ICFSR 2014

International Conference on Frailty & Sarcopenia Research

Implementing frailty and sarcopenia into clinical practice

Thursday 13th & Friday 14th March, 2014 Barcelona, Spain

Frailty:

- Biology of frailty and aging
- Physical frailty and age-related body composition modifications
- Cognitive frailty
- Frailty in clinical practice and public health
- Clinical trials and therapeutics

Sarcopenia:

- Biology
- Animal models
- Preclinical studies
- Clinical trials
- Functional assessment
- Biomarkers and imaging
- New drug developments
- Physical exercise
- Nutrition intervention
- Epidemiology

Meeting Place:
Hospital de la Santa Creu i Sant Pau

under the auspices of

The 21st IAGG World Congress of Gerontology and Geriatrics

Global Aging and Health: Bridging Science, Policy, and Practice

The International Association of Gerontology and Geriatrics holds its World Congress every four years in different countries all over the world. As one of the most highly acclaimed meetings in the field of aging, The 21st IAGG World Congress of Gerontology and Geriatrics, IAGG 2017, will be held in the place known as “Everybody’s Favorite City” — San Francisco. Famous for scenic beauty, cultural attractions, diverse communities, and world-class cuisine, San Francisco’s landmarks include the Golden Gate Bridge, cable cars, Fisherman’s Wharf, Alcatraz, Union Square, North Beach, the Castro district, Mission Dolores, and the largest Chinatown in the United States.

Visit iagg2017.org and sign up to receive future IAGG 2017 news.

THE 20TH IAGG WORLD CONGRESS OF GERONTOLOGY AND GERIATRICS

H.B. CHA

President of the 20th IAGG World Congress of Gerontology and Geriatrics, President-elect of International Association of Gerontology and Geriatrics

I take great pleasure in welcoming you to the 20th IAGG World Congress of Gerontology and Geriatrics to be held from June 23 to 27, 2013 at COEX in Seoul. Many people like to refer to this event as the Seoul Gerontology Olympiad because it has been held every four years on the five Continents with the view of providing an opportunity for researchers, educators, practitioners and students in the area of gerontology and geriatrics with the results of the research they have worked on with hard effort for the last four years. Just as the best players from across the world compete with each other in the Olympic Games under the watchful eye of the people of all nations, a great number of professionals and specialists of gerontology and geriatrics will produce and supply precious knowledge and wisdom regarding the matter of ageing to the world through this academic festival.

The International Association of Gerontology and Geriatrics (IAGG), the official host of the Congress, was established in 1950 in Belgium. IAGG's mission is to promote the highest levels of achievement of gerontological research and training worldwide in order to promote the highest quality of life and well-being of all people as they experience ageing at individual and societal levels. Since the 1st World Congress in Belgium in 1950, the event has been held mostly in Europe or America. We have high expectations for the Seoul Congress, for it is an event of great significance which will happen for the second time in the Asian region since the 11th World Congress which was held in Tokyo in 1978.

We anticipate a total of 5,000 researchers, educators, practitioners and policy makers in the field of gerontology and geriatrics from more than 90 countries all over the world to participate in the Congress and release some 4,000 papers covering almost all the disciplines and topics involving older persons and ageing such as how we can age well, how we can manage age-related diseases and how we see the global population ageing.

On top of these academic issues, the Congress will also provide space for the exhibitions concerning the way of life in old age and a program for participants to make personal visits to institutes, hospitals, nursing homes and welfare facilities for the aged.

We expect the Seoul Congress to contribute immensely to the academic research, policy-making and industrial development in the field of gerontology and geriatrics thanks to its magnitude and diversity.

Firstly, the Seoul Congress will greatly enrich and enhance the quality of life of older persons by providing a wide spectrum of knowledge on health care, economic life, social participation and family life, etc across the world by releasing the results of numerous studies on ageing and older persons.

Secondly, the Seoul Congress will offer an effective guideline for all nations in the world to address global population ageing, which has now become one of the most urgent issues mankind of the 21st century has to cope with together with the problem of climate change and global poverty. It will highlight the necessity of a new paradigm for population ageing by presenting a positive image of older persons.

Thirdly, the Seoul Congress will play its role fully as the consultative body to the UN by opening a forum for the discussion of global issues such as elder abuse and age-friendly city environments among the experts and specialist concerned.

Fourthly, the Seoul Congress will contribute to the development of the age-friendly industry around the world. The production of knowledge and information in the field of health care, economic life and social services for the aged will lead to the development of related industry. The increase in the aged population, combined with the increase in the demand for a variety of social services for the aged, will eventually contribute greatly to the continued growth of the economy as well.

NORTH AMERICA IS PLEASED TO WELCOME ALL TO THE 2013 IAGG WORLD CONGRESS

T.C. ANTONUCCI

Chair North American Regional Committee of IAGG, University of Michigan, Ann Arbor, MI, USA

It is a pleasure to be a part of this XXth IAGG World Congress and to welcome you to the Seoul Meeting. The IAGG and the World Congress is committed to enhancing the highest quality of life and well-being of all people as they experience ageing at individual and societal levels. We are grateful to our hosts Professor Cha and his committee for their hard work and the wonderful Congress they have put together. The theme Digital @ging is an exciting one. The breadth and diversity of topics and the quality of the speakers will provide a dynamic and informative Congress for all. We wish you a pleasant, educational and productive experience at the World Congress and in South Korea.

As the world becomes increasingly aware of the challenges presented by the changing shape of the human population, we will mutually benefit from the internationally recognized scholarship of IAGG members. At the same time, the occasion of our South Korean meeting permits us to look to the future, appreciate the multiple faces of aging, and recognize the importance of both the needs and abilities of our aging society. North Americans will willingly share their knowledge of aging and are anxious to learn from our colleagues in other parts of the world, especially South Korea.

The North American Regional Committee (NARC) includes three interdisciplinary societies: The Gerontological Society of America (founded in 1945); The Canadian Association on Gerontology (founded ~ 1970) and The Canadian Geriatric Society (founded in 1981). Each of these societies is well represented at these meetings. NARC and our member societies are strongly committed to the advancement of students. Through various programs and sponsorships we were able to offer special travel awards for students to attend the meeting. We expect a strong presence of students from North America at the Seoul World Congress and are committed to

providing significant mentorship experiences for all students attending the conference.

There are a number of pressing concerns noted by members of NARC. These include unique issues related to immigration in North America. Many other regions of the world are experiencing out migration, whereas the US and Canada face in-migration and the consequent issues of cultural and economic assimilation. These are especially critical if and when there are generational differences in cultural experiences and expectations. Another area of concern is the challenges we face as an aging society, not only in terms of individual differences in aging and longevity but also in terms of what it means to have a society with a different age structure, e.g., a work place that includes three to five generations of workers; or a built environment that must include universal design specifications so as to meet the needs of the young and old, the healthy, frail and disabled; as well as the needs of a society facing climate change, energy conservation, and pollution. And finally, we are strongly committed to assuring that there will be a well-trained next generation of gerontologists and geriatricians to meet the challenges we are facing.

The North American Regional Committee is pleased to note that several outstanding North American scholars are represented among the Keynote Addresses and Presidential Symposia. We also bring to your attention the special interest group meeting of the Global Social Initiative on Aging, a unique, recently formed group and core activity of IAGG focusing on social aspects of aging.

On behalf of all members of the North American Region of IAGG, I would like to add my welcome to this XXth World Congress on Gerontology and Geriatrics. I look forward to seeing you here in Seoul and in San Francisco in 2017.

JAMDA

Journal of the American Medical Directors Association

Long-Term Care: Management Applied
Research and Clinical Issues

**Increased for the fourth
year in a row!**

Journal of the American Medical Directors Association (JAMDA) is one of the top peer-reviewed journals with practical information and research immediately applicable to the long-term care setting.

Ranked 4th in the Geriatrics & Gerontology category*, *JAMDA* emphasizes original, evidence-based articles that enable medical directors and other long-term care practitioners to proactively improve patient care, address emerging clinical issues, devise evidence-based policies and achieve regulatory compliance.

The Journal provides comprehensive coverage of issues with the greatest relevance to the long-term care setting, including disease processes, medications, infection control, syndromes, assessment techniques, and interventions. Features include Editorials, Original Studies, Controversies, Case Reports, Quality Improvement, Reviews, and Clinical Experience.

In addition to medical directors, *JAMDA* is an indispensable resource for attending physicians, consultant pharmacists, directors of nursing, nurse practitioners and geriatric psychiatrists.

Articles available ahead of print on jamda.com accelerate the exchange of intellectual information by publishing content before it appears in the print journal.

Find out how you can receive *JAMDA* as a free member benefit of the American Medical Directors Association (AMDA). Visit the Association at amda.com.

PREPARING FOR THE 20TH IAGG WORLD CONGRESS

H.J. YOO

The Scientific Committee Chairman of the 20th World Congress of Gerontology and Geriatrics. Professor, Department of Internal Medicine (Endocrinology & Geriatrics), Kangnam Sacred Heart Hospital, Hallym University College of Medicine, Korea

Dear Colleagues,

First of all, I welcome all of you to participate in the 20th IAGG World Congress of Gerontology and Geriatrics in Seoul. As Chair of the Scientific Committee of the Congress, I would like to express my sincere gratitude for your cordial concerns and contributions for the success of the Congress.

The world has been experiencing population aging at a much faster rate than ever in recent days, resulting in such serious problems in every aspects of society, such as medical, economic, cultural, etc., which have never even existed before.

Under these circumstances, the Congress, where about 5,000 professionals all over the world gather and about 4,000 papers are presented, is the very right place to share the latest academic findings, and further suggested directions and visions to enhance quality of life and values of older persons. Especially because the quality of human life in this century is strongly influenced by information technology, the Organizing Committee of the Congress decided the main theme as 'Digital Aging: A New Horizon for Health Care and Active Aging', and the ideal will be embodied through a variety of ways including scientific programs.

We, the Scientific Committee, have prepared not only the classical and usual programs like keynote lectures, presidential

symposia, oral & poster presentations, workshops embracing every fields of Gerontology and Geriatrics, but also some distinguished programs, handling the newest issues related to an ageing society. They include a roundtable discussion on 'Population Ageing and the Economic Growth', and a workshop on 'The Human Rights of Older Persons', one of the United Nations' main concerns at the moment. Simultaneously, some programs are prepared to explore and strengthen network and companionship between IAGG members, and give our devoted colleagues honor and respect. The Gary Andrews Memorial Symposium and the Busse Award Ceremony & the Awardees' Lectures are part of those.

I am very confident that we would make meaningful scientific progress through sharing a variety of studies & views on all the fields of Gerontology and Geriatrics during the Congress. Again, all your strong participations in the scientific programs are definitely appreciated.

Finally, I express my heartfelt thanks for the active supports of the IAGG Headquarters, the Federation of Korean Gerontological Societies, and the Congress Sponsors. Also, I cannot thank all my colleagues of the Scientific Committee enough for their great deal of precious contributions and efforts to prepare for the Congress.

The Journal of Frailty & Aging

Please consult : <http://www.jfrailtyaging.com>

The Journal of Frailty & Aging is a peer-reviewed international journal aimed at presenting articles that are related to research in the area of aging and age-related (sub)clinical conditions. In particular, the journal publishes high-quality papers describing and discussing social, biological, and clinical features underlying the onset and development of frailty in older persons. The Journal of Frailty & Aging is composed by five different sections :

- **Biology of frailty and aging:** In this section, the journal presents reports from preclinical studies and experiences focused at identifying, describing, and understanding the subclinical pathophysiological mechanisms at the basis of frailty and aging.
- **Physical frailty and age-related body composition modifications:** Studies exploring the physical and functional components of frailty are contained in this section. Moreover, since body composition plays a major role in determining physical frailty and, at the same time, represents the most evident feature of the aging process, special attention is given to studies focused on sarcopenia and obesity at older age.
- **Neurosciences of frailty and aging:** The section presents results from studies exploring the cognitive and neurological aspects of frailty and age-related conditions. In particular, papers on neurodegenerative conditions of advanced age are welcomed.
- **Frailty and aging in clinics and public health:** This journal's section is devoted at presenting studies on clinical issues of frailty and age-related conditions. This multidisciplinary section particularly welcomes reports from clinicians coming from different backgrounds and specialties dealing with the heterogeneous clinical manifestations of advanced age. Moreover, this part of the journal also contains reports on frailty- and age-related social and public health issues.
- **Clinical trials and therapeutics:** This final section contains all the manuscripts presenting data on (pharmacological and non-pharmacological) interventions aimed at preventing, delaying, or treating frailty and age-related conditions.

The Journal of Frailty & Aging is a quarterly publication of original papers, review articles, case reports, controversies, letters to the Editor, and book reviews. Manuscripts will be evaluated by the editorial staff and, if suitable, by expert reviewers assigned by the editors. The journal particularly welcomes papers by researchers from different backgrounds and specialties who may want to share their views and experiences on the common themes of frailty and aging.

The Journal of Aging Research and Clinical Practice

Please consult : <http://www.jarcp.com>

The aims of the new journal is to connect more closely research on aging and clinical practice in several fields including Alzheimer's disease, memory and physical decline, sarcopenia, nutrition, and other age-related diseases or syndromes. Our aging population is growing fast, mostly in new emerging countries from Asia, South America and Africa. In the next few decades, these regions will need to benefit from all that has already been accomplished during the last century in Northern America and Western Europe. The Journal of Aging Research and Clinical Practice (J.A.R.C.P) is a new initiative of the IAGG (International Association of Gerontology and Geriatrics), and of the GARN (IAGG's Global Aging Research Network), dedicated to latest findings and clinical experiences in the fields of aging, gerontology and geriatrics.

EDITORIAL

ASIA/OCEANIA WELCOME ALL TO THE 2013 IAGG WORLD CONGRESS

P. DU

Chair, Asia/Oceania Regional Committee of IAGG; Institute of Gerontology, Renmin University of China

On behalf of the Asia/Oceania Regional Committee of IAGG, we are pleased to welcome all to participate in the 2013 IAGG Congress in Seoul. It is a great opportunity for the participants to exchange the latest research findings of gerontology and geriatrics and good practice experiences on services to the older persons. I believe the congress will play a very important role to promote the development of gerontology and geriatrics as well as the international collaborations both in the region and the world. The 2013 IAGG congress is the third one hosted in the region (after Japan and Australia) and the first one in the new century, we are pleased that our member association has the honor to host it and the large number of participants from the region will benefit the most from the regional perspective. We would like to thank Professor Cha and his committee for their various efforts to encourage and enable more participants from the region as well as the other regions to attend the congress, share their thoughts and to make the congress a great success.

The Asia/Oceania region is the home of more than half (56 per cent) of the world's older persons and most of the countries in the region have been experiencing rapid population ageing. By the year 2050, 62 per cent of the world's older persons will be living in the region, therefore ageing issues and ageing studies have gained unprecedented importance and attention. The Asia/Oceania region is also very diverse on a developmental level and culture. Some ageing issues are common challenges faced by both developed and developing countries in the region, such as dementia, long-term care, productive ageing, declining fertility, social security system

reform etc., and some are the key challenges for developing countries in the process of economic development and social transformation from the traditional family support system to the modern society, such as the international and domestic migration, family role in the care of older persons, changing intergenerational relationships, training of the service professionals, rapid urbanization and inequality amongst the older persons. The 2013 IAGG congress have many symposiums and presentations relevant to these research and practice, and will provide a wonderful chance to exchange ideas and experience, to promote more creative policies to enhance the quality of life of the older persons.

Comparing to the huge number of older persons and their increasing needs in the region, Asia/Oceania still needs to make greater efforts to promote the education and research on gerontology and geriatrics as well as the practice of services and care of older persons. We appreciate the strong support of IAGG in the past two years to run 3 Master Classes in Taipei, Hong Kong and Beijing, to enhance the capacity of junior researchers in gerontology and geriatrics. The Asia/Oceania region has also paid lots of attentions to the new generation of researchers and practitioners; we have run several training programs and plan to launch the Gary Andrews Academy for the promotion of training and education of gerontology and geriatrics in the region.

May you enjoy the academic activities in the 2013 IAGG congress as well as the rich Korean culture and find some time to visit the neighboring countries in the region. We look forward to seeing you in Seoul.

1st independent French pharmaceutical company

1st independent French pharmaceutical company. Over 20 000 employees. Nearly 3 000 researchers preparing the drugs of the future. 25 % of turnover invested in Research and Development. 44 new chemical entities currently under development in the following therapeutic fields: cardiovascular diseases, central nervous system and psychiatry, cancer research, diabetes and metabolism, and rheumatology. Present in 140 countries over 5 continents. 92 % of SERVIER'S medicines are prescribed internationally. A turnover of 3.9 billion euros for 2012. BRIDGING THE GAP BETWEEN RESEARCH AND POLICY MAKING

V. KHAVINSON

IAGG-ER President; Russia

Integration and participation of older persons in society are important elements in realizing a society for all ages. How to reach it? Through digital ageing, in particular. It may improve everyday life of seniors, who constitute the most vulnerable group of population. Availability of related information is crucial for them and could support their independence, confidence and dignity. In this context the theme of the 20th World Congress on Gerontology and Geriatrics in Seoul is very timely.

Population ageing and disequilibrium between the younger and older generations are the most important consequences of the demographic transition, and most inevitably influence the strategy and implementation of national health and social programs.

Europe is getting older and Europeans are living longer than ever before, nearly 10 years more than in 1960. Increased longevity is a great achievement and a great challenge. It is our task (those finest gerontological minds from all over the world who meet in Seoul) to turn challenges into opportunities and to make the most of the chances offered by the scientific community.

Thirty seven National Gerontological Societies in IAGG's European region work together to raise the awareness about the enhancing the potential of older persons for the benefit of our societies and to increasing their quality of life by enabling their participation in social and economic development. The 2012 European Year for Active Ageing and Solidarity between Generations has been very instrumental for exchange of knowledge, practice and policy experience.

The Vienna Research Forum participants who came together to contribute to the UNECE Ministerial Conference on Ageing in September 2012 unequivocally supported the implementation of the Madrid International Plan of Action on

Ageing in the region and recognized that researchers and research institutions "...have a special responsibility to share the scientific analysis of ageing and its implications with the rest of the world".

To this end, the Executive Board of IAGG's European region called all European National Gerontological Societies to present their chapters on the background, history and achievements on the national levels to be a part of the historic book on the development of gerontology in Europe which is going to see the light by the forthcoming IAGG European Congress in 2015 that will take place in Dublin (Ireland). As a first step, a special issue of the *Journal of Biogerontology* was issued on the occasion of the 7th European Congress of IAGG in Bologna in 2011. It contains articles presented by the National European Gerontological Societies and provides an overview of the state of research in biogerontology in various countries in Europe.

Research and knowledge dissemination may help in designing appropriate policy responses.

Involvement of all key stakeholders and experts including policy makers, research institutions, civil society, business sector, older people themselves in analyzing and implementing research findings can contribute to the sustainable national and cross-national programs. It will help to bridge the gap between policies and research. Such an exchange of knowledge, practice and policy experience among major stakeholders on ageing is most valuable.

On behalf of the IAGG-ER Executive Board, I would like to welcome all participants, hosts and guests at the 20th World Congress on Gerontology and Geriatrics and wish fruitful and stimulating deliberations in the beautiful and powerful city of Seoul.

International Research Conference Nursing Home

Friday 22nd & Saturday 23rd November, 2013
St. Louis, Mo, USA

www.nursing-home-research.com

SPONSORED BY INTERNATIONAL ASSOCIATION OF GERONTOLOGY & GERIATRICS • GLOBAL AGING RESEARCH NETWORK • SAINT LOUIS UNIVERSITY – USA

**The conference will be held at Saint Louis University, Tegeler Hall,
3550 Lindell Blvd. St. Louis, MO 63103**

Despite the increase of both the aging population and the number of institutionalized older people, clinical research in nursing homes is still scarce. Research is, however, essential to improve the quality of care in the nursing homes. The improvement of the quality of care in the nursing home will rely on future evidence from researches performed in these settings, their feasibility in real life conditions and the successful dissemination of these new clinical evidences. The International Research Conference Nursing Home offer an opportunity to learn and share ideas, and promote current knowledge among researchers in the field of nursing home care.

The international Research Conference Nursing Home will focus on :

- Research in the nursing home
- Hospitalizations in the long-term care population
- Pressure ulcers in the nursing home
- A multicentric individually-tailored controlled trial of education and professional support to nursing home staff.
- What should be the optimal staff organization in nursing home?
- Depression in the nursing home
- Transitions between nursing and hospital
- Clinical update on nursing home medicine
- Neuropsychiatric symptoms and Psychotropic drug prescription in nursing home patients
- Cognition-based psychological interventions
- End-of-life care in the nursing home
- Delirium in nursing home

Call for abstracts:

AFRICAN GERONTOLOGY AND GERIATRICS: STRIDES AND CRUCIAL NEXT STEPS

I. ABODERIN

Senior Research Scientist, African Population and Health Research Center, Nairobi, Kenya; Senior Research Fellow, Oxford Institute of Population Ageing, University of Oxford, UK;
Regional Chair for Africa, International Association of Gerontology and Geriatrics

Africa features more prominently in the affairs of the International Association of Gerontology and Geriatrics (IAGG) than it has ever before. The formal establishment of an IAGG Africa region at the last IAGG World Congress in Paris in 2009, spurred the formation of new National Societies of Gerontology and Geriatrics in three African countries - Kenya, Senegal and Nigeria, and the forging of research and capacity building initiatives in the continent as part of the IAGG Global Social Initiative on Ageing (GSIA).

The perhaps most prominent development was a landmark 1st IAGG Africa Region Conference of Gerontology and Geriatrics, held 17-20 October 2012 in Cape Town, which brought together close to 400 researchers, policy makers, practitioners, and civil society and private sector role players from 21 countries across Africa and a further 20 beyond.

The remarkable spectrum and quality of evidence presented and the discussions generated in the conference, signaled clearly that research and policy debate on ageing in Africa have finally reached a point of inflection -- more than 30 years after they first emerged. We now have a considerable understanding of many key dimensions of ageing in the continent and of necessary responses to them, including:

- The crucial ways in which older people care for younger generation kin, and act as agents of stability and positive change in contexts of poverty, HIV and migration.
- The living circumstances, family relations of- and support for older persons, as well as the patterns and causes of ill-health, social exclusion, abuse and poverty in old age in both rural and urban settings.
- Types of models that work in providing institutional and community-based long-term care, as well as medical treatment for older people, including those with dementia.

- Systematic adaptations needed to African health and social protection systems to ensure income security and access to services in old age.
- Frameworks and approaches needed to safeguard older persons' human rights.
- Mechanisms for robust, policy relevant national data generation

Building on the tremendous strides made, the time is now ripe for a next, crucial step for African Gerontology and Geriatrics. This is to connect much more explicitly than hitherto, with the international debate and scientific community in the field – and in so doing to deepen our understanding of ageing, globally.

In terms of science, this means above all a more direct use, critical interrogation and even refinement of existing (mostly western) theories and conceptual perspectives in the quest to fully grasp the realities of old age in Africa.

Enhanced engagement with the wider academic community requires more substantive debate and a forging of comparative perspectives between African scholars and those from other parts of the globe.

The Cape Town conference stimulated the beginnings of such exchange. The forthcoming 20th IAGG World Congress of Gerontology and Geriatrics in Seoul promises to provide an effective platform and catalyst for expanding it. The greatest ever presence of African speakers and delegates at an IAGG congress – made possible by the generous and active support of the Organizers – augurs well. If harnessed it should yield many opportunities for forging connections that will advance both the African– and the Global endeavour on ageing in coming decades.

JNHA-Journal of Nutrition, Health and Aging

There is increasing scientific and clinical interest in the interactions of nutrition and health as part of the aging process. This interest is due to the important role that nutrition plays throughout the life span. This role affects the growth and development of the body during childhood, affects the risk of acute and chronic diseases, the maintenance of physiological processes and the biological process of aging. A major aim of «The Journal of Nutrition, Health & Aging» is to contribute to the improvement of knowledge regarding the relationships between nutrition and the aging process from birth to old age.

LATIN AMERICA AND CARIBBEAN REGION WELCOMES THE WORLD TO THE IAGG WORLD CONGRESS IN SEOUL

J.R. JAUREGUI

Chair, Latin America & Caribbean Region, International Association of Gerontology and Geriatrics, Internal Medicine Department, Geriatric Branch Consultant, Hospital Italiano de Buenos Aires, Argentina

Longevity and Digital development may be regarded as one of the successes of the contemporary world. Yet despite advances in our knowledge of geriatrics and gerontology, demographic transitions and a new digital world have led to new challenges. In both developing and developed countries many older people rank among the most vulnerable in society.

IAGG's 20th World Congress, with its slogan "DIGITAL AGING", provides the opportunity to discuss these challenges and reach creative solutions. This approach and strategies of regions and different disciplines put us into a position to solve complex problems of this age group. The debate must be based on research results obtained from all sectors and fields of gerontology and geriatrics.

This congress will bring together researchers and clinicians from a large variety of countries, and from all research disciplines and areas related to population aging and older adults.

We have the opportunity to share research findings, policies, strategies and programs of emerging countries from sub-Saharan Africa or South America, that have not previously had much information on the characteristics of their seniors. This wide participation of researchers from many of these countries that have not previously exhibited many papers or communications, are very welcome indeed. Furthermore, the

opportunity to hear updated information from established research groups and countries with longstanding research traditions in aging is part of the richness of this World Congress.

Every four years, there is the opportunity to exchange knowledge, experience, success and failures on research of older people. It is only with an enthusiastic view and an obdurate soul that gerontology and geriatrics will advance. This special issue is the sample of collective proposals and solutions to the challenge of aging.

On this occasion, it is also a pleasure, to tell you all that our region gives support to both the Argentinean Gerontology & Geriatrics Society (SAGG) and the Argentinean Gerontology Association (AGA), to present its candidacy to host the XXIst IAGG World Congress in 2021, featuring the city of Buenos Aires, Argentina, as the organizer of it, and of course, we are looking forward to your support to being elected.

Finally, on behalf of all members of the IAGG's Latin America and Caribbean Region, I would like to welcome you to this 20th World Congress on Gerontology and Geriatrics in Seoul, Korea. May our deliberations be productive and stimulating and provide steps toward improving quality of life for older adults in all regions of the world.

