹, Shelley STERNBERG², Jennifer SHULDINER¹ (1. Center for Research on Aging, Myers-JDC-Brookdale Institute, Israel; 2. Department of Public Health, Maccabi Health Services, Israel)

Introduction : Patients with dementia have substantial unmet needs including behavioral concerns, pain, difficult decisions regarding treatment, and caregiver burden. Our aim was to examine the quality of end-of-life care in Israel provided for older people with severe dementia living in the community. Method : Face-to-face interviews were conducted with 120 family primary caregivers of older people with severe dementia, about half of them died within the last 6 months. Results : The average age of the caregiver respondents was 61.3±12.5 and 71% were female. The average age of patients with advanced dementia was 86.3±7.6 years (64-101) and 65% were female. Dementia lasted on average for 6.4±5.0 years. About 65% received home medical care that included a visit from either a nurse and/or a doctor. However, in a state of emergency, 48% needed to visit the ER. Two scales were used to measure symptom management and comfort around dying. The mean scores were acceptable, 29 (Range =0-45), and 31 (Range=14-42) respectively with lower scores indicating suffering. Half of the caregivers reported that their relative suffered from pain at least once a day in the last week of life. Advance end-of-life care planning was very limited: 20% used advance directives, 63% had guardians and 22% had power of attorneys. Only 15% of caregivers reported discussing advance care planning tools with the medical team. Conclusion : The quality of end-of-life care for people with advanced dementia in Israel is quite poor. The data supports the need to develop tailored services for dementia patients living in the community. Keywords : Dementia, Palliative Care

OP26 310-R-3 AGREEMENT STUDY BETWEEN SELF-REPORTED DOCTOR-DIAGNOSED ARTHRITIS AND JOINT SYMPTOMS

Thomas LO, Lynne PARKINSON, Julie BYLES (PRCGHA, University of Newcastle, Australia)

Introduction : Objective of this study is to examine the agreement between self-report doctor-diagnosed (SRDD) arthritis and self-report joint symptoms suggesting arthritis. Method : A pilot cross-sectional study was conducted in late 2012. Self-administered surveys were distributed to women aged ≥ 60 years, recruited from the Hunter Medical Research Institute Research Register. SRDD-arthritis cases were women answered positively to: "In the past three year, have you been diagnosed or treated for osteoarthritis, rheumatoid arthritis, psoriatic arthritis, gout, and/or other form of arthritis." Joint symptoms (JS) were assessed with the validated Community Oriented Program for Control of Rheumatic Disease (COPCORD) questions. Agreement was examined using kappa (k) statistics. Sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV) were calculated using JS-arthritis as the reference. Logistic regression models examined predictors of agreement. Results : Eighty participants completed the pilot survey. Sixty-seven per cent of respondents self-reported doctor-diagnosed arthritis (95% CI 57.7-79.5%); and 52.9% reported joint symptoms suggesting arthritis (95%CI 41.1-64.7%). Agreement between SRDD-arthritis and JS-arthritis was moderate (k=0.45); sensitivity, specificity, PPV and NPV were 0.89, 0.65, 0.69 and 0.82 respectively. Logistic regression analyses revealed that agreement is influenced by types of arthritis, number of problematic joints, and pain severity. Conclusion : Results suggest that survey data can validly identify cases of chronic disease such as arthritis. This finding will further be tested in a sample of 700 women drawn from the mid-age cohort of the Australian Longitudinal Study on Women's Health. Knowledge gained will benefit researchers who conduct epidemiologic studies of chronic diseases in the ageing population. Keywords : arthritis, health survey, sensitivity and specificity

OP26 310-R-4

PRESENCE OF AND CORRECTION FOR INTERVIEWER ERROR ON AN INSTRUMENT ASSESSING COGNITIVE FUNCTION: A MULTILEVEL ANALYSIS

Rahul MALHOTRA¹, Benjamin A HAALAND², Choy Lye CHEI¹, Angelique CHAN¹, Chetna MALHOTRA¹, David Bruce MATCHAR¹ (1. Health Services and Systems Research, Duke-NUS Graduate Medical School, Singapore; 2. Centre for Quantitative Medicine, Duke-NUS Graduate Medical School, Singapore)

Introduction : Extent of interviewer error on instruments used for assessing cognitive function, often utilized in community-based surveys on the health of the elderly, is not known. The objective of the current analyses is to determine the presence of interviewer error on an instrument used for assessing cognitive function- the Short Portable Mental Status Questionnaire (SPMSQ), identify interviewer attributes contributing to interviewer error, compare prevalence of cognitive status categories before and after adjusting for interviewer error, and identify SPMSQ items sensitive to interviewer error. Method : Data of 4542 older adults from a national survey in Singapore was utilized. Interviewer error (intra class correlation [ICC]) on the SPMSQ, and identification of interviewer attributes (age, ethnicity, education and number of interviews conducted) contributing to interviewer error and of SPMSQ items sensitive to interviewer error were assessed using multilevel modeling. Results : We observed substantial interviewer error (ICC= 0.41) on the SPMSQ. Interviewer ethnicity and educational status contributed to interviewer error. Adjustment for interviewer error resulted in an 'improvement' in the cognitive status of a substantial proportion of those initially classified as moderately or severely impaired. Two of the SPMSQ items were particularly sensitive to interviewer error. Conclusion : Investigators using the SPMSQ, and potentially, other instruments, for assessing cognitive function in surveys of older adults should be cognizant of their sensitivity to interviewer error. Assessment for interviewer error and its correction, using appropriate statistical models, such as multilevel modeling, is warranted. Keywords : Cognition, Interviewer, Multilevel Analysis

OP26 310-R-5

REDUCING ALCOHOL MISUSE AMONG OLDER ADULTS: A PROPOSED TRAINING MODEL FOR COMMUNITY PROFESSIONALS

Nancy BROSSOIE (Center for Gerontology, Virginia Tech, USA)

Introduction : Current efforts to reduce alcohol misuse among older adults have generally focused on training healthcare professionals (e.g., physicians, nurses, therapists) to use the evidence-based Screening Brief Intervention and Referral to Treatment (SBIRT) model. While SBIRT interventions have helped many older adults change their drinking behaviors, reliance on healthcare providers to respond is inadequate. Studies have shown that most healthcare providers do not ask probing questions about alcohol use during health visits and patients are unlikely to disclose their drinking habits, even when asked. However, non-healthcare community professionals (e.g., social workers, police officers, clergy) possess insights into the daily lives of community members and become well acquainted with their habits and routines. Thus, they are well positioned to initiate a brief intervention with individuals they suspect of misusing alcohol and refer them for additional help. Method : To facilitate involvement of community professionals, a brief intervention training model for community professionals is proposed. Adapted from SBIRT, the evidence-based training modules address education and awareness, skill building, participant introspection, and collaborative community

response. Results : The resultant model is based on evidence-based research. Skill-building exercises are informed by client-centered and self-determination theory, the use of motivational interviewing techniques, and enhanced through role-playing opportunities with trainer feedback. Introspection activities address the tension between balancing professional objectives with intervention, personal views on alcohol use in late life, ageist attitudes, social norms and expectations to intervene, and respect for self-determination. Conclusion : Variations among professional responses are embedded in model. Opportunities and methods for individual and collaborative responses are also addressed. Keywords : alcohol misuse, training, brief intervention

OP26 310-R-6

BETWEEN SCYLLA AND CHARYBDIS: ANTIPSYCHOTIC DRUG USE AND ELDERLY PATIENTS WITH DEMENTIA

John HSU¹, Maggie PRICE¹, Vicki FUNG² (1. Health Care Policy, Harvard Medical School, USA; 2. MAPRI, KP, USA)

Introduction : Antipsychotic drug use in elderly patients with dementia is controversial. The US FDA has issued warnings of increased mortality risk, and Medicare is seeking to reduce use in nursing homes. Community-based patients also receive the drugs, and can have comorbid neuropsychiatric conditions or symptoms; moreover, clinical guidelines allow for off-label use in select situations. We examined 2007 outpatient antipsychotic use. Method : Subjects were Medicare Advantage beneficiaries, age 65+ years, with a dementia diagnosis. We examined the clinical, geographic (three-digit zip code), income, and individual characteristics associated with antipsychotic drug use, using multivariate logistic regression models. Results : There were 25,119 subjects with dementia: 73.5% had a comorbid mental health condition; 1.8% had schizophrenia and 2.0% had bipolar disorder, specifically. Overall, 23.2% of beneficiaries with dementia received an antipsychotic; 88% of drug recipients had a mental health diagnosis. The clinical characteristics most strongly associated with receiving an antipsychotic drug were having schizophrenia (OR=23.0; 95%CI: 18.3-28.9) or bipolar disease (OR=11.9; 95%CI: 9.8-14.5). Receiving low-income subsidies also was significantly associated with antipsychotic drug use. The ratio for drug use across zip codes (75th-25th percentile) was 2.8. Conclusion : Both comorbid mental health conditions and antipsychotic drug use are common in patients with dementia living in the community. Most antipsychotic use appears to be among patients with comorbid mental health conditions, though few have FDA-approved indications for use. There is a substantial amount of geographic variation in the frequency of antipsychotic drug use among beneficiaries with dementia, as well as greater use among the poor. Keywords : Dementia

ENHANCING EQUITABLE ACCESS TO MENTAL HEALTH CARE FOR THE OLDER PERSONS IN AFRICAN COMMUNITIES

Oluyinka ADEJUMO¹, Eucebious LEKALAKALA-MOKGELE² (1. School of Nursing, University of the Western Cape, South Africa; 2. School of Health Care Sciences, University of Limpopo, South Africa)

Introduction : Mental health for the elderly population is a neglected public health issue in many African countries. Research in this area has been minimal in the lower and middle income countries (LMIC),

suggesting that elderly mental health issues is of low priority in these countries. The World Health Organization says up to 85 % of mentally ill people in the developing world never get treatment. This is likely to be more true for the elderly in African countries. The paper examines the status of older persons' access to mental health care in African countries. Method : Published articles and policy documents on mental health of the elderly from selected African countries were reviewed. Check list was used to identify specific information on elderly mental health status, recognition of older persons' vulnerability to mental health related problems, situation of mental health policies, and issues related to the older persons access to mental health care. Results : Findings confirm that mental health of the elderly is a neglected public health issue in most countries; 64% of countries lack mental health legislation or have legislation that is out-dated and fails to adequately promote the rights of people with mental disabilities; with resultant poor access to mental health care for the older persons. Some specific cultural beliefs also prevent equitable access to mental health care for the elderly. Conclusion : Inequitable access to mental health care violates the rights of the older persons. Recommendations were made to improve older persons' access to mental health care in the sub-Saharan Africa. Keywords : Equitable access, mental health, older persons

OP26 314-S-3

INEQUALITIES IN ACCESS TO HEALTHCARE IN THE US AND ENGLAND

Alan MARSHALL¹, Kevin FEENEY², Jinkook LEE², James NAZROO¹ (1. *CCSR, University of Manchester, United Kingdom*; 2. *RAND, USA*)

Introduction : In this paper we compare quality of healthcare for hypertension in the USA and England focussing on inequality according to individual wealth and the nature of health insurance. Whilst social inequalities have been documented in terms of quality of healthcare, particularly in relation to the USA, few studies have attempted to compare healthcare outcomes across countries. Method : We analyse data from the English Longitudinal Study of Ageing and the Health and Retirement Survey. We use multinomial logistic regression to predict clinical outcomes of care for hypertension amongst older people (50+) including controlled hypertension, uncontrolled hypertension and undiagnosed hypertension. Results : Whilst similar proportions of the older population had normal blood pressure in England and the USA, levels of controlled hypertension were significantly greater in the USA. Patterns of healthcare outcomes for hypertension were largely consistent across the wealth distribution in England but varied a great deal in the USA. Poorer US people or those holding only government health insurance were much more likely to have controlled hypertension and uncontrolled hypertension compared to their richer or private insurance holding counterparts. Conclusion : That the USA has similar levels of measured hypertension amongst older people compared to the England is attributable to medical care which is most prevalent amongst poorer people reflecting higher levels of hypertension in this group. However, our finding of greater inequality in terms of uncontrolled hypertension in the USA compared to England is of concern. Keywords : Hypertension, health care outcomes, US, England, inequality

OP26 314-S-4

INFLUENCING CHOICE OF BRANDED OR GENERIC STATINS BY OLDER ADULTS IN THE US

Shirley PORTERFIELD¹, Sharon LEVIN², Susan FEIGENBAUM² (1. *Social Work & Gerontology, University of Missouri-St. Louis, USA*; 2. *Economics, University of Missouri-St. Louis, USA*)

Introduction : Spending for prescription drugs has been one of the fastest-growing components of national health expenditures in many countries. In the US, generics accounted for 78 percent of all retail prescriptions in 2010, up from 63 percent in 2006. While the trend towards generic drug use is promising, insurers and government health agencies continue to focus on ways to steer even more patients away from high-priced branded drugs. Method : In this study we use multivariate analysis to examine a number of factors that may influence switching from branded to generic statins, a class of drugs primarily used by older adults. We use data from five panels of the Medical Expenditure Panel Study (MEPS), covering 2005-2010. Each panel contains medical information on each prescription filled for members of a representative sample of US households for all major categories of insurance coverage and pharmaceutical drug vendors along with socio-demographic information, at 5 points in time over a 2 year period. Results : Preliminary results suggest that switching is more likely to occur among older adults who report high out-of-pocket costs for statins, and significantly lower costs are reported post switch. Switching is also more likely to occur among those who have prescriptions filled in drugstores or other stores (where it is possible to speak with a pharmacist in person), and among those who report good communication with their physician, in their native language. Conclusion : Price and provider consultation both influence the choice between branded or generic pharmaceuticals by older adults in the US. Keywords : pharmaceuticals, switching, insurance

OP26 314-S-5

CATEGORIZATION OF CONSUMPTION EXPENDITURE AND ANALYSIS OF THE FACTORS AFFECTING IT

Namhee YUN¹, Min-Suk YOON² (1. *Ph. D Course, Columbia University, Korea*; 2. *Department of Future and Social Policy Research, The Seoul Institute, Korea*)

Introduction : This study was conducted for the purpose of exploring how the consumption expenditure of elderly household can be classified based on their demographic characteristics, economic characteristics, and consumption patterns, and of determining the factors that affected the classification of the consumption expenditure of the 1,000 participants in the Employment Promotion Project for the Elderly in 2011. Method : we conduct the study with 1,000 participants Employment Promotion Project for the Elderly in 2011. By use cluster analyze. Results : First, households with elderly members can be classified into three types through cluster analysis. Cluster I is the basic-living-expenditure-centered type whose living and housing expenditures account for high portions of its total expenditure, whose members have an average age of about 70, and which consist of middle-school graduates living in big cities. Cluster II has much higher consumption expenditure than the other clusters; the elderly in Cluster II were also evenly distributed in the big, medium-sized, and small cities and rural areas, and there seemed to be more of them who were living together with their children than in the other clusters. As for Cluster III, its medical expenditure was relatively higher than its other expenditures. Conclusion : It was proven in this study that both the motives for participation and the economic status of the participants (whether they were poor or not) influenced the results of the survey on the elderly who participated in the Employment Promotion Project for the Elderly by consumption type. Keywords : elderly household, consumption expenditure, cluster analysis

SUMOYLATION RECIPROCALLY STIMULATES PHOSPHORYLATION AND INHIBITS DEGRADATION AND UBIQUITINATION OF TAU

Xiaochuan WANG (*Pathophysiology, Tongji Medical College, Huazhong University of Science and Technology, China*)

Introduction : The intracellular accumulation of the phosphorylated tau is a characteristic pathology of Alzheimer's disease (AD), but the mechanism leading to tau accumulation is not fully characterized. SUMO-1, a protein that can stabilize proteins, co-localizes with the phosphorylated tau, suggesting an intrinsic link of tau phosphorylation and SUMOylation. **Method :** To test this, we studied here the effects of SUMOylation on degradation and phosphorylation of tau. **Results :** We found that up-regulation of tau SUMOylation significantly inhibits tau degradation. Furthermore, SUMOylation of tau promotes its phosphorylation at multiple AD-associated sites, whereas mutation of tau at K340R (the SUMOylation site) or simultaneous treatment of the cells with ginkgolic acid, an inhibitor of protein SUMOylation, abolishes the effect of SUMO-1. Alternatively, hyperphosphorylation of tau induced by inhibiting protein phosphatase-2A or activating glycogen synthase kinase-3 promotes tau SUMOylation. We also found that SUMOylation inhibits tau ubiquitination and expression of K340R mutant tau restores the ubiquitination of tau proteins. **Conclusion :** These findings disclose a reciprocal stimulation of tau SUMOylation and phosphorylation, and an inhibitory effect of tau SUMOylation on its ubiquitination and degradation. We conclude that SUMOylation at K340 may cause tau accumulation via stimulating the phosphorylation and inhibiting the ubiquitination/degradation. **Keywords :** Alzheimer's disease (AD), tau, phosphorylation, SUMOylation, ubiquitination, degradation

OP26 319-B-2

REGULATION OF LONGEVITY BY A RGS PROTEIN, LOCO/RGS14

Yuh-Ru LIN, Hardik PARIKH, Zachary KOPP, Yongkyu PARK (*Cell Biology and Molecular Medicine, UMDNJ-New Jersey Medical School, USA*)

Introduction : Although several conserved signaling pathways such as IGF-1 are known to regulate stress resistance and longevity in various organisms, the mechanism by which the RGS (regulator of G-protein signaling) protein affects the aging process is not understood yet. **Method :** Stress resistance, lifespan, iTRAQ, Phos-tag. **Results :** Our data exhibited that 1) reduced expression of a RGS protein, Loco, resulted in a longer lifespan of flies, with stronger resistances to stressors, higher MnSOD activity and increased nutrient storage. 2) In contrast, overexpression of the loco gene shortened lifespan significantly with lower stress resistance and reduced nutrient content. 3) Interestingly, the expressional changes of yeast RGS2 and rat RGS14, homologues of the fly Loco, also affected oxidative stress resistance and longevity in the respective species, which suggests that the Loco/RGS14 signaling pathway is evolutionarily conserved in various organisms for the regulation of longevity. Notably, proteomic iTRAQ screening and Phos-tag gel analyses revealed that reduction of Loco signaling decreases phosphorylation levels of Rpd3 protein (HDAC1, histone deacetylase 1) which is consistent with a previous report that the reduced expression of Rpd3 extends lifespan in *Drosophila*. We also found that fat body-specific downregulation of the loco gene enhances stress resistance and lifespan systematically. The fat body, which is equivalent to mammalian liver and adipose tissue, is known to function in metabolic homeostasis, stress tolerance, growth and longevity in *Drosophila*. **Conclusion :** Here we propose that the Loco/RGS14, a RGS protein, regulates stress resistance and

longevity by modulating the phosphorylation level of Rpd3/HDAC1 protein in a tissue (fat body)-specific manner. **Keywords :** stress resistance, longevity, regulator of G-protein signaling

OP26 319-B-3

AGEING-DEPENDENT TGF BETA1 SIGNALLING IN THE NEUROPROTECTION AGAINST AN OXIDATIVE STRESS

Kyoji OHYAMA, Kunihiko YASUDA, Kazuko ONGA, Nozomu MORI (*Department of Anatomy and Neurobiology, Nagasaki University School of Medicine, Japan*)

Introduction : Ageing is a risk factor for neurodegenerative diseases. Many previous studies focused on uncovering cell signalling of ageing-related declines in brain functions such as memory deficits. As yet, it remains unclear whether a self-defense mechanism of the brain operates in an ageing-dependent manner and prevents neurodegeneration. Emerging evidence suggested that TGF beta1 expression is upregulated after brain injury and ischemia. These studies led us to hypothesize that TGF beta1 may act as a self-defense signal to prevent neurodegeneration induced by brain insults such as oxidative stresses during ageing. **Method :** We deployed long-term culture (up to 6 months) of hippocampal neurons and examined whether TGF beta1 can protect mature neurons against H2O2-induced oxidative stress. We also monitored the expression of downstream components of TGF beta1 signalling during neuronal ageing, together with the analysis of their expression patterns in vivo. **Results :** TGF beta1 protects mature hippocampal neurons against H2O2-induced oxidative stress in vitro. Both pp38MAPK and Smad7 were upregulated during the ageing of hippocampal neurons. Further, TGFbeta1-p38MAPK pathway is required for the accumulation of Nrf2, a transcriptional regulator of an anti-oxidant responsive gene, in the cell nucleus. Overexpression of Nrf2 can prevent the degeneration of hippocampal neurons in the absence of TGF beta1 signal. **Conclusion :** TGF beta1-pp38MAPK-Nrf2 cascade may operate as an ageing-dependent self-defense signal against oxidative stresses. **Keywords :** TGF beta1, p38 MAPK, Nrf2

OP26 319-B-4

ROLE OF FOXO3A ON REGULATION OF ROS AND DNA REPAIR DURING CELLULAR AGING

Jeong-Hyeon KIM, Jee-In HEO, Seong-Hoon PARK, Hong-Jun KANG, Jae-Bong PARK, Jaebong KIM, Sung-Chan KIM, Jae-Yong LEE (*Hallym university, Medical School, Department of Biochemistry, Korea*)

Introduction : Since the detailed function of FOXO3a in DNA damage and DNA repair during mammalian cellular aging has not been elucidated yet, the role of FOXO3a in replicative senescence of HEF (human embryonic fibroblast) was examined. **Method :** Promoter activity assay CHIP assay Measurement of DNA repair activities. **Results :** When HEF cells were aged, FOXO3a was inactivated and APE1 expression level and BER activity were decreased. Overexpression of FOXO3a in aged HEF cells up-regulated APE1 and activated BER activity. Knock-down of FOXO3a by siRNA in young HEF cells down-regulated and inactivated BER activity. The deletion and point mutants in FOXO3a binding sites of APE1 promoter decreased promoter activity. CHIP (Chromatin Immunoprecipitation) assay showed that APE1 binding to FOXO3a binding sites of APE1 promoter was decreased in aged HEF cells, indicating that APE1 is a transcriptional target gene of FOXO3a. Deacetylation and dephosphorylation of FOXO3a (activation of FOXO3a) by various treatments resulted in up-regulation of APE1 and activation of BER as expected. Human fibroblast obtained from skin of young age group

(younger than 10 years old) had higher FOXO3a and APE1 levels and higher BER activity when compared to human fibroblast obtained from skin of old age group (older than 60 years old), confirming that aging-related correlation of FOXO3a, APE1 and BER activity exists in fibroblast of skin tissue. Conclusion : Our result showed that APE1 (a BER factor), XRCC4, a NHEJ (a factor of non-homologous end-joining) and XPC (a component of nucleotide excision repair) are transcriptional target genes of FOXO3a to mediate the decreased. Keywords : FOXO3a, Reactive oxygen species, DNA repair

OP26 319-B-5

INSULIN SIGNALING AND ITS ROLE IN LONGEVITY OF C. ELEGANS

Eun-Soo KWON (*Aging Research Center, KRIBB, Korea*)

Introduction : The Insulin/IGF-1 Signaling (IIS) pathway plays diverse roles from metabolism to longevity. In *C. elegans*, the single Forkhead Box O (FOXO) homolog DAF-16 functions as the major target of the IIS pathway. One of two isoforms, DAF-16a, is known to regulate longevity, stress response and dauer diapause. However it remains unclear how DAF-16 achieves its specificity in regulating these various biological processes. Here we identify a new DAF-16 isoform as the major isoform regulating longevity of long-lived IIS mutants. DAF-16 isoforms functionally cooperate to modulate IIS-mediated processes through differential tissue enrichment, preferential modulation by upstream kinases, and regulating distinct and overlapping target genes. Promoter swapping experiments reveal both the promoter and the coding region of DAF-16 are important for its function. Importantly, in mammals, four FOXO genes play overlapping and different functions, and in *C. elegans*, a single FOXO/DAF-16 uses distinct isoforms to fine-tune the IIS-mediated processes. Method : The *C. elegans* IIS is an evolutionarily conserved pathway that plays a central role in the regulation of longevity, development, stress response, and metabolism. Using *C. elegans* as a model system, I generated daf-16/FOXO family transcription factor ortholog transgenic worms. And I analyzed four major biological processes controlled by IIS in worms. Results : I identified a new isoform of DAF-16 protein and showed that this isoform regulates the lifespan in *C. elegans*. Therefore, multiple isoforms from the single daf-16 gene, convert diverse upstream signals into the proper regulation of its numerous target genes, in turn various phenotypes in *C. elegans*. Conclusion : DAF-16f regulate lifespan. Keywords : *C. elegans*, aging, daf-16, daf-2

PROTECTIVE ROLE OF SIRT1 IN UVB-INDUCED SKIN FIBROBLASTS SENESCENCE: SUPPRESSION OF OXIDATIVE STRESS AND DEACETYLATION OF P53

Ki Wung CHUNG¹, Dae Hyun KIM¹, Yeon Ja CHOI¹, Chan Hum PARK¹, Min Hi PARK¹, Eun Ji JANG¹, Daewi PARK¹, Jun Sik LEE², You Jung KIM³, Sung Jin BAE¹, Chung HAE YOUNG¹ (*1. Molecular Inflammation Research Center for Aging Intervention (MRCA), Department of Pharmacy, Pusan National University, Korea; 2. Department of Biology, College of Natural Sciences, Chosun University, Korea; 3. Department of Cosmetology, Pusan Women's College, Korea*)

Introduction : Stresses such as UV are widely known to cause premature cellular senescence, characterized by growth arrest, morphological changes, and altered gene expressions. It is also known that UV irradiation-induced cell senescence is likely due to oxidative stress and damaged DNA resulting from oxidative stress. Method : In the present study, we report that the overexpression of SIRT1

attenuates UVB-induced cell senescence by suppression of oxidative stress and deacetylation of p53 using various biochemical and histochemical analyses. Results : Under our in vitro experimental conditions, exposure to a sub-cytotoxic dose of UVB enhanced the senescence of human dermal fibroblasts (HDFs). Senescent cells showed broadened morphology as well as increased β -galactosidase activity. Adenovirus mediated overexpression of SIRT1 significantly protected HDFs from UVB-induced cellular deterioration. Evidence showing the protection of senescent cells by overexpressed SIRT1 was documented by various biochemical and histochemical analyses. UVB irradiation increased oxidative stress as well as induced the disruption of the cell cycling process, which was attenuated by SIRT1 overexpression. DNA damage from oxidative stresses caused by UVB, measured by 8-OHdG, were attenuated by SIRT1, while SIRT1 overexpression boosted anti-oxidative catalase levels. Our molecular analysis data demonstrated that deacetylation of FOXO3a by SIRT1 changed FOXO3a's transcriptional activity, leading to reduced oxidative stress. In addition, SIRT1 also suppressed UVB-induced p53 acetylation and its transcriptional activity, which directly affects cell cycle arrest induced by UVB. Conclusion : Based on these findings, we conclude that overexpression of SIRT1 exerts a protective action against UVB-induced cell senescence through suppression of oxidative stress and deacetylation of p53. Keywords : SIRT1, senescence, ultraviolet

TEMPORAL AND STRUCTURAL DIFFERENCES IN THE CARE OF OBESE AND NON-OBESE PEOPLE IN NURSING HOMES

Gerda APELT¹, Vjenka GARMS-HOMOLOVA² (*1. Institute for Medical Sociology, Charite-Universitätsmedizin Berlin, Germany; 2. Department of Economics, HTW Berlin, University of Applied Sciences, Germany*)

Introduction : Obesity is a common disease in Germany. Although care facilities are confronted with an increasing number of obese people, the care of them in nursing homes is barely investigated. The study examines the amount of work using the example of the activity of dressing obese and non-obese nursing home residents and discloses with its temporal and structural differences. Method : In five nursing homes in Berlin a fully structured observational study based on a convenience sample was conducted. 48 nurses were observed while performing the activity of dressing 70 residents aged 65 years and older. The residents' demographic data and medical diagnoses were taken from the nursing records. Information about the functional/cognitive status and pain events were collected by using the interRAI Contact Assessment. Further data regarding the nurses were obtained through face-to-face interviews. Results : We found a significant correlation between Body Mass Index and the required time of dressing. No correlations exist between age, qualifications and nurses' level of education and the time of dressing. Structural differences in the care of obese and non-obese residents appear by changes of, single activity sequences. The care of the obese residents is associated with increased time requirements and structurally differs from the care of the non-obese residents. Conclusion : The care of the obese residents is associated with increased time requirements and structurally differs from the care of the non-obese residents. This should lead to further research because it has implications for staffing in nursing homes. Keywords : Obesity, Nursing home, Care

OP26 320-S-2

AN OBESE PERSON IS FAT -AND THAT'S IT. 'NURSES' ATTITUDES TOWARDS OBESE CLIENTS IN NURSING CARE

Gerda APELT¹, Vjenka GARMS-HOMOLOVA² (1. Institute for Medical Sociology, Charite-Universitätsmedizin Berlin, Germany; 2. Department of Economics, HTW Berlin University of Applied Sciences, Germany)

Introduction : This qualitative study examines nurses' attitudes towards obese people in nursing care. **Method :** 16 guideline-based interviews with professional caregivers of an ambulatory care facility in Germany were conducted. The analysis was done using case-related coding. **Results :** The results show that nurses have predominantly negative attitudes towards obese people. In general society anchored prejudices and Social stigmas, were taken over from nurses, although they reject every form of discriminations in their professional role. The problem consciousness for obesity is limited and chances for the implementation of intervention measures are hardly seen by nurses. **Conclusion :** To promote a knowledge-based nursing care of obese people, nurses should be familiar with the causes and consequences of obesity. Future research should examine the consequences of negative attitudes to the care of those who are affected **Keywords :** obesity, attitudes, nursing staff

OP26 320-S-3

THE ASSOCIATION OF SELF BODY IMAGE PERCEPTION, WEIGHT PERCEPTION, BODY COMPOSITION AND DEPRESSION IN GERIATRIC COMMUNITY DWELLERS IN SOUTHERN BRAZIL

Laura Brenner MARIANO DA ROCHA, Eduardo Lopes NOGUEIRA, Irenio GOMES, Newton Luiz TERRA (*Geriatrics and Gerontology, IGG PUCRS, Brazil*)

Introduction : There are few studies on self body image perception (SBIP) in the elderly. There are even fewer studies dealing with SBIP and depression among the aged. The purpose of the present study is to evaluate SBIP, weight perception and body composition with depression in an elderly population. **Method :** The sample was composed by 236 elderly community dwellers. SBIP was measured through the Stunkard Scale and body composition was verified by BMI. Depression was assessed through a screening question. **Results :** 53.4% were women and 46.6% were men; 31.8% were widow, 37.7% were married, 15.3% were single. The mean age was 67.57 ± 6.72 years. The prevalence of overweight/obesity was 51.7% and normal weight was 36.9%. 66.5% were not satisfied with their body image and 40.3% were not satisfied with their weight. 30.5% had a positive screening for depression. Among the depressed 75.0% were not satisfied with their body image; 55.6% were overweight/obese and 30.6% had normal weight; 55.6% were not satisfied with their weight. Among the non depressed 62.8% were not satisfied with their body image; 50.0% were overweight/obese and 39.6% had normal weight and 10.4% were underweight; 33.5% were not satisfied with their weight. We found a statistically significant association between screening for depression and weight satisfaction (P=0.001) and no statistically significant association between screening for depression and body composition or SBIP. **Conclusion :** We found a high prevalence of body image dissatisfaction, overweight/obesity, weight dissatisfaction and positive screening for depression. We found an association between screening for depression and weight dissatisfaction. **Keywords :** depression, body image, weight satisfaction, obesity, aged.

OP26 320-S-4

NUTRITION SCREENING USING MNA-SF DETECTS ELDERLY WITH POOR NUTRITION

Josefa KACHEL¹, Felicia STERN², Dorit NITZAN KALUSKI³, Lital KEINAN-BOKER² (1. Department of Nutrition, Ministry of Health, Israel; 2. Center for Disease Control, Ministry of Health, Israel; 3. Food and Nutrition Administration, Ministry of Health, Israel)

Introduction : Elderly people are at increased risk of malnutrition. The objective of the survey was to ascertain whether a modified form of the short Mini Nutritional Assessment (MNA-SF) tool correctly identifies elderly at risk of malnutrition by evaluating their food groups and nutrient intake. **Method :** A cross-sectional study was conducted in 1,067 free-living Jewish elderly, sampled from two major Health Insurance Funds in Israel. Nutritional screening was carried out, using modified MNA-SF. To evaluate food intake, a 24-hour dietary recall was carried out. **Results :** Based on the MNA-SF score for the 'at risk for malnutrition' category (≤ 11), 36.0% of the elderly were at risk of malnutrition. Elderly 'at risk of malnutrition' compared to those with normal nutritional status, consumed significantly less portions of some food groups. Significant differences were found for energy, macronutrients, calcium, magnesium and selected micronutrients, with a lower consumption in the elderly at risk. With the modified full MNA being utilized as a gold-standard, the modified MNA-SF sensitivity (for 'risk of malnutrition' vs. 'normal nutritional status') was 87% and its specificity, 96.6%. **Conclusion :** The modified MNA-SF accurately captures elderly at risk for malnutrition. Thus, health systems should adopt MNA-SF as a screening tool and use it within the comprehensive geriatric assessment. **Keywords :** MNA-SF, 24-h dietary recall, elderly

OP26 320-S-5

PREVALENCE AND DETERMINANT OF OBESITY AMONG AGING AT JAKARTA

Charles SURJADI, Regina Satya WIRAHARDJA (*Public Health and Preventive medicine, Atmajaya Catholic University Indonesia Faculty of Medicine, Indonesia*)

Introduction : Realizing that obesity is a risk factor of Non Communicable Disease, we looked for problem of obesity among aging using data of basic health research in the year of 2007. **Method :** Respondent consisted of a total of 1,671 person of 55 years old and more selected using random sample. We collected data through questions about their age character, sex, number of household members, socio economic status etc. and do measurement of BMI. Bivariate analysis was performed using chisquaretest test ($p < 0.05$) to obesity status and multivariate logistic regression was performed to look for the best model to explain factors relate to obesity among aging. **Results :** prevalence of obesity among elderly persons were 31.29% (BMI). There were 11.6% belongs to under weight (BMI), about 25.2% smokers and 30 % household mothers. Further analysis using multivariate logistic regression gave the result that elder person with age 65 - 74 year (OR = 2.001; CI 95%= 1.284 - 3.118;) age 55-65years (OR= 1.891CI 95% 1.2-2.7), work as household mother (OR = 1.728; CI 95% = 1.261 - 2.368), higher social economy (OR = 1.788; CI 95% = 1.249 - 2.558), mild physical activity (OR = 1.874 ; CI 95% = 1.310 - 2.681;), and regularly smoking (OR = 1.605; 95% CI = 1.194 - 2.157; $p = 0.002$) were more likely to obese. **Conclusion :** This study called for attention on obesity prevention program to elderly persons concentrated on household mothers, smokers and facilitate higher social economic groups to actively did physical activities. **Keywords :** Nutrition, obesity aging

OP26 320-S-6

NECESSITY OF NUTRITIONAL EDUCATION AT THE DAY CARE CENTER FOR OBESE ELDERLY

Keiko ENDO (*Section of Oral Health Care Science for Community, Tokyo Medical and Dental University, Japan*)

Introduction : We conducted the subpopulation analysis from the nationwide survey for the more than 600 Day Care Centers throughout Japan in 2009 and 2010. Preventative care for elderly is performed by The Nursing Care Insurance system in Japan, in which nutritional intervention is programmed for underweight elderly. The overweight elderly have been left out regarding their dietary education and/or intervention. The aim of this research is to verify the necessity of a new nutrition guidance program for the overweight elderly who are receiving the day-care services. **Method :** For the purpose of examining their mental wellbeing, several questions were asked such as their judgment of present physical status, their awareness of weakening ability, their daily diet, and their request for the better services at the Day Care Center. The elderly at the Day Care Center was divided into five groups by BMI for the analysis; BMI below 18, 18-21, 22-24, 25-29, and more than 30. Overweight is categorized with BMI over 25, and various characteristics were compared with low weight group whose BMI is below 18. **Results :** Daily diet and their feeling of contentment induced by the food showed the significant correlation between each BMI group's physical activities, nursing care necessity, and the services they were receiving. A strong correlation between the overweight and the necessity for a further nursing care, especially in remedy for nutrition balance. **Conclusion :** A new nutrition guidance should be adopted at the Day Care Center to support the quality of life for the overweight elderly now and in the future. **Keywords :** Obese elderly, nutritional care, Day Care Center

RETIREMENT LIFE & RETIREMENT PREPARATION

OP26 321-S-1

RETIREMENT AND MENTAL HEALTH - A STUDY OF 237,218 AUSTRALIANS AGED 45 YEARS AND OLDER IN NEW SOUTH WALES

Kha VO¹, Julie E BYLES¹, Peta FORDER¹, Bryan RODGERS², Meredith TAVENER¹, Emily BANKS³, The Seef Project (Social, Economic And Environmental Factors) INVESTIGATORS⁴ (*1. Priority Research Centre for Gender, Health and Ageing, University of Newcastle, Australia; 2. College of Arts and Social Sciences, Australian National University, Australia; 3. College of Medicine, Biology and Environment, Australian National University, Australia; 4. New South Wales 45andUp Study, The Sax Institute, Australia*)

Introduction : In 2011, it was estimated that around 36% of Australians aged 45 years and older were retired. Due to population ageing, there is a need to examine the impact of retirement on mental health. The study sought to evaluate the associations between mental health and retirement status for men and women, and investigate reasons for retirement at different ages (<65 years versus ≥65 years). **Method :** Data from 237,218 participants within the New South Wales 45andUp Study were included in the analysis. Logistic regression was used separately for men and women at different ages (<65 years versus ≥65 years) to examine the association between mental health (measured by Kessler 10 score), retirement status and reasons for retirement, while adjusting for demographics, lifestyle behaviours and other health factors. **Results :** For participants aged less than 65 years, retirement was associated with greater chance of having high psychological

distress (K10 of 22-50) for men (OR = 1.29, 95% CI: 1.16 - 1.43), but lower chance of having high psychological distress for women (OR = 0.87, 95% CI: 0.80 - 0.95), compared to not retired participants. Participants who retired because of job redundancy or ill health were more likely to have high psychological distress, compared to those who retired due to reaching retirement age. **Conclusion :** Retirement appears to have different impacts on mental health of men and women, and is influenced by reasons for retirement and age at retirement. Retirement policies should focus on people who retired prematurely due to ill health or job redundancy. **Keywords :** Kessler 10, Retirement, Job redundancy

OP26 321-S-2

WHAT DO THEY GAIN AFTER RETIREMENT? RETIREES' LEARNING EXPERIENCES IN BRIDGE JOBS

Chih Ying HUANG¹, Ya-Hui LEE² (*1. Graduate Institute of Adult & Continuing Education Department, National Chung Cheng University, Taiwan; 2. Department of Adult & Continuing Education, National Chung Cheng University, Taiwan*)

Introduction : Bridge employment has been increasing among many developed counties under global aging trends. **Method :** The authors present a qualitative study that explored the learning process of retirees who participate in bridge employment before they retire completely. The authors conduct semi-structured interview with 6 older workers to understand: (1) what they gain from bridge jobs, (2) how they learn through bridge jobs, and (3) how such gain impact their retirement life. **Results :** The result of this study are (1) Older adults who participate in bridge employment find that bridge employment can contribute to their financial need, help them enjoy their work, bring their skills and talents into full play, fulfill their interest, and keep social contact with other people. (2) They experience learning from bridge job by the work itself and through the environment, taking lessons related to work, and reading religious books. (3) They found out that from bridge employment the reconstructing of their daily life in retirement improves, their lives become more meaningful as they achieve their goals, they have high self-esteem, they can share life experiences with others, and fully adapt to the retirement life style. **Conclusion :** Bridge employment can help older workers have a smooth transition from full time job into retirement completely. The authors then present the findings of the study, the recommendations for older adult educators, and the implications for future research. **Keywords :** bridge employment, phased retirement, older adult learning, retirement life

OP26 321-S-3

WORK AND FAMILY EXPERIENCES IN MIDLIFE AND JOINT RETIREMENT EXPERIENCES IN LATER LIFE AMONG MARRIED AMERICAN WOMEN

Jeong-hwa HO (*Sociology, Ajou University, Korea*)

Introduction : We examined associations between married American women's work and family experiences in midlife and synchronization of retirements with their husbands in later life. **Method :** We used panel data from the Wisconsin Longitudinal Study (1975-2004), an ongoing study on American men and women who graduated Wisconsin high schools in 1957. Study sample is limited to female respondents. We estimated multinomial regression models for joint retirement experiences where wives retiring before or after retirement of their husbands. **Results :** Wives who were not working in their mid-30s are more likely to retire jointly with their husbands. Wives who preferred to retire by their mid-60s and wives with lower degrees of work and family conflict at their mid-50s were more likely to retire jointly. Experience of career interruption due to family reasons during

one's midlife (mid-30s ~ mid-50s) did not significantly predict joint retirement experiences. Conclusion : Early and midlife work and family experiences continue to shape couple-level retirement decisions in later life. Joint retirement is more prevalent among wives with lower preference of continued work in later life. It suggests that joint retirement, for this age cohort, is a preferred way of labor force exit for women with traditional work and family role division throughout their life course. Keywords : retirement, life course, work and family experiences

OP26 321-S-4

THE FUTURE OF RETIREMENT IN KOREA

Edward PARK (*Institute of Insurance and Financial Research, Samsung Life Insurance Company, Korea*)

Introduction : Retirement is a complex phenomenon, one that occurs where labor market dynamics, demographics and welfare (pensions) legislation intersect. In South Korea, a country whose rapid industrialization in the latter half of the twentieth century is often held up as a model of successful economic development, the path to modernization come at a price, and population aging and limited institutional resources compete for attention with increased social welfare requirements and a pension system that is still evolving. As a result, effective preparation for retirement is still very much an uncertain proposition for a large part of the working population. In our presentation, we take another look at the unique forces that helped shape the state of Retirement in Korea today, one that may offer a glimpse into the future not only of Korea, but of the development of Asia as a whole. Conclusion : Pension and retirement issues pose unique difficulties for emerging and rapidly expanding economies. As the Korean economy matures, the focus is shifting from accumulation of assets to effective decumulation for the aging population. Keywords: Korea, Retirement, Pensions

PARKINSON'S DISEASE & STROKE

OP26 324-C-1

THE CAREGIVER EXPERIENCE IN PARKINSON'S DISEASE: FACTORS RELATED TO CAREGIVER DISTRESS IN HOME CARE SAMPLES FROM ONTARIO AND FINLAND

Andrea FOEBEL¹, Harriet FINNE-SOVERI², Matti MAKELA², Anja NORO², John HIRDES¹ (*1. School of Public Health and Health Systems, University of Waterloo, Canada; 2. Older Persons Services Unit, National Institute for Health and Welfare, Finland*)

Introduction : Parkinson's disease (PD) is the second most common neurodegenerative disorder after Alzheimer's disease. PD risk increases with age and prevalence will increase substantially with population ageing. Managing PD among individuals who remain at home can be difficult for caregivers and a better understanding of factors related to caregiver distress is needed. Method : This cross-sectional, retrospective analysis used data from interRAI's Resident Assessment Instrument - Home Care (RAI-HC) to explore caregiver characteristics in samples of home care clients with PD from Ontario (Canada) and Finland. Using these comprehensive databases, multivariate logistic regression analysis was used to identify correlates of caregiver distress in both samples. All analyses were performed using SAS, Version 9.2. Results : The prevalence of PD in Ontario was 4.3% (n=4169), and in Finland was 3.2% (n = 414). In Ontario, more clients with PD had a caregiver (99%), who was most likely a spouse. In Finland, 71% of clients had caregivers, who were most commonly children. Caregiver stress was higher in Ontario (32%) than

Finland (20%). In both samples, the factors most strongly correlated with caregiver distress were whether the caregiver lived with the client, and whether the client with PD had a recent change in behaviour. Other factors related to caregiver distress were caring for male clients, depression, but not age. Conclusion : These results show that identification of caregivers at risk for distress may be possible. Interventions designed to support caregivers of home care clients with PD could help with overall disease management and reduce health service use and institutionalization. Keywords : Parkinson's disease, caregivers, home care

OP26 324-C-2

A STUDY OF FACTORS PREDICTING THE EFFICACY OF STN-DBS FOR ELDERLY PARKINSON'S DISEASE

Yutaka SUZUKI¹, Katsuhiko OGAWA¹, Hiroshi SHIOTA¹, Satoshi KAMEI¹, Hideki OSHIMA², Chikashi FUKAYA³, Takamitsu YAMAMOTO³, Yoichi KATAYAMA² (*1. Division of Neurology, Department of Medicine, Nihon University School of Medicine, Japan; 2. Department of Neurological Surgery, Nihon University School of Medicine, Japan; 3. Division of Applied System Neuroscience, Department of Advanced Medical Science, Nihon University School of Medicine, Japan*)

Introduction : Subthalamic nucleus deep-brain stimulation (STN-DBS) effectively improves motor function in Parkinson's disease (PD) patients who respond poorly to pharmacological management. Generally, an age of 65 years or less is thought to be an indication for surgery; however, STN-DBS is also feasible in the elderly. The efficacy of STN-DBS varies from patient to patient. We studied the factors predicting the rate of improvement following STN-DBS in elderly PD patients. Method : The Nihon University Itabashi Hospital has been performing STN-DBS for PD patients 70 years of age or older. Expert neurologists evaluated patients before and after STN-DBS. These patients were classified into the following four groups using the rate of improvement assessed by the off-period Unified Parkinson's Disease Rating Scale (UPDRS) part III score (post-operative score / pre-operative score): Group A (up to 10%: no change) (6 cases), Group B (between 10% and 25%: mild improvement) (8 cases), Group C (between 25% and 35%: moderate improvement) (9 cases), and Group D (over 35%: marked improvement) (17 cases). Age, pre-operative LED, morbidity duration, and pre-operative UPDRS part II and III scores were used as criteria. Results : Group D showing marked improvement following STN-DBS had a shorter duration of morbidity than group A (no change), and had lower on-period pre-operative UPDRS part II and III scores. Conclusion : These results suggests that shorter duration of morbidity, and lower on-period pre-operative UPDRS part II and III scores could be predictors of the rate of improvement following STN-DBS in elderly PD patients. Keywords : predicting factor, STN-DBS, elderly, Parkinson's disease

OP26 324-C-4

ELDERLY AND REHABILITATION OUTCOMES IN POST-STROKE PATIENTS

Maria Panagiota PANOURGIA¹, Alberto MALOVINI², Caterina PISTARINI¹ (*1. Neurorehabilitation, Salvatore Maugeri Foundation, Italy; 2. Statistics Department, University of Pavia, Italy*)

Introduction : Stroke is a leading cause of disability and as a result of the increasing of life-span, older people have a greater incidence and prevalence of stroke, thus is important to examine the outcomes in terms of functional disability and neurological conditions after a 2 months of intensive neuro-rehabilitation treatment. Method : We

selected stroke (ischemic or hemorrhagic) affected patients, admitted from an acute ward (Intensive Care, Neurosurgery, Stroke Unit) and with Glasgow Coma Scale ≥ 12 . To define the performances in activities of daily living at admission, Barthel Index (BI) has been considered. We used the National Institutes of Health Stroke Scale (NIHSS) to evaluate neurological status and Functional Independence Measure (FIMTM) to assess functional disability. Results : 122 patients have been selected (age range 20-89 years). Age has been dichotomized using a cut off value corresponding to 65 years ($n \geq 65$ years = 76 patients; $n < 65$ = 46 patients). Patients < 65 y.o. had worst neurological conditions comparing to the ≥ 65 y.o. at admission and at discharge ($p=0.07$). Elderly patients were more independent at admission (< 65 y.o. median BI = 65, ≥ 65 y.o. median BI = 85) even though this difference was not statistically significant ($p > 0.05$). Regarding FIM scale, younger patients became significantly more independent after hospitalization period ($p < 0.05$). Conclusion : Even though younger patients seem to better recuperate in terms of functional disability, older patients have a better outcome in their neurological conditions. Consequently, older patients may cope better after a rehabilitation treatment. Keywords : rehabilitation outcomes, stroke

OP26 324-C-5

STATIN USE AMONG ELDERLY PATIENTS WITH NON-CARDIOEMBOLIC ISCHAEMIC STROKE: A TURKISH POPULATION STUDY

Vildan BINAY SAFER¹, Umut SAFER², Ilker TASCI², Fusun KOSEOGLU¹, Huseyin DORUK² (1. *Physical Medicine and Rehabilitation, Ankara Physical Medicine and Rehabilitation Training and Research Hospital, Turkey*; 2. *Geriatrics, Gulhane School of Medicine, Turkey*)

Introduction : Stroke is a major cause of disability and death worldwide. Preventing recurrence is important in reducing the mortality and disability associated with this condition. Lipid lowering therapy is one of the key point in stroke prevention. The aim of this study was to investigate lipid lowering therapy use rate and control of hyperlipidemia among Turkish non-cardio embolic ischemic stroke patients on rehabilitation program. Method : Stroke survivors who were recruited to inpatient rehabilitation program between January 2009 and December 2010 were retrospectively examined in this single center study. Demographic data, etiology of stroke, duration of stroke, acute stroke care center, co morbid diseases and medical data and lipid profile were recorded. Results : 1002 stroke patients' records were screened. 402 elderly non-cardio embolic ischemic stroke patients fulfilled the inclusion criteria and underwent assessment. Mean age was 75.86 ± 6.68 . 51.2% were woman and mean post stroke time was 7.4 ± 18.11 month. 247(61.4%) patients' low-density lipoprotein (LDL) levels were > 100 mg/dl. Statin use rate was 23.6% and 45.3% of these patients' LDL were not at target level. Conclusion : In this study, we found lower rates of statin use among Turkish elderly stroke survivors, particularly among patients; statins were indicated according to existing guidelines Lipid profile and statin use should be, carefully, assessed in elderly non-cardio embolic stroke survivor. Keywords : stroke, Lipid, elderly

OP26 324-C-6

ANALYSIS OF NORMATIVE FINGER FORCE CONTROL CAPABILITIES FOR QUANTITATIVE EVALUATION OF MOTOR INTENTIONAL DISORDERS

Baekhee LEE¹, Hyunji PARK¹, Kihyo JUNG², Byunghwa LEE³, Giltae YANG⁴, Hojun JEON⁴, Duklyul NA³, Heecheon YOU¹ (1. *Department of Industrial and Management Engineering, POSTECH, Korea*;

2. *School of Industrial Engineering, University of Ulsan, Korea*; 3. *Department of Neurology, Sungkyunkwan University School of Medicine, Samsung Medical Center, Korea*; 4. *R&D Research, SEED Technology, Korea*)

Introduction : Motor intentional disorders (MIDs), caused mainly by the impaired frontal lobe, degrade the capabilities of motor functions by damaging the action-intention system. Small-scale studies have found that force control capabilities in four phases (initiation, development, maintenance, and termination) significantly differ between normal controls and patients with MID. The present study was intended to establish a normative database of force control capabilities that can be used for quantitative evaluation of MID. Method : The finger force capabilities of 360 healthy participants (30 males and 30 females from each of age strata 20s to 70s) were measured using a force measurement system. Four-factor mixed-subjects ANOVA and Turkey-Kramer test as post-hoc analysis were conducted to analyze the effects of age, gender, hand (left and right), and location (left and right) on force control capability. Results : The force capabilities of all the phases were found significantly decreased by age. A significant gender effect on force control capability was found only at the initiation and maintenance phases. Based upon the post-hoc analysis results, a normative database of force control capabilities classified into four age groups (20s ~ 30s, 40s ~ 50s, 60s, and 70s) and gender (female and male) were established. Conclusion : The normative database of force control capabilities would be useful for better assessment of MID by considering age and gender. Future research is needed to develop a diagnostic model which evaluates the existence and severity of MID by analyzing the force control capabilities of patients with various MIDs in comparison with the normative database. Keywords : Motor intentional disorder, Force control capability, Normative database

GENERATIONAL EQUITY & CONFLICT

OP26 406-S-1

NEW PERSPECTIVES ON INTERGENERATIONAL SOLIDARITY: COMPARING THE VIEWS OF 'ORDINARY' CITIZENS AND POWERBROKERS IN IRELAND

Thomas SCHARF¹, Gemma CARNEY¹, Virpi TIMONEN², Catherine CONLON² (1. *Irish Centre for Social Gerontology, National University of Ireland Galway, Ireland*; 2. *Social Policy and Ageing Research Centre, Trinity College Dublin, Ireland*)

Introduction : Population ageing, combined with the economic recession that has affected many western nations since 2008, has reinvigorated longstanding debates about the distribution of resources between generations. Central to such debates are concerns around the status of intergenerational relations at times of major social and economic transformation. Previous research highlights the continuing strength of intergenerational solidarity amongst 'ordinary' citizens in many western nations and suggests only limited potential for inter-generational conflict. However, the views of 'ordinary' citizens may not be shared by those in positions of power. Method : This paper presents findings from a unique study which explores the potentially contrasting perspectives of 'ordinary' citizens and 'powerbrokers' on intergenerational relations in Ireland. One hundred in-depth interviews were conducted in 2011-12 with a diverse sample of people of all ages living in Ireland. A further twenty in-depth interviews were undertaken in 2012 with powerbrokers representing Ireland's particular welfare mix. Both datasets probe intergenerational relations at individual, family and societal levels. Using constructivist Grounded Theory

techniques to analyse the data, the paper compares and contrasts 'ordinary' individuals' perceptions of intergenerational relations with those of leading public figures drawn from the state, market and community sectors of Irish society. Results : While analysis reveals little evidence to suggest that (potential) conflict between generations represents a major concern in Ireland, the paper highlights important differences between the perspectives of 'ordinary' people and powerbrokers around the distribution of resources within and across generations. Conclusion : The paper concludes by identifying key issues arising from the study for research and public policy. Keywords: Intergenerational solidarity, Constructivist grounded theory, Qualitative research

OP26 406-S-2

GENERATIONAL COMPARISON OF EMOTIONAL WELL-BEING

Yadollah ABOLFATHI MOMTAZ, Tengku Aizan HAMID, Rahimah IBRAHIM (*Social Gerontology, Institute of Gerontology, Universiti Putra Malaysia, Malaysia*)

Introduction : There are several negative stereotypes about older adults, which have negatively influenced people's attitude about ageing. Therefore, it is imperative to do research that may dispel these myths about ageing. The present study was conducted to compare emotional well-being between older adults and young people. Method: Data for this study comprised of 1403 community dwelling elderly persons and 1190 secondary school students, were obtained from two national cross-sectional surveys namely "Patterns of Social Relationship and Psychological Well-Being among Older Persons in Peninsular Malaysia (PSRPWO)" and "Mental and Spiritual Well-Being among Adolescents (MSWBA)", respectively. Emotional well-being was measured using WHO-Five Well-Being Index. Data analysis was conducted using a multivariate analysis of covariance (MANCOVA) with SPSS software version 20. Results : Elderly people significantly scored higher level of emotional well-being ($M=62.3, SD=22.55$) than younger age ($M=57.9, SD=18.46$); ($t=5.32, p\leq.001$). The findings from MANCOVA revealed a significant difference between older adults and younger people in emotional well-being ($F(3, 2587) = 120.21, p\leq.001; \eta^2=.122$), after controlling for gender. Conclusion : Contrary to negative ageist stereotypes of miserable elderly, our findings showed higher level of emotional well-being among older adults compared to younger people. The principal findings of the present research together with previous studies jibe with socioemotional selectivity theory as well as wisdom theory. The findings from the present study can be employed by the media to demonstrate more positive images of older people, which may promote positive attitudes to ageing. Keywords : Ageism ; Well-Being

OP26 406-S-3

AGING IN SINGAPORE: EXPLORING INTERGENERATIONAL RELATIONS

Cindy TAN (*Centre for Governance & Leadership, Civil Service College, Singapore*)

Introduction : Singapore has one of Asia's fastest ageing population. As a small country with human resources as its competitive advantage, encouraging older employees to work longer is key to maintain Singapore's economic progress. The Government recognised the effects of an ageing workforce and enacted the re-employment legislation from January 2012 onwards. This legislation enabled older employees to work beyond the retirement age. In an increasingly multi-generational and team-based work environment, both the older and younger generation of employees collaborate closely at the

workplace. Research studies found that four generations of employees (i.e. Generation Y, Generation X, Baby Boomers and Traditionalists) co-exist at our workplace and often result in intergenerational issues. Within the Public Service of 120,000 staff, more than 10% are currently aged 55 and above, with this percentage rising progressively in future. Method : Literature Review Survey Research. Results : As the largest employer in Singapore, the Public Service offers many opportunities for our young graduates, recruiting them in roles that supervise employees who are much older than them. However, Generation Y employees' lack of generational differences awareness, perceived bias on baby boomers/traditionalists as well as skills and experience in managing and working with older employees can cause tensions at the workplace and undermine effectiveness of our multi-generational workforce. Similarly, baby boomers/traditionalists whose work motivations differ vastly from Generation Y employees, have limited knowledge on the latter's work expectations and styles. Conclusion : The situation of older people working longer in Singapore and the issues arising intergenerational differences are outlined in this research. Keywords : Intergenerational Relations

OP26 406-S-5

A STUDY ON THE CHANGE OF LIFE IN THE BABY BOOMER GENERATION

Yang-Hee KANG¹, Yu-Mi JANG², Carol KIM³ (*1. Department of Nursing, Changshin University, Korea; 2. Department of Social Welfare, Changshin University, Korea; 3. Department of English, Changshin University, Korea*)

Introduction : This study attempts to find how the government policies regarding population aging may affect the life patterns of the baby boomer generation and what factors play a significant role in providing life satisfaction. This study hopes to contribute to the understanding of the baby boomer generation who has been playing major roles in building the nation of South Korea. Method : This study uses the data provided by Korea Welfare Panel Study published between the years 2006 and 2009. The research data consists of the data about the members of households who were born between the years 1955 and 1963. The model selected for this study is Structural Equation Modeling and for the data analysis, AMOS 7.0 is used to verify the variables year by year. Results : First, according to the analysis of the data from Korea Welfare Panel Study in the year 2006, the factors affecting the life satisfaction are family relations, health and social relations. However, in the case of the data from Korea Welfare Panel Study between the years 2007 and 2009, the major factor is not the present income providing security or life satisfaction. Second, the next significant factor in improving the quality of life is family relations after health or occupation. Conclusion : Therefore, the government should provide them with re-employment programs prior to their retirement through which baby boomers can find employment similar or different to their present occupations. In addition, the government should impose structured senior employment policies so that baby boomers can find employment. Keywords : baby boomers (baby boomer generation), senior employment policy, family-friendly policy, life satisf

LONG TERM CARE

OP26 412-R-1

THE STUDY ON THE LONG-TERM CARE POLICY?--IN THE CASE OF QIQIHAER CITY

Weimei SHI (*Management School, Minzu University of China, China*)

Introduction : The City of QiQiHar, of Heilongjiang Province in China, as an underdeveloped city, was evaluated to be the unique International Age-Friendly City by WHO in China in 2011. This oral presentation will discuss the advantages upon which QiQiHar City won this honor and the reason why it can compete with many other developed cities. The presenter with other investigators went to QiQiHaer city to conduct a survey in June of 2012 under the support of National Social Science Fund Project (12CRK014). This presentation will show the result of the investigation. It will discuss the role of government, enterprises, nonprofit organizations and families of the elderly using the analytical framework of welfare pluralism. **Method :** The study was conducted in terms of literature analysis, social network and in-depth interviews. **Results :** It finds out that although the financial situation of QiQiHaer city is comparatively underdeveloped in China, the government's policy and its degree of attention to the welfare of the elderly are very important because they will encourage and attract the social funds to invest in establishing the non-profit nursing home, and contributes to motivate the social capital to help the elderly. **Conclusion :** Financial situation is important in providing welfare for the elderly, but the case of QiQiharer city has proved it isn't necessarily the most important factor. Poor financial situation will become comparatively advantageous due to its lower human resource costs in providing service, if the government takes proper responsibilities. **Keywords :** Social Network, Long-term Care Policy, Welfare Pluralism

HOW TO IMPROVE QUALITY IN NURSING HOME AND LONG TERM CARE FACILITIES WITH PRACTICAL AND EFFECTIVE TOOLS? THE FRENCH EXPERIENCE MO BI QUAL (MOVE TO QUALITY)

Sebastien DOUTRELIGNE¹, Florence DELAMARRE DAMIER², Gilles BERRUT³, Genevieve RUAULT¹ (1. Ile De France, French Society Of Geriatrics and Gerontology, France; 2. Maine Et Loire, French Nursing Home Research Organization (AGREE), France; 3. Geriatrics Department Nantes University Hospital, French Society Of Geriatrics and Gerontology (SGFF), France)

Introduction : The French Society of Gerontology and Geriatrics, and the French health care Authorities have proposed educational and training tools with the aim of improving the quality of care in institutions. These tools are topic based kits that focus on welfare, depression, palliative care, pain, nutrition and Alzheimer's diseases and other dementias. The objective of this study is to demonstrate (with the use of questionnaires pre and post experiment) that using "Mobiqual" tools increase the quality of care in nursing homes and long care facilities. (pain tool). **Method :** 6,020 professionals from 128 different structures have benefited from this tool. (nurses (23%), carers (21%), physicians (21%) health managers (17%), psychologists (7%) and others (10%) 193 POST-training questionnaires were sent to 111 nursing homes on the following items: pain identification, assessment and systematic monitoring of pain, number of professionals involved in "pain evaluation behavior", practices changes in terms of evaluation and monitoring of pain. **Results :** Systematic evaluation of pain are performed during the stay for 86% of the patients, 65% are evaluated at the entrance, 75% of institutions routinely perform follow-up of pain and a tracking sheet is included in the patient file; Scales of self-evaluation and other scales are used for identification and evaluation of pain in almost 64% of the cases. The visual scale is used in only 12% of cases, the numeric scale in 10%. Another 14% say not to use any scale. **Conclusion :** These Mobiqual tools are particularly practical for the quality of care. They help in the approach to patient health and

personal care. **Keywords :** practical tools ,quality ,nursing home

HOW TO IMPROVE QUALITY IN NURSING HOME AND LONG TERM CARE FACILITIES WITH PRACTICAL AND EFFECTIVE TOOLS? (WELFARE TOOL)THE FRENCH EXPERIENCE MO BI QUAL (MOVE TO QUALITY)

Sebastien DOUTRELIGNE¹, Florence DELAMARRE DAMIER², Gilles BERRUT³, Genevieve RUAULT¹ (1. Geriatrics, French Society of Geriatrics and Gerontology (SFGG), France; 2. Maine Et Loire, French Nursing Home Research Organization (AGREE), France; 3. Geriatrics University Hospital, French Society of Geriatrics and Gerontology (SFGG), France)

Introduction : The French Society of Gerontology and Geriatrics, and the French health care Authorities have proposed educational and training tools with the aim of improving the quality of care in institutions. The objective of this study is to demonstrate (with the use of questionnaires pre and post experiment) that using "Mobiqual" tools increase the quality of care in nursing homes and long care facilities. (WELFARE TOOL). **Method :** 168 different facilities have benefited from this tool. (University hospital (34), local hospital (21), training organization (23) nurses (3), others (2). 250 POST-training questionnaires were analyzed on the following items: does the welfare thematic exist in your structure? How many meetings were organized? Who are the professionals involved? What kind of changes did you observe in your practice? **Results :** 90 % of the structures have a welfare thematic. The tool is used from a quality point of view in 80 % of cases. A average of 6 work meetings were organized (12 hours), 1432 meetings were performed in 232 institutions. 8745 professionals were involved, and the movie was really appreciated (average note 8,5/10), with a debate after the meeting in 82 % of cases. The tool is used mainly by the health professionals (69%) and they believe that the tool had a positive impact on their practice (99%), to prevent welfare risk situations (87%), to help resident (93%) and health staff quality of life (75%). **Conclusion :** These Mobiqual tools are particularly practical for the quality of care. They help in the approach to patient health and personal care. **Keywords :** welfare, training tool, nursing home

OP26 412-R-4

QUALITY OF END-OF-LIFE CARE OF ELDERLY ADULTS WITH CANCER IN ISRAEL

Netta BENTUR¹, Shirli RESNIZKY¹, Sophia EILAT-TSANANI², Ran BALICER³ (1. Center for Research on Aging, MYERS-JDC Brookdale Institute, Israel; 2. North District, Clalit Health Services, Israel; 3. Research and Planing Center, Clalit Health Services, Israel)

Introduction : Although awareness of the quality of care of terminal cancer patient and their palliative needs has grown in Israel, only a small minority receive it. To demonstrate its advantages to decision-makers and service suppliers, we conducted a study examining the quality and cost of care of patients who received and did not receive home-hospice care. This presentation shows the quality of care in both groups. **Method :** Personal interviews with 193 family members of deceased cancer patients in one district of an Israeli HMO. **Results :** The average age of the deceased patients was 69, 65% were 65+, 60% were men. About 95% of patients who received home-hospice care received opiate medication in the severe stage of illness whereas only 68% of patients without home-hospice care received such medication. Far more patients with home-hospice were treated according to the principles of palliative care (receiving explanations on patient rights, including the patient and family members in decision making,

continuity of care, writing advance directives, dying at one's place of choice, foregoing curative medication at the end of life etc.) than patients with no home-hospice. Palliative sedation as part of treatment was much higher among those with home-hospice (45% and 25% respectively). Conclusion : Every effort should be made to increase the number of patients treated by palliative services at the end of life to improve both the efficiency and the quality of their care. Keywords : End-of-Life, QLC, Hospice-Care

OP26 412-R-5

CAN NETWORKS OF RESEARCH ACTIVE CARE HOMES FOR OLDER PEOPLE BE CREATED AND SUSTAINED?

Sue DAVIES¹, Claire GOODMAN¹, Steve ILIFFE², Jill MANTHORPE³, Adam SMITH⁴, Natasha CARRICK⁴ (1. *Centre for Research in Primary & Community Care, University of Hertfordshire, United Kingdom*; 2. *Primary Care and Population Sciences, University College London, United Kingdom*; 3. *NIHR School for Social Care Research, King's College London, United Kingdom*; 4. *NIHR Dementias and Neurodegenerative Diseases Research Network (DeNDRoN), University College London, United Kingdom*)

Introduction : In the UK care homes are one of the main providers of long term care for older people with dementia. Despite the recent increase in care home research, residents with dementia are often excluded (Gordon et al, 2012). Networks of research enabled care homes may increase recruitment of people with dementia (MAGDR, 2009). Internationally, comparable networks of nursing homes focus on education and training. The ENRICH research network is an England wide initiative to promote care home participation in research. Method : The ENRICH care home network was piloted in four regions of England. An evaluation was commissioned to assess the impact of the networks and describe the implementation process. A mixed method approach was used: Phase 1 mapped current care home involvement in research across England using on-line searches, interviews with researchers and care home staff. Phase 2 evaluated the impact of the networks on recruitment to studies, staff engagement, and costs. Results : Thirty three out of 42 research studies identified were confirmed as including care homes (January 2011 to June 2012). Their research focus, methods and numbers varied considerably. Care homes were recruited to the research networks through corporate engagement and individual invitation. Recruitment costs were calculated for individual networks. Care home managers were keen to be involved in research, especially if it provided support for staff or direct benefits for residents. Conclusion : Care home research networks have the potential to increase recruitment to research studies and develop partnerships between health care services and care home providers. Keywords : Dementia Older people Research networks

OP26 419-B-3

SYSTEMIC TREATMENT BY COLLAGENOLYTIC ENZYME: NEW APPROACH TO THE REJUVENATION PROBLEM

Alexander RABINOVICH¹, Pavel RABINOVICH², Yaffa LERMAN² (1. *Geriatrics, Tel Aviv Sourasky Medical Center, Israel*; 2. *Geriatrics, Sourasky Tel Aviv Medical Center, Israel*)

Introduction : All attempts for systemic rejuvenation of the old mammalian organism were not successful. Aging of connective tissue extracellular proteins (CTEP) colloidal condition is supposed to be the principal timer in aging 'Biological Watch'. Method : The specific

Collagenolytic Agent (CLA) was used for the old CTEP destruction with simultaneous synthesis of new CTEP, as a fibroblasts reaction. CLA was injected in the rat's tail vein twice weekly for 12 weeks. The monitored parameters were: - Urine hydroxyprolin excretion as indicator of the mature/old collagen destruction - Content of mature/old collagen and elastin in the dermis of the skin sections by skin biopsy. - Oxygen consumption as an indicator of all-body metabolic activity. We hope that the improvement of the internal body cells' environment connective Tissue will reverse the aging process. Results : Injection of CLA causes statistically significant increase of the hydroxyprolinuria (1.5 times in average; $p < 0.05$). The distribution and density of mature/old collagen histochemically were significantly lower in biopsies obtained after the course of the injections of CLA and amount of the elastic fibers was in 1.6 times higher ($p < 0.001$). The rate of oxygen consuming by the rats increased after the course of CLA injection in 1.4 times ($p < 0.001$). Conclusion : Injection of CLA resulted in breakdown of old collagen and formation of new (young) collagen matrix. Formation of the elastic fibers significantly increased. All-body oxygen consumption increased too. These data can be interpreted as the signs of CLA systemic anti-aging activity. Keywords: rejuvenation, ageing, collagen, connective tissue

OP26 419-B-4

THE ROLE FOR NON-RECEPTOR TYROSINE KINASE C-ABL IN MESENCHYMAL STEM CELL SENESCENCE AND DEVELOPMENT OF SENILE OSTEOPOROSIS

Huijuan LIU, Lili LI, Baojie LI (*The Bio-X Institutes, Shanghai Jiao Tong University, China*)

Introduction : Tissue stem cells underlie the etiology of aging-related diseases such as osteoporosis, a disorder that is associated with a decrease in the number of mesenchymal stem cells (MSCs) and impeded MSC differentiation into osteoblasts, the bone-forming cells. Yet, how MSC homeostasis is controlled remains a mystery. Method : We analyzed bone remodeling of *c-Abl*^{-/-}, *p16*^{-/-} and *c-Abl*^{-/-}*p16*^{-/-} mice and studied proliferation, differentiation, and aging of the primary MSCs from these mice. Results : We found that proto-oncogene *c-Abl*, a disease gene for chronic myeloid leukemia, plays a critical role in MSC homeostasis and bone remodeling (Li et al, *Nature Genetics*, 2000, Li et al, *Genes and Dev.* 2004). *c-Abl*^{-/-} mice show defects in osteoprogenitor expansion and osteogenic differentiation, leading to decreased bone formation and development of senile osteoporosis. Moreover, *ex vivo* MSC, osteoprogenitors, and MEFs all undergo premature senescence, which is accompanied by upregulation of pro-aging *p16INK4a* and/or *p53* (Kua et al, *Nature Cell Biology*, 2012; Zhang et al, *Age*, 2012; Chau et al, *Nature Communications*, 2012). In MSCs/osteoprogenitors, *c-Abl* regulates *p16INK4a* expression by phosphorylating *BMPRIA* and differentially affecting the canonical and non-canonical pathways of BMPs (major growth factors for bone formation). Mouse genetic studies revealed that *p16INK4a* controls MSC homeostasis and mediates the effects of *c-Abl* deficiency on MSC and bone formation defects. Future studies will focus on how *c-Abl* activity is controlled during MSC homeostasis. Conclusion : These studies help to understand how *Abl* kinases regulate stem cells homeostasis and oncogenic transformation and help to identify drug targets for prevention or treatment of osteoporosis. Keywords : MSC, osteoporosis, senescence

OP26 419-B-5

IDENTIFICATION OF LONG NON-CODING RNAs REGULATED BY ESTROGEN IN OSTEOBLASTIC CELLS

Kotaro AZUMA¹, Kazuhiro IKEDA², Tomohiko URANO³, Kuniko HORIE², Yasuyoshi OUCHI¹, Satoshi INOUE³

(1. Department of Geriatric Medicine, Graduate School of Medicine, The University of Tokyo, Japan; 2. Division of Gene Regulation and Signal Transduction, Research Center for Genomic Medicine, Saitama Medical University, Japan; 3. Department of Anti-aging Medicine, Graduate School of Medicine, The University of Tokyo, Japan)

Introduction : Osteoporosis is one of the menaces in aged society since osteoporotic patients are at high risk of bone fracture which reduces ADL and QOL of elderly people. Effectiveness of hormone replacement therapy indicates a bone protective role of estrogen. Estrogen is shown to have several targets in bone tissue, for example, osteoblast, osteoclasts and bone marrow lymphocytes. Action of estrogen is mediated by estrogen receptor alpha and beta, which function as ligand-dependent transcriptional factors regulating specific target genes. Recently, RNA products which are not translated into proteins have been gradually considered to play biological roles. Such RNAs longer than 200 bp are called long non-coding RNAs. The aim of this study is to investigate the estrogen-regulated transcription of long non-coding RNAs in osteoblastic cells. **Method :** Primary osteoblasts were isolated from calvarias of 4-day-old ER alpha deficient mice and control wild type mice of both sexes. Osteoblasts were stimulated by 100 nM estradiol for 24 h, then RNA was isolated from these cells. Sequencing was carried out with the Illumina Genome Analyzer IIX platform (GAIIX) using 41-bp single read. **Results :** Several long non-coding RNAs were differentially detected in osteoblasts from wild type mice compared with osteoblasts from ER alpha-deficient mice. Among them, we found some novel transcripts which are not involved in the present databases. Induction of some long non-coding RNAs by estrogen stimulation was observed using osteoblastic cell line, ST2. **Conclusion :** Other than transcriptional regulation of protein-coding genes, we propose novel estrogen actions by inducing functional long non-coding RNAs in osteoblasts. **Keywords :** osteoporosis, estrogen, long non-coding RNA

HIPPOCAMPUS, NEUROGENESIS IN MITOCHONDRIAL AGEING

Michiru D. SUGAWA¹, Hans ROMMELSPACHER², Regine HILL², Norbert A. DENCHER³, Monika FRENZEL³ (1. Clinical Neurobiology, Department of Psychiatry, Charite-Universitaetsmedizin Berlin, Technische Universitaet Darmstadt, Germany; 2. Clinical Neurobiology, Department of Psychiatry, Charite-Universitaetsmedizin Berlin, Germany; 3. Chemistry and Physical Biochemistry, Technische Universitaet Darmstadt, Germany)

Introduction : The aim of our studies is to elucidate the key factors of successful-, healthy-, and smart-ageing, instead of prolongation of solely life span. To gain insight into the molecular mechanisms of ageing we have focussed on the involvement of mitochondria as trigger and/or target of ageing in hippocampus, as compared to other brain regions as well as to heart and liver. The hippocampus plays various important roles such as in learning and memory. Hippocampal perturbation is one of the earliest symptoms of Alzheimer's disease. **Method :** To survey the ambitious aim of understanding the basic mechanisms of ageing, we have studied age-associated alterations in the mitochondrial proteome and of OxPhos enzyme activities of selected rat brain regions, the cortex, striatum, and hippocampus. Currently, the influence of calorie restriction is analysed. **Results :** In respect to mitochondrial bioenergetics and changes in the protein profile, the hippocampi show surprisingly different features. The age-related changes in the amount of intact MFoF1 ATP synthase and in its distribution as oligomers might be a clue for understanding the link between respiration and longevity. The abundance of OxPhos

complexes and supercomplexes, the natural assemblies of the respiratory chain complexes I11112IV0-4 into supramolecular stoichiometric entities, such as I11112IV0-4, considerably differs between young and aged tissue. **Conclusion :** The age-related changes observed might explain alterations in respiratory activity and ROS production during aging and age-associated diseases. Supported by the BMBF grant 0315585D GerontoMitoSys "Systems Biology in Health Ageing" and EU grant "MiMage" **Keywords :** brain ageing, hippocampus, mitochondria

OP26 419-B-7

FOXO6 IS A NEW COMER OF FOXO FAMILY THAT MEDIATES INSULIN-DEPENDENT REGULATION OF HEPATIC GLUCOSE PRODUCTION

Dae Hyun KIM¹, Henry DONG², Hae Young CHUNG¹ (1. Department of Pharmacy, Molecular Inflammation Research Center for Aging Intervention, Pusan National University, Korea; 2. Children's Hospital of Pittsburgh, University of Pittsburgh School of Medicine, USA)

Introduction : Excessive hepatic glucose production is causative for fasting hyperglycemia in diabetes. We investigate hepatic regulation of gluconeogenesis by FoxO6, a new member of FoxO nuclear factor family. FoxO6 activity is up-regulated, correlating with increased gluconeogenesis in liver under fasting conditions. **Method :** Using adenovirus-mediated gene transfer approach, we delivered FoxO6 cDNA and its siRNA to achieve gain- vs. loss-of-function in mice. **Results :** FoxO6 gain-of-function stimulates hepatic gluconeogenesis, raising fasting blood sugar levels. In contrast, FoxO6 loss-of-function suppresses gluconeogenic activity, contributing to lower fasting blood sugar levels. FoxO6 stimulates the expression of G6Pase, a hepatic enzyme that catalyzes the rate-limiting step of gluconeogenesis. FoxO6 binds and enhances G6Pase promoter activity, and this effect is counteracted by insulin. Insulin inhibits FoxO6 activity in a distinct mechanism by promoting its phosphorylation and disabling its binding to target promoters without altering its subcellular distribution. To address the potential synergistic effect of FoxO6 and FoxO1 on glucose metabolism, we achieved co-production vs. double-knockdown of FoxO6 and FoxO1 in liver. FoxO6 in concert with FoxO1 augments hepatic G6Pase expression at much higher levels, producing an additive effect on hepatic G6Pase activity and fasting blood glucose levels. Hepatic FoxO6 activity is markedly induced in insulin-resistant and insulin-deficient livers of dietary obese mice, diabetic db/db mice and streptozotocin-induced diabetic mice. **Conclusion :** These data characterize FoxO6 as a new regulator and therapeutic target of gluconeogenesis. Augmented FoxO6 activity, resulting from insulin resistance or deficiency, is attributable to excessive hepatic glucose production and fasting hyperglycemia in diabetes. **Keywords :** FoxO6, Glucose metabolism, Insulin

LONG TERM CARE XII

OP26 420-S-1

PREVALENCE OF POSSIBLE RISK FACTORS FOR INCREASING ELIGIBILITY LEVEL IN HOME HELP SERVICE USERS OF JAPANESE LONG-TERM CARE INSURANCE SYSTEM: THE CROSS-SECTIONAL STUDY

Kuniyasu KAMIYA¹, Sumio YAMADA², Kenji SASOU³, Makoto FUJITA⁴ (1. Rehabilitation Center, Kitano Hospital The Tazuke Kohukai, Japan; 2. Department of Rehabilitation Sciences, Nagoya University Graduate School of Medicine, Japan; 3. Welfare Department, CO-OP AICHI Consumer Co-operative Society, Japan; 4. Welfare Department, CO-OP KANAGAWA Consumer Co-operative

Society, Japan)

Introduction : Growing cost of nursing care is common concern in the aging countries. In Japan, the cost of long-term care insurance (LTCI) system doubled between 2000 and 2009. For maintaining the system, it is necessary to create the strategy for preventing the increase of the eligibility level. However, the risk factors for increasing eligibility level have not revealed. This study aimed to survey the prevalence of possible risk factors in persons who receive home help service in Japan. **Method :** This is a cross-sectional study of home help service users who were certified as LTCI support level 1-2 and care level 1-2 in Japan. Data were collected from October 2011 to November 2011. Variables included eligibility level, grip strength, calf circumference (CC), body mass index (BMI), memory impairment, depression, functional limitation, participation restriction, social support, and nutrition status. The presence of risk was evaluated with the cut-off values of previous studies. The data of care level 2 were compared with ones of care level 1 or less. **Results :** A total of 417 subjects (109 males and 308 females, mean age 83 years) were examined. There were 109 subjects (26.1%) with memory impairment. By dividing by cut-off values, care level 2 was found to have higher prevalence of low grip strength, low CC, and depression. **Conclusion :** High prevalence of memory impairment indicated the importance of assessment without recalling, such as grip strength, CC, BMI. Low grip strength and low CC may predict increasing eligibility level because the factors showed higher prevalence in higher eligibility level. **Keywords :** risk factor, prevalence

OP26 420-S-2

COST-EFFECTIVENESS ANALYSIS COMPARING A FAMILY MEETINGS INTERVENTION FOR FAMILY CAREGIVERS OF DEMENTIA PATIENTS TO USUAL CARE- A RANDOMIZED CONTROLLED TRIAL

Karlijn JOLING¹, Judith E. BOSMANS², Harm W. VAN MARWIJK¹, Henriette E. VAN DER HORST¹, Philip SCHELTENS³, Janet MACNEIL-VROOMEN⁴, Hein P. VAN HOUT¹ (1. *General Practice and Elderly Care Medicine, VU University Medical Center, Netherlands*; 2. *Health Sciences, VU University Medical Center, Netherlands*; 3. *Neurology, VU University Medical Center, Netherlands*; 4. *Internal Medicine, Amsterdam Medical Center, Netherlands*)

Introduction : Dementia patients impose a heavy economic burden on society. Family caregivers, providing most of the care are at risk to become overburdened. Interventions which effectively support caregivers may prevent patient institutionalization and hence be very cost-effective. However, evidence about their cost-effectiveness is scarce. The aim of this study was to assess the cost-effectiveness of a family meetings intervention for caregivers of dementia patients and to provide insight in the formal and informal costs of caring for a dementia patient. **Method :** The economic evaluation was conducted from a societal perspective alongside a randomized trial among 192 primary caregivers of community-dwelling dementia patients. Outcome measures included the incidence of depression and anxiety disorders in caregivers and Quality Adjusted Life-Years (QALY) of caregivers and patients. Missing cost and effect data were imputed using multiple imputation. Bootstrapping was used to analyze differences in costs and cost-effectiveness. **Results :** At 12 months, total costs per patient and primary caregiver dyad were €77,832 for the intervention group and €75,201 for the usual care group (mean difference €2631, 95% CI -13912;20697). Main cost driver was informal care (66% of total costs), followed by patients' day treatment and admission costs. No significant differences in costs and effects

between the groups were found. **Conclusion :** The annual costs of caring for a dementia person were substantial with informal care being by far the single largest cost item in size. Based on this study, the family meetings intervention was not considered a cost-effective intervention strategy in comparison with usual care. **Keywords :** family caregiver, dementia, cost-effectiveness

OP26 420-S-3

PREDICTORS OF INCREASING ELIGIBILITY LEVEL FOR JAPANESE LONG-TERM CARE INSURANCE SYSTEM: THE FIRST YEAR FOLLOW-UP RESULTS FROM THE PROSPECTIVE LONGITUDINAL STUDY

Sumio YAMADA¹, Kuniyasu KAMIYA², Kenji SASOU³, Makoto FUJITA⁴ (1. *Department of Rehabilitation Sciences, Nagoya University Graduate School of Medicine, Japan*; 2. *Rehabilitation Center, Kitano Hospital, The Tazuke Kofukai, Japan*; 3. *Welfare Department, CO-OP AICHI Consumer Co-operative Society, Japan*; 4. *Welfare Department, CO-OP KANAGAWA Consumer Co-operative Society, Japan*)

Introduction : Cost containment for long-term care is one of major concerns in the aging countries. In Japanese long-term care insurance (LTCI) system, preventing the increase of the eligibility level is vital to contain the cost. However, the modifiable risk factors for increasing eligibility level, such as body composition or physical functions, have not been revealed yet. Therefore, we started a prospective study in October 2011. This study describes candidate risk factors from the first year follow-up data. **Method :** The data were obtained from a longitudinal study of home help service users who were certified as LTCI support level 1-2 and care level 1-2. Baseline survey was carried out from October 2011 to November 2011. The adverse outcome was defined as certified as care level 3 or more, institutionalization, and death until October 2012. Predictor variables included age, gender, history of diseases, living alone, eligibility level, grip strength, calf circumference (CC), body mass index (BMI). **Results :** A total of 413 subjects (111 males and 302 females, mean age 84 years) were examined. Adverse outcomes occurred in 44 subjects (10.7%). Multiple logistic regression analysis indicated that age, eligibility level, grip strength, and CC were predictors of adverse outcomes. By ROC analysis, the area under the curve was 0.63 for grip strength and 0.61 for CC. **Conclusion :** The findings of this study suggest that, in the home help service users, adverse outcome may be predictable by some modifiable risk factors even in the short term period. **Keywords :** risk factor, follow-up study

OP26 420-S-4

MODEL ANALYSIS OF LONG-TERM CARE SERVICE USE AMONG THE ELDERLY LIVING AT HOME - JAPAN-SOUTH KOREA COMPARATIVE ANALYSIS

Katsuhisa KOJIMA (*Department of International Research and Cooperation, National Institute of Population and Social Security Research, Japan*)

Introduction : Even in the countries with public long-term care system, family caregivers are prevailing. What kinds of factors will decide the in-home long-term care service usage or not? I have analyzed it with the model based on the framework by Andersen behavior model. **Method :** I have used probit model. There is the dependent variable whether the elderly use in-home long-term care service. The independent variables are attributes of the elderly, family caregivers and region where the elderly live. The data are 2010 Japan and South Korea survey conducted by our research team, which covered the elderly need long-term care services and family caregiver. The

samples are 1500 in Japan and 930 in South Korea. Results : In Japan, there are significant independent variables at 5% level, like level of ADLs losses (+), income class of the elderly (-), caregiver employment status dummy (+). South Korea result has also such variables, like level of ADLs losses (+), level of dementia (-). In addition to these results, regional variable will affect in-home long-term care use. Conclusion : There are differences between the factors deciding the in-home long-term care use or not in Japan and South Korea. Long-term care policy makers in Japan and South Korea often refer to the system of other countries. But, they also should take into account the differences between the needs of in-home long-term care services in own country and other countries. OP26 420-S-5

THE DEVELOPMENT OF A GATE KEEPING INSTRUMENT FOR LONG TERM CARE IN MACAO

Edward M.F. LEUNG¹, Stella Yuk Har CHEUNG¹, Alice Dick Wah CHIU² (1. *Research and Division Department, Hong Kong Association of Gerontology, Hong Kong*; 2. *Quality Development Division, Hong Kong Association of Gerontology, Hong Kong*)

Introduction : The ageing population in Macao SAR increased rapidly to 11.95% in 2012. Some of the Long Term Care services were mismatched especially found in the subvented residential care homes for the elderly in a consultancy report by Hong Kong Association of Gerontology in 2005. In order to assure the resources are well matched with the needy, a research on the effectiveness of the gate keeping instrument was conducted in Macao in 2006. Method : To (1) understand the actual needs of the long term care service users and provide appropriate services to them; (2) attribute the residential care services and community care services to the elders according to their need based. The research study was divided into 2 phases. First phase was a feasibility testing on the gate keeping instrument. A pilot test was conducted with 36 elders and the results were compared with the MDS-HC (Version 2.0) used in Hong Kong. After the pilot test, 100 cases conducted the assessment with the revised instrument in the second phase. It is to measure the validity and reliability of the instrument. Validity testing and inter-rater reliability testing were done. Results : The findings showed that the gate keeping instrument is effective and has a high reliability in assessing the elders' ADL, cognitive, the support from family areas and the service matching according to the need based. Conclusion : Macao started to use the instrument from 2008 till now for the long term care service matching. Keywords : gate keeping instrument

OP26 420-S-6

INSTITUTIONAL CARE FOR OLDER PEOPLE WITH DEMENTIA IN AN EUROPEAN PERSPECTIVE

Staffan KARLSSON¹, Connie LETHIN¹, Ulla Melin EMILSSON², Ingalll Rahm HALLBERG¹ (1. *Health Sciences, Lund University, Sweden*; 2. *School of Social Work, Lund University, Sweden*)

Introduction : Cognitive impairment has been found to be a main predictor for institutionalization. Various types of institutional care are available for persons with dementia, but knowledge is sparse about how the institution should be designed and scaled, and if it should be specialised in dementia or mixed with other older people. To explore various types of institutional care for older people with dementia in eight European countries. Method : Estonia, Finland, France, Germany, Netherlands, Spain, Sweden and UK were included in the

study. A template was developed for collecting data among other areas also about various institutional care. Terminology was reviewed by experts and agreed between the countries. The template covers 50 types of care provided in relation to the dementia trajectory, from diagnosis to end of life stage. Questions about various types of institutional care were analysed. Each question covered estimation of availability, utilization and professionals involved. Results : In the description of the care system, preliminary results showed that residential home or nursing home not specifically organised for persons with dementia was the most common institution through all stages. Institutions more specialised in dementia care was less common and mostly available for those in moderate to end of life stage. The professionals were more educated in dementia in the specialised institutions compared to non specialised institutions. Conclusion : For people with dementia disease, institutions not specific for those with dementia were common in all eight countries, while institutions more specialised were available for few. On the behalf of RightTimePlaceCare consortium. <http://www.righttimeplacecare.eu>. Keywords : Institutional care, Older people, Dementia

SUCCESSFUL AGING

OP26 421-S-1

SUCCESSFUL AGING IN THE ELDERLY OF MEXICO

Elva Dolores ARIAS MERINO¹, Neyda Ma. MENDOZA-RUVALCABA², Xxii Scientific Research Summer Group MASTER OF GERONTOLOGY¹ (1. *Public Health, Cucs. University Of Guadalajara, Mexico*; 2. *Health Sciences, Cutonala. University Of Guadalajara, Mexico*)

Introduction : Aging is a public health challenge as well as a challenge for the elderly to remain active and healthy as long as possible. Rowe and Kahn postulate the successful aging in an individual level. In this study, the successful aging of the elderly in seven states of Mexico is identified. Method : Quantitative cross-sectional study. Sample of 583 elderly (≥ 60 years), conventional and proportional by gender. Participating states: Sinaloa (15.4%), Jalisco (25.6%), Michoacan (8.6%), Guerrero (7.7%), Edo. Mexico (25.6%), Veracruz (8.6%) and Tabasco (8.6%). A survey was applied evaluating the following: socio-demographic characteristics, cognitive function (Folstein), Rowe and Kahn indicators of successful aging and ideas about successful aging (Phelan). Inclusion criteria: age and preserved cognition. Results : Age 70.8 ± 8 years, education 5.7 ± 4.8 years. 13.9% had successful aging, range of 23.3% (Sinaloa) and 8.7% (State of Mexico). In similar proportions they consider aging as successful, healthy and active. The most prominent features of successful aging were: not having any chronic disease, make self- decisions, economic security, be active, be able to meet their own needs and desires, to have good health until the last moment of their life and stay involved with the world and the people around them. Conclusion : Successful aging figures are higher than other studies while controlling the cognitive function. Elderly define aging in a multidimensional way, most representative attributes were: the duality health- disease, cognitive physical and economic autonomy and social participation. Health is the most important indicator of aging well and to reach the stage of aging successfully. Keywords : Successful Aging, Mexico

OP26 421-S-2

OLDER NEW ZEALANDERS' VIEWS ON AGEING WELL

Valerie A. WRIGHT-ST CLAIR, Clare HOCKING, Adina NACHUM (*Occupational Science and Therapy, Auckland University of Technology, New Zealand*)

Introduction : The United Nations Research Agenda on Ageing prioritized understanding older people's subjective views on successful ageing. This project explored Maori and non-Maori New Zealanders' views about growing older and their hopes and values for ageing well. **Method :** Ethics approval was granted for this feasibility for cohort study. A non-representative sample of 33 Maori, aged 75-79, and 79 non-Maori, aged 85 were recruited from three urban and rural regions. The final section of the interview-based questionnaire focused on thoughts about growing older using two closed (5-point Likert scale) and 5 open written questions. Ordinal data were analyzed in SPSS by comparing frequencies and associations using Fisher's exact test where appropriate. Narrative responses were analyzed using interpretive methods. **Results :** Ninety-eight percent agreed or strongly agreed they can do a lot to keep healthy in old age, and 80% agreed or strongly agreed that, overall, growing older was a positive experience. Respectively there were no statistically significant differences for sex ($p=.835$) and ($p=.598$), or ethnicity ($p=.908$) and ($p=.773$). However many who felt growing older was mainly negative or very negative, agreed there was a lot they could do to keep healthy ($p=.001$). Qualitatively, Maori and non-Maori valued their health, cared about a peaceful future and the world's resources, its people and future generations of family. Maori hoped for community unity and togetherness while non-Maori wanted to be independent and age at home. **Conclusion :** Overall, participants hoped to be healthy, be connected with family, and for a better world for future generations. **Keywords :** ageing well, subjective values, cultural differences

OP26 421-S-3

THE NATURAL OCCURRENCE OF SUBJECTIVE AGEING EXPERIENCES IN COMMUNITY-DWELLING OLDER ADULTS AND ASSOCIATIONS WITH SUBJECTIVE WELL-BEING

Martina MICHE¹, Hans-werner WAHL¹, Manfred DIEHL², Frank OSWALD³, Roman KASPAR³ (1. Dept. of Psychological Aging Research, Heidelberg University, Germany; 2. Human Development & Family Studies, Colorado State University, USA; 3. Interdisciplinary Ageing Research, Goethe University Frankfurt, Germany)

Introduction : The subjective experience of ageing is a relevant correlate of developmental outcomes. However, traditional measures of subjective ageing experiences (SAEs), such as felt age, fail to acknowledge the multidimensionality inherent in subjective appraisals of ageing, as well as the day-to-day experience of being aware of one's own age. Based on the concept of Awareness of Age-Related Change (AARC, Diehl & Wahl, 2010), the aim of this paper was to capture the natural ecology of subjective ageing based on a daily diary approach. **Method :** We analyzed 1,757 semi-structured diary entries in which participants described daily events and experiences reminding them of their own ageing. These reports were collected from a sample of 225 community-residing adults aged 70 to 89 years and coded according to AARC domains and subdomains. **Results :** Seventy percent of all participants had SAEs about physical functioning. About half of the sample reported experiences in the domains of interpersonal relations, social-emotional and social-cognitive functioning, and lifestyle. Thirty percent experienced ageing in terms of changes in cognitive functioning. Contents of SAEs varied by gender, age group, and functional status. SAEs about social-emotional and social-cognitive functioning were most consistently related to affective components of subjective well-being. **Conclusion :** Our results demonstrate the benefits of an open-ended approach to a multidimensional understanding of SAEs. Content-related, social-cognitive and social-emotional changes more than functional age-related changes were most important for well-being. Future studies should extend this

research by investigating the dynamic, time-related interplay between different domains of SAEs or between SAEs and well-being related measures. **Keywords :** Subjective Experience of Ageing, Subjective Well-Being, Self-Perceptions of Ageing, Subjective Age, Age Identity, Life Satisfaction

OP26 421-S-4

THE ANTI-AGING-PANACEA OF THE ELDERLY: EXPLORING THE NEW OPPORTUNITY OF TECH PRODUCTS AT THE ELDERLY MARKET VIA THREE-VALUE CONCEPT

Hui-Yi LO (The Department of Marketing, National Chung Hsing University, Taiwan)

Introduction : Ideally, technologies should make the task easier, more efficient or perhaps more pleasurable. However, new technologies might sometimes lead elders to do their task more difficult, slower, or more frustrating. Given the fact of aging, the elderly adults today will become one of the largest social groups and they will be with a growth rate higher than the population as a whole. Thus, tech-products must be adapted to seniors' need. The aim of this study focuses on matching psychological needs with the design concept of a tech-product of elderly people. **Method :** Three aging reflections (physical, sensory, and affective) and three arousing value-perceptions (utilitarian, emotional, spiritual) are explored in this study. Four focus group interviews were conducted and included two age groups (above 55-65 year-old, above 65 year-old). All interviewees consisted of equal number of females and males. **Results :** For utilitarian value, results indicate that five elements, physical compatibility, less risk, without fear, durability and reliability, affect seniors' acceptance of tech-products. The happiness or pleasure is not derived from tech-products, but from their associations and meanings for the seniors, such as learning new things, fun, and interaction between communities. Tech-products with spiritual value can motivate their learning, enrich their life, and impact health-related outcomes. Once elderly adults adopt a particular technology, they use it as frequently as young adults, and they are highly willing to upgrade this tech-product. **Conclusion :** Three values, utilitarian, emotional, spiritual, should be embedded in a tech-product of seniors. Findings provide those high-tech marketers an insight into the elderly market. **Keywords :** Healthy Aging, Tech-products, Value-perceptions, Aging reflections

OP26 421-S-5

DYNAMICS OF LIFE BALANCE IN LATER LIFE IN THE UK: TIME USE AND SUCCESSFUL AGEING

Jiweon JUN (Department of Sociology, University of Oxford, United Kingdom)

Introduction : This study examines the issue of balance in daily time use of older people in the UK. From disengagement theory to successful ageing, there have been a number of theoretical attempts to identify what is good to spend time on in later life. In empirical studies, however, the results have been mixed. In this study, we argue that rather than focusing on the effect of certain kinds of activities on well-being, applying the perspective of balance can be more fruitful in understanding the relationship between daily activities and well-being in later life. **Method :** We propose a theoretical model of life balance, and empirically measure the life balance of older people in the UK using the UK time use data from MTUS (Multinational Time Use Studies). We develop two measurements for life balance: the life balance triangle and the multidimensional life balance index. We then examine the determinants of life balance in later life. **Results :** We found that in later life, the balance shifts to having more discretionary

time and less committed time, yet having too much discretionary time/too little committed time is negatively associated with well-being. We found that demographic and socio-economic variables such as gender, income, and retirement status affect the level of life balance in later life. Conclusion : Findings suggest that maintaining balance in daily life especially in terms of balance between discretionary time and committed time is important in well-being in later life, as it provides a time-structure in daily life. Keywords : work-life balance, time use of older people, retirement

OP27 101-S FAMILY CARE-GIVING

OP27 101-S-1 FAMILY SUPPORT AND SOCIAL ADJUSTMENT OF ELDERLY IN LATER LIFE: A CASE OF RURAL INDIA Dhananjay BANSOD (*Population Research Centre, Institute for Social and Economic Change, India*)

Introduction : The present paper focuses on family support and social adjustment of elderly in rural Maharashtra. Issues like adjustment in various stages of life regarding self, health and social matters are explored and discussed under the sub domain of social adjustment. Further, the impact of various socio-economic factors on social adjustment is discussed in detail. Method : Data for this study was collected from rural areas of Amravati district, Maharashtra using semi-structured interview schedule. 600 males and females were interviewed using systematic sampling technique. Chi-square test is used for establishing associations. Multinomial logistic regression is used to analyse the determinants of social adjustment of elderly. Results : The higher proportion of elderly living in joint families shows better social adjustment than those living in nuclear families or living alone. Marital status has significant influence on their social adjustment. The elderly who were economically dependent on others showed poor adjustment compared to those who were economically independent. The elderly who get family support and care are more socially adjustable than the elders with no family support. Conclusion : The family support system and level of social adjustment of elderly in rural Maharashtra seems to be good. However, there are elders who are not getting any kind of support from either from family or from the government and for them we need to have some sort of policy or support system to secure their welfare. Keywords : social adjustment, family support, elderly

OP27 101-S-2 CARING FOR OLDER ADULTS AT END-OF-LIFE: FAMILY INVOLVEMENT AND INTERACTION Diane Martha PRICE (*School of Nursing and Health Professions, State University of New York Institute of Technology, USA*)

Introduction : As the population ages, elder individuals need more care and assistance from others. Some elders are at end-of-life and their needs often intensify. This care and assistance is often provided by family members however family members may disagree as to how to care for their loved one. The caregivers may have interpersonal disagreements regarding the division of labor. This may lead to one family member taking on the central role in the elder's care, again leading to friction among the rest of the family caregivers. Method : After the researcher had experienced this phenomenon in her practice, she conducted a literature review regarding the topic of family

dynamics and elder care at end-of-life. Results : While much of the research done on caring for a loved one at end-of-life reveals a situation where family members get along and work together in caring for a loved one, there is some research that differs from this scenario. This particular research shows that a rift can occur among family members who are caregivers. Conclusion : It is important for the provider to be aware that not all family caregivers of elders at end-of-life get along and have the same goals for the elder. The provider needs to establish this early in the elder's death trajectory in order to provide good care that is consistent with the elder's wishes. The provider may also want to act as an intermediary thus coordinating care among the family members. Keywords : family relationships

OP27 101-S-3 POSITIVE GAINS IN FAMILY CAREGIVING AND SUCCESSFUL AGING: AN EXPLORATORY STUDY Chiu Mei Lee TERESA (*Department of Rehabilitation Sciences, Hong Kong Polytechnic University, Hong Kong*)

Introduction : According to Rowe and Kahn, successful aging is comprised of three hierarchical components: prevention of disease and disability, high cognitive and physical function, and active participation in meaningful activities. This paper aims to explore positive gains in family caregiving through the concept of successful aging. Method : A mixed method design was used to interview 14 family caregivers who took care of a person with dementia. The caregivers took part in in-depth interviews and shared their positive experiences in caregiving. They also completed a questionnaire that measures the gains in Alzheimer care in four areas: personal, interpersonal, knowledge and spiritual gains. Main themes were identified using a grounded theory analysis procedure and a substantive theorizing process. Results : Three themes of positive gains were identified. All participants felt that giving care is more than a responsibility; it is a way of life. Being able to fulfill the meaningful role was extremely important to them. Next, most caregivers felt that they had improved the relationship with the care recipient and other family members. Finally, many indicated that their knowledge in dementia care had increased. The highest domain of successful aging was reflected in the first two themes: sustained engagement in meaning and social activities. The third theme reflected that the caregivers could have maintained high cognitive function through continuous learning. Conclusion : Although caregiving can be stressful, caregivers who experience gains can be a subgroup that age more successfully. The findings support intervention studies that can enhance positive gains and successful aging among family caregivers. Keywords : family caregiving, successful aging, dementia

OP27 101-S-5 THE EFFECTS OF DEPRESSION OF THE ELDERLY WITH CARDIO-CEREBROVASCULAR DISEASES ON SUICIDAL THOUGHTS : MODERATING EFFECT OF SOCIAL SUPPORT Dongbae KIM, Soomin SHIN, Jihee YUN (*Social Welfare for the Elderly, Graduate School of Social Welfare, Yonsei University, Korea*)

Introduction : In Korea, the suicide of the elderly is on the rise as the most serious social problem. Therefore, suicide of the elderly is 1st grade among OECD countries. According to many researches, the depression of the elderly has an effect on the suicidal thoughts and thoughts directly lead to suicide in the end. Especially, the elderly patients with cardio-cerebrovascular disease could be more easily exposed in the depression than the others. According to some of researches, the social support could control the relationship between

the depression of the elderly with cardio-cerebrovascular disease and the suicidal thoughts. Based upon this fact, it is the goal of this research to verify the moderate effect of the social support between the depression of the elderly with cardio-cerebrovascular disease and the suicidal thoughts. Method : The data were Seoul welfare panel data made by Seoul welfare foundation in 2010. The total sample size was 901 elderly aged over 60. The used statistical analysis methods were frequency analysis, correlation analysis, t-test, ANOVA, and the multiple regression analysis. Results : As a result, the depression of the elderly with cardio-cerebrovascular disease is direct influential factor to suicidal thoughts. Moreover, social support including family support and social network works as a moderator in the research model. Conclusion : This research makes an effort to approach the concept of the moderating effect of social support of the elderly with an integrated perspective. Also, verifying the relationship between the depression and suicidal thoughts of the elderly with cardio-cerebrovascular disease is meaningful. Keywords : the elderly with cardio-cerebrovascular disease , depression and suicidal thoughts, social support

EMERGING ISSUES

OP27 102-S-1
AGEING AND ITS HUMORS

Chris GILLEARD (*Mental Health Sciences, University College London, United Kingdom*)

Introduction : Early Greek medicine created a model of human nature based upon elements, qualities and humors. This tradition was maintained by Galen who elaborated the idea of aging as a process of cooling down and drying out. Later followers of the Galenic tradition pursued the idea of ageing through a lamp metaphor that saw aging as the diminishing and extinction of the lamp's flame due to a loss of radical moisture. Method : Examining the literature from Hippocrates to Floyer's Galenic medicine of old age, this paper reviews the continuities embedded in humoral theories of aging. Results : From this review, three themes emerge - that of a unitary process of endogenous aging; that of the potential for 'positively aging' through maintaining the humors; and that of the use of the six 'non-naturals' as the principle vehicles for living well in later life. Conclusion : Current literature on active, positive or successful aging shows many continuities with these traditions that saw old age as both inevitable and yet modifiable. In contrast to the magical traditions of astrology, alchemy and mysticism that offered an escape from old age, the use of the six non naturals can be observed still in contemporary self help books designed to help us all 'age well'. Keywords : Galenic humors non-naturals and aging

OP27 102-S-2
BABY BOOMERS' MOBILITY PATTERNS AND PREFERENCES: WHAT ARE THE IMPLICATIONS FOR FUTURE TRAVEL?

Anu SIREN, Sonja HAUSTEIN (*Department of Transport, Technical University of Denmark, Denmark*)

Introduction : The demographic grand challenge of population ageing will be reflected on most of the areas of society, and to a great extent also on the area of transportation. The large post-II world war cohorts, the so called baby boomers, will comprise a large share of tomorrows older population, and it is expected that they will differ from their parents' generation when growing old. Method : In order to understand how the aging boomers may impact the future travel, the travel

behaviour and future expectations of Danish baby boomers were analysed based on 1772 standardized telephone interviews. Results : The boomers reported in general being healthy, independent and highly (auto)mobile. They also showed optimism regarding the level of mobility, use of various transport modes, and leading an independent life in the future. However, there were significant gender differences somewhat similar to those observed in the older cohorts. In addition, using cluster analysis, three segments of baby boomers could be differentiated. The segments showed significant differences in current travel behaviour and living circumstances and some similarities to former segmentations of older road users. Conclusion : The boomers will be strong consumers of the transport system, with high demand for mobility. This will pose challenges to society, which must generate policies and plans to support these needs. However, the results indicate that the differences between boomers and their parents might in some aspects be smaller than expected. Keywords : baby boomers; travel; future expectations; forecasts

A BIBLIOMETRIC ANALYSIS OF STUDIES ON PSYCHOLOGY OF AGING IN CHINA

Fengzhan LI (*Institute of Development Psychology, Beijing Normal University, China*)

Introduction : This study aimed at discovering the trends of research on psychological aging in China during the past three decades, and proposing possible directions needed to be reinforced. Method : There are 761 articles, based on Chinese samples and authored by Chinese scholars, retrieved from the CNKI (the most well-known academic database in China) and ISI Web of Knowledge. Bibliometric analyses, mainly with percentage and frequency index, were conducted. Results: The results showed that: (1)the research themes mainly concentrate on mental health, social life, cognitive aging, and physiological changes more than other aspects; (2) the articles are published most (30.1%) on the Chinese Journal of Gerontology, which is a comprehensive rather than a psychological specialized journal; (3) cooperative study has become the main pattern of undertaking research; (4) the distribution of research investment is unbalanced with respects to regions and institutions, and the core alliance on research of psychological aging has not been formed so far in China; (5) However, as time goes by, the number of publications about psychology of aging has increased obviously, especially in past ten years. And some researchers started to look at the aged population from a cross-cultural perspective. Conclusion : In conclusion, more study more and more studies on psychological aging can be anticipated in the near future. However, it may take some time to widen the research investment cross the whole nation. And the core organizations are called to help promoting the research quality in China. Keywords : psychology of aging; bibliometric analysis; the elderly; literature review

OP27 102-S-4
THE TEMSED FRAMEWORK: A HOLISTIC AND ETHICAL APPROACH OF EVALUATION IN E-HEALTH TECHNOLOGY

Lionel BEN-AHMED¹, Bertrand BOUDIN¹, Juliette SABLIER¹, Iwan BARTH², Jeremy BAUCHET³, Yannick FOUQUET⁴, Nicolas VUILLERME², Vincent RIALLE² (*1. Laboratory AGIM, University Joseph Fourier, France; 2. Medecine, University Joseph FOURIER AGIM Laboratory, France; 3. Informatique, University Joseph FOURIER, AGIM Laboratory, France; 4. Technology, TASDA (Technopole Alpes Sante a Domicile et Autonomie), France*)

Introduction : We are living in the technology era. We use them in the

field of health and gerontology with the aim of help us to cope with demographic ageing. These device should increase our quality of life, our social networks, our efficiency, etc. However, we have to assess the real values of these new technologies. What is the social utility of this technology, the health service provided, the acceptability and the financial sustainability? Method : Presently a huge number of experiments are being conducted using their own evaluation methods. We need to define a guideline for the evaluation of innovative technology, but without creating another method similar to the other. This is the purpose of the framework TEMSED (Technology Medical Social Economy Deontology), which answer to the question: what does evaluation mean? This issue allows putting together the value needed for the evaluation, and the development of assessment tools: Technology, safety, reliability, acceptability; Ergonomics: usability; Medical: improvement of autonomy and adjustment of the disposal to an evolving disease; Social: improvement of social network; Economy: costs & returns, economic valuation; Deontology: Ethical basement and issues. Results : TEMSED is a holistic framework of evaluation. The originality of this method lies in its ethical basement. Conclusion : With the TEMSED framework , we have to think about the meaning of evaluation, the place and function of ethic in assistive technology. Keywords : evaluation, e-health, ethics

OP27 102-S-5

QUALITY OF FAMILY RELATIONSHIP AND LATE-LIFE DEPRESSION AMONG LATINO AND ASIAN AMERICAN POPULATIONS

Mijung PARK (Dept. Health and Community Systems, University of Pittsburgh School of Nursing, USA)

Introduction : The purpose of this study was to examine the associations between the quality of family relationship (family conflict and family cohesion) and late-life depression outcomes in Latino and Asian populations and test if these associations vary by race/ethnicity and gender. Method : We used subsample of older adults from the National Latino Asian American Study (N=395), a nationally representative epidemiological study of Asian and Latino mental health. The dependent variable of this study was the 12-month DSM-IV Major Depressive Episode, assessed with the World Health Organization Composite International Diagnostic Interview (WMH-CIDI). And the independent variables of interest were family conflict and family cohesion. All analysis were controlled for age, gender, race/ethnicity, marital status, education, living in poverty, duration of living in the U.S., relative support, and friend support. Results : We document a robust inverse association between late-life depression and family cohesion in Latino and Asian older adults populations (weighted adjusted OR: 0.66 95% CI: 0.46, 0.93). And these associations vary by gender, with men being more sensitive to family cohesion than women. In contrast to previous literature, ethnicity was not a significant effect modifier of the relationship between late-life depression and family cohesion. Furthermore, family conflict was associated with late-life depression, but this relationship was not statistically significant (weighted adjusted OR: 1.27 95% CI: 0.98, 1.62). Conclusion : The quality of family relationship is a major determinant of late-life depression outcomes. Further research is needed to better understand the complex interplay between social support, ethnicity, and gender in predicting late-life depression. Keywords : Family, culturally diverse family: Late-Life Depression

OP27 102-S-6

SELF-NEGLECTING ELDERLY IN AN AGING SOCIETY: HOW SERIOUS IS IT IN JAPAN?

Yoshiaki TAKAHASHI (JICA Research Institute, Japan International

Cooperation Agency, Japan)

Introduction : The share of the population aged 65 years and over in Japan is now the highest in the world. Self-neglect was appeared as one of serious issues same as other developed countries. However, due to the lack of its magnitude to the society, we could not deal with it appropriately. Impact of elder self-neglect on Japanese society was measured. Method : The questionnaires were sent to three major gatekeepers in local communities: directors for aging in the local government authorities, local comprehensive support centers, and district welfare commissioners. 41.6% of the centers (n=1,884) and 5.2% of the commissioners (n=11,806) reported us 7,061 cases in detail. Results : Taking account of duplication between three sources, we estimated total number of cases in each municipality. If the information is missing for the municipality, we estimated the number by using the probability of likelihood in the municipalities which have similar size of the population. As a result, we estimated total number of cases in Japan as a whole. It was 10,785 cases in average (9,381-12,190 cases with 95% confidence interval). Conclusion : Self-neglect was already widespread in Japan. Because serious cases are identified by other members in the communities, the magnitude of self-neglect to the society has already been significant. When ratio of elderly to population is increased, self-neglectors are expected to increase more. Therefore, we need to explore risk factors and solution for this serious issue in detail. Keywords : Self neglect, elderly, Japan

QUALITY OF LIFE AND LIFE SATISFACTION

OP27 103-S-1

QUALITY OF LIFE IN OLDER PEOPLE FROM CHILE: THE ROLE OF SUBJECTIVITY AND AGENCY

Paulina OSORIO¹, Maria-Jose TORREJON², Cynthia MEERSOHN³, Maria-Sol ANIGSTEIN⁴ (1. Department of Anthropology, Universidad de Chile, Chile; 2. Department of Sociology, University of British Columbia, Canada; 3. School of Applied Social Sciences, Durham University, United Kingdom; 4. Faculty of Social Sciences, Universidad de Chile, Chile)

Introduction : From a subjective perspective, the concept 'quality of life' is the evaluation that individuals make of their living conditions. Because individuals place themselves in relation to the opportunities and constraints in their societal and cultural environment, a subjective perspective of quality of life invites us to reflect on the ability of individuals to exercising agency over conditions imposed by a broader context. Method : This is a qualitative research that includes in-depth interviews to semi-dependent seniors 60 years and older living in the Metropolitan Region, Chile. The analysis was informed by a grounded theory approach assisted by Atlas ti 5.0. Results : Through the application of a constructivist stance, we have developed a diagram that gives dynamism to the dimensions of quality of life identified by the participants. We can observe how the dimensions interact to distinguish those that correspond to the social environment (e.g. intimacy and social inclusion) from those related to living conditions (e.g. health and economics). Conclusion : Living conditions do not univocally affect the quality of life of older people since those conditions can be managed with greater or lesser agency depending on the social environment where they are experienced. In fact, it is the idea of self-determination -to have some control over a situation- which is the axis to positively evaluate a given condition. Keywords : quality of life in older people, agency, self-determination

OP27 103-S-2

INVESTIGATING SHORT TERM TEMPORAL ASPECTS OF LONELINESS IN OLDER PEOPLE: RESULTS FROM A PILOT STUDY

Mary Pat SULLIVAN, Christina VICTOR, Mary GILHOOLY (*School of Health Sciences and Social Care, Brunel University, United Kingdom*)

Introduction : The dynamic nature of loneliness in later life has been largely overlooked in the existing literature which has sought to establish the prevalence of, and risk factors for, loneliness or quantify how loneliness varies longitudinally. Much less is understood about how the experience of loneliness may vary across seasons, different days of the week or various times in the day. **Method :** We used a mixed methods study with people aged 65+ to explore the links between the temporal variations in loneliness and an individual's intra and inter personal characteristics and social environment: (1) secondary analysis of 'loneliness' interviews (n=45); and (2) survey of a volunteer sample to explore levels of loneliness using a self report and the de Jong Gierveld scales, at 3 month intervals across a 12 month period (n=33). Participants had a mean age of 74, 18 were female and they were all living independently in the community. At baseline 40% were lonely. **Results :** Re-analysis of our interviews revealed that temporal variations are important for the experience of loneliness and these are intimately linked with the individual's socio-environmental context. Across the survey sample, variations in loneliness at different times of the year (winter), days of the week (weekends) and times of day (evenings) were evident. **Conclusion :** There is a complex relationship between temporal variations in loneliness and an individual's characteristics and psychosocial context which present challenges for the development of intervention strategies. Further longitudinal investigations are warranted to explore individual experiences of loneliness and effective interventions for a diverse older population. **Keywords :** loneliness

OP27 103-S-3 ASSOCIATIONS AMONG STRESSFUL LIFE EVENTS, ANXIETY AND WELLBEING AMONG OLDER ADULTS: FINDINGS FROM THE HEALTH AND RETIREMENT STUDY (HRS)

Robert STAWSKI, Tara QUEEN, Lindsay RYAN, Jacqui SMITH (*Survey Research Center, University of Michigan, USA*)

Introduction : Considerable research has documented the negative influence of stressful life events on psychological wellbeing, and anxiety as an important risk factor for vulnerability to stress. While the effects of stressful life events on wellbeing are robust during early adulthood, less is known about interactive effects of stressful life events and anxiety on psychological wellbeing during old age. **Method:** A nationally representative sample (N=4,516) of adults aged 50 and over (Mean = 70, Range = 50-100; 64% Female) from the 2008 wave of the Health and Retirement Study (HRS) completed measures of early life events, lifetime traumatic experiences, and recent life events, as well as measures of anxiety and psychological well-being (negative affect, positive affect, life satisfaction). **Results :** Preliminary analyses revealed three main findings. First, the distribution of early life events, lifetime traumatic experiences, and recent life events differed across age, sex, and education. Second, early life events, lifetime traumatic experiences, and recent life events were all significant and independent predictors of poorer psychological wellbeing. Finally, anxiety moderated the effect of stressful life events such that the negative influence of stressful life events on psychological wellbeing was strongest among older adults reporting the highest levels of anxiety. **Conclusion :** Early life events, lifetime

traumatic experiences, and recent life events are all important predictors of older adults' psychological wellbeing, and anxiety is an important risk factor for increased vulnerability to stress in old age. **Keywords :** Stress, Wellbeing, Anxiety

OP27 103-S-4 THE EFFECTS OF INTERNET USE ON THE LIFE SATISFACTION OF THE ELDERLY: THE MEDIATING EFFECT OF SELF-ESTEEM AND SOCIAL RELATIONSHIP

Soomin SHIN, Kyuhyoung JEONG (*Social Welfare for the Elderly, Graduate School of Social Welfare, Yonsei University, Korea*)

Introduction : Aging is often accompanied by various physical and mental problems including deteriorating health and cognitive functioning. The Internet has become an accepted, routine means of communication for many people, including the elderly. The Internet has created new opportunities for isolated older people to participate in online support groups and communities. These unique characteristics of the Internet can enhance the quality of life for older people. This study looks into the effects of internet use on the life satisfaction level of the elderly in depth. **Method :** In order to verify the correlation of the two variables, a mediating model structured by psycho-social resources (self-esteem and social relationship) was used. The data used, the Seoul welfare panel data, was created by the Seoul Welfare Foundation in 2010. The total sample size was a group of 340 elders aged over 60. When it came to our research methods, structured equation analysis was applied to verify the mediating effect and theoretical background. **Results :** The results revealed that Internet use by the elderly indirectly affected their life satisfaction level positively, thus self-esteem and social relationships showed a complete mediating effect between Internet use and life satisfaction levels. Internet use seems to contribute to older adults' life satisfaction by affecting their interpersonal interactions and promoting their experience of self-efficacy and independence. **Conclusion :** The outcome of this study emphasizes the importance of promoting internet utilization by the elderly. To ensure this, an improved and increased number of computer education programs should be put in place as a theoretical and practical intervention. **Keywords :** The aged Internet use, Life satisfaction, Psycho-social resource

OP27 103-S-5 THE STUDY OF CARE QUALITY IN NURSING HOMES FOR OLDER PERSONS WITH DEMENTIA IN SWEDEN, IN RELATION TO CHARACTERISTICS OF THE INHABITANTS AND THE FACILITY

Staffan KARLSSON¹, Sangyo NAM² (*1. Department of Health Sciences, Faculty of Medicine, Lund University, Sweden; 2. Department of Health Services Administration, Yuhan University, Korea*)

Introduction : Older people with dementia admitting to nursing homes are vulnerable persons and in need of extensive care and service. To develop strategies for improvements in nursing homes for people with dementia it is important to provide knowledge about factors that will have an impact on care quality. The aim of this study was to investigate comparisons and correlations between care quality and, the characteristics of the inhabitants and the nursing home facilities. **Method :** Data was collected from 51 nursing homes and 115 newly admitted persons 65 years or older with dementia. Statistical analysis included comparisons and correlations between characteristics of the nursing homes, inhabitants' condition and the rating of care quality called CLINT(Vaarama 2009). **Results :** The people were in mean 85 years old and those living in nursing homes specialised in dementia

were more depended in activities of daily living (ADL) and had more often defined dementia diagnosis than those living in an ordinary nursing homes. Less number of older people per ward and higher staff ratio were found in specialised nursing homes or group dwellings compared to ordinary nursing homes. Preliminary results indicated that low rate of care quality was associated with dependency in ADL and living in group dwelling. Conclusion : The dementia diagnosis is more often made in nursing homes specialized in dementia. When improving care quality in nursing homes it is important to consider the inhabitants dependency of ADL. Keywords : Care quality, Dementia, Nursing home

ELDER ABUSE AND SUICIDE

OP27 104-S-1

AN INNOVATIVE SUICIDE PREVENTION PROGRAM FOR DEPRESSED OLDER ADULTS

Sylvie LAPIERRE¹, Micheline DUBE¹, Lyson MARCOUX¹, Sophie DESJARDINS¹, Paule MIQUELON¹, Michel ALAIN¹, Richard BOYER² (1. *Department of Psychology, University of Quebec in Trois-Rivieres, Canada*; 2. *Centre de recherche Fernand-Seguin, University of Montreal, Canada*)

Introduction : The realization of personal goals is positively related to psychological well-being, life satisfaction, happiness, self-esteem, and gives meaning to one's life. Since reasons for living and meaning in life are incompatible with suicide, an intervention program centered on the realization of personal goals was developed as an innovative way to decrease depression and suicidal ideations in older adults living in the community. Method : The 14-week group intervention program was offered to help participants set, plan, pursue, and realize meaningful personal goals in order to promote their mental health, increase their psychological well-being and quality of life. The 24 participants (14 women, 10 men), aged 65 to 84 years (M = 68.6), were moderately depressed (Beck Depression Inventory-II, M = 21.1). They completed questionnaires on goal realization, depression, and suicidal ideations as well as various measures of well-being at three times (pre, post, and six months later). Results : Results indicated that improvement could be observed on goal realization abilities ($F(2,22) = 11.46, p < 0.001$) and that depressive symptoms had decreased significantly ($F(2,22) = 20.86, p < 0.001$) as well as suicidal ideations ($F(2,22) = 5.99, p < 0.01$). Progress was maintained six months later. Repeated anovas (time X gender) also indicated a gender effect for depression. Conclusion : The goal intervention program seems efficient to improve psychological well-being of depressed older adults and could be an innovative approach to suicide prevention, especially for men. Keywords : suicide well-being intervention

OP27 104-S-2

PREVALENCE OF ELDER ABUSE AND AFFECT OF SOME SOCIAL FACTOR ON IT IN MARKAZI PROVINCE 2010

Babak ESHRATI¹, Ezat VAHIDIAN¹, Mahin AZIMI¹, Pegah MEHRTALAB², Ezat TAHERI³ (1. *Public Health, Arak University of Medical Science, Iran*; 2. *Psychology, Applied and Science University, Iran*; 3. *Public Health, Arak University, Iran*)

Introduction : Elder abuse has devastating consequences for older persons such as poor quality of life, psychological distress, and loss of property and security. The purpose of this study is to determine the prevalence of elder abuse and effects of social factor on it in Markazi province. Method : the society of the study was all of the elders in Markazi province that were available by geographical address in the

table of rural and urban household societies .the study was cross sectional and multi phases in sampling .the first one was classification according rural and urban area and the second one was cluster sampling with equal cluster. estimation of samples were 472 persons and increased by design effect to 1110 persons .collection data was done by questionnaire and analyzed by SPSS and chi 2 exam. Results: This study showed 6.3 % of elderly were abused. 42/8% male and 57.2% female, mean of ages was 74.7 years, 64% were married and 31% were widows. There weren't any significant meaningful association between elder abuse and area of living ($p.v=0.299$), occupation ($p.v=0.104$), education ($p.v=0.358$) and age ($P.value=0.104$). There were significant meaningful association between physical impairment ($p.v=0.08$) and movement impairment ($P.value=0.008$). Conclusion : results verify that maltreatment occurred in the aged persons. Analysis of data indicated that elder abuse exist in every socio economic group with any context of education in urban area and rural area and in men and women .prevalence of elder abuse was 6.3 %(70persons) that verify the data of developed countries with limited sample. Keywords : elderly, abuse, elder abuse, physical impairment, movement impairment, education, occupation

OP27 104-S-3

ELDER MISTREATMENT IN RURAL TAMIL NADU, INDIA

Srinivasan CHOKKANATHAN (*Social Work, National University of Singapore, Singapore*)

Introduction : Elder mistreatment is a serious human rights and public health problem. However, there is limited research on the nature and magnitude of elder mistreatment in developing countries such as India. The current study attempts to determine the prevalence rate and risk factors of mistreatment in rural Tamil Nadu, India. Method : A two stage 30 (villages) by 31(respondents) sampling design was employed in this study. In the first stage, villages were selected through Probability Proportionate to Size (PPS) method. In the second stage 902 elderly persons aged 61 years and above were randomly selected. The mistreatment questionnaire encompassed items on psychological, physical and financial abuse as well as neglect. Measures on demographic profile, family environment, family stressors, and dependency were also administered. Logistic regression analysis was performed using complex survey method in stata.12. Results : The overall prevalence rate of mistreatment in the past one year to the interview was 20%. Almost all of them who were mistreated reported multiple abuses. Psychological abuse was most common followed by physical abuse, financial abuse and neglect. Risk factors for mistreatment included high levels of family stressors, low levels of family cohesion and alcoholism in the family. Conclusion : Interplay of socio-cultural and familial factors pose severe challenges in the identification of mistreatment. Elder abuse is multifactorial and effective intervention preferably should occur in the context of a multidisciplinary team. Keywords : elder abuse rural risk factors

OP27 104-S-4

CONNECTED BUT LONELY: MOBILE TECHNOLOGY AND SURVIVAL BATTLES OF OLDER ADULTS IN RURAL COMMUNITIES

Eucharia Chinwe IGBAFE (*Of Adult and Community Education and Training, University of Pretoria, South Africa, South Africa*)

Introduction : Connecting with people through mobile technology has been linked to well-being. Science has established that faulty connection is stressful and may become anti well-being. This study presents an exploration of the effect of mobile technology on older

adults in rural communities. Method : The participants were 300 older adults selected purposefully from rural communities in South-South Geographical zone in Nigeria. Quantitatively, questionnaire was used for data collection and qualitatively, semi-structured interview was conducted. Results : The results suggested that in mobile technology, voice to voice contact have more negative impact on older adults. The older adult perceived voice to voice contact as unhelpful to their need for face to face contact; spend time together to fulfill sincere yearning for family reunion and improve source of revenue situation. These factors results in emotional imploding which significantly affect the well-being of older adults. Conclusion : The study concluded that older adults in rural communities' battle to survive as mobile technology has limited the number of their children and relatives, who visit, see their living conditions and empathically give financial supports. Keywords : Connected, Lonely, Mobile Technology

OP27 104-S-5

HELPING RELATIONSHIPS, LIFE SATISFACTION AND SELF ESTEEM: INTERGENERATIONAL POLICY IMPLICATIONS FOR KOREAN OLDER ADULTS AND CHILDREN

Sondra Seungja DOE (*College of Health and Welfare, Woosong University, Korea*)

Introduction : This study examined whether perceived relationships between older adults and children were associated with older adults' life satisfaction and children's self esteem. Method : Data were collected from a total of 31 Korean Community Welfare Centers (CWCs), yielding usable data on 242 children and 244 older adults. A 20-item Old Age Life Satisfaction Index was used for older adults aged 60 or above and a 32-item Self Esteem Index for Children were used to measure 4 dimensions of children's self-esteem. Results : Results from children's data showed a positive linkage between children's self-esteem scores and their positive beliefs about their relationship with older adults. Children who received help from older adults and those who helped them showed significantly higher Global Self-Esteem (SE), Social-Peer SE, and Home-Parents SE scores than their counterparts who did not have helpful relationships with older adults with whom they interacted at CWCs. Among older adults, the younger they were, the higher expectation they had for receiving help from children and older adults who were relatively younger than others in the participant group were more likely to attend intergenerational programs. Among older adults, the older they were, the less they were satisfied in family relationships and friendships, and they were less likely to participate in social groups and organizations. Conclusion : The author concludes that isolated older adults and children with low self-esteem may benefit from participating in intergenerational social programs developed in the community setting. Policy implications are provided for fostering mutually-helpful interactions between children and older adults. Keywords : intergenerational networks; helping relationships

OP27 104-S-6

THE EFFECTS OF HOBBY AND LEISURE ACTIVITY PREPARATIONS ON THE SUICIDE IMPULSE FOR SOUTH KOREA'S OLDER GENERATION, AND THE MEDIATING EFFECT OF EGO INTEGRITY

Dongbae KIM, Hyunjeong KIM, Kyeongwon LEE, Eunjin LEE (*Graduate School of Social Welfare, Yonsei University, Korea*)

Introduction : Suicide is currently one of the most critical social problems in Korea, because Korea has the highest suicide rate among the Organization for Economic Cooperation and Development

(OECD) countries. The incidence of suicide among the elderly has dramatically increased. This study investigated the relationship between hobby and leisure activity preparations and the suicide impulse. Method : A mediating model structured by ego integrity was used to verify the relation between the two variables. The data was obtained through the Seoul Welfare Panel Data Study compiled by the Seoul Welfare Foundation in 2010. This study analyzed 1,862 people over sixty years old. Descriptive analysis, t-tests, ANOVA and the multiple regression analysis are used as research methods. Additionally, a Sobel test was used to verify the significant mediating effect. Results : The findings are as follows: First, hobby and leisure activity preparations indicated significant effects on the suicide impulse. Second, ego integrity functioned as a partial mediator on the relationship between hobby and leisure activity preparations and the suicide impulse. Conclusion : These findings suggest that practical interventions focused on hobbies and leisure activities reduce the suicide impulse for older adults. Furthermore, promoting ego integrity should be considered by practitioners who both plan and implement suicide impulse programs. Finally, this article provides theoretical and practical implications for promoting hobby and leisure activity preparations to prevent the problem of elderly suicides in South Korea. Keywords : Hobby and leisure activity preparations for older generation, the Suicide impulse, Ego integrity

OP27 105-S

GRANDPARENTING

OP27 105-S-1

THE GRANDMOTHER ROLE IN THEIR GRAND-CHILDREN'S EDUCATION: CASE LOMAS OF TABACHINES

Margarita MALDONADO (*Psychology, Instituto Tecnológico y de Estudios Superiores de Occidente (ITESO), Mexico*)

Introduction : In Mexico the structure of households had diversified in period from 1990 to 2000 there was a considerable decrease in nuclear units (from 74.9% to 68.8%) and an increase in large units (from 19.6% to 24.5%) (Sieglin, 2005). The dedication of the grandmothers to grandchildren has changed from voluntary to an obligation to them involves physical exertion, emotional and economic impact (Mestre, 2012). Hoyuelos (2004) mentions in general the roles of grandparents are: Caregiver, playmates, storyteller, transmitter of moral values and help in times of crisis. Objective: Describe the roles they have in the maternal grandmothers raising their grandchildren during their early childhood. Method : Descriptive study was conducted in the Lomas de Tabachines. This colony is characterized for high level of marginalization. Six grandmothers were interviewed. The age was $x = 67.0$, poor education 50.0% cannot read and write. The 100% were Catholics. Results : In all cases the presence of grandchildren was permanent. The grandmothers had an authority role because; they were responsible for correcting and provide guidelines for their grandchildren education. The responsibilities of this group of grandmothers who have to their grandchildren can be grouped into three categories: a) Care giver b) Support in their schooling c) Discipline. Conclusion : All of the families visited have extended family structures, where in addition to the couple, living children, nephews and grandchildren. This shows what Sieglin mentions (2005) on the extended family increased steadily and progressively. The best person to care for grandchildren was the maternal grandmother. Keywords : Grndmother poverty education

OP27 105-S-2

GRANDPARENTING IN SINGAPORE AND VIETNAM

Kalyani Kirtikar MEHTA¹, Bui The CUONG² (*1. Human Development*

and Social Services, SIM University, Singapore; 2. Southern Institute for Sustainable Development, VietNam Academy of Social Sciences, Viet Nam)

Introduction : The paper is based on a study on Grandparenting in Singapore and Vietnam. Within the context of an ageing Asia, the growing numbers of grandparents and the important roles they play within the family propel the need for more research devoted to their experiences. The sweeping social changes that are increasingly felt within individual families and society are giving rise to a shift in expectations of the role and functions of grandparents. **Method :** Using a mixed method of surveys and face to face interviews a comparison was made of the grandparents in Singapore with their counterparts in Vietnam. The survey questionnaire and interview guideline of questions were the same in both nations. The data was analyzed using SPSS to compare various variables across Singaporean and Vietnamese grandparents. **Results :** In terms of relationship with grandchildren, grandparents from both the countries indicated that they had a very good/good relationship with their grandchildren; however the grandparents from Vietnam indicated a slightly higher response (82.2%) in comparison to Singapore grandparents (77.1%). The roles and functions played by grandparents were similar across both countries. However, there were some urban and rural differences in Vietnam with regard to the views and experiences of grandparents. In both countries, grandchildren expressed greater intimacy with grandmothers than with grandfathers. **Conclusion :** Recommendations for further research and policies conclude the paper. **Keywords :** intergenerational, grandparenting, family

OP27 105-S-3
AGE GROUP DIFFERENCES IN HUMAN SERVICE NEEDS AND SERVICE ACCESSIBILITY IN CENTRAL TEXAS, U.S.A.
Kyong Hee CHEE (*Sociology, Texas State University, USA*)

Introduction : Most older people in the United States want to continue living in the community where they currently reside. Yet, it is difficult to “age in place” without easy access to various human services. The purpose of this study is to assess human service needs as well as accessibility to such services among older residents in Central Texas, Texas. **Method :** This study uses the survey data from a community needs assessment for a small city government in Central Texas. The assessment was conducted during the summer of 2012, and the author worked on it as a project manager/research collaborator. A total of 207 study participants who completed the surveys were recruited with the assistance of 18 local human service agencies. Surveys were made available in both English and Spanish. The typical respondent is Hispanic, middle-aged, a woman, and from a lower-income household. **Results :** Statistical data analyses reveal a number of areas in which older residents differ from their younger counterparts. Not surprisingly, older respondents are more likely to have need for senior services and housing for special needs populations. They are, however, less likely to have received substance and alcohol abuse services, and legal services. Older respondents also reported significantly greater difficulty accessing services for domestic violence victims. **Conclusion:** These results suggest the need for greater attention to population aging at the community level. To respond to shifting resident needs, human service agencies and communities should recognize the age-differentiated patterns of human service needs and accessibility. Implications for local government policy are discussed. **Keywords :** Age Group Differences, Human Service Needs, Service Accessibility

OP27 106-S-1
KOREAN OLDER PEOPLE'S CARE IN THE POLITICS OF FAMILY SUPPORT
Keong-Suk PARK (*Sociology, Seoul National University, Korea*)

Introduction : This study aims to examine the deep relationship between the characteristics of family change and the delayed social perception of older people's care. The main argument to evince in the paper is that the politics of family support between the extended family and the interest of nuclear family has been unrecognized under the influence of familism, and it deterred from building a broader semantic basis of social care and had deleterious effects on the care of elderly people as well as their self perception. **Method :** Main method is semantic analysis to trace the social meanings of the diverse, conflicting, and scattered images in family laws and mass media (mainly newspapers) between the 1980s and the present time. Using these materials, it was analyzed how conflictual legal underpinnings about family relationship have been and how the conflicts have changed, and how views and contents of family relationship between gender and generation in mass media have changed. **Results :** Legal contradictions and real conflicts between extended and nuclear family interest, and the social pressure to cover this family conflict are interpreted in the context of intense but covert politics of family support. Inertial reliance on family support irrespective of its tension and social ignorance to cover the patriarchal coercion underlying the tension of family support, have deterring effect on building social ethics about care. **Conclusion :** Ignorance of progressive aspect of family conflict, inertial reliance on filial piety for the elderly, and social absence of care ethics have displaced the elderly from the care. **Keywords :** care, family support, familism

OP27 106-S-2
DETERMINANTS OF LIFE SATISFACTION AMONG THE ELDERLY USING SOCIAL SERVICES IN KOREA
Hongjik LEE¹, Sooyoun K. HAN² (*1. Social Welfare, Kangnam University, Korea; 2. Executive Director, CARE the Right, USA*)

Introduction : The purpose of this study was to explore the determinants of life satisfaction among the elderly using social services in Korea. Especially, it aimed to explore how the socioeconomic characteristics of the elderly, service organizational characteristics and service performances affected their level of life satisfaction. **Method :** The subject of this study was 152 elderly who received social services of nine service agencies in the Seoul-Gyeonggi metropolitan area. The level of life satisfaction was measured by the 5-subset questionnaires of feeling of daily life, expectation of future, meaningful work, pride and overall feeling of life. Also, socioeconomic characteristics of the elderly, organizational characteristics, and service performances were introduced as predictors of life satisfaction. This study conducted descriptive statistics analyses and multiple regression analyses to explore the determinants of life satisfaction among the elderly in social service agencies. **Results :** Although life satisfaction of the elderly was varied significantly according to various socioeconomic characteristics, service organizational characteristics and service performances, only subjective health status, type of facility, reliability, tangibility, responsiveness of services were still remained as statistically significant predictors to their level of life satisfaction in the total model. **Conclusion :** The result of this study showed us that elderly who were healthy, were not living in the facilities, who received reliable, tangible and responsive services enjoyed higher level of life

satisfaction than their counterparts. It suggested us that more policy and program considerations should be took for the elderly to improve their levels of life satisfaction. Keywords : elderly, life satisfaction, service performances, socioeconomic status, organizational traits

EXPLORING INTERGENERATIONAL RELATIONSHIPS THROUGH UTILIZING INTERACTIONAL PATTERN ANALYSIS (IPA)

Erica DE LANGE (African Unit for Transdisciplinary Health Research, North West University, South Africa)

Introduction : This presentation addresses the topic of intergenerational relationships evident within the family. The context of this research is the field of gerontology as the research findings are appropriate to persons of age 60+. Method : Interactional pattern analysis was utilized with various gerontology case studies. These cases were taken from clinical private practice, where therapy was conducted with persons of age 60+. Data was collected during the first consultation with the client and during the therapeutic process. Then the collected data was analysed thematically. Interactional pattern analysis was used to identify the intergenerational relationships of these clients. Results : The findings of the research reflected the interactional patterns and the interactional styles of the participants and the outcomes of the therapeutic interventions are presented. Conclusion : The implications of the research are presented with some suggestions regarding the facilitation and improvement of interpersonal relationships for people that are ageing and recommendations for future research are given. Keywords : Intergenerational, relationships, family

OP27 106-S-4

THE EFFECT OF PSYCHO-EDUCATIONAL INTERVENTION PROGRAM ON COMPLETION OF END OF LIFE DECISION FOR KOREAN AMERICAN, DEMENTED OLDERS

Sooyoun K. HAN¹, Jason J. HAN², Hongjik LEE³, John KIM⁴ (1. Executive Director, CARE the Right, USA. 2. VAD & Cardiac Transplant Program, Exercise Physiology Laboratory, Center for Advanced Cardiac Care, Columbia University Medical Center, USA. 3. Social Welfare, Kangnam University, Korea. 4. Internal Medicain & Geriatrics, Bergen Regional Medical Center, USA)

Introduction : The study examined the benefits of a psycho-educational intervention program (PEIP) on completion of end-of-life decision (EOLD) for demented, Korean-American, nursing home olders. Method : This study used a classic pre and post-test control group design to identify that PEIP would enhance family caregiver(FC) to complete EOLD in comparison to control group receiving only the standard information routinely provided in Korean. A two-hour long PEIP was designed to educate FCs about dementia prognosis and symptoms, life sustaining treatment choices, and the EOLD procedure, all by using supportive counseling skills. The telephone interview included semi close-ended questions with regard to how many FCs had actually completed EOLD or consulted physicians, and why the FCs decided to complete EOLD. Data analyzed by SPSS 19, the One-Way Analysis of Covariance(ANCOVA). Results : Results found FC who received the PEIP statistically significantly scored higher completion rate of EOLD than the control group. They significantly increased their knowledge to compare with the control group after three months of PEIP. They involved in EOLD to help elderly residents' pain relief, elder's dignity, medical condition. Conclusion : This study suggests if PEIP works in such a positive way to improve the quality of EOLD for minority

elders, encouraging policy maker and healthcare providers to be more cognizant of the system's current shortcomings in caring for and educating minority elders and FCs is needed in order to effectively address them. Keywords : End-of-Life Decision, Korean American Olders, Nursing Home

OP27 106-S-5

EFFECT OF NURSING EDUCATION ON STUDENTS' KNOWLEDGE, ATTITUDES AND PREFERENCES TO WORK WITH OLDER ADULTS: ISRAELI PERSPECTIVES

Anna ZISBERG¹, Max TOPAZ², Tova BAND-WINTERSHTEIN¹ (1. The Cheryl Spencer Department of Nursing, Haifa University, Israel; 2. School of Nursing,, University of Pennsylvania, USA)

Introduction : More nurses are needed to provide care for increasing numbers of older adults; however, many are reluctant to work in geriatric settings. Nursing education has a controversial effect on the development of positive attitudes towards old age and career choices in geriatrics. There is lack of knowledge on how older adults are viewed by nursing students, especially in the Middle East. We examined the effect of nursing education on students' knowledge, attitudes and work preferences with older adults in ethnically-diverse Israeli society. Method : We conducted a cross-sectional survey applying Kogan's Old People Scale to measure attitudes toward elderly and Palmore's Facts on Aging Quiz-1 to assess knowledge level. Socio-demographics and intention to work with older adults were also examined. We used multivariate-regression models to examine the effect of nursing education on students' attitudes and work preferences. Results : 224 nursing students from the largest academic institution in Northern Israel across four cohorts responded to the survey. 55% were Jewish and the rest Arabs. Ethnicity (being Jewish, $\beta=.40$, $p<.000$) and knowledge ($\beta=.27$, $t=4.54$, $p<.000$) were the strongest predictors of attitudes; attitudes ($\beta=.28$, $p<.000$) and ethnicity (being Arab, $\beta=-.28$, $p<.000$) predicted work preferences. Conclusion : While the knowledge of old age increased, preferences for future career in geriatrics declined. Student's attitudes did not change with education. Ethnicity was a strong predictor of attitudes and work preferences; Arabs indicated more willingness to work in geriatrics while their attitudes were more negative. The results highlight the need in culturally tailored educational programs focused on changing the attitudes toward aging. Keywords : nursing education, attitudes toward elderly, knowledge of old age

AGEING AND PSYCHOSOCIAL THEORY I

OP27 107-S-1

FEASIBILITY AND VALIDITY OF DEMENTIA ASSESSMENT BY TRAINED COMMUNITY HEALTH WORKERS

Hae-Ra HAN¹, So-Youn PARK², Heejung SONG³, Miyong KIM⁴, Kim B. KIM⁵, Hochang Ben LEE⁶ (1. Department of Community and Public Health, The Johns Hopkins University School of Nursing, USA; 2. College of Social Sciences, Kyonggi University, Korea; 3. College of Agriculture and Natural Sciences, University of Maryland, USA; 4. Department of Community and Public health, The Johns Hopkins University School of Nursing, USA; 5. Korean Resource Center, USA; 6. School of Medicine, Yale University, USA)

Introduction : Ethnic minority elders in the United States, particularly recent Asian immigrants, have a heightened prevalence of dementia but lack timely diagnosis and treatment. One of the critical steps in addressing the unmet needs of dementia care in this rapidly growing ethnic population is to build the capacity to adequately screen people

with dementia for necessary follow-up assessment and care. The purpose of this study was to determine whether dementia rating by trained community health workers (CHWs) based on the Clinical Dementia Rating (CDR) could achieve an acceptable level of agreement with the gold standard, physician diagnosis of dementia. Method : A total of six CHWs were trained and certified as CDR raters. Ninety community-dwelling Korean American elderly (aged 60 years or older) were included in the analysis. After completing a Korean version of the Mini-Mental State Examination (MMSE-KC), each study participant was interviewed and rated by a trained CHW based on the CDR. A bilingual geriatric psychiatrist evaluated the participants independently for dementia status. Results : 61.1% of the participants were rated as having either mild cognitive impairment (CDR=0.5) or dementia (CDR=1 or higher) by CHWs, as compared to 56.7% diagnosed by the clinician. A receiver operating characteristic (ROC) curve analysis demonstrated a good predictive capability for CDR rating by trained CHWs (ROC area under the curve=0.86 [95% confidence interval=0.78-0.93], with sensitivity=85.5% and specificity=88.6%) in detecting mild cognitive impairment and dementia. Conclusion : These findings provide preliminary evidence that trained CHWs can effectively identify community-dwelling Korean elderly with mild cognitive impairment and dementia. Keywords : Clinical Dementia Rating, community health workers, dementia, elderly, Korean

OP27 107-S-2
FUNCTIONAL SELF-EFFICACY IN FACE OF A HYPOTHETICAL DECLINE IN HEALTH AND FUNCTION: DEVELOPMENT AND VALIDATION OF A SCALE

Hava TOVEL¹, Sara CARMEL¹, Victoria H. RAVEIS² (1. Center for Multidisciplinary Research in Aging, Ben-Gurion University of the Negev, Israel; 2. Psychosocial Research Unit on Health Aging and the Community, New York University College of Dentistry, USA)

Introduction : Decline in health and/or function is one of the major factors negatively affecting wellbeing in old age. This paper describes the development and validation of a scale for assessing the degree of confidence in self-functioning while facing a decline in health/function - Functional Self-Efficacy (FSE). Method : The FSE scale was evaluated in three different studies of older Israelis aged 75+ (N1=191, N2=350, N3=1364). Data were collected by structured home interviews. Results : Results of the three exploratory factor analyses clearly revealed two underlying factors: emotional, and behavioral self-efficacy. Confirmatory factor analyses resulted in acceptable model fit criteria (e.g.: NFI=.952-.987, CFI=.983-.991, RMSEA=.040-.052). The final 13-item FSE scale was found to have good internal consistency in all three studies (Cronbach's alpha ranged .90-.95) and good criterion validity based on Pearson correlation coefficients with relevant scales such as general self-efficacy (r=.479-.553) and life satisfaction (r=.379-.520). Multiple regression analyses conducted to predict wellbeing showed a positive and significant contribution of FSE to wellbeing, controlling for age, gender, health evaluation, economic status, education, social support, and general self-efficacy. Conclusion : The FSE scale appears to be a reliable tool for evaluating older adults' confidence in self-functioning in the presence of health decline, and an important predictor of wellbeing. Functional abilities and the confidence in them can be strengthened by appropriate interventions and in turn enhance wellbeing in older adults. Keywords: Functional Self-Efficacy, well-being, elderly

OP27 107-S-3
STATISTICAL GERONTOLOGY

Yury GUSCHO (Gerontology, Longevyty AS, Norway)

Introduction : According to the statistics the average human has at least 1 disease if he is between 18 and 25 years old (the health resource is about 90%). He has 3 diseases if he is between 37 and 50 (the health resource is about 75%), and 5 diseases if he is between 60 and 80 (the health resource is about 50%). The average life expectancy of the Earth's inhabitants is 50 years. Method : In the 17-th century the first attempts to create "the formula of life" and to forecast the lifetime on its foundation were made by K.Huygens, V.Leibnitz and E.Halley, and in the 18-th and the 19-th centuries - by Eylerer and P.Laplace. In the 20-th centuries the theory was pushed by Mr. Gomperts, Mr.Meykem, Mr.Johnson, Mr.Pavelets, Mr.Brillinger, Gavrilovs's married couple and by many other well-known scholars. In the Report the algorithm of the calculation of the index of the vital and business activity is presented. Results : On the basis of statistical data, collected and processed by the author in 120 countries for 25 years, it was possible to complete the efforts of the Pleiad of scientists, executed during the previous four centuries. Conclusion : On basis of our program product, it is possible to forecast the dynamics of the index of vital and business activity, the resource of health and longevity. Now it is realizable to optimize the style of life in consideration of the possible changes in living conditions and to prolong the lifetime for twenty-three years and completely free of charge. Keywords : Active longlife

OP27 107-S-4
PERCEIVED CONTROL IN HEALTH CARE AMONG FRAIL OLDER ADULTS: FROM CONCEPTUALISATION TO ASSESSMENT

Lily CLAASSENS¹, Martijn HUISMAN¹, Suzanne VAN RHIJN¹, Caroline TERWEE¹, Marjolein BROESE VAN GROENOU², Guy WIDDERSHOVEN³, Fenna VAN NES¹, Dorly DEEG¹ (1. Dept. of Epidemiology & Biostatistics (LASA), VU University Medical Center, EMGO Institute for Health and Care Research, Netherlands; 2. Dept. of Sociology, VU University, Netherlands; 3. Dept. of Medical Humanities, VU University Medical Center, EMGO Institute for Health and Care Research, Netherlands)

Introduction : Experiencing control in the health care process can be challenging for frail older adults with multi-morbidity. We conduct a mixed method study to address: 1.) the conceptualisation of health care-related 'perceived control' from the perspective of frail older adults; and 2.) the construction of a measurement instrument. Method : In a qualitative interview study, among 32 frail older Dutch adults aged 65 and over, elements of perceived control were identified and integrated into a conceptual framework. Based on this framework, a self-administered questionnaire was developed and revised upon pilot-testing and a (first-round) field-test with 197 individuals from the target group. Subsequently, 300 frail older people are invited to participate in a survey starting December 2012, to complete the questionnaire validation process, and to assess the empirical association of perceived control with socioeconomic status; the perceived quality of care; and quality of life. Results : Perceived control in health care is believed to be a subjective state, driven by internal and external factors. Our 29-item questionnaire reflects a formative model and captures 5 independent sub scales: self-confidence in (I) organising formal health care, (II) communicating with health care providers, and (III) self-management in the home setting, (IV) expectations regarding future health care needs, and (V) perceived support from and interaction with significant others. Conclusion : Assessing perceived control in the health care domain may be a new step towards understanding at what level supportive interventions should operate, and at whom these should be directed. Keywords : perceived control, health care, frail older adults

OP27 107-S-5

CAREGIVER DUTY FULFILLMENT AND CAREGIVER SATISFACTION : INSTRUMENT DEVELOPMENT

Lyda Consuelo AREVALO-FLECHAS¹, Michael SIERRA-AREVALO² (1. St. David's School of Nursing, Texas State University - Round Rock Campus, USA; 2. Sociology, Yale University, USA)

Introduction : Caregiver satisfaction and caregiver duty fulfillment are concepts central to the Latino caregiving experience. Yet, measures of caregiver burden remain in use as outcome indicators of the effectiveness of caregiver interventions. Aims To describe the use of mixed methodology in the initial phase of development of a culturally and linguistically congruent instrument that captures central concepts in the Latino Alzheimer's caregiving experience: Duty fulfillment and satisfaction. Method : Three phase mixed methodology. Phase I (QUAL) : Ethnographic interviews of bilingual and monolingual Latino/Hispanic Alzheimer's caregivers. Phase II (QUAL-QUANT) : Interviews in Spanish and English and completion of the English and Spanish versions of the Screen for Caregiver Burden (SCB) by bilingual caregivers. Phase III (QUANT) : Completion of the English and Spanish versions of the SCB and three measures of quality of life: The Perceived Stress Scale (PSS), the Short Form 36 (SF-36) Health Survey, and the Center for Epidemiologic Studies Depression Index (CES-D). Results : Data from the ethnographic and subsequent interviews were used to identify substantive content areas. An initial 120-item pool was constructed and balanced across referent groups and direction of wording. Items with minimal variance were eliminated during pilot testing. The reduced set was initially administered to a sample of 100 Latino caregivers of a relative living with Alzheimer's disease. Conclusion : The instrument must continue to be refined as it shows promise in the measurement of previously ignored central concepts in Latino caregiving. Latinos have been described as under reporting or not acknowledging the existence of burden. Keywords : instrumentation, cross-cultural, caregiver

OP27 107-S-6

AN EXPLORATORY STUDY ON THE AFFECTING FACTORS OF GEROTRASCENDENCE IN METROPOLITAN AREA IN KOREA

Min-Suk YOON (Department of Future and Social Policy Research, The Seoul Institute, Korea)

Introduction : This study aims to confirm the existence and influencing factors of Gerotranscendence in the case of elders living within the Metropolitan area in Korea. The definition of gerotranscendence is as people grow older after mid-age, they experience a major shift in the way they view the world. This theory was first mentioned by Tornstam(1994), and the ninth stage of Erikson(1997)'s psycho-social development theory. Method : This study investigated 494 elders over the age of 65 who living within the Metropolitan area in order to confirm the existence of Gerotranscendence. We used The scale of gerotranscendence, which was executed by SPSS 12.0. to confirmed the existence of the phenomenon of gerotranscendence in the elderly. Results : The result shows that, First, as a result of comparison between the middle aged group and the elder group through the average points of Gerotranscendence, that the score of the middle aged group was significantly lower than that of the elder group. Second, it has been proven that the factors influencing Gerotranscendence are everyday life stress, social support, satisfaction of one's health status, marital status and educational level being over Middle school graduated. Conclusion : The age factor wasn't significant in quantitative research by gerotranscendence, but when we interviewed subjects over 70's years in age, some of them realized the concept of

gerotranscendence and were affected by other factors. These results show that the difference of the phenomenon of gerotranscendence dose in fact depend on the age group. Keywords : Gerotranscendence, Erikson & Erikson's Ninth Stage, Social Support, Life - Satisfaction, Daily Stres

INCREASING VCT SERVICES UPTAKE BY OLDER PEOPLE THROUGH PEER COMMUNICATION

Michael Kanyingi KIMUHU (Mgh Project, Mkccs Helpage Kenya Project, Kenya)

Introduction : HIV is a major problem for Older People in Africa. HIV impacts Older People in two main ways. Older People become infected within their older years or are entering their older age infected with HIV. Older people in most cases do not consider themselves at risk of HIV infection. Project objective - To increase older people's awareness and understanding of HIV/AIDS transmission and available support services and enhance their ability to more effectively protect themselves and their dependents from HIV/AIDS transmission. Method : The programme staffs communicate with the community through the area provincial administration where a public forum is called for the community to select the older persons for training as peer educators. This is followed by the training of the older persons as peer educators. The training units included; Facts about HIV and AIDS, Issues of older persons, communication, and basics of community home based care. The project is designed to use volunteer community resources among older persons 50+ to provide accurate, honest information about sexuality HIV and AIDS, through household visits, one-on-one conversations and community meetings. Peer educators visit homes and give information about HIV and encourage testing. Each peer educator refers about 20 older people for HIV test. Results : 284 older people tested for HIV during two HTC days. 1350 tested in three years. Conclusion : There is notable increase in the comfort by older people talking about sexuality. There is an increase in the number of older people who access and request for HTC services. Keywords : Older people, HTC, Peer

ST-AGE-ING MATTERS: TRAINING ELDER ACTORS TO PROMOTE EMPOWERMENT AND SOCIAL INCLUSION

Mary Ann MURPHY (Social Work/Sociology, University of British Columbia, Canada)

Introduction : The complex concept of social inclusion includes elements of belonging, participation, community/civic engagement, the elimination of discrimination, the promotion of independence and quality of life. These elements include access to services. The oral presentation of this paper will summarize the process and outcomes of a Canadian community-based "geriatric actors project" titled "ST-AGE-ING Matters: Acting Out Our Issues". The main goal of this project was to mentor and train members of a lifelong learning organization as community 'elder actors' to promote empowerment, public understanding and awareness of issues such as seniors care, dementia and Alzheimer's disease, intergenerational communication, ageism, elder abuse, and social exclusion. Two well qualified theatre directors were hired. Method : The methods include: participant observation; focus groups with participants, and a thematic analysis of developed vignettes. Results : The presentation - with performance footage - includes results of a formal evaluation of this 'elder actors'

project. The major intended outcomes of this project were met: 1) to increase the social capital of older adults by training novice actors and 2) to generate public awareness and conversation about issues that critically and negatively affect older adults. The dramatic process itself had a major impact on participants. Conclusion : An inclusive society is one where it is common to find attitudes of mutual respect, friendships, and communication across the generations regardless of race, religion, gender etc. (Government of Ireland, National Action Plan for Social Inclusion, 2008; European Social Watch, 2010). This creative project makes a contribution in the area of arts, health, and active ageing. Keywords : actors, social inclusion, empowerment, active ageing

OP27 108-S-3

EVALUATING THE IMPACT OF MEMBERSHIP OF AN ACTIVE RETIREMENT IRELAND ON THE QUALITY OF LIFE OF MEMBERS

Aine NI LEIME, Aoife CALLAN, Caroline FINN, Ronan HEALY
(*Irish Centre for Social Gerontology, National University of Ireland Galway, Ireland*)

Introduction : It is increasingly recognised at international policy level that non-governmental organisations that promote older people's participation in society play an important role in enhancing their quality of life and well-being. The World Health Organisation suggests that keeping active mentally, physically and socially promotes healthy ageing. Research indicates that volunteering and participating in older people's organisations enhances the quality of life and well-being of older people. There remains a scarcity of research exploring the impact of participating in such organisations. This paper discusses the findings of an evaluation conducted with a non-governmental organisation in Ireland, Active Retirement Ireland (ARI) in 2012. It investigates the impact of volunteering and participation in ARI on the well-being of older volunteers and participants. ARI is a national organisation with 23,000 members that encourages the involvement of older people in a wide variety of activities. Method : The mixed methods study involves a questionnaire sent to 882 ARI members to establish the impacts on them of involvement in ARI; CASP-19 scale was used to measure quality of life. Five focus groups and 30 interviews were conducted with 64 ARI members to explore the processes by which participants are impacted. Results : Response rate is 54%. Findings indicate impacts across a number of domains including enhanced quality of life, mental and physical well-being and reduced loneliness. The time spent by members participating in the organisation is assigned an economic value. Conclusion : Findings allowing for the identification of key elements that may lead to a healthier lifestyle in older age. Keywords : volunteering, quality of life, impact

OP27 108-S-4

TRANSITION TO RETIREMENT AND SOCIAL ACTIVITIES: A FOCUS ON GENDER DIFFERENCE

Jinkuk HONG¹, Gyounghae HAN², Jeong-yeon SON³ (1. *Waisman Center, University of Wisconsin-Madison, USA*; 2. *Dept. of Child and Family Studies, Seoul National University, Korea*; 3. *Institute on Aging, Seoul National University, Korea*)

Introduction : Employment status playing a critical role in individual's social identity, the retirement process usually reflects individual's own social sphere, and simultaneously influences one's social connectivity significantly. The goal of this study is to examine how transition to retirement is associated with one's social activities among Koreans baby boomers, many of whom are going through the retirement

process. Method : Using data from the Study of Korean Baby Boomers that surveyed men and women born between 1955 and 1963, this study examined the differences in social activities across different stages in transition to retirement: continually working on a main job, working on a bridge job - the second job after retiring from the main job, and not working at all after retiring from the main job. Results : Results of regression analysis show that, for women (n = 2306), compared to those who were continually working, women in other phases of the retirement process reported higher levels of social participations and more frequent contacts with her social networks. For men (n = 1995), those not working at all after retiring from the main job reported lower levels of social participation than those continually working. Men working on a bridge job, however, reported higher level of social participation if they were high in the "positive relation" domain of psychological well-being. There was no difference in the amount social contact across three phases of transition to retirement for men. Conclusion : These findings suggest that transition to retirement has very different social consequences for men and women. Keywords : Social participation, retirement, gender differences

OP27 108-S-5

A STUDY ON THE DIGITAL DIVIDE AND LIFE SATISFACTION OF THE BABY-BOOM GENERATION IN KOREA

Chung Sun PARK (*Department of Family Welfare, Daegu University, Korea*)

Introduction : The baby-boomers have recently experienced the expansion of the digital devices in every sphere of their lives. However, there is a significant difference between baby-boomers who were well adapting and those who were not to new digital environments. This difference resulted in a digital divide within a baby-boom generation. Some reasons for the digital divide were individual, but most reasons seemed to be social-structural. In our study, the factors to cause the digital divide were analyzed, and the relationship between the causes of the digital divide and the life satisfaction was examined. Method : 400 men and women of baby-boom generation were surveyed with a structured questionnaire. Results : The findings are as follows; the possession and the buying intention of digital devices were related to sex, education, income, and job, but not to the age of the baby-boomers. The capability to digital device utilization showed a negative relationship with age, and a positive relationship with education and income. The accessibility to digital devices and the capacity to manage digital information showed a strong relationship with socio-economic backgrounds. The participation rate in digital activity also showed significant differences among socio-economic backgrounds of the baby-boomers. Finally, satisfaction with digital life and overall life satisfaction of the baby-boomers were influenced by digital-related activities. Conclusion : Therefore, in order to narrow down the gap of the digital divide, and to enhance digital life and overall life satisfactions, there should be strong support programs and services for the baby-boomers who had relatively disadvantages in their socio-economic backgrounds. Keywords : baby-boom generation, digital divide, quality of life

OP27 108-S-6

THE STUDY FOR RETIREES' STRESS AND LIFE SATISFACTION OF THE ELDERLY: MODERATING EFFECT OF PRODUCTIVE AGING ACTIVITY

Soomin SHIN (*Social Welfare for the Elderly, Graduate School of Social Welfare, Yonsei University, Korea*)

Introduction : The emphasis on a continuous productivity for the

elderly is the main characteristic among the developed countries getting ready for the aging society. Traditional perspective has viewed the elderly as diseased, lacking of ability, and dependent person. However this paradigm shifts to a positive viewpoint considering them as healthy, productive, and independent people. Moreover, retirement from work can present a significant adjustment challenge for the elderly financially, socially and emotionally. In this aspect, retirement has been identified as a significantly stressful event. Method : The purpose of this research is to verify how the multi-dimensional activities of the elderly could moderate the relations between retirees' stress and life-satisfaction. The data used, the Seoul welfare panel data, was created by the Seoul Welfare Foundation and this study was targeted at retirees aged over 50. Results : According to the result, retirees' economic, relational, dairy stresses are direct influential factor to life-satisfaction. Moreover, periodical physical exercise, active social participation, leisure activity, volunteering activity, donation, participation for job training and continuing education program work as a moderator in the research model. Conclusion : This research makes an effort to approach the concept of productive aging activity of the elderly with an integrated perspective. Also, verifying the relationship between retiree's stress and life-satisfaction in terms of multi-dimension is meaningful. Through this outcome, national policies have to provide not only quantitative opportunities for activity of the elderly, but also qualitative services in order that the productive activity could recover retirees' stress in the old age and enhance their life-satisfaction finally. Keywords : Retiree's Stress, Life-Satisfaction of the Elderly, Productive Aging Activity

OP27 109-S **HOUSING & URBAN**

OP27 109-S-1 **THE VIRTUAL ENVIRONMENT IN COMMUNICATION OF AGE-FRIENDLY DESIGN**

Eunju HWANG¹, Andrew PARK², Andrew SIXSMITH³, Gloria GUTMAN³ (1. Apparel, Housing and Resource Management, Virginia Tech, USA; 2. Computer Sciences, Thomson Rivers University, Canada; 3 Gerontology Research Center, Simon Fraser University, Canada)

Introduction : The purpose of this study was to construct a virtual environment (VE) and to conduct oral narratives from older adults to listen to their virtual walking experiences in making the Vancouver Chinatown, Canada more age-friendly. Method : To construct the VE, first an environmental audit was conducted and pictures of buildings and streets were taken at the street level (segment). Then using a computer software program (Maya), 3D models of the Chinatown were built, and they were imported to a game engine (Unity 3D) so that participants could interact with the VE. A total of 21 seniors participated in oral narratives experiencing the virtual walk. 11 participants were male and 10 were female. The participants freely talked about what they were exploring, motivations to make their choice of route, and likes and dislikes. Results : Safety and shortest routes to local amenities were mentioned frequently in making decisions on walking routes. About using the VE, the majority (16) of participants said that they navigated the VE as if they navigated in the real environment and over half of participants (13) felt that the experience was very similar with playing a video game. However, only about the half of participants (12) agreed that it was definitely easy to learn how to navigate the VE. Conclusion : The VE can be developed as a potential research tool when we work in a high crime areasuch as the Vancouver Chinatown. It can greatly reduce ethical issues since there would be no real physical risk of danger. Keywords : virtual

environment; age friendly; physical environment

OP27 109-S-2 **DEVELOPING AGE-FRIENDLY CITIES: CASE STUDIES FROM BRUSSELS AND MANCHESTER AND IMPLICATIONS FOR POLICY AND PRACTICE**

Tine BUFFEL¹, Chris PHILLIPSON², Paul MCGARRY³, An-sofie SMETCOREN⁴, Nico DE WITTE⁴ (1. Social Sciences, Humanities, The University of Manchester, Adult Educational Sciences, Vrije Universiteit Brussel, United Kingdom; 2. School of Social Sciences, The University of Manchester, United Kingdom; 3. Senior Strategy Manager Valuing Older People (VOP), Public Health Manchester, United Kingdom; 4. Adult Educational Sciences, Vrije Universiteit Brussel, Belgium)

Introduction : Developing environments responsive to the aspirations and needs of older people has become a major concern for social and public policy. Policies and programmes directed at achieving 'age-friendly' communities are considered to require a wide range of interventions, including actions at the level of the social and physical environment. Method : This article aims to provide a comparison of the age-friendly approaches in two European cities, Manchester and Brussels, with a particular focus on policies and initiatives that promote active ageing in an urban context. Both cities have been recognised as 'age-friendly' cities by the World Health Organization because of their active policy for older people. Results : This comparative paper is developed by examining: first, the main findings from empirical studies which sought to examine experiences of place among older people living in inner-city neighbourhoods in Brussels and Manchester; second, the key factors driving the age-friendly debate in both cities; third, the implementation of age-friendly policies; fourth, the nature of the cooperation between older people and different stakeholders, including both formal and third sector agencies; and fifth, examples of practice initiatives aimed at involving older people in the development of age-friendly environments. Conclusion : The article concludes by discussing the key elements and resources needed to develop age-friendly cities. Keywords : Age-friendly cities, living environment, inner-city neighborhoods, aging

OP27 109-S-3 **EXAMINING DIFFERENCES IN RURAL AND URBAN COMMUNITIES IN CHINA FROM AN AGING FRIENDLY COMMUNITY PERSPECTIVE**

Yi WANG, Ernest GONZALES, Nancy MORROW-HOWELL (George Warren Brown School of Social Work, Washington University in St. Louis, USA)

Introduction : The Aging Friendly Communities (AFC) Initiative by the World Health Organization has gained worldwide momentum given its potential to facilitate health, economic security and engagement. Unfortunately, measures have yet to be explicated. Moreover, much emphasis is on urban communities; yet significant increases of rural older adults are projected. Our objectives are to (a) analyze community-level measures in the 2011-2012 national baseline survey of China Health and Retirement Longitudinal Survey (CHARLS) within the paradigm of AFC-Initiative, and (b) compare the 'age-friendliness' of urban/rural communities. Method : Community variables in CHARLS baseline survey were reviewed and analyzed. Chi-square and t-tests were utilized to explore differences between 301 rural and 152 urban communities. Results : Information pertaining to the built environment but not the social environment was collected. The existence of certain facilities was assessed from some basic infrastructure to highly age-friendly facilities. Quality,

accessibility, and affordability dimensions were not collected. Secondly, rural communities are significantly underdeveloped regarding basic infrastructure (public transportation, type of roads, drinking water system, heating system, sewer system, usage of electricity) and the quality of the medical care in rural communities was lower than urban areas. Significant urban-rural distinctions are also found in community facilities that can encourage older adults' engagement in physical exercise, leisure, personal enrichment activities, employment, and volunteering. Conclusion : This is the first study to examine CHARLS data through an AFC perspective. Social inclusion measures and research that examines the impact of urban/rural settings on health, economic security and engagement are warranted. Keywords : aging-friendly community, CHARLS baseline, urban-rural comparison

OP27 109-S-4

“MOVING OUT? OR NOT!”: URBAN NEIGHBORHOOD CONTEXT AND INTENTIONS TO MOVE IN LATER LIFE

Min Hee KIM¹, Philippa CLARKE², Jeffery MORENOFF³ (1. *School of Social Work & Department of Sociology, University of Michigan, USA*; 2. *Survey Research Center, Institute for Social Research, University of Michigan, USA*; 3. *Survey Research Center, Institute for Social Research & Department of Sociology, University of Michigan, USA*)

Introduction : Based on competing theories surrounding the role of neighborhood push factors and attachment factors on moving intentions in later life, this paper examines the association between neighborhood-level physical and social environments and the intention to move among community-dwelling adults in Chicago by age. Method : Data comes from Chicago Community Adult Health Study (2001-2003)(N=2,972), which collects neighborhood-level data using Systematic Social Observation and US Census. Multilevel multinomial logistic regression was applied. Results : Results indicate that neighborhoods with greater signs of risky behavior are associated with a greater desire to move for all age groups. Poor physical conditions in the neighborhood played a significant role in increasing the intention to move. However, older adults(65 and over) were less likely to report an intention to move than the younger age group(18-40) when living in a physically decaying neighborhood. The push effect of a high proportion of racial minorities at the neighborhood-level was also attenuated among older adults. At individual level, being female, married, owning a home, and having more friend/kin networks decreased the odds of move intention, whereas higher education levels and physical health limitations increased the odds for all age groups. Conclusion : Older adults' decisions to stay or leave neighborhood are related to residential safety and personal health status, but not the neighborhood physical condition or racial segregation itself. Results show the importance of an individual's support network on moving intention. This study suggests incorporating theories from social gerontology, neighborhood health effects, and residential mobility studies to understand older adults' intention to age in place. Keywords: Social and Built Environment, Residential mobility, Neighborhood safety

OP27 109-S-5

BABY BOOMERS' PREFERENCES FOR RESIDENTIAL TECHNOLOGIES FOR AGING-IN-PLACE

Hyun Joo KWON¹, Eunju HWANG², Julia O. BEAMISH³ (1. *Art and Design, Purdue University, USA*; 2. *Apparel, Housing, and Resource Management, Virginia Tech, USA*)

Introduction : Almost 90% of people in the United States age 50 and

over have indicated they want to age in place. Residential technologies could support older adults' independence and healthy living. The purpose of this study is to investigate U.S. Boomers' needs for residential technology, their intention to use the technologies at their retirement, and considerations they have when purchasing technology products. Method : A national on-line survey was conducted during April, 2011 using a self-administered questionnaire. The questionnaire included demographic characteristics, need for residential technology systems, overall intention to use the technologies, and considerations when purchasing the technologies. Descriptive statistics, t-test, chi-square analysis, and analysis of variance (ANOVA) were employed (N=403). Results : Among the need for various residential technology systems, the entertainment system was significantly higher, and the on-site health care system and environment control system were significantly lower than overall needs. The mean value of intention to use residential technology was higher than the neutral point of 3.0. When considering purchasing residential technology products, price, usability and compatibility were the most important considerations. Chi-square analysis and ANOVA detected significant differences among needs of the residential technology and purchasing considerations in terms of gender, education level, marital status, income, health status, housing type, location, number of bedrooms and years of residence. Conclusion : Participants identified need for certain residential technologies for their later life. They were more interested in entertainment systems and have concerns for on-site health care systems, suggesting more familiarity with certain technologies and a lack of immediate concerns about their health. Keywords : Aging-in-place, Residential Technologies, Baby Boomers

OP27 109-S-6

A STUDY OF REASONS FOR MOVING INTO ELDERLY CONCENTRATED SMALL CITIES IN THE UNITED STATES, CANADA, AND KOREA

Choon-Seek RIM (*Dept.of Social Welfare, Hannam Univeristy, Korea*)

Introduction : It is essential that past experience of initiating senior zone small cities needs to be reviewed along rural communities of other counties as they are done in all other zones, and their research model of settling senior concentrated township should be taken into considerations for the future of rural areas in Korea, as a primary means of offering urbanized environment for the elderly along aged rural community. Method : In this study, a series of qualitative analysis was taken from 12 open-ended interviews conducted in 2007 and 2010 with older men, women, and couples aged 55 or more who moved to a smaller residence such as a single house or condominium in small cities of higher elderly population, located in rural counties of the United States, Canada, and Korea within the past year. Results : Because they spent middle lives working heavily without adequate income and culture social activities, nearby small cities with social supports and policy considerations are affordable and satisfiable places. In addition to positive and hopeful mobility, many mobility is an inevitable final choice. Several episodes help illustrate interactions across ecological layers of the aging context: individual health and functional limitations, individual beliefs and attitudes, the physical environment of the home, and social pressures. Conclusion : For the future of Korean rural elderly policies, productive and active early old stage lifestyles need to be maintained by limiting expansion of dependent level facilities around the moved in new class of independent active elderly. Keywords : Senior Living, Cottage, RV-Park, Senior Zone, Functional Limits

SOCIAL POLICY

OP27 110-R-1
LOCAL AUTHORITY MANAGED PERSONAL BUDGETS - WHAT OPPORTUNITIES FOR CHOICE AND CONTROL BY OLDER SERVICE USERS?

Caroline GLENDINNING, Kate BAXTER, Parvaneh RABIEE
(*Social Policy Research Unit (SPRU), University of York, United Kingdom*)

Introduction : Increasing choice and control is at the heart of English social care policy. All older people eligible for local authority-funded social care are now offered personal budgets; it is expected that care markets will respond as older people have greater command over the resources for their care. However, instead of taking the personal budget as a cash payment and arranging their own support (eg hiring a carer), most older people opt to have their budget managed by the local authority which purchases and arranges services on their behalf. Older people with local authority-managed personal budgets should also receive personalised and flexible home care support. A new study examined: What local authorities are doing to develop local markets so that older people with managed personal budgets receive personalised and flexible services; How care managers and home care agencies are planning and delivering personalised and flexible services; What factors help or impede the delivery of personalised home care; Older people's satisfaction with the home care services they receive. Method: Interviews with senior local authority managers and front-line staff; staff from home care agencies; and older people using home care services in three innovative local authorities. Results : The findings will illustrate the potential for home care markets to adapt to delivering personalised services, and the barriers remaining. Conclusion : The findings will illustrate the potential for home care markets to adapt to delivering personalised services, and the barriers remaining. Keywords : care markets, home care, personalisation

OP27 110-R-2
NATIONAL PENSION SCHEME IN TAIWAN: A WINDING ROUTE OF CONSENSUS-BUILDING IN DEMOCRATISATION

Hubert C.Y. LIU (*Department of Gerontological Care and Management, Chang Gung University of Science and Technology, Taiwan*)

Introduction : In Taiwan, social welfare systems developed in correspondence with the consolidation process of democratisation, after martial law was initially lifted in 1987. From that time onward, Taiwan's social security system as a whole developed drastically. Nevertheless, economic security for the elderly had been insufficient until the National Pension Scheme (NPS) could be enacted as late as 2007. Democratisation and political liberalisation seemed unable to promote the progress of enacting the NPS. Method : Regarding methodology, I adopted an unobtrusive method and field research method to collect primary data in Taiwan. I also adopted the snow ball sampling method to collect main participants' opinions from different realms. Results : This study explores the preventing factors and promoting factors in the process of the belated enactment of the NPS, particularly within the background of democratisation. The controversies surrounded its institutional design, coverage, and the benefit for the elderly. The involvement in the process of enactment of the NPS from different angles of viewpoint, by actors in three main circles, namely the bureaucrats, the political elites, and the Social Movement Groups (SMGs), aggravated the complexity of the proceedings. Conclusion : This process was embedded in struggled political competitions in which democratisation affected every sphere of planning the National Pension Scheme. Hence, this study explores

the nature of democratisation in depth in Taiwan and then its impacts toward the National Pension Scheme were manifested subsequently. Keywords : National Pension Scheme, Democratisation, Taiwan

OP24 412-S-4
MEETING THE HEALTH AND WELLNESS NEEDS OF THE AGING POPULATION IN CANADA: THE 2013-2018 STRATEGIC PLAN OF THE CANADIAN INSTITUTES OF HEALTH RESEARCH - INSTITUTE OF AGING

Yves JOANETTE (*Scientific Director, CIHR-Institute of Aging, Canada*)

Introduction : In the context of the aging population in Canada, new knowledge is required in order to face the health and wellness needs of the population. Method : The Canadian Institutes of Health Research - Institute of Aging (IA) has undergone extensive consultations in order to identify its 2013-2018 strategic orientations. After being successful in consolidating the community of research on aging in Canada, IA is now facing new challenges such as the need to identify the determinants of healthy aging and the complexity and the chronicity of health challenges in older adults, as well as their need to be supported at the community level. Results : IA's vision is to become the key player in ensuring that knowledge is generated to enable evidence-based decisions and promote prevention, care, management and better health systems for all aging Canadian within the diversity of the Canadian society. In doing so, IA's goal is to optimize health and wellness over the course of the aging trajectory. Five strategic orientations are identified in this plan: Priority 1) The Health and Wellness Trajectory. Priority 2) Adding Life to the Late Years. Priority 3) Interventions that Meet the Complex Needs of Older Adults. Priority 4) Innovative and Efficient Health Service Care Transitions for Older Adults. Priority 5) Ensuring the Conditions for a Positive Impact on Health and Wellness of the Aging Population. Conclusion : This is a unique and privileged opportunity to engage in discussions in view of developing future international collaborations around these shared priorities. Keywords : Canadian Strategic Plan, Health and Wellness, Research Needs

POVERTY AND ECONOMIC OF AGING

OP27 111-S-1
ECONOMIC WELL-BEING AMONG OLD-AGE IMMIGRANTS IN THE UNITED STATES

Yunju NAM (*Social Work, University at Buffalo, USA*)

Introduction : Older immigrants are a growing but vulnerable population in the United States. Among older immigrants, those who immigrated at old age (older than 55) are especially vulnerable since many are ineligible for Social Security benefits and pension. We know little about old-age immigrants' economic conditions, especially asset ownership. Method : This study conducts secondary data analyses using data from the Current Population Survey, collected by the U.S. Census Bureau from 2003 to 2008. The sample consists of 71,161 older adults consisting of native-born citizens, young-age immigrants (those who immigrated at or before age 55), and old-age immigrants. This study employs various indicators of economic well-being: poverty, homeownership, and asset income (income from assets such as interests and rental properties). This study employs a decomposition method to estimate how much economic gaps are explained by compositional differences in demographic and human capital characteristics among the three groups. Results : Old-age immigrants' economic conditions are worse than native-born adults and young-age

immigrants in all indicators. Poverty rate is 9.5% among native older adults, 12.8% among young-age immigrants, and 20.9% among old-age immigrants. Homeownership rate is 84.4%, 76.5%, and 52.8%, respectively. While the majority of native older adults (61%) have asset income, only 52% of young-age immigrants and 34.2% of old-age immigrants do. Mean asset income is \$ 4,529 among native older adults, \$3,677 among young-age immigrants, and \$1,637 among old-age immigrants. Conclusion : The results indicate that older immigrants, especially old-age immigrants, are at high risk of experiencing economic hardship in the United States, calling for policy intervention. Keywords : economic security , assets

OP27 111-S-2

THE BLIND SPOT: ETHICAL CHALLENGES IN THE HEALTH CARE FOR OLDER PRISONERS

Violet HANDTKE, Wiebke BRETSCHNEIDER, Tenzin WANGMO, Bernice ELGER (*Institute for Biomedical Ethics, University of Basel, Switzerland*)

Introduction : Prisons worldwide are facing challenges associated with growing numbers of aging prisoners. This trend will continue due to a greater call for public safety, longer sentences and the incarceration of a higher number of adults. So far, studies have concluded that the health, both physical and mental, of prisoners in general and older prisoners in particular is worse than that of the general population. Detainees are reported to age faster as compared to adults in the community. However, to date, very little is known about the actual healthcare conditions of older prisoners and the ethical challenges associated with it. Method : The principle of equivalence is the guiding principle for the health care of older prisoners. The principle stipulates that health care received by prisoners and non-prisoners should be equivalent. However, it has to be analysed what the principle of equivalence means in practice, how it is interpreted, and utilized in prison medicine. Results : It remains to be explored how far the principle can be stretched to issues indirectly related to health care of older prisoners such as preventive efforts, housing and end-of-life care. Alternative solutions such as compassionate release must also be considered under this umbrella of the principle of equivalence. These issues will be analysed focusing on the declining abilities of older prisoners. Conclusion : Finally, ethically acceptable solutions to prison medicine for aging and dying prisoners will be discussed with an emphasis on clarifying the range and limits of the principle of equivalence for aging prisoners. Keywords : aging prisoners, principle of equivalence, ethics

OP27 111-S-3

MATERIAL DEPRIVATION OF OLDER GENERATIONS IN CENTRAL AND EASTERN EUROPEAN COUNTRIES

Jolanta PEREK-BIALAS (*Institute of Statistics and Demography, Warsaw School of Economics/Jagiellonian University Cracow, Poland*)

Introduction : Although there are a lot of publications which focus on showing the material situation of older generations in Europe, they are primarily about the industrialized Western countries of Europe. The paper offers an unique comparison the material deprivation of older generations in selected countries of Central and Eastern European countries. Aim is to identify factors which lead to material deprivation (other measure of poverty) with relation to other economic aspects of life in old age in countries of CEE. Method : Multivariate data analysis are based on the European Union Surveys of Income and Living Conditions (2007, 2008, 2009) with taking into account that samples are complex designed. Results : Single 65+ households from Czech

Republic are in the best economic situation compared to other countries while Bulgarian single 65+ households are in the worst situation. Older persons who live as couple are in much better situation in all countries than single 65+ persons. As an example in Bulgaria 54.1% of couple households with at least one 65+ person were not able to face unexpected expenses compared to 82.3% of single 65+ households from this country. The clusters of countries in which we observe the similar situation are identified. Conclusion : The results and recommendations given can help in planning and implementation of the policy aiming at fight with social exclusion (deprivation, poverty) of older persons (not only) in Europe. Older persons in various households types can benefit or could be deprived and understanding these differences and its magnitude are crucial for effective policy against poverty. Keywords : material deprivation, Central and Eastern Europe, older persons

OP27 112-R

GERIATRICS & DIGNIFIED CARE

OP27 112-R-1

THE EFFECT OF COGNITIVE TRAINING ON GAIT STABILITY: A CONTROLLED TRIAL STUDY IN THE OLDEST OLD

Jean-Paul STEINMETZ, Carine FEDERSPIEL (*Department of Research & Development, ZithaSenior, Luxembourg*)

Introduction : Recent empirical findings suggest that positive outcomes of cognitive trainings are not limited to improvements in specific cognitive functions such as attention and working memory, but may in addition contribute to the reduction of related gait disturbances. Spatial and temporal gait cycle instabilities under dual task conditions represent one major gait disturbance increasing the risk of falling in old adults. The present study investigates the influence of a structured cognitive training program on spatial and temporal gait cycle stabilities. Method : Participants are selected according to predefined inclusion criteria from a population of long-term care residents and allocated to two different groups, one training group (n=30) or one control group (n=30). Gait parameters are analysed in both groups by using an electronic walkway following a clinical protocol at three predefined intervals: before the onset of the training in the training group, after the 6-week training period, and 3 months after the training phase. Results : In the training group, we expect to find a significant reduction of spatial and temporal gait instabilities under dual task conditions after the completion of the 6-week cognitive training period. No improvements are expected to be observed in the control group. We furthermore hypothesize that the effects of the cognitive training program on attention and related gait parameters remain stable over three months after completion of the training. Conclusion : The discussion of the findings focuses on the necessity of introducing structured cognitive training programs to reduce falls in older adults. Keywords : gait stability, falls, cognitive training

OP27 112-R-2

A COMPARISON OF THE RESPONSIVENESS OF THREE PREFERENCE-BASED QUALITY OF LIFE INSTRUMENTS (EQ-5D, ICECAP-O, ASCOT) IN COMMUNITY-DWELLING FRAIL OLDER ADULTS

Karen VAN LEEUWEN¹, A.P.D. JANSEN¹, J.E. BOSMANS², R.W. OSTELO³, M.W. VAN TULDER², H.E. VAN DER HORST¹ (*1. General Practice and Elderly Care Medicine, VU University Medical Centre / EMGO Institute for Health and Care Research, Netherlands; 2. Department of Health Sciences, VU University /*

EMGO Institute for Health and Care Research, Netherlands;
3. Department of Epidemiology and Biostatistics, VU University
Medical Centre / EMGO Institute for Health and Care Research,
Netherlands)

Introduction : In economic evaluations the EQ-5D is widely used to assess health-related quality of life (hr-QoL). However, the focus on health does not correspond with current developments towards integrated health- and social care systems and with older people's experiences, who consider other aspects of life just as essential. In complex care situations involving older adults, the aim is to improve or sustain general quality of life (also referred to as 'well-being'), which includes non-health components. Two recently developed preference-based generic quality of life instruments have taken these considerations into account: the ASCOT and the ICECAP-O. We compared the responsiveness of these instruments with the EQ-5D in community-dwelling frail older adults. Method : Quality of life in 147 Dutch community-dwelling frail older adults (participants in the ACT study) was assessed using Dutch translations of the instruments and repeated after 6 months. A criterion based approach was used to analyse responsiveness; changes in quality of life as measured with the three instruments were compared with a global rating scale of change in quality of life. Results : Results about the responsiveness of the three instruments are available in March 2013. Conclusion : The results of this study show which of the three instruments is most responsive to changes in quality of life of community-dwelling older adults. Combined with the results of our further clinimetric and feasibility studies the results contribute to the selection of more relevant outcome measures for future economic evaluations in complex care settings aimed at generic quality of life, rather than hr-QoL alone. Keywords : Responsiveness, Preference-based quality of life, Economic evaluation

OP27 112-R-3

THE MEANING AND IMPORTANCE OF DIGNIFIED CARE: FINDINGS FROM A SURVEY OF HEALTH & SOCIAL CARE PROFESSIONALS

Christina VICTOR¹, Deborah CAIRNS¹, Veronika WILLIAMS², Wendy MARTIN³, Sally RICHARDS⁴, Andree LE MAY⁵ (1. School of Health Sciences and Social Care, Brunel University, United Kingdom; 2. Department of Primary Care, University of Oxford, United Kingdom; 3. School of Health and Social Care, Brunel University, United Kingdom; 4. School of Health and Social Care, Oxford Brookes University, United Kingdom; 5. School of Health Sciences, University of Southampton, United Kingdom)

Introduction : There are well established national and local policies championing the need to provide dignity in care for older people. We have evidence as to what older people and their relatives understand by the term 'dignified care' but less insight into the perspectives of staff regarding their understanding of this key policy objective. Method : A survey of health and social care professionals across four NHS Trusts in England to investigate how dignified care for older people is understood and delivered. We received 192 questionnaires of the 650 delivered; a 30% response rate. Results : Health and social care professionals described the meaning of dignified care in terms of their relationships with patients: 'respect' (47%), 'being treated as an individual' (40%), 'being involved in decision making' (26%) and 'privacy' (24%). 'Being treated as an individual' and 'maintaining privacy' were ranked as the most important components of dignified care. Physical tasks caring tasks such as 'helping with washing, dressing and feeding' were rarely described as being part of dignified care and attributed much less importance than the relational

components. Conclusion : Dignity in care is a concept with multiple meanings. Older people and their relatives focus upon the importance of providing physical care when describing what this means to them. Our participants focussed upon the relational aspects of care delivery rather than care itself. Proactive measures are therefore required to ensure that the physical aspects of care are met for all older people receiving care. Keywords : Dignity

OP27 112-R-4

POLICY REVIEW ON GERIATRIC CARE IN NEPAL

Hom Lal SHRESTHA (*Geriatric Care Policy, Advocacy and Research, Non-Smokers' Rights Association of Nepal, Nepal*)

Introduction : Nepal faces lack of geriatric care at hospital for senior citizens despite some initiative of public and private health sector since 2009. However, 2011 Nepal Census recorded 2.5 million population of old aged over 60s. There is no public health policy and provision to address geriatric care problem for senior citizens. Non-Smokers' Rights Association of Nepal was initiated pioneering effort to start Geriatric Ward at Janamaitri Hospital in August 2009 but not sustained due to misconception on geriatric medicine and lack of institutional strength. Method : The numerous data on geriatric care in medical department of very few hospitals, National Health Policy 1991, Second Long Term Health Plan (1997-2017) and National Plan of Action on Ageing 2005 and research references have rigorously been reviewed. Results : The geriatric care concern among senior most citizens are virtually ignored by the health care delivery system. The initiative of geriatric services in Geriatric Center Nepal (2010) and Patan Hospital (2011) were no more sustained due to lack of geriatric care national policy and guidelines. JP Foundation initiated establishing Senior Citizen Natural Home and Geriatric Hospital as model of public health policy advocacy device. Conclusion : The concept of Comprehensive Geriatric Assessment should be incorporated as practice of general medicine to develop geriatric care policy and system integrated into national health care delivery system. Government of Nepal (GON) must regulate to teach geriatric medicine in entire medical and nursing colleges. GON must facilitate private and public health sector to operate geriatric care center and hospital in the senior citizen communities. Keywords : geriatric, policy, nepal

OP27 112-R-5

ASIAN NEIGHBORHOODS AND THE MENTAL HEALTH OF OLDER ASIAN AMERICANS

So-young PARK¹, Duy NGUYEN¹, So-youn PARK² (1. Silver School of Social Work, New York University, USA; 2. Department of Social Welfare, College of Social Science, Kyonggi University, Korea)

Introduction : Applications of social capital theories with Asian Americans show social connections can improve health and mental health outcomes. Little research has extended the theories to older Asian Americans, who have many health, mental health, and social vulnerabilities. This study examines the relationship between social context and the depressive symptoms of community-dwelling older Asian Americans. Method : This study utilized a cross-sectional, mixed method design to collect data in partnership with community-based agencies. A semi-structured interview was used to elicit responses to questions about housing, health and mental health, and service use. Phone and in-person interviews yielded 120 completed surveys. Open ended items were analyzed qualitatively by two independent coders. In order to account for missing values, missing imputation with bootstrapping methods were used to test a multiple regression model that examined the effect of neighborhoods, social capital, and discrimination on Patient Health Questionnaire 9 scores.

Results : The results reveal the separate and unique contributions of two dimensions of neighborhood relationships. Elders living in non-Asian neighborhoods endorsed more depression symptoms, while higher levels of social capital were associated with lower depression scores. Four major themes emerged from the qualitative analysis: characteristics of neighbors, physical environment, convenience, and safety. Elders living in Asian neighborhoods expressed less satisfaction with their neighbors, and more uncertainty about their surroundings, while elders in non-Asian neighborhoods reported positive experiences with their neighbors. **Conclusion :** The social environment and role of aging in place are vitally important for elders with implications for elder housing policies, social capital theorization and mental health promotion. **Keywords :** Asians, social capital, mixed methods

OP27 112-R-6

OBESSE AND OVERWEIGHT MEN SURVIVE LONGER THAN THE NORMAL - WEIGHT AND STABLY UNDERWEIGHT MEN - A SIX-YEAR PROSPECTIVE STUDY IN 3322 OLDER PERSONS

Tung Wai AUYEUNG¹, Jenny Shun Wah LEE¹, Timothy KWOK², Jason LEUNG³, Jean WOO¹ (1. *The S. H. Ho Centre for Gerontology and Geriatrics, The Chinese University of Hong Kong, China*; 2. *Department of Medicine and Therapeutics, The Chinese University of Hong Kong, China*; 3. *School of Public Health, The Chinese University of Hong Kong, China*)

Introduction : Whether being underweight or having rapid weight loss was associated with excess mortality in old age remains controversial. Furthermore, the advantageous effect of being overweight can alternatively be explained by the biased comparison to the sicker persons who are rapidly losing weight. We therefore examined whether the advantageous effect of being overweight persisted after exclusion of rapid weight-losers. **Method :** Four thousand community-dwelling men and women older than 64 years were recruited. Their baseline BMIs were categorized into four groups: <18.5 (underweight), 18.5-22.99(normal-weight), 23-24.99(overweight), ≥25(obese), according to the Asia-Pacific definition. Those having weight loss of >10% or early death in the first two years were excluded. They were followed up for six years and their mortality status was ascertained by the Hong Kong Death Registry. The mortality rate was compared across the four groups with adjustment for age, smoking status, history cancer, COPD, stroke heart disease, hypertension and diabetes mellitus. **Results :** 1692 men and 1630 women were analyzed after exclusion of the rapid weight-losers or early deaths. The mortality across the four groups in ascending BMI was: in men, 13.1%, 10.5%, 7.0%, 6.5%, p-for-trend <0.01; in women, 5.8%, 2.2%, 3.5%, 3.3%, p-for-trend >0.05. **Conclusion :** In older men, being stably underweight was associated with excess mortality. The advantageous effect of overweight and obesity in older men cannot be accounted for by the inclusion of sicker rapid weight-losers. **Keywords:** body mass index, old age, mortality

OP27 113-S-1

THE RELATIONSHIP BETWEEN ORAL HEALTH CONDITION AND NUTRITIONAL STATUS OF THE INSTITUTIONALIZED OLDER ADULTS IN EGYPT

Rasha Ahmed FOUAD, Bothaina Hussein HASSAN (*Gerontological Nursing, Faculty of Nursing, Alexandria University, Egypt*)

Introduction : With aging of the population, the oral health and nutritional status of the elderly people have become important public health issues. Oral health and nutritional status are critical areas in the care of the elderly as they may be associated with negative effects on general health and their quality of life. **Method :** Mini-Nutritional Assessment (MNA), The Kayser-Jones Brief Oral Health Status Examination (BOHSE), and A modified version of Geriatric Oral Health assessment Index. **Results :** According to the Mini nutritional assessment score. It was noticed that, more than two fifth (43%) of the study subjects are at risk of malnutrition, nearly two fifth (39%) are malnourished, and the rest 18% had good nutritional status. According to the geriatric oral health index score it was found that, two thirds (66%) of the study subjects had poor oral health status, followed by 22% had fair oral health status, while the rest (12%) had good oral health status at the time of data collection. The majority (87.2%, 72.1%) of the study subjects who had poor oral health status are malnourished or at risk of malnutrition respectively, a highly significant difference was found (p= 0.000). On the other hand, one half (50%) of the study subjects and more than two fifth (44.4%) who had good and fair oral health condition respectively had good nutritional status. **Conclusion :** There is a significant relationship between oral health and nutritional status, as the majority of elders who had poor oral health status are malnourished or at risk of malnutrition. Moreover, a significant relationship was found between poor oral health condition and increased age. **Keywords :** oral health-nutrition - elders

OP27 113-S-2

DEVELOPMENT OF REHABILITATION MODEL FOR CHRONICALLY ILL OLDER ADULTS THROUGH FAMILY AND COMMUNITY PARTICIPATION BASED ON SUFFICIENCY ECONOMY CONCEPT AND THAI WISDOM

Pornchai JULLAMATE, Rarcharneeporn SUBGRANON, Narirat SUNGVORAWONGPHANA, Wanida NOIMONTEE, Sasithon KARUNA (*Gerontological Nursing Department, Faculty of Nursing, Burapha University, Thailand*)

Introduction : This study aimed to develop rehabilitation model for chronically ill older adults through family and community participation based on sufficiency economy concept and Thai wisdom. **Method :** One community located in Chon Buri province was selected for conducting this research. Sixty samples who were chronically ill older adults, their caregivers, community leaders, health volunteers, and community dwellers of this community were recruited. Data were gathered using four valid and reliable instruments and focus group discussion. Descriptive statistics and content analysis were performed for data analysis. **Results :** The results revealed that: 1. This suburb community consisted of 6.71 % of older adults. 2. Knowledge, attitude, and practice regarding rehabilitation in chronically ill older adults of samples obviously increased after finishing the project. 3. The proposed rehabilitation model for chronically ill older adults was a consecutively dynamic four-step process comprising of policy and rehabilitation planning, implementing, evaluating, and following up the progress and giving feedback to all steps with the participation of various sectors. Several rehabilitation strategies emerged during the study such as setting up “the instrument bank for chronically ill older adult rehabilitation and disable persons”. and training programs. **Conclusion :** The findings suggest that knowledge, attitude, family and community participation, and cooperation of all relevant persons and institutions play important components in rehabilitation for chronically ill older adults in the community. This proposed rehabilitation model should be introduced and implemented in various communities in order to strengthen the usefulness of this model. Additionally,

continuity of the rehabilitation model is also recommended for further study. Keywords : rehabilitation, family and community participation, older adults

OP27 113-S-3

HEALTHY ROUTES AND NORDIC WALKING

Elisaveta KACHAN¹, Olga MILOVIDOVA² (1. Department of demography of aging, Saint Petersburg Institute of Bioregulation and Gerontology, Russia; 2. Saint Petersburg Society of Nordic Walking, Saint Petersburg Society of Nordic Walking, Russia)

Introduction : Taking into consideration global trends of urbanization and population ageing and recognizing that active living is essential for daily living and a cornerstone of health and quality of life, we strongly believe that modern city must provide structures and services to support wellbeing and productivity of its elderly residents. Method : Walkways and cycle paths are always seen as part of a health promoting urban systems; nevertheless we should admit that there are not many adapted for elderly people. Jointly with our partners we recommend developing a system of walkways - 'healthy routes' - adapted for walking, Nordic walking, jogging and winter skiing. Nordic walking demonstrates and meets the main principles of the active living: it possesses definite advantages such as functionality, safety and availability for almost everyone; moreover it helps to involve people into the process of health maintenance as well as into the social relationships maintenance. Results : Healthy routes are designed from the point of view of the walking distances, also comprise outdoor gyms sites for aerobic warm-up exercises, being a convenient alternative to rather expensive and often-inconvenient indoor gyms, they are integrated into existing safe green spaces of the city. Conclusion : These routes are accessible and safe for elderly pedestrians and should be utilized not only for physical activity and active life style promotion, but also as a cultural platform for projects giving general information about local and city history, botany, natural sciences, arts and all other forms of activities which can be interesting for city dwellers of all ages. Keywords : healthy routes, active life style promotion, Nordic walking

OP27 113-S-5

PATIENT COGNITIVE IMPAIRMENT AND OTHER CHARACTERISTICS DO NOT INFLUENCE SHARED DECISION MAKING IN FAMILY MEETINGS FOR OLDER PEOPLE AND THEIR CARERS

Catherine MILTE¹, Julie RATCLIFFE², Owen DAVIES¹, Craig WHITEHEAD¹, Stacey MASTERS³, Maria CROTTY¹ (1. Rehabilitation, Aged and Extended Care, Flinders University Repatriation General Hospital, Australia; 2. Clinical Effectiveness Cluster, Flinders University, Australia; 3. Discipline of General Practice, Flinders University, Australia)

Introduction : Clinicians, older people and carers frequently meet to make decisions around treatment and lifestyle following an acute hospital admission. Patient age, psychological status and health locus of control influence patient preference for consultation involvement and information. However, it is not known if these characteristics and the presence of cognitive impairment influence shared decision making (SDM) competency during family meetings. Method : Family meetings (n=59) involving geriatricians, patients and carers undergoing transition care were coded using the OPTION system for measuring clinician SDM behaviour. Patients completed the geriatric depression scale and multidimensional health locus of control scale. The mini mental state exam (MMSE) assessed level of cognitive impairment. Patient and meeting characteristics associated with a

SDM communication style were explored using multiple hierarchical regression. Results : Meetings lasted 38 minutes (S.D. 13) and scored 41 (S.D. 17) out of 100 on the OPTION scale. Patient MMSE ranged from 10 to 30. The final regression model explained 48% of variance in OPTION scores (p<.001). After controlling for the geriatrician involved in the meeting, patient and meeting characteristics explained 12% of variance in OPTION scores (p=.015). Meeting length was the only significant determinant of OPTION score (beta=.413, p=.017), with higher SDM competency displayed in longer meetings. Patient characteristics, including MMSE, health locus of control and depression did not make a significant contribution to the model to explain OPTION score. Conclusion : Whilst SDM can be achieved during consultations with frail older patients and their carers, an increased consultation time is a consequence of this approach. Keywords : shared decision making, physician-patient relations, frailty

Saw Swee Hock School of Public Health, National University of Singapore Genome Institute of Singapore, A*Star, Singapore)

Introduction : Changes in length of stay (LOS) and its effect on rehabilitation outcomes for different disease groups on patients admitted for inpatient rehabilitation is not known in Asia. Method : National data were retrospectively extracted from medical records of community based inpatient rehabilitation admission. There were 12,506 first admissions for rehabilitation in four community hospitals. 40.6% were for stroke, 30.4% for fracture, 2.9% for lower limb (LL) joint-replacement, 2.3% for LL amputation, 1.9% for cancer, 1.8% for falls, 1.6% for pneumonia and 18.5% for other illnesses. The overall mean age was 73.2(SD=11.5). Results : The overall median LOS decreased by 16.2% from 37 days in 1996 to 31 days in 2005 with sharpest decline observed in LL amputation group. The overall mean admission and discharge activities of daily living scores were 45.6 (SD=25.7) and 60.3 (SD=28.9) respectively; median Rehabilitation Effectiveness(REs) was 28.8%, median Rehabilitation Efficiency(REy) was 12.9/30 days. REs increased by 184% from 14% in 1996 to 40% in 2005, REy increased by 104% from 9 units/30 days in 1996 to 19 units/30 days in 2005. Overall, 78.2% of patients were discharged home, 9.7% to nursing or sheltered homes and 10.9% to acute hospital. Conclusion : The socio-demographic profile and rehabilitation outcomes of patients varied between different disease conditions. Rehabilitation outcomes of patients admitted into Singapore's community hospitals have improved between 1996 and

2005 despite a decreasing LOS. Discharge destinations have largely remained unchanged. Keywords : Trends, Rehabilitation, Aging

**OP27 114-S-2
COPING WITH HEALTH LOSSES AND SUBJECTIVE WELLBEING**

Sara CARMEL¹, Victoria H. RAVEIS², Hava TOVEL¹ (1. Center for Multidisciplinary Research in Aging, Ben-Gurion University of the Negev, Israel; 2. Psychosocial Research Unit on Health, Aging, and the Community, New York University College of Dentistry, USA)

One of the main challenges of aging societies is maintaining quality of life despite inevitable changes in health and/or functioning. The purpose of this longitudinal study was to evaluate the relative influences of various personal resources and different patterns of coping behaviors (reactive and proactive) on elderly persons' subjective wellbeing following a decline in health/functioning. Altogether, 1,216 individuals were interviewed at baseline (T1) and 1,022 one year later (T2), a response rate of 84%. T2 wellbeing was comprised of 6 z standardized scores measuring Life satisfaction (2 scales), Morale, Self-evaluation of ageing, Depression, and Loneliness. The influence of changes in health/function, personal resources and coping patterns on T2 wellbeing was evaluated by a structural equation model, resulting in satisfying fit criteria: $\chi^2 = .741$ (df=288, $p < .01$); CFI=.954; NFI=.927; RMSEA=.043. The model explained 70% of the variability in wellbeing. In addition to indirect effects, all the studied personal resources had significant direct positive effects on wellbeing: self-efficacy ($\beta = 0.26$), functional self-efficacy ($\beta = 0.21$), social support (Carmel, $\beta = 0.15$; Berlin, $\beta = 0.10$) economic status ($\beta = 0.11$) and satisfaction with health services ($\beta = 0.11$). Among the reactive coping patterns only optimization had a positive effect on wellbeing ($\beta = 0.06$), while the proactive coping pattern of awareness of future care needs had a negative effect on wellbeing ($\beta = -0.09$). It appears that elderly people can control their wellbeing even in presence of decline in health/function by using appropriate personal resources and coping behaviors. Controlled interventions can help older people acquire and/or strengthen some of the effective resources and coping patterns, thus promoting their well-being. Keywords : subjective wellbeing, aging, personal resources

**OP27 114-S-3
A LIFE REVIEW GROUP PROGRAM FOR NURSING HOME RESIDENTS WITH SEVERE PHYSICAL IMPAIRMENT : PROGRAMME DEVELOPMENT AND FEASIBILITY TEST**

Enid Wai-yung KWONG, Mandy MA, Po Yi LUK, Pui Nam YIP, Ka Yee WONG, Ka Po WONG (School of Nursing, The Hong Kong Polytechnic University, China)

Introduction : Empirical data has supported the effect of life review on various kinds of participants except the physically impaired elderly. This study aimed to develop a life review group program specifically for Chinese nursing home residents with physical impairment and test its feasibility. Method : We identified the specific life themes for Chinese older people which enabled us to develop guiding questions and group activities for 5-section life review group programme which is culturally sensitive. In the feasibility test, we adopted mixed method which are primarily qualitative design and one-group pretest and posttest design. A group of six nursing home residents who were chair bounded voluntarily participated in the programme. Before and after completion of the programme, they were assessed life satisfaction, depressive symptoms and quality of life. Moreover, they were individually interviewed to explore their perceptions of the programme after the programme implementation. Results : The participants

welcomed the programme which was new and unique to them. They expressed that it allowed them to recall their past life events, enhanced self-exposure through peer sharing and promoted their psychological wellbeing. They were satisfied with the current lives through evaluation and integration of past experiences and willing to talk life and death issues. In their life review booklets, they expressed their wishes, appreciation and blessings to their close family members. No significant changes of the study outcomes except life satisfaction ($p = 0.034$). Conclusion : The programme is feasible to be implemented and acceptable to the participants. It is recommended to test its effect in future studies. Keywords : nursing home residents, life review, physical impairment

**OP27 114-S-4
LONGITUDINAL DYNAMICS IN INDICATORS OF FRAILTY AND LONG TERM EFFECTS ON MORTALITY AND HOSPITALIZATION RATE**

Oleg ZASLAVSKY¹, Barbara COCHRANE², Hilaire THOMPSON³, Nancy Fugate WOODS³, Jerald HERTING⁴, Andrea LACROIX⁵ (1. Department of Nursing, University of Haifa, Israel; 2. Family and Child Nursing, University of Washington, USA; 3. Biobehavioral Nursing and Health Systems, University of Washington, USA; 4. School of Sociology, University of Washington, USA; 5. Public Health Science Division, Fred Hutchinson Cancer Research Center, USA)

Introduction : Although most frail older adults develop age-related deficits affecting multiple biological systems, their clinical outcomes are not universally adverse, and they fluctuate in severity even among individuals sharing the same level of frailty initially. The aim of this study was to determine the extent to which membership in previously estimated longitudinal trajectories of individual frailty criteria predicts mortality and first incident hospitalization over 5 years of follow up. Method : We used longitudinal data from a subset of Women's Health Initiative Clinical Trial participants, ages 65+ at baseline (N=19,891). Cox proportional hazard models were used to estimate the effect of membership in longitudinal trajectories on mortality and first incident overnight hospitalization. Results : For each of the defining elements of frailty, the magnitude of risk carried by membership in particular longitudinal trajectories was closely linked to the distance from the trajectory that represented the most optimal functioning over time. Although most criterion-specific trajectories of frailty predicted mortality and first incident hospitalization independently of other baseline factors, energy/fatigue and physical activity indices has the strongest effects (range of HRs=1.09-2.26). Conclusion : In contrast to other prospective studies that measured the association between frailty-related indicators and distant outcomes, we were able to capture the effect of variability in longitudinal patterns of individual frailty criteria over a relatively long follow up period. These findings provide new and vital insights into mechanisms of frailty development. Keywords : frailty, mortality, hospitalization

**OP27 114-S-5
YEARLY TRANSITIONS OF ISO-SMAF DISABILITY PROFILES AND MEAN LENGTH OF STAY IN A PROFILE FOR OLDER PEOPLE IN LONG-TERM CARE FACILITY**

Michel RAICHE¹, Nicole DUBUC¹, Rejean HEBERT¹, N'deye Rokhaya GUEYE², Michel TOUSIGNANT¹ (1. Research Centre on Aging, Sherbrooke University Geriatrics Institute, Canada; 2. Faculty of Arts & Faculty of Sciences, Université de Saint-Boniface, Canada)

Introduction : To plan services for older people in a long-term care facility (LTCF), extensive knowledge of disability progression is

required. The objective was to analyse yearly transitions between disability profiles and mean length of stay in a profile in a LTCF. Method : Disabilities were evaluated with the 29-item SMAF covering five sectors of activity: activities of daily living (ADL), mobility, communication, mental functions, and instrumental ADL (IADL). Patients were then classified into their predominant disability profile based on the Iso-SMAF Profile case-mix classification. The 14 Iso-SMAF profiles can be grouped into four predominant disability categories: IADL profiles 1-2-3; mobility P-4-6-9; mental P-5-7-8-10; mixed and severe disability profiles 11-12-13-14. The data were analysed using a continuous-time, multi-state Markov model to estimate the matrix of probabilities for transitions into and out of each of clinical states or to death. Results : Disability profile (or death) was measured 19126 times over 8 years, in 2450 patients (mean age 81.5 years). Initial profiles were mainly in moderate to severe profiles (8 to 14). Detailed transitions matrix will be presented; from severe profiles 13-14, transitions to death were very high (0.35 and 0.42 respectively). We observed mean length of stay in a profile of 1 year for profiles 8-10-11-12, and near 1.5 year for profiles 9-13-14. Conclusion : Levels of required nursing care are already known for each of the Iso-SMAF profiles. Together with estimates of the transition probabilities -- and thus of the proportion of patients following any given trajectory, we are now able to predict nursing care requirements. Keywords : Disability profiles transitions

A SYSTEMATIC REVIEW OF FACTORS ASSOCIATED WITH INITIATING OF ADVANCE CARE PLANNING IN DEMENTIA

Jenny T. VAN DER STEEN¹, Nicole VAN UDEN², Mirjam C. VAN SOEST-POORTVLIET¹, Meertje HALLIE-HEIJERMAN³, Bregje D. ONWUTEAKA-PHILIPSEN⁴, Luc DELIENS⁴, Marike DE BOER¹, Lieve VAN DEN BLOCK², Cees M. HERTOOGH¹, Henrica C. DE VET⁵ (1. Dept. of general practice & elderly care medicine, EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 2. End-of-Life Care Research Group, Ghent University & Vrije Universiteit Brussel, Belgium; 3. Dept. of general practice & elderly care medicine (formerly), VU University Medical Center, Netherlands; 4. Dept. of Public and Occupational Health, EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 5. Dept. of Epidemiology and Biostatistics, EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands)

Introduction : Planning ahead regarding end-of-life issues may be particularly relevant in dementia considering patients' cognitive decline and difficulty to predict the course of the dementia. We aimed at identifying factors associated with initiation of advance care planning in dementia. Method : We performed a systematic review of the PubMed, Psycinfo, Cinahl, Embase and Cochrane databases until April 2011 (we present an updated review scheduled February 2013). Two researchers assessed eligibility independently and included articles reporting on empirical research, identifying factors related to: (1) starting of a discussion; (2) starting of decision making; (3) having a written advance directive. Results : Of 3803 unique articles, we assessed 143 as full-texts, and we included 25 articles. Most articles were from the US (60%), employed an exclusively qualitative design (56%), and referred to severe dementia only (52%). Perspectives varied: family (36%), clinician (20%, physicians only), patient (12%), or mixed (32%). A complexity of factors may be involved in starting

of discussions or decision making. Family factors dominated, such as families' attitudes towards planning, taking initiative, care involvement, and these could either facilitate or hinder initiating advance care planning. Other factors included patients' wishes and decline, professional caregivers' taking time and their relationship with patient or family, continuity and philosophy of care. Quantitative studies identified demographics (e.g., younger age) related to having an advance directive, but findings were inconsistent. Conclusion : Professional caregivers should initiate advance care planning and invest time in building up relationships so that strategies carefully consider timing and receptiveness, and are family- and patient-centred. Keywords : dementia, advance care planning

OP27 115-S-3
A GOOD DEATH IN RESIDENTIAL CARE HOMES FOR THE ELDERLY: A CASE STUDY

Edward Mf LEUNG, Yuk Har CHEUNG, Ka Ming CHUN (Research and Development Division, Hong Kong Association of Gerontology, Hong Kong)

Introduction : A three-and-a-half year pilot project of "Palliative Care in Residential Care Homes for the Elderly" was started in 6 residential care homes in Hong Kong in 2010. It aims to initiate holistic end of life care and a change in the practice of care of the terminally ill in residential care homes for the elderly (RHCEs), i.e. dying in the RCHEs instead of hospitals. Method : Suitable terminally ill residents were recruited to join the project to receive holistic end of life care provided by multidisciplinary professionals including Palliative Care Doctor, Palliative Care Nurse, Counseling Psychologist and Social Worker. A care protocol was implemented in order to facilitate the end of life care. A comfortable, peaceful Palliative Care Room was provided to encourage family members to stay with their loved ones. Bereavement support was also provided. Results : 10 suitable residents had joined the pilot project till June 2012. One of the cases completed the whole care pathway and a good death was happened in a RCHE, i.e. died in the Palliative Care Room fully supported by a multidisciplinary team with the co-operation with the RCHE itself. Conclusion : It was reviewed that the case's last wish was fulfilled and the family members appreciated the pilot project and the efforts from all parties. The result demonstrated the effectiveness of the care pathway and the directions in future practice. Keywords : end of life

OP27 115-S-4
FACTORS AFFECTING TERMINALLY ILL BLACK ELDERLY USE OF HOSPICE CARE

Hyunjin NOH (School of Social Work, The University of Alabama, USA)

Introduction : The underuse of hospice care by African-Americans has been witnessed for decades in the United States. Though knowledge from previous studies on barriers to African-Americans' access to, and use of, hospice care provides insight into why African-American elders might not choose to use hospice care even when they have access to it, currently there appears to be no research that has explored why some African-American elders do choose to receive such care. Method : This study addresses this gap by interviewing older African-American hospice patients to seek answers to three research questions: why do terminally ill African-American elders choose to use hospice care?; what structural barriers do they face accessing hospice care, and how have they overcome them?; and what cultural preferences do they have in receiving hospice care and what is their experience in having their preferences respected? To gain such information, face-to-face interviews were conducted using a semi-structured survey with 28

older African-American hospice patients residing in Georgia, United States. Participants' responses were analyzed using the content analysis. Results : Themes that emerged include the importance of open communication between healthcare providers and patients, the sources of correct/incorrect information, family support/non-support in choosing to use hospice care, the role of spirituality/religiosity in making the choice, and important values in receiving hospice care. Conclusion : The findings of this study have implications for hospice service providers in developing their outreach programs directed toward the African American community focusing on building a trusted relationship with the community and providing correct and detailed information about hospice care. Keywords : African American, Hospice Care

OP27 115-S-5

LONG-TERM EFFECT OF END-OF-LIFE CARE AMONG SPOUSES WHO DEALT WITH DEATH AT HOME

Yongjoo RHEE (*Health Sciences, Dongduk Women's University, Korea*)

Introduction : Background: Spouse caregivers for dying elderly face intense psychological burdens and the effect on psychological and physical well-being remains even after caregiving ends. Objective: This study examines spouses' depressive symptoms before and after end-of-life-care as well as its long-term effects. Method : Methods: Data were extracted from the Health and Retirement Study, a nationally representative US survey of community-dwelling adults age 50. The spouses of decedents who lived at homes before death were identified in EXIT surveys from 1996 to 2004. The HRS measures depressive symptoms with a short version of the standard Center for Epidemiologic Studies Depression scale (CES-D). We identified active depression (CES-D \geq 3) based on previous literature. Results : Results: Among 1335 spouses providing end-of-life care for the past ten years, 69.2 % were female and 79.4% were white. The average age was 79.1 years. Health problems included arthritis (79.1%), high blood pressure (67.4%), heart disease (34.2%), pain (33.6%), diabetes (23.0%), psychiatric problem (20.1%), cancer (17.3%), lung disease (13.1%), and stroke (10.4%). The average CES-D scores significantly increased from two years before their spouses' death (2.03) and at the time period of their spouses' death (2.87) ($p<.001$). Over half (55.3%) had active depressive symptoms at the time of their spouses' death. The rate decreased 2 years later (40.2%). However, 33.5% still reported depression after ten years. Conclusion : Conclusion: This study provides evidence of the intensity of end-of-life care and long-term effect on spouse caregivers' depressive symptoms. Keywords : end-of-life care, depression

DEMENTIA & MENTAL HEALTH

OP27 116-S-1

THE EVALUATION STUDY FOR A PILOT HOME-BASED PLUS CENTRE-BASED COGNITIVE TRAINING MODEL FOR EARLY DEMENTIA PEOPLE IN HONG KONG

Choi Ying TONG¹, Adeline TSANG¹, Danny, Yw CHAN² (*1. Integrated Elderly Care Service, Christian Family Service Centre, Hong Kong; 2. Mind-Lock Memory and Cognitive Training Centre, Christian Family Service Centre, Hong Kong*)

Introduction : Christian Family Service Centre, with the HK\$1.5 million sponsorship by the Bank of China, has started a pilot cognitive training service for early dementia people in Hong Kong since 2010, named as the Mind-Lock Cognitive and Memory Training Centre

(MCT). The MCT adopted a new service model in the Hong Kong context, which including both centre-based group training and home-based individual training in the treatment and training programmed designed by occupational therapist. In the first pilot year, more than 180 people have participated in training programmed. With the evidents of the effectiveness of this pilot project, it was also gained a grant of HK\$6.6 million from the Keswick Foundation to continue and upscale the service in October, 2012 - September, 2015. Method : A pilot pre-and-post study was conducted and 34 subjects were measured by Dementia Rating Scales (DRS), Mini-Mental State Examination (MMSE) before and after their training programme in 2010-2011. Results : The result shows significant changes in the total rating of DRS ($p < 0.02$), DRS-memory ($p < 0.001$) and MMSE ($p < 0.002$) after the subjects finished the training programme when compared to the pre test ratings. Conclusion : Participants also gave positive feedback on home-based training for the convenience and high frequency of training of the programme. Participation of Family carers were also attributed to the positive change of the subjects. The positive result in the Pilot Project shows the effectiveness of the combined model. Hence, further grants was given to continue and upscale the project. Keywords : early dementia, training, home-based

OP27 116-S-2

DO HEARING AIDS PROTECT AGAINST COGNITIVE DECLINE OR DOES HIGHER COGNITIVE FUNCTION PREDICT HEARING AID USE?

Kim M. KIELY¹, Mary A LUSZCZ², Kaarin J. ANSTEY¹ (*1. Centre for Research on Ageing Health and Wellbeing, The Australian National University, Australia; 2. Centre for Ageing Studies, Flinders University, Australia*)

Introduction : Age-related hearing loss is a risk factor for cognitive dysfunction. Hearing aids may protect against cognitive decline by enabling older adults with hearing loss to remain socially engaged and participate in cognitive reserve building activities. The present study aimed to investigate links between hearing loss, aid use and cognitive decline. Method : Two-piece linear mixed models with fixed and random effects analyzed change in perceptual speed using data from the Australian Longitudinal Study of Ageing. The sample comprised 1547 participants aged between 65 and 103 assessed on up to 5 occasions over a 16-year period. Audiometric hearing thresholds were defined by a pure-tone average (PTA) of 0.5, 1, 2 and 4 kHz. Perceptual speed was measured by the Digit Symbol Substitution (DSS) test and hearing aid use was self-reported. Results : After adjusting for socio-demographics and health, there were within-person ($\gamma = -0.12; p < .01$) and between-person ($\gamma = -0.07; p < .01$) effects of PTA on DSS test scores. There was no significant association between occasional hearing aid use and DSS ($\gamma = -0.02, p = .97$), however regular hearing aid use predicted higher levels of DSS ($\gamma = 1.70, p = .02$). Although rates of change in DSS scores trended to more gradual decline trajectories after the commencement of regular hearing aid use, this association was not significant and could not be interpreted as reliably indicating discontinuities in slope. Conclusion : Rather than protecting against cognitive decline, on the basis of this evidence it appears more likely that good cognitive function is required for older adults to properly adjust to hearing aids and gain the full benefits of hearing aid use. Keywords : Hearing Aids, Cognitive Decline, Longitudinal Research

OP27 116-S-3

A CASE STUDY - POSITIVELY ENGAGING WITH A PERSON WITH FRONTOTEMPORAL DEMENTIA (FTD)

Karen Ellen BOROCHOWITZ (*Management, Dementia SA a national*)

South African NGO Providing Support, Counselling, Education, Awareness, Collaborative Research and Training. We also advocate for the rights of people with dementia, South Africa)

Introduction : Frontotemporal Dementia (FTD) is often a mis-understood and often mis-diagnosed dementia. A person with fronto temporal dementia often exhibits a host of complex and challenging behaviours which need to be understood. **Method :** This is a case study which will illustrate how a more integrated approach with family, care staff and the person with FTD, provides enhanced purpose and meaning into interactions with their environment. The use of inclusion, participation, positive communication and a person-centered approach all help add value to the well-being of a person with FTD and a decrease in behaviour that challenges. **Results :** Results in practical applications and tasks which included observation, active participation, communication, preferences and inclusion. **Conclusion :** A very rewarding case study that contributed significantly to the family and to the well-being of a person with FTD which included the development of skills for carers at a residential care facility. **Keywords:** dementia, fronto-temporal, case-study

OP27 116-S-4

THE IMPACT OF DEPRESSIVE SYMPTOMS ON THE RELATIONSHIP BETWEEN PERCEIVED CONTROL AND HEALTH-RELATED QUALITY OF LIFE DIFFERS BETWEEN OLDER AND YOUNGER PATIENTS WITH HEART FAILURE

Kyoung Suk LEE¹, Terry A. LENNIE², Seongkum HEO³, Sandra DUNBAR⁴, Susan J. PRESSLER⁵, Debra K. MOSER² (1. School of Nursing, University of Wisconsin-Madison, USA; 2. College of Nursing, University of Kentucky, USA; 3. College of Nursing, University of Arkansas Medical Science, USA; 4. School of Nursing, Emory University, USA; 5. School of Nursing, University of Michigan, USA)

Introduction : High perceived control is positively associated with health-related quality of life (HRQOL) in patients with heart failure (HF). Given that depressive symptoms are associated with perceived control and HRQOL, depressive symptoms may be an underlying factor in the relationship between perceived control and HRQOL. As younger HF patients are more depressed and have worse HRQOL than older patients, the association among depressive symptoms, perceived control, and HRQOL may differ between younger and older HF patients. **Purpose:** To determine whether the relationship between perceived control and HRQOL was mediated by depressive symptoms and whether the relationships differ between younger and older HF patients. **Method :** A total of 402 community dwelling patients with HF (62±12 years, 45% > 65 years, 32% female) completed the Control Attitudes Scale-Revised, Minnesota Living with HF Questionnaire, and Beck Depression Inventory-II to measure perceived control, HRQOL, and depressive symptoms, respectively. We conducted path analyses stratified by two age groups (age > vs. ≤ 65 years). **Results :** Perceived control was indirectly associated with HRQOL via depressive symptoms among older patients. However, perceived control in younger patients had neither direct nor indirect effects via depressive symptoms on HRQOL. **Conclusion :** Depressive symptoms mediated the relationship between perceived control and HRQOL in older HF patients but not younger patients. As older adults tend to focus on emotional aspects of situations and prioritize emotion-focused over problem-focused coping, being depressed may be more detrimental to HRQOL in older patients than younger patients. Therefore, different approaches by age are needed to improve HRQOL. **Keywords :** health-related quality of life , depressive symptoms , perceived control

OP27 116-S-6

AGEISM AND MENTAL HEALTH AMONG KOREAN ELDERS

Heeran CHUN¹, Il-Ho KIM² (1. Faculty of Health Science, Jungwon University, Korea. 2. Social and Epidemiological Research Center for Addiction and Mental health, University of Toronto, Canada)

Introduction : Although respecting older people was traditionally considered as commonplace in family and society, getting older in modern Korea is often associated with unpleasant experiences of personal and institutional age related discrimination, commonly known as Ageism. This study aims to examine how Korean elders experienced age discrimination and how this relates to mental health. **Method :** Data was gathered from a convenient sample of 256 people aged 60-89 via face-to-face interviews. Age discrimination was measured using a 20 item questionnaire from 'The Ageism Survey' by Palmore. Mental health included symptoms of depression. **Results :** Half of the respondents reported having experienced ageism 'more than once' in all 20 listed situations. The prevalence of Ageism and sub-group characteristics appeared to show a different picture compared to the results in the USA by Palmore's: with men (vs. women), people with higher education (vs. lower), and people with lower income (vs. higher) reporting higher level of ageism. Furthermore, the ageism experience increased the risk of having symptoms of depression, with the association still significantly consistent even after adjusting for socio-demographic characteristics by OR 1.17 (95%CI 1.07-1.29). **Conclusion :** This study supports the positive associations between Ageism and poorer mental health among older Koreans, suggesting extended cross-cultural research would be beneficial. **Keywords :** Ageism, Mental health, South Korea

OP27 118-B-1

AMINO ACIDS EXTENDS CHRONOLOGICAL LIFESPAN IN YEAST SACCHAROMYCES CEREVISIAE

Ziyun WU, Shao Quan LIU, Dejian HUANG (Chemistry, National University of Singapore, Singapore)

Introduction : Dietary restriction (DR) was found to extend lifespan from yeast to primates and delay the onset of aging-associated diseases. However, recent studies suggested that dietary composition but not dietary restriction plays a key role for longevity in higher organisms. In yeast aging studies, DR reflects in glucose restriction exclusively to extend chronological and replicative lifespan significantly. **Method :** Taking the advantage of yeast chronological aging model, we use a high throughput assay to quantitatively measure chronological lifespan in a number of media with different amino acids and glucose composition. **Results :** Our data shows that the ratios of essential amino acids and nonessential amino acids change yeast lifespan obviously. For individual amino acids, restriction of methionine or increase of glutamic acid prolongs lifespan significantly in normal condition and can further increase lifespan in DR condition. Interestingly, medium with low methionine and high glutamic acid extends longevity greatly, and also further increases lifespan in DR condition. Furthermore, buffered medium (pH 6.0) with restriction of methionine and glucose plus increase of glutamic acid extends yeast lifespan tremendously. **Conclusion :** Altogether, our findings demonstrate that amino acids composition change lifespan significantly. Methionine, glutamic acid, glucose, pH neutralization have strongly synergetic effect on yeast longevity through distinct mechanisms. Thus, this study would help to fill a gap in yeast model

for the fast developing view that nutrient balance could be a possibility to extend lifespan, and the remarkable longevity effect of methionine and glutamic acid merits the future investigation of their anti-aging activity in higher organisms. Keywords : Chronological lifespan, methionine, glutamic acid

OP27 118-B-2

MECHANISM OF CHRONOLOGICAL LIFESPAN EXTENSION BY CRYPTOTANSHINONE IN BUDDING YEAST SACCHAROMYCES CEREVISIAE

Ziyun WU¹, Shao Quan LIU¹, Dejian HUANG² (1. Food Science and Technology Programme, National University of Singapore, Singapore; 2. Food Science and Technology Programme, National University of Singapore Suzhou Institute, China)

Introduction : Cryptotanshinone, a major active constituent isolated from the roots of *Salvia miltiorrhiza* Bunge (Danshen), possesses multiple biological activities relevant to late-life diseases, such as stroke, Alzheimer disease, atherosclerosis, cancer, inflammatory, obesity and type 2 diabetes, by targeting regulation of several signaling pathways that are highly conserved in multiple species, such as the mammalian target of rapamycin (mTOR), AMP activated protein kinase (AMPK), and phosphatidylinositol 3-kinase (PI3K) pathways. Method : We report a highly conserved mechanism of lifespan extension by cryptotanshinone in budding yeast chronological aging model. Using a high throughput assays developed in our lab, we measured the lifespan extension activity of cryptotanshinone. Results : The three Danshen compounds, cryptotanshinone, tanshinone IIA and tanshinone I, have no synergetic effect on yeast longevity through similar mechanisms. Our findings demonstrate that essential amino acid sufficiency, and three conserved protein kinases Tor1, Sch9 and Gcn2 are required for cryptotanshinone induced longevity. In addition, cryptotanshinone increases lifespan of SOD2 deletion mutant significantly, suggesting that it mediates ROS stress protection. Conclusion : Altogether, genetic epistasis analyses indicate one mechanism that cryptotanshinone involves regulation of Tor1-Sch9-Gcn2-Sod2, a highly conserved longevity pathway modulated by nutrients from yeast to human, to extend CLS greatly at relatively low concentrations. Thus, the evolutionarily conserved mechanism merits the future investigation of anti-aging activity of cryptotanshinone in higher organisms. Keywords : yeast, chronological lifespan, cryptotanshinone

OP27 118-B-3

VITAMIN D INSUFFICIENCY AND MILD COGNITIVE IMPAIRMENT IN OLDER ADULTS

Cedric ANNWEILER¹, Cyrille LAUNAY¹, Bruno FANTINO¹, Anne-Marie SCHOTT², Gilles ALLALI³, Olivier BEAUCHET¹ (1. Geriatrics, Angers University Hospital, France; 2. Department of Medical Information, Lyon University, France; 3. Neurology, Geneva University, Switzerland)

Introduction : Low serum 25-hydroxyvitamin D (25OHD) concentrations have been associated with dementia. The association with mild cognitive impairment (MCI) has not yet been explored. The objective of this cross-sectional study was to examine the association between vitamin D insufficiency and MCI status among older community-dwellers with subjective memory complaint. Method : Ninety-five nondemented Caucasian community-dwellers with subjective memory complaint (mean age 71.1±6.4years; 54.7%female) included in the GAIT study, were divided into 2 groups according to Winblad et al. consensus criteria (i.e., subjects with MCI, or cognitively healthy individuals [CHI]). Vitamin D insufficiency was

defined as serum 25OHD concentration < 75nmol/L. Age, gender, body mass index, number of comorbidities, education level, Mini-Mental State Examination (MMSE) score, Frontal Assessment Battery (FAB) score, Geriatric Depression Scale (GDS) score, creatinine clearance and season tested were considered as potential confounders.

Results : Compared to CHI (n=52; mean age 72.7±7.0years; 71.2% female), MCI patients (n=43; mean age 71.4±5.6years; 34.9% female) had lower mean serum 25OHD concentrations (P=0.006) and presented more often with vitamin D insufficiency (P=0.010). In addition, increased serum 25OHD concentrations were associated with a lower risk of MCI (adjusted odds ratio=0.96, P=0.002), and vitamin D insufficiency was associated with MCI status (adjusted odds ratio=4.50, P=0.039). Conclusion : Low 25OHD concentrations were associated with MCI status in the studied sample of older nondemented community-dwellers with subjective memory complaint. Keywords : vitamin D; mild cognitive impairment; older adults; neuroendocrinology

OP27 118-B-4

SUPEROXIDE OVERPRODUCTION BY NADPH OXIDASE AND MORTALITY IN COMMUNITY-DWELLING OLDER ADULTS

Gregory BAPTISTA¹, Nils KUSTER², Julie LANO², Anne Marie DUPUY², Ernestine FERREIRA¹, Jean Paul CRISTOL², Claude JEANDEL¹ (1. Geriatrics, University Hospital of Montpellier, France; 2. Biochemistry, University Hospital of Montpellier, France)

Introduction : Indirect markers of oxidative stress have been associated to mortality in older women, but there is no data about free radicals. Method : Between 2003 and 2009, 500 community-dwelling older adults in Southern France were included in this study. Inclusion criteria were age above 60 years. Non-inclusion criteria were systemic inflammatory disease. Comorbidity index (CIRS-G) were evaluated for all subjects. Superoxide anion production by NADPH oxidase (NOX) was evaluated using a lucigenin-based chemiluminescence method. Results : Median age was 80.9 ± 9.1 years old. Median follow-up was 3.8 years. Among the 500 patients included in the study from 2003 to 2009, 155 had died by the end of 2009. At baseline those who died compared to survivors, were older (p <0.001), more often male (p <0.001), had a higher CIRS-G (p <0.001), a lower albumin (p <0.001), a lower total and LDL cholesterol (p = 0.004 and p = 0.001 respectively), had higher biological parameters of inflammation (p = 0.015 for orosomucoid, p = 0.035 for fibrinogen), a higher creatinine and homocysteine (p = 0.003 and p = 0.004 respectively), as well as a greater blood superoxide anion production (p = 0.006). In multivariate analysis, factors independently related to all-cause mortality in our population were age (p <0.001), male gender (p <0.001), CIRS-G (p = 0.027), albumin (p = 0.001), fibrinogen (p = 0.017), hemoglobin (p = 0.06) and blood production of superoxide anion by NADPH oxidase (p = 0.03). Conclusion : Superoxide overproduction by NOX was found to be independently associated with mortality in older adults. Keywords : oxidative stress, mortality, NADPH oxidase

OP27 118-B-5

MITOCHONDRIAL PEPTIDES IN AGING AND LONGEVITY

Pinchas COHEN (School of Gerontology, USC Davis, USA)

Introduction : Mitochondria contain >1000 nuclear proteins, but the mitochondrial-chromosome only encodes 13 proteins. Humanin; a novel 24AA peptide encoded from the 16S rRNA region of the mtDNA is a potent neurosurvival factor shown to be cytoprotective and metaboloprotective in vitro and in vivo, in models of aging-related diseases. Method : We developed a humanin ELISA assay and

demonstrated that humanin declines with aging and its levels are altered in states of insulin resistance, endothelial-dysfunction and neurodegeneration. Results : In vivo administration of humanin reverses pathological processes involved with diabetes, atherosclerosis and Alzheimer's disease. We recently identified an additional six peptides encoded from ORFs within the 16S rRNA, which we named SHLPs (small humanin-like peptides). Analysis of their expression reveals that they are transcribed in the mitochondria from mtDNA, are detectable in plasma, and exhibit tissue-specific distribution and age dependency. SHLPs 1-5 act as potent bioactive molecules acting to induce cell protection and ROS inhibition (like humanin, via activation of Erk and Stat3 phosphorylation) but with different temporal profiles, suggesting that these peptides may act in concert. SHLP6 has opposing actions, potentially inducing apoptosis. Conclusion : These observations reveal that the mitochondria possess previously unappreciated roles in the regulation of metabolism and apoptosis that occur via the synthesis of mitochondrial-derived peptides (MDPs). We propose that the mitochondrial peptidome could explain important new aspects of mitochondrial biology and dysfunction with relevance to human biology and disease and that the novel MDPs we describe here may represent retrograde communication signals from the mitochondria that are critical to the aging process. Keywords : mitochondria, longevity, humanin

OP27 119-S **HOUSING & ENVIRONMENT & TECHNOLOGY I**

OP27 119-S-1 **CREATING ENABLING ENVIRONMENTS IN RURAL RESIDENTIAL AGE CARE SETTINGS: AN AUSTRALIAN EXAMPLE**

Sandra DAVIS (*Palliative and Supportive Services, Flinders University, Australia*)

Introduction : Much work has been done to move to more domestic, familiar physical environments in residential aged care settings in Australia. This paper examines to what extent rural aged care providers understand the principles of enabling environments for people with dementia and how knowledge and appropriate resources are used when developing environmental improvements. Method : Thirteen rurally based aged care homes, varying in size, participated in improving environments with funding from the Victorian Department of Health. Evidence-based guidelines and tools were provided to support homes to develop projects creating more enabling environments. Proposals were reviewed in relation to findings from the Environmental Audit Tool (EAT), created to assess the quality of residential environments for people with dementia. A self-complete survey provided information about staff perspectives of enabling environments. Onsite expert support was provided over six months. Results : The majority of proposals for change received from facilities did not target issues within the environments identified in audit as priorities. Very few homes used the guidelines or audit tools provided to develop their proposal. Those homes who accessed expert advice and used evidence based resources to develop proposals were more effective in targeting and completing their improvements. Most utilised post proposal design assistance but few used support to implement staff education and practice change improvements. Conclusion : Tools and resources for creating enabling environments are poorly used by rural aged care homes and have limited effectiveness alone in facilitating appropriate improvements. Choices made are frequently on the basis of organisational effectiveness or staff preferences, not therapeutic value. Keywords : long term care, enabling environments

OP27 119-S-2 **PASSIVE OR ACTIVE CONSUMERS?: ACCESSING PRIMARY HEALTH CARE SERVICES AS A CARE HOME RESIDENT**

Christina VICTOR¹, Claire GOODMAN², Angela DICKINSON³, Susan DAVIES³, Kathryn FROGGATT⁴, Hazel MORBEY⁴, Masey HELEN¹, Steve ILIFFE⁵, Wendy MARTIN¹, Heather GAGE⁶ (*1. School of Health Sciences & Social Care, Brunel University, United Kingdom; 2. Centre for Primary Care, University of Hertfordshire, United Kingdom; 3. Centre for Primary and Community Care Research, University of Hertfordshire, United Kingdom; 4. Faculty of Health, University of Lancaster, United Kingdom; 5. Department of Primary Care & Population Science, University College, London, United Kingdom; 6. Department of Economics, University of Surrey, United Kingdom*)

Introduction : Much research in care homes in the United Kingdom focuses upon enumerating the nature of the health and social care needs of residents; evaluating specific interventions such as fall prevention; or describing the nature and composition of the care home work force. There is much less focussing upon the experiences of older people living in care homes, how they view their health, and how they access primary care and other health services when needed. Method : Using data from the case study phase of a three year study of integrated working between care homes and health services we focus upon the experiences of 39 residents across 6 care homes who were followed up for a year. This involved reviewing residents' notes (127 reviews) and interviewing them up to 3 times (87 interviews in total) about their health care needs, how they access primary care services if required, and their daily experiences of the care home. Results : Participants were aged from 65 to 101 years and had lived in the care home for 1 month to 11 years. Conclusion : Relying upon staff to call for a GP or arrange other primary health care visits could represent both a 'passive' loss of control but also an 'active' expectation that care staff are paid to both monitor residents' health needs and make appropriate arrangements. Our data showed evidence of both narratives and these findings indicate the importance of including the voice of residents in care home research. Keywords : Care home

OP27 119-S-3 **POLISH OLDER ADULTS' PERCEPTIONS ABOUT PHYSICAL ACTIVITY AND OPPORTUNITIES IN THEIR LOCAL ENVIRONMENT. QUALITATIVE STUDY**

Alina ZUREK¹, Grzegorz ZUREK² (*1. Dept. of Psychology, University of Wroclaw, Poland; 2. Dept. of Biostructure, University School of Physical Education, Poland*)

Introduction : Some reports from various researches present psychophysiological benefits resulting from undertaking physical activity (PA) by the elderly. It appears, however, that a lifestyle full of physical exercise doesn't enjoy much popularity among Polish elders. Thus, the reasons for which many elderly persons choose sedentary lifestyle are immensely interesting, as well as the possible ways of helping them change their habits and become physically active. The researchers have been realizing two aims: 1) to ascertain the types of PA and the way it's viewed by residents of retirement homes; 2) to observe the opportunities of the local environment to motivate them to undertake PA. Method : The participants of the research were 20 residents of retirement homes in Poland. The method used was the structuralized interview by Chodzko-Zajko (2009) examining the perception of PA and the local environment, and its influence on undertaking PA by the elderly. Results : Physical activity is equated by Polish elders from retirement homes with physical work. An active

person is the one who e.g. cultivates a garden, cleans, cooks, knits. A physically active person is also the one who spends free time out in the fresh air being active, e.g. going for a walk. The local environment is perceived by elders as not very effective in motivating them to be physically active. The only trigger for undertaking various activities is one's inner motivation. Conclusion : Physical activity understood as doing physical exercise is not a form of spending their free time looked for and undertaken by Polish elders from retirement homes. Keywords : physical activity, local environment, older adults

OP27 119-S-4

COOL TOWNS FOR THE ELDERLY - PROTECTING THE HEALTH OF ELDERLY RESIDENTS AGAINST URBAN HEAT

Franz KOLLAND, Anna WANKA (*Department of Sociology, University of Vienna, Austria*)

Introduction : The 2003 heat wave in Europe resulted in 70,000 deaths. Particularly at risk were socially isolated persons over the age of 65 years. Predicted climate changes will increase the health risk for the elderly in the future. The STOPHOT project explores how to reduce their vulnerability against heat stress. Method : Using a standardised questionnaire, a telephone survey was conducted (summer 2011). 400 subjects (>65y) living in four different residential area types in Vienna were interviewed. Face-to-face interviews with residents of retirement homes (n=200) and 15 in-depth interviews with stakeholders were carried out. Results : Older people adjust their behavior during a heat wave mainly by wearing lighter clothes, increasing liquid intake and staying indoors during daytime. Heat primarily affects the elderly's energy balance. Most frequently mentioned conditions are fatigue (58%) and sleeping problems (48%). High-risk groups are persons with a lower socio-economic status and activity level and poor health condition. This group is also more likely to withdraw from the public for the duration of the hot periods. Factors increasing the likeliness to stay at home are a disadvantaged neighborhood, dissatisfaction with and lack of neighborhood networks and age discrimination in the residential area. Conclusion : The elderly are particularly vulnerable towards heat stress. With urban populations ageing, and urban temperatures rising, design of urban areas must consider the interaction of social and climatic factors to become an age-friendly city. Heat is an environmental factor which is not natural and unchangeable. Resilience and individual coping strategies have to be supported by community-planning initiatives. Keywords : Heat stress, Urban areas, Resilience

OP27 119-S-5

ACCESS AND USE OF THE OUTDOOR ENVIRONMENT BY OLDER PEOPLE WITH OA: RESULTS FROM THE EUROPEAN PROJECT ON OSTEOARTHRITIS

Suzan VAN DER PAS¹, Laura SCHAAP¹, Sanne WIEGERSMA², Maria Victoria CASTELL³, Michael DENKINGER⁴, Elaine DENNISON⁵, Nancy PEDERSEN⁶, Stefania MAGGI⁷, Dorly DEEG¹ (*1. Epidemiology & Biostatistics, VU University Medical Center EMGO Institute for Health & Care Research - LASA, Netherlands; 2. Partoer, Social Economic Research Bureau, Netherlands; 3. Department of Preventive Medicine and Public Health, Unit of Primary Care and Family Medicine Faculty of Medicine Universidad Autonoma de Madrid, Spain; 4. AGAPLESION Bethesda Clinic, University of Ulm, Germany; 5. MRC Lifecourse Epidemiology Unit, University of Southampton Southampton General Hospital, United Kingdom; 6. Department of Medical Epidemiology & Biostatistics, Karolinska Institute, Sweden; 7. Department of Medical and Surgical Sciences, University of Padova, and National Research*

Council (CNR), Aging Branch Institute of Neuroscience, Italy)

Introduction : The aims of the present study were to examine cross-country differences in the access and use of the outdoor environment in relation to clinical OA at different sites, and to examine the mediating effects of physical functioning. Method : The European Project on OsteoArthritis (EPOSA) is a six-cohort study (Germany, Italy, the Netherlands, Spain, Sweden and the United Kingdom (UK)) on community-dwelling persons aged 65 to 85 years. Clinical hand, hip and knee OA was assessed using ACR criteria, and functional limitations were measured with the physical function subscale of the WOMAC and AUSCAN. Four items from the Home and Community Environment (HACE) instrument were used to assess access and use of the outdoor environment. Results : Of the 2816 participants, 19% had knee OA, 6% had hip OA and 17% had hand OA. There was more access to parks and walking areas, places to sit and rest, and public transport in the Netherlands and Sweden, and less access to these outdoor resources in Italy. Persons with knee or hip OA in the Netherlands, Sweden and the UK make less use of parks and walking areas, and more use of places to sit and rest. Functional limitations seem to mediate the association between OA and use of the environment. Conclusion : OA is associated with use of the outdoor environment. Countries that have more environmental resources enable more use of the environment. Having access to resources such as places to sit and rest are important to be able to deal with functional limitations caused by OA. Keywords : Outdoor environment, Osteoarthritis, Physical functioning

OP27 119-S-6

ENSURING ENABLING AND SUPPORTIVE REGIONAL TOWN CENTRES

Catherine Elizabeth BRIDGE (*City Futures Research Centre, The University of New South Wales, Australia*)

Introduction : The NSW Department of Family and Community Services funded the Regional Town Centres iPad application to explore new ways of understanding and engaging older people in developing age-friendly environments in NSW. This research conducted in 2012 set out to understand from the perspective of older persons what physical features in a regional town centers best supports its older residents adaptive capacity and wellbeing outcomes by provision, appropriate design, construction and maintenance of its town centre infrastructure. Method : Two regional councils were partnered with to pilot the iPad application with four small groups of older people aged over 60 years (the average age was 68 years). Within each town centre two walk and talk groups were conducted using the specially developed GPS iPad application to evaluate its age-friendliness. Results : The iPad application captured all the good, bad and ugly features of the built environment from the perspective of the older persons. The data gathered was displayed as histograms and on a google map, which allowed users to zoom in and out. The five point score allocated to every entry was then translated to a specific colour marker for visualisation and ease of integration. The data gathered can then be filtered according to which session the data was collected on, the object type and the score of each comment. Conclusion : Positive feedback from older people and councils across NSW now means that wider adoption of the system is being explored. Comments about potential fall and trip hazards were in the majority (54%), with issues such as inappropriate slopes (18%) and the need for improved road crossings (20%) being common. Further analysis revealed changes in materials, poor maintenance or obstructions were often causal issues. Keywords : age-friendly, streetscape, mapping technology

OP27 120-S
SUCCESSFUL AGING & SOCIAL SUPPORT

OP27 120-S-1
RURAL HEALTHCARE THROUGH PATIENT-DOCTOR E-COMMUNICATION AND E-SUPPORT GROUP PARTICIPATION

Younsook YEO¹, Eunjeong KO², Sue LEVKOFF¹ (1. College of Social Work, University of South Carolina, USA; 2. School of Social Work, San Diego State University, USA)

Introduction : Despite documented disparities stemming from limited quality healthcare, limited financial resources, and transportation barriers, little is known about rural older adults' online activities regarding healthcare needs. This study aims to examine the prevalence of the digital divide in (1) accessing the Internet, (2) patients' e-communication with doctors, and (3) e-support group participation between rural and urban adults aged 50 or older, and examine factors associated with these activities among rural older adults. **Method :** Multivariate logistic regression was estimated using nationally representative data collected in 2005 and 2008 by the National Cancer Institute for the Health Information National Trends Survey. **Results :** Rural older adults were significantly less likely than urban counterparts to access the Internet ($\exp(b)=1.44$, $p<.001$), even after controlling for socio-demographics. However, once they became wired, no significant difference in patient-doctor e-communication was observed between rural and urban internet users. Rural older adults were somewhat more likely than their urban counterparts to attend e-support groups ($\exp(b)=1.66$, $p=0.06$), after controlling for other covariates. Rural internet users tend to be non-Hispanic whites, educated, and higher income earners, who are frequent healthcare users and overweight. Both e-support group participants and patient-doctor e-communicators among rural internet users tend to be U.S.-born non-Hispanic whites who discuss online health information with doctors. **Conclusion :** Rural older adults lagged far behind in access to the Internet. However, once they became Internet users, they actively attended e-support groups and patient-doctor e-communication. However, the digital divide still exists even among rural older adults. Policy level changes are needed to reduce this digital divide. **Keywords :** successful aging, online healthcare resource, digital divide

OP27 120-S-2
FACTORS ASSOCIATED WITH SUCCESSFUL AGING: A STRUCTURAL EQUATION MODELING APPROACH

Hao LUO¹, Xiaomei PEI¹, Dale YEATTS² (1. Sociology, Tsinghua University, China; 2. Sociology, University of North Texas, USA)

Introduction : Successful aging is multidimensional, encompassing physical, mental and social well-being in older age. Its core is to distinct between primary and secondary aging in later life. By identifying factors associated with successful aging, interventions can be made to identify, prevent and reverse functional losses associated with usual aging. **Method :** Based on the data collected from the pilot survey of the China Health and Retirement Longitudinal Study (CHARLS), we assess the prevalence of successful aging in China's aged people and identify the factors associated with it using a structural equation modeling (SEM) approach. The differences between men and women as well as urban and rural elderly are estimated using the multiple group comparison technique. **Results :** We show that, although multiple logistic regression was routinely used to assess the predictors of successful versus usual aging, SEM provides an elegant alternative in this area. **Conclusion :** In the end, we discuss procedures for redressing common problems and

misunderstandings in the application of SEM procedures, focusing on the distributional characteristics of the measures, the choice of appropriate estimation method and the chi-square goodness-of-fit test. **Keywords :** successful aging, structural equation modeling, CHARLS

OP27 120-S-3
LAY VS. RESEARCHER CONCEPTUALISATIONS OF SUCCESSFUL AGEING: A SYSTEMATIC REVIEW

Theodore David COSCO¹, Jaime PERALES², Blossom STEPHAN³, Carol BRAYNE¹ (1. Public Health & Primary Care, University of Cambridge, United Kingdom; 2. Parc Sanitari Sant Joan de Deu, Universitat de Barcelona, Spain; 3. Institute of Health and Society, Newcastle University, United Kingdom)

Introduction : Despite having been used in a gerontological context for more than half a century, "successful ageing (SA)" has not been operationalised in a universally accepted definition. Definitions and conceptualisations of SA vary dramatically from study to study. However, there are generally two groups from which conceptualisations of SA stem: researchers and laypersons. **Method :** The current study compares two systematic reviews: quantitative operational definitions of SA and themes developed through exploratory studies of layperson perspectives of SA. **Results :** Results from the reviews reveal marked differences in the conceptualisations of SA between researchers and the "real world." Qualitative studies generally have greater multidimensionality and more emphasis on psychosocial aspects of SA, such as resilience and coping. Conversely, quantitative studies contain fewer components that are generally biomedically focused, such as physical functioning/disability and the presence of illness. The vast majority of included studies were conducted in North America and the UK using non-clinical populations, resulting in limitations on the generalisability of SA conceptualisations beyond these Anglophone contexts. **Conclusion :** Future SA research needs to be explicit about the geographic and cultural scope, focussing on the pragmatic application and societal value of definitions of SA. **Keywords :** successful ageing, operational definitions, layperson

DEVELOPMENT AND VALIDATION OF THE MALAYSIAN ELDERLY WELLNESS INDEX

Tengku Aizan HAMID¹, Rahimah IBRAHIM², Yadollah ABOLFATHI MOMTAZ¹, Mohmad SALLEH³, Siti Sa'adiyah HASSAN NUDIN⁴, Zaitun YASSIN⁵, Siti Aisyah NOR AKAHBAR⁶ (1. Social Gerontology, Institute of Gerontology, Universiti Putra Malaysia, Malaysia; 2. Social Gerontology, Institute of Gerontology, Malaysia; 3. Family Health Development Division, Ministry of Health Malaysia, Putrajaya, Malaysia; 4. Institute for Health Behavioural Research, Ministry of Health Malaysia, Malaysia; 5. Department of Nutrition and Dietetics, Faculty of Medicine & Health Sciences, Universiti Putra Malaysia, Malaysia; 6. Medical Gerontology, Institute of Gerontology, Universiti Putra Malaysia, Malaysia)

Introduction : As the population is aging, more attention is being paid to assess older adults' wellness. However, there is a lack of suitable and validated assessment tools. The major aims of the present study were to develop and evaluate an assessment tool that would meaningfully assess the various components of wellness in older persons. **Method :** The data for this study, consisting of 2541 community dwelling elderly people, were obtained from the national wellness survey entitled "Determinants of Wellness among Older Malaysian: A Health Promotion Perspective" conducted in 2010. SPSS 20 was used to assess the internal consistency of wellness

index and its domains. Confirmatory factor analysis was conducted using AMOS 20 to assess the construct validity. Results : The confirmatory factor analysis showed the six factor model with 26 items had a good fit with the latent constructs (CMIN=5.0, RMR = 0.006, GFI = 0.955, AGFI = 0.944, NFI = 0.944, RFI = 0.935, IFI = 0.954, TLI = 0.947, CFI = 0.954, RMSEA = 0.042). The Cronbach's alpha value of the wellness index was 0.82. The internal consistency for the six domains also showed acceptable to high reliability. All indicators significantly and substantively loaded on their corresponding latent constructs ($p \leq .01$). Conclusion : This study conceptualized and supported the wellness index as a multi-dimensional model consisting of cognitive, receiving support, providing support, physical functioning, environmental, and financial components. The findings showed that the proposed model of wellness might serve as a useful theoretical and empirical tool for future research. Keywords : Aged; Malaysia; Measurement Model; Wellness

OP27 120-S-5

YOUR LIFE YOUR WELLBEING: EVALUATING THE IMPACT OF COMMUNITY AGED CARE SERVICES

Sarah FOGG¹, Saul FLAXMAN¹, Tomasz SITEK¹, Anne CHAMBERLAIN² (1. *Social Policy and Research, The Benevolent Society, Australia*; 2. *Community Services, The Benevolent Society, Australia*)

Introduction : In addition to providing support that enables older people to remain living their homes, community aged care services are increasingly providing more holistic care which takes into account older people's social and emotional wellbeing. Despite anecdotal observations that service use positively impacts on clients wellbeing, there is currently a substantial evidence gap around the impact of community aged care. Method : The Benevolent Society, an Australia not-for-profit organisation, has embarked on an evaluation to assess the impact of their community aged care services on clients' wellbeing. A mixed methods longitudinal evaluation involving 21 community care programs across Sydney examined aspects of client wellbeing such as psychological distress, social isolation, autonomy and control as well as positive and negative aspects of being engaged in a caring role. The presentation client wellbeing as they begin to receive services, and how this changes over 12 months. Results : The results focus on the prevalence of social isolation among clients, and the relationship between this and other aspects of wellbeing such as physical and mental health. Results from qualitative interviews with clients (which investigated the mechanisms through which community care services and external factors impacted on wellbeing) are also reported. Conclusion : Finally, the presentation focuses on the methodological challenges in implementing a large scale evaluation through a partnership of the internal evaluator and community care practitioners, and the opportunities such a partnership provides in applying the knowledge gained through the evaluation towards positive practice change and advocacy in the policy sphere. Keywords: Wellbeing, Not for profit, Social

OP27 120-S-6

IMPACT OF ICT-BASED INTERVENTIONS ON FAMILY CAREGIVERS: A CROSS-ANALYSIS OF 54 GOOD PRACTICES IN EUROPE

Francesco BARBABELLA¹, Andrea SCHMIDT², Carlos CHIATTI³, Giovanni LAMURA¹ (1. *Centre for Socio-Economic Research on Ageing, National Institute of Health and Science on Aging (INRCA), Italy*; 2. *Health and Care Programme, European Centre for Social Welfare Policy and Research, Austria*; 3. *Scientific Direction, National Institute of Health and Science on Aging (INRCA), Italy*)

Introduction : Information and communication technologies (ICTs) have gained an increasing relevance for delivering innovative care and support services for dependent older people and their family caregivers. Although ICT-based interventions can vary remarkably in terms of functions, target users, operational aspects and technologies used, little knowledge is available concerning their implementation and impact in Europe, a gap that the CARICT project (<http://is.jrc.es/pages/EAP/eInclusion/carers.html>) has tried to fill. Method : 54 ICT-based interventions addressing needs of older people or their family caregivers have been identified in 12 European countries through internet search, literature review and expert interviews. Reports have been delivered for each case studied, and cross-analysed to better understand their potential impact at micro, meso and macro level. Results : Little evidence was found for positive outcomes at micro-level, including improvements in users' health-related quality of life and social inclusion. At meso-level, implementation of 1st/2nd generation telecare contributes to reduce hospitalization and institutionalization rates of older users, as well as to cost savings for local care providers. At macro-level, only one intervention shows concrete effects on a larger scale through a targeted program evaluation, while most ICT-based interventions do not use any tool to assess their impact, and can thus demonstrate only technology acceptance or users' satisfaction. Conclusion : The lack of relevant evidence at all levels, as well as difficulties in comparing and generalising results, strongly urge practitioners to improve impact assessment methodologies and researchers to develop a better general framework of ICT potentials at a conceptual, theoretical and methodological level in this area. Keywords : ICT, caregiver, older people

WORK, LABOR AND EMPLOYMENT II

OP27 121-S-1

AGEISM AT WORK AND ITS IMPACT ON HEALTH, JOB SATISFACTION AND LABOR FORCE PARTICIPATION

Ernest GONZALES¹, Lisa MARCHIONDO² (1. *George Warren Brown School of Social Work, Washington University in St. Louis, USA*; 2. *Department of Psychology, Wayne State University, USA*)

Introduction : A large body of research has examined how racism and sexism impacts health and work. Scant evidence has examined ageism. Given the burgeoning of an aging workforce, we aim to examine how ageism impacts health, job satisfaction, and work/retirement expectations and behaviors. Selective incivility theory guided this investigation. Method : Data were drawn from the Health and Retirement Study. Inclusion criteria were working full-time in 1998, participated in every wave between 1998 and 2008, and completed information for all variables of interest: ageism, labor force status and expectations, job satisfaction, health, and control measures; resulting in a sample of 5,909. Bivariate, logistic and time-pooled fixed effects regressions were utilized both cross-sectionally and prospectively. Results : Higher levels of ageism were reported by men, non-Caucasians, lower educated and those who were young-old. Ageism was strongly and positively related to indicators of mental health (felt depressed, everything an effort, sleep was restless, felt lonely, not happy, felt sad, couldn't get going, not enjoyed life) as well as the global mental health measure (CESD). Ageism was positively associated with job dissatisfaction, expectations to stop working all together during retirement, reduce hours or become self-employed; there was a trend to change employment. Conclusion : Effects of ageism go beyond not being promoted, hired, or trained; it effects health, job satisfaction and informs work-retirement plans.