New Edition of Pathy's Principles and Practice of Geriatric Medicine

Edited by Alan J. Sinclair, John E. Morley, and Bruno Vellas

Now in its fifth edition, this comprehensive two-volume text of geriatric medicine provides up-to-date, practical information on all medical problems of aging citizens. It includes 41 new chapters on new infections, treatments, and approaches to care; and it features expanded sections on acute stroke, dementia, cardiovascular disease, respiratory disease, and global healthcare systems. Written from an international perspective, this landmark resource is edited by renowned geriatricians from the US, UK, and France.

Key Features:

- Fully updated, including additions to literature and changes in treatment options
- 41 new chapters on new infections, treatments, and approaches to care
- New editorial team ensures a global perspective
- Now available in e-book format

Praise for the 4th edition:

"... an excellent reference for learners at all clinical and preclinical levels and a useful contribution to the geriatric medical literature."

Journal of the American Medical Association, November 2006

IAGG GARN Symposium

on Implementing Frailty into Clinical Practice and Clinical Research:
**Prevention of Frailty in Robust Older Adults / Prevention of Further
Disabilities in Frail Older Adults**

**MONDAY JUNE 24TH, 2013 AT THE SEOUL CONVENTION CENTER
DURING IAGG'S 20TH WORLD CONGRESS OF GERONTOLOGY AND GERIATRICS**

PROGRAM:

01:30pm: **Introduction:** Pr B. VELLAS, IAGG President (France), Pr HB. CHA, IAGG President Elect (South Korea), Pr R. GUIMARAES, IAGG Past President (Brazil)

02:00pm to 03:30pm:

04:00pm to 05:30pm:

Session 1: Prevention of Frailty in Robust Older Adults

Session 2: How to Implement Frailty into Clinical Practice and Clinical Research?

Is a Continuum between Robust, Frailty and Disabilities with Aging?

The Gérontopôle Experience, to implement frailty into clinical practice.

Pr J. ROWE (New York, USA), IAGG Future President Elect

Pr B. VELLAS (Toulouse, France)

The Risk Factors for Frailty in Robust Older Adults.

Pr A. SINCLAIR (Luton, UK)

How to implement Sarcopenia into clinical practice.

Pr LK. CHEN (Taipei, Taiwan)

How to Empower the Primary Care Physician in the Identification of the

Vulnerable Older Person with a View to Preventing Frailty and all its Consequences.

Pr I. PHILP (Warwick, UK)

An international consensus definition and assessment for frailty.

Pr J. MORLEY (St Louis, USA)

05:30PM TO 06:30PM: IAGG GARN RECEPTION

Supported by an unrestricted educational grant from Pfizer

Symposium strictly reserved for people registered for the IAGG 20th World Congress

DIGITAL AGING: WHY, WHAT AND HOW?

Sang Chul PARK (*Well Aging Research Center, Samsung Advanced Institute of Technology, Korea*)

Digital Aging is the new concept of aging in the technologically innovated world for the dynamic integrative interaction and adaptation of older individuals with new environment of the innovative artificial technology. Digital Aging can be analyzed in three domains of individual aging, life style changes and social influence. The individual aging is in the domain of Digital Genomics. Since biological nature is holistically analyzed in terms of genomics, as digital terms of genes, it is naturally assumed that nature of biological aging can be fully explained and modulated. The life style changes in the technologically innovated world are in domain of Digital Ubiquitous. With advance of IT, NT and BT, totally new patterns of life styles have been generated, leading to better quality of life with faster speed with higher efficiency. The social influence is in the domain of Digital Divide. Advance of technology results in social divide for haves and have-nots of the digital technology, directly linked to generation gaps between young and old groups, resulting in the neo-ageism. Since Digital Genomics and Digital Ubiquitous can be resulted from technological innovation, it can be readily expected that the quality of life and human dignity in the late stage of life might be improved. But in reality, Digital Divide is ensued, leading to dampening the quality of life and human dignity of the older people. Therefore, it is urgently required to develop the balancing strategy of Digital Genomics, Digital Ubiquitous and Digital Divide in order to overcome the global issue of new aging problem.

PATHWAYS MODULATING AGING? APPROACHES TO EXTEND HEALTHSPAN

Brian KENNEDY (*Buck Institute for Research on Aging, USA*)

Aging research has entered a new era. In the past three decades, the field has defined hundreds of genes that influence aging in model organisms. These studies have demonstrated that (1) aging can be manipulated relatively easily, (2) that many genetic interventions enhancing longevity also extend healthspan (the highly functional disease free period of life) and (3) there are many protein targets for small molecule interventions that extend lifespan. This latter observation has spawned a new breakthrough area in aging research – the identification of small molecules that promote longevity. Two forerunners are rapamycin and resveratrol, but there are a plethora of other compounds that are emerging in their wake. In this lecture, rapamycin and resveratrol will be explored and the likelihood that the small molecules that emerge from aging research can precede to clinical development will be discussed. Will aging research catalyze a new arena for drug development? Can small molecules be developed that are given to healthy people to maintain them in a disease-free

state? Can drug development and preventative medicine more closely align? These questions will be explored.

ACTIVE AGEING: A POLICY FOR ALL AGES?

Alan WALKER (*Social Policy & Social Gerontology, University of Sheffield, UK*)

This keynote lecture focuses on active ageing and, specifically, the ubiquitous stereotypes of activity and age it evokes. Rather than a policy prescription and set of behaviours uniquely associated with the third age it is argued that active ageing should be ageless: concerned with function rather than age. The lecture starts with a brief overview of the origins of active ageing, its evolution from successful to active ageing, through productive, positive, healthy ageing. The key component of each approach is identified. Then attention is switched to the common stereotype of active ageing and its base reduction to working longer, it is argued that the neo-liberal policy context is the main driver of this reduction rather than science or the interests of older people. The severe limitations of this approach are discussed and include the exclusion of the oldest old and the failure to acknowledge the inherent gender bias in active ageing policies. Finally, an alternative policy approach is outlined, one which emphasizes the core element of all previous constructs: activity. The scientific foundations of the relationship between activity and well-being are summarized. Then the essential principles of a life course approach to active ageing are advanced, including inclusivity (all ages, all functional abilities) and empowerment. Among other sources the lecture draws on research under the UK New Dynamics of Ageing Programme. <http://www.newdynamics.group.shef.ac.uk/>

KL-25-004

POPULATION AGEING ISSUES IN DEVELOPING COUNTRIES

Peng DU (*Institute of Gerontology, Renmin University of China, China*)

Population ageing in developing countries has been accelerating and accounts for an increasing proportion of the world older persons, among the 810 million people aged 60 years or over in the world in 2012, 65.5% are living in the developing countries and it is projected to further increase to 79.4% by 2050. Meanwhile, the proportion of the older persons in developing countries will increase from 9% in 2012 to 20% by 2050, a similar level as that of the developed countries at the beginning of this century. Therefore, with less economic resources and shorter time to adapt to the more rapid population ageing process, how to meet the challenges of the ageing issues in developing countries will play a crucial role of achieving the global goal of “a society of all ages”. Population ageing has extensive socioeconomic implications in developing countries, many latent ageing issues in the traditional societies have emerged as the urgent social issues and fundamentally changed the socioeconomic systems and national strategies to adapt for. The erosion of family support function due to fewer children and emigration of the family members requires more adequate social

pension, Medicare and daily care support from the society and communities; the changing living arrangements and increasing number of older persons with ADL difficulties and dementia need better long term care system and services; the new generations of healthier and better educated older persons need a more enabling social environment to actively participate the development, to promote new intergenerational relationships, to narrow and eliminate gender inequality, to develop more comprehensive protection system of the rights of older persons. Although some ageing issues are common in both developed and developing countries, a variety of ageing issues are more severe and become policy priorities in the developing countries, such as poverty, rural ageing, HIV/Aids, older persons in emergency situations, the lack of universal social pension, health program and services, gender discrimination, poorer housing condition, worsening affected by the financial crises and very limited protection by the laws and public policies. Most developing countries have already realized the urging needs to tackle the ageing issues and many countries have been trying to make efforts to adapt to the trend of population ageing and the changing needs of older persons and their families especially since the first UN World Assembly on Ageing in 1982, more active and concrete actions have been taken after the adoption of MIPPA in 2002 to meet the challenges of population ageing. The key progresses in the diverse developing countries include the development of social security system, community elderly services and institutional care, the efforts to have specific national strategy on ageing and the laws and policies to improve the life of older persons, more systematic collection of data through the census and surveys, increasing number of the professional geriatricians, gerontologists and social workers, etc. However, comparing to the developed countries, huge gaps in various aspects of systems, policies, research and practices on ageing issues still widely exist in developing countries, and far more efforts should be made before the age boom to come.

Wednesday June 26th

KL-26-001

DRUG TRIALS FOR ALZHEIMER'S DISEASE: WHAT HAVE WE LEARNED, AND WHERE ARE WE ARE GOING?

Bruno VELLAS (*Gerontopole, University of Toulouse, France*)

After modest success in bringing symptomatic therapy to the clinic, there is still high drug discovery need for effective disease-modifying treatment for the worldwide exploding epidemic of Alzheimer's disease (AD). From the development of the first transgenic mouse model of brain amyloidosis, and the report on the effect of active immunization against aggregated amyloid peptide on this model, anti-amyloid immunotherapy has been the leading strategy for disease-modifying drug development. However progress has been slow. While efforts turned to the development of safer active vaccines, using short sequence antigens to minimize toxicity mediated by cellular immunity, many investigators sought development of passive immunotherapy. At least 6 monoclonal anti-amyloid antibodies have advanced into mid- and late-phase trials. Results of the two largest AD drug development programs to date were announced recently, indicating little clinical benefit to immunologic attack on amyloid at the dementia stage of sporadic disease. In an international Phase III trial program involving four thousand individuals with mild to moderate AD, bapineuzumab did not demonstrate a favorable impact on the primary cognitive and functional measures. Two phase III studies of solanezumab failed on their primary cognitive and functional measures; however, planned, post-hoc pooled analyses of individuals with mild AD dementia did show cognitive benefit with treatment, so the development of this agent for the treatment of AD

dementia will continue with a confirmatory clinical trial planned for launch later this year. In contrast to bapineuzumab, solanezumab is a humanized monoclonal antibody that targets a mid-sequence amyloid peptide epitope. This antibody binds tightly to monomeric amyloid peptides, but not to aggregated or fibrillar forms. Crenezumab another monoclonal antibody binds to a mid-sequence epitope, but differs from solanezumab in that it possesses an IgG4 (rather than IgG1), so that it triggers less cytokine production from microglia while maintaining phagocytosis towards amyloid. Gantenerumab is a fully human monoclonal antibody that binds to both N-terminus and mid-sequence epitopes, and shows high affinity for fibrils. Like bapineuzumab, early studies demonstrated that treatment reduced brain amyloid as indicated by PET imaging, supporting target engagement. Trials in mild to moderate AD and prodromal AD are under way. SAR228810 is a humanized antibody that recognizes a particular conformational epitope that allows it to bind specifically protofibrils and fibrils. A phase I single and multiple dose administration clinical study in patients with Alzheimer's Disease is ongoing. To optimize the development of disease-modifiers, careful attention must be directed to lessons from these studies. What characteristics of antibodies (eg, epitope specificity, tightness of binding, inflammatory potential) relate to biomarker, cognitive and adverse effects? How robust is reduction in amyloid PET signal? What is the impact on biomarkers of AD neurodegeneration such as cerebrospinal fluid tau and p-tau? How does immunotherapy alter regional atrophy rates as indicated by volumetric magnetic resonance imaging? Is there evidence relating biomarker effects to impact on cognition? Which cognitive assessments are most sensitive to immunotherapy effects? How do subject characteristics such as disease severity and genotype influence immunotherapy effects? Secondary prevention trials, at very early stage of the disease, seem much more likely than the recent dementia-stage trials to demonstrate beneficial effects of anti-amyloid therapy on clinical progression. Drugs trials have to be now hosted in such well defined cohort studies. Several beta inhibitor are also in progress as well that new drugs targeting tau. Other approaches include multidomain preventive trials, eg nutrition intervention plus physical and cognitive exercise several projects have been funded worldwide. In this key note lecture an update will be presented on current drug trials in Alzheimer's disease focusing on disease modifying drugs.

KL-26-004

CHANGES IN FAMILY STRUCTURE AND CARE OF OLDER PERSONS

Karen A. ROBERTO (*Virginia Polytechnic Institute and State University, USA*)

The structure of families is changing worldwide. While an increase in life expectancy is resulting in the greater likelihood of more multigenerational families, population trends show future generations of families with fewer members. As a result, individuals in the middle generations will feel the emotional and financial pressures of supporting both their children and older parents, and possibly grandparents simultaneously and for a longer duration than in the past. Additionally, family structures and relationships are becoming more complex, requiring a new understanding of kinship beyond the nuclear family as the conceptual and ideological standard. Older adults acquire or develop relationships as new individuals enter their lives (e.g., in-laws; grandchildren; friends). Other relationships evolve as they expand or renegotiate existing roles (e.g., caregiver; sibling). Ties with partners, biological kin, step kin, chosen kin, and friends have implications for the care of old people. The goal of this presentation is to highlight changes in family structures by expanding upon normative models of kinship to develop perspectives more relevant for examining

the roles and responsibilities of contemporary families in light of a rapidly expanding aging population. Scholars and practitioners around the world must attend to transformations of family structures and interpretations of family relationships and roles, both within families of origin and within families created through marriage, choice, adoption, or necessity, as they provide new opportunities and challenges for elder care.

Thursday June 27th

KL-27-001

HEALTH CARE THROUGH GERONTECHNOLOGY

Alain FRANCO (*Gerontology and Gerontechnology, Nice University Hospital, France*)

Population aging and increase of longevity deeply modify socio-economic basis of developed nations and their founding health and social paradigms. The most illustrative changes are the current shifting for the Health paradigms. As a person grows in age he/she might face multiple problems related with multiple acute or chronic diseases (poly pathology, comorbidity) instead of a unique disease (monopathology) which is the usual case for younger persons. In that situation the objectives for health professionals are different. Monopathology leads to a disease management strategy needing a right diagnosis related to the 10th WHO International Classification of Diseases and an adapted if possible curative treatment. In case of multiple and chronic diseases it might not be possible to cure simultaneously all the patient's diseases and the focus is to maintain the activity at the personal and social level that means quality of life, prevention of avoidable disabilities, rehabilitation, pain's relief, care and indeed cure if possible. This new health paradigm is legitimated by the 2001 WHO International Classification of Functioning, ICF. Aging population is not uniform. It is better described with three different situations, morbidity, frailty and successful aging. A/ Morbidity corresponds to the last part of the life leading to diseases, disability, dependency, long-term care and end of life situations. The good news for all of us is that there is a compression in morbidity in the aging countries, as described by demographers. That means that the rate of population in a morbid status decreases regularly, or in other words that the life time for morbidity is reduced more and more as the healthy part of life is increasing. B/ Frailty has to be better scientifically defined but this state corresponds to a reduction of functional reserves of persons and an increase of risk for a morbid situation shifting. This frailty status is a step to morbidity and all geriatric teams in the world are actively looking for finding of some reverse solutions. C/ Successful aging relates to an increasing proportion of aging persons, mainly in developed countries. It describes the fact that more and more aging persons are fully active in social and even professional life and remain in good health condition. Successful aging is probably the result of modernization, social and health progresses and wealthy global conditions. Active and healthy aging becomes a political goal as it makes longevity growing happy for the persons and affordable by the families, the society and national economies. European Innovation Partnership for Active and Healthy Ageing and its plus two years active and healthy aging for European Citizens in 2020 is a current example. Other paradigms are changing as re-emphasis of primary care and home care, healthy aging as a human right, social solidarity and political concern of aging and healthy issues, and sustainable health systems and practices with the hope that the coming world economic crisis do not threaten the current progresses. But, the main goal is prevention of disability for all citizens including ageing persons, anticipation and preservation of

functional independency. It needs a pro-active policy and a societal consensus. Technologies and services have a major role to play, in helping to maintain functional independency for the citizens upstream to the health issues, system and financing, and in increasing care productivity (1). Gerontechnology is defined by the ISG (2) as designing technology and environment for independent living and social participation of older persons in good health, comfort and safety. Actually all economic sectors may be involved, nutrition, transports, education, sports, cosmetics, finance, communication. All these sectors adapted to the digital revolution are able to contribute to the reduction of avoidable disabilities of aging population. It is probably in the mass economy that soft solutions may be efficient, adapted and respecting the aging consumer as an active economical actor, and avoiding to increase the financial burden of the health and social budgets. Providing and Paying for Long-Term Care, OECD Health Policy; Studies, OECD Publishing. <http://dx.doi.org/10.1787/9789264097759-en>; (2) International Society for Gerontechnology. <http://www.gerontechnology.info>.

KL-27-004

ALPHA-KLOTTHO IN HEALTH AND DISEASES

Yo-Ichi NABESHIMA¹, Ryota MAEDA², Hiroaki IMURA³
(1. Graduate School of Medicine, Kyoto University, Japan; 2. Tokyo Metropolitan Institute of Gerontology, Japan; 3. Faculty of wellbeing science, Fukuyama Heisei University, Japan)

α -klotho was first identified as an aging-related gene and later shown to regulate mineral homeostasis by binding to Na⁺,K⁺-ATPase complex and FGF23. However, the precise molecular mechanisms and functional roles of α -Klotho are still unclear. In this lecture, I will focus on two topics. (1) The first is "how does α -Klotho specifically and stably bind to its partners". Regarding this, we isolated terminal glucuronidated O- and N-glycans from FGF23, and the other α -Klotho binding proteins such as NaK b-subunit, respectively. N-glycans play significant roles for preferential interactions of α -Klotho and its partners. If O-glycan of FGF23 is docked to α -Klotho, the homo α -Klotho becomes more thermodynamically stable, shifting α -Klotho toward a high-affinity state for FGF23. These support our conclusions that α -Klotho acts as a novel glucuronide-binding lectin and that the glycan initiates conformational/allosteric-changes by docking to target proteins, leading to stabilized interaction. (2) The second is "how can we ameliorate the premature aging related phenotypes seen in α -klotho^{-/-} mice". We found that daily administration of calpain-1 inhibitor strikingly ameliorates phenotypes such as cardiovascular/soft tissue calcifications, bone mineral density reduction, pulmonary emphysema, atrophies of skin/ovary/testis/thymus/spleen, and so on. We also found that FGF23, Osteopontin, Runx2, and RANKL are ectopically induced in the aorta and arteries of α -klotho^{-/-} mice in accompany with the progression of cardiovascular calcification. These support the clinical evidence that FGF23 levels are highly associated with the cardiovascular mortality and allow us to propose that calpain-1 inhibition may prove useful in the alleviation of aging related syndromes.

GERIATRIC SYNDROMES RELATED WITH FRAILTY,

DEMENTIA, AND DIABETES MELLITUS

PS24 201-R-1

MANAGEMENT OF GERIATRIC SYNDROME IN ELDERLY DIABETES MELLITUS

Hyung Joon YOO (*Division of Endocrinology & Geriatrics, Department of Internal Medicine School of Medicine Hallym University, Korea*)

Introduction : There is a plenty of evidence that geriatric syndromes are prevalent in diabetics. There has been some progress in the management of diabetes. But it is often impractical to extrapolate from the young adult to the elderly, especially the frail or dependent ones. The management of them cannot be restricted to the management of hyperglycemia and specific diabetic complications. The improving the care of the older diabetics includes geriatric syndromes. An integrated approach including education must assess and manage the presence of geriatric syndromes. Education is another fundamental element of the care for older adults with DM, because there are many older adults, whose functional and cognitive status may change over short periods of time. To evaluate the effect of education in the management of geriatric syndromes in elderly patients with diabetes mellitus. **Method :** We checked the current status of geriatric syndromes (disability, depression, fall, incontinence, constipation, sleeping disorder, hearing loss, syncope, dizziness, pain, dementia, osteoporosis, and malnutrition) of elderly diabetics and confirmed the two most frequent geriatric syndromes. We divided the patients with the two most frequent ones into two groups (ordinary DM education and reinforced-education). **Results :** After 12 months, HbA1c was decreased from 9.2 % to 7.7 % in ordinary-education group, from 9.3 % to 8.0 % in reinforced-education group respectively. In reinforced-education group than in ordinary-education one, the status of geriatric syndromes got better. **Conclusion :** The glycemic control combined with reinforced-education about geriatric syndromes was more effective in the management of diabetes mellitus in older diabetics. **Keywords :** elderly diabetes, geriatric syndrome, reinforced-education

GERIATRIC SYNDROME IN FRAIL ELDERLY

Kenji TOBA, Sayaka KIMURA², Yukiko YAMADA², Ryuhei NAKAI³, Koichi KOZAKI³ (*1. Center for comprehensive care and research on memory disorders, National Center for Geriatrics and Gerontology, Japan; 2. Center for comprehensive care on memory disorders, Kyorin University, Japan; 3. Geriatric Medicine, Kyorin University, Japan*)

Introduction : Frailty is a concept born in the mid 1980s, toward which a disease-oriented approach has turned to functional assessment. The domain of frailty contains the weakness of muscle strength, mental problems and social solitude. However, multiple geriatric conditions related with the mechanisms in the progression of frailty remain unclear. **Method :** 1) We elucidate the sex difference of hip fracture in relation with the sex difference of fall risks in fall -prevention clinic 2) We will focus on the relationship between multiple geriatric conditions and brain white matter lesion in MRI in memory clinic. **Results :** 1) The postural changes with osteoporosis is one of the risks for falls. 2) PVH in MRI correlate with tripping, urinary frequency, urinary incontinence, body weight loss and swallowing disturbance, which are frequently observed in frail elderly persons. **Conclusion :** Postural changes related with locomotor system and brain white matter lesion are potential candidates to explain multiple geriatric syndromes in frail elderly persons. **Keywords :** Geriatric syndrome, Postural changes, Brain white matter lesion

PS24 201-R-3

FRAILTY AND GERIATRIC SYNDROMES: SEARCHING FOR THE RELEVANT AND EVIDENCE BASED CLINICAL FRAMEWORK

Howard BERGMAN (*Family Medicine, McGill University, Canada*)

Introduction : The concept of frailty has received increasing attention among clinicians and researchers. Clinicians often say, "I know frailty when I see it, but I can't define it". This is not surprising given that in spite of a growing body of knowledge, there is no widely accepted definition of frailty. The literature abounds with different models, criteria and definitions. While consensus has yet to be attained, work accomplished to date while revealing exciting new horizons, has also raised important issues and questions. The presentation will discuss existing models of frailty, the complex relationship between the concepts of healthy aging, chronic disease frailty, geriatric syndromes, and disability, and implications of applying these concepts in the clinical and research setting. **Conclusion :** Ultimately, work on frailty will be relevant to clinicians, older individuals, and society if it can identify effective health promotion, prevention, treatment, rehabilitation, and care interventions. **Keywords :** Geriatric syndromes, chronic disease, frailty

IMMUNE FRAILTY AND DEFENSE AGAINST INFECTIONS

PS24 204-R-1

PSYCHOLOGICAL AND PHYSICAL STRESS COMPOUNDING AGEING OF THE IMMUNE SYSTEM

Janet Mary LORD¹, Niharika Arora DUGGAL¹, Jane UPTON, Anna C PHILLIPS² (*1. Immunity and Infection, University of Birmingham, United Kingdom; 2. Sport and Exercise Sciences, University of Birmingham, United Kingdom*)

Introduction : Ageing has profound effects upon immunity, reducing the efficiency of both the innate and adaptive immune systems and remodelling the response to pathogens and self antigens. Taken together these effects increase susceptibility to viral and bacterial infections, increase autoimmunity and also contribute to post-infection frailty. The immune system does not operate in isolation and is affected by a range of environmental factors, including both physical and psychological (emotional) stress. Our work looks at immunity in hip-fracture patients, comparing patients who develop depression after hip fracture with those who do not. **Method :** We assessed a range of immune functions and measured stress hormone levels in 101 patients with hip fracture. Immune function was assessed 1 month and 6 months after hip fracture and physical and cognitive function was also measured. **Results :** 38 of the patients developed depression after their hip fracture. Hip fracture patients who developed depression had significantly lower superoxide generation by neutrophils and monocytes ($p < 0.05$), lower NK cell cytotoxicity ($p < 0.05$) and lower regulatory B cell function ($p < 0.02$). The patients with depression also had poorer physical functioning scores: Activities of Daily Living ($p < .001$), walking speed ($p = .04$) and poorer balance at ($p = .005$). The reduced innate immunity and association with slower walking speed appeared to be mediated by a higher cortisol:DHEAS ratio in depressed patients. **Conclusion :** Both physical and psychological stress in combination impact upon immunity in older adults and the effects on immunity and physical frailty are mediated at least in part by an altered HPA axis. **Keywords :** stress, immunity, frailty

PS24 204-R-2

PHYSICAL FRAILTY AND IMMUNE FRAILTY: A CRUCIAL

RELATIONSHIP

Tamas FULOP (*Medicine, Universite de Sherbrooke, Canada*)

Introduction : The concept of frailty as a medically distinct syndrome has evolved based on the clinical experience of geriatricians and is clinically well recognizable. Frailty is a nonspecific state of vulnerability, which reflects multisystem physiological change. Together, the signs and symptoms of frailty, operationalized by the Fried and Rockwood models, seem to reflect a reduced functional reserve and consequent decrease in adaptation (resilience) to any sort of stressor. The overall consequence is that frail elderly are at higher risk for accelerated physical and cognitive decline, disability and death. All these characteristics associated with frailty can easily be applied to the definition and characterization of the aging process per se and there is little consensus concerning the physiological/biological pathways associated with or determining frailty. Method : However, a consensus view would implicate heightened chronic systemic inflammation as a major contributor to frailty with some degree of innate immune cell activation including monocytes/macrophages at the same time as decreased adaptive immune response efficiency (Inflamm-frailty). Results : Thus, significant inflammatory and immune dysregulation is present in frail older adults which seems to mirror age-associated changes loosely termed immunosenescence. But how these inflammatory and immune changes are intertwined with physical frailty is still largely unknown. Conclusion : Possible interventions at the immune level should aim to reduce the occurrence and effects of frailty in elderly people. Keywords : Physical frailty, immunosenescence, Inflamm-aging

PS24 204-R-3

INFLAMMAGING DECREASES THE HUMAN B CELL RESPONSE TO THE INFLUENZA VACCINE

Bonnie BLOMBERG (*Microbiology and Immunology, University of Miami Miller School of Medicine, USA*)