Interventions in the workplace are needed to reduce ageism within the workplace. Such interventions may promote healthy lives and, in turn, lead to working in advanced ages. Keywords : ageism, older workers

OP27 121-S-2

AGE-MANAGEMENT MEASURES AND THE IMPACT ON WORKABILITY, MOTIVATION AND PICTURES OF AGEING - FINDINGS FROM A GERMAN SURVEY

Gerhard NAEGELE (*Gerontology, TU Dortmund University, Germany*)

Introduction : In the course of demographic trends, older workers will continue to gain importance for economy and society. Findings show, that German staff executives primarily ascribe practical knowledge, work ethics, quality awareness, loyalty, theoretical knowledge and mental capacity to older employees; teamwork, creativity, flexibility, willingness or ability to learn on the other hand is more likely seen among younger employees (Bellmann 2008, IW Koln 2009). Method : The paper will present key results from an own recent and representative German survey which was realized in a project financed by the Federal Ministry of Family, Senior Citizens, Women and Youth in 2010. Results : The paper will focus on: - age-management measures from the perspective of older workers - pictures of ageing in German companies from the perspective of older workers and of managers - the impact of age-management measures of workability, motivation and satisfaction. Conclusion : Also a conclusion and transfer to Korean background will be drawn. Keywords : Age management, Workability, Pictures of Ageing

OP27 121-S-3

THE PROBLEMS AND ADVANTAGES OF OLDER WORKERS

Audrey GUY (*Business, Law and Government, University of Canberra, Australia*)

Introduction : The encouragement of older people to stay in the workforce can benefit three groups: older people themselves, the labour market and the national economy. This can only be successful if the very different needs of these groups are addressed; in particular the specific needs of older people. Method : Research using Australian data suggests that there is an unmet demand for work amongst older people including the unemployed and the underemployed. The mismatch between employers wanting experienced workers and insufficient work may be the result of employers failing to recognise the different needs and advantages associated with older workers. Older people often require a shorter working week and flexible hours, particularly those with commitments such as carer responsibilities. Some prefer irregular or home based work. They are less interested in promotion and higher wages. They can offer reliability and company loyalty and are less likely to seek other work, attributes which are beneficial to the employer. The older employee gains other advantages such as companionship, both within the workplace and through work related functions, and retains a sense of purpose in their lives. It gives them a position in society and the self esteem associated with this. Results : The financial aspect from the employees' viewpoint is largely in the hands of government. The amount of taxation and loss of superannuation entitlements can be manipulated by government departments and need to be seen to be beneficial by the employee. Conclusion : All three groups stand to gain from older people's participation in the workplace. Keywords : Older workers

OP27 121-S-4

AGEING PRODUCTIVELY: LONGITUDINAL PATTERNS

AMONG OLDER AUSTRALIANS

Vanessa LOH¹, Hal KENDIG² (*1. Ageing, Work and Health Research Unit & CEPAR, The University of Sydney, Australia; 2. Centre for Research on Ageing, Health and Wellbeing & CEPAR, The Australian National University, Australia*)

Introduction : Population ageing, increasing longevity, and economic uncertainty have generated global concern for economic and social sustainability in both developed and developing countries. In Australia, there is increasing policy attention to maintaining productivity through continuing participation of older adults in paid work and other productive activities including volunteering, caregiving, and household work. This paper examines ways in which various forms of productivity changed for older Australians between 2002 and 2010. Method : The analysis is based on three waves (2002, 2006, and 2010) of longitudinal data obtained for 3,729 individuals aged 45 to 68 in 2002 from the Household Income and Labour Dynamics in Australia (HILDA) survey. Results : We found that productive engagement, particularly in less formalised, non-market-based activities such as volunteering, caregiving, and household work, remains prevalent amongst Australians in mid- to later-life, with the majority indicating involvement in multiple activities concurrently. However, time spent on productive activities is highly variable and exhibits an overall decline as people age. There appears to be a trend towards more productive ageing with the most recent cohorts showing greater engagement and less decline over time, particularly in paid work, as they move through the same age groups as earlier cohorts. Conclusion : These findings are discussed in the context of Australian policy initiatives addressing older people's continuing contributions in both the workforce and wider community including those outlined in the Government's Intergenerational Report (2010) and the 2012 Government Response to the Final Report on the Economic Potential of Seniors. Keywords : productive contributions, paid and unpaid work, ageing policy

OSTEOPOROSIS

OP27 122-C-1

ASSOCIATION OF FONG AND THSD7A GENES WITH THE PREVALENCE OF VERTEBRAL FRACTURE IN 2427 CONSECUTIVE AUTOPSY CASES

Heying ZHOU¹, Seijiro MORI¹, Ikuyo KOU², Noriyuki FUKU³, Makiko MIENO³, Tomio ARAI³, Motoji SAWABE³, Masashi TANAKA³, Shiro IKEGAWA², Hideki ITO¹ (*1. Center for Promotion of Clinical Investigation, Tokyo Metropolitan Geriatric Hospital, Japan; 2. Laboratory for Bone and Joint Diseases, Center for Genomic Medicine, RIKEN, Japan; 3. Department of Genomics for Longevity and Health, Tokyo Metropolitan Institute of Gerontology, Japan; 4. Department of Medical Informatics, Center for Information, Jichi Medical University, Japan; 5. Department of Pathology, Tokyo Metropolitan Geriatric Hospital, Japan*)

Introduction : We previously reported 2 osteoporosis-susceptibility genes, formiminotransferase N-terminal sub-domain containing gene (FONG) and thrombospondin, type 1, domain-containing 7A (THSD7A), in which we identified 2 common single-nucleotide polymorphisms (SNPs), rs7605378 (FONG) and rs12673692 (THSD7A). The former was associated with a predisposition to osteoporosis and the latter with bone mineral density. To further elucidate the importance of these polymorphisms in the pathogenesis of osteoporosis, we examined their association with the incidence of vertebral fracture. Method : DNA extracted from the renal cortex of

2427 consecutive Japanese autopsies (1331 men, mean age: 79 years; 1096 women, mean age: 82 years) were examined in this study. The presence or absence of vertebral fracture during each subject's lifetime was determined by a thorough examination of the clinical records as well as autopsy reports. Results : After adjustments for sex and age at autopsy, logistic regression analysis revealed that homozygotes for the risk alleles of rs7605378 (A-allele) or rs12673629 (A-allele) possess an increased risk of vertebral fracture. The subjects simultaneously homozygous for both the risk alleles of rs7605378 (AA genotype) and rs12673629 (AA genotype) showed significantly higher risk of vertebral fracture (odds ratio 2.401, 95% confidence interval 1.305-4.416, $P = 0.0048$) than those who had at least 1 non-risk allele of either rs7605378 (AC/CC genotypes) or rs12673629 (AG/GG genotypes). Conclusion : Japanese subjects homozygous for the risk alleles of rs7605378 and rs12673629 may have a higher risk of vertebral fracture. Keywords : FONG, THSD7A, vertebral fracture

OP27 122-C-2

EFFECTS OF KNEE EXTENSOR MUSCLE STRENGTH ON THE INCIDENCE OF OSTEOPENIA AND OSTEOPOROSIS AFTER SIX YEARS

Yasumoto MATSUI¹, Marie TAKEMURA¹, Atsushi HARADA¹, Fujiko ANDO², Hiroshi SHIMOKATA³ (1. Department of Orthopedic Surgery, National Center for Geriatrics and Gerontology, Japan; 2. Department of Health and Medical Sciences, Aichi Shukutoku University, Japan; 3. Department for Development of Preventive Medicine, National Center for Geriatrics and Gerontology, Japan)

Introduction : The association of knee extensor muscle strength with bone mineral density (BMD) has been reported in cross-sectional epidemiological studies, but it remains unclear whether or not this is the case with longitudinal change. Thus, we investigated whether or not the knee extension strength can predict the incidence of osteopenia or osteoporosis after 6 years, then compared the difference between sexes. Method : Subjects were 1255 community-dwelling Japanese men and menopausal women, aged 40-81 years. BMD of lumbar spine and femoral neck was assessed by dual-energy X-ray absorptiometry (DXA) twice at 6-year intervals. Subjects were divided into three groups, normal, osteopenia, and osteoporosis, depending on their YAM (young adult mean BMD) % value. Longitudinal analyses were conducted to determine the odds ratio, controlled for age and BMI, given that those who were normal in the initial stage developed osteopenia after 6 years, for every 1 SD increase in knee extension strength, as well as those who first had osteopenia and then developed osteoporosis. Results : The longitudinal analysis showed the clear effect of muscle strength on the loss of BMD in the femoral neck but not in the lumbar spine. The effect differed by gender, affecting the early stage of bone loss in men (OR 0.56, 95% CI 0.37-0.67, $p < 0.01$) and the late stage in women (OR 0.65, 95% CI 0.44-0.96, $p < 0.05$). Conclusion : The results suggest the importance of knee extension strength to maintain the bone health of the proximal femur in aging. Keywords : Longitudinal epidemiological study, Knee extensor strength, Bone mineral density

OP27 122-C-3

ALL-CAUSE AND CAUSE-SPECIFIC MORTALITY AFTER HIP FRACTURE AMONG CHINESE WOMEN AND MEN: THE SINGAPORE CHINESE HEALTH STUDY

Gerald Choon-Huat KOH¹, Bee Choo TAI², Li Wei ANG³, Derrick HENG⁴, Jian Min YUAN⁵, Woon Puay KOH⁶ (1. Saw Swee Hock School of Public Health, National University of Singapore, Singapore; 2. Saw Swee Hock School of Public Health, National University of Singapore, National University Health System, Singapore;

3. Epidemiology and Disease Control Division, Ministry of Health, Singapore; 4. Public Health Group, Ministry of Health, Singapore; 5. Department of Epidemiology, University of Pittsburgh Graduate School of Public Health, USA; 6. Duke-NUS Graduate Medical School, Singapore)

Introduction : To determine all-cause and cause-specific mortality risk in the first 5 years after hip fracture in an Asian Chinese population. Method : The Singapore Chinese Health Study is a population-based cohort of 63,257 middle-aged and elderly Chinese men and women in Singapore recruited between 1993 and 1998. This cohort was followed up for hip fracture and death via linkage with nationwide hospital discharge database and death registry. As of 31 December 2008, we identified 1,166 hip fracture cases and matched five non-fracture cohort subjects by age and gender for each fracture case. Cox proportional hazards and competing risks regression models with hip fracture as a time-dependent covariate were used to determine all-cause and cause-specific mortality risk, respectively. Results : Increase in all-cause mortality risk persisted till five years after hip fracture [adjusted hazard ratio, aHR=1.58 (95% CI:1.35-1.86) for females and aHR=1.64 (95% CI:1.30-2.06) for males]. Men had higher mortality risk after hip fracture than women for deaths from stroke and cancer up to one year post-fracture but women with hip fracture had higher coronary artery mortality risk than men for five years post-fracture. Men had higher risk of death from pneumonia while women had increased risk of death from urinary tract infections. There was no difference in mortality risk by types of hip fracture surgery. Conclusion : All-cause mortality risk persisted for 5 years after hip fractures in men and women. There are gender-specific differences in effect size and duration of excess mortality risk from hip fractures between specific causes of death. Keywords : Hip Fracture, Mortality, Chinese

OP27 122-C-5

COMPARISON OF FRAX, GARVAN AND QFRACTURE TOOLS IN PREDICTING FRACTURE RISK IN PATIENTS ATTENDING OSTEOPOROSIS CLINICS

Tahir MASUD, Jenny THAIN, Darren AW, Aamer ALI, Thanda AUNG, Wei CHUA, Opinder SAHOTA, Namal WEERASURIYA, Lyndsey MARSHALL, Fiona KEARNEY (Geriatric Medicine, Nottingham University Hospitals NHS Trust, United Kingdom)

Introduction : FRAX, Garvan and QFracture are commonly used web-based fracture prediction tools used to help guide management decisions in osteoporosis. This study compared fracture prediction between these three tools in women attending osteoporosis clinics. Method : Clinicians used a questionnaire to collect information required to populate the three tools in women attending osteoporosis clinics from which 10 year fracture predictions were calculated and compared. FRAX and Garvan, unlike QFracture, allow for inclusion of femoral-neck bone density. Effect of falls on fracture prediction was explored for Garvan and QFracture (FRAX does not include falls history). Results : 106 women (mean age=69.1years,SD=12.4) were studied. 34.9% were fallers, 73.6% had prevalent fractures and 66.0% were osteoporotic at any site (hip or spine, $T < -2.5$). The mean 10 year any (major) fracture risks in percentage (95% CIs) for FRAX, Garvan and QFracture were 18.3% (10.9-25.7), 46.4% (35.6-57.3) and 12.1% (5.5-18.7) respectively. The mean 10 year hip fracture risks were 7.1% (2.2-12.0), 29.1% (19.1-39.1) and 6.0% (1.2-10.8) respectively. There was a significant difference in the mean 10 year any fracture risk between non-fallers versus fallers using the Garvan tool [39.4% vs 63.7%; $p < 0.001$] whereas QFracture was unable to distinguish between the groups [12.0 vs 12.4%; $p = 0.8$]. Conclusion : Compared to

FRAX, the Garvan tool grossly overestimated risk of any and hip fractures. QFracture underestimated risk of any fractures compared to FRAX, although hip fracture prediction was similar. Only Garvan predicted a higher fracture risk in fallers. Clinicians should be aware of the differences and variations in fracture prediction between the web-based tools. Keywords : Fracture prediction FRAX

OP27 122-C-6

RISK FACTORS FOR COMPLICATIONS OF OSTEOPOROSIS IN OLDER PEOPLE

Gabriel - Ioan PRADA¹, Ioana ALEXA², Raluca NACU³, Eliza TAPELEA³, Speranta Petria PRADA³, Irina IGNAT³, Ioana FITA¹ (1. Clinical Department, Ana Aslan National Institute of Gerontology and Geriatrics, and Carol Davila Univ. of Medicine, Romania; 2. Clinical Department of Geriatrics, Gr.T. Popa University of Medicine and Pharmacy, Romania; 3. Clinical Department, Ana Aslan National Institute of Gerontology and Geriatrics, Romania)

Introduction : Osteoporosis is one of the most frequent diseases encountered in older people, its prevalence increasing with age. The objective of this study was to identify risk factors that enhance the odds of having osteoporosis complications in older people. Method : We performed a retrospective case-control study on 628 patients consecutively admitted to our clinical departments. We included 297 subjects (16% males and 84% females) in study group ('case') and 331 patients (24% males and 76% females) in control group. Age range in control group was 50 to 64 years, and in study group was \geq 75 years. Results : Advance age, decreased mineral bone density, altered vision and equilibrium disorders were main risk factors for fractures in general (Odds Ratios 0.69, 0.63, 0.51, 0.39, respectively). Sedentary life style was most important risk factor for neck femur fracture (Odds Ratio 0.61), the lowest importance having high alcohol consumption (Odds Ratio 0.21). Hypocalcaemia (Odds Ratio 0.35) and low dietary calcium (Odds Ratio 0.26) are risk factors for vertebral and Pouteau-Colles fractures, irrespective of age. Smoking is most important factor for all types of fractures (0.48). Most important for Pouteau-Colles fractures was orthostatic hypotension (0.42) and it was a lesser important risk factor for femur neck fractures (0.21). The latter were more prevalent in females ($p < 0.01$), while vertebral fractures were more prevalent in men ($p < 0.05$). Conclusion : An early diagnostic and a careful follow-up of risk factors for complications in older people with osteoporotic fractures will improve survival and increase quality of life. Keywords : osteoporosis, complications, risk factors

THE INTEGRATED SYSTEMATIC CARE FOR OLDER PEOPLE (ISCOPE)-STUDY

Jeanet BLOM, Wendy DEN ELZEN, Anne VAN HOUWELINGEN, Margot HEIJMANS, Jacobijn GUSSEKLOO (Public Health and Primary Care, Leiden University Medical Center, Netherlands)

Introduction : The number of older people with a combination of somatic, functional, mental or social problems is rising. The problems these older people are struggling with are not always known to care-providers. Although a pro-active way of working by GPs is advocated, the feasibility and cost-effectiveness is yet unknown. Aim: The introduction of a structural monitoring system to detect older people of ≥ 75 years with a combination of functional, somatic, mental or social problems (complex problems). For those with complex problems a

care plan is executed. Method : Design: cluster randomised trial. Population: all older persons of ≥ 75 years in 59 general practices. Questionnaire: contained 4 domains (functional, somatic, mental and social). For participants with problems on ≥ 3 domains general practitioners (GPs) made a care plan using a functional geriatric approach. The care plan incorporated indicated diagnostic strategies, interventions, medication review, home care, social work or bringing together caregivers involved. The GPs in the control group continued care as usual. Outcome measures: competence to perform ADL independently, quality of life, satisfaction with delivered care, process measures, cost-effectiveness of the intervention. Results : The questionnaire was sent to 11,617 persons. Response rate 62.7 % ($n=7285$, mean age 81, 61% female). Twenty-six percent ($n=1,921$) of the respondents had problems on ≥ 3 domains. For 225 randomly chosen persons with complex problems in 30 GP practices a care plan was made. Some 600 participants with complex problems were followed in usual care. Conclusion : Details of the screening procedure and outcomes of the ISCOPE strategy will be presented. Keywords : pro-active care, general practice, screening

OP27 123-C-2

GLOBAL APPLICATION OF FINDINGS FROM A SYSTEMATIC REVIEW OF TRANSITIONAL CARE FOLLOWING HOSPITALIZATION FOR ACUTE STROKE OR MYOCARDIAL INFARCTION

Janet Prvu BETTGER (School of Nursing, Duke University, USA)

Introduction : Globally, myocardial infarction (MI) and stroke are the leading causes of death and the third and fourth leading causes of disease burden, respectively. Older adults experiencing these acute events are rarely living without co-morbidities and are significantly more likely to require multiple strategies of care to prevent adverse outcomes as they transition from the hospital back home. The purpose of this study was to describe 'transitional care' interventions for older adults and for patients hospitalized with acute stroke or MI, the evidence for their benefit or harm, and the opportunity to translate these findings with the availability of different health care resources. Method : Of the 5783 citations identified, 62 articles representing 44 studies of transitional care (27 acute stroke and 17 MI) from 16 countries met inclusion criteria. Results : A transitional care taxonomy for stroke and MI was developed to guide future program development, research and evaluation of the four intervention types that emerged: hospital-initiated support ($N=14$), patient and family education ($N=7$), community-based support ($N=20$), and chronic disease management ($N=3$). Overall, evidence suggests hospital-initiated support reduces hospital length of stay for stroke patients and mortality for MI patients. There was insufficient evidence and significant heterogeneity across studies for other intervention types. Secondary review of transitional care models found effective for other chronic conditions further enhanced the taxonomy. Conclusion : While the importance of transitional care is recognized, evidence of the effectiveness for MI and stroke is limited. The existing literature establishes a foundation for continued research and evaluation of practice-based interventions around the globe. Keywords : transitional care, systematic review, research translation

OP27 123-C-3

VISITING HEALTH CARE SERVICE'S EFFECTS ON GERIATRIC DEPRESSION AND FRAILTY IN KOREAN ELDERLY GROUP

Young Ji KIM, Soongnang JANG, Gui Ok JUNG (College of Nursing, Chung Ang University, Korea)

Introduction : As geriatric people are rapidly increasing in Korea, frailty and depression are important health issues in elderly group. Visiting Health Care Service(VHCS)'s goal was to deliver sustained long-term care and to improve elderly health status. Previous studies have only examined limited topics not effect of comprehensive services. The objective of this study is to identify the effect of VHCS to geriatric depression and frailty in elderly group in Korea. **Method :** The design for this study was retrospective descriptive. We used data for approximately 50,000 elderly people in Seoul. Data were collected from 2008 to 2011 by visiting nurses. The level of depression was measured by an GDS-15 and the level of frailty was captured by an instrument developed by the Japanese Ministry of health. **Results :** 17.50% of the elderly were considered moderate or severe depression and 18.86% of subjects were considered frail elderly. Using a logistic regression analysis from 2008 to 2011, results show a decreasing linear trend in odds ratios (OR) for depression and it was statistically significant(OR=.827 95% CI =.819-.835,p<.0001). There was also a decreasing linear trend in OR for frailty and it was statistically significant(OR=.777, 95% CI =.770 -.784, p<.0001). **Conclusion :** Results show a decreasing linear trend in depression and frailty in elderly group received long-term visiting health care service by visiting nurses. We expect visiting health care service is helpful for decreasing depression and frailty in Korean elderly group. **Keywords :** visiting health care service, geriatric depression, frailty.

OP27 123-C-4

HOME-BASED CASE MANAGEMENT FOR FRAIL OLDER PEOPLE (+65): EFFECTS ON HEALTHCARE UTILISATION

Magnus SANDBERG¹, Jimmie KRISTENSSON², Patrik MIDLOV¹, Ulf JAKOBSSON¹ (1. Department of Clinical Sciences, Malmo, Lund University, Sweden; 2. Department of Health Sciences, Lund University, Sweden)

Introduction : The aim was to investigate the effects of a home-based case management intervention for frail old people (+65) on healthcare utilisation. **Method :** The design was a randomised controlled trial (n=153) with participants randomly assigned to either intervention (n=80) or control group (n=73). The one year case management intervention comprised home visits made by a nurse and a physiotherapist. Group differences concerning in and outpatient care were investigated for 12-6 and 6-0 months before, and 0-6 and 6-12 months after baseline. **Results :** In the intervention group there was a significantly lower mean number of emergency department visits that did not lead to hospitalisation 6-12 months after baseline compared with the control group (0.08 vs. 0.37, p=0.041). For the same period the proportion of total emergency department visits leading to hospitalisation was significantly higher in the intervention group than in the control group (83.3 vs. 53.1%, p=0.012). There was a significantly lower mean number of total contacts with a physician in private outpatient care 0-6 and 6-12 months after baseline in the intervention group compared to the control group (1.01 vs. 1.71, p=0.050; 0.88 vs. 1.70, p=0.005). No significant differences were found for inpatient care. **Conclusion :** The case manager intervention in the present study seems to have some effect on healthcare utilisation, especially on contacts with physicians in outpatient care. The effect seen on emergency department visits, where those in the control group were not hospitalised to the same extent suggesting that the control group may not been as well monitored. **Keywords :** Case management, Frail elderly, Healthcare utilisation

AN ANALYSIS OF THE REFERRAL PATTERN OF PATIENTS REFERRED TO AN POST-DISCHARGE SUPPORT

PROGRAM IN HONG KONG

Edmund Kwok Yiu SHA, Elaine Yee Lan CHENG, Edward Man Fuk LEUNG (Medicine & Geriatrics, United Christian Hospital, Hong Kong)

Introduction : Integrated Discharge Support Program is a pilot program launched in Hong Kong from 2008 till 2011 to plan and support the discharge of high risk elderly from the hospital. The aim of the program is to support elderly patients to settle in their own homes and reduce unplanned hospital readmission upon hospital discharge. **Method :** Under the program, a hospital based Discharge Planning Team had been set up to provide comprehensive geriatric assessment to high risk elderly patients admitted to acute hospital in Hong Kong and formulate discharge care plan according to the needs of elderly patients. High Risk Elderly Patients were selected according to their admission problem like stroke or hip fracture, or according to the risk prediction of HARRPE, and also high risk patients identified by medical and nursing colleagues in ward. **Results :** The present paper analyzes the referral pattern of 8896 patients recruited into the IDSP (Integrated Discharge Support Program) from Mar 2008 to Sept 2011. Findings include the demographic pattern of the referral, their social support network, the medical condition, risk indicators and their post-discharge readmission pattern. **Conclusion :** The Integrated Discharge Support Program is effective in supporting frail elderly patients on discharge from hospital. **Keywords :** Discharge Support Program

OP27 123-C-6

DEMENTIA: A POPULATION HEALTH APPROACH

Melinda MARTIN-KHAN¹, Catherine TRAVERS², David LIE³ (1. Centre for Research in Geriatric Medicine, University of Queensland, Australia; 2. Centre for Research in Geriatric Medicine, School of Medicine, University of Queensland, Australia; 3. Centre for Trauma, Loss & Disaster Recovery, Metro South Mental Health, Queensland Health, Australia)

Introduction : The increasing prevalence of dementia poses enormous social, health and economic challenges. In the absence of a cure, strategies to prevent, delay the onset of, or reduce the impact of dementia are required to contain a growing disease burden, and health and care costs. A population health approach has the potential to substantially reduce the impact of dementia. The aim of this study was to examine elements of a comprehensive population health strategy and barriers to its implementation. Study outcomes have implications at national and jurisdictional policy development levels. **Method :** International dementia frameworks and strategies were reviewed to identify existing approaches for a population health focus on dementia. **Results :** Dementia frameworks are being developed that include population health approaches. Eight relevant frameworks were identified: Australia, United Kingdom, Scotland, Wales, France, Netherlands, Norway and South Korea. Common elements included early diagnosis and intervention, and increasing community awareness as key objectives. Some frameworks also included a promotion of the links between a healthy lifestyle and reduced risk for dementia. The central theme of quality of care and post-diagnostic support were common in several national strategies although whole-of-community approaches to dementia were lacking. Important enablers of population health approaches to dementia include financial mechanisms, workforce development, health systems change, information development, partnership arrangements and overall governance. **Conclusion :** A limited evidence base (especially for illness prevention), diagnostic and technical limitations, and policy and implementation issues are significant barriers in maximising the potential of population health approaches in this area. **Keywords :**

HIGHER PULSE WAVE VELOCITY IN ELDERLY ALGERIAN AS COMPARED TO EUROPEAN WOMEN OF THE SAME AGE

Ghassan WATFA¹, Mohamed TEMMAR², Laure JOLY¹, Anna KEARNEY-SCHWARTZ¹, Youcef MERABIA³, Bensalah SELT⁴, Mustapha YAHIA⁵, Paolo SALVI⁶, Michel SAFAR⁷, Carlos LABAT⁸, Athanase BENETOS¹ (1. *Geriatrics, University Hospital of Nancy, France*; 2. *Cardiology, Cardiology Centre, Algeria*; 3. *Cardiology, El Menia Hospital, France*; 4. *Health, Directorate of Health, Algeria*; 5. *Diabetology, Diabete Center, Algeria*; 6. *Cardiology, IRCCS Istituto Auxologico Italiano, Italy*; 7. *Diagnosis and Therapeutic Center, Paris Descartes University & AP-HP, France*; 8. *Inserm, U961, Faculty of Medicine, France*)

Introduction : Increased arterial stiffness (AS), is an independent predictor of cardiovascular risk of particular interest in the elderly populations. Most of the existing studies regarding the AS have been performed in industrial countries while few or no data are available in emergent populations. We aimed to compare AS, as evaluated by carotid-femoral pulse wave velocity (cfPWV) in an Algerian elderly population to an age and gender-matched European population. **Method :** 321 Algerian subjects aged 81.1 ± 4.9 years and 321 age and gender-matched Europeans subjects aged 80.8 ± 5.2 years, were included. All underwent measurement of cfPWV. **Results :** Algerian subjects had higher cfPWV values (14.9 ± 3.3 m/sec) than their European counterparts (13.4 ± 3.1 m/sec) ($p < 0.00001$) even after adjustment for age, gender, body mass index, heart rate (HR), mean blood pressure (MBP) and diabetes. This difference was mainly due to a higher PWV in Algerian women (14.9 ± 3.4 m/sec) as compared to European women (12.7 ± 2.7 m/sec); $p < 001$. In both populations, age, MBP and HR and presence of diabetes were positively associated with cfPWV, whereas female gender was inversely associated with cfPWV only in the European population. **Conclusion :** Elderly Algerian women thus have higher PWV in as compared to elderly European women. Higher BP and HR, metabolic factors and socioeconomic conditions may explain at least in part the increased arterial stiffness observed in elderly Algerian women. Interventions in this emerging population should be a priority in order to address these risk factors by acting on current lifestyle. **Keywords :** Aging, arterial stiffness, ethnicity

Introduction : The aim of the longitudinal PARTAGE study was to determine the predictive value of blood pressure (BP) and pulse pressure amplification, a marker of arterial function, for overall mortality (primary endpoint) and major cardiovascular (CV) events, in subjects over 80 years living in nursing home. Assessment of pulse indices may be important in the evaluation of the cardiovascular risk in very elderly frail subjects. **Method :** A total of 1126 subjects (874 women) were enrolled (mean age 88 ± 5 y), living in French and Italian nursing homes. Central (carotid) to peripheral (brachial) pulse pressure (PP) amplification (PPA) was calculated with the help of an arterial tonometer. Clinical and 3-day self-measurements of BP were conducted. During the 2-year follow-up, 247 died and 228 had major CV events. **Results :** The PPA was a predictor of total mortality and major CV events in this population. A 10% increase in PPA was associated with a 24% ($p < 0.0003$) decrease in total mortality and a 17% ($p < 0.01$) decrease in major CV events. Systolic BP, diastolic BP or PP were either not associated or even inversely correlated with total mortality and major CV events. **Conclusion :** In very elderly individuals living in nursing homes, low PPA from central to peripheral arteries strongly predicts mortality and adverse effects. Assessment of this parameter could help in risk estimation and improve diagnostic and therapeutic strategies in very old, polymedicated persons. In contrast, high BP is not associated with higher risk of mortality or major CV events in this population. **Keywords :** blood pressure, elderly, mortality, nursing home, pulse pressure amplification

IMPLICATIONS OF MICROVASCULAR DISEASE IN AGE-RELATED FUNCTIONAL LOSS AND DISABILITY

Dae H. KIM¹, Anne NEWMAN², Paulo CHAVES³, Kushang PATEL⁴, Ronald KLEIN⁵, Mark SARNAK⁶, Lewis LIPSITZ¹ (1. *Division of Gerontology, Department of Medicine, Beth Israel Deaconess Medical Center, Harvard Medical School, USA*; 2. *Department of Epidemiology, University of Pittsburgh, USA*; 3. *Department of Medicine, Florida International University, USA*; 4. *Department of Anesthesiology and Pain Medicine, University of Washington, USA*; 5. *Department of Ophthalmology, University of Wisconsin, USA*; 6. *Department of Medicine, Tufts Medical Center, USA*)

Introduction : The burden of vascular disease is associated with age-related functional loss and disability. However, the implications of microvascular disease, as compared with macrovascular disease, remain poorly understood. **Method :** We conducted a prospective cohort study among 2452 participants (mean 79 years) in the Cardiovascular Health Study who had available measures of microvascular disease (brain, retina, and kidney) and macrovascular disease (brain, carotid, coronary, and peripheral artery) in 1996-1999. The summary index was created for each disease and examined cross-sectionally for cognitive function, physical function, and mood; and prospectively for mortality until 2009 and active life expectancy in 2005-2009, defined as number of days with < 3 activities of daily living dependencies. **Results :** The majority of participants had

evidence of predominantly microvascular (9%), predominantly macrovascular (37%), or both (42%). Compared with participants with minimal disease, those with microvascular disease had lower cognition and more depression symptoms, whereas those with macrovascular disease had lower cognition and slower gait only when microvascular disease coexisted. Both microvascular (range: 0-10) and macrovascular disease (0-12) indices predicted mortality (hazard ratios: 1.25 and 1.10 per unit increase, respectively; $p < 0.001$ for both). In quantile regression, the negative impact of microvascular disease on the 25th percentile of active life expectancy seemed stronger in the presence of advanced macrovascular disease (extensive - minimal microvascular disease: -39, -83, or -171 days for minimal, modest, or extensive macrovascular disease, respectively; $p < 0.001$ for interaction). Conclusion : The burden of microvascular disease appears to be more important than macrovascular disease in maintaining functional independence in advanced age. Keywords : Microvascular Disease, Disability, Successful Aging

PREVALENCE AND CHARACTERISTICS OF MAJOR VASCULAR DISEASES OF ELDERLY MEN IN THE INCHEON AREA

Insoo PARK¹, Il Yong SHIN¹, Jang Yong KIM¹, Eunmi KONG², Ji-Eun JUNG², Yong Sun JEON², Soon Gu CHO², Kee Chun HONG², Seok-Hwan SHIN³ (1. Division of Vascular and Endovascular Surgery, Department of Surgery, The Catholic University of Korea, College of Medicine, Korea; 2. Departments of Radiology, Inha University School of Medicine, Korea; 3. Departments of Surgery, Inha University School of Medicine, Korea)

Introduction : Peripheral vascular disease (PVD), disproportionately affects the elderly, is a major cause of morbidity and mortality in elderly population. As Korea is an aging society (WHO classification) and projected to be an aged society in 10 years, PVD has emerged as an important social and medical issue in Korea. But the prevalence was rarely reported. The purpose of this study is to define the prevalence of carotid artery stenosis (CAS), abdominal aortic aneurysm (AAA), and peripheral arterial occlusive disease (PAOD) of lower limb in the Incheon area. Method : Elderly men (≥ 65 years) were referred randomly from the Incheon Federation of Korean Senior Citizens' Association (from Nov 2008 to Dec 2012) to Inha University Hospital, Incheon, Korea for a PVD screening program. The subjects were screened for CAS and AAA as duplex. CAS was defined as $\geq 50\%$ internal CAS and AAA as ≥ 3 cm aortic diameter in minor axis. PAOD of lower limb was screened by measurement of ankle-brachial index (ABI); ABI of ≤ 0.9 was considered abnormal. Results : 2189 subjects were screened including 214 octogenarians (9.8%). Mean age was 72.3 ± 5.2 years. Combined conditions were hypertension (55.9%), diabetes mellitus (25.2%), coronary artery disease (14.3%), dyslipidemia (20.5%), obesity (36.4%) and smoking history (53.3%). CAS was detected in 10.0% (219/2189) subjects. Fifty-two (2.4%) were diagnosed with AAA. PAOD was detected in 89 subjects (4.1%). Conclusion : Prevalence of PVD in Korea is not lower compared to that of western countries, especially the USA and the UK. A nationwide program for timely detection and treatment for PVD should be developed. Keywords : Peripheral arterial occlusive disease, Carotid artery stenosis, Abdominal aortic aneurysm

OP27 125-C-6

VALUE YOUR INDEPENDENCE (VENOUS LEG ULCERS AND EXERCISE)

Jane O'BRIEN¹, H. EDWARDS¹, K. FINLAYSON¹, G. KERR² (1. School of Nursing, Institute of Health and Biomedical Innovation,

Queensland University of Technology, Australia; 2. School of Exercise and Nutrition Sciences, Institute of Health and Biomedical Innovation, Queensland University of Technology, Australia)

Introduction : The objective of this study is to provide evidence for the benefits of exercise for adults with venous leg ulcers on healing and self-management of chronic venous insufficiency (CVI). The outcomes from an exploratory study (Study 1) will be discussed in relation to the formation of a multi-factorial self-management intervention to promote lower limb exercise for people experiencing venous leg ulceration, which is being trialed in Study 2. Method : Study 1: Ten participants with venous leg ulceration participated in semi-structured interviews. The interviews focused on investigating participants' experience of exercise pre/during venous leg ulcer occurrence. Interviews were thematic content analysed to determine major themes and categories. Study 2: 20 participants ($n = 10$, intervention; $n = 10$, control) have currently been recruited for a randomised controlled trial to test the effectiveness of the intervention on healing and self-management of CVI. A multivariable model will be used to identify any differences in outcomes between groups. Results : Preliminary analysis from Study 2 indicates a positive trend of the intervention on healing, with a clinically important improvement at this stage, which will be discussed in this presentation. Conclusion : Patients with venous leg ulcers have been reported as being less physically active than age-matched controls. This intervention aims to provide support for patients to be able to conduct lower limb exercises to promote venous return thereby improving healing outcomes for adults with venous leg ulcers. Keywords : Venous leg ulcers, Exercise, Randomised controlled trial (RCT)

POLYPHARMACY

OP27 126-C-1

DEVELOPMENT OF A EUROPEAN LIST OF POTENTIALLY INAPPROPRIATE MEDICATION (PIM) FOR OLDER PERSONS: A CONSENSUS-BASED APPROACH

Anna RENOM GUITERAS¹, Gabriele MEYER¹, Simone BERNARD², Stefanie HOLT-NOREIKS², Petra THURMANN³ (1. School of Nursing Science, Faculty of Health, Witten/Herdecke University, Germany; 2. Department of Medicine, Faculty of Health, Witten/Herdecke University, Germany; 3. Department of Medicine, Faculty of Health, Chair Clinical Pharmacology, Witten/Herdecke University; Philipp Klee-Institut Clinical Pharmacology, Germany)

Introduction : Several drugs are classified as potentially inappropriate for older persons because of their pharmacological effects and/or increased risk for causing adverse drug reactions. Different country specific PIM lists are available. A European PIM-list for older persons is lacking so far and will therefore be developed and validated in this project, nested in the 7th Framework European Right Time Place Care study. Method : 1) Development of a preliminary PIM-list based on the German PRISCUS list, the French PIM list by Laroche et al., and including drugs from other international PIM lists (Beers, Fick et al., McLeod et al.). 2) Recruitment of experts on geriatric medication from England, Estonia, Finland, France, Netherlands, Spain and Sweden. 3) Structured expansion of the preliminary list by experts. 4) Development of a final list using a two-round, web-based Delphi survey in which experts will assess the proposed drugs appropriateness, recommend dose adjustments and suggest therapeutic alternatives. 5) Validation of the final list using recently collected prescription data from approximately 2000 older persons with dementia from the same countries. Results : The preliminary expanded

PIM-list has been developed and expanded by 8 international experts, and contains 266 drugs belonging to 28 therapeutic subgroups. Twenty-six experts are participating in the Delphi survey at the moment. The list will be ready for validation in May 2013. Preliminary final results will be presented at the IAGG World Congress in 2013. Conclusion : The European PIM-list can be used in clinical practice and for analysing and comparing the prescribing patterns across European countries. Keywords : aged , inappropriate prescribing, potentially inappropriate medications

OP27 126-C-2

PREVALENCE AND DETERMINANTS OF POLYPHARMACY AMONG OLDER PATIENTS IN A PERIURBAN HOSPITAL IN KAMPALA, UGANDA

Joseph Gyagenda OGAVU (*Medicine, Nsambya Hospital, Uganda*)

Introduction : Polypharmacy, the simultaneous use of five or more medications, has been well documented and is a topic of much concern for those looking to improve the quality of care for the older patients. Elderly patients often develop complicated and multi-factorial health states that require extensive pharmacotherapy, leaving this population at risk of exposure to drug-drug interactions and other adverse events. It also costs the health care system dearly. Many medications are potentially inappropriate (PIMs) and are against Rational Use of Medications (RUM). Literature, predominantly from the Western world, supports an association between adverse events and the number of drugs taken by older patients. There is a scarcity of information on the same in the developing world. This study seeks to evaluate and document the prevalence and determinants of polypharmacy in the older population receiving medical care at a periurban hospital in Uganda. Method : A cross-sectional descriptive study of drug prescriptions among patients aged 60 years and above admitted to the Medical wards and attending the medical outpatient clinics of a periurban hospital in Kampala, Uganda. Preliminary Results: The study is hoped to provide baseline information on the prevalence and determinants of polypharmacy among older patients in Uganda. Preliminary Conclusions: The results of this study might be critical to raising physicians' awareness of polypharmacy while helping to ensure safe, effective and appropriate use of medication particularly in the older persons in Uganda. Keywords : Polypharmacy, Older, Uganda

OP27 126-C-4

ASSOCIATIONS BETWEEN MEDICATION AND RECURRENT FALLS IN ELDERLY PATIENTS-AFTER AN INJURIOUS FALL

Marjan ASKARI¹, Saied ESLAMI¹, Alice C. SCHEFFER², Stephanie MEDLOCK¹, Sophia E DE ROOIJ², Nathalie VAN DER VELDE², Ameen ABU HANNA¹ (*1. Medical informatics, Academic Medical Center, Netherlands; 2. Internal and Geriatric Medicine, Academic Medical Center, Netherlands*)

Introduction : Polypharmacy and the use of certain drugs have been associated with increased risk of falling in elderly patients. However, it is not yet clear whether for recurrent fallers the fall-risk-increasing drugs can be extrapolated, since they form a distinct high-risk group. Therefore, we investigated which classes of drugs are associated with recurrent falls in elderly patients. Method : Between 2004 and 2010 patients who visited the emergency department of an academic medical center because of a fall were invited to fill in a validated questionnaire pertaining to the patient and falls. We translated the self-reported medications on the questionnaire into ATC codes. Multivariate logistic regression analysis was performed to identify the

independent association between medication classes and recurrent falling. Results : Among the 2258 participants 39% had a recurrent fall. A significant independent association was found between recurrent falls and drugs for acid related disorders (adjusted odds ratio (aOR) 1.29; CI 1.03-1.60), analgesics (aOR:1.22; CI: 1.06-1.41), ophthalmologicals (aOR 1.51; CI: 1.10-2.09), nasal preparations (aOR 1.49; CI: 1.07-2.08), anti-Parkinson drugs (aOR 1.59; CI: 1.02-2.46), antipsychotics (aOR 2.21; CI: 1.08-4.52), and antidepressants (aOR 1.64; CI: 1.13-2.37). Conclusion : Known fall-risk-increasing drugs, such as psychotropic drugs, also increase the risk of recurrent falls but we found relatively new classes that showed significant association with recurrent falls. These classes potentially act as markers of frailty/comorbidity. Our findings underline the importance of selective prescribing and potential drug withdrawal. Keywords : Recurrent falls, medication, falls.

OP27 126-C-5

PRESCRIBING FOR OLDER PEOPLE DISCHARGED FROM THE ACUTE SECTOR TO RESIDENTIAL AGED CARE FACILITIES

Peter HOPCROFT¹, Nancye M. PEEL¹, Arjun POUDEL², Ian A. SCOTT³, Leonard C GRAY¹, Ruth Eleanor HUBBARD¹ (*1. Centre for Research in Geriatric Medicine, The University of Queensland, Australia; 2. School of Pharmacy, The University of Queensland, Australia; 3. Department of Internal Medicine, Princess Alexandra Hospital and School of Medicine, The University of Queensland, Australia*)

Introduction : Medication management in residential aged care facilities (RACFs) is complex. Residents often have multiple comorbidities yet they are frail, with reduced life expectancy and high risk of adverse drug reactions. Here, we aimed to investigate medication prescribing for older inpatients discharged from the acute sector to RACFs. Method : This study included 206 patients (mean 84.8y± 6.76) discharged into RACFs from 11 acute care hospitals in Australia. The interRAI Acute Care assessment tool was used to record medications and to collect data on each patient's physical, cognitive and psycho-social functioning. Results : Patients were prescribed a mean of 8.51 regular medications at admission to acute care and 8.67 on discharge to their RACF. They had multiple comorbidities (mean 6.03± 2.23). At discharge, 49 (23.8%) were completely dependent in basic activities of daily living (ADL), 122 (59.3%) were cognitively impaired, 105 (51%) incontinent of urine and 204 (99%) needed full assistance with instrumental ADLs. At discharge, 27 (13.1%) patients were prescribed < 5 medications with excessive polypharmacy (≥10 drugs) observed in 78 (37.9%). Aspirin and anti-aggregates were the most frequently prescribed medications (110, 53.4%), followed by antiulcer drugs in 106 (51.5%) patients. Other prevalent medications included antidepressants (25.7%), benzodiazepines (18.9%), antipsychotics (16.5%) and opioids (16%). Conclusion : For frail older people, admission into hospital is an opportunity to rationalize prescribing, weighing up the benefits of pharmacotherapy against significant risks of polypharmacy. Yet in this study, patients discharged to RACFs from hospital continue to be exposed to extensive polypharmacy and medications with uncertain risk-benefit ratio. Keywords : polypharmacy; institutionalisation; frailty

LONG-TERM CARE

OP27 127-C-1

TELEHEALTH FOR NURSING HOMES: UTILISATION OF

SPECIALISTS SERVICES

Melinda MARTIN-KHAN¹, Elizabeth BEATTIE², Sisira EDIRIPPULIGE³, Leonard C. GRAY⁴, Trevor RUSSELL⁵, Anthony SMITH³ (1. Centre for Research in Geriatric Medicine, University of Queensland, Australia; 2. School of Nursing and Midwifery, Faculty of Health, Queensland University of Technology, Australia; 3. Centre for Online Health, School of Medicine, University of Queensland, Australia; 4 Centre for Research in Geriatric Medicine, School of Medicine, University of Queensland, Australia); 5 Telerehabilitation Research Unit, School of Health and Rehabilitation Sciences, University of Queensland, Australia)

Introduction : Telehealth has often been advocated as a method of providing services to rural or remote patients who have limited access to specialist assessment or management of care needs. Telehealth has been recognised as a method of supporting urban patients, who may be living close to specialist services, but are too frail. The aim was to determine the nature and volume of telehealth services that might be provided to a large, urban, residential care facility. Method : Specialist care consultations were identified by research nurses using documentation in patient records, appointment diaries, electronic billing services and on-site observations at a 441-bed long term care facility. To account for facility size and activity, consulting rates were expressed as the number of consultations per year per 100 beds. Results : Over a six-month period there were 3333 consultations (1511 consultations per year per 100 beds). Most consultations were for general practice (n=2589, 78), a rate of 1174 GP consultations per year per 100 beds.. There were 744 (22%) consultations for specialities other than GPs. A total of 146 events related to an emergency or unplanned hospital admission. The remaining medical consultations (n=598, 18%) related to 23 medical specialities. The largest number of consultations were for surgery (n=106), podiatry (n=100), nursing services including wound care (n=74), imaging (n=41) and ophthalmology (n=40). Conclusion : Many services which are currently being provided on-site to metropolitan residential care facilities could be provided by telehealth in both urban and rural facilities. This study provides crucial data for planning future telehealth services for residential care. Keywords : residential care, geriatrics

OP27 127-C-2

NUTRITIONAL ASSESSMENT OF ELDERLY PATIENTS IN LONG-TERM HOSPITAL USING MNA-SF AND PREDICTION OF OCCURRENCE OF PNEUMONIA

Sadao YOSHIDA (Department of Internal Medicine, Okinawa Rehabilitation Center Hospital, Japan)

Introduction : Japan faces severe problems caused by super aged society. As one of them, number of death due to pneumonia is increasing. Pneumonia is the most major cause of death in Japanese elderly. Increase of patients of pneumonia influences increase of medical expenses. Pneumonia could be caused by dysphagia following cerebral vascular disease or dementia. Nutritional status could affect the occurrence of pneumonia. We examined if nutritional assessment predict occurrence of pneumonia in elderly or not. Method : Forty eight elderly patients (> 65 yr) admitted in long-term hospital in Kitanakagusuku, Okinawa. Nutritional status was assessed with BMI (cut-off 18.5 kg/m²), Subjective Global Assessment (SGA), Mini Nutrition Assessment (MNA-SF) and serum albumin (cut-off 3.5 g/dl). Patients were observed for 6 month. Number of occurrence of pneumonia was accumulated. Results : Average number of occurrence of pneumonia in case classified as undernutrition with MNA was 1.03±3.48 events / 6 month (n=30). In contrast, average number of

occurrence of pneumonia in case classified as at risk or well-nourished with MNA was 0.22±0.30 events / 6 month (n=18). Pneumonia is easy to develop in patients classified as undernutrition with MNA (p=0.032). Frequencies of pneumonia tend to elevate in patients with BMI < 18.5, classified as undernutrition with SGA and with serum albumin < 3.5. However, there were no significance (p>0.05). Conclusion : Undernutrition is major risk of pneumonia in elderly. MNA is effective for prediction of occurrence of pneumonia in elderly. Appropriate assessment and management of nutritional status of elderly might be important for prevention of pneumonia. Keywords: pneumonia, MNA, nutrition

OP27 127-C-3

DECREASED PREVALENCE AND SEVERITY OF WOUNDS IN RESIDENTIAL AGED CARE: THE EFFECTIVENESS OF THE CHAMPIONS FOR SKIN INTEGRITY MODEL OF EVIDENCE BASED WOUND MANAGEMENT

Kathleen FINLAYSON¹, Helen EDWARDS², Anne M. CHANG¹, Michelle GIBB¹, Christina PARKER¹ (1. Institute of Health and Biomedical Innovation, Queensland University of Technology, Australia; 2. School of Nursing, Queensland University of Technology, Australia)

Introduction : The incidence of pressure injuries, skin tears and leg ulcers increases with age and comorbidities, thus wounds are a significant issue for residents in aged care facilities. The aim of this project was to preserve skin integrity through the implementation of a model to promote evidence based wound prevention, assessment and management in the residential aged care environment. Method : Pre and post data were gathered via clinical and chart audit of random samples of residents, n=200 (pre), n=201 (post); in addition to surveys and interviews of health professionals, residents and carers from seven Residential Aged Care Facilities. The Champions for Skin Integrity model was based on evidence based strategies to promote transfer of evidence into practice and was implemented over a six month period sequentially in each facility. Results : Implementation of the Champions for Skin Integrity (CSI) model resulted in increased implementation of evidence based wound management and prevention, associated with a significant decrease in the prevalence of pressure injuries (p<0.001) and leg ulcers (p=0.004), and significantly decreased severity of skin tears (p=0.019) and pressure injuries (p=0.003). Additional benefits included improved staff confidence and knowledge and increased awareness of residents, families, carers and staff of evidence based wound management and prevention strategies. Conclusion : This study demonstrated that implementation of the CSI model promoted implementation of evidence based wound management and improved health for residents. In addition, information was gained on the effectiveness of strategies to facilitate implementation of evidence based wound care. Keywords : evidence-based wound management, residential aged care

OP27 127-C-4

DIFFUSION OF DYSPHAGIA REHABILITATION

Mana YAMORI¹, Ayaka TANIHATA², Takeshi UMEHARA³ (1. Health and Welfare, Prefectural University of Hiroshima, Japan; 2. Rehabilitation, Arida Saiseikai Hospital, Japan; 3. Rehabilitation, Bobath Memorial Hospital, Japan)

Introduction : Recently, some politicians, economists, surgeons, and general practitioners allege strong objection for gastrostomy in geriatric patients with dysphagia. However there are few reports on the effects of dysphagia rehabilitation and gastrostomy in the mass media. Therefore many patients and their families refuse to have gastrostomy

even in acute or convalescent, they might lose opportunity to recover. Analyze the negative coverage, information about the effects of dysphagia rehabilitation and gastrostomy has not penetrated to doctors and staffs who work in geriatric long-term care facilities, and to Japan society. Method : 312 medical / nursing staff (Staff group), 133 general adults answered the right and wrong judge questionnaire. It consists of 20 questions ; 4 questions for the general condition of dysphagic patients, 7 for environmental control, 2 for cognitive phase of swallow, 3 for oropharyngeal phase, 2 for food management, and 2 for gastrostomy. Results : Staff group shows more than 90% diffusion in 15 questions, although the information about relation between malnutrition and dysphagia, silent aspiration, and oropharyngeal anatomy have not become widespread. Especially the diffusion in nurses and care givers are less homogeneous than other occupations. General group also do not have those information or about environmental control. Conclusion : The general society, nurses and care givers who work in geriatric long-term care facilities must be informed appropriately about dysphagia rehabilitation and gastrostomy by medical doctors and speech language hearing therapists who work with many dysphagic patients. The argument against gastrostomy could have after sufficient rehabilitation and precise care. Keywords : dysphagia rehabilitation, gastrostomy, diffusion

OP27 205-S
ECONOMICS OF AGEING

OP27 205-S-1
HEALTH LITERACY AND RETIREMENT SAVINGS IN LATER YEARS

Hyungsoo KIM, Jennifer L. HUNTER, Ann VAIL (*Family Sciences, University of Kentucky, USA*)

Introduction : Numerous studies suggest that health literacy improves health outcomes; similarly scholarly literature indicates financial literacy increases financial outcomes in later years. But how, and to what extent, health literacy contributes to improving financial outcomes has not been examined. This study articulates the role of health literacy on retirement savings. Method : This study proposes a model to explain the mechanisms between health literacy and retirement savings. To test this model, data from the Health and Retirement Study (HRS) are used. The HRS is a representative and panel study of middle-aged and older Americans (50+). The 2010 HRS is a rare data set with both measures of health literacy and detailed financial information. Regression analyses are conducted for estimating 1) the impact of health literacy on out of pocket medical expenses (OOP), and 2) the role of health literacy on net worth in later years. Results : High health literacy is associated with lower OOP: \$2,226 less spending of OOP than low health literacy for near retirees (age 50-64) for the two previous years. Near retirees with high health literacy have 3.7 times higher levels of retirement savings than those with low health literacy. The impact of OOP on retirement savings is significant but negligible. Conclusion : These findings indicate that health literacy is an important factor to affect net worth for financial security in later years as well as a determinant of OOP. These findings also provide information to motivate individuals to increase health literacy for retirement savings as well as for healthy lifestyle. Keywords : Knowledge on Health, Out of Pocket Medical Expenses, Retirement Wealth

OP27 205-S-2
ANALYSIS ON THE MEDICAL DEMAND OF ALZHEIMER'S PATIENTS UNDER THE CONSIDERATION OF MEDICAL COSTS GENE

Shu-Hua SHEN¹, Miaofen YEN², Shou-Lin YANG³, Chiung-Ying LEE⁴, Hsien-Jane CHIU⁵ (*1. Institute of Allied Health Sciences & Nursing, National Cheng Kung University, Jianan Mental Hospital, DOH, Taiwan; 2. Nursing, College of Medicine, National Cheng Kung University, Taiwan; 3. Department of Business Administration and Graduate Institute of International Business, National Cheng Kung University, Taiwan; 4. Finance, Chang Jung Christian University, Taiwan; 5. Superintendent Office, Jianan Mental Hospital, D.O.H., Taiwan*)

Introduction : In this study, we employ the travel cost method (TCM) and altruism concepts to establish a negative binomial regression model for outpatient medical demand. We apply this model to consider the medical costs of dementia-related outpatient visits with accompanying caregivers. We consider the time and transportation costs of caregivers and evaluate the factors that influence the medical demands of Alzheimer's outpatient visits. Method : We employ the mini-mental State exam (MMSE), geriatric depression scale short form (GDS-15), and Barthel index to evaluate and conduct preliminary screening of older adults in Tainan City, Taiwan, and select 201 dependent older adults with a risk to develop Alzheimer's disease (≥ 65 y) to participate in this study. Our subsequent analysis examines the dementia-related medical records of participants from the January 1, 2009 to December 31, 2010. Results : The findings on influential factors for medical demand show that medical visits reduce as the time cost of accompanying caregiver visits increases. Conclusion : However, the frequency of medical visits increases with the level of patients' financial independence. In addition, patients that also suffer from other chronic illnesses have a further reduced number of visits related to the chief complaint of dementia. Keywords : Medical Costs Gene

OP27 205-S-3
DEVELOPMENT AND VALIDATION OF A MEASURE OF LIVING STANDARDS FOR OLDER PEOPLE

Mary BREHENY¹, Christine STEPHENS², Fiona ALPASS², Brendan STEVENSON², Kristie CARTER³, Polly YEUNG¹ (*1. School of Health and Social Services, Massey University, New Zealand; 2. School of Psychology, Massey University, New Zealand; 3. School of Medicine and Health Science, University of Otago, New Zealand*)

Introduction : Living standards are an effective way to assess socioeconomic status in relation to health but controversy remains about their assessment, particularly for older people. Sen's capability framework shifts attention from material conditions to opportunities for choice enabled by material resources. To develop this promising approach, this paper reports on the development of a measure of living standards for older people based on Sen's capability framework. Method : Six living standards domains were established from thematic analysis of 143 interviews with people aged over 65 years in New Zealand. Questionnaire items were developed and tested to assess the extent to which older people had the freedom to pursue these domains. The 73 items were tested for face validity in interviews. Following this, a revised version was posted to 2,000 people aged over 65 years randomly selected from the New Zealand electoral roll and 1064 completed questionnaires were returned. Results : Item screening for response rates and spread reduced the items to 34. Confirmatory factor analysis of these 34 items suggested that the six theoretical domains were supported. Following model development, 25 items assessing the six domains were selected. Conclusion : Results to date show that this measure of living standards (LS-Cap) is a promising instrument to assess living standards. A capabilities approach to living standards solves the problems of the meanings of material goods by focussing on

the freedom to access valued needs. Inequalities in these freedoms are related to inequalities in living standards and health across the gradient. Keywords : Living Standards, Capability Approach, Inequalities

OP27 205-S-4

THE WELFARE PARADOX IN KOREAN NATIONAL PENSION SCHEME

Kwang-Seok LEE¹, Sung-Ho KANG² (1. Dept. of Public Administration and Public Policy, Kyung-pook National Univ., Korea; 2. Team Head/Associate research fellow, Pension Research Department, Korea National Pension Research Institute, Korea)

Introduction : This paper aims at the explanation of welfare paradox in Korean National Pension Scheme(KNPS). Welfare paradox means that if one function in KNPS is emphasized, the other functions should be weakened. The research seems to show that the vision or time-span of the Scheme-designers is important. Korean Scheme-designers were lacking in the long-term vision in the starting point, which resulted in the policy change and priority change in the next stage. That is the paradoxical relationship between short-term and long-term goals. The policy change and priority change brought the distrust in the Scheme into being to Koreans, which led them to National Pension Dismantlement Movement. Method : The main methodology includes IPA (Interpretative Phenomenological Analysis) in addition to literature research, and archival research. Two researchers search the materials, turn them into the data, which show the future problems both from the financial viewpoint and from the elderly life viewpoint in KNPS. And the researchers visit the policy-makers, the committee members, and the pension scheme beneficiaries, and have interviews with them as to what is the main cause of the policy change and priority change. Results : Following the research by Bruner et al.(1956:50), the institutional process takes preparation, incubation, illumination, and verification. In the starting point the important issue was how to fix KNPS, which led to the priority of the guarantee of elderly life over the financial stability. As time passes, the relationship between the guarantee of elderly life and the financial stability shows the paradoxical one. Conclusion : KNPS' long-term vision. Keywords : Korean National Pension Scheme, paradox, Interpretative Phenomenological Analysis

OP27 205-S-5

AGE-FRIENDLY CITIES IN QUEBEC (CANADA): IMPLEMENTATION AND EVALUATION OF SEVEN PILOT PROJECTS TO 578 AFC

Suzanne GARON¹, Marie BEAULIEU², Mario PARIS² (1. Research Center on Aging, Universite de Sherbrooke, Canada; 2. Gerontology, Universite de Sherbrooke, Canada)

Introduction : This presentation aims to describe the implementation and evaluation processes of the AFC in Quebec, Canada (AFC-QC). AFC-QC started with 7 pilot projects in 2008 and is now in implementation in 578 municipalities in 2012. Firstly, we will focus on the 7 pilot projects by exemplifying actions implemented in several municipalities and exposing issues associated with success or failure of AFC-QC implementation. Secondly, it will demonstrate the influence of knowledge and know-how developed in the pilot projects in the expansion to the 572 more recent AFC-QC municipalities. Method : The AFC-QC evaluation process is inspired by the program theory models in evaluation, i.e. logic model (Chen, 1990; 2005; 2010) and realistic model (Paslow & Tilley, 1997). The focus is on understanding the changes introduced by AFC-QC from the perspectives of older adults and stakeholders, and identifying objective

and subjective elements that contribute to AFC-QC implementation success or failure. The evaluation process requires the use of mixed method (cases studies and survey). Results : Actions implemented in the municipalities are coherent with the needs and problems of older adults identified during the social diagnostic step. Actions aim to improve transportation, housing, social inclusion, urban planning, and health care services for older adults. Conclusion : Traditionally, stakeholders, agencies and organizations work in silos, but within AFC-QC steering committees, they are exposed to a new form of governance where coordination between members of the steering committee is essential. In all, AFC-QC contributes to the understanding of effective social changes that intend to include older adults in communities. Keywords : Age-friendly cities, community building, evaluation, partnership, collaboration, mixes methods, Queb

PREDICTORS OF CAREGIVERS' CONSIDERATION FOR INSTITUTIONALIZATION OF ELDERLY CARE RECIPIENTS WITH ALZHEIMER'S DISEASE AMONG THREE DIFFERENT ETHNICITIES

Hyunju SHIM (Social Work, Washington University in St.Louis, USA)

Introduction : The increasing number of older adults in the US suggests accordingly increasing older populations with Alzheimer's Disease (AD). Culturally relevant and reliable practices are needed for caregivers of individuals with AD. To promote deeper understanding of diverse ethnic caregivers' consideration for institutionalization, the aim of the current study is to examine the factors that influence caregivers of different ethnic origins, in deciding about institutionalization, using the secondary analysis of the Resources for Enhancing Alzheimer's Caregiver Health II (REACH) data. Method : The study used 2002-2004 REACH II baseline data with 615 caregivers [n=204(Hispanic), n=211(Caucasian), & n=200 (African-American)] and their care recipients with Alzheimer's disease. Employing a model of ethnic differences in caregiving variables (Pinquart & Sorensen, 2005), seven variables of interest were identified. A binary logistic regression was used to predict the caregivers' having consideration/no consideration about institutionalization. Results : The results indicate that caregivers' ethnicity and stress were strong predictors of caregivers' consideration about institutionalization ($p < .001$). Interestingly, caregivers' ethnicity was only significant for Hispanic ($p < .001$) and not for African Americans. Other significant predictors include caregivers' use of transportation service and caregiving hours ($p < .05$). The only significant characteristic of care recipients was their IADL level ($p < .01$). Conclusion : Social workers and policy makers should not be misinformed that being an ethnic minority makes caregivers immune from feeling stressed. To promote understanding among policymakers, practitioners, and older persons and their families, a project to build the knowledge-sharing platform will be introduced. Keywords : family caregivers, Alzheimer's Disease, ethnicity

DEMENTIA AND COGNITIVE IMPAIRMENTS

OP27 206-S-1

GLOBALISING THE STUDY AND ANALYSIS OF ALZHEIMER'S DISEASE: A DIGITAL EARTH MODEL

Hamish ROBERTSON¹, Nick NICHOLAS², Joanne TRAVAGLIA³, Andrew GEORGIU³, Julie JOHNSON³ (1. Ageing Research Centre, Neuroscience Research Australia, Australia; 2. Ageing Research Centre, Prince of Wales Hospital, Australia; 3. Faculty of Medicine, University of NSW, Australia)

Introduction : Alzheimer's disease (AD) is no longer only a problem for the wealthy global north. Ageing population cohorts are emerging across many low to middle income countries and this trend is set to continue into the middle of this century. As chronic disease increasingly characterises the global burden of disease, AD and its correlates will become increasingly important in the management of health care design, funding and delivery at the global level. **Method :** We show how emerging spatial science technologies, geographic information systems and digital earth models, can support AD planning, surveillance, treatment and management at the global level. This involved projecting world AD prevalence out to 2050 by country. **Results :** The result is a digital earth model showing the current and projected prevalence of AD at the country and sub-country level. At the Australian level we analysed local prevalence projections and aged care infrastructure including primary care, hospitals and aged care facilities. These results provide a spatial analysis of the future of AD and aged care delivery issues up to the year 2050. **Conclusion :** AD can be modelled across the whole earth including national and regional geographies. We use Australia to show how this approach can include health infrastructure and workforce to build a planning and monitoring tool relevant to rich and poor countries. Lastly, because the key technologies are becoming increasingly accessible to users, we show how the global burden of AD can be supported by international cooperation utilising these emerging technologies. **Keywords :** spatial, GIS, visualisation

OP27 206-S-2

MILD COGNITIVE IMPAIRMENTS BEFORE AND SIX MONTHS AFTER CARDIAC SURGERY INCREASE MORTALITY RISK AT MEDIAN 11 YEAR FOLLOW-UP: A COHORT STUDY

Phillip J TULLY (*Dept. Cardiac Surgery, Flinders Medical Centre, South Australia, Australia*)

Introduction : The effects of mild cognitive impairment (MCI) on mortality risk after cardiac surgery are unknown. **Method :** Patients were assessed on a battery of six neurocognitive measures before cardiac surgery (N = 521) and at six month follow up (N = 377/521, 72.4%). MCI classification was based on cognitive test scores 1 SD below age and sex matched normative data, and classified according to amnesic, non-amnesic and mixed MCI subtypes. Survival analyses adjusted for significant covariates and interaction effects with depression. **Results :** In minimum 7 year follow-up there were 5,407 person years for analysis (median survival 11.1 years, interquartile range 7.9 to 13.1) and 176 deaths (33.8% of total) occurred by the census date. Before cardiac surgery, patients with a mixed MCI (adjusted hazard ratio (HR) = 2.53; 95% confidence interval (CI), 1.57-4.06, p<.001) and non-amnesic MCI (adjusted HR = 1.51; 95%, 1.00-2.32, p=.05) were at greater mortality risk. Analyses with six month neurocognitive measures corroborated that the mixed MCI group were at higher mortality risk (adjusted HR = 2.35; 95%, 1.30-4.25, p=.005). When change in neurocognitive functioning over time was analysed, a nearly twofold higher mortality risk was evident amongst patients with a continuing-MCI evident at baseline and six months (adjusted HR = 1.83; 95%, 1.08-3.10, p=.03). No significant mortality risk was attributable to incident-MCI or resolved-MCI. **Conclusion :** These data suggest that a mixed MCI subtype, and continuing MCI before and six months after cardiac surgery, is associated with long term mortality, independent of depression. **Keywords :** mild cognitive impairment, heart disease, psycho-geriatrics

OP27 206-S-3

DIFFICULTIES IN CARING FOR PEOPLE WITH DEMENTIA AT A GROUP HOME - PERSPECTIVE OF "REFLECTION IN ACTION" THROUGH INTERVIEWS AND PARTICIPANT OBSERVATIONS

Kyoko HORI (*Faculty of Human Welfare, Seigakuin University, Japan*)

Introduction : Providing care for the demented elderly is an important problem in Japan, where the population is aging rapidly. This study was designed to develop a psychological understanding about caring for the demented elderly at a group-home, where users utilize their remaining abilities, from the perspective of interactions between care-workers and users. **Method :** Qualitative research methodology was used because the context of dementia care was considered to be important. Exploratory analysis was conducted with data on care-workers talking about their work, being obtained through participant observations. **Results :** Results indicated that care-workers had difficulties in understanding elderly people with dementia having Behavioral and Psychological Symptoms of Dementia (BPSD). Care-workers could manage care during the daytime with the help of colleagues. By contrast in the midnight, BPSD aggravated problems and lead to stress, fear and breakdowns in care workers because they have to take care all alone. As a result, they felt that the most significant source of difficulties in caring was users with midnight BPSD. **Conclusion :** These results are discussed from the perspective of "reflection in action" introduced by D. A. Schon. It was suggested that a gap has been created between care-workers' intentions and the practice of care. Moreover, it was also indicated that care-workers are unable to attend to the structure of this gap. As a result, they cannot control their care strategies, set goals, conduct and modifying strategies, and examine the results. It is optional that psychological supports can play a role in enabling care-workers to control care strategies under changing conditions. **Keywords :** Caring for the elderly people with dementia, Psychological perspective, Interaction

OP27 206-S-4

DESIGNING A PILOT STUDY TO TEST THE EFFECTS OF TIMESLIPS ON PERSONS WITH DEMENTIA

Mercedes BERN-KLUG (*School of Social Work & Aging Studies Program, The University of Iowa, USA*)

Introduction : Half of US nursing home (NH) residents have dementia. Persons with dementia (PWD) cannot fully participate in NH activities because of memory loss. TimeSlips, a group story-telling activity developed by Dr. Anne Bastings especially for people with dementia, relies on imagination rather than memory. The purpose of this pilot study is to develop a protocol that can be administered by students to test for the effects of TimeSlips on mood and behavior of PWD. **Method :** Different measures for assessing cognitive status, self-reported mood and observed behavior were tested for ease, sensitivity, and time. A final set of instruments was decided upon after three data collection episodes (each lasting three hours and each one week apart) and then refined during the next three weeks of TimeSlips sessions. After baseline, data were collected one hour before the intervention, during the intervention, and one and two hours post-intervention. PWD were asked to report on mood and students observed behavior. **Results :** Self-reported mood was assessed with a 5 level faces tool (sad face, neutral, happy) and the GDS as well as a social interaction tool developed for TimeSlips as part of the pilot study. The final observation checklist was an adaptation of the Cohen-Mansfield Agitation Inventory. **Conclusion :** It is possible to measure the effects of TimeSlips on PWD using self-reported mood and a behavioral checklist. The next step is to test TimeSlips on a larger sample of

PDW stratified by cognitive impairment. Keywords : social inclusion, quality of life, Alzheimer's disease

OP27 206-S-5

COLOMBIAN ALZHEIMER'S CAREGIVERS: ¿ CUIDADORES ?

Lyda Consuelo AREVALO-FLECHAS (*St. David's School of Nursing, Texas State University, USA*)

Introduction : The word caregiver has been translated to Spanish as the word 'cuidador', a word not completely understood in meaning or use by Spanish speaking Latinos/Hispanics. Additionally, the word caregiving lacks a universally accepted one-word translation to Spanish. Because language is the vehicle that provides meaning to a person's reality, the aim of the study was to explore the expressions and words used by Spanish speaking Colombians to describe their experience of being responsible for the well-being of a relative living with Alzheimer's disease or a related dementia (ADRD). Method : Ethnographic interviews and participant observation of 45 Colombian ADRD caregivers. The interviews and initial content analysis were conducted in Spanish. Results : Colombian caregivers did not use the descriptor 'cuidador' to talk about their experience and duty towards their relatives living with ADRD. The word 'cuidador' was reported as the term used in printed media intended to provide information and support. There was a general distaste for what the participants perceived as a 'label' imposed on them by media and scientific literature. Cultural values of respeto and familismo were explained in the participants' narratives. Conclusion : The use of words that are culturally and linguistically congruent with a person's values may set the right stage for a relationship in which support may be offered and accepted. Latinos caring for a loved one living with ADRD may be more willing to accept support and guidance when they are acknowledged above all as family members carrying out a family duty that implies sacrifice and difficulty, but can be satisfying. Keywords : Dementia, caregiving, Latinos

OP27 206-S-6

SEX IN LATER LIFE: A GENDER PERSPECTIVE

Duck Soon SON¹, Yeong-ran PARK², Chan Hee PARK³, Soon Wha KANG³, Kyung Soon PARK³, Eun Wha CHUNG³, Soo Kyung AHN³
(1. Department of Social Welfare, Yongin Songdam University, Korea; 2. Division of Silver Industry, Kangnam University, Korea; 3. Graduate School of Social Welfare, Kangnam University, Korea)

Introduction : Sex in later life has become a topic of interest not only in gerontological research but also in service settings. The purpose of this research is to analyze the experiences of Korean men and women regarding sex in older age. Method : A survey was conducted on approximately eight hundred older men and women using 16 senior centers in Korea. A structured questionnaire was used to collect information about the socio demographic characteristics, attitudes towards sex and sexual behavior, services use experience and needs. Results : The results will be elaborated from a gender perspective, and the similarities and differences between older men and women regarding attitudes towards sex and their behaviors will be highlighted. Conclusion : The results from this research will be used to promote understanding of the issues of sex in later life, and further implications will be drawn for designing gender sensitive intervention programs. Keywords : sex later life gender perspective

AGEING AND PSYCHOSOCIAL THEORY II

OP27 207-S-1

IS SUBJECTIVE AGE A SELF-PROTECTING STRATEGY? RESULTS FROM A FIVE-YEAR PANEL STUDY OF SUBJECTIVE AGE AND MENTAL WELL-BEING IN THE SECOND HALF OF LIFE

Marijke VEENSTRA, Svein Olav DAATLAND (*NOVA, Norwegian Social Research, Norway*)

Introduction : Wanting to be younger than one's actual age may operate as a maladaptive identity strategy whereas feeling younger may serve as a compensatory, adaptive, strategy in terms of ageing processes. There are few longitudinal studies assessing the stability of subjective age in general and its relation with mental well-being over time in particular. Hence, the direction of causality remains unclear and mental well-being may be a cause rather than a consequence of youthful identities. The objective of this study is to assess stability and change in subjective age and its causal relation with mental well-being over five years. Method : Two waves from the NorLAG panel study from 2002 and 2007; a community-based panel study of Norwegians aged 40 years + (N=2,400). Measures include Felt age and Ideal age discrepancies, and the Positive and Negative Affect Scale (PANAS). Structural Equation Modelling is used to assess stability and the direction of causality between domains of subjective age and mental well-being. Results : Felt age discrepancies are stable over five years: respondents indicated that on average they felt 7.6 years younger than their actual age. Ideal age discrepancies increased slightly over time, from 16.5 to 17.3 years. In addition, wishing to be younger than one's actual age has a negative effect on Positive Affect five years later, whereas feeling younger was not associated with well-being. Conclusion : Stability in felt age discrepancies may reflect an 'optimal illusion'. Ideal age tends to stabilize around age 40 and may then become more dysfunctional with increasing age. Keywords : Subjective age, Successful ageing, Subjective well-being

OP27 207-S-2

DEVELOPMENT OF A CONCEPTUAL MODEL FOR PERSON-ENGAGED DEMENTIA CARE

Gretchel AJON-GEALOGO (*School of Nursing, University of Texas Health Science Center San Antonio, USA*)

Introduction : In the U.S., adult day programs have become the care alternative of choice reported by caregivers of community-dwelling older adults with dementia because of its cheaper cost compared to other dementia care interventions. However, a strong theoretical underpinning is lacking for interventions that promote person/consumer engagement in this vulnerable population. A complex adaptive system framework is needed to analyze dementia care interventions across microsystem, mesosystem, and macrosystem levels. Therefore, the aims of this study are to: (1) Develop preliminary measures for microsystem variables: an independent variable (dementia care communication triad), outcome variable (health-related quality of life) and mediating variable (strength of person/consumer engagement in care delivery); (2) Refine existing measures for safe care and program costs; (3) Describe the contextual characteristics of an adult day program specializing in dementia care for community-dwelling older adults. Method : A mixed methods approach employing organizational ethnography and descriptive correlational design will be used. The following questions will be addressed: (1) What are the characteristics of an adult day program for community-dwelling persons with dementia? (2) What meta-inferences can be drawn from the data? (3) What are the convergent and/or divergent characteristics of these meta-inferences? Results : Results are expected to inform the development of clear definitions for

each variable, the establishment of accurate measures for these variables, and a description of multi-level interfaces with outcomes. Conclusion : Using a mixed methods design is appropriate for theory building, as it identifies essential components of dementia care relative to microsystem-level health-related quality of care, mesosystem-level safe care delivery, and macrosystem-level program and consumer costs. Keywords : dementia, person-centered care, complex adaptive systems, mixed methods

OP27 207-S-3

THE FOURTH AGE AS A SOCIAL IMAGINARY

Chris John GILLEARD, Paul Frederick HIGGS (*Mental Health Sciences, University College London, United Kingdom*)

Introduction : The idea of a human life cycle is embedded in most societies with its division into a period of growth, a period of stability and a period of decline. Until recently the period of decline - old age - has been represented as a homogeneous entity with positive and negative aspects whose salience varied over time and place. Method : Beginning in the second half of the twentieth century, later life has become fragmented. What Castoriades termed the social imaginary of old age has lost much of its old coherence. The rise of the third age - a cultural field determined by active consumerism the politics of identity and a rejection of becoming 'old' - has excluded many of the more abject aspects of old age from later lifestyles. Results : The result is the emergence of a new social imaginary based around the idea of a fourth age, in which all the fears of ageing are located, whose boundaries are shaped on the one hand by the rejection or exclusions evident in third age culture and on the other by the abjections of agedness, in terms of an irremediable mental and physical frailty. Conclusion : The consequences of formulating the fourth age in such terms will be drawn out for both health and social policy in individual societies and in an apocalyptic demography that represents the growing agedness across societies as a potential global catastrophe. Keywords : social imaginary fourth age

OP27 207-S-4

IS THE "STRUGGLE FOR RECOGNITION" THE NEXT STEP IN CRITICAL GERONTOLOGY STUDIES?

Mario PARIS¹, Suzanne GARON², Marie BEAULIEU² (*1. Gerontology, University of Sherbrooke, Canada; 2. Social Work, University of Sherbrooke, Canada*)

Introduction : Critical studies in gerontology are far from having one solo standpoint. Indeed, many social theory approaches coexist (e.g. feminist theory, political economy, poststructuralism, etc.) under the term Critical Gerontology. However, researchers in gerontology have not yet considered seriously the latest works from Frankfurt School and applied it to aging and old age studies. Method : We build our answer from the theory of struggle for recognition from the German philosopher Axel Honneth. He is one of the leading philosophical thinkers of Critical Theory and the actual Director of the Institute of Social Research in Frankfurt. Based on Hegel and Mead, he has developed a philosophical theory that focuses on conditions of individual achievement in modern society which take place through three patterns of intersubjective recognition: love, rights, and solidarity (Honneth, 1995). The Theory of recognition allows individuals to experience personal dignity and a social integrity. Results : This theoretical framework permits to identify some social pathologies associated with aging and old age. For example, the appreciation of older people from a successful and productive aging standpoint leads us to reflect on the nature of recognition toward aging and old age. Indeed, such a representation is imbued with ideological elements and

is not immune to certain excesses, particularly the invisibility of old age. At the end, we identify some research avenues for Critical Gerontology. Conclusion : In the end, our presentation will answer to sociologist Vitor Marshall's question (2009): "What is new about critical gerontology?" Keywords : Critical Theory, Old Age, Recognition

OP27 207-S-5

COMPETING RISKS ANALYSIS OF GOING TO NURSING HOME PLACEMENT AND MORTALITY AMONG ADULTS WITH INTELLECTUAL DISABILITIES

Hyun Ja LIM¹, Lilian THORPE², Prosanta MONDAL¹ (*1. Community Health & Epidemiology, College of Medicine, University of Saskatchewan, Canada; 2. Psychiatry, College of Medicine, University of Saskatchewan, Canada*)

Introduction : Depressive symptoms have been linked to decreased active life expectancy in general population. Adults with intellectual disabilities (ID) are commonly prescribed antipsychotics/anticonvulsants for behavioural problems, both of which are potential contributors to increased adverse health outcomes. Method : Population-based, community-dwelling adults with childhood onset ID were recruited during 1995-2000, and followed until 2011. Competing risks analysis using Cox cause-specific and sub-distribution hazards models were conducted to estimate/to illustrate the effect of risk factors and the cumulative incidence functions for the study outcomes: NHP and death. Results : 233 participants (43% females) were followed for an average of 13 years (s.d= ±4.1). Of those, 28 people (12%) went to NHP and 61 (26.2%) died before NHP. Multivariable cause-specific and sub-distribution hazards models consistently showed that age, behavioral depression (anxious, crying spells, fearful, overly sensitive, sadness), and mood were significant factors for NPH. Mood symptoms result in 1.54 times increased hazard of NPH, after controlling for age and behavioral depression (HR=1.54, 95% CI: 1.1-2.17, p=0.01). However, age, physical depression (body stress, eating problem, low energy, sleep problem), a seizure history at baseline were significant predictors of mortality. A seizure history at baseline significantly increased mortality risk, after controlling for age and physical depression (HR=2.44, 95% CI: 1.23-4.87, p=0.01). Conclusion : As expected, aging is significantly associated with the risk of NHP and death. Our study showed that there was an association between behavioral and physical depression symptoms and increased NHP and mortality, respectively. Clinicians should consider depressive symptoms as a serious risk to increased adverse health outcomes. Keywords : competing risks analysis, depressive symptoms, nursing home placement, mortality

SEX AND SEXUALITY

OP27 208-S-1

SEXUALITY AND DISCRIMINATION IMPACTS ON HEALTH AND WELLBEING OF OLDER PEOPLE

Charles WALDEGRAVE (*Social Policy Research Unit, Family Centre, New Zealand*)

Aim: This presentation will provide results from the New Zealand Longitudinal Study of Ageing (NZLSA). The specific aim of this paper will be to explore the specific relationships of sexuality and discrimination respectively with health and wellbeing. Methods: Amartya Sen's capabilities approach has formed the conceptual basis of the theoretical framework of this research programme (Sen, 1999).

An extensive survey of a national random sample of 3,317 older New Zealand citizens aged between 50 to 84 years was carried out in the second half of 2010. The survey questionnaire included questions on sexuality (Sexual Functioning Scale) and discrimination (Everyday Discrimination Scale). These variables were tested for statistical associations with a range of health and wellbeing measures, including CASP 12, and WHOQoL 8. Findings: The results demonstrated higher incidence of sexual contact and lower levels of discrimination than predicted. They also revealed significant associations, indicating that older people who engage in sexual activity show higher levels of wellbeing and those who are discriminated against show lower levels of health. The findings add weight to Sen's notion that human freedom and functional capability are at the centre of human wellbeing. Relevance: The results demonstrate the important associations sexuality and discrimination have with wellbeing. Furthermore they address stereotypes about older people being unable to participate or are disinterested in sex. The discrimination data identifies the types of discrimination older people experience and the dangers of double discrimination like age and gender or age and race. Keywords : Sexuality, discrimination, health

OP27 208-S-2

WIDOWHOOD, INTERGENERATIONAL FAMILY SUPPORT AND LIVING ARRANGEMENT AMONG OLDER ADULTS IN CHINA: BASED ON GENDER LENS

Yunzhu JIA (*Policy and Law Studies Section, Women's Studies Institute of China, China*)

Introduction : Widowhood becomes an extended experience for old adults in China because of increased life expectancy, particularly for older women. While intergenerational family support and living arrangement of older adults has changed greatly during the past decades in China because of huge population migration and life style transformed. Method : Drawing on the Senior Citizens Survey date of the Third Wave Survey on the Social Status of Women in China, jointly launched and organized by the All-China Women's Federation (ACWF) and National Bureau of Statistics (NBS), which carried out on December 1, 2010. Results : This paper explores the patterns, status and associates of widowed older adults' living arrangement and intergenerational support in China, using logistic model. Conclusion : Preliminary findings suggest that the widow older women have closer intergenerational support and higher probability of live together with children than widower. Controlled the age, health status, educational attainment, housing and income resource, whether older adults give a hand to their children on housework make sense on their living arrangement, give money to their children can great increase the probability of older widower live together with their children, while take care of grandchildren decrease the probability of living together with children for widow older women. The paper try to explain the gender difference based on gender lens. Keywords : widowhood, living arrangement, intergenerational support

OP27 208-S-3

AN EVALUATION OF THE SENIOR EMPLOYMENT PROGRAM OF SENIOR WELFARE CENTER IN CHANGWON BASED ON BLENDED RETURN ON INVESTMENT

Yu Mi JANG¹, Carol KIM² (*1. Social Welfare Department, Changsin University, Korea; 2. Foreign Languages Department-English, Changshin University, Korea*)

Introduction : This study attempts to evaluate social and economic benefits of the Senior Employment Program (SEP) by using the

approach used to evaluate REDF and NEF. The Blended Return on Investment (BROI), Economic Return on Investment (EROI) and Social Return on Investment (SROI) of the SEP are calculated and compared which are then used to assess the possibility of continuing the SEP and social values and influences that the SEP has on the senior community. Method : A preliminary social enterprise obtained authorization from Changwon City Hall, a community welfare center, and a commercial enterprise obtained authorization from Korea Labor Force Development Institute for the Aged. Each organization's BROI is calculated and compared using the formula stated below. Results : Under the conditions where the performance period is 2 years, discount rate 3.5%, average inflation rate 4.0% according to the Bank of Korea in Year 2011, and the level of significance $\pm 20\%$, EROI, SROI, and BROI are all found to be the highest in the case of the SEP in the preliminary social enterprise. Conclusion : EROI and SROI of the SEP are all high in all three organizations. This means the SEP is socially beneficial. The variables that affect BROI are not the increase in the income tax, but the decrease in government subsidies and the increase in the net income as well as the average monthly income and the number of the senior clients in the SEP. The major interest of senior citizens would be having more senior clients embracing the SEP. Keywords : Blended Return on Investment (BROI), Senior Employment Program (SEP), Sensitivity Analysis

OP27 208-S-5

OLDER IMMIGRANTS' ACCESS TO THE INTERNET AND ONLINE PATIENT-DOCTOR COMMUNICATION

Younsook YEO¹, Soonhee ROH², Jisung PARK³ (*1. College of Social Work, University of South Carolina, USA; 2. Department of Social Work, University of South Dakota, USA; 3. Retirement Research Center, Samsung Life Insurance Co., Korea*)

Introduction : Despite increasing demand for Internet-based communication with healthcare providers, little is known about online patient-doctor communication among older immigrants in the United States. The purposes of this study are to (1) describe the prevalence of the digital divide, controlling for sociodemographic variables, and (2) examine factors associated with Internet use and online patient-doctor communication between U.S.-born and foreign-born older adults (50 or older). Method : Multivariate logistic regression was estimated using nationally representative data collected in 2005 and 2008 by the National Cancer Institute for the Health Information National Trends Survey (N = 7,324). Results : Foreign-born older adults were less likely than their U.S.-born counterparts to use the Internet ($\exp(b) = 0.65, p < .01$). Interestingly, once older immigrants became wired, they were more likely than U.S.-born counterparts to communicate online with doctors (15% vs. 11%). Among the wired U.S.-born older adults, talking with doctors about health information they found on the Internet, trusting in online health information, using more healthcare services, and living alone were significantly associated with online patient-doctor communication. Among the wired older immigrants, however, online patient-doctor communication was significantly associated with having cancer and having no disability. Conclusion : Older immigrants lagged far behind their U.S.-born counterparts in access to the Internet. However, once they became wired, they actively participated in online patient-doctor communication for medical care. Considering that the Internet can help reduce language barriers and enhance autonomy among older immigrant populations, efforts to reduce the digital divide may include more computer training programs for older immigrants in the community. Keywords : social support, elderly immigrants, online health communication, Internet access

SOCIAL PARTICIPATION II

OP27 209-S-1

E-CONVERGENCE, THE LIFE BLOOD OF ACTIVE AGEING

Kallirroi NIKOLI (National Committee of Ageing/as Expert on Ageing, SOCIAL AID OF HELLAS/in consultative status with ECOSOC/UN, Greece)

Introduction : The e-Convergence is a measurable approach of reaching successful ageing through e-knowledge and e-information (During the presentation we will give appropriate index) The recent financial crisis illustrated the intrinsic needs for shifting priorities. Leaders, Social Workers, Senior Citizens, are aware Ageing Sustainability is an effort to grow and thrive well beyond the 21st c. second decade. It is here and rather to stay. Catalyst research has shown that societies outperform where e-information diffused as a tool of knowledge and not as a game of killing boredom. e-knowledge is a major step towards Ageing Sustainability promoting social inclusion and intergenerational cohesion Societies understand that e-informed and skilled Aged persons are the best answers to the asked model of our global society: a) global accepted principles b) high standards of life c) information as the lifeblood of active ageing e-informed Ageing creates leaders for a globalized up-to-date Voluntarism without borders. Method : To reach e-convergence needs to be passed through several steps of knowledge: Ageing has rigidity, Ageing frailty, Ageing has fixed ideas, the 21st c. Ageing are not homogenized. The e-Convergence be implemented successfully some key prerequisites: Friendly social environment, Healthy vitality coming from within e-Convergence for embracing Voluntarism is a method with parameters will be shown in graphics. Some of the tools will be e-lessons in an environment without discriminations and segregate from other ages. Results : The high mark of e-convergence towards Ageing Sustainability leads to successful Ageing Success is a process through Volunteering-Independent fulfilled life. Conclusion : Implementation of e-Convergence. Successful Ageing through Voluntarism. Through Integression. Social Participation as equal Partner in our global society. Keywords : e-convergence Ageing Sustainability

OP27 209-S-2

PARTICIPATING IN COMMUNITY: OLDER ASIAN IMMIGRANTS TAKING ON RESPONSIBILITY IN NEW ZEALAND SOCIETY

Valerie WRIGHT-ST. CLAIR¹, Shoba NAYAR² (1. Research Cluster for Active Ageing, AUT University, New Zealand; 2. Centre for Migrant and Refugee Research, AUT University, New Zealand)

Introduction : New Zealand has an increasingly ethnically diverse ageing population, in particular from the Asian region; yet little is known about how these older migrants contribute to communities and wider society. This study explored the processes by which Indian, Chinese and Korean elder migrants engage in voluntary work in Auckland, New Zealand. Method : A grounded theory methodology framed this study. Participants were men and women, aged 60 years and over at the time of interview, identifying as Indian, Chinese or Korean. Purposive sampling was used to recruit 74 participants for 9 focus groups across the three communities. Theoretical sampling was used to complete up to a further 30 individual interviews (10 with each community). Semi-structured interviews conducted in English, Hindi, Mandarin and Korean were audio recorded, transcribed verbatim, and translated where relevant to English for analysis. Data were analysed using grounded theory methods. Ethics approval was obtained from Auckland University of Technology Ethics Committee. Results: Participants engaged in a diverse range of voluntary activities,

both within their families and own ethnic community, and wider society. These activities included looking after grandchildren, knitting garments for children in hospital, working voluntarily in community organisations such as 'Red Cross' and libraries, and volunteering at Auckland city homeless shelter. Conclusion : This study reveals that elder Indian, Chinese, and Korean migrants make a significant social contribution. Participants expressed a sense of duty to give back to New Zealand society in recognition of the multiple ways in which government assists them to live in the country at an older age. Keywords : Older immigrants, Social participation, Civic society

OP27 209-S-5

TRAJECTORIES OF ELDERLY'S LIFE SATISFACTION AFTER THEIR RETIREMENT: A LONGITUDINAL GROWTH CURVE MODEL FOR CHANGE

Dongbae KIM¹, Byungsun YOO², Youngkwang OH¹, Yohan JUNG¹ (1. Graduate School of Social Welfare, Yonsei University, Korea; 2. Gyeonggi Welfare Foundation, Korea)

Introduction : This study has a purpose to analyze trajectories of life satisfaction of the elderly after their retirement and how the characteristics of individual and social relationship have an effect on the life satisfaction. Method : This study has investigated the Korean elderly (age ≥ 55), using the data from three waves (1st wave (2005) ~ 3rd wave (2009) of the Korean Retirement and Income Panel (KReIS). Data analysis has been used to identify the predictors of the intercept and slope related to the life satisfaction after retirement, focusing the trajectories of the elderly's life satisfaction after retirement and individual characteristics and social relationship with application of the growth curve model by Amos 20.0. Results : First, the intercept of the elderly's life satisfaction after retirement was somewhat below average. Life satisfaction averagely increased little by little from 1st wave to 3rd wave. Second, by conducting the growth curve model, the study revealed that the intercept of the elderly's life satisfaction after retirement is high on individual characteristics (sex, educational level, economic status, health status) and in social relationship (family relations). Furthermore, individual characteristics (sex, educational level, economic and health status) asserted the meaningful variables in the slope of elderly's life satisfaction after retirement, otherwise there were no meaningful variables in social relationship. Conclusion : A variation of the elderly's life satisfaction after retirement has showed a wide variable breadth by the individual characteristics than the social relationship. It is a clue to indicate the importance of the individual preparation for the old age with economic and health status for improving the elderly's life satisfaction after retirement. Keywords : The Elderly, Life satisfaction after retirement, Individual Characteristics, Social relationship, Gr

OP27 209-S-6

AN ANALYSIS ON THE PREFERENCE OF LEISURE PROGRAM AND SENIOR'S SEGMENTATION OF SENIOR CENTER USING PREFERENCE PROGRAMS IN KOREA

J.H KIM¹, H.I Kim², J.I Wassel¹, (1. Gerontology, University of North Carolina at Greensboro, USA; 2. Physical Education, Cheong Ju University, Korea)

Introduction : The purpose of this study is to provide viable materials for the development of leisure programs for senior welfare centers for the betterment of senior's quality of living. Method : To conduct this study, image-based poster and 7 virtual image cards were created. A total of 406 people were surveyed at Senior Centers and their valid responses of the subjects were analyzed through SPSS 18.0. A conjoint analysis yielded relative importance of each factor and then a

perceptual map was acquired through a multidimensional scaling with the Part-worth estimate. Results : First, the most important program among the leisure's mentioned was the sports health. Second, the most preferred combination program of seniors was the combination of sports health and song/music program. Third, seniors preferred sports health and music programs, but Internet Information, Language Education and Art creation programs were not. There were old program such as song/music, Language Education and dance included in the category. On the other side, the new programs were Spots Health, Internet Information and Art Creation. Fourth, the five groups were identified through cluster analysis namely; Preference Sports health, Preference Sports health and Music, Dissatisfaction Welfare, Non preference Dance Program, Preference Internet Information, and Language Education groups. Fifth, Preference Internet Information, and Language Education groups showed the highest level in education and the dissatisfaction welfare program group showed the highest level during the period of participation in the said program. Conclusion : Programs should be presented and applied to meet the needs of the elderly. Ahead rather than weak and dependent elderly, healthy, self-reliant and active social policy issues for seniors, which have to have changes in the resource, have to be prioritized. Therefore, this research should be welcomed to help an aging society in favor to a program that is required by the elderly people and to let the program provides physical, mental, social, and intellectual improvement. Improving the quality of life of the elderly and operating a stable and vibrant elderly living have to be taken into course considerably. Keywords : Leisure programs, preference program, welfare center.

**OP27 210-S-1
IMPACT OF PRIVATE SOCIAL NETWORKS ON HOME CARE SETTINGS - CHALLENGES AND OPPORTUNITIES**
Martina ROES (*Institute for Quality and Case Management, University of Applied Sciences, Germany*)

Introduction : Network analysis focuses on the relations among actors and see individual people nested within networks of face-to-face relations with other persons. Often these networks of interpersonal relations become 'social facts' and take on a life of their own. A social network represents the close relations among a set of people. In Home Care, a case manager not only works with the patient but with their family members, their friends or the neighbors and with the professional staff (if needed). Method : 17 case managers (working for a private insurance company) were asked to draw pictures of the social network for one of their cases, which represents their view on the social (private and professional) network. The drawn network (social entities) included the role of all people, their way to interact with each other and information about how strong the connection seemed to be. Thus it was possible to calculate the stability of these networks and to identify 'structural holes'. Results : In six out of 17 cases the out-patient did not have a social network to support the care at home. In seven out of 17 cases the out-patient did have a social network, but a weak one; thus the ability to stay at home relied on the support from a direct family caregiver and the case manager. Only in 3 out of 17 cases a stable social network could be identified. Conclusion : Homecare services have to add the analysis of the stability of the social network in their assessment. Keywords : social networks, family caregiver, counseling

AN EXERCISE INTERVENTION FOR FRAIL ELDERLY**

USING DAY-CARE SERVICES IN THE COMMUNITY IN JAPAN

Akane OHGANE¹, Yuto IMAI², Toru SOMEYA², Masaru OKAMOTO², Hiroyuki SHIMADA³, Naoshi SHINOZAKI⁴, Takao SUZUKI⁵ (*1. Sports & Health & Welfare, Yamaguchi University of Human Welfare and Culture, Japan; 2. Section for Research and Development, Wellness Frontier Co. Ltd., Japan; 3. Section for Health Promotion, National Center for Geriatrics and Gerontology, Japan; 4. Cornea Center, Tokyo Dental College Ichikawa General Hospital, Japan; 5. Research Institute, National Center for Geriatrics and Gerontology, Japan*)

Introduction : This study examines the effects of a new systematic exercise approach on physical functions in the frail elderly. The approach provides a 3-hour light and mixed exercise program to the elderly who attend day-care center. Method : There were more than 1220 participants for the study, and all were community-dwelling men and women (mean age \pm standard deviation = 74.5 \pm 9.5) with mild to moderate physical frailty. The group-based exercise was provided for 3 months to participants who were admitted to a day-care center at 8 towns in the Tokyo area. Mixed exercise programs consisted of rhythmic dancing performed in a seated position, gait training, balance training, operating fingers, and aerobic and resistance training by machines were performed in one room twice a week. Participants were assessed by functional measures before and after a 3-month intervention using the same methods. Functional measurements included grip strength, static balance with eyes opened, functional reach, a sit-and-reach test, bar-gripping reaction time, a 5m walking time, timed up and go, and a 2min step test. Results : All functional measurements stated above increased significantly ($P < 0.05$) in participants over the follow-up period. Conclusion : The light and mixed program provided for the frail elderly in day-care centers can improve the physical function in the Japanese elderly living in the community. Our results indicate that an appropriate exercise program can be effective for reducing frailty and increasing autonomy for the frail elderly under the Japanese long-term-care insurance system. Keywords : frail elderly, mixed exercise, day-care service

OP27 210-S-4 PREDICTORS OF UNPAID CAREGIVER'S HEALTH OUTCOMES IN THE U.S.

Yura LEE, Iris CHI (*School of Social Work, University of Southern California, USA*)

Introduction : Older adults with chronic disease require great amount of caregiving from their family members and this may cause considerable caregiving burden. Previous caregiving studies often focused on caregiver's general health status rather than specific health outcomes related to caregiving experiences. The purpose of this research is to investigate the predictors of caregiving-related health based on Pearlin's Stress Process Model. Method : "Caregiving in the U.S." data was collected in 2009 by interviewing caregivers, who provided unpaid care to a child or an adult in the last 12 months. The data included 858 White, 200 African-American, 201 Hispanic, and 200 Asian-American caregivers. For this study, 1,397 caregivers of adult age 50 and older were investigated. Multinomial logistic regression analysis was conducted to test the predictors of caregiving-related health, categorized into three responses ("made better", "not affected it", "made worse"). Results : The study result showed that Hispanic (OR=1.81, CI=1.01-3.25), spouse (OR=3.49, CI=1.23-9.92), and helping ADLs (OR=1.16, CI=1.02-1.31) were significant predictors of reporting "made it better" health versus "not affected it". On the other hand, African American (OR=0.49, CI=0.28-0.88),

adult/grandchildren (OR=1.59, CI=1.08-2.33), helping IADLs (OR=1.23, CI=1.09-1.39), physical (OR=1.18, CI=1.01-1.37) emotional (OR=1.86, CI=1.59-2.18), and financial strains (OR=1.25, CI=1.09-1.44) were significant predictors of reporting "worse" health versus "not affected it". Conclusion : This study suggests that unpaid caregivers need specified support based on their different race/ethnic backgrounds and different types of (physical, emotional and financial) strains they face. It also suggests more available services for both caregivers and care recipients to actively seek support and improve their quality of life. Keywords : unpaid caregivers, caregiving health

OP27 210-S-5

A QUALITATIVE STUDY ON THE INTRODUCTION OF MARKET-FRIENDLY POLICY AND ITS RESULTS OF THE NEW LONG-TERM CARE INSURANCE SYSTEM IN KOREA
Yongho CHON (*Elderly Welfare, Namseoul University, Korea*)

To cope with the rapid growth in its aging population, the Korean government introduced compulsory long-term care insurance (LTCI) for elderly people in July 2008, becoming the second country in Asia to establish social LTCI. The existing LTC infrastructures were unable to meet the increasing needs of elderly people, particularly as regards the number of service providers and the size of the care workforce in Korea. The Korean government decided to adopt market-friendly and deregulatory policies in developing a new LTC service infrastructure, an approach that has led to significant growth in the number of certified service providers and personal care workers in Korea. This study aims to understand how home visiting service providers experienced and evaluated the market-friendly policies in the Korean LTCI system. I conducted semistructured in-depth qualitative interviews with 20 home visiting service providers in a city. The findings suggest that interviewees had negative experiences with the marketisation of long-term care service owing to severe competition among service providers. They endeavored to increase the number of cases and some of them adopted illegal practices. The findings suggest that the government should be actively involved in minimizing such challenges. Keywords : Long-term Care, Care Worker, Market

OP27 211-S-1

EXTRACARE, A HOME FOR LIFE?: A RESIDENT'S PERSPECTIVE

Paul NASH, Vanessa BURHOLT (*Centre for Innovative Ageing, Swansea University, United Kingdom*)

Introduction : The creation of new, and expansion of existing 'extracare' schemes demonstrates high levels of interest in assisted living environments for older people within the UK. The assumptions behind extracare developments are that they will enable older people to live for longer in their own homes, utilising a range of care and support services, promoting their health and well-being. Method : 180 older people in Wales participated in a mixed methodological approach using validated scales and quantitative measures with physical assessments and semi-structured interviews. Results : The Survey showed, of those in receipt of care, the fittest older people (cognitively & physically) resided in extracare facilities. Further, through one-to-one interviews, extracare residents were the least sure about their future. Residents highlighted concerns about their ability to remain in place citing perceptions about the inability of facilities to meet their changing needs especially regarding cognitive decline. Conclusion : By 2051 it is estimated that 17% (115.4 Million) of the

global population will be living with, and requiring some form of support for dementia (US Census, 2010). Of those people with dementia, increasing numbers will be living in assisted living/extracare environments. The Welsh Government pledged £41 million stating "...currently we do not know whether extracare accommodates the changing needs of both fit and frail older people.". Current findings demonstrate the need to inform both residents and policy makers about what can be expected from assisted living and whether it can indeed meet the needs of fit and frail older people. Keywords : Extracare Housing; Care levels; Dementia

OP27 211-S-2

FAIR SEX AND UNFAIR LIFE: THE SITUATION OF ELDERLY WIDOWS IN KERALA, INDIA

Jacob John KATTAKAYAM (*Dept of Sociology, University of Kerala, Centre for Gerontological Studies, India*)

Introduction : India's elderly population is growing very fast and those over 65 are overwhelmingly females. India is home to 42.4 million widows, constituting a marginalized group because of their low social status, living in deplorable conditions. They are often viewed as inauspicious. The increasing longevity among widows in Kerala has intensified their problem. 13 % of Kerala's population is above 60 years of age and majority are widows. Method : Stratified random sample survey consisting of 250 aging widows in Kerala on the basis of age group, marital, religious, educational and caste status, type of family and professional status are done. A conceptual framework has been developed for analysis. Results : Social customs inhibit women from re-marrying, resulting in an increased likelihood of women ending up alone. Social bias often results in unjust allocation of resources, neglect, abuse, exploitation, gender-based violence. Besides, lack of access to basic services and lack of ownership of assets aggravate their hardships. Psychological and emotional aspects of widows, especially the elderly are often taken for granted. Older widows are doubly affected due to the combined effects of aging and widowhood. Social security mechanisms in place are well below satisfactory level. Conclusion : Widows face difficulties like social, economic, health and emotional because of advanced age and ageist attitudes. Remedies for tackling their problems and improve their status are also suggested. Keywords : Elderly, Widowhood, Social Security

OP27 211-S-3

OLD AGE INSTITUTIONS: AN ENDURING SOCIAL AND PHYSICAL FORM

Andrew SIXSMITH (*Gerontology Research Centre, Simon Fraser University, Canada*)

Introduction : Institutions have been the backbone of the caring services for older people throughout the modern era. While we have witnessed the emergence and passing of different paradigms in our understandings and social responses to aging and old age, the essential form and role of the institution remains largely unchanged. This presentation will trace the (non)evolution of the institution as a socio-physical apparatus for the reproduction of coercive social relations that frame the everyday lives of many older people. Method : The research is based on a reflexive methodology that combines academic autobiography, family and social history of institutions in England to describe, understand and explain the nature of the old age institution in modern societies. Results : Institutions (asylums, workhouses, geriatric hospitals, nursing homes, residential schools, etc.) have consistently been subjected to scrutiny, notably by writers such as Goffman and Townsend. Yet despite these powerful critiques, the institution has

endured as a social and physical form, often relabeled and dressed-up, but essentially the same. The historical analysis argues that the contingencies of the institution as a socio-physical apparatus (the nature of communal life, the regimes of care, resourcing) continue to regulate and impoverish the lives of the inmates. Conclusion : The enduring presence of institutions in the care of older people reflects modern society's inability to effectively deal with the "problem" of dependent old people. Keywords : Institutions, reflexivity, dependency

OP27 211-S-4

THEORIES OF SURVEILLANCE AND AMBIENT ASSISTIVE LIVING

Ben MORTENSON¹, Andrew SIXSMITH², Ryan WOOLRYCH³
(1. *Gerontology Research Centre, Simon Fraser University, Canada;*
2. *Gerontology, Simon Fraser University, Canada;* 3. *Department of Gerontology, Simon Fraser University, Canada*)

Introduction : Through the use of home automation, activity monitoring, and ubiquitous computing, ambient assistive living (AAL) technology is intended to provide unobtrusive support of activities of daily living and to extend the quality and length of time older people can live in their homes. Although AAL is designed to support independence and autonomy, concerns have been raised with how activity monitoring may affect user's sense of privacy. Drawing on the contributions of Foucault and Goffman, the purpose of this paper is to compare and contrast potential experiences of surveillance in four settings: private homes without AAL, private homes with AAL, institutional settings (i.e., residential care facilities) and public spaces. Method: We employed Foucault's concepts of self-discipline and governmentality and Goffman's ideas of dramaturgical analysis and total institutions, as a way of contextualizing AAL in relation to the sense of observation experienced in other settings. Results: Activity monitoring in AAL contributes to an erosion of the boundary between public and private space. This conflation threatens the existence of backstage areas that may enable public performance, although they are less constraining than total institutions. AAL has the potential to create a pseudo-panopticon, in which monitoring is continuously ongoing, but the types of activities that are recorded may be only crudely documented (e.g., "lying in bed" may include sleeping, reading, or watching television). Conclusions: The findings suggest that the manner in which activity monitoring is developed and introduced needs to attend to the unintended negative consequences associated with use of this technologically-based "clinical gaze." Keywords : Surveillance, Ambient-Assisted Living, Privacy

OP27 211-S-6

EXPLORING THE HOUSING AFFORDABILITY OF OLDER HISPANIC HOUSEHOLDS (65+) IN THE UNITED STATES

Mira AHN¹, Sung-Jin LEE², Kathleen PARROTT³ (1. *Family and Consumer Sciences, Texas State University - San Marcos, USA;*
2. *Family and Consumer Sciences, North Carolina Agricultural and Technical State University, USA;* 3. *Apparel, Housing, and Resource Management, Virginia Tech, USA*)

Introduction : Among the increasing elderly population in the United States, especially older Hispanic population is the fast growing segment. According to the report from the Administration on Aging (AOA) in 2010, the Hispanic older population made up 6.8% of the older population in 2008. However, by 2019, the Hispanic population aged 65 and older is projected to be the largest racial/ ethnic minority in this age group. The purpose of this study is to explore the housing affordability of older Hispanic households (65+) in the United States. Method : A secondary data set, the biennial 2009 AHS, sponsored by

the U.S. Department of Housing and Urban Development (HUD) and conducted by the U.S. Census Bureau was used. With the sample for this study (N=595), binary logistic regressions were employed to find relationships between housing affordability and other variables. The dependent variable of this study is housing affordability (ratio of family incomes to housing expenses) and independent variables include socio-demographic and housing variables. Results : Selected findings are: the elderly Hispanics, who were older or U.S. citizens; who had larger incomes or a smaller number of household members; who lived in the South or a smaller structure size, were more likely to afford their housing. Conclusion : The results show housing affordability of the older Hispanic households in the United States is related to several demographic and housing factors. It implies some specific groups such as who are not citizens, younger, or living in non-Hispanic popular areas (non-South) have more housing challenges. Keywords : Elderly Hispanic population, Housing affordability, United States

INTEGRATED MODELS OF CARE II

OP27 212-R-1

MOBILEAGE: A HOSPITAL-BASED INTERVENTION FOR MEDICALLY IMPAIRED OLDER DRIVERS

James D. STOWE (*Trauma Services, University of Missouri Hospital, USA*)

Introduction : The MobileAge intervention is a form of hospital-based Mobility Transition Counseling (MTC) for older drivers with medical impairment. The intervention uses a collaborative, peer-led, and individualized format to aid the older driver in moving to alternative forms of transportation when they become unsafe to drive. The approach is in contrast to the popular, yet ineffective, approach of age-based screening for all older drivers. Method : Two US research and referral hospitals were used to evaluate the MobileAge intervention in a healthcare setting. Ninety older drivers with specific medical conditions were targeted random assignment to experience Mobility Transition Counseling (n = 90) or the control condition of regular hospital care (n = 30). Participants will receive two intervention sessions over a period of six months. Sustained email or phone contact helped to support the participant during implementation of a mobility plan. Repeated measures ANCOVA, and hierarchical multiple regression were used to assess outcomes. Results : Preliminary results appear to indicate increased readiness to cease driving, fewer risky driving behaviors, and increased self-rated health for the intervention group, while controlling for age, cognitive health, and race. Additional time in the intervention will be necessary to analyze full results. Conclusion : MobileAge may be an effective approach for aiding the most dangerous older drivers in moving to alternative forms of transportation. It avoids penalizing healthy, safe older drivers and can be implemented by non-physicians in a variety of healthcare settings. Keywords : transportation, mobility, drivers

OP27 212-R-2

ACCESSING INFORMATION BEFORE THE POINT OF NEED - A CADENZA INITIATIVE TO DIGITALIZE PRE-DISCHARGE PLANNING FOR OLDER PATIENTS AND THEIR FAMILY MEMBERS

Lisa P.L. LOW (*Nethersole School of Nursing, The Chinese University of Hong Kong, Hong Kong*)

Introduction : In this day and age, timely discharge is paramount. Discharge planning of older patients is a daunting time often

characterized by the challenges of time constraint and limited access to information. Yet, the discharge process and impacts of such challenges on the patients, families and nurses is lacking. An integrative perspective of the discharge process and needs from the patients, families and nurses in the phase 1 study will be presented from a 4-year study to digitalize discharge planning by developing an eLearning Information Package (eLIP) to help make decisions about discharge locations. Method : The perceived discharge needs of older patients from the hospital were examined through interviewing 181 participants in acute and convalescent hospitals. Data were analyzed using MAXQDA. Results : An overarching theme 'accessing information before the point of need' emerged, highlighting the need to know how to ask questions about 'what', 'where' and 'how' to access relevant and appropriate information about caring for older people following discharge. The time of receiving information was preferably 'before the point of need'. Some participants described confronting a time lapse and information being outdated when the patient did not have a 'real need' to receive such information. A categorization of discharge needs and perceived solutions were derived. Modes of obtaining information revealed verbal, written and electronic sources. Conclusion : Discharge process for older patients is characterized by a sense of urgency, quick decision-making to meet multiple needs, and limited participation among stakeholder groups. Digitalizing pre-discharge programmes will promote autonomy and overcome time constraints among its users. Keywords : Discharge, Needs, Older patients

OP27 212-R-3

NARRATIVE THERAPY IN RECONSTRUCTING THE MEANING OF LIFE OF STROKE SURVIVORS: FINDINGS FROM A RANDOMIZED CONTROLLED TRIAL

Esther Oi Wah CHOW (*Applied Social Studies, City University of Hong Kong, Hong Kong*)

Introduction : To examine the effectiveness of narrative therapy (NT), use of life narrative, in helping stroke survivors (SS) to externalize their experiences, reconstruct the identity and their meaning of life. Method : A randomized controlled trial was conducted to SS who had stroke within 2 years and aged over 59. SS participants were recruited from five different hospital clusters, and intervention was taken place in the older adults' district community centers. Fifteen intervention and fifteen control groups were carried out for eight weekly sessions. SSs were assessed at baseline, interim and post-intervention through face-to-face interviews. Repeated-measures ANOVA were used to assess the group changes throughout these three time-points on their self-esteem, proactive coping skills and meaning of life. Results : 181 SS were randomly assigned to intervention groups (n= 91) or control groups (n= 90). Significant group and time changes were found in self-esteem (F=4.78, p=.01), proactive coping skills (F=5.52, p=.004), and their meaning of life (F=4.49, p=.01) after the intervention. Conclusion: NT was found effective in enhancing SS' self-esteem, proactive coping skills and the meaning of life. NT could be an alternative or even a better psychosocial intervention option in helping the stroke survivors and caregivers to ensure their strengths and wisdom, reconstruct the preferred identity and hold the positive & appreciative perspective of life. Keywords : Stroke rehabilitation, life narratives, meaning of life

OP27 212-R-4

WHICH OLDER PEOPLE DECLINE PARTICIPATION IN A PRIMARY CARE TRIAL OF PHYSICAL ACTIVITY AND WHY? INSIGHTS FROM QUANTITATIVE AND QUALITATIVE DATA

Christina VICTOR¹, Annabelle ROGERS², Tess HARRIS², Allison WOODCOCK³, Sally KERRY⁴, Derek COOK⁵ (*1. School of Health Sciences and Social Care, Brunel University, United Kingdom; 2. Population Health Sciences and Education, St George's, University of London, United Kingdom; 3. Department of Psychology, Royal Holloway, United Kingdom; 4. Pragmatic Clinical Trials Unit, Queen Mary, University of London, United Kingdom; 5. Population Health Sciences and Education, St George's University of London, United Kingdom*)

Introduction : Physical activity (PA) studies with older people are often associated with low recruitment, yet little is known about non-participants. Our study aims to compare participants and non-participants in a primary care PA trial and explore reasons for non-participation. Method : 60-74 year old patients from three Thames Valley general practices were invited to participate in a pedometer-based walking intervention with nurse support. Demographic characteristics of 310 participants and 983 non-participants were compared using practice records. 310 participants and 165 non-participants completed surveys (including health status; PA levels). Non-participants rated reasons for non-participation, 15 were interviewed in more depth. Results : Trial Recruitment was 32% (310/983). Participants and non-participants were similar in age, gender, living with a partner and reported health conditions. Non-participants were more likely to report a faster walking pace (p=0.004) and lived in more deprived areas (Index of Multiple Deprivation p=0.003). Main survey reasons for non-participation were: already active (66%); time constraints (47%); lack of interest (27%). Barriers to participation from interviews included: reluctance to walk alone or in the evening; physical symptoms; slower pace in retirement; depression; time restraints; lack of interest in PA; trial duration. Conclusion : Similarities in age, gender and health conditions between participants and non-participants are reassuring, but participants tended to live in less deprived areas and reported slower walking speeds. Interviewees supported the idea of general practice based PA studies, but a shorter more flexible engagement and addressing physical symptoms and lack of confidence in pursuing PA may increase trial recruitment and uptake of practice-based PA endeavours. Keywords : Physical activity uptake

OP27 212-R-5

DOES A HOTLINE FOR GENERAL PRACTITIONERS IMPROVE THE CARE OF OLDER FRAIL PATIENTS? A PILOT STUDY

Nathalie SALLES¹, Leila DIALLO¹, Marie-neige VIDEAU¹, Marie FLOCCIA¹, Jerome CHARRIEU², Muriel RAINFRAY¹ (*1. Pole de Gerontologie Clinique, CHU Bordeaux, France; 2. Direction Generale, CHU Bordeaux, France*)

Introduction : Difficulties in managing complex situations for elderly people living in the community and lack of communication between primary care physicians and geriatric specialists may predict avoidable Emergency Department (ED) admissions for older patients. The aim of this study was to evaluate the impact of a hotline on reducing avoidable ED admissions for older patients. Methods: This experiment was set up by representatives of the Regional Union of General Practitioners (GP), and both the Pole of Gerontology and the Direction of the University Hospital of Bordeaux. The missions of the hotline were: 1) to meet the expectations of GPs by allowing a direct call with a geriatrician every day, Monday to Friday (9 AM to 7 PM) and 2) to give medical advices and alternatives to ED admissions, i.e., geriatric consultation, day hospital, and programmed geriatric medicine hospitalizations. Results: A total of 714 calls were recorded (Nov.

2010 - Feb. 2012) for the management of 230 older persons (mean age 86.2-6.2 years). The reasons for call were most of the time management of behavioral disorders (29.5%), unexplained asthenia (17%), repeated falls (13%) and complex social problems (10.3%). Only 4.3% of the patients were directly admitted to the ED and the hotline permitted to avoid ED admissions in 81.4% of cases. The hotline permitted to give advices to GPs (38.3%), and to organize geriatric consultations (5.3%), day hospital (9.2%) or hospitalization in geriatric medicine (42.9%). Conclusion : In conclusion, this hotline permitted to avoid ED admissions and to improve continuity of care for older patients. Keywords : hotline, GP, elderly

OP27 212-R-6

ACTIVATION OF THE PREFRONTAL AREA OBSERVED BY FNIRS: EFFECT OF SHAKING HANDS

Akemi KARIYA¹, Tatsumi YOSHINO², Satoshi IMAIZUMI³
(1. Health and Welfare Sciences, Gerontology Nursing, Prefectural University of Hiroshima, Japan; 2. Clinical Nurse, Kure Medical Center, Japan; 3. Health and Welfare Sciences, Prefectural University of Hiroshima, Japan)

Introduction : Hospitalization of elderly patients has been increasing in Japan. Management of delirium including hallucination and auditory hallucination after surgery and before and after treatment is important in many of these patients. The objective of this study was to collect basic data of changes in cerebral blood flow in order to develop a preventive intervention program before elderly patients develop delirium. Method : Cerebral blood flow in the prefrontal area and temporal lobe was measured using a near-infrared functional neuroimaging system in 12 college students from August to October, 2009. A total of 44 channel were used to measure the prefrontal area and temporal lobe. A Bonferroni t test ($p < 0.01$) was used to compare the data for the 7 volunteers in the main study, out of a total of 12 subjects and a t test ($p < 0.05$) for statistical analysis. Results : Blood flow based on oxy-Hb measurement decreased when subject performed calculations ($P < 0.001$). Oxy Hb was significant in the left temporal lobe. The act of Shaking hand performing a calculation establishes an amicable relationship, which is so far related to the prefrontal area. Therefore an increased oxyHb occurred or cerebral blood was activated, suggesting that Shaking hand maintained cognitive function. Conclusion : This study confirmed the effect of Shaking hands as a daily action based on changes in cerebral blood flow using f-NIRS, which can be a useful basic data in clinically care and preventive programs for delirium in elderly patients. Keywords : Elderly, delirium, shaking hands, functional neuroimaging (f-NIRS)

OP27 213-S-1

BELOW THE SURFACE: AN EXPLORATION OF THE CHALLENGES OF COLLABORATIVE RESEARCH

Jacque EALES¹, Robin MEANS², Norah KEATING¹ (1. Department of Human Ecology, University of Alberta, Canada; 2. Faculty of Health and Life Sciences, University of the West of England, United Kingdom)

Introduction : The emphasis upon interdisciplinary research by major funders permeates the current research milieu despite the extensive literature on the challenges of collaboration in practice and the more limited literature on research collaboration itself. This paper explores the collaborative experiences of a group of gerontological researchers. Method : The focus group format was used to ask Eleven Canadian

and UK researchers to describe one positive and one negative experience of collaborative research at a workshop at the University of Alberta. The group interview was recorded on digital voice recorders and transcribed verbatim. A combination of content analysis and axial coding was used to draw out key issues at each stage of the life span of a project (establishing projects; their ongoing life; and outcomes). Results : In terms of establishing projects, the sub themes of motivations for involvement, how teams were established and whether or not common research goals existed emerged as critical to whether or not positive or negative experiences occurred. With regard to the ongoing life of projects, governance, understanding stakeholders, communication and dealing with difficult personalities were the sub themes which emerged. In terms of outcomes it became clear researchers sometimes achieved good outcomes despite unsatisfactory experiences of doing the research but that on occasions one can be faced with little choice but to withdraw from the research altogether. Conclusion : It is argued that researchers need to engage with the messy realities of collaborative research and be willing to build bridges and not barriers when the inevitable tensions inherent in this dynamic research approach appear. Keywords : connectivity; social participation; volunteering

OP27 213-S-2

TOWARD A BETTER QUALITY OF LIFE AMONG LOW-INCOME OLDER PERSONS IN URBAN AREAS

Rina Kurniasri KUSUMARATNA, Adi HIDAYAT (Public Health, Faculty of Medicine, Trisakti University, Indonesia)

Introduction : Older persons have impaired functional status, cognitive function, and depression, affecting health status and quality of life (QOL). Improving their QOL and reducing barriers to health care access are major goals of healthy ageing. The aim of study was to assess functional status, cognitive function, depression and QOL among urban low-income older persons, to develop preventive actions for achieving healthy ageing. Method : Cross-sectional study on 136 low-income urban residents aged 60+ years. Assessment of socio-demographic profile, functional status, cognitive function and depression was by 45-minute face-to-face questionnaire-based interviews, and QOL by SF-36. Recruitment was by convenience sampling from two non-institutional groups in Jakarta, managed by non-profit community foundations (PUSAKA). Respondents met Indonesian low-income criteria. Analysis of sample characteristics and variable distribution was by descriptive statistics, differences in proportions by chi-square test and differences in means of independent factors to SF-36 scores by Kruskal-Wallis test, at $p < 0.05$. Results : Respondents' mean age was 67 ± 6.2 years (range 60 - 96 years); 86% was female, 72% illiterate, 76.5% without social activities, 31.6% underweight, and 24.2% overweight. Around 30.1% had poor QOL. Age, functional independence, cognitive function and depression ($p < 0.05$) had a significant association, particularly within physical and mental domains. Conclusion : Interventions are needed that assist urban low-income older persons to manage functional independence, cognitive function and depression. Educational and multidisciplinary approaches are needed to support better QOL at community level. Keywords : Quality of life, low-income, older persons

OP27 213-S-3

DEVELOPMENT AND INITIAL VALIDATION OF THE ATTITUDES TOWARD EDUCATION FOR OLDER ADULTS (AEOA) SCALE

Hyejin KIM, Neil ABELL, Leah Powell CHEATHAM (College of Social Work, Florida State University, USA)

Introduction : The purpose of this study is to validate a new scale assessing attitudes toward elderly education. Educational programs teaching basic computer skills and how to use the Internet have been expanded in the digital era. Senior centers are significant providers of such educational programs, and social workers are highly involved with the programs. Assessing social workers' attitudes toward elderly education is critical to increase the effectiveness of the educational programs. **Method :** The 42 items in the initial pool for the Attitudes toward Education for Older Adults (AEOA) scale were developed by focusing on the three subconstructs of attitudes (cognition, emotion, and behavior) across three age groups (young-old, mid-old, and old-old). The survey was administered to 252 college students in 2012. Several reliability and validity analyses were conducted. **Results :** 38 items were retained in the final AEOA scale. All α coefficients were over .80; stratified α was .96; and the results of SEMs were acceptable. In terms of the validity, CFA indicated a good model fit: the chi-square ratio lower than 2.5, the CFI greater than 0.95, and the RMSEA and the SRMR lower than 0.08. Respondents who were older, who had work experiences with older adults, and who had positive attitudes toward older adults and aging ($r = .37, p < .01$) were positively associated with the AEOA scale. **Conclusion :** The AEOA scale was successfully developed and validated. The scale expands this area of gerontological research and provides a new tool for better assessing attitudes regarding educational opportunities for older adults. **Keywords :** older adult education, attitudes toward older adults, scale development

OP27 213-S-4

THE EFFECTS OF INCORPORATING INTERGENERATIONAL LEARNING INTO SOCIAL GERONTOLOGY COURSE

Stephanie Yu-Ching CHEN (*Adult and Continuing Education & Elder Education, National Chung Cheng University, Taiwan*)

Introduction : Many researches indicate that college students manifest slightly negative attitudes toward older adults and are reluctant to engage in occupations that entail services for elders. This study incorporated intergenerational learning into social gerontology course to improve college students' attitudes toward older adults and adopted a nonequivalent pre-post test design to evaluate the teaching effects. **Method :** The experimental group consisted of 22 college students studying "Social Gerontology," whereas the control group consisted of 26 students taking "Advanced Audio-Visual Communication." In the experimental group, we invited 25 people aged of 55 years or above to attend the class for the semester and reorganized the course design with intergenerational co-learning and reflective activities. In the control group, the students were required to perform a group assignment regarding an elderly person's life story in a digital form without elders attending the class. The evaluation tools included quantitative indicators such as knowledge about aging, attitude toward elders and behavior intention toward elders, fulfillment rates for teaching objectives, and teaching satisfaction. Furthermore, qualitative information, such as course observation, weekly reflective journal and final report for students, was included. **Results :** The results showed that all three indicators regarding aging had significant differences, the fulfillment for teaching objectives corresponded with the previous results, and the teaching satisfaction evaluations indicated high scores. **Conclusion :** Based on these results, we propose that long-term participation in intergenerational learning is an impetus not only for transforming college students' aging knowledge and attitudes toward elders but also their inclination to serve elders. **Keywords :** Intergenerational learning, elder education

OP27 213-S-5

THE MODEL DEVELOPMENT OF QUALITY ASSURANCE FOR ELDERLY CARE ASSISTANT

Siriphan SASAT¹, Branom RODCUMDEE¹, Tuanjai PUKDEEPROM²
(1. *Faculty of Nursing, Chulalongkorn University, Thailand*;
2. *Medical Department, Surathani General Hospital, Thailand*)

Introduction : Socio-economic trends in Thailand are challenging the ability for older adults to remain in their homes can cared for by family members when health care needs emerge. Nearly half (48%) of older Thai people have chronic illnesses (TGRI, 2008) which may lead to increasing disability, dependency and need long-term care. Families and older persons, seeking extra help in the home has fueled the growth of the elderly care assistant industry. Without clear quality assurance guidelines for training programs, elder care assistants may function beyond the scope of their abilities with the potential for elder abuse or being exploited themselves. **Method :** A qualitative research method with focus group interviews and public hearings were conducted with key stakeholders to study the preferable characteristics of care assistants and a quality assurance model for elder care assistant training programs. **Results :** Content analysis revealed that desirable characteristics of elderly care assistants should consist of 3 components; knowledge, attitude and practice. The model development of quality assurance for elderly care assistant consisted of 8 components; applicants, admission, teaching and learning, management, financial and budget, graduate, follow-up graduate, and system and mechanism of quality assurance. Each component can be explained in 3 types of quality measures, including a descriptive index, a qualitative index and quantitative indicators. **Conclusion :** All elder care assistant training schools are encouraged to incorporate quality assurance methods and to evaluate the application process in their training programs. **Keywords :** Elder Care Assistant, Model Development, Quality Assurance

END-OF-LIFE CARE II

OP27 214-S-1

FACTORS OF GOOD COLLABORATION FOR END-OF-LIFE CARE AT HOME: QUESTIONNAIRE SURVEY TO JAPANESE HOMECARE NURSES, CARE MANAGERS AND HOME HELPERS

Noriko YAMAMOTO-MITANI¹, Yuko OKAMOTO², Ayumi IGARASHI², Miho SUZUKI¹, Masakazu NISHIGAKI¹, Maiko WATANABE¹ (1. *Adult/ Palliative Care Nursing, U of Tokyo, Japan*;
2. *Gerontological Nursing, Tokyo Medical & Dental U, Japan*)

Introduction : There is a pressing need to learn how we can collaborate inter-professionally in providing end-of-life care for the elderly at home. **PURPOSE:** To identify factors of "good collaboration" as it is evaluated by the professionals. **Method :** Participants were homecare nurses, care managers, and home helpers with experiences of collaboration with the other two professionals in providing end-of-life care. In a cross-sectional questionnaire survey, we asked them to report actual collaborative activities for a recent case as well as their evaluation regarding their collaboration for this case. Logistic regression analyses were used to examine the factors of good collaboration. **Results :** Questionnaires from 109 nurses, 129 care managers, and 63 home helpers were used where data were available on collaborative activities among all three parties. Among homecare nurses, working with a care manager with whom they had multiple collaborative experiences, the client being independent for their toileting soon before the death, and sharing information regarding the

client's end-of-life decision with home helper at 1 month before dying, were significant factors. For care managers, the client being dependent for their toileting, needing palliative care and having such symptoms as edema or fever at 1 month before dying were significant factors. For home helpers, working at the agency with fewer collaborative agencies, having inter-agency conference 1 week before dying, and sharing information with homecare nurse regarding the current condition 1 month before dying, were significant factors. Conclusion : The results highlighted characteristics of how each professional seeks to collaborate in providing end-of-life care. Keywords : End-of-life care, interprofessional collaboration, homecare nurses

OP27 214-S-2

CARE MANAGERS' CONFIDENCE IN PROVIDING END-OF-LIFE CARE FOR THE OLDER PERSON AT HOME IN JAPAN

Maiko WATANABE¹, Noriko YAMAMOTO-MITANI¹, Yuko OKAMOTO², Ayumi IGARASHI², Masakazu NISHIGAKI¹, Miho SUZUKI¹ (1. *Adult Nursing / Palliative Care Nursing, University of Tokyo, Japan*; 2. *Gerontological Nursing, Tokyo Medical and Dental University, Japan*)

Introduction : Care managers are expected to coordinate end-of-life care services for the older person at home in Japan. The objective of this study was to examine care managers' confidence in providing end-of-life care for the older person at home and its factors. Method : Subjects of this cross-sectional survey were care managers from 1,200 agencies in Japan that were selected randomly from the national database. Subjects were asked about their overall confidence in providing end-of-life care for the older person at home. Their demographic characteristics and professional experience were also asked. Multiple logistic regression analysis was used to examine the factors of care managers' confidence. Results : Four-hundred and fifty eight valid responses (response rate = 39.4%) were obtained. Ninety-four (20.2%) were men, their mean age was 49.2 years (SD = 8.8), and years of experience as care managers was 7.1 years (SD = 3.1). Background professional licenses were: 228(49.8%) care workers, 129 (28.2%) nurses, 28 (6.1%) home attendants, and 50 (10.9%) social workers. Care managers who expressed confidence in providing end-of-life care at home was 335 (59.9%). Multiple logistic regression analysis showed that significantly more care managers with registered nursing license showed confidence in end-of-life care than those without nursing license (OR 2.71, 95% CI 1.26-4.74) after adjusting for demographic variables as well as variables pertaining to their experiences as care managers. Conclusion : To improve confidence in care managers' end-of-life care, we need to learn more the educational needs of those without nursing license and provide them appropriate education. Keywords : End-of-life care, Confidence, Care managers

OP27 214-S-3

ONLINE RESOURCES SUPPORTING END OF LIFE CARE

Jennifer TIEMAN (*Palliative and Supportive Services, Flinders University, Australia*)

Introduction : Patterns of disease, dying and death are changing as the world's population ages, and as serious life-limiting illnesses such as dementia, cardiovascular and respiratory diseases, and cancer increase. People affected by the need for palliative care such as patients and aged care residents and their family, carers and friends as well as the health professionals providing their care, need access to evidence-based information on end-of-life issues. Method : A project to develop an online resource to meet the palliative care information needs of health and social professionals and of health consumers was funded by the Australian Government's Department of Health and Ageing in

2006. Working with clinical, community and policy stakeholders from across Australia, the project team designed, developed and tested a web-based set of palliative care resources. Results : The CareSearch website (www.caresearch.com.au) was launched in May 2008. Among the resources to support clinicians and health consumers are knowledge hubs (including a Residential Aged Care Hub), patient and carer information and tools, search filters that facilitate access to the existing and emerging literature and evidence, and a research data management system. Each month, more than 40,000 visitors use the site and over 400,000 content pages are viewed. Conclusion : The CareSearch Project has developed evidence-based resources to support palliative care across the community. The needs of older people as they approach the end-of-life have been explicitly recognised in the structure and content of the website. Keywords : palliative, end of life, website

OP27 214-S-4

THE INVISIBLE NETWORK OF 'HANDS ON' CAREGIVERS AT THE END OF LIFE

Catherine Mary BURNS¹, Currow C. DAVID², Amy P. ABERNETHY³ (1. *Discipline of Palliative & Supportive Services, School of Medicine, Flinders University, Australia*; 2. *Professor, Palliative & Supportive Services, School of Medicine, Flinders University, Australia*; 3. *Division of Medical Oncology, Department of Medicine, Duke University Medical Center, USA*)

Introduction : Aim This population study seeks to explore the nature of bereavement over the life course and examine caregiver activity within this setting. Method : An Australian study conducted an annual randomized health population survey (n=23,706) to obtain a sample of self-identifying bereaved (n=7915). This group was closely representative of the total population in most key socio-demographic details including gender, marital status, income, occupation, place of residence and birth. Results : People of all ages indicated they undertook 'hands on' care at the end of life. The core group of 'active caregivers' did so on a daily or intermittent basis (22%), with a further 7% engaged on a rare basis. They were related to the deceased either as close family, that is a spouse, parent or child or as a sibling, extended family member or a friend. People married for a long time sought to care for their spouses till death including some people aged over 80 years. Surprisingly, 14% of active caregivers were young, aged between 15 and 29 years. A distinctive profile based on availability drove caregiving amongst the middle years. Females most likely to provide daily 'hands on' care had frequently never married or were widowed. Siblings, Extended Family members and Friends accounted for more than half (n=1222) of the 2028 respondents. Conclusion : This substantial network of supportive caregivers is mainly invisible to the health team. Clinical practice changes are urgently needed to identify potential social support that could be an important resource for patient end of life planning and care. Keywords: end-of-life care, caregivers, 'invisible network'

OP27 214-S-5

IMPACTS OF A PALLIATIVE CARE PROGRAM ON OLD AGE HOME STAFF'S WILLINGNESS, COMPETENCIES AND SELF-CARE: A PROSPECTIVE COHORT STUDY

M.F. Edward LEUNG¹, M.C. Samantha PANG², Y.L. Helen CHAN³, Y.K. Erica NG¹ (1. *Research and Development Division, Hong Kong Association of Gerontology, Hong Kong*; 2. *School of Nursing, The Hong Kong Polytechnic University, Hong Kong*; 3. *The Nethersole School of Nursing, The Chinese University of Hong Kong, Hong Kong*)

Introduction : Promoting palliative care to frail older people has

widely been advocated. While considerable attention has been given to identifying care needs of the older people, little is known about the readiness of the care home staff for the care provision. Method : This was a prospective cohort study aimed to examine the impacts of a Palliative Care Program in four old age homes. It is a multidisciplinary comprehensive program with educational and clinical components. A specialized room was also set up for residents in need of intensive palliative care. The effects of the program were evaluated at baseline (T1) and after 12 months (T2). Of the various outcome measures, influence of the program on care home staff was assessed in terms of their willingness, competencies and self-care related to palliative care provision by means of a 16-item questionnaire. Results : There were 247 and 225 completed questionnaires at T1 and T2 respectively. Almost half of the respondents were frontline staff, with more than five years of clinical experience. Their mean scores at baseline were 3.31 ± 0.60 (willingness), 2.81 ± 0.68 (competencies), and 3.31 ± 0.66 (self-care). Significant improvement was noted in competencies (mean change: $+0.16$, $p=0.012$) and self-care (mean change: $+0.27$, $p=0.000$) over the study period. Conclusion : Findings of the study showed the program is effective in improving knowledge and skills for the care delivery, in particular among the frontline staff. The program was also effective in enhancing self-care in view of stress arise from caring for residents near the end of life. Keywords : End-of-life

OP27 215-S **CENTENARIANS & LONGEVITY**

OP27 215-S-1 **CROSS-NATIONAL COMPARISONS IN FUNCTIONAL CAPACITIES AMONG CENTENARIANS**

Jimyoung CHO¹, Keonyeop KIM², Peter MARTIN³, Hyunjee KIM⁴, Marcia G. ORY⁵, Leonard POON⁶ (1. Center for Applied Health Research; School of Rural Public Health, Scott & White Healthcare; Texas A&M Health Science Center, USA; 2. School of Medicine, Kyungpook National University, Korea; 3. Gerontology Program, Iowa State University, USA; 4. School of Medicine, Chungnam National University, USA; 5. School of Rural Public Health, Texas A&M Health Science Center, USA; 6. Institute of Gerontology, University of Georgia, USA)

Introduction : The importance of functional capacity among oldest-old adults is now well documented. The purpose of this study was to investigate cross-national differences in functional capacities of centenarians from two countries: United States and South Korea. Method : One hundred and seventeen centenarians from the Georgia Centenarian Study in the United States (US) and seven hundred eighty centenarians from a census survey of the Korean National Statistical Office were used. Ten items of functional capacity were compared: using the telephone, shopping, doing housework, taking medicines, handling money, eating, dressing, walking, getting in and out of bed, and taking a bath. Results : Results showed that the Georgia centenarians were more likely to report fewer problems going shopping, taking medicines, handling money, eating, dressing, walking, and taking a bath than the Korean centenarians. Chi-square comparisons yielded significant differences in using the telephone, $\chi^2(1, N= 897) = 334.33$, $p < .001$; shopping, $\chi^2(1, N= 897) = 150.38$, $p < .001$; taking medicines, $\chi^2(1, N= 897) = 29.05$, $p < .001$; handling money, $\chi^2(1, N= 897) = 19.63$, $p < .001$; eating, $\chi^2(1, N= 897) = 15.90$, $p < .001$; dressing, $\chi^2(1, N= 897) = 22.77$, $p < .001$; walking, $\chi^2(1, N= 897) = 6.48$, $p < .05$; and taking a bath, $\chi^2(1, N= 897) = 71.63$, $p < .001$. Conclusion : These results emphasize the importance of considering cross-national differences in functional capacity in very late life. This study highlights the role of culture in everyday life

among oldest-old adults and longevity in different geographical and social contexts. Keywords : Centenarians, Functional Capacity, Cross-national comparisons

OP27 215-S-2 **ALTERNATIVE MEASURES OF HEALTH RATINGS FOR PREDICTING MORTALITY: IS PAST OR FUTURE ORIENTATION MORE IMPORTANT?**

Kenneth F. FERRARO, Lindsay R. WILKINSON (Center on Aging and the Life Course, Purdue University, USA)

Introduction : The purpose of this study was to compare the prognostic validity of alternative measures of health ratings, including those that tap temporal reflections, on adult mortality. Method : The study uses a national sample of 3,032 Americans surveyed in 1995, with vital status tracked through 2005, to compare the effect of three types of health ratings on mortality: standard indicator for self-rated health (SRH), social comparison form of SRH, and health ratings that incorporate temporal dimensions. Logistic regression was used to estimate the odds of mortality associated with alternative health ratings while adjusting for health conditions, lifestyle factors, and status characteristics. Results : Although self-rated health was a consistent predictor of mortality, temporal orientation to health was an independent predictor. Future health expectations were more important than past (recalled change) in predicting mortality risk: people with more positive expectations of future health were more likely to survive. Conclusion : The findings reveal the importance of future-time perspective for older people, and suggest that it is more useful to query older people about their future health expectations than how their health has changed. Keywords : survival, health ratings

OP27 215-S-3 **TRAJECTORIES OF POSITIVE AGING: OBSERVATIONS FROM THE WOMEN'S HEALTH INITIATIVE STUDY**

Oleg ZASLAVSKY¹, Nancy Fugate WOODS², Barbara COCHRANE³, Andrea LACROIX⁴ (1. Department of Nursing, University of Haifa, Israel; 2. Biobehavioral Nursing and Health Systems, University of Washington, USA; 3. Family and Child Nursing, University of Washington, USA; 4. Public Health Science Division, Fred Hutchinson Cancer Research Center, USA)

Introduction : Our analyses of data from the Women's Health Initiative participants yielded a two-factor index of positive aging: physical-social functioning and emotional functioning. Next, we described trajectories of positive aging indicators over time and differentiated among women by identifying those baseline characteristics that predict trajectory group membership. Method : Women ages 65 years and older who enrolled in one or more clinical trials and had data collection points on the positive aging indicators were included in these analyses (N=2,281). We used Group Based Trajectory Modeling to identify distinct subgroups of individuals, following a similar pattern of change over time on both dimensions of positive aging and multinomial logistic regression to identify baseline predictors of these trajectories. Results : A 5-trajectory model has been chosen to represent the data. These trajectories included Low Maintainer, Low Improver, Moderate Decliner, Moderate Maintainer and High Maintainer groups for Physical-Social function and Low Maintainer, High Improver, Moderate Decliner, Moderate Maintainer, High Maintainer groups for Emotional function. Using the Low Maintainers as the reference category High Maintainer group of Physical Social function was younger, lighter, had fewer symptoms of depression, chronic conditions or other somatic symptoms, was predominantly non-white, had less pain, was more physically active, had higher

optimism and had either moderate or mild alcohol consumption. Conclusion : This research has demonstrated that aging women are heterogeneous in terms of positive aging indicators over time. A number of distinct baseline characteristics had significant effect on a membership in each of the longitudinal trajectories. Keywords : positive aging, longitudinal trajectories, women's health initiative

OP27 215-S-4

DERIVING NORMATIVE VALUES FOR THE MMSE AND ACE-R FOR THE OLDEST-OLD

Melissa J. SLAVIN¹, Katrina GISKES¹, Charlene LEVITAN², Nicole A. KOCHAN², Henry BRODATY¹, Perminder S. SACHDEV² (1. Dementia Collaborative Research Centre, The University of New South Wales, Australia; 2. Centre for Healthy Brain Ageing, The University of New South Wales, Australia)

Introduction : The Mini-Mental State Examination (MMSE) and the revised Addenbrooke's Cognitive Examination (ACE-R) are tools used to estimate current cognitive status and screen for possible dementia. Their diagnostic utility among the oldest old (i.e. 95+ years) is limited due to lack of normative data and failure to account for sensory impairment. Method : Data from 200 men (29.5%) and women aged ≥95 years (mean age=97.3, SD=2.3 years) enrolled in the Sydney Centenarian Study (Australia) were used to establish normative values for these scales, and their association with a range of sociodemographic and sensory factors was examined. Results : Missing data, largely due to sensory impairment, was a significant issue: 18.3% of participants had a reduced MMSE denominator of 28 or below, 14.5% had a reduced ACE-R denominator of 90 or below. Scores were prorated for missing data, and still normative values for this age group were considerably lower than currently-used cut-offs derived from younger age groups. Mean prorated MMSE was 21.7 (SD=6.1), mean prorated ACE-R was 63.1 (SD=18.1). Residents of residential aged care facilities, participants with 10 years or less education, and participants with hearing or visual impairments were more likely to have low scores. Conclusion : Normative data specific to this age group are required for valid diagnostic classification, and such data need to take into account sensory impairment. The difficult task of teasing apart the relative contribution of sensory impairment versus genuine biological ageing is discussed further. Keywords : Cognition, Normative, Oldest-old

OP27 215-S-5

CHRONOLOGICAL EVALUATION OF SOCIO-ECONOMIC STATUS AND HEALTHY LIFE EXPECTANCY INDICATORS OF JAPANESE URBAN ELDERLY AND ASSESSMENT OF CAUSAL INTER-RELATIONSHIPS

Suwen YANG, Tanji HOSHI, Shuo WANG, Naoko NAKAYAMA, Fanlei KONG (Graduate School of Urban Environmental Science, Tokyo Metropolitan University, Japan)

Introduction : This study was conducted to make a chronological evaluation over 3 years of socio-economic status (SES) and healthy life expectancy (HALE) indicators (including activity limitation, chronic diseases and self-rated health) among Japanese urban elderly. Method : A questionnaire survey was administered to all people aged 65 years and over in A city in Tokyo in September 2001, and 13,195 (response rate of 80.2%) people answered. Then, a follow-up study was conducted in 2004. The data on 8,162 subjects were collected for analysis. Data analysis was performed using Structural Equation Modeling (SEM) by AMOS 17.0 for Windows. Results : The data were well fit by the models, with a NFI of 0.976, CFI of 0.978 and RMSEA of 0.033. SES in 2001 was observed to be significantly

predictive of each indicator, but the effects were minor for both sexes. The activity limitation in 2004 was found to be well explained by SES, self-rated health and chronic diseases (R² = 0.64 of men and R² = 0.66 of women). Chronic diseases were predictive of both self-rated health and activity limitation; however, the indirect effect of chronic diseases on activity limitation via self-rated health was stronger rather than its direct effect. Conclusion : It was suggested that SES as significant predictors of HALE; reducing chronic diseases and self-rated good health maybe predictive of decreasing activity limitation of elderly populations. Further research needs to be done to assess independent contributions of each HALE indicator on future mortality of the elderly. Keywords : socio-economic status ,healthy life expectancy indicators , structural causal relationship

OP27 215-S-6

LONGEVITY BLUE ZONES: A FIRST ATTEMPT TO IDENTIFY COMMON LONGEVITY DETERMINANTS

Michel POULAIN¹, Gianni PES², Anne HERM³, Christina CHRYSOHOOU⁴ (1. Estonian Institute for Population Studies, Tallinn University, Belgium; 2. Department of Clinical and Experimental Medicine, Università degli Studi di Sassari, Italy; 3. Estonian Institute for Population Studies, Tallinn University, Estonia; 4. Department of Cardiology, Athens Medical School, Greece)

Introduction : Longevity may be related to individuals (individual longevity) or to a populations as a whole (population longevity). When searching for the determinants of population longevity, the chance to find more powerful predictors is increased when most persons concerned are born and live in the same place and are more likely to share the same genetic make-up, early life conditions, traditional habits including the local diet. Method : The concept of Longevity Blue Zone (LBZ) has been defined as a rather limited geographical area where people share the same lifestyle and environment and whose exceptional longevity has been validated convincingly. This study is a first attempt to find common longevity determinants across the four LBZs identified so far. Results : LBZ populations are geographically and/or historically isolated. Island and mountains are favorable locations. The common characters that emerged from our surveys are a traditional lifestyle including locally produced food, an intense physical activity prolonged above 80, a reduced level of stress and large family and community support for the oldest olds. Conclusion : This is likely to have facilitated the accumulation of ideal conditions capable to limit the impact of the negative health factors found in most Western populations. These people experienced the epidemiological transition - and its implications - in relative recent times, and have succeeded in creating a delicate balance between the benefits of the traditional lifestyle and those of modernity (increased wealth, better medical care). All these factors could have promoted an ideal milieu for the emergence of long-lived phenotypes at the population level. Keywords : Longevity Centenarians Bluezones

OP27 216-S

FALLS I

OP27 216-S-1

CONCERN ABOUT FALLING IN OLDER WOMEN WITH A HISTORY OF FALLS: ASSOCIATIONS WITH HEALTH, FUNCTIONAL ABILITY, PHYSICAL ACTIVITY AND QUALITY OF LIFE

Radhika PATIL, Kirsti UUSI-RASI, Pekka KANNUS, Saija KARINKANTA, Matti PASANEN, Harri SIEVANEN (Accident and Osteoporosis Unit, The UKK-Institute for Health Promotion Research, Tampere, Finland)

Introduction : Fear of falling has been linked to activity restriction, functional decline, decreased quality of life (QoL) and increased risk of falling. Factors that distinguish persons with high concern about falling from those with low concern have not been systematically studied. This study aims to identify and explore potential health-related, functional and psychosocial factors that correlate with fear of falling in community-dwelling women aged 70-80 years, who had fallen in the past year. **Method :** Baseline cross-sectional data of 409 women recruited from Tampere, Finland as participants of a randomised controlled trial for falls prevention (NCT00986466) were used. Participants were classified according to their level of concern about falling using the Falls Efficacy Scale International (FES-I). Multinomial logistic regression analyses were performed to study associations between health-related variables, functional performance tests, current level of physical activity, QoL scores and FES-I score. **Results :** 68% of the participants reported moderate/high concern (FES-I ≥ 20) about falls. Multinomial logistic regression showed that highly concerned women were significantly more likely to have poorer health, lower functional ability and QoL. Lower scores for instrumental activities of daily living, outdoor mobility and QoL, and perceived hindrance due to impaired balance contributed independently to greater concern about falling. **Conclusion :** Concern about falling was highly prevalent in our sample of community-living older women. Particularly, poor perceived general health and mobility constraints contributed independently to the difference between high and low concern of falling. Knowledge of these associations may help in developing interventions to reduce fear of falling and avoidance of activity in old age. **Keywords :** aging, fear of falling, falls efficacy, functional ability, well-being, correlates

OP27 216-S-2

UNDERSTANDING FALL RISK IN ACUTE MENTAL HEALTH SETTINGS

Angela DICKINSON¹, Venkat NARAYANAN², Charles SIMPSON¹, Christina VICTOR³, Caroline GRIFFITHS², Deborah HUMPHREY² (1. Centre for Research in Primary and Community Care, University of Hertfordshire, United Kingdom; 2. Older Adults, Oxford Health NHS Foundation Trust, United Kingdom; 3. School of Health Sciences and Social Care, Brunel University, United Kingdom)

Introduction : Falls are the most commonly reported patient-safety incident in mental health settings for older people with approximately 36,000 falls reported from these settings annually in the UK. Risk of falling is exacerbated by mental health problems and their treatments. However, we have little understanding of how fall risk is perceived by patients in these care settings or staff and senior managers. This paper will present initial findings from a mixed-methods exploratory case study. **Method :** Retrospective analysis of routine falls reporting data for a 12 month period, non-participatory observation (300+ hours), focus-groups with staff (n=5) and interviews with patients (n=23), staff (n=20) and senior managers (n=6). **Results :** Falls were not evenly distributed across the course of the day, with peaks occurring in the morning, and early afternoon. Temporally-determined flows of activity (e.g. meal times) and use of space by staff, patients and visitors to the ward contribute to these patterns and are potential contributory factors to falls in these settings. **Conclusion :** Understanding of falls by patients with mental health conditions reflect the extrinsic and intrinsic perspectives of older people in other settings, however, psychiatric medication, patient behaviour and unfamiliar environment is perceived to add to fall risk by patients and staff. Routinely collected data, enhanced by patient and staff reflection and observation can aid understanding of factors contributing to falls in acute mental health settings. Data of this nature could be used by

organisations seeking to manage risk, improve patient safety, and develop appropriate interventions. **Keywords :** Falls, Mental health

OP27 216-S-3

FALLS PREVENTION RESEARCH IN DEVELOPING COUNTRIES: CHALLENGES AND OPPORTUNITIES

Shanthi JOHNSON (Kinesiology and Health Studies, University of Regina, Canada)

Introduction : Falls are a major threat to the health of older adults. In addition, many older adults have compromised functional capacities marked by indicators such as mobility limitations associated with increased rates of falls. While it has been estimated that seventy percent of the world's older adults are and will be in developing countries, most of the research in the area of functional capacity and falls emerge from developed countries. As a result, considerable research gap exists in the context of developing countries. **Method :** The methods includes a systematic review of the literature; **Results :** This presentation will highlight several conceptual and methodological challenges and opportunities for functional capacity and falls research through the analysis of publications in this area including the functional capacity, frailty, and falls studies in India. Specific attention will be paid to issues related to study design, sampling issues, definitions of constructs, measures, and data collection. Opportunities to promote culturally appropriate innovative research and to develop evidence-based health promotion strategies such as exercise program as well as falls prevention programs for older adults are discussed. **Conclusion :** Falls prevention research is important in the context of both developed and developing countries. Further research is needed especially from the developing countries perspective. **Keywords :** falls prevention, developing countries, injury prevention

OP27 216-S-4

HOME EXERCISE FOR OLDER PEOPLE WITH MILD BALANCE DYSFUNCTION: RESULTS OF IMPLEMENTATION OF A SUCCESSFUL RANDOMISED TRIAL THROUGH COMMUNITY HEALTH SETTINGS

Keith D. HILL¹, Claudia MEYER², Frances BATCHELOR³, Sue WILLIAMS³, Kirsten MOORE³, Leslie DOWSON³, Karen BORSCHMANN⁴, Julie SIMPSON⁵, Shyamali DHARMAGE⁵, Xiao Jing YANG³ (1. School of Physiotherapy, Curtin University, Australia; 2. Faculty of Health Sciences, La Trobe University, Australia; 3. Public Health Division, National Ageing Research Institute, Australia; 4. School of Physiotherapy, The University of Melbourne, Australia; 5. School of Population Health, The University of Melbourne, Australia)

Introduction : Older people with mild balance dysfunction often do not seek health professional advice. This presentation reports findings from a randomised controlled trial (RCT) evaluating effectiveness of a home based exercise program to improve balance in older people with mild balance dysfunction, and a followup study evaluating implementation of the approach through community health centres. **Method :** The RCT involved 165 community dwelling older people reporting concerns regarding balance, identified as having mild balance impairment (mean age 80 years). The intervention group received an individualised home exercise program (balance, strength, walking), and intermittent home visits by a physiotherapists for 6 months to review the program. Control participants were encouraged to maintain usual activities. In the Implementation Trial (IT), 29 physiotherapists (six community health centres) were trained in the approach utilised in the RCT, and implemented the program for 71 older people (77.3+/-6.5 years) with mild balance dysfunction.