Introduction : In order to develop predictive markers for a beneficial humoral immune response, we evaluated the in vivo and in vitro response to the seasonal influenza vaccine in young and elderly individuals. Method : We measured serum antibody response and associated this with the in vitro B cell response to the vaccine, measured by AID (activation-induced cytidine deaminase). AID is a measure of immunoglobulin class switch recombination, the process that generates protective antibodies, and is a good measure of B cell function. Results : Both responses decrease with age and are significantly correlated. We hypothesize that the increased pro-inflammatory status of the elderly, called inflammaging, impacts directly on B cell function, thus impairing the capacity of the individual to make protective antibodies and to respond to vaccination. Our data indicate that aged B lymphocytes themselves make TNF- α before vaccine challenge and this correlates with their impaired function, including reduced AID expression after B cell stimulation. These data are currently being correlated with subject CMV status and will also be presented. Conclusion : Our results reveal new molecular mechanisms which contribute to reduced antibody responses in aging and suggest that these will have an impact for crucial development of effective vaccines to protect the elderly from infectious and other debilitating diseases. Keywords : Aging, B cells, Vaccine responses, inflammation

PS24 204-R-4

MECHANISMS FOR END STAGE DIFFERENTIATION IN HUMAN T LYMPHOCYTES

Arne AKBAR (*Infection and Immunity, UCL, United Kingdom*)

Introduction : Immune enhancement is desirable in situations where decreased immunity results in increased morbidity. Method : We investigated whether blocking PD-1 surface inhibitory receptor that is involved in immune exhaustion and/or the p38 MAP kinase pathway, that is involved with immune senescence could enhance the function of human memory CD8+ T cells. Results : We focussed on the effector memory CD8+ T cell subset that re-expresses CD45RA (EMRA) which exhibit end-stage characteristics such as decreased proliferation and telomerase activity but increased expression of the DNA damage response-related protein γ H2AX after activation. Blocking of both PD-1 and p38 signalling in these cells enhanced proliferation but by distinct pathways, as the increase was additive. A striking observation was that telomerase activity in EMRA CD8+ T cells could be enhanced considerably by blocking the p38 pathway indicating that the activity of this enzyme is controlled by active cell signalling. Conclusion : Collectively our data indicates that the end-stage characteristics of EMRA CD8+ T are stringently controlled by reversible cell signalling pathways. This raises the possibility for selective manipulation of these pathways in tandem in human T cells to enhance immune competence in subjects with defective immunity that occurs during ageing. Keywords : senescence, p38

CHANGING TIMES AND FILIAL PIETY

PS24 205-S-1

FILIAL PIETY AND DIGITAL DIVIDE IN EAST ASIAN CHINESE SOCIETIES

Nelson W.S. CHOW (*Social Work and Social Administration, The University of Hong Kong, Hong Kong*)

Introduction : While it is generally acknowledged that filial piety is the most dominant value governing the behavior of the young towards the old in East Asian Chinese societies, the value is now receiving serious doubts as these societies are rapidly entering into the global trend of digital innovation. The digital divide that now exists between the young and the old has not only varied the ways in which they obtain knowledge and information but has also made the values upheld by each of them as completely different, if not antagonistic. Is filial piety no longer a relevant value in East Asian Chinese societies? Method : The presentation is based on research conducted on digital divide between the young and the old in East Asian Chinese societies, including Hong Kong, Taiwan and major cities in China. Results : Results will try to answer the following questions: What is the conflict between digital innovation and the value of filial piety? Is filial piety a dying value in East Asian Chinese societies? Could we have a modified version of the value of filial piety that fits in harmoniously with digital advancement? What other values could take place of filial piety so that the tradition of respecting the old could continue to be treasured in East Asian Chinese societies? Conclusion : Filial piety is too important a value in East Asian Chinese societies. While some traditional practices of filial piety could be modified or even forfeited, the spirit of respecting the old must continue to create love and support between generations. Keywords : Filial piety, digital divide, Chinese societies

PS24 205-S-2

CHANGING ATTITUDES TOWARD SUPPORTING OLDER PARENTS IN JAPAN

Yoshiko SOMEYA (*Sociology, Tokyo Woman's Christian University, Japan*)

Japanese population ageing is 23.3 percent in September 2012 and

highest in the world. Male longevity is 79.44 years old and female longevity is 85.90 in 2011. Particularly, female longevity had been the highest in the world for 26 years until 2011. Both longevities have prolonged about 30 years since the end of the World War II. According to the Japanese old civil law, only one child, usually the eldest son, succeeded in family assets, lived with parents and took responsibilities for the later life of their parents. Providing all supports to parents showed "the filial piety" as "a good son". However, under the new civil law enacted in 1947, all children came to be equally entitled to succeed in family assets and to be obligated to take care of their older parents. In the 1980s, more than 100,000 working women quit their jobs a year for caregiving. Hence, "the Gold Plan" was implemented in 1989 and the Long-term Care Insurance started in 2000. It covers over 65 years old Japanese residences, regardless of their incomes. Public pensions consist of fully 70 percent of elderly household incomes and more than 80 percent of them own a house. The majority of elderly are financially independent with decent incomes substantial savings and high rates of home ownership. Therefore, the living with children becomes unfavorable obviously among the post war baby-boomer generation. In fact, the filial piety in Japan has shifted from meeting financial and caregiving needs to psychological needs over last several decades together with industrialization. Keywords : family support, care, living arrangement

PS24 205-S-3

FILIAL CARE AND RECIPROCITY: PHILOSOPHICAL REFLECTIONS FROM AN EAST ASIAN PERSPECTIVE

Alan K. L. CHAN (*College of Humanities, Arts, and Social Sciences, Nanyang Technological University, Singapore*)

Introduction : In this discussion, I address two main issues: 1) the universality and contextual delineation of "filial piety" (xiao 孝 in Chinese, kō in Japanese, and hyo in Korean), a fundamental virtue in the Confucian tradition; and 2) the contemporary relevance and adaptation of xiao in an ageing East Asia. At one level, filial piety can be said to be a universal virtue; yet, cultural specificities render the unfolding of xiao more complex. In the Confucian tradition, I argue, it is filial care and reciprocity that underlies the sense of piety and reverence in the concept of xiao. In the 21st century, xiao remains central to the ideal of harmony in the East Asian imagination, although it requires new interpretation in the face of an ageing population, declining birth rate, and globalization. Method : Philosophical reflections. Results : Discussion on filial piety: meaning and contemporary adaptations. Conclusion : continuing relevance of filial care and reciprocity. Keywords : Filial Piety, Confucianism

PS24 205-S-4

FILIAL PIETY IN THE NEW CENTURY IN CHINA

Peng DU (*Institute of Gerontology, Renmin University of China, China*)

Introduction : Filial piety is the tradition in China and has been getting more emphasis in the beginning of the new century. With the rapid socioeconomic development in the past three decades, China has been making efforts to promote filial piety in the society by the following four major means: education, law, social protection system and social services system. Method : The presentation uses the data of National Survey of Older Persons in China conducted in 2010 and 2000, to provide an evidence based analysis. Results : Have these comprehensive measures worked? What are the current reality of filial piety in China and the changes of filial piety through the eyes of older persons themselves in the beginning of the new century? In the 2010 national survey, 79.4% older persons aged 60 and over regard their

children as very filial or filial, 1.6% regard as not filial, and 19% are neutral. Comparing with the result of year 2000, the filial proportion increased from 74.2% to 79.4%, while the not filial proportion decreased slightly from 1.9% to 1.6%. Further in-depth analysis shows that older persons give more positive comments on their children and have less worry about their children would not be filial. The research findings indicate various differences still exist, the older persons who are urban, healthy, with higher educational attainment, married and co-residing with their children have more positive comments on their children's filial piety. Conclusion : The filial piety has been well kept and promoted, but socioeconomic policies are still needed to support the younger generation. Keywords : Filial piety, China, new century

FILIAL PIETY IN AGEING SOCIETY

Kyu-Taik SUNG (*Center for Filial Piety Culture Studies, Korea*)

This presentation reviews 'gerontologists' varied perspectives on elder respect upheld by peoples of Korea, China, and Japan, and explores the continuity and change among these East Asians in terms of the practice of the value, which integrates elderly persons with the family and society. The three perspectives are reviewed, i.e., that elders are automatically respected, that elder respect is residual in the social structure, and that the young are socialized to respect elders. These perspectives are contrasted with the data from empirical studies of elder respect in the three respective countries. Data from the above approaches reveal clear similarity among the three countries. In all of them, the value of elder respect is automatically expressed; the value is residual deep in the social structure of their societies, and the young are socialized from early ages to respect the elderly. These findings coincide with the findings from other studies on attitudes toward elderly persons conducted in other countries in East Asia. Among the three countries, the practice of elder respect in one country strongly resembles those found in two other countries, as all the three East Asian countries have been much influenced by Confucian ethical conception of filial piety-the primary component of which being elder respect. To portray the overall state of elder respect in these countries, all of the perspectives would have to be considered. This review also reveals that East Asians are modifying their way of elder respect in response to immense challenges from changing times while retaining the traditional cultural value that enhances the dignity and worth of elderly people. Keywords : filial piety, perspectives on elder respect, East Asian culture

INTEGRATION OF SIGNAL PATHWAYS ON ENERGY METABOLISM AND LONGEVITY

PS24 211-B-1

A NOVEL ROLE OF NEUROPEPTIDE Y IN MAMMALIAN AGING: LINKING CALORIE RESTRICTION TO LONGEVITY

Isao SHIMOKAWA (*Investigative Pathology, Nagasaki University Graduate School of Biomedical Sciences, Japan*)

Introduction : Modest restriction of dietary calorie intake with essential nutrients, referred to as calorie restriction (CR), inhibits aging-related disorders and extends lifespan in a range of organisms. Key molecules that modulate the effect of CR remain elusive particularly in mammals. We evaluated neuropeptide Y (Npy), which is involved in the physiological adaptation to energy deficits, for its role in the effects of CR. Method : To test potential roles for Npy in the effect of life-long 30% CR, we compared lifespan, pathology,

stress resistance, neuroendocrine systems, and energy metabolism between Npy-null (-/-) and wild-type (WT) mice. Results : In Npy-/- mice, the effects of CR on lifespan, the occurrence of spontaneous tumors, and oxidative stress responses were minimized, in contrast to the wild-type (WT) mice. However, the physiological processes to adapt to CR, including circulating hormones and energy metabolism, were similarly modulated in the Npy-/- and WT mice. Conclusion : The present study indicates that Npy is indispensable in the link between CR and longevity in mammals, and defines a novel role of Npy in mammalian aging beyond the known physiological functions of Npy including regulation of energy expenditure and neuroendocrine system. Keywords : Calorie restriction, Neuropeptide Y

**PS24 211-B-2
USING GENETIC VARIATION TO PROBE THE MECHANISMS AND LIMITS OF DIETARY RESTRICTION AS AN ANTI-AGING INTERVENTION**

James F. NELSON¹, Chen-yu LIAO², Thomas E. JOHNSON³
(1. Barshop Institute for Longevity and Aging Studies, University of Texas Health Science Center at San Antonio, USA; 2. Buck Institute for Research on Aging, Buck Institute for Research on Aging, USA; 3. Institute of Behavioral Genetics, University of Colorado at Boulder, USA)

Introduction : Dietary restriction (DR) extends lifespan in many species. A major challenge is how to distinguish from the many biochemical and physiological changes that are induced by DR those that underlie its anti-aging effect. Method : Our study of DR across many genetically different recombinant inbred (RI) strains of mice has revealed striking variation in the lifespan response to DR—ranging from marked lifespan extension to marked shortening. Whether the unexpected life-shortening effect of DR extends to other genetically variable populations, the highly variable response of the RI strains to DR reveals a strong genetic influence on the response to DR. Moreover, this genetically variable response to DR provides a novel tool for testing hypotheses concerning the biological cause of lifespan modulation by DR. Results : We measured several responses to DR that have been hypothesized to underlie its anti-aging action: reduction in adiposity, hypoinsulinemia, and hyperadrenocorticism. All varied markedly across RI strains. Maintenance of adiposity was predictive of lifespan extension and loss of adiposity predicted lifespan shortening by DR. Hypoinsulinemia did not correlate with the lifespan response to DR. Although all strains were hyperadrenocortical, the lowest hyperadrenocortical responses predicted lifespan extension and the greatest responses were associated with lifespan shortening. Conclusion : These results are consistent with a role for metabolic efficiency and enhanced stress responsiveness in the lifespan extending effects of DR. Conversely, metabolic inefficiency and an overly exaggerated stress responsiveness may negate and even reverse the effect of DR on longevity. Supported by the National Institute of Aging and the Ellison Medical Foundation. Keywords : Dietary Restriction Metabolism

**PS24 211-B-3
EVOLUTIONARILY CONSERVED ALTERATIONS BY AGE AND CALORIE RESTRICTION OF THE ORGANIZATION AND PERFORMANCE OF THE RESPIRATORY CHAIN**

Norbert A. DENCHER¹, Monika FRENZEL², Manuela KRATOCHWIL², Michael MUSCHOL², Eva R. SCHAEFER², Sandra THILMANY², Sataro GOTO³, Heinz D. OSIEWACZ⁴, Isao SHIMOKAWA⁵, Michiru D. SUGAWA⁶ (1. Physical Biochemistry/Chemistry, Technische Universitaet Darmstadt, Department of Chemistry, Physical Biochemistry, Germany; 2. Physical

Biochemistry/Chemistry, Technische Universitaet Darmstadt, Germany; 3. Health and Sports Science & Medicine, Juntendo University, Japan; 4. Institute of Molecular Biosciences, Goethe-University, Germany; 5. Investigative Pathology, Nagasaki University, Japan; 6. Clinical Neurobiology, Department of Psychiatry, Charite-Universitaetsmedizin Berlin / Technische Universitaet Darmstadt, Germany)

Introduction : With knowledge of the common biology for ageing and diseases like cancer or Alzheimer's, efforts towards prolonging healthy lifespan got triggered. Dietary/calorie restriction came forward as the most promising approach to retard ageing as well as the inception of age-related diseases. We have analyzed changes in protein profiles and enzyme activities of mitochondria in evolutionarily far distant ageing model systems with a defined mitochondrial etiology of ageing, ranging from fungus to rat and human cells, as response to ageing and to calorie restriction. Method : The mitochondrial proteome and performance at different age and/or nutritional status were analyzed by 2D native/SDS-PAGE, mass spectrometry and enzyme activity measurements. In addition, age/CR-associated changes in the composition, amount and oxidative status of mitochondrial lipids in fungus and rat brain were compared. Age/CR-associated posttranslational modifications of the ATP synthase and of other mitochondrial proteins were examined. Results : Pronounced age- and CR-related changes in abundance of MFoF1-ATPsynthase as well as of OxPhos-complexes and supercomplexes (natural assemblies of the complexes I, III, and IV into stoichiometric entities, such as I1III2IV0-2) were observed. Conclusion : We could capture some of the specific initial targets of age reversing mechanism of calorie restriction. Since enzyme activities of OxPhos-complexes assembled as supercomplexes are 2 to >15 times higher than those of the individual complexes, the amount, the proportion of the individual vs. specific supercomplexes and the activities of OxPhos (super)complexes will determine the performance of the respiratory chain and have to be considered to describe the interplay of age- and CR-controlled mechanisms. Keywords : calorie restriction, ageing, evolution, mitochondria

**PS24 211-B-4
IMPACT OF SHORT-TERM CALORIC RESTRICTION ON GLOBAL GENE EXPRESSION IN MOUSE ADIPOSE TISSUE**

Seung-soo KIM, Cheol-Koo LEE (College of Life Sciences & Biotechnology, Korea University, Korea)

Introduction : Caloric restriction (CR) has been used for understanding mechanisms how the aging process could be slowed down. Also, CR could significantly improve the organism's health. Method : To find directly regulated genes by CR, we performed DNA microarray experiments at three serial CR groups adjusted total calories to 15%, 30% and 45% reduction from control mice group (each fed 17.1 calories per day). Results : Total 549 genes were significantly regulated (ANOVA FDR 5%) at 10 weeks of CR conditions. Expression levels of these genes were correlated with the strengths of serial CR, so we defined the genes as 'Directly Regulated Genes' (DRGs). From analysis of functional categories for the DRGs, we observed constant down-regulation of genes for signaling including canonical Wnt, epidermal growth factor (EGF), transforming growth factor β (TGF- β) and cell death signaling pathways. In addition, the DRGs categorized in extracellular matrix (ECM), cell adhesion and cytoskeleton showed a consistent down-regulation. Interestingly, the DRGs reflected a strong suppression of immune response in the non-immunogenic adipose tissue by CR. In contrast, the DRGs categorized in energy and xenobiotic metabolism exhibited a consistent up-regulation. The DRGs for lipid metabolism showed a complicated

mixture of up- and down-regulation. To identify potential master transcriptional regulator, we analyzed 1 kb upstream sequences of the DRGs and found two transcription factors including Paired box gene 6 (PAX6) and Paired-like homeodomain 2 (PITX2). Conclusion : Our results provide clues how CR sets a transcriptional program for assurance of longevity. Keywords : Caloric restriction; mice; adipose tissue

PS24 212-C

ARTERIAL COMPONENT OF AGE-RELATED DISEASES

PS24 212-C-1

ARTERIAL AGING AND COGNITIVE IMPAIRMENT

Olivier HANON (*Department of Geriatric Medicine, Broca hospital, France*)

Introduction : Recent studies have shown that a higher pulse pressure is associated with increased risk of Alzheimer's disease (AD) suggesting that arterial aging could be involved in the pathogenesis of dementia. Pulse pressure or arterial stiffness are related to atherosclerosis and/or arteriosclerosis in large and small vessels. Vascular mechanisms of cognitive impairment involve small-vessel diseases which are associated with small infarcts (lacunae), white matter lesions and cortical brain atrophy. Summation of cerebrovascular lesions, white matter changes and pre-existent asymptomatic Alzheimer's brain lesions may lead to dementia. Presence of arteriosclerosis and/or lipohyalinosis of small vessels might be the origin of vascular cerebral lesions and/or chronic hypoperfusion of the white matter and thus contribute to the early expression of a subclinical AD. Method : These vessel changes may compromise the function of the blood-brain barrier leading to an increased vascular permeability and protein extravasation in brain parenchyma resulting in the A beta-amyloid accumulation. Results : Likewise, hypertension and beta-amyloid may act on endothelial cells to produce an excess of free radicals suggesting that oxidative stress may be involved in the mechanisms of both arterial aging and AD. Randomized, placebo-controlled trials have demonstrated that blood pressure-reducing agents may decrease the incidence of dementia in stroke patients (PROGRESS, HOPE) and in elderly patients with isolated systolic hypertension (SYST-EUR) but these results were not found in 2 other trials (SCOPE and SHEP). Conclusion : In this context, the incidence of dementia should be a major outcome measure of future trials evaluating the effect of antihypertensive drugs on arterial aging. Keywords : arterial aging, cognitive impairment, Alzheimer disease, vascular dementia

PS24 212-C-2

ARTERIAL AGING AND SARCOPENIA

Katsuhiko KOHARA (*Department of Geriatric Medicine, Ehime University Graduate School of Medicine, Japan*)

Introduction : Arterial stiffness has been shown to be associated with a number of disorders related to the dependence-related conditions including stroke and dementia, suggesting that arterial stiffness directly reflects general aging in addition to cardiovascular aging and may be a risk factor among the elderly for developing frailty. Body composition changes dramatically with age, with increases in fat content, particularly visceral fat, and decreases in muscle volume and bone mineral density. Sarcopenia, the aging-related loss of muscle volume and strength, may affect not only metabolic profiles such as insulin resistance but also activity in daily life via a reduction in muscle strength, thereby resulting in dependence and frailty. Method : In the present study we used computed tomography to quantify thigh

muscle cross-sectional area (CSA) and visceral fat areas as indices for sarcopenia and visceral obesity, respectively, in participants in Ehime University Anti-aging Doc. Abdominal Brachial-ankle pulse wave velocity (baPWV) was measured as an index for arterial stiffness. Results : Thigh muscle cross-sectional area (CSA) was significantly and negatively associated with baPWV in men, independently of age and blood pressure, while visceral fat area was significantly and positively associated with arterial stiffness. Subjects with both sarcopenia and visceral obesity had higher baPWV than those with only one abnormality. Conclusion : These findings suggest that arterial stiffness is related to changes in body composition and may underlay the process of general frailty in the elderly population. Keywords : Arterial stiffness, sarcopenia, visceral obesity

PS24 212-C-3

INCREASE IN ARTERIAL STIFFNESS WITH AGING IN INDUSTRIALIZED AND DEVELOPING COUNTRIES

Athanase BENETOS (*Dpt of Geriatrics, University of Nancy, France*)

Introduction : Several studies performed in industrial countries have shown lower PWV levels in women as compared to men, and this difference could at least partially explain increased longevity in women. However, no data are available in emerging populations. Method : In the present study, we evaluated arterial stiffness (AS), measured by carotid-femoral pulse wave velocity (cfPWV), in elderly Algerian and European men and women. 782 subjects were studied: 391 Algerians including 183 men (81.2±5.3 years) and 138 women (81.1±4.4 years); an age- and gender-matched cohort of 391 European subjects. Results : Algerian women compared with men had higher BMI and heart rate, higher prevalence of hypertension and were more frequently treated for hypertension. PWV was not different between Algerian men (14.8±3.3 m/sec) and women (14.9±3.4 m/sec). By contrast, in Europeans, women had lower cfPWV (12.7±2.7 m/sec) than men (14.0±3.3 m/sec) ($p < 0.001$). As compared to European women, Algerian women had higher PWV ($p < 0.01$). In both ethnic groups, multivariate analyses showed that age, MBP, HR and diabetes were positively associated with cfPWV, whereas female gender was associated with lower cfPWV only in Europeans. Conclusion : Elderly Algerian women have as high as men PWV values, whereas in Europeans, women have lower than men, arterial stiffness. This lack of "gender arterial advantage in Algerians may be explained by higher BP, HR and a worse metabolic profile in Algerian women. Interventions in emerging populations, especially in women, should be a priority in order to address these risk factors by acting on current lifestyle. Keywords : Aging, gender, arterial stiffness, pulse wave velocity, Algerian

PS24 212-C-4

NEW APPROACHES FOR THE EVALUATION OF ARTERIAL AGING

Jeong Bae PARK (*Medicine/Cardiology, Cheil General Hospital, Kwandong University College of Medicine, Korea*)

Introduction : The aorta and systemic arteries in youth receive spurts of blood from the heart's left ventricle and transforms this to steady flow into peripheral arterioles and capillaries. This "tuning" of the heart to artery ascending aorta minimizes aortic pressure fluctuations and confines flow pulsations to the larger arteries. Method : However, with aging, repetitive pulsations cause fatigue and fracture of elastin lamellae of the central arteries. This causes stiffening and distension; it speeds up and amplifies the return of wave reflections from the periphery to the central aorta. In consequence, aortic systolic pressure rises, with increase of left ventricular (LV) load and decrease of

myocardial perfusion in the heart. Another consequence of aortic stiffening is pressure in diastole predisposes to myocardial ischaemia and development of microvascular disease in highly perfused organs such as the brain and kidneys. Results : Clinical manifestations of these changes are LV hypertrophy in the heart with heart failure, ischemic heart disease and arrhythmia, and small vessel degeneration in the brain and kidneys with intellectual deterioration and renal failure. How can a physician recognize aging changes in old arteries before the development of clinical vascular events? Advances are likely to involve more attention to the analysis of waveforms of pressure, flow and diameter in arteries, how they change with aging and disease, and how ill effects can be monitored and ill effects prevented with appropriate therapy. Conclusion : The 'Vascular Aging Continuum' helps understanding of these concepts, and will be introduced and discussed. Keywords : Vascular aging, artery, clinical consequence

FACING THE CHALLENGES OF LATER LIFE: LESSONS FROM SCIENCE OF PSYCHOLOGY OF AGING

PS24 305-S-1

RESILIENCE WHEN CONFRONTING COGNITIVE AGING: PREVENTION, COMPENSATION, AND ADAPTATION

Christopher HERTZOG (*School of Psychology, Georgia Institute of Technology, USA*)

Introduction : Aging is normatively associated with declines in many but not all aspects of cognitive functioning past age 60. Old age brings increasing risks of diseases with negative impact on perception and cognition, including macular degeneration, Type 2 diabetes, and atherosclerosis. Recent evidence indicates that older adults can engage in lifestyle choices and behaviors that help prevent or forestall major cognitive loss. Furthermore, preservation of functional capacity in old age may depend on self-regulatory strategies that can compensate for perceptual and cognitive changes -- maintaining level of function -- or that lead to effective adaptation to loss so as to preserve quality of life.

Method : This paper presents a selective review of the emerging empirical evidence in psychological studies of older adults' cognitive functioning in the lab and in everyday life. Results : I review studies demonstrating that older adults strive to stay active as a means of preventing cognitive decline, report using memory compensation strategies in everyday life, adapt their strategic behavior in cognitive task contexts depending on demand, and actively seek to achieve real-world goals that are cognitively demanding in an effective manner, in ways that would not necessarily be predicted from age-comparative studies of cognitive task performance. Conclusion : Older adults' resilience in the face of aging indicates that they should be seen as active influences on their cognitive and functional capacities rather than as passive targets of age-related biological changes. Keywords : cognition, adaptation, compensation

PS24 305-S-2

EMOTIONAL CHANGES ACROSS ADULTHOOD: GAINS OR LOSSES?