Results: In the RCT, 72% of the exercise group completed the exercise program, and achieved significant improvement relative to the control group for Functional Reach, Step Test, hip abductor strength, and gait step width ($p < 0.0024$). Almost 25% of the exercise group regained balance within normal limits. Similar results occurred in the Implementation Trial, with 80% completing the program, 26% regaining balance within normal limits, and significant improvements in Functional Reach, Step Test and quadriceps strength ($p < 0.05$). Conclusion : An individualised home exercise program that was effective in improving balance in older people with mild balance dysfunction in a RCT was equally effective when implemented through through community health centres. Keywords : balance, exercise, elderly

OP27 216-S-5

TRANSLATING FALLS PREVENTION KNOWLEDGE FOR COMMUNITY-DWELLING PEOPLE WITH DEMENTIA: HOW AND WITH WHOM?

Claudia MEYER¹, Sophie HILL², Keith HILL³, Briony DOW⁴
(1. School of Physiotherapy, LaTrobe University, Australia; 2. Australian Institute for Primary Care and Ageing, LaTrobe University, Australia; 3. School of Physiotherapy, Curtin University, Australia; 4. Health Promotion Division, National Ageing Research Institute, Australia)

Introduction : A mixed method systematic review was undertaken to explore empirical evidence of knowledge translation (KT) interventions, plus perceptions of communication and participation, in preventing falls in community-dwelling older adults living with dementia. Method : Eight health and gerontology databases were searched (1990-2012). Search terms were “falls” and “community”, with identification of papers about KT interventions, including hand-searching of reference lists. Included studies had a population of community-dwelling people living with dementia and/or their caregivers. Interventions of falls prevention KT and outcomes were based on a unique taxonomy encompassing fall-related factors and communication/ participation in healthcare. Results : Two hundred and seven of 14311 titles/abstracts were retrieved as full-text. Two independent reviewers identified ten articles for detailed data extraction. Three randomized controlled trials; two pre-post design; and five qualitative papers, of mixed quality, were subjected to a mixed method synthesis. KT interventions included ‘inform and educate’ (5); ‘support behavior change’ (3); ‘teach skills’ (4); and ‘facilitate communication and/or decision-making’ (1). Outcomes for quantitative papers included falls, injury, hospitalization and residential care admission rates; health behaviour; involvement in care; and health status. Qualitative papers identified ‘perceptions of older people for communication of falls prevention strategies’. Mapping of the qualitative and quantitative literature provided insights for provision of falls prevention programs - the importance of the caregiving dyad; accommodation of individual preferences; and health professional involvement. Conclusion : This review provides a rich and practical understanding of translating falls prevention knowledge for people living with dementia, identifying both useful strategies and gaps for further research. Keywords : falls, dementia, knowledge translation

OP27 216-S-6

THE DETERMINANTS OF FALL PREVENTION BEHAVIORS AMONG OLDER ADULTS: KNOWLEDGE, ATTITUDES, AND SOCIAL RESOURCES

Chih-I TENG¹, Chia-Ming CHANG² (1. Institute of Gerontology, College of Medicine, National Cheng Kung University, Taiwan;

2. Division of Geriatrics and Gerontology, Department of Internal Medicine, National Cheng Kung University Hospital, Taiwan)

Introduction : Considerable evidences indicated the effectiveness of a number of interventions on falls prevention. While translating these evidence-based researches into practice, practitioners and health care professionals have been facing reluctant attitudes and low compliance from older people. This research is aiming for an in-depth study among older adults’ knowledge, attitudes and the social resources related to fall prevention, in order to explore the interactions as well as key factors among these determinants and behaviors. Method : The structured questionnaire assessed the determinants of fall prevention behaviors, including knowledge, attitudes and social resources related to fall prevention. Older adults aged 65 or more were sampled from an emergency department of a medical center in southern Taiwan. Demographic information, underlying diseases, fall history and presentations at the ED were collected. Results : A total of 200 questionnaires were enrolled. The presence of fall prevention resources was associated with fall prevention knowledge and attitudes. In addition, fall prevention behaviors were adopted worse among older adults with poor knowledge or negative attitudes toward fall prevention behavior. Conclusion : This study revealed further evidences of the interactions among social resources, knowledge and attitudes of older adults’ behaviors related to fall prevention. Fall prevention intervention in future should target at these determinants to design suitable messages, choose effective dissemination channels and build supportive environment (like multiple medical and social services) to promote the benefit of fall prevention and improve older adults to uptake fall prevention behaviors. Keywords : older adults, fall prevention behaviors

CENTENARIAN AND POSITIVE AGING

OP27 218-B-1

WHY NONAGENARIANS DO NOT BECOME CENTENARIANS IN BRAZIL?

Angelo Jose G. BOS, Andrea Ribeiro MIRANDOLA, Andressa LEWANDOWSKI, Andre RIBEIRO (Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil)

Introduction : The 2000 Brazilian Census identified 261,200 90+ years old habitants. After 10 years only 24,236 (9.3%) were 100 years old according to the 2010 Census. This study aimed to identify and report on the causes that led 236,964 nonagenarians in 2000 not been centenarians in 2010. Method : Through consultation of the National Death Registration database (DATASUS) we identify the leading causes of death among those who were nonagenarians in 2000, born before July 1st, 1910. Between 2000 to 2010 the number of deaths from specific causes was recorded. The specific causes of death were described according to the ICD10. The analyzes were performed using data from two censuses (2000 and 2010) and by DATASUS (2000 to 2010). Results : We identified 221,977 deaths (93.7%) between 2000 to 2010 in those born before July 1st 2010. The five leading causes of death of potential centenarians were: 'Death Without Health Care' in 31,429 (14.2%), followed by 'Other Abnormal Signs and Symptoms' (undefined causes) of 24,731 deaths (11.2%), 'Cerebrovascular diseases' with 22,335 deaths (10.1%), 'Other Heart Disease' with 20,713 deaths (9.3%) and 'pneumonia' with 19,544 (8.8%), accounting for over 50% of the deaths. Conclusion : We found a significant number of deaths without medical assistance. We believe that the lack of attention given to the health of Brazilians aged 90 or older would be

the leading cause of death in this segment of the population that has grown 80% in the period surveyed, in contrast to the 1.4% fall in the number of centenarians in the country. Keywords : Longevity survival, Death cause, Pontential centenarians

OP27 218-B-2

CLINICAL AND FUNCTIONAL PHENOTYPES OF SUPERCENTENARIANS IN JAPAN

Yasumichi ARAI¹, Hiroki INAGAKI², Yukiko ABE¹, Michiyo TAKAYAMA³, Yasuyuki GONDO⁴, Nobuyoshi HIROSE¹ (1. Geriatric Medicine, Keio University, Japan; 2. Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Institute of Gerontology, Japan; 3. Center for Preventive Medicine, Keio University, Japan; 4. Clinical Thanatology and Geriatric Behavioral Science, Osaka University, Japan)

Introduction : Exponential growth of the number of centenarians in these two decades offers an opportunity to examine a new elite group that is supercentenarians (SC). Method : We followed 249 Tokyo centenarians study cohort (mean age 100.5 years) and 353 semisupercentenarians (SSC, mean age 106.2) study cohort for all-cause mortality by annual telephone or mail survey, and identified 85 SC (110 years or older, 7 men and 78 women) by April 2011. All SC were visited by geriatricians at least one time before or after they reached 110. We evaluated SC's medical history, activities of daily living (Barthel index), cognitive function (mini-mental scale examination, MMSE), and blood chemistry, and compared with those of younger centenarians (YC, centenarians who died between 100-104 years), and SSC (died between 105-109 years). Results : As compared to YC and SSC, SC were characterized by lower prevalence of hypertension (p=0.051), and higher prevalence of fragile fracture (p=0.022). There was no significant difference in the prevalence of stroke, coronary heart disease, or non-skin cancer between YC, SSC and SC. When they were at age 100-101, SC exhibited higher score of Barthel index and MMSE (both p<0.001) and higher serum albumin levels than YC or SSC at the corresponding age. Conclusion : These results suggest that SC represent a more elite phenotype of healthy aging than YC and SSC. Keywords : longevity, centenarians, functioning

OP27 218-B-3

STRESS RESPONSE AND EXCEPTIONAL LONGEVITY: CLUES FROM THE HPA AXIS OF CENTENARIAN ROTTWEILER DOGS

David J. WATERS¹, Aimee H. MARAS², Huiping XU³, Seema S. KENGERI², Emily C. CHIANG², Naomi N. KARIUKI⁴ (1. Center for Exceptional Longevity Studies, Gerald P. Murphy Cancer Foundation, Department of Veterinary Clinical Sciences, Center on Aging and the Life Course, Purdue University, USA; 2. Center for Exceptional Longevity Studies, Gerald P. Murphy Cancer Foundation, USA; 3. Department of Biostatistics, Indiana University School of Medicine, USA; 4. Department of Veterinary Clinical Sciences, Center on Aging and the Life Course, Purdue University, USA)

Introduction : An age-related loss of hypothalamic-pituitary-adrenal (HPA) axis resilience can result in hypercortisolism, which has been linked to an array of adverse outcomes including cognitive impairment, insulin resistance, immune suppression, and progressive cancer growth. To better understand the biological mechanisms and adaptive capacities that contribute to highly successful aging, we studied exceptionally long-lived Rottweiler dogs that, similar to human centenarians, had achieved a duration of longevity that exceeds by more than 30% their breed-specific norm. Method : We

hypothesized that highly successful aging might be associated with a preservation of HPA resilience and life-long avoidance of hypercortisolism. The HPA axis of 28 canine centenarians was evaluated by determining: basal plasma cortisol, aldosterone, and ACTH concentrations; post-ACTH challenge plasma cortisol and aldosterone concentrations; and urine cortisol:creatinine ratios. Results: HPA axis evaluation revealed three categories of canine centenarians. Forty-three percent of dogs had normal basal cortisol with youthful response to ACTH challenge. Forty percent of dogs had low basal cortisol levels, yet preserved a youthful response to ACTH challenge. Seventeen percent of dogs showed deterioration of the aldosterone arm of the HPA axis. None of the canine centenarians had hypercortisolism. Conclusion : Taken together, our results from canine centenarians suggest that hypercortisolism resulting from impairment of the HPA axis is not an obligate phenotype intrinsic to the aging process. Further, the discovery of an adaptive, low basal cortisol endophenotype in some of these dogs emphasizes the importance of studies that rely upon challenge, rather than basal measures, to determine how physiological resilience contributes to exceptional longevity. Keywords : hypothalamic-pituitary-adrenal (HPA) axis, stress response, canine centenarian

OP27 218-B-4

EXCEPTIONAL LONGEVITY IN FEMALE ROTTWEILER DOGS IS NOT ENCUMBERED BY INVESTMENT IN REPRODUCTION

Emily C. CHIANG¹, Seema S. KENGERI¹, Aimee H. MARAS¹, Cheri L. SUCKOW¹, David J. WATERS² (1. Center for Exceptional Longevity Studies, Gerald P. Murphy Cancer Foundation, USA; 2. Center for Exceptional Longevity Studies, Gerald P. Murphy Cancer Foundation, Department of Veterinary Clinical Sciences, Center on Aging and the Life Course, Purdue University, USA)

Introduction : To better understand the potential trade-off between reproductive investment and longevity in females, we studied pet dogs to determine whether intensity of reproduction (total number of offspring) encumbered the likelihood of exceptional longevity. Method: This hypothesis was tested by collecting and analyzing lifetime medical histories, including complete reproductive histories, for a cohort of canine "centenarians" exceptionally long-lived Rottweiler dogs that lived more than 30% longer than the breed's average life expectancy. Reproductive intensity (number of litters, total number of pups) and tempo of reproductive effort (age at first reproduction, mean inter-birth interval, age at last reproduction) in 78 oldest-old female Rottweilers (>13 years old) were compared to a cohort of 97 female Rottweilers that had usual longevity (age at death 8.0 - 10.75 years). Results : We found no evidence that a mother's physiological investment in offspring was associated with disadvantaged longevity. Instead, similar to some studies in women, our data showed an inverted U-shaped trend, suggesting that moderate investment in reproduction may promote longevity. Late reproductive success, a much-studied surrogate of maternal fitness in women, was not a strong predictor of longevity in this canine cohort. Instead, independent of reproductive investment, the duration of lifetime ovary exposure was significantly associated with highly successful aging. Conclusion : Our results from exceptionally long-lived pet dogs, which represent the first step toward probing the longevity cost of reproduction in this emerging model of human healthspan, provide rationale for further investigative efforts to understand the ovary-sensitive biological factors that promote healthy longevity in women and pet dogs. Keywords : pet dog, longevity trade-off, U-shaped dose response

OP27 218-B-5

CELLULAR AND HUMORAL FACTORS OF INNATE IMMUNITY OF CENTENARIANS WITH MORBIDITY

Victor SEMENKOV¹, Tamara YURINA², Elena KOVALENKO³, Gennady LUTSENKO³, Maria GRECHIKHINA³, Alexander SAPOZHNIKOV³ (1. Immunology, Centre of Gerontology of Medical State University, Russia; 2. Immunology, Centre of Gerontology of Russian State Medical University, Russia; 3. Immunology, Shemyakin-Ovchinnikov Institute of Bioorganic Chemistry RAS, Russia)

Introduction : Innate immunity presents the ancient system of organism's defense against pathogens by means of natural killer cells, different types of phagocytes, system of complement, Phagocytes consume foreign microorganisms, and produce reactive oxygen species (ROS). Method : Peripheral venous blood from 25 centenarians (90-101 years) and 30 old patients (60-90 years) with cardiovascular diseases, respiratory illnesses, gastrointestinal disorders, cerebrovascular disease and so on was used for examination. Interferon- α and γ was induced by stimulation of whole blood cells with Newcastle disease virus or PHA. Phagocytosis of *St. aureus* by leucocytes was determined. The luminol-dependent chemiluminescence was used to measure the level of ROS production by neutrophils. HSP70 expression in neutrophils was assessed by flow cytometry IL-6 and TNF- α in serum were measured by using ELISA. Results : We have registered decrease of *St. aureus* phagocytosis, interferon- α and interferon- γ , and increase of serum interferon in centenarians in comparison with the old patients. IL-6 and TNF- α were detected in serum most of centenarians. Transferrin and C4 component of complement in serum of centenarians was decreased, but level of ceruloplasmin, α 1-antitripsin, IgA and C-reactive protein was increased. Zymosan-induced extracellular ROS production by neutrophils showed a negative correlation with the level of intracellular HSP70 in centenarians, but not in the group of 60-89-years old patients. Conclusion : We suggest that decreased phagocytosis and production of interferon- α in centenarians may be compensated by increased concentration of some acute phase proteins and IgA. Keywords : innate immunity, proinflammatory cytokines, phagocytosis

WORK, LABOR AND EMPLOYMENT III

OP27 220-S-1

WHY AND HOW DO RETIREES RETURN TO WORK? LOOKING BEYOND ECONOMIC FACTORS. RESULTS FROM HRS 1998-2008

Ernest GONZALES (George Warren Brown School of Social Work, Washington University in St. Louis, USA)

Introduction : To broaden our understanding of why and how retirees return to work, I examine not just the economic, but also the biopsychosocial factors that predict their return. I hypothesize that human/social capital is positively associated with returning; while retirement satisfaction is negatively associated. An exploratory approach was taken with assets. Post-retirement work characteristics were examined. Method : A sample of fully retired individuals 62+ were drawn from the Health and Retirement Study in 1998 and followed to 2008 (N=8,332). Bivariate analyses and survival analyses were utilized. Results : Average age was 74 (range 62-104). One out of ten retirees returned to work in subsequent waves. Factors predicting returning to work were gender (men more likely), age (younger), health (higher self-report and standardized measures), income, retirement dissatisfaction, and social capital of the household. Wealth,

education, and years of work experience were insignificant. Retirees were more likely to return to professional, retail and business industries within the clerical/administrative support, professional, and sales occupations. Conclusion : While economic factors are important determinants of retirees returning to work, so are biopsychosocial factors. Retirees with work experience in physically demanding industries are less likely to return to work after retirement; re-tooling the human capital of this group to match labor sector needs and physical capabilities may enable them to return to work. Keywords : Older workers, assets, volunteering, caregiving

OP27 220-S-2

ACTIVITY PARTICIPATION, LIFE STYLE, AND HEALTH STATUS OF OLDER ADULTS IN SOUTH KOREA

Jungui LEE¹, Eun-Kyoung Othelia LEE² (1. Division of Policy Research, Gyeonggido Family & Women's Research Institute, Korea; 2. Social Work, University of North Carolina Charlotte, USA)

Introduction : Population aging in South Korea poses a grave challenge to the task of improving the quality of lives of older citizens whose health status has been challenged by various socioeconomic and demographic shifts. Previous studies have shown a strong positive relationship between activity participation and quality of life among older adults. Yet, less attention has been focused on examining determinants of specific activity participation. This study examined factors related to a variety of activity participation in social clubs, self development, and labor force. Method : The nationally representative sample of community dwelling older adults aged 55+ (n=6,688) was drawn from the Wave II of the Korean Longitudinal Study on Aging (KLoSA), and conducted in 2008. Three separate logistic regressions were undertaken to assess the effect of sociodemographics, lifestyle (e.g., smoking, drinking, and exercise), and health status on a variety of activity participations. Results : Determinants of participation in social clubs and labor force were age, income, drinking, exercise, self-rated health, and depression. While marital status, religion, and cognition were significant predictors for social club activity participation, gender and education predicted labor force participation. Major determinants of self-development activity were educational attainment, exercise, and depression. The results revealed that lower depression and regular exercise were predictive of all three types of activities. Conclusion : In order to encourage activity participation among community dwelling older adults, gerontologist should develop community-based interventions to promote physical activity and reduce depression. Other implications for practice, policy, and research were discussed. Keywords : work, learning, activities

OP27 220-S-3

POST-RETIREMENT WORK INTENTION: THE INTERPLAY OF OUTCOME EXPECTATIONS AND WORK DESIGN

Anne Marit WOEHRMANN, Juergen DELLER (SMARD, Leuphana University of Lueneburg, Germany)

Introduction : While the share of individuals in retirement is increasing in many OECD countries, also the share of individuals working past retirement age is rising. Research has revealed influencing factors for post-retirement work on different levels. However, not much is known about the interplay of person factors and environment factors with regard to post-retirement work intention. The purpose of this study is to examine the combined effects of outcome expectations regarding post-retirement work and job demands as well as job resources on post-retirement work intention. Method : Data sets of 1128 employees of a German logistics company were used in this study. Commercial employees filled in web-based questionnaires while industrial

employees filled in paper and pencil questionnaires. Results : Results revealed that outcome expectations and post-retirement work intention are strongly related. This effect is moderated by job demands and resources in a way that it is stronger when physical job demands are low and social support in the workplace is high. Conclusion : The results of this study extend the literature on post-retirement work as well as on job demands and resources. Companies who would like their employees to continue to work after retirement should design interventions to strengthen older workers' outcome expectations regarding post-retirement work. This will be especially important if physical job demands are low and social support in the workplace is high. Keywords : post-retirement work, outcome expectations, work design

OP27 220-S-4

WORKPLACE AGE DISCRIMINATION: ATTRIBUTION-SENSITIVITY THEORY AND THE COMPARATIVE EXPERIENCES OF OLDER WORKERS IN THE LABOUR MARKET

Christopher MCLOUGHLIN (*Faculty of Business and Economics, Monash University, Australia*)

Introduction : The prominent public policy push in many developed nations focusing on increasing the labor force participation of older workers and prolongation of working lives raises questions about barriers to said participation. The recent theoretical advancements proposed by Chou and Choi (2011) to explain the non-linear relationship between reports of perceived workplace discrimination and age represent an important step in understanding how age stereotypes affect the labour market experiences of older workers. Attribution-sensitivity theory contends that individuals with higher socio-economic status, through the tendency towards attribution error and greater sensitivity to perceived non-performance related discrimination, are more likely to perceive discrimination in the workplace. Method : This paper reports on the results of a national survey of approximately 3200 members of the Australian workforce undertaken in 2011. Standard statistical procedures were used to test relationships contended by Attribution-sensitivity theory. Results : Analysis of participants' responses provided further supporting evidence for Attribution-sensitivity theory. These results provide greater generalizability by assessing a wider range of perceived discrimination types, drawing comparisons of experiences of discrimination between workers across the life course and extending theory testing to a new population. Conclusion : The implications of the accumulating evidence uncovered in this study and that of Chou and Choi, among others, warrants reassessment of considerations for organisational and public policy makers wishing to address the well-documented physical and psychological consequences associated with persistent experiences of discrimination. Equally, researchers are challenged to explicate approaches to addressing the dynamic needs of workers across the life course that experience discrimination in the workplace. Keywords : perceived workplace discrimination

OP27 220-S-5

HOW THE EXPERIENCE OF AGE INFLUENCES POST-RETIREMENT EMPLOYMENT

Ulrike FASBENDER, Juergen DELLER (*Institute for Strategic HR Management, Leuphana University Lueneburg, Germany*)

Introduction : We present a statistical analysis of the German Age Survey (DEAS) to investigate employment among older people over a period of 12 years. Next to socioeconomic variables and health factors, psychological predictor variables were quality of life, subjective well-

being, attitudes, norms, values and images of ageing people. The study's aim was to better understand psychological processes on greying labor markets. Method : Original data from three waves of the DEAS (n=542) were collected via paper or computer assisted personal interviews. We applied a hierarchical regression analysis to identify relations between the different predictors and post-retirement employment. Further, structural equation modeling was used to test latent state-trait measurement models. Results : The study results investigated influencing factors of employment of older people. Results indicated whether (and which) psychological variables are able to predict post-retirement employment above socioeconomic variables and health factors. Differentiated conclusions of employment after retirement were drawn. Strategies and barriers for older people were discussed. Conclusion : The relevance of this study is set by challenges on the labor market due to demographic changes of 21st century. The multi-dimensional approach including socioeconomic, health and psychological variables addresses a holistic perspective of post-retirement employment. The sample was drawn from a German population and therefore cannot be generalized above the country's borders. Cross-national research is needed to identify interaction effects between factors on the individual and societal level. Practically, the abolishment of age barriers supported by political regulations is needed. Keywords : retirement, conditions of employment, aging

OP27 220-S-6

GRADUAL RETIREMENT AMONG MIDDLE-AGED AND OLDER WORKERS: A TAIWANESE STUDY

Wan-Chun CHUANG, Ching-Li YANG (*Institute of Gerontology, National Cheng Kung University, Taiwan*)

Introduction : As a result of the aging population across the world, middle-aged and older workers play a key role in the labor market that is likely to face supply shortage in the near future. Gradual retirement gives these workers an alternative other than full-time work or complete retirement. While most related studies are based on the situations of the U.S. and European countries, this study attempts to better understand the case of Taiwan by examining the factors for gradual retirement among Taiwanese middle-aged and older workers. Method : Using data from Taiwan Longitudinal Study on Aging (TLISA), we employed logistic regression models to explore the factors that affect an individual's decision on taking gradual retirement. Two different definitions of gradual retirement including taking bridge jobs and working after receiving retirement benefit are used. Results : The results show that the utilization of bridge jobs was more common among younger respondents, respondents with higher income and respondents are self-employed. We also found that keeping working after receiving retirement benefits was more common among male, self-employed and blue-collared respondents, respondents with poorer self-assessed financial status, respondents with higher income and respondents with better self-assessed health status. Conclusion : There are various factors for middle-aged and older workers' gradual retirement behavior, and the factors may differ with the definitions that are used. The factors proposed in this study may provide some policy recommendations. Keywords : Gradual Retirement, Middle-aged and Older Workers, Taiwan

THE WAR AGAINST POLYHARMACY (3) A WORKSHOP: DRUGS TO BE DISCONTINUED IN THE LAST DECADES OF LIFE - WHAT, WHY AND HOW?

OP27 221-C-1

THE EXTENT OF CO-MORBIDITY AND POLYPHARMACY

IN COMMUNITY DWELLING TURKISH ELDERLY FEMALES: ONE EXAMPLE OF A MAJOR GLOBAL PROBLEM

Gulistan BAHAT¹, Fatih TUFAN¹, Asli TUFAN¹, Yucel AYDIN², Timur Selcuk AKPINAR², Sevilay NADIR¹, Nilgun ERTEN², Mehmet Akif KARAN¹ (1. Department of Internal Medicine, Division of Geriatrics, Istanbul Medical School, Istanbul University, Turkey; 2. Department of Internal Medicine, Istanbul Medical School, Istanbul University, Turkey)

Introduction : The elderly usually suffer from many chronic diseases that may result in polypharmacy. Elderly females have been reported to have more comorbidities resulting in higher number of drugs and disability. The types of comorbidities and the drugs of choice are influenced by the genetic background, environmental-social factors and availability of resources. We report the extend of polypharmacy in the context of multi-morbidities in community-dwelling Turkish elderly females. **Method :** Geriatrics outpatients were assessed cross-sectionally. Patients underwent comprehensive geriatric assessment. Co-morbidities and drugs were defined by reviewing patients' self-reports and current medications assessed via the medical files. Depression and cognition were assessed by 30-item geriatric depression scale and mini-mental-state-examination (MMSE), respectively. **Results :** 515 elderly females were included in this study. Mean age was 73.4±6.9 years. The average number-of-chronic-diseases was 2.8. 61.1% had >3 chronic diseases, the most common diagnoses being hypertension (75.3%), depression (45.5%) and dementia (39.4%). Mean number-of-drugs was 4.8. 63.2% were consuming ≥4 drugs and 47.6% were using >5 chronic drugs. **Conclusion :** Polypharmacy seem to be more prevalent in Turkey than in England or the US. Regardless of the specific number of medications in each and every country, the problem is obviously international. This study highlights the differences between individual countries further stressing our global need for "Joint International Venture" for assessing polypharmacy and reducing its related negative health and economical impacts. **Keywords :** polypharmacy, comorbidity, elderly

OP27 221-C-2

THE WAR AGAINST POLYHARMACY (3)-A WORKSHOP: THE TRIPLE WIN-WIN GAME OF REDUCING POLYPHARMACY BY THE GARFINKEL METHOD

Doron GARFINKEL (M.D., Deputy Head, Home Care Hospice-Israel Cancer Association & Maccabi Health Care Services, Israel)

Introduction : Improved medical technology is associated with an alarming increase in the number of patients with incurable chronic comorbidities resulting in disability, and suffering for increasingly prolonged periods before death. The vicious circle of increased number of specialists involved and medications prescribed, leads to Morbid Polypharmacy and inappropriate medication use (IMU). This situation makes models of "one disease - one therapy/guideline" an unrealistic approach to good care. Beers criteria represent an example of inappropriate attempts to increase physician alertness and may avoid just specific drugs; 'drugs-to-avoid' criteria are insufficiently accurate to use as stand-alone measures. Furthermore, the sole use of computer or other programs as alarms are of limited benefit because they lack the Doctor's personal touch, time and clinical judgment, as well as the patient/family preferences. **Method :** The Garfinkel Palliative-Geriatric method represents an ethical, simple and safe clinical approach and was proven effective in improving quality of life in the last years of life. With the patient/family approval, many 'non-life-saving' medications are discontinued simultaneously, thus

significantly minimizing drug load. Apart from improved health, there is a double financial benefit: reducing both drug costs and the cost of unnecessary hospitalizations due to IMU. **Results :** Results and Discussion: Members of the IGRIMUP will discuss different drug group with the audience. Case reports of community dwelling elderly patients who consume many drugs will be presented to the audience for an open discussion. Then, the actual recommendations given to the patient will be presented along with the follow up and outcomes. **Keywords :** Polypharmacy, Triple Win-Win situation, Garfinkel Method

REHABILITATION & FRACTURE

OP27 222-C-1

GERIATRIC COMPARED TO USUAL MANAGEMENT OF ELDERLY PATIENTS WITH HIP FRACTURE. PRELIMINARY RESULTS

Jacques BODDAERT¹, Judith COHEN-BITTAN¹, Frederic KHIAMI², Yannick LE MANACH³, Mathieu RAUX³, Jean-Yves BEINIS⁴, Marc VERNY¹, Bruno RIOU⁵ (1. Geriatric Department, Peri-Operative Unit, Pitie-Salpetriere Hospital, APHP. UPMC Paris 6, France; 2. Orthopedic Surgery, Pitie-Salpetriere Hospital, APHP. UPMC Paris 6, France; 3. Anesthesiology Department, Pitie-Salpetriere Hospital, APHP. UPMC Paris 6, France; 4. Rehabilitation Unit, Pitie-Salpetriere and Charles Foix Hospital, APHP. UPMC Paris 6, France; 5. Emergency Department, Pitie-Salpetriere Hospital, APHP. UPMC Paris 6, France)

Introduction : Geriatric management has been proposed in elderly patients with hip fracture but its effect on mortality remains unknown. We tested the hypothesis that this strategy improved mortality. **Method:** Over a 6 years period (2006-11), we compared elderly (> 75 years) patients with hip fracture admitted to orthopedic vs geriatric department in a time series analysis corresponding to the creation of a dedicated geriatric unit (June 2009). Main end point was 6 months mortality. Comorbidities score was calculated using CIRS score. **Results :** 131 patients were included in the Orthopedic cohort and 203 in the Geriatric cohort. Comorbidities were more frequent in the Geriatric cohort (median CIRS 8 vs 4, p<0.001). Patients in the Geriatric cohort experienced less contention, pressure ulcers and ICU referral, but were more frequently transfused, stool impaction or swallowing disorders were more frequently detected. Mortality during acute care was 7.6 % (95% confidence interval 4.2 to 13.5%) in the Orthopedic cohort and 3.0 % (95% confidence interval 1.4 to 6.3 %) in the Geriatric cohort. At 30 days, readmission was significantly reduced in the Geriatric cohort (5 vs 17%, p=0.002). At 6 months, readmission (14 vs 29%, P=0.007) and mortality (15 vs 24%, P=0.04) were significantly decreased in the Geriatric cohort. Considering comorbidities, risk ratio of death at 6 months was reduced (0.43, 95%CI 0.25 to 0.73, P=0.002). **Conclusion :** We observed that early admission to a dedicated geriatric unit improved morbidity and 6-month mortality in elderly patients with hip fracture. Our results should be confirmed in other countries with different health care systems. **Keywords :** hip fracture, orthogeriatrics

OP27 222-C-2

REHABILITATION INDICES AND THEIR INDEPENDENT PREDICTORS: A SYSTEMATIC REVIEW

Gerald Choon-Huat KOH¹, Cynthia Huijun CHEN², Rob PETRELLA³, Amardeep THIND³ (1. Saw Swee Hock School of Public Health, National University of Singapore, Singapore; 2. Saw Swee Hock School of Public Health, National University of Singapore, National

University Health System, Singapore; 3. Department of Family Medicine, Schulich School of Medicine & Dentistry, University of Western Ontario, Canada)

Introduction : To (1) identify all available rehabilitation indices (RI) based on their mathematical formula, (2) assess the evidence for independent predictors of each RI, and (3) propose a nomenclature system to harmonize the names of RI. **Method :** We identified all available RI through preliminary literature review using PubMed and references in primary papers. Then, we used the various names of the same formula as search terms to identify studies which report their independent predictors, limited to papers in English and up to 31 December 2011, including case-control and cohort studies, and controlled interventional trials where RI was outcome variable and matching or multivariate analysis was performed. Details of final papers were extracted by three reviewers separately and independent predictors of RI were identified. **Results :** The five RIs identified were (1) Absolute Functional Gain (AFG)/Absolute Efficacy/Total Gain, (2) Rehabilitation Effectiveness (REs)/Montebello Rehabilitation Factor Score (MRFS)/Relative Functional Gain (RFG), (3) Rehabilitation Efficiency (REy)/Length of Stay?Efficiency (LOS-EFF)/Efficiency, (4) Relative Functional Efficiency (RFE)/MRFS Efficiency and (5) Revised MRFS (MRFS-R). REy/LOS-EFF/Efficiency had the most number of supporting studies, followed by REs and AFG. Although the evidence for different predictors of RIs varied according to the RI and study population, there is good evidence that older age, lower pre-rehabilitation functional status and cognitive impairment are predictive of poorer AFG, REs and REy. **Conclusion :** Five RIs have been developed in the last two decades as composite rehabilitation outcome measures that control for pre-morbid and pre-rehabilitation functional status, and rate of functional improvement, each with varying levels of evidence for its predictors. **Keywords :** Activities of daily living, index, outcomes, rehabilitation

Occupational Therapy and Occupational Sciences, University of British Columbia, Canada; 3. Physical Therapy, GF Strong Rehabilitation Centre, Canada; 4. Physical Medicine and Rehabilitation, University of British Columbia, Canada)

Introduction : Prosthetic rehabilitation programs for individuals with lower limb amputation (LLA) are designed to enhance mobility primarily through walking retraining. Continual cuts to health care resources have reduced the number of rehabilitation hours to such a great degree that older adults often do not receive sufficient training to learn to walk using the prosthesis; therefore, innovative rehabilitation programs are needed. The objective of this study was to determine the feasibility of a home-oriented Nintendo WiiFit™ program for improving walking in older adults with unilateral LLA. **Design:** Parallel evaluator-blind randomized controlled trial (RCT). **Subjects:** 50 years or older and ≥1 year post a unilateral transtibial (TT) or transfemoral (TF) amputation (recruitment and data collection ongoing at time of abstract submission). **Procedure:** Subjects were randomly allocated to the intervention or control group. The intervention consisted of 3 x 40-minutes sessions/week of WiiFit training for 4 weeks (initially group training at the clinic, graduating to home training). Controls underwent an identical process using cognitive video games to account for attention, device and activity exposure.

The outcomes of interest were feasibility indicators consisting of recruitment, adherence, attrition and adverse event rates, and post-intervention fatigue and pain levels. **Results :** Thirteen participants were recruited within 4 months. To date, 3 participants (2TT; 1TF) with a median age of 62 years (range=53-66) have completed the WiiFit intervention. Median adherence was 100% (range=58-100). Two participants experienced a fall during the intervention but were not injured. Mean (SD) fatigue and pain levels were 4.2/10 (1.5). **Conclusion :** Our preliminary data suggest that the WiiFit intervention is feasible in older adults with unilateral LLA. **Keywords :** Older adults, Lower limb amputation, Nintendo Wii , Randomized controlled trial, Feasibility

OP27 222-C-4

HIP FRACTURES ARE ASSOCIATED WITH DECREASED GRIP STRENGTH, SLOWER WALKING SPEED AND INABILITY TO STAND FROM CHAIR WITHOUT USING ARMS IN A LARGE EUROPEAN AGEING STUDY

Jesper RYG¹, Mette Lindholm ERIKSEN², Sonja VESTERGAARD², Karen ANDERSEN-RANBERG², Tahir MASUD³ (1. Geriatric Medicine, Odense University Hospital, Denmark; 2. Danish Ageing Research Centre, University of Southern Denmark, Denmark; 3. Geriatric Medicine, Nottingham University Hospitals NHS Trusts, United Kingdom)

Introduction : Hip fractures in older people cause much morbidity, mortality and expenditure. Identifying those at high risk of hip fracture risk should enable earlier preventative measures including interventions to reduce falls and treat osteoporosis. **Method :** The Survey of Health, Ageing and Retirement in Europe (SHARE) is an ongoing longitudinal study of individuals' aged ≥50 years in 14 countries. Using cross-sectional data from SHARE wave 2 we investigated if three commonly used functional tests were associated with hip fractures: ability to perform chair stand test (rising from chair without using arms, performed in those <75 years)[CS], walking speed[WS] (performed in those >75 years), and grip strength[GS]. **Results :** 31,021 participants, 54.0%=women, median age=64.9 (IQR=58.4-73.2) years were studied. Hip fracture history was reported by 2.0% and were positively correlated with age (spearman's rho 0.101, p<0.001). Women had more hip fractures (2.3% vs 1.7%;OR=1.4; 95%CI=1.2-1.7;p<0.001). Those unable to perform the CS (20.7%) had more hip fractures (4.3% vs 0.8%;OR=4.1;95%CI=3.3-5.1;p<0.001). Compared to the highest sex-specific quartile of GS, those with lowest quartile GS had more hip fractures (3.5% vs 0.8%;OR=4.7;95%CI=3.5-6.4;p<0.001). Compared to the highest sex-specific quartile of WS, those with the lowest quartile WS had more hip fractures (5.2% vs 2.2%;OR=2.4;95%CI=1.4-4.1;p=0.001). CS, GS and WS remained independently significantly associated with hip fractures after adjustment for age, gender, and country. **Conclusion :** These cross-sectional data show that hip fractures are significantly associated with CS, GS and WS. Prospective data are now planned from SHARE to determine if these functional tests can predict hip fractures in subsequent waves. **Keywords :** hip fracture, functional tests, multinational study

OP27 222-C-5

EVALUATION OF POST STROKE OUTCOME - A DESCRIPTIVE ANALYSIS

Ravi P. RUBERU, Shaad MANCHANDA, Patrick CONNOLLY, Laura GILLGAN, Deepal LECAMWASAM (Geriatric and Rehabilitation Medicine, Royal Adelaide Hospital, Australia)

Aim: A retrospective analysis of outcome variables in patients admitted following stroke to determine rehabilitation outcome. **Method:** Case notes of stroke patients admitted between July 07 to July 12 were reviewed. Selection criteria were ischemic or hemorrhagic stroke with completed admission notes. Sixty-eight variables were analysed using Partition modelling. **Results :** Of 482 patients, 426 patients met inclusion criteria (mean age 70.67 SD = 13.31, SEM 0.645; male 58%, n=245). Mean length of rehabilitation was 48.36 d. Majority (98%, n=419) of patients were from home and 80% (n=333) returned home. For those who returned home the mean length of rehabilitation was 45.22 d where 66% (n=221) were discharged within 50 d. Student t test for total admission functional independence measure score (FIMS) by discharge destination was significantly different in relation to FIMS for patients who were discharged home compared to those discharged to either high level residential care (HLOC)(p<0.001) or low level residential care (LLOC) (p=0.0497) and a significant difference between those who were discharged to LLOC compared to HLOC (p=0.0044). Total FIMS \geq 77, carer support, and age \leq 77 y were associated with returning home. When considering patients with total FIMS 36-77, age <82 y and carer support were associated with returning home. HLOC was predictable in those who were \geq 82 y, length of stay in acute hospital \geq 14 d, FIMS for upper body dressing of <5. **Conclusion :** Use of total FIMS together with other predictors would improve patient selection for stroke rehabilitation. **Keywords :** Stroke, Rehabilitation outcome, hemorrhagic stroke, ischemic stroke, FIMS

OP27 222-C-6

GAIT SPEED AT USUAL PACE AS A PREDICTOR OF OUTCOMES IN RECIPIENTS OF A POST ACUTE TRANSITION CARE PROGRAM

Sukumar NAVANATHAN, Nancy PEEL, Ruth E. HUBBARD
(Centre for Research in Geriatric Medicine, The University of Queensland, Australia)

Introduction : Gait speed has been advocated as a marker of vulnerability but its discriminatory utility in frail older people has not been extensively investigated. Here we examined changes in gait speed in patients receiving a Transitional Care Program (TCP) and determined whether gait speed at admission correlated with outcomes. **Method :** In a prospective cohort study, 351 older persons admitted to TCP were comprehensively assessed using the inter-RAI Home Care instrument. This included a timed four metre walk at admission and discharge. A telephone interview 6 months after admission determined functional independence, living status and readmissions to hospital. Wilcoxon Signed Ranks Test was used to assess the difference between admission and discharge gait speed and binary logistic regression examined the relationship between admission gait speed and outcomes. **Results :** Mean gait speed improved significantly during the program (from 0.34 to 0.54 m/s, Z = -11.84, p< .001). This represents a clinically meaningful change. At 6 months post TCP admission, 86.9% of patients were living in the community and 4.6% in institutional care; 5.4% died and 3.1% were lost to follow up. 40.5% had at least one readmission to hospital. Gait speed at admission was positively associated with reduced risk of hospital readmissions (OR= 0.19, p= .006), increased likelihood of living in the community (OR= 0.05, p= .015) and being functionally independent (OR= 0.012 p=0.002). **Conclusion :** Gait speed is an inexpensive, feasible and objective measure of physical performance in frail older people. It may be a useful tool in TCP settings to predict outcomes. **Keywords :** Gait speed, Post acute rehabilitation, Frailty

STRESS, COPD AND SUBJECTIVE WELLBEING: SINGAPORE LONGITUDINAL AGEING STUDIES

Yanxia LU¹, Ma Shwe Zin NYUNT¹, Xinyi GWEE¹, Liang FENG¹, Lei FENG¹, Ee Heok KUA¹, Rajeev KUMAR², Tze Pin NG¹
(1. Psychological Medicine, National University of Singapore, Singapore; 2. Academic Unit of Psychological Medicine, Australian National University Medical School, Australia)

Introduction : The relationship between life event stress and chronic obstructive pulmonary disease (COPD) and its impact on the quality of life of individuals with COPD is seldom investigated. This study aimed to investigate whether life event stress was associated with greater psychological distress and poorer quality of life in older individuals with COPD, in comparison to their counterparts without COPD. **Method :** In a cross-sectional study, we measured life event stress, depressive symptoms (GDS), cognitive symptoms and function (CFQ, MMSE), and physical and mental health functional status (SF36-PCS and SF36-MCS) in a population-based sample of individuals aged 65 and above with COPD (post-bronchodilatation FEV1/FVC<0.70, N=136) and without COPD (N=277). **Results :** In two-way analysis of variance controlling for potential confounders, life event stress was associated with significant main effects of worse GDS (p<0.001), SF36-PCS (p=0.008) and SF36-MCS scores (p<0.001), and with significant interaction effects on GDS score (p<0.001), SF36-PCS (p=0.045) and SF36-MCS (p=0.034) in participants with COPD more than in non-COPD participants. Main effect of COPD was found for post-bronchodilator FEV1 (p<0.001) and cognitive symptoms (p=0.02). **Conclusion :** Our findings indicate that life event stress was associated with more depressive symptoms and worse quality of life in individuals with COPD, much more than in those without COPD. Further studies should explore the role of cognitive appraisal of stress, coping resources and psycho-social support in this relationship. **Keywords :** Life event stress; COPD; Quality of life

THE INQUIRY ABOUT THE AGE-ASSOCIATED CHANGE OF THYROID FUNCTION AND IMMUNITY--- ANALYSIS OF 765 COHORT PERSONS

Yongxing MA¹, Pei-Fang LU², Ri-Ping HAN²
(1. Antiaging and Cognitive Function, Shanghai Institute of Gerontology and Geriatrics, Affiliated Huadong Hospital, Shanghai Medical College, Fudan University, China; 2. Department of Aging, Antiaging and Cognitive Function, Shanghai Institute of Gerontology and Geriatrics, Affiliated Huadong Hospital, Shanghai Medical College, Fudan University, China)

Introduction : To observe the basal value aging changes of thyroid infections(T.F.)and its relationship with nosocomial infections(N.I.), and the inquiry about the age-associated changes of thyroid function and immunity. **Method :** To study the basal values of T3, T4, FT4 and TSH with BM. Of every five years groups in randomized cohort sample with 765 persons(45-90 years.M710,F55) of healthy care objects in HuaDong Hospital in 1995. 2.To select 134 cases with N.I. in 211 N.I. and 114 persons without N.I. in 1840 aged(\geq 60 years old) admitted into hospital with various diseases in 1995-1997 with prospective randomized methods. **Results :** The combined statistical results mean value,(M \pm SD) of M+F in various age groups was significant difference.The mean value (M \pm SD) of T3,FT3, FT4 and TSH in the objects with N.I.(134 cases) were significantly lower

($P < 0.01-0.001$) than that of subjects without N.I.(No N.I.)(114).
Conclusion : The significant decreasing of the mean value of FT3 and FT4 on the whole in this cohort may be reflecting aging decreasing of thyroid function. It is suggested that there is functional decreasing of hypothalamus-pituitary-thyroid axis with aging in the oldest old. No significant difference of mean value of T3,FT3,T4,FT4 and TSH were found between M. and F. The M±SD of T3,FT3,FT4 and TSH were significantly lower in nosocomial infection. The immunity in the aged is correlated with the age-associated changes of thyroid function.
Keywords : Thyroid function, Aging changes, Aging changes of thyroid function and nosocomial infections, Thyroid

SUBCLINICAL DECREASE OF THYROID FUNCTION AND SUBCLINICAL HYPERTHYROIDISM IN THE 1540 PRESAGED AND ELDERLY

Yongxing MA, Pei-Fang LU (*Antiaging and Cognitive Function, Shanghai Institute of Gerontology and Geriatrics, Affiliated Huadong Hospital, Shanghai Medical Collage, Fudan University, China*)

Introduction : To find the subclinical decrease of thyroid function and subclinical hyperthyroidism in the 1540 Presaged and elderly. Method: To study the basal values of T3, T4, FT3, FT4 and TSH with BM in the elderly and the relationship between TSH and T3, T4, FT3 and FT4. Of every five years groups in randomized cohort sample with 1540 persons (45-90 years. M 1367, F 173) of healthy care objects in HuaDong Hospital. Results : The combined statistical results mean value (M±SD)of M+F in various age groups. There were significantly decreased in T4 and T3 among various age groups in the mean value (M±SD) of combined. There was significantly increased in TSH among various age groups. The mean value of T3 was significantly decreased in Group A with aging ($P < 0.001$). The mean value of T4, FT3, FT4 in group B were significantly lower than that of Group A. ($P < 0.05-0.001$). The mean value of FT4 in Group C was significantly higher than that of Group A. The mean value of T4, FT4 and FT3 were significantly higher than that of Group B ($P < 0.05-0.001$). Conclusion : No significant difference between FT3 and FT4 was observed. The mean value of T3 was significantly decreased in Group A with aging ($P < 0.001$). Level of TSH was significantly increased on the whole with aging but decreased in aged > 90 years. These results showed that 11.30% persons suffered from subclinical hypothyroidism and 13% persons suffered from subclinical hyperthyroidism or high T4 status. Keywords : Subclinical Hyperthyroidism, thyroid function, Presaged and Elderly

OP27 223-C-4

SARCOPENIA IN PHYSICALLY INACTIVE JAPANESE ELDER PATIENTS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD) UNDERGOING INTERDISCIPLINARY COMPREHENSIVE PULMONARY REHABILITATION

Kazuyoshi SENDA¹, Shosuke SATAKE², Izumi KONDO³, Haruhiko TOKUDA⁴, Masataka SHIBASAKI⁵, Mitsunori NISHIKAWA⁵, Hisayuki MIURA¹, Hidetoshi ENDO², Kenji TOBA⁶ (*1. Division of Home Care Promotion, National Center for Geriatrics and Gerontology, Japan; 2. Department of Geriatric Medicine, National Center for Geriatrics and Gerontology, Japan; 3. Department of Rehabilitation Medicine, National Center for Geriatrics and Gerontology, Japan; 4. Department of Clinical Laboratory, National Center for Geriatrics and Gerontology, Japan; 5. Department of Pulmonary Medicine, National Center for Geriatrics and Gerontology, Japan; 6. Director of the Hospital, National Center for Geriatrics and Gerontology, Japan*)

Introduction : Reduced physical activity (PA) of COPD patients accelerates sarcopenia, however evaluation methods for PA remains to be established. This study aimed to investigate association of sarcopenia and PA in COPD patients undergoing pulmonary rehabilitation. Method : Clinically stable 25 outpatients with COPD (age: 75.4 +/- 6.1 years; BODE index: integrated BMI, air-flow obstruction, dyspnea, and exercise capacity; 0-7/10) were underwent a comprehensive geriatric assessment including body composition. PA was measured with the self-administered Modified Baecke Questionnaire (Total activity: TA), and compared with step-count (SC) using an electric accelerometer. Results : While 20 patients were diagnosed with sarcopenia by Baumgartner Criteria, 9 sarcopenic patients were diagnosed by the European Working Group on Sarcopenia in Older People Criteria. Mean TA was 6.7 +/- 2.5 /12. Mean SC was 4853 +/- 2463. TA was positively correlated with SC ($r = 0.52, p = 0.007$) and visual analog scale for health ($r = 0.64, p = 0.001$), and negatively with frailty ($r = -0.48, p = 0.02$), 5m walking speed ($r = -0.49, p = 0.01$), St. George's Respiratory Questionnaire ($r = -0.44, p = 0.04$), and COPD Assessment Test ($r = -0.40, p = 0.05$). SC was negatively correlated with BODE ($r = -0.54, p = 0.005$) and 5m walking speed ($r = -0.44, p = 0.03$). Conclusion : Sarcopenia was prevalent and walking speed, which is one of the determinants of sarcopenia, associated with TA, SC, and QOL. SC was closely associated with TA. Amount of walking accounted for a large part of PA and SC was an effective marker of PA. Regimens to promote PA using accelerometer are awaited. OP27 224-C-1

RELIABILITY AND VALIDITY OF CLINICAL DEMENTIA RATING FOR COMMUNITY LIVING ELDERLY NOT BASED ON INFORMANT INFORMATION (CDR-NI)

Shwe Zin NYUNT¹, Tze Pin NG¹, Mei Siang CHONG² (*1. Psychological Medicine, National University of Singapore, Singapore; 2. Geriatric Medicine, National Health Care Group, Singapore*)

Introduction : The Clinical Dementia Rating scale (CDR) currently relies on a close informant's information to assess the cognitive function and dementia in the elderly. The number of elderly without an informant (such as those living alone) in the community is expected to contribute to an increasing proportion of cases of dementia. There is hence a need to establish whether the CDR can reliably assess dementia without relying on an informant. Method : The Mini Mental State Examination (MMSE) and Montreal Cognitive Assessment (MOCA) were used to select cognitively impaired (MMSE or MOCA < 26) elderly from the Singapore Longitudinal Aging Study Wave II. Among them, consenting participants who could communicate without an informant were interviewed using a modified Clinical Dementia Rating Scale for non-informant (CDR-NI) and clinically assessed using DSM IV criteria for dementia. Results : Out of 90 eligible participants, 36 (41%) were clinically diagnosed with mild cognitive impairment (MCI) and 4 (4.4%) with mild dementia. The internal consistency (Cronbach α) for each rating was 0.83 to 0.84. The Kappa statistics ($p < 0.001$) of inter-rater agreement ranged from 0.77 to 1.00 for six domains, and 0.95 for global score. Test retest reliability ranged from 0.75 to 1.00 for six domains and 0.80 for global score. Kappa for agreement between Global CDR score and Clinical assessment by DSM IV was 0.79. CDR-NI severity grades were significantly related to MMSE, MOCA, IADL and BADL measures of cognitive and

functional impairment. Conclusion : The CDR-NI showed good reliability and validity in assess dementia without an informant report. Keywords : Clinical Dementia rating, elderly, living alone

OP27 224-C-2

PREVENTION OF DELIRIUM IN OLDER PEOPLE IN HOSPITAL - FEASIBILITY AND ACCEPTABILITY OF THE PREVENTION OF DELIRIUM (POD) PROGRAMME

Francine CHEATER¹, Anne FORSTER², Mary GODFREY², John GREEN², Sharon INOUE³, Najma SIDDIQI⁴, Jane SMITH², John YOUNG² (1. School of Nursing Sciences, University of East Anglia, United Kingdom; 2. Academic Unit of Elderly Care and Rehabilitation, University of Leeds, United Kingdom; 3. Department of Medicine, Harvard Medical School, USA; 4. Adult Mental Health Services, Bradford District Care Trust, United Kingdom)

Introduction : Delirium is the most frequent complication for older people following hospitalisation. Evidence suggests it could be prevented in about ½ of patients using multi-component interventions. We have developed a multi-component intervention (the Prevention of Delirium (POD)) Programme designed to be integrated into ward routines without the need for additional resources. POD targets 10 known, modifiable 'clinical factors' for delirium and involves a role for hospital volunteers. We are now in the latter stages of a pilot study to test the feasibility and acceptability of POD implementation, to provide a realistic assessment of the practical, professional and cultural issues involved in changing practice. Method : We are using a case study approach in six wards (four hospital trusts) to explore: implementation process; impact on staff workload and patient and carer satisfaction; acceptability to patients, carers, staff and volunteers. Results : Data collection on the impact of POD on staff workload, patient and carer satisfaction with care, and acceptability to patients, carers, staff and volunteers is ongoing and results will be presented. To date, POD has been fully implemented in three wards and partially implemented in a fourth. A potentially generalisable implementation strategy has emerged, including ALL of the following pre-requisites for 'site readiness': 1. Engagement of senior nurse, ward manager, voluntary services manager; 2. Named person to drive implementation forward; 3. Dedicated time (one day a week) of a senior, experienced nurse to lead implementation; 4. Total staff on duty ≥ 6 . Conclusion : Implementation and delivery of POD is feasible in 'site-ready' wards. Keywords : Delirium, Prevention, System of care, Feasibility, Acceptability

OP27 224-C-3

THE EFFECT OF THE HEARTHQUAKE ON ELDERLY PEOPLE: A MULTIDISCIPLINARY EXPERIENCE OF CARE IN THE EMERGENCY

Fabbo ANDREA, Mary GUERZONI, Simone LUGLI, Lucia BERGAMINI, Mara VESCHI, Maria SCARANO, Marina TURCI (Primary Care, Ausl Modena, Italy)

Introduction : In May 2012 the district of Mirandola was hit by a strong earthquake that forced thousands of elderly people to leave their homes. Nearly all hospitals and nursing home weren't safe. Aim: To assess if during the health emergency a short specialized geriatric observation could be a proper answer for elderly people's needs. Method : Within few days a tent with 8 beds for short geriatric observation was set up. The experience went on for 2 months. 194 patients were hospitalized in the tent. During the hospitalization patients received all the necessary diagnostic and therapeutic intervention thanks to the help of specialists. At the same time it was arranged a secure discharge with a constant communication with

general practitioners and social assistants. Results : 100 were elderly people (average age 81) with different health and social problems who needed complete and complex answers. The most frequent reasons of admission were delirium or dementia with behavioral disorders (55%), dehydration, heart failure (many people in those days lived in tent, garages, cars). The average hospitalization was 1.2 days. 11% went to the hospital, 66% went to nursing homes and 33% went home. 49% needed sedative therapy, 25% analgesic therapy, 46% hydration therapy. Many people received specialist's assistance. Conclusion : The model of short intensive observation was proper because created a network between the available resources in the district, in a short it gave a complete answer for a high number of people with problematic situations and most of them could return home. Keywords : elderly care , delirium, dementia

OP27 224-C-4

DELIRIUM IN GERIATRIC MEDICINE IS RELATED TO ANTICHOLINERGIC BURDEN

Moustafa NAJA¹, Jadwiga ZMUDKA¹, Sanaa HANNAT¹, Sophie LIABEU², Pierre JOUANNY¹ (1. Geriatric Medicine, University Hospital, France; 2. Center for Clinical Research, University Hospital, France)

Introduction : The objective was to evaluate the relationship between anticholinergic drugs use and delirium. Method : Prospective monocentric study in geriatric medicine patients Anticholinergic burden (AB) was assessed by a grid literature synthesis, classifying drugs into 4 levels (none, low, medium and high) every week. A total weighted score was established. Delirium symptoms were measured with CAM at day 1, 3, 5, 8, 15 and 21. Covariates studied are Charlson score, health status, ADL/IADL, albumin, MMS, length of stay. Results : 91 patients (86.3 ± 5.8 years, 53 women and 49 men) were included and followed up for 14.5 ± 9.9 days. 51.2% were taking anticholinergic drugs at home. AB average is 2.13 ± 1.34 . Prevalence (%) of delirium symptoms were respectively: 43.1 at Day 1, 36.9 at Day 3, 34.8 at Day 5, 44.9 at Day 8 and 60 at Day 21. AB was correlated with appearance of delirium symptoms. Delirium was associated with increased mortality (16.1% vs 3.7% ; $p=0.049$) and average length of stay (18.09 ± 11.34 vs 11.75 ± 7.80 days; $p = 0.001$), decreased autonomy on exit (ADL 1.57 ± 1.56 vs 3.41 ± 1.45 on 6; $p<0.0001$) and health status more degraded on exit (5.3 ± 2.7 vs 7.0 ± 1.7 on 10; $p = 0.0008$). Appearance of delirium symptoms is correlated with high AB ($p=0.017$) and also like high mortality ($p = 0.01$). Conclusion : AB is a definite risk factor for delirium, but also mortality. Prevention of delirium must go through its reduction. Keywords : delirium, anticholinergic burden, elderly, hospitalization

OP27 224-C-5

REVISITING THE CONCEPTUALISATION OF DELIRIUM

Eamonn EELES¹, Nancy PEEL², Susan WHITE³, Anthony BAYER³, Sinead OMAHONY³, Ravi BHATT⁴, Ruth HUBBARD³ (1. University of Queensland, The Prince Charles Hospital, Australia; 2. Centre for Research in Geriatric Medicine, University of Queensland, Australia 3. Geriatrics, Cardiff University, United Kingdom; 4. Psychiatry, Rural Health Academic Centre The University of Melbourne, Australia)

Introduction : The multifactorial model of illness, based on the interaction between predisposing and precipitating factors, has been applied to the understanding of delirium. Attempts to replicate the risk tool in other areas, have been inconclusive. We have undertaken to reappraise the relationship between the classical multifactorial model and delirium. We also review an alternative approach to

conceptualization based on global and archetypal vulnerability and insult: frailty and illness severity. Method : Secondary analysis of a prospective cohort study of 273 patients aged ≥ 75 years. Diagnosis of delirium was made using Confusion Assessment Method. Baseline demographics and functional status were collected. Replication of the classical interaction of predisposing and trigger factors was explored. An alternative approach investigating frailty, according to deficit accumulation, in relation to illness severity was undertaken. Frailty status was measured by an index of accumulated deficits (FI), giving a potential score from 0 (no deficits) to 1.0 (all 33 deficits), with 0.25 used as the cut-off between 'fit' and 'frail'. Delirium was defined as absent, community acquired or hospital acquired. Results : Separation into risk categories (low/medium/high) showed that only precipitating factors were associated with hospital acquired delirium (table 1). Frailty and illness severity was strongly associated with all delirium ($\text{Chi}^2 51.8; p < 0.00$) and remained a risk factor for hospital acquired delirium ($\text{Chi}^2 = 56; p = 0.04$). Conclusion : The classical multifactorial model of delirium was not generalized in this study. The interaction between frailty and illness severity offers a way of understanding delirium that may extrapolate to all patients. Keywords : delirium

OP27 224-C-6

TRANSLATING RESEARCH TO PRACTICE: IMPLEMENTING THE PREVENT MODEL IN PRIMARY CARE

Mary Guerriero AUSTRUM¹, Cathy A. ALDER², Christopher M. CALLAHAN³, Malaz A. BOUSTANTI³, Hugh C. HENDRIE⁴ (1. Psychiatry and Indiana Alzheimer Disease Center, Indiana University School of Medicine, USA; 2. Aging Brain Center, Wishard Health Services, USA; 3. Medicine, Division of General Internal Medicine and Geriatrics, IU Center for Aging Research Regenstrief Institute, Inc Indiana University School of Medicine, USA; 4. Psychiatry, IU Center for Aging Research Indiana University School Medicine, USA)

Introduction : Effective management of Alzheimer's disease (AD) requires comprehensive care for both patients and their caregivers. The PREVENT study [Providing Resources Early to Vulnerable Elders Needing Treatment (for Dementia)], a randomized controlled trial in primary care at Wishard Health Services (WHS) in Indianapolis IN, USA, demonstrated the effectiveness of collaborative care to address the needs of AD patients and caregivers. Collaborative care resulted in improved quality of care for AD, improved satisfaction with care, reduction in neuropsychiatric symptoms and caregiver distress. Method : In 2007, an interdisciplinary team distilled the PREVENT intervention to its essential components in order to transform the research model to a clinical program at WHS. Two years later, finding that significant numbers of older adults do not come into geriatric clinics due to transportation problems, complex social situations, fear of losing independence, etc.), the team developed the ABC Medical Home (ABC) to deliver care to patients and caregivers in their homes and/or community settings. The pilot program included a nurse practitioner, social worker and medical director supported by eMR-ABC care coordination software. Approximately 200 patients were enrolled from one primary care center within WHS. Results : Based on the effectiveness of the pilot, we received a CMS Innovation Award to expand services to 2000 Medicare/Medicaid beneficiaries with dementia or late life depression. Conclusion : Implementation of the PREVENT model in HABC and the ABC pilot has resulted in effective patient management and reduced caregiver burden. Support provided by IP-RISP R24MH080827 & 1C1CMS331000-01-00. Dr. Austrom was also supported in part by NIH-P30AG101. Keywords : Alzheimer disease, primary care, caregiver burden

NEUROLEPTIC, SEDATIVE AND ANALGESIC PRESCRIPTION IN DEMENTIA PATIENTS ADMITTED INTO ACUTE HOSPITAL

Upul FERNANDO, Emma JAY, Daryl LEUNG, Rebecca WINTER (Geriatric Department, Royal Wolverhampton NHS Trust, United Kingdom)

Introduction : Aggressive behavioural symptoms can be very challenging to clinicians and also harmful to patients. Prescription of antipsychotics and sedatives for challenging behaviour are widespread. They are associated with many side effects and clearly increase mortality and morbidity including increasing stroke risk. Method : A Point prevalence survey was carried out for all patients with dementia on 12/10/11. 51 patients were identified using the dementia flag via the computer system at the Hospital and referrals to the Dementia Outreach service. Drug charts were examined to identify if the patients had been prescribed any neuroleptics or sedatives from admission until 12/10/1. A retrospective review of the same 51 notes and drug charts were done looking at whether patients had been prescribed regular or prn analgesia. Results : We found 35% of patients in our survey had been prescribed neuroleptics since admission, mainly by junior doctors. Reassuringly many of these prescriptions were stopped and very few were continued after discharge. It was very clear patients who were on regular or PRN analgesia did not need any neuroleptics or sedatives. Interestingly patients who were on regular or PRN neuroleptics or sedatives were not on analgesia. Conclusion : High numbers of patients had been prescribed neuroleptics or sedatives by the junior medical staff without trying other alternatives. We also learnt if patients with dementia were having disturbed behaviour or agitation, this could be due to pain that they could not express properly. This behaviour can be easily managed with regular or PRN analgesics rather than giving neuroleptics or sedatives. Keywords : Dementia, Neuroleptics, Aggressive behaviour

ASSOCIATION BETWEEN TREATMENT-LIMITING DECISION, COMORBIDITIES AND DYING IN EMERGENCY DEPARTMENT: CROSS-SECTIONAL ELDERLY POPULATION-BASED STUDY

Laure DE DECKER¹, Aude GOURAUD-TANGUY², Gilles BERRUT¹, Olivier BEAUCHET³ (1. Geriatric, University Nantes, France; 2. Geriatric, Hospital Nantes, France; 3. Geriatric, University Angers, France)

Introduction : Older adults experience a higher risk of death in the emergency departments (EDs), in part, as a result of their comorbidities. A treatment-limiting decision is often reported for older adults who die in the EDs. The Charlson Comorbidity Index (CCI) is a validated method for the scoring of comorbidities. Whether an association between the CCI and treatment-limiting decisions exists remains unknown. Method : To determine whether the CCI was associated with the treatment-limiting decisions made for older patients who die in the EDs. Methods: A total of 2,095 patients ≥ 65 years old who died in the ED in France and Belgium were prospectively included between 2004 and 2005. The recorded data included: 1) the CCI score; 2) patient age; 3) gender; 4) living in senior housing facilities; 5) hospitalizations occurring in the previous year; 6) presence of functional limitations (according to the Knaus classification); 7) chronic diseases; and 8) presence of organ failure(s).

A treatment-limiting decision was defined as a predetermined choice not to implement therapies that would otherwise be required to sustain life. Results : A treatment-limiting decision was identified in 993 (47%) patients. Fully-adjusted logistic regression model showed that a CCI ≥ 5 (OR=25.56 with P=0.037), age ≥ 85 years (OR=20.33 with P<0.001), living in an institution (OR=0.15 with P=0.017), hematologic (OR=6.92 with P=0.020) and respiratory disease (OR=0.17 with P=0.046), and neurologic causes (OR=0.20 with P=0.010) of organ failure were significantly associated with treatment-limiting decisions. Conclusion : An elevated CCI score (≥ 5) was associated with a treatment-limiting decision in elderly patients evaluated in the EDs. Keywords : Older patients, treatment-limiting decision, comorbidities.

MISTREATED DEPRESSION IN LONG TERM CARE INSTITUTIONS

Hana VANKOVA¹, Iva HOLMEROVA², Martina JEDLINSKA²
(1. Faculty of Humanities and 3rd Medical Faculty, Charles University in Prague, Czech; 2. Faculty of Humanities, Charles University in Prague, Czech)

Introduction : Depression and its mistreatment may be considered one of the most important quality indicators in long term care for older adults. Depression is interrelated with many geriatric syndromes, has important impact on quality of life, morbidity and mortality. Method : Depressivity was assessed using Geriatric Depression Scale (GDS-15). Use of antidepressants of different types was mapped in three LTC institutions in the Czech Republic in the last year.. The same protocol was used in 2007 in 12 LTC institutions, so we are able to observe the trends in use of antidepressants in LTC institutions in the Czech Republic. Results : In 2007 out of 584 residents 17 were prescribed tricyclic antidepressants. This represented 15% of all prescribed antidepressants. While recently, according to our preliminary results, 9% of all prescribed antidepressants were tricyclic antidepressants. On the contrary, prescription of the new generation antidepressants, SSRIs and SNRIs increased. Detailed results will be discussed. Conclusion : Prescription of high risk tricyclic antidepressants for LTC residents was quite frequent in the Czech Republic in the last years, and this bad practice continues even now. Prescription of tricyclics seems to decrease while the use of new generation antidepressants increased. However, the problem of undiagnosed and untreated depression is still present in many LTC residents in the Czech Republic and intervention is needed. Supported by the grants NT11325 and NT13705 of the Ministry of Health of the Czech Republic Keywords : depression, mistreatment

CORRELATION BETWEEN ESTRADIOL SERUM CONCENTRATION WITH PELVIC FLOOR MUSCLES' STRENGTH AS A PARAMETER OF URINARY INCONTINENCE IN GERIATRIC WOMEN AT Pengeragoan Village, Jembrana, Bali

Agnes RENZA¹, R.A. Tuty KUSWARDHANI² (1. Internal Medicine Dept., Atma Jaya Hospital, Faculty of Medicine-Atma Jaya University, Indonesia; 2. Geriatric Division, Faculty of Medicine, Udayana University / Sanglah Hospital, Indonesia)

Introduction : One of bothersome urinary tract complaints in geriatric women is urinary incontinence with prevalence is 1.3 to 2.0 times greater than geriatric men. This research purpose to determine mean serum estradiol concentration in geriatric women and correlation between serum estradiol concentration with pelvic floor muscles'

strength as a parameter of urinary incontinence in geriatric women. Method : This is a cross sectional study in geriatric women population at Pengeragoan Village, Jembrana, Bali. Samples determined using cluster proportional (systematic) random sampling. In brief, this study included female patients aged ≥ 60 years old who were eligible to do examinations. Patients were excluded if they had history of severe perineal rupture, vaginal and/or pelvic infection/malignancy, immobilization and/or extremity paralysis history of fractures in hip, pelvic or lower extremity, decrease of consciousness, end stage renal disease, stones in urinary tract, severe infection (sepsis), urinary catheter user. Written informed consent was obtained from all study participants. Pelvic floor muscles' strength measured with a Perineometer (PFX2®). Urinary incontinence diagnosed by an anamnesis (using a questionnaire). Results : Total sample of geriatric women were 77 people, with mean of age are 66.9 ± 7.09 year old (p = 0.019), BMI 22.05 ± 3.74 kg/m² (p = 0.735), perineometer score (without contraction) 6.34 ± 2.26 mmHg (p = 0.000) , perineometer score (with contraction) 9.97 ± 2.1 . Conclusion : In this research we found low mean serum estradiol concentration (13.8 ± 9.7 pg/mL) and there is correlation between serum estradiol concentration with pelvic floor muscles' strength in geriatric women at Pengeragoan Village, Jembrana, Bali. Keywords : Estradiol, pelvic floor muscles strength, urinary incontinence

OP27 225-C-5

URINARY INCONTINENCE PROJECT: HOSPITAL & COMMUNITY COLLABORATION MODEL

Mei Yee Bonnie WONG, Cy TONG (Integrated Elderly Care Services, Christian Family Service Centre, Hong Kong)

Introduction : In Hong Kong, 40-45% frail elderly (aged over 65) living in community, suffered from different types of urinary incontinence and related symptoms. It influences the quality of life and may lead to pre-mature institutionalization to old aged homes. However, due to the declined cognitive and physical function, the compliance rate of the treatment was low. This study explored the prevalence of urinary complaints and the attitude of treating the urinary symptoms of the participants and to evaluate the clinical effectiveness of the collaboration model. Method : The study included two phases: The phase I used face to face interviews to collect informations through closed-end questionnaires while the phase II used Paired sample-t-test for "pre" and "post" comparison for the validated measuring tools: i) Urogenital Distress Inventory Short Form(UDI-6) ii) Incontinence Impact Questionnaire Short Form (IIQ-7) iii) General Health Questionnaire (GHQ-12) iv) International Prostate Symptom Score (IPSS) and v) Subjective Program evaluation. Results : For phase I, 1103 clients were interviewed (n=1103). The response rate was 81.2%. 79.1% had at least one kind of urinary symptoms. Nocturia was the most common complaints (55.5%). 55% refused to be referred for further treatment. For phase II, 87 clients joined the clinical program. The overall results were significant in reducing the severity of urinary symptoms; increased the quality of life, confidence and life satisfaction; decreased the severity of nocturia and distress. Conclusion : A new collaboration service model between the nurse-led continence clinic and community care service increased the compliance rate and enhanced the continuity and effectiveness of the treatment. Keywords : pre-mature institutionalization, nurse-led continence clinic, urinary incontinence, UI, nocturia,

FRAILITY AND SARCOPENIA

OP27 226-C-1

FRAILTY PREDICTS DEPRESSION IN OLDER ADULTS AGED 55 AND ABOVE IN THE SINGAPORE LONGITUDINAL AGEING STUDY (SLAS-1)

Liang FENG¹, Ma Shwe Zin NYUNT¹, Lei FENG¹, Keng Bee YAP², Tze Pin NG¹ (1. *Psychological Medicine, National University of Singapore, Singapore*; 2. *Department of Geriatric Medicine, Khoo Teck Puat Hospital, Singapore*)

Introduction : The interrelationships between depression and frailty are unclear. Whether depression and frailty are a cause, consequence, or comorbidity of the other, or even congruent conditions has been examined in few studies. This study aimed to examine the cross-sectional and longitudinal relationships between frailty and depressive symptoms at baseline and depressive symptoms at follow up. **Method :** 1827 older Chinese adults aged 55 and above in the Singapore Longitudinal Ageing Study cohort 1 (SLAS-1) provided data on frailty measures (based on Fried criteria) at baseline, and depression (GDS-15) at baseline and follow ups at 1.5 and 4 years. **Results :** The mean age of the population was 65.9 (± 7.26). Among them, 11.4% (n=209) had depressive symptoms (GDS ≥ 5), 2.5% (n=46) were frail and 32.4% (n=591) pre-frail at baseline. In cross-sectional analysis of baseline data, the adjusted odds ratios (OR) and 95% confidence intervals (CI) controlling for demographic, health status and other confounders were 1.69(1.23-2.33) for pre-frailty and 2.36(1.08-5.15) for frailty, (p, linear trend<0.001) In longitudinal data analyses, prospective associations among all participants were: pre-frail: OR=1.86 (1.08-3.20); frail: OR=3.09 (1.12-8.50); p (trend)=0.009). Among participants free of depressive symptoms at baseline, similar prospective associations were found: pre-frail OR=2.26 (1.12-4.57); frail: OR=3.75 (1.07-13.16); p (trend)=0.009). **Conclusion :** These data support a significant role of frailty as a predictor of depression in a relatively younger old adult population aged 55 and above. Further interventional studies should explore whether the reversal of frailty can decrease the risk of depression. **Keywords :** Frailty, depressive symptoms, elderly

FRAILTY SYNDROME AMONG BRAZILIAN ELDERLY

Yeda DUARTE¹, Maria Lucia LEBRAO¹, Fabiola Bof ANDRADE², Luciana Correia ALVES¹ (1. *Epidemiology, School of Public Health University of Sao Paulo, Brazil*; 2. *Odontology, Federal University of Brasilia, Brazil*)

Objective: to provide a systematic examination of frailty categories - no frail, pre-frail, frail - in a well-defined sample of older Brazilian adults in 2006 and associate variables. **Method :** This was a cross-sectional study with data from the Health, Wellbeing and Aging cohort study (SABE), Brazil. The SABE uses a stratified, multistage sampling design to obtain a representative sample of noninstitutionalized individuals, with 60 years and older, from Sao Paulo City and is designed to collect information on the general health and life conditions. The study started in 2000 as a multicenter survey conducted in seven countries in Latin America and the Caribbean and in 2006 it was continued in Sao Paulo and was transformed into a cohort study. The sample was composed by 1399 people aged 60 years and over and phenotype model proposed by Fried et.al. **Results :** In 2006, frailty prevalence was 41.5 pre frail and 8.5 frail. Frailty and pre-frailty were associated with the same variables, except the variable that represents the difficulties in ADL showed that a statistically significant only with pre-frailty. Increasing age increased the odds of being pre-frail and frail. It was found that individuals with depression, with 2+ disease, difficulties in IADL showed significantly more likely to be frail and pre-frail. Between older people with cognitive decline,

less educated, difficulties in IADL and ADL demonstrated more likely to be considered pre-frail. Frailty was significantly associated with five variables: age, living alone, depression and difficulty in IADL. **Conclusion :** Frailty is an public health problem in Brazil. **Keywords :** Frailty, SABE Study, Brazil

OP27 226-C-3

ASSOCIATIONS OF SARCOPENIC OBESITY AND DYNAPENIC OBESITY WITH CHANGES IN FALLS RISK OVER FIVE YEARS IN COMMUNITY-DWELLING OLDER ADULTS

David SCOTT¹, Alan HAYES², Kerrie SANDERS¹, Peter EBELING¹, Graeme JONES³ (1. *Department of Medicine, NorthWest Academic Centre, University of Melbourne and Western Health, Australia*; 2. *Institute of Sport, Exercise and Active Living, School of Biomedical and Health Sciences, Victoria University, Australia*; 3. *Menzies Research Institute, University of Tasmania, Australia*)

Introduction : Dynapenia (the age-related decline in muscle strength) may be a better predictor of functional outcomes than sarcopenia. Concurrent low muscle mass and high fat mass (sarcopenic obesity; SO) may result in cumulative functional declines, but few data have examined outcomes of dynapenic obesity (DO). **Method :** 674 community-dwelling volunteers (61.4 \pm 7.0 years; 48% female) completed assessments at baseline and 5.1 \pm 0.5 years later. Dual-energy X-ray absorptiometry determined trunk fat (TFAT) and appendicular lean (ALM) mass. Lower-limb strength (LLS) was assessed by dynamometer. Sarcopenia, dynapenia, and obesity were categorised according to the lowest sex-specific tertiles of ALM/height² and LLS, and the highest sex-specific tertile for TFAT. A validated Physiological Profile Assessment assessed falls risk at baseline and follow-up. **Results :** At baseline, N = 36 and N = 79 participants demonstrated SO and DO respectively, and 22 met both definitions. A significant trend was observed for higher falls risk score amongst DO compared to non-DO participants (P < 0.001), but not for SO compared to non-SO participants (P = 0.152) at baseline. Adjusting for age, falls risk score significantly increased over five years for DO men [(0.32 (95% CI 0.07, 0.56)], and for both DO [0.38 (95% CI 0.14, 0.62)] and dynapenic alone [0.22 (95% CI 0.01, 0.43)] women, compared to non-DO participants. No associations were observed for sarcopenia alone or SO (all P > 0.05). **Conclusion :** Dynapenic obesity may have better predictive ability for increasing falls risk over five years in community-dwelling older adults than sarcopenic obesity, and sarcopenia or dynapenia alone. **Keywords :** sarcopenic obesity; falls

SARCOPENIC OBESITY IS ASSOCIATED WITH A HIGHER LEVEL OF SERUM HIGH-SENSITIVITY C-REACTIVE PROTEIN IN CHINESE OLDER PERSONS - A COMMUNITY-BASED STUDY

Chuan-Wei YANG¹, Chia-Ing LI², Chiu-Shong LIU³, Chih-Hsueh LIN³, Wen-Yuan LIN³, Tsai-Chung LI⁴, Cheng-Chieh LIN⁵ (1. *Ph.D. Program for Aging, College of Medicine, China Medical University, Taiwan*; 2. *Department of Medical Research, China Medical University Hospital, Taiwan*; 3. *Department of Family Medicine, China Medical University Hospital, Taiwan*; 4. *Graduate Institute of Biostatistics, College of Public Health, China Medical University, Taiwan*; 5. *School of Medicine, College of Medicine, China Medical University, Taiwan*)

Introduction : The prevalence of obesity and sarcopenia is high in older persons. These two disorders occurring simultaneously form

sarcopenic obesity. Research suggests that inflammation plays an important role in the pathogenesis of the obesity and sarcopenia. This study explores the association between sarcopenic obesity and inflammatory markers. Method : The study sample consisted of 844 community-dwelling people aged 65 years and older (448 men and 396 women). Sarcopenic obesity was determined by low muscle mass (skeletal muscle index < 6.87 and 5.46 kg/m² for men and women, respectively) and excess body fat (percentage body fat greater than the 60th percentile of the study sample by genders [27.82% in men and 37.61% in women]). The inflammatory markers, including the interleukin-6 (IL-6), high-sensitivity C-reactive protein (hs-CRP) and tumor necrosis factor-alpha (TNF- α) were measured. Results : The prevalence of sarcopenic obesity was 7.37% in men and 7.07% in women. The percentage of subjects in the groups of normal, obesity only, sarcopenia only, and sarcopenic obesity were 48.0, 32.9, 11.8 and 7.2, respectively. There was no difference in the serum levels of IL-6 and TNF- α among 4 groups of different sarcopenia and obesity status. After multivariate adjustment, the serum hs-CRP levels in the groups of sarcopenia only and sarcopenic obesity compared with the normal group were significantly higher by 0.12 mg/dl (P = 0.043) and 0.18 mg/dl (P = 0.017), respectively. Conclusion : Our results provide evidence that sarcopenic obesity was associated with increased level of serum hs-CRP. Keywords : Sarcopenic obesity, hs-CRP, exercise behavior

MEASURING GAIT SPEED IN NURSING HOME RESIDENTS: A SYSTEMATIC REVIEW

Alexandra SLATER¹, Nancye May PEEL², Suzanne S. KUYS³, Ruth E. HUBBARD² (1. School of Medicine, The University of Queensland, Australia; 2. Centre for Research in Geriatric Medicine, The University of Queensland, Australia; 3. Centre for Musculoskeletal Research, Griffith University, Australia)

Introduction : Gait speed is an established measure of physical performance and a strong predictor of adverse outcomes, including hospitalisations, disability, cognitive decline and death. In community-dwelling older adults, 0.8m/s has been proposed as a cut-off between fitness and frailty. A recent meta-analysis of gait-speed values for older patients in clinical settings estimated mean usual pace of 0.58m/s. Here, we aimed to review gait speed values for ambulatory geriatric nursing home residents. Method : A systematic search of relevant databases provided articles published prior to December 2012. Study inclusion criteria were: original research article, mean participant age >70 years, resident in nursing home, residential aged care facility or similar and measurement of gait speed over a short distance. Results : Final data included 2,654 participants from 32 studies, 65% of which required participants to be ambulatory over the measurement distance. 12 studies reported maximal gait speed, 17 gait speed at usual pace, in 6 studies, pace was unspecified and assumed to be usual. The unadjusted means for maximal and usual gait speed were 0.65m/s (range: 0.48-1.00; 95% Confidence Interval [CI]: 0.60-0.71) and 0.45m/s (range: 0.14-0.82; 95% CI: 0.38-0.51) respectively. Conclusion : Gait speed values in the geriatric nursing home population are lower than those reported for older adults in the community and in clinical settings. However, unadjusted gait speed values suggest that for many nursing home residents, mobility, while impaired, is still functional. Keywords : gait speed; nursing home; systematic review

OP27 226-C-6

PREDICTING QUALITY OF LIFE OF OLDER PEOPLE IN THE NETHERLANDS USING A MULTIDIMENSIONAL

ASSESSMENT OF FRAILITY

Robbert J. GOBBENS¹, Katrien G. LUIJKX², Marcel A. VAN ASSEN³ (1. Institute for Health Care, Rotterdam University of Applied Sciences, Netherlands; 2. Department of Tranzo, Scientific Center for Care and Welfare, Tilburg University, Netherlands; 3. Department of Methodology and Statistics, Tilburg School of Social and Behavioral Sciences, Tilburg University, Netherlands)

Introduction : Although frailty was originally a medical concept, nowadays more and more researchers are convinced of its multidimensional nature, including a psychological and social domain of frailty as well as a physical domain. The objective of this study was to test the hypothesis that the prediction of quality of life by physical frailty components is improved by adding psychological and social frailty components. Method : This cross-sectional study was carried out in a sample of 1,031 people aged 65 years and older. Participants completed a web-based questionnaire containing the Tilburg Frailty Indicator (TFI) for measuring physical, psychological and social frailty, and the WHOQOL-BREF for measuring four quality of life domains (physical health, psychological, social relations, environmental). Results : The findings show that the prediction of all quality of life domains by eight physical components of frailty was improved after adding four psychological and three social frailty components. The psychological frailty component 'feeling down' significantly improved the prediction of all four quality of life domains, after controlling for the effects of background characteristics and all other frailty components. The psychological frailty component 'feeling nervous or anxious' and the social components 'lack of social relations' and 'lack of social support' improved the prediction of three quality of life domains, after controlling for the effects of all other variables. Conclusion : This study emphasizes the importance of a multidimensional assessment of frailty in the prediction of quality of life in older people. Keywords : Quality of life; frailty

FRAILITY OUTCOME

OP27 227-C-1

FRAILITY AND FUNCTIONAL DECLINE INDICES AS PREDICTORS OF POOR OUTCOMES IN HOSPITALISED OLDER PEOPLE

Elsa DENT¹, Ian CHAPMAN², Cynthia PIANTADOSI¹, Renuka VISVANATHAN³ (1. Department of Medicine, University of Adelaide, Australia; 2. Department of Medicine, University of Adelaide, The Royal Adelaide Hospital, Australia; 3. Aged and Extended Care Service, The Queen Elizabeth Hospital, Adelaide, University of Adelaide, Australia)

Introduction : Admission to a Geriatric Evaluation and Management Unit (GEMU) can optimise a patient's chance of functional recovery. The aim of this study was to evaluate several common frailty and functional decline indices on their ability to predict poor GEMU outcomes, both at discharge and at six months. Method : This was a prospective observational study of consecutive patients aged 70+ years admitted to the GEMU at the Queen Elizabeth Hospital, Adelaide, Australia. Patients were classified as "frail" or "at high risk of functional decline" using several different frailty and functional decline indices. The predictive ability of indices was evaluated using logistic regression and area under receiver operator characteristic curves (auROC). A poor outcome was considered as mortality or residential care admission. Results : 172 patients (mean age 85.2 years; 72% female) were included. Frailty prevalence varied from 24 - 94 % depending on the index used. Several instruments were predictive of

poor outcome at both discharge and 6 months. Adequate predictive accuracy for discharge outcome was achieved by the FI-CD (auROC = 0.735, $P < 0.001$) and modified Katz score (auROC = 0.704, $P < 0.001$). The FI-CD was the only index to show discriminatory power in predicting poor six month outcome (auROC = 0.702, $P < 0.001$). Conclusion : Frailty and functional decline instruments are a feasible application for identifying GEMU patients at risk of poor discharge and six month outcomes. The FI-CD is best predictor overall, and is recommended for research purposes. Pragmatically, the modified Katz index is the most valuable predictive instrument. Keywords : frailty; prognosis; hospital

OP27 227-C-2

STATIN USE AND CLINICAL OUTCOMES IN OLDER MEN: A PROSPECTIVE POPULATION-BASED STUDY

Danijela GNJIDIC¹, David LE COUTEUR², Fiona BLYTH³, Vasi NAGANATHAN², Robert CUMMING⁴, Sarah HILMER⁵ (1. Faculty of Pharmacy, University of Sydney, Australia; 2. Concord Hospital and CERA, University of Sydney, Australia; 3. Concord Clinical School and CERA, University of Sydney, Australia; 4. Sydney School of Public Health, University of Sydney, Australia; 5. Clinical Pharmacology Department, Royal North Shore Hospital and University of Sydney, Australia)

Introduction : Statin use is highly prevalent in robust and frail older people, but there is limited evidence available about their effects on major clinical outcomes. This study aimed to investigate the relationship of statins with institutionalization and death in older men living in the community, accounting for frailty. Method : Men aged ≥ 70 years ($n=1665$) enrolled in the Concord Health and Ageing in Men Project, Sydney, Australia were studied. Data were obtained from baseline (2005-2007) and follow-up (maximum 6.79 years) assessments. Statin use was captured at baseline. Cox proportional hazards regression analyses were conducted to estimate the risk of institutionalization and death according to statin use (exposure, duration and dose) and frailty status, with adjustment for clinically relevant factors. A secondary analysis used propensity score matching to replicate covariate adjustment in regression models. Results : At baseline, 43% of participants reported taking statins. In the adjusted models, current statin use was not statistically associated with increased risk of institutionalization (hazard ratios [HR] =1.60; 95% confidence intervals [CI]: 0.98-2.63) or death (HR=0.88; 95%CI: 0.66-1.18). There was no significant association of duration of use or dose of statins with either outcome. Propensity scoring yielded similar findings. Compared to non-frail participants not prescribed statins, the adjusted HR for institutionalization for non-frail participants prescribed statins was 1.43 (95%CI: 0.81-2.51), for frail participants not prescribed statins was 2.07 (95%CI: 1.11-3.86) and for frail participants prescribed statins was 4.34 (95%CI: 2.02-9.33). Conclusion : These data imply no independent association between statin use and institutionalization or death in community-dwelling older men. Keywords : statins, frailty, older men, clinical outcomes.

OP27 227-C-3

NON-RESPONSE RESULTS IN THE UNDERESTIMATION OF FRAILITY BUT DOES NOT BIAS THE ASSOCIATION WITH MORTALITY

Leon FLICKER¹, Osvaldo ALMEIDA¹, Graeme HAMKEY², Bu YEAP³, Paul NORMAN⁴, Kieran MCCAUL¹ (1. Western Australian Centre for Health & Ageing, University of Western Australia, Australia; 2. Department of Neurology, Royal Perth Hospital, Australia; 3. School of Medicine and Pharmacology, University of Western Australia, Australia; 4. School of Surgery, University of

Western Australia, Australia)

Introduction : In cohort studies of older people non-response frequently occurs but it is uncertain as to whether this results in bias of the strength of association. We sought to determine the effects of non-response on prevalence of frailty and the association between frailty and mortality. Method : The Health In Men Study arose out of a population-based randomised trial of screening for abdominal aortic aneurysms conducted in Perth. Men aged 65-79 years were identified in 1996 and 12,203 attended. Response fraction for a face-to face survey at approximately 5 years of follow-up was 46%, and similar at 10 years using a postal survey. In addition linkage to hospital, morbidity and mortality datasets was performed using the Western Australian Data Linkage System. We calculated the observed and imputed prevalence of frailty and 5 and 10 years of follow-up using the FRAIL scale and frailty index based on a deficit approach. Imputation utilised all available data from the first wave. We then sought to determine the association of frailty on subsequent mortality. Results : We found that the prevalence of frailty as determined by surveys of men who responded were major underestimates compared with imputed estimates. However the association of frailty and mortality did not appear to be biased as there were no differences in the associations with mortality produced from the observed and imputed frailty data. Conclusion : We conclude that non-response may produce major bias on the prevalence of factors associated with frailty but this may not bias the association between these factors and other outcomes. Keywords : Frailty, mortality, imputation

OP27 227-C-4

FRAILITY STATUS, MUSCLE STRENGTH AND FUNCTIONAL PERFORMANCE IN OUTPATIENT OLDER ADULTS WITH CHRONIC DISEASE

Tsai-Chun CHEN¹, Ching-Yu CHEN², Ssu-Yuan CHEN³, Ming-Hsia HU¹ (1. School and Graduate Institute of Physical Therapy, National Taiwan University, Taiwan; 2. Department of Family Medicine, National Taiwan University College of Medicine, Taiwan; 3. Department of Physical Medicine and Rehabilitation, National Taiwan University College of Medicine, Taiwan)

Introduction : Muscle strength loss is a characteristic of frailty, and lower extremity performance have been shown to be predictive of disability. However, there is insufficient evidence to access the interaction among frailty status, muscle strength and functional performance. The purposes of this study were to examine the difference of frailty status, lower extremity muscle strength and functional performance in outpatient older adults. Secondly, we investigate the relationship of lower extremity muscle strength and functional performance in outpatient older adults. Method : This is a cross-sectional study design. and 148 outpatient older adults were included with their inform consent. Frailty status was determined by Fried's frailty. For testing of the knee strength, Cybex dynamometer was used to evaluate isometric test, and isokinetic tests at 0, 60, and 180 per second. Time-up and go (TUG) test was used to measure the functional performance in outpatient. Results : Over 60% of outpatient older adults with chronic disease were in pre-frail status whether in male or female. The isometric and isokinetic muscle strength of knee extensors and flexors were significant decrease in pre-frail and frail outpatient older adults. Knee extensor isokinetic parameters were significant correlated with TUG performance. Conclusion : Lower extremity muscle strength was significant related to physical performance in outpatient older adults with vary frail status. And, it's also a key characteristic to distinguish outpatient older adults from non-frail to pre-frail or frail. These results may support the idea that

strength training is an intervention that can potentially improve physical health status in many outpatient older adults with varying status. Keywords : frailty, older adults, muscle strength

OP27 227-C-5

THE RELATIONSHIPS BETWEEN FIVE FRAILTY INDICES AND THE ADVERSE HEALTH OUTCOMES

Pay-Shin LIN¹, Tsai-Jou TSENG², Huey-Shinn CHENG³, Alice May-Kuen WONG¹, Min-Chi CHEN⁴, Bing-Hong GI² (1. Dept. of Physical Therapy & Graduate Institute of Rehabilitation Science, College of Medicine, Healthy Aging Research Center, Chang Gung University, Taiwan; 2. Dept. of Physical Therapy & Graduate Institute of Rehabilitation Science, College of Medicine, Chang Gung University, Taiwan; 3. Dept. of Internal Medicine, Chang Gung Memorial Hospital, LinKou Branch, Taiwan; 4. Dept. of Public Health and Biostatistics Consulting Center, College of Medicine, Chang Gung University, Taiwan)

Introduction : Frailty may cause older people highly vulnerable to adverse health outcomes (AHOs). Frail status could be expressed by five phenotypes, or frailty indices, including weight loss, low physical activity, slow gait speed, muscle weakness, and exhaustion. The associations between each frailty index and other AHOs have not yet been reported. The purpose of this study is to determine the associations between individual frailty index and AHOs in all older adults as well as specifically in the pre-frail group. Method : This is a 2-year retrospective longitudinal study of 341 elders. They received baseline evaluation and were followed up for 2 years with annual assessment and finally, medical records check for the occurrences of AHOs, including hospitalization, emergency visit, fall, ADLs/IADLs disability, physical function decline, quality of life (QOL) score decline. Logistic regression analysis was applied to describe the associations of individual frailty index with AHOs. Results : Among five frailty indices, muscle weakness was significantly associated with emergency visit (OR=2.41), slow gait speed and exhaustion with ADL disability (OR=3.26 and 1.98), and exhaustion with QOL decline (OR=2.49). In pre-frail older adults, slow gait speed was the only frailty index which significantly associated with emergency visit (OR=2.40), fall (OR=2.66), and IADL disability (OR=3.39). Conclusion : The study provided evidence to support that muscle weakness, slow gait speed and exhaustion were frailty indices strongly associated with the occurrences of AHOs in older adults, and slow gait speed was the only index significantly associated with the occurrences of AHOs in the pre-frail older adults in 2 years. Keywords : Frailty, Frailty index, Adverse health outcomes

OP27 227-C-6

FRAILTY IMPACT ON SURVIVAL ANALYSIS IN OLDER BRAZILIANS WITH AND WITHOUT COGNITIVE DECLINE: A FOUR YEARS FOLLOW UP SURVEY IN SAO PAULO, BRAZIL

Maria Lucia LEBRAO, Yeda DUARTE, Ligiana Pires CORONA; Luciana Correia ALVES (Epidemiology, School of Public Health University of Sao Paulo, Brazil)

Introduction : The number of Brazilian older adults is expected to grow dramatically over the next decades. Frailty is an important health problem associated with high risk for adverse health outcomes including mortality, institutionalization, falls, decrease of functional capacity and hospitalization. Implications of these public health problem demand increasing attention, particularly because frailty has been documented as avoidable and, if installed, is reversible by active intervention strategies. In this study we will analyze the survival curve

of older Brazilians (≥ 60 years) according frailty categories - not frail or robust, intermediate, frail - in a large, well-defined sample of older Brazilian in four years follow up. Method : Data comes from a longitudinal survey - SABE Study (Health, Well being and Aging). that included population aged 60 and living in Sao Paulo/Brazil (n=1,143 from a multi stage clustered sampling) evaluated in 2006. Survival analysis was done based on data of 2010 (death analyses). Kaplan-Meier Survival Analysis was used to analyze the results considering frailty categories in baseline and and the presence or absence of cognitive decline. Losses occurred during the follow-up where considered with the half time of the period. Results : In survival analysis, the 3 strata (not frail, intermediate and frail) could be observed the strong impact of cognitive decline (OR=1.97, p=0.001). The hazard adjusted model showed a hazard ratio 1.39 for pre-frail and 2.66 for frail (p<0.001). Conclusion : Frailty is associated with mortality in Brazilian elders and cognitive decline has a significant impact in this outcome. Keywords : Frailty, SABE Study, Cognitive decline

ELDER ABUSE AND AGEISM

OP27 303-S-1

AGEISM IN EUROPE: NEW FINDINGS FROM THE CULTURAL MAP OF THE WORLD AND THE EUROPEAN SOCIAL SURVEY

Moritz HESS¹, Jeroen DIKKEN² (1. Department of Sociology, University of Mannheim, Germany; 2. Department of Nursing, Hogeschool Utrecht, Netherlands)

Introduction : Stigmata on older people in society remain a big problem in the whole of Europe. Studies have shown that traditional versus rational-secular and survival versus self-expression values are related to sexism, homophobia and racism. Those with rational-secular and self-expression values show less stereotyping. Therefore this study questions whether such a connection exists for ageism as well. Method: Macro country level data was derived from the Cultural Map of the World which is constructed based on data of the World Value Survey. Micro individual level data was derived from the European Social Survey. Both data sets were merged to allow multi-level analysis. The sample consisted of 39017 persons. Multilevel regression analyses were used to examine the influence of the two dimensions of the Cultural Map of the World on ageism. The influence of traditional versus rational-secular and survival versus self-expression values on affective ageism was examined while controlling for gender, age, education and income. Results : A significant influence was found for the traditional versus rational-secular dimension. Which means, people living in secular-rational countries have a more positive feelings towards older people compared to people living in traditional countries. No significant influence was found for the survival versus the self-expression dimension. Conclusion : The results suggest that people living in countries which are less religious and less family oriented show a lower level of ageism. These results are in line with the findings from other studies concerning homophobia, sexism and racism. Keywords : Cultural map of the world, Ageism, Multilevel analysis

OP27 303-S-2

THE PERVASIVE NATURE OF AGEISM: A META-ANALYSIS

Paul NASH¹, Ian STUART-HAMILTON², Peter MAYER² (1. Centre for Innovative Ageing, Swansea University, United Kingdom; 2. Psychology Department, University of Glamorgan, United Kingdom)

Introduction : Pervasive, ingrained implicit ageism is found in the general (Levy & Banaji, 2002) and professional medical (James and Haley, 1995) populations, negatively affecting older peoples health care (Duerson, Thomas, Chang & Stevens, 1992; Filipp & Schmitt, 1995). In its measurement, the Implicit Association Test (IAT) has been shown to be a stable predictor of spontaneous behaviour where explicit measures predict only planned (Steffens, Schulze & Konig, 2006). **Method :** 203 participants over six study populations used The Fraboni Scale of Ageism (Fraboni, Saltstone & Hughes, 1990) and a bespoke IAT (Greenwald, McGhee & Schwartz, 1998), measuring explicit and implicit attitudes respectively. **Results :** Data demonstrated consistently negative implicit attitudes, where explicit attitudes were largely positive. Spanning each population, there were significant differences reported on both implicit ($F(7,162)=8.352$, $p<0.001$) and explicit ($F(7,162)$, $p<0.05$) measures illustrating the measurement of distinct constructs. Additionally, results demonstrated a negative societal ageist bias, increased self-presentational bias in-line with educational level and internalisation of negative attitudes. **Conclusion :** It is estimated that by 2051, 17% (115.4 Million) of the global population will be living with, and requiring some form of support for dementia (US Census, 2010). This is leading to increased contact between older people medical professionals thus dementia care should be prioritised. Negative attitudes and consequential prejudicial behaviour need to be challenged and addressed, ensuring proper treatment and dignity in care. Through well structured training based on psychological principles, attitudes towards older people can be changed (Westmoreland et al., 2009). **Keywords :** Ageism, IAT, Implicit

OP27 303-S-3

THE CANADIAN APPROACH TO ADDRESS ELDER ABUSE

Yongjie YON¹, Gloria GUTMAN² (1. Davis School of Gerontology, University of Southern California, USA; 2. Gerontology Research Centre, Simon Fraser University, Canada)

Introduction : With aging of the Canadian population, the number of abused elderly is projected to increase, with potentially serious health, social and economic consequences for victims, families and Canadian society. To adequately address both causes and consequences, which tend to be complex, a multi-sectorial approach is required. **Method :** This paper critically examines past and present government, NGO and academic/professional initiatives targeted to identifying, mitigating and preventing elder abuse in community and institutional settings. Data sources include government white papers and websites, NGO/professional association publications and websites and interviews with key informants. **Results :** The paper begins with discussion of roles and responsibilities of governments, NGOs, academic and professional communities in addressing elder abuse. A synopsis is then provided of government initiatives at the federal/provincial/territorial level and exemplary provincial initiatives. Attention then turns to major activities of NGO, academic and professional sectors. In the process, a broad overview is provided of legislation, awareness building, major national and regional research projects, provincial/territorial elder abuse strategies as well as services and programs for victims, abusers and those who work with them. **Conclusion :** While Canada can take pride in recent activities directed to preventing and curtailing elder abuse, gaps in knowledge still exist and further actions are needed. For example, the recently initiated national prevalence study will provide updated estimates of community and institutional abuse but is focused on urban settings. As in other countries, evaluation research has been minimal and information on best practices remains largely anecdotal. And, the impact of recently enacted legislation is unknown. **Keywords :** Elder

Abuse and Neglect, Programs and Services, Policy, Government Initiatives and NGO

OP27 303-S-4

COMMUNITIES' AGEISM ATTITUDE TOWARDS ELDERLY

Guler DURU ASIRET, Ebru OZTURK, Tugce TURTEN, Imatullah AKYAR (Nursing, Hacettepe University, Turkey)

Introduction : Worlds population is getting older and the proportion of elderly is also increasing in Turkey. This demographic change effects social life and gathers new problems like ageism. Ageism is a result of society's, family members' and especially young peoples' negative attitudes against elderly individuals and ageing. **Method :** Study was carried out to determine younger people's attitudes towards ageism. This cross-sectional and descriptive study was applied on 90 person between the ages of 18-25, living in Ankara, Turkey. Socio-demographic data sheet and Ageism Attitude Scale (min.23, max.115) were used for data collection. Data were analyzed with frequency, percentage distribution and Kruskal-Wallis and Mann-Whitney U tests. **Results :** Participants had a mean age of 22.4 ± 2.2 ; all were female, and 44.5% of them were still living with elderly. Nearly half of participants living with elderly stated disease and care process as a reason. Participants defined aging as compassion (65.4%), wisdom (34.6%), disease (56.4%), loneliness (47.4%), frailty (42.3%). Mean Ageism Attitude Scale Score of participants was 80.0 (min:63, max:105) and their attitude towards aging and ageism were positive. Scores of unmarried young participants found to be significantly higher than those married ($p<0.05$). And scores of the young people arranging to live with their parents when they get older also found significantly higher than those don't want to live with elderly parents ($p<0.05$). **Conclusion :** The findings of this study demonstrated that young peoples' living in community attitudes towards elderly is positive. **Keywords :** elderly, young people, ageism

OP27 303-S-5

AFRAID OF GETTING OLD? – YOUNG ADULTS' CONCEPT AND IMAGE OF AGING AND ITS CAUSE

Yi-fen WANG (Adult & Continuing Education, National Chung Cheng University, Taiwan)

Introduction : Based on Active Ageing: A Policy Framework, a report issued by WHO, the number of aging population worldwide is increasing clearly faster than the total global population (WHO, 2002). This phenomenon has predicted the fast coming of an aging world. Obviously, people at the present and in the future seem to enjoy a longer life than any generation in the past. However, how do people think of their long-lasting life? Aging is always a phase associated with the decline and loss of physical functions as well as poor health. Moreover, young generations may have a bias against aging, regarding it as a weak, old-fashioned, and non-negotiable symbol. Therefore, this study is aimed at exploring the concept and image of aging from the perspective of young adults. **Method :** This study adopts semi-structured interview of qualitative study as the study method, and interviews with 10 various participants aged between 20 and 40 in the manner of purposive sampling. **Results :** (A) Young generations tend to have a rather negative concept of physical aging. (B) Young generations hold polarized attitudes towards the concept of psychological aging. (C) Young generations seem to hold a rather positive attitude towards the concept of social aging. **Conclusion :** (A) Deepen aging education and cultivate young generations to have correct understanding of aging. (B) Make good use of the media to shape the positive and active images of senior citizens. (C) Get involved in social activities and encourage senior citizens to

participate in to realize the concept of successful aging. (D) Improve social schemes and establish sound social welfare policies. Keywords : aging, aging image

OP27 303-S-6

HEALTH CARE PROVISION FOR OLDER PERSONS: THE INTERPLAY BETWEEN AGEISM AND ELDER NEGLECT

Tova BAND-WINTERSTEIN (Department of Gerontology, University of Haifa, Israel)

Introduction : The aim of this study is to explore the link between neglect and ageism in health care provision for older persons. Method : Semi-structured in-depth interviews with 30 RNs, with at least two years' experience in ten long-term care facilities in Israel were conducted. Interviews were digitally recorded and transcribed verbatim. Data analysis was performed according to the qualitative method. Results : Three main themes emerged: Ageism and neglect as the everyday routine - neglect is built into institution life on the platform of ageism; How the institutional system promotes neglect: Between institutional and personal ageism - the ways institutions promote neglect in the shadow of ageism; From vision to reality: How neglect can be prevented in an ageist reality. Conclusion : The attempt to demonstrate the link between ageism and neglect, and suggesting how to include them as interrelated phenomena in health care provision programs could promote older persons' quality of life. Keywords : Elder abuse, Neglect, Ageism

ELDER ABUSE II

OP27 304-S-1

A TYPOLOGY OF OLDER VIOLENT MEN DWELLING IN LIFELONG INTIMATE VIOLENCE RELATIONSHIPS

Tova BAND-WINTERSTEIN (Department of Gerontology, University of Haifa, Israel)

Introduction : Most research on intimate partner violence (IPV) to date has focused on young men. Although interest and research regarding older abused women has increased in recent years, research on the voices and experiences of older abusive men is still scarce. The purpose of this study is to present a typology of older battering men dwelling in lifelong intimate violence relationships. Method : Fifteen older Israeli abusive men, aged 65-84, were interviewed in-depth. Interviews were digitally recorded and transcribed verbatim. Data analysis was performed according to the qualitative method. Results : Four types were identified: the Avenger; the Cover-up-er; the In-between-er and the Normalizer. These types were constructed based on four dimensions: the construction of violence over the years, the perception of the spouse over the years, losses accompanying the violent relationship and the meaning of violence in old age. Conclusion : The four types enable an in-depth look at the experiential world of older abusers, and paint a complex picture of various ways in which abusive men live with violence over time. Keywords : Domestic violence, Intimate partner violence, Qualitative research

OP27 304-S-2

INNOVATIVE STRATEGIES TO COMBAT ELDER ABUSE WITHIN THE ISRAELI MENTAL HEALTH SYSTEM

Barbara LANG¹, Sara ALON², Mara SHECHTER³ (1. National Social Services, Ministry of Health, Israel; 2. Eshel, JDC-Eshel, Israel; 3. Jerusalem Department of Health, Ministry of Health, Israel)

Introduction : The elderly are vulnerable to abuse, neglect and

exploitation while the elderly who suffer from mental illness are at increased risk. Prevalence data about elder abuse and neglect for the general elderly population is limited and it is virtually nonexistent for the elderly population who suffer from mental illness. In 2003 the Ministry of Health in Israel published policy guidelines for addressing elder abuse within the healthcare system which included mental health care frameworks. In order to promote the implementation of these guidelines a unique program for psychiatric hospitals was instituted in 2011 by the Ministry of Health and JDC-Eshel. Method : Program activities included: 1. Raising awareness regarding elder abuse and emphasizing Ministry of Health guidelines. 2. Engaging psychiatric hospital administrations. 3. Establishing multidisciplinary committees to increase awareness, identification and intervention. 4. A seven week training course for committee representatives focused on complexities of elder abuse and mental health while providing organizational tools. 5. Establishing a quarterly forum for committee members to serve as a forum for presenting case studies and providing assistance regarding program development. 6. Implementing a data tracking mechanism. Results : 1. Improved conception of unique characteristics of elder abuse and mental illness. 2. Established government mandated frameworks. 3. Increased identification, reporting and intervention in cases of suspected elder abuse. 4. Staff gained role clarity. Conclusion: Policies and training provide successful strategies to combat elder abuse within mental health frameworks. This innovative approach is essential in protecting one of the most vulnerable populations. Keywords : mental health, elder abuse

OP27 304-S-3

INTIMATE PARTNER VIOLENCE AND ITS PSYCHOLOGICAL IMPACT IN OLDER CHINESE MEN AND WOMEN

Elsie YAN (Social Work and Social Admin, University of Hong Kong, Hong Kong)

Introduction : Contrary to the general perception that intimate partner violence (IPV) diminishes as relationship partners grow old, a sizeable proportion of older persons remain victims of abuse by their partners. This study investigated prevalence and psychological impact of IPV in a representative sample of older Chinese. Method : A sub-sample of participants aged 60 or above and who were married at the time of the interview were extracted from a representative population study conducted in 2012. The following analysis includes a total of 320 older Chinese (195 males and 125 females, mean age = 69.98). Information of interest include participants demographic characteristics, past year and life time experience of domestic violence (Revised Conflict Tactics Scale - CTS2), and depressive symptoms (Center for Epidemiologic Studies Depression Scale - CES-D). Results : IPV is common in this sample. Past year prevalence rates for psychological aggression, physical assault, and injury by partner were 39.4%, 5.9%, and 0.3% respectively. Life time prevalence rates were 53.1% 11.3%, 0.6% respectively. No gender difference was observed ($p > .05$). The various forms of IPV were highly correlated with each other (r ranged from .19 to .95, $p < .001$). Past year physical assault and injury were associated with depressive symptoms ($r = .13$ & $.14$, $p < .05$) and so were life time physical assault and injury ($r = .15$ & $.14$). Psychological aggression, however, was not associated with depression symptoms ($p > .05$). Conclusion : A large proportion of older Chinese men and women experience IPV. Experience of IPV is mildly associated with depressive symptoms. Keywords : Intimate Partner Violence

OP27 304-S-4

PREVENTION OF ELDER ABUSE IN EUROPE. A FRAMEWORK FOR THE MONITORING OF ELDER ABUSE

Uwe Eugen BRUCKER (*Longterm-Care, Medical Advisory Service of Social Health Insurance (MDS), Germany*)

Introduction : The MILCEA-Project (funded by the European Commission) generated a monitoring system that allows the assessment of elder abuse and elder abuse risks in long-term care as a precondition for prevention including appropriate actions to protect older persons. Older people who are in need of care are dependent from the help of others and thus those being cared for are very vulnerable. **Methods:** focus discussions on national experts' level elements of a monitoring system in preventing elder abuse were defined, determination of indicators and risk factors based on an international literature research and expert opinions; analysis of existing monitoring structures for identifying and recording elder abuse followed by the identification of key actors as their deficiencies and lack of structures. Evaluation of the findings by international experts' conference. **Results :** Monitoring elder abuse refers to observation and evaluation of the care giving process in order to detect risks or actual cases of elder abuse. Concrete steps of actions lead to the older person's protection. Basic requirements on a political level; awareness and knowledge of elder abuse as a main prerequisite for monitoring. Elder abuse, its risk factors and indicators will become part of the education of health-care-professionals and social workers. The responsibilities of key actors in the prevention of elder abuse must be defined. Service providers of longterm-care include the topic into their quality-management-system. **Conclusion :** Requirements on monitoring, identification and action, will be presented in Seoul as part of the framework on preventing elder abuse in longterm-care. www.milcea.eu. **Keywords :** Elder Abuse; Longterm-Care; Monitoring; Prevention

OP27 304-S-5

ELDER ABUSE AND NEGLECT IN URBAN AND RURAL SETTINGS IN NAMIBIA

Herman STRYDOM¹, Janet ANANIAS² (*1. Social Work, North-West University, Potchefstroom Campus, South Africa; 2. Social Work, University of Namibia, Namibia*)

Introduction : National programmes on gender based violence against women and children exist in Namibia, but very little data is available on older people as complainants of abuse and neglect. Indeed elder abuse is a global human rights concern that has only been acknowledged recently. The aim of this study was to explore elder abuse and neglect within the urban and rural settings of the Khomas region in Namibia. **Method :** Key informant interviews were conducted with professionals and community leaders, while focus group discussions were held with older people and informal caregivers. **Results :** The findings suggested that older people are also victims of gender based violence. The forms of elder abuse reported in the study were physical abuse, financial abuse, emotional abuse, sexual abuse and neglect. Findings suggested that emotional abuse and neglect of older people are very common. Risk factors within the informal care giving settings that place older people at risk of elder abuse and neglect were substance abuse, poor interpersonal relationships between older people and informal caregivers, caregiver stress and the social isolation of informal caregivers. Protection orders against perpetrators of elder abuse and neglect is not always a suitable response to elder abuse and neglect in family settings. **Conclusion :** Future intervention research that strengthens intergenerational relationships and support within family structures can offer better alternatives in addressing elder abuse and neglect. **Keywords :** elder abuse, neglect, Namibia

OP27 304-S-6

ELDER ABUSE IN RESIDENTIAL AND LONG-TERM CARE FACILITIES IN KOREA

Younghee WON¹, Yeong-Ran PARK², Juhyun KIM³ (*1. Dept. of Social Welfare, Korean Bible University, Korea; 2. Division of Silver Industry, Kangnam University, Korea; 3. Institute of Social Development and Policy Research, Seoul National University, Korea*)

Introduction : In 2004, Korea adopted a legal measure for preventing and protecting the elderly from abuse and an elderly protective service network has been in operation for almost a decade. However, elder abuse still remains a serious social problem and violation of human rights. Many forms of elder abuse exist, and there is a variety of circumstances that lead to elder abuse. In recent years, an increasing number of elder abuse cases from the residential facilities has been reported as more the elderly move to the residential facilities. In this context, this study attempted to find out the situation of elder abuse in the residential facilities in Korea from both residents and care providers' perspectives. **Method :** We carried out a survey of 97 facilities in 10 cities in November-December, 2012. 516 residents and 498 care providers participated in the survey. The questionnaires included items such as socio-demographic characteristics, attitudes toward elder abuse, experiences of elder abuse, causes of elder abuse, education and training experiences and needs, responses to elder abuse, and suggestions for preventive measures. **Results :** In terms of abuse experiences, the survey results showed the highest incidents on 'ignoring from others (6.4%)', 'using inappropriate language or name-calling (4.8%)', and 'treating like a child (3.1%)'. From care providers' perspective, 'using inappropriate language or name-calling (36.7%)', 'threatening and accusation about mistakes (38.8%)', and 'ignoring from others (33.5%)' were the most frequent abuse problems issues. According to further analysis of the data, the abuse problems occurred not only between residents and care providers but also among the elderly residents themselves in the residential facilities. In response to abuse experiences, only 18.6% of the elderly residents requested help from others while most either ignored or responded on a personal level. The care providers also showed relatively low level of request for formal help. Both group of survey participants responded that personality and dependent characteristics of the elderly, as well as the lack of government support for residential facilities, might have contributed to elder abuse. **Conclusion :** The results of this study showed that elder abuse existed in the residential facilities. More active policy and practice measures such as expansion of the elderly protective service network, development of quality service guidelines, education and training programs for prevention of abuse, and continued interest and support from the community are needed in order to prevent elder abuse in the residential facilities. **Keywords :** Elder abuse, Residential Facilities, Human Rights

COMMUNITY AND LIVING ARRANGEMENT

OP27 306-S-1

URBAN SOCIAL AND BUILT ENVIRONMENTS AND TRAJECTORIES OF SOCIAL ISOLATION IN VULNERABLE ELDERLY: FINDINGS FROM DETROIT MI CHOICE (HOME AND COMMUNITY-BASED WAIVER PROGRAM) POPULATION

Min Hee KIM¹, Philippa CLARKE² (*1. School of Social Work & Department of Sociology, University of Michigan, USA; 2. Survey Research Center, Institute for Social Research, University of Michigan, USA*)

Introduction : Decreased social interaction, which often accompanies ageing, has been found to have adverse health effects at later life, both

physically and mentally. Because older people tend to interact with their most proximate neighborhoods in later life, understanding the role of the social and built environments for social isolation becomes more significant. Method : This study used administrative data(2000-2008) from a sample of Michigan's home-care clients (Obs=4,875) coupled with neighborhood data collected through a virtual audit instrument (Google-Street-View). The effect of neighborhood social and built environments on 15-month trajectories of social integration was examined using Generalized Hierarchical Linear. Results : Results indicate clients who are not frequently left alone during the day are less likely to decline in their level of participation in social, religious, or other preferred activities (OR=0.72,95%CI=0.50,1.05). People with more limitations on instrumental-activities-of-daily-living(IADL) were likely to decrease their social interaction, (OR=1.98,95% CI=1.24,3.17), adjusting for socio-demographic, health, neighborhood factors. At the neighborhood-level, a higher proportion of residential security signs was strongly associated with a decline in social interaction. The odds of reduced social interaction was much higher for those living in unsafe neighborhoods over time (OR=23.14,95%CI=2.42,108.57). Conclusion : A variety of technical and social supports for older adults with IADL limitations and those frequently alone would help older adults engage in society. Neighborhood safety factors needs to also be publicly addressed in order to reduce older adults' withdrawal from society. The application of innovative methods in the collection of neighborhood data as linked with administrative data also have methodological implications for advancing research in aging. Keywords : Social and built environment, Virtual audit instrument, Social integration trajectories

OP27 306-S-2

STRATIFICATION RESEARCH OF URBAN HOUSING FOR SENIORS IN CHINA

Hongli WANG (*Gerontology Study Institution of Renmin University, Renmin University of China, China*)

Introduction : Housing linked with people's quality of life closely. As China has experienced the transformation from the free physical welfare distribution system to the paid monetary distribution system, the housing conditions of elder are quite different. Method : Using method of stratification, logistic regression according to the data of 'China urban and rural seniors survey in 2006' from China Research Center on Aging. Results : Study found that rich housing seniors accounted for 11% and the poor ones only 2.1%. Most of seniors belong to the general level. Further study found that it has the correlations between housing and the seniors' different social economic characteristics. Things like gender, education level, age, political status, cadres or not, work unit properties, registered permanent residence etc all influence the seniors' housing conditions. the influence factors of the senior's housing include both the personal factors and social factors. Social factors including unit properties, whether or not cadre, political status impact more significantly. Thus social factors are responsible for the senior's housing difference mainly. Conclusion : The Chinese government needs to give them special attention and should make policy to guarantee, should pay special attention to those extremely difficult old man of average living space per person not more than 8 m² and without running water or toilet, should take corresponding social assistance to help them so that they can get rid of poverty housing as soon as possible, narrowing the gap between the poor and the rich, benefiting the development and the stability of society at last. Keywords : Stratification, elderly housing

OP27 306-S-3

NEGATIVE LIFE EVENTS AND HEALTH; GENDER

DIFFERENCES IN MODERATING EFFECTS OF ENVIRONMENTAL MASTERY

Jinkuk HONG¹, Gyounghae HAN², Joohyun KIM³ (*1. Waisman Center, University of Wisconsin-Madison, USA; 2. Dept. of Child Development and Family Studies, Seoul National University, Korea; 3. Institute on Aging, Seoul National University, Korea*)

Introduction : In describing negative consequences of stressors on well-being of individuals, the stress process model emphasizes the salience of social and psychological resources in buffering the detrimental effects of life stressors. In this context, this study aims to investigate how negative life events are associated with mental and physical health of middle-aged Koreans, and the extent to which the sense of environmental mastery moderates the associations, focusing on gender differences. Method : Using data from the Study of Korean Baby Boomers that surveyed 4668 men and women born between 1955 and 1963, this study examined the association between the number of recent negative life events in the family and three domains of health outcome: depression, frequent physical symptoms, and self-rated health. Results : Results show that, for women (n = 2551), negative life event was associated with higher likelihood of depression, a greater number of frequent physical symptoms, and poorer self-rated health, but there was no moderating effects of environmental mastery. For men (n = 2117), in contrast, there were significant interaction effects between environmental mastery and negative effects on depression and frequent physical symptoms. When experiencing negative life events, compared to men with lower levels of environmental mastery, those with higher levels of environmental mastery had lower likelihood of having depression and reported fewer number of frequent physical symptoms. Conclusion : The findings of this study suggest the different pathways through which negative life event is associated with health outcomes for men and women, main effect model for women, and moderating effect model for men. Keywords : Life event, Health, Mastery

OP27 306-S-4

OLD PEOPLES' CONDOM USE AND PERCEPTION: A BIG CHALLENGE TO MITIGATION OF HIV/AIDS IN HIGH RISK URBAN SLUMS IN NIGERIA

King ODOR¹, Ngozi IWUJI², Uchenna EZIEFULA³ (*1. Health promotion, University of Ibadan, Nigeria; 2. Immunization, Olive Hospital and Maternity, Nigeria; 3. Research, Sure Health Organization, Nigeria*)

Introduction : As HIV/AIDS continues to pose a public health challenge in Africa, the pandemic cut-across boarders. It affects all the age groups including old persons, despite engagement in risky sexual activities which increases HIV/AIDS infection. However, limited attention is paid to this sub-group in mitigating the pandemic. This study therefore examined condom-use and perceived HIV/AIDS infection among old people in Nigeria. Method : The study was cross-sectional in design. A multi-stage sampling procedure was used to select 400-geriatrics. Pre-tested questionnaire developed, using information obtained from 10 Focus Group Discussion (FGD), was used to collect information. FGD data were analyzed thematically, while questionnaire data were analyzed using descriptive and statistically. Results : Twenty-five percent of the participants had extra-marital sex since they attained elderly age. However, among this subgroup that had extra-marital sex, few (6.8%) used a condom. More males (5.3%) than females (1.5%) used condom during the last extramarital sex. Low level of condom-use was attributed to condom not worthwhile (34.5%) and opinion (50.0%) condom not made for the elderly. Moreover, FGD participants viewed sex could not lead to

pregnancy and majority (60.3%) posited patronizing traditional healers and few (10.3%) use of herbs/concussion could prevent HIV/AIDS. Similarly, non-condom use was due to confidence in traditional herbs, perceived to protect against STIs including HIV/AIDS. Conclusion : Engagement in risky activities among elderly is a growing HIV/AIDS challenge. Condom-use is misconstrued probably due to knowledge gap. Without urgent measures to enable them protect themselves, development efforts will be in jeopardy. Condom-use is cost-effective in mitigating HIV/AIDS pandemic. Keywords : traditional-herbs, Condom-use and extra-marital-sex

OP27 307-S-2

RELATIONSHIP BETWEEN FEELING OF SAFETY PERCEIVED BY OLDER PEOPLE AND THE RISK OF CRIMES IN THE LOCAL ENVIRONMENT

Piotr BRZYSKI, Monika BRZYSKA, Beata TOBIASZ-ADAMCZYK
(Chair of Epidemiology and Preventive Medicine, Jagiellonian University Medical College, Poland)

Introduction : Recently the issue of elder abuse was widely discussed, explored and analysed. Community violence, as acts of interpersonal violence between individuals who are unrelated and who may or may not know each other [1] is also an experience of older people. Method: Statistical data concerning different crimes obtained from Municipal Police Office in eighteen districts of Krakow were compared with results of cross-sectional study, carried out in 2009 in a simple random sample of 631 older (i.e., aged 65 years and over) citizens of Krakow. The respondents were asked about personal experiences with different forms of community violence, knowledge on crimes and maltreatment among social network, and the lack of safety at home or in the close neighbourhood. The results were visualised graphically. Results : Significant correlation was found between percentage of respondents who reported being victims of theft themselves or by their close family and friends, and data reported by Police statistics ($\tau\text{-}b=0,57$ and $\tau\text{-}b=0,93$, respectively). Percentage of respondents who reported that members of their social network were victims of assault or battery correlated with number of assaults as reported by the Police ($\tau\text{-}b=0,57$). Feeling of physical threat of respondents correlated with number of thefts committed outside home ($\tau\text{-}b=0,57$) and assaults and robberies at homes ($\tau\text{-}b=0,64$). Conclusion : Feelings of older people concerning various symptoms of community violence are consistent with risk of being a victim of violent crimes, committed at different districts of Krakow, as reported by statistical data of the Police. Keywords : abuse, elder people

OP27 307-S-3

CARER HEALTH AND SUPPORT NEEDS IMPROVE WITH TREATMENT OF FRAILITY

Christina AGGAR¹, Ian D. CAMERON², Sue RONALDSON¹
(1. Nursing, University of Sydney, Australia; 2. Medicine, University of Sydney, Australia)

Introduction : It is important to consider caregiving reactions as an outcome measure in interventions designed to treat frailty because of the significant consequences of caregiving. The aim of this study is to examine reactions to caregiving in a cohort of carers (n=119) nominated by community living people >70 years, participating in a twelve month randomised controlled trial of treatment of frail older people. Method : A study of carers (n=119), embedded in a 12 month randomised controlled trial targeting frailty in older people (≥ 70 yrs).

The Caregiver Reaction Assessment (CRA), measured caregiving experience in five independent subscales (health, finance, self esteem, family support and schedule). Anxiety and depression levels were evaluated utilising the Hospital Anxiety and Depression Scale (HADS). Carer outcomes were measured at six month intervals during the intervention and 3 months post intervention. Results : Carer health scores improved during the treatment of frailty (df 3, 159.112, $F=2,956$, $p=0,034$) while anxiety levels increased for both treatment and control groups (df 3, 198.708, $F=2,819$, $p=0,04$). The treatment group reported overall better health (df 1, 115.632, $F=5,303$, $p=0,023$) and self esteem scores (df 1, 118.671, $F=4,158$, $p=0,044$) than the control group. Conclusion : Whilst increasing anxiety levels may be an intrinsic reaction to caregiving, interventions targeting frailty have the potential to improve carers' health. Frailty intervention protocols that include assessment of the carer will facilitate initiatives and strategies to support carers and identify those at risk. To sustain the involvement and contribution of carers for an ageing community living society, health care professionals need to understand reactions to caregiving. Keywords : family, carers, health, support needs, frailty

OP27 307-S-4

ATTITUDE TOWARDS INSTITUTIONAL CARE FOR ELDER PARENTS IN URBAN CHINA: INTERGENERATION PERSPECTIVE

Shuo WANG (Institute of Social Gerontology, Renmin University of China, China)

Introduction : In China, traditionally adult children should provide physical care of older parents by themselves, according to the norm of filial piety. And some people view parents' living in nursing home as an unfilial behavior. Does the action of turning to institutional care really show the adult children's abandon of their elderly parents? Does it really mean adult children's unfilial? These are our concerns. Method : This research examined the motivation of living in institution, behaviors of adult children and the changing attitudes about filial piety, using data from intensive interviews with 16 elderly residents and 6 family members in Beijing. Results : As the results, family members' unavailability of care-giving, loss of spouse and housing shortages are main factors that make elder people moving into institutions. After the movement, the children of elder residents are still proving financial and emotional support for parents. And children's visiting is also a supervision of the quality of institution care. Most interviewees, express their approval of institution care. However, the positive view relies on the high-quality of the facility and services of institution. The dissatisfaction of the institution will generate negative emotions in elder residents. Conclusion : The findings show that the practice of filial piety has varied, that not only require children's behavior, but more focus on parents' own well-being. For our respondents, as long as parents maintaining well-being, children are filial, even if the elders are placed in institutions. The advantages of institutional care, children's financial assistance for older parents, and children's frequent visiting are explained as filial behaviors. Keywords : institutional care, filial piety, intergeneration relationship

FAMILY CARE ACROSS DIVERSE CULTURES: BEYOND LOCAL CARING TO TRANSNATIONAL CARING

Cynthia Lee ANDRUSKE¹, Sing Mei CHAN², Deborah L. O'CONNOR³ (1. Facultad Ciencias de la Educacion, Universidad Catolica del Maule, Chile; 2. Social Work and Family Studies, University of British Columbia, Canada; 3. Social Work, University of British Columbia, Canada)

Introduction : With an increasingly globalized world, well reflected in Canada's culturally diverse population - the importance of developing a more culturally complex understanding of family care has been clearly identified. This study explored family care across three different cultural groups living in Vancouver, Canada: Chinese, Latin-American, and South Asia. **Method :** In-depth qualitative interviews were held with 30 family members regarding how they practiced care of their aging, frail, relatives. **Results :** A surprising theme that emerged across all three groups regarded the importance of conceptualizing family care as a transnational or transcontinental or transgeographical phenomenon. This understanding challenged a conventional Canadian understanding of family care which has generally translated as one primary local carer with some support from other family members. Three themes helped to explain this phenomenon: redefining 'family'; geographic mobility (movement) be it regionally-based, national, or international; and, the importance of technology for facilitating continuity and connection. The notion of 'flow' or movement, rather than a fixed arrangement, figured prominently across many of these families. **Conclusion :** This study suggests the need to redefine how services and support are offered. **Keywords :** Family care, culture, support

INNOVATION IN SERVICES DELIVERED TO OLDER PEOPLE IN THEIR HOMES: USING VOLUNTEERS TO DEVELOP SUSTAINABLE MEALS ON WHEELS SERVICES

Jeni WARBURTON¹, Melanie OPPENHEIMER² (1. *John Richards Initiative, La Trobe University, Australia*; 2. *School of Humanities, University of New England, Australia*)

Introduction : Meals on Wheels (MoWs) is an iconic community organisation with a long history of delivering services to some of the most vulnerable and disadvantaged in the community. It operates across a diversity of international contexts, including Europe, North America and Japan. Its mission is to provide nutritious meals and basic social contact to enable frail older people and those with disabilities to remain in their own homes. As a result of contemporary change, MoWs is facing a range of serious challenges that threaten its capacity to provide these services. Principle among these is its reliance on traditional volunteer models of service delivery, and many services are now struggling to provide sufficient volunteers to meet growing need, challenging this way of operating. **Method :** In response, new and innovative ways of delivering community-based services are emerging. This paper presents findings from a large, Australian study of MoW services in order to identify new models of volunteering which aim to appeal to a more diverse group of volunteers, and ensure that services are viable and sustainable. **Results :** New models are identified that are aimed at recruitment of a more diverse source of volunteers; offer a range of different volunteer roles; or explore new modes of service delivery. **Conclusion :** Findings from the Australian study will be compared and contextualised with reference to an earlier international phase of the research in order to identify new trends and models in the delivery of critical community services like Meals on Wheels in an ageing context. **Keywords :** community services, volunteers, non-profit sector

OP27 308-S-2
DO PRODUCTIVE ACTIVITIES REDUCE INFLAMMATION IN LATER LIFE? MULTIPLE ROLES, FREQUENCY OF ACTIVITIES, AND C-REACTIVE PROTEIN

Seoyoun KIM, Kenneth F FERRARO (*Department of Sociology, Purdue University, USA*)

Introduction : Previous research has demonstrated that productive activities have a salutary effect on health, but the precise mechanism by which this occurs remains a matter of debate. Although many studies have examined the effects of productive activities on indicators of mental health or self-rated physical health, we ask whether productive activities can reduce inflammatory processes in the body, as indicated by C-reactive protein (CRP), a biomeasure of inflammation associated with the risk of cardiovascular diseases. **Method :** The study uses a representative survey of adults aged 57-85 years, from the National Social Life, Health, and Aging Project (NSHAP, N=1790). Linear regression models were used to analyze the effects of multiple roles (volunteering, socializing with friends, and attending meetings) as well as the frequency of activity within each role on CRP concentration (mg/L) drawn from assayed blood samples. **Results :** Number of productive activities was associated with lower levels of CRP net of chronic conditions, lifestyle factors, and socioeconomic resources. When specific types of activity were examined, volunteering manifested the strongest effect on inflammation, particularly in the older age group. There was no evidence that sustained volunteering was associated with higher levels of inflammation. **Conclusion :** Productive activities and frequent volunteering in particular protect individuals from inflammation that is associated with increased risk of hypertension and cardiovascular disease. **Keywords :** Productive activities, Volunteering, Acute-Phase Protein

OP27 308-S-3
PRODUCTIVE ACTIVITIES AND PERCEIVED WELL-BEING IN AN AFRICAN AMERICAN OLDER ADULT URBAN SAMPLE

Heehyul MOON (*Institute on Aging, University of North Carolina-Chapel HILL, USA*)

Introduction : Few studies have examined the relationship between productive activities and well-being among urban lower-income African American older adults. The purpose of this study was to examine (1) the pattern and prevalence of types and specific kinds of productive activities and (2) the association among sociodemographic data, individual capacity, kinds and levels of productive activity, and well-being at the individual level. **Method :** A random sample of 604 lower income individuals was drawn from a group of 15,000 people over 60 years of age who resided in the central geographic area of the City of Detroit, a large urban metropolitan area in Michigan. **Results :** Approximately 12% of 531 respondents participated in employment, whereas 20% participated in volunteer activities. The majority of the respondents (99.4%) joined in leisure activities. More than 75% engaged in religious activities. The respondents also reported that they participated in various kinds of productive activities. Higher levels of involvement in religious and leisure activities were related to a greater perceived well-being. **Conclusion :** This study not only explored participation in civic, social, and leisure activities but also specified the types of activity participation. The study participants engaged in a variety of activities, indicating that service providers need to expand their view of clients' interests, the relationships among individual factors, level of activity participation, and well-being were examined using Sherraden et al.'s (2001) modified model of productivity in later life. The results of the study support Sherraden et al.'s proposed affects of sociodemographics, individual capacity, religious activity, and leisure activity on well-being. **Keywords :** Productive Activities, well-being, lower-income minority

OP27 308-S-4

TOWARDS AGE-FRIENDLY CITY: THE CONSTRAINTS OF ELDERLY'S PARTICIPATION IN COMMUNITY PROGRAMS IN AKITA CITY

Yoshihiko KADOYA (*Institute of Social and Economic Research, Osaka University, Japan*)

Introduction : In the current era of aging global populations, it is important to governments that elderly people stay healthy for as long as possible, so that the costs to take care of them through social security programs are minimized. Policies that help elderly people stay healthy typically encourage them to participate in local community programs, such as sports events, local festivals, and community-building activities. Unfortunately, many elderly people are reluctant to interact with others, which isolates them. This study investigates the constraints on elderly people's participation in community programs. **Method :** It analyzes micro data concerning individuals aged 65 who are capable of ADL. The data used for this research are from the results of the "Questionnaire for Age-Friendly Scheme" in Japan's Akita city, where people aged 65 or above make up 24% of the total population. **Results :** It reveals that developing transportation systems and encouraging elderly people to live with others are the keys to improving the participation of the elderly in local community programs. **Conclusion :** Towards Age-Friendly City, the development of public transportation system and encouraging living may be important policy implications. **Keywords :** Age-friendly city, social participation, community

OP27 309-S

SOCIAL PARTICIPATION IV

OP27 309-S-1

SOCIAL PARTICIPATION OF RETIREES: FORMAL AND INFORMAL PATTERNS

Jeger FRANCOIS (*Ageing Unit Research, National Pension Scheme, France*)

Introduction : Participation in formal or informal social activities enhances healthy ageing. The main social network of retirees is family and friends, but participation in associations - sportive, cultural, charitable - gives also opportunities for sociability. **Method :** Two French surveys are used for analysing the determinants of social participation. National health and disability survey 2008 (n=9.900 retirees). Survey participation in association 2010 (n = 1200 retirees). A logistical regression identifies the main factors of social participation. **Results :** The main factors of social participation are education level and health status. Associative practice culminates between 60 and 70 years and then declines with ageing. In fact, young retirees are more educated and older retirees are often in worse health status. This is the main explanation of decreasing social participation with age. Many retirees have a dense social life outside associations, such as having meals with friends, phone calls, and social networks. This can be called informal social participation. The survey shows that formal and informal sociability are not mutually exclusive. The more people are educated and in good health status, the more they participate both in formal and informal social activities. Often, retired volunteers were already committed before their retirement. **Conclusion:** New retirees are more educated and healthier. So we can expect a higher social participation, but in which type of association? Charity, sports, bridge? Renewal of leaders of associations, mostly retired, is a real challenge for the million of associations. **Keywords :** active ageing, education, health, association, volunteering,

OP27 309-S-2

PARTICIPATION AMONG VERY OLD SINGLE LIVING PERSONS - INDICATIONS OF A PROTECTIVE EFFECT ON MORTALITY

Vibeke HORSTMANN, Maria HAAK, Susanne IWARSSON (*Department of Health Sciences, CC0002, Sweden*)

Introduction : The aim is to investigate if factors related to participation in everyday life in very old age can have a protective effect on mortality. **Method :** The study is based on single living Swedish participants (n=314, aged 81 to 91) from the ENABLE-AGE Survey Study. Demographic information and indicators of health were obtained directly from the database; three variables representing each of togetherness- and performance-oriented participation were constructed afterwards along the lines of a previous study. Cox regression analyses were used to model mortality. First the participation variables were considered separately. Then a model explaining mortality by means of demographic variables and health indicators was obtained, and it was investigated if participation variables contributed any further to the explanation of mortality. **Results :** Higher togetherness- and performance- oriented participation were significantly related to lower mortality. In particular, more social activities outside home and more leisure time activities performed alone indicated a lower mortality beyond what was already explained by gender, age and health aspects. **Conclusion :** Participation, here especially social participation and leisure-time activities performed alone, had a protective effect on mortality in this group of very old people. In health care and social services targeting very old people, it is thus important to enhance their possibilities of participation in everyday life. **Keywords :** participation, social engagement, physical activity,

OP27 309-S-3

CONNECTIVITY AND AGEING: RESULTS AND ISSUES FROM A UK INTERDISCIPLINARY PROJECT

Robin MEANS¹, Vanessa BURHOLT², Catherine HENNESSY³ (*1. Faculty of Health and Life Sciences, University of the West of England, United Kingdom; 2. Centre for Innovative Ageing, Swansea University, United Kingdom; 3. Faculty of Education, Health and Society, Plymouth University, United Kingdom*)

Introduction : The 'Grey and Pleasant Land' An Interdisciplinary Exploration of Older People's Connectivity in Rural Civic Society' was funded through the UK's 'New Dynamics of Ageing' Programme as a collaboration between five different universities. **Method :** The project contained seven work packages which drew upon six different rural areas, three in SW England and three in Wales, chosen because of their varying degrees of remoteness. Work Package One was based on a community survey of the six areas with the remaining packages focussing down in more depth on such areas as mobility in later life, intergenerational relations, social exclusion, landscape, gay and lesbian elders and the use of the internet. From the outset, the challenge of holding such inter disciplinary diversity together was recognised and 'connectivity' was adopted as an 'heuristic' device to help keep all the different elements of the project together. **Results :** Drawing upon the work packages, the explanatory power of the concept of connectivity will be illustrated. It will be argued that connection to place still matters to many rural elders but that overall they are starting to transition from place based to a more geographically dispersed connectivity. This movement is driven by greater mobility (many more of us move from place to place throughout the lifecourse) but the paper will also illustrate the transformational power of the internet. **Conclusion :** The conclusion

focuses down on the desirability of developing a Connectivity Continuum which embraces the full spectrum of connectivity options from 'place' to the 'virtual'. Keywords : connectivity;social capital;civic participation

OP27 309-S-4

OLDER ADULTS VOLUNTEERING IN RUSSIA

Gulnara Afruzovna MINNIGALEEVA (*Centre for Studies of Civil Society and Nonprofit Sector, National Research University Higher School of Economics, Russia*)

Introduction : Despite the economic and political transitions, slowly recovering birth rate and low life expectancy in 2016 older people are predicted to constitute a quarter of total population (24.8%) in Russia. People considered old now and getting old soon are 'children of the Soviets', which means they've inherited lack of personal initiative, little understanding of the concept of volunteering, and paternalistic views that the State must provide all for people. Method : Our report discusses findings from survey (800+ people of pensionable age) and over 40 interviews with employees of governmental and nongovernmental organizations in 8 Russian cities, data from online survey (400+ respondents), as well as the data from all-Russia monitoring of the civic and nonprofit activities (over 1000 respondents from all Russian regions). Results : Younger older people (60-69) reveal the same patterns of very low civic engagement as the rest of the population (4-4.5%), naturally the rate drops further for older ages. However, older people volunteer more frequently than others for particular organizations such as veterans' unions, local communities and condominiums' boards and committees, religious organizations. This role is supported by public expectations that older people're engaged with their families and homes only (63%), 28% believe they are a burden, however 42% think they're a resource. A number of nonprofits do offer a range of volunteer opportunities for older people. Conclusion : Older volunteering (like other ages) in Russia's hindered by public images of older people, lack of volunteering traditions, but there's also a trend for positive changes and acknowledgement of older people's role. Keywords : older volunteering, volunteering in Russia, civic engagement

OP27 309-S-5

SOCIAL PARTICIPATION OF THE PENSIONERS THROUGH THE CIVIC ENGAGEMENT IN GERMANY

Young Sin SONG (*Social Gerontology, University of Dortmund(Germany), Korea*)

Introduction : Since the beginning of the 21st century the topic "Civic engagement (Burgerschaftliches Engagement)" has emerged in Germany. Civic engagement is a top priority with the demographic change in the aging society. It has a great importance particularly for the elderly, who go into retirement. After retirement, elderly should reshape their lifestyle, not only within the private field, but also within the social range. For this context, the civic engagement enables pensioners to connect with the society and to implement their social participation. Method : The number of elder people participating in the civic engagement has increased over the last 10 years in Germany. Between 1999 and 2009, the proportion of participation over the age of 65 rose from 23% to 28%. In 2004, the rate of participants at age of 60 to 69 years reached 37% and it remained unchanged till 2009. Results : Germany calls attention to such strong interest in social participation, because social cohesion can be achieved through the civic engagement. This research is examined through interviews with pensioners who are active in civic involvement. This research determines the role of the civic engagement in individual and social

sphere. Conclusion : This research aims to emphasize the relevance of the civic engagement to individual and society and to find out appropriate measures to promote the civic engagement. Keywords : civic engagement, retirement

OP27 309-S-6

DEVELOPMENT OF A MUSICAL BRAIN FITNESS PROGRAM FOR SOCIAL, PHYSICAL, EMOTIONAL, AND COGNITIVE CAPABILITIES OF SENIORS

Young Geun CHOI¹, Taekho YOU¹, Geon Ha KIM², Ji Yeong AN³, Hojun JEON⁴, Giltae YANG⁴, Duklyul NA², Heecheon YOU¹ (*1. Department of Industrial and Management Engineering, Postech, Korea; 2. Department of Neurology, Sungkyunkwan University School of Medicine, Samsung Medical Center, Korea; 3. Brain Fitness Clinic, Gangnam Center for Dementia, Korea; 4. R&D Research, SEED Technology, Korea*)

Introduction : A steady increase in the number of dementia along with aging requires a counterplan to help the aged effectively manage their cognitive capabilities. Although many brain fitness systems have been developed, seniors have had difficulty in utilizing them due to lack of usability and customization. This study developed a medical entertainment (meditation) program for brain fitness of seniors. Method : The brain fitness meditation program, called Smart Harmony, was developed by a 5-step process: (1) needs survey, (2) benchmarking, (3) idea development, (4) prototyping, and (5) usability testing. First, desirable values and user needs for brain fitness were investigated. Second, existing brain fitness programs were benchmarked. Third, novel design concepts were generated and selected. Fourth, the selected concepts were prototyped. Lastly, iterative usability tests were conducted for refinement. Results : Smart Harmony is a musical game which can enhance the social, physical, emotional, and cognitive (SPEC) activities of users. The features of Smart Harmony includes (1) played by up to seven users, (2) eight musical instruments such as piano and violin and numerous favorite songs for selection, and (3) scores by brain age of the team and individuals for motivation. Conclusion : Smart Harmony is expected to be utilized in welfare centers to improve seniors' SPEC capabilities. A clinical evaluation is needed to examine the validity of Smart Harmony for brain fitness. Keywords : brain fitness, senior, music

HOUSING & ENVIRONMENT & TECHNOLOGY III

OP27 310-S-1

RISK EVALUATION IN SENIOR CITIZEN HOUSING PROVIDED BY THE STATE OF CHILE, QUALITY OF LIFE IMPROVEMENT FROM AN ARCHITECTURAL PERSPECTIVE

Marcela PIZZI¹, Maria-Jose TORREJON² (*1. Architecture, Universidad de Chile, Chile; 2. Sociology, University of British Columbia, Canada*)

Introduction : We identify senior citizens risk in the performance of basic activities of daily living, (ADL) in housing typologies offered by the State of Chile, since 1990, in the city of Santiago. Method : Following a theoretical approach from an ergonomic perspective, we develop an evaluation instrument, used to observe the functional operational sequence of ADL associated to risk and its relation with architectural space and objects (Katz and Akpom, 1976), Defining Impacts related to risk of loss of autonomy associated to architectural and object dimensional issues during performance of ADL and follow up of the different operations needed. Results : Dressing, Bathing and

Washing in sink basin presented 100% dysfunctions associated to risk in all their functional operations. Eating and using toilet 66.4% and transferring 60% in ADL performance the units analyzed. From the standpoint of the different functional operations needed to perform each ADL, major dysfunctions relate to transferring specially associated with risk when connecting appliances due to height and location and changing light bulbs for the same reason. Difficulties occurred also entering the tub; opening closets or drawers also related to height. Conclusion : Urbanization and aging set new relevant challenges for our society and public policy makers, especially in Latin American countries which face added economic and social difficulties in implementing inclusiveness, promoting autonomy and active aging intended to provide a better quality of life and meeting the needs of seniors with strategies which will demand new designs and adaptations of the existing built environment for an aging population. Keywords : Risk Housing Ergonomics

OP27 310-S-2
INFORMING FUTURE HOUSING DEVELOPMENT FOR OLDER ADULTS

Lori WEEKS¹, Donald SHINER², Robin STADNYK³, Dany J. MACDONALD¹ (1. *Applied Human Sciences, University of Prince Edward Island, Canada*; 2. *Department of Business Administration, Mount Saint Vincent University, Canada*; 3. *School of Occupational Therapy, Dalhousie University, Canada*)

Introduction : Few researchers have examined expectations that older adults have about their future housing options. In this study, we explored what the future housing preferences of older adults are and how can these results can inform the development of appropriate future housing. Method : A random sample of 1,670 Canadian community-dwelling older adults completed a mailed survey including questions on their current housing situation, whether they would seriously consider a variety of specific housing options in the future, and ideal living arrangements. Results : One-third of participants preferred to remain living in their current home while two-thirds wished to relocate. Over one-half preferred to live in a smaller single-detached home, or already lived in this form of housing. Forms of housing that ensured an independent living unit, such as an apartment, options geared specifically to older adults, and options that provide access to assistance were highly preferred. Conclusion : The results are useful in informing decisions about housing options to support those who prefer to remain living in their homes and to create forms of housing that best meet the needs of our diverse older population who wish to relocate. More forms of housing that blend the provision of shelter and services are needed. Educational efforts are needed to ensure that older adults are aware of options that can support them to continue living in their own homes, or move to housing that better meets their needs. The methods used in this study can be replicated to inform the development of housing in other countries. Keywords : preferences, future, ideal housing, Canada

OP27 310-S-3
EMERGING FAMILY STRUCTURES AND LIVING ARRANGEMENTS IN FRENCH OLDER HOUSEHOLDS

Jim OGG¹, Loic TRABUT², Sylvie RENAUT¹ (1. *Unite des Recherches sur le Vieillissement, Caisse Nationale d'assurance Vieillesse, France*; 2. *Unite 6, Institut national d'etudes Demographiques, France*)

Introduction : Socio-demographic trends are transforming the family and living structures of older households. These include greater longevity and smaller family size, a rise in the number of one person

households, and more recently, the effects of the European economic crisis. New forms of older households are emerging as a result of these trends which will in turn influence social care policies directed towards the elderly population. Method : The research explores, from the perspective of older individuals, how social, demographic and economic trends are currently transforming older families and their living arrangements. The data source is the survey Families and Housing survey, ("Familles et logements") 2011 (INSEE-INED), based on a sub-sample of the 2011 census (n=368,000). The research classifies different older household types according to family structures. These are then examined in relation to the proximity of family members in different households, as well as other socio-demographic characteristics contained within the census such as labour market participation of children. Results : The results show the emerging complexity of older households. These include notably situations of re-cohabitation, whereby adult children return to live with their ageing parent or an ageing parent moves to the home of an adult child. The research also demonstrates different residential strategies of older households in relation to family structures as well as exploring indications of social isolation. Conclusion : The dynamics of older household living arrangements in the French population suggest that new and emerging solidarities within families need to be taken into account when designing current and future social care policies. Keywords : census, households, cohabitation

OP27 310-S-4
ENVIRONMENTAL REQUISITES PERCEIVED FROM THE CURRENT STATUS OF SERVICE-ADDED ELDER PERSONS' HOUSING IN JAPAN

Mari KINUKAWA¹, Tokiko INOUE¹, Minjung CHO² (1. *Research Dept., Institute of Elderly Housing Sciences, Japan*; 2. *Research Dept., The Hyoto Institute of Assistive Technology, Japan*)

Introduction : Amended Act on Securement of Stable Supply of Elderly Persons' Housing in Japan led to a newly-established housing institution, the registration of Service-added Elder Persons' Housing (Oct.,2011). This new housing is interpreted as to be a new form of housing integrating of hardware and software necessary for supporting aging in place. The new institution sets limited requirements and broadens its market to any business operators, which can be considered, at the same time, to possibly produce problems to secure the quality of the housing. Method : The current status of the housing was marshaled based on MLIT Information Supply System on the housing. A questionnaire survey was conducted on approximately 300 housings to explore more detailed status, which illustrated environmental features (building environment, service supply, and management situation). Cross tabulation analysis, correlation analysis and ANOVA were conducted to see environmental differences between housing groups of different occupancy rates. Results : Monthly expence was not the ultimate requisite for this housing. The high occupancy rate group holds 'home environment' common with general multidwelling such as 'having community rooms' and 'being in residential environment' and 'involved with community activities.' 'Individual and indirect monitoring method' was seen in this high rate group. 'Care service' and 'Life support service' were not counted as significant differences. Conclusion : Toward the development of the housing of good quality, this research indicates the environmental requites to meet older adults' needs for the relocation housing. Aging in place requires adequate care and life support services. A further survey is underway on detailed service supply and residents' life situation. Keywords : Stable Supply of Elderly Persons' Housing, Service-added Elder Persons' Housing, Aging in Place

OP27 310-S-5

LIFE-SPACE CONSTRICTION AND RISK OF MORTALITY

Moon CHOI¹, Melissa Lunsman O'CONNOR² (1. College of Social Work, University of Kentucky, USA; 2. Department of Human Development and Family Science, North Dakota State University, USA)

Introduction : Life-space signifies the geographical boundaries where an individual spends his/her daily life and interacts with the environment and other people. Limitation in life-space mobility (ability to travel independently to a certain geographic area) has been reported as a risk factor for cognitive decline and frailty. However, little is known about how life-space constriction is related to the risk of mortality among older adults. This study longitudinally examined the relationship between life-space constriction and mortality in old age. Method : Data were from the five-year longitudinal Advanced Cognitive Training for Independent and Vital Elderly Study in the United States (n=2,793; mean age=73.6; 75.8% women). Life-space was assessed with the self-report Life Space Questionnaire, which addressed whether respondents left their property or town during the past week and their county, state, or region during the past two months. Logistic regression models were used to estimate odds ratios for mortality in relation to the level of life-space constriction. Results : At baseline 18.8% of respondents did not travel beyond their towns, while only 2.8% reported not traveling beyond their properties. Higher proportions of respondents did not travel beyond county, state, or region at baseline: 20.7%, 57.1%, and 80.5%, respectively. After accounting for baseline sociodemographic and health characteristics, life-space constricted to one's property was significantly associated with five-year mortality (OR=2.78, 95% CI=1.49-5.21, p=.001), while other levels of life-space constriction were not. Conclusion : The risk of mortality varied by the level of life-space constriction. A critical geographical boundary associated with five-year mortality was one's own property. Keywords : life-space, mobility, mortality

ELDERLY CONSUMER

OP27 311-S-1

E-SERVICES AND SENIORS - TYPOLOGY, USE AND IMPACTS

Satya BRINK (Gerontology, Simon Fraser University, Canada)

Introduction : The literature on e-services and the seniors focuses mostly on specialized services such telemedicine where they would disproportionately benefit. However, there is little that examines how the shifts to e-services in the economy affects them. E- services are those with both tangible and intangible elements that are performed totally or partly by the customer via a technology interface. Method : The research questions are: What are the different types of e-services available to consumers including elderly consumers and what are their characteristics? What are the impacts on the seniors when e-services are used and when they are not? What are the factors that would increase higher usage of beneficial e-services among seniors? To answer the questions in a nuanced way, a typology of e-services is developed to identify issues related to each type based on literature review. The characteristics of elderly consumers are contrasted with those of other customers based on statistical data. Results : Analysis of the typology show that seniors are expected to take the initiative and play multiple roles if they are to benefit from e-services. Though boomers are familiar with technology, there are reasons why they are not e-consumers, including remembering multiple passwords and using the small screens of mobile technology. Ten different factors

differentiated seniors from other consumers. Based on these five age-friendly factors were identified. Conclusion : Results show seniors are a specific market segment with both growth opportunities and vulnerabilities which expose them to risks but also gain them benefits. Keywords : E-services, consumers

OP27 311-S-2

PARTICIPATORY DESIGN IN THE HOST PROJECT

Bertrand BOUDIN¹, Lionel BEN AHMED¹, Juliette SABLIER¹, Filippo FABBR², Mark HEPWORTH³, Wendy OLPHERT⁴, Vincent RIALLE¹ (1. AGIM Laboratory, Joseph Fourier University, France; 2. Fundamental Electronics Institute, University of Paris Orsay, France; 3. People's Information Behaviour, Loughborough University, United Kingdom; 4. Information Science, Loughborough University, United Kingdom)

Introduction : The European AAL funded HOST project consists of a two step technology and service development, first a participatory design process and then a test phase. Participatory design considers the conception of a new technological system a co-creative activity between technologists and end-users, from conceptual development to user trials (Demirbilek & Demirkan, 2004). Method : A total of 70 older users participated in the co-design workshops, 24 in United Kingdom, 32 in Italy and 14 in France (57 to 98 years old). All lived in social housing and were voluntary. Older users and professionals were gathered during group sessions aiming at expressing their needs concerning technology. The mean duration of the sessions was 2 hours, and 3 to 8 sessions were conducted. Facilitation methods were employed, including video demonstrations, sketching, brainstorming, and serious games. Results : In Italy, several devices were considered (e.g., personal computer, smartphone, tablet PC) but none were already chosen and the workshops were focused on the concept development. In UK, the technological device was well defined when workshops started (a TV box, operated by remote control), thus they focused on the ergonomics and aesthetics of the device. In France, the choice occurred during the workshops (an app for tablet PC) and the focus changed accordingly, shifting from conceptual to user trial. Conclusion: Despite the workshops focuses were slightly different in the three countries; they were complementary and both involved the older users living in social housing in the definition of their future living arrangements. Keywords : social housing, participatory design, technology

OP27 311-S-3

OLDER PEOPLE'S USE OF ASSISTIVE TECHNOLOGY: A QUALITATIVE STUDY

Gary PRITCHARD, Katie BRITAIN (Institute of Health and Society, Newcastle University, United Kingdom)

Introduction : Assistive Technology (AT) is equipment that increases or maintains the functional capabilities of people with cognitive, physical or communication difficulties and has been shown to reduce the costs associated with an ageing population as well as allow people to live independently for longer. However, evidence shows that uptake rates are low and when older people do adopt AT, they regularly abandon them. Our sociologically focused research gains an understanding of users' relationship to AT and the principle factors that determine the degree to which they are accepted and integrated into everyday lives and routines. Method : Our data is derived from focus groups (n=15) and semi-structured interviews (n=30) with older people and their informal carers. Visual prompts, videos and technological artifacts were used to facilitate discussions, which were audio-recorded, transcribed and anonymised. Transcripts were then

coded and analysed vigorously. Results : Demographic characteristics, level of disability and medical status are important variables in determining older people's AT use. It was also found that many favour human assistance over technological intervention, feel stigmatized in using these devices and concerned about how they impact upon privacy. Conclusion : Factor associated with older people's AT use are complex and wide-ranging. To a large extent use is dependent on the individual and personal meanings attributed to them. However, there are a lot of things manufacturers can do to increase use. These include creating greater public awareness about AT, improving the design and efficacy of their devices and provide better initial assessment and on-going consultation. Keywords : Assistive technology

OP27 312-C PREVENTION OF FALLS

OP27 312-C-1 A RANDOMIZED CONTROLLED TRIAL TO EVALUATE THE EFFECT OF COMPLIANT FLOORING ON FALL-RELATED INJURIES IN LONG-TERM CARE: THE FLOORING FOR INJURY PREVENTION (FLIP) TRIAL

Chantelle C. LACHANCE¹, Andrew C. LAING², Stephen N. ROBINOVITCH¹, Fabio FELDMAN³, Ming LEUNG³, Dawn C. MACKEY¹ (1. *Biomedical Physiology and Kinesiology, Simon Fraser University, Canada*; 2. *Kinesiology, University of Waterloo, Canada*; 3. *Older Adult Program, Fraser Health Authority, Canada*)

Introduction : Falls are the leading cause of unintentional injury deaths in older adults worldwide. Long-term care (LTC) is a particularly high-risk setting, as approximately 60% of LTC residents fall at least once per year and 30% of these falls cause injury (Rubenstein, AIM, 1994; Stevens, HCP, 2000). Despite these disturbing statistics, little attention has been directed to fall injury prevention in LTC. A promising strategy for reducing fall-related injuries is to decrease the ground surface stiffness, and the subsequent force applied to the body parts at impact. Laboratory studies have demonstrated that compliant flooring can substantially reduce forces applied to the hip and head during simulated falls, without impairing balance (Laing, AAP, 2009; Wright, MEP, 2011). Definitive evidence demonstrating that compliant flooring can prevent fall-related injuries in LTC is lacking. A randomized controlled trial is warranted to fill this evidence gap. Method : The Flooring for Injury Prevention (FLIP) trial is a randomized, triple-blinded, controlled trial. The trial is designed to compare compliant flooring with non-compliant flooring in 150 resident rooms at a LTC facility, to be followed for 4 years. This will provide power of 0.88 for a 40% reduction in the primary outcome. Results : FLIP's primary outcome is serious fall-related injury. Secondary outcomes include all fall-related injuries, falls, cost-effectiveness, and acceptability. Conclusion : Results will provide insight about the potential of compliant flooring to reduce fall-related injuries in LTC and are expected to guide the development of safer facilities for vulnerable older adults. Keywords : compliant flooring, long-term care, fall injuries

OP27 312-C-2 EFFECTS OF ALFACALCIDOL SUPPLEMENTATION ON PHYSICAL PERFORMANCE AND FALLS PREVENTION OF INDONESIAN ELDERLY WOMEN: A RANDOMIZED CLINICAL TRIAL

Siti SETIATI (*Department of Internal Medicine, Faculty of Medicine Universitas Indonesia, Indonesia*)

Introduction : Falls is a serious cause of morbidity and mortality in older adult. Some age-related risk factors including muscle strength and sarcopenia, change in gait and balance have been recognized as the contributors for higher risk of future falls. Recent studies have supported the benefit of vitamin D supplementation in improving muscle strength and function, leading to decreased risk of fall. However, only few evidence exist for analog vitamin D, while it offers several pharmacological advantages compared to native ones. Objective: to study the effect of alfacalcidol supplementation on physical performance and falls prevention in Indonesian elderly women. Method : A-double blind randomized controlled trial was conducted in Geriatric Outpatient Clinic of Cipto Mangunkusumo National Hospital Jakarta Indonesia on April-Agustus 2012. Of 122 elderly women, 95 subjects (mean age \pm standard deviation 70,9 \pm 5,8, range 61-88) were fulfilling criteria and randomized into alfacalcidol group (0.5 mcg/day) or placebo supplementation for 3 months; all received 500 mg supplemental calcium. Upper extremity muscle strength, 4-feet walking test, Timed Up and Go Test were measured and falls occurrence was recorded. Results : Hand grip measurement, 4-feet walking test, timed up and go test were all improving in alfacalcidol group (p value 0,005; 0,026; 0,02 respectively). Subjects in alfacalcidol group show reduction in falls occurrence during treatment (ARR 0,23; NNT 4,34). Conclusion : Alfacalcidol supplementation 0.5 mcg/day for three months effectively improves physical performance and reduces falls in Indonesian elderly women. Keywords : alfacalcidol, physical performance, falls, Indonesia, elderly women

OP27 312-C-3 PRIMARY PREVENTION OF FALLS: STATEWIDE PRAGMATIC CLINICAL TRIAL

Steven ALBERT, Jennifer KING (*Behavioral & Community Health, University of Pittsburgh, USA*)

Introduction : The Pennsylvania (USA) Department of Aging offers Healthy Steps for Older Adults, a population-wide falls prevention effort in senior centers throughout the state. The program consists of physical performance assessment of mobility (timed get up and go, chair stands, one-leg stand) and referrals to physician care and home safety checks for people scoring in the lowest third of performance, along with a 2-hour education program. This simple intervention, designed to heighten awareness of fall risk, could be an effective approach to primary prevention of falls. Method : In 2010-12, we enrolled 1837 older adults from senior centers throughout the state, 815 who completed Healthy Steps and 1022 who did not. Random assignment was not possible, but all completed a common assessment at baseline, allowing planned comparisons. The sample was followed monthly by telephone to ascertain falls using an interactive voice recognition protocol. Incidence rate ratios were calculated to compare falls incidence. Results : The mean age of the sample was 75.0 \pm 8.5; 80% were female; 11% were nonwhite; 16% completed college. 38% reported fair-poor balance. The intervention and comparison groups did not differ in sociodemographics or medical status, and the intervention group did not differ from the universe of seniors completing the program across the state. Fall-months significantly differed between the intervention and comparison groups among those reporting fair-poor balance: 14 fall-months per 100 in the intervention vs. 18 in the comparator (p = .01). Conclusion : Falling is a reasonable target for primary prevention using a low-cost, community-based state intervention. Keywords : falls, intervention, prevention

OP27 312-C-4 CAN ECG ABNORMALITIES PREDICT HIP FRACTURES?

Sof e JANSEN¹, Rudolph W. KOSTER², Frederik J. DE LANGE², Matthias U. SCHAFROTH³, Carel J. GOSLINGS⁴, Sophia E. DEROOIJ¹, Nathalie VAN DER VELDE¹ (1. *Medicine, Section of Geriatric Medicine, Academic Medical Center, Netherlands*; 2. *Cardiology, Academic Medical Center, Netherlands*; 3. *Orthopedic Surgery, Academic Medical Center, Netherlands*; 4. *Traumatology, Academic Medical Center, Netherlands*)

Introduction : Cardiovascular disorders form an important cause of unexplained or recurrent falls in older persons because of the overlap with syncope. However, cardiovascular causes of falls are still underestimated in clinical practice. >90% of hip-fractures are caused by a fall. Aims of this study were to investigate the proportion and association of clinically relevant ECG abnormalities in hip-fractures versus study controls. **Method :** Case-control study. Cases: traumatic hip-fractures. Controls: planned hip surgery (non-traumatic). **Inclusion criteria:** age ≥ 50 years. **Exclusion criteria:** high energetic trauma, pathological and/or previous hip-fracture. ECG's were scored through predefined categories. Multivariate logistic regression analyses were performed to calculate odds ratios (OR) and correct for confounders. **Results :** We included 1861 patients (1297 cases). Cases: mean age 81 years (SD 10), 73% female. Controls: mean age 68 (SD 9), 67% female. After correction for age, gender, previous falls, cardiovascular disease, diabetes mellitus, mobility aid, visual impairment, cognitive impairment, depression and Parkinsonism, we found the following associations between hip fractures and ECG abnormalities: Atrial fibrillation: OR 2.8 (95%CI 1.6 - 5.1) Sinus tachycardia: OR 5.7 (2.9 - 10.9), Abnormal-QTc prolongation OR 4.2 (2.8 - 6.3), LVH OR 1.8 (1.0 - 3.4), low-QRS-voltage OR 3.7 (1.3 - 10.6), pathologic-Q-wave OR 1.9 (1.1 - 3.4), inverted-T-wave OR 2.6 (1.1 - 6.1) and specific-ST-T changes OR 1.5 (1.1 - 2.0). **Conclusion :** Hip-fracture patients show significantly more clinically relevant ECG abnormalities indicative of rhythm- and conduction abnormalities and impaired cardiac function. Detection of these abnormalities may form a valuable basis for additional cardiovascular screening in older fallers. **Keywords :** Falls/Hip fractures, Syncope, ECG abnormalities

OP27 312-C-5

HOW DO HEALTH CARE PROFESSIONALS MANAGE FALLS IN OLDER PEOPLE? A QUALITATIVE INQUIRY
Annaletchumy L¹, Ng CJ¹, Low WY² (1. *Department of Primary Care Medicine, Faculty of Medicine, University of Malaya, Kuala Lumpur, Malaysia*; 2. *Dean's Office, Faculty of Medicine, University of Malaya, Kuala Lumpur, Malaysia*)

Introduction : Managing falls in older people is challenging because it is often multi-factorial and, if not managed appropriately, may result in serious consequences. Despite the availability of effective fall interventions, there is a wide variation in the management of falls among healthcare professionals (HCP). **Method :** Semi-structured individual interviews and focus group discussions were conducted with HCP's who were involved in managing falls in older people in the University of Malaya Medical Centre, Malaysia. The participants were primary care doctors (n=7), rehabilitation physician (n=1), occupational and physiotherapists (n=2), ophthalmologist (n=1), geriatricians (n=2), internal medicine physicians (n=4), and policymakers (n=3). A topic guide was used to facilitate the interviews, which were audio recorded, transcribed verbatim and analyzed using thematic approach. **Results :** Four main themes emerged from the analysis: lack of knowledge, underassessment of falls, negative attitudes towards falls and lack of inter-professional communication. Some HCPs were not aware of the value of exercise in preventing falls and that hearing problem is a risk factor for falls. This gap of knowledge was attributed to the lack of training in fall

management. In addition, HCPs tend to underestimate the severity of falls and failed to associate falls with serious consequences. Enquiry about falls was not part of the screening questions. HCP's were also lack in inter-professional communication. **Conclusion :** HCPs in this study lacked competency in managing falls in the elderly and this is most likely due to lack of training. This calls for more structured training programme to educate HCPs in screening, preventing and managing falls in older people. **Keywords :** Managing falls, Health care professionals (HCP), older people

FALLS II

OP27 313-S-1

THE EFFECTS OF THE IMPLEMENTATION OF AN EVIDENCE-BASED FEAR OF FALLING PROGRAM IN PRACTICE

G.A. Rixt ZIJLSTRA¹, Monique F.M.T. DU MOULIN², Jolanda C.M. VAN HAASTREGT¹, Martha C. DE JONGE³, Gertrudis I.J.M. KEMPEN¹, Agnes VAN DER POEL³ (1. *Department of Health Services Research / CAPHRI, Maastricht University, Netherlands*; 2. *Faculty of Health, Zuyd University of Applied Sciences, Netherlands*; 3. *Program Mental Health, Trimbos Institute, Netherlands*)

Introduction : Fear of falling and related activity avoidance are common in older people. An RCT showed the effectiveness of a multifaceted cognitive behavioral program on concerns about falling, daily activity, and recurrent falls in community-living older people. In the present study we explored the effects and acceptability of the 8-week group program after its nationwide implementation in homecare organizations in The Netherlands. **Method :** A pretest-posttest study was carried out in 125 community-living older adults. Prior to the program and at 2 and 4 months we collected data on concerns about falls, related avoidance behavior, falls, fall-related medical attention, loneliness, and symptoms of anxiety and depression for the effect evaluation. To explore the program's acceptability the participant's opinion on different program aspects was registered. **Results :** Pretest-posttest analyses showed significant improvement at 4 months on several outcomes, e.g. concerns about falling (1-item: p<.01; scale: p<.05), avoidance behavior (p<.01), and falls (p=.01). No differences were found for daily activity (p=.13) and feelings of loneliness (p=.47). Participants held a positive overall opinion regarding the program. Directly after the program 63.1% of the participants reported substantial program benefits; at 4 months this had slightly decreased to 56.3%. **Conclusion :** The outcomes of the program as implemented in the homecare organizations were highly similar to the outcomes of the RCT, i.e. participants reported reduced concerns about falls, avoidance behavior and falls, and the majority benefited from the program. This indicates that the program is not only effective and acceptable in an experimental setting but also in practice. **Keywords :** fear of falling, accidental falls, activities of daily life, effect evaluation, feasibility, implementation

OP27 313-S-2

ASSOCIATION OF FALL WITH EXERCISE AND FARMING WORK AMONG CHINESE NONAGENARIANS/CENTENARIANS

Qiukui HAO, Ming YANG, Li LUO, Dingwen DONG, Xiang DING, Birong DONG (The Center of Gerontology and Geriatrics, West China School of Medicine, West China Hospital, Sichuan University, China)

Introduction : Fall is very common among old people. Previous studies

shows that exercise can prevent the occurrence of fall. However, less is known about the relationship between falls and exercise and farming work in oldest old people. This study was conducted to observe the different association of fall with habits of exercise and farming work among very old people. Method : In the present cross-sectional study, we observed the association of fall with habits (current and former) of farming work and exercise among very old people using a Chinese cohort aged 90-108 years. Results : The population included 805 unrelated Chinese nonagenarians and centenarians (68.94% women, mean age 93.70 years). In women, subjects with current habit of farming work had significantly higher prevalence fall than those without this habit ($p=0.032$); but subjects with current habit of exercise had significantly lower prevalence fall than those without this habit ($p=0.009$). However, in men, there was no significant difference in prevalence of these habits between subjects with and without fall. After adjust for age, gender, body mass index, educational levels, living styles, vision levels and temperament, we found that current habit of farming work and exercise had a significant odds ratio (OR=1.527 95% CI (1.142, 2.042) and OR=0.631 95% CI (0.429, 0.928), respectively) for fall. Conclusion : In summary, among nonagenarians and centenarians, the habit of farming work might be positively associated with fall, but the habit of exercise might be negatively associated with fall in Chinese longevity people. Keywords: Exercise; Fall; farm

OP27 313-S-3

OLDER WOMEN AND MEN AS CO-CREATORS IN DESIGN OF A MOBILE APPLICATION FOR FALL PREVENTION

Petra POHL¹, Birgitta BERGVALL-KAREBORN², Lillemor LUNDIN-OLSSON¹, Christina AHLGREN¹, Marlene SANDLUND¹, Anita MELANDER-WIKMAN³ (1. Department of Community Medicine and Rehabilitation, Umea University, Sweden; 2. Department of Business Administration, Technology and Social Sciences, Lulea University of Technology, Sweden; 3. Department of Health Sciences, Lulea University of Technology, Sweden)

Introduction : There is a plethora of fall prevention programs for older community-dwelling people. The evidence for exercise-based programs is strong. There is a problem however with implementation and adherence. Motivational factors and barriers have been identified to some extent. Previous studies have shown that what works best is when exercise programs are tailor made, home based, and when people have access to personal feedback on a regular basis. Mobile applications for Smartphones with exercises have these advantages, and have been available for a long time, but these are most commonly directed to young and middle-aged people. There are no applications for fall prevention developed based on senior's own wishes. The aim was to investigate how healthy older community-dwelling women and men reason and what exercises they prefer when participating in development and design of a fall prevention program in shape of a mobile application for Smartphones. Method : Participatory and appreciative action research design with focus group interviews and workshops. Qualitative data analysis. Results : The preliminary results show that when older community-dwelling men and women participate in developing a fall prevention program for Smartphones, they have many ideas, thoughts and experiences that may serve as a motivational factor for following a fall prevention program regularly. Conclusion : The implementation and adherence for evidence based fall preventative exercise programs is insufficient. This study will gain knowledge to design tailor made, home based fall prevention exercise programs among community-dwelling healthy seniors. Keywords : mobile applications, fall prevention, older people

OP27 313-S-4

STAND UP TO FALLING: EVALUATING THE IMPACT OF A FALL PREVENTION PROGRAM ON OLDER ADULTS

Amy F. HOSIER, Anthony SETARI (Family Sciences, University of Kentucky, School of Human Environmental Sciences, USA)

Introduction : Each year 1 out of 3 adults age 65+ experiences a fall which leads to a fear of falling, moderate to severe injury, and even death. In addition to the physical and psychological impact, falls are associated with severe economic consequences for individuals, their families, and society at large. Concerns over rising healthcare costs and discussion of healthcare reform in the United States create an additional incentive to reduce the risk of falls. Falls have become a recognized and mostly preventable public health problem. Extension is a non-formal educational program provided by the United State's land-grant universities. Extension translates and disseminates research-based information to help improve communities and individuals' lives. Method : Stand Up to Falling emphasizes four preventable risk factors identified by the Centers for Disease Control and Prevention (CDC): lack of exercise, unsafe home environments, vision problems, and medication usage. When properly addressed, each of these factors can reduce and even prevent the likelihood of falls. The program also emphasizes the steps that should be taken by older adults should a fall occur. The program was presented to participants (N = 1,324) in Kentucky by trained Extension professionals. Results : Preliminary evaluation analysis suggests that as a result of participation, 98.6% of participants have a better understanding of how to reduce the risk of falling, 82.8% will discuss their medications with healthcare professionals, and 99.3% know how to safely get up following a fall. Conclusion : These preliminary findings suggest that the program was successful in educating participants on how to prevent falls. Keywords: Falls, Prevention, Education

OP27 313-S-5

DEVELOPING A SENSORMAT TO REDUCE FALLS INVOLVING PEOPLE WITH DEMENTIA, FAMILIES AND STAFF

Christine BROWN WILSON¹, Patricia SCULLY², Krikor OZANYAN³, Nurgie NURGIYATNA³, Jose CANTORAL CEBALLOS³, Paul WRIGHT³, John VAUGHAN⁴, Chris TODD⁵ (1. School of Nursing, Midwifery and Social Work, University of Manchester, United Kingdom; 2. Photon Institute, University of Manchester, United Kingdom; 3. School of Electronic and Electrical Engineering, University of Manchester, United Kingdom; 4. School of Chemical and Analytical Science, University of Manchester, United Kingdom; 5. School of Nursing, Midwifery and Social work, University of Manchester, United Kingdom)

Introduction : Falling is a serious and frequent occurrence in people over 65, with high personal and economic costs. Falls and the fear of falling, restricts the lifestyle of older people resulting in disability, loss of confidence and reduction in quality-of-life. This interdisciplinary project developed of technology with the capacity to predict changes in a person's condition that may result in falling. Method : Phase one: Construction of a sensormat from interconnected, flexible, optical fibres with the application of Tomographic imaging principles to record changes in pressure distribution of foot balance, step sequence and position in real time. Data were collected to identify how the system communicates changes in gait pattern leading to a fall. Phase Two: Focus groups involving people with dementia, family caregivers and professionals from the NHS and private care sector evaluated the utility of this system for clinical practice. Acceptability of this technology for people with dementia and carers was assessed. Results :

Embedded optical fibres in a light mat or underlay can be used to non-intrusively collect data over time without infringement on privacy. People with dementia and caregivers identify the importance of technology that can alert them prior to an incident such as a fall occurring. Clinical staff can use a sequence of images that identify changes in walking patterns to identify risk factors that may precipitate a fall. Conclusion : Involving people with dementia, family caregivers and clinical staff in the development of technology at an early stage, ensures it meets the needs of the end users in health care. Keywords : Falls, dementia, technology

OP27 314-S

GENDER & SEXUALITY

OP27 314-S-1

GENDER AND SEXUALITY IN BRAZILIAN CONTEXT

Guita Grin DEBERT (*Anthropology, Universidade Estadual de Campinas, Brazil*)

Introduction : Brazil is a country where the cult of beauty, youth and sexuality is seen as one of its most salient cultural characteristics. This cult contrasts with the premature ageing of the population along axes of gender, class, race and ethnicity. Drawing on the interplay of gender, ageing, and sexuality, the aim of this paper is twofold: (1) to show through content analysis of discourse produced by Brazilian Gerontology, Sexology and self-help literature how gender difference are dissolved in their attempt to demonstrate that the decrease in sexual activity in old age is replaced by a unique and intense sexual pleasure ;(2) to analyze the way in which these discourses on the ageing body and sexuality are differently perceived and evaluated by older men and women participating in “senior citizens clubs” who mobilized mostly women and the “pensioners' associations” that generally congregate men in the city of Sao Paulo. Method : Qualitative Method (ethnography and content discourse analyses). Results : The work shows the way in which sexology establishes a relationship between health and a fulfilling sexuality and struggles against the view of the older person as an asexual being by operating a sort of des-genitalization of their sexuality, or else proposing a reversal of the conventional correlation of feminine x masculine sexuality in old age. Conclusion : The politically correct sexuality in old age requires the establishment of an indissoluble relationship between sexual pleasure and health. Keywords : sexuality, ageing, Brazilian context

OP27 314-S-2

GENDER AND RACIAL DISPARITIES IN LIFE-SPACE CONSTRICTION

Moon CHOI¹, Melissa Lunsman O'CONNOR² (*1. College of Social Work, University of Kentucky, USA; 2. Department of Human Development and Family Science, North Dakota State University, USA*)

Introduction : Life-space is defined as the size of the spatial area through which a person travels within a specified time period. Life-space may be socially and culturally constructed beyond physical functioning; therefore, gender and race might influence the size of one's life-space. This study examined gender and racial disparities in life-space constriction among older Americans. Method : Data were from the five-year longitudinal Advanced Cognitive Training for Independent and Vital Elderly (ACTIVE) Study (n=2,793; mean age=73.6; 75.8% women). Life-space was assessed with the self-report Life Space Questionnaire, which addressed whether respondents left their neighborhood or town during the past week and their county, state, or region during the past two months. Life space constriction

was defined as not traveling beyond one's town. A series of logistic regression models were used to estimate odds ratios for life-space constriction by gender and race. Results : Overall, white participants and men were more likely to travel beyond their towns and counties than their counterparts at baseline. Race had different influences on acquired constriction in life-space by gender. For men, being non-white was associated with the risk for constricted life-space to town (OR=4.08, 95% CI=1.75-9.47, p<.001). For women, conversely, non-whites were less likely to experience constricted life-space to town than whites (OR=0.62, 95% CI=0.41-0.93, p=.021) after adjusting for sociodemographic and health characteristics. Conclusion : Race and gender play an important role in constructing life-space in old age. Racial disparities in constricted life-space may vary by gender. Keywords : life-space, mobility, disparities

OP27 314-S-3

GROWING OLD WITHOUT A CHILD: HEALTH, CHILDLESSNESS AND LGB AGEING

Gerardo ZAMORA¹, Rosanna DE LA ROSA², Mikel OTXOTORENA³, Ines AGUINAGA², Francisco GUILLEN-GRIMA² (*1. Departamento de Ciencias de la Salud, Universidad Publica de Navarra (UPNA); ETORBIZI, Spain; 2. Department of Health Sciences, Universidad Publica de Navarra (UPNA), Spain; 3. ON:GIZ Elkarte, Spain*)

Introduction : Research on ageing is increasingly calling attention on the diversity of the new cohorts of elderly people. Gay, lesbian, bisexual and transgender (LGBT) ageing is a blooming area of investigation because individuals who age as GLBT face particular challenges to their well-being across the life course and reach old age through more diverse paths. At the same time, childlessness is increasing in many societies. Childless or childfree individuals, regardless of their sexual identify or sexual behaviour, face also particular challenges throughout their life course. Both groups, LGBT elders and childless/childfree elders, although different, face similar challenges in health. Method : This paper draws on the analysis of data from wave 1 (2004) of the Survey of Health, Ageing and Retirement in Europe (SHARE), which includes information on more than 31,000 individuals aged 50+ from twelve countries. The paper particularly considers more than 2,500 individuals who were either ageing as childless and follows then on wave 2 (2006). The impact of childlessness on health, perceived health, use of health services and other health-related dimensions is analysed. To include the perspective of LGB elders, 10 in-depth interviews with LGB individuals aged 50+ focusing on the same health variables. Results : Childlessness does seem to impact some health outcomes, especially mental health, self-reported quality of life, and social interaction. LGB individuals' discourses confirm the impact of stigma and health. Conclusion : Being childless or childfree is as pervasive as any other type of identity such as being an LGB person. Keywords : LGB ageing, childlessness - childfree ageing, health

OP27 314-S-4

A STUDY TO EXPLORE HOW THE SEXUAL IDENTITIES AND RELATIONSHIPS OF OLDER LESBIAN, GAY, BISEXUAL (LGB) RESIDENTS ARE PERCEIVED AND SUPPORTED IN RESIDENTIAL CARE ENVIRONMENTS IN WALES

Penny MILES, Paul WILLIS, Michele RAITHBY, Tracey Anne MAEGUSUKU-HEWETT, Paul NASH, Christine BAKER (*Centre for Innovative Ageing, Swansea University, United Kingdom*)

Introduction : Sexuality and sexual health are an integral aspect of

health and wellbeing throughout the lifecourse. However, older people are often assumed to be asexual (Bauer et al, 2009). For older people within residential care environments, the priority of care needs can overshadow their sexual health needs (Windle & Burholt, 2006). Too frequently older people are also presumed to be heterosexual, neglecting social differences in sexual orientation. Consequently, older lesbian, gay and bisexual (LGB) people can experience dual discrimination through the heterosexist assumptions of care providers and through ageist beliefs circulating in LGB communities (Clarke et al, 2010). Method : Our study, focuses on the provision of services to older LGB people in residential care environments. Research participants in our study included care and nursing staff, managers and older LGB people and our mixed method approach included a content analysis of government care home inspection reports, a self complete questionnaire with validated measures designed to elicit attitudes towards ageing, sexuality and lgb sexuality, focus groups and narrative interviews. Results : Our findings point to an absence of specific policy, and a lack of awareness, training or 'comfort' around affirmative practice to meet the needs of older LGB people, and in some instances, sexuality per se. In anticipation of their future life, older LGB people are fearful of discrimination and isolation, with some preferring 'ghettoisation'. Conclusion : Our research makes an important contribution to raising awareness of LGB sexuality and ageing ,and seeks to promote anti-discriminatory and dignified care amongst health and social care professionals in care environments. Keywords : care lgb sexuality

OP27 315-C **MECHANISM OF FALLS II**

OP27 315-C-1 **ASSOCIATIONS BETWEEN FRAILTY AND SERUM 25 HYDROXYVITAMIN D AND 1,25 DIHYDROXYVITAMIN D LEVELS IN AUSTRALIAN COMMUNITY DWELLING MEN AGED ≥70 YEARS: THE CONCORD HEALTH AND AGEING IN MEN PROJECT (CHAMP)**

Vasant HIRANI¹, Vasikaran NAGANATHAN¹, Robert G. CUMMING², Fiona BLYTH¹, Markus J. SEIBEL³ (1. Centre for Education and Research on Ageing, Concord Hospital, University of Sydney, Australia; 2. School of Public Health, University of Sydney, Australia; 3. ANZAC Research Institute, and Dept of Endocrinology & Metabolism, Concord Hospital, University of Sydney, Australia)

Introduction : Low serum 25hydroxyvitamin D(25D) concentrations are known to be associated with frailty, but the relationship between 1,25dihydroxyvitamin D(1,25D) and frailty has not been studied. The aims were to examine the associations between serum 25D and 1,25D levels and frailty and with the components of frailty in older men. Method : Cross-sectional analysis of 1,625 men aged≥70 years, participating in the CHAMP, conducted in Sydney 2005-2007. Outcome measurements were frailty (assessed using the Cardiovascular Health Study criteria) and components of frailty: weight loss, weakness, slow walking speed, exhaustion and low activity level. Covariates included serum 25D and 1,25D, age, country of birth, season of blood collection, sun exposure, vitamin D supplement use, smoking status, income, activities of daily living, health measures, parathyroid hormone and estimated glomerular filtration rate. Results : Low serum levels of 25D and 1,25D were independently associated with frailty (OR: 2.53, 95%CI:1.59-4.03 for 25 D<40nmol/L compared to levels ≥68.9nmol/L and OR: 2.99, 95%CI:1.72-5.17 for 1,25D<62pmol/L compared to levels ≥145.9pmol/L) and with four of the five components of frailty (except weight loss),independent of other covariates. When both vitamin D

measures were considered together, there was an increased risk of frailty among men in the lowest quartiles of both measures, despite a weak correlation between them (r=0.30). Conclusion : 1,25D and 25D levels were independently associated with frailty in older men. This suggests that low vitamin D status may influence frailty through different biological mechanisms and pathways. Keywords : frailty, vitamin D measures,older men, the Concord Health and Ageing in Men Project

OP27 315-C-2 **A CANDIDATE GENE APPROACH TO UNDERSTANDING THE PATHWAYS ASSOCIATED WITH THE FRAILTY PHENOTYPE IN A POPULATION SAMPLE OF OLDER ADULTS FROM ENGLAND (ELSA)**

Krisztina MEKLI¹, Neil PENDLETON², James NAZROO¹ (1. Cathie Marsh Centre for Census and Survey Research, University of Manchester, United Kingdom; 2. Institute of Brain, Behaviour and Mental Health, University of Manchester, United Kingdom)

Introduction : The term frailty refers to a reduced functional reserve and consequent decrease in adaptation (resilience) to any stressors with a multi-system failure. The mechanistic pathophysiological pathways of frailty are not known but the hypothalamic-pituitary-adrenal (HPA) axis and heightened chronic systemic inflammation are thought to be major contributors. Method : Higher cortisol/dehydroepiandrosterone-sulphate (DHEAS) ratio in frail individuals indicates the role of the HPA axis in frailty. In our study we used a candidate gene approach to evaluate the role of selected cortisol pathway-related genes in this phenotype. We used the English Longitudinal Study of Ageing (ELSA) dataset of 4000 individuals over the age of 60 and assessed their frailty status using a widely accepted method of 5 factor criteria for Frailty Phenotype (FP) (Fried et al. J Gerontol 2001). We chose 30 genes involved in cholesterol transport, cortisol and DHEAS metabolism, analysed with logistic regression against FP, using only age and sex as covariates. Results : The strongest signals were observed in two cholesterol transport related protein genes. The stronger was in the amyloid beta precursor protein gene (APP) (uncorrected P value=0.01, OR=1.7), the weaker in the lecithin-cholesterol acyltransferase (LCAT) gene (uncorrected P value=0.04, OR=1.93). None of these associations were supported following correction for multiple testing. Conclusion : In this analysis using an English population sample we found association with cholesterol transport related protein genes and frailty phenotype (FP), which lost significance after correction for multiple testing. Other approaches using more informed analysis tools with more comprehensive coverage of this area of the genome may be warranted. Keywords : frailty, cortisol, genetics

OP27 315-C-4 **VEGETABLES AND FRUITS CONSUMPTION AND SARCOPENIA IN OLDER KOREAN ADULTS**

Jinhee KIM¹, Yunhwan LEE¹, Yoon-Sok CHUNG², Kwang Min KIM³ (1. Dept. of Preventive Medicine and Public Health, Ajou University School of Medicine, Korea; 2. Dept. of Endocrinology and Metabolism, Ajou University School of Medicine, Korea; 3. Dept. of Family Practice and Community Health, Ajou University School of Medicine, Korea)

Introduction : Research on the association of vegetables and fruits that are rich in antioxidants and sarcopenia are rare. We examined the relationship between frequency of vegetables and fruits consumption and sarcopenia in older persons living in the community. Method : Data were from the Fourth Korean National Health and Nutrition

Examination Survey (KNHANES-IV, 2008-2009). Subjects were aged 65 years and older (n = 1907) living in the community. Information on food group consumption was obtained using a food frequency questionnaire (FFQ). Sarcopenia was defined by the residual method, assessed using the dual X-ray absorptiometry. The association between vegetables and fruits consumption and sarcopenia was analyzed with multiple logistic regression analyses, adjusting for sociodemographics, health behaviors, and dietary factors. Results : Among the study population 56.6% were women, with mean age of 72.0 (\pm 5.3) for men and 72.0 (\pm 5.2) for women. Adjusting for covariates, an inverse association of sarcopenia with tertiles (T1: lowest, T3: highest) of vegetables, fruits, and combined vegetables and fruits consumption was observed in men (odds ratio [OR] and 95% confidence interval [CI]: 0.52 [0.30-0.93], 0.53 [0.30-0.93], 0.41 [0.23-0.73] for T3 vs. T1, respectively). In women, fruits and combined vegetables and fruits consumption was significantly associated with sarcopenia (OR = 0.60, 95% CI: 0.36-1.00, OR = 0.58, 95% CI: 0.36-0.95, T3 vs. T1, respectively). Conclusion : Increased vegetables and fruits consumption may be protective against sarcopenia in older persons. Further research is needed to ascertain the effect of food consumption on sarcopenia in older adults. Keywords : vegetables, fruits, sarcopenia

OP27 315-C-5

FRAILTY AS A PREDICTOR OF MORTALITY: THE MODERATING EFFECTS OF BODY MASS INDEX

Yunhwan LEE¹, Jinhee KIM¹, Joung Hwan BACK², Mikyung RYU¹, Eun Sook HAN³, Yunyoung CHO⁴, Haewon BYEON⁵, Song-I CHAE¹ (1. Department of Preventive Medicine and Public Health, Ajou University School of Medicine, Institute on Aging, Ajou University Medical Center, Korea; 2. National Health Insurance service, Health Insurance Policy Research Institute, Korea; 3. Physiologic Diagnostic Lab, Seoul National University Bundang Hospital, Institute on Aging, Ajou University Medical Center, Korea; 4. Department of Dental Hygiene, Suwon Women's College, Institute on Aging, Ajou University Medical Center, Korea; 5. Department of Language Therapy, Daelim University College, Institute on Aging, Ajou University Medical Center, Korea)

Introduction : Frailty is predictive of late life mortality, but little is known about the effects of body weight on the association between frailty and mortality. This study investigated the moderating effects of body mass index (BMI) on the frailty-mortality relationship in older adults. Method : Data were from the Living Profiles of Older People Survey (LPOPS), a national survey of 12,087 Koreans aged 65 years and older in 2008. During the 3-year follow-up 832 subjects died (6.9%). Frailty was categorized as not frail, prefrail, and frail, based on 5 indicators (weight loss, exhaustion, physical activity, walking speed, grip strength). BMI (kg/m²) was classified as underweight (<18.5), normal (18.5-24.9), overweight (25-29.9), and obese (\geq 30.0). Cox proportional regression was used to analyze the relationship between frailty and mortality risk, according to baseline BMI, controlling for sociodemographics and health-related variables. Results : Among the study participants 7.8% were classified as frail, 50.4% as prefrail, and 41.8% as non-frail. Adjusting for all covariates, compared with the normal weight and not frail counterpart, the underweight or normal weight of prefrail or frail status demonstrated significantly increased odds of death. The obese frail respondents also showed a significantly higher mortality risk (hazard ratio=3.77, 95% confidence interval: 1.12-12.67). Among the overweight prefrail/frail group, however, there was no significant association with mortality. Conclusion : Among older people with normal weight or underweight, greater frailty was associated with poorer survival. Whereas overweight tended to be protective of the effect of frailty on mortality, the obese

frail exhibited a significantly elevated risk of mortality. Keywords : frailty, mortality, body mass index

OP27 315-C-6

DIET QUALITY AND PHYSICAL PERFORMANCE ARE ASSOCIATED WITH INFLAMMATORY MARKERS IN COMMUNITY-DWELLING FRAIL OLDER ADULTS

Do Yeon KIM (Department of Medical Nutrition, Graduate School of East-West Medical Science, Kyung Hee University, Korea)

Introduction : There is growing evidence that higher levels of cytokines such as interleukin-6 (IL-6) and tumor necrosis factor alpha (TNF- α) are associated with lower nutritional and functional status in older adults. The aim of this study was to investigate the association among the serum level of inflammatory markers, diet quality, and physical performance in frail older adults living in community. Method : A total 87 frail older adults (usual gait speed <0.6 m/sec and Mini Nutritional Assessment < 24) were participated in this cross sectional study from National Home Healthcare Services in Gangbuk-gu, Seoul, South Korea. Diet quality was assessed by nutrient adequacy ratios (NARs) for various nutrients and the mean adequacy ratio (MAR). MAR was calculated as the sum of NARs divided by the number of nutrients (n=13). Physical Performance was measured by Short Physical Performance Battery (SPPB). Results : Linear regression analysis showed that higher level of IL-6 (log-transformed) was associated with lower MAR score after adjustment for age, sex, education, income, social network, and number of chronic disease (β =-6.16; p=.014). However, there was no significant association between level of TNF- α (log-transformed) and MAR score (β =-3.31; p=.156). Higher level of TNF- α was associated with lower SPPB score after adjustment for multiple covariates (β =-0.58; p=.003). However, no correlation was found between level of IL-6 and SPPB score (ρ =-0.11; p=.347, Spearman's correlation). Conclusion : Higher level of IL-6 was independently associated with lower diet quality, and higher level of TNF- α was associated with lower physical performance in community-dwelling frail older adults in South Korea. Keywords : inflammatory marker, diet quality, physical performance

SKILL DEVELOPMENT FOR NURSES IN HOME CARE - AN INTERVENTION STUDY

Gro HAANES¹, Marit KIRKEVOLD², Gunnar HORGEN³, Grethe EILERTSEN¹ (1. Faculty of Health Sciences, Buskerud University College, Norway; 2. Institute of Health and Society, Department of Nursing, Oslo University, Norway; 3. Department of Optometry and Visual Sciences, Faculty of Health Sciences, Department of Visual Sciences and Optometry, Norway)

Introduction : A training program for nurses in home care was developed in order to increase knowledge within the eyesight, the hearing, and the indoor lighting in the home of elderly. The overall objective was to develop nurses' competence, and place the nurses in a position to perform simple screening tests for vision and hearing. A light measuring device (Hagner luxmeter) was used, and in addition a form for assessing and surveying indoor lighting, was developed and used. Method : Qualitative and quantitative methods were used. The intervention comprised an intervention group (IG) and a control group (CG), with 10 nurses in each group. Both groups performed a multiple choice knowledge test (MC-test) before and after the training program. The nurses were also interviewed after the intervention. Results :

Nurses in the intervention group on average had a higher score in the 2nd than in the 1st MC-test. Nurses in the IG had better theoretical knowledge about hearing, vision and lighting conditions at home, than knowledge about the practical consequences of living with reduced sight, hearing and/or low lighting levels. Nurses (IG) considered themselves to be far more aware of the vision, hearing and lighting conditions of the elderly after the training program. Nurses (IG) especially valued doing the practical tests of seeing, hearing and measuring the indoor lighting. Conclusion : The study indicates that knowledge and awareness about the practical consequences of reduced eyesight and hearing and low lighting levels in the homes of the elderly, is poor. Keywords : sensory impairment, low indoor lighting levels

**OP27 316-S-3
INSTITUTIONAL CARE OF THE ELDERLY-A STUDY
AMONG THE RESIDENTS OF OLD AGE HOMES IN
KARNATAKA, INDIA**

Vanitha DAPPARABAIL (*Dept of Sociology, A.V.K College for Women, Hassan 573201, Karnataka, India*)

Introduction : Old age homes are homes for senior citizens, unable to stay with their families, wish for a secured living, looking for social interaction and stay away with social pressures. There are more than 1000 old age homes in India. Old age homes are a necessity today due to the work pressure of the younger generations. This paper attempts to know the living conditions and level of satisfaction of elderly people living in old age homes in Hassan, Karnataka. Method : For the present study, 100 respondents were selected by using simple random sampling method and information collected through interview schedule is tabulated and analyzed. Results : Food security, companionship and recreational facilities were available in all the institutions. But proper health care was not provided to the residents. Emotional security and personal attendance is felt. Declining health due to physical degeneration, nutritionally inadequate diets, lack of exercise and limited sources of interaction precipitated health problems of the residents. Almost all respondents (92%) have expressed varying levels of dissatisfaction with the supportive services and care provided by the institutions. However, to a great extent, Institutional care offers a common place for shelter, dining and recreation, sharing feelings, thoughts and companionship. Conclusion : The Institutional living for the aged provided scope for sharing of the bottled up emotional securities which is a tension releasing mechanism for the aged. The Old age homes provide a secure place to overcome loneliness and health care. But more attention is required from the government to monitor the working of old age homes. Keywords : Institutional care, Living conditions, level of satisfaction

SENIORS' EXPERIENCES OF LIVING IN SPECIAL
HOUSING ACCOMMODATION (SHA) CHALLENGES FOR
SCANDINAVIAN ELDERLY CARE**

Ulla Helena HELLSTROM MUHLI (*Department of Sociology, Uppsala University, Sweden, Sweden*)

Introduction : This article presents a hermeneutic phenomenological analysis of interview material in which 12 seniors living in Special Housing Accommodation (SHA) facilities reflect on the experience of living in such facilities. Of particular interest in the analysis is living in a SHA as a phenomenon. Method : The data material was collected by face-to-face interviews (each participant had one interview) using an interview guide (Fontana & Frey, 1994), containing the question topics of (i) life situation now, (ii) experiences of dwelling, (iii) being at

home, and (iv) life situation in the future. Results : The finding shows that the phenomenon of lived experience in a SHA seems to be a state of ambiguity regarding one's existence, which is made up of several constituents (elements of meaning). The analysis contributes to the understanding of how the phenomenon of SHA living is coming into existence as a need, due to an individual's failing health; however, the SHA is not considered to be a true home. Conclusion : The seniors learn to cope with living in the SHA by lowering their expectations of life and existence while the SHA provides the prerequisites for their existence. An implication for promoting care is to support the seniors to enable a full existence of life within SHA living. Keywords : Home; Experiences; Special housing accommodation; Scandinavian elderly care

ACCELERATION OF AGE-RELATED GENE EXPRESSION IN
THE BRAIN OF SAMP8: IT'S EFFECT ON MYELIN BASIC
PROTEIN (MBP) GENE EXPRESSION DURING POSTNATAL
DEVELOPMENT**

Ryoya TAKAHASHI, Keiko ODERA (*Department of Biochemistry, Faculty of Pharmaceutical Sciences, Toho University, Japan*)

Introduction : The senescence-accelerated mouse (SAM) was established as an animal model of accelerated aging by T. Takeda et al. SAMP8/Toho mice have much shorter life-span (approx. 50% of control strain, accelerated senescence resistant strain SAMR1/Toho). In an attempt to find molecular biological difference between SAMP8/Toho and SAMR1/Toho mice, we investigated age-related changes in the expression of various genes in different brain regions of both strains. Method : SAMP8 and SAMR1 mice obtained from Dr. T. Takeda were bred and maintained in our animal facility. These mice were designated as SAMP8/Toho and SAMR1/Toho, respectively. The mRNA levels were determined by Northern blot analysis. Results : The patterns of various gene expression (cyclophilin, actin, hsc70, etc.) in the brain were remarkably different each other. However, when the gene expression level of each strain was expressed as a percentile of respective average life span, the timing and intensity of gene expression was found to be nearly the same despite a twofold difference in the life span. On the other hand, the expression of MBP gene declined dramatically after weaning in the cerebellum but not cerebrum and brain stem of SAMP8. Conclusion : The results of this study suggest that post-weaning gene expression in mice of different life span is controlled by mechanisms associated with physiologic rather than chronologic age. The altered expression of MBP gene in the cerebellum of SAMP8 might be due to indirect effects of disorganized gene expression during weaning. Keywords : cerebellum, myelin basic protein, senescence-accelerated mouse

**OP27 318-B-2
VITAMIN D AND BRAIN VENTRICULAR VOLUME IN
OLDER ADULTS**

Cedric ANNWEILER¹, Manuel MONTERO-ODASSO², Vladimir HACHINSKI³, Sudha SESHADRI⁴, Robert BARTHA⁵, Olivier BEAUCHET⁶ (*1. Neuroscience and Geriatrics, Angers University Hospital and Western University, France; 2. Geriatrics, Western University, Canada; 3. Neurology, Western University, Canada; 4. Neurology, Boston University, USA; 5. Roberts Research Institute, Western University, Canada; 6. Neuroscience and Geriatrics, Angers University Hospital, France*)

Introduction : Vitamin D deficiency is associated with an enlargement

of the lateral cerebral ventricles in rodents. The effect of low serum 25-hydroxyvitamin D (25OHD) on lateral cerebral ventricular volume has not been studied yet in humans. The purpose of this cross-sectional study was to determine whether vitamin D deficiency was associated with greater lateral cerebral ventricular volume in older adults. Method: Ninety-two Caucasian community-dwellers with no clinical hydrocephalus (mean, 72.2±6.2years; 46.7%female) were divided into 2 groups according to serum 25OHD concentration (deficiency≤50nmol/L; normal>50nmol/L). Cerebral ventricular volume was quantified using semi-automated software from three-dimensional T1-weighted MRI. Age, gender, body mass index, blood pressure, education level, Mini-Mental State Examination, white matter lesions and serum calcium concentrations were used as covariates. Results : There was an inverse linear association between 25OHD concentration and ventricular volume (P=0.049). Compared to individuals with normal 25OHD, those with 25OHD deficiency (n=33) had 28% larger lateral ventricles (46.9±26.8mL versus 36.6±16.4mL, P=0.026). Vitamin D deficiency was associated with an increase in ventricular volume (adjustedβ=16.55, P=0.023). The ventricular enlargement involved ventricle bodies (P=0.025) but not temporal horns (P=0.112). Conclusion : Serum 25OHD deficiency was associated with larger lateral cerebral ventricles. These findings provide a scientific base for vitamin D replacement trials. Keywords : vitamin D; brain; ventricular volume; MRI; morphometry; neuroendocrinology; older adults

OP27 318-B-3

MECHANICAL PROPERTIES OF SINGLE MUSCLE FIBER REPRESENTING POOR MUSCLE QUALITY OF OLDER ADULTS WITH DIABETES

Eun-Jeong LEE¹, Ji-Wan YOON², Hak Chul JANG³, Jae-Young LIM⁴
(1. Department of Rehabilitation Medicine, Seoul National University Bundang Hospital and Seoul National University Institution on Aging, Korea Institute of Machinery & Materials, Korea; 2. Department of Internal Medicine, Seoul National University Hospital Healthcare System Gangnam Center, Korea; 3. Department of Endocrinology, Seoul National University Bundang Hospital, Korea; 4. Department of Rehabilitation Medicine, Seoul National University Bundang Hospital, Korea)

Introduction : Aging is known to cause muscle weakness while type2 diabetes mellitus (DM) is also considered as a high risk factor to induce a serious skeletal muscle. Berria et al. (2006) found that insulin-resistant skeletal muscle showed the increased collagen content. Here we studied mechanical properties of aged skeletal muscle with type2 DM to investigate whether the aged skeletal muscles with type2 DM induce the higher passive tension due to abundance of extracellular matrix (ECM) inside or outside of muscle fibers. Method : Permeabilized single muscle fibers from gluteus maximus (GM) muscle of older adults during hip surgery (n=6 for each diabetes (DM) and non-diabetes (non-DM) group) were used for the mechanical test. SDS-PAGE was used to quantify the amount of titin of muscle. Results : The average CSA and maximal active tension of single fibers were smaller in DM compared to non-DM. Based on the measured titin- and ECM-based passive tension, we estimate the ratio of titin- and ECM-based passive tension (titin/ECM ratio). DM showed significantly lower titin/ECM ratio than non-DM, which indicates that more ECM but less titin contributes to the total amount passive tension. No significant differences were found between two groups in the amount of T1 (intact titin) relative to the amount of myosin heavy chain (MHC). Conclusion : Based on our findings we conclude that passive stiffness of skeletal muscle fibers was shown to increase in older adults with type2 DM. This observation may result

from the excessive accumulation of ECM in and around the single fibers. Keywords : Diabetes mellitus, Skeletal muscle atrophy, Titin

OP27 318-B-4

GENOME-WIDE PROFILING OF MIRNA IN SKELETAL MUSCLE WITH AGING

Ji Young KIM¹, Seon-Young KIM², Ki-Sun KWON¹ (1. Aging Research Center, Korea Research Institute of Bioscience & BioTechnology, Korea; 2. Medical Genomics Research Center, Korea Research Institute of Bioscience & BioTechnology, Korea)

Introduction : Skeletal muscle degenerates progressively, loses mass (sarcopenia) along in years, and leads to reduced physical ability, often causing secondary diseases such as diabetes and obesity. MicroRNAs (miRNAs) play critical roles in a variety of biological processes and it is also known that regulation of gene expression by miRNAs is a key event in muscle development and disease. Although there are several report to profile miRNA expression in skeletal muscle with age, these studies are typically medium scale profiling using microarray technique. Method : Here, we performed next-generation sequencing which allowed us to assess genome-wide expression profiling of miRNAs during aging in combination with mRNA microarray using mouse gastrocnemius muscle at two different ages (6-mo-old versus 24-mo-old). Results : We found that 28 miRNAs were differentially expressed with age, 12 up-regulated and 16 down-regulated. Further detailed comparison of miRNA expression with its target gene expression from microarray data revealed that miRNAs contribute to muscle aging possibly through the control of glucose metabolism, ion homeostasis, and transcription regulation. Conclusion : Finally, we believe genome-wide miRNA profiling helps to expand our knowledge of miRNA function in the muscle aging process. Keywords : skeletal muscle, aging, miRNA

OP27 318-B-5

ROLES OF AKT AND MTOR IN PROINFLAMMATORY AND HYPERPIGMENTARY MECHANISMS OF SKIN AGING

Yeon Ja CHOI, Dae Hyun KIM, Chan Hum PARK, Min Hi PARK, Ki Wung CHUNG, Eun Ji JANG, Deaui PARK, Hae Young CHUNG (College of Pharmacy, Molecular Inflammation Research Center for Aging Intervention, Pusan National University, Korea)

Introduction : Mechanisms underlying skin aging have features of the process triggered by both intrinsic and extrinsic factors. The activation of nuclear factor- κ B (NF- κ B) by intrinsic and extrinsic mediators is well-known, however, research has not fully explored to define major signaling pathways for NF- κ B activation. Method : In the present study, experimental setups are designed to explore the inductions of Akt and mTOR/autophagy and their roles in proinflammatory and hyperpigmentary mechanisms. This study employed both well-accepted skin aging models; intrinsic skin aging and photoaging models. Results : In the initial experiments, it was ascertained that the activation of NF- κ B and proinflammatory genes caused the accumulation of oxidative stress in both intrinsic and photo skin aging. Akt signaling pathway was significantly activated in both skin aging models leading to the inhibitor of NF- κ B (I κ B) kinase α to be phosphorylated at its Thr23. Further study provided that the NF- κ B was activated by phosphorylations of I κ B α and p65 subunit of NF- κ B during skin aging. The involvement that skin aging induced the expression and activation of mTOR and inhibited autophagy was explored in the second part of the present study. It was found that mTOR complex 2 was responsible for the activation of NF- κ B stimulated by UVB. Conclusion : Taken together, these findings strongly suggest that increased Akt activity induced activations of NF-

α B, and mTOR play a major role in causing proinflammatory process and inhibition of autophagic activity leads to hyperpigmentation in skin aging. Keywords : skin aging, akt, NF- α B

OP27 318-B-6

URSOLIC ACID TREATMENT PREVENTS MUSCLE ATROPHY INDUCED BY DEXAMETHASONE THROUGH MODULATION OF MUSCLE DEGRADATION

Kyung-Kyun NOH, Changshin YOON, Yong Jung KANG, Bokyoung SUNG, Minjung KIM, Hae Young CHUNG, Nam Deuk KIM (Department of Pharmacy, Molecular Inflammation Research Center for Aging Intervention (MRCA), The Longevity Life Science & Technology Institutes, Pusan National University, Korea)

Introduction : Skeletal muscle atrophy results from various conditions, such as a side effect of treatment with synthetic glucocorticoids (e.g., dexamethasone, DEX). Especially two genes specific to muscle atrophy, muscle ring finger 1 (MuRF1) and muscle atrophy F box (MAFbx), are upregulated in several muscle atrophy states. Inhibition of these genes could be an effective strategy for preventing muscle atrophy. FoxO contributes to the expressions of MuRF1. Method : In the present study, we investigated whether the administrations of ursolic acid could blunt DEX-induced muscle atrophy by exporting FoxO1 and thus downregulate the expression of MuRF1. From in vivo experiments, daily intraperitoneal injection of DEX in six-week-old Sprague Dawley (SD) male rats induced muscle atrophy. Results : DEX injection weakened grip strength of SD rats, and this was alleviated by administrations of ursolic acid. The amount of muscle damage from DEX injection was quantified by measuring serum creatine kinase (CK) level. Administrations of ursolic acid alleviated the level of CK. In addition, the Western blot analysis showed DEX injection resulted in increased degradation of myosin heavy chain (MyHC) and expression of MuRF1. All of these effects of DEX were attenuated by administrations of ursolic acid. Nuclear levels of FoxO1 were also consistent with the expression of MuRF1. In contrast to the Western blot analysis, RT-PCR data showed mRNA levels of MyHC were remained same in all groups, while mRNA levels of MuRF1 were coincident with protein levels of that. Conclusion : It is concluded that administrations of ursolic acid could prevent DEX-induced muscle atrophy by attenuating muscle degradation. Keywords: muscle, atrophy, ursolic acid

COGNITION AND AGING II

OP27 319-C-1

RELATIVE PERCENTAGE OF FOUR COGNITIVE TYPES IN THE ELDERLY AND CORRELATION BETWEEN AAMI, MCI AND APOE GENOTYPES

Yongxing MA, Zhuowei YU, Yue ZHUO (Shanghai Institute of Gerontology and Geriatrics, Affiliated Huadong Hospital, Fudan University, China)

Introduction : To survey the relative percentage of “NCF”, AAMI, MCI and dementia in two cohort elderly 65 years or older in Shanghai, (especially in the 75-84 and 85-98 years age group), and correlation between AAMI, MCI and ApoE genotypes. Methods: ①A sample of two cohort, 2666 (M 2132, F 534; Age group, 65-74: 925, 34. 70%; 75-84: 1054, 39. 53%; 85-98: 867, 25. 77%) elderly \geq 65 years old were obtained. ②The Normal Cognitive Function (“NCF”) was defined as MQ (WMS-R) \geq 100, MMSE 28-30. The diagnosis of AAMI, MCI and dementia met the generally used criteria (AAMI: Textbook of

Geriatric Neuropsychiatry. 1994, P145-158; MCI: JAGS 2000,48:1601-1606; Dementia: DSM-IV、NINCDS-ADRDA). ③APOE genotypes were determined in AAMI (421 cases; control 398) and MCI (307; control 675). Results : ① The relative percentage of “NCF”、AAMI、MCI and dementia were as following : NCF : 867 subjects, 32. 52%; AAMI: 860 cases, 32. 26%; MCI: 782 cases, 29. 33%; Dementia: 157 cases (AD: 88, 3.3%; VD 39, 1.46%; MD30, 1.13%. VD+MD69, 2.59%), 5.89%. ②Allele frequency of APOE ϵ 4 were significantly higher in MCI than that of controls. But no significant difference between AAMI and control was found. Conclusion : The relative percentage of Normal cognitive function(“NCF”), AAMI and MCI in the elderly as in this report was not found in the other reports . It is very important to study the relative prevalence of various cognitive impairment including AAMI, MCI and dementia, and then to give the intervention in order to decrease the incidence, worsening rate and converting rate (NCF \rightarrow AAMI? \rightarrow MCI \rightarrow dementia) of various cognitive impairment. It is suggested that all this cognitive status should be considered and included in the study of cognitive function, and intervention on the cognitive impairments in the elderly. Keywords : Aged; Old-old; Normal Cognitive Function; AAMI; MCI; Dementia; APOE genotypes

THE RELATIONSHIP BETWEEN COGNITION, BODY IMAGE AND FUNCTIONALITY IN ELDERLY USERS FROM FAMILY HEALTH PRACTICES IN PORTO ALEGRE (BRAZIL)

Thais De Lima RESENDE¹, Raquel Rousselet FARIAS¹, Graziela Trindade PENA¹, Vera Elizabeth CLOSS², Laura M.B.C.R.M. Da ROCHA², Eduardo Lopes NOGUEIRA², Irenio GOMES² (1. Faculdade de Enfermagem Nutricao e Fisioterapia, Pontificia Universidade Catolica do Rio Grande do Sul, Brazil; 2. Instituto de Geriatria e Gerontologia, Pontificia Universidade Catolica do Rio Grande do Sul, Brazil)

Introduction : In the elderly, the functional capacity (FC) assessment can detect possible risks of dependency. In them, satisfaction with body image (BI) and its relationship with FC has not been investigated. This study, therefore, was designed to: examine cognitive function and BI perception, determine the performance on functional tests and investigate the association between cognition, BI and functionality in the elderly. Method : This cross-sectional, analytical study was conducted on a random sample of 180 subjects from 10 Family Health Practices in Porto Alegre (RS, Brazil). Data were collected on demographic aspects (sex, age, marital status and education), cognition (Mini-Mental State Examination - MMSE), satisfaction with BI (Stunkard scale), lower (Sit/Stand - S/St) and upper limb strength (Hand Grip - HGS, Jamar® dynamometer). Results : The mean age was 68.1 \pm 6.3 years. Most participants were female (62.2%), with low education (4.5 \pm 3.4 years), dissatisfied with their BI (72.3%) and cognitively intact (85.6%). Notwithstanding, the prevalence of dementia was high (14.4%). The average HGS was 28.5 Kgf. The average score for the S/St was 8.9s. Gender, age, marital status proved independent of cognition and BI. Cognition was not associated with functionality or with BI. Seniors happy with their BI had significantly higher S/St and HGS results than the dissatisfied ones. Conclusion : In this sample, the prevalence of dementia was high, the lower limb strength was within the expected, but the upper limb strength was below. Most seniors were dissatisfied with their BI; those satisfied performed better at the functional tests. Cognition was not related to BI or functionality. Keywords : Aging, Cognition,

Dementia

THE TREATMENT OF AGE- ASSOCIATED MEMORY IMPAIRMENT IN 168 CASES AND DEMENTIA IN 136 CASES WITH THE REINHARDT AND SEA CUCUMBER. PART II

Yongxing MA, Chuanfu WANG, Yue-Di GU (*Department of Aging, Antiaging and Cognitive Function, Shanghai Institute of Gerontology and Geriatrics, Affiliated Huadong Hospital, Shanghai Medical Collage, Fudan University, China*)

Introduction : To study the efficacy of Reinhardt and Sea Cucumber Capsule (R.S.C., Sea animal products) to treat dementia in the aged. Method : Double blind trail were performed in 136 cases of dementia (R.S.C. 68,VD30,AD 38; placebo 68,VD 24,AD 44) in the aged with MMSE \leq 24. The dosage of R.S.C. and placebo were all 6 capsules(0.28g/cap)tid for 3 months. The effect were evaluated with MMSE、HDS and MQ(WMS). Results : ①MMSE increment, R.S.C. 2.397 \pm 1.694,placebo 654 \pm 1.589 (P<0.01);Total effective rate, R.S.C. 54.4%,placebo 29.4%(P<0.01).②HDS increment, R.S.C. 2.015 \pm 1.994,placebo 1.140 \pm 1.785(P<0.01); Total effective rate, R.S.C.48.60%; placebo 27.9%(P<0.05) ③MQ increment, R.S.C. 4.364 \pm 4.617;placebo 1.824 \pm 5.803(P<0.01);Total effective rate, R.S.C. 48.5%;placebo 25.0%(P<0.05). ④Similiar effects were observed in VD and AD with slight better results in VD. No significant side effects were observed.⑤The mechanism of R.S.C. to improve the learning and retrival function of the adult and old rats and adult mouse, and cognitive function in the demented may be related to its effects to enhance neuron growth、to increase acetylcholine and decrease glutamine level in the brain as confirmed in cell and animal experiment, and to improve free radical metabolism and microcirculatory state confirmed clinically. Conclusion : R.S.C. is rather effective and safe to treat mild and moderate dementia (AD、VD) in the aged and presaged. Keywords : Reinhard and Sea Cucumber Capsule (R.S.C.) Dementia in the aged

OP27 319-C-4

EFFECTS OF EXERCISE AND COGNITIVE TRAINING IN OLDER ADULTS ON NOVEL TRANSFER TASKS OF EVERYDAY FUNCTION

Ellen F. BINDER¹, Julie M. BUGG², Jie ZHENG³, Kenneth B. SCHECHTMAN³, Mark A. MCDANIEL² (*1. Internal Medicine/Geriatrics, Washington University in St. Louis, USA; 2. Psychology, Washington University, USA; 3. Biostatistics, Washington University, USA*)

Introduction : Studies in older adults have demonstrated the benefits of exercise and cognitive training on measures of memory, reasoning, and speed of performance, but these effects have not translated into improvements in everyday functioning. The aim of this randomized, controlled pilot study was to evaluate the effects of aerobic exercise training and cognitive training, separately and combined, on novel transfer tasks to reflect performance of daily activities. Method : Ninty-six healthy men and women, age 55-70 years (mean 65 \pm 6 yrs) were randomly assigned to one of four groups: Control (home exercise + health education), Cognitive (home exercise + cognitive training), Exercise (aerobic exercise + health education), Combined (aerobic exercise + cognitive training). The assigned exercise intervention was performed for 6 months, while the cognitive training and education interventions were conducted during the final 2 months of the intervention period. Outcome measures administered using a

computer-based format, at baseline and 6 months were: Cooking Breakfast, Virtual Week, and Memory for Medical Information. Results : Participants assigned to the Exercise and Combined groups had significantly greater increases in aerobic power (V02) than those in the Control or Cognitive groups (p<0.04). In regression models for the Cooking Breakfast task, performance declined over 6 months for Home exercise but not Aerobic exercise (p=0.056). For Virtual Week, analyses showed that Cognitive training significantly improved prospective memory for regular events (p=0.001) and irregular events (p=0.0007). Conclusion : We conclude that aerobic exercise training and cognitive training each have independent but separate effects on two novel measures of everyday function in older adults. Keywords : exercise, cognitive training, cognitive control

FOOT HEALTH OF OLDER PEOPLE IN HOME CARE NEEDS ATTENTION

Minna STOLT¹, Riitta SUHONEN¹, Pauli PUUKKA², Matti VIITANEN³, Paivi VOUTILAINEN⁴, Helena LEINO-KILPI⁵ (*1. Department of Nursing Science, University of Turku, Finland; 2. National Institute for Health and Welfare, National Institute for Health and Welfare, Turku, Finland; 3. Department of Clinical Medicine, University of Turku, Finland; 4. Ministry of Social Affairs and Health, Ministry of Social Affairs and Health, Finland; 5. Department of Nursing Science, University of Turku and Hospital District of Southwest Finland, Finland*)

Introduction : Healthy feet are a prerequisite for functional ability and general well-being in older people. However, the attention paid for foot health or its potential problems is limited. Studies in the field focus mainly on specific disease-related foot problems rather than foot health with preventative perspective. Method : The purpose of this study was to assess the foot health and factors associated with foot health among older people receiving public home care services in Finland. The data were collected by visiting home nurses with Foot Health Assessment Instrument (FHAi, 23 items) consisting of the assessment of skin and nail health, foot structure and pain. Results : Altogether 309 (response rate 47%) older people (mean age 83.4 years) participated the study. Older people in home care have different foot health problems. Main skin problems were oedema (47%, n=143) and dry skin (44%, n=135). In nail health, thickened (41%, n=126), elongated (27%, n=82) and yellow (40%, n=121) nails were prevalent. Hallux valgus (34%, n=102), Taylor's bunion (32%, n=97) and low foot arch (26, n=80) were common problems in foot structure followed with lesser digital deformities (23%, n=69). The foot pain was common in ankle (32%, n=97). Foot problems were associated with higher age, poor self-evaluated foot health, female gender and footwear. Conclusion : Older people have multiple foot health problems which need to be cared and identified. Regular foot health assessments would promote the foot health of older people accompanied with podiatric services meeting the foot health needs of the older people. Keywords : foot health, older people, home care

OP27 320-S-3

VISUAL IMPAIRMENT, DISABILITY AND DIABETES MELLITUS : BASELINE DATA OF THE THREE CITIES STUDY

Marie DANET¹, Karine PERES², Fanny MATHARAN², Cecile DELCOURT², Jean-Francois DARTIGUES², Isabelle BOURDEL-MARCHASSON³ (*1. Geriatric Department, CHU of Bordeaux,*

France; 2. INSERM U897 - ISPED, University of Bordeaux Segalen, France; 3. UMR 5536, CNRS, RMSB - University of Bordeaux Segalen - CHU of Bordeaux, France)

Introduction : Reducing disability and preventing loss of autonomy are major challenge in aging population. Yet the prevalences of diabetes and visual impairment, both known to be associated with disability are increasing, especially among the elderly. **Objectives** Our aim was to determine whether diabetes is associated with visual impairment, decrease in walking speed and disability (mobility, IADL, ADL, confinement) in a non-institutionalized urban population in order to identify a possible rise of action. **Method :** Cross-sectional data from 3C study enrolment visit, a multicenter observational cohort study in urban population over 65 years, conducted between 1999 and 2001. The population was distributed in 4 categories of glycemic status (known diabetes mellitus KD, unknown diabetes UD, impaired fasting glucose IFG, non diabetes ND). **Multivariate analyzes** of factors associated with visual impairment, walking speed decrease, and disability (mobility, IADL, ADL, confinement). **Results :** 8654 patients have been enrolled, 60.4% were women, mean age was 74.1 years + / -5.5 years. KD and IFG were significantly associated with visual impairment (OR = 1.50, [95% CI 1.19 to 1.89] and OR = 1.51, [95% CI 1.09 to 2.11]). KD was significantly associated with a decrease in walking speed (= - 0.023 [95% CI -0.041, -0.004]), the dependence of mobility and IADL (OR 1.38 [95% CI 1.14 - 1.66] and OR 1.53 [95% CI 1.15 -, 202]). There was no association between confinement and disorder of glucose regulation. **Conclusion :** The independent association of diabetes with different types of disabilities and visual impairment is confirmed in the elderly. **Keywords :** diabetes mellitus, visual impairment, disability

OP27 320-S-4

HEAT STROKE AND EXCESS MORTALITY OF ELDERLY RELATED TO VERY HOT SUMMER IN JAPAN

Masao KANAMORI¹, Seiichi NAKAI², Mizue SUZUKI³, Yuko TATARA¹, Yoshifumi NAGAI¹ (1. Department of Sport and Health, Biwako Seikei Sport College, Japan; 2. Department of Food and Nutrition, Kyoto Women's University, Japan; 3. Faculty of Nursing, Hamamatsu University, School of Medicine, Japan)

Introduction : Recently Japanese elderly have experienced very hot summer and the highest temperature due to the climate change. We focus on the heat stroke and excess mortality of elderly. This survey is to show a increased death of heart stroke, and a clear age-dependent relationship with very hot summer and the high temperature to clear excess mortality of elderly. **Method :** Recently age-specific mortality from Vital statistics from 2005 to 2011 in Japan is compared with it which was statistics from twenty century. Incidence of the cases of heat stroke were obtained from the annual reports of the Kyoto region meteorological observatory. **Results :** On a day of the highest temperature more than temperature 35 degrees centigrade , it was 35 days in summer of 2010, Kyoto area. It was the best record of the observation history. The emergency conveyed person was 364 July, 750 August, 215 September by heart stroke and related diseases. The age-specific mortality rate at 74 years old from 65 became more than 6 times in 2007 and 4.6 per a population of 100,000 people from vital statistics. **Conclusion :** On the survey there is the limit called the limit of the classification of the vital statistics and the reports of Kyoto region meteorological observatory. It may be said that we cleared a increased death of heart stroke, and a clear age-dependent relationship with very hot summer and the high temperature to clear excess mortality of elderly. **Keywords :** Heat stroke, Excess mortality, Japan

OP27 320-S-5

EXPERIENCES OF SEEKING TREATMENT FOR URINARY INCONTINENCE IN POSTMENOPAUSAL WOMEN: A QUALITATIVE STUDY

Minoo PAKGOHAR¹, Tengku Aizan HAMID², Rahimah IBRAHIM² (1. Geriatric Nursing, School of Nursing and Midwifery, Tehran University of Medical Sciences, Iran; 2. Institute of Gerontology, Universiti Putra Malaysia, Malaysia)

Introduction : Urinary incontinence is known as a pervasive traumatic condition with high prevalence in postmenopausal women. The aim of this study was to illuminate the experiences of seeking treatment of postmenopausal women living with urinary incontinence. **Method :** Hermeneutic phenomenology underpinned the study's interpretive research approach. Nine community dwelling postmenopausal women with urinary incontinence participated in-depth, semi-structured interviews in two sessions with three or five weeks interval. **Results :** Two themes emerged to illuminate the experiences of seeking treatment for urinary incontinence including: "overcoming the barriers" and "anticipating of the future". **Conclusion :** The results of this study indicated that if the sufferers can overcome the barriers and perceive potential risk of UI, and have high expectations of treatment, then treatment seeking would follow. Thus, health care providers should encourage them to seek treatment for early diagnosing and improving their quality of life as the goal. **Keywords :** seeking treatment, urinary incontinence, postmenopausal women

OP27 320-S-6

THE EFFECT OF FUNCTIONAL FITNESS OF PHYSICAL DISABILITIES OF LONG - TERM CARE INSTITUTIONS

I-Chen YEH¹, Ching-Yun HUANG², Hui-Chuan WEI¹ (1. Department of Adult and Continuing Education, National Chung-Cheng University, Taiwan; 2. Department of Physical Education, National Chiayi University, Taiwan)

Introduction : According to an investigation done by Taiwan Ministry of the Interior in 2011, there was more than 90% of the disability care institutions mainly based on life care. In those institutions, physical disabilities accounted for 35.58%. Previous studies have shown that, individuals can effectively improve lower extremity strength, softness, timed up and go, Berg balance and knee proprioception as well as reduce the risk of falls by regular exercise. The purpose of the study was to investigate influence of the intervention program applying functional fitness to residents in the institution. **Method :** The subjects were disabled persons of a care institution in southern Taiwan, and were randomly divided into exercise and control groups, both having 17 subjects. The age of the subjects was between 56 and 98 years with a mean age of 79.08 ± 10.04 years; the subjects of exercise group implemented 12 weeks of training on flexible degrees, functional leg strength, grip strength, and balance, while the control group subjects did not have any training program. **Results :** The study results revealed that, subjects of the exercise group have significantly improved their functional shoulder rotation flexibility of left and right; anterior hip muscle group flexibility of right; sitting functional balance of left and right; and shift activities function evaluated by the Barthel Index (P <.05). **Conclusion :** The study suggested to develop physical fitness programs and exercise prescriptions for the disabled people of the institutions. **Keywords :** functional fitness, physical disability,

OP27 321-C

IDENTIFICATION OF FRAILTY

OP27 321-C-1

THE PREDICTIVE VALIDITY OF THE KIHON CHECKLIST FOR IDENTIFYING FRAILTY IN A COMMUNITY-DWELLING OLDER POPULATION

Shosuke SATAKE¹, Hiroshi SHIMOKATA², Kazuyoshi SENDA³, Izumi KONDO⁴, Kenji TOBA⁵ (1. *Comprehensive Geriatric Medicine, National Center for Geriatrics and Gerontology, Japan*; 2. *Development of Preventive Medicine, National Center for Geriatrics and Gerontology, Japan*; 3. *Pulmonary Medicine, National Center for Geriatrics and Gerontology, Japan*; 4. *Research and Development to Support Independent Life of Elderly, National Center for Geriatrics and Gerontology, Japan*; 5. *Director of the Hospital, National Center for Geriatrics and Gerontology, Japan*)

Introduction : The Kihon Checklist (KCL) is widely used to identify at-risk elderly for needing care/support in Japan. It is a self-report questionnaire which consists of 25 yes/no questions in multiple domains. We previously reported that the total score of KCL correlated with the sum of frailty phenotypes by Fried's model. However, it is still obscure whether the KCL could predict anew incidence of needing care/support or mortality. The purpose of this study was to validate the predictive ability of the KCL to identify at-risk elderly who would be dependent or die. **Method :** The KCL was performed in the Higashiura-town resident seniors who had not yet been certified as dependent. From the total score of KCL, 0-4 was classified into robust, 5-9 was into prefrail, and 10+ was into frail. We had followed up an incidence of needing care/support or mortality in the resident seniors for 2.5 years. **Results :** We considered 5,543 elderly who completely answered the questionnaire as eligible. The KCL classified 3,529 seniors (63.6%) as robust, 1,456 (26.3%) as prefrail, and 558 (10.1%) as frail. Prefrailty was significantly associated with an incidence of needing care/support with an age- and sex-adjusted hazard ratio (HR) of 2.145 (95% CI 1.633-2.766), but not with mortality. On the other hand, frailty significantly predicted both an incidence of needing care/support and mortality with adjusted HRs of 5.839 (95% CI 4.498-7.581) and 4.802 (95% CI 3.022-7.631), respectively. **Conclusion :** The KCL is a useful tool to predict anew incidence of dependent elderly or mortality in a community-dwelling population. **Keywords :** Kihon Checklist, frailty

OP27 321-C-2

GAIT SPEED AND GRIP STRENGTH AS PREDICTORS OF INCIDENT DIFFICULTY IN INSTRUMENTAL ACTIVITIES OF DAILY LIVING

Mario PEREZ-ZEPEDA, Luis GUTIERREZ-ROBLEDO (*Clinical and Epidemiological Research, Instituto Nacional de Geriatria, Mexico*)

Introduction : Physical performance tests have shown to be predictors of a number of adverse outcomes in the geriatrics population. This could be useful in screening those subjects who are at risk even when they are totally independent. The aim of this study is to test if grip strength and gait speed can predict incident difficulty in instrumental activities of daily living in group of community dwelling elderly. **Method :** Subjects are from the Coyoacan cohort, a study of community dwelling elderly of Mexico city. Baseline grip strength was tested with dynamometry and reported in kilograms and gait speed with the timing of a walk in a 4 meter track. Only subjects independent in instrumental activities of daily living were included. 3-year follow up was done, and incident difficulty was present if the subject reported it in the Lawton scale. **Results :** 102 subjects were assessed, with a mean age of 76.31 (SD 5.86), 58.8% women, mean grip strength of 20.93 (SD 7.89), mean gait speed 0.74 (SD .31). Incident difficulty was present in 56.9% of the subjects; those with incident difficulty had

a significant lower mean of grip strength (18.82 vs 23.7, p=.004) and gait speed (.66 vs .84, p.002); area under the ROC curve was .315 (p=.002) for grip strength and .321 (p=.001) for gait speed. **Conclusion:** Even in those highly independent subjects gait speed and grip strength could aid in assessing elderly, in an easy, ready-available and reproducible fashion. **Keywords :** Gait speed, grip strength, incident difficulty in IADL

OP27 321-C-3

A SELF REPORT INSTRUMENT TO IDENTIFY FRAILTY IN BRAZILIAN ELDERLY

Yeda DUARTE, Daniela Pires NUNES, Maria Lucia LEBRAO (*Epidemiology, School of Public Health University of Sao Paulo, Brazil*)

Introduction : The evaluation of frailty measures requires some measurable criteria. In our environment, it is known that the use of these measures on a large scale is not easily operationalized, due to logistical difficulties. Thus, we study the possibility of identifying the syndrome of frailty through self reported questions. **Objective:** To validate the frailty self reported components for evaluation of frailty syndrome (Fried's Model). **Method :** This study is part of the SABE Study - Health, Well-being and Ageing, held in Sao Paulo, Brazil. This is a cross sectional study of 433 elderly (age ≥ 75 years) in 2009. We adopted the phenotype of frailty proposed by Fried and colleagues as a gold standard (measuring objectively 5 criteria: unintentional weight loss, fatigue reported, reduced grip strength, reduced walking speed and low physical activity). In this model, elderly with one or two components were considered frail, and those with three or more were considered frail. Subjective evaluation was performed using dichotomous questions for each component. We calculated the reliability, sensitivity, specificity and positive and negative predictive values for psychometric analysis of subjective evaluation. **Results :** The subjective evaluation is reliable and valid. For the pre-frail elderly the sensitivity was 89.7% and specificity of 24.3%, while for the frail, the sensitivity was 63.2% and specificity of 71.6%. When analyzing frailty process (pre-frail+frail) almost 90% of the frail elderly were detected in the subjective assessment, 85.2% were predicted positively and 32.7% were predicted negatively. **Conclusion :** The frailty self reported instrument is a good screening tool to identify frailty syndrome. **Keywords :** Frailty, SABE Study, Self reported instrument

OP27 321-C-4

A NEW FRAILTY INDEX VALID IN KOREAN ELDERLY POPULATION

Heewon JUNG¹, Sunwook KIM¹, Kiwoong KIM², Kwangil KIM³, Cheolho KIM³ (1. *Internal Medicine, Seoul National University Hospital, Korea*; 2. *Neuropsychiatry, Seoul National University Bundang Hospital, Korea*; 3. *Internal Medicine, Seoul National University Bundang Hospital, Korea*)

Introduction : Frailty, as a core geriatric syndrome, is related with mortality, morbidity and functional decline. As a most rapidly aging country in the world, the importance of frailty is more emphasized in Korea. However, validity of any individual criteria for frailty has not been evaluated for Korean elderly population. This study adapted various criteria for frailty and evaluated their usefulness and relationship with clinical outcomes. **Method :** Between 2005 through 2007, 693 participants of The Korean Longitudinal Study on Health and Aging (KLoSHA) study underwent evaluation for frailty. Frailty criteria from Cardiovascular Health Study(CHS), Study of Osteoporotic Fracture(SOF) were adapted and used with suggested frailty index (KLoSHA FI) by authors for this study. Follow up for

mortality, morbidity, quality of life, functional decline was done. Results : Criteria from SOF, CHS and KLoSHA FI correlated with each other, measuring Pearson's coefficient from 0.458 to 0.654. (All $p < 0.01$) During follow up (4.56 ± 0.89 years) period, 94 (13.6%) died. Frail status by CHS criteria (HR = 3.748, 95% CI: 1.773-7.925) and KLoSHA FI (HR = 2.885, 95% CI: 1.443-5.768) were related with mortality. Vulnerability (KLoSHA FI = 0.20-0.35) was related to following functional decline ($p = 0.040$), but prefrailty identified by SOF and CHS criteria was not ($p = 0.431$ and 0.218 , respectively). Increasing KLoSHA FI and frailty status by CHS criteria predicted hospitalization ($p = 0.005$ and <0.001 , respectively) but not frailty by SOF. ($p = 0.376$). Conclusion : KLoSHA FI is useful and valid index to evaluate frailty status in Korean elderly. Keywords : Aging, Frailty, Mortality

MANAGEMENT OF FRAILTY

OP27 323-C-1

PREDICTING THE EFFICACY OF PROTEIN-ENERGY SUPPLEMENTATION IN FRAIL OLDER ADULTS LIVING IN COMMUNITY

Chang-O KIM (Department of District Health Care Service, Gangbuk-gu Community Health Center, Korea)

Introduction : The aim of the study is to investigate predicting factors that maximizes the effect of protein-energy supplementation and test the hypothesis whether severity of frailty is associated with the efficacy among frail older adults living in community. Method : A total 123 frail older adults (usual gait speed (UGS) <0.6 m/sec and Mini Nutritional Assessment (MNA) <24) were participated from National Home Healthcare Services in Gangbuk-gu, Seoul, South Korea. Each participant was provided with two 200mL per day of commercial liquid formula (additional 400kcal of energy, 25g of protein) for 12 weeks. Relative change in the Physical Functioning (PF) and Short Physical Performance Battery (SPPB) score between the baseline and follow-up assessments at 12 weeks were measured. Results : Multilevel mixed-effect linear regression analysis showed that a lower level of baseline UGS was associated with a greater improvement in PF and SPPB score after adjustment for age, gender, education, living status, beneficiary of social security insurance, number of chronic disease, compliance, and type of dataset ($P < .001$). A lower level of baseline MNA score was associated with greater change in PF and SPPB score after adjusted for multiple covariates ($P < .045$). Participants with severe frailty (UGS <0.3 m/sec + MNA <17) showed 52.4% and 44.6% better efficacy in PF and SPPB score, respectively, than those with mild frailty (UGS 0.3-0.6 m/sec + MNA 17-24) ($P < .001$). Conclusion : Lower level of UGS and MNA score were independently associated with the greater efficacy of protein-energy supplementation on functional status. Keywords : Frailty, nutritional supplementation, usual gait speed, Mini Nutritional Assessment

OP27 323-C-2

FRAILTY AMONG OLDER INDIANS: DEVELOPMENT OF A NEW CLINICAL TOOL

A.B DEY¹, M. NAVINATH² (1. Department of Geriatric Medicine, All India Institute of Medical Sciences, India; 2. Department of Medicine, All India Institute of Medical Sciences, India)

Introduction : 33% of hospitalized older patient were detected to be frail by using criteria developed by Fried et al in our earlier study. A similar trend was noted among ambulatory older patients in a study

under publication. As there is no gold standard, diagnosis of frailty is often difficult. Current definition of frailty by Fried's criteria does not Indian population. Several practical difficulties in using this tool was encountered. These include determining extent of weight loss in those who may not have any previous record, measurement of grip strength may not be a true reflection of muscle strength due to lack of training, and the calorie calculation from physical activities for Indians is not available. To obviate these difficulties a new clinical tool is proposed. Method : The new clinical tool includes seven points such as gait speed, lifting an object, rise from sitting on a chair, two behavioral questions, weight loss and memory loss appreciated primary care giver. Two cut offs are proposed: 5/7 and 4/7. Results : 85 older patients who were attending the Geriatrics OPD of our hospital were subjected to evaluation for presence of frailty by the new criteria. They were also subjected to evaluation by Fried's criteria for comparison. Among the patients 22 (25%) were frail by 5/7 criteria and while 26 (30%) by 4/7 cut off. By using Fried's criteria 28 (32%) were labeled as frail. Conclusion : The new clinical tool can pick up frailty among Indians as the Fried's criteria. Keywords : Frailty, diagnosis

OP27 323-C-3

IMPACT OF POST-ACUTE TRANSITION CARE FOR FRAIL OLDER PEOPLE: A PROSPECTIVE STUDY

Nancye May PEEL, Ruth E. HUBBARD, Leonard Charles GRAY (Centre for Research in Geriatric Medicine, The University of Queensland, Australia)

Introduction : Older people hospitalised with acute illness are at increased risk of acquired disability and cognitive decline. Post-acute care programs aim to maximise functional recovery, enabling older people to return home rather than remain in hospital for extended lengths of stay or prematurely enter long-term residential aged care (RAC). This study explored whether those with complex care needs could benefit from a community-based transition care program. Method : In a prospective cohort study, 351 patients admitted to transition care programs in Australia were recruited. A comprehensive geriatric assessment was conducted at admission and discharge. Primary outcomes included changes in functional ability during transition care, living status at discharge and six months follow-up, as well as hospital re-admissions over the follow-up period. Based on risk profile for admission to RAC, the cohort was divided into two groups (high or low care needs) for comparison of outcomes. The 'high needs' group (50.1% of the cohort) was characterised as having two or more geriatric syndromes including moderate to severe cognitive impairment, high dependency in personal or instrumental activities of daily living, daily incontinence or mobility impairment. Results : There were no significant differences between groups on outcomes, with over 85% of the cohort living in the community at follow-up. Over 80% of the cohort showed functional improvement or maintenance of independence during the program, with no significant differences between the groups. Conclusion : Community-based transition care has the potential to improve functional ability and maintain independent living in the community, even for a group with high care needs. Keywords : post-acute care; frail aged; community-based rehabilitation

OP27 323-C-4

INNOVATIVE COMMUNITY CARE FOR THE HIGH-RISK FRAIL ELDERLY: THE VIRTUAL WARD PROGRAM

C.P.I. CHAN¹, S.C.J. NG², Pui Chi CHIU³, S.H. LEUNG³, K.C. YEUNG³, P.T. LAM¹, K.S. CHAN², M.F.E. LEUNG¹ (1. Department of Medicine and Geriatrics, United Christian Hospital, Hong Kong; 2. Department of Medicine, Haven of Hope Hospital,

Hong Kong; 3. Community Nursing Service, Kowloon East Cluster, Hong Kong Hospital Authority, Hong Kong)

Introduction : Frailty was associated with adverse outcome in community-dwell elderly discharged from the hospitals. Virtual Ward Program was a transitional intensive medical community care service adopted “Hospital at Home”, “RETREAT” care pathway, digital equipment and information technology, aimed at “Age in Community” in Hong Kong. **Method :** This was retrospective review study. Patients, under Virtual Ward Program (KEC, HAHO) between 1st October, 2011 and 30th June, 2012 were recruited. Descriptive data of patients’ demographics, frailty, disease burden, HARRPE score (elderly readmission risk prediction model developed in Hong Kong), emergency department attendance, unplanned 28-day readmission and number of hospital days were analysed. **Results :** Eighty-six cases were recruited. Mean age was 84 years old (SD +/- 7). Male to female ratio was 1:2. Majority were suffering from multi-organ impairment, advanced organ failure and frailty. The mean CSHA Clinical Frailty Scale and Charlson’s Comorbidity Index were 8 (SD +/- 1) and 6 (SD +/- 3) respectively. More than 1000 physician and nursing interventions, including medication reconciliation, crisis intervention, portable ultrasound and echocardiogram, parenteral medication and fluid administration, advanced care planning and End-of-life care were delivered. The overall 28-day unplanned readmission risk was reduced by 50% and reduced by 60% in very high risk frail elderly. After the implementation of the Virtual Ward program, the total hospital-bed-day of the cohort was reduced by nearly 50%. **Conclusion :** Our study suggested that Virtual Ward Program was effective in prevention of adverse outcomes in post-discharged high risk frail community-dwell elderly. **Keywords :** Frailty, Virtual Ward, Hospital at home, Age in community

A MULTIFACTORIAL INTERDISCIPLINARY INTERVENTION REDUCES FRAILITY AND IMPROVES FUNCTIONING IN COMMUNITY-DWELLING FRAIL OLDER PEOPLE: RANDOMISED CONTROLLED TRIAL

Nicola FAIRHALL¹, Catherine SHERRINGTON², Susan E. KURRELE³, Stephen R. LORD⁴, Keri LOCKWOOD³, Noeline MONAGHAN¹, Christina AGGAR⁵, Ian D. CAMERON¹ (1. Rehabilitation Studies Unit, The University of Sydney, Australia; 2. The George Institute for Global Health, The University of Sydney, Australia; 3. Division of Rehabilitation and Aged Care, Hornsby Kuring-gai Health Service, Australia; 4. Falls and Balance Research Group, Neuroscience Research Australia, Australia; 5. Faculty of Nursing, The University of Sydney, Australia)

Introduction : Frailty has serious consequences in older people, yet there is no evidence of treatment to reduce frailty. We aimed to evaluate whether a multifactorial intervention could reduce frailty and improve functioning in frail older people. **Method :** A randomised controlled trial with 241 frail community-dwelling older adults in Sydney, Australia. Participants met the Cardiovascular Health Study criteria of frailty and had no severe cognitive impairment. The experimental group received a 12-month multifactorial, interdisciplinary intervention targeting identified characteristics of frailty, functional limitations, and management of health conditions. The control group received usual healthcare. Blinded assessors measured outcomes at three and 12 months after study entry. Primary outcomes were frailty and mobility (using the Short Physical Performance Battery (SPPB)). Secondary outcomes included measures of functioning. **Results :** The mean age of participants was 83.3 years (SD: 5.9 years); 68% were women. 216 participants (90%) were followed-up at 12 months. In the intention-to-treat analysis at 12

months, the between group difference in frailty was 14.7% (95% CI 2.4 to 27.0%, p=0.02), and the intervention group scored significantly better on the SPPB (mean difference between groups 1.44 (95% CI 0.80 to 2.07, p<0.001)). The intervention group walked 0.05 m/s faster over 4 meters (95% CI 0.0004 to 0.1, p=0.048) than the control group, and had significantly better scores on the Goal Attainment Scale (odds ratio 2.1; 95% CI 1.3 to 3.3, p=0.004) at 12 months. Exercise-associated musculoskeletal symptoms constituted adverse events in two participants. **Conclusion :** A multifactorial intervention reduced frailty and increased functioning in frail older adults. **Keywords :** frailty; randomised trial

OP27 323-C-6

ORAL HEALTH AND QUALITY OF LIFE AS PREDICTORS OF FRAILITY IN MEXICAN ELDERS

Roberto Carlos CASTREJON-PEREZ¹, S. Aida BORGES-YANEZ², Luis Miguel GUTIERREZ-ROBLEDO³ (1. Geriatrics Epidemiology, Instituto Nacional de Geriatria, Mexico, Mexico; 2. Dental Public Health, National Autonomous University of Mexico, Mexico; 3. General Director, National Institute of Geriatrics, Mexico)

Introduction : Association between frailty and oral health has not been explored. **Objective:** To identify if oral health and oral health related quality of life (OHRQoL) are predictors of frailty in home-dwelling mexican elders controlling by sex, age, schooling, marital and socioeconomic status; myocardial infarction, stroke, hypertension, diabetes, osteoporosis, arthritis, number of medications, urinary incontinence, smoking, falling, hospitalization, fractures and self-rate of general health. **Method :** Household survey in a representative sample of elders ≥70 years living in one district of Mexico City. Sample size was 1294, 1124 were interviewed, 838 were clinically evaluated, 594 non-frail were followed for 3 years, 228 completed the follow up. **Dependent variable:** Frailty (having ≥3 of five components [weakness, slowness, fatigue, low physical activity and weight loss]). **Independent variables:** utilization of dental services, self-rate of oral health, habits with removable dental prostheses (RDP) (hygiene, daily utilization and utilization during night); xerostomia, OHRQoL, number of teeth, wearing and functionality of RDP, and severe periodontitis (≥2 teeth with ≥5mm attachment loss). Univariate analysis and a logistic regression model (LRM) were carried out. **Results :** Incidence of frailty=14.7%, those who developed frailty were older (80.4±6), and have less years of schooling (5.4±4). The LRM showed that each additional year of age, each medication used and having osteoporosis increases 15% (OR=1.15; 95%CI1.1-1.3), 38% (OR=1.38; 95%CI1.1-1.8) and 3 times (OR=3.02; 95%CI1.0-9.1) the risk for developing frailty respectively, while each additional tooth reduces 7% (OR=0.93; 95%CI0.87-0.99) the risk for developing. **Conclusion :** There is a reduced risk for developing frailty among those persons who have more teeth. **Keywords :** Frailty incidence, oral health, loose teeth, cohort

MECHANISM OF FALLS I

OP27 324-C-1

BLOOD PRESSURE RESPONSES TO ORTHOSTASIS AND THEIR ASSOCIATION WITH FALLS IN OLDER ADULTS IN LONG-TERM CARE

Brett H. SHAW¹, Thomas M. LOUGHIN², Stephen N. ROBINOVITCH¹, Victoria E. CLAYDON¹ (1. Biomedical Physiology and Kinesiology, Simon Fraser University, Canada; 2. Statistics and Actuarial Sciences, Simon Fraser University, Canada)

Introduction : Cardiovascular impairments are a risk factor for falls in older adults. However, we need an improved understanding of the

precise relationships between abnormal blood pressure control and fall susceptibility. The primary aim of this study was to compare the hemodynamic and cerebrovascular responses to orthostatic stress with falling risk in a cohort (n=47) of long-term care residents. Method : We used portable equipment to assess residents' beat-to-beat blood pressure responses to orthostatic stress while simultaneously monitoring cerebral blood flow velocity. These data were compared to their retrospective and prospective falling risk as recorded through incident report forms. Results : 57% of subjects were previous fallers (1 or more previous falls). Fallers tended to have decreased mobility, poorer function during activities of daily living, and a higher prevalence of coronary artery disease. Data (mean ± SD) indicates that fallers had greater delayed systolic blood pressure drops in response to orthostatic stress (-20.6 ± 19.8 mmHg) compared to non-fallers (-9.4 ± 14.3 mmHg). Additionally, previous fallers had a greater decline in maximum cerebral blood flow velocity (-10.4 ± 15.0 cm/sec), compared to non-fallers (2.02 ± 10.8 cm/sec). Conclusion : These data illustrate that differences in blood pressure and cerebral hemodynamics exist between previous fallers and non-fallers. This work has important implications for developing feasible, noninvasive orthostatic stress testing procedures for identifying older adults at risk of falls related to impaired blood pressure control. This work was supported by team grants from the Canadian Institutes of Health Research (grant numbers AMG- 100487 and TIR-103945). Keywords: Falls, Orthostatic hypotension, Long-term care

OP27 324-C-2

REGIONAL WHITE MATTER LESIONS PREDICT BALANCE/GAIT DISTURBANCE AND FALLS IN PATIENTS WITH AMCI AND ALZHEIMER DISEASE

Takashi SAKURAI (Center for Comprehensive Care and Research on Memo, National Center for Geriatrics and Gerontology, Japan)

Introduction : The purpose of this study is to elucidate association between white matter lesions (WMLs), and balance/gait functions and falls in the elderly with amnesic mild cognitive impairment (aMCI) or Alzheimer disease (AD). Method : The subjects were classified into a group experienced falls (63 subjects), and a group not experienced falls (100 subjects) in the previous 1 year. We tested center of gravity sway, gait function (Timed Up-and-Go test: TUG, tandem gait, one-leg stand) and investigated their relationship to WMLs. Periventricular hyperintensity (PVH) in frontal caps, bands and occipital caps, and deep white matter hyperintensity (DWMH) in frontal, parietal, temporal, and occipital lobes, basal ganglia, thalamus and brain stem were semi-quantitatively measured on MRI. Results : The fallers group was older and many patients were on polypharmacy, but their cognitive status was similar to that of non-fallers. Fallers had severer center of gravity sway and lower gait function, as well as higher values of PVH and DWMH. DWMH in frontal and parietal lobes and PVH total score associated with center of gravity sway. DWMH in frontal and temporal lobes, and PVH in frontal caps associated with impaired gait function. Polypharmacy, PVH in frontal caps and DWMH in occipital lobe were independent risk factors of falls. Conclusion : In patients with aMCI and AD, regional distribution of WMLs associated with balance/gait disturbance. Lesions of PVH in frontal cap and DWMH in occipital lobe, but not cognitive impairment, strongly predicted fall. Preventive strategy of falls in aMCI and AD should be conducted based on the severity of WMLs. Keywords : white matter lesion falls

OP27 324-C-3

GAIT CONTROL: A SPECIFIC SUBDOMAIN OF EXECUTIVE FUNCTION?