Helene Hoi-lam FUNG (*Psychology, Chinese University of Hong Kong, Hong Kong*)

Introduction : The literature on emotion and aging has gone through two extremes: A phase of studying older adults as depressed and lonely to a phase of recognizing that older adults are the same or better than younger adults on any index of emotion well-being. Method : This presentation will critically review the literature on age differences

in emotion experience, processing and regulation, to identify areas where older adults fare better or worse than their younger counterparts. Results : Outcomes of these age differences in emotion will also be reviewed, focusing on whether some forms of emotion or emotion regulation are more adaptive for particular age groups in specific sociocultural contexts. Conclusion : Implications of these findings for emotion aging and cross-cultural gerontology will be discussed. Keywords : affect, emotion regulation, culture

PS24 305-S-3

COPING WITH CHRONIC STRESS IN LATE LIFE: CAREGIVING AS EXEMPLAR

Bob KNIGHT (*Davis School of Gerontology, University of Southern California, USA*)

Introduction : This paper discusses the revised the sociocultural stress and coping model for culturally diverse family caregivers proposed by Knight and Sayegh (2010). Method : The paper is a theory oriented review of existing research with a focus on research from the author's lab group. Results : Research concerning the influence of cultural values on the stress and coping process among family caregivers supports a common core model that is consistent across ethnic groups and that links behavior problems, burden appraisals, and caregiver health outcomes. Familism as a cultural value appears to be multi-dimensional in its effects, with obligation values often more influential than family solidarity. The effects of cultural values and other ethnic differences in stress and coping appear to involve social support and coping styles rather than burden appraisals. Conclusion : Implications of the revised model for research and practice are discussed. Keywords: chronic stress, caregiving, cultural values

PS24 305-S-4

A DRIVING AMBITION: HOW TO KEEP DRIVING WELL INTO LATER LIFE

Nancy A PACHANA (*Psychology, University of Queensland, Australia*)

Introduction : Older adults worldwide are driving for more years, and over more miles, than ever before. Yet common speedbumps and detours encountered with aging may derail older drivers; these include sensory changes, physical declines, challenges to confidence, and changes in cognition. Method : These potential barriers to continued driving are addressed through psychological and technological research aimed at keeping older drivers in the community driving safely for longer. Results : Psychosocial research has resulted in better evaluations for older drivers, as well as programs aimed at improving driving skills, particularly those facing barriers of a psychological or self-efficacy nature. For those with progressive neurological or other disorders that make driving cessation inevitable, empirically-based intervention programs can improve social engagement and quality of life. Conclusion : Driving is an issue which health care professionals, family members and older drivers themselves find emotive and challenging to address. Psychosocial assessment and intervention strategies can ease the transitions involved in contemplating mobility and driving safety in later life. Keywords : driving, assessment, intervention

PS24 311-B

EPIGENETIC REGULATION OF AGING

PS24 311-B-1

GENOMES OF SENESCENT CELLS UNDERGO FUNDAMENTAL ARCHITECTURAL CHANGES AND DERE-

PRESSION OF TRANSPOSABLE ELEMENTS

John M. SEDIVY (*Department of Molecular Biology, Cell Biology and Biochemistry, Brown University, USA*)

Replicative cellular senescence is an important tumor suppression mechanism and also contributes to aging. Progression of both cancer and aging include significant epigenetic components, but the chromatin changes that take place during cellular senescence are not known. We used formaldehyde assisted isolation of regulatory elements (FAIRE) to map genome-wide chromatin conformations. In contrast to growing cells, whose genomes are rich with features of both open and closed chromatin, FAIRE profiles of senescent cells are significantly smoothed. This is due to FAIRE signal loss in promoters and enhancers of active genes, and FAIRE signal gain in heterochromatic gene poor regions. Chromatin of major retrotransposon classes, Alu, SVA and L1, becomes more open in senescent cells, affecting most strongly the evolutionarily recent elements, and leads to an increase in their transcription and ultimately transposition. Constitutive heterochromatin in centromeric and pericentromeric regions also becomes more open, and the transcription of satellite sequences increases. The peripheral heterochromatic compartment (PHC) becomes less prominent, and centromere structure becomes notably enlarged. Some of these large scale genomic changes are also found in cancer cells, and our study shows that these processes are already activated in normal senescent cells.

Keywords : Aging, Epigenetics, Chromatin

PS24 311-B-2

STRATEGY FOR IDENTIFYING GENETIC AND EPIGENETIC CONTRIBUTES TO EXCEPTIONAL LONGEVITY IN HUMANS

Nir BARZILAI, Gil ATZMON (*Medicine & Genetics, Albert Einstein College of Medicine, USA*)

Introduction : Aging is the major risk for diseases such as cancer, AD, type 2 Diabetes mellitus and cardiovascular disease. We hypothesize that healthy centenarians have protective genomic factors that prevent these diseases. Method : We established a unique cohort of individuals with exceptional longevity (~550 Ashkenazi Jews ages 95-112) and their offspring (approximate age 70 years) and age- and sex-matched controls without a family history of unusual longevity. Our analysis is based on a very large selection that occurs between ages 60 and 112. This selection is an opportunity to follow which genotypes have been under represented with aging ('killing' genotypes) and which have been overrepresented (longevity genotypes). Results : Using a candidate gene approach we identified a common homozygosity in favorable genotypes such as CETP VV, APOC-3 CC, a deletion at +2019 in the adiponectin (ADIPOQ) gene, FOXO3A genotype, and TSH-receptor genotype, that were associated with exceptional longevity in our cohort. Using an un-biased approach we performed GWAS we have identified aging genotypes and explored how these are buffered by longevity genes. These analyses will allow us to discover what are the target for longevity genes and develop drugs that will delay aging and will prevent several age related diseases. In addition we have discovered whole genome methylation patterns and miRNA that are typical to centenarians. Conclusion : We conclude that exceptional longevity is characterized by genetic and epigenetic changes, and that initial discovery has led to drug discovery.

Keywords : Longevity, genes, epigenetics

PS24 311-B-3

ALTERATIONS IN HISTONE MODIFICATION CONTRIBUTE TO ACCELERATED AGING

Zhongjun ZHOU (*Biochemistry, University of Hong Kong, Hong Kong*)

Introduction : A de novo G608G mutation in LMNA gene activates a cryptic splicing signal, giving rise to a truncated prelamin A termed progerin, which leads to Hutchinson-Gilford progeria syndrome (HGPS). Mice lacking prelamin A-processing metalloprotease, Zmpste24, recapitulate many of the progeroid features of HGPS. HGPS and Zmpste24 null cells are characterized by abnormal nuclear shape, disorganized heterochromatin and defective DNA damage repair. Method : We used genetically modified mouse to generate double KO mice to investigate the contribution of epigenetic changes to premature aging in Zmpste24 KO mice. Results : Here we show that A-type lamins interact with SUV39H1 and prelamin A/progerin exhibits enhanced binding capacity to SUV39H1, protecting it from proteasomal degradation and consequently increasing the level of H3K9me3. Depleting or knocking down Suv39h1 significantly reduces the level of H3K9me3, restores DNA repair and early senescence in progeroid cells. Remarkably, loss of Suv39h1 in Zmpste24 null mice reduces body-weight loss, increases bone mineral density and extends lifespan significantly. Conclusion : Thus, increased H3K9me3 mediated by enhanced Suv39h1 stability in the presence of prelamin A/progerin compromises genome maintenance, which in turn contributes to accelerated senescence in laminopathy-based premature aging. Our study provides a potential therapeutic strategy for HGPS by targeting SUV39H1-mediated heterochromatin remodeling.

Keywords: SUV39, Lamin A, H3K9me3.

PS24 312-C

FRAILITY AND SARCOPENIA

PS24 312-C-1

SARCOPENIA IN ASIA: CHALLENGES IN DIAGNOSIS AND TREATMENT

Liang-Kung CHEN¹, Li-Kuo LIU¹, Wei-Ju LEE², Li-Ning PENG¹ (*1. Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taiwan; 2. Department of Family Medicine, Taipei Veterans General Hospital Yuanshan Branch, Taiwan*)

Sarcopenia is a prevalent condition in older people and deserves extensive attention internationally. However, in Asia, the diagnosis of sarcopenia has not been standardized yet. Current epidemiological studies showed a very low prevalence of sarcopenia in Asia compared to western countries. The highest prevalence was approximately 20% but most reports showed <10% of prevalence in Asian countries, in particular in older women. Two possible possibilities of a low prevalence in Asia may include the potential cohort effect because current older people eventually did more physical activities than current younger generation. Another possibility is the limitation of DEXA. In sarcopenia diagnosis, low muscle mass were defined by 2 standard deviations below the mean of younger people by using DEXA. However, the higher adiposity of older Asian women may overestimate the appendicular muscle mass by DEXA. Therefore, we should either modify the approach of the cutoff of skeletal muscle mass measurements by DEXA or to adjust the skeletal muscle mass by weight instead of height. Nevertheless, an Asian study showed that appendicular muscle mass adjusted by height square was better related to muscle strength and physical performance than muscle mass adjusted by weight. Sarcopenia diagnosed by height-adjusted skeletal muscle index was more on lean people but is more on overweight and obese people by using weight-adjusted skeletal muscle index. In 2013, Asian Working Group for Sarcopenia proposed the Asian consensus of sarcopenia diagnosis which summarized various

challenges of sarcopenia diagnosis and treatment in Asia. Keywords : frailty, sarcopenia, skeletal muscle, DEXA

PS24 312-C-2

TOWARDS A WORLD CONSENSUS DEFINITION OF SARCOPENIA

John E. MORLEY (*Geriatric Medicine, Saint Louis University, USA*)

Introduction : A number of consensus groups have defined the criteria for sarcopenia and more recently an international group has provided a framework for screening for frailty by primary care physicians. Method : All definitions for sarcopenia require limited mobility (either gait speed or distance on the 6 minute walk) in addition to 2 standard deviations of muscle mass below the normal using DEXA or CT scan. There is movement in the United States to include grip strength in the definition. Validation data for limited mobility and low muscle mass will be presented. Results : Recently for osteoporosis the simple FRAX questions have been shown to work as well as a bone mineral density. This has led to attempts to find questions to define sarcopenia. One such questionnaire is the SARC-F: Strength, Assistance walking, Rise from a chair, Climb stairs, and Falls. Conclusion : Validation data for this approach will be presented. An update on the IAGG consensus definition for Frailty and the use of the FRAIL questionnaire for screening will be presented.

PS24 312-C-3

IS SARCOPENIA EQUIVALENT TO PHYSICAL FRAILTY?

Jean-Pierre MICHEL (*Geriatric Medicine, Geneva Medical University, Switzerland*)

This today question has a long history starting in the eighties and not yet finished. The word "frailty" started to be used by geriatricians in 1983 with the following definition: "Frailty occurs when there is diminished ability to carry out the important practical and social activities of daily living". A decade later, endocrinologists and nutritionists focused their interest on "sarcopenia", which was defined as the "involuntary decrease of skeletal muscle mass during ageing" and proposed to call this phenomenon Between 1993 and today, 3'215 scientific papers were devoted to frailty, while 1'721 were focused on sarcopenia. The publication rate of papers has been depending greatly of key papers* proposing more precise definitions of both terms. But, the absence of consensual working definition slowed scientific research. A precise analysis of risk factors, symptoms and signs as well as consequences of these two clinical conditions testifies the close relationships between frailty and sarcopenia. Their pathogenesis links them in a vicious cycle starting by ageing and malnutrition, sarcopenia before reaching the frailty and disability thresholds leading to similar poor outcomes (repeated falls, mobility impairment, disability, institutionalization and death). Moreover, it appears more and more precisely that these two clinical conditions are both reversible. Resistance and aerobic physical exercises are key therapeutic approaches recently completed and enhanced by amino acid supplements. These new and important discoveries allow preventing or delaying the onset of both sarcopenia and frailty. Sarcopenia leads to physical frailty and can be considered as the equivalent of physical frailty. *L FRIED et al in 1998 for frailty and A CRUZ JENTOFT et al in 2010 for sarcopenia; Keywords : Frailty, Sarcopenia, Functional decline

PS24 312-C-4

REVERSIBILITY IS THE MAIN AND COMMON CHARACTERISTICS OF FRAILTY AND SARCOPENIA

Hidenori ARAI (*Department of Human Health Sciences, Kyoto*

University Graduate School of Medicine, Japan)

Introduction : Frailty and sarcopenia are now in the front line of geriatric research. One feature that distinguishes them from aging per se is the potential reversibility. Resistance training is feasible for frail elderly and can increase muscle mass and strength along with amelioration of physical functions, while inadequate intake of dietary energy and protein are important causes of frailty and sarcopenia. A major challenge in preventing sarcopenia-induced frailty is developing public health interventions that deliver an anabolic stimulus to the muscle of older adults. Only resistance training with or without nutritional supplementation has shown its efficacy in increasing skeletal muscle mass. We also studied the effects of the combination of resistance training and multinutrients supplementation (including vitamin D and protein) on muscle mass and physical performance in frail older adults. Method : This trial was conducted in Japanese frail older adults (n=77), which underwent a standardized protocol of a 3-month resistance training intervention. They were divided into two groups; exercise only and exercise plus multinutrient supplementation. Results : The older adults assigned to exercise and nutritional supplementation had significant improvements for skeletal muscle mass index and maximum walking time, compared to those assigned to exercise only. The prevalence of sarcopenia was also significantly decreased. Conclusion : Thus our study indicates that the combination of resistance training and multinutritional supplementation may be more effective at improving muscle mass and walking speed than an intervention only based on resistance training. More evidence is needed to establish the public interventions to prevent sarcopenia and frailty in the elderly. Keywords : nutrition, physical exercise.

MITOCHONDRIA QUALITY CONTROL AND AGING

PS24 411-B-1

THE ROLE FOR MTDNA MUTATIONS IN AGING

Nils-goran LARSSON (*Max Planck Institute for Biology of Ageing, Germany*)

Introduction : The mtDNA genome only encodes 13 of the ~103 proteins present in mammalian mitochondria, but mtDNA expression is nevertheless critical for oxidative phosphorylation. Pathogenic mtDNA mutations often coexist with wild-type molecules and undergo segregation. The transmission of mtDNA is asexual, i.e. mtDNA is only transmitted from the mother to the offspring and recombination does not occur in the germ line. Germ-line transmission of mtDNA is subject to a bottleneck phenomenon whereby only a subpopulation of the mtDNA molecules in female germ cells is transmitted to the embryo. In addition, there is a mechanism for purifying selection in the female germ line, which selects against amino acid substitutions. Point mutations and deletions of mtDNA accumulate in a variety of tissues during ageing in humans, monkeys and rodents. To study the link between mtDNA mutations and ageing, we have previously generated homozygous knockin mice expressing an error-prone form of the catalytic subunit of the mtDNA polymerase, PolgA. These mice have an mtDNA mutator phenotype with a substantial increase in the levels of point mutations, as well as increased amounts of linear deleted mtDNA molecules and develop a premature onset of ageing-related phenotypes. Remarkably, reactive oxygen species seem to have no role in inducing the ageing phenotypes. The challenges for the future are to understand the molecular mechanisms governing basic principles in mitochondrial genetics (mitotic segregation, the bottleneck phenomenon and purifying selection). Conclusion : In addition we do not know how somatic mutations of mtDNA are generated and

when in life they start to appear.

PS24 411-B-2

MITOCHONDRIAL ROS AND AGING

Takamasa ISHII¹, Phil S HARTMAN², Naoaki ISHII^{1*} (1. Department of Molecular Life Science, Tokai University School of Medicine, Japan; 2. Department of Biology, Texas Christian University, USA)

Introduction : We have previously demonstrated that the excessive mitochondrial superoxide production caused by mitochondrial complex II SDHC mutations results in premature death in *C. elegans* (G71E) and *Drosophila* (I71E) and cancer in mouse embryonic fibroblast cells (V69E) (M. Tsuda, et al. BBRC 2007, T. Ishii, et al. Cancer Res. 2005, N. Ishii, et al. Nature 1998). In humans, it has been reported that mutations in SDHB, SDHC or SDHD often result in inherited head and neck paragangliomas (PGLs). **Method :** The Tet-mev-1 conditional transgenic mice were established using our uniquely developed Tet-On/Off system, which can induce the mutated SDHC V69E gene to be equally and competitively expressed compared to the endogenous wild-type SDHC gene. Tet-mev-1 mice experienced mitochondrial respiratory chain dysfunction that resulted in superoxide overproduction. **Results :** The mitochondrial oxidative stress caused excessive apoptosis leading to low birth weight and growth retardation in the neonatal developmental phase in Tet-mev-1 mice (T. Ishii, et al. Mitochondrion 2011). Tet-mev-1 mice also display precocious age-dependent corneal physiological and pathological changes, such as dry eye, keratitis, Fuchs's corneal dystrophy (FCD) and probably keratoconus (H. Onouchi, et al. Invest. Ophthalmol. Vis. Sci. 2012 and Y. Uchino, et al. PLoS ONE 2012). **Conclusion :** These results indicate that the Tet-mev-1 mice will be useful in clarifying the effects of excessive mitochondrial oxidative stress on age-dependent various diseases. **Keywords :** Mitochondria, Oxidative stress, Aging

PS24 411-B-3

MITOCHONDRIAL DYSFUNCTION AND METABOLIC ALTERATION IN CELL SENESCENCE

Hae-ok BYUN, Hyun-jung JUNG, You-mie KIM, Gyesoon YOON (Dept. of Biochemistry, Ajou University School of Medicine, Korea)

Introduction : Metabolic alterations including mitochondrial dysfunction has often been reported as characteristic phenotypes of senescent cells. However, it is not clear what is overall consequence of senescent metabolic features and how they are developed and linked to the other senescent phenotypes, such as enlarged cell volume, increased granularity, or oxidative stress. Recently, we investigated multiple roles of glycogen synthase kinase 3 (GSK3) in development of the metabolic alteration in cell senescence. **Method :** Glycogenesis, lipogenesis, and mitochondrial respiration were monitored by employing diverse cellular senescence systems. **Results :** First, GSK3 inactivation increases glycogenesis through activating glycogen synthase, GSK3 inactivation increases glycogenesis through activating glycogen synthase, associated with cellular granularity increase, one of the typical senescence phenotypes. Second, GSK3 inactivation (phosphorylation) enhances lipogenesis through activating SREBP1. This event is linked to organellar and cellular mass increase. Third, GSK3 inactivation augments cellular protein synthesis. Finally, mitochondrial GSK3 inactivation inhibits respiratory complex IV activity through decreasing phosphorylation of complex IV subunit 6b, progressively producing mitochondrial ROS and placing the cell under continuous oxidative stress. **Conclusion :** Taken together, our results suggest that GSK3 may be a master player controlling metabolic shift toward anabolism and maintaining oxidative stress, thereby contributing to senescence development. **Keywords :** Cellular

senescence, Metabolic alteration, Mitochondrial dysfunction

PS24 411-B-4

MODULATION OF MITOCHONDRIA PHYSIOLOGY BY NICOTINAMIDE-INDUCED MITOPHAGY AND POSSIBLE INTERVENTION OF IMMUNESENESCENCE

Eun Seong HWANG (Life Science, University of Seoul, Korea)

Introduction : Nicotinamide (NAM), when administered at high doses, exerts positive effects on survival of various cell types in vitro and in vivo. In addition, NAM treatment increases replicative lifespan of normal human cells. In NAM-treated fibroblasts, mitochondria content decreased while their membrane potential increased. Along with these changes, both cellular levels of ROS and oxidative damage on the mitochondrial proteins decreased and autophagy activity was increased. Thereby, the improvement of mitochondria quality through activation of mitophagy has been proposed as a part of the underlying mechanism for the cell-beneficial effects of NAM. **Method :** In this study, we further examined the effect of NAM on T cell activation, which is accompanied by a rapid increase in the content of mitochondria and ROS. Primary CD8+ T cells were isolated and activated by CD3/CD28 antibody stimulation. **Results :** When naive T cells were activated in the presence of NAM, the increase of the mitochondria content and ROS was substantially attenuated. Moreover, the population grew at higher rates and to higher extent. This could be attributed to a decrease in the ROS-triggered activation-induced cell death (AICD) which is physiologically responsible for the population contraction after activation. Importantly, this occurred without a delay in the onset of contraction or a decrease in T cell effector function. NAM treatment also attenuated the increase in the level of cytosolic Ca⁺⁺, another factor for AICD. **Conclusion :** These, if occurred in aging human body, which suffers from declining T cell activation, would exert a significant beneficial effect against immunosenescence. **Keywords :** nicotinamide, T cell activation, mitophagy, ROS, immune senescence

PS24 501-R

INTERNATIONAL PERSPECTIVES ON POVERTY AND LIVEABILITY OF OLDER PERSONS

PS24 501-R-1

POVERTY AND LIVEABILITY: DEFINITIONS, CONCEPTS AND PERSPECTIVES

Judith PHILLIPS (Centre for Innovative Ageing, Swansea University, United Kingdom)

Introduction : The concept of 'liveability' is multi-dimensional, comprising the material, social, institutional, built and natural environments- contexts in which older people live to enable a good quality of life and self-determination. It includes both objective and subjective factors: how people feel about and make sense of their situation is as important as the situation itself in determining how they experience quality of life. Poverty is also multi-dimensional and presents threats to the survival of older people and their ability to take action as well as participate in the circumstances of their lives. Structural provision throughout the life course that enables adequate resources/income and an adequate standard of living is crucial for liveability in later life. Similarly supportive living environments are necessary for a good quality of life. **Method :** The presentation will draw on an international literature review of liveability. **Results :** Survival in the face of extreme environmental conditions is the foremost challenge to assessing the supportiveness (or lack) of living environments and older people's contribution to shaping the different

contexts of liveability even in environments of poverty. Definitions, concepts and different perspectives on poverty and liveability need to be discussed to assist in a way forward to empower older people and provide a platform for policy reform. Conclusion : Consequently, we need to understand the social forces influencing liveability and which of these create risk and poverty at an individual level as well as community and societal levels. Keywords : Liveability, Poverty, Environment

PS24 501-R-2

CONCEPTUALIZING LIVEABILITY IN THE CONTEXT OF WELL-BEING OF OLDER SOUTH AFRICANS

Suzan VAN DER PAS¹, Norah KEATING², Serela RAMCLASS³, Brian O'LEARY⁴, Bilkish CASSIM³ (1. *Dept Epidemiology & Biostatistics, VU University Medical Center, Netherlands*; 2. *Human Ecology, University of Alberta, Canada*; 3. *Medicine, University of KwaZulu-Natal, South Africa*; 4. *eThekweni Municipality, eThekweni Municipality, South Africa*)

Introduction : Liveability concerns the influence of the social, economic, and environmental contexts of older people on their quality of life. It includes both objective and subjective factors: how people feel about and make sense of their situation is as important as the situation itself. Living conditions of older people warrant further exploration since so much of their time is spent in the near environment of home and neighbourhood. Method : In this study we investigate indicators of liveability and their impact on wellbeing among older persons in KwaZulu-Natal, South Africa. Data were collected in 2010 in a random sample of 1,008 subjects, aged 60 years and over. Liveability was measured through physical and social aspects of housing (access to electricity, water, toilet; feeling safe in the home) and neighborhood (walking outside, shopping for groceries, feeling safe from crime in neighborhood). Wellbeing was based on a question on general life satisfaction. Results : Regression analyses revealed that those who have housing (electrical appliances, water and toilet inside) and neighbourhood (feeling safe, walking and shopping) resources have a higher wellbeing compared to those who do not have housing or neighbourhood resources. A positive association was also found between perceived housing and neighborhood safety and satisfaction with the dwelling. Conclusion : Both the physical and social aspects of housing and the neighbourhood impact the wellbeing of older South Africans though characteristics of home especially feelings of safety are particularly important. Keywords : liveability, quality of life, neighbourhood

PS24 501-R-3

POVERTY-IMPACTS ON SUBJECTIVE WELL-BEING IN OLD AGE IN SUB-SAHARAN AFRICA: INTER-GENERATIONAL AND PSYCHOSOCIAL DIMENSIONS

Isabella ABODERIN¹, Jaco Retief HOFFMAN² (1. *APHRC / OIPA, APHRC / Oxford University, Kenya*; 2. *OIPA / AUTHeR, Oxford University / NWU, South Africa*)

Introduction : Sub-Saharan Africa is the world's poorest and 'least developed' region where ageing largely occurs against a backdrop of considerable economic, infrastructural and personal strain. Within this context, there is a growing recognition and policy concern about older people's particular vulnerability to income insecurity and a lack of access to essential services. Yet, the impacts of such contexts of deprivation on older people's experiential well-being and quality of life (QOL) remain poorly understood. This study presents an interpretive investigation, based on older people's own perspectives, of the extent to, and ways in which poverty 'gets under the skin' to affect

their/ quality of their lives and wellbeing. Method : Empirical data is drawn from in-depth qualitative investigations undertaken among samples of community-dwelling older people in South West Nigeria (N=22) and South Africa (N=21) spanning a spectrum of rural-urban and gender groups. Analysis draws on sociological and gerontological theoretical perspectives on older people's subjective evaluations of their material conditions; Results : Severe poverty and exclusion, especially where they affect older people and their offspring, have a profound, experienced impact on the former's subjective- and, consequently, physical well-being. The impact is mediated, above all, through psychosocial pathways that are shaped by culturally defined age norms and role identities. Conclusion : Contexts of poverty have major effects on older people's well-being in SSA beyond their material impacts, with intergenerational and psychosocial dimensions playing a key role. Policies to provide social protection across generations are needed to mitigate these effects. Keywords : sub-Saharan Africa; poverty; subjective well-being

DISEASE OR DISABILITY; IMPACT OF GERIATRIC DISEASES ON FUNCTIONAL OUTCOME

PS24 512-C-1

INTERVENTIONAL OUTCOMES ON CHRONIC KNEE PAIN

Hunkyung KIM (*Epidemiology, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : Knee pain is a common health problem, and is a major cause of long-term care and mobility limitations in the elderly population, and non-invasive treatments for knee pain have been recommended as first line treatments in the management of knee pain. This study was conducted to investigate the effects of exercise with or without thermal therapy on community-dwelling elderly women with chronic knee pain. Method : Women over 75 years of age with chronic knee pain (n=150; mean age=80.5±2.41) were randomly assigned into four groups; exercise and heat-and-steam generating sheet (HSGS), exercise, HSGS, or health education. The exercise group attended a 60-minute comprehensive training program twice a week for 3-months. The HSGS group placed two sheets on the knee for five hours per day. Visual analogue scale (VAS), Japanese knee osteoarthritis measure (JKOM), and functional fitness were assessed at baseline and post-intervention. Results : Muscle strength, and mobility significantly improved in the exercise+HSGS group compared with the health education group. VAS improved in the exercise+HSGS and HSGS groups. Total JKOM, pain and stiffness, and condition in daily life scores only improved significantly in the exercise+HSGS group. The odds ratio for VAS and walking speed improvement was more than eight times as great in the exercise+HSGS group (odds ratio=8.63, 95%CI=2.80-29.83) compared with the education group. Conclusion : Exercise alone was insufficient in improving pain and quality of life. The combined effects of both exercise and heat therapy seems to have an added benefit of decreasing pain, improving quality of life and increasing physical function. Keywords : Chronic knee pain, exercise, heat and steam generating sheet

FAMILY STRUCTURE ON THE RELATIONSHIP BETWEEN MULTIPLE CHRONIC DISEASES AND DEPRESSIVE SYMPTOMS IN KOREAN ELDERLY

Dong Hoon OH¹, Shin Ah KIM², Hye Young LEE², Bo-young CHOI², Jung Hyun NAM^{1*} (1. *Psychiatry, Hanyang University, Korea*; 2. *Preventive medicine, Hanyang University, Korea*)