Olivier BEAUCHET¹, Manuel MONTERO-ODASSO², Bruno FANTINO¹, Francois R. HERRMANN³, Gilles ALLALI⁴,

Cedric ANNWEILER¹ (1. Neuroscience and Geriatrics, Angers University Hospital, France; 2. Geriatrics, Western University, Canada; 3. Geriatrics, Geneva University Hospitals, Switzerland; 4. Neurology, Geneva University Hospitals, Switzerland)

Introduction : Few studies looked at the association between gait variability and executive subdomains (ESD). The aim of this study was to examine the association between information updating and monitoring which is an ESD and stride time variability among healthy older adults. Method : Seventy-eight healthy older adults (mean age 69.9±0.9 years) were divided into 3 groups according to stride time variability tertiles while steady state walking. Scores on cognitive tests evaluating information updating (Digit Span), shifting (Trail Making Test) and cognitive inhibition (Stroop test) were used as measures of ESD. Results : The full adjusted and the stepwise backward logistic regression models showed that the highest tertile (i.e., the worst performance) of stride time variability was only associated with lower Digit Span performance (Odds ratio=0.78 with P=0.020 and Odds ratio=0.81 with P=0.019). Conclusion : Walking should be considered as a complex motor task specifically associated with the ability to update and monitor information which is an ESD. Keywords : gait; gait control; executive functions; information updating; older adults

OP27 324-C-4

MOTOR CORTEX AND GAIT IN MILD COGNITIVE IMPAIRMENT: A MAGNETIC RESONANCE SPECTROSCOPY STUDY

Cedric ANNWEILER¹, Olivier BEAUCHET², Robert BARTHA³, Jennie L. WELLS⁴, Michael J. BORRIE⁴, Vladimir HACHINSKI⁵, Manuel MONTERO-ODASSO¹ (1. Gait & Brain Lab, Western University, Canada; 2. Neuroscience and Geriatrics, Angers University Hospital, France; 3. Roberts Research Institute, Western University, Canada; 4. Geriatrics, Western University, Canada; 5. Neurology, Western University, Canada)

Introduction : Gait disorders are common in the course of dementia, even at the stage of MCI, due to probable changes in higher-levels of motor control. Our purpose was to determine whether proton magnetic resonance spectroscopy measures in the primary motor cortex (PMC) were associated with gait performance in MCI while single and dual-tasking. Method : Twenty community-dwellers with MCI, aged 76[11]years (median[interquartile range]) (30%female) were included. Gait velocity (GV) and stride time variability (STV) were measured while single (i.e., walking alone) and dual-tasking (i.e., walking while counting backwards by seven) with a GAITRite system. Ratios of N-acetyl-aspartate to creatine (NAA/Cr) and choline to creatine (Cho/Cr) were calculated in PMC. Participants were categorized according to median NAA/Cr and Cho/Cr ratios. Age, gender, cognition and subcortical vascular burden were used as potential confounders. Results : Participants with low NAA/Cr (n=10) had higher STV while dual-tasking than those with high NAA/Cr (P=0.007). Those with high Cho/Cr had slower GV while single (P=0.015) and dual-tasking (P=0.002). Low NAA/Cr was associated with increased STV while single (adjustedβ=0.63, P=0.046) and dual-tasking (adjustedβ=4.87, P=0.012). High Cho/Cr was associated with slower GV while single (adjustedβ=-22.01, P=0.025) and dual-tasking (adjustedβ=-41.86, P=0.011). Finally, the probability of exhibiting abnormal metabolite ratios in PMC was 63%[95%CI:0.27;0.98] higher among participants with major gait disturbances in dual-task. Conclusion : PMC metabolite levels were associated with gait performance while single and dual-tasking. STV was sensitive to PMC neuronal integrity (NAA/Cr), while GV was more affected by inflammatory changes (Cho/Cr). Keywords : gait; motor cortex; proton magnetic resonance spectroscopy; MCI; older adults

SP24 202-1

NEW ACHIEVEMENTS, CHALLENGES AND PROSPECTS OF OLD-AGE INSURANCE SYSTEM IN CHINA

Juanjuan SUN (*Institute of Gerontology, Renmin University Of China, China*)

This paper summarizes and reviews the achievements of China's old-age insurance system in recent years, and introduces main ideas and characteristics of the newly implemented policies related to different types of population group. Main challenges for the insurance in the background of China's population and society transition are also discussed in the paper. Based on some survey data, the paper analyses the influences of the changes of population ageing and old-age support ratio, family structure and living arrangement on the future development of old-age insurance in China. Agriculture-registered population and migrated population are the focus groups to be discussed. The recommendations includes ensuring the basic level and sustainability, narrowing the great gaps between the same generation groups, developing medical and care insurances, as well as maintaining family support for older people.

SP24 202-2

HOW TO IMPROVE LONG-TERM CARE SERVICE THROUGH CHINA'S HEALTH REFORM

Yan LIN (*PKU China Center for Health Economic Research, China*)

Both medical care and long-term care are of great importance for elderly people, and they are closely related in many aspects. However, medical care is administered by the National Health and Family Planning Commission, while long-term care services are under the administration of the Ministry of Civil Affairs in China. Their coordination and integration are crucial for the long-term care service provision. This presentation will review the five major tasks in china's health reform and discuss their potential impacts on the long-term care system in China.

SP24 202-3

ELDERLY WELFARE SERVICES IN KOREA

Hyeji CHOI (*Department of Social Welfare, Seoul Women's University, Korea*)

Elderly welfare services in Korea can be broadly divided into leisure, employment promotion, nursing and other services. First of all, elderly leisure service is designed for healthy senior citizens without any physical or mental disabilities with the goal of helping them achieve self-realization and enjoy fruitful later lives. Elderly leisure service is provided through elderly leisure establishments such as elderly welfare centers, community centers for senior citizens, elderly classes and

elderly rest centers. As of the end of December 2012, Korea has 259 senior welfare centers, 60,737 community centers for senior citizens, 1,464 elderly classes, and nine elderly rest centers. Offered for free or at reasonable prices, elderly leisure service is comprised of a wide array of programs including: specialized counseling on psychological, medical and legal issues; social education programs such as liberal arts courses and hobby classes; and recreation programs. Aimed at promoting the social participation of senior citizens and enhancing their economic stability, elderly employment promotion service consists of job placement service and job creation projects. The former includes job placement and counseling for senior job seekers, management of elderly workers, identification of potential demands for senior resources, vocational training for the elderly, and operation of group workplaces. The service is offered by 249 elderly employment promotion centers run by the Korea Senior Citizens Association (KSCA). Job creation projects for senior citizens are intended to: (a) facilitate the social participation of the elderly; (b) improve social awareness of the utilization of elderly workers and encourage the participation of the private sector in this regard; and (c) provide better vocational training and education for senior resources. Supervised by the Korea Labor Force Development Institute for the Aged (KLFDA), these projects are undertaken by local governments, elderly welfare centers, senior clubs and KSCA employment promotion centers depending on the types of project (e.g. public good, education, welfare, market-oriented and resource placement). Wages for the participants vary by project type, but the average wage stands at 200,000 Korean won for 20 hours worked per month. The job creation projects added 220,346 elderly workers to the payroll in 2011. As for nursing service for the elderly, its prime examples include long-term care service, comprehensive care service and basic care service. Operated on the basis of social insurance, long-term care service supports the daily activities of senior citizens with an aim of improving their quality of life and alleviating the care-giving burdens for their family members. The service is available for everyone aged 65 or above with severe functional limitations or those under 64 with senile disorders who have not been unable to perform their daily activities independently for six months or longer. Long-term care service for the elderly is divided into home-based care service and nursing home-based care service. Caregivers and nurses employed by long-term care institutions are responsible for providing the services. Home-based care service is comprised of in-home care (with housekeeping support, physical activity support and emotional support included), in-home bathing, daytime/nighttime protection and short-term protection. As of the end of January 2013, a total of 645,470 senior citizens have been found eligible for long-term care service. Comprehensive care service is offered in the form of vouchers primarily to low-income senior citizens with moderate functional limitations. It features housekeeping support, physical activity support, emotional support, daytime protection and other in-home care services provided by caregivers. Basic care service is designed for single-person elderly households to check and ensure their safety. Other services include: (a) in-home welfare service where local governments provide low-income senior citizens with housekeeping support and meal delivery services; (b) elderly protection service aimed to prevent

abuses of the elderly and protect abused senior citizens; and (c) dementia patient/family support service for early diagnosis and management of dementia and support for the family members of aged patients with dementia.

**SP24 202-4
INCOME MAINTENANCE PROGRAMS FOR THE ELDERLY
IN KOREA**

Baeguui HONG (*Department of Social Welfare, Seoul National University, Korea*)

I. Purpose: Like all other advanced countries, Korea is also confronting at the aged society due to the rapid growth of the elderly people. Furthermore, the increasing rate of the elderly in Korea is faster than any other countries in the world. Under this circumstance, the income maintenance programs, such as National Pension and Basic and Basic Old-Age Pension, have very crucial roles for sustaining adequate living standard of the elderly. However, it is also true that a large proportion of the elderly are living without fulfilling the minimum living standard, because of the immature of National Pension system as well as a low benefit level of the Basic Old-Age Pension. Thus, this paper aims to introduce main features of the current National Pension system and Basic Old-Age Pension, to discuss several problems of these programs, and finally to provide several policy alternatives. This would be helpful to remedy some problems inherent in the current policies and to provide adequate income for the elderly. II. Contents: This study will consist of the following sessions. First, this study will explain key features of the programs, such as history, coverage, finance and types of benefits. Next, this study will examine primary policy issues surrounding the current reform debates about the programs and compare their advantages and disadvantages. In final, this study will introduce the ways of reform on Basic Old-Age Pension proposed by the presidential committee and discuss its limitations.

THE STUDY AND FOUND OF “CHINESE TRADITIONAL
JIAN-SHEN EXERCISES”**

Xiaohong GU (*Beijing Taiyangshukang Chinese Medicine Factory, China*)

“Chinese Traditional Jian-shen Exercises” oriented from Chinese ancient healthy exercises. We have found that exercises has obviously effect on body and mental. Objective: To observe the curative effect of “Chinese Traditional Jian-shen Exercises”. Method: ①185 volunteers had been chosen in accord with chosen criteria, and then divided randomly into the test group (n=88), control group (n=97). The test group practice “Chinese Traditional Jian-shen Exercises”, and the control group practiced with “the 8th guang-bo exercise” three times every weeks. The treatment and observation were carried out for 4 weeks and the curative effect was compared and summed up by ETS. ② 60 Diebites of the olders had been chosen in accord with chosen criteria as the test group, and to practice “Chinese Traditional Jian-shen Exercises” five times every weeks. The treatment and observation were carried out for 4 weeks and the curative effect was compared and summed up by bio-chemical check method . Result: ①Both the test group and control group can improve the weight, length, energy and nerve function, while control group can do good to weight and weight

exponent. The combined curative effect of test group was much better than the control group. ② Not only the weight, length of chest, length of wrist decreased, but also the high blood pressure decreased than one month before obviously, while the low blood pressure increased obviously. And the number of blood sugar, ganyousanzhi decreased obviously. Conclusion: ① “Chinese Traditional Jian-shen Exercises” has obvious curative effect on the youth. ② “Chinese Traditional Jian-shen Exercises” has obvious curative effect and match the use of the diabetes mass, it is worth to study further. Keywords : Chinese Traditional Jian-shen Exercises; meridian detection of ETS; Diabetes; effect of good health

RESEARCH ON THE ORIGIN AND DEVELOPMENT
OF SHILIAOZUANYAO AND IN AGED CARE
REHABILITATION IN THE APPLIED RESEARCH**

Yin LIN (*Beijing University of Chinese Medicine, China*)

This paper is composed of 2 chapters and their contents are summarized as below. Chapter 1. Progress of Korean Dietary Treatment. The first chapter of the paper is about the origin of diet therapy in Korea and its changes which have been correlated with Chinese medicine and its culture. As a brief introduction of the ShiLiaoZuanYao , this part is also telling you about its author, versions, and primary contents based on historical research. Chapter 2. Discussion of the Statistic Outcome. The Kinds of Illnesses and Their Percentage. When examining overall dietetic mixing technique, there are 109 kinds of illnesses mentioned in the book. The 7 Primary Ailments. Among other symptoms of illnesses from the book, there are 7 frequently addressed ailments chosen from the aspect of food therapy ? a stroke, a disease diagnosed by thirst, a serious cough, an ache resulting from numbness, a disease relating to stomach, blurry vision and weak hearing, and a drinking related disease. This part is to discuss these illnesses and how to cure them with food based on its characteristics and rules of application. Keywords : ShiLiaoZuanYao, the aged, food therapy

**SP24 203-3
PREVENTIVE GERIATRICS: AN OVERVIEW FROM
TRADITIONAL MEDICINE**

Mi-Yeon SONG (*Department of Korean Rehabilitation Medicine, Kyung Hee University, Korea*)

1. Geriatrics in Traditional Medicine (老人養生) Preventive geriatrics is the art and science of preventing disease in the geriatric population and promoting their health and efficiency. The aim of geriatrics is maintenance of health in old age by high levels of engagement and avoidance of disease, early detection and appropriate treatment of disease, and maintenance of maximum independence consistent with irreversible disease and disability. Hippocrates noted conditions common in later life and Aristotle offered theory of ageing based on loss of heat in conventional medicine. In traditional medicine, Huang Ti Nei Jing (The Yellow Emperor’s Classic of Internal Medicine), the landmark medical text which appeared about 400 B.C., devoted its first two chapters to a detailed description of those aspects of personal hygiene essential to longevity. Since then scores of influential monographs on aging and longevity or geriatrics have been published. 2. Philosophical Considerations The philosophical consideration of traditional geriatrics contains a strong preventive element closely tied to the concept of a balanced man-nature relationship (天人相應), body-mind relationship (調和心身), and Yin and Yang relationship (協調陰陽). It has been emphasized that the laws of Nature must be

observed in the care of the body and in pursuit of longevity. A sound mind in a sound body is essential to longevity. Moderation in physical and emotional activities is encouraged. In the concept of traditional medicine, the balance of Yin and Yang is also emphasized. 3. Physiology of Geriatric People (老化) Geriatric people have several physical problems such as senility, decline in sexual prowess, diminution in endocrine activity, loss of elasticity of blood vessels, and impairment of special senses. They are also prone for infections, injuries, and psychological problems like senile dementia. 4. Approaches to Longevity (長壽) There have been a number of approaches to longevity or rejuvenation in the armamentarium of traditional medicine such as physical activity (運動養生, e.g. Kung Fu, Tai Chi Chuan 太極拳), breathing exercise with relaxation and meditation (呼吸養生, e.g. Chi Kung 氣功), acupuncture and Moxibustion (鍼灸), and herbal Medicine (韓藥, e.g. Ginseng 人蔘, Ho-shou-wu 何首烏, Kou-chi-tsi 枸杞子).

SP24 203-4

INTEGRATIVE MEDICINE AS THE NEW PARADIGM OF MEDICINE IN AGED SOCIETY

Sung Jae LEE (*Center for Integrative Medicine, Korea University Medical Center, Korea*)

Due to our aged society, expeditious growth of diseases resulting from daily habits, frequent occurrences of sicknesses, and the variation in the awareness of health by patients, the worldwide need for the complementary and alternative medicine (CAM) to run parallel with our current medical science and treatment is rapidly becoming conspicuous. According to a report from the Korean Sanitation Researchers in 2002, as much as 20 billion dollars were spent on complementary and alternative medicine, suggesting that the demand is much higher in Korea, compared to other countries. CAM treatment is being put into clinical application worldwide. Also, clinical research as well as the education of medical schools (35 of 41 medical schools) and graduate schools on CAM are being performed more and more. In U.S.A. The centers (departments) for integrative medicine, which use CAM therapies in combination with conventional medicine, in U.S.A. as well as in Korea clinical research as well as the education of medical schools (35 of 41 medical schools) and graduate schools on CAM are being performed more and more. The most available CAM in the treatment of diseases in the U.S.A. and Europe are phytomedicine, homeopathy, acupuncture, nutrition therapy, mind body therapies, and so on. One of the most widely used classification structures, developed by National Center for Complementary and Alternative medicine (NCCAM) (2000), divides CAM modalities into five categories: 1. Alternative medical systems 2. Mind-body interventions. 3. Biologically based treatments 4. Manipulative and body-based methods. 5. Energy medicine. As the name implies, alternative medical systems is a category that extends beyond a single modality, and refers to an entire system of theory and practice that developed separately from conventional medicine. Ex-amples of these systems include traditional Chinese medicine, ayurvedic medicine, homeopathy, and naturopathy. The second category in the NCCAM classification scheme is mind-body interventions, which include practices that are based on the human mind, but that have an effect on the human body and physical health, such as meditation, prayer, and mental healing. The third category, biologically based therapies, includes specialized diets, herbal products, and other natural products such as minerals, hormones, and biologicals. Specialized diets include those proposed by Drs. Atkins and Ornish, as well as the broader field of functional foods that may reduce the risk of disease or promote health. A few of the well-known herbals for which there is evidence of

effectiveness include St. John's wort for the treatment of mild to moderate depression and Ginkgo biloba for the treatment of mild cognitive impairment. An example of a nonherbal natural product is fish oil for the treatment of cardiovascular conditions. The fourth category, manipulative and body-based methods, includes therapies that involve movement or manipulation of the body. Chiropractic is the best known in this category, and chiropractors are licensed to practice in every U.S. state. A defining feature of chiropractic treatment is spinal manipulation, also known as spinal adjustment, correct spinal joint abnormalities (Meeker and Haldeman, 2002). Massage therapy is another example of a body-based therapy. The final category described by NCCAM is energy therapies which include the manipulation and application of energy fields to the body. In addition to electromagnetic fields outside of the body, it is hypothesized that energy fields exist within the body. The existence of these biofields has not been experimentally proven; however, a number of therapies include them, such as qi gong, Reiki, and therapeutic touch. Even as CAM and conventional medicine each maintain their identities, traditions, and practitioners, integration of CAM and conventional medicine is occurring in many settings. Hospitals are offering CAM therapies, a growing number of physicians are using them in their private practices. The center, in which CAM therapies are used in combination with conventional medicine, is called in U.S.A. and in Europe as center for integrative medicine. The well known hospitals (Harvard, Memorial Sloan-Kettering Cancer Center, Duke, Maryland etc.) in U.S.A. in Europe are offering integrative medicine. With the time the centers for integrative medicine in Korea are being established more and more. It is critical for us as physicians to be aware of the fact that the role of CAM is to support conventional medicine, not to alternate it. The important roll of university hospital is to integrate care delivery by proven CAM therapies into conventional medicine (integrative medicine), and to develop the standard curriculum for integrative medicine at the undergraduate and graduate levels.

SP24 301

ROUNDTABLE ON POPULATION AGEING AND THE ECONOMIC GROWTH

SP24 301-1

POPULATION AGING AND ECONOMIC GROWTH

John M. KIM (*Korea Institute of Public Finance, Korea*)

The notion that population and economic growth are closely, perhaps even causally interlinked with each other is not a new one. The idea is readily apparent to the casual observer, and has also been explored in more formal contexts — from Malthus' justly famous Essay to the controversial McKeown thesis to more recent work by some economic historians, where nutrition, which can be taken as a proxy for economic status, has often featured prominently. Without delving into too much detail, I remind the audience that an inquiry into the linkage between population and economic growth can bring together such diverse strands of discourse as the agrarian, commercial, and industrial revolutions; interwoven with the epidemiological and demographic transitions; interspersed with discussions on how advances in medicine and technology have influenced human and economic development. Lest one is still unimpressed with the breadth of intellectual disciplines involved, one need only recall that we have at this point only set the stage to begin talking about social policy, pensions, healthcare financing, youth unemployment, and the like. Yet the branch of economics that deals with growth — growth theory and modeling — unfortunately offers relatively little to inform our understanding of the interaction between economic growth and population dynamics.

Growth economists generally have been content to leave population as “exogenous,” choosing to focus on technology or, as a later variant, human capital (knowledge) accumulation. As an economist would put it, this represents a nice dichotomy between quantity (population) and quality (average productivity of a person), and it is the latter element that accounts for the secular rise in living standards (per capita income). However, we are already witnessing a transition into the next stage of the demographic transition, which would seem to ask growth economists to rethink their focus and approach. Together with drastic changes in the population age structure, population growth has slowed down and has even begun to reverse in some countries. As the elderly claim significantly larger proportions out of populations, should we not allow for an additional index of population quality other than knowledge? Will it be sufficient to simply add population age structure to a growth model, or will economies behave differently as aging progresses to the stage that populations begin to decline? After all, the eminent mathematician Euler already proved almost three centuries ago that a stable population (constant age structure) is not necessarily a stationary population and can still grow or decline. Finally, I would like to remind everyone that fertility rates can change quicker and by greater magnitudes than mortality rates, with a correspondingly larger potential to impact the population age structure. Although we are gathered here at a congress of gerontology and geriatrics, ironically it may prove more productive for us to look at the younger end of the life cycle.

SP24 301-2

POPULATION AGEING AND THE ECONOMIC GROWTH: THE CASE OF EUROPE

Axel BOERSCH-SUPAN (*Munich Center for the Economics of Ageing, Max Planck Institute for Social Law and Social Policy, Germany*)

The extent of the demographic changes in Europe is dramatic and will deeply affect future labor, financial and goods markets. The expected strain on public budgets and especially social security has already received prominent attention, but aging poses many other economic challenges that threaten growth and living standards if they remain unaddressed. This paper therefore sheds light on the potential benefits of pension and labor market reform for growth and living standards, taking into account behavioral reactions to specific reforms. Which behavioral reactions will strengthen, which will weaken reform policies? Can Old Europe maintain its standard of living even if behavioral reactions offset some of the current reform efforts?

SP24 301-3

IMPACT OF POPULATION AGING ON ASIA'S FUTURE GROWTH*

Donghyun PARK (*Economics and Research Department, Asian Development Bank, Philippines*) and Kwanho SHIN (*Korea University, Korea*)

The demographic dividend which contributed substantially to developing Asia's economic growth in the past is coming to an end. Population aging affects growth through a number of channels: savings, capital accumulation, labor force participation, and total factor productivity. In this paper, we empirically examine the impact of aging on labor force participation, savings, capital accumulation, and total factor productivity in 12 countries in developing Asia. Based on those estimates, we make forward-looking projections about the effect of demographic change on the GDP growth of the 12 countries in 2011-2020 and 2021-2030. Our results indicate that aging will have a sizable adverse impact on countries where population aging is more

advanced. * We thank Ji-soo Kim for her excellent research assistance. We also thank for the ADB for financial support.

SP24 301-4

POPULATION AGEING AND THE ECONOMIC GROWTH

Arie HOEKMAN (*Representative to China and as Country Director for the Democratic People's Republic of Korea for the United Nations Population Fund, Netherlands*)

Aging is a global issue and it is important to put aging fair and square on the global development agenda. While two UN conferences have been held on aging thus far (Vienna 1982, Madrid 2002), aging has yet to be seen as central to most countries' development aspirations. It is now that we need and can push aging on to that global development agenda through the ongoing 20-year review processes of the Programme of Action of the International Conference on Population and Development (Cairo 1994) and the Plan of Action of the International Women's Conference (Beijing, 1995), as well as the discussions on the construction of the interlinked global sustainable development goals that would need to follow up on the Millennium Development Goals in 2015. Aging can be a challenge and a possible burden, as well as an opportunity and a blessing to society. Whether burden or blessing, whether challenge or opportunity will largely depend on the action to be taken by each society and the international society at large. Aging will have a deeply transformative effect on all societies and will impact on the labor market, on capital markets, public sector spending and governance systems. Maintaining sound information systems, taking stock, sharing knowledge and focusing on evidence based solutions for consensus building and policy making will be key for society to successfully meet the challenge and grasping the hidden opportunities that ageing will bring to society.

SP24 302

KOREA-CHINA FORUM ON GLOBAL AGEING AND EAST ASIA: POPULATION AGEING AND LONGEVITY

SP24 302-1

EFFECTS OF ENVIRONMENTAL FACTORS ON THE LONGEVITY PEOPLE IN CHINA

Wuyi WANG¹, Yonghua LI², Hairong LI², Jiangping YU², Bixiong YE² (*1. Longevity Study Committee, Chinese Gerontological Society, China; 2. Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, China*)

Healthy longevity is associated with environmental conditions. In China, different age group of elderly could be influenced by different factors. The distribution of elderly aged 65 and above is more influenced by the economical factor. However, by using longevity index (LI%) and centenarity index (CI%) to evaluate the longevity level in different location, it has been found that people aged 90 and above could be more influenced by physical environmental factors. The more centenarians live in south China related to certain climatic preferences including near to the coasts, suitable mean year temperature, plenty of rainfall, higher relative humidity and low mean wind speed, which might contribute to relatively high longevity level. Nevertheless, enrichment of essential nutrients and less pollution in the environment would be benefit for health and longevity. Keywords: Centenarian; longevity index (LI%); Centenarity index (CI%); climate; nutrient

SP24 302-2

REGIONAL LONGEVITY STUDY OF CHINA

Ye YUAN (*Support and Nursing Committee for the Elderly, Chinese*

The proportion of older person aged 60 and over to total population reached 10% in 1999, Chinese population became aged type. Chinese aged population was 177.6 million and about 13.31% of total population; there were 20.99 million old persona aged 80 years and over, it was 11.81% of old population in 2010. Now the oldest old population is increasing rapidly with 7% annual increasing rate, it is faster than the increasing rate of general old population which is 3.6%; it shows that the old population is also aging in China. The Chinese centenarians were 6681 persons, 17877 persons and 35934 persons in 1990, 2000 and 2010; the annual increasing rate was more than 10%, and it's becoming the longevity society. Although the number of centenarians is increasing rapidly, but it still rare to see, we often treat the centenarian as the symbol of longevity. As the death rate is between 20% and 40% to the centenarians or the top nonagenarians, it is very hard to remain in the cohort team of centenarians, so the very important issue is the accurate of the age of the centenarians; the age validation is the base of the longevity study. The longevity level as the ratio of the centenarians to the total population, it shows the significant high in the regions in China according to the Census Data. The longevity regions were more concentrate in the southern of Huai River; the highest regions were found in Donglan, Bama, Fengsha and Dahua counties where is Hongshui River Valley in Guangxi province, and Chengmai, Lingao counties where is Nandu River in Hainan Province. The number of longevity regions(counties) were more in Guangdong and Guangxi province, and the regions of Huang-Huai River Valley; there were more than 7 counties whose longevity level was over 100 (as 100 centenarians to 100000 total population) in Guangxi province; there were more than 10 counties concentrating in the region of Nantong-Taizhou city in Jiangsu province. Keywords : Longevity Symbol, Age Validation, Longevity Level, Regional Longevity

SP24 302-3
KOREA'S POPULATION AGEING AND LENGTHENING LONGEVITY

Jeah JUNG (Department of General Education, Dongguk University, Korea)

Korea's average life expectancy as of 2010 is 77 years for men, and 84 years for women which places Korea in the 17th place among 194 WHO member countries. Life expectancy for both sexes has been on continuous growth from 61.9 in 1970s to 72 in 1992 which has grown 20 years on average in the last 40 years. Average year of life expectancy as of 2010 is a year older than that of OECD member countries' of 79.8 years. This is due to Korea's success in decreasing infant mortality rate that has become noticeably lower than developing countries and other Asian countries and simultaneously increasing life expectancy at a rapid pace. Also we can see that ratios of population who is 65 and over, and over 80 years of age are 2.9 % and 0.2% respectively in 1960s whereas they reached 11 % and 2% in 2010, which is estimated to soar up to 38.2% and 14.5% in 2050. Korea seems to have some time spare to catch up many European countries and Japan's ratio of elderly yet its rapidity of population aging seems unprecedentedly fast. It is at a pace of reaching aging society in the beginning of 2000 and predicted to arrive at a aged society in 2016 to have 65 and over elderly to surpass under 15 population. This is the typicality of Korea's population aging. It is undergoing rapid and compressed intensity of time of less than 20 years which other developed countries went in a decade. That may not be of sufficient time for Korea to comprehensively prepare for population transition especially in terms of increasing old age dependency ratio that have

become a task to overcome to achieve economic development.

SP24 302-4
LIFE AND HEALTH LIFE EXPECTANCIES FOR THE QUALITY OF LIFE IN KOREA

Yousung PARK (Department of Statistics, Korea University, Korea)

Lee and Carter's methods (LC) are assessed their performances for forecasting mortality in Korea. It appears that the model of Li and Lee (2005) is not appropriate for forecasting mortality in Korea, which is shown by examining validity of their model assumptions using the difference between sex-specific mortality, cointegration test, mortality forecasts of oldest old, and life expectancy at age 0. We propose a new LC model called VECM-LC to accommodate longitudinal and cross-sectional correlations and cointegration relationship in the time effects of mortality rates. Over the last 30 years there has been the fastest increase in the life expectancy in Korea. To answer the question for the quality of life - are the additional years of life spent in good health or in worth health? are the increased years of life at older ages because we are keeping sick and disabled people alive longer?, we present the health life expectancies using the National Health Insurance Data Base provided in Korea, which is a big data containing the medical information of all korean people for 9 years from 2002 to 2010.

SP24 303-1
THE PRESENT SITUATION AND THE DEVELOPMENT OF CHINESE NEUROSURGERY IN ISCHEMIC STROKE PREVENTION

Feng LING (Xuanwu Hospital, Capital Medical University, China)

China's stroke burden is heavy, according to statistics, in 2020, the Chinese stroke new cases will reach 3.7 million/year, under this background, the ministry of health of the People's Republic of China to create a 'stroke screening and prevention and control project', the purpose is the early detection of high-risk groups , and active prevention of stroke. So as to reduce the incidence and the harm of stroke. We statistics status of the vascular reconstruction of China ischaemic stroke, and predict the future prospects. Carotid endarterectomy and carotid artery stent is for carotid artery stenosis treatment of positive method, review of Chinese literatures, nearly 5000 cases of CEA have been completed in China during recent 30yrs. With tens of thousands of cases of CAS have been completed in recent 15 years. There is the imbalance of the development of the two kinds of technology, and at the same time, there are regional difference and the difference of technology standardization, which requires us to these two kinds of technology standardization training, Therefore, we represent the ministry of health began to the multiple training in expected 5 years. and strive to cultivate hundreds of doctors can be competent this work, and began the qualification admittance system. Intracranial artery stenosis is our Asian people, especially east asians common disease, although SAMMPRIS studies suggest that stenting is in safety weak than drug therapy, but we have more than ten years experience for this technology, which shows good prospects. According to us statistics, China's literature reported more thousands of the intracranial artery stenting cases in recent ten years, with good curative effect. Now, we have begun to the nation's CASSISS subject research, is aimed to intracranial artery stent and drug treatment again strict prospective randomized study, only 11 experienced institution

are participated. Within the next three years, we will complete more than 600 cases of the control study; The intracranial artery bypass is for cerebral artery occlusion therapy, although the lack of effective clinical evidence, but China's experience is still let we have enough confidence to carry out another multicenter, randomized study - CMOSS research, to contrast bypass surgery and drug treatment effectiveness and safety of differences. We believe that with our key technology research and promotion, Chinese neurosurgeon should make more contributions for stroke prevention.

SP24 303-2

PREVENTION OF CARDIOVASCULAR DISEASE IN ELDERLY-A GREAT CHALLENGE FOR CHINESE PHYSICIAN

Meilin LIU (*Peking University First Hospital, China*)

China has already stepped into an elderly society. People aged over 60 years amounted to 178 million representing 13.26 % of the 1.3397 billion Chinese according to China's 6th national census 2011. There were 119 million Chinese people aged 65 and over, accounting for 8.87%. China's aging population has been growing at a rate of 3.28% annually since 2001 and is expected to reach 437 million by 2050 (25% of the population). Cardiovascular Diseases are leading cause of death in China according to "Report on Cardiovascular Diseases in China 2011". Cardiovascular death in Chinese population were 3.5 million/year, accounts for 40% of all deaths in China. There are more than 80% of people who die from coronary heart diseases or strokes are 65 or older. More than 38 billion RMB was used to purchase drugs to treat CVD in hospital. As a whole, the succession sector from acute, to chronic recovery, until long term rehabilitation, may be the optimal care for older people. Comprehensive geriatric services on the Chinese pattern are necessary. Departments of geriatrics have developed throughout China within the past 2 decades, because leaders of the hospitals or universities became aware of the needs of an aging population specialist services. There are a few of geriatrics hospitals. Community-Based care is an alternative to institutional care for older adults. It works as the rehabilitative and long term care of older people. We believe it is the best practice of chronic illness rehabilitation in the future. Home care is an important part of elderly health care service models in China. Some older people have one-to-one care from a family care worker. Some of the challenges facing China in the care of its aging population are how to promote geriatrics education, quality care, and aging research throughout China. Geriatrics development in China should take these unique characteristics into account and be tailored to the Chinese culture and society. Geriatricians are expected to play a central role in health care for the elderly. However, there are no formal geriatric fellowships or national board certifications in geriatrics health care in China. Although rising number for the elderly with CVD, there are limited focus on primary health care and more concentration on secondary intervention in elderly management. Prevention of cardiovascular disease in elderly is a great challenge for Chinese physician.

SP24 303-3

HOW TO EVALUATE VASCULAR AGEING (ARTERIAL STIFFNESS) NON-INVASIVELY?

Kye Hun KIM (*Chonnam National University Hospital, Korea*)

The incidence and prevalence of cardiovascular diseases(CVD) increase steeply with the advance of age, and these increase of CVD are known to be associated with vascular ageing. Among these age-related vascular changes, arterial stiffening, so called arteriosclerosis, is an emerging risk factor of cardiovascular diseases or events. Arterial

stiffness can be measured by invasive hemodynamic study using cardiac catheterization. With the technical advance, nowadays, arterial stiffness can be measured by several non-invasive techniques. Pulse wave velocity (PWV) is a simple, reproducible, and non-invasive measurement of arterial stiffness and defined as the speed of travel of the pressure pulse between any given 2 sites within arterial systems. PWV has been studied widely and proved to be an independent predictor of cardiovascular risk in large healthy and diseased population based studies. Augmentation pressure and index also reflect the stiffness of the systemic arterial tree and can be non-invasively evaluated by pulse wave analysis (PWA) using applanation tonometry. Echocardiography, which is one of the most important imaging modality in the evaluation of cardiovascular diseases, is also a useful tool for the non-invasive evaluation of arterial stiffness. Several echocardiographic parameters have been proposed and used to evaluate arterial stiffness, and the prerequisite for these echocardiographic evaluation of arterial stiffness is to obtain the diameter change of the artery and blood pressures (systolic and diastolic blood pressure); diameter change = systolic diameter (SD) - diastolic diameter (DD). Distensibility, stiffness index β , elastic modulus, and strain of the artery can be calculated from these measurements. With the technical advance in echocardiography, recently, arterial strain measured by tissue Doppler method or 2D speckle tracking method has been proposed as an more accurate method of arterial stiffness. To be clinically useful, however, these techniques require large population based clinical outcome study. Because arterial stiffness and its change after medical therapy has important prognostic significance, the risk of CVD or future CV events in the elderly should be assessed by using these non-invasive methods of arterial stiffness.

SP24 303-4

THE ROLE OF RENIN-ANGIOTENSIN SYSTEM IN VASCULAR AGING

Hae-Young LEE (*Seoul National University Hospital, Korea*)

Cellular senescence-associated changes in blood vessels have been implicated in aging and age-related cardiovascular disorders. Cellular senescence is characterized by the permanent and irreversible growth arrest of cells cultured in vitro. Senescent cells display characteristic phenotypic changes in gene expression, function and morphology. Replicative senescence is characterized by shortened telomere length and eventually induces incomplete chromosomal replication. However, another phenotype, stress-induced premature senescence is triggered by a variety of stresses including chemical or oxidative stresses and oncogene activation. Reactive oxygen species (ROS) break DNA strands and modify DNA bases to elicit both replicative senescence and stress-induced premature senescence. Age-associated arterial stiffness is the foundation for the initiation and progression of cardiovascular diseases in elderly. Females display higher stiffness than males during the prepubertal years and a dramatic increase after menopause. Females might have intrinsically stiffer large arteries than males, but that such effects are mitigated by sex steroids during the reproductive years. The accelerated stiffening of the large vessels in females postmenopause likely contributes to the elevated prevalence of systolic HT, postinfarct mortality and CHF in elderly women. In hypertension, small artery remodeling is the most prevalent (earliest?) form of vascular change. Recent evidence strongly suggests that angiotensin II promotes the onset and progression of vascular senescence, which is associated with vascular functional and structural changes, contributing to age-related vascular diseases. The majority of the cardiovascular actions of angiotensin II, including vascular senescence, are mediated by the angiotensin II type-1 receptor. In

young and aged rats, the mRNA expression of AT1 receptor was increased associating aging process. It is somewhat interesting because in hypertension guidelines, diuretics are the first recommended therapy for aging population, whereas renin-angiotensin system inhibitors are less recommended. The background of the guidelines comes from the high prevalence of low-renin, salt sensitive hypertension among aged population. Indeed, an increase in arterial pressure during aging may lead to a baro-mediated reduction in renin release from the kidney, contributing to the decline in the circulating RAS. And aging association reduction in functioning nephron numbers also contributes the salt-sensitive hypertension phenotype. In contrast, the regulation of tubular renin may be opposite to or at least different from that of the circulation. In the urinary excretion of angiotensin II, which reflects tissue renin-angiotensin activation was increased in elderly mice kidneys. The accumulated data indicate that aging is associated with activation of the tissue RAS, making vascular calcification, which can be one mechanism for aortic stiffness. Antihypertensive therapy may have direct effects on the vascular wall. RAS inhibitors have corrected all small artery structure, endothelial function, and calcification in patients with essential hypertension. In summary, hypertension and hyperlipidemia are major risk factors not only in atherosclerosis but also in vascular senescent change including calcification. Previous studies to modulate vascular calcification with statins or calcium antagonist failed to reverse or retard the senescence progression. Although, the precise mechanism controlling cellular senescence is currently poorly understood, some data suggests the relation of renin-angiotensin II-aldosterone system using angiotensin receptor might be effective in controlling vascular calcification.

KOREA-CHINA FORUM ON GLOBAL AGEING AND EAST ASIA: CHANGE OF FAMILY STRUCTURE AND LONG-TERM CARE SERVICE

SP24 402-1

THE CHANGE OF SHANGHAI FAMILY SIZE AND STRUCTURE AND THEIR CHALLENGE TO ELDERLY SERVICE

Suyun HU (*Shanghai Academy of Social Sciences, Institute of Urban and Demographic Studies, China*) and Haiwang ZHOU (*Shanghai Academy of Social Sciences, China*)

This paper analyze the feature and trend of Shanghai family size and its structure. Family Size in Shanghai are reducing continuously, however number of household families is increasing at the same time. Most of Shanghai inhabitants family size is 2 person or 3 person. One Generation and two generation family is the main part of Shanghai inhabitant family. The increasing of the elderly and change of family size caused the Challenge to LTC. 1) The increasing of the very elderly is fast and demand for LTC is increasing obviously. 2) Families with the elderly is increasing fatly. 3) The elderly in empty nest and Living alone is increasing. 4) The number of average children is decreasing for the elderly and the lack of family care resources. Aging population with fewer children is obviously not only in macro level, but also in family level. Except for the setting up LTC system and multiple service organization, we need to design public policy to advance social participation in elderly service. This paper focused on the suggestion about human resources: Firstly, Improving housing taxing to encourage children to live nearby their parents. Secondly, Developing domestic service human resources to meet the demand. Thirdly, Encourage younger elderly, students and rural migrants to join in service for the elderly. Fourthly Improving family care and support holiday in order to make more convenient for

internal mutual among family members.

SP24 402-2

FRAMEWORK FOR OPERATION AND THINKING OF DEVELOPMENT OF SHANGHAI COMMUNITY HOME CARE SERVICES FOR AGED PEOPLE ("HCSAP")

Xu JUN (*Bureau of Civil Affairs, Shanghai, China*)

Shanghai is a pioneer entering into the aging city. Jing'an District, located in the centre of Shanghai with small area but high population density, has stood in the forefront of having high degree of aged population (above 60 years old) and senile population (above 80 years old) for many years. Therefore, Jing'an District is making great efforts to explore and practice the Socializing Service System for the aged with the basis of HCSAP, the support of community service and the supplement of nursing homes for the aged. Furthermore, it is focusing on making the HCSAP stronger by combining its own characteristics of geography, culture and economy so that it can help aged people to live in their own homes under the support of HCSAP as long as possible. A. Under the support and guidance in the field of financial motives, resources and technologies and etc of the Government, the HCSAP develops. B. Progressively make the HCSAP professional and personalized through developing NGOs, nurturing the network of HCSAP and introducing professional organizations to meet the demand of services for the aged. C. Improve the situation of fragmented and scattered resources through cross-border cooperation and then form a joint force to make the HCSAP being practical and stronger. D. Establish an evaluation system, such as unifying the evaluation criteria for HCSAP institutions and introducing third-party evaluation mechanisms, to promote the development of the HCSAP. Therefore, we can achieve the aim of socialized services for the aged which is guaranteeing the basic services to aged people with difficulties and helping other aged people to have personalized services for the aged progressively.

LONG-TERM CARE POLICY AND WELFARE SERVICES FOR ELDERS IN KOREA: CURRENT ISSUES AND DIRECTIONS FOR THE FUTURE

Chan-Woo KIM (*Catholic University, Korea*)

This paper addresses the introduction of welfare policies for elders and public long-term care insurance (LTCI) in Korea discussing their challenges and directions for future. Since 2008 implementing National LTC Insurance for elders has tremendously changed the system of Korean elderly welfare by enlarging the coverage from low-income elders to all elder regardless their income and assets. With the rapid increasing elderly population, the healthcare expenditures for elders have also expanded problematically. Within this context, this paper will introduce and discuss backgrounds of Korean elderly care services, overview of elderly welfare services, particularly focusing on the Korean LTC system.

SP24 402-4

SERVICE QUALITY CONTROL FOR NURSING HOMES IN SOUTH KOREA: REGULATION VS. EVALUATION?

Jae-Sung CHOI (*Yonsei University, Korea*)

Since the launching of the long-term care insurance scheme of 2008, service quality control for nursing homes has been a constant and serious issue for South Korea. Over supply, excessive competition, and consumer complaints are also related to service quality issue. Within a

relatively short period, a rapid expansion of nursing homes has provoked such issues. In reality, the number of nursing homes was 815 at 2006. However, its number increased with 2,489 at 2011. The purpose of this study is to diagnose the present service quality mechanism, to investigate its limits, and to suggest future direction of service quality control for nursing homes. The long-term care insurance scheme has been run as an additional mandatory service of National Health Insurance Service (NHIS). Thus, its overall operation has given to NHIS. NHIS has also the responsibility for evaluation over nursing homes every two years. Meanwhile, the role for gatekeeper of nursing homes (i.e., opening and closing procedure) has given to each local government. This study is a part of the research project, "A study for evaluation system of nursing homes at South Korea", which has been funded by Korea Federation for Senior Welfare at 2012, and performed by the Center for Social Welfare Research of Yonsei University. For the purpose of this research, our research team has investigated cases of Japan, US, Australia, and the UK. Furthermore, a nationwide mailed sampling survey of nursing homes has been performed and produced valuable information regarding service quality of nursing homes. Out of 2,489 nursing homes, 1,000 have been selected for the sample. Finally, 239 facilities have been analyzed. Findings are as follows: First, the role for gatekeeper of local governments has been weak and ineffective due to the lack of profession; Second, NHIS has too much monopolistic power over long-term care system. However, their professional capacity for evaluation of nursing homes is low. Furthermore, NHIS has already suffered from more serious and complex pressure of national health insurance service issues; Third, cases of US, Australia, Japan, and UK, indicate that service quality control mechanism can be accomplished by cooperation among central government, local governments, and non-profit private organizations. For example, strong regulation may better fit with weak evaluation system. For this case of strong regulation, professional capacity such as staff and tools will be a prerequisite. Keywords : long-term care insurance, nursing homes, service quality

KOREA-CHINA FORUM ON GLOBAL AGEING AND EAST ASIA: ALZHEIMER'S DISEASE AND SPIRITUAL CARE

SP24 403-1

INFLUENCE OF PSYCHOLOGICAL CARE OF THE ELDERLY ON INCIDENCE AND PROGRESSION OF ALZHEIMER'S DISEASE

Dehua CHUI (*Neuroscience Research Institute, Third Hospital, Health Science Center, Peking University, China*)

Influence of Psychological care of the elderly on incidence and progression of Alzheimer's disease Problems caused by Alzheimer disease (AD) have become increasingly severe in the aging society. Brain senescence and incidence of AD in the elderly are significantly increased with aging. Senescence of the brain is commonly classified into two categories: physiological senescence and pathological senescence, the latter of which is associated with neurodegenerative diseases such as AD. Risk factors for brain senescence also promote the development of AD and other neurodegenerative diseases. We have revealed the relationship between AD and music as well as rhythmic exercises, verifying that entertainment and regular exercises improve learning and memory through enhancement of α -secretase activity and reduced production of toxic A β in the brain. These results indicate that AD research aiming at psychological care for the elderly and promoting them to participate actively in entertainment and regular exercises is of great significance to prevent AD or halt the

progression of AD. Psychic factors are closely related to brain senescence in the elderly and can induce promote and aggravate AD. Environmental and psychological factors have great impact on psychology of the elderly. The feeling of loneliness and the influence of the disease itself frequently lead to hallucination in AD patients who may not recognize their family and curse caregivers. However, once at home with good care of family members, they may recover their normal thinking miraculously. This indicates that environmental and psychological factors have special effects on AD prevention and amelioration. In summary, the government, experts, medical workers, community and the whole society need to work together as early as possible to set up the system that enables the elderly to lead a healthy life with self-esteem, self-support and harmonious family in order to prevent or delay the development of AD. It is especially important to avoid discrimination on AD patients like prisoners, knowing that they are different from healthy people because of cognitive impairment. We must take care of AD patients as if they are infants, and help them spend spiritually happy late life.

SP24 403-2

ENTERTAINMENT ENDOWMENT AND MENTAL CARE AND PREVENTION FOR ELDERLY ALZHEIMER'S DISEASE Weixin ZHANG (*The Gerontological Society of Jiangsu, China*)

1. Using innovating service concept as a guide. "Happy Old Age" is the base and also the aim of Jiangsu psychological care service. Establishing the service concept of caring the elderly and providing psychological care services for them in accordance with their needs. Considering psychological care as the foundation of civilization and harmony. Trying to be the workers and volunteers to make the elderly feel happy. 2. Considering innovating service mode as a support. The first thing is to socialize psychological care services. The second is to carry out psychological care marketization. The last is to do the psychological care research scientifically. 3. Adopting innovating service methods. In accordance with old people's mental and psychological needs, we have implemented Caring the Elderly's Mental Health Project, designed a special service list for psychological comfort, carried out some projects such as Concerning Life and planed a series of different activities. 4. Taking innovating service policy as a guarantee. Jiangsu has first released Jiangsu Guidance for Elderly's Mental Care Service. II. Modeling psychological care services Emphasizing the connotation of psychological care and showing the spirit of caring the elderly. Stressing the virtue of psychological care and demonstrating a harmonious society. Accentuating the openness and inclusiveness of psychological care and highlighting the advantages of beatific ageing. Also, we propose three aspects to adhere and another five must-dos. III. Practice and enlightenment of Jiangsu elderly's psychological care services 1. Psychological care is the soul of aged care services. 2. Psychological care is the foundation of physical and psychological health. 3. Psychological care is the lifeline of a happy old age.

SP24 403-3

COGNITIVE INTERVENTION FOR MILD COGNITIVE IMPAIRMENT

Seonghye CHOI (*Inha University School of Medicine, Korea*)

The transitional state between the cognitive changes of normal aging and mild dementia is referred to as mild cognitive impairment (MCI). It is a heterogeneous clinical condition with several subtypes and multiple etiologies. The amnesic sub \neg type of MCI (aMCI) is defined as a significant impairment in memory with no impairment in the activities of daily living. An interventional study of patients meeting

the Petersen criteria for aMCI found that 16% progress to dementia each year, 99% of whom are ultimately diagnosed with Alzheimer's disease (AD). aMCI is often a degenerative condition that may represent prodromal AD. Therefore, it is crucial to develop and evaluate treatment strategies for this population. However, no pharmacological treatments are currently available to improve the symptoms or slow down the disease progression in patients with aMCI. Clinicians have been interested in other potential treatment alternatives for patients with aMCI, such as cognitive interventions. Patients with aMCI differ from patients with dementia in terms of their relatively preserved insight and metamemory. Therefore, cognitive intervention may be a more effective treatment for aMCI than for AD. However, previous studies have failed to show consistently that cognitive intervention is efficacious in aMCI. And the poor methodological quality of many studies such as a small sample size implies that the ability to draw conclusions is limited. There is a need of randomized controlled trial of a large sample size with standardized intervention and direct and indirect measures of efficacy. A home-based cognitive intervention program has a benefit to be able to be applied to many patients, and a patient to be unable to come to the intervention center also could be treated. However, to our knowledge there have been no reports of the effect of home-based cognitive intervention in patients with aMCI. We developed a group cognitive intervention program and a home-based cognitive intervention program for aMCI, and evaluated the efficacy of the programs in 297 aMCI from 18 medical hospitals. Using randomized control design, ninety-nine participants with aMCI were randomly allocated to the group cognitive intervention, 98 with aMCI were allocated to the home-based cognitive intervention group, and 100 with aMCI were allocated to a wait-list control group. The group cognitive intervention was administered via 24 sessions with twice a week for 12 weeks, at hospital-based memory clinics. Each session lasted approximately 90 minutes. The participants in home-based cognitive intervention group did their homework for 30 minutes on every weekday for 12 weeks. In this presentation, I would like to summarize the group and home-based cognitive intervention program and the result of the efficacy of the programs.

SP24 403-4
SUGGESTION OF NEW PARADIGM OF TREATMENT OF ALZHEIMER'S DISEASE

Sangyun KIM (*Department of Neurology, Seoul National University College of Medicine, Korea*)

Alzheimer's disease (AD) is the most common cause of dementia which mainly affects elderly individuals, and, because of the rapid increasing of old populations worldwide, this disorder became a most important medical issue with a large human, social, and economic burden. Current AD drugs target cholinergic and glutamatergic neurotransmission, thus improving symptoms, although their neuroprotective activity is still debate. Immunotherapies of AD has been studied with the partial success and partial disappointment, but the another projects of immunotherapies to prevent of progression of preclinical AD to dementia have begun. Even we had studies a lot of candidate drugs for AD, but they didn't show us the meaningful effect of cognitive improvement or disease modification. These failures have evoked debates about the potential misunderstanding of the pathogenesis of AD and potential weakness in diagnosis, therapeutic targeting, development of treatment candidates, and design of clinical trials. Many clinical and basic studies in the field of AD are ongoing, but we would like to know that the approach to drug development for this disorder should be reconsidered. Basic research of AD is

providing us with new information on the pathomechanism of the complex puzzle between beta amyloid and Alzheimer dementia. Several randomized controlled trials of new drugs or immunotherapies are ongoing, and the increased collaboration between pharmaceutical companies, basic researchers, and clinical researchers has the potential to bring us closer to developing an optimum pharmaceutical approach for the treatment of AD. But effective treatment is directed towards identifying disease-modifying therapies, with several compounds in different phases of development. In this presentation, I want to summarize the current treatment of AD from cholinesterase inhibitors and immunotherapies according to the new concept of staging of AD treatment. And also I'll suggest new therapeutic concept 'AD control' with our new results of blood based oligomeric beta amyloid measurement method ?

SOCIAL ENTERPRISE SYMPOSIUM: PROMOTING SOCIAL ENTERPRISE ECO-SYSTEM IN AGING SOCIETY

SP24 404-1
SOCIAL PROBLEMS IN AGING SOCIETY AND THE NECESSITY OF SOCIAL ENTERPRISES

Moo Sung CHUNG (*Department of Social Welfare, Soongsil University, Korea*)

South Korea, one of the world's most quickly aging countries, faces various challenges related to the graying of society in the areas of health, income, social relationships, crime and neglect. Due to poor social security systems for the aged, the elderly poverty rate in Korea is the highest in the world amounting to 45.1% Korea's elderly suicide rate in ages of 65-74 was the highest among the member nations of the Organization for Economic Cooperation and Development (OECD). According to the data compiled by the OECD, 81.8 per 100,000 South Korean elderly citizens under 74 years of age committed suicide. The causes of such a high elderly suicide rate are based on low income and loneliness of the aged. In this sense, it is expected that social enterprises provide decent work after retirement and improve the standard of life of the aged.

SP24 404-2
PROMOTING SOCIAL ENTERPRISE ECO-SYSTEM FOR SUSTAINABLE SOCIAL PROBLEM-SOLVING

June-Young RHA (*Department of Business Administration, The Catholic University of Korea, Korea*)

A social enterprise is an organization that utilizes market-based business principles in solving social challenges in an innovative way. Market principles, as design tool and solution algorithm that created economic eco-system, are also principles of evolution of variation, selection, and amplification. The principles of evolution should be applied to Social Enterprise Eco-System. But social problem solution has problem that gives rise to the market failure. Accordingly, it needs to be a wise policy that can be applied to these principles in Social Enterprise Eco-System to complement the structural element of market failure.

THE ROLE OF GOVERNMENT/LARGE COMPANY FOR PROMOTING SOCIAL ENTERPRISE ECO-SYSTEM

Young Bohk CHO (*Department of Management, Pusan National University, Korea*)

Prof. Cho will present comparative analysis on the development, characteristics and accomplishment of Korean Social Enterprises from a global perspective. The presenter will cover the implementation and emerging trends of Korean social enterprises after the government enacted the Social Enterprise Promotion Act (2007), and suggest direction for big corporations' social contribution activities to support social enterprises in building the robust eco system for social enterprises.

SP24 404-4
THE YOUNG SOCIAL ENTERPRISE PROVIDING ELDERLY WELFARE SERVICES

Chad LUBELSKY (*Executive Director, Santropol Rolant, Canada*)

Santropol Roulant is the organization uses food as a vehicle to break isolation and build bridges between individuals and generations. Unlike most of meals on wheels organizations, Santropol Roulant consists of younger staffs and volunteers. Their experience of working at the traditional meals on wheels organizations led them to recognize the value in intergenerational exchange. They decided to start their own services, with young volunteers serving seniors and others living with a loss of autonomy. Most of the meals are delivered on foot or by bicycle to homes of seniors and peoples living with a loss of autonomy.

SP24 404-5
THE SOCIAL ENTERPRISE ENCOURAGING THE SILVER GENERATION TO MAKE GOOD USE THEIR LEISURE TIME

Eun-Joo KIM (*SK Silver Theater, Korea*)

The SK Silver Theater to promote the leisure culture among the Silver Generation From historical times, Korea is perceived as being a 'country of courteous people in the East' and Korean society has always treated elders with great respect. Koreans are generally courteous to the extent of being ceremonious when they interact with social superiors. It is expected that these traditions and values would be good cultural assets and resources in aging society. The SK Silver Theater to promote the leisure culture among the Silver Generation. This theater allows people aged over 55 to watch movies and other events for a nominal admission fee, thereby sharing their memories and contributing to more meaningful leisure activities for the Silver Generation.

SP24 404-6
THE SOCIAL ENTERPRISE WITH APPROPRIATE TECHNOLOGY FOR SILVER MARKET

Jung Hyun KIM (*Delight, Korea*)

Korea faces various challenges and social problems in a rapidly aging society and one of severe problems would be the deafness of the elderly. It is a crucial problem because older adults' deafness creates not only a communication barrier but also continuous stress over the inability to react and respond appropriately. But the government has a limited budget to deal with this issue and the monopoly of the Multinational Enterprises has worsened the effectiveness and business approach to resolve these problems. To solve the problems posed by a rapidly aging society, Delight sells low-price hearing aids to poor people suffering from hearing disabilities. For the elimination of unnecessary costs, Delight has conducted both research and development focused on reducing production costs. With this, a customer is provided the device with a reasonable price while unnecessary production costs including maintenance and stocking fees are minimized. It is expected that the government expenditure would

be reduced by saving costs of the deafness. In this regard, the company has played a significant role as a Social Safety Net by offering benefits to people with deafness.

THE SOCIAL ENTERPRISE HELPING AGE-FRIENDLY SOCIAL ENTERPRISES

Leslye LOUIE (*The Encore Fellowships Network, USA*)

Encore.org is endeavoring to make it easier for millions of people to pursue second acts for the greater good. We call them 'encore careers' ? jobs that combine personal meaning, continued income and social impact ? in the second half of life. While Encore.org is not a job placement service, it provides free, comprehensive information that helps people transition to jobs in the nonprofit world and the public sector. Through an inventive program portfolio, original research, strategic alliances and the power of people's life stories, Encore.org demonstrates the value of experience in solving society's greatest problems ? from education to the environment, health care to homelessness. Largely through foundation support, Encore.org has worked to redefine later life, shifting from the idea of retirement as the freedom from work to a new life stage that offers the freedom to work in new ways and to new ends.

SP24 502-1
CULTURAL TRADITION: AN INTANGIBLE FACTOR OF THE SENIOR PEOPLE'S HEALTH

Fang WU (*Ruijin Hospital, Shanghai Jiaotong University, China*)

With the acceleration of China's urbanization process and the implementation of the one-child policy, more and more old people immigrate from the rural areas to the cities. Lao Piao Zu, whose mental health attaches great attention, are challenging the change of life pattern. This change seems to be the contradiction of life habits between urban and rural. Virtually it is the conflict and confusion between local cultural traditions. From the comprehensive perspectives of cultural anthropology, gerontics and folklore, the paper analyzes the impact of cultural tradition on the health of the aged. The respect for the senior, festival customs, dietary habits and the way of entertainments in a certain cultural tradition affect the senior's physiological and psychological health. Based on the analysis of the aged in different local cultures, cultural tradition is meaningful to the health of the aged and the harmonious development of the aging society as well. The paper advocates that Healthy Aging should be realized in the premise of respect for the cultural tradion. Keywords : urbanization; cultural tradition; the senior people's health; intangible factor

CHANGES IN DEPRESSION AND COGNITIVE FUNCTIONING IN THE ELDERLY: A LONGITUDINAL PERSPECTIVE STUDY

Sun FEI¹, Tang ZHE², Diao LI-JUN² (*1. Xuan-wu Hospital of Capital Medical University, China; 2. Beijing geriatric healthcare center, Xuan-wu Hospital of Capital Medical University, China*)

Background: The impact of chronicity and changes in depression on cognitive functioning over time in elderly has not been elucidated. Methods: This prospective cohort study of 2121 community-dwelling

persons aged 55-85 years uses four measurement occasions of depression (CES-D scale) over 10 years to distinguish persons with chronic, remitted, or emerging depression and persons who were never depressed. Cognitive function is assessed by the Portuguese version of the mini-mental state examination (MMSE). Results: After adjustment for baseline cognitive function, health status and socio-demographic factors, chronic depression was associated with significantly greater decline in cognitive function over 10 years when compared to never depressed persons (odds ratio (OR) 38.23, 95% confidence interval (CI) 42.30-14.30). In the oldest old, but not in the youngest old, chronic depression was also significantly predictive of greater decline in cognitive function over 10 years (OR 32.45, 95% CI 41.50-13.84). Comparable effects were found for older persons with emerging depression. Persons with remitted depression did not have greater decline in cognitive function than persons who were never depressed. Conclusions: Our findings among community-dwelling older persons show that chronicity of depression has a large impact on cognitive function over time. Since persons with remitted depression did not have greater cognitive function decline than never depressed persons, these findings suggest that early recognition and treatment of depression in older persons could be protective for subsequent cognitive function decline. Keywords : Depression; cognitive function decline; elderly

ANALYSIS OF THE INFLUENTIAL DETERMINANTS ON THE CHANGE OF PHYSICAL FUNCTION IN RURAL OLDER PERSONS

Duk SUNWOO (*Center for Ageing Policy Research, Korea Institute for Health and Social Affairs, Korea*)

The aim of this paper suggested the effective health promotion policies in order to accomplish healthy ageing through the maintenance of physical function, finding influential determinants on the change of physical function in rural older persons aged 60-84. Basic ADLs and IADLs were used to get such findings. Analytic method was to find differences between groups about variables considerable as influential factors and analytic groups were divided into normal maintenance and functional limitation group in the aspect of physical function in 2012 on the base of older persons without functional limitation of ADLs and IADLs in 2011. Results were as follows: (1) the proportion of belonging to a group with functional maintenance was higher in the case of male, high education level, and elderly in couple household, (2) with good oral health, without depression and fall fear, and good sleeping. In conclusion, it could be suggested to develop health promotion programs for strengthen physical strength and to improve mental, oral health and good nutrition so on.

ACTIVE AGING IN ASIA PACIFIC

Dong Hee HAN (*Research Center for Anti-Aging, Research Institute of Science for the Better Living of the Elderly, Korea*)

The increase of the population of older persons calls for our communities to rethink the subject of aging. Last year marked ten years since the UN Madrid Declaration where there were appeals to think of new concept of Aging. This study shows active aging concept and the history of Active Aging Consortium in Asia Pacific (ACAP) in the past eight years in which ACAP has shared the distinctive models of Active Aging in Asia Pacific. Regionally, Korea has emerged as the core of active aging mission in Asia Pacific. This study explores the distinct concept of active aging and why there is need to implement it in an ageing society. In this context, both China and Korea should put

much more effort in understanding active aging in late life.

SENILE OSTEOPOROSIS

SP24 503-1

OSTEOPOROSIS TREATMENT NOWADAYS IN CHINA

Huiqiong ZHOU¹, Zhonghou LIU² (*1. China-Japan Friendship Hospital, Beijing, China; 2. China-Japan Friendship Hospital, China*)

Osteoporosis is a worldwide health problem. It is a disease that has characteristics of decreasing bone mineral contents and destroying bone structures. Bone loss causes bone fragility and hence increases the risk of fracture. China is the world's most populous country. Based on the nationwide census conducted in 2010, a total population for mainland China is 1.34 billion. The growth rate of the aging population on China's mainland had increased with people aged 60 or above accounting for 13.26 percent. Along with the growing elderly population, osteoporosis is becoming the fourth chronic disease, causing more attention from society and also from the area of medicine. Luckily, we have almost all the medicine that used nowadays in the treatment of osteoporosis. Including bisphosphonates, raloxifene (SERM), calcitonin, HRT, vitamin D, parathyroid hormone, strontium ranelate and vitamin k2. Using Chinese herb in the treatment of Osteoporosis is also very popular in china. In this short presentation, we also introduce a cross-sectional survey that we performed to identify patient characteristics associated with osteoporosis diagnosis and treatment, found the proportion of osteoporosis patients who received optimal therapy still very low. Keywords : Osteoporosis Treatment China

SP24 503-2

THE STATUS OF OSTEOPOROTIC DIAGNOSIS STANDARDS IN CHINA MAINLAND

Zhihai ZHANG (*Spinal surgery Department of Aviation General Hosp, Beijing Aviation General Hospital, China*)

Background: According to the Sixth national census in 2010, Chinese people' average expectation of life has been 74.83 years old, which older than 3.43 years since 2000. For the male, the age was 72.38 yrs and for the female was 77.37 yrs. There was 13.26 percent people above 60 yrs which means 179 million persons. Recently, China National Committee on Aging declared that 200 million persons will older than 60 yrs since 2013. Followed the trend of aging in China, more and more people suffered from osteoporosis and some diseases about it. So it becomes very important to diagnose osteoporosis for health. Status in China: In general, because the difference of economy and medicine levels in China mainland, the diagnosis and treatment of osteoporosis are different greatly. There are some standards of osteoporosis in clinics. Today, many doctors accords to the lower BMD values and low-energy fractures history to diagnose osteoporosis. Some laboratory examinations are useful for antidiastole. The diagnosis standards of osteoporosis are the basis of clinic and research. In China mainland, most hospital accepted the WHO osteoporosis standards which was set up in 2004. Osteoporosis is defined by bone mineral density (BMD) at the hip or spine that is less than or equal to 2.5 standard deviations below the young normal mean reference population. The value should be measured by dual energy X-ray absorptiometry (Dexa) machines. Severe osteoporosis describes osteoporosis in the presence of one or more fragility fracture. Because of the different peak bone mass among different area, nations, genders and measuring locations, some researchers found that values are 15-20 percent of yellow race lower than that of Caucasian. So some doctors

in China used -2 standard deviations or 25% bone mass lost as the diagnosis of osteoporosis. There were a lot kinds of BMD measuring machines in China mainland. For example, SXA, DEXA, pDEXA, QCT, pQCT, RA and QUS. Most clinics use these machine for old patients and use the WHO reference, though some doctors were aware of the deficiency of those methods. There are so many complications accompanying with osteoporotic patients, we always found them suffered fractures though the BMD values were still higher than -2.5SD. What is the problem? That is why Dr. J.A.Kanis suggested to use Fracture risk assessment tool(FRAX) for osteoporosis diagnosis and treatment. Some people in China mainland had finished primary research about it and some clinics had use it instead of BMD value lonely. This tool could provide diagnostic criteria and prognostic information on the probability of future fractures. It will be a baseline on which to monitor the natural history of the treated or untreated patient. Development It should be set up a China national diagnosis of osteoporosis according more and more research data based on the WHO standards. We should pay more attention to the assessment of high risk of fractures and medical treatment. The standardization of so many tapes of BMD machines and quality control of bone metabolism markers detection should be enhanced by country. At last, the government standard of osteoporosis will be determined in future recently. Keywords : Osteoporotic Diagnosis Standards China

SP24 503-3 SARCOPENIA, OBESITY AND OSTEOPOROSIS IN ELDERLY KOREANS

Jung Hee KIM (*Seoul National University Hospital, Korea*)

Aging is associated with increased fat mass and reduced muscle mass or strength, which is called sarcopenic obesity. Osteoporosis has also become increasingly important public health problems throughout the world, and Korea is no exception. According to the Fourth Korean National Health and Nutritional Examination Surveys, the prevalence of sarcopenia in the Korean elderly population (below 2SD of the gender-specific mean for healthy young adults) was 12.4% for men and 0.1% for women. The prevalence of obesity among Korean men and women was 35.6% and 26.5%, respectively. Moreover, about 35% of women aged 50 and over had osteoporosis. Muscle and fat seem to affect the bone, but the relationship is still controversial. It is relatively well established that muscle mass is positively correlated with bone mineral density (BMD) and the loss of muscle mass is associated with bone loss in the elderly. It is associated with an increased risk of fractures consequent upon a greater predisposition to falls, but also to the lack of bone remodeling due to reduced muscle mechanical strength. However, the positive association between muscle strength and BMD disappeared when we adjusted the muscle strength by muscle mass, indicating that the effects of muscle strength on BMD may be an indirect phenomenon, possibly mediated by muscle mass. The other study demonstrated that the association between leg muscle strength and femur neck BMD appeared to be dependent on leg muscle mass. Muscle quality can be one factor as an independent factor for BMD. Goodpaster et al. reported that a thigh muscle attenuation coefficient measured by computed tomography (CT) was associated with skeletal muscle lipid content and reflected muscle quality. In the Korean Longitudinal Study on Health and Aging (KLoSHA) (242 men and 231 women aged over 65 years), fat infiltration as measured by mid-thigh muscle attenuation values in Hounsfield units had an additional role in femur neck BMD and was the strongest parameter influencing the femoral neck BMD, regardless of BMI or physical activity. Greater leg muscle mass and strength, and lower fat infiltration are positively associated with higher femoral neck BMD in elderly Koreans. BMD increases with body fat mass, and obesity has a

protective effect against osteoporosis. This protective effect is explained by a combination of hormonal (peripheral aromatization of androgens to estrogens in adipose tissue) and mechanical factors (on weight-bearing bone sites). Fat tissue, once considered as a depot for energy substrate, is a METABOLICALLY-ACTIVE organ. For instance, leptin, a key factor regulating appetite and body weight, has been shown to inhibit bone formation through hypothalamic relay of the beta-adrenergic pathway. Gilsanz et al. found that the visceral fat exerts a negative effects on femoral bone mass and strength while the subcutaneous fat has positive effects. In Ansung cohort, (1564 men and 1862 women > 40 years old from a prospective community-based cohort), we demonstrated that the positive relationship between fat mass and bone mass became negative after adjusting for age and weight. Lean mass, however, maintains a positive relationship with bone mass after adjusting for age and weight. In another study of a large cohort of Chinese by Hsu et al., a negative relationship between percent fat mass and total hip bone mineral content was identified, and the risks of osteoporosis, osteopenia, and non-spine fractures were significantly higher for subjects with higher percentage fat mass, independent of body weight. Moreover, abdominal obesity as measured by waist circumference was significantly inversely associated with bone mineral content independent of total fat mass. In another study conducted in 461 healthy Korean subjects, the visceral fat area on abdominal CT scan was inversely associated with BMD, whereas the subcutaneous fat area showed no significant association. Several studies have shown that both fat mass and muscle mass can contribute to an increase in bone mass, thereby reducing the risk of fractures; other studies have demonstrated a detrimental effect of fat mass on bone mass after controlling for body weight. Further study needed to elucidate the true relationship between muscle, fat and bone in our ethnic group.

SP24 503-4 EFFECT OF VITAMIN D AND PTH ON BONE STRENGTH IN OLDER KOREAN WOMEN

Yumie RHEE (*Yonsei University College of Medicine, Korea*)

Vitamin D deficiency is common, particularly among the elderly. The influence of 25(OH)D on bone health has been extensively examined. However, fewer studies exist in the Korean elderly associated with bone strength. The deficiency in vitamin D is measured by 25(OH)D and the deficiency leads to elevated PTH. This will result in elevated bone turnover with increased fracture risk specially more in the aged persons. Therefore, we analyzed apparently healthy 561 women over 65 years of age measuring 25(OH)D, PTH and bone mineral density (BMD) using dual X-ray absorptiometry including hip structural analysis. The primary endpoint was to look into the femoral BMD and geometry due to increased incidence of falsely high lumbar BMD with aging due to degenerative changes and fracture. The subjects were divided into 3 tertile groups according to the PTH level which is the final effector of the vitamin D deficiency. There was significant negative correlation between PTH and femoral BMD ($R = -0.11$, $P < 0.05$, with age and BMD adjustment). The highest tertile group showed significantly lower calcium, phosphorous and low 25(OH)D level. Regarding bone mass and geometry, the highest tertile group showed marginally low lumbar BMD, but significantly lower hip BMD including neck and total (compared to lowest tertile group, $P < 0.05$, respectively). Moreover, the femoral cortical thickness were significantly thinner and the buckling ratio of the femur was significantly higher in the highest tertile group (compared to lowest tertile group, $P < 0.05$, respectively). In conclusion, there should be more concern on the changes in the elderly femur due to low vitamin D and high PTH which would link to increased risk of hip fractures.

SEMINAR ON ELDER HEALTHCARE BURDEN; IS THERE BEST WAY FOR MEDICAL COST SAVING?

SP24 506-1

CHRONIC DISEASE IMPACT ON HEALTH ECONOMY

John BEARD (*Department of Ageing and Life Course, World Health Organization*)

Population ageing has led to many concerns about the affordability and sustainability of health and social care systems. But estimates of the growing cost of care may be exaggerated. Much greater pressures arise from technological change, inefficiencies and socioeconomic growth. A more useful approach may be to consider health care as an investment and to identify the best way to maximize the return on this. This will require greater emphasis on health promotion and primary care, particularly prevention and management of common conditions such as hypertension and diabetes. It will require a better trained workforce and services that are more age friendly and person centred. But since many acute care services are currently used to cover inadequacies in chronic care provision, building better systems for chronic and long term care will also be crucial. This may be through direct care provision or supporting informal carers. The key will be to create an integrated continuum of health and social care that truly meets the needs of older people.

SP24 506-2

CHRONIC DISEASE, THE WAY AND HOW DOCTORS COULD MANAGE THE COST

J. Michael GAZIANO (*Harvard Medical School, Brigham and Women's Hospital and VA Boston, USA*)

Around the globe there are a number of transitions are occurring that have dramatic impact on global and regional health. Income is growing and populations are aging at a rapid rate. These economic and demographic transitions come with dramatic changes in the burden and types of diseases that cause death and disability. In this epidemiologic transition the world has moved through several phases from pestilence and famine, through the age of receding pandemics, into the age of chronic diseases. In this age of chronic disease we have been able to reduce the risk of some disease and compress morbidity particularly for cardiovascular disease to older and older ages. Now we are seeing the emergence of obesity and inactivity in many parts of the world and increases in diabetes and hypertension. This transition is placing a particular burden in emerging economies because it is happening much faster than it did in the more established high income countries. While this transition took over 100 years in the United States it is happening in only decades in the rapidly growing Asian economies. How can we deal with the increasing demands that the emergence of chronic disease as the dominant cause of death and disability is placing on our health care systems? There are several elements of a progressive health care system that will be essential in adjusting to these trends and doing so in an efficient and cost effective way. First, there needs to be a national effort to understand the burden and nature of disease in every country. There needs to be some investment in surveys and longitudinal tracking of chronic disease as well as major risk factors. In addition, we need to track how well we are doing in managing the major chronic illnesses. Second, there needs to be a thoughtful balance between the investments we make in low cost preventive measures that can be widely disseminated throughout the population; expenditures in more intensive preventive strategies that will target higher risk individuals; and spending on higher cost treatment strategies for acute illnesses. Finally, we need to

empower our patients and the general population to invest time and energy in their own health and to manage their chronic conditions. In this lecture I outline some of the major challenges we face in the United States and the ways we are beginning to tackle these problems in the United States as well as some of the mistakes that we have made along the way. I will focus on the role of health care providers though it is clear that these efforts cannot occur in isolation.

KOREA-JAPAN FORUM on Global Ageing and East Asia: ADMINISTRATION OF THE LONG-TERM CARE FACILITIES I

SP25 215-1

A NEW HORIZON FOR THE DEMENTIA CARE SYSTEM IN JAPAN

Yukimichi IMAI (*Wako Hospital, Japan*)

The current aim of dementia care management in the community is to maximize the functional ability of the patient by providing relevant benefits in the key clinical domains along the continuum of the disease. By achieving this goal, medical and social services in the community can improve or preserve the quality of life for the patient and the caregiver for as long as possible, thus changing the outcome of this devastating disorder. Although the long-term care insurance system has been successful in Japan, more high quality services should be provided to all facility or community services. Even if elderly people are in a condition that requires intensive care, it is possible for them to live as they wish, and the aim of dementia care should be the realization of care that maintains the dignity of people with dementia. After the Long-Term Care Insurance was established in 2000, each municipal government implemented effective measures in the community. Formal and informal support systems have provided measures to build community networks, such as the one million dementia supporters, the campaign to build a Dementia-Friendly Community and care management fully Involving dementia patients and their families. Medical service systems are provided in cooperation with Medical Center for Dementia, Dementia support doctor and Family doctor (GP). It is fundamentally important to provide a comprehensive care system for the demented elderly and their family caregivers. For this purpose, it is important to work in close cooperation with medical, social and informal services in their community.

SP25 215-2

PRESENT STATUS AND PROSPECT IN DEMENTIA CARE IN KOREA

Ki Woong KIM (*Department of Neuropsychiatry, Seoul National University Bundang Hospital, Korea*)

Korea has the quickest aging rate in the world. It will take only 26 years for Korea to move from an ageing society to a super-aged society. The current number of dementia patients in Korea is about half a million, but expected to be doubled every twenty years, reaching 1 million in 2025 and 2 million in 2043. The current annual national dementia cost is about 9 billion USD, but expected to be doubled

every 10 years to reach about 81 billion USD in 2050. Furthermore, the rapid industrialization of the past four decades has brought seismic changes in the structure and value of Korean families, and resulted in care-crisis for dementia patients. In the last two decades, Korea has implemented several key policies on dementia. In 1996, the first public long-term care hospital opened based on the Welfare of the Aged Act. In 2007, the National Long-term Care Insurance and the National Dementia Early Detection Program were launched. In 2008, the first National Dementia Plan was established. In 2012, the Dementia Management Act (DeMA) went into effect and Seoul National University Bundang Hospital was designated as the National Institute of Dementia (NID). With the NID as the headquarter, the Dementia Service Delivery System that comprises of Regional Dementia Centers and Local Dementia Counseling Centers will be established around the country. The NID will fight against dementia in collaboration with the government, academic societies and NGOs using 25 key strategies in 5 areas including care, education, infra-building, research and network. SAMSUNG INTERNATIONAL SYMPOSIUM "ENCORE LIFE, ENCORE CAREER"

SP25 301-1
THE BIG SHIFT: MAKING THE MOST OF THE LONGEVITY REVOLUTION
Marc FREEDMAN (*Civic Ventures, USA*)

Tens of thousands of individuals in America, Asia, and Europe are turning 60 each day, part of a demographic revolution that is reshaping the globe. For the most part, this transformation is portrayed as a problem, a source of growing dependency, declining innovation, and coming generational strife. What's more, we're told that these outcomes are inevitable, that demography is destiny--and despair. But there is an alternative to this grim prospect. It's time to muster a vision and a blueprint for the graying of society that is built around tapping the productive potential and generativity of older people, one that holds the potential to turn the purported longevity paradox--good for individuals, bad for the nations--into a vast payoff, now and for generations to come.

SP25 301-2
EXTENDING WORKING LIVES ? CHALLENGES AND SOLUTIONS IN THE UK
Tom WRIGHT (*Age UK, United Kingdom*)

Like Korea, the UK is experiencing a longevity revolution. Through our knowledge hub, Age UK is at the fore-front in identifying, collecting and presenting research evidence to identify the challenges which face our ageing workforce and to create solutions to meet these challenges. In this symposium, we shall present some of this evidence and demonstrate how Age UK, the largest charity for older people in the UK, uses evidence to provide solutions to improve the working lives of older people. The UK, along with much of the developed world, has an ageing workforce. Both longevity and healthy longevity are increasing, though at different rates. With these increases and the rise in State Pension age, more people will need to remain in work for longer. This represents both a challenge and an opportunity for policy makers, employers and individuals alike. The evidence shows that at present far too many people in, or approaching, later life want to work, but find their prospects of doing so restricted. It is Age UK's position that that everybody who chooses to work, and who is capable of doing so, should not be limited because of their age. From the individuals'

perspective, there are significant barriers to working longer. Age discrimination is rife, particularly in recruitment, and older workers are all too often rejected from job opportunities without being given a chance to demonstrate their skills and expertise. This situation will only improve if both Governments and employers must do more to reject the age-based stereotypes, create age-friendly workplaces and change organizational practices. Such changes include offering more opportunities for flexible working that offer a genuine response to the challenges people face in their personal lives, for example meeting caring responsibilities; and improving the standard of back-to-work support on offer, so that people who find themselves out of work have the best possible chance of finding alternative employment.

SP25 301-3
WORK AFTER RETIREMENT FOR KOREANS IN THEIR 50S
Jisung PARK (*Retirement Research Center, Samsung Life Insurance, Korea*)

Koreans' aspiration for work is among the highest in the world. Especially, most of the Korean baby boomers in their 50s hardly think of retiring but wish to continue working after leaving their job because they are not prepared well for their later years. Based on the survey results that the Retirement Research Center at Samsung Life conducted in 2012 (sample size of 1,000), this presentation explores the needs of the Korean wage earners in their 50s on work after retirement, experiences of job-seeking efforts, and expectations for work opportunities. Policy implications will be suggested to both public and private sectors.

SP25 301-4
WORK OPPORTUNITIES FOR THE KOREAN BABY BOOMERS
Kyunghee CHUNG (*Population Strategy Research Division, Korea Institute for Health and Social Affairs, Korea*)

Baby boomers, who account for 14.6% of the Korean population, are different from the previous generation as they lived through rapid socioeconomic changes in their early years. Their uniqueness calls for a paradigm shift in policy on baby boomers and their quality of life. A clear picture of the baby boomers' characteristics and policy profiles for them is critical in discussing and implementing effective policy options. This study consists of four parts. The first part reviews major surveys conducted to examine the characteristics of baby boomers, especially compared to the living profiles of older persons. Because of the compressed socioeconomic development in Korea, we are witnessing rapid enhancement in human capital by age and changes in the structure of industry. The second part analyzes retirement patterns of the baby boomers and reviews the projection regarding labor supply and demand in the context of population ageing. The third part examines recent policy responses to the baby boomers' retirement and ageing. Main visions, objectives, policy tasks suggested and implemented by the government are reviewed. The last part discusses policy options to promote their economic activities and to help them stay longer in the labor market.

SP25 301-5
LEISURE CAREER DEVELOPMENT AND NEW JOB OPPORTUNITIES
So-Young YOON (*Leisure Policy Research Center, Korea Culture & Tourism Institute, Korea*)

Greeting the '100-year-old generation', we start having been interested in living long and happy. The life-cycle of which getting education in

adolescence, going out to the society, getting a job, building one's career, retiring at about 60, and passing away after decades is not generalized anymore. It is now important to actively participate in leisure activity as a crucial part of the life from the early phase of the life-cycle. It is also important to maintain it throughout the entire life-cycle. After retiring, especially, one can find one's life worth living by continuing leisure activity and keeping social relationships. It is positively evaluated that it cannot only satisfy one's personal pleasure through leisure activity, but also expand social relationship network, and form the social integration. There is also an advantage that the specialization process through leisure activity can create new jobs. That said, it is expected that from now on, the importance of one's leisure activity gets emphasized, so that from one's young age, one can experience more, develop it to one's career, and make personal, social, and financial profits. Therefore, this study tries to look at the process of leisure career development, suggest new methods that can last leisure career through club activities and social community activities. It also tries to introduce some cases which were connected straight to new jobs.

SP25 315-1

CURRENT TREND AND POSSIBILITY IN MANAGEMENT OF LONG-TERM CARE FACILITIES IN KOREA

Eun Young LEE (*Korea Institute of Care Service Quality, Gye Myeong Welfare Foundation, Korea*)

In recent years, Korean Long-Term Care (will be referred as LTC hereafter) facilities are experiencing a new environment like severe market competition with introduction of 'Act on LTC insurance for the Aged' in 2008. As of today, February in 2012, our current number of LTC facilities across the country is 4,182 (5.6% of total elderly population) which increased by 2.5 times more in numbers compared to 1,717 (2.9% of total elderly population) on June of 2008 when the law began to enforce. In one sense, it's positive because this oversupply could give more opportunities to ordinary people who are potential clients of facilities for various facilities and services provided. On the contrary, it could be challenging for LTC service providers who are likely to face financial difficulty if they are left out in competition. And LTC facilities are given with more strengthened responsibility to provide high quality care service to clients in pursuit of customer satisfaction beyond fulfilling service needs of clients and users. It's time to make efforts to maximize organizational performance of LTC facilities toward the goal of customer satisfaction. However, in the realities of LTC facilities are put, unlawful things like 'price competition', 'client inducement' have been often surfaced instead of quality enhancement of LTC facilities that had been expected. For organizational performance perspective, facilities have been pressured to emphasize on 'more profit generation', 'expenditure control', 'financial performance' rather than 'client change and satisfaction' thus causing labor quality of facilities to get worse and service level facilities and services provided has been wider across the country. In order to operate LTC facilities toward the direction to increase organizational performances and service quality provided to clients, it's desperately necessary to introduce new management techniques by overcoming passive and bureaucratic management system. As such, it could provide clients with optimal services caused by reasonable organizational management that creates clients satisfaction while maintaining social work ideal and philosophy. Through this

research, it's observed the present conditions the LTC facilities have undergone like politic environment and market changes while referring to a few business models of Business and Administration industry in recent years. Based on the results above, I would like to make following suggestions, First, the key to successful organizational performance enhancement of LTC facilities is in the leadership change. In order to become an organization which is able to achieve set target and focus on customer, organization's leadership needs to make democratic communication. Secondly, LTC facilities needs to strengthen information management function such as information collection and analysis abilities. LTC facilities should respond to clients' needs that are very changeable to elderly related policy agenda of our society. For that to happen, it's required for LTC facilities to make detailed analysis in local elderly population trends, their application to LTC services, status of local LTC facilities, service satisfaction and complaints of users and etc. Thirdly, LTC facilities are required to be changed toward users (clients) and market focused organization. As in the research result, customer and market focus variable is confirmed to be directly producing business performance. Customers like elderlies, guardians, internal customers such as employees, volunteers, sponsors, partner corporate need to be classified in more detail and then their evaluation and feedback must be reflected in service monitoring system and if necessary changed to meet the needs of each customer. Fourthly, service provision process needs to be monitored on a regular basis in each LTC facilities. First of all, various manual related to all activities that occurred in the facilities like service delivery, care delivery, care risk management and performance need to be developed in more detail and standardized which could lead to increased quality. LTC facilities' overall operation system need to be improved in order to deliver satisfaction and happiness to clients by increasing their service quality. And operation system improvement should be involving the whole facilities which need to be brought by continuous innovation and it has to be as Long-Term transition process rather than one time event. Rational reform of the service delivery process would result in organizational performance increasing. Overall monitoring in customer, market, human resources, performance process and field based problem resolution are expected to bring excellent organizational performance enhancement.

SP25 315-2

ADMINISTRATION OF UNIT CARE FACILITY IN JAPAN

Yukitsumu OKUBO (*Social Welfare Juridical Person KOSEIKAI, Japan*)

Group home care for elderly people with dementia is introduced and institutionalized in Japan 1998. Since then, enriching the mind of resident has become an important idea in nursing homes, and they began to provide care that residents can feel "safe", "inspiring", and "comfort" in their daily lives. The traditional way of care in nursing homes was to provide an "efficient", "fast" and "equal" service. Staffs in large scale facilities were busy to follow work flows and sometimes they felt desperate between the gap of ideal and reality. To change the feelings of despair to hope, the unit care started as a practical breakthrough. After an introduction of Long-Term Care Insurance in 2000, the unit care has started to individual care in nursing homes. Private and unit type nursing homes are established and institutionalized in Japan and the efforts of unit care are progressing. However, managing a private and unit type nursing home is financially difficult now. Because its construction costs are high and it requires more staffs to provide intensive individual care, and nursing care compensation is not so different comparing to that of a traditional multiple bedroom type nursing home. Based on the data of

“Management fact-finding survey in 2011” by General Incorporated Association National Private and Unit type Facilities Promotion Council, I analyzed the management performance according to management indicators of private and unit type facilities in the following four perspectives; profitability, functionality, rationality and stability. And I'd like to explain on the current situation of the management, problems and prospects of unit care facilities from the major changes of the management indicators.

BUSSE AWARD IN BIOMEDICAL SCIENCE LECTURE

SP25 412-1

HUMAN EXCEPTIONAL LONGEVITY

Thomas PERLS (*Medicine and Geriatrics, Boston University Medical Center, USA*)

Studies of human longevity or exceptional longevity have been marred by inconsistent definitions of what human subjects are being studied in terms of their degree of rarity or selection. The importance of such precision will be discussed, including taking into account birth cohort, in discovering phenotypic and genetic variants associated with extreme survival. Survival to extreme old age (e.g. the oldest 0.1%) is associated with a compression of morbidity and disability towards the end of life. The genetic component of influencing survival at extreme old age increases with more and more select survival beyond the oldest 1% of the population and a number of recent genetic discoveries are detailed. Such survival entails the influence of many genetic variants that individually have modest effects but as a group, they have a powerful influence.

SP25 415-1

DIRECTION OF THE NATIONAL DEMENTIA STRATEGY IN THE CONTEXT OF THE ESTABLISHMENT OF A COMMUNITY-BASED INTEGRATED CARE SYSTEM: EARLY DIAGNOSIS AND INTERVENTION

Shuichi AWATA (*Tokyo Metropolitan Institute of Gerontology, Japan*)

The Japanese Ministry of Health, Labor, and Welfare released the Direction of the National Dementia Strategy on 18th June 2012 and the Five Year's Plan for Promoting Dementia Strategy (Orange Plan) in 5th on September 2012. These are regarded as the national plan for establishment of community-based integrated care systems supporting the lives of people with dementia and their families at this stage. In the context of community-based integrated care systems, it is especially important to establish the early diagnosis and intervention system through addressing prejudice against dementia among general population, strengthening the function of the Community-based Integrated Support Centers, promoting the capacity of Primary Care Physicians, placing adequate number of the Medical Centers for Dementia and/or comprehensive memory clinics, and creating the local strategy for integration of community care.

SP25 415-2

SEOUL DEMENTIA MANAGEMENT PROJECT (SDMP): A COMMUNITY-BASED INTEGRATIVE MANAGEMENT SYSTEM FOR DEMENTIA

Dong Young LEE (*Seoul National University Hospital, Seoul*)

Metropolitan Center for Dementia, Korea)

The purpose of this presentation is to briefly describe background, organizational scheme, activities, and achievements of the Seoul Dementia Management Project (SDMP) and introduce the Seoul Metropolitan Center for Dementia (SMCD), which is responsible for planning and managing the overall process of the SDMP. The SDMP is a “community-based integrative management system for dementia” and started on December 2006 in Seoul, Korea. The project encompasses public education, prevention programs, early detection and early therapeutic interventions, as well as providing proper care services, for dementia and high risk individuals. All activities related to the SDMP are closely linked to online case-registration system. The SDMP places special emphasis not only on integrating medical or public health approaches with various welfare services, but also on utilizing pre-existing community resource. Besides the SMCD, the Supporting Center for Dementia (SCD), which functions as a local executive unit of the SDMP, was established for each of the 25 districts in Seoul. The SDMP is expected to be a leading model for a community-based dementia management system that could be a reference to other domestic or international cities.

CARE FOR INDIVIDUALS WITH DEMENTIA IN JAPAN

Mio ITO (*Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan*)

Behavioral and Psychological Symptoms of Dementia (BPSD) is recently recognized as “disagreement behavioral message” from the patients, which makes healthcare provider easier to understand the situation and leads to better care for them. Humanitude, created by Gineste and Marescotti in France, is the novel care method based on the philosophy of human attitude. It was implemented to hospitals in Japan in 2012 and widely accepted by nurses, care givers and physicians who have difficulties taking care of demented patients. In this session, we will introduce “disagreement behavioral message” and Humanitude to nurses and care staff in Asian countries.

SP25 515-2

MEDICAL TREATMENT & LONG-TERM CARE FOR DEMENTIA IN KOREA : TOWARD INTEGRATION

Seung-ho RYU (*Konkuk University Medical Center, Korea*)

Korea is the most rapidly aging society in the world. The rapid aging of the population results in the increase of the mental illnesses of the elderly such as dementia. But the traditional support system which was maintained mainly by the family and community is rapidly collapsing by the rapid industrialization and urbanization of the Korean society and the rapid nuclearization of the Korean family. So there is an urgent need to establish a system to deal with this problem of dementia. The Korean government has started the long-term care system for the elderly people, which is partially dealing with the welfare services for dementia. For more efficient management of dementia, the welfare service such as long-term care service should be more integrated with the medical service for dementia. The author will suggest the way for the integration between medical services and long-term care services for dementia. The pathway from linkage through coordination to full integration will be discussed.

REFLECTIONS ON THE LIFE AND WORK OF GARY ANDREWS

Melinda ANDREWS, Wendy ANDREWS (*Center for Ageing Studies, Australia*)

This is not a scientific paper but rather a reflection on the life and work of Gary Andrews as seen through the eyes of Melinda, his daughter with photos supplied by Wendy, his wife. Melinda Andrews worked with her father on and off for a total of ten years and will share some of her experiences as well as outlining some of Gary Andrews' career achievements before showing a slide show of photos spanning his life.

SP26 205-2

THE IMPROVABILITY OF AGEING OVER THE LIFE COURSE

Hal KENDIG (*Centre for Research on Ageing Health and Wellbeing, Australian National University, Australia*)

A societal goal of ageing well requires a vision and knowledge as to how quality of life can be fostered by enabling opportunities and overcoming adversity over the life course. The IAGG Research Agenda on Ageing, led by Professor Gary Andrews, outlined how research evidence can contribute to constructive responses to individual and population ageing in developed and developing countries. In Australia the National Research Priority for Promoting and Maintaining Good Health includes goals of A Healthy Start in Life, Ageing Well and Ageing Productively, and Strengthening Australia's Social and Economic Fabric. This new view of ageing, broadly in line with the social determinants of health, has been difficult to achieve in the contest for research funding and policy development. Further evidence can underpin inclusion of ageing in health promotion and employment strategies and policy initiatives such as Living Longer, Living Better reforms in aged care. This paper draws on three main information sources to report on the improvability of ageing experiences. The Australian Survey of Social Attitudes (AUSSA) 2009-2010 reveals sympathetic but nonetheless negative public views on the capacities of older people. The Life History and Health (LHH) Survey 2010-11 demonstrates the importance of childhood and mid life socio-economic opportunities for productivity and wellbeing among babyboomers. The Melbourne Longitudinal Surveys of Healthy Ageing (MELSHA) 1994-2011 demonstrate substantial variability and change in health and wellbeing as people move through later life. Findings are reported on critical factors in enabling individuals and social groups who have been able to overcome adverse circumstances earlier in life and as well as health and social losses in later life. The address concludes by developing an ethical, social and economic case for an inclusive life span approach to policy development attentive to social justice and social change. Keywords : international gerontology, longitudinal research, developing countries

INTERNATIONAL PRIORITIES IN AGEING RESEARCH; GLOBAL AND EUROPEAN

Alan WALKER (*Sociological Studies, University of Sheffield, United Kingdom*)

This paper will look first at the pioneering work that Gary Andrews did on the UN/IAGG Research Agenda on Ageing for the 21st Century. In particular it will show how the agenda reflects the Madrid International Plan of Action on Ageing and, therefore, represents a truly global approach to research. This section will draw on Gary's own analysis of the relationship between the UN/IAGG ageing research agenda and those of national and regional bodies. The second part of the paper will focus on the most recently produced international ageing research agenda, the European Road Map. Following a brief description of the Road Map its contents will be compared to the the global UN/IAGG agenda.

WHO SYMPOSIUM ON DEVELOPING INDICATORS FOR WHO AGE-FRIENDLY CITIES: MEASURING THE AGE-FRIENDLINESS OF CITIES AROUND THE WORLD

SP26 301-1

THE WHO AGE-FRIENDLY CITIES INDICATOR DEVELOPMENT PROJECT

Megumi KANO¹, Louise PLOUFFE², Katsunori KONDO³, Katrin ENGELHARDT⁴, Amit PRASAD¹ (*1. Centre for Health Development, World Health Organization, Japan; 2. Policy Research, International Longevity Centre, Brazil; 3. Center for Wellbeing and Society, Nihon Fukushi University, Japan; 4. Western Pacific Regional Office, World Health Organization, Philippines*)

Introduction : The WHO published a guide on essential features of an 'age-friendly' city, and has been promoting political commitment and action at the municipal level to create more age-friendly cities and communities, globally. In order to assist in the planning, monitoring, evaluation and bench-marking of age-friendly cities, WHO has taken the initiative to develop Age-Friendly City Indicators. Method : An extensive review of existing indicators of health and the broader determinants of health related to the older adult population was conducted. An international expert meeting was convened to review these indicators and identify candidates to be included in a core set of Age-Friendly City Indicators. A preliminary set of 67 indicators selected by the expert group was piloted in several cities and countries around the world to test their feasibility and utility. Results : Based on the pilot study results, the 67 indicators were ranked according to their ratings on ten criteria, including validity, replicability, sensitivity to change, social acceptability and others. The ranking results were used to narrow down the set of indicators with additional consideration to ensure coverage of the key domains of an Age-Friendly City. Conclusion : WHO has developed a set of core indicators to evaluate Age-Friendly Cities through a process involving a comprehensive desk-top review, expert consultation and multi-site piloting. Next steps include further refinement of the core indicators and developing guidance on how to use the indicators. Keywords : Age-Friendly City, Indicators, WHO

SP26 301-2

HEALTHY CITIES IN THE WESTERN PACIFIC REGION: INTEGRATING AN AGEING-FRIENDLY FOCUS

Katrin ENGELHARDT (*Health Promotion and Noncommunicable Diseases, WHO, Philippines*)

Introduction : Healthy Settings, including Healthy Cities, offer effective ways to address public health priorities. In 2010, the Member States of the WHO Western Pacific Region adopted a resolution on healthy settings (WPR/RC61.R6) noting that recent rapid economic, environmental and social changes call for scaling up and revitalizing

the Healthy Cities and Healthy Islands approaches in the Region. Method : A Regional Framework for Scaling up and Expanding Healthy Cities 2011-2015 was subsequently launched in order to promote and strengthen the Healthy Cities approach to maximize its potential positive impact on the urban living environment and lives of urban residents. Results : An important demographic change, and a positive outcome of improved public health, education and healthcare over the past century is that in many countries - and urban areas - people are living longer. This is one of the challenges that cities - as settings for health promotion - face. The Healthy Cities movement needs to be proactive and adapt to this trend. An important step is to have indicators for age-friendly cities available to enable the identification of the needs of older urban populations. Conclusion : The indicators that have been developed by the WHO will be field tested in cities within the WHO Western Pacific Region. This presentation will share the results of the field test and provide recommendations for wider implementation of the indicators. Keywords : Healthy Cities Ageing

SP26 301-3

JAGES HEART: ACHIEVEMENT AND CHALLENGES

Katsunori KONDO¹, Yukinobu ICHIDA¹, Kayo SUZUKI¹, Naoki KONDO², Toshiyuki OJIMA³ (1. Center for Well-being and Society, Nihon Fukushi University, Japan; 2. Graduate School of Medicine, The University of Tokyo, Japan; 3. Community Health and Preventive Medicine, Hamamatsu University School of Medicine, Japan)

Introduction : JAGES HEART was jointly developed with the WHO Kobe Center (WKC) as indicators for Age-Friendly Cities (AFC). Here we describe its development, examine the validity of indicators, and discuss JAGES HEART challenges. Method : We developed an indicator framework comprised of 5 elements and 2 dimensions, and used 6 criteria to select 71 benchmark indicators from 238 possibilities. To harmonize with Urban HEART (Health Equity Assessment and Response Tool) developed by the WKC, we divided those indicators into health outcomes and determinants of health indicators. To examine the feasibility of data collection and validity of indicators, we administered the JAGES (Japan Gerontological Evaluation Study) survey to 100,000 older people (response rate: 66.3%) living in 31 municipalities across Japan, and analyzed correlations among indicators. Results : We narrowed down 21 core indicators that included health outcomes such as all-cause mortality and proportion eligible for long-term care insurance, and determinants of health indicators, such as proportion of people with a park or road nearby suitable for walking, participation in sports clubs, and average taxable income. There were some significant differences between school districts, such as the percentage of people who fell down, ranging from 11.8-33.9% for 65-74 year olds, which correlated with the rate of sports organization participation. Conclusion : Though many challenges remain, development of JAGES HEART is progressing and the validity has been partially examined as AFC indicators for Japanese older people. Keywords : Age Friendly Cities, Urban HEART , indicators

SP26 301-4

AGE-FRIENDLY CITY INDICATOR DEVELOPMENT: THE EXPERIENCE IN OTTAWA, CANADA

Louise PLOUFFE¹, Clara FREIRE², Dominique PARIS-MACKAY³ (1. Policy Research, Brazil International Longevity Centre, Brazil; 2. Community and Social Services, City of Ottawa, Canada; 3. Age Friendly Ottawa Project, Council on Aging of Ottawa, Canada)

Introduction : The WHO Age-Friendly Cities initiative was originally

developed to guide cities in adapting their structures and services to promote Active Ageing. Assessing baseline 'age-friendliness' in eight policy domains and monitoring and evaluating corrective action from a seniors' viewpoint and with their full engagement was the key direction of the WHO initiative. This direction was adopted by the City of Ottawa and a coalition of community organizations led by the Ottawa Council on Aging when they implemented the WHO Age-friendly Cities initiative in 2011-12, and joined the WHO Global Network of Age Friendly Communities. Because developing indicators to monitor and evaluate local age-friendly actions was an essential component for success, piloting the development of global indicators was considered a win-win opportunity. Method : Following extensive consultations with older persons, including persons from socially marginalized or minority groups, the City of Ottawa's Older Adult Plan, and the community-based Age-Friendly Ottawa developed action plans with identified goals, activities and indicators in the 8 domains of age-friendly cities. Using the indicator piloting template provided by the World Kobe Centre for the global indicators project. Results : City and community officials are assessing the proposed global indicators. in light of their relevance, adequacy and feasibility at the local level. Conclusion : It is expected that confirmation and adoption of a set of common age-friendly community indicators at the local and global level will enhance the authoritativeness of the initiative locally and enable WHO to evaluate and sustain the Age Friendly Cities initiative globally. Keywords : active ageing age-friendly cities, indicator development project

SP26 301-5

STATUS AND FUTURE PLAN OF AGE-FRIENDLY CITY SEOUL: ITS EVALUATION AND DEVELOPMENT PLAN

Sangchul LEE (R&D Department, Aging Policy Team, Seoul Welfare Foundation, Korea)

The AFC background is that Seoul is getting old very fast and emerging as the biggest social and economic issue in the city. It could be a so-called "Age-Quake." So, a comprehensive, strategic response is mandatory. Problems caused by the fast pace of population aging in Seoul can be summarized as follows: First, the demand for healthcare, welfare and safety keeps increasing. Second, the economic growth is expected to slow down. Third, the social status of the elderly is deteriorating. Our new policies will be implemented in three directions. First, our policy areas for the elderly will expand from just traditional welfare programs to virtually all the areas covered by the city administration. Second, our new elderly policies will cover not just the population of over the age of 65 as stipulated by the Elderly Welfare Act but also the baby boomers born between 1955 and 1963. Third, our new policies will custom-tailor our services depending on their age, health and income among others. We are promoting the establishment of an age-friendly city in four stages. Step 1: the institutional support through the update of a city ordinance in line with a changed environment. Step 2: the organizational reshuffle with the mayor taking the helm of the affairs. Step 3: the publication of guidelines based on the findings of in-depth surveys and interviews. Step 4: the establishment of action plans and the establishment of evaluation systems

VULNERABLE PEOPLE IN PUBLIC PENSIONS: IDEAS, INSTRUMENTS AND CONTRADICTIONAL MECHANISMS IN

EUROPE

Patricia FRERICKS (*Faculty of Economic and Social Sciences, Centre for Globalisierung and Governance, Hamburg University, Germany*)

European welfare states are so-called mature welfare states. Starting in the 19th century they “matured” across the western part of the continent after the Second World War. However, their design, aims and effects widely differ from one another. Therefore, established welfare systems have been inclusive in different ways. In addition, European welfare states change dramatically since the 1990s, pointing towards convergence of the continent’s systems as well as to a further diversification of them. The examination of coverage (3) I will combine both with the analysis of the level of benefits (2) to gain insights into the essence of coverage over the life-course, and with the analysis of the states’ objectives (1) in order to understand current shifts in pension coverage (‘marketization’). I will refer to different stages of European pension systems to show their ideas, instruments and contradictory mechanisms in terms of coverage and the changing definition of the vulnerable in the systems’ “adulthood” and today.

SP26 304-2

A FEASIBILITY STUDY ON THE MINIMUM GUARANTEE PENSION SCHEME IN JAPAN

Katsuya YAMAMOTO (*Department of Social Security I, National Institute of Population and Social Security Research, Japan*)

Recently, the young are compelled to work as non-regular workers in Japan, and as they don’t have the enough pensions in the future, the newly problem; the extension of coverage to non-regular workers in employees’ pension system is emerging. In this paper, we attempt to estimate the cost of the former ruling party’s pension blueprint. However, the key of success to introduce the MPG is the working and economic condition. If Japanese economy doesn’t improve significantly, the level of consumption tax for the MGP is to raise 20% more, and making the basis of low-income 1.8 million yen to 1.0 million yen, we need to raise 14%. It is the long way for reform. Keywords : minimum guarantee pension, actuarial simulation, non-regular worker, consumption tax

SP26 304-3

EXTENSION OF COVERAGE TO VULNERABLE PEOPLE IN PUBLIC PENSION

Hosun YOO (*National Pension Research Institute, Korea*)

The purpose of the study is to examine the coverage of the Korean National Pension and suggest alternative policy to extend the coverage especially focused on women. Because the coverage of women in Korean National Pension is lower than that of man. We suggest alternative policy, especially, focused on credit system for women.

FINANCIALLY LITERACY AND RETIREMENT PLANNING OF MARRIED COUPLE

Wonah YOON (*Samsung Life Insurance, Korea*)

We examine financial literacy in Korea, wherein we demonstrate that financial literacy is particularly low among the young, women, and the less-educated. As result, we show that people who score higher on the financial literacy questions are also much more likely to plan for retirement.

SP26 304-6

LATER LIFE PLANNING IN THE PUBLIC SECTOR

Heayoung SUNG (*National Pension Research Institute, Korea*)

It is necessary to build up later life planning in individual and family level. The reason is that the period of after retirement is longer than before and people cannot expect any support from their children due to a change of support consciousness. Because of the complexity of social system and the diversity of welfare systems, the elderly, women and low-educated groups are very vulnerable to plan their own later life. Therefore it is becoming more important to provide counseling, pension education and information about government services. As the earning replacement rate of national pension reduced by 40% due to the 2007 pension reform, it is required to guarantee a disposable income including retirement pension and individual pension. In order to support these process, the role of the public sector becomes very important. The purpose of providing later life planning in the public sector is to assist people in deciding the priority of their own life and to be aware of the importance of preparing for old age. The National Pension Service (NPS) has provided later life planning service to its insured people from 2008. Each area of later life planning is divided into financial planning, health, jobs, family relationships and leisure. The financial planning is the most important part of later life planning and national pension is a basic source of income of old age. The NPS tries to help people to get their retirement pension and individual pension in addition to national pension. Life models after retirement are inevitably different from individuals because family types or lifestyles are more various than ever before. Therefore later life planning in the public sector should be focused on improving an ability of planning their own life.

INSERM U 853, Univ Bordeaux Segalen, Pole de Gerontologie Clinique, CHU hopitaux de Bordeaux, France)

Introduction : Helicobacter pylori infection seems to play a critical role in extragastric diseases including Alzheimer's dementia (AD). We found that H. pylori infection was associated with a higher cognitive impairment in AD patients. Chronic H. pylori infection could worsen AD lesions via atherosclerosis and inflammation. Thus, our aim was to infect AD transgenic (Tg) mice and their wild type (WT) littermates by Helicobacter species in order to explore their cerebral and behavioural lesions. Method : In a first study, C57Bl/6 mice were infected during 18 months with H. pylori SS1 strain (n=6) or Helicobacter felis (n=6) or left uninfected (n=6). In a second study, two groups of Tg mice (APP^{swe}+PS1^{de9}) and their WT littermates were infected with SS1 (n=75) or H. felis (n=75) or uninfected (n=75) and sacrificed after 3, 6 and 9 months. For the 2 studies, brain and stomach were processed to detect cerebral amyloid plaques (thioflavine S stain), astroglial and microglial cells (immunohistochemistry anti-GFAP and anti-IBA1 respectively) and gastric lesions (hematoxylin and eosin stain). For the second study only, spatial memory, social interaction and anxiety were tested before sacrifice. Results : In the first study, no amyloid plaque was observed in C57Bl/6 infected mice but astroglial activation tended to increase in the hippocampus of these mice compared to non-infected mice. Behavioural and histological experiments related to the Tg mice are currently in progress. Conclusion : Based on epidemiological arguments supporting an AD - H. pylori association, this murine model should provide elements on the impact of H. pylori infection on the brain. Keywords : Helicobacter pylori, Alzheimer's dementia, murin model

ALTERATION IN CELL CYCLE REGULATION CAN BE THE UNDERLYING CAUSE OF COCKAYNE SYNDROME

Mi-Sun KANG¹, Sung-Lim YU², Ho-Yeol KIM¹, Choco Michael GOROSPE³, Sung-Keun LEE¹ (1. Department of Pharmacology, College of Medicine Inha University, Korea; 2. Inha Research

Institute for Medical Sciences, College of Medicine Inha University, Korea; 3. Department of Molecular Biomedicine, Inha University, Korea)

Introduction : RAD2, a yeast counterpart of human XPG gene, encodes a well known DNA repair related endonuclease that specifically cleaves the 3' side of a DNA lesion. RAD2 is also known to be involved in transcription elongation. Defects of XPG gene cause xeroderma pigmentosum (XP) and/or Cockayne syndrome (CS), two distinct hereditary human disorders. XP is characterized by increased UV sensitivity and predisposition of cancer incidence due to the accumulation of damaged-DNA, while CS is characterized by growth retardation, neurological abnormalities, and premature aging without increased cancer rate. Transcriptional defects have been suggested as the cause of CS, but it is still elusive. Method : Using yeast genetics, we have examined a novel function of RAD2 in CS. Results : Over-expression of RAD2, which mimics induction of RAD2 expression in response to DNA damage, caused cell cycle arrest. Further analysis revealed that the C-terminal region of Rad2p is responsible for cell cycle arrest. Later, we examined the phenotypes of rad2 C-terminal deletion mutant (rad2CΔ) that resembles the C-terminal truncation of XPG in XPG/CS patients caused alteration in cell cycle after irradiation of ultra violet (UV) light. rad2CΔ mutant exhibits abnormal cell morphology, a defective α-factor response, shortened lifespan and cell polarity defect. Conclusion : These results implicate that post-UV cell cycle arrest due to the C-terminal truncation is the fundamental cause of XPG/CS. Keywords : RAD2/XPG, Cockayne syndrome, cell cycle regulation

PP25 B-003

INCREASED TH17 DIFFERENTIATION IN AGED MICE IS SIGNIFICANTLY ASSOCIATED WITH HIGH IL-1B LEVEL AND LOW IL-2 EXPRESSION

Mi-Ae LIM¹, Jennifer LEE¹, Jin-Sil PARK¹, Joo-Yeon JHUN¹, Young-Mi MOON¹, Mi-La CHO¹, Ho-Youn KIM² (1. Rheumatism Research Center, The Catholic University of Korea, Korea; 2. Division of Rheumatology, Department of Internal Medicine, Konkuk University, Korea)

Introduction : Aging has been reported to be associated with changes in immune function. Although frequent infection and development of malignancy suggest the decline of immune function with aging, changes toward proinflammatory conditions also develop at the same time. We investigated changes in the Th17 population during aging to elucidate a possible mechanism for this response. Method : Splenocytes were isolated from 2-month-old (young) and 20-month-old (aged) mice. The frequency of IL-17-producing cells was measured by flow cytometry. The expression of IL-17 and Th17-related factors at the mRNA level was measured by RT-PCR. The expression of IL-17 and IL-1β in spleen tissues was additionally assessed by confocal microscopy. Results : The proportion of IL-17-producing CD4⁺ T cells was higher in the splenocytes of old mice than those of young mice. In addition, the expression of retinoic acid receptor-related orphan nuclear receptor gamma t (RORγt) and other

Th17-related factors was increased in the splenocytes of aged mice compared to those of young mice. The expression of IL-1 β , which was reported to promote Th17 differentiation, was higher in the aged mice. CD4+ T cell expression of IL-1R was also higher in the aged mice, suggesting that the CD4+ T cells of the aged mice could more easily differentiate into Th17 cells in response to IL-1 β . When an anti-IL-2 antibody was applied, the proportion of IL-17-producing cells increased more prominently in the young mice. Conclusion : The proportion of Th17 cells was increased in the aged mice. Keywords : aging, Th17

PP25 B-004

VASCULAR DYSFUNCTION AND ALZHEIMER'S DISEASE

Alice BREINING¹, Chantal BOULANGER², Veronique FAUCOUNAU¹, Marc VERNY¹, Jean-Sebastien SILVESTRE², Jacques BODDAERT¹ (1. Geriatric Department, Peri-Operative Unit, Pitie-Salpetriere Hospital, APHP, UPMC Paris 6, France; 2. U970, INSERM, France)

Introduction : Search for new diagnostic or prognostic tools in Alzheimer's disease (AD) is challenging. Since current evidence suggests a role for cerebro-vascular dysfunction in AD, the aim of our study was to analyze the interest of endothelial dysfunction biomarkers in AD patients. Method : Community dwelling older persons who present to our reference center with a memory complaint were included. AD diagnostic and prognostic value of 3 biomarkers were studied in blood sample: endothelial microparticules (EMP), circulating endothelial cells (CEC) and endothelial progenitor cells (EPC). Results : 132 patients were included and classified into three groups: patients with dementia (n=84), with Mild Cognitive Impairment (n=11) and control patients (n=37). Sixty two patients had a neurodegenerative dementia, among which 48 (57%) had AD, 20 a vascular or mixed dementia (24%) and 2 patients undetermined dementia. No significant difference was found in the level of EMP, CEC and EPC between patients without or with dementia, whether it was a neurodegenerative or vascular dementia. Those results were not modified after adjusting on cardiovascular risk factors. No correlation was found between the level of EMP, CEC and EPC and rapid cognitive decline during the following year. Conclusion : Endothelial dysfunction biomarkers do not allow to diagnose dementia, nor its aetiology. Nor do they allow to predict cognitive decline. Further studies on endothelial dysfunction markers in the cerebrospinal fluid open new perspectives on diagnosis of dementia. Keywords : Alzheimer, microparticules, biomarker

CROSSING HUMAN APP WILD TYPE MICE WITH PS1(M146V)KI MICE REVEALS A β DEPENDENT SYNAPTIC DEFICITS

Kiyoka KINUGAWA¹, Noemie NOEL², Hadi ZANJANI², Mark MATTSON³, Jean MARIANI², Catherine ROVIRA² (1. Functional Exploration Unit, Charles Foix Hospital, Assistance Publique des Hopitaux de Paris, France; 2. UMR7102 Neurobiologie des Processus Adaptatifs, University Paris 6 Pierre and Marie Curie, Centre National de la Recherche Scientifique, France; 3. Laboratory of Neurosciences, National Institute on Aging Intramural Research Program, USA)

Introduction : Alteration of hippocampal synaptic efficacy is thought to be one of the earliest events in Alzheimer's disease. Early onset Alzheimer's disease is mainly caused by mutation in the PS1 gene. We know that A β hypersecretion may lead to synapse loss and at latter stage to neuron loss. We showed that transgenic mice Knock-in for the

M146V mutation exhibit an inhibition of the early LTP at 12 months but also of the late-LTP in 3-month-old mice. These deficits are likely Abeta-independent since murine A β do not aggregate and mutated PS1 mice do not exhibit amyloid plaques. In this work we aimed to investigate the A β -dependent effect of PS1(M146V)KI mutation on synaptic plasticity. Method : We crossed mice overexpressing wild type Human APP with PS1(M146V)KI mice to obtain double transgenic mice hAPPwt/PS1(M146V)KI mice. We recorded in the CA1 region from hippocampal slice the early LTP in 9-month-old mice. Results : We find no significative differences between control mice : +/+ mice (1,29 \pm 0,0027, 8 mice, 11 slices); +/APP mice (1,242 \pm 0,0027, 7 mice, 10 slices); PS1 KI/KI mice (1,2563 \pm 0,0032, 6 mice, 10 slices). On the other hand there was a clear deficit in the early LTP in the hAPPwt/PS1(M146V)KI mice (0,0997 \pm 0,0018, 10 mice, 11 slices). Conclusion : Therefore this study reveals early Abeta-dependent synaptic deficits caused by the PS1(M146V)KI mutation. This work was supported by grants from LECMA and foundation Lejeune. THE IMPACT OF PHYSICAL REHABILITATION IN THE FRAIL SYNDROME OF ELDERLY IN THE COMMUNITY

Debora Melo SIGNORETTI¹, Lilian Tiemi SONODA², Milene Silva FERREIRA³, Gabriela SATO⁴, Miriam Ikeda RIBEIRO⁵, Sandra Alves BARBOSA⁶ (1. Physicaltherapy, Residencial Albert Einstein, Brazil; 2. Physiotherapy, Residencial Israelita Albert Einstein, Brazil; 3. Physician, Residencial Israelita Albert Einstein, Brazil; 4. Coordinator, Residencial Israelita Albert Einstein, Brazil; 5. Manager, Residencial Israelita Albert Einstein, Brazil; 6. Nurse, Residencial Israelita Albert Einstein, Brazil)

Introduction : The objective was to verify the results of a physical rehabilitation program directed to frail elderly of the community. Method : A study was held with 12 elderly of the community, attended at Residencial Israelita Albert Einstein geriatric clinic. Data comparison was run before and after the physical rehabilitation program, according to SPPB (Short Performance Physical Battery) variables, handgrip strength, age, gender and number of falls in the last year. Results : By the sample comprised by 12 elderly it was verified that after 4 months (48 physiotherapy sessions) there was an improvement in all parameters assessed. The male individuals have improved 106% whereas the female have improved 31.54%. There was 15% improvement in the gait speed, 147% in the muscular strength of the lower limbs and 70% improvement in balance. In the right and left handgrip strength there was 32% and 25% increase, respectively. In TUG (Timed Up and Go) there was 27.9% improvement. The elderly that were 80 or more years old have shown 83% improvement while those that were less than 80 had 41%. 50% showed correlation between the falls and the handgrip strength lower than 17Kg/F. Conclusion : The physical rehabilitation program directed to the frail elderly is able to demonstrate a significant improvement in the gait speed and balance parameters and in the muscular strength of the lower limbs. There was a difference in the results by gender and age. Moderate correlation of parameters with number of falls and handgrip strength. Keywords : elderly, frailty, community

DIMINISHED HEMISPHERIC LATERALIZATION OF MOTOR CONTROL IN ELDERLY

Jinsung WANG (Kinesiology, University of Wisconsin, USA)

Introduction : Hemispheric asymmetry reduction in older adults (HAROLD) has been reported in previous imaging studies that employed not only cognitive, but also motor tasks. However, whether age-related reductions in asymmetry of hemispheric activations affect the symmetry of motor behavior in older adults remains largely untested. In the present study, we examined the effect of aging on lateralization of motor adaptation and transfer by investigating adaptation to a novel visuomotor environment in both old and young adults. We have previously reported substantial asymmetries in interlimb transfer of visuomotor adaptation in young adults, and attributed these asymmetries to hemispheric lateralization for motor control. Based on the HAROLD model, we reasoned that older adults should recruit more symmetrical hemispheric activity, and thus show more symmetrical transfer of visuomotor adaptation across the arms. **Method :** Half of the subjects in each age group first adapted to a rotated visual display with the left arm, then with the right arm; and the other half in the reversed order. Naive performance with one arm and the same-arm performance following opposite arm adaptation were compared to determine the extent of transfer in each age group. **Results :** Our results indicated that interlimb transfer of initial direction information only occurred from the nondominant to dominant arm in young adults, whereas it occurred in both directions in older adults. **Conclusion :** Our findings clearly indicate substantially reduced asymmetry in visuomotor adaptation in older adults, and suggest that this reduced motor asymmetry might be related to diminished hemispheric lateralization for motor control. **Keywords :** Hemispheric lateralization, Motor control, Reaching movement

CORRELATIONS BETWEEN PHYSICAL FITNESS AND SERUM BIOCHEMISTRY PARAMETERS IN ELDERLY MALE LIVED IN RURAL AREA

Yi-Chen TUNG¹, Jin Jong CHEN¹, Meng-Tzu HOU¹, Chih-Hsing WU²
(1. *Physical Therapy and Assistive Technology, National Yang-Ming University, Taiwan*; 2. *Family Medicine, National Cheng Kung University Hospital, Taiwan*)

Introduction : The purpose of this study was to disclose the relationship between serum biochemistry parameters and physical fitness performance in old male lived in rural community in Taiwan. **Method :** In 2010, 1033 men aged 65 and over lived in Tianliao District was selected in an epidemiological survey. A total of 414 subjects were enrolled, the respond rate was 60.8%. Structured questionnaires included age, living state, occupation state, living habits, socioeconomic state and physical activity of weekly etc. which were inquired by face-to-face instructor for each subject. The physical fitness tests had grasp test of dominant hand, muscle strength/endurance, balance, flexibility, and reaction. Then serum biochemistry parameters were collected, percent body fat and hip bone mineral density (DAX) were also obtained accordingly. **Results :** There were 402 subjects completed the study, the average age was 74.5±6.0 (range=65-98) y/o. Using multiple linear regression models, the independent factors (β coefficient) for different physical function tests were listed as followings: 30-s chair stand test = age(-0.295), percent body fat(-0.136), creatinine with 1.5ng/ml cut point(-0.099) and GFR-MDRDs with 60 ml/min/1.73 m² cut point(0.106); open-eye stand= age(-0.386), BMI(-0.17) and fasting plasma glucose (-0.175); chair sit-and-reach test= age(-0.169); 8-feet walking test= age(0.322), BMI(0.156), tea(-0.122), physical activity(-0.22) and fasting plasma glucose (0.1); hand grip test= age(-0.386), BMI(0.207), physical activity(0.144), albumin(0.135). Vitamin and HDLC didn't have correlation with any physical fitness performance significantly. **Conclusion :** We can use creatinine and GFR-MDRDs to predict the

muscle strength and endurance of elderly, and fasting plasma glucose may use to predict balance and reaction ability of elderly. **Keywords :** physical fitness, elderly

ACUTE EFFECTS OF ANTI-AGING PROGRAMS ON HEALTH-RELATED PHYSICAL FITNESS, CARDIOVASCULAR ADAPTATION AND ANTIOXIDANT IN THAI ELDERLY

Apiwan NUTTAMONWARAKUL¹, Amornrat SATTHATUMARAT²
(1. *Medical Service, Geriatric Institute, Thailand*; 2. *The Supreme Patriarch Center on Aging, Ministry of Public Health, Thailand*)

Introduction : Anti-aging as a specialty practice is growing rapidly in contemporary medical practice. The approach becomes common in many areas of fields, with provable scientific basis. Even if aging is inevitable, with successful treatment, it can be possible for delaying or extending period of good health. The objective of this research was to study and develop a program to slowing down effect of aging. **Method:** One-hundred subjects were assigned either to experimental group anti-aging program (n=50) or health promotion program control group (n=50) for a period of one week. **Results :** Body weight, BMI, body fat (%), systolic blood pressure, heart rate rest and rate pressure product were decreased significantly (p <0.05) after the end of the Anti-aging program over a period of 1 week. But there was no significant difference between the two groups whereas, strength, flexibility, basal metabolic rate (BMR) and maximum oxygen consumption (VO₂max) were increased significantly (p <0.05) after 1 week of the Anti-aging program and also found statistically significant at the .05 level between groups, which the experimental group had BMR and VO₂max higher than the control group. The levels of Dehydroepiandrosterone Sulfate (DHEA-S) and blood urea nitrogen (BUN) were decreased significantly (p <0.05) in both group. But, there was no significant difference between the two groups. **Conclusion :** Anti-aging program included CRAN, interval exercise training, Pray and Anapanasati meditation for a period of 1 week shown result in slowing the process of aging in the body to act effectively affect longevity with good health more than general health promotion program. **Keywords :** anti-aging, antioxidant, elderly

PROTECTIVE EFFECT OF BIOCHANIN A ON IN-VITRO MODEL OF ALZHEIMER'S DISEASE: A POSSIBLE FUTURE FRONTIER AGAINST AGEING

Ji Wei TAN, Min Kyu KIM (*Institute of Bioscience, Universiti Putra Malaysia, Malaysia*)

Introduction : Alzheimer's disease is currently the most common form of dementia in the world which is closely related with ageing. In this current study, biochanin A, a phytoestrogen compound found in *Trifolium pretense*, was used to investigate its effects against β -amyloid-induced cytotoxicity in PC12 cells. **Method :** The study was carried out by exposing PC12 cells to β -amyloid with or without biochanin A. The cell viability test was accessed using thiazolyl blue tetrazolium bromide assay. In addition, annexin V/Propidium iodide staining was used to quantitate the apoptotic cells whereas the mitochondrial membrane potential (MMP) was accessed through rhodamine123 fluorescent probe. The result data were evaluated using one-way ANOVA followed by Fisher's Least Significant Difference test as a post-hoc test. **Results :** Exposure of PC12 cells solely to β -amyloid was found to significantly increase cell viability loss and apoptosis as compare to untreated control group (P < 0.01). However, in the present of biochanin A, such adverse effects induced by β -

amyloid were attenuated as indicated by the recovering of cell viability and also decreasing of apoptosis. Moreover, the decrease in MMP caused by β -amyloid ($P < 0.01$) was able to show sign of increase in the present of biochanin A. Conclusion : As a conclusion, biochanin A was able to act as a potential compound to exert its protective effects against β -amyloid-induced cytotoxicity. The outcome of this study may, in the future, contribute to anti-ageing in some extend. However, more tests still need to be conducted to further investigate and fully understand the potentials. Keywords : Alzheimer's disease, Mitochondrial, Biochanin A

MECHANISM OF NANOMETER PREPARATION OF DOGWOOD AGAINST ENCEPHALIC ANAPLASIA IN AGING
Qin OU¹, Shu-Qiu WANG², Jin-Hua PIAO¹, Ming-Fu WANG¹, Li-Na LIU¹ (1. Department of Biochemistry & Molecular Biology, College of Basic Medicine, Jiamusi University, China; 2. Department of Pathophysiology, College of Basic Medicine, Jiamusi University, China)

Introduction : By detecting the mRNA expression of Bdnf, TrkB, Syp and P-ERK protein expression in hippocampus of aging model rats , To explore the relation between the learning and memory capabilities and the BDNF-TrkB signal transduction pathway and the effect of nanometer particle of dogwood on it. Method : Forty male SD rats (body weight 350g~400g) were randomly divided into 4 groups, the youth compare group (YCM), the aging model group(AMG), water extract and nanometer particle of dogwood groups (WER and NPR). The ability of learning and memory were measured by Morris water maze. Serum SOD and MDA were detected by chemical method; The mRNA expression of Bdnf, TrkB and Syp in hippocampus were measured by RT-PCR method. The expression of P-ERK protein was examined by western blot method. Results : The ability of learning and memory and the activity of SOD were decreased significantly, the expression of Bdnf、TrkB、Syp mRNA and P-ERK protein were decreased significantly ($p < 0.01$) than those in YCM. Compared with ACG rats, the capacity of learning and memory of the medication administration group were improved significantly ($p < 0.01$), The activity of SOD ($p < 0.01$), the amount of Bdnf ($p < 0.01$), TrkB ($p < 0.01$) and Syp mRNA ($p < 0.01$) and the expression of P-ERK protein were increased ($p < 0.01$). Furthermore, the effect of NPR is more obvious than WER of dogwood ($p < 0.05$). Conclusion : Cognition deterioration of aging model rats is related to the abnormality of cognition related gene Bdnf, TrkB and Syp mRNA expression. Dogwood could improve the learning and memory capabilities by increasing the Bdnf, TrkB and Syp mRNA and P-ERK protein expression in hippocampus. The effect of NPR is superior to its WER. Keywords : dogwood; BDNF-TrkB; learning and memory

Shanghai Institute of Geriatrics, Huadong Hospital, Shanghai Medical College, Fudan University, China; 4. Central laboratory, Shanghai Institute of Geriatrics, Huadong

Hospital, Shanghai Medical College, Fudan University, China)

Introduction : Oxidative stress contributes to a chronic inflammatory process referred to as inflamm-aging. Acetylcholinesterase inhibitors (AChEI) can enhance cholinergic transmission and act as anti-inflammatory agents via immunocompetent cells expressing α -7 acetylcholine receptors (AChR). The present study has been conducted to explore the possible role of huperzine A, a reversible and selective AChEI, against D-galactose-induced oxidative damage, cell toxicity and inflamm-aging in rat livers. Method : In two-month-old rat with normal liver function, an eight-week administration of D-galactose (300 mg/Kg subcutaneously (s.c.)) was used to induce liver inflamm-aging. An eight-week co-administration of both D-galactose (300 mg/Kg s.c.) and huperzine A (0.1 mg/Kg s.c.) was used to study anti-inflamm-aging and the hepatoprotective effects of huperzine A. Results : D-galactose significantly increased hepatic function impairment, ROS generation and oxidative damage, hepatic senescence, nuclear factor-kappa B (NF- κ B) activation and inflammatory responses. Huperzine A not only significantly decreased D-galactose induced hepatic function impairment, ROS generation, oxidative damage, but also suppressed inflamm-aging by inhibiting hepatic replicative senescence, AChE activity, I α B α degradation, NF- κ B p65 nuclear translocation and inflammatory responses. The expressions of mRNAs and proteins of pro-inflammatory cytokines, such as TNF α , IL-1 β , and IL-6 decrease significantly, and the protein levels of the anti-inflammatory cytokine IL-10 increase obviously. Conclusion : Huperzine A exhibited protective effects against D-galactose-induced hepatotoxicity, inflamm-aging by inhibiting AChE activity and the activation of the cholinergic anti-inflammatory pathway. The huperzine A mechanism might be involved in the inhibition of DAMPs mediated NF- κ B nuclear localization and activation. Keywords : D-galactose; huperzine A; inflamm-aging; inflammation and anti-inflammation; cholinergic anti-inflam

INHIBITION OF ANGIOTENSINII-INDUCED CARDIAC HYPERTROPHY BY PUERARIN THROUGH REACTIVE OXYGEN SPECIES

Gang CHEN, Cong SHEN, Xiumin ZHANG, Qiyang HE (Institute of Medicinal Biotechnology, Chinese Academy of Medical Sciences and Peking Union Medical College, China)

Introduction : Puerarin, an isoflavone purified from Chinese herb radix of Pueraria lobata, possesses comprehensive pharmacological actions for treatment of cardiovascular diseases and diabetes mellitus. However, whether it affects cardiac hypertrophy remains elusive. Method : Potent inhibition of cardiac hypertrophy by puerarin was shown in the angiotensin II-induced mice model after intraperitoneally administration of puerarin injection. The cardiac hypertrophic morphology and ratio of heart weight/body weight were markedly improved by puerarin in comparison with the angiotensin II-treated-alone mice. The inhibition of cardiac hypertrophy markers such as atrial natriuretic peptide, brain natriuretic peptide, β -myosin heavy chain mRNA expressions and suppression of extracellular signal-regulated kinase 1/2 phosphorylation were observed. Results : The cardiac hypertrophic morphology and ratio of heart weight/body weight were markedly improved by puerarin in comparison with the angiotensin II-treated-alone mice. The inhibition of cardiac hypertrophy markers such as atrial natriuretic peptide, brain natriuretic peptide, β -myosin heavy chain mRNA expressions and suppression of extracellular signal-regulated kinase 1/2 phosphorylation were observed in the mice and primary cultured cardiomyocytes after exposure to puerarin. Furthermore, puerarin inhibited the generation of

reactive oxygen species and decreased in proportion of DNA synthesis phase distribution stimulated by angiotensin II in the cultured cardiomyocytes. Conclusion : Puerarin prevents cardiac hypertrophy by inhibiting the generation of reactive oxygen species and the signaling pathway of extracellular signal-regulated kinase 1/2. Keywords : puerarin; angiotensin II; cardiac hypertrophy; reactive oxygen species; extracellular signal-regulat

ANTIOXIDANT ENZYMES ACTIVITY AND MALONDIALDEHYDE LEVELS CAN BE MODULATED BY PIPER BETLE, TOCOTRIENOL RICH FRACTION AND CHLORELLA VULGARIS IN AGING C57BL/6 MICE

Yasmin MOHD YUSOF, Nor Syahida ALIAHMAT, Suzana MAKPOL, Wan Zurinah WAN NGAH (*Department of Biochemistry, Faculty of Medicine, Universiti Kebangsaan Malaysia, Jalan Raja Muda Abdul Aziz, Malaysia*)

Introduction : Ageing has been associated with increased reactive oxygen species (ROS) in our body. A balance between ROS and antioxidants is essential for a healthy ageing. The aim of this study was to determine the erythrocyte antioxidant enzymes activities, superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPx) and plasma malondialdehyde (MDA) levels in aging mice and its modulation by potential antioxidants; Tocotrienol Rich Fraction (TRF), Piper betle (PB) and Chlorella vulgaris (CV). Method : One hundred and twenty male C57BL/6 inbred mice were divided into three age groups, young (6 months old), middle (12 months old) and old age (18 months old). Each age group consisted of two control groups (distilled water and olive oil) and three treatment groups: PB (50 mg/kg body weight), TRF (30 mg/kg) and CV (50 mg/kg). The duration of treatment for all groups was two months. Blood was withdrawn from orbital sinus for biochemical determination. Results : PB increased the activities of CAT, GPx and SOD in young, middle and old age groups respectively. TRF decreased SOD activity in the middle and old age groups but it had no effect on CAT and GPx activities in all age groups. CV increased GPx and decreased CAT activities in the middle and young age groups and reduced lipid peroxidation (MDA levels) in all age groups. No significant changes of MDA levels were seen with TRF and PB treatments. Conclusion : We found equivocal age-related changes in erythrocyte antioxidant enzymes activity with PB, TRF and CV treatments. Keywords : antioxidant enzymes, Piper betle, Chlorella vulgaris

THE ANTI-AGING EFFECT OF ORION COULD BE ASSOCIATED WITH ELEVATED STABILITY OF MACROMOLECULES AND/OR ENHANCED REMOVAL OF CELLULAR GARBAGE

Vladislav Victorovich BEZRUKOV¹, Sergey Anatolevich MIKHALSKY², Vasiliy Nikolaevich BONDAR³, Oleg Igorevich ZHUKOVSKY⁴, Vladimir Ilich POLYAKOV⁵, Khachik Kazarovich MURADIAN¹ (*1. Physiology, Institute of Gerontology NAMS Ukraine, Ukraine; 2. Morphology, Institute of Gerontology NAMS Ukraine, Ukraine; 3. Orion 387, Charitable fund 'Kievskaya rus', Ukraine; 4 Orion, International charitable fund 'Kievskaya rus', Ukraine; 5 Orion387, International charitable fund 'Kievskaya rus', Ukraine*)

Introduction : Orion is a drug based on derivatives of taurocholic acid and several other compounds. It could be one of few genuine geroprotectors because its anti-aging efficiency manifested only in old animals. In our experiments with drosophila, Orion was ineffective at

early periods of ontogenesis. The geroprotective effect, nevertheless, gradually elevated with flies aging, resulting in several folds increase of the remaining life span and survival at stresses which could primarily be associated with higher resistance of macromolecules to denaturation (heat shock, acidic or alkaline feeding medium). It is known that significant part of proteins (around 30 %) misfolds augmenting the pool of useless macromolecules. Given that the content of such malfunctioned macromolecules and lipofuscin-like products dramatically increases with aging, it was tempting to speculate whether the late-ontogenetic effects of Orion could be associated with stabilization of macromolecules and/or enhanced removal of cellular garbage. Method : Number and surface of granules of lipofuscin-like products, as well as destructed laminar and vacuolar products were measured in electron-microscopic study of glia and neurons of old (50-60 days) drosophila after 1-2 weeks maintenance on the medium with Orion (1-2 %). Results : Data obtained support the ameliorating potential of the drug. On the background of moderate decline in the number of granules, highly significant decrease of their surface was observed, implying gradual erosion of garbage-like products. Conclusion : Although further research is clearly warranted to confirm the remarkable anti-aging capacities, Orion could be one of few drugs provoking macromolecule stabilization, cellular garbage removal and life span extension specifically in old. Keywords : Orion, anti-aging, cellular garbage

PP25 B-016

PEPTIDES SLOW DOWN AGING OF THE BRAIN AND THYMUS CELLS

Vladimir KHAVINSON, Natalia LINKOVA, Valerii BENBERIN, Roman UMNNOV, Natalia CHERVIAKOVA, Svetlana TROFIKOVA (*Biogerontology, Saint Petersburg Institute of Bioregulation and Gerontology, Russia*)

Introduction : Some causes of mortality in people aged 60 and older are neurodegenerative diseases which reduce brain and immune functions. Moreover major part of pathologies associated with neurons destruction and reduced cognitive functions (Alzheimer's disease, Parkinson's disease and other), age-related thymus involution (autoimmune, infectious, oncological diseases) in elderly people represent a big problem. Method : A new approach to the restoration of brain and thymus functions is an application of peptide geroprotectors. Results : Tripeptide enhances proliferation and differentiation of brain cortex neurons, it exerts neuroprotective effect, contributes to the antioxidant system activation and increased capacity for work. Dipeptide restores immunogenesis in the thymus and spleen, induces T- and B-lymphocytes proliferation and differentiation, stimulates regeneration processes, contributes to the increased average lifespan. Conclusion : It was revealed that peptides penetrate into the nucleus and nucleolus of the cell and bind with one- or double-stranded DNA fragments. This evidences peptide effect on epigenetic mechanisms of gene expression regulation. Keywords : peptides, immune system, brain, aging

EXPERIMENTAL STUDY OF ARGININE EFFECT ON THE HEMOPOIETIC FUNCTION OF MATURE LABORATORY ANIMALS UNDER PHYSIOLOGICAL CONDITIONS AND UNDER CONDITIONS OF IONIZING RADIATION

Dmitry GREBNEV, Anatoly YASTREBOV, Irina MAKHLAKOVA (*Laboratory of Patological Physiology of Aging, Institute of Medical Cell Technologies, Russia*)

Introduction : The objective of our study was to investigate arginine

effect on hematosis in mature laboratory animals under physiological conditions and conditions of ionizing radiation. Method : Laboratory animals were divided into four groups. The first group was composed of animals free of extreme factor influence. The second group getting arginine under physiological conditions. The third group under the effect of ionizing radiation (4.0 Gr), the fourth group were being given arginine per os 1 hour after ionizing radiation. Results : The analysis of myelogram on the 7th day after arginine introduction showed increase of myelocytes number in granulocyte differon ($0,34\pm 0,07$, $p<0,05$). At the same time a 39 % increase of erythroblasts was noted in erythroid sprout. But it did not change general content of erythroid elements. While analyzing myelogram of laboratory animals on the 7th day after arginine insertion and irradiation it was noted that in granulocyte sprout there was increase of myeloblasts ($0,25\pm 0,03$, $p<0,05$), and myelocytes ($0,23\pm 0,03$, $p<0,05$). At the same time general content of granulocytes did not different from the control group data. In the erythroid growth increase in polychromatophile normoblasts was noted. At the same time general content of erythroid elements was similar to the control subgroup. Conclusion : So the introduction of arginine under physiological conditions promotes the increase of erythroblasts and myelocytes in the myeloid tissue, while its introduction under the ionizing radiation condition brings the increase of polychromatophile normoblasts, myeloblasts and myelocytes. Keywords : haemopoiesis, regeneration, arginine

THE EXPERIMENTAL STUDY OF ARGININE ACTION ON THE HEMATOPOIESIS STIMULATION OF THE OLD LABORATORY ANIMALS UNDER THE PHYSIOLOGICAL CONDITIONS AND CONDITIONS OF IONIZING RADIATION
Dmitry GREBNEV, Anatoly YASTREBOV, Irina MAKLAKOVA
(Laboratory of Patological Physiology of Aging, Institute of Medical Cell Technologies, Russia)

Introduction : The key question in this study was the investigation of arginine action on the hematopoiesis of old laboratory animals both under the physiological conditions and the conditions of ionizing radiation. Method : Experiments were conducted on 72 white male laboratory animals of CBA breed aged 18 months, weighing 60g. Radiation was achieved with the help of the AGAT-C Gamma-therapeutic device with radionucleur Co-60 source[1]. Arginine was introduced in the dose of 4.2 mg/kg in a 0.4ml solution. The control group received a 0.4ml NaCl solution. The investigation of hematosis tissue were conducted on the 1st and the 7th day. Results : On the 1st day after arginine introduction no changes in the thropoiesis and granulocytopenesis were noted. On the 7th day after arginine introduction in animals the analysis of myelogram showed an increase of promyelocytes content. In the erythroid growth the increase in erythroblasts and polychromatophilic normoblasts. The changes mentioned brought an increase in general erythroid elements number. On the 7th day significant increase of reticulocytes in the peripheral blood was observed. Analyzing myelogram after radiation and arginine introduction the increase of proliferating elements of erythroid sprout was noted. The changes noted led to the general increase of erythroid elements, being is the evidence of erythropoiesis activation in the old laboratory animals after arginine introduction. A significant increase of granulocytic elements. Conclusion : Thus, arginine both under physiological conditions and conditions of ionizing radiation produces erythroid differon stimulation and the increase in proliferating elements of granulocytic differon of the old laboratory animals. Keywords : haemopoiesis, regeneration, arginine, ionizing radiation

A TIME-SERIES ANALYSIS OF GENE EXPRESSION PROFILES OF REPLICATIVE SENESENCE IN HUMAN DIPLOID FIBROBLAST

Hae-ok BYUN¹, You-mi KIM¹, Hyun Woo CHO², Hyun Goo WOO², Gyesoon YOON¹ (1. Department of Biochemistry, Ajou University School of Medicine, Korea; 2. Department of Physiology, Ajou University School of Medicine, Korea)

Introduction : Cellular senescence has long been implicated in aging-associated diseases. However, it is not clear which cellular features provide susceptibility to the diseases. To address this, we employed replicative senescence of human diploid fibroblast. The senescence progress was divided into 12 stages according to their population doubling number and resultant doubling time. Method : Typical senescent phenotypes, such as senescence-associated β -galactosidase activity and increase of cellular mass, granularity and intracellular reactive oxygen species, were monitored and compared to gene expression profile which was obtained by cDNA microarray analysis. The heatmap of the gene expression profile revealed four distinct modules (G1, G2, G3 and G4) which are prominently expressed during the senescence process and the functional characterization of each module was performed by Gene Ontology analysis. Results : G1 showed the prominent enrichment of cell cycle-related genes indicating active proliferation activity. This was suppressed at the end of G1 phase (doubling time, 2 days) suggesting the event of the 'senescence growth arrest' might occur at this time point. In the young-to-mid-old phase of G2 module, metabolic process-related genes and tRNA/RNA processing were prominently expressed. In the mid-old phase (G3), immune-related functions such as defense response and antigen processing were significantly enriched. In far-old phase (G4), the genes related with cell death and cell growth control were prominently activated. NF- κ B pathway-related genes were also activated, which was previously notified to play important role in the aging process. Conclusion : We suggest that senescent phenotypes may provide different pathologic background according to the senescence stage, implying a potential link to age-associated diseases. Keywords : Cellular senescence, senescence-associated β -galactosidase activity, cDNA microarray analysis

INVOLVEMENT OF MITOCHONDRIAL COMPLEX IV DEFECT AND GSK3 INACTIVATION IN TGF β 1-INDUCED SENESENCE

Hyun-Jung JUNG, Hae-Ok BYUN, Young-Kyoung LEE, Gyesoon YOON (Department of Biochemistry & Molecular Biology, Ajou University School of Medicine, Korea)

Introduction : Transforming growth factor β 1 (TGF β 1) induces Mv1Lu cell senescence by persistently producing mitochondrial ROS through decreased complex IV activity. Here, we investigated the molecular mechanism underlying the effect of TGF β 1 on mitochondrial complex IV activity. Method : Mv1Lu cells exposed to TGF β 1 or SB412586, a GSK3-specific inhibitor. To generate siRNAs for mink GSK3 α and β , partial cDNAs of mink GSK3 α and β were obtained by RT-PCR against total mRNAs of Mv1Lu. SA- β -gal was assayed at pH6.0 as described by Dimri et al with a slight modification. Intracellular ROS levels were estimated by DCFH-DA and MitoSOX staining followed by flow cytometry. OCR and complex IV activities were also measured in situ with cultured cells using XF-24 Extracellular Flux Analyzer. Results : TGF β 1 progressively phosphorylated the negative regulatory sites of both GSK3 α and β , corresponding well to the intracellular ROS generation profile.