Introduction : The aim of this study was to investigate the potential effect of family structure on the relationship between multiple chronic diseases and depressive symptom. **Method :** We analyzed cross-sectional data collected from 67,998 Korean elderly aged 60 yr and above who participated in a Korean Community Health Survey conducted in 2009. **Results :** The prevalence of MCC in men was much higher than in women and the prevalence increased as the age of subjects was increased. The prevalence of depressive symptom in men and women were 9.0% and 16.1%, respectively. The prevalence of depression in various groups was increased as the number of chronic diseases was increased. The prevalence of depressive symptom was lowest in elderly who lived in 3 generations family and was highest in elderly who lived in 1 generation family, when the number of MCC was stratified. The prevalence of depressive symptom in elderly who were live with spouse were lower than in elderly who were live alone when the number of generations and MCC were stratified. **Conclusion:** We confirmed the potential effect of family structure on the relationship between multiple chronic diseases and depressive symptom. We need to more sophisticated analysis and should make a search for developing the methods and strategies to assess and to manage the depressive symptoms in persons with multiple chronic diseases, especially vulnerable risk people such as elderly who live without spouse and in small family. **Keywords :** Family structure, Depression, Chronic disease, Elderly

PS24 512-C-3

DEFINITION OF POLYPHARMACY TO PREVENT DRUG-RELATED GERIATRIC SYNDROME

Masahiro AKISHITA (*Department of Geriatric Medicine, The University of Tokyo, Japan*)

Introduction : Polypharmacy is a well-known risk for adverse drug reactions (ADR), but is frequently seen in elderly patients because of multiple geriatric conditions. We aimed to determine the cut-off number of drugs in relation to drug-related geriatric syndrome. **Method :** Study I: Hospital records of 2412 patients (mean age = 79 years) who were admitted to our department were analyzed. Study II: A total of 172 patients (mean age = 76 years) of a geriatric outpatient clinic in Tokyo were followed up for 2 years. **Results :** Study I: The number of prescribed drugs per patient was 6.6 ± 3.6 , and ADR were observed in 252 patients (10.5%). ADR was significantly associated with the number of drugs in multiple logistic regression analysis. The odds ratio of ADR was significantly higher in the groups taking six or more drugs. Furthermore, ROC analysis showed that the optimal cut-off number of drugs was six. Study II: Thirty-two patients (18.6%) experienced falls within 2 years. On multiple logistic regression analysis, the number of drugs was associated with falls, independent of age, sex, number of geriatric conditions and other factors. ROC analysis showed that the optimal cut-off number of drugs was five. **Conclusion :** These findings suggest that polypharmacy may be defined as 5 or 6 drugs to prevent drug-related geriatric syndrome. Intervention studies examining the effect of drug review and reduction on geriatric syndrome are required to confirm this. **Keywords :** Falls, Adverse drug events

PS24 512-C-4

STUDIES ON GERIATRIC SYNDROME, CO-MORBIDITY AND FUNCTIONAL OUTCOME

Ching-yu CHEN (*Department of Family Medicine, College of Medicine, National Taiwan University, Taiwan*)

Introduction : Clinical manifestations of geriatric diseases are closely related to co-morbidity and declining physical functions. Definition of

frailty can further intensify the core component in geriatric care. **Method :** During 2006 to 2010, a three year cohort study of physical frailty has conducted in older ambulatory outpatients at National Taiwan University Hospital. All of the eligible elderly subjects were invited to accomplish clinical assessment, structuralized questionnaire evaluation, anthropometric measurements, frailty evaluation by Fried Frailty Index, and physical functions performance including muscle strength in upper and lower extremities, timed up&go test, and 5m walking time regularly. Additionally, their active chronic diseases and adverse outcome evaluations were recorded every 3 months follow-up. **Results :** Total 312 participants (geriatrician care 189 and usual care 123), aged 65 to 90, were recruited for comprehensive geriatric assessment and regularly followed up. The results showed as follows: (1) No single frailty index transition predicts all outcomes. Transition of accumulation deficits better predict outcomes than phenotypic frailty in elderly. (2) Grip strength and walking speed were important indicators to reduce risk of functional decline and adverse outcomes including frailty transition, disability transition, and transition from frailty to disability. (3) frailty could predict both social and environmental quality of life (QOL) 2 years after by path analysis. Depressive emotion (GDS) served as a mediator for frailty to all 4 aspects of QOL. **Conclusion :** For clinical applications, timely recognition of frailty in older patients with chronic diseases can predict and provide opportunities to prevent poor functional outcomes and to improve the quality of life. **Keywords :** Frailty, co-morbidity, functional decline

AGEING INTERVENTIONS AND MECHANISMS

PS25 102-B-1

PEPTIDERGIC REGULATION OF AGEING: PEPTIDES INCREASE VITALITY RESOURCE

Vladimir KHAVINSON¹, Boris VANYUSHIN² (*1. Biogerontology, Saint Petersburg Institute of Bioregulation and Gerontology, Russia; 2. Belozersky Institute of Physico Chemical Biology, Lomonosov Moscow State University, Russia*)

Introduction : Peptides restore functions of different organs of aging. The most valuable effect of peptide correction of age-related changes in animals consists in 25-30% increase in the average lifespan and 42% increase in the maximal lifespan. **Method :** Peptides Lys-Glu and Ala-Glu-Asp-Gly increase the amount of heterochromatin 1.4-1.7-fold in the lymphocytes of the elderly people. In transgenic mice they suppress expression of the breast cancer gene HER-2/neu 2-3.6-fold and reduce tumour diameter. In the culture of fibroblast cells peptide Ala-Glu-Asp-Gly induces expression of the gene of telomerase, contributes to the 2.4-fold lengthening of telomeres accompanied by an increase in the number of cell divisions by 42.5% and correlates with an increase of the lifespan in animals. Application of the pineal and thymus peptides in patients (15 years of observation) led to the reliable improvement of physiological functions and reduction of the mortality rate in people aged 65 years and older. **Results :** Peptides bind to deoxyribonucleotides which are targets for DNA methylation in eukariots and modulate wheat endonucleases. Binding of peptides with promoter CG or CNG sites of the DNA can make these sites be inaccessible for DNA-methyltransferases. As a result promoter remains unmethylated, this being a factor of genes activation. **Conclusion :** Thus, peptidergic regulation of gene expression is manifested at all levels of living matter organisation and is common for all eukaryotic organisms. Changes in the expression of

genes are accompanied by the restoration of the synthesis of proteins encoded by relevant genes. Keywords : peptides, pineal gland, thymus, resource

PS25 102-B-2

HORMETICS, HORMESIS AND HORMETINS FOR EXTENDING HEALTH-SPAN AND LONGEVITY

Suresh RATTAN (*Laboratory of Cellular Ageing, Aarhus University, Denmark*)

Ageing occurs in spite of the presence of complex pathways of maintenance, repair and defence, and there is no “enemy within”. This viewpoint makes modulation of ageing different from the treatment of one or more age-related diseases. A promising strategy to slow down ageing and prevent or delay the onset of age-related diseases is that of mild stress-induced hormesis by using hormetins. Physical, nutritional and mental hormetins, which initiate stress responses and strengthen the homeodynamics, are potentially effective aging modulators. The rationale and a strategy for discovering novel hormetins as potential drugs for aging intervention are presented, by elucidating multiple stress responses of normal human cells in culture. Establishing immediate and delayed stress response profiles, followed by cell type-specific functional assays, after exposure to natural or synthetic compounds and mixtures, is the first step in identifying prospective hormetin drugs. A recent example of a successful product development based in the ideas of hormesis and by following the strategy described here is a skin care cosmetic. As a biomedical issue, the biological process of aging underlies all major diseases, and although the optimal treatment of every disease, irrespective of age, is a social and moral necessity, preventing the onset of age-related diseases by intervening in the basic process of aging is the best approach for achieving healthy aging and extending the healthspan.

Keywords : longevity, stress, hormesis

PS25 102-B-3

MULTIFUNCTIONAL MORTALIN AS AN AGEING MODULATORY MACROMOLECULE

Renu WADHWA, Sunil KAUL (*Biomedical Research Institute, National Institute of Advanced Industrial Science & Technology (AIST), Japan*)

Introduction : Mortalin is a member of the hsp70 family stress proteins. It is a dynamic protein with several essential functions including chaperoning, intracellular trafficking, mitochondrial import of proteins, regulation of cell proliferation and oxidative stress signaling that are essential for continued proliferation of cancer cells. In contrast to its enrichment in cancer cells, the level of mortalin was seen to decrease in cultured senescent cells and in brain samples from Parkinson’s disease patients. Knockdown of mortalin homologue in worms (*C. elegans*) caused progeria like phenotype, associated with abnormalities in mitochondria and accumulation of molecular damage. Method : Biochemical, molecular and cell biological analyses of mortalin function in human cultured (normal and cancer) cells and during old age pathologies. Results : We report an existence of mortalin in the nucleus of cancer cells that causes (i) strong inactivation of tumor suppressor protein, p53, resulting in aneuploid cells, (ii) activation of telomerase, (iii) activation of heterogeneous ribonucleoprotein-K (hnRNP-K) leading to aggressively malignant and metastatic cancer cells. Cancer cells compromised for mortalin function enter growth arrest or apoptosis, the two innate checkpoints to carcinogenesis. Interestingly, mortalin was shown to be an important protein for neuronal differentiation and its overexpression was able to rescue cells against β -amyloid toxicity in cellular models of

Alzheimer’s disease. Overexpression of mortalin in normal human fibroblasts was shown to cause their lifespan extension. Conclusion : Mortalin plays an important role in stressed physiologies like aging and cancer and hence is an attractive candidate for preventive and therapeutic interventions. Keywords : mortalin, stress, multifunction

PS25 102-B-4

GEROPROTECTIVE ACTION OF THE PINEAL PEPTIDE IN PREMATURELY AGEING HUMANS: THE RESULTS OF LONGITUDINAL STUDY

Oleg KORKUSHKO, Valeriy SHATYLO*, Vadym ISHCHUK (*Clinical Physiology & Pathology of Internal Organs, State Institute of Gerontology Chebotarev named NAMS of Ukraine, Ukraine*)

Introduction : To evaluate the results of long-term use of pineal peptide (PP) in elderly patients with accelerated aging (AA) and coronary artery disease (CAD). Method : 79 patients, aged 65±3 years were divided into 2 groups. The 1st group patients (n=39) were administered PP during 1992-1996, the 2nd group patients (n=40) were not prescribed PP. For both groups the low doses of acetylsalicylic acid, ACE inhibitor, beta-blocker and simvastatin were prescribed during 1992-2007. Functional age (FA) was determined using indices of exercise working ability and hemodynamics at peak exercising. Over 15 years the causes of fatalities were verified. Results: After treatment with PP the degree of aging, that is the difference between FA and chronologic age, was decreased by 3.6 years. In of 2nd group the degree of aging increased by 4.5 years (p<0.05). In year 2007, the FA of patients, who had been administered PP, was significantly lower than in patients who did not receive PP. After 15 years since we began using PP, there remained 26 of 39 survivors (66.7%) in 1st group. In the 2nd group only 16 of 40 (40%) CAD patients were survived. Construction of Kaplan-Meier survival curves showed a statistically significant reduction of deaths from all causes among patients of 1st group. Long-term intake of PP reduced mortality rates relative cardiovascular disease. Conclusion : The results have shown that long-term use of the PP may reduce the rate of aging in elderly CAD patients. Prolonged use of PP significantly reduced a risk of premature death due to cardiovascular events. Keywords : Pineal peptide, geroprotection

THE INTERVENTION OF AGEING: APPROACHES AND STRATEGIES FOR THE DIGITAL AGEING ERA

PS25 201-R-1

RESPECT FOR THE ELDERLY IN EAST ASIA: CONTINUITY AND CHANGE

Kyu-taik SUNG (*Center for Filial Piety Culture Studies, Korea*)

Introduction : This presentation is to describe the way in which the overlooked value of elder respect is practiced by peoples in East Asia. Method : Based on empirical studies conducted in Korea, China, and Japan, an inventory of the forms of elder respect is formulated. Results: The studies reveal the commonality among East Asians in terms of their practice of multiple forms of elder respect, and that the forms are widely practiced among the three peoples. Conclusion : Gerontologists tend to emphasize instrumental and quantitative aspects of eldercare, and to undervalue affective and qualitative aspects of it, e.g., respect for the aged. Expressions of elder respect among the three peoples strongly resemble, as all of them have been much influenced by the Confucian ethical conception of filial piety. The expressions are shifting, however. The shifts indicate a new trend emerging--a move from authoritarian and patriarchal relationships to egalitarian and

reciprocal patterns of mutual support between generations. To counter the immense challenge from social changes, East Asians are searching for alternative ways of upholding the traditional value of elder respect. The East Asians would have to implement their own unique policies and programs for the aged in changing times by incorporating the traditional cultural value, which has, for many generations, integrated the elderly with the family and society, and enhanced the dignity and worth of aged persons. Keywords : filial piety, communality among East Asians, changing trend of elder respect

**PS25 201-R-2
MAINTENANCE OF HEALTHY BRAIN: PUTATIVE INTERVENTIONS OF DEMENTIA**

Takeshi TABIRA (*Department of Diagnosis, Prevention and Treatment of Dementia, Graduate School of Medicine, Juntendo University, Japan*)

Introduction : Amyloid-beta protein (A-beta) is produced and secreted with nerve activities at the presynaptic terminal, which is degraded quickly mainly by neprilysin. Phagocytosis by microglia and astrocytes and cerebrospinal fluid flow are also involved in the clearance of A-beta. The aging process seems to reduce all these activities, resulting in increase of A-beta in the nerve parenchyma. The increased A-beta aggregates to form oligomers which acquire synaptotoxicity and neurotoxicity. To keep our brain healthy, prevention of these processes is a key issue. Physical and cognitive exercise and certain nutrient may delay the mechanism, but it is uncertain how these protective factors act on the degradation and clearance of A-beta. Recently selective serotonin reuptake inhibitors were shown to reduce A-beta production and reduction of amyloid deposits in humans. Since the aggregated form of A-beta is recognized by immune system, immune-mediated enhancement of clearance is thought to be a hopeful strategy for prevention and treatment of age-related brain amyloidosis, Alzheimer's disease (AD). Since immunization trial with synthetic A-beta1-42 and adjuvant induced autoimmune encephalitis, trials with antibodies to A-beta are on-going. A humanized monoclonal antibody was reported effective in mild AD. Human intravenous immunoglobulin was also reported effective in slowing progression of AD. However, antibodies are extremely expensive, active immunization therapies are also developed. Method : We developed an oral vaccine using recombinant adeno-associated virus vector carrying A-beta1-43. Results : It was safe and efficient in AD mice and aged monkeys. Conclusion : Immunization is one of good strategies for brain anti-aging. Keywords : Alzheimer immune vaccine

**PS25 201-R-3
GERIATRIC APPROACHES BASED ON PREVENTION OF AGE-RELATED DISEASES**

Belong CHO (*College of Medicine, Department of Family Medicine, Seoul National University, Korea*)

Because it has been revealed that multiple factors are involved in occurrence of age-related chronic disease, the most important strategy in geriatric approaches to prevent age-related disease is 'Comprehensiveness'. Comprehensive preventive geriatric approaches start with comprehensive geriatric assessment which screens not only disease surrogate markers but also risk factors. Preventive approaches usually categorized the first and second, third. The first approaches with healthy lifestyle should start and be established as early as possible in life. The second approaches are to screen some diseases before their symptoms develop. The third approaches focus on adequate disease management not to develop complications from the

disease. This session will be talked about these comprehensive geriatric approaches to prevent chronic diseases in the clinics. Keywords : Age-related disease, Comprehensive care, Clinical prevention

**PS25 201-R-4
ANTI-AGING INTERVENTION: EPIGENETIC APPROACH**
Byung Pal YU (*Physiology, University of Texas Health Science Center, USA*)

Introduction : In the past, various intervention approaches have been tried with limited success. Using laboratory models, most attempted genetic modification, gene modulation, antioxidants and nutritional supplements, and pharmacologic agents. It is now known that the efficacy of these tests was limited mainly to the disease suppression, not necessarily the aging intervention. Recent studies made clear that to be effective, both the retardation of aging process and suppression of disease are required for the maximum intervention. Method : Recent advances in molecular biology proved that the aging is predominantly epigenetic process influenced by the extrinsic lifestyle like nutrition and exercise. Epigenetic analyses on aged animals and centenarians revealed altered DNA, histone, and chromatin, signifying the possibility that these altered structures can be targeted and prevented by anti-aging manipulations. It is now technically feasible to regulate gene expression by manipulating histone and chromatin that are altered by aging and diseases as exemplified by well-publicized resveratrol and many cancer drugs. Results : This presentation reviews what is epigenetics and why epigenetic approach would be more effective intervention by highlighting its merits and advantages over other measures. One distinct advantage of epigenetic intervention is the efficacy generated from epigenetic modifications may potential be passed onto subsequent generations through transgenerational inheritance without changing gene sequence. Conclusion : In summary, epigenetic approach promises a brighter future for the successful intervention because it attenuates both aging and its associated diseases by modifying the hierarchical histone and chromatin that are the master controllers for gene silencing and activation. Keywords : Epigenetics, Aging intervention, Healthy longevity.

**PS25 202-B
STEM CELLS REGULATION AND USE DURING HEART AND LIVER REGENERATION**

**PS25 202-B-1
EPIGENETIC REGULATION IN STEM CELLS AND ITS POSSIBLE ROLE IN AGING**

Mario FERNANDEZ FRAGA (*IUOPA, CNB-CSIC, Spain*)

Epigenetic mechanisms are essential elements for the regulation of cellular differentiation and the maintenance of cell type-specific gene expression patterns. They manipulate gene expression directly through modification of DNA (DNA methylation) or indirectly via modification of chromatin. Chromatin functionality and structure is tightly linked to covalent modification in histones which are regulated by histone modifying enzymes. Sirtuins are a class of histone deacetylases that play an essential role in the cellular response to environmental stress, promoting DNA repair, telomere stability, cell cycle arrest, cellular senescence and apoptosis. Much attention has been given to the role of sirtuins in aging and cancer development; however, less is known about their role in stem cell regulation. I will focus my talk in this topic and I will discuss the possible implications in adult stem cell aging. Keywords : Epigenetics, aging, stem cells

PS25 202-B-2

HEPATOCTYTE SENEESCENCE: IMPLICATIONS FOR THE LIVER AND ITS DISEASES

Malcolm ALISON (*Tumour Biology, Barts Cancer Institute, Charterhouse Square, United Kingdom*)

Introduction : The liver in a healthy young to middle aged mammal is highly efficient at replacing hepatocytes, lost by either acute toxic injury or 'wear and tear'. On the other hand, in aged individuals many hepatocytes become reproductively sterile, unable to re-enter the cell cycle. Chronic liver injury also results in hepatocyte senescence, and further liver cell loss provokes activation of a facultative stem cell response located within the intrahepatic biliary tree. These so-called hepatic progenitor cells (HPCs) represent a transit amplifying compartment ultimately able to differentiate into hepatocytes. Method: We can model the HPC in rodent livers by chemically blocking hepatocyte regeneration after partial hepatectomy, shifting the burden of regeneration to these biliary-derived cells. We monitor the HPC response in rodents and man using in situ hybridization and immunohistochemical techniques for detection of biliary and hepatocytic mRNAs and proteins. We have also sought the existence of clonal populations in the human liver to prove the existence of stem cells, achieved by looking for families of hepatocytes sharing identical mtDNA mutations. Results : The HPC response is activated only when hepatocyte regeneration is compromised after liver injury. Clonally-derived hepatocyte populations exist in human liver and appear to emanate from the portal areas and migrate towards the central veins. The HPC response is activated in many types of cirrhosis, a disease that often is associated with senescence. Importantly, the cirrhotic regenerative nodules are clonal populations derived from HPCs. Conclusion : The HPC response represents a life-saving back-up system activated by ageing-associated regenerative stress. Keywords : liver, senescence, regeneration

PS25 202-B-3

ATTENUATION OF CARDIAC STEM CELL SENEESCENCE ENHANCES CARDIAC REPAIR

Antonio Paolo BELTRAMI (*Department of Medical and Biological Sciences, University of Udine, Italy*)

Introduction : Cardiac Stem Cells (CSC) expanded in vitro from explanted hearts of elderly patients suffering from end stage heart failure (E-) are characterized, compared to those obtained from young donors (D-), by shorter telomeres, a larger fraction of cells showing: telomere induced dysfunction foci, p16 and p21 positivity, and reduced proliferation and migratory capabilities. Aim of the study was to verify if CSC senescence impairs the in vivo reparative potential of cardiac primitive cells. Additionally, we investigated the pathways involved in E-CSC senescence and tested drugs able to reduce E-CSC senescence in vitro and to restore their reparative ability in vivo. Method : The ability of CSC to repair a myocardial infarction was evaluated in SCID/beige immunodeficient mice. Western blot analysis was performed to assess molecular determinants of E-CSC dysfunction. Results : D- CSC repaired infarcted hearts more efficiently than E-CSC. E-CSC showed a trend towards a higher activity of TORC1 complex (assessed as S6K phosphorylation on Thr389) and an arrested autophagic degradation. Inhibition of TORC1 and enhancement of TORC2 signalling (assessed as phosphorylation of Akt on Ser473) with a combination of 10nM rapamycin + 0.5µM resveratrol significantly reduced the fraction of senescent E-CSC in vitro and restored their reparative ability to D-CSC levels in vivo. This latter was associated with a reduction in myocyte apoptosis and senescence and with a significant increase in the tissue density of c-

Kit+ CSC. Conclusion : In vitro pretreatment of E-CSC with rapamycin and resveratrol enhances their reparative ability in vivo suggesting the use of such approach to enhance CSC therapy. Keywords : Cardiac Stem Cells, Cell Senescence, Heart Failure

PS25 203-C

INTEGRATING GERIATRICS INTO ONCOLOGY CARE

PS25 203-C-1

CAN WE PREDICT AND PREVENT SEVERE SIDE EFFECTS FROM CHEMOTHERAPY IN OLDER CANCER PATIENTS?

Martine EXTERMANN (*Senior Adult Oncology, Moffitt Cancer Center, USA*)

The majority of cancers occur beyond the age of 70, and the recent dramatic increase in options in chemotherapy and targeted therapies makes most of them potential candidates for such treatments. However, the oncogeriatric research from the last two decades has demonstrated that: 1) Older cancer patients do have a significant number of geriatric conditions; 2) That amount is highly variable from individual to individual; 3) Geriatric conditions influence outcomes independently from classic oncologic predictors. More recently, the efforts have focused on using that information to develop practical risk evaluation systems that could help guide treatment in older cancer patients. One such score is the Chemotherapy Risk Assessment Scale for High-Age patients (CRASH score). The other is the Cancer and Aging Research Group (CARG) score. Both scores aim at predicting the incidence of severe toxicity. Other tools allow us to identify patients at low risk of neutropenia, or patients at high risk of death within 6 months. On the other hand, proactive supportive care is a key to good chemotherapy tolerance in the elderly. We will review the most frequent issues encountered in the elderly and their preventability with an integrated oncogeriatric approach. Finally, we will discuss the respective place of chemotherapy and alternative options in the care of non-curable cancer in older patients. Keywords : cancer, chemotherapy, treatment tolerance, supportive care

PS25 203-C-2

TREATING COLON CANCER IN THE ELDERLY - MULTIDISCIPLINARY CHALLENGES AND OPPORTUNITIES

Jee Hyun KIM (*Department of Internal Medicine, Seoul National University Bundang Hospital, Korea*)

Colorectal cancer is one of the most pronounced example which shows increased incidence with increasing age. Approximately 50% of patients diagnosed with colorectal cancer (CRC) are 70 years of age or older. The standard treatment for early stage colon cancer include surgical resection and adjuvant chemotherapy based on the risk of recurrence. For metastatic diseases, systemic chemotherapy and targeted therapy are the mainstay of treatment while surgical removal of the primary and metastatic lesions can lead to cure in some patients. Recent advances in the surgery, perioperative care, systemic chemotherapy and targeted therapy have resulted in increased survival of not only early stage disease but also metastatic colorectal cancer. However, elderly patients have been under-represented in clinical trials, leading to lack of evidence based data regarding the appropriate therapeutic approach in this age group. Moreover, older patients are frequently denied of surgery and/or chemotherapy because of concerns about the complication of treatment and impact on quality of life. A multidisciplinary team including geriatricians can help determine which patients can be treated with aggressive approaches which can lead to cure. In the meeting, how multidisciplinary oncogeriatric approach can improve care of older patients with cancer will be

presented with an example of colorectal cancer. Evidences on the use of geriatric assessment in predicting tolerance to surgery and chemotherapy will be reviewed. Also, a pilot model of tailored dosing strategy which can be used to increase tolerance to chemotherapy will also be presented. Keywords : Colon cancer, Oncogeriatric, geriatric assessment

PS25 203-C-3

HOW DOES GERIATRIC ASSESSMENT AND INTERVENTION IMPACT CANCER TREATMENT? REVIEW OF RECENT DATA

Ravindran KANESVARAN (*Department of Medical Oncology, National Cancer Centre Singapore, Singapore*)

Cancer afflicts mainly the elderly. Nearly 60% of cancer patients are over the age of 65 years old. Cancer treatment can be toxic and as such it is important to be able to select the right treatment for the right patient. Elderly cancer patients form a very heterogeneous group in terms of their functional status and ability to tolerate cancer treatment. We have realised that age and currently available functional status scales alone (like ECOG or Karnofsky) or in combination is not accurate in stratifying these patients. There has been much research done in this area and we have found that the comprehensive geriatric assessment and its various domains have not only been able to predict prognosis in this group of patients quite accurately but also be used in evaluating and treating these patients whilst improving their outcomes. A number of CGA scales have been developed to help these patients, however many physicians find it time consuming and cumbersome. As such a number of screening tools have been developed to help physicians select the right patients for a full CGA. Here we will review the recent data and discuss the latest CGA tools available and how its use, together with selection of the right intervention can impact cancer treatment in this vulnerable group of patients. Keywords : Cancer, Geriatric Assessment, Treatment

PS25 204-R

GOVERNMENTAL RESPONSES TO GLOBAL AGEING: LESSONS FROM SIX NATIONS

PS25 204-R-1

GOVERNMENTAL RESPONSE TO AGEING SOCIETY

Sung Jae CHOI (*Department of Social Welfare, Graduate School of Public Policy, Hanyang University, Korea*)

The rapidity of population ageing in Korea during the past decade epitomizes how rapidly developing countries are aging compared to developed countries. The implications of population aging are not only limited to the welfare of older persons, but have a much wider effect. In this sense, population ageing may require a new perspective or a new paradigm in societal response to ageing society. Korea has attempted to model its policies for ageing society to resemble those of advanced welfare states, but as welfare states like those in advanced countries no longer seem viable, Korean policy makers are searching for more effective and efficient measures to deal with its rapidly ageing population. Following brief introduction of a profile of population ageing and recent development of relevant national policies, this presentation will highlight the comprehensive national policy plan for ageing society set by the Korean government and finally suggest a new perspective to approach an ageing society. Korean government's five-year policy plans for ageing society deserve our attention because it contains comprehensive policies from a broad and long-term perspective. The first five year-plan was already implemented during 2006-2010 and the second one (2011-2015) is

currently being implemented. The major policies of the second one consist of four parts: (1) creating an environment conducive to child birth and child rearing, (2) building foundation to improve quality of life of older persons, (3) ensuring power of economic growth and improvement of socio-economic systems and (4) building social environment responsive to low-fertility and ageing society.