Interestingly, pharmacological inhibition of GSK3 by SB415286 significantly increased mitochondrial ROS, decreased complex IV activity and cellular respiration rate, implying that GSK3 phosphorylation is an upstream event of the ROS generation. Interestingly, we found that active GSK3 exists within mitochondria and binds subunit 6b1 of complex IV which is known to be topologically located in mitochondrial intermembrane space. Silencing of the subunit 6b1 significantly decreased complex IV activity and overall respiration rate. Finally, TGF β 1 treatment decreased the binding of the subunit 6b to GSK3 and subunit 6b phosphorylation. Conclusion : Our results suggest that GSK3 inactivation is involved in TGF β 1-induced complex IV defects by binding the subunit 6b1, thereby persistently generating senescence-associated ROS. Keywords: Transforming growth factor β 1 (TGF β 1), senescence, Glycogen synthase kinase 3 (GSK3)

APOPTOTIC EFFECTS OF IA PI3K/AKT SIGNALING PATHWAY ON LEUKEMIA HL-60 CELLS INDUCED BY OLEANOLIC ACID

Pengxia ZHANG, Di-Di WANG (*Department of Biochemistry & Molecular Biology, College of Basic Medicine, Jiamusi University, China*)

Introduction : To provide new clues for AML targeted therapy by researching the apoptotic effects of IA PI3K/AKT signaling pathway on leukemia HL-60 cells induced by oleanolic acid. Method : The growth-inhibiting effects of PI3K inhibitor (LY294002) on HL-60 cells were detected by MTT assay ; After being treated by drug, the morphological and structural changes of the cells were observed by transmission electro microscopy ; In HL-60 cells, after being treated by OA, the mRNA expressions of cav-1, pi3k, akt were measured by RT-PCR; CAV-1, AKT, p-AKT protein levels were measured by Western blot. Results : MTT experiment proved PI3K inhibitor (LY294002) has growth-inhibiting effects on HL-60 cells, which are enhanced with the increase of concentration in 24h; In HL-60 cells, after being treated by OA, apoptotic morphology changes are found by transmission electro microscopy, the mRNA expression of cav-1 is upregulated while the mRNA expressions of pi3k、 akt are down regulated by RT-PCR test, CAV-1 protein level is increased and AKT、 p-AKT protein levels are reduced by Western blot test. Conclusion : After being treated by 50 μ mol/L PI3K inhibitor (LY294002) in 24h, the growth-inhibiting effects on HL-60 cells are the best; OA can inhibit proliferation of HL-60 cells by PI3K/AKT Signaling pathway, the ratio of the P-AKT/AKT in medication group in 24h compared with LY294002 group is 1.18, explaining its inhibition effect is equivalent to 84.72% of LY294002 group; OA can inhibit PI3K/ AKT signaling pathway by upregulating the expression of CAV-1, resulting in inhibiting cell proliferation and promoting apoptosis in HL-60 cells. Keywords : OA; HL-60; PI3K/AKT

PP25 B-022
EFFECTS OF GANODERMA LUCIDUM SPORES ON THE CHANGE OF CASPASE-8 AND NESTIN IN EPILEPSY RATS

Shu-Qiu WANG¹, Xiao-Jie LI², Xiao-Ru MA¹, Lei LIU¹, Jun-Xing LIU¹, Xiao-Lian ZHAO¹, Fang-Fang WANG¹ (*1. Department of Pathophysiology, College of Basic Medicine, Jiamusi University, China; 2. Rehabilitation Medical Collge, Jiamusi University, China*)

Introduction : To investigate the effects of ganoderma lucidum spores on caspase-8 and nestin in brain tissue of rats with epilepsy induced by pentylenetetrazol (PTZ), and to further study the pathogenesis of

epilepsy and the anti-epilepsy mechanism of ganoderma lucidum spores. Method : Thirty-six male Sprague-Dawley rats were divided into control, PTZ epilepsy and ganoderma lucidum spores (GLS) groups. Results : The results showed that caspase-8-positive cell in rats of PTZ model group were higher than normal control and GLS group, while the content of caspase-8-positive cell were decreased in the GLS group compared with the epileptic model group. The content of nestin were higher in PTZ model group than those of control group and GLS group at in cortex and hippocampus, also The content of nestin in GLS group were higher than control group. Conclusion : Ganoderma lucidum spores can effectively reduce the expression of apoptosis cell and inhibit the caspase-8 activations in the epileptic rat's brain tissue, strengthen the function of anti-oxidize in brain tissue, and can supply recovering of epilepsy nerve cell with important basis by reducing the content of nestin neural internality protect mechanism can be strengthened to reduce the damage on nerve system induced by falling sickness. Ganoderma lucidum spores is an assistant medicine to cure epilepsy, it can be very useful in clinic application. Keywords : ganoderma lucidum spores; epilepsy; nestin; caspase-8

THE STUDY OF CONTENT OF HCY IN THE HIGH HOMOCYSTEINE RATS TO AFFECTING CARBON MONOXIDE/ADD OXYGEN ENZYME 2 (CO/HO-2) IN PENIS

Wen-Bo QIN¹, Wen-Jun HUANG¹, Bao-Jin CHI², Hao-Lin HE¹, Da Ren CHEN¹, Shu-Qiu WANG² (*1. Department of Urology, The second Affiliated Hospital of Jiamusi University, China; 2. Department of Pathophysiology, College of Basic Medicine, Jiamusi University, China*)

Introduction : To study the high homocysteine rats, to explore the sponge body homocysteine hemoglobin content of carbon monoxide/add oxygen enzyme 2 (CO/HO-2) the influence of the system. Method : The forty male wistar rats divided into normal control group (group A), Hhcy rats way of treatment (group B), Hhcy betaine hydrochloride treatment group (group C) and zinc porphyrin IX interention group (D group). Results : The rat models whether raised homocysteine levels in the blood increased significantly, penile erectile rate reduced significantly, and CO content and HO-2 activities were to drop, and homocysteine levels was negatively related (P < 0.01). The penis sponge body treatment group HCY CO and HO-2 content and the treatment group is obviously higher, penile erectile rate increased significantly (P < 0.01), there is statistical significance. Conclusion : Hhcy cause penile erectile function is reduced, may and CO content and the penis sponge body HO-2 express reduce relevant, added to Hhcy betaine produced a certain role influence ED relief. Keywords : hcy; CO/HO-2; The penis sponge body

CELL MARKERS OF THE AGING PROCESS IN PATIENTS WITH MULTI ORGAN PATHOLOGIES -- POSSIBILITIES OF LABORATORY DIAGNOSTICS

Viktor MESHCHANINOV, Ilya GAVRILOV, Mariya BALUEVA and Olga MOLOSTOVA (*Laboratory of Antiage Technologies, Institute of Medical Cell Technologies, Russia*)

Introduction : The existing hetero-protective measures are not very effective as they don't prevent fading of the organism's cellular functions. Perhaps, by using cell oriented techniques it might be possible to optimize age preventing technologies. Method : Two groups of patients participated in the research: 73 adults with an average age of 41, and 19 seniors with an average age of 62. Blood serum was used to determine concentrations of TTG, T3, T4, protein

S100, BDNF with the help of immune fermenting blood analysis (IA). IA was carried out using the complex 'Chem Well' with the set of reagents 'R&D'. Biological age (BA) was determined by techniques of the Institute of gerontology (Ukraine). BA was calculated in 'BIOAGE' program. The results were processed in Stata 6.0 program. Results : A negative correlation between BA and T4 level ($r=-0.658$) and a positive correlation between BA and T3 level ($r=0.829$, $p<0.05$) were revealed. A negative correlation between BA and protein content in blood, S100 ($r=-0.31$, $p<0.05$) was observed. Conclusion : 1. The increase in the age causes the decrease of the average T4 concentrations and the increase of the average T3 concentrations. Protein concentrations S100, BDNF decrease with age insignificantly. 2. There is a reliable correlations between protein S100 and BA and between T3 and BA. 3. Substances T3 and protein S100, being the predictors of the aging, have been revealed. Keywords : bioage, markers of aging

PP25 B-025

CELLULAR, METABOLIC, NANOMOLECULAR AND SOCIAL COMPONENTS OF HUMAN LIFE EXPECTANCY

Viktor MESHCHANINOV¹, Evgeniy TKACHENKO¹, Konstantin EGORIN¹, Sergey ZHARKOV¹, Ilya GAVRILOV¹, Viktor MYAKOTNYKH² (1. Laboratory of Antiage Technologies, Institute for Medical Cell Technologies, Russia; 2. Gerontology Department, Ural State Medical Academy, Russia)

Introduction : For the Sverdlovsk region of Russia low life expectancy of the population is characteristic. We have conducted the research for disclosing of the possible reasons of it. Excitation of human body cells by oxygen, pro- and antioxidants can influence on ageing processes. Method : The research lipid peroxidation in plasma and blood cells was carried out during 10 years. More than 1800 patients with a polypathology of mature, elderly and senile age received hypoxitherapy, hyperbaric oxygenation, ozonotherapy, dry carbonic baths, L-arginin. These patients were measured the biological age and was registered the death rate indicator. Results : Hypoxitherapy and hyperbaric oxygenation activated lipid peroxidation in erythrocytes and plasma of human blood elderly and senile age persons, reduced a life of erythrocytes, increased a biological age and did not influence duration of a calendar life. Nanoparticles of ferric oxide did not render influences on this process. After carrying out of dry carbonic baths courses in all age groups and hypoxitherapy in group of mature age patients lipid peroxidation and the biological age decreased, and antioxidizing activity and life time of erythrocytes increased. Ozonotherapy in all human groups normalized the studied indicators. We have created the mathematical model connecting lipid peroxidation in erythrocytes and blood plasma, the biological age, real life expectancy of blood cells and of a human organism. Conclusion : The correction lipid peroxidation in erythrocytes, blood plasma and a human organism by means of gas therapy is effective like a geroprophylactic remedy depending on age of patients. Keywords : biological age cellular

SYSTEMIC LUPUS IN THE ELDERLY: REPORT OF A CASE AND REVIEW OF LITERATURE

Abrar-Ahmad ZULFIQAR¹, Yann DUVAL¹, Rachid MAHMOUDI¹, Mustapha DRAME², Jean-Loup PENNAFORTE³, Jean-Luc NOVELLA¹ (1. Medecine Interne et Geriatrie, CHU REIMS, France; 2. Unite D'aide Methodologique-pole Recherche, CHU REIMS, France; 3. Medecine Interne, CHU REIMS, France)

Introduction : Systemic lupus is a multisystem inflammatory disease

predominantly occurring in females of childbearing age. The late-onset systemic lupus has been poorly studied so far. We report here a case of severe lupus in a 72 year-old male. Method : A 72 year-old man presented with thrombocytopenia 29 G/L, asthenia and scheduled inflammatory arthralgia predominant in both hands. Biological assessment found positive anti-nuclear and anti-DNA native antibodies, with autoimmune thrombocytopenia. Thoracic scanner allowed to find the presence of straight pulmonary arterial thrombi despite the absence of clinical signs. Systemic lupus was diagnosed according to the criteria of ACR. Oral corticosteroids associated with hydroxychloroquine and curative anticoagulation were initiated, allowing clinical and biological improvement. Results : The late-onset lupus is rare. Late-onset lupus patients have a more insidious onset, a longer lag time from disease onset to diagnosis, and a decrease in female preponderance compared to patients with young systemic lupus. The clinic is insidious and atypical. The onset in old age is seldom associated with malar rash, arthralgia, renal impairment as first symptom, whereas deterioration of general status and thrombosis are very frequent. Anti-nuclear antibodies are constant, anti-DNA native are often positive, while specificity of lymphopenia in the elderly is discussed. Late-onset lupus has a poor long-term prognosis. Infection is the major cause of death in patients with late-onset lupus. Mortality remains high in aged patients with late-onset lupus. Conclusion : Lupus in the elderly remains a rare event and difficult to evoke. Strategies to reduce disease activity and better medical care may be effective in improving outcome of late-onset lupus. Considering the peculiarity of older patients is essential for optimal management. Keywords : Systemic lupus, Late-onset, elderly

IDENTIFICATION OF CELLULAR SENESCENCE-RELATED GENES IN HUMAN BONE MARROW-DERIVED MESENCHYMAL STEM CELLS UNDER INFLAMMATORY STIMULUS

Hee-Young SOHN, So Young PARK, Sang Ick PARK (Division of Brain Diseases, National Institute of Health, Korea)

Introduction : Human mesenchymal stem cells (hMSCs) are capable of differentiating to osteocytic, chondrocytic and adipocytic lineages, and thus provide potential for the regeneration therapy. Also, MSCs can modulate functions of immune cells by secretion of immunomodulatory molecules such as cytokine and chemokines. However, regeneration potential of MSCs decreases with age. The chronic inflammation leads to degenerative conditions associated with ageing. In this study, we investigated the effects of proinflammatory cytokines IFN- γ and TNF- α on cellular ageing of hMSCs based on gene expression profile by microarray analysis. Method : Human bone marrow-derived MSCs were incubated with interferon- γ (IFN- γ) and tumor necrosis factor- α (TNF- α) for 72 h. Illumina HumanHT-12 v4 Expression BeadChip was used for microarray analysis. RT-PCR was performed to confirm the microarray data. Results : Cytokines changed typical fibroblast-like features to rounded shapes, but did not affect cell viability. Immunomodulatory factors including indoleamine 2,3 dioxygenase (IDO), IL-6, cyclooxygenase-2 (COX-2) were enhanced in cytokines-treated hMSCs. Microarray analysis showed that 707 genes were upregulated and 493 genes were downregulated when analyzed by 2-fold expression change of cutoff. Among these, the IL8 and CCL5 genes were drastically upregulated by 138-fold and 137-fold, respectively. In addition, age-related marker genes of hMSCs, SERPINB2, PSG4 and EDN1 were increased by the proinflammatory stimulus. Conclusion : Genome-wide gene expression profile was analyzed to find common marker genes of both inflammation and ageing in human mesenchymal stem cells. These results provide

molecular evidence that the processes of inflammation are a potent source of promoting development of ageing. Keywords : Mesenchymal stem cell, Inflammation, Ageing

THE NEUROVASCULAR PROTECTIVE EFFECTS OF HUPERZINE A IN D-GALACTOSE-INDUCED INFLAMMATORY DAMAGE IN RAT HIPPOCAMPUS

Qingwei RUAN¹, Zhanjuan GAO², Fang LIU², Zhijun BAO², Yongxing MA³, Zhuowei YU⁴ (1. Central Laboratory, Shanghai Institute of Geriatrics, Huadong Hospital, Shanghai Medical College, Fudan University, China; 2. Department of Gastroenterology, Huadong Hospital, Shanghai Medical College, Fudan University, China; 3. Institute of Geriatrics, Huadong Hospital, Shanghai Medical College, Fudan University, China; 4. Central laboratory, Shanghai Institute of Geriatrics, Huadong Hospital, Shanghai Medical College, Fudan University, China)

Introduction : Chronic inflammation results in the excessive or sustained expression of adhesion molecules, excessive recruitment of inflammatory cells, the releases of pro-inflammatory cytokines from glial and endothelial cells, causing neuronal and vascular dysfunction and damage. Acetylcholinesterase inhibitor plays an anti-inflammatory role by the activation of $\alpha 7$ nicotinic acetylcholine receptor mediated cholinergic anti-inflammation pathway in glial and endothelial cells. Method : The aging rat model was obtained by injecting D-galactose (300 mg/Kg) subcutaneously for 8 weeks in 4-week-old rat. The control rat was injected with saline. Huperzine A-treated aging rat that Co-administration of both Huperzine A (0.1 mg/Kg) and D-galactose (300 mg/Kg) subcutaneously for 8 weeks were compared with D-galactose induced aging rat in terms of cell death, inflammation, and the changes of TJs. Results : Huperzine A markedly suppressed D-galactose induced neuronal cell apoptosis, the upregulations of cell-associated adhesion molecules ICAM-1 and VCAM-1 in mRNA levels, and the decreases of TJs in both mRNA and protein levels in hippocampus. Huperzine A also significantly suppressed D-galactose induced releases of inflammatory cytokines TNF- α , IL-1 β and IL-6 by inhibiting D-galactose induced I κ B α degradation and NF κ B nuclear translocation. Finally, huperzine A can obviously suppressed acetylcholinesterase activity. Conclusion : These findings indicate that D-galactose induced neuronal cell apoptosis with the decrease of TJ proteins in the blood-brain barrier is associated with the development of proinflammatory phenotype mediated by NF κ B in rat hippocampus. Huperzine A suppresses D-galactose induced neuronal and vascular damages in rat hippocampus partly by inhibiting acetylcholinesterase activity and preventing NF κ B nuclear translocation mediated chronic sterile inflammation. Keywords : Huperzine A; D-galactose; Apoptosis; neuroinflammation; Tight junction protein; Hippocampus

PP25 B-029

THE MULTIPLE AND COMPLEX OF MECHANISMS OF AGING AND LONGEVITY

Yongxing MA, Qingwei RUAN, Zhijun BAO, Zhuowei YU (Department of Aging, Antiaging and Cognitive Function, Shanghai Institute of Gerontology and Geriatrics, Affiliated Huadong Hospital, Shanghai Medical Collage, Fudan University, China)

Introduction : Fifteen hereditary and postnatal factors were reported to verify the mechanisms of ageing and longevity. Method : 1. HLA-A9 was highly associated with longevity (frequency of longevity 38% in 201, frequency of the control group 24% in 211 cases, Fisher's $P=0.0007$). 2. The allele frequency of APOE $\epsilon 4$ in the very old age

group (≥ 85 years ; $n=71$, APOE $\epsilon 4$, 2. 8%) was significantly lower than that in the 20-39($n=137$, APOE $\epsilon 4$, 8. 4%) , 40-59 ($n=232$, APOE $\epsilon 4$, 8. 4%), 60-84($n=1360$, APOE $\epsilon 4$, 7. 6%) years old group, $P<0. 05$. 3. The mean value of SOD contents of RBC (determined in 542 healthy)of the adult ($558\pm 41\mu\text{g/gHb}$) was significantly lower than that of the youths ($587\pm 50\mu\text{g/gHb}$), but no significantly decline thereafter. 4. The changes of SOD, GSH-PX, CAT, G-6-PD, POD, and LPO with aging in the healthy person, Wistar rat and rhesus monkey were reported. 5. Nature killer cells tends to fall in 70-79years group but rises again in 70 longevous among 232 persons. Results : 6. Chromosome aberration (1. $22\pm 0. 53$, 0. $57\pm 0. 23$ and 0. $23\pm 0. 24\%$ in the person groups of PaO $_2<75$, 75-84 and $\geq 85\text{mmHg}$, $P<0. 025$) was significantly associated with PaO $_2$ in the healthy elderly. 7. The % of type B behavior pattern of the longevous is 55. 5% which was much higher than that of 26. 6% of the aged ($P<0. 01$) in 896 subjects, type B behavior pattern may be favorable for longevity. Conclusion : 9. The oxidation-inflammation Mechanisms is an Important aspects of aging, and the involvement of the immune system in oxi-inflamm-aging. 10. The mechanisms of aging is comprehensive, therefore the measures of antiaging (aging retarding) must be comprehensive too. Keywords : Mechanism of Aging HLA APOE $\epsilon 4$ FR NK PaO $_2$ Behavior Microcirculation

SAFETY, TOLERABILITY, AND IMMUNOGENICITY OF A BOOSTER DOSE OF ZOSTER VACCINE (ZV) ADMINISTERED ≥ 10 YEARS AFTER A FIRST DOSE COMPARED WITH A FIRST DOSE OF ZV

Myron J. LEVIN¹, Kenneth E. SCHMADER², Gary O. ZERBE³, Adriana WEINBERG⁴, Shu-chih SU⁵, Liang CHEN⁵, Angela WILLIAMS-DIAZ⁶, Janie PARRINO⁶ (1. Pediatric Infectious Diseases & Vaccine Clinical Trials, University of Colorado Denver and Health Sciences Center, USA; 2. Geriatrics, Duke University / GRECC, Durham VAMC, USA; 3. CSPH, University of Colorado Denver and Health Sciences Center, Aurora, CO, USA; 4. School of Medicine, University of Colorado Denver and Health Sciences Center, Aurora, CO, USA; 5. BARDS, Merck, Sharp, & Dohme Corp., USA; 6. MRL, Merck, Sharp, & Dohme Corp., USA)

Introduction : Open-label study evaluated the safety, tolerability, and immunogenicity of a booster dose of zoster vaccine (ZV) administered ≥ 10 years after a first dose. Method : Herpes zoster (HZ) history-negative subjects-70 years of age were assigned to Group 1 (booster dose group: 201 subjects who received ZV ~ 10 years previously) or Group 2 (ZV-naive group: 199 subjects who had never received ZV). Blood samples were obtained Day 1 and \sim Day 42 postvaccination for varicella-zoster virus (VZV) antibody testing by glycoprotein ELISA (gpELISA). Subjects were followed for adverse experiences (AEs) for 42 days postvaccination. Results : VZV gpELISA baseline titers were similar in Group 1 (248.0 [95% CI: 219.7, 280.0]) and Group 2 (254.2 [95% CI: 223.5, 289.3]). VZV gpELISA antibody response at Week 6 postvaccination was non-inferior in Group 1 (389.1) compared to Group 2 (366.6); estimated geometric mean titer ratio (Group 1/Group 2) 1.05 (95% CI: 0.97, 1.15). VZV antibody response was acceptable in Group 1 with geometric fold rise of 1.5 (95% CI: 1.4, 1.7). The proportions of subjects reporting injection-site and systemic clinical AEs were numerically but not significantly higher in Group 1 than Group 2. No vaccine-related serious AEs were reported. Conclusion : In subjects-70 years receiving a booster dose of ZV ~ 10 years after a first dose, the VZV antibody response was acceptable and non-inferior

to the VZV antibody response of age-matched subjects receiving a first dose of ZV. ZV given as a booster dose ~10 years after a first dose was generally well-tolerated. Keywords : zoster vaccine, immunogenicity, safety

Universidade Aberta da Terceira Idade, Universidade Estadual do Amazonas, Brazil)

Introduction : The aim of this study has been to correlation among the follow issues: 1) functional fitness, 2) balance condition factors, and 3) risk of falling with mortality Amazon riparian older people. Method : A longitudinal study was conducted with 637 riverine elderly residents (≥ 60 years old) in the Maues city Amazonas, Brazil. Results : 42 elderly residents died three years later (males = 19; females = 23. $p=0.131$). The died causes was: 48% natural death, 16% cardiovascular morbidities, 14% cancer, 8% pulmonary causes, 4% transmissible diseases, 2% external causes. There was statistic association between of advantage age (>75 years ($p=0.000$), lower equilibrium (score Berg Scale <45 points), less hand strength (<14 Kg ($p=0.025$) and poor self-perceived health ($p=0.012$). Conclusion : The number of men and women who died was equal. The most part elders died without medical care. This issue did not allow an analysis and the causes of mortality with health physical factors analyzed herein. Keywords : Falls; riverine people; mortality

THE COMPARISON OF LIFE EXPECTANCY AT BIRTH (YRS) OF SHANGHAI IN RECENT YEARS WITH HONGKONG AND MACAO POPULATION

Zhijun BAO, Yue ZHU, Yongxing MA (Department of Aging, Antiaging and Cognitive Function, Shanghai Institute of Gerontology and Geriatri, Affiliated Huadong Hospital , Shanghai Medical Collage, Fudan University, China)

Introduction : Comparison the life expectancy at birth (yrs) of Shanghai in recent years with HongKong and Macao population. Method : Compare the life expectancy at birth(yrs) from the data in: ① Unit Nations Population Reference Bureau (PRB): 2000-2012, World Population Data Sheet. ② Shanghai Bureau of Civil Administration. Results : ①Shanghai: 2003-2005, 80 yrs; 2006-2008, 81 yrs; 2009-2010, 82 yrs; 2011-2012, 82.5 yrs. ② HongKong: 2003,80 yrs; 2007-2009,82 yrs; 2010-2012,83 yrs. ③Macao: 2008-2012, 82 yrs. Conclusion : ①The population life expectancy at birth (yrs) of Shanghai is one yr lower than HongKong ②The population life expectancy at birth (yrs) of Shanghai is similar as Macao in 2009-2012. Keywords : life expectancy at birth, Shanghai ,HongKong, Macao

PP25 B-034
SYSTEMS BIOLOGY ABOUT EMERGENCE, DEVELOPMENT, AND CONTROL OF AGING

Alexander KHALYAVKIN (Kinetics of Biological Processes, Inst of Biochem Physics, RAS & Inst for Systems Analysis, RAS, Russia)

Introduction : The evidence is currently accumulating that many age-related changes in cells and organs are quite reversible and that the normal somatic cell lines are potentially immortal like cancer or germ-line cells. In this connection 'the efforts of evolutionists-gerontologists should probably be directed at clarifying the question of why the organism consisting of potentially immortal cells gets old'. Method : Critical analysis of the array of published findings was applied for interpretation of these findings in order to unite at the one conception many separate and various data obtained from the molecular level up to the level of population. The systems approach application is useful for understanding of the causes and mechanisms of aging because the organism represents a supercomplex system, consisting of a hierarchy of cooperating subsystems. Results : Some researchers agree that the aging of the whole animal is more a function of breakdown in integrative mechanisms than of primary changes in individual cells. The normal cells do not exist in isolation in the body, and their functions are regulated by out-of-cells factors. The levels and activities of most of these factors are highly dependent on the current response of living being to external challenges. Conclusion : Current knowledge of the problem and a better understanding of some phenomenological peculiarities of macro-systems in different environment might lead us to the development of useful approaches to the origin of aging and its control. The lowering environmental pressures beyond the critical threshold must inevitably result in senescence, which is statistically expressed in age-related rise in mortality rate. Keywords : Origin of Aging, Systems Approach, Environmental Influences

PP25 B-035
REGULATION OF FOXO3A AS A MEDIATOR OF DNA DAMAGE RESPONSE SIGNAL

Jee-In HEO, Jeong-Hyeon KIM, Seung-Min LEE, Jeong-Min LEE, Jae-Bong PARK, Jaebong KIM, Sung-Chan KIM, Jae-Yong LEE (Hallym University, Medical School, Department of Biochemistry, Korea)

Introduction : FOXO3a is a transcriptional factor that is involved in multiple cellular processes including cell cycle arrest, apoptosis, differentiation, DNA repair, and metabolism. FOXO3a has been known to be activated by various DNA damaging agents and oxidative stresses. **Method :** Doxorubicin was treated to induce FOXO3a in human embryonic fibroblasts (HEFs) and SH-SY5Y cells. An inhibitor of ATM and ATM-null cell were used to analyze ATM-dependance of FOXO3a stability. Protein stability of FOXO3a was measured and phosphorylation of FOXO3a by ATM was analyzed. **Results :** Protein levels of FOXO3a were rapidly increased within 10 min in response to doxorubicin treatment in human embryonic fibroblasts (HEFs) and SH-SY5Y cells. However, RNA levels of FOXO3a were unchanged, indicating the protein stability is increased. Induction of FOXO3a protein in response to doxorubicin treatment was inhibited by an inhibitor of ATM and in ATM-null cell, suggesting that the increase of FOXO3a protein stability is dependent on ATM. FOXO3a was phosphorylated in Ser and Thr residues by doxorubicin treatment. This phosphorylation is also dependent on ATM. Interaction between FOXO3a and MDM2 turned out to be decreased by doxorubicin treatment so that FOXO3a stability is increased. **Conclusion :** Taken together, the result showed that the protein stability of FOXO3a increased rapidly through ATM-dependent manner in response to doxorubicin treatment, implying that FOXO3a plays an important role in DNA damage response possibly through interaction with ATM and activation of DNA repair activity. **Keywords :** FOXO3a, ATM, MDM2

MODULATION OF CELLULAR SENEESCENCE AND SKIN AGING BY NONSTEROIDAL ANTIINFLAMMATORY DRUGS
So Ra KIM¹, Mi Eun LEE¹, Sung Chul PARK², Jeong A. HAN¹
(1. Department of Biochemistry and Molecular Biology, Kangwon National University School of Medicine, Korea; 2. Lee Gil Ya Cancer and Diabetes Institute, Gachon University, Korea)

Introduction : It has been proposed that pro-inflammatory genes such as cyclooxygenase-2 (COX-2) play a key role in the aging process. However, it remains unclear whether the pro-inflammatory catalytic activity of COX-2 is involved in the aging process and whether COX-2 inhibitors prevent aging. **Method :** We here examined the effect of COX-2 inhibitors on aging both in the replicative cellular senescence model of human dermal fibroblasts and in the intrinsic skin aging model of hairless mice. **Results :** We observed that among three selective COX-2 inhibitors studied, only NS-398 inhibited the cellular senescence whereas celecoxib and nimesulide accelerated the senescence. Non-selective COX inhibitors including aspirin, ibuprofen and flurbiprofen accelerated the senescence. Also, we observed that only NS-398 inhibited the skin aging while celecoxib and aspirin accelerated the skin aging. **Conclusion :** These results suggest that the pro-inflammatory catalytic activity of COX-2 does not mediate the aging process at least in our models and that the COX-2 inhibitors modulate the aging process via catalytic activity-independent mechanisms. **Keywords :** cyclooxygenase-2, inhibitor, cellular senescence, skin aging

PP25 B-037

ACTIVE TELOMERASE HOLOENZYME IS ASSEMBLED IN THE NUCLEOLUS DURING S PHASE

Ji Hoon LEE¹, Yang Shin LEE², Sun Ah JEONG², Prabhat KHADKA¹, Roth JURGEN², In Kwon CHUNG¹ (1. Department of Systems Biology, Department of Integrated Omics for Biomedical Science, WCU program, Yonsei University, Korea; 2. Department of Integrated Omics for Biomedical Science, WCU program, Yonsei University, Korea)

Introduction : The maintenance of human telomeres requires the ribonucleoprotein (RNP) enzyme telomerase, which is composed of telomerase reverse transcriptase (TERT), telomerase RNA component (TERC), and several additional proteins for assembly and activity. Telomere elongation by telomerase in human cancer cells involves multiple steps including telomerase RNA biogenesis, holoenzyme assembly, subnuclear trafficking, and telomerase recruitment to telomeres. Although telomerase has been shown to accumulate in Cajal bodies for association with telomeric chromatin, it is unclear how and where the assembly and trafficking of catalytically active telomerase is regulated in the context of nuclear architecture. **Method :** Cell culture, Small interfering RNA transfections, Immunoprecipitation and immunoblotting, Telomerase assay, Immunoelectron microscopy, Immunofluorescence microscopy, Fluorescence-activated cell sorter (FACS) analysis, Double thymidine block of HeLa cells. **Results :** Here, we show that the catalytically active holoenzyme is initially assembled in the dense fibrillar component of the nucleolus during S phase. Our findings indicate that the telomerase RNP (hTERT-TERC-dyskerin RNP) is retained in nucleoli through the interaction of hTERT with nucleolin, a major nucleolar phosphoprotein. Upon association with TCAB1 in S phase, the telomerase RNP is transported from nucleoli to Cajal bodies, suggesting that TCAB1 acts as an S phase-specific holoenzyme component. **Conclusion :** These results suggest that the TCAB1-dependent trafficking of telomerase to Cajal bodies occurs in a step separate from the holoenzyme assembly in nucleoli. We propose that the nucleolus is the provider of an active telomerase RNP for supporting the continued proliferation of cancer and stem cells. **Keywords :** Telomerase, Telomere, Active holoenzyme assembly

RETROSPECTIVE AND PROSPECT OF MECHANISM FOR ACUPUNCTURE IN POSTPONING AGING

Lihui LI¹, Jun ZOU², Jie YANG¹, Lingli ZHANG¹, Junni WU¹
(1. School of Kinesiology, Shanghai University of Sport, China; 2. Department of Scientific Research, Shanghai University of Sport, China)

Introduction : It has gained much progress during the recent 10 years in studying the mechanism of acupuncture for anti-aging. Acupuncture may play a role of postponing aging by the overall integration of meridians and acupoints. The present article was going to summarize the action mechanism for highlighting the further research and providing testimonies, and promoting the application of acupuncture in anti-aging. **Method :** To review recent progress in the mechanism of acupuncture-resisting aging in recent ten years from clinical treatment and studies and animal experiments, and put forward several practical views and suggestions on them. **Results :** Aging is the procedure in which all the systems of the body gradually decline, and it is relative to the lowered or disordered endocrine system, free radicals, immune system. Modern medicine holds that acupuncture postpones aging possibly through regulating anti-free radicals injury, regulating neuroendocrine function, regulating immune function, regulating aging gene of the aged organism, thus to postpone the aging. In addition, the article also makes a preliminary analysis on the extant problems of techniques of both genomics and proteomics in acupuncture research

at the present and predict their applicable prospect. Conclusion : Various acupuncture therapies have the actions of disease prevention, health enhancement, life lengthening, with the application of acupuncture as the most common one in particular. More studies should be carried out in the future in the diversified researches, crossing points searching, stressing on the senescence-associated gene regulation mechanism for promoter, methodology searching, the integration of clinical observation and experimental studies. Keywords: acupuncture; aging; mechanism; review

PP25 B-039

RADIATION EFFECTS ON AGING: RADIATION EFFECTS RESEARCH FOUNDATION ADULT HEALTH STUDY

Michiko YAMADA (*Department of Clinical Studies, Radiation Effects Research Foundation, Japan*)

Introduction : To investigate whether or not radiation exposure accelerates aging, many studies into radiation effects on the shortening of lifespan and on the aging process have been carried out among atomic bomb survivors. Method : RERF's Adult Health Study (AHS) has been conducted since 1958 to collect disease incidence and health information through biennial health examinations. Several studies of aging-related diseases including cardiovascular diseases, dementia, osteoporosis, and cataract have been conducted within the AHS. Results : RERF's Life Span Study has pointed to increased risks of leukemia, cancer, and non-cancer diseases due to radiation exposure and the shortening of lifespan among exposed subjects. In the AHS, although many cross-sectional studies concerning morphological and functional changes with aging have failed to show clear acceleration of aging due to radiation exposure, longitudinal studies regarding changes in levels of hemoglobin and cholesterol suggest radiation effects on aging. The AHS study did not reveal radiation effects on cognitive function/occurrence of dementia and bone mass/occurrence of osteoporosis. On the other hand, however, the incidences of cardiovascular diseases such as hypertension and myocardial infarction as well as cataract increased among exposed subjects at relatively young ages. Conclusion : Mechanisms of the aging process and aging-related diseases are beginning to be understood, with similar biological mechanisms shown to be associated with radiation exposure. Major progress is therefore anticipated in the AHS and other such longitudinal aging studies of radiation exposure as it relates to the phenomenon of aging. Keywords : radiation, aging, atomic bomb survivors

INTERLEUKIN-2 AS A POTENTIAL GEROPROTECTOR

Sergey ZHARKOV, Viktor MESHCHANINOV, Evgeny TKACHENKO (*Anti-aging Laboratory, Institute of Medical Cellular Technologies, Russia*)

Introduction : The injection of embryonic stem cells is prohibited by the Russian federation due to numerous dangerous complications and negative cross effects. The possible solution for this is a stimulation of the individual organism stem cells with cytokines. Method : The experiment was set up using a group of rats, who had regular blood loss, to imitate hard life conditions, resulting in premature aging. The next stage was the determination of biological age by the «Bioage polynom®» method among patients before and after use of interleukin-2. Effectually IL-2 was the same as some of the other cytokines (M. Marzec, 2007). Additionally different age-dependent blood parameters were also studied in patients. Results : The result of the study is that a reliable decrease in the mortality of rats, who had a

blood loss up to 26.7%, was consistent with data regarding IL-2 hematopoiesis stimulation (Popovich A.M., 2004). In contrast to the control blood loss group, the livers of the rats who had IL-2 resulted in no focal hepatocytes necrosis and less dystrophic changes. The beneficial effects on people showed in other works (S.Seidler,2012), as well as on anti-tumor effects (W.Cheng,2012). Patients had an average decrease of biological age 14.9%. There was increasing the number of white blood cells (+18.1%), lymphocytes (+9.9%) and granulocytes(+25.5%). Conclusion : Presently interleukin-2 is used in medicine mostly for the correcting of the immune system, but this cytokine can also be applied for the improvement of hematological parameters, such as liver protection and decreasing biological age. Keywords : interleukin-2, biological age, stem cells

PP25 B-041

HAPLOTYPE ANALYSIS OF WRN GENE REGION AMONG ASIAN POPULATIONS AND WERNER'S SYNDROME PATIENTS

Shinji HARIHARA¹, Yuka ONOGI², Worawit LOUTHRENOO³, Fujio TAKEUCHI² (*1. Department of Biological Sciences, Graduate School of Science, The University of Tokyo, Japan; 2. Department of Internal Medicine, Faculty of Medicine, The University of Tokyo, Japan; 3. Department of Internal Medicine, Faculty of Medicine, Chiang Mai University, Thailand*)

Introduction : Werner's syndrome (WS) is one of the premature aging disorders and it is due to some mutation in the gene of WRN. Though many mutations causing the disease have been reported, the mechanism of gene mutation or distribution of mutations which are related to disease is still obscure. Therefore we are investigating several SNPs in the WRN gene and analyze the distribution of haplotypes among Asian populations and Werner syndrome patients. Method : DNAs were extracted from 100 normal Japanese, 99 normal Thais and 4 Japanese WS patients. Types for seven SNPs sites were determined using PCR-RFLP method. Based on each data of SNPs sites, distribution of haplotypes was estimated. Results : Six SNPs sites were polymorphic among both Japanese and Thai populations, though one site was not polymorphic. More than 30 haplotypes were observed in both Japanese and Thai populations. Though frequent haplotypes were common in the two populations, the distributions for the two populations were significantly different. Two haplotypes, which were frequent ones in Japanese normal population, were detected in the four WS patients. Conclusion : WRN gene region is rather much polymorphic and many haplotypes were detected in the Asian populations. Mutation, which cause WS disease, may be related to a few frequent haplotypes. Keywords : Werner syndrome, WRN gene, haplotype

PP25 B-042

SENESCENCE-RELATED CHANGES IN GENE EXPRESSION OF PERIPHERAL BLOOD MONONUCLEAR CELLS FROM OCTO/NONAGENARIANS COMPARED TO THEIR OFFSPRING

Wan Zurinah WAN NGAH¹, Amirah ABDUL RAHMAN¹, Norwahidah ABDUL KARIM¹, Noor Aini ABD HAMID² (*1. Dept. of Biochemistry, Universiti Kebangsaan Malaysia, Malaysia; 2. Dept. of Biochemistry, Cyberjaya University of Medical Sciences, Malaysia*)

Introduction : Mechanisms determining both functional rate of decline and the time of onset in aging remain elusive. Elucidation of the complex process of aging are fairly limited, especially those involving the comparison of long-lived individuals and young controls. Therefore, this research aims to determine the differential gene

expression profile in related individuals from villages in Pahang, Malaysia to control for environmental factors. Method : Genome-wide microarray analysis of 18 samples of peripheral blood mononuclear cells (PBMC) from two groups: octo/nonagenarians (80-99 years old) and their offspring (50.2 ± 2.0 years old) revealed 477 transcripts were age-induced and 335 transcripts were age-repressed with fold changes ≥1.2 in octo/nonagenarians compared to offspring. Results : Interestingly, changes in gene expression were associated with increased capacity for apoptosis (BAK1), cell cycle regulation (CDKN1B), metabolic process (LRPAP1), insulin action (IGF2R) and increased immune and inflammatory response (IL27RA), whereas response to stress (HSPA8), damage stimulus (XRCC6) and chromatin remodelling (TINF2) pathways were down-regulated in octo/nonagenarians. These results suggested that systemic telomere maintenance, metabolic, cell signalling and redox regulation may be important for individuals to maintain their healthy state with advancing age. Conclusion : We hypothesize that these biological processes play a critical role in the determination of a healthy long lifespan, wherein genes involved in these pathways could be the regulators of the complex aging process in human. Keywords : Microarray, nonagenarians, offspring

PP25 B-043

AGE-RELATED CHANGES OF PEPTIDYLARGININE DEIMINASE 2 IN THE MOUSE BRAIN

Yayoi KAGAMI¹, Nobuko SHIMADA¹, Setsuko HANDA¹, Eun-Kyoung CHOI², Yong-Sun KIM², Hideki ITO³, Naoki MARUYAMA¹, Akihito ISHIGAMI¹ (1. *Molecular Regulation of Aging, Tokyo Metropolitan Institute of Gerontology, Japan*; 2. *Ilsong Institute of Life Science, Hallym University, Korea*; 3. *Internal Medicine, Tokyo Metropolitan Geriatric Hospital, Japan*)

Introduction : Peptidylarginine deiminases (PADs) are a group of posttranslational modification enzymes that citrullinate (deiminate) protein arginine residues in a Ca²⁺-dependent manner. Enzymatic citrullination abolishes positive charges of native protein molecules, inevitably causing significant alterations in their structure and functions. Among the five isoforms of PADs, PAD2 and PAD4 are proved occupants of the central nervous system (CNS), and especially PAD2 is a main PAD enzyme expressed in the CNS. We previously reported that abnormal protein citrullination by PAD2 has been closely associated with the pathogenesis of neurodegenerative disorders such as Alzheimer's disease and prion disease. Protein citrullination in these patients is thought to play a role during the initiation and/or progression of disease. However, the contribution of changes in PAD2 levels, and consequent citrullination, during developmental and aging processes remained unclear. Method : We used quantitative RT-PCR, Western blot analysis, and immunohistochemical methods to measure PAD2 expression and localization in the brain during developmental and aging processes. Results : PAD2 mRNA expression was detected in the brains of mice as early as embryonic day 15, and its expression in cerebral cortex, hippocampus, and cerebellum increased significantly as the animals aged from 3 to 30 months old. No citrullinated proteins were detected during that period. Moreover, we found that PAD2 localized specifically in the neuronal cells of the cerebral cortex and Purkinje cells of the cerebellum. Conclusion : Despite PAD2's normally inactive status, it becomes active and citrullinates cellular proteins, but only when the intracellular Ca²⁺-balance is upset during neurodegenerative changes. Keywords : Peptidylarginine deiminase, citrullination, Alzheimer's disease

HP1 α -MEDIATED PREMATURE AGING VIA INTERACTION

WITH PRELAMIN A IN ZMPSTE24-DEFICIENT MOUSE EMBRYONIC FIBROBLASTS

Jia LIU¹, Xianhui YIN¹, Guangqian ZHOU¹, Baohua LIU², Huiling ZHENG², Vaidehi KRISHNAN³, Zimei WANG¹ (1. *Biochemistry and Molecular Biology, School of Medicine, Shenzhen University, China*; 2. *Biochemistry, Li Ka Shing Faculty of Medicine, The University of HongKong, Hong Kong*; 3. *Cancer Science Institute of Singapore, National University of Singapore, Singapore*)

Introduction : HP1 (heterochromatin protein 1) is not only an important chromatin-associated protein to remain heterochromatin organization but also interacts with various proteins including lamin A to trigger versatile functions in nuclei. In this study, we investigated the effects of prelamins A accumulation on the HP1 expression, sub-cellular distribution, phosphorylation after DNA damage and its relationship to premature cellular senescence in laminopathy-based Zmpste24 gene knockout mouse embryonic fibroblasts (Zmpste24^{-/-}-MEFs). Method : Primary Zmpste24^{-/-} and wild type MEFs which obtained from 13.5 days embryos were identified with PCR genotyping. HP1 interaction with prelamins A was detected by Co-IP, Western blotting and subcellular fractionations were used separately to examine HP1 expression, distribution and site-specific phosphorylation. Via depletion of HP1 by RNAi, P16 expression and senescence-associated β -galactosidase activity was examined. Results : (1) All three HP1 family members had interaction with prelamins A in an extent similar to lamin A, especially HP1 α ; (2) HP1 α expression and distribution in heterochromatin and nuclear matrix were significantly higher in Zmpste24^{-/-} MEFs than that in Zmpste24^{+/+}; (3) Following DNA damage with 4 μ M Camptothecin, though HP1 α expression showed no changes, HP1 α Thr50 position was characterized as an important phosphorylation site after DNA damage, but such phosphorylation was found to be in an obscure level and delayed in Zmpste24^{-/-} MEFs; (4) Furthermore, depletion of HP1 α by RNAi reversed cellular senescence in Zmpste24^{-/-} MEFs, as indicated with down-regulation of P16 expression and reduction of SA- β -gal activity. Conclusion : Taken together, these results suggest a novel mechanism of HP1 α -mediated defective DNA damage response and premature aging via interaction with prelamins A in Zmpste24-deficient premature mice model. Keywords : Premature aging; Heterochromatin protein 1 (HP1), Lamin A

PP25 B-045

A NEW HYPOTHESIS OF THE ORIGIN OF MENOPAUSE

Amalia Gabriela DIACONEASA, Mariana RACHITA (Biology of Aging, Ana Aslan National Institute of Gerontology & Geriatrics, Romania)

Introduction : Menopause is an intriguing human trait. Although the decrease in fertility with age is among the criteria of aging, a sudden cease of fertility is uncommon in mammals. There are some hypotheses that try to explain the origin of menopause in Homo sapiens supposing that this trait may have some selective advantages, as the recent "grandmother hypothesis". Method : Based on the analysis of certain metabolic human traits, we developed a new hypothesis of the human evolution. Results : According to this hypothesis, ecological conditions documented in the human species' history, i.e. alternating resource scarcity and relative abundance might determine epigenetic changes reflected in alterations of the activity and regulation of the IGF1/insulin pathway, involved in cell survival, division and differentiation. A high activity of the IGF1/insulin pathway in humans may alter the cell proliferation/differentiation ratio. These changes may be responsible for the occurrence of certain

unique human traits. Obesity in women is often associated with the ovarian polycystic syndrome, while small intervals between ovulations when numerous ova produced fail to mature leading to earlier menopause. The prediction of this hypothesis is the appearance of menopause in species with insulin resistance or high IGF1 level. In fact menopause was signaled in zoo in female gorillas, species with high IGF1, and in *Macaca mulata*, species that develop diabetes (1%) when adopts the western diet. Menopause is present in some dolphins and whales, animals with big fat deposits. Conclusion : Menopause may result from premature oocyte exhaustion and impaired differentiation because of the particular IGF1/pathway in humans. Keywords : menopause, human evolution

PP25 B-046

A NEW HYPOTHESIS OF AGING BASED ON BIOCHEMICAL ASPECTS

Amalia Gabriela DIACONEASA (*Research, Qeme Project, Romania*)

Introduction : Although during the last decades some genes and biochemical pathways with crucial effects in aging were discovered, the progress in understanding aging is very modest. Method : Taking into account the most important experiments related to the aging modulation, as well as the data on aging patterns and dynamics in various species, a new evolutionary hypothesis of aging is developed. Results : This hypothesis states that the aging phenotype results from gradual decrease in some specific reactions in differentiated tissues. A lack of stimulation of these reactions, especially during and after organism maturation, may be the cause of this phenomenon. Consequently, a systemic imbalance of local and distant reactions appears, that affects not only the specific functions of the differentiated tissue, but also the proper differentiation of the cell stem. Misrepairs at different levels, meta-differentiation, abnormal cell proliferation and immune reactions may occur. Aging may be a consequence of the developmental dysregulation more than of “wear and tear”. This hypothesis agrees with the patterns of the epigenetic changes during aging, the limited influence of free radicals on aging pace, and explains the actions of caloric restriction and other ways of prolonging the life span in various species. It also explains the differences in senescence rhythm and longevity in various species, the influence of weight, metabolic rate, and other physiologic aspects. Conclusion : This hypothesis provides a new vision of aging and degeneration, opening the door to multiple theoretic and medical applications in aging and degenerative disorders. Keywords : aging, developmental dysregulation, hypothesis

PP25 B-047

AGED-RELATED DIFFERENCES IN THE FORCE TO STRETCH SOLEUS MUSCLE OF FEMALE RATS

Talita G.G. ZOTZ¹, Sabrina Peviani MESSA², Eduard Wolfgang GOOSEN¹, Rafael ZOTZ³, Anna Silveira GOMES⁴ (*1. Physical Education, Federal University of Parana, Brazil; 2. Physical Therapy, Fderal University of Sao Carlos, Brazil; 3. Biotherium, Pontificia Universidade Catolica do Parana, Brazil; 4. Physiotherapy and Physical Education, Universidade Federal do Parana, Brazil*)

Introduction : Stretching exercise is performed applying a force to deform the muscle-tendon unit. However, how much force is needed to induce muscle-tendon deformation is not known and it can differ between young and aged rats. Main: to compare the force (N) to stretch soleus muscle of young and old rats. Method : Twelve Wistar female rats were divided into two groups: Young Group (YG, n=6, 311±11g)-rats 3 month old; Aged Group (AG, n=6, 351±43g)- rats 15 month old. Left soleus muscle was submitted to passive stretching

following the protocol: 1 set of 10 repetitions of 60s of stretching with 45s interval between repetitions, performed once a day, twice a week, during 1 week. The rats were previously anesthetized and to stretch soleus muscle the left ankle was held mechanically in full dorsal flexion through an apparatus constituted by a load cell, to measure the force (N) to induce the muscle-tendon unit deformation. Data were compared by ANOVA (parametric) or Kruskal-Wallis (non-parametric) ($p \leq 0.05$). Results : There was no difference between the force applied on young or aged group (intragroups comparisons). However, it was found significant decrease on force applied when compared aged ($0,48 \pm 0,04$ N) to young ($0,65 \pm 0,04$ N) rats ($p < 0.05$) along the most part of the repetitions (first to 10th repetition). Conclusion : In the aged rats the force to induce muscle-tendon deformation was significantly lesser compared to the force applied in young rats. This may have occurred because aged soleus muscle has a decline in the passive torque despite an increase in connective tissue. Keywords : Muscle Stretching Exercise, Rats, Force

PP25 B-048

WAIST CIRCUMFERENCE (WC) EVALUATION OF ELDERLY IN SOUTHERN BRAZIL

Maria Marina Serrao CABRAL¹, Claudine Lamanna SCHIRMER², Angelo Jose G. BOS² (*1. Nutrition, Federal University of Santa Maria, Brazil; 2. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil*)

Introduction : Changes in body composition, with fat redistribution, which reduces the peripheral level and increases inside the abdomen, and reduced lean body mass are peculiarities related to the aging process. As becomes necessary to assess more completely the corporal composition, additional anthropometric data must be obtained. The Waist Circumference (WC) becomes important, as has been pointed out as one of the best anthropometric indicators of visceral fat. Objectives: To determine the Waist Circumference and assess risks for metabolic disorders in this population. Method : We measured the waist circumference of 7315 elderly people, of both sexes, aged ≥ 60 years randomly selected from their homes. To measure used was flexible and inextensible tape, placed in the horizontal plane at the natural waist line, the midpoint between the iliac crest and the last rib, readings were made at the time of expiration. Statistical analysis of data was by Epi Info version 3.5.3. Results : For the measurement of waist circumference, we found that the female has a significantly lower mean value ($89 \text{ cm} \pm 13.65 \text{ cm}$) compared to males ($93.01 \text{ cm} \pm 13.50 \text{ cm}$). The cutoffs for such classification were recommended by the World Health Organization (WHO, 1998), according to the degree of risk for metabolic complications associated with obesity: increased risk for women ($WC > 80 \text{ cm}$) and men ($WC > 94 \text{ cm}$), and very high risk $WC > 88 \text{ cm}$ and $WC > 102 \text{ cm}$ for men and women, respectively. Conclusion : There are women at high risk for metabolic complications and men they are not at risk. Keywords : Anthropometric assessment, Obesity, Health promotion

PP25 B-049

EVALUATION OF BODY MASS INDEX IN SOUTHERN BRAZILIAN ELDERLY

Maria Marina Serrao CABRAL¹, Claudine Lamanna SCHIRMER², Angelo Jose G. BOS² (*1. Nutrition, Federal University of Santa Maria, Brazil; 2. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil*)

Introduction : Body composition alters with age, increasing the adipose tissue and reducing muscle tissue. Therefore, it is essential to use specific reference standards for this age group. Objectives: To

compare the Body Mass Index (BMI) of elderly. Method : The study involved 7315 elderly people, of both sexes, aged ≥ 60 years randomly selected from their homes. Measurements of weight and height were requested verbally to participants. Results : We found that men had a mean weight of 76.5 ± 12.09 Kg higher than women (68.8 ± 11.63 Kg), most likely due to the average value height is also greater in males (169.6 ± 7.27 cm) than women (162.4 ± 7.61 cm). By analyzing BMI results, in women the mean was 26.09 ± 3.96 kg/m² and slightly higher in males (26.54 ± 3.57 kg/m²), both classified as eutrophic, according Lipschitz parameters (parameters considered normal BMI between 22 kg/m² and 27 kg/m²). In total, 60.2% (n=461) of women and 39.8% (n=305) of men classified into a state of slimness and 1479 (54%) men and 1,261 (46%) women are inside overweight range. Within the cutoffs for normal, are 53.6% (n=1,875) of women and 46.4% (n=1,626) of men. It is noteworthy that 4.2% (n=308) of respondents did not have a measurement of weight and/or height, which are unable to perform the calculation of BMI. Conclusion : We found that there is a higher prevalence of overweight and normal weight men among women. Also, is the low prevalence of thinness, being higher in females. Keywords : Obesity, Health promotion, Anthropometry

PP25 B-050

THE EFFECTS OF AQUATIC EXERCISE TRAINING ON CUTANEOUS REACTIVE HYPEREMIA IN OLDER WOMEN WITH TYPE 2 DIABETES MELLITUS

Apiwan NUTTAMONWARAKUL¹, Supathra AMATYAKUL², Daroonwan SUKSOM³ (1. Inter-department of Biomedical Sciences, Chulalongkorn University, Thailand; 2. Department of Physiology, Faculty of Dentistry, Thailand; 3. Faculty of Sport Science, Chulalongkorn University, Thailand)

Introduction : Hyperglycemia associated with diabetes because endothelial dysfunctions by increasing oxidative stress lead to increase risk of hypertension, atherosclerosis and disorders of the microcirculation. Aerobic exercise training has traditionally been advocated as an essential component in the medical management of type 2 diabetic patients. Therefore, the present study investigated whether aerobic aquatic exercise training could improve endothelial function in older women with type 2 diabetes mellitus. Method : Twenty-four older type 2 diabetic women (age 65 ± 5 years) were assigned to aquatic exercise (AE; n=12) group and control (C; n=12) group. AE group performed aerobic exercise in swimming pool (water temp $\sim 34-36$ °C) which consisted of 4 day/week at 65-75% of maximum heart rate for 30 min. Before and after 12 weeks, all subjects were monitored in fasting plasma sugar (FBS), glycosylated hemoglobin (HbA1c) and physical fitness. Cutaneous reactive hyperemia (cRH) was also measured by using a laser Doppler flowmetry. Results : After 12-weeks, AE group had lower in resting heart rate, systolic blood pressure and the percentage of body fat ($p < 0.05$). Maximal oxygen consumption (VO₂max) was significantly higher after aquatic exercise training ($p < 0.05$). We found the improvement of FBS and HbA1c in AE group ($p < 0.05$). The greater in peak cRH of AE group were also observed ($p < 0.05$). Conclusion : These results demonstrated that aerobic aquatic exercise training improved physical fitness and endothelial function in type 2 diabetic patients. Therefore, aerobic aquatic exercise may be an effective therapeutic modality in the treatment of diabetic cardiovascular complications. Keywords : aquatic exercise, type 2 diabetes

PP25 B-051

THE MEAL EVALUATION OF LOCAL SENIOR WELFARE CENTER : A FOCUS ON SO

Chorong OH¹, Jae-kyung NO¹, Sunkug JHO², Ju Young KANG¹, Hoon Ji BAK¹, Hye Bin PARK¹, Eun Jin CHOI¹ (1. Department of Nutrition and Health Care, Kyungsoong University, Korea; 2. Rehabilitation Medicine/Clinical Aging Research Institute, Busan Medical Center, Korea)

Introduction : Theseday as increasing the elderly who visit to local senior welfare center, investigation of their provided lunch meal , eating habits , body composition chages is very significant on evaluation of SO. Therefore the purpose of this study is to fine the role of major nutrients related body composition for prevention SO in elderly. Method : we analyzed 118 subjects (60 for men, 58 for women) through a survey at two welfare centers in Busan by SPSS 19.0 and evaluated meal service menu by the Can Pro 4.0. Results : The results of this study are as follows : Average ages (75.5 ± 6.0 for men vs 72.1 ± 6.7 for women), grip strength (28.6 ± 11.7 vs 16.3 ± 6.6), obese (16.6% vs 31.0%), rate snack intake (76.6% vs 79.4%), and the kinds of chronic diseases - cardiovascular disease ,musculoskeletal disorder , endocrine disease are a high rank .There are nutritional assessment such as intake of a meal : protein (37.76 g), fiber (12.94 g), vitamin C (51.62 mg),vitamin D ($3.17 \mu\text{g}$), calcium (276.89 g), sodium (3.2 g), vitamin B12 ($4.95 \mu\text{g}$). Conclusion : In this study, grip strength was lower than cut-off point (< 30 kg for men, < 20 kg for women) in both gender which may explain they must be considered to be at risk of SO. Compared with the ecommended amount (RDA), generally nutritional assessment was high exsept calcium (276.89 mg). For muscle and bone health , calcium is required enough amount with sufficient vitamin D. Keywords : local senior welfare center, sarcopenic obesity , nutrients

PP25 B-052

THE NUTRITIONAL SITUATION IN THE CHILEAN ELDERLY: WERE THERE CHANGES BETWEEN THE YEARS 2003 AND 2010?

Chung Bin YU¹, Luis VILLARROEL², Pedro Paulo MARIN³ (1. Acute Geriatric Hospitalization Unit, Instituto Nacional de Geriatria, Chile; 2. Public Health, Department of Family Medicine, Faculty of Medicine, Pontificia Universidad Catolica de Chile, Chile; 3. Geriatrics and Gerontology, Department of Internal Medicine, Faculty of Medicine, Pontificia Universidad Catolica de Chile, Chile)

Introduction : The nutritional status has an important impact on the health of the person. In the elderly, being underweight is associated with an increased mortality risk, in comparison to those who are eutrophic. There is controversial evidence of how obesity affects the longevity in the older adult (OA). The objective of this study is to describe the tendency and compare the anthropometric measurements and nutritional status in the elderly in Chile, during a seven year period (2003-2010). Method : Analysis of the Body Mass Index (BMI), nutritional status, and sedentarism in a representative sample of elderly in Chile. The data was obtained from the Chilean 'Encuesta Nacional de Salud' (ENS) or National Health Survey, from the years 2003 and 2010. Results : The prevalence of overweight and obese elderly (BMI equivalent or more than 25) was 72.4% and 73.9% ($p = 0.656$), the years 2003 and 2010, respectively. The prevalence of underweight elderly did not vary between both years (1.7%, $p = 0.896$). There was also a tendency towards sedentarism in the OA, which increased from 95.7% to 96.1%, in this time period. Conclusion : There were no statistically significant differences in the prevalence of overweight or obese elderly in seven years, although there was an increasing trend. The prevalence of those OA who are overweight and/or obese are still high, and considering a slight tendency towards sedentarism, this might imply a failure in the politics of health promotion and primary

prevention, in a period of seven years. Keywords : Longevity, aged, obesity

PP25 B-053

THE ESTABLISHMENT OF ANIMAL MODEL FOR SARCOPENIC OBESITY

Ken SUGIMOTO, Xiang WANG, Yukiko YASUNOBE, Mitsuru OHISHI and Hiromi RAKUGI (*Geriatric Medicine, Osaka University Graduate School of Medicine, Japan*)

Introduction : The age-related changes in body composition, a combination of excess weight (obesity) and reduced muscle mass or strength (sarcopenia), have been recently defined as sarcopenic obesity. It is estimated that their individual effects on physical disability, morbidity and mortality would be synergistically potentiated when occurring simultaneously. A good animal model for sarcopenic obesity is needed to clarify the mechanism, however, it has not yet been established. Here, we tried to establish a suitable animal model for the understanding of these relations using Spontaneously Hypertensive rats (SHR). Method : 20-week-old male SHR rats were divided into two groups, SHR fed a normal diet (SHR-ND) and SHR fed a high fat & fructose diet (SHR-HF) At 32 weeks of age, the soleus muscle (SOL) and the extensor digitorum longus muscle (EDL) were extracted after exercise. The morphological and molecular biological analyses were performed using these muscles. Male Wistar Kyoto rats (WKY) were used as controls. Results : There was no difference in the weight of SOL among three groups, however the weight of EDL was lower in SHR-ND and SHR-HF than in WKY. The expressions of inflammatory cytokines were higher in SHR-HF than in SHR-ND and WKY. The expressions of atrogen1, MuRF1 (ubiquitin?ligases) and Pax7 (a marker of muscle satellite cells) were higher in SHR-HF than in SHR-ND and WKY. Conclusion : The changes observed in this animal model are similar to the changes in the subjects with sarcopenic obesity, so this model might be useful for clarifying the mechanisms for sarcopenic obesity. Keywords : obesity, sarcopenia, SHR

CANNABINOID RECEPTOR 1 (CNR1) POLYMORPHISM WAS ASSOCIATED WITH OBESITY IN JAPANESE MEN

Masayuki YAMASAKI¹, Paulin Beya Wa Bitadi MUTOMBO¹, Toru NABIKA², Kuninori SHIWAKU¹ (*1. Department of Environmental & Preventive Medicine, Shimane University School of Medicine, Japan; 2. Department of Functional Pathology, Shimane University School of Medicine, Japan*)

Introduction : The endocannabinoid system (ECS) has been well demonstrated to be involved in the regulation food intake process and lipid and glucose metabolisms. ECS over activation is associated with obesity and obesity-related cardiovascular disease (CVD). The aim of this study was to investigate the association of cannabinoid receptor 1 (CNR1)4895 C/T gene polymorphism (rs806368) with obesity and obesity-related cardiovascular disease (CVD) risk factors in Japanese. Method : This study included 1,452 Japanese (678 men and 774 women, aged 56.8±13.4) from rural communities in Shimane Prefecture, Japan. Results : The frequency of the C minor allele of CNR1 4895 C/T polymorphism was 47%. In men, the CC genotype carriers showed significantly greater body mass index (BMI) and waist circumference (WC) values than T allele carriers, even after adjusting for age and medications for hypertension, dyslipidemia and type 2 diabetes. The frequency of obesity (BMI ≥25 kg/m²) in CC genotype carriers was significantly greater than in T allele carriers (31.8% vs 21.5%), but the frequency of central obesity (WC ≥ 85 for men and WC ≥90 cm for women) was not significant by CNR1 4895 C/T

genotype. CC genotype carriers of CNR1 4895 C/T showed significantly greater odds for obesity than T allele carriers, even after adjustment for age and the abovementioned medications. Conclusion : This study supports the association of CNR1 4895 C/T with interindividual differences in obesity in men. Keywords : CNR1, Obesity

EFFECTS OF SYMBIOTIC SUPPLEMENTATION ON INFLAMMATION AND BODY COMPOSITION IN ELDERLY: A RANDOMIZED DOUBLE-BLIND STUDY

Joao VALENTINI NETO¹, Camila Maria DE MELO², Sandra Maria LIMA RIBEIRO³ (*1. PRONUT, University of Sao Paulo, Brazil; 2. EACH - USP, University of Sao Paulo, Brazil; 3. School of Arts, Sciences and Humanities, University of Sao Paulo, Brazil*)

Introduction : Symbiotic substances intake has been recommended in order to preserve or recover the gut microbial balance, which is related to systemic inflammation. We hypothesized that administration of symbiotic by elderly can improve tissue integrity, reducing risk of muscle loss, by reducing systemic inflammation. Purpose: To evaluate some effects of supplementation (for 3 months) of a symbiotic substance on body composition and inflammatory markers of elderly with risk of frailty. Method : Double blind and randomized study. Were studied 17 individuals, between 65-75 years old, both genders, free-living, and fulfilling at least one frailty criteria. Were excluded the ones referring chronic or acute intestinal disease, recent antibiotics use, and recent intake of prebiotic, probiotic, symbiotic or anti-diarrheic substances. The individuals were randomly distributed in two groups: S (n=10) - daily intake of a symbiotic substance; and P (n=7)- placebo. Before and after the experiment we analyzed: body mass index (BMI), skinfold thicknesses, body circumferences, grip strength, bioelectric impedance by vectorial analysis (BIVA), and plasma concentration of inflammatory cytokines (IL-6 and TNF- α). Statistical analysis: ANOVA and Hotelling's T² for vectorial analysis. Results : Mean comparison between groups did not show significant difference in any variable investigated. Individual analysis of tissues electrical properties (BIVA) pointed a trend of "S" group to become more hydrated at the end of the supplementation period. Conclusion : individual analysis, but not the statistical comparison between groups, pointed symbiotic supplementation to be associated with better hydration status and therefore better tissue integrity, reducing risk of tissue loss. Keywords : Symbiotic, tissue loss, frailty

FACTORS ASSOCIATED WITH FOOD INTAKE AMONG INDONESIAN ELDERLY POPULATION : MULTI-CENTRE STUDY

Siti SETIATI (*Department of Internal Medicine, Faculty of Medicine Universitas Indonesia, Indonesia*)

Introduction : Aim To obtain factors associated with energy intake in Indonesian elderly population. Method : A multicentre-cross sectional study conducted in 13 hospitals across Indonesia between January ? April 2011 among 387 subjects. The study population consisted of individuals aged 60 years and older, of both genders who attend to geriatric clinic (outpatient). The data collection consisted of demographic characteristics, functional status (ADL score), cognitive status (MMSE score), mental status (GDS score), nutritional status (MNA score), food intake, present activities, and data on self reported chronic diseases. Food intake was obtained by 24-hour food recall. Data was analyzed using statistical package software. Results : Age range of subjects in this study was 60-90 years, with mean age 69.8

years old. Most of subjects (58.4%) were women and had educational background senior high school or higher degree (61.1%). More than half of subjects (87.6%) were not active. Average energy intake was 1266.7 (336.5) calories. Bivariate analysis showed that age, sex, hypertension, osteoporosis, osteoarthritis, hyperuricemia, vision impairment, and functional status were significantly associated with energy intake. Multivariate analysis showed variables sex, education, and osteoporosis significantly associated with energy intake. Analysis of food intake found that subjects with educational background junior high school or lower consume less amount of eggs, fats/oil, fruits and juice, legumes, and snack. Osteoporotic subjects consume eggs, fruits and juice, seafood, milk, and other non-alcoholic beverages more than non-osteoporotic subjects. Conclusion : Factors associated with energy intake are sex, education, and osteoporosis. Keywords : Elderly, energy intake, food intake

SATISFACTION WITH LIFE IN EUROPEAN OLDER ADULTS WITH TYPE 2 DIABETES

Sofia VON HUMBOLDT, Isabel LEAL, Susana SANTOS (*Research Unit in Psychology and Health, R&D, ISPA-Instituto Universitario, Portugal*)

Introduction : Objectives: The population's increased longevity is leading to a worldwide concern about older adults' well-being and about the incidence of chronic diseases such as diabetes. The present research intends to determine significant differences among three groups of older adults with diverse diabetes diagnosis, namely, participants with only type 2 diabetes, participants with diabetes and other chronic diseases and the remaining without any chronic disease, regarding the satisfaction with life (SWL). Method : Method: We recruited 304 non-institutionalized older adults aged between 74-100 years (M=82.9; SD= 6.71), who were allocated to three groups, according to their diagnosed medical condition. Measures were completed, including demographics and the Satisfaction with Life Scale. All estimates were statistically significant ($p < .01$). Results : Results: Significant differences were found regarding the SWL among the three groups. The lowest SWL score were found in the 'only diabetes' group. In specific, the ANOVA indicated that there are significant differences between at the least two groups ($F(2)=7.598$, $p < .01$). Post hoc comparisons of means (Tukey's honestly significant difference) indicated that the 'diabetes and other' participants had a significantly lower SWL score than the 'no diabetes' group ($M=-.335$, $p < .05$). This latter had a significantly higher SWL score than the 'only diabetes' group ($M=.483$, $p < .05$). Conclusion : Conclusions: Findings suggest that diabetes, as well as the existence of comorbidities, differently influence both SWL. This study discloses the importance of SWL for the elderly with diabetes, and their relevance in the context of healthy aging in older populations. Keywords : Chronic diseases, diabetes, older adults, satisfaction with life

PP25 B-058

SENSE OF COHERENCE AND SATISFACTION WITH LIFE IN A CROSS-NATIONAL SAMPLE OF OLDER ADULTS WITH TYPE 2 DIABETES

Sofia VON HUMBOLDT, Isabel LEAL, Susana SANTOS (*Research Unit in Psychology and Health, R&D, ISPA-Instituto Universitario, Portugal*)

Introduction : Objectives: The present research intends to: (a) determine significant differences among three groups of older adults with diverse diabetes diagnosis, namely, participants with only type 2 diabetes, participants with diabetes and other chronic diseases and the

remaining without any chronic disease, regarding the satisfaction with life (SWL) and sense of coherence (SOC) scores, and (b) to assess the association of SWL with SOC in these groups. Method : Method: We recruited 304 non-institutionalized older adults aged between 74-100 years (M=82.9; SD= 6.71), who were allocated to three groups, according to their diagnosed medical condition. Measures were completed, including demographics, the Satisfaction with Life Scale and the Sense of Coherence Scale. Results : Results: Significant differences were found regarding the SWL and SOC among the three groups. A moderate positive correlation between the total SOC score and SWL ($r=.447$, $p \leq .01$) in the 'only diabetes' group was found. Findings showed a higher association between the score of 'manageability' and SWL ($r=.493$, $p \leq .01$), a weak correlation between 'meaningfulness' and SWL ($r=.207$, $p \leq .05$), a weak positive correlation between the scores of 'manageability' and SWL ($r=.218$, $p \leq .01$) as well as a weak and negative correlation between 'meaningfulness' and SWL ($r=-.201$, $p \leq .05$) in the 'diabetes and other' group. Conclusion : Conclusions: These pertinent findings contribute to an understanding of diabetes beyond the medicalized approach that is common in the literature and enhance the important role played both by SOC and SWL in older patients' diabetes adaptation to their medical condition. Keywords : Diabetes, older adults, satisfaction with life, sense of coherence

PP25 B-059

ACUTE CHANGES IN BLOOD GLUCOSE LEVEL BY A SHORT BOUT OF STAIR CLIMBING-DESCENDING EXERCISE AND A BICYCLE EXERCISE

Tetsuo TAKAISHI¹, Tatsuya HAYASHI² (*1. Graduate School of Natural Sciences, Nagoya City University, Japan; 2. Graduate School of Human and Environmental Studies, Kyoto University, Japan*)

Introduction : This study was designed to compare the acute hypoglycemic effect of a short bout of stair climbing-descending exercise (ST-EX) and a bicycle ergometer exercise (BI-EX) at the same heart rate. Method : Six elderly persons with T2DM (age 72.5 ± 4.3 y, fasting blood glucose 112 ± 7 mg/dl, HbA1c 6.7 ± 0.5 %) joined this study. On separate days, 5 h after breakfast, the subjects ingested a test meal composed of carbohydrate and protein (660 kcal), and then (1) kept sitting on a chair for 150 min (REST), (2) kept sitting for 90 min, then performed BI-EX for about 8.5 min and then kept sitting until 150 min (BIKE), or (3) kept sitting for 90 min, then performed ST-EX for about 8.5 min and then kept sitting until 150 min (STAIR). ST-EX comprised 16 sets of climbing a stairway to a second floor (18 cm height, 21 steps) at the rate of 90 steps/min followed by walking down the stairs slowly to the first floor. Results : At 90 min after ingestion, blood glucose levels (BG90) were not different among the conditions. However, blood glucose decreased more rapidly in STAIR than other conditions, particularly shortly after exercise (BG105-BG90: REST -10 ± 15 , BIKE -44 ± 24 , STAIR $-71 \pm 14^*$ mg/dl. * $P < .05$ vs. REST and BIKE) without dyspnea and leg fatigue. Conclusion: A short bout of ST-EX may be a powerful modality to improve glucose excursions after meals for elderly people with T2DM. Keywords : postprandial hyperglycemia, stairs, indoor

BIO-PARAMETERS: ARE DIFERENCES AMONG GENERATIONS?

Zaida Aguiar Sa AZEREDO¹, Eduarda MATOS² (*1. UNIFAI, Portugal; 2. SAude Comunitaria, BioMedical Sciences Institute Abel Salazar, Portugal*)

Introduction : In Portugal it seems new generations are taller than the

old generations. Also the number of obese persons is increasing. The main objectives of the Authors were : to know the prevalence of elderly obesity; to compare with young adults. Method : The Authors studied 403 adults who frequent a GP consultation . It is a opportunistic sample. We divided the participants into 3 age groups : <65; 65-79; >= 80 years old. Results : There are significant differences between young adult and elderly on what concern the BMI and the arm perimeter. The percentage of young adults with obesity or over weight is higher than old people; In the abdominal perimeter there are not differences among the three groups. Conclusion : Although this sample is an opportunistic sample and we can't generalize to the portuguese population we found more obesity in young adults and some other differences among the groups. Also in Portugal the obesity becomes a problem in young generations. Keywords : generations, elderly , bio-parameters

PP25 B-061

SALIDROSIDE, A NATURAL COMPOUND ISOLATED FROM RHODIOLA ROSEA L, PROMOTES OSTEOBLASTIC DIFFERENTIATION THROUGH REGULATION OF BONE MORPHOGENETIC PROTEIN (BMP) SIGNALING PATHWAY

Jinjing CHEN, Diandong LI, Zhen WANG (*Biochemistry Department, The Institute of Medicinal Biotechnology, China*)

Introduction : Salidroside (SAL) is one of main active components of *Rhodiola rosea* L, a traditional Chinese medicine which possesses diverse pharmacological activities including anti-aging effects. Our previous work found that SAL could enhance the transcriptional activity of BMP2, a well-established osteogenic regulator. In this study, the effect of SAL on proliferation, differentiation and mineralization of multipotential mesenchymal cell line C3H10T1/2 and osteoblastic cell line MC3T3-E1 was examined, and the role of SAL in BMP2 pathway was tested. Method : Cellular proliferation was measured by MTT assay. Effects of SAL on osteogenic marker genes and BMP2 pathway was measured by RT-PCR and Western blot. Cellular mineralization was tested with Alizarin Red S staining. Ovariectomized rats were used to study the effect of SAL in vivo. Results : SAL (1-10 μ M) promoted the proliferation of the osteoblastic cells and stimulated osteogenic capacity, evidenced by the increase of ALP activity and mRNA expression of ALP, osteopontin and osteocalcin in C3H10T1/2 and MC3T3-E1 cells after treatment for different time. The mineralization of C3H10T1/2 cells was dose-dependently increased by SAL. Moreover, SAL significantly increased the mRNA level of genes involved in the regulation of BMP2 signaling pathway, including BMP2, BMP4, BMP6, Runx2 and Osterix, and enhanced the phosphorylation of Smad1/5/8. The osteogenic effect of SAL was abolished by dorsomorphin, a BMP pathway inhibitor. Further in vivo study demonstrated that SAL prevented bone loss in the ovariectomized rats. Conclusion : Our findings demonstrate that SAL could stimulate osteoblastic differentiation through BMP signaling pathway, and thus may be developed as a promising anti-osteoporosis drug. Keywords : Salidroside; osteogenesis; BMP2; anti-osteoporosis

MODULATORY ROLE OF THIOREDOXIN-1 IN BASE EXCISION REPAIR UNDER REDOX MODULATION

Ji Su SON, Hye Lim KIM, Young Rok SEO (*Department of Life Science, Institute of Environmental Medicine for Green Chemistry, Dongguk University, Korea*)

Introduction : Thioredoxin-1 (Trx1) is an antioxidant enzyme with a

protective role in removal of reactive oxygen species (ROS). We investigated the mechanism of how the redox modulator Trx1 affects base excision repair (BER) activity to understand the protective role of Trx1. Method : To demonstrate the specific mechanism by Trx1, we constructed a Trx1 knockdown system in RKO cells using RNA interference technology. Results : Induced ROS generation and decreased Trx1 expression were concomitantly observed in Trx1 shRNA knockdown cells relative to wild type cells. DNA damage in terms of relative intensity of DNA tail and γ -H2AX foci was markedly higher in the Trx1 shRNA cells compared with that in wild type cells, leading to increased cellular susceptibility to nitrosomethylurea (NMU). In addition, we observed a modulatory role of Trx1 in the BER pathway via the p53 downstream gene, growth arrest and DNA-damage-inducible protein 45 α (Gadd45a). The protein level and function of p53, a Trx1 downstream gene, coincidentally decreased in the Trx1 shRNA cells. Furthermore, Trx1 shRNA cells showed decreased Gadd45a expression and interaction of Gadd45a with apurinic/aprimidinic endonuclease 1 (APE1) as well as APE1 activity. Conclusion : In conclusion, Trx1 might cooperate in the control of APE1 function as one of the critical steps in BER by modulating the p53 function and protein-protein interaction between Gadd45a and APE1, providing insight into the molecular mechanism for modulating BER activity with redox factor Trx1. Keywords : Base excision repair (BER), p53, Thioredoxin-1 (Trx1)

PP25 B-063

ACUTE MODERATE-INTENSITY CYCLING EXERCISE DOSE NOT LEAD CONSISTENTLY INCREASING THE SERUM BDNF IN JAPANESE HEALTHY YOUNG MALE

Akio GODA, Shohei OHGI (*Rehabilitation Sciences, Seirei Christopher University, Japan*)

Introduction : Brain-derived neurotrophic factor (BDNF) is one of a family of neurotrophic factors that participates in neuronal transmission, modulation and plasticity. Previous human-based studies have demonstrated that acute exercise leads to increases in BDNF in the peripheral blood, but there is no study conducted in Japanese subjects. Purpose of this study, to determine the effects of acute exercise on serum BDNF levels in Japanese healthy young male. Method : Forty Japanese male subjects (24.1 \pm 2.9yr) performed a graded exercise test for the determination of peak VO₂ on a cycle ergometer. On separate days, subjects performed 30-min cycle exercise at 60% of peak VO₂. Serum BDNF was analyzed both at rest and after exercise. Results : Twentytwo out of all subjects increased serum BDNF after exercise than rest period. However, in all subjects, there was no significant change in serum BDNF from rest value after exercise (rest 14.7 \pm 5.4 ng/ml; after exercise 15.3 \pm 5.8ng/ml; p=.21). Conclusion : This is the first study showing that serum BDNF levels are not significantly increased immediately after the exercise in Japanese male subjects. Additional research is needed to explore how BDNF change was produced by exercise in Japanese subjects at other age group. Keywords : Brain-derived Neurotrophic Factor, aerobic exercise, Japanese

FATIGUE OPTIMIZES NEUROMUSCULAR RESPONSES OF SUBSEQUENT EXERCISE

Hideaki ISHII, Yusuke NISHIDA (*Graduate School of Rehabilitation Sciences, Seirei Christopher University, Japan*)

Introduction : Exercise is associated with fatigue and improved physical function in the elderly. Fatigue during exercise impairs performance but enhances corticomuscular coupling; therefore, fatigue

promotes neuromuscular adaptation. In the elderly, neuromuscular adaptation improves functional tasks. We investigated the effect of fatigue on neuromuscular responses of subsequent exercise. Method : Fourteen healthy young men performed fatigue and non-fatigue protocols. Torque and electromyogram (EMG) responses during sustained maximal voluntary contraction (MVC) of knee extension were measured before protocol initiation. EMG during sustained 50% MVC was measured before and after protocols. In fatigue protocol, subjects performed low-intensity (50% MVC) knee extensions with slow movement and tonic force generation (fatigue exercise). After 5 min rest, subjects performed warm-up for 5 min and cycle ergometer exercise at 30% HRmax for 20 min. In non-fatigue protocol, subjects only performed the ergometer exercise. Neuromuscular efficiency (NME) and %iEMG were assessed. During fatigue exercise, respiratory exchange ratio (RER) was measured. Results : RER was significantly higher during fatigue exercise than during rest ($p < 0.05$); %iEMG was significantly higher after both protocols than before (fatigue protocol: $41.2 \pm 6.2\%$ vs. $44.1 \pm 6.5\%$; non-fatigue protocol: $41.5 \pm 6.6\%$ vs. $46.7 \pm 7.3\%$) ($p < 0.05$). NME was significantly lower after non-fatigue protocol (0.38 ± 0.10 Nm/mV) than before (0.43 ± 0.11 Nm/mV) ($p < 0.05$). Changes in iEMG and NME were significantly larger for non-fatigue than for fatigue protocol ($p < 0.05$). Conclusion : Fatigue optimized neuromuscular responses of subsequent exercise in healthy young men, suggesting that fatigue may provide exercise benefits to the elderly. Keywords : Neuromuscular, Exercise, Fatigue

BUTYRIC ACID-INDUCED HEME INCREASE IS CORRELATED WITH SIRT1 DECREASE IN GINGIVAL TISSUES

Marni E. CUENO¹, Kenichi IMAI¹, Noriko MATSUKAWA², Takamitsu TSUKAHARA², Kuniyasu OCHIAI¹ (1. Department of Microbiology, Nihon University School of Dentistry, Japan; 2. Laboratory of Animal Sciences, Kyoto Institute of Nutrition and Pathology Inc, Japan)

Introduction : Aging has been correlated to periodontopathic bacterial accumulation in the gingival tissue which would imply that periodontopathic bacterial metabolite, such as butyric acid (BA), also accumulate. BA is an extracellular metabolite that causes mitochondrial oxidative stress in vitro and associated with latent viral activation and apoptosis induction. It is, however, not clear whether BA contributes to aging. In this study, we determined the possible correlation between BA and aging in rats. Method : Jugular blood was collected 1 hour after BA-injection and separated into blood mitochondrial and cytosolic fractions. Hydrogen peroxide (H₂O₂), superoxide dismutase (SOD) and catalase (CAT) levels were measured in blood mitochondria to establish mitochondrial reactive oxygen species (ROS) homeostasis. NAD kinase (NADK), NADPH oxidase 2 (NOX2) and sirtuin 1 (SIRT1) activities were determined through immunoblotting while NAD⁺ (prerequisite for SIRT1) and NADP⁺ (prerequisite for NOX2) levels were quantified in blood cytosol to determine the possible correlation between BA and SIRT1. Heme levels were likewise determined in both blood mitochondria and cytosol. Results : We found that both pro-oxidants (H₂O₂) and antioxidants (SOD and CAT) levels increased suggesting that mitochondrial ROS homeostasis was affected and, likewise, mitochondrial oxidative stress was not induced. Moreover, we established that cytosolic heme levels and NOX2 activity was increased while SIRT1 activity decreased. Consistently, NAD⁺ amounts measured were decreased whereas NADP⁺ levels were increased. This was further confirmed with an increase in NADK

activity which is needed for NADP⁺ production. Conclusion : Thus, BA-induced heme increase favors NADP⁺ (NOX2) over NAD⁺ (SIRT1) which putatively could contribute to aging. Keywords : butyric acid, gingival tissue, heme

THE MECHANISM OF LONGEVITY WITH HORMESIS BY THE LOW DOSE X RAY-IRRADIATION IN C. ELEGANS

Seitaro HAYASHI¹, Kayo YASUDA², Takamasa ISHII¹, Naoaki ISHII¹ (1. Department of Molecular Life Science, Tokai University School of Medicine, Japan; 2. Teaching and Research Support Center, Tokai University School of Medicine, Japan)

Introduction : *Caenorhabditis elegans* development can adopt a quiescent stage called the dauer larva, under adverse environmental conditions such as a high population density or starvation. They can resume normal development when presented with food. The time spent as a dauer larva did not affect the post-dauer life span, giving the impression that dauer larvae suspend the process of aging. A strong beneficial effect was observed when dauer larvae were irradiated and allowed to recover soon after X-ray irradiation; that is, irradiation (30 Gy) to one day old but not 30 days old dauer larvae significantly increased the post-dauer life spans. Method : To be clear the molecular mechanisms of the longevity, a genome-wide gene expression analysis was performed in a comparison between irradiated and non-irradiated worms. Results : In the irradiated worms, activation of antioxidants such as glutathione-S-transferase, alteration of the energy metabolism such as an activation of unsaturated fatty acid synthesis and activations of some signaling pathways were observed by the gene expression analysis. Conclusion : It is suggested that the longevity by X ray-irradiation is due to the activation of antioxidants and the alteration of energy metabolism derived from the activations of some signaling pathways such as JNK and p38 MAPK and an insulin-like ligand-receptor signaling pathway related with stress responses. Keywords : *C. elegans*, Dauer larvae, X ray-irradiation

IN-DEPTH ANALYSIS OF UBA1 CYSTEINE UNDER OXIDATIVE STRESS

Ung YANG, Hee-Young YANG, Tae-Hoon LEE (Department of Biochemistry, School of Dentistry, Chonnam National University, Korea)

Introduction : The oxidation of intracellular proteins and the formation of protein aggregates have been suggested to underlie the loss of cellular function and the reduced ability of senescent animals to withstand physiological stresses. Especially, Selective and regulated protein degradation via the ubiquitin-proteasome system is essential for maintenance of cellular homeostasis. In Peroxiredoxin II (Prdx II) knockout mice, morphologically aged cells and aggregated hemoglobins were detected in the dense RBC fractions, which contained markedly higher levels of reactive oxygen species (ROS). Method : To identify oxidation-sensitive cysteines in RBC of Prdx II^{-/-} mice, we performed comparative analysis by nano-UPLC-MSE shotgun proteomics. And then, we confirmed in vitro enzyme activity of UBA1 (ubiquitin activating enzyme E1) using designed five mutants (C23S, C278S, C340S, C494S and C632S). We also evaluated the relation between UBA1 activity and ubiquitination, and the functional role of UBA1 cysteine in both in vivo and in vitro ubiquitination. Results : In this study, we identified oxidation-sensitive cysteines in some candidates in RBCs from PrdxII^{-/-} mice. Among identified targets, UBA1 was detected oxidation-sensitive four cysteines containing reduced form and hyperoxidative form.

Particularly, Cys-278 can affect ubiquitin charging through a change in the structural conformation of UBA1, not through direct interaction at the UBA1-Ub interface. Conclusion : We hypothesized that oxidative stress-induced impairment of UBA1 activity may trigger the accumulation of protein aggregates due to the impaired ubiquitination. Keywords : Red blood cell, cysteine oxidation, UBA1

SOD1 INSUFFICIENCY EXACERBATES ALZHEIMER'S-LIKE PHENOTYPES IN MICE

Takahiko SHIMIZU¹, Kazuma MURAKAMI², Shigeo MURAYAMA³, Kazuhiro IRIE², Takuji SHIRASAWA⁴ (1. *Advanced Aging Medicine, Chiba University Graduate School of Medicine, Japan*; 2. *Graduate School of Agriculture, Kyoto University, Japan*; 3. *Neuropathology, Tokyo Metropolitan Institute of Gerontology, Japan*; 4. *Aging Control Medicine, Juntendo University Graduate School of Medicine, Japan*)

Introduction : Oxidative stress is closely linked to the pathogenesis of neurodegeneration. Soluble amyloid β (A β) oligomers cause cognitive impairment and synaptic dysfunction in Alzheimer's disease (AD). However, the relationship between oligomers, oxidative stress and their localization during disease progression is uncertain. Method : Our previous study demonstrated that mice deficient in cytoplasmic copper/zinc superoxide dismutase (CuZn-SOD, SOD1) have features of drusen formation, a hallmark of age-related macular degeneration. Amyloid assembly has been implicated as a common mechanism of plaque and drusen formation. Results : Here, we show that Sod1 deficiency in an amyloid precursor protein-overexpressing mouse model (AD mouse, Tg2576) accelerated A β oligomerization and memory impairment as compared with control AD mouse, and that these phenomena were basically mediated by oxidative damage. The increased plaque and neuronal inflammation were accompanied by the generation of N ϵ -carboxymethyl lysine in advanced glycation end-products, a rapid marker of oxidative damage, induced by Sod1 gene-dependent reduction. The Sod1 deletion also caused tau phosphorylation and the lower levels of synaptophysin. Furthermore, the levels of SOD1 were significantly decreased in human AD patients rather than non-AD age-matched individuals, but mitochondrial SOD (Mn-SOD, SOD2) and extracellular SOD (CuZn-SOD, SOD3) were not. Conclusion : These findings suggest that cytoplasmic superoxide radical produced by SOD1 insufficiency plays a critical role in the pathogenesis of AD. Activation of SOD1 may be a therapeutic strategy for the inhibition of AD progression. Keywords : SOD1, Oxidative stress, Alzheimer's disease

PP25 B-069

MATHEMATICAL ANALYSIS OF INDIVIDUAL SENSITIVITY TO OXIDATIVE STRESS

Victor SEMENKOV¹, Anatoli MICHALSKI² (1. *Laboratory of Ageing Immunology, Centre of Gerontology of Medical University of Ministry of Health of Russian Federation, Russia*; 2. *Control on Incomplete Data, Institute of Control Sciences of Russian Academy of Science, Russia*)

Introduction : Active ageing may depend on individual sensitivity of human's organism to oxidative stress. Misbalance in favor of oxidants may result in pathophysiological responses, functional disorders and diseases. Individual sensitivity to oxidative stress is reflected in the ability of organism to reduce the surplus production of reactive oxygen species (ROS) under stress in order to prevent cells and organs from damage. Method : The study included 30 patients(6 male and 24 female) aged 35 to 95 years. The luminol-dependet

chemiluminescence of the neutrophils as phagocytizing cells isolated from the patient's peripheral blood was used to measure the level of ROS production. Neutrophils were exposed to heat shock at 42°C for 30 sec, 1 min. and 3 min. and then induced by zymosan A(Sigma,USA) chemiluminescence. Another part of neutrophils of the same patient was used as a control of chemiluminescence without stress reaction. Mathematical method used approximation of the experimental curves and calculation of the differences between ROS production after stress and control neutrophils for each patient. Results: The statistically significant difference in ROS production between control neutrophils and neutrophils after stress during 30 sec., 1 min. and 3 min. was observed in the first minutes after heat shock in the most patients (p<0.05). The degree of reduction in ROS production by neutrophils after stress was opposite to individual sensitivity to oxidative stress. Conclusion : These data testify that shortening of heat shock stress duration for neutrophils is suitable for determination of individual sensibility to oxidative stress. Keywords : stress, individual sensitivity

PP25 B-070

TELOMERE LENGTH OF HUMAN ADULT BRONCHIAL EPITHELIUM MEASURED BY TISSUE Q-FISH METHOD

Shinsuke AIDA¹, Junko AIDA², Toshio KUMASAKA³, Hideyuki SHIMAZAKI⁴, Seiichi TAMAI⁴, Kaiyo TAKUBO², Yoshiyuki R. OSAMURA¹ (1. *Department of Pathology, Mita Hospital, International University of Health and Welfare, Japan*; 2. *Research Team of Geriatric Diseases, Tokyo Metropolitan Institute of Gerontology, Japan*; 3. *Department of Pathology, Japanese Red Cross Medical Center, Japan*; 4. *Department of Laboratory Medicine, National Defense Medical College, Japan*)

Introduction : We investigated the telomere lengths of human adult bronchial epithelium using tissue Q-FISH method, and examined its correlation with aging and smoking. Method : Lung tissue obtained from 53 autopsy cases (range 51-100 years, average 82) and 20 surgically resected lung cancer cases (range 45-72 years, average 62) were examined. Telomere lengths of basal cells of bronchial epithelium were measured by tissue quantitative fluorescence in situ hybridization (Q-FISH) method, and were shown by normalized telomere to centromere ratios (NTCRs). Results : 53 autopsy cases include 20 nonsmokers (NoS), 14 ex-smokers (ExS), 10 current smokers (CuS), and 9 unknown cases. 20 surgical cases include 19 CuS and 1 unknown case. NTCRs of NoS, ExS and CuS of autopsy cases are 1.18, 1.17, 1.51, respectively. The telomeres of CuS are significantly longer than those of NoS and ExS. NTCRs of the bronchial epithelium of lung cancer cases and lung cancer tissue are 1.38 and 1.46, respectively. NTCRs of CuS tend to be reduced with age. NoS and ExS show no correlation between NTCRs and age. Conclusion : The significant elongation of telomeres of CuS suggests that smoking causes some mechanism to lengthen telomeres such as induction of telomerase. Most of lung cancer cases are CuS but their telomeres are shorter than those of CuS of non-cancer autopsy cases, which is considered to indicate reduction of telomere length in carcinogenic process. Keywords : telomere, Q-FISH, smoking

Introduction : This study was to investigate socio-economic, clinical, anthropometric, balance and functional fitness factors present in Amazon riparian older persons that can be associated with a risk of falling. **Method :** A cross sectional study was performed with 637 riverine elderly residents (≥ 60 years old) in Maues city Amazonas, Brazil. The elderly were grouped in two categories with and without a history of falls in the past six months. The following variables were compared between these groups: self-reported social and health conditions; biochemical and physiological variables related to the control of metabolic diseases; body composition; hand grip strength; functional fitness evaluation (Senior Fitness Test) and balance condition (Berg Balance Test). **Results :** The prevalence of at least one fall in the past six months was 24.6% ($n = 157$) and was similar between the sexes. The mean age between males and females with and without a history of falls was also similar (males with falls = 72.67 ± 8.86 ; males with no falls = 73.26 ± 7.58) female falls = 71.78 ± 8.18 , female with no falls = 71.48 ± 8.17). A history of falls was associated with hospitalization in the last year and to self-health perception to both sexes and presence of chronic morbidity and percentage of body fat (BF) to women. However, the other variables including balance and functional fitness, did not present differences between elderly with and without a history of falls. **Conclusion :** These falls experienced by the riparian elderly are strongly associated to accidents due to environmental conditions related to daily life. **Keywords :** Falls, riverine people, aging

AGE-DEPENDENT STEROID METABOLISM IN SERUM AFFECTED BY TOTAL BODY IRRADIATION OF C57BL/6 FEMALE MICE

Ju-Yeon MOON¹, Hee-June SHIN², Hyun-Hwa SON¹, Jeongae LEE¹, Uhee JUNG², Sung-Kee JO², Hyun Sik KIM³, Kyung-Hoon KWON³, Kyu Hwan PARK³, Bong Chul CHUNG¹, Man-Ho CHOI¹ (1. *Future Convergence Research Division, KIST, Korea*; 2. *Radiation Biotechnology Research Division, KAERI, Korea*; 3. *Division of Mass Spectrometry Research, KBSI, Korea*)

Introduction : Although radiation therapy is general in cancer treatment, it may accelerate aging and degenerative changes on steroidogenesis. The effects of gamma-radiation in steroid metabolism were therefore investigated. **Method :** Gas chromatography-mass spectrometry-based quantitative steroid signatures were introduced to 6-week-old C57BL/6 female mice ($n = 5$, each group) exposed to different dose (0, 1 and 4 Gy) with total body irradiation (TBI). The serum samples were collected at 1, 3, 6, and 9 months after the TBI. **Results :** Androgenic steroids including testosterone, epitestosterone, androstenedione and epiandrosterone were not significantly altered in the models, except for 4-Gy/9-month mice. In contrast, a metabolite of progesterone, 20 α -dihydroprogesterone, resulted in a significant decline during the modeling of both 2- and 4-Gy models. In case of stress hormones, the level of allo-tetrahydrodeoxycorticosterone (5 α -THDOC; $P < 0.01$) and allo-dihydrocorticosterone (5 α -DHB; $P <$

0.05) were significantly increased from 3-month after TBI. The P450scc (CYP11A1) activity, the metabolic ratio of pregnenolone to cholesterol, was slightly down-regulate according to the exposure, whereas 24-reductase (cholesterol/desmosterol) was significantly increased at 6-month after TBI. **Conclusion :** The cholesterol accumulation was observed in TBI. In addition, the increased 5 α -reductive metabolism of corticosterone may accelerate aging, while age-protective 20 α -dihydroprogesterone was decreased by radiation. **Keywords :** radiation, aging, steroid metabolism

PP25 B-073
EFFECT OF P38 MAPK INHIBITOR SB203580 ON GASTROINTESTINAL MOTILITY IN DIABETIC RAT

Bo Yun QIU, Hua Tian GAN (Department of Geriatrics, West China Hospital, Sichuan University, China)

Introduction : The pathogenesis of diabetic gastrointestinal motility disorder, a common chronic complication of diabetes, remains unknown. Oxidative stress is demonstrated to play an important role in its development, and oxidative stress has been shown to be closely related to P38 mitogen-activated protein kinase. The purpose of this study is to investigate the effect of selective P38MAPK inhibitor SB203580 on gastrointestinal motility in STZ-induced diabetic rat and elucidate the possible role of P38MAPK signal pathway on gastrointestinal motility in diabetic etiology and pathogenesis. **Method :** 32 SD rats were randomly divided into four groups, normal control group, STZ model group, STZ+saline group, STZ+SB203580 group. Diabetic rat gastrointestinal motility disorder model was induced by intraperitoneal injection of STZ. Gastric emptying and intestinal transit was measured using the geometric center. Small intestine iNOS protein expression was measured by Western blot. **Results :** 1. Gastric emptying and intestinal transit were significantly delayed in rats from STZ model group and STZ + saline group compared with the normal control group ($P < 0.05$), and delayed gastric emptying and intestinal transit in STZ+SB203580 model group were improved significantly after using SB203580. 2. iNOS expression was significantly increased in rats from STZ model group and STZ + saline group compared with the normal control group ($P < 0.05$), and iNOS expression was significantly decreased after treatment with SB203580. **Conclusion :** The blockade of P38 MAPK pathway with SB203580 ameliorates delayed gastric emptying and intestinal transit, at least in part, by inhibiting iNOS expression. p38 MAPK could represent a novel target for therapy of gut dysmotility in diabetes. **Keywords :** diabetes, P38 MAPK pathway, gastrointestinal motility disorder, iNOS

THE COMPARISON OF LIFE EXPECTANCY AT BIRTH (YRS) OF SHANGHAI IN RECENT YEARS WITH CHINA AND MORE DEVELOPED COUNTRIES POPULATION

Zhuowei YU, Zhijun BAO, Qingwei RUAN, Yongxing MA (Department of Aging, Antiaging and Cognitive Function, Shanghai Institute of Gerontology and Geriatrics, Affiliated Huadong Hospital, Shanghai Medical College, Fudan University, China)

Introduction : Compare the life expectancy at birth (yrs) of Shanghai in recent years with China and world Population. **Method :** Compare the life expectancy at birth (yrs) from the data in: ① Unit Nations Population Reference Bureau (PRB): 2000-2012, World Population Data Sheet. ② The State Statistics Bureau. SSB. ③ Shanghai Bureau of Civil Administration. **Results :** ① Shanghai: 2003-2005, 80 yrs; 2006-2008, 81 yrs; 2009-2010, 82 yrs; 2011-2012, 82.5 yrs. ② China: 2003, 71 yrs; 2005-2006, 72 yrs; 2007-2009, 73 yrs; 2010-2011, 74

75 yrs; 2012, 75 yrs. ③ More developed countries: 2003-2005, 76 yrs; 2006-2010, 77 yrs; 2011-2012, 78 yrs. Conclusion : ① The population life expectancy at birth (yrs) of Shanghai is 8-9 yrs higher than China. ② The population life expectancy at birth (yrs) of Shanghai is 4-5 yrs higher than more developed countries. ③ These suggested the results of active aging, healthy aging, and so aging well together: Regional perspectives. Keywords : life expectancy at birth, China, Shanghai, More developed countries

PP25 B-075

THE NATURAL HISTORY OF CHRONIC PAIN FROM AGE 70 TO 85

Jochanan STESSMAN, Jeremy M JACOBS (*Jerusalem Institute of Aging Research, Hadassah Hebrew University Hospital, Israel*)

Introduction : Although chronic pain is considered to be a major contributor to quality of life, nonetheless the natural history of chronic pain among older people is poorly documented. We present longitudinal data from age 70 to 85 concerning chronic musculoskeletal, joint, and abdominal pain and chronic headache. Method : Data was collected by the Jerusalem Longitudinal Study, which is an ongoing prospective study of a representative sample from the 1920-1921 birth-cohort living in West Jerusalem. Subjects underwent comprehensive assessment and examination at home in 1990, 1998, and 2005, at ages 70 (n=605), 78 (n=1023) and 85 (n=1222). Results : At ages 70, 78 and 85 chronic musculoskeletal pain was present among 41.5%, 59.2%, and 39.6% of subjects respectively; chronic joint pain was present among 42.9%, 60.6%, and 45.4% respectively. In contrast abdominal pain was less common, and among the oldest old was very infrequent: 14.7%, 13%, and 1.5%, with a similar pattern for chronic headache: 16.9%, 18.8%, and 1.9%. Clear consistent gender differences were observed, with pain being significantly more common (X1.5-2) among women. Kaplan-Meier survival curves adjusted for gender showed no significant differences in longevity according to either abdominal pain or headache. Conclusion : In contrast to musculoskeletal and joint pain which remains common at all ages, visceral pain is very infrequent among the oldest old. Keywords : Chronic pain, longitudinal study

PP25 C-001

CORONARY REVASCULARIZATION VERSUS OPTIMAL MEDICAL THERAPY IN ELDERLY PATIENTS WITH STABLE ANGINA

Aleksandr BOGACHEV, Kirill KOZLOV, Igor OLEKSYUK (*Cardiovascular Science, St. Petersburg Institute of Bioregulation and Gerontology, Russia*)

Introduction : Multivessel coronary disease is more common in elderly patients. The question is which primary strategy should be chosen for elderly patients with stable angina, i.e., revascularization (percutaneous coronary intervention or coronary artery bypass surgery) with intensive pharmacological therapy and lifestyle changes (optimal medical therapy) or optimal medical therapy alone. Method : Clinical trials that compare these two approaches showed that elderly patients benefit more from revascularization than younger patients. Results : There is no doubt that multivessel disease requires a heart team to select the optimal strategy. Age itself is not a criterion for selecting optimal treatment strategies. Conclusion : One must consider many other factors, including medical findings, angiography, the patients' wishes, social and cultural aspects, and other parameters. Patients should be given complete and objective information. Keywords : chd, elderly, multivessel disease

PP25 C-002

FRAGMENTED QRS IN ELDERLY PATIENTS WITH HIP FRACTURE : PRELIMINARY RESULTS

Alice BREINING¹, Nadjib HAMMOUDI², Veronique FAUCOUNAU¹, Judith COHEN-BITTAN¹, Helene VALLET¹, Marc VERNY¹, Jacques BODDAERT¹ (*1. Geriatric Department, Peri-Operative Unit, Pitie-Salpetriere Hospital, APHP, UPMC Paris 6, France; 2. Cardiology, Pitie-Salpetriere Hospital, APHP, UPMC Paris 6, France*)

Introduction : The fragmented QRS (fQRS) are due to terminal conduction delay after myocardial infarction. The fQRS is a marker of prior myocardial infarction. The main purpose of the study is to describe electrocardiograms (ECG) before and after hip fracture surgery in elderly patients and to evaluate fQRS pronostic value and arrhythmic events rate. Method : In this monocentric study, all consecutive patients > 75 years with a hip fracture were enrolled. Clinical and biological data and outcome were collected prospectively. Each 12-lead ECG was analysed by 2 independent readers. We present our preliminary results. Results : A total of 184 patients were enrolled. Before surgery, 91% of the patients were in sinus rhythm and 8% had atrial fibrillation. Twenty nine percent of the patients had a fQRS and 15% a Q wave. During their stay in the geriatric post operative unit, cardiac and arrhythmic events occurred in 56% of the patients: 28% presented premature atrial complexes, 21% premature ventricular complexes, 11% paroxysmic atrial fibrillation. New fQRS appeared in 9% of the patient, and acute coronary syndrome (with and without ST-elevation) were observed in 7%. Pre-operative fQRS was not associated with any post-operative ECG new event. Conclusion : Fragmented QRS is a frequent pattern of elderly's ECG, and cardiac and arrhythmics events are frequent in the post operative evolution of a hip surgery in elderly patients. However, our preliminary results suggest that fQRS are not predictive of post-operative ECG event in our population. Keywords : hip fracture, coronary artery disease

PP25 C-003

THE CASE OF THE STAGED HYBRID REVASCULARISATION OF AN ELDERLY PATIENT WITH THE GENERALIZED ATHROSCLEROSIS

Kirill Lenarovich KOZLOV¹, Gennadii Grigor'evich KHUBULAVA², Sergei Sergeevich MIKHAILOV¹, Ekaterina Viktorovna SEDOVA¹, Andrei Nikolaevich SHISHKEVICH², Alexandr Borisovich SMOLJANINOV³ (*1. Vascular Surgery Department, Saint-Petersburg Institute of Bioregulation and Gerontology, NWB of RAMS, Russia; 2. Kuprianov Cardio-Thoracic Surgery Clinic, Saint-Petersburg Military Medical Academy, Russia; 3. Vascular Department, Center of cellular and gene therapy "Pokrovsky stem cell bank", Russia*)

Introduction : Patient "E" is 73 years old. He complained of stenocardia, high blood pressure. The patient suffers from second type of diabetes (compensated form). The patient had an angiography, which showed the multivascular lesion of coronary streambed, nephric and carotid arteries and the arteries of pelvic limbs at all levels including the crus. SYNTAX Score 35 points. Method : Combined surgery was performed - aorta-coronary bypass surgery plus carotid endarterectomy with the preliminary stenting of nephric arteries on both sides with satisfactory angiographic and clinical results. In 4 months patient had two-sided stenting general iliac arteries, balloon angioplasty of the proximal part of the left superficial femoral artery and the stem cells therapy of both cruses according to the standard scheme. Results : In 6 months referenced angiography of pelvic limbs showed clear positive trend in terms of pelvis limbs' revascularization. After treatment the patient noted a significant improvement in health

and quality of life, which is showed in increasing the level of physical tolerance, normalization of blood pressure and in improvement in psycho-emotional background. Conclusion : Despite the growing number of such patients, the experience of treatment so far is limited. There aren't any specific algorithms for different combination of arterial streambed's lesions and there aren't any convincing facts of possible one-moment endovascular and open surgeries or making open surgeries against the background of double antimodular therapy. Keywords : generalized atherosclerosis, hybrid intervention, elderly patients.

TWO-YEAR INCIDENCE OF CORONARY EVENT IN TURKISH PEOPLE AGED 65-74 YEARS

Sinem DOGANAY, Reyhan UCKU (*Public Health, Dokuz Eylul University, Turkey*)

Introduction : Coronary heart disease(CHD) is the most important and also preventable cause of death in the world. The objectives of the study are to determine two-year CHD incidence in people aged 65-74 years and to evaluate the incidence of coronary event according to the level of CHD risk. Method : This is a population-based cohort study. The study population is 1382 people aged 65-74 years living in an urban area. The dependent variable of the study was coronary event. The main independent variable was Framingham risk level. Coronary event was defined as coronary heart disease or death from CHD. For analysis, Chi-square and Cox regression analysis were used. Results : Two-year incidence of coronary event was found as 3.8%. It was determined that the incidence of coronary event increases significantly as Framingham risk score increases. The relative risk was 3.18 for high versus low CHD risk level. Conclusion : The incidence of coronary event increases significantly as Framingham risk score increases. Keywords : conorary event, incidence, young elderly

ASSOCIATION BETWEEN TESTOSTERONE LEVEL AND CORONARY ARTERY CALCIUM SCORE IN MIDDLE AND ELDERLY MEN

Yon Chul PARK¹, Moon Jong KIM¹, Yong Sang KIM¹, Jong Koo KIM², Yong Jae LEE³ (*1. Department of Family Medicine, CHA University, Bundang CHA Hospital, Korea; 2. Department of Family Medicine, Yonsei University Wonju Severance Christianity Hospital, Korea; 3. Department of Family Medicine, Yonsei University Yongin Severance Hospital, Korea*)

Introduction : The number of elderly people in Korea is growing fast in past few years, and also mortality of coronary artery disease. Predictive value of coronary calcium score as a risk factor of ischemic heart disease is well known. Decreasing testosterone and increasing mortality due to ischemic heart disease accompanied by aging suggested testosterone as a risk factor of coronary artery disease. Method : A cross-sectional study with 292 health check-up subjects who checked coronary artery CT and serum testosterone level was conducted. Patients with ongoing testosterone replacement therapy were excluded. Three groups were organized on the basis of Agatston criteria(none, mild, moderate and severe). ANOVA and ANCOVA were used to verify association between testosterone and coronary artery calcium score. Results : Fasting glucose, drinking, hypertension, history of diabetes were associated with tertile coronary artery calcium score group after an analysis of variance. After analysis of covariance, with correcting those variables, no association was found between coronary artery calcium score and testosterone. (p=0.600). Conclusion: No association was found between coronary artery calcium score and

testosterone in middle and elderly men. Keywords : coronary artery calcium score, testosterone

PP25 C-006

FACTORS AFFECTING QUALITY OF LIFE AMONG THE PATIENTS WITH HEART FAILURE

Haejung LEE, Jihyoung YU, Yeonjung LIM, Sungmin KIM (*College of Nursing, Pusan National University, Korea*)

Introduction : This study was conducted to identify the factors related to the quality of life (QOL) in patients with heart failure (HF). Method: Data were collected from 102 patients diagnosed with HF in 3 hospitals in Korea from April 25 to November 2, 2012. The Kansas City Cardiomyopathy Questionnaire (KCCQ), Korean Activity Scale Index (KASI), Activities of Daily Living (ADL), European Heart Failure Self-care Behavior Scale (EHFScBS-9), Self-Efficacy for Exercise (SEE) were used to measure QOL, the levels of functional activities, self-care, and self-efficacy for exercise. Data were analyzed with descriptive statistics, Pearson correlation, and stepwise multiple regression analysis. Results : The mean age of the participants were 62 years old. The mean score of QOL was 83.73±14.51 (range: 31.77~100.0). Employment status, educational level, household income, ADL, functional activities, left ventricular ejection fraction (LVEF) and SEE were significantly related to the levels of QOL. The significant correlates of QOL identified from the multivariate approach, were the levels of functional activity ($\beta=.508$), ADL ($\beta=-.334$), and SEE ($\beta=.164$). These variables explained 54.8% of variance in QOL. The level of functional activities was the most important predictor of QOL among HF patients. Other demographical and disease related factors, regular exercise and self-care had no predictive value. Conclusion : Findings from this study provide a comprehensive understanding of QOL and related factors in patients with HF. Researchers and health care professionals need to develop effective strategies to enhance functional status of patients with HF to improve QOL. Further study with a larger sample and long-term design is necessary. Keywords : Quality of life, Heart Failure, Kansas City Cardiomyopathy Questionnaire

PP25 C-007

THE TECHNOLOGY FOR THE RESEARCH OF INTERACTION BETWEEN OPTIMAL BLOOD PRESSURE AND COGNITIVE FUNCTION IN ELDERLY

Anatoly ZHIRKOV¹, Subbota ALEKSANDR² (*1. Medical College, Saint Petersburg State University, Russia; 2. Physiology, Russian Medical Military Academy, Russia*)

Introduction : The cognitive disorders often revealed in the old and very old people. The hypertension is one of some the most discussed causes of cognitive decline in elderly. But till now the quantitative parameters of this connection is unclear. We had researched connection between blood pressure (BP) and cognitive function as a measure for optimal BP in old people. Method : We used original calculator based on ZhGS formulas for optimal BP (systolic, diastolic, mean, and pulse) determination to research interaction between cognitive functions and hemodynamic. MMSE and Luria tests were used for research cognition in more than 98 old and very old patients (mean 75 years old) compare with 221 middle age patients (mean 42 years). The follow up period was 6 month and include 67 patients with Hypertension. The Multilevel correlation analysis were used. Results : The results showed that the cognitive decline may be detected using as MMSE, as Luria test, but MMSE is more convenient for old patients. BP data revealed high correlation with cognitive function in elderly, but correlation between MMSE and BP was higher ($r=0.62$) than

between BP and Luria test . During 6 month of follow up period for patients with Hypertension correlation between BP and cognitive function rised in group where BP was optimal. The closest correlation revealed between MMSE and pulse BP. Conclusion : Optimal blood pressure model based on minimal energy consumption principle useful for research the role of BP in cognitive decline in elderly. The electronic calculator may helpful for this aim. Keywords : hypertension, cognition, optimization

PP25 C-008

QUALITATIVE ANALYSIS OF HYPERTENSION MEDICAL TREATMENT IN A FRENCH NURSING HOME

Caroline JOYAU¹, Florence DELAMARRE DAMIER², Gwenaëlle VEYRAC¹, Pascale JOLLIET¹ (1. *Clinical Pharmacology Institute of Biology, Nantes University Hospital, France*; 2. *Geriatric Cholet Hospital and Boussay Nursing Home, French Nursing Home Research Organization (Agree), France*)

Introduction : Several studies have shown that hypertension treatment in the elderly patient over 80 years of age could reduce stroke. In this population, the objective is a systolic blood pressure less than 150 mmHg. Hypertension treatment in the elderly population recommended by experts should not include more than three antihypertensive agents including thiazide diuretics at low doses. The main objective of this study is to describe hypertension medical treatment in nursing home. Method : We analyzed 76 prescriptions of patients in a nursing home of Loire-Atlantique. A descriptive analysis of the study population and their antihypertensive treatments was performed. Results : Among the 76 prescriptions, there were 55 women and 21 men with an average age of 86.84 (\pm 5.86) years. Forty-six patients had a documented history of hypertension and among them, the number of antihypertensive drugs prescribed per patient ranged from 0 to 4 with a median of 2. Thirty-nine of these patients received antihypertensive drugs: 15 were treated in monotherapy, 11 with dual therapy, 9 with triple therapy and 4 with quadruple therapy. Among these 39 patients, 27 had at least one diuretic associated or not with another treatment (13 received a thiazide diuretic) and 18 were treated with a calcium channel blocker. Conclusion : It is essential to treat hypertension in the elderly patients, in order to maintain their quality of life. A close monitoring of these treatments should be performed because of their hypotension risk and associated falls. This initial study should be extended to other nursing homes. Keywords : Hypertension nursing home

PP25 C-009

THE RELATIONSHIP BETWEEN CIRCADIAN AND POSTURAL VARIATION OF BLOOD PRESSURE IN THE HYPERTENSIVE ELDERLY- AUTHORS GEORGETA POPESCU, SILVIU DONTU, SANDRA NANIU

Georgeta Popescu Silviu Dontu SANDRA NANIU (*Geriatrics, The National Institute of Geriatrics and Gerontology "Ana Aslan", Romania*)

Introduction : It is a circadian variation of blood pressure (BP) with a nocturnal BP fall between 5-15% which defines the dipping status: dipper, non dipper, extreme dipper. It is also a postural BP values variation which defines two aspects: ortostatic hypertensive reaction and orthostatic hypotension. Both circadian and postural variation of BP values are associated with target-organ dammages, and could be predictors for the following-up. Method : We selected 68 asymptomatic patients, 46 females and 22 males, aged between 65-79 years old, with moderate BP values (systolic BP 165-180 mm Hg and diastolic BP 90-105 mm Hg), +/- diabetes mellitus type II, with stroke

(32) and heart attack (6) in their history; we determined serum total cholesterol, glicemia, creatinine, the rest EKG and BP-holter registration. Results : Orthostatic hypertensive reaction was found in 10 of the extreme dippers (71,4%), in 6 of dippers (14,3%) and in 1 of non dippers (8,3%). The ortostatic hypertensive reaction was more frequent in the diabetic patients. The orthostatic hypotension was found in 4 non dippers patients (33,3%). Conclusion : The abnormal circadian variation of BP in the elderly patients is in relationship with postural BP variation. The orthostatic hypertensive reaction is more obvious in the extreme dippers, and the orthostatic hypotension rather in the non dippers. The hypertensive elderlies with diabetes develop more frequent a hypertensive orthostatic reaction than non diabetics. We noticed that orthostatic hypertensive reaction is more associated with target-organ dammage. The cardiovascular events seems to be more frequent in non dippers than in dippers. Keywords : hypertension, holter examination

PP25 C-010

RELATIONSHIP BETWEEN TISSUE GLYCATION MEASURED BY AUTOFLUORESCENCE AND PULSE WAVE VELOCITY IN YOUNG AND ELDERLY NON DIABETIC POPULATIONS

Ghassan WATFA¹, Georges SOULIS¹, Elisa TARTAGNI², Anna KEARNEY-SCHWARTZ¹, Paolo SALVI³, Claudio BORGHI², Athanase BENETOS¹ (1. *Geriatrics, Nancy University Hospital - CHU de Nancy, France*; 2. *Internal Medicine, Aging and Kidney Disease, University of Bologna, Italy*; 3. *Cardiology, IRCCS Istituto Auxologico Italiano, Italy*)

Introduction : Advanced Glycation End Products (AGEs) and Pulse Wave Velocity (PWV) are pivotal indices of the processes of arterial ageing and damage accumulation. The aim of the present study was to investigate the impact of AGEs, as measured by a non invasive skin autofluorescence method, on arterial stiffness estimated by PWV in two different age groups of non-diabetic subjects. Method : 116 non-diabetic subjects were classified into two groups, 55 subjects in the (<65 years) group and 61 in the (\geq 65 years) group. AGEs were measured by skin autofluorescence while carotid-femoral PWV was assessed by tonometry. Results : A significant (positive) association was observed between PWV and AGE Skin autofluorescence in the younger age group ($r = 0.51$; $p < 0.0001$). This association was no longer significant after further adjustment for age and other factors upon multiple regression analyses. In contrast, this correlation was not found in the elderly group ($r = 0.098$; $p = 0.454$). Conclusion : Young non diabetic subjects exhibit a different correlation profile between AGEs accumulated in skin and cfPWV as an index of arterial stiffness comparatively to that observed in elderly subjects. AGEs were found to be significantly associated with cfPWV in younger individuals but not in the elderly. A further study with a larger number of subjects is proposed to confirm the contribution of AGEs, the formation of which is manageable, as a determinant of arterial stiffness in young subjects. Keywords : AGEs, PWV, non-diabetic

PP25 C-011

SEX DIFFERENCES IN THE RELATIONSHIP BETWEEN NORMAL AGING-RELATED ARTERIAL STIFFNESS AND CARDIAC DIASTOLIC DYSFUNCTION IN HEALTHY POPULATION WITHOUT OVERT DISEASE

Lulu HAN¹, Xiaojuan BAI¹, Hongli LIN², Xuefeng SUN³, Xiangmei CHEN³ (1. *Department of Gerontology and Geriatrics, The First Affiliated Hospital of China Medical University, China*; 2. *Department of Kidney, Dalian Medical University, China*; 3. *Department of Kidney, General Hospital of Chinese PLA, China*)

Introduction : To identify sex difference associations between CIMT and diastolic function in healthy Chinese individuals. **Method :** We examined 852 healthy participants in three north China cities by M-mode ultrasonography to analyze CIMT and cardiac structure and function. Cardiac function was measured by determining the ratio of early diastolic peak flow velocity (E) and late diastolic peak flow velocity (A) (E/A), as well as the deceleration time of the early mitral velocity (MV-DT). Cardiac dysfunction was defined as E/A values <25th percentile and MV-DT values >75th percentile (E/A < 0.778 for males and <0.792 for females; MV-DT > 210 ms for males and > 195 ms for females). **Results :** CIMT, E/A, and MV-DT significantly correlated with age in both males and females (P<0.01). CIMT was significantly associated with lower E/A in females with the odds ratio (95% CI) 3.298 (1.742-6.246) and 6.002 (3.202-11.251), respectively. The association was still significant after fully adjustments including age, blood pressure, blood lipid and inflammatory markers with the odds ratio (95% CI) 3.031 (1.228-7.48) and 3.224 (1.308-7.946), respectively. The association between higher CIMT with lower E/A in males and with MV-DT in both males and females were significant only in an unadjusted model and were lost upon age adjustment. **Conclusion :** Normal aging related increases in CIMT correlated with the decline in cardiac diastolic function only in females, which may contribute to the higher incidence of heart failure with preserved ejection fraction. **Keywords :** aging, carotid intima-media thickness, cardiac diastolic function

PP25 C-012

TREATMENT WITH BETA-BLOCKERS IS ASSOCIATED WITH LOWER LEVELS OF SERUM SEROTONIN AND THROMBOCYTES IN ELDERLY MEN - MR OS STUDY

Bodil LERNFELT¹, Asa TIVESTEN², Mattias LORENTZON², Claes OHSSON², Annika ROSENGREN¹, Osten LJUNGGREN³, Magnus KARLSSON⁴, Dan MELLSTROM² (1. Department of Internal Medicine, Sahlgrenska Academy, University of Gothenburg, Sweden; 2. Center for Bone and Arthritis Research, Sahlgrenska Academy, University of Gothenburg, Sweden; 3. Department of Medical Sciences, University of Uppsala, Uppsala, Sweden; 4. Department of Clinical Sciences and Orthopaedics, Lund University, Sweden)

Introduction : Elderly patients are often treated with a combination of drugs including beta-blockers and anticoagulants. In circulating blood serotonin bind to platelets. Experimental studies indicate that beta-blockers may affect circulating serotonin. The aim of this study was to examine how beta-blockers affect the circulating levels of serotonin and thrombocytes in a population sample and to investigate this association in relation to metabolic parameters and body composition. **Method :** Serum serotonin, adiponectin, leptin and thrombocytes were analysed in a population sample of 1007 men aged 70-80 years recruited from a national population register. Hologic DXA was used to measure bone mineral density (BMD), total body fat and lean body mass. Anthropometric data, medical history and actual drug treatment was registered. **Results :** Treatment with beta-blockers was observed in 308 men (30.6%). The majority (83%) had selective beta-blockers. Serotonin and platelet count was lower in those taking beta-blockers compared with men without this treatment (138.6 versus 161.7 pg/L p=0.000 and 222 versus 239 p=0.002). Higher leptin levels were noted in men with selective beta-blockade (30 versus 20 ng/ml p=0.000). Men with selective beta-blockers had higher BMI, greater fat mass and lower levels of adiponectin. The relationship between beta-blockers, and serotonin and platelet count remained after correction for age, body composition and renal function. **Conclusion :** In conclusion we found that treatment with beta-blockers was associated with lower levels of circulating serotonin and platelets irrespective of age, body

composition and renal function. The clinical implication of low serum serotonin has to be further investigated. **Keywords :** beta-blockers, serotonin, platelets

PP25 C-013

THE RELATIONSHIP BETWEEN CHRONIC KIDNEY DISEASE AND ARTERIAL STIFFNESS IN AN ELDERLY POPULATION

I-Ting LIU, Jin-Shang WU, Yi-Ching YANG, Ying-Hsiang HUANG, Feng-Hwa LU, Chih-Jen CHANG (Department of Family Medicine, National Cheng Kung University Hospital, Taiwan)

Introduction : To assess the association of arterial stiffness with early and late chronic kidney disease (CKD), different blood pressure and glycemic status, independent of other risk factors in an elderly population. **Method :** A total of 1251 eligible subjects aged 60 years or more were enrolled from Health Examination Center, National Cheng Kung University Hospital between 2006 and 2009. Bilateral brachial-ankle pulse wave velocities (baPWV) were simultaneously measured in the supine position after at least 5-min rest. The average baPWVs from both sides ≥ 1400 cm/s were used as an atherosclerotic cardiovascular risk. Based on 2003 Clinical Practice Guidelines for Chronic Kidney Disease from the National Kidney Foundation, early and late CKD were defined as CKD stage 1-2 and stage 3-5, respectively. Other variables included prediabetes, diabetes, prehypertension, hypertension, lipid profile and life style factors. **Results :** Compared with subjects with baPWV <1400 cm/s (n=223), those with baPWV ≥ 1400 cm/s (n=1028) had a lower eGFR value, but a higher serum creatinine and higher prevalence of CKD stage 1,2, stage 3-5, diabetes, prediabetes, hypertension and prehypertension. In multivariate analysis, early and late stage CKD were positively with increased baPWV (≥ 1400 cm/s) after adjustment for age, sex, and BMI, lifestyle and other cardio-metabolic variables. Besides, age, prediabetes, diabetes, prehypertension and hypertension were independently associated with increased baPWV (≥ 1400 cm/s). **Conclusion :** Both early and late CKD increased the risk of higher arterial stiffness in elderly. Age, prediabetes, diabetes, prehypertension and hypertension were also independently associated with increased arterial stiffness. **Keywords :** chronic kidney disease, elderly, arterial stiffness

PP25 C-014

PREVALENCE OF METABOLIC SYNDROME AND CARDIOVASCULAR RISK FACTORS AMONG ADULTS IN A SOUTHERN CITY OF BRAZIL

Patricia G. PANNI, Laura Brenner MARIANO DA ROCHA, Angelo G. BOS, Yukio MORIGUCHI (Institute of Geriatrics and Gerontology, IGG-PUCRS, Brazil)

Introduction : Aging is a continuous process. The longer we live the greater the change of developing chronic diseases. Cardiovascular diseases (CVD) and Metabolic Syndrome (MS) are among the major causes of morbidity and mortality. It is crucial to study the risk factors of such diseases and prevent their occurrence. This study was conducted with adults in order to verify the possibility of preventing CVD and Metabolic Syndrome later in life. **Method :** The study comprised 100 individuals, 47 men and 53 women, between 30 and 57 years of age (average 45.56 SD 7.63). The individuals were invited to participate from all Primary Health Care Units in the city. Blood tests for HDL, triglycerides, glucose were performed; blood pressure and waist circumference were measured as well. The individuals were evaluated for MS. **Results :** Our preliminary results showed a high prevalence of metabolic syndrome (MS) (31%) in this population, less

common in men(29.8%), in whites(27.3%),in high schooling level individuals (28.6%). 35.6% of the individuals with hypertension had MS. The waist circumference was greater in women.Blood glucose levels were higher in men(29.8%) and HDL lower in women(62.3%). None of the results were significant. Conclusion : The early detection of Metabolic Syndrome and risk factors for cardiovascular diseases is a key point for promoting a successful aging. As such, it is advisable to engage in health programs to prevent such events earlier in life as a way to improve quality of life and longevity as free from disease as possible. Keywords : metabolic syndrome, cardiovascular risk factors, aging

PP25 C-015

WHY MIGRATION CAUSES A DECREASE IN CENTENARIANS ?