PS25 204-R-2

AGEING IN ISRAEL: NEEDS, ACHIEVEMENTS AND CHALLENGES

Sara CARMEL (*Center for Multidisciplinary Research in Aging, Ben-Gurion University of the Negev, Israel*)

Introduction : In line with current global demographic trends, Israel's population has rapidly aged, and family members are the principal caregivers to frail adults. Unlike other immigration countries, Israel is unique in its high proportions of older immigrants. Immigration from over a hundred countries has created diverse needs for elder care and support. The purpose of this presentation is to describe Israel's ageing-related needs, current societal responses, and remaining challenges. Method : We will present the socio-demographical characteristics and trends of change, the health profile of older Israelis and current health and welfare related laws and services, the education and training system for professionals in the field of ageing, and the remaining needs and problems to be solved. Results : 'Ageing in Place' is the dominant approach guiding Israel's ageing policies. Accordingly, Israel has developed a community-based widely spread system of health clinics, as well as social and welfare services. Concomitantly to the establishment of a system of services for older people, Israel has developed an educational system for professionals in geriatrics and gerontology. Yet, a number of unsolved problems and needs continue to exist and may intensify with the foreseen economical and national security difficulties. Conclusion : The current Israeli responses to ageing-related needs in a diverse society of immigrants and family caregivers, along with the lessons learned from experience, may have relevance for other countries with similar features. Keywords : ageing, family caregivers, elder care policy

PS25 204-R-3

NATIONAL RESPONSES TO THE CHALLENGES OF AGEING SOCIETY WITH DECLINING FERTILITY RATES: JAPAN'S CURRENT STATUS

Noriko TSUKADA (*Graduate School of Business, Nihon University, Japan*)

Introduction : Japan is the world's most rapidly aging society. The proportion of older people aged 65 and over to the total population reached 23.3% in 2011 and is expected to be 33.4% in 2035. Although the fertility rate is slightly increasing after hitting its lowest rate of 1.26 in 2005, it is far below the replacement level. Coupled with the rapid development of economic globalization strategies, demographic pressures have forced Japanese society to confront many challenges, including worker shortages in critical areas of long-term care. This presentation examines recent policy initiatives for this aging population relating to health and social care issues in Japan. Further examinations will be made with special focus on newly started scheme for employing foreign care workers based on Economic Partnership Agreements (EPA) with Indonesia, Philippines, and Vietnam in Japan. Method : First, demographic data are briefly introduced. Then, recent public policy solutions regarding long-term care and employment of older people are summarized. Finally, the current status of recent activities on employing foreign long-term care workers based on EPA will be introduced and examined. Results : Although original

expectations in terms of cultural and value differences were not a huge barrier, foreign care workers had poor skills in writing the Japanese language, and in order for them to pass the national qualification exam for a certified care worker would be the biggest concern. Conclusion : Japan is hoping to learn how to solve its shortfall of long-term care workers from other nations with a longer history of this practice. Keywords : long-term care, foreign workers, EPA

PS25 204-R-4

COMPREHENSIVE NATIONAL POLICY PLANNING FOR AGEING SOCIETIES

Fernando M. TORRES-GIL (*Social Welfare and Public Policy, University of California, Los Angeles (UCLA), USA*)

The world is rapidly aging and governments across the globe are recognizing the demographic imperatives to plan and prepare for the growth of the older adult populations. Yet, nations are utilizing various approaches to the development of policies, programs and involving their elders. This session will examine various approaches and provide examples of how different nations adjust to the aging of their populations and prepare for the needs of older persons. While government differ depending on their political systems, the United States, Korea, Japan, United Kingdom, Australia and Israel provide case studies of lessons learned; achievements, mistakes, adjustments and innovations. Speakers from each of these countries will share the experiences of their governments and societies in responding to the needs, requirements and complexities of the aging of their populations but also, in many cases, the decline in younger populations. The session will serve as a guide for global aging and will illuminate diverse approaches for diverse populations and governing systems. No nation has the perfect solution to the unprecedented human experience of longevity, gerontocracies and aging but each nation can provide a guidepost to plan for the inevitable demographic destiny facing all nations. Keywords : Global Aging, Public Policy, Government

PS25 204-R-5

THE UNITED KINGDOM: THE POLICIES OF SUCCESSIVE POST-WAR GOVERNMENTS IN LEGISLATING, LEVERAGING AND LIBERATING RESOURCES TO MEET THE DEMANDS OF AN AGEING SOCIETY

Gregor RAE (*Business Lab, United Kingdom*)

Published on 2nd December 1942, the 'Report of the Inter-Departmental Committee on Social Insurance and Allied Services', commonly known as the Beveridge Report, set out a plan for eradicating the 'Five Giant Evils' of society ? squalor, ignorance, want, idleness and disease. Thenew Labour-led government of 1945, with Aneurin Bevan as its Heath Minister, adopted the Beveridge proposals and pledged to provide for the people of the United Kingdom 'from the cradle to the grave.' The Welfare State, conceived by David Lloyd George, framed by William Beveridge and nurtured by Aneurin Bevan,came into being in 1948. And at the heart of the system was the new National Health Service - free at the point of use, available to all who needed it, paid for out of taxation and used responsibly. Due to his concern about the ageing of the population and the contemporary evidence that many, but not all, people were fit to work beyond age 65, Sir William Beveridge also recommended a flexible pension age to discourage early retirement by providing significantly higher pensions for later retirement. Seventy-one years after the Beveridge ReportThe House of Lords Select Committee on Public Service and Demographic Change, chaired by Lord Filkin, concluded in its report,published on 14 March 2013, that Britain is 'woefully under-prepared' to cope with an expected explosion of older

people. This presentation will examine the policies of consecutive UK governments, from post war settlement through to the Big Society of the 2010 coalition government. And it will track the journey of the post-war Baby Boomers who are now reaching old age in a period of social, financial and economic uncertainty.

NEW PERSPECTIVES ON SUCCESSFUL AGEING: CROSS-CULTURAL AND INTER-DISCIPLINARY APPROACHES

PS25 205-S-1

SUCCESSFULLY AGING BODIES: PERCEPTIONS OF MIDDLE-AGERS IN THE UNITED STATES

Toni CALASANTI (*Sociology, Virginia Tech, USA*)

Introduction : Critical gerontologists have critiqued notions of "successful ageing" as being based on experiences and values rooted in particular class, race, and gendered positions. We (and others) argue that "successful ageing" is based on a middle-aged standard and is thus inherently ageist as well. Left relatively unexplored, however, is the extent to which these critiques reflect people's actual perceptions of what successful aging entails. That is, how do people interpret the dictate to age successfully? Method : In this presentation, we use in-depth interviews conducted among 19 middle-aged men and women in the U.S. to explore what successful aging means to them, and the extent to which their views reflect gender, race, and class as well as ageism. Results : We find that respondents equate successful aging with a prolonged middle age, one often judged on the basis of bodies: bodies that "look active," that seem to be "participating", that appear to contribute. While respondents make allowances for some bodily changes (in middle age and beyond), they rule out disability of significant functional losses. They equate looking inactive, overweight, or "soft" with failing to age successfully. ccessful aging and appropriate bodies look like. Conclusion : Middle-ager's perceptions of successful aging reflect ageism and are shaped by intersecting inequalities. Keywords : success aging

PS25 205-S-2

THE NUANCES OF SUCCESSFUL AGING: VIEWS FROM CULTURAL AND INTERGENERATIONAL PERSPECTIVES

Leng Leng THANG (*Japanese Studies, National University of Singapore, Singapore*)

Introduction : Anthropological studies on successful aging in different cultures have yielded rich understanding of what is regarded as 'successful' in later years and suggests the need for cultural sensitivity in understanding what constitutes successful aging. For example, the ability to successfully manage declining health, instead of good health, characterizes successful aging among the Canadian Inuit community (Collings, 2001). They also regard one's willingness to transmit wisdom and knowledge intergenerationally as critical in successful old age. What further nuances can be critically drawn from the Asian context? Method : In this presentation, examples especially from the Asian context will be discussed to highlight the cultural nuances that should be considered in understanding 'successful aging'. Results : In Asia, relatively high emphasis has been placed on the success of one's children and grandchildren as a measure of one's definition of successful aging. However, in late modernity, where more older Asians are desiring individual freedom in later life, will the nuances in the concept of 'successful aging' remain? Conclusion : The anthropological perspective on successful aging expands and questions the normative measures of 'successful aging'. For instances, it highlighted the significance of intergenerational connection and

generativity in old age. However, will the nuances continue to remain salient with changing cultural and intergenerational relationships? Keywords : successful aging, Asian context, intergenerational relationships

PS25 205-S-3

SUCCESSFUL AGEING IN AUSTRALIA AND CHINA: A SOCIAL SCIENCES APPROACH

Colette BROWNING (*School of Primary Health Care, Monash University, Australia*)

Introduction : Understanding successful ageing in different cultural contexts requires a strong recognition of the social determinants of health and well being and the influences of the processes of social change. This paper examines successful ageing in two countries: China and Australia. Method : The paper draws on a number of our ageing studies as well as policy documents to compare and contrast understandings of and approaches to successful ageing in China and Australia. Data from (1) qualitative studies of older Chinese people in China and Australia, (2) longitudinal studies in Australia and China, and (3) policy documents will be used to examine the differences and similarities in ageing experiences and policy approaches to population ageing in these two countries. Results : In Australia and China, successful ageing approaches have emphasized physical health as the central driver of ageing well. However, older people hold broader understandings of the concept that include psychological well being, independence, social contributions and generativity. The well being of their children is a particular driver of their own well being in older Chinese adults while older Australians value financial and functional independence. Conclusion : In order to promote successful ageing we need to understand the perceptions, aspirations and expectations of adults within their social and cultural contexts as they move through the life span. These understandings can help reconstruct our social and economic institutions to better respond to the needs and contributions of older people. Keywords : successful ageing, China, Australia

PS25 205-S-4

SUCCESSFUL AGING IN THE CONTEXT OF MIGRATION: ARE ESTABLISHED CONCEPTS RELEVANT?

Sandra TORRES (*Dept. of Sociology, Uppsala University, Sweden*)

Introduction : It is a well-known fact that successful aging (SA) has been one of the most debated constructs in gerontology since its inception into the social gerontological vernacular. Anthropogerontologists have, for example, problematized the established models for the study of SA for being culture-specific while critical gerontologists have questioned the fact that these models take for granted that continuity through the life course is the norm. In this presentation we will address the way in which the process of migration - a process characterized by discontinuity - can challenge the manner in which the construct of SA is understood. Method : The presentation departs from a culturally-relevant theoretical framework for the study of SA and the vignette-driven interviews with Iranian immigrants to Sweden that were collected in order to tap into the prior and post-migration value orientations that these older people prefer and the understandings of SA that they uphold. Results : The study showed that there is congruence between the value orientations that people prefer and the understandings of SA that they uphold. Understandings that are not recognized by the established models were also unveiled and the migratory life-course did challenge the way in which this construct is understood. Conclusion : The presentation will address the implications of these findings for the way in which gerontology understands, conceptualizes and measures SA by arguing that the

context of migration is a profuse source of information not only about how migrants make sense about gerontological constructs but also about how the gerontological debate on SA can move forward. Keywords : successful aging, migration, culture

PS25 302-B

CONSERVED MECHANISMS OF AGING: FROM MODEL ORGANISMS TO MAN

PS25 302-B-1

MOLECULAR MECHANISMS LINKING DIET, DISEASE, AND AGING

Matt KAEBERLEIN (*Pathology, University of Washington, USA*)

Introduction : Aging is controlled by a complex interaction between environmental and genetic factors. The best-characterized environmental modulator of longevity is dietary restriction (DR), defined as a reduction in nutrient availability in the absence of malnutrition. The longevity and healthspan promoting effects of DR are mediated in part by reduced signaling through the mechanistic target of rapamycin. Recent work in mice has indicated that the effect of DR on lifespan is strongly influenced by genetic background; however, the molecular mechanisms underlying this observation are unknown. Method : We have utilized the budding yeast to begin to define these mechanisms. From an analysis of about 200 unique genotypes, we have observed that genes involved in lysosomal function, superoxide detoxification, and mitochondrial function strongly influence the effect of DR on yeast lifespan. Results : These observations suggested that hypothesis that dietary restriction or mTOR inhibition might be particularly beneficial in the context of defective mitochondrial function. Here I will present these data and our efforts to test this hypothesis in the *Ndufs4* knockout mouse model of the human mitochondrial disease Leigh Syndrome. Conclusion : These studies will provide insight into the cellular mechanisms by which dietary restriction interacts with individual genotype to impact longevity and healthspan, and may also yield an effective therapy for treating mitochondrial disease. Keywords : mTOR, caloric restriction, mitochondria

PS25 302-B-2

PATHWAYS MODULATING AGING: APPROACHES TO EXTEND HEALTHSPAN

Brian KENNEDY (*Buck Institute for Research on Aging, USA*)

Introduction : The focus of research at the Buck Institute is to understand the molecular events that drive aging, to determine how aging enables chronic disease and to develop interventions that extend healthspan, the disease free period of life. Studies using invertebrate model organisms have been instrumental to understanding the aging process. Using yeast, worms and flies, investigators have identified hundreds of aging genes, and have been responsible in large part for discovering and characterizing three of the most studies longevity pathways: Insulin/IGF, TOR and Sirtuins. Method : Recently in the Kennedy lab, we have completed a genome-wide study of yeast replicative aging identifying nearly three hundred long-lived strains, each lacking one yeast gene. Insights from this screen will be described. Current goals in the Kennedy lab are directed at (1) determining whether longevity pathways identified in invertebrates and (2) understanding the mechanisms by which these pathways modulate aging. Another major direction of research involves studying the role of the mTOR pathway in mammalian aging and chronic disease states. Results : Data from our lab and others indicates the mTOR signaling is aberrantly upregulated in a variety of aging tissues.

This finding suggests that (1) altered mTOR signaling may be a response to the molecular events that drive aging and (2) the beneficial effects of rapamycin on aging may be through suppression of these age-related changes rather than a reduction in basal levels in the adult state. Conclusion : Altered mTOR signaling may also be a common response to pathology associated with a range of disease states. Keywords : Aging, Healthspan, mTOR

PS25 302-B-3

SYSTEMS BIOLOGY OF AGING: NEW TRICKS TO THE OLD PROBLEM

Jing-Dong (jackie) HAN (*Partner Institute for Computational Biology, Chinese Academy of Sciences, China*)

Introduction : Many fundamental questions on aging are still unanswered or are under intense debate. These questions are frequently not addressable by examining a single gene or a single pathway, but can best be addressed at the systems level. Method : Previously we have examined the modular structure of the protein-protein interaction (PPI) networks during fruitfly and human brain aging. Results : We found that in both networks, there are two modules associated with the cellular proliferation to differentiation temporal switch that display opposite aging-related changes in expression. Genes linking such modules are enriched for lifespan, transcription and epigenetic regulators, leading to prediction and validation of new lifespan regulators. One regulator thus uncovered is the histone modification enzymes for H3K27me3. By *C. elegans* genetic analysis, we confirmed that a demethylase for H3K27me3, *utx-1* is a key lifespan regulator acting through IGF-1 signaling pathway. Conclusion : Recently, we started to examine not only age-dependent transcriptomic changes, but also gene expression changes under different dietary conditions which result in different lifespans and aging-related phenotypes. This allowed us to identify genes and pathways that modulate the aging process through dietary intervention. In addition to examining transcriptomic changes, we also explored the epigenetic changes during the aging process in *C. elegans* and Rhesus macaque using ChIP-seq, and identified key epigenetic events modulating the aging process. Keywords : Systems biology, epigenetics, epigenome

PS25 302-B-4

FUNCTIONAL APPROACHES TO THE GENETICS OF HUMAN AGING

Yousin SUH (*Genetics, Albert Einstein College of Medicine, USA*)

Aging is a major risk factor for the most common human diseases. Identification of gene variants that predispose humans to crippling diseases at old age is likely to help find novel strategies for prevention and therapy. Moreover, such genetic insight in gene variants will provide important mechanistic insights into the molecular basis of aging. The discovery of evolutionarily conserved pathways with major impact on lifespan in animal models has provided tantalizing opportunities to test the relevance of these pathways for human aging. We hypothesize that genetic variation at loci involved in conserved pathways of aging can be related to individual differences in the rate and severity of aging in humans as well. We have been conducting systematic multidisciplinary studies to discover functional gene SNPs (single nucleotide polymorphisms) in these pathways. For a mechanistic understanding of the causal relationships between SNPs and the aging-associated phenotypes, candidate gene-SNP variants are screened for various parameters of cellular fitness in short-term cell culture studies. Functionally relevant gene variants are then further studied for their in vivo effect during aging by modeling them in

mouse. The results may open up the possibility of targeted and personalized intervention strategies, ultimately leading to improved quality of life of the elderly population. Keywords : Human Aging and Longevity, Functional Variation

PS25 303-C

LATE LIFE DEPRESSION: ADVANCES IN RESEARCH AND TREATMENT

PS25 303-C-1

THE PSEUDO-DEPRESSION OF "PSEUDO"-DEMENTIA

Donald R. ROYALL (*Department of Psychiatry, University of Texas Health Science Center at San Antonio, Family & Community Medicine, USA*)

Depressive symptoms, specifically subsyndromal depressive symptoms ("Pseudo-depression"), appear to be common in the elderly, and hasten progression to dementia and Alzheimer's Disease (AD). Paradoxically, this association is not mediated through common neurodegenerative AD pathologies. Using data from a variety of sources, I will show that: 1. Subsyndromal depressive symptoms are related to both cognitive decline and future AD diagnosis. 2. Subsyndromal depressive symptoms are "dementing" in their own right (i.e., a true, not "Pseudo"-dementia). 3. The association between subsyndromal depressive symptoms and cognitive decline is not mediated by AD neuropathology. 4. The Pseudo-depression of "Pseudo"-Dementia (PD2) is specific to Mild Cognitive Impairment (MCI). 5. PD2 may be associated with amyloid deposition in the Default Mode Network (DMN) (as distinct from neuritic plaque formation) (Royall et al., 2012). In addition, there appears to be a strong signal in PD2's relationship with its serum protein biomarkers. The latter clearly affect cognition and dementia in opposite directions, simultaneously! In summary, serum inflammatory biomarkers appear to be signalling reciprocal changes in the DMN and its anticorrelated Task Specific Network(s). The DMN changes are potentially disabling /dementing, and uncoupled (largely) from cognitive performance. They may bias clinicians into making an AD diagnosis at lower levels of pathology. This is consistent with the disabling nature of Major Depressive Disorder (MDD) and the difficulty of correlating it with cognitive performance. MCI may invoke such an inflammatory response. It is secondarily related to future AD, but more specifically related to depressive symptoms in AD.

PS25 303-C-2

DEPRESSION AND EXECUTIVE FUNCTION : LESSONS FROM EPIDEMIOLOGIC STUDY

Dong-Woo LEE (*Inje University Sanggye Paik Hospital, Korea*)

Executive function has been the focus of recent researches in elderly depression. A clinical subtype called 'depression-executive dysfunction (DED) syndrome' was suggested based on clinical, neuropathological, and neuroimaging findings. DED was known to be associated with loss of interest in activities, and psychomotor retardation. It is also known to be associated with disability, poor treatment response, relapse, and recurrence. DED was mainly studied on clinical population, and community epidemiologic data is relatively sparse. After briefly reviewing the concept of DED, the data from epidemiologic study will be presented, focusing on the similarities with clinical data.

PS25 303-C-3

NEXT GENERATION ANTIDEPRESSANTS

Sun Young YUM (*Global Clinical Development, Boehringer*)

Ingelheim, Korea)

Antidepressants are clinically effective, but there are still insufficiencies with response delays, and not enough patients benefiting sufficiently. Many patients experience recurrence, with each subsequent episode becoming more treatment-resistant. While the pathophysiology of depression remains an enigma, trends in research for new antidepressants have been dynamic. The monoamine hypothesis dominated for many decades. A couple decades ago, hyperselectivity of serotonin receptor subtypes promised SSRI efficacy without the side effects. More recently, 'dirty drugs' are once again fashionable as we view multiple neurotransmitter systems to be involved in the development and maintenance of depression. In parallel, pain/inflammation pathways have been associated with depression, as well as the stress response systems. These trends seem to be merging in neuroplasticity, and hence efforts from industry to target neuro/synapto-genesis, and neuronal/synaptic remodeling. Accompanying developments in genomics offer promises in identifying vulnerability to depression as well as treatment response. Keywords : antidepressants, clinical development

CROSS-ORGAN AGEING IS A KEY TO CARDIOPULMONARY DISEASE IN THE ELDERLY

PS25 307-R-1

NEURONAL AND VASCULAR AGING: ROLES OF TESTOSTERONE, ENOS AND SIRT1 AXIS.

Masato ETO (*Department of Geriatric Medicine, University of Tokyo, Japan*)

Introduction : Oxidative stress and atherosclerosis are risk factors for cognitive decline with aging. In a clinical study in men, testosterone improved cognitive function; however, it is unknown how testosterone ameliorates the pathogenesis of cognitive decline with aging. We investigated whether the cognitive decline could be reversed by testosterone in a mouse model, and the mechanism by which testosterone inhibits cognitive decline. Method : Senescence-accelerated mice prone 8 (SAMP8), which exhibit cognitive impairment and hypogonadism, were used in this study. Morris water maze test and open field test were performed for cognitive function. SA-beta gal staining was performed for the detection of cellular aging. Results : We found that treatment with testosterone ameliorated cognitive function and inhibited senescence of hippocampal vascular endothelial cells of SAMP8. Notably, SAMP8 showed enhancement of oxidative stress in the hippocampus. We observed that an NAD(+)-dependent deacetylase, SIRT1, played an important role in the protective effect of testosterone against oxidative stress-induced endothelial senescence. Testosterone increased eNOS activity and subsequently induced SIRT1 expression. SIRT1 inhibited endothelial senescence via up-regulation of eNOS. Finally, we showed, using co-culture system, that senescent endothelial cells promoted neuronal senescence through humoral factors. Conclusion : Our results suggest a critical role of testosterone, eNOS and SIRT1 in the prevention of vascular and neuronal aging. Keywords : testosterone, eNOS, SIRT1

PS25 307-R-2

SKELETAL MUSCLE CHANGE IN THE ELDERLY PATIENTS WITH CHRONIC HEART FAILURE AND CHRONIC OBSTRUCTIVE PULMONARY DISEASE: UNDERLYING MECHANISM AND CLINICAL SIGNIFICANCE

Kwang-Il KIM (*Department of Internal Medicine, Seoul National*

University College of Medicine, Seoul National University Bundang Hospital, Korea)

Exercise intolerance is one of the common symptoms of heart failure and chronic obstructive pulmonary disease (COPD), which has a detrimental impact on the quality of life. A variety of skeletal muscle abnormalities, including skeletal muscle atrophy, altered muscle metabolism, reduced mitochondrial-based enzymes, decreased mitochondrial size, and a shift in skeletal muscle fiber type, have been reported in patients with heart failure or COPD and show a strong correlation with exercise intolerance. Skeletal muscle atrophy has been considered an important contributor to exercise intolerance. Furthermore, previous studies showed that sarcopenia is associated with a poor prognosis irrespective of the severity of heart failure or COPD. Several mechanisms have been suggested to explain the cause of skeletal muscle atrophy in patients with heart failure or COPD. Malnutrition, metabolic dysfunction, disuse atrophy, inflammatory and neurohormonal activation, anabolic/catabolic imbalance, and cell death might play an important role in the pathogenesis of skeletal muscle wasting in patients with heart failure or COPD. However, the etiology of the muscle changes is not yet entirely clear. In this talk, I will present the clinical significance of skeletal muscle change in patients with heart failure or COPD, and then briefly introduce the underlying pathophysiological mechanism of skeletal muscle change in those patients. Keywords : Skeletal muscle, heart failure, COPD

PS25 307-R-3

ROLE OF METABOLIC SYNDROME TO HEALTH OF PEOPLE AGED 75 YEARS AND OLDER

Liang-kung CHEN¹, Chien-liang LIU², Ming-hsien LIN², Liang-yu CHEN² (*1. Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taiwan; 2. Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taiwan*)

Metabolic syndrome is a cluster of various cardiometabolic risks and is predictive for cardiovascular disease and diabetes. However, role of metabolic syndrome to people aged 75 years and older may be different and deserve further attentions. In classical approach, metabolic syndrome represents a global cardiometabolic risk and has been proved to increase risk of cardiovascular disease, diabetes mellitus, disability and mortality. However, among older old people, i.e. people aged 75 years and older, the role of metabolic syndrome may be less predictive to cardiovascular outcomes. On the contrary, the so-called cardiometabolic risk in this particular group of people may in some way reflect the nutritional status. Previous studies showed that metabolic syndrome is of survival benefits among people aged 75 years and older in 3-year follow-up and also prevents cognitive decline in 1-year follow-up. These confusing results may not be resulted from cardiovascular risk per se but the presence of malnourished status and frailty. The phenomenon of reverse epidemiology clearly suggested the need of shifting traditional approach of health care to older people. Although geriatricians are familiar with these concepts, it will be delivered to healthcare professionals of other domains. Maintaining optimal nutritional status, and preventing frailty and sarcopenia may be of greater importance to improve the quality of life among older old people. Health care expenditure should be directed to a proper direction targeted to health of older people, instead of disease approach. Keywords : metabolic syndrome, cardiovascular disease, dementia