Laura Brenner MARIANO DA ROCHA, Nair Monica Ribascik NASCIMENTO, Yukio MORIGUCHI (*Institute of Geriatrics and Gerontology, IGG-PUCRS, Brazil*)

Introduction : The average life expectancy at birth of Japanese living in Japan has recently climbed to the top of the world rank, accompanied by a low mortality from cardiovascular diseases, the major causes of death in many Western countries. In addition to progress to medical treatment and management of both infectious and chronic diseases, improvements in nutrition, in addition to the cardioprotective properties of the Japanese diet, appear to have contributed greatly to longevity in Japan. Method : Population-based samples of 433 middle-aged Japanese men and women in Japan and 269 Japanese immigrants living in Brazil were recruited to the study. They underwent blood pressure measurement, 24-h urine collection, blood tests and electrocardiographic examination, and completed a dietary questionnaire. Results : There was a significant difference in the groups with respect to the prevalence of obesity, hypertension, increased glycohaemoglobin concentrations and ST-T segment change on the EKG, all greater in the immigrant group. The prevalence of hypercholesterolemia was greater in the group of immigrants. The fish intake was twice as high in Japanese living in Japan(3.6 X 0.5 times /week). Conclusion : Our study revealed a high prevalence of obesity, hypertension and ischemic ECG changes in the Japanese immigrants living in Brazil. No single diet-related factor was sufficient to explain these differences. These results suggested that coronary risk factors and cardiovascular health are regulated not only by genetic factors but that the impact of lifestyle can be large enough to modulate the expression of genes and lower life expectancy even in Japanese populations. Keywords : nutrition, cardiovascular diseases, longevity

PP25 C-016

COMPARISON OF TROUBLES AND QUALITY OF LIFE OF OLD AND YOUNG INDIVIDUALS EXPERIENCE OF CARDIAC ARRHYTHMIA

Betulay KILIC¹, Nuran TOSUN², Vesile UNVER², Birgul ARMUTCU³, Sedat KOSE³ (*1. School of Nursing, Gulhane Military Medical Academy, Turkey; 2. School of Nursing, Gulhane Military Medical School, Turkey; 3. Cardiology, Gulhane Military Medical Academy, Turkey*)

Introduction : In this study, comparison of troubles and quality of life of young and old individuals experiencing cardiac arrhythmia was intended. Method : The research was done GATA, Department of Cardiology between December 2009 and May 2010. The sample of the study is consisted of 80 individuals. The data were obtained from Sociodemographic Data Collection Form and SF-36 quality of life scale. Statistical analysis was done by using SPSS 15.0. Results :

Average age of young patients group is 25±4.54 and of 87% are men. Average age of old patients group is 72.9±7.05 and of 55% are men. 40% of young patients group have SVT, 57.5% of old patients group have AF. Young patients cited that they had troubles in daily physical activities, social/emotional relations, future planning and material issues, old patients cited that they had troubles mostly in daily physical activities. SF-36 scale total point average in young patients is (49.46±23.28) and in old patients is (41.87±22.19) but, statistically meaningful difference was not found between groups (p>0.05). While SF-36 physical component point average in young's (48.12±25.04) and in olds' (38.96±22.37) was found, but mental component point average in young's (50.80±23.15) and in olds' (44.78±24.44) was found (p<0.05). Physical function (41.62±31.65) and physical role (23.12±38.55) sub scale point average of old patients are lower than young's (57.50±30.90 and 41.25±37.78) and difference between groups is statistically meaningful (p<0.05). Conclusion : There was suggested that patient's age and educational level must be considered in evaluating patients quality of life individually, nursing care and patient education planning. Keywords : Arrhythmia, old patients, quality of life

PP25 C-017

AGE-DEPENDENT HOSPITALIZATION RISK ASSOCIATED WITH LOW BODY MASS INDEX IN PATIENTS WITH TYPE 2 DIABETES: TAIWAN DIABETES STUDY

Wei-Chun LIN¹, Tsai-Chung LP, Cheng-Chieh LIN³, Sing-Yu YANG⁴ (*1. Department of Digital Media Design, Asia University, Taiwan; 2. Graduate Institute of Biostatistics, College of Public Health, China Medical University, Taiwan; 3. Department of Family Medicine & Geriatric Medicine, China Medical University & Hospital, Taiwan; 4. Department of Medical Research, China Medical University Hospital, Taiwan*)

Introduction : The relationship between low body weight and adverse outcomes has seldom been evaluated in persons with type 2 diabetes. We explored the association between body mass index (BMI) and hospitalization risk in a Chinese population with type 2 diabetes, and further examined whether age modified this association. Method : We conducted a retrospective cohort study on 57,203 persons with type 2 diabetes, who participated in the Taiwan National Diabetes Case Management Program. BMI at baseline and hospitalization events over the subsequent 12 months were analyzed by Cox's proportional hazard models to adjust for traditional risk factors. Results : Patients were grouped in quintile of BMI. The one-year in-hospital mortality, and hospitalization rates for all causes, diabetes, respiratory failure, shock, renal failure, and pneumonia were 184.5, 37.7, 4.2, 3.5, 2.8 and 9.9 per 1,000 person-years for patients aged <65 years and were 319.4, 53.8, 15.7, 8.1, 6.5 and 30.9 per 1,000 person-years for patients age ≥65 years, respectively. After multivariate adjustment, we observed a U-shaped association between BMI and all-cause hospitalization. The hazard ratios of all-cause hospitalization, for 1st (<22.50) and 5th (≥28.33) quartiles versus 3rd quartile (24.35-26.08) of BMI were 1.16 (1.10-1.23) and 0.98 (0.87-1.10), respectively. We also observed patients aged 65 years and over were associated with higher risk in hospitalization risks for diabetes (p for interaction<0.05). Conclusion : BMI and all-cause hospitalization had a U-shaped association among patients with type 2 diabetes. Our finding shows that age-dependent hospitalization risk due to diabetes associated with low body mass index in patients with type 2 diabetes. Keywords : body mass index, hospitalization, type 2 diabetes

ANNUAL VARIATION IN FASTING PLASMA GLUCOSE

INCREASES RISK OF STROKE IN ELDERLY WITH TYPE 2 DIABETES: THE TAIWAN DIABETES STUDY

Chih-Hsueh LIN¹, Tsai-Chung LI², Cheng-Chieh LIN¹, Ming-May LAI¹ (1. Department of Family Medicine & Geriatric Medicine, China Medical University & Hospital, Taiwan; 2. Graduate Institute of Biostatistics, College of Public Health, China Medical University, Taiwan)

Introduction : Glucose stability is important to diabetes care and is one of the goals in the management of diabetes for complication prevention. A number of studies have examined the relation of glucose variation to microvascular complication such as diabetic nephropathy and retinopathy, no study has examined its relationship to macrovascular complication. **Method :** The present study examined whether annual variation in fasting plasma glucose (FPG), as represented by the coefficient of variation (CV), can predict stroke independent of mean FPG, HbA1C and other risk factors in elders with type 2 diabetes. A computerized database of elders with type 2 diabetes aged 65 years and above and free of stroke (n= 11,102) who were enrolled in the Taiwan National Diabetes Care Management Program before 2004 was used in a Cox's proportional hazards regression model. **Results :** The incidence of stroke were 32.33, 39.88, and 46.43 per 1000 person-years in groups of 1st, 2nd, and 3rd tertiles of baseline FPG -CV, respectively. After adjusting for FPG, HbA1C, and other risk factors, annual FPG -CV was independently associated with stroke, congestive and ischemic stroke. The hazard ratios of 3rd versus 1st tertile of annual FPG -CV for stroke, congestive and ischemic stroke were 1.41 (1.24, 1.59), 1.59 (1.04, 2.42) and 1.43 (1.20, 1.70), respectively. **Conclusion :** Annual variation in FPG is a strong predictor of stroke of all types in elders with type 2 diabetes, suggesting that glucose variation during outpatient visits may become a measure in clinical practice for the management of these patients. **Keywords :** diabetic nephropathy, fasting plasma glucose variation, elders with type 2 diabetes

PP25 C-019

ANNUAL VARIATION IN FASTING PLASMA GLUCOSE INCREASES RISK OF DIABETIC NEPHROPATHY IN ELDERLY WITH TYPE 2 DIABETES: THE TAICHUNG DIABETES STUDY

Cheng-Chieh LIN¹, Chih-Hsueh LIN¹, Tsai-Chung LI², Wen-Yuan LIN³, Sing-Yu YANG⁴ (1. Department of Family Medicine & Geriatric Medicine, China Medical University & Hospital, Taiwan; 2. Graduate Institute of Biostatistics, College of Public Health, China Medical University, Taiwan; 3. Department of Family Medicine, China Medical University & Hospital, Taiwan; 4. Department of Medical Research, China Medical University Hospital, Taiwan)

Introduction : Diabetic nephropathy is the most common cause of end-stage renal disease (ESRD) worldwide. Glucose stability is one of the many factors related to diabetes care and is one of the goals in the management of diabetes for complication prevention. The present study examined whether annual variation in fasting plasma glucose (FPG), as represented by the coefficient of variation (CV), can predict diabetic nephropathy independent of mean FPG, HbA1C and other risk factors in elders with type 2 diabetes. **Method :** A computerized database of all patients with type 2 diabetes aged 65 years and above and free of diabetic nephropathy (n=1,051) who were enrolled in the Diabetes Care Management Program of China Medical University Hospital before 2007 was used in a time-dependent Cox's proportional hazards regression model. **Results :** The incidence of diabetic nephropathy were 43.22, 69.19, and 100.51 per 1000 person-years in groups of 1st, 2nd, and 3rd tertiles of baseline FPG -CV, respectively.

After adjusting for FPG, HbA1C, and other risk factors, annual FPG -CV was independently associated with diabetic nephropathy. The corresponding hazard ratios for 2nd and 3rd versus 1st tertile of annual FPG -CV were 2.06 (1.39, 3.03) and 3.18 (2.21, 4.56), respectively. **Conclusion :** Annual variation in FPG is a strong predictor of diabetic nephropathy in elders with type 2 diabetes, suggesting that glucose variation during outpatient visits may become a measure in clinical practice for the management of these patients. **Keywords :** diabetic nephropathy, fasting plasma glucose variation, elders with type 2 diabetes

PP25 C-020

THE USEFULNESS OF HEART RATE VARIABILITY IN ELDERLY DIABETES

Hiroshi NAKANO (Division of Geriatric Medicine, Nippon Medical School, Japan)

Introduction : Heart rate variability (HRV) is one of the methods for evaluating the autonomic nervous system activity. However HRV is affected by age. In this study, we studied the usefulness of HRV in the elderly diabetic patients. **Method :** We studied 196 subjects (31-91 years) who have no arrhythmia. We divided subjects into four groups by age, young adult (<55 years), old adult (55-64 years), young-old (65-74 years) and old-old (75 years <). Besides, subjects were divided into two groups, with or without diabetes. Retinopathy group was defined as pre-proliferative and proliferative retinopathy. High frequency(HF) was used as the index of parasympathetic nervous system activity and low frequency(LF)/(LF+ HF) (%LF) was used as the index of sympathetic nervous system activity. **Results :** There was no difference of HF without diabetes between age groups and %LF without diabetes was significantly decreased with age. In regression analysis, age was significant predictor of %LF. There was no difference of HF and %LF between age groups in diabetes group irrespective of retinopathy. There was no difference of HF of young adult regardless of retinopathy and %LF was decreased in diabetes with retinopathy. There was no difference of HF of young adult with or without retinopathy and %LF decreased in diabetes with retinopathy. **Conclusion :** Autonomic nervous system activity was affected by both aging and diabetes. HRV was useful for diabetic complication under 55 years. However, HRV was not useful over 55 years, affected by ageing and diabetes. **Keywords :** Heart rate variability, Diabetes mellitus, Elderly

PP25 C-021

COMPARISON OF GLUCOSE CONTROL BETWEEN DIABETICS WITH AND WITHOUT DEMENTIA

Hiroshi YOSHINO, Takehiko WATANABE, Gen YOSHINO (Internal Medicine, Shinsuma Hospital, Japan)

Introduction : The diabetic patients with dementia have difficulty controlling their blood sugar and suffer from acute effects of hyperglycemia and hypoglycemia. In present study, we compared glucose control in subjects with diabetes without dementia versus diabetes with dementia for 3 months. **Method :** Twenty eight diabetic inpatients with similar baseline characteristics, using insulin therapy (mean age 75.4±8.1 years). The severity of dementia was evaluated using the Hasegawa Dementia Scale-Revised (HDSR). They were divided into 2 diabetic groups, i.e., with and without dementia groups (HDSR 13.4±6.7). (diabetics without n=15, diabetics with dementia n= 13). HbA1c (baseline, and 3 months later), duration of diabetes, duration of admission were investigated. Data were expressed as mean±SD. ANOVA was used for analysis between groups. **Results :**

At baseline, HbA1c (NGSP) of 2 groups (diabetics without dementia and diabetics with dementia) was 9.9 ± 1.1 and $9.9 \pm 2.3\%$, respectively. Both groups had similar change in HbA1c at 3rd month (7.9 ± 0.8 VS $8.3 \pm 2.1\%$) ($P=0.41$). Duration of diabetes was 14.3 ± 29.5 and 17.0 ± 11.2 years. Duration of admission were significantly longer in diabetics with dementia (19.8 ± 1.0 vs 88.2 ± 172 days) ($P < 0.05$). Conclusion : We conclude that insulin therapy provides similar benefits in glucose control for both diabetic inpatients group with and without dementia. Keywords : Diabetes Mellitus, Dementia, Insulin

ASSOCIATION BETWEEN INSULIN AND INFLAMMATORY MARKERS IN DIABETIC AND HYPERTENSIVE ELDERLY

Karin VIEGAS¹, Maria Gabriela Valle GOTTLIEB², Paula ENGROFF³, Luisa Scheer ELY³, Bruna Luz CORREA³, Irenio Gomes FILHO³ (1. *Enfermagem, Universidade Federal de Ciências da Saúde de Porto Alegre, Brazil*; 2. *Programa de Pós Graduação em Gerontologia Biomedica, Instituto de Geriatria e Gerontologia Pontifícia Universidade Católica do Rio Grande do Sul, Brazil*; 3. *Instituto de Geriatria e Gerontologia da PUCRS, Pontifícia Universidade Católica do Rio Grande do Sul, Brazil*)

Introduction : Inflammation is involved in the genesis of diabetes mellitus (DM) as hypertension (HTN). To investigate, in diabetic and hypertensive elderly, the relation between insulin levels, interleukin 6 (IL-6) and ultrasensitive C-reactive protein (CRP). Method : 549 elderly (346 [63%] and 203 women [37%] men aged > 60 years) from the Family Health Strategy of the Municipality of Porto Alegre, where investigated for clinical and biochemical markers for DM and inflammation. The variables investigated were age, sex, fasting insulin and inflammatory cytokines (IL-6 and CRP). Results : The mean age of the sample was 69.02 ± 7.21 years. There were 203 (45.8%) with hypertension only, 112 (25.3) presented DM and HTN, 11 (2.5%) of diabetes only and 117 (26.4) without disease manifestation. The ANOVA demonstrated a significant difference in the insulin dosage in the healthy group (14.95 ± 29.30) and the group with DM + HTN (22.72 ± 19.84) ($p = 0.09$). The mean CRP presented a significant difference between healthy (0.42 ± 0.70) group and DM group (1.16 ± 2.26) ($p = 0.02$), also found when comparing the HTN group (0.44 ± 0.64) and DM group ($p = 0.02$). There were no significant differences between groups related to IL-6 dosage ($p > 0.05$). Conclusion : Elderly with DM and HTN have a higher insulin level when comparing with healthy elderly or patients with DM or HTN, who presented higher levels of CRP only with one disease. Keywords : elderly; inflammatory markers; insulin

PP25 C-023

THE PREVALENCE, MANAGEMENT AND FOLLOW UP OF DIABETES MELLITUS AND ITS RELATIONSHIP TO HYPERTENSION AND OBESITY IN PERSONS AGED 60 YEARS AND OVER LIVING IN A PERI-URBAN AREA OF SOUTH AFRICA

Kuven NAIDU, Sophia RAUFF, Bilkish CASSIM (*Geriatrics, College of Health Sciences, University of Kwazulu-Natal, South Africa*)

Introduction : The increasing longevity is expected to increase the burden of NCDs, especially in sub-Saharan Africa where the number of older persons is rising rapidly. This study aims to determine the prevalence, management and follow-up of self-reported diabetes mellitus (DM) and hypertension, and obesity in community dwelling older persons. Method : In an observational cross-sectional survey a questionnaire was administered to 1007 participants aged 60 years and

over selected by random sampling. Results : The prevalence of self-reported hypertension was 64.8% and that of DM 20%. Of the latter 111 (55.2 %) were confirmed to be on treatment; 64 on a single agent and 47 on combination therapy. Of the 175 participants (87.1%) reporting DM and hypertension, 51.4% were prescribed an ACE inhibitor. The BMI was calculated in 988 participants with 475 (48.1%) being obese. Women were more likely to be obese than men (54.4% vs. 26.7%; $p = 0.000$). There was no association between DM and obesity. While participants who reported DM, when compared to those who did not, were more likely to have a blood sugar (73.6% vs. 45%; $p = 0.000$) and blood pressure measurement (76.6% vs. 60.2% $p = 0.000$;) in the last three months; 17.4% did not have a blood sugar and 15.5% a blood pressure measurement in the preceding 6 months. Participants reporting DM were more likely to report their quality of life as poor (22.9% vs. 13.9%; $p = 0.000$). Conclusion : Non-communicable diseases contribute significantly to the disease burden and measures to ensure optimal management need urgent implementation. Keywords : Diabetes, Hypertension, Obesity

PP25 C-024

POOR GLYCEMIC CONTROL INCREASES HOSPITALIZATION RISK FOR ADVERSE OUTCOMES WITHIN ONE YEAR IN OLDER PATIENTS WITH TYPE 2 DIABETES: TAIWAN DIABETES COHORT STUDY

Yi-Min HSU¹, Cheng-Chieh LIN², Tsai-Chung LI³, Sing-Yu YANG⁴ (1. *Department of Nursing, China Medical University Hospital, Taiwan*; 2. *Department of Family Medicine & Geriatric Medicine, China Medical University, Taiwan*; 3. *Graduate Institute of Biostatistics, College of Public Health, China Medical University, Taiwan*; 4. *Department of Medical Research, China Medical University Hospital, Taiwan*)

Introduction : The relationship between glycemic control and adverse outcomes found in the general population has seldom been evaluated in older persons with type 2 diabetes. Accordingly, we explored the association between hemoglobin A1c (HbA1c) and hospitalization risk within one year in this population. Method : We conducted a retrospective cohort study on 22,023 older persons with type 2 diabetes, who participated in the national Diabetes Case Management Program, Taiwan. HbA1c at baseline and hospitalization events over the subsequent 12 months were analyzed by Cox's proportional hazard models to adjust for age, gender, and traditional risk factors. Results : Patients were grouped in quintile of HbA1c. The rates for in-hospital mortality, and hospitalization rates for all causes, diabetes, respiratory failure, shock, renal failure, and pneumonia were 7.71, 319.24, 53.71, 15.74, 8.11, 6.56 and 30.99 per 1,000 person-years, respectively. After multivariate adjustment, higher level of HbA1c was independently associated with all-cause hospitalization, and hospitalization due to diabetes, respiratory failure, and pneumonia. The hazard ratios of all-cause hospitalization, and hospitalization due to diabetes, respiratory failure, and pneumonia for top quartile (>9.5%) versus 3rd quartile (7.2-8.1%) of HbA1c were 1.35 (1.25-1.47), 2.81 (2.31-3.42), 1.38 (1.00-1.90), and 1.54 (1.21-1.96) respectively. Although we observed lower level of HbA1c increased hospitalization risk due to respiratory failure, shock, and renal failure, these associations were at borderline significance. Conclusion : Significant linear trends were found across different HbA1c levels for all-cause, diabetes-related and pneumonia hospitalization. Our study findings suggest that meeting the recommended HbA1c targets could improve outcomes by avoiding the likelihood of hospitalization. Keywords : hospitalization, HbA1c, glucose control

FACTORS ASSOCIATED ANNUAL DECREASE IN ESTIMATED GLOMERULAR FILTRATION RATE IN PATIENTS WITH TYPE 2 DIABETES: TAICHUNG DIABETES STUDY

Tsai-Chung LI¹, Cheng-Chieh LIN², Ming-May LAI², Sing-Yu YANG³, Shu-Jung CHUANG⁴ (1. Graduate Institute of Biostatistics, College of Public Health, China Medical University, Taiwan; 2. Department of Family Medicine & Geriatric Medicine, China Medical University & Hospital, Taiwan; 3. Department of Medical Research, China Medical University Hospital, Taiwan; 4. Department of Family Medicine, China Medical University Hospital, Taiwan)

Introduction : Nephropathy in type 2 diabetes is the most common cause of end-stage renal disease. The decline in kidney function varies among individuals, however, factors associated with renal function loss has seldom been evaluated. We estimated the annual decrease in eGFR within subjects during more than 3 years of follow-up and identified determinants of the annual decrease in eGFR in a Chinese population with type 2 diabetes. **Method :** We conducted a retrospective cohort study on 1,154 patients with type 2 diabetes aged 65 and over, who enrolled in Diabetes Care Management Program (DCMP) of China Medical University Hospital, Taichung. Renal function was assessed with annual mean eGFR using the modified Modification of Diet in Renal Disease (MDRD) Study equation for Chinese. All individuals had been followed up at least 3 years. Two-stage analysis was applied. At first stage, a linear regression was used to estimate the slope (annual change) of repeated measurements eGFR over time within each subject. At second stage, a linear regression was used to evaluate the independent effects of each factor on annual changes in eGFR. **Results :** Over average 4.78 years of follow-up, the mean annual decrease in eGFR was 1.62 ml/min/1.73 m². After multivariate adjustment, we identified chronic kidney disease, hypertension medication, DM duration per year, and peripheral neuropathy were associated with greater annual decrease in eGFR by 1.15, 1.15, 0.06, 1.13 ml/min/1.73 m² (all p<0.05). **Conclusion :** Our study has revealed several factors enhanced decline in renal function in Chinese elders with type 2 diabetes. **Keywords :** body mass index, hospitalization, type 2 diabetes

PP25 C-026

VARIATION IN C-REACTIVE PROTEIN IN RESPONSE TO WEIGHT LOSS IN OVERWEIGHT AND OBESE POSTMENOPAUSAL WOMEN WITH IMPAIRED GLUCOSE DISPOSAL : IS THERE AN INDEPENDENT CONTRIBUTION OF LEAN BODY MASS?

Razieh BARSALANI¹, Eleonor RIESCO¹, Karine PERREAULT¹, Pascal IMBEAULT², Martin BROCHU¹, Isabelle J. DIONNE¹ (1. Research Centre on Aging, Faculty of Physical Education and Sports, University of Sherbrooke, Canada; 2. Behavioral and Metabolic Research Unit, Faculty of Health Sciences, University of Ottawa, Canada)

Introduction : We showed that insulin-resistant obese postmenopausal women are characterized by higher lean body mass (LBM) and elevated C-reactive protein (CRP). Although counterintuitive, we hypothesized that losses in LBM following caloric restriction will be associated with improvements in glucose homeostasis through decreases in CRP. **Objective:** To determine 1) whether insulin-resistant obese postmenopausal women improve CRP concentrations through losses in LBM following a caloric restriction program, and 2) if decreases in CRP levels contribute to improvements in insulin sensitivity. **Method :** Fifty postmenopausal women (BMI > 26 kg/m²) with impaired glucose disposal (<7.5 mg/kg/min) were studied after a

6-month caloric restriction. Outcome measures: Glucose disposal (by hyperinsulinemic-euglycemic clamp), body composition [total LBM and fat mass (FM) by DXA], LBM index [LBM (kg)/height (m²)], body fat distribution [visceral adipose tissue (VAT) and subcutaneous adipose tissue (SAT) by CT scan], plasma high-sensitive (hs) CRP and interleukin-6 (IL-6). **Results :** Positive correlations were observed between ΔCRP level and ΔIL-6 (0.332, p≤0.05), ΔLBM index (r=0.438, p≤0.01), Δtrunk LBM (r=0.383, p≤0.01) and ΔSAT (r=0.353, p≤0.05) and negative correlation was observed between ΔCRP and Δglucose disposal rate (r=-0.445, p≤0.01). Stepwise linear regression analyses revealed that ΔLBM index was the only independent predictor of the reduction in CRP levels (r²=0.202, p≤0.01) after including all the correlated values in the model. **Conclusion :** Losses in LBM are associated with improvements in inflammation state in obese postmenopausal women with impaired glucose disposal. **Keywords :** Inflammation, insulin resistance, caloric restriction, body composition

PP25 C-027

DISREGARDING AGE AS A RISK FACTORS FOR OSTEOPOROSIS

Stig ANDERSEN¹, Martin G. JØRGENSEN¹, Ib T. CHRISTENSEN¹, Ole Bf NIELSEN¹, Peter LAURBERG² (1. Dept. of Geriatric Medicine, Aalborg University Hospital, Denmark; 2. Dept. of Endocrinology, Aalborg University Hospital, Denmark)

Introduction : Osteoporosis is a debilitating condition that can be prevented by timely detection and treatment. Detection requires referral for dual energy X-ray absorptiometry (DXA) that depends on risk factors. **Method :** We estimated the importance of risk factors for a T-score of <-2.5 measured by spine and hip DXA in all men and women referred from general practice for a DXA scan at Aalborg University Hospital during a 30 months period. Risk factors were assessed by questionnaire and referral papers. **Results :** A total of 4,177 women and 782 men were referred: 2,822 aged 50-69 years/1,603 aged 70 years or above/ 441 aged 80 years or above. A low T-score was found in 33/41/46% respectively (p<0.001). No risk factors were identified in 13/15/18% (p=0.03) when age was excluded as a risk factor. Risk factor occurrence differed between the age groups 50-69/70-79/80+ years for family history (46/25/15%; p<0.001), predisposing disease (21/30/25%; p<0.001), steroid use (5.6/12.3/13.2%; p<0.001), low sun exposure (12.8/16.5/24%; p<0.001), smoking 25/19/10%; p<0.001), and high alcohol intake (5.8/5.1/2.0%; p=0.004), while not for premature menopause (21/20/15%; p=0.12), low intake of dairy products (4.3/4.4/2.5%; p=0.18), or low BMI (2.4/2.0/2.0%; p=0.69). Fragility fractures increased with age (22/38/46%, p<0.001). **Conclusion :** The decrease in subjects with family history, sun exposure, smoking, and alcohol intake was expected. Interestingly, the limited decrease in other risk factors than age with age indicate a limited influence of age on referral for DXA scanning even though age is a major determinant of fracture risk. **Keywords :** Osteoporosis, Risk factors, DXA scan

PP25 C-028

THE ASSOCIATION BETWEEN COGNITIVE FUNCTION AND OSTEOPOROTIC FRACTURE RISK IN THE ELDERLY

Shuo-Wei SU¹, Yih-Jing TANG², Wayne H.H. SHEU³ (1. Division of Endocrinology & Metabolism, Department of Internal Medicine, Taichung Veterans General Hospital, Taiwan; 2. Center for Geriatrics and Gerontology, Taichung Veterans General Hospital, Taiwan; 3. Deputy Superintendent, Taichung Veterans General Hospital, Taiwan)

Introduction : The prevalence of osteoporosis and cognitive

impairment are high in the elderly. However, the relationship between cognitive function, osteoporosis and fracture risk remains unclear. The aim of our study is to investigate the association among cognitive function, low bone mineral density and estimated fracture risks in the elderly inpatients. Method : Patients aged more than 65 years old were enrolled from 2008 to 2010 if they were hospitalized with osteoporosis or osteopenia, detected by dual-energy x-ray absorptiometry. The medication, history of fracture and frequency of fall in past one year were also collected. We did comprehensive geriatric assessment, in which cognitive function was assessed by Mini-Mental State Examination, 10-year major osteoporotic fracture risks were calculated by an international fracture risk assessment tool (FRAX). Results : In totally 117 subjects (70 male, age 81 ± 6 years), mean MMSE score was 22 ± 6 points, and the average FRAX for 10-year hip fracture risk was $9.4 \pm 8.5\%$, the mean bone mineral density (BMD) of femoral neck was 0.693 ± 0.146 Kg/m². There was a significantly negative correlation between MMSE score and osteoporotic fracture risk ($r = -0.343$, $p = 0.001$). By using multivariate regression analysis, MMSE score was negatively correlated with major osteoporotic fracture risk ($p = 0.041$) and hip fracture risk ($p = 0.04$) after adjustment of age, sex, body mass index (Kg/m²), previous fracture, fall episode, activity of daily living, nutrition and associated chronic diseases. Moreover, the association was more significant in female than in male. Conclusion : In geriatric inpatients with low BMD, cognitive function is negatively correlated with 10-year fracture risk and this relationship is more significant among the female. Keywords : elderly, cognition, osteoporosis, osteopenia, fracture risk, BMD

PP25 C-029

CORRELATION OF DAILY URINARY CALCIUM EXCRETION WITH SPOT URINARY CALCIUM TO CREATININE RATIO: A POSSIBLE INSIGHT FOR RAPID EVALUATION

Gulistan BAHAT¹, Sevilay NADIR¹, Asli TUFAN¹, Timur Selcuk AKPINAR¹, Ilker BAY¹, Ozlem SOYLUK², Nilgun ERTEN¹, Mehmet Akif KARAN¹ (1. Department of Internal Medicine, Division of Geriatrics, Istanbul University Istanbul Medical School, Turkey; 2. Department of Internal Medicine, Bakirkoy Education and Research Hospital, Turkey)

Introduction : It is difficult to collect 24 h urine for the patients from all ages. Elderly usually have more difficulty in collecting daily urine due to possible urinary incontinence, cognitive impairment, functional impairments and comorbidities. However, calcium and vitamin D supplementation is essential part of management of osteoporosis and related fractures which requires serial follow-up of daily urinary calcium excretion. We aimed to study whether spot urinary calcium/creatinine ratio could be used as a predictor of 24-h urinary calcium excretion in patients having difficulty in collecting 24 h urine sample. Method : The community dwelling elderly ≥ 60 years of age admitted to our geriatrics outpatient clinics were included into the study. All patients were given written information to learn how to collect 24 h urine. After collection of daily urine, patients are asked to give a portion of urine after their breakfast. From each sample urinary calcium and creatinine concentrations were calculated and 24 h urine volume were noted. The correlation between spot urinary calcium/creatinine ratio and 24-h daily calcium excretion was studied. Results : 70 elderly were included into the study. 15.7% were male, 84.3% were females. Mean age was 73.5 ± 6.9 . The mean 24-h urinary calcium excretion was 110 ± 95 mg. There was a strong and significant correlation between spot urinary calcium/creatinine ratio and 24-h daily calcium excretion ($p < 0.05$, $r = 0.67$, $r^2 = 0.48$). Conclusion : We suggest that in elderly having difficulty in collecting 24 h urine

sample, the spot urinary calcium/creatinine ratio yielded from morning urine following breakfast can be used to predict 24 h urinary calcium excretion. Keywords : Calciuria, daily

PP25 C-030

DECLINE OF VITAMIN D STATUS IN OLDER MEN IN BEIJING AND IT'S ASSOCIATION WITH BONE TURNOVER MARKERS

Ping MENG¹, Yixin HU¹, Shuhong FU² (1. Health Care Department, PLA General Hospital, China; 2. Clinical Laboratory, PLA General Hospital, China)

Introduction : Vitamin D deficiency is common among older people and can cause mineralization defects, bone loss. The aim of this study was to investigate the serum Vitamin D status and relationships between serum 25OHD concentration and parathyroid hormone (PTH) of old men in Beijing region. Method : This was a cross-sectional analysis of baseline data in 564 elderly Chinese men, mean age 73.7 ± 8.5 yr. The participants were divided into 3 age groups, old group1 (≥ 60 -70 years group), old group2 (≥ 70 -80 years group), old group3 (≥ 80 years group). The level of serum 25(OH)D₃, PTH, BGP, β -CTX, PINP was measured by direct competitive electroluminescent immunoassay from May to June in 2010. The relationship between 25OHD, PTH, and serum BGP And serum β -CTX was evaluated. Results : 1. The 25(OH)D₃ of total old men was 14.57 ± 5.95 ng/ml, which indicated to be vitamin D deficiency. The level of PTH, BGP, β -CTX, PINP were 34.85 ± 12.23 pg/ml, 13.49 ± 4.81 ng/ml, 0.30 ± 0.15 ng/ml, 39.13 ± 16.51 ng/ml, individually. 2. The prevalence of vitamin D severe deficiency, deficiency, insufficiency and sufficiency were 23.4% (132/564), 56.6% (319/564), 18.4% (104/564), 1.6% (9/564) for the total people. 3. Serum 25(OH)D₃ was inversely correlated with Serum PTH ($r = -0.240$, $p = 0.000$), threshold as defined by suppression of serum PTH was found within the serum 25(OH)D₃ range 9.8-15.6 ng/ml. Serum 25(OH)D₃ was weakly inversely correlated with Serum BGP ($r = -0.080$, $p = 0.034$). Conclusion : Vitamin D deficiency is highly prevalent among healthy Beijing old men. Bone turnover markers were not useful biomarkers of vitamin D status. Keywords : serum 25hydroxyvitamin D; bone turnover markers

PP25 C-031

A HOSPITAL-BASED MULTIDISCIPLINARY APPROACH REDUCES ALL-CAUSE MORTALITY IN THE ELDERLY LIVING IN LONG-TERM CARE FACILITIES IN TAIWAN

Wen-Yuan LIN¹, Chih-Hsueh LIN¹, Hua-Shui HSU¹, Chia-Ing LI², Chiu-Shong LIU¹, Tsai-Chung LI³, Chih-Te HO¹, Cheng-Chieh LIN¹ (1. Department of Family Medicine, China Medical University and China Medical University Hospital, Taiwan; 2. Department of Medical Research, China Medical University Hospital, Taiwan; 3. Graduate Institute of Biostatistics, China Medical University, Taiwan)

Introduction : To find effective care model for mortality reduce in the elderly is important. In this study, we aimed to assess the effect of a hospital-based multidisciplinary approach on the all-cause mortality in the elderly. Method : A baseline cohort of 374 elderly people (mean \pm S.D. age = 78.8 ± 7.2 years) living in eight long-term care facilities in Taiwan were recruited from 2002-2003. The subjects were divided into two groups using randomized block design; a hospital-based multidisciplinary team was responsible for the care of the intervention group, and the control group received usual care for 6 months. Cox proportional hazard regression analyses were adopted to evaluate the relative risks (RRs) of all-cause death. Taiwan's Department of Health provided the mortality data. Results : After 6 months of intervention,

83 subjects in the intervention group and 182 subjects in the control group had completed the study. There were 151 deaths during a 5-year follow-up period. After adjustment for age, gender, body mass index, albumin, total cholesterol, high-density lipoprotein cholesterol, triglycerides, and glucose level, compared to subjects in the control group, the adjusted relative risk (95% CI) of all-cause mortality among subjects in the intervention group subjects were 0.64 (0.42-0.97). For those subjects completed 6 months intervention, the adjusted RR was 0.52(0.32-0.86). The result did not differ when excluding those who died within 6 months. Conclusion : A hospital-based multidisciplinary care effectively reduced all-cause mortality in the elderly living in long-term care facilities in Taiwan. Keywords : hospital-based, multidisciplinary care, mortality

PP25 C-032

GENERAL OBESITY ASSOCIATED WITH INCREASED RISK OF GASTRIC HELICOBACTER PYLORI INFECTION IN A CHINESE ELDERLY POPULATION

Gi-Hua YANG¹, Jin-Shang WU², Yi-Ching YANG², Ying-Hsiang HUANG², Feng-Hwa LU², Chih-Jen CHANG² (1. Department of Family Medicine, National Cheng Kung University Hospital, Taiwan; 2. Department of Family Medicine, National Cheng Kung University Hospital College of Medicine, National Cheng Kung University, Taiwan)

Introduction : Obesity and Helicobacter pylori (H. pylori) infection are prevalent and play a role in diseases of several systems. Previous studies demonstrated inconsistent results on the relationship between obesity and gastric H. pylori infection. However, there was no study on their relationship in the elderly. Therefore, the aim of this study was to investigate the association between obesity and gastric H. pylori infection in a Chinese elderly population. Method : We enrolled 3,664 elderly subjects who received physical check-up in the National Cheng Kung University Hospital from 2000 to 2009. Biopsy was performed in 496 out of subjects who underwent esophagogastroduodenoscopy. Finally, 324 subjects were available for analysis after exclusion criteria consisting of gastric cancer, prior upper gastrointestinal tract surgery, prior H. pylori eradication therapy and use of non-steroidal anti-inflammatory drugs. H. pylori infection was defined as H. pylori present in samples of gastric biopsy. Obesity was defined as body mass index ≥ 27 Kg/m². Results : The prevalence of obesity was 28.6 and 19.0% in subjects with and without gastric H. pylori infection ($p=0.047$). Subjects with H. pylori infection had lower estimated glomerular filtration rate (eGFR) and higher prevalence of current smoking and alcohol use than subjects without H. pylori infection. Multivariate analysis showed that obesity was positively associated with H. pylori infection (odds ratio 1.89, $p=0.037$), in addition to current smoking while reversely associated with age ≥ 65 years and eGFR. Conclusion : Obesity was associated with increased risk of gastric H. pylori infection in the elderly. Keywords : Obesity, Helicobacter pylori

PP25 C-033

USEFULNESS OF TRANSNASAL ESOPHAGOGASTRO-DUODENOSCOPY FOR THE ELDERLY OVER 65 YEARS OLD

Jong Og SEO (Internal Medicine, Dr SEO's Clinic, Korea)

Background: To expand their lives it is a trend amongst the elderly to take regular medical check ups. The gastroscopy for seniors is not different from the one used for middle aged people, but the conscious sedative gastroscopy is taken very carefully considering their age and the lack of anaesthetics. So the transoral endoscopy or upper GI series

is recommended. As a result, we recently surveyed the satisfaction and preference for the future use of the endoscopy on elders aged above 65 who took transnasal EGD without the use of sedatives. Subjects: 185 seniors (Men: 75, woman: 110) out of 187 over 65 who have been examined by use of transnasal EGD with gastroenteric symptoms and health check ups in the clinic for the period from January 1 ~ September 11, 2008. Methods: We researched the ratio of satisfaction and the preferred method of endoscopy for future choice by use of a telephone questionnaire from 114 patients responding to it. Results: Very satisfied (20.2%), satisfied (65.8%), neutral (11.4%), dissatisfied (2.6%). With regards to preference for the conscious sedative gastroscopy (0.9%), transoral gastroscopy (2.6%) and, transnasal EGD(96.5%). Failure by use of this examination was 2 out of 187. This gives a ratio of success of 99.0%. Conclusions: The diagnostic transnasal EGD practiced safely and without the use of sedatives, is the preferred choice over the more conventional ways. Especially taking into consideration the increase of the elderly population and promotion of it by nursing care hospital. Keywords : Transnasal endoscopy, Over 65 Years Old, Patients' satisfaction

PP25 C-034

FACTORS RELATED TO SHORTENING OF TELOMERES IN ESOPHAGEAL EPITHELIUM

Junko AIDA¹, Naotaka SHIMOMURA¹, Ken-Ichi NAKAMURA¹, Naoshi ISHIKAWA¹, Tomio ARAI², Mutsunori FUJIWARA³, Kaiyo TAKUBO¹ (1. Research Team for Geriatric Pathology, Tokyo Metropolitan Institute of Gerontology, Japan; 2. Department of Pathology, Tokyo Metropolitan Geriatric Hospital, Japan; 3. Department of Pathology, Japan Red Cross Medical Center, Japan)

Introduction : Telomeres are repetitive G-rich DNA sequences found at the ends of chromosomes. They generally shorten with each normal somatic cell division due to incomplete replication of telomere repeats during DNA synthesis, the so-called end-replication problem. Telomere shortening occurs with human aging in many organs and tissues, and is accelerated by exposure to various stressors. It may also promote genetic instability and increase the risk of malignancy. Chromosomal and genomic instability due to telomere dysfunction plays an important role in carcinogenesis. We have developed the Q-FISH method using tissue sections to determine the telomere to centromere ratio (NTPCR), in order to measure telomere lengths in distinct cells or cell-groups. We have also determined telomere length in many human organs. Method : In the present study, we compared the telomeres in normal esophageal epithelia (10 younger individuals, average age 2.4 yr; 24 age-matched individuals, average age 73.3 yr), epithelia adjacent to CIS (17 individuals, average age 68.3 yr) and biopsied epithelia from 26 alcoholic patients with distinct iodine-unstained lesions (DIULs; frequent site of esophageal carcinoma)(average age 61.2 yr). Results : In all groups, we found that basal cells had longer telomeres than parabasal cells. Among normal individuals, those who were younger had significantly longer telomeres than the age-matched subgroup. Telomeres in esophageal epithelium adjacent to CIS and those in alcoholics showed no significant difference in length, but both were significantly shorter than in age-matched controls. Conclusion : Therefore, aging shortens telomeres in esophageal epithelium, and precancerous conditions and/or alcohol intake accelerate telomere shortening and cause chromosomal instability. Keywords : telomere, Q-FISH, chromosomal instability

PP25 C-035

THE RELATIONSHIP BETWEEN TEA DRINKING AND EROSIIVE ESOPHAGITIS IN AN ELDERLY TAIWANESE

POPULATION

Pei-Chi CHIH¹, Yi-Ching YANG¹, Jin-Shang WU², Yin-Fan CHANG¹, Feng-Hwa LU¹, Chih-Jen CHANG¹ (1. Family Medicine, National Cheng Kung University Hospital, Taiwan; 2. Family Medicine, Hospital, Taiwan)

Introduction : Certain lifestyle factors, such as consumption of tobacco, alcohol, and tea are believed to stimulate gastric acid secretion, but findings of previous cross-sectional epidemiological studies have been inconsistent. The study on the relationship between tea consumption and erosive esophagitis (EE) was scarce. Therefore, the aim of this study was to investigate the association between tea drinking and erosive esophagitis in an elderly population. Method : A total of 1349 subjects more than 60 years were enrolled from National Cheng Kung university medical center after excluding those with esophageal or gastric cancer, current medication for gastrointestinal disease, heart disease, arrhythmia, asthma and arthritis. Lifestyle habits (cigarette smoking, alcohol use, tea drinking habits and details of physical exercise) were obtained by a structured questionnaire. Tea drinking habit was dichotomized into none and current tea drinking, which was defined as at least once per week for more than half-a-year. The Los Angeles classification was adopted to determine the presence of EE. Results : The prevalence of EE was 17.9%. Compared with subjects without EE, those with EE had higher waist circumference and plasma triglyceride levels, and higher prevalence of male gender, hiatus hernia, current tea drinking, smoking and alcohol use. Multivariate analyses revealed a significantly positive association of EE with current tea drinking, hiatus hernia and male gender after adjusting for age, overweight/obesity, hypertriglyceridemia, Low HDL cholesterol, current smoking, alcohol use and regular exercise. Conclusion : Tea drinking was associated with increased risk of EE in the elderly population. Keywords : Tea drinking, erosive esophagitis

PP25 C-036

ASSOCIATION BETWEEN BONE FRACTURE AND HELICOBACTER PYLORI INFECTION IN TAIWANESE ELDERLY WOMEN WITH UPPER GASTROINTESTINAL DISEASES

Shih-Chun LIN¹, Kun-Wei TSAI¹, Malcolm KOO² (1. Department of Geriatrics, Buddhist Dalin Tzu Chi General Hospital, Taiwan; 2. Department of Medical Research, Buddhist Dalin Tzu Chi General Hospital, Taiwan)

Introduction : Helicobacter pylori (H. pylori) infection is a common chronic bacterial infection of the upper digestive tract. Because of its chronicity, it is often associated with adverse conditions such as chronic ulcers or gastric lymphoma in the elderly. The present study aimed to investigate the factors associated with H. pylori infection in Taiwanese elderly patients with upper gastrointestinal diseases. Method : A retrospective patient record review study was conducted in a regional teaching hospital in southern Taiwan. Patients diagnosed with diseases of esophagus, gastric ulcer or duodenal ulcer during January 1, 2008 to Dec 31, 2010 were identified (n=3058). Patients aged 65 years and over and had tested for the presence of H. pylori were included. Patients diagnosed with cancer or renal failure was excluded from the study. The presence of H. pylori infection was determined by histological examination or rapid urease test. Factors associated with H. pylori infection was evaluated using multiple logistic regression analysis. Results : Of the 1072 patients (657 males and 415 females) included in the analysis, 250 (23.3) had H. pylori infection. H. pylori infection was significantly associated with alcohol drinking (OR=1.73, 95% CI=1.20-2.50, p=0.003) in male patients while it was associated with bone fracture (OR=1.89, 95% CI=1.02-3.49,

p=0.043) and coronary artery disease (OR=0.45, 95% CI=0.23-0.90, p=0.023) in female patients. Conclusion : In elderly Taiwanese men, H. pylori infection was associated with alcohol consumption. In elderly Taiwanese women, while H. pylori infection was associated with bone fracture, it was inversely associated with coronary artery disease. Future studies should investigate whether the association in bone fracture is related to the use of analgesics. Keywords : Helicobacter pylori, bone fracture, alcohol use

PP25 C-037

EDENTULISM ASSOCIATED WITH DIABETES: A STUDY OF FOUR NATIONAL SURVEYS OF ELDERLY SWEDES

Ake RUNDGREN, Valter SUNDH, Tor OSTERBERG (Dept. of Geriatrics, University of Gothenburg, Sweden)

Introduction : Dental health is related to nutrition, health and lifestyle factors. Diabetes is a global health problem associated with many diseases. Studies have shown increasing secular trends for diabetes. The aim of this study was to investigate the association between edentulism and diabetes in four national samples investigated over a period of 22 years. Method : Subjects aged 55-84 years (in total n = 15 875) were randomly sampled from the Swedish population by Statistics Sweden on four occasions (1980/81, 1988/89, 1996/97 and 2002). Trained interviewers collected information about dental status, diseases and living condition factors. The participation rate varied between 75% and 86%. Statistical analyses were based on logistic regression models. Results : Edentulism decreased from 43% to 12% between 1980 - 2002. In dentate participants diabetes increased from 3.7 % to 6.4% and in edentulous participants from 7.9 % to 14.1 % (p< 0.001, age adjusted). Significant background factors for diabetes were found for cardiovascular disease (OR 2.62; 95% CI=2.23 - 3.06), BMI >30 (OR 1.78; 95 % CI=1.45 - 2.19), edentulism (OR 1.69; 95 % CI=1.42 - 2.01) and physical activity (OR 0.74; 95 % CI= 0.61 - 0.90) in logistic regression. Conclusion : This study indicated an obvious and strong association between edentulism and diabetes in the age groups 55-84 years. Keywords : Edentulism, diabetes, elderly

PP25 C-038

APPLICATION OF ORAL DIADOCHOKINESIS FOR ORAL FUNCTION EVALUATION AMONG THE ELDERLY

Hiroko MIURA¹, Shuichi HARA², Kiyoko YAMASAKI³, Naoko MORISAKI⁴ (1. Area on Community Healthcare, National Institute of Public Health, Japan; 2. Faculty of Health Science, Kyushu University of Health and Welfare, Japan; 3. Faculty of Social Welfare, Kyushu University of Health and Welfare, Japan; 4. Faculty of Nursing, University of KinDai Himeji, Japan)

Introduction : Articulation is a very important oral function for elderly individuals. The purpose of the present study was to examine the relationship between objective evaluation on articulation and level of independence in the elderly, and to discuss the capability of oral diadochokinesis as an indicator of elderly oral function. Method : We included 250 elderly patients from the Miyazaki prefecture (southern Japan) of which 183 were healthy, 44 were frail, and 23 were disabled. Oral diadochokinesis by testing alternating (/pa/, /ta/, and /ka/) and sequential motion rates (/pataka/) were examined as an indicator of articulation among the elderly. We conducted ANOVA to examine the relationships among each oral diadochokinesis, age, and the 3 groups according to different levels of physical independence. Furthermore, we determined the relationship-adjusted age using ANCOVA between evaluation of oral diadochokinesis and physical independence groups. Results : The results obtained by ANOVA revealed that each diadochokinesis had significant differences with respect to age and

these 3 groups of independence ($p < 0.01$); subsequently, age was determined to be a confounding variable. After adjustment for age using ANCOVA, the each oral diadochokinesis had a significant relationship corresponding to the level of physical independence ($p < 0.01$). Conclusion : The evaluation of each oral diadochokinesis had a significant relationship with the level of physical independence. Thus, these findings suggest that the articulation assessment using oral diadochokinesis will be useful as a subjective evaluation of oral function among the elderly. Keywords : oral function, assessment, oral diadochokinesis

PP25 C-039

ACCIDENTAL INGESTION OF REMOVABLE DENTURES IN JAPAN

Kazuhiro SHIMOYAMA¹, Tsuneto OHWATARI², Miho MATSUO³
(1. Faculty of Dentistry, Tokyo Medical and Dental University, Japan; 2. Gerodontology, Graduate School, Tokyo Medical and Dental University, Japan; 3. Cleanliness & Sanitation Planning & Development, Kao Professional Services Co., Ltd, Japan)

Introduction : Ingested removable dentures have been identified as a cause of local perforation or obstruction at many sites in the gastrointestinal tract. This study was conducted in 58 patients to assess characteristics of patients, ingested removable dentures and methods of treatment. Method : A total of 58 patients with removable dentures in the gastrointestinal tract were selected from case reports published in the Japanese literature between 1997 and 2011. Age, sex, classification of dentures, location of dentures and medical intervention were analyzed. Results : Thirty-nine (67%) and 19 (33%) were males and females, respectively, with a male:female ratio of 2.1:1. The patients ranged in age from 21 to 93 years. Ingested dentures were 3 complete dentures (5%) and 55 partial dentures (95%) which mainly consisted of unilateral posterior partial dentures. Sixty percent of the patients ingested dentures while eating meal. The location of the ingested dentures was in the esophagus in 38 % of cases, in the small intestine in 26%, in the colon in 22%. The perforation was in 22 (38%) before and after extraction. The surgical treatment was used in 38 patients (66%) of the patients as a method for removal of dentures. Conclusion : A removable denture in the gastrointestinal tract is a serious condition. It is important to recognize that ill-fitting and damaged dentures constitute a risk factor for accidental ingestion. The patients should be advised on the wearing and care of their dentures and the need to return for maintenance. Keywords : accidental ingestion, foreign body, removable denture

PP25 C-040

NUMBER OF REMAINING TEETH, MASTICATION AND SPEECH DISTURBANCES IN INDONESIAN PRE ELDERLY AND ELDERLY

Lindawati Soetanto KUSDHANY¹, Vita Priantina DEWI², Dinni AGUSTIN², Sri Lasmidjah DIPONEGORO², Rodiyah SOEKARDI³, Yeny SULISTYOWATI³, Jennifer STOCK⁴, Eef HOGERVORST⁴, Tri Budi RAHARDJO²
(1. Prosthodontic Department Faculty of Dentistry UI, Center for Ageing Studies Universitas Indonesia, Indonesia; 2. Center for Ageing Studies, Universitas Indonesia, Indonesia; 3. Faculty of Public Health, Universitas Respati Yogyakarta, Indonesia 4. SSEHS, Loughborough University, United Kingdom)

Introduction : To investigate the association between the socio-demographic status (age, education, and area of residence), number of remaining teeth and mastication and speech disturbances in Indonesian pre elderly and elderly living in Yogyakarta Province, Indonesia. This research benefits is to gather a data base for the development of oral

dental health promotion program and to raise awareness of the pre elderly and elderly population in Indonesia about the importance of oral health and denture treatment. Method : The design of this study was cross-sectional with 60 pre elderly and elderly subjects taken by consecutive sampling from 4 district in Yogyakarta Province, Indonesia. Age of the subjects ranges from 47-83 years. Subjects consisted of 30 women and 30 men. All subjects undergone oral examination, and a structured interview on the socio-economic status, also the complaints for mastication and speech. Results : 44 (73,3%) subjects had more than 20 remaining teeth and only 13 subjects (21.7%) were using denture. 19 subjects (31.7%) had mastication disturbances and only 4 subjects (6.7%) had speech disturbances. Data was analyzed using Pearson chi-square test and Fisher exact test. The result showed that number of remaining teeth was significantly related to mastication disturbances ($p < 0.014$) and speech disturbances ($p = 0.004$). Although the number of remaining natural teeth was not related significantly to socio-economic status such as age, education and areas of residence. ($p > 0.05$) but there was a tendency that older and less educated subjects had less remaining teeth. Conclusion : Number of remaining teeth was most closely related to mastication and speech disturbances. Keywords : remaining teeth, mastication and speech disturbances

PP25 C-041

THE RELATIONSHIP BETWEEN THE MODERATE ALCOHOL DRINKING AND GALLSTONE DISEASE IN A TAIWANESE ELDERLY POPULATION

Yen-Chun LEE, Jin-Shang WU, Yi-Ching YANG, Chin-Sung CHANG, Feng-Hwa LU, Chih-Jen CHANG
(National Cheng Kung University Hospital, Department of Family Medicine, Taiwan)

Introduction : The relationship between alcohol drinking and gallstone disease (GSD) were inconsistent. Excessive alcohol consumption has been perceived as one of the mechanisms for the risk of GSD, while moderate amounts of alcohol drinking was protective effect in general population. However, there is no study on the association between alcohol drinking and GSD in the elderly. The purpose of this study was to determine the relationship between moderate alcohol drinking and GSD in an elderly population. Method : Totally, 2694 subjects receiving health checkup at National Cheng Kung University Hospital between 2000 and 2009 were enrolled after excluding subjects with cancer, cholecystectomy, major liver surgery, hypothyroidism, leukocytosis, severe anemia, medication for dyslipidemia, alcohol consumption more than 30 gm/day for men and 20 gm/day for women. The diagnosis of GSD was based on the finding of abdominal ultrasonography. Moderate alcohol drinking was defined by the average amount of the alcohol consumption was < 30 gm/day for men, < 20 gm/day for women at least once drink per week for six months. Results : Compared with non-GSD group, the GSD group was older and had a higher diastolic blood pressures, higher prevalence of diabetes, liver cirrhosis, hepatitis B but a lower estimated glomerular filtration rate (eGFR) level and lower prevalence of moderate alcohol drinking. Based on binary logistic regression, age, female gender, diabetes mellitus, liver cirrhosis and hepatitis B were positively associated factors of GSD, but moderate alcohol drinking was negatively related to GSD. Conclusion : Moderate alcohol drinking showed a lower risk of GSD in the elderly. Keywords : gallstone, alcohol drinking

PP25 C-042

THE METABOLIC EQUIVALENT OF TASK IS AN INDEPENDENT PREDICTOR OF POST-CHOLECYSTECTOMY COMPLICATIONS IN THE ELDERLY

Ioannis Emmanouil PETRAKIS, Konstantinos LASITHIOTAKIS, Maria VENIANAKI, Alexandros ANDREOU, George CHALKIADAKIS (*General Surgery, University Hospital of Heraklion Crete Greece, Greece*)

Introduction : The Metabolic Equivalent of Task (MET) is a physiological measure expressing the rate of energy consumption during a specific physical activity. Herein we analyzed, for first time, the association between preoperative MET assessment and the occurrence of postoperative complications in elderly patients undergoing cholecystectomy for biliary stone disease. **Method :** 92 patients, 46 (50%) were women older than 65 years undergoing cholecystectomy for biliary stone disease were prospectively examined. Preoperative assessment of the activity with the highest MET was assessed and detailed perioperative data and patients' comorbidity was registered with the use of a standardized questionnaire. The main outcome of the study was the rate of any postoperative complication within 30 days of surgery. **Results :** The median (IQR) age of the collective was 73(10) years and the median(IQR) MET was 4(1.5). 26 (29.3%) of the patients experienced at least one postoperative complication. Patients experiencing postoperative complications reported significantly lower MET scores (3.5 vs. 4.3, $p=0.031$). In the multivariate logistic regression analysis adjusted for age, gender, body weight, type of operation (laparotomy/laparoscopy, elective/emergency), ASA score, Charlson comorbidity index and duration of operation, MET score retained its significance as an independent predictor of postoperative complications. For every unit of increase of the value of MET score a corresponding decrease of 40% (95%CI, 40%-90%) of the probability of postoperative complication was calculated on the basis of the logistic regression model ($P=0.006$). **Conclusion :** Preoperative assessment of the physical activity with the use of MET may predict the occurrence of postoperative complications of elderly patients undergoing cholecystectomy for bile stones. **Keywords :** Frailty, Comprehensive Geriatric Assessment, MET, Cholecystectomy, Postoperative Complications

PP25 C-043

SERUM LOW-DENSITY LIPOPROTEIN CHOLESTEROL PREDICTS FUTURE ALBUMINURIA IN THE ELDER TAIWANESE-TAICHUNG COMMUNITY HEALTH STUDY (3 YEARS FOLLOW-UP)

Wen-Yuan LIN¹, Chih-Hsueh LIN¹, Hua-Shui HSU¹, Chia-Ing LI², Chiu-Shong LIU¹, Tsai-Chung LI³, Chih-Te HO¹, Cheng-Chieh LIN¹ (*1. Department of Family Medicine, China Medical University and China Medical University Hospital, Taiwan; 2. Department of Medical Research, China Medical University Hospital, Taiwan; 3. Graduate Institute of Biostatistics, China Medical University, Taiwan*)

Introduction : Serum low-density lipoprotein cholesterol (LDL-C) and urine albuminuria have been reported to increase the risk of cardiovascular disease and all-cause mortality. In this study, we investigated the association between LDL-C change and future albuminuria in the elder Taiwanese. **Method :** A total of 832 subjects, aged 60 years and above, were recruited from Taichung city in Taiwan in 2004. Among these, 533 subjects were followed up with a mean 2.8 years. 427 baseline normoalbuminuria subjects were kept for final analyses, 32 of whom exhibited incident albuminuria. Albuminuria was defined as urinary albumin-to-creatinine ratio (ACR) ≥ 30 mg/g creatinine. The relationships between serum LDL-C and urine ACR change were analyzed. LDL-C change was categorized as LDL-C increase and decrease. Multiple logistic regression analyses were used to evaluate the relationship between LDL-C increase/decrease and

incidence of albuminuria after adjustment for age, gender, body mass index, blood pressure, glucose, smoking, betel nut chewing, alcohol drinking, and physical activity. Multiple linear regression analyses were also done for the association between Δ LDL-C and Δ urine ACR. **Results :** The mean follow-up duration is 2.8 years. After adjustment for potential confounder, using linear regression, Δ LDL-C was positively associated with Δ urine ACR. In multivariable models, participants with LDL-C increase had a 122% increase in risk of incident albuminuria (adjusted incidence rate ratio (95% CI): 2.22(1.003-4.93)) compared with participants with LDL-C decrease. **Conclusion :** Serum LDL-C change predicts future albuminuria in the elder Taiwanese. Further study is necessary to clarify the linking mechanism between LDL-C and albuminuria. **Keywords :** albuminuria, LDL, elderly

PP25 C-044

ACUTE CONFUSIONAL STATE (DELIRIUM) IN ELDERLY PATIENTS ADMITTED TO AN ACUTE GERIATRIC UNIT

Rolando Olegario ALTAMIRANO¹, Marcela Andrea BARRENECHEA², Ricardo Roger VILLALBA², Sandra Elizabeth BERNACHEA², Silvia Elisa RAMIREZ³ (*1. Servicio de Psicogeriatría, Hospital Geriátrico de Agudos Juana Francisca Cabral, Argentina; 2. Hospital Geriátrico de Agudos Juana Francisca Cabral, Argentina; 3. Hospital Geriátrico de Agudos Juana Francisca Cabral, Asociación de Gerontología y Geriatria Del Nea, Argentina*)

Introduction : Objectives: Know the prevalence of Acute Confusional State in this population of patients. Identify the risk factors for the clinical manifestation. **Method :** This prospective study included 190 patients. They were evaluated when they had been admitted using a registration tab with a complete geriatric assessment for 8 month in the year 2010 It was used for the diagnosis of ACS Confusion assessment method, the cognitive status was evaluated with the Pfeiffer test, the functional status with Katz index, the emotional status with Yesavage Scale, and Social assessment, nutritional status and other clinical variables. It was used SPSS program for statistical analysis. **Results :** The average age of the population admitted was 79,81 years old (SD+9,6), with regard to the sex was 68,9% F (131 p) and 31,1% M (59 p). The average age of the females was 79, 85 years old (SD +/- 9). Among 190 patients hospitalized the 51, 6% (98 p) was diagnosed of ACS when they were admitted. The ACS increases its prevalence with increasing age with an statistically significant relationship ($p<0,05$). It was comparing groups divided into decades and when they were divided in young elderly (< 74 years) and elderly (>75 years).The variables related with with high risk of ACS were functional dependence. **Conclusion :** The Prevalence of ACS was 51, 6% in patients hospitalized. The ACS was more frequent with the increasing age. The Risk Factors for the clinical manifestation were the previous cognitive impairment and functional dependence and previous cognitive impairment. **Keywords :** Delirium, Acute, Elderly

PP25 C-045

DEVELOPMENT OF A PREDICTION SCALE FOR POSTOPERATIVE DELIRIUM IN PATIENTS UNDERGOING CEREBROVASCULAR SURGERY

Nozomi HARASAWA, Toshiko MIZUNO (*School of Nursing, Tokyo Women's Medical University, Japan*)

Introduction : The purpose of this study was to develop a scale for predicting postoperative delirium (POD) in patients undergoing cerebrovascular surgery. **Method :** The predictive scale for POD is composed of 27 items selected from the drafted risk factors based on literature reviews, providing weightage to selected items. In this study,

the onset and severity of POD were determined by reference to the Japanese version of the NEECHAM Confusion Scale. The study was approved by the Ethics Committee of the relevant university. Results : Delirium developed in 38 of the 122 patients (31.1%) in our cohort. Analysis using a logistic regression model revealed the following risk factors: age, impairment of consciousness, underlying illness, depression, dehydration, and anxiety. The final scale was weighted by referring to the odds ratios. The area under the curve was 0.849 (95% CI : 0.773-0.926). The possible total score on this scale is 25 points, and a cutoff score of 14 was selected for determining the risk of postoperative delirium, with patients having scores of >15 being at a higher risk. The average score was 8.2 ± 4.4 in the non-delirium group, and 15.0 ± 4.7 points in the delirium group, with a significant difference between the two groups ($t = -7.575$, $p < 0.001$). The scores on this scale tended to be higher with increasing severity of delirium. Conclusion : This scale is able to predict postoperative delirium, and allow measures to be taken for prevention and early recovery focusing on patients with a high risk of delirium. Keywords : postoperative delirium, predictive scale, cerebrovascular surgery

PP25 C-046

DELIRIUM OR ACUTE CONFUSIONAL SYNDROME (ACS) IN HOSPITALIZED PATIENTS AT THE INTENSIVE CARE UNIT (ICU)

Rolando Olegario ALTAMIRANO¹, Marcela Andrea BARRENECHEA², Ricardo Roger VILLALBA², Sandra Elizabeth BERNACHEA², Guillermo Dionisio CANETE³ (1. *Unidad de Terapia Intensiva, Hospital Geriatrico de Agudos Juana Francisca Cabral Aggenea, Argentina*; 2. *Corrientes Capital, Hospital Geriatrico de Agudos Juana Francisca Cabral, Argentina*; 3. *Residencia Medica en Geriatria, Hospital Geriatrico de Agudos Juana Francisca Cabral, Argentina*)

Introduction : Delirium is a clinic syndrome with a multiple-factor origin. It is characterized by disorganized thinking, difficulty as regards awareness and attention. It occurs mainly in the elderly, prevalent over 75 years old. Objectives: Determine the frequency of delirium in hospitalized patients at the intensive care unit. Method : We made an observational and longitudinal study in ICU's rooms, in which 87 patients were included and evaluated by comprehensive geriatric assessment sheets during six months. The confusion Assessment method was employed for establishing diagnosis. These patients were statistically analyzed with the SPSS program. Results : The average age was 77, 47 years old (SD \pm 10); regarding gender 55,2 (48p) were female and 44,8 (39p) were male. 86, 2 % (74p) has ACS, which 82,75% from admission and 3,45% during hospitalization. The most common form was the hypoactive (60p). Regarding risk factors, the statistically significant predisposition was ($p < 0,5$) of dehydration, depression and previous ACS. The precipitating were: polypharmacy, local cathetering, iatrogenic, physical restraint, nasogastric tube and albumin $< 3g/l$. The complications were: pressure ulcers, functional impairment, urinary incontinence, nosocomial infection and excessive sedation. The diagnoses were: CAP (Community-acquired pneumonia) 32, 2 %; CHF (congestive heart failure) of 13,8%; COPD (Chronic obstructive pulmonary disease) of 10,3%; Stroke and severe sepsis of 6,9%. Mortality was 27,6%. Conclusion : Delirium in ICU was common in the actual population study, being the most common form the hypoactive, and concerning risk factors, it was observed that these components favored the ACS emergency. The complications and mortality were higher in this group of patients. Keywords : Delirium, elderly, hospitalized

PP25 C-047

REDUCING POST-SURGICAL DELIRIUM IN ELDERLY HIP FRACTURE PATIENTS BY IDENTIFYING AT-RISK PATIENTS

Sheda HEIDARIAN (*Internal Medicine/Geriatrics, Eisenhower Medical Center, USA*)

Introduction : Post-surgical delirium (PSD) is common among the elderly and has serious short- and long-term consequences. Method : Patients admitted through the Emergency Department (ED) for hip fracture between January and April of 2012 (n: 25) were identified as high risk for PSD using the following criteria: Age > 70 , BUN/creatinine > 20 and albumin < 2.5 . Patients meeting criteria were evaluated by a geriatric team for underlying causes including polypharmacy-related issues. Interventions emphasized medication management, orientation to the environment, sleep hygiene, early mobility, and pain management. The intervention group was compared with all patients meeting the same criteria admitted through the ED January-April, 2009 (n: 34). Variables compared included length of stay, use of restraints, falls, and use of personal attendants. Charts were also reviewed for notes indicating the emergence of confusion or agitation no present on admission. Results : A change in cognition was noted in 12% of the intervention group vs. 34% in the comparison group. Restraints were used in 7.7% of the intervention group vs. 14.7% of the comparison group. Personal attendants were not necessary in the intervention group vs. 2.9% of the comparison group. Length of stay of similar in both groups: 6.5 vs. 6.6 in patients with a change in cognitive status compared with 4.6 vs. 4.9 in those without. There were no falls in either group. Conclusion : Identifying patients at high risk for PSD and implementing a package of interventions based on current evidence shows promise for reducing the incidence of PSD. Keywords : Delirium, risk-factor identification

PP25 C-048

THE SYNDROMES AT THE TIME OF ADMISSION AND THE CONTENTS OF HOME CARE FOR THE ELDERLY AT HOME

Hiroko OHSHIMA¹, Mitsuyo OZAKI², Akemi MATSUMOTO², Takao SUZUKI³ (1. *Nursing and Care, National Center for Geriatrics and Gerontology, Japan*; 2. *Home-medical Support Ward, National Center for Geriatrics and Gerontology, Japan*; 3. *Research Institute, National Center for Geriatrics and Gerontology, Japan*)

Introduction : The purpose of this study was to examine the syndromes at the time of admission and the contents of home care for the elderly who were registered in on the Home-Medical-Support ward. Method : Observation study was conducted. 188 elderly people aged 65 and over were included in this study. Dates were collected by the ward nurses. Collected items were demographics, syndromes at the time of admission, the contents of home care, the number of admission, length of stay, family caregiving, medical procedure at-home, and so on. Results : The prevalence of geriatric syndromes in the community-dwelling elderly was over fifty percent as follows: pneumonia, urinary-tract infection, dysphasia, falls, pressure ulcer, and frail. Conclusion : The results suggested that the care and management of geriatric syndromes is important for geriatric nursing both hospital and home-care. Keywords : geriatric syndromes, nursing management, home care

PP25 C-049

A MEMANTIN OVERUSE CASE WITHOUT DEMENTIA

Umut SAFER, Huseyin DORUK, Ilker TASCI, Ilkin NAHARCI, Ergun BOZOGLU (*Geriatrics, Gulhane School of Medicine, Turkey*)

Introduction : Memantin HCL (Ebixa) is a drug which antagonizes the effects of N-methyl-D-aspartat receptors and which is used for the treatment of dementia. Several forms consisting tablet (5-10 mg), solution (2mg/ml) and pump actuation oral solution (5mg/ml) are available. **Method :** Female patient at the age of 88 was admitted to our geriatric department with complaints of dyspepsia. Her history consist of hypertension (for 40 years), hiatal hernia(for 40 years), Alzheimer disease(since 2007), Parkinson disease (since 2007), Panic disorder(since 2007). She was on Ebixa pump actuation oral solution 40-50 mg/day. Ebixa was first prescribed in year 2007 as solution form in dose of 8-10 drop/day by a neurologist and patient continued to use until November 2012. Unfortunately Ebixa solution form was changed with pump actuation oral solution in year June 2011 in Turkey. After this form change patient continued to use Ebixa as usual (8-10 pump/day) which cause 40-50 mg/day memantin use. **Results :** Our geriatric assessment showed that patient had dysarthria and Parkinsonism but no dementia. Patient's upper gastrointestinal endoscopic assessment showed that she had pan gastritis, hiatus hernia and alkali reflux gastritis. **Conclusion :** Assessment of geriatric patient is difficult particularly if the patient has dysarthria. Communication deficit in these patients may cause overdose medication use and drug addiction. Dysarthric patient must be more carefully assessed to avoid misdiagnosis and inappropriate medication. Also change medical forms of dementia drugs could cause crucial results as in this case. **Keywords :** memantin, missdiagnosis, dementia

PP25 C-050

MINIMIZING THE RISK OF BLOOD CLOTS WITH THE USE OF ELECTRONIC MEDICAL RECORDS

Joshana K. GOGA¹, Robert ROCA², Abhilash DESAI³, James K. WALTERS⁴, Anita POLOWAY⁵ (1. Geriatric, Sheppard Pratt Health System, USA; 2. Vice President of Medical Affairs, Sheppard Pratt Health System, USA; 3. Geriatric Psychiatry, Sheppard Pratt Health System, USA; 4. Pharmacy, Sheppard Pratt Health System, USA; 5. Geriatrics, Sheppard Pratt Health System, USA)

Introduction : The CDC recognizes hospitalization as a major risk factor for venous thromboembolism (VTE). Appropriate VTE prophylaxis is under-utilized in geropsychiatric patients admitted to psychiatric facilities eventhough the risk of a VTE event significantly impacts morbidity and mortality rates. **Method :** 1.Our Anticoagulation team developed a 2 step VTE risk screening tool with specific psychiatric risk factors incorporated. 2.Our Information Technology team translated the screening tool into the existing hospital history and physical assessment template on the electronic medical record. 3.Our Ambulation program was developed by geriatric physical therapist, occupational therapist, music therapist, pharmacist and nursing staff. **Results :** Since the implementation of the VTE prophylaxis program in 2009 the number of enoxaparin orders have increased by nearly 90%, only 4 VTE events have been documented which is significantly lower than the national average and no gastrointestinal bleeds have been reported with the initiation of enoxaparin. **Conclusion :** The geropsychiatric population should be screened for VTE risks in both an inpatient setting and outpatient long-term setting. Patient risks can compound as they transition from one environment to another. In an acute care setting increased levels of cortisol, decompensation of psychiatric symptoms, and addition of psychotropics along with immobilization can impact VTE risk. In the long-term setting extended immobilization in patients with medical co-morbidities can significantly increase the risk of an event with an acute hospital admission. The combined efforts from both the outpatient medical team and inpatient medical team to reduce risks would have a much greater impact in reducing the overall VTE burden. **Keywords :** blood

clots, electronic medical record, multidisciplinary team

PP25 C-051

A 12 WEEK YOGA PROGRAM IMPROVED BALANCE AND MOBILITY IN OLDER COMMUNITY-DWELLING PEOPLE: A RANDOMISED CONTROLLED TRIAL

Anne TIEDEMANN¹, Sandra O'ROURKE², Romina SESTO³, Catherine SHERRINGTON² (1. Musculoskeletal Division, The George Institute for Global Health, University of Sydney, Australia; 2. Musculoskeletal Division, The George Institute for Global Health, The University of Sydney, Australia; 3. Yoga Instructor, Yoga To Go, Australia)

Introduction : Yoga is a popular form of exercise among older people, but its effectiveness in improving balance and preventing falls has not been adequately explored. This study evaluated the feasibility and effect of a 12 week yoga program on balance and mobility in community-dwelling older people. **Method :** We conducted an assessor-blinded randomised controlled trial with intention-to-treat analysis. Participants were 54 community-dwelling people aged 59+ (mean 68, SD7.1) not currently participating in yoga or Tai Chi. Twenty seven people allocated to the intervention group participated in a 12 week twice-weekly yoga program, focussing on standing balance postures. Twenty seven controls received a booklet containing general information about falls risk factors/prevention. Primary outcome measure was the standing balance component of the Short Physical Performance Battery with the addition of one-legged stance time (SPPB+OLS). Secondary outcome measures included the timed sit to stand test (STS), timed four metre walk (T4MW), one-legged stance with eyes closed (OLSEC) and the Short Falls Efficacy Scale-International (SFES-I). **Results :** Linear regression analysis revealed significant improvements in the intervention group compared to control group for the SPPB+OLS (mean difference =1.53, 95% CI 0.10 to 2.96), STS (-2.99, -4.84 to -1.15), T4MW (-0.56, -0.80 to -0.32) and OLSEC (1.94, 0.40 to 3.49). Mean class attendance was 20 out of 24 classes (83%). **Conclusion :** This trial demonstrates the popularity and beneficial effects on balance and mobility of 12 weeks of yoga for older people. Further research is needed to determine the effect of yoga on risk and rate of falling in older people. **Keywords :** yoga, falls, balance

PP25 C-052

PSYCHOLOGICAL IMPACTS OF FALL AMONG SENIOR CITIZENS IN MACAU

Christopher LUM (Medical & Geriatrics, Shatin Hospital, Hong Kong)

Introduction : About one third older persons have a fall over 12 months. Besides physical injury, fallers may lose confidence in mobility, resulting in restricted activity range. Primary objective of current study was to estimate prevalence of fall among community living senior citizens in Macau. Secondary objective was to evaluate psychological impact of having had fall(s). **Method :** This was a cross sectional survey using a structured questionnaire. Subjects were recruited using structured sampling method. Fall history in preceding one year and potential psychological impacts of falls were captured using the Chinese Activities ?Specific Balance Confidence Scale (ABC-C). **Results :** 199 valid questionnaires were analyzed. They had a means age of 72.3 (SD 5.2). 117 (58.8%) were female. Total of 155 (77.9%) had at least one fall in past 12 months. Although fallers and non-fallers did not differ in total ABC-C scores [990.0 (SD 121.8) in non-fallers versus 993.1 (SD 150) in fallers], fallers had significantly lower confidence in each of the nine questions relating to outdoor

activities, and on sum of scores of these nine questions [512.8 (SD 77.7) in non-fallers versus 462.9 (SD 86.9) in fallers, $p=0.001$]. Conclusion : The sample had a high fall rate at about 78% over past one year. Though they did not differ much in confidence of balance in indoor activities, fallers had significantly lower confidence in outdoor mobility. This potentially may limit their activity range and resulted in reduced psycho-social interactions. Keywords : falls, ABC-C, psychological impact

PP25 C-053

LONG-TERM PARTICIPATION IN OTAGO PEER-LED FALLS PREVENTION CLASSES PREDICTS LOWER FALLS INCIDENCE

Birgit WURZER¹, Debra L. WATERS², Leigh HALE¹, Sophia LEON DE LA BARRA² (1. School of Physiotherapy, University of Otago, New Zealand; 2. Preventive and Social Medicine, University of Otago, New Zealand)

Introduction : Falls prevention programs are typically short-term interventions. Whether continued participation predicts falls incidence, is unknown. Steady As You Go (SAYGO) are community-based, peer-led, falls-prevention exercise classes adapted from the home-based Otago Exercise Programme. Classes began forming in 2003, and currently >40 are operating in the Otago region. We investigated whether long-term SAYGO participation predicted falls incidence over 24 months. Method : Two hundred and ten participants were recruited from the peer-led groups. Previous 12-months falls incidence was obtained by questionnaire, followed by 12-monthly falls calendars. Fall details were obtained by phone-administered questionnaires. Negative binomial regression was used to examine falls incidence over 24-months and correlation with years of attending SAYGO. Age, sex, number of medications, and total months of follow-up were in the model. Results : Mean age was 77.7 ± 6.6 years. Mean SAYGO was participation 4.3 ± 2.5 years. Falls incidence at 24 and 12-months were highly correlated ($r=.897$, $p<0.001$). Longer years of SAYGO participation predicted lower 24-month falls incidence (IRR 0.91, 95%CI: 0.84 to 0.98, $p=0.02$). Higher number of medications correlated with more falls (IRR 1.29, 95%CI 1.04 to 1.61, $p=0.019$). Out of 158 total falls, 81 (51%) were reported as not injurious. Medical attention following a fall was sought 29 times. Seven fractures were reported and none were femoral. Conclusion : These data suggest sustained participation in SAYGO may reduce falls incidence. Research on community translation of falls prevention exercise programs into peer-led models, using monthly falls calendars, data on injuries, and cost effectiveness, are needed to confirm and extend these findings. Keywords : Falls Community Interventions

PP25 C-054

FALLS AND FRACTURES CLINICS: A PROGRAM COMPARISON BETWEEN AUSTRALIA AND COLOMBIA

Fernando GOMEZ¹, Carmen Lucia CURCIO¹, Pushpa SURIYAARACHCHI², Oddom DEMONTIERO², Gustavo DUQUE² (1. Research Group on Geriatrics and Gerontology, University of Caldas, Colombia; 2. Ageing Bone Research Program, Sydney Medical School Nepean, The University of Sydney, Australia)

Introduction : Falls and fractures are major causes of morbidity and mortality in older people. More importantly, previous falls and/or fractures are the most important predictors of further events. Therefore, secondary prevention programs for falls and fractures are highly needed. However, the question is whether the model should integrate falls prevention alone or in combination with fracture prevention. Method : By comparing a Falls Prevention Clinic in

Manizales (Colombia) vs. a Falls and Fracture Prevention Clinic in Sydney (Australia), our objective was to identify similarities and differences between these two programs and to propose an integrated model of care for secondary prevention of fall and fractures. Results : We performed a comparative study of services using an internationally agreed taxonomy. Service provision was compared against benchmarks set by the National Institute for Health and Clinical Excellence (NICE) and with previous reports in the literature. Comparison included organization, administration, client characteristics and interventions. We report several similarities and an amount of differences that could be easily unified into a single model. Conclusion : Similarities included population, a multi-disciplinary team and a multi-factorial assessment and intervention. Differences were eligibility criteria, a bone health assessment component, and the most common therapeutic interventions. In Australia, bone health assessment is reinforced whereas in Colombia dizziness assessment and management is pivotal. We propose that falls clinic services should be operationally linked to osteoporosis services as a "Falls and Fracture Prevention Clinic", which would facilitate a comprehensive intervention to prevent falls and fractures in older persons. Keywords : Outpatient clinics; falls and fracture services; geriatric health services; secondary prevention.

PP25 C-055

VIRTUAL REALITY COMPUTER SIMULATED HOME VISIT: TEACHING HOME SAFETY

Irene HAMRICK (Family Medicine, University of Wisconsin, USA)

Introduction : To improve home safety instruction for health professionals, students and patients. Most health professional students are required to do home visits but may be limited in their experience by driving distance and differences in home visit environments. Method : Health professional students, resident physicians (combined as learners) and patients ($n=300$) will be recruited to go through the Virtual Reality Computer Simulated Home Visit (VRCSHV) to learn home safety. Participants will take a pre- and post-test to evaluate learning and assess the software. The VRCSHV is a 3D computer interactive home environment, similar to a video game. Participants look for safety hazards and click on objects to 'fix' them. Throughout, the simulation informational boxes explain the hazards (62) and a summary at the end provides feedback on number of fixes. The control group will be family medicine residents going on a home visit, who will have the list of hazards read to them and complete the pre- and post-test. After three months, participants will take another follow up post-test. Statistical analysis will be by Chi-square and t-test. Results : We hypothesize: The VRCSHV will improve Health professionals', learners' and patients' knowledge about home safety. Teaching home safety is more comprehensive with the VRCSHV. Evaluation of home visits will be more uniform and objective with the VRCSHV. The VRCSHV is accepted and well received by learners and patients. Conclusion : The VRCSHV will teach health professionals, learners and patients to identify and correct safety hazards, more comprehensive and fun, and evaluations more uniform. Keywords : home, safety, falls

PP25 C-056

PREDICTIVE VALIDITY AND CUT-OFF SCORES IN FOUR DIAGNOSTIC TESTS FOR FALLS - A STUDY IN FRAIL OLDER PEOPLE AT HOME

Ulrika OLSSON MOLLER, Jimmie KRISTENSSON, Patrik MIDLOV, Charlotte EKDAHL, Ulf JAKOBSSON (Department of Health Sciences, Lund University, Sweden)

Introduction : Today frail older people to a greater extent receive healthcare at home. Various diagnostic tests to identify the risk of falls in older people should be used in different clinical settings. However, no study has investigated the predictive validity and cut-off scores in diagnostic tests for falls used in in-home assessment in frail older people. The objective was to investigate the predictive validity for falls in the Downton Fall Risk Index (DFRI), Timed Up and Go (TUG) and Romberg test (RT) used in this setting. **Method :** Data on the diagnostic tests were collected in in-home assessments at baseline (N=153) and fall frequency and at six- and twelve month follow-ups. The inclusion criteria were: 65 years or older; living in the municipality where the study was conducted; needing help with at least two activities of daily living (ADL); admitted to hospital at least twice or with at least four contacts with outpatient or primary healthcare during the previous 12 months. At baseline (N = 153) 67% were women and the mean age was 81.5 years (SD 6.3, range 66-94 years). **Results :** The optimal cut-offs were 3 p in DFRI with 79% sensitivity and 24% specificity and 12 s with 78% sensitivity and 37% specificity in TUG. The validity indexes were generally low and only 40-50% were correctly classified. The RT showed low sensitivity; 6-22%. **Conclusion :** To increase the predictive validity for falls in this context, the use of DFRI and/or TUG as a part of a comprehensive fall-risk assessment tool, should be investigated in future studies. **Keywords :** falls, frail, predictive validity

PP25 C-057

EFFECT OF A THREE-MONTH THERAPY OF ALFACALCIDOL ON FUNCTIONAL MOBILITY IN INDONESIAN COMMUNITY-DWELLING ELDERLY WOMEN: RANDOMIZED CONTROLLED TRIAL

Siti SETIATI (*Department of Internal Medicine, Faculty of Medicine Universitas Indonesia, Indonesia*)

Introduction : Previous studies reported the D-analog alfalcidol, increases muscle power and balance and lead to a highly significant decreases in the number of fallers and falls in Caucasian elderly community-dwelling population. **Objective** To determine the effect of alfalcidol on functional mobility in Indonesian elderly women community-dwelling population. **Method :** A randomized, double-blind controlled trial was conducted in elderly women subjects geriatric clinic of Cipto Mangunkusumo National Hospital Jakarta Indonesia on April-Agustus 2012. Intervention group was given 0,5 mcg alfalcidol and 500 mg calcium daily for 90 days and another group was given placebo and 500 mg calcium. Balance test, Timed-up and Go Test (TUG) was measured at the beginning and after 3 months. Per protocol analysis to functional mobility after intervention between the two groups was performed. **Results :** Of 122 patients, 95 subjects were fulfilling study criteria and randomized into 2 groups, containing 47 subjects in alfalcidol group and 48 subjects in placebo group. Both groups were comparable in all important prognostic factors including age, BMI, nutritional status, muscle strength. After three months the mean time in alfalcidol group used for the TUG was decrease significantly by 2,32 s ($p < .0001$). There were significant improvement of the mean time for TUG in the group that received alfalcidol compared to placebo (10.65 vs.12.37, $p = 0.025$). **Conclusion :** Treatment with 0.5 mg alfalcidol with calcium effectively improved functional mobility in Indonesian elderly women. **Keywords :** alfalcidol, functional mobility, Indonesian elderly women

ENGLISH VERSION OF THE NEWLY-DEVELOPED CGA INITIATIVE "DR. SUPERMAN" FOR ELDERLY

OUTPATIENTS

Toshihiko IWAMOTO (*Geriatric Medicine, Tokyo Medical University, Japan*)

Introduction : The CGA is necessary to improve the QOL in elderly patients. However, CGA with multiple components and with time-consuming consultation can lead difficulty to be performed in primary care. Recently, we developed a concise screening test for CGA, named "Dr. SUPERMAN" to elucidate its usefulness. **Method :** The "Dr. SUPERMAN" is based on mnemonics connecting the first letters of each item. Briefly, the letters "Dr" indicate physical examination; the letter "S" denotes the item of sensation; the letter "U" refers to the item of understanding of speech; the letters "PER" relate to the items of pharmacy and key person; the letter "M" signifies the term "3 M's", which indicates the geriatric syndrome of disturbances of mentality, mobility and micturition; the letter "A" symbolizes the item of ADL; and the letter "N" designates the item of nutrition. It was performed in 110 outpatients with various diseases. **Results :** It took 5-15 minutes. The prevalence of specific geriatric problems in each item showed visual or auditory difficulty in 18-30%, communication difficulty in 13%, poor medication adherence in 25%, cognitive decline in 55%, depressive status in 38%, functional disturbance of the upper and lower extremities in 11% and 79%, respectively, eating and swallowing difficulty in 19%, urination disturbance in 52%, any disability of ADL in 51%, and nutritional problems in 23%. **Conclusion :** It is useful to gain a fuller understanding of the patients complex needs and should serve to improve and maintain the QOL in elderly patients. **Keywords :** Comprehensive Geriatric Assessment, screening test, mnemonics

USE NEW TOOL TO ASSESS WALKING IN THE OLD PATIENTS: CLINICAL PROTOCOL

Cecile CRIDELICH¹, Guillaume SACCO², Claire VUAGNOUX³, Laure BOSHER³, Bernard TEBOUL³, Julie PIANO⁴, Jean-Pierre MERLET⁵, Patrick MALLEA⁶, Olivier GUERIN⁷ (1. *Plateforme Partenariale d'Innovation, Universite Nice Sophia-Antipolis, France*; 2. *Hopital de Cimiez, Centre Hospitalier Universitaire de Nice, France*; 3. *Plateforme Patient, Centre Hospitalier Universitaire de Nice, France*; 4. *Centre Memoire de Ressources et de Recherche, Centre Hospitalier Universitaire de Nice, France*; 5. *COPRIN, Institut National de Recherche en Informatique et Automatique, France*; 6. *Centre National de Reference Sante a domicile et Autonomie, Centre National de Reference Sante a domicile et Autonomie, France*; 7. *Plateforme Partenariale d'Innovation, Universite de Nice Sophia-Antipolis, France*)

Introduction : With aging, the ability to walk is modified by the combined effect of physiological and pathological aging. It is therefore important to recognize gait modifications and prevent falls. Currently, tools exist to assess the risk of falling. Some are comprehensive but time-consuming and are generally discarded in favour of other simpler but less sensitive tests. This pilot study was the first step for the development of a simple, sensitive assessment tool. **Method :** In this study, we will use the smart rollator walker developed by INRIA (National Institute for Research in Computer Science and Control), entitled ANG (for Assisted Navigation Guide), to obtain more reliable and accurate measurements of walk parameters. The main objective of this study is to compare a standard evaluation of walking and our technology assessment for people between 65 and 90 years old. Secondary objectives are to evaluate use's tolerance of ANG walker in the elderly and test the feasibility of detecting subtle alterations of the musculoskeletal system, which are not felt by the

patient. Results : Currently, 11 volunteers were included in this protocol and 35 will be finally assessed at the end of inclusion in December 2012. Conclusion : It's not possible to conclude now. The results of this study should be available in March 2013. Keywords : Walking, smart walker, risk of falling

PP25 C-060

EFFECTS OF FALL INJURY TYPE AND DISCHARGE PLACEMENT ON MORTALITY, HOSPITALIZATION, FALLS, AND ADL CHANGES AMONG OLDER PEOPLE IN TAIWAN

Mau-Roung LIN¹, Hei-Fen HWANG² (1. Institute of Injury Prevention and Control, Taipei Medical University, Taiwan; 2. Department of Nursing, National Taipei University of Nursing and Health Sciences, Taiwan)

Introduction : Falls are the most-common cause of injuries and hospital admissions in persons aged 65 years and older, and falls account for 90% of hip fractures, 33% of vertebral fractures, 96% of distal-forearm fractures, and 61% of traumatic brain injuries (TBIs). Method : A longitudinal study was conducted. Results : Compared to patients with a soft-tissue injury, those with TBI had significantly higher risks of dying (rate ratio (RR) = 3.59) and hospital admissions (RR = 3.23) and better improvement in activities of daily living (ADLs) (1.51 points) at 6 months post-injury, and those who sustained a hip fracture (4.26 and 4.41 points), a vertebral fracture (3.81 and 3.83 points), or a distal-forearm fracture (2.80 and 2.80 points) had significantly better improvement in ADLs at 6 and 12 months post-injury. Patients discharged to a nursing home had a significantly increased risk of death (RR = 2.08) and hospital admission (RR = 2.05) than those returning to their usual residence during the first year post-injury. No significant differences in the occurrence of falls during the first post-injury year were found among patients with different injury types or between those with different discharge placements. Conclusion : Among the five major fall injury types in older people, TBIs result in the highest risk of death and hospital admissions, while hip and vertebral fractures exhibited the largest improvement during the first year after injury. Additionally, nursing home care may be associated with increased risks of death and hospital admissions than home care. Keywords : falls; older people; discharge placement;

SARCOPENIA PREVALENCE AND ITS ASSOCIATED FACTORS IN AN ELDERLY TAIWANESE METROPOLITAN POPULATION

Cheng-Chieh LIN¹, Tsai-Chung LI², Chiu-Shong LIU³, Chih-Hsueh LIN¹, Chin-Kai CHANG⁴, Nai-Hsin MENG⁵, Wen-Yuan LIN³, Chuan-Wei YANG⁶ (1. Department of Family Medicine & Geriatric Medicine, China Medical University & Hospital, Taiwan; 2. Graduate Institute of Biostatistics, College of Public Health, China Medical University, Taiwan; 3. Department of Family Medicine, China Medical University & Hospital, Taiwan; 4. Department of Rehabilitation & Geriatric Medicine, China Medical University & Hospital, Taiwan; 5. Department of Rehabilitation, China Medical University & Hospital, Taiwan; 6. Ph.D. Program for Aging, College of Medicine, China Medical University, Taiwan)

Introduction : Sarcopenia has been defined as the loss of skeletal muscle mass and strength that occurs with advancing age. The aim of our study was to determine the sarcopenia prevalence using the European Working Group on Sarcopenia in Older People algorithm in a general elderly population in Taiwan. Method : We did a cross-sectional survey of 761 ethnic Taiwanese elders aged 65 years and

over who lived in Taichung City, Taiwan in 2009. Elders with low muscle mass plus presence of either low muscle strength or low physical performance were defined as sarcopenia. Low muscle mass is determined by skeletal muscle mass index, which was measured by dual energy X-ray absorptiometry. Low muscle function was defined as grip strength in the lowest quintile measured by handgrip dynamometer. Low physical performance was based on walking time to 15 feet. Results : The age- and gender-weighted prevalence of sarcopenia was 14.4% (95% CI: 13.0%-15.7%). The sarcopenia prevalence was 6.8%, 14.6% and 41.7% in men aged 65-74, 75-84 years and 85 years and over, and the corresponding prevalence was 8.1%, 21.4% and 26.7% in women, respectively. Older age (odds ratio, OR: 2.43, 95% confidence interval, CI: 1.42-4.15 for 75-84 years old; and 6.26, 2.75-14.25 for >85 years old), no regular exercise (2.62, 1.61-4.26), and fall history (1.72, 1.03-2.90) were associated with an increased prevalence of sarcopenia. Conclusion : Sarcopenia was present in 14.4% of the elderly Taiwanese population aged 65 years and over in a metropolitan area; there were substantial variations by age, regular exercise status, and fall history. Keywords : sarcopenia, prevalence, population-based study

PP25 C-062

INFLAMMATION MODULATES THE ASSOCIATION BETWEEN LOW MUSCLE MASS AND PHYSICAL PERFORMANCE

Chia-Ing LI¹, Nai-Hsin MENG², Cheng-Chieh LIN³, Tsai-Chung LI⁴, Chin-Kai CHANG⁵, Tsang-Mu LEE¹ (1. Department of Medical Research, China Medical University Hospital, Taiwan; 2. Department of Rehabilitation, China Medical University & Hospital, Taiwan; 3. School of Medicine, College of Medicine, China Medical University, Taiwan; 4. Graduate Institute of Biostatistics, College of Public Health, China Medical University, Taiwan; 5. Department of Rehabilitation & Geriatric Medicine, China Medical University & Hospital, Taiwan)

Introduction : Low muscle mass and inflammation may play essential roles in the decline of physical performance though recent studies. This study aimed to explore the effect of inflammation on the association between low muscle mass and physical performance in Taiwanese. Method : A cross-sectional survey of a sample of 844 older adults with complete information of dual energy X-ray absorptiometry examination, physical performance tests and inflammatory markers were included. Low muscle mass was defined as low appendicular skeletal muscle mass. High inflammation level was defined as the highest tertile of inflammatory markers by genders. Physical performance was assessed according to grip strength, time-up and go, walking speed, one-leg balance, test for squat, and flexibility. Results : Older adults with low muscle mass had worse scores than those without low muscle mass in all measurements of physical performance tests. The effects of low muscle mass on time-up and go, grip strength, six-minute walk, and physical performance score were different according to TNF- α levels ($p=0.04$, 0.02 , 0.01 , and <0.01 for interaction of low muscle mass and TNF- α); and the effects of low muscle mass on six minute walk and physical performance score depended upon CRP level ($p=0.01$ and 0.01 for interaction of low muscle mass and CRP). For older persons with high level of inflammation, we observed decreased scores in physical performance tests for older persons with low muscle mass compared with those without low muscle mass. Conclusion : Inflammation potentially play a modulate role with low muscle mass on the physical performance of elders. Keywords : low muscle mass, inflammation, physical performance

PP25 C-063

EFFECTS OF A MODIFIED HOSPITAL ELDER LIFE PROGRAM ON FRAILITY

Cheryl Chia-Hui CHEN (*School of Nursing, National Taiwan University, Taiwan*)

Introduction : Frailty is highly prevalent in older hospitalized patients, but no intervention program has proved to be effective. A Modified Hospital Elder Life Program is successful to reduce geriatric syndromes such as delirium and functional decline, but its effects against frailty has not been tested. **Method :** The effects of a modified HELP intervention targeting three shared risk factors (cognitive, functional, and nutritional status) was evaluated in a pre-and post-intervention pilot trial. The end point at this evaluation was rate and level of frailty upon hospital discharge and 3 months afterward, using Fried's 5 phenotype criteria. Participants were 179 patients enrolled as the control (n = 77) and intervention (n = 102) groups. To evaluate a modified HELP intervention for older patients undergoing elective, major abdominal surgery. **Results :** By hospital discharge, patients in the intervention group experienced significantly less risk for frailty (14.7% vs. 67.5% for controls; adjusted OR = .07; p < .001). These results were independent of patients' education, periampullary diagnosis, duration of surgery, and baseline frailty. At 3 months after discharge, a lower rate of frailty for intervention group than controls (15.2 vs. 30.1%, respectively; p = .03) was found, but results did not reach significant levels after multiple adjustments (adjusted OR = .47; p = .14). **Conclusion :** The modified HELP is effective to reduce frailty by hospital discharge but benefit faded out at 3 months after discharge. This modified HELP provides a constructive solution to manage in-hospital frailty for older patients undergoing major abdominal surgery. **Keywords :** Frailty; Hospital Elder Life Program; Acute Care for the Elderly

DO PSYCHOSOCIAL FACTORS MODIFY THE EFFECTS OF FRAILITY ON FUNCTIONAL DECLINE AND MORTALITY?

Emiel O. HOOGENDIJK¹, Hein P.J. VAN HOUT¹, Henriette E. VAN DER HORST¹, Dinnus H.M. FRUITERS¹, Dorly J.H. DEEG², Martijn HUISMAN² (*1. Department of General Practice & Elderly Care Medicine, EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 2. Department of Epidemiology & Biostatistics, EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands*)

Introduction : The aim of this study was to investigate whether psychosocial factors modify associations between frailty and adverse outcomes. **Method :** The study sample consisted of 1188 men and women aged 65 and over participating in the two most recent waves of the Longitudinal Aging Study Amsterdam (LASA). Frailty and psychosocial factors were assessed at T1 (2005/2006). The frailty indicator was based on the frailty definition of Strawbridge. Psychosocial factors included mastery, self-efficacy, personal network size and received emotional support. Adverse outcomes included functional decline and mortality assessed at T2 (2008/2009). **Results :** Results of logistic regression analyses demonstrated that frail older adults had higher odds of both functional decline and mortality. Mastery was associated with mortality and self-efficacy was associated with functional decline. No statistically significant interaction effects between frailty and psychosocial factors were found. **Conclusion :** The results of this study showed that frailty and psychosocial factors are associated with functional decline and mortality. However, it seems that psychosocial resources do not buffer against adverse outcomes in frail older adults. **Keywords :** Frailty, Psychosocial factors, Adverse

outcomes

THE IDENTIFICATION OF FRAIL OLDER ADULTS IN PRIMARY CARE: COMPARING THE ACCURACY OF 5 SIMPLE INSTRUMENTS

Emiel HOOGENDIJK, Danielle JANSEN, Giel NIJPELS, Hein VAN HOUT (*General Practice and Elderly Care Medicine, VU University Medical Center, Netherlands*)

Background: Many instruments are available to identify frail older adults who may benefit from geriatric interventions. Most of those instruments are time-consuming and difficult to use in primary care. In order to select a valid instrument to identify frail older adults in primary care, five simple instruments were compared. **Method :** Instruments included clinical judgement of the general practitioner, prescription of multiple medications, the Groningen Frailty Indicator (GFI), PRISMA-7, and the self-rated health of the older adult. Fried's frailty criteria and a clinical judgement by a multidisciplinary expert panel were used as reference standards. Data were used from the cross-sectional Dutch Identification of Frail Elderly Study consisting of 102 people aged 65 and over from a primary care practice in Amsterdam. In this study, frail older adults were oversampled. We estimated the accuracy of each instrument by calculating the area under the ROC curve. The agreement between the instruments and the reference standards was determined by kappa. **Results :** Frailty prevalence rates in this sample ranged from 11.6% to 36.4%. The accuracy of the instruments ranged from poor (AUC = 0.64) to good (AUC = 0.85). **Conclusion :** PRISMA-7 was the best of the five instruments with good accuracy. Further research is needed to establish the predictive validity and clinical utility of the simple instruments used in this study. **Keywords :** frailty, screeners, accuracy

STANDARD GERIATRIC ASSESSMENT IN A GERIATRIC WARD DEBRECEN, HUNGARY PROF. DR. GYULA BAKO; DR. ADRIENN SZABO, DR. FRANCISKA TIZEDES, DR. ILONA TARKANYI DIVISION OD GERIATRIC MEDICINE, INSTITUTE OF MEDI

Gyula BAKO, Adrienne SZABO, Franciska TIZEDES, Ilona TARKANYI (*Institute of Int. Med., Division of Geriatric Medicine, University of Debrecen, Hungary Medical and Health Science Centre, Hungary*)

Introduction : The population of Hungary is getting older similarly to the world. The majority of them suffers from multimorbidity and need hospitalization. **Method :** We made a geriatric assessment among our randomly selected patients over 65 years. We processed the data of 368 patients (249 female and 119 male) accepted from their home to our ward as acute cases hospitalized between 2009 ? 2011. We used the standard geriatric assessment questionnaires. **Results :** Over the age of 65 almost all of the patients are still able for independent daily living, Elderly patients tend to use less instruments, they could learn fewer new things. Tinetti's balance and gait examination shows that advancing in age the risk of falling increases gradually, the chance of falling reached 100 % at the age of 95+. Fractures happened over the age of 65 was increased gradually and reached 100 % at the age of 95+. The nutritional status showed, that 60-70% of them has a high risk of malnutrition. Nearly 40-50% of the patients suffer from moderate depression. We assessed the degree of dementia. In the age between 75 and 80 ages in 2% we noticed serious, in 5% medium, and in 23% moderate dementia. We also examined 60 elderly patients with multimorbidity to see their effect(s) on quality of life. We found that it

increases the chance of falling, depression and undernutrition. Conclusion : We conclude that, our elder patients are in need of more help, care, solicitude. Furthermore all of these examinations helped us in proper diagnosis, careful treatment. Keywords : geriatric, standard, assessment

PP25 C-067

SARCOPENIA PREVALENCE IN OCTOGENARIANS AND NONAGENARIANS IN A DEVELOPING COUNTRY: ADVANCES, SANTIAGO AGING STUDY (SAS)

Martin MEDRANO, Sergio DIAZ, Carolina MEDRANO, Manuel RAMOS, Lissette OTERO, Juanly RODRIGUEZ (*School of Medicine, Pontificia Universidad Catolica Madre y Maestra, Dominican Rep.*)

Introduction : Sarcopenia is characterized by degenerative loss of skeletal muscle mass and strength associated with aging. A risk factor is frailty syndrome, causing physical disability and mortality in the elderly. Given all this, it is highly important to identify patients in the pre-sarcopenia state in order to develop therapeutic strategies. The Dominican Republic is a developing country and there is no statistical data available of sarcopenia's prevalence in our elderly population. We are reporting data from our Santiago Aging Study (SAS), a longitudinal study of a population-based cohort, wherein we study the profile of aging and its determinants. Method : From SAS's cohort, we analyzed a group of Dominican elders whose ages ranged from 80 years and older. Of 203 participants, 164 qualified for the protocol for sarcopenia evaluation. We based our study on the European Working Group on Sarcopenia in Older People (EWGSOP) criteria, which includes measurement of the muscle mass by bioimpedance, muscle strength by JAMAR's dynamometer, and physical performance by the speed to travel up to 6 meters. Results : 30.5% had sarcopenia. The conceptual stages of sarcopenia was as follows: 12.2% pre-sarcopenia, 28.6% high-grade sarcopenia and 59.2% sarcopenia. Conclusion : In developing countries, sarcopenia prevalence in elders 80 years old or older is high, with rates similar to those of developed countries. Keywords : sarcopenia, developing country

PP25 C-068

FRAILTY, ANTHROPOMETRIC PARAMETER AND DIABETES IN COMMUNITY-DWELLING OLD MALES

Meng-Tzu HOU¹, Pei-Ying WU², Chih-Hsing WU³, Jin-Jon CHEN⁴ (*1. Physical Therapy and Assistive Technology, National Yang-Ming University, Taiwan; 2. Center for Geriatrics and Gerontology, Taichung Veterans General Hospital, Taiwan; 3. Department of Family Medicine, National Cheng Kung University Hospital, Taiwan; 4. Exercise and Health Science Research Center, National Yang-Ming University, Taiwan*)

Introduction : Diabetes mellitus (DM) is a common condition in older persons and has been linked to a lot of healthy problems. Method : The participants are 404 old males (age > 65) living in the rural community. People who are bed-ridden, walking-disability, or poor communication were excluded. All Subject received anthropometric assessment, including measurement of sitting-height, knee-height, arm span, waist circumference, body mass index, and percent body fat. We also collect basic characteristics, such as age, socioeconomic status, and behaviors of lifestyle. We used the modified frailty definition proposed by Fried in 2001. Subjects were reclassified either non-frailty, or pre-frailty or frailty. People has either self-reported DM, or HbA1c? 6.5%, or fasting plasma glucose? 126 mg/dl are defined as DM. Results : The average age is 74.55 ± 6.14 y/o. Of the 404 subjects, 100 (24.8%) subjects are DM. The prevalence of pre-frailty/ frailty in total, NDM and DM group are 41.6%/ 8.7%, 38.6%/ 7.2%, and 50%/ 13%, respectively

($p=0.009$). The prevalence of frailty doubles along with age by every 10-year of age increment. The univariate analysis revealed height, weight, sitting-height, knee-height, arm-span are risk factors and BMI, body fat percentage, habitual drinker, socio-economic status (SES) are negative correlation in NDM. Only age and SES are significant differences in DM group. Multiple-logistic-regression analysis showed that age, HbA1c, and SES are independent risk factors for frailty in total population, but only age is independent factor in DM. Conclusion: The prevalence of frailty is higher in DM than NDM. Frailty is associated with age and DM, but is not associated with anthropometric parameter. Keywords : Anthropometric Parameter, Fasting plasma glucose, Frailty

PP25 C-069

RELATIONSHIP BETWEEN SERUM BRAIN-DERIVED NEUROTROPHIC FACTOR AND PHYSICAL ACTIVITY PATTERNS IN FRAIL ELDERLY WOMEN: A PRELIMINARY STUDY

Miji KIM, Hunkyung KIM, Narumi KOJIMA, Kyoko SAITO, Erika HOSOI (*Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : Physical activity (PA) has been shown to increase circulating brain-derived neurotrophic factor (BDNF) levels in animals. This study investigated the relationship between serum BDNF levels and PA patterns in frail elderly. Method : A cross-sectional analysis was conducted on 109 community-dwelling frail elderly women according to Fried's frailty phenotype (mean age = 80.3 years [SD = 2.7; range = 75-88 years]). Serum BDNF levels were analyzed using the enzyme-linked immunosorbent assay, and Body composition measurements were assessed by dual energy X-ray absorptiometry. Objective PA assessments were obtained over a 1-week period by using a triaxial accelerometer. PA was classified as sedentary time (1.0-1.5 metabolic equivalent units [METs]), light PA (1.6-2.9 METs), moderate PA (3.0-5.9 METs), and vigorous PA (≥ 6 METs); the average time spent on each PA daily was recorded. Results: Univariate correlation analysis showed that serum BDNF levels were associated with percentage of time sedentary ($r = -0.21$, $p = 0.032$), but no significant relationship was observed between serum BDNF levels and light PA ($r = 0.18$, $p = 0.060$) and moderate to vigorous PA ($r = 0.41$, $p = 0.142$). Stepwise multiple regression analysis with serum BDNF levels as the dependent variable and with PA patterns and potential confounding factors as explanatory variables revealed that sedentary time was significantly and independently associated with serum BDNF levels ($\beta = -0.29$, $p = 0.021$). Conclusion: This preliminary study suggests that the proportion of sedentary time is associated with serum BDNF levels, independent of PA, in frail elderly women. Keywords : Brain-derived neurotrophic factor, Physical activity, Frailty

PP25 C-070

NUTRITIONAL SUPPLEMENTATION DURING RESISTANCE TRAINING IMPROVED SKELETAL MUSCLE MASS IN COMMUNITY-DWELLING JAPANESE FRAIL OLDER ADULTS

Minoru YAMADA, Shu NISHIGUCHI, Takanori TANIGAWA, Hiroki KAYAMA, Taiki YUKUTAKE, Tomoki AOYAMA, Hidenori ARAI (*Human Health Sciences, Kyoto University, Japan*)

Introduction : Sarcopenia, the age-related loss of skeletal muscle mass, is highly prevalent in older adults. The aim of this study was to investigate the effects of the combination of resistance training and multinutrients supplementation (including vitamin D and protein) on

muscle mass and physical performance in frail older adults. Method : This trial was conducted in Japanese frail older adults (n=77), which underwent a standardized protocol of a 3-month resistance training intervention. The participants were divided into two groups; exercise + nutritional supplementation group (S/Ex: n = 38) and exercise only group (Ex: n = 39). The outcome measures were the skeletal muscle mass index (SMI) and physical performance. Results : Participants in S/Ex group had significant improvements in SMI and maximum walking time (P<0.05), compared to those in Ex group. The prevalence of sarcopenia decreased from 65.7% to 42.9% in S/Ex group, while that in Ex group remained unchanged (68.6% to 68.6%) (relative risk = 1.60, 95% CI: 1.03-2.49). Conclusion : The results of this study suggest that the combination of resistance training and multinutritional supplementation may be more effective to improve muscle mass and walking speed than resistance training only. Keywords : Sarcopenia, Nutritional supplementation, resistance training

PP25 C-071

FRAILTY SYNDROME AND CARDIOVASCULAR RISK

Larissa Barradas CALADO, Fernanda Pinheiro Amador Dos Santos PESSANHA, Eduardo FERRIOLLI, Julio Cesar MORIGUTI, Nereida Kilza Da Costa LIMA (Clinical Medicine, University of Sao Paulo, Brazil)

Introduction : Older population grows worldwide and geriatric syndromes become more frequent, including frailty syndrome. More recent studies have found relationship between frailty and high blood pressure (BP) and obesity. Method : This was a cross-sectional population study, with the objective to evaluate associations between frailty syndrome and cardiovascular risk factors among older individuals (≥ 65 y) in Ribeirao Preto, Brazil. The sample was randomly by clusters area. This study adopted frailty and pre-frailty criteria according to the definition of Fried et al. and body mass index (BMI), waist circumference (WC) and BP were obtained at home. Results : Were selected 385 volunteers, mean age of 73.9 ± 6.5 years, with prevalence of women. Hypertension was the more prevalent self-reported disease. No difference was observed in systolic or diastolic BP between genders. Men had higher WC, however, 74.3% of women had WC above of the normal level. BMI was 26.6 ± 4.5 Kg/m² for men and 27.7 ± 5.3 Kg/m² for women (p = 0.03). Frail individuals were 9.1% of the sample. WC and BMI was similar in all levels of fragility. There was no difference in systolic and diastolic BP among the 3 groups of frailty. It was observed that there was a strong correlation between BMI and WC in all three levels of frailty, suggesting that WC can be used instead of BMI, when it is difficult to measure height and weight at home. Conclusion : This study found 9.1% of frailty and no association of frailty and higher BMI, WC or BP. Keywords : frailty, cardiovascular risk, older individuals

PP25 C-072

EVALUATION OF FRAILTY, ACCORDING TO THE CRITERIA OF FRIED, IN PATIENTS OVER 75 YEARS IN PRIMARY CARE. COMPARISON OF SUBJECTIVE AND OBJECTIVE SCALES

Flavie GLEIZE, Jadwiga ZMUDKA, Yoann LE FRESNE, Jean-Marie SEROT, Pierre JOUANNY (Geriatrics, CHU Amiens, France)

Introduction : Frailty is a geriatric syndrome, characterizes by a dynamic process of increasing vulnerability favoured by age. Frailty is associated with high risk for falls, disability, hospitalization, and mortality. Our aim was to compare the objective assessment of the frailty to Fried's criteria with subjective assessment perceived by the physician and the patient to identify a screening tool easier. Method :

We performed a descriptive prospective study in patients over 75 years coming consult three general practitioners (GP) during 1 year. Frailty was defined by the presence of three criteria including weight loss, weakness (grip strength), self-reported exhaustion, low physical activity and slow walking speed. Present one or two criteria defined pre-frail patients. GP and patient must evaluate the frailty with a numerical scale ranging from 0 to 10. Results : 64 patients were included: 38 female and 26 male, men age 81.2 ± 5.0 years-old. According to Fried criteria, 10 (15.6%) were frail and 34 (53.1%) were pre-frail. The number of medications, ADL and IADL, CES-D total, energy expenditure, age and grip strength were significantly correlated with frailty. Frailty estimated by GP was correlated with nutritional status, but not with objective frailty. Patient estimated frailty was the most correlated criterion (p = 0.0313). Conclusion : Fried tool is difficult to implement in primary care. Subjective fatigue of the patient seems to constitute an interesting approach for simple screening tool in general practice to allow early treatment and delay progression to dependence. Keywords : frailty, assessment, primary care, elderly, fatigue

PP25 C-074

PREVALENCE OF SARCOPENIA AND ITS RELATION TO BODY COMPOSITION, PHYSIOLOGICAL FUNCTION, AND NUTRITIONAL STATUS IN COMMUNITY-DWELLING FRAIL ELDERLY PEOPLE

Tomohiko KAMO, Yuusuke NISHIDA (Rehabilitation Sciences, Seirei Christopher University, Japan)

Introduction : Patients with sarcopenia experience an impaired state of health with various comorbidities, including mobility disorders, increased risk of falls and fractures, impaired ability to perform activities of daily living, and other disabilities. The prevalence of sarcopenia differs with population, age, and gender. The aim of this study was to assess the prevalence of sarcopenia and its association with functional and nutritional status in community-dwelling frail elderly people. Method : Seventy-two community-dwelling frail elderly individuals (55 women) above the age of 75 years were included in the study. The European Working Group on Sarcopenia in Older People (EWGSOP) criteria were adopted. Accordingly, sarcopenia was diagnosed in cases with documented low muscle mass and either low muscle strength (grip strength) or low physical performance (short physical performance battery [SPPB]). We also assessed the participants' nutritional status (MNA), mental state (MMSE), and daily activities (Barthel Index [BI]). Results : Sarcopenia was diagnosed in 26 participants (36.6%). MNA score in elderly people with sarcopenia was significantly lower than that in those without sarcopenia (19.8 ± 2.9 vs. 24.6 ± 2.4 , p < 0.0001); similarly, BI score in participants with sarcopenia was significantly lower than that in those without sarcopenia (74.8 ± 24.8 vs. 87.8 ± 17.7 , p < 0.05). SPPB score and MMSE score were not significantly different between the participants with sarcopenia and those without sarcopenia. Conclusion : The prevalence of sarcopenia was high in community-dwelling frail elderly people. Sarcopenia was associated with low nutritional status but not with functional status and cognitive status. Keywords : sarcopenia, nutritional status, functional status

PP25 C-075

CHALLENGES AND STRATEGIES TO IMPROVE RECRUITMENT AND RETENTION OF THE FRAIL ELDERLY IN RESEARCH STUDIES: A SYSTEMATIC REVIEW

Veronique PROVENCHER¹, Ben MORTENSON², Marion DAGENAIS³ (1. Rehabilitation Department, Universite Laval,

Canada; 2. Gerontology Research Centre, Simon Fraser University, Canada; 3. School of Rehabilitation, Université de Montréal, Canada)

Introduction : More research is needed to address the complex needs of a growing number of frail older adults. However, recruitment and retention of these individuals in research studies remains a challenge. Our objective was to identify the challenges and strategies to improve recruitment and retention of the frail elderly in research studies. **Method :** A systematic review was conducted. Four databases (MEDLINE, CINAHL, AgeLine and Embase) were searched from 1992 to March 2012. Empirical studies were included if they explored barriers or strategies for recruitment or retention of adults aged 65 and older who were identified as frail, vulnerable or housebound. Two researchers independently determined eligibility of each abstract reviewed, and assessed the methodological quality of the included studies. Data about challenges (type and impact) and strategies used (type and effectiveness) were abstracted. **Results :** Of 805 articles retrieved from the searches, 13 met study inclusion criteria. Most studies reviewed had poor to fair methodological quality. Lack of perceived benefit, distrust of research staff as well as transportation problems were identified as common challenges. The most frequently reported strategy used was to establish partnership with community staff that participants known and trusted. However, few studies measured the impact of specific strategies' on recruitment or retention rates. **Conclusion :** The review highlights the need to develop innovative recruitment and retention strategies that target frail older adults. The use of incentives, proven as an effective means to increase the participation, may improve the generalizability of the research findings for this population. **Keywords :** Frailty, recruitment, systematic review

PP25 C-076 COMMON CAUSES OF HOSPITALIZATION OF OLDER PEOPLE WITH FRAILITY

Wei-Ju LEE¹, Liang-Kung CHEN², Ya-Fang ZENG³, Chiu-Jung YUAN³, Tzuo-Yun LAN³ (1. Division of Geriatrics and Gerontology, Taipei Veterans General Hospital Yuashan Branch National Yang-Ming University, Taiwan; 2. Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taiwan; 3. Institute of Hospital and Health Care Administration, National Yang-Ming University, Taiwan)

Introduction : Frailty is defined as an at-risk condition that increases the vulnerability of older people to falls, disability, institutionalization, hospitalization and mortality. However, little was known regarding to the medical utilization of frailty among older adults. **Method :** Data of a random cohort of 1 million people from Taiwan's National Health Insurance in 2005-2006 were obtained for this study. Data of people aged over 65 years were retrieved for this study, and frailty was defined according to the Johns Hopkins Adjusted Clinic Groups (ACG) system. Main diagnoses of frailty-related hospital admissions were categorized by using of the Clinical Classification Software of the Agency for Healthcare Research and Quality. **Results :** Overall, 2,102 old adults (mean age: 79.4±7.4 years, 55.5% female) with frailty were identified by ACG from the dataset. During the study period, 821 subjects (mean age: 80.8±7.1 years, 48.9% women) with 1791 episodes of hospitalizations occurred, and the mean hospital length of stay was 16.7±54.5 days with the mean hospital expenses of 74,484±98,914 NTD. The leading causes of hospitalizations were 'Diseases of the respiratory system' (32%), 'Diseases of the genitourinary system' (12%), and 'Diseases of the circulatory system' (11%). In terms of disease entities, pneumonia, respiratory failure, cerebral infarct and hip fracture all common diagnoses. **Conclusion :** Results of this study showed that older people with frailty were at a higher risk of

hospitalizations with longer hospital length of stay, and pneumonia was the leading cause of hospitalizations. Further investigation is needed to explore the impact of frailty on health care outcomes and medical utilization. **Keywords :** frailty, hospitalization, discharge diagnosis

PP25 C-077 FITNESS AND FRAILITY IN OLD PREVENTIVE HEALTH SERVICE USERS IN TAIWAN

Yaw-Wen CHANG, Tung-Wei KAO, Wen-Hui FANG (Family Medicine and Community Health, Tri-Service General Hospital, National Defense Medical Center, Taiwan)

Introduction : The study aimed to investigate the prevalence and frailty status and the functional fitness performance in old preventive health service users in Taiwan. **Method :** It was a cross-sectional study and people aged 65+ years who visited a medical center in Taipei City from March to August in 2011 for an annual routine check-up were eligible. Frailty status was determined according to the Fried frailty criteria. Functional fitness was assessed with Senior Fitness Tests including chair stand, sit reach, arm curl, back scratch and up-and-go. The fitness score was generated from sum of individual performance which was scored as -1 (below average), 0 (normal range) and +1 (above average) according to the normative data provided by Rikli and Jones. **Results :** A total of 322 eligible elderly adults with a mean age of 74.7±6.3 years were enrolled. The prevalence of prefrailty and frailty was 40.7% and 4% (3.6% in men, 4.3% in women). The mean fitness score in men and women were -0.26±1.98 and 0±1.90. The fitness score is higher in robust group (0.35±1.83) than in prefrail group (-0.46±1.79, p<0.001). **Conclusion :** The prevalence of frailty was relatively low in old preventive health service users. The performance of functional fitness in frail group is significant worse than robust group. Deterioration of fitness in old people might be an early sign of transition between frailty states. **Keywords :** frailty, fitness, preventive health service

PP25 C-078 VITAMIN D STATUS AMONG BELGIAN GERIATRICIANS

Hilde BAEYENS¹, Jean-Pierre BAEYENS², Julien DEKONINCK³, Peter DESMET⁴ (1. Geriatrics, General Hospital, Az Alma, Belgium; 2. Geriatrics, University of Luxembourg, Luxembourg; 3. Geriatrics, University Hospital Ugent, Belgium; 4. Geriatrics, General Hospital, az alma, Belgium)

Introduction : Geriatricians are aware of the low vitamin D status of their patients and their negative impact on quality of life. Too often, they fail to implement this guideline. On behalf of the council of the Belgian Society of Geriatrics and Gerontology (=BVG), we decided to measure the vitamin D status of attending geriatricians of the 34 th Wintermeeting BVGG, Ostend on 24 feb 2011. A second measurement took place in 2012. **Method :** 80 (2011) and 46 (2012) geriatricians participated voluntarily. The results were blinded and pooled. After the meeting the results were individually sent to the participants. **Results :** In 2011, 68,75 % of the participating geriatricians demonstrated vit D level below of 20 ng/ml (= <50 nmol/l). Only 13,75 % of the geriatricians had a vit D level > 30 ng/ml (=75 nmol/l), 30 % of them taking a vit D supplement. In 2012 22% of geriatricians had a vit D level > 30 ng/ml (=75 nmol/l). Only 43 % had a level below 20 ng/ml (= <50 nmol/l). 43 % of geriatricians were taking a vitamin D supplement. **Conclusion :** Vit D level status in 2011 among active geriatricians was unexpectedly low. This shocking results were presented at the Wintermeeting 2011. In 2012, geriatricians take more vit D supplements and their vit D level is

higher, suggesting that they were awakened by their individual vit D level. Since 2011, more vit D has been prescribed to elder person in Belgium, according to the organization of pharmacists. We hope that the sensitisation of Belgium geriatricians led to higher supplementation ratio for the elder people. Keywords : vitD belgian geriatricians

VITAMIN D SUPPLEMENTATION IN NURSING HOME RESIDENTS : MISSION IMPOSSIBLE ?

Hilde BAEYENS¹, Jean-Pierre BAEYENS², Julien DEKONINCK³, Peter DESMET⁴ (1. Geriatrics, General Hospital, Az Alma, Belgium; 2. Geriatrics, University of Luxemburg, Belgium; 3. Geriatrics, UZ Gent, Belgium; 4. Geriatrics, Az Alma, Belgium)

Introduction : It is generally accepted that nursing home residents in Northern-Europe have a poor vitD (=vitamin D) status. Emerging evidence reveals that vitD has multiple end-organ receptors. In this way, it influences quality of life. As VitD status can be used as a marker of quality of care, we evaluated the adherence to treatment guidelines for vitD inadequacy in our region. Method : We asked for voluntary participation of CRA (=coordinating GP) of collaborating nursing homes with our regional hospital az alma. Each CRA had to ask the pharmacist the number of nursing home residents who got a supplement of vitD at a given moment. These results were blinded and related to the total number of residents in each nursing home. A supplementation ratio could be calculated. This ratio was calculated three times : the first time on 01/02/2010, the second time on 01/12/2010 and the third time on 1/1/2012. Results : On the first measurement (01/02/2010, N=12 nursing homes, 1183 nursing home residents) the global supplementation ratio was low : 24,3 %. Variation between nursing homes was high : 8,6% and 61,3 % (median 23,50 %). On the second measurement, (01/12/2010, N=11 nursing homes, 1085 nursing home residents) the global supplementation ratio augmented significantly to : 42,8 %. The lowest ratio 21,4% and the highest ratio 70,3 % (median 39,9 %). On 01/09/2012 at the third measurement, 15 nursing homes participated (n=1532 residents). The supplementation ratio rose to 57,6%, with median of 58,1 %. Conclusion : Improving vitD status among nursing home residents is possible, but needs urgent and continued action by CRA and nursing homes. Keywords : Improving vitD status

THE MOTOR UNIT NUMBER INDEX (MUNIX) IN SARCOPEMIC PATIENTS

Michael DREY¹, Clara GROSCH¹, Christoph NEUWIRTH², Jurgen BAUER³, Cornel Christian SIEBER¹ (1. Institute for Biomedicine of Aging, University of Erlangen-Nurnberg, Germany; 2. Neuromuscular Diseases Unit / ALS clinic, Cantonal Hospital St.Gallen, Germany; 3. Geriatric Centre Oldenburg, Klinikum Oldenburg, Germany)

Introduction : The cause of sarcopenia is still not fully understood. A multifactorial aetiology is discussed. Neurodegenerative aspects in the genesis of sarcopenia, such as loss of motoneurons, have not yet been explored to a sufficient extent. Method : The Motor Unit Number Index (MUNIX) is a method for assessing the number and size (Motor Unit Size Index - MUSIX) of Motor Units (MUs) using the Compound Muscle Action Potential (CMAP) and the Surface electromyographic Interference Pattern (SIP). This method was used to study the hypothenar muscle in the right hand of 27 sarcopenic patients. Results: The mean MUNIX (111) of all investigated sarcopenic patients lies between the mean MUNIX of healthy persons and the mean MUNIX of ALS patients. 25% of sarcopenic patients exhibit pathologic values

for both MUNIX (<80) and MUSIX (>100µV). A strong correlation (r=0.75, p<0.001) between MUSIX and the reciprocal value of MUNIX was identified. Conclusion : It was demonstrated for the first time by applying the MUNIX technique that loss of motoneurons plays a pathogenic role in the onset of sarcopenia. This was shown in 25% of sarcopenic participants who exhibited pathologic values for both MUNIX and MUSIX. Nerve sprouting seems to be an important mechanism of compensation for loss of motoneurons, reflected by the strong correlation between MUNIX and MUSIX. Use of MUNIX leads to the identification of a distinct subgroup of sarcopenic patients, which might have a major impact on future therapeutic concepts. Keywords : Sarcopenia, Motoneuron, MUNIX