PS25 307-R-4

ASPIRATION PNEUMONIA AMONG OLDER PERSONS

Takashi OHRUI (*Division of Geriatric Pharmacotherapy, Tohoku*

University, Japan)

Introduction : Pneumonia is the third leading cause of death despite the availability of potent new antimicrobials in Japan. Aspiration of oropharyngeal bacterial pathogens to the lower respiratory tract is one of the most important risk factors for pneumonia. **Method :** Impairments in swallowing and cough reflexes among disabled older persons having cerebrovascular disease or Parkinson disease increase the risk of pneumonia. Thus, strategies to reduce the volumes and pathogenicity of aspirated material should be pursued. **Results :** Since both swallowing and cough reflexes are mediated by endogenous substance P contained in the vagal and glossopharyngeal nerves, pharmacologic therapy using angiotensin-converting enzyme inhibitors, which decrease substance P catabolism, can improve both reflexes and result in the lowering the risk for pneumonia. Similarly, since the production of substance P is regulated by dopaminergic neurons in the cerebral basal ganglia, treatment with dopamine analogs or potentiating drugs such as amantadine can reduce the incidence of pneumonia. **Conclusion :** The main theme of this presentation is to discuss how pneumonia develops in disabled older people and to propose preventive strategies that may reduce the incidence of pneumonia among these subjects. **Keywords :** aspiration pneumonia, substance P, basal ganglia

PS25 402-B

STRESS RESPONSES AND HOMEOSTASIS IN AGEING

PS25 402-B-1

HOMEOSTASIS, STRESS RESISTANCE, AND LONGEVITY

Khachik Kazarovich MURADIAN (*Physiology, Institute of Gerontology NAMS Ukraine, Ukraine*)

Introduction : Restricted reserves and declined coordination of homeostatic systems resulting in lower stress resistance and elevated probability of death is a central paradigm of aging. **Method :** The relationship between homeostasis, stress, aging and longevity is analyzed on three principal gerontological models ? phylogenic, ontogenic and life span extension (LSE) using our own data and literature material. **Results :** Comparative studies show that maximum life span correlates with some, but not all, stress factors and counteracting defense or repair systems. Moreover, it is problematic to discriminate correlates and determinants of aging rate, thus, hindering further validating the findings in direct experiments with LSE - the most reliable choice in proving an anti-aging concept. The well known, though declarative, idea that longer-lived species could have superior homeostatic systems was quantitatively supported only for the acid-base balance. The age-decline of stress resistance was confirmed for most indices tested in experiments with both drosophila and mice. Significant age-alterations were found in coordinated action of homeostatic systems assessed by circadian rhythms of metabolic, motor and sleep variables in young, middle-aged, old and very old mice kept in standard conditions or in constant light and darkness. As to longevity association with stress resistance in LSE, it seems strongly dependent on the model. The suggestion was supported in experiments with drosophila kept at various temperature and feeding regimes, as well as in artificial atmosphere constructed by varying concentrations of carbon dioxide, oxygen, nitrogen, helium, argon and hydrogen. **Conclusion :** Further research is warranted to clarify the relationship between homeostasis, stress and aging. **Keywords :** homeostasis, stress, longevity

PS25 402-B-2

LIFESPAN EXTENSION BY HORMESIS IN D. MELANO-

GASTER

Kyung-jin MIN (*Department of Natural Medical Sciences, Inha University, Korea*)

Introduction : Hormesis means favorable biological responses by low exposures to toxins and other stressors. From an evolutionary perspective, plants have produced phytochemicals to dissuade insects and other pests from eating them. However, the amount of phytochemicals ingested by humans is subtoxic level and the ingested phytochemicals can induce hormesis, including anti-aging effects. **Method :** Curcumin, a yellow pigment extracted from the rhizome of the plant *Curcuma longa* (turmeric) has been widely used as a spice and herbal medicine in Asia. It has been suggested to have many biological activities such as anti-oxidative, anti-inflammatory, anti-cancer, chemopreventive, and anti-neurodegenerative properties. D-chiro-inositol, a member of inositol family, and pinitol, a 3-methoxy analogue of D- chiro-inositol, have been proposed to have anti-diabetic, anti-inflammatory, anticancer and stamina enhancing effects. *Viscum album coloratum* (Korean mistletoe) is a semi-parasitic plant growing on various trees. This plant has been shown to possess a variety of biological functions such as immunomodulating, apoptosis-inducing and antitumor activity. **Results :** Feeding these compounds/extract extended the lifespan of fruit fly without compromising locomotion, fecundity or feeding behavior. Some of them seems to work as calorie restriction mimetics. The mechanism of lifespan extension by these compounds/extract will be discussed. **Conclusion :** Curcumin, D-chiro-inositol/pinitol and mistletoe extract have anti-aging effect. **Keywords :** aging, drosophila, lifespan

PS25 402-B-3

HORMESIS: A KIND OF EPIGENETIC PHENOMENON?

Alexander VAISERMAN (*Laboratory of Epigenetics, Institute of Gerontology, Ukraine*)

Introduction : In a number of experimental and epidemiological studies it has been repeatedly found that agents that are harmful at high doses can up-regulate physiological/biochemical processes in the body to produce a beneficial (hormetic) response at lower doses. Convincing evidence exist that hormesis may be the result of a generalized whole-organism adaptive epigenetic response and hence can be considered as a kind of adaptive life-history tactic. **Method :** Epigenetic alterations are mitotically and/or meiotically heritable changes in gene function that cannot be explained by changes in DNA sequence. Epigenetic regulation of gene expression is a key molecular mechanism linking environmental factors with the genome with consequences for health status throughout the life course. **Results :** According to the modern view, epigenetic changes are far more likely than genetic changes to be directed, and many of these changes are manifestly adaptive. Recent experimental studies clearly indicate that environmental fluctuations can induce specific and predictable epigenetic-related molecular changes, and support the possibility of adaptive epigenetic phenomenon. The epigenetic adaptation processes implying alterations of gene expression to buffer the organism against environmental changes support adaptability to the expected life-course conditions. **Conclusion :** It appears likely that adaptive epigenetic rearrangements can occur not only during early developmental stages but also through the adulthood, and they can cause hormesis, a phenomenon in which adaptive responses to low doses of otherwise harmful conditions improve the functional ability of cells and organisms. In this report, several lines of evidence are presented that epigenetic mechanisms can be involved in hormesis-like responses. **Keywords :** Epigenetics, adaptive response, hormesis

PS25 403-C

SLEEP DISORDERS AND THE OLDER ADULT

PS25 403-C-1

SLEEP AND CIRCADIAN RHYTHMS: KEY TO SUCCESSFUL AGING

Phyllis ZEE (*Neurology, Northwestern University, USA*)

Introduction : Between 50-70% of older adults report sleep problems, in particular difficulty falling and staying asleep. Multiple age-related factors, including physical and mental health disorders and “usual” age related changes in sleep and wake regulation and circadian rhythms have been shown to contribute to the high prevalence of sleep disturbances in older age. Method : Eligibility for the study included a diagnosis of chronic insomnia disorder by clinical interview and a Pittsburgh Sleep Quality Index (PSQI) score > 5. Participants were instructed to engage in at least 30 min of aerobic physical activity > 3 times per week for 16 weeks. Self-reported sleep quality assessments questionnaires were completed at baseline and post treatment. Participants completed sleep and exercise logs and wore wrist activity monitors for the duration of the study. Data were analyzed using multilevel models to evaluate the day to day relationships between physical activity and sleep. Results : There was a significant improvement in sleep quality (objective and subjective), as well as quality of life (PSQI), daytime sleepiness level and mood in the exercise group compared to the non-physical activity group. Conclusion : Exercise improves sleep quality, mood and daytime function in older adults with insomnia. This lecture will discuss age-related changes in sleep architecture and circadian rhythms and their impact on performance, cognition and overall quality of life. Keywords: sleep, circadian, insomnia

PS25 403-C-2

SLEEP AND SLEEP APNEA IN OLDER ADULTS AND DEMENTIA

Donald BLIWISE (*Neurology, Emory University School of Medicine, USA*)

Dementia is associated with marked changes in sleep patterns. Evidence suggests that disturbed sleep may not only be an outcome or consequence of dementia but that it also may also be a potential risk factor for dementia and play a causal role in the development of certain types of dementia. This presentation will first review selected studies suggesting that disrupted sleep follows dementing illness, with an emphasis not only on Alzheimer’s Disease but also Dementia with Lewy Bodies. Then we will describe how disturbed sleep, generally, and particular sleep disorders, such as sleep apnea, may confer or accelerate risk for loss of specific neurotransmitter systems, hasten amyloid deposition, and accelerate neuronal apoptosis. These basic science observations will be balanced by human studies of disease natural history linking sleep apnea to dementia and clinical trials exploring the options for treating dementias in this manner. Keywords: Sleep, Sleep Apnea, Dementia

PS25 403-C-3

SLEEP AND DELIRIUM IN THE ACUTE HOSPITALIZED ELDERLY

Mei Sian CHONG (*Department of Geriatric Medicine, Tan Tock Seng Hospital, Singapore*)

Delirium is a common and serious condition, which affects many of our older hospitalized patients. The prevalence in hospitalized elderly patients is shown to be as high as 50%, with the diagnosis in 11-24%

of older patients upon admission and another 5-35% of them developing delirium during admission. It is an indicator of severe underlying illness and requires early diagnosis and prompt treatment. Despite varying etiologies, delirium has a characteristic constellation of symptoms suggesting a common neural pathway. Importantly, motor symptoms are core symptoms, associated with cognitive impairments and sleep disturbances. In this session, we will review the prevalence of sleep disturbances associated with delirium across the different acute care settings and the various interventions which may aid in addressing sleep disturbances in the acute hospitalized delirious older adult. Keywords : Delirium, Sleep, Hospitalized older persons

PRODUCTIVE AGING INITIATIVES IN ASIA: BEST PRACTICES FROM KOREA, JAPAN, SINGAPORE, AND INDONESIA

Kathryn L. BRAUN¹, Takeo OGAWA², Thelma KAY³, Tri Budi RAHARDJO⁴, Dong Hee HAN⁵ (*1. Public Health, University of Hawaii, USA; 2. Social Sciences, Kumamoto Gakuen University, Japan; 3. Ministry of Community Development Youth and Sports, Singapore, Singapore; 4. Centre for Ageing Studies, University of Indonesia, Indonesia; 5. Anti Aging, Busan National University, Korea*)

Introduction : Counties across Asia are experiencing rapid growth of the number and percent of older adults in their societies. Policy makers and planners are challenged to facilitate ways in which older adults can actively contribute to society, rather than becoming (or being seen as) dependent on it. The purpose of this symposium is to share “best practices” for productive aging from select Asian countries. Method : Presenters are country representatives of ACAP (Active Aging Consortium Asia Pacific), who work within their countries to demonstrate the real and potential social capital of older adults and to advocate for social policies that encourage and facilitate productivity aging. Dr. Braun will moderate the session. She will provide a brief overview of the trends that have led to rapid aging and describe ACAP’s individual-family-social policy framework for the development of active-aging initiatives. She will summarize arguments for productive aging, as well as the criticism of productive aging from the field of critical gerontology. Results : Dr. Han will describe the aging situation in South Korea and share best practices from the Research Institute of Science for the Better Living of the Elderly and from Busan National University. After reviewing Japan’s aging situation, Dr. Ogawa will describe initiatives such as Fukuoka City’s “active aging” plan. Ms. Kay will discuss productive-aging-related policy developments in Singapore, including increasing retirement age and promoting volunteerism. Dr. Rahardjo will discuss differences in the urban and rural experience of aging in Indonesia, and describe productive-aging projects in these settings. Conclusion : All countries must develop suitable productive-aging initiatives. Keywords : active aging, work, volunteerism

PS25 405-S-2

PRODUCTIVE AGEING IN INDONESIA

Tri Budi W RAHARDJO¹, Lindawati KUSDHANY², R Irawaty ISMAIL³, Vita Priantina DEWI³, Dinni Agustin NUGRAHA³, Sri Lasmidjah DIPONEGORO³, Eef HOGERVOST³ (*1. Centre for Ageing Studies, Universitas Indonesia, Indonesia; 2. University of Indonesia,*

Centre for Ageing Studies, Indonesia; 3. Centre for Ageing Studies, University of Indonesia, Indonesia)

Introduction : The purpose of this presentation is to share the level participation in workplace, community, and family among older persons in promoting productive ageing in Indonesia. **Method :** We analyzed the data of Susenas, the National Socio and Economic Survey of Indonesia, 2009, which included a representative sample of older adults. **Results :** The results showed that 58.95 % of older persons were in the position of head of household for their extended family, and 47% were still active in place for more than 35 hours per week. However, most of them (71%) were active in social activities, including religious activities as supervisor and participants, in scientific meetings as speakers and facilitators, in education as voluntary teachers, in older persons association doing various kinds of activities, such as dancing, painting, producing handicraft, etc. Most of them conducted social activities using their own money, supported by the family and cooperation. There was also evidence that active aging had a significant association with the level of disability and cognitive declining. Assistance provided by the government is still very limited. **Conclusion :** We conclude that productive ageing in Indonesia is significant and dominated by social activities with high motivation of older adults. Although causation cannot be determined from this cross-sectional dataset, active aging may be a protective factor against disability and cognitive decline. **Keywords :** Older persons, productive aging, workplace and social activities

PS25 405-S-3
INITIATIVES TO INCREASE THE PRODUCTIVITY OF OLDER ADULTS IN SINGAPORE

Thelma KAY (*Ministry of Social and Family Development, Singapore*)

Introduction: With a rapidly ageing population, a shrinking workforce and increasing dependency ratio, and growing sensitivity against foreign workers, initiatives have been introduced in Singapore to increase the productivity of older adults particularly through active ageing and enhancing employability. **Method :** The presentation will cover studies done on active ageing (including wellness programmes), age-friendly environment, factors influencing the employment of older adults from the perspective of employees and employers, and legislative and institutional measures to promote the employment of older adults. **Results :** Studies evaluating the outcome of active ageing initiatives will be presented. These cover pilot wellness programmes which have shown their effectiveness in enhancing participation, neighbourliness and social cohesion. Intergenerational activities, lifelong learning, reskilling programmes, process redesign and IT enablement, and use of technology will also be covered. Of particular interest will be the outcome of interventions to employ and manage older adults such as the Tripartite Alliance for Fair Employment Practices, the enactment of Re-employment of Older Workers legislation from 2012, and the increased Workfare Income Supplement Scheme for older low-wage workers. Challenges however remain with older workers more likely to be unemployed and also more likely to be in long term unemployment. **Conclusion :** Results of studies indicate the increasing acknowledgement of the importance of productive ageing in Singapore. This is being enabled with policies and programmes on active ageing (as both preventive and productive measures) as well as legislative/regulatory, awareness raising and mindset changing imperatives recognizing older persons as assets/resource and contributors. **Keywords :** Active ageing, productive ageing, intergenerational interdependence

PRODUCTIVE AGEING IN KOREA
Dong Hee HAN (*Research & Development, Research Institute of Science for the Better Living of the Elderly, Research Center for Anti-Aging, Korea*)

Introduction : Koreans are living longer, and more programs and roles need to be developed to help older Koreans stay productive. The purpose of this study is to introduce best practices of productive aging in Korea. **Method :** Case studies were gathered from the Elderly Welfare Center, Healthy Family Support Center, Senior Clubs, and the Research Institute for Science of the Better Living of the Elderly. Interviews were conducted with older people on their late-life roles. **Results :** The case studies feature programs that engage older Koreans as teachers, internet navigators, mentors to young people and new immigrants, and in other productive roles. Older persons wanted to be considered as social capital and to continue to contribute to families and communities in later life. More systemic education and training programs are needed to actualize this. **Conclusion :** It was concluded that productive ageing is significant in late life in Korea. Active Aging could also suggest productive aging, and a new conceptual model of productive aging will be shared. **Keywords :** productive aging, Active Aging, Social Capital

PS25 405-S-5
PRODUCTIVE AGING IN FUKUOKA-CITY, JAPAN
Takeo OGAWA (*Faculty of Social Welfare, Kumamoto Gakuen University, Japan*)

Introduction : Fukuoka-city is still young comparatively, although the demographic onus is progressing in Japan. However, some local communities are aging rapidly. We need to estimate the future population aging in Fukuoka-city, and actualize the social capital in communities for preparing to coming demographic onus. It means that older persons will have to work longer, and to maintain their healthy life. Also, younger generations will have to change their life style to follow up their parent-generations. **Method :** We make the empowerment tool of "Aging Imagination Game," which acknowledges residents the community aging in future. We select three communities for comparing their situation. Residents participate in workshops of 'Aging Imagination Game' Our research teams discussed their images on community aging, and try to cope their needs to community resources for creating sustainable communities in the super-aged society. **Results :** We have found some possibilities of intergenerational relationships which are not only family type but also neighborhood type. There are some paradigm shifts from individualism to contextualism. The social differentiation will be not well functions but the social integration will be alternative functions for realizing productive aging society. **Conclusion :** For promoting the productive aging, we will have to focus on the social capital in communities. The intergenerational relationship should be enforced for establishing productive/active aging society. We will design some intergenerational programs for promoting all-age friendly communities. **Keywords :** community design, intergenerational relationship, aging imagination game

PS25 410-R
COMPARATIVE LONG-TERM CARE SYSTEMS IN EAST ASIA

PS25 410-R-1
LONG-TERM CARE SYSTEM IN CHINA
Tuohong ZHANG (*Global Health, Peking University School of Public Health, China*)

Introduction : China is facing rapid ageing of population. China will only take about 20 years for the population of over 65 years old increasing from 7% to 14%, whilst France takes more than 100 years. Speedy ageing is accompanying with increased burdens of care, including clinic visit, hospitalization, self-care and long-term care. According to the analysis by the MOH, the total financial costs increases annually from 1993 to 2008 by 11.8% (post-adjusted by CPI, the consumer price index), even higher than the annual increasing rate of GDP during the same period of time (10.1%). **Method :** Second hand data analysis. **Results :** The need for long-term care could be proxy by the situation of functional loss or disability. In 2008, during the National Household Health Survey, the old people over 60 reported 16.9% of functional loss and 5.6% of disability. In China, there is no national program for long-term care insurance. Only one city has been starting the pilot by covering limited beneficiaries. The long-term care services have been provided separately by the Ministry of Civil Affairs (MCA) and the Ministry of Health (MOH). Officially recognized long-term care institutions and qualified human resources are in a big gap. In most nursing homes run by the MCA, The quality of service is doubted. The training for the long-term care staff is just started. **Conclusion :** China need to take urgent action to deal with the long-term care needs otherwise the financial burden due to LTC will not able to be met. **Keywords :** long-term care, China

PS25 410-R-2

LONG-TERM CARE IN JAPAN; SOCIO-POLITICO-CULTURAL DEBATE TOWARDS REFORM

Hideki HASHIMOTO (*School of Public Health, University of Tokyo, Japan*)

Long term care had been regarded as a private act in household under the traditional family system in Japan, and the concept is still vital in the current formal long-term care system established since 2000, where formal care provision is complementary to informal household care. Demographic change and subsequent decline in household function made a social driving force to prepare formal care provision under public financing. Japan chose social insurance system, no cash benefit, and relatively generous eligibility criteria solely based on functional evaluation. The choice allowed wide and rapid acceptance of the formal care, but also resulted in a financial threat to system's sustainability. Current debate over system reform includes a search for new financial source, rationing of service provision, improvement of service efficiency, and a more comprehensive policy beyond long-term care provision to build ageing-proof society. **Keywords :** Long-term Care Insurance (LTCI), Japan, Reform

PS25 410-R-3

LONG-TERM CARE SYSTEM AND POLICY IN KOREA

Soonman KWON (*School of Public Health, Seoul National University, Korea*)

Introduction : Rapid aging of population has fundamental effects on socioeconomic and health care system and policy in Korea. This paper will discuss the institutional design, cost containment, and key challenges and lessons of the long-term care system in Korea. **Method:** Based on a health system perspective, it reviews key aspects of health and long-term care system, such as governance and policy, financing, service delivery, and human resources in Korea. **Results :** In response to population aging, Korea introduced social insurance for long-term care in 2008. It contributed to reducing the financial barrier to care, but challenges remain in the areas of benefit packages, cost containment, over-supply of providers, and service coordination. The roles of long-term care hospitals, paid by health insurance, and long-term care

facilities, paid by long-term care insurance, are not clearly shared. **Conclusion :** Korea needs to better coordinate health and long-term care systems to improve health and well-being of the elderly and enhance financial sustainability of health and long-term care systems. **Keywords :** Long-term Care, Policy, Korea

PS25 410-R-4

DESIGN AND POLICY ISSUES OF THE UNIVERSAL LONG-TERM CARE INSURANCE SCHEME IN TAIWAN

Yue-chune LEE (*Institute of Health and Welfare Policy, National Yang-Ming University, Taiwan*)

Introduction : Following the footsteps of Germany, Japan, Korea and others, Taiwan Government is planning for the universal Long-term Care Insurance (LTCI) program, a compulsory social insurance program that would pay for basic long-term care (LTC) and support to the physically and mentally disabled persons, regardless of age, and their caregivers in Taiwan. The aims of this presentation are as following: 1. Introduce the basic scheme of the LTCI program, including the goals, eligibility, benefit, financing & payment system, cost containment and quality assurance mechanism. 2. Delineate the contents, methods, and application of the multi-dimensional need assessment instrument (MD-NAI). 3. Describe the methods to develop LTC case-mix system (LTC-CMS), which will be used to determine the levels of the NLTCI benefits. **Method :** Literature review, focus group and expert opinion were applied to develop MD-NAI. Cronbach's α were applied to determine the reliability. For the development of LTC-CMS, level of need were determined by MD-NAI, resources use were recorded by different kinds of LTC personnels who provide care to 5000 disabled persons received services from home, community care center and institution. Reliability test will be conducted by time-motion study on 10% of the samples. Tree-analysis will be conducted to develop care-mix system. **Results :** Except for emotional and behavior problems ($\alpha=0.76$), Cronbach's α were high (0.86-0.95) for the other five subdimensions of MD-NAI. **Conclusion :** Major policy issues regarding the financial sustainability, manpower demand and supply, cash benefits will be discussed. **Keywords :** Long-Term Care Insurance, need assessment, case-mix

PREVENTING DELIRIUM IN HOSPITALIZED PATIENTS: INSTITUTING THE HOSPITAL ELDER LIFE PROGRAM (HELP)

PS25 503-C-1

PREVENTING DELIRIUM IN HOSPITALIZED PATIENTS: INSTITUTING THE HOSPITAL ELDER LIFE PROGRAM (HELP)

Sandra Y. MOODY (*Medicine, Kameda Medical Center (Japan) & University of California, San Francisco (USA), Japan*)

Introduction : Delirium is a complex neuropsychiatric syndrome; its definition and pathophysiology are further complicated by the multiple synonyms or terms used to describe it. For example, several authors have noted more than 30, including acute confusional state, reversible dementia, and intensive care unit (ICU) psychosis. Despite description of delirium in the peer-reviewed medical literature for over 2,000 years, it remains under-recognized and frequently inappropriately treated and managed. **Method :** Delirium is prevalent in hospitalized patients, particularly among those aged 65 years or older, and is associated with significant morbidity and increased mortality risk. With aging societies, the incidence and prevalence of delirium are likely to markedly increase. Thus, prevention, and early diagnosis and

treatment are imperative. Results : Recent research has reported the development of tools and programs shown to improve early recognition, diagnosis, treatment, and more importantly, prevention of delirium. Conclusion : In this symposium, we will aim to accomplish the following objectives using an interactive approach. 1. Review the definition, risk factors, epidemiology, purported pathogenesis, prevention, diagnosis, and treatment of delirium. 2. Discuss the Inouye Hospital Elder Life Program (HELP) and its goal. 3. Using an example from Japan, describe one method of developing and implementing HELP at two community-based hospitals in Osaka area. Keywords : Delirium, Hospitalization, HELP.

FINDING HIGH RISK PATIENTS FOR DELIRIUM IN ORTHOPEDIC PATIENTS

Narei HONG (*Dept. of Psychiatry, College of Medicine, Hallym University, Korea*)

Introduction : Delirium is a common substantial neuropsychiatric syndrome for older patients. Also patients with delirium have a worse prognosis than patients without delirium, and delirium is associated with many adverse outcomes including more prolonged hospitalization, increased mortality and increased health care costs. Delirium usually occurs as a result of multiple causes and many predisposing and precipitating factors are known for delirium. Some predisposing factors such as existing cognitive impairment and dementia, advanced age and main physical problems which lead patients to be hospitalized cannot be changed, however predictive risk models and early management of some risk factors can help to prevent delirium in older patients. Method : For developing predictive risk models for delirium which is clinically feasible in Korean surgical situation, we surveyed all elderly patients who were admitted to

orthopedic departments of one university hospital in Korea. For diagnosing delirium, Confusion Assessment Method (CAM) and diagnostic interview based on Diagnostic and Statistical Manual of Mental Disorders, Fourth edition, Text Revision (DSM-IV-TR) were used by psychiatrists. Preoperative blood results and past medical history which were usually done by orthopedic surgeon were also collected. Results : Using these data, we made provisional predictive risk models of delirium for orthopedic elderly patients. Conclusion : This model can help orthopedic surgeons to find high risk patients for delirium in elderly patients. The surgeons may observe high risk patients closer and refer them to psychiatric department easily with this model. Keywords : delirium

INTERNATIONAL PERSPECTIVES ON FAMILY ROLES AND OBLIGATIONS

PS25 505-S-1

CULTURAL FORCES AND AGING FAMILIES: A REAPPRAISAL

Merril SILVERSTEIN (*Department of Sociology and School of Social Work, Syracuse University, USA*)

Introduction: Culture and exigent need are often counter-posed as competing altruistic motivations driving intergenerational resource transfers. However, this distinction is likely a false dichotomy in the sense that culturally sanctioned roles and obligations are patterned responses to unfulfilled needs. In much the same way, cultural norms are consistent with welfare state structures also patterned responses to need and that are themselves built on cultural assumptions about what family members are obligated and not obligated to do for each other. Method: This paper builds on a decade review of the literature on cultural aspects of aging families. There view emphasizes Hispanic and African American families in the United States but also considers national and cross-national dimensions of intergenerational transfers within a cultural context. Results: A paradigmatic set of principles are derived to describe how culture forms preferences for intergenerational transfers of money, time, and housing resources--with demonstrable outcomes in terms of the well-being of older adults and their descendants. At the micro level, pro-social values represent a form of moral capital that becomes valuable when need arises, but can also be manifest in generalized and redistributive transfers to older adults at the societal level. These micro and macro elements are manifestations of cultural preferences that are mutually determined. Conclusion: Culture and need as the driving forces of intergenerational transfers are interdependent with each other. The concept of moral capital subsumes this symbiosis by making explicit the presumptions that guide altruistic helping behavior in the family and dictates the preferred course of action within a social context. Keywords : Culture, care, families, intergenerational transfers

PS25 505-S-2

INTERGENERATIONAL FAMILY RELATIONS: SOLIDARITY, CONFLICT AND AMBIVALENCE IN EUROPE AND ISRAEL

Ruth KATZ¹, Ariela LOWENSTEIN², Dafna HALPERIN³ (*1. Human Services, Yezreel Valley college, Emek Yezreel & University of Haifa, Israel; 2. president, Yezreel Valley College, Emek Yezreel & University of Haifa, Israel; 3. Health Services Management, Yezreel Valley College, Israel*)

Introduction : Population aging results in fewer family members and caregivers available for older people. Parallel to the ageing of

populations, changes in family structures occurred which creates uncertainty in intergenerational relations and expectations and a shrinking pool of family support. Changes in social policies suggest less government responsibility for elder care with associated pressures on families. Giving these trends, the paper aims to explore intergenerational relations among adult family members comparing European countries and Israel. Method : Analysis of data from two international research projects: OASIS (Norway, England, Germany, Spain, Israel) and SHARE (more than 20 countries from Scandinavia through Central Europe to the Mediterranean), both having rich range of topics regarding family intergenerational relations. Moreover SHARE is a multi-disciplinary cross-national longitudinal study, completed four waves of data collection. Results : intergenerational relations are affected by social changes however they are not uniformly in the direction of weaker ties; the majority of people acknowledge some degree of filial obligation, although moderate differences between countries were found; generous welfare state services have not crowded out the family and helped generations to establish more independent relationships; majority of respondents were involved in the exchange of resources both as givers and receivers; In Israel the impact of the LTC insurance law on care relations showed that involvement and care of families was not reduced but had changed to more emotional support. Conclusion : Policy implications: to strengthen intergenerational relations and obligations and to achieve a balance among the three systems: the welfare system, the labor market, and the family system. Keywords : intergenerational family relations, caregiving, SHARE, OASIS

PS25 505-S-3

INTERGENERATIONAL RELATIONS, AGEING AND RISK TO FAMILY IDENTITY: EXAMPLES FROM AUSTRALIAN SOCIAL POLICY

Simon BIGGS (*Social & Political Sciences, University of Melbourne, Australia*)

Introduction : This paper considers changing perceptions of adult ageing, the family and their interpretation in social policy. The need for cultural adaptation to population ageing becoming accepted in policy debate. The question now is which forms of intergenerational activity will be legitimated and whether these forms take a sufficiently broad series of life-priorities into account. Once wider international trends are outlined, Australian policy is used as a case example. It is argued that a mismatch between policy initiatives and personal change is a new social risk associated with demographic and socio-cultural development, having implications for the way in which social ageism and age discrimination should be considered. Method : Critical analysis of policy material. Results : Risks are located between a policy context which is changing rapidly and a set of identities and expectations associated with ageing, which may or may not be evolving in the same direction. A struggle for dominance and legitimacy emerges, which risks the submersion of personal, family and age-related priorities. Conclusion : Contemporary trends, both nationally and internationally evidence solutions to 'the problem of demographic ageing' by adopting a form of economic instrumentalism. This restricts legitimate age identities to those associated with work and work-related activity. Effects on family life run the risk of reducing intergenerational engagement to unpaid care roles, while personal development and age-related life priorities are in danger of being ignored. A new direction for social policy is proposed. Keywords : intergenerational identity policy

ORAL HEALTH AND QUALITY OF LIFE IN OLD AGE

PS25 506-C-1

POTENTIAL MOLECULAR TARGET FOR PERIODONTAL DISEASE AND OSTEOARTHRITIS OF AGING

Eun-cheol KIM (*Department of Maxillofacial Tissue Regeneration, School of Dentistry, Kyung Hee University, Korea*)

Introduction : Anatomical, functional, and cellular changes in periodontal and joint tissues have been reported as being associated with the aging process. Method : The inflammatory response such as periodontitis and osteoarthritis is a frequent occurrence, because it is a normal reaction of the body's defense against various stimuli, including oxidative stress and microbial invasion into tissues. Results : With the emerging principles of inflammation indicating the important relationship between polypeptide signaling mechanisms and tissue destruction, the control of tissue destruction via control of these processes will become an important therapeutic goal in periodontics and osteoarthritis. Conclusion : In order to further improve regeneration efficacy, the possible causes and solutions will be discussed on the basis of: (a) mechanism and novel molecular targets of periodontitis such as, Nrf-2, HO-1, and endoplasmic reticulum stress, HIF-1 α , and SIRT1 (b) application sites for growth factors and stem cells, and (c) application of scaffold and carriers for growth factors and cells, and (d) age-related changes in the PDL fibroblasts. ACKNOWLEDGEMENTS. This work was supported by the National Research Foundation of Korea (NRF) grant funded by the Korea government (MEST) (No.2012R1A5A2051384). Keywords : Periodontitis; Molecular Target; Aging

PS25 506-C-2

SWALLOWING PROBLEMS IN THE AGING SOCIETY IN JAPAN

Toru NAITO (*Geriatric Dentistry, Fukuoka Dental College, Japan*)

Introduction : The population aging rate was 24% in Japan in 2012. As the aging of society progresses, the configuration of the disease profile of the population changes dramatically. Last year, the third most common cause of death was recorded as pneumonia, followed by cancer and heart disease. Many elderly people have died from pneumonia in recent years. There has been an especially high rate of aspiration pneumonia in the elderly. Method : Reduced oral care is known to be a risk factor for aspiration pneumonia, and Japanese dentists are very interested in oral care for the elderly population. Results : A recent survey showed that eating was one of the favorite activities of elderly subjects, but many elderly people have chewing or swallowing problems, referred to as dysphagia. Stroke, dementia or other serious diseases sometimes lead to dysphagia. In particular, approximately 80% of patients in the acute phase of stroke show swallowing problems. Some Japanese dentists are now trying to identify and treat patients with swallowing problems. To successfully treat patients with dysphagia, dentists need to cooperate with otolaryngologists, speech therapists and other medical workers. Conclusion : In Japan, geriatric dentistry attracts many dentists. One of the final goals of dentistry is the rehabilitation or recovery of the fun of eating. Geriatric dentistry should therefore include academic activities to contribute not only to the general oral health of the patients, but also to their systemic health. That is to say, dentistry should help patients to meet their expectations about health and normal activities, such as eating. Keywords : Swallowing, Dysphagia, Pneumonia

PS25 506-C-3

XEROSTOMIA IN OLD ADULT AND DEVELOPMENT OF ARTIFICIAL SALIVA

Hong-seop KHO (*Dept of Oral Medicine & Oral Diagnosis, Oromaxillofacial Dysfunction Research Center for the Elderly, School of Dentistry, Seoul National University, Korea*)

Introduction : Xerostomia is common in the old adults and the prevalence is increasing with the advent of aged society. Patients with dry mouth have many complaints and inadequate saliva production can significantly diminish quality of life in these patients. At present there is no effective machinery for the treatment of dry mouth. Sialogogues are not always effective and have side effects. The clinical efficacy of saliva substitutes is usually limited and not satisfactory. Therefore, the development of novel sialogogues and artificial saliva with more therapeutic and lesser side effects is needed. Method : Development of ideal saliva substitutes requires understanding of the rheological and biological properties of human saliva. Animal or plant substances were evaluated as candidate molecules and innate defense molecules such as lysozyme and peroxidase were used as antimicrobial supplements. For rheological properties, viscosity and wettability were measured. For biological properties, antimicrobial enzymatic and antifungal activities were evaluated. For the evaluation of clinical effectiveness, mucosal wetness was measured. Results : Animal mucins, hyaluronic acid, and yam were evaluated as candidate molecules. They have viscoelastic properties similar to human saliva at certain concentrations. They showed additive or inhibitory effects on antimicrobial supplements in the aspects of enzymatic and candidacidal activities. Conclusion : For the development of ideal saliva substitutes, research based on pathophysiology of dry mouth condition and biorheology of human saliva is necessary. Keywords : Xerostomia, Artificial saliva, Old adult

PS25 506-C-4

ORAL HEALTH PROMOTION CAN CONTRIBUTE TO MAINTAIN SYSTEMIC HEALTH AND HIGH QOL FOR ELDERLIES

Hideo MIYAZAKI (*Oral Health Science, Niigata University, Japan*)

Introduction : Periodontal disease is associated with general health status such as cardiovascular disease and diabetes. Those with complex health conditions are at greater risk of oral diseases that complicate their overall health. However, integration on the other oral-systemic relationships are still unclear. Method : Randomly selected 763 individuals aged 70 and 80 years old were employed for the Niigata Elderly Study in 1998. Sample size was 12% of number of inhabitants registered in the city. A personal interview was performed to obtain the bulk of information including socioeconomic variables, life style, etc. Four trained dentists assessed subjects' oral health conditions with same methodology once a year since 1998. In order to monitor the general health condition, blood pressure levels were recorded and serum levels of disease markers, nutritional factors, and physical ability tests were also investigated. Results : Occlusal supports were associated with lower extremity dynamic strength, agility, and balance function at baseline. While, significant declines of leg extensor power (OR=4.61) and one-leg standing time (OR=4.27) were observed in 0-3 occlusion support group than those having 4 supports during 8-years follow up period. These findings suggest that maintenance of dental occlusion may prevent a decrease in activities of daily living in the elderly. Moreover, during 10-year follow up, cox regression analysis showed that high scores in muscle strength for lower extremities and isokinetic leg extensor power were related to decreases mortality. Conclusion : These results clearly reveal the oral-systemic relationships and also suggest that maintaining oral health can contribute to support higher QOL in elderly people. Keywords : Dental occlusion, Physical ability, Mortality

NAVIGATING NEW HORIZONS AT THE END OF LIFE

PS26 105-S-1

PALLIATIVE CARE AND AGED CARE - UNLIKELY PARTNERS?

Margaret O'CONNOR¹, Keunyoul KIM², Helen YUE-LAI CHAN³, Edward WING-HONG POON⁴ (*1. Palliative Care Research Team, School of Nursing, Monash University, Australia; 2. Respiratory Medicine, Seoul National University, Korea; 3. The Nethersole School of Nursing, The Chinese University of Hong Kong, China; 4. Nursing, Thye Hua Kwan Hospital, Singapore*)

Introduction : Palliative care and aged care services share much in common, clinically and organisationally, but in most parts of the world, there has been slow recognition of how these disciplines can work together. The key connection is that just like a hospice, residential aged care is a person's final home. Thus even though death may be a common occurrence in aged care settings, there is little recognition that care of the dying is a required clinical skill. Results : Palliative care services have adapted their scope of practice in recent years, to work alongside their colleagues in primary healthcare. This organisational shift recognised that most health professionals will care for a dying person at some stage in their career; and that not every dying person requires the expertise of specialist palliative care. Aged care is a significant area of primary healthcare. Over the last 10 years in Australia, the Government has made a significant commitment to supporting the development of primary care including aged and palliative care services, to support care of the dying in aged care settings. Conclusion : This paper discusses aspects of the development of primary healthcare, and the work undertaken to support older dying people who require palliative care. Keywords : End of life, palliative care, aged care

PS26 105-S-2

WHAT OLDER PEOPLE NEED TO KNOW WHEN THEY HAVE A LIFE THREATENING ILLNESS? - FOR THE PC SESSION

Wing Hong POON (*Nursing Service, Ang Mo Kio-Thye Hua Kwan Hospital, Singapore*)

Introduction : With the fast ageing population, dying of an old age in Chinese society is less understood than might be expected. This paper is to uncover the lived experience of older people with life threatening illness and receiving palliative care in the inpatient hospice. Method : As this study is to understand and interpret the meaning of the older people with life threatening illness, hermeneutic phenomenology, descriptive and interpretative research methods were used to guide the whole research. 15 older people aged 65 and above were recruited. An in-depth interview was conducted individually that last from 30 minutes to 60 minutes. The tape was transcribed by the researcher. Results : Nine themes were identified: 1. Dislike of hospital stay 2. Fear of pain and suffering 3. Reliance of religion 4. Defining hospice 5. Being in the hospice 6. Issue of burden 7. Worry about family 8. Communication Issues 9. Culture barrier. Conclusion : The fifteen participants have provided valuable insights to inform clinicians about their needs and have help clinician to alter their care approach. Keywords : older people, palliative care

PS26 105-S-3

PROMOTING ADVANCE CARE PLANNING TO CHINESE OLDER PEOPLE

Helen Yue-lai CHAN (*The Nethersole School of Nursing, The Chinese University of Hong Kong, China*)

Introduction : Many older people live with chronic progressive disease for years, but their preferences for end-of-life care have seldom been sought due to difficulties in prognostication and inadequate attention to their palliative care needs. However, discussing about end-of-life care is generally considered as sensitive and potentially distressing in the Chinese culture. This often results in an avoidance approach that downplays the end-of-life care needs of older people and their right to express their care wish. **Method :** Mixed-method approach was used to examine the acceptability of older people towards advance care planning (ACP) and its impact, and to explore their experience with the planning process. **Results :** Findings showed that most of the Chinese older people were aware of their deteriorating health and open to expressing their views regarding end-of-life care. ACP helped to clarify their goals of care and empowered them to communicate their care preferences with families and healthcare providers. While it has often been believed that older people would be disgraceful with the sensitive topic, our previous studies showed that challenges in promoting ACP to older population mainly arisen from their families and society. **Conclusion :** ACP, which is an integral part of palliative care, facilitates older people to better prepare for their end-of-life care. The concept has not been widely accepted because death and dying has been misunderstood as a failure of medicine. The philosophy of palliative care therefore should be promoted to the wider society, so that the concerns and needs of older people can be addressed. **Keywords :** end of life, decision making, advance care planning

PS26 105-S-4

END-OF-LIFE(EOL) CARE MEDICINE AND MEDICAL EDUCATION (KOREAN PERCEPTION)

Keun-youll KIM (*Executive office, Zero TB World (Headquarter Office, Seoul, Korea), Korea*)

Introduction : End-of-Life(EOL) Care Medicine and Medical Education (Korean perception) Keun-Youll KIM, M.D.,MPH,Ph.D. ZeroTB World, Republic of Korea Increasing population of aged senile patients in every large hospitals with multiple degenerative incurable diseases, and the development of newer medical technologies for Life- Sustaining Treatment(LST), make the clinical decision problems much more difficult than before and former decades era. Medicalized hospital demise is becoming as more common trend since the Korean National Health Insurance system and the issue of termination of LST from dying patients posed as one of the hot social issue of Korean society. Recent experience (in 2009 & 2005) of two such cases of Korean Supreme Court's verdict of 'Futile LST Withdraw cases', after many years of legal dispute via Seoul District Court and Seoul Superior Appeal Court would exemplify the incidents as one of the important social issue. The Supreme high court of Korea legal authority have endorsed the legality of 'LST Withdrawal' when medical doctors can establish the clinical diagnosis of 'Medical Futility', even though it has been quoted for long time that 'to try to define the 'futility' is itself futile'. Due Process Law of Korea in medical practise is to be initiated, implemented, activated and to be educated for the solution of the problem of terminating LST and for the quality care of EOL situation. **Method :** Review. **Results :** Review. **Conclusion :** The changing view of medical educators for EOL Care Medicine and the curriculum change of medical school and post-graduate education are to be needed as prime importance. **Keywords :** Withdrawal of Life-Sustaining Treatment, Due Process Law, Quality of life of dying

patients

PS26 201-R

STRENGTHENING THE RIGHTS OF OLDER PERSONS GLOBALLY: ADVANCES AND CHALLENGES

PS26 201-R-1

RIGHTS OF OLDER PERSONS: FROM DENIAL TO A (IN) CONVENIENT TRUE?

Laura MACHADO (*Director, Global Alliance for the Rights of Older People, Brazil*)

Introduction : Older persons represent a large and growing segment of the population and they face particular and urgent human rights challenges. Despite existing instruments on human rights, age discrimination and ageism are widely tolerated across the world and older persons continue to be highly vulnerable to abuse, deprivation and exclusion. Whilst 10 years of implementation of MIPAA has resulted in some advances there is some evidence demonstrating that the existing international and regional human rights law do not sufficiently protect older people's rights and that the failure at regional and national levels to adequately respond to discrimination in old age leads to continued systematic violations of older people's rights across the world. **Method :** The symposium will discuss the outcomes of recent discussions at regional, national and international levels towards a convention on the rights of older persons and/or a designation of a special rapporteur. **Conclusion :** It is very clear that a UN Convention on the Rights of Older Persons cannot be achieved without public support in many countries and that is essential the involvement of all sectors of society. Non-governmental organizations in every country have an important role in this process and we expect as an outcome of this symposium a better involvement of academia and civil society in order to facilitate, engage and empower older persons into this process.

PS26 201-R-2

HUMAN RIGHTS OF OLDER PERSONS - UNITED NATIONS PERSPECTIVE

Rosemary LANE (*Department of Economic and Social Affairs, United Nations, USA*)

Introduction : In 2010, the UN General Assembly adopted resolution 65/182 which established the open-ended working group on ageing for the purpose of strengthening the protection of the human rights of older persons. The working group met twice in 2011 and once in 2012. It has recently been agreed at the General Assembly that another session will be held in 2013. **Method :** Based on reporting from the UN. **Results :** What has happened during the sessions of the working group? What are the positions of Member States and how is civil society participating? What are the arguments both for and against an international human rights instrument for older persons? What are the latest developments leading up to the next session? **Conclusion :** A dialogue among participants about moving the human rights agenda forward. **Keywords :** human rights, older persons

PS26 201-R-3

AFRICAN AND GLOBAL ENDEAVOURS ON THE RIGHTS OF OLDER PERSONS: FORGING CONNECTIONS

Isabella ABODERIN (*African Population and Health Research Center (APHRC), Kenya*)

Introduction : Pioneering strides have been made at regional level in Africa in the formalization of the human rights of older persons in the

continent. In contrast, engagement of African member States in the global, United Nations level process of deliberation on a global convention on older persons' rights - the UN Open Ended Working group (OEWG) has been limited, thus undermining the chances of an eventual UN endorsement of such a treaty. This paper seeks to examine the potential for, and concrete avenues to foster, greater African participation in and active support for a global convention. Method : The paper draws on the outcomes of a recent expert workshop on human rights of older persons in Africa, and a critical review of relevant scientific and policy literature. Results : The African Union's recent 'African Common position on human rights of older persons in Africa', explicitly advocates for the development of a UN convention. This together with the open support for such a development expressed by a few individual countries, notably South Africa and Ghana, provides an effective basis for garnering broad African Member State backing of a UN convention. Conclusion : Regional- and national-level approaches and steps involving actors from African civil society, academia and public bodies are required to harness the current potential for fostering active African engagement in the OEWG and support for a convention. Keywords : Human Rights, Africa, Advocacy

PS26 201-R-4

THE GLOBAL MOVEMENT TOWARD A UN CONVENTION: THE VOICES OF OLDER PERSONS

Mark Robert GORMAN (*HelpAge International, United Kingdom*)

This presentation will examine the ways in which the voice of older people can be involved in the global debate on ageing. This becomes especially important as the campaign for a Convention on the rights of older people is now under way. The example of the joint UNFPA/HelpAge International report 'Ageing in the 21st Century' demonstrates both the processes of engagement with older people in different social and economic contexts and across the world, and will be used to illustrate how the voices of older people can be heard. The consultations undertaken for the report were also an opportunity gauge the impact of the Madrid Plan of Action (2002) over the past decade since it was agreed. I will examine what older people think about the process of consultation and the progress that they think has been made since MIPAA was agreed. The presentation will also consider the wider role of civil society actors including NGOs and academics, in the process of development towards a rights Convention.

PS26 202-B

NUTRITIONAL INTERVENTION IN AGEING

PS26 202-B-1

VITAMIN C AND AGING

Akihito ISHIGAMI (*Molecular Regulation of Aging, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : Vitamin C (L-ascorbic acid) has a well-documented, strong anti-oxidant function, evident as its ability to scavenge reactive oxygen species (ROS) in cells and blood. Additionally, an anti-aging effect has been attributed to vitamin C stemming from its deletion of ROS; however, no scientific evidence has yet proven this assertion. Method : The senescence marker protein-30 (SMP30) was first described as an age-associated protein of decreasing quantity in the liver and kidney late in life. Recently, we identified SMP30 as the lactone-hydrolyzing enzyme gluconolactonases (GNL) of animal species. GNL is a key enzyme involved in vitamin C biosynthesis. Therefore, SMP30/GNL knockout mice are unable to synthesize vitamin C in vivo. These knockout mice died by 135 days after the

start of receiving the vitamin C-free diet. Results : It cannot be said that the vitamin C deficiency promoted aging in this model, because SMP30/GNL knockout mice died of scurvy, when fed a vitamin C-free diet. A most important point is that scurvy is a disease; whereas, aging is not. Aging refers to a slow gradual decrease of physiological functions of the body as time passes. We found that these SMP30/GNL knockout mice were shorter in life span than the wild type when fed vitamin C low diet (about 2.5% a day of vitamin C). Conclusion : Until now, there was no scientific evidence for this conclusion despite the conventional wisdom that vitamin C has an anti-aging influence. This might be a first research to show in a scientific manner that the shortage of vitamin C decreased life. Keywords : Aging, nutrition, vitamin C

PS26 202-B-2

DIETARY RESTRICTION AFFECTS PROTEIN ACETYLATION IN AGED RATS: EFFECTS ON HISTONE AND CYTOPLASMIC PROTEINS

Sataro GOTO¹, Kyojiro KAWAKAMI¹, Hideko NAKAMOTO¹, Hisashi NAITO¹, Shizuo KATAMOTO² (*1. Institute of Health and Sports Science & Medicine, Juntendo University Graduate School, Japan; 2. Institute of Health and Sports Science & Medicine, Juntendo university Graduate School, Japan*)

Introduction : In recent years, much attention has been paid to protein acetylation in aging animals subjected to dietary restriction (DR). As the extension of our research on post-translational modifications of protein in aging, oxidation among others, we have studied epigenetic histone modifications that can influence chromatin activities and also cytoplasmic proteins that appear to have roles in energy metabolism. Method : Young and old male F344 rats were used. DR was either short term in old age or lifelong. Protein carbonylation and acetylation were studied by immunological methods. The gene expression was studied measuring mRNA by RT-PCR. The gene specific histone acetylation of chromatin was studied by immunoprecipitation with the antibody to site-specific acetylation and quantitative PCR (qPCR) using primers for gene specific DNA segments. Results : Contrary to our expectation, histone carbonylation was reduced in the liver of aged animals but was increased by DR. Similarly, we found that acetylation of histone is reduced in aged rats but increased in DR animals. These findings are consistent with the idea that chromatin activities are reduced with age but increased by DR. The results of qPCR did not explain those of RT-PCR influenced by aging and DR, however. Acetylation of cytoplasmic proteins, notably mitochondrial proteins related to energy metabolism, were also affected by aging and DR. Conclusion : Post-translational modifications of histone and cytoplasmic proteins appear to play important roles in aging and its intervention by DR. Keywords : Dietary restriction, protein acetylation, epigenetics

PS26 202-B-3

CALORIE RESTRICTION MIMETICS: STATE OF THE ART

Donald Keith INGRAM (*Nutritional Neuroscience and Aging Laboratory, Pennington Biomedical Research Center, USA*)

Introduction : By reducing dietary intake by 20-50% in a wide variety of species, many health benefits have been reported, including reduced incidence and retarded onset of chronic diseases, enhanced stress protection, and maintenance of youthful function in conjunction with increased lifespan. Calorie restriction (CR) has proven to be the most robust means to retard aging, but its application to human aging represents a challenge. Reports of persons who practice CR and from controlled clinical studies of CR also indicate such regimens can

positively impact indices of health and risk factors for disease. Nonetheless, despite evidence that CR produces beneficial effects in humans, therapeutic application would be problematic due to difficulties of compliance and other quality of life issues. Method : To address this challenge, the concept of CR 'mimetics' (CRM) has been introduced as a method to obtain the 'anti-aging' and health-promoting benefits of CR without requiring reduced food intake. Results : Several candidate CRM compounds have been proposed with different strategies involving both upstream and downstream targeting. These include sirtuin activators (resveratrol), insulin sensitizers (metformin), mTOR inhibitors (rapamycin), citric cycle intermediates (oxaloacetate), and glycolytic inhibitors (2-deoxyglucose, mannoheptulose). Conclusion : The field of CRM has evolved to commercial applications and is generating new candidates to evaluate, but there remains uncertainty about what targets will be most effective and what proof will be required to demonstrate efficacy of candidate CRM. Keywords : calorie restriction, anti-aging, metabolism

PS26 202-B-4

GLYCOLYTIC INHIBITION AS A STRATEGY FOR CALORIE RESTRICTION MIMETICS

George S. ROTH (*GeroScience, USA*)

Introduction : The emerging field of calorie restriction mimetics (CRM) is quickly attaining a high priority niche in biogerontological research. With the relevance and applicability of CR to humans under intense scrutiny, the more practical CRM approach is beginning to generate great momentum in both the academic and commercial spheres. Method : While there are numerous candidate CRM agents and strategies, our own focus for over a decade has been glycolytic inhibition as the most faithful reproduction of actual CR. This approach takes advantage of reducing energy flux through the glycolytic pathway in a manner quite analogous to reducing caloric intake, in effect 'tricking' the cells of an organism into adopting the CR phenotype. Results : The first candidate CRM in this category was 2-deoxyglucose (2DG) which inhibits phosphohexose isomerase to reduce the number of native glucose molecules metabolized. Although 2DG feeding to rodents reproduced many of the shorter-term CR endpoints, such as lower body temperature and plasma insulin levels, it exerted some cardiotoxicity and lower dosages were ineffective in extending lifespan. Most recently, however, we have employed mannoheptulose (MH), a 7 carbon sugar derived primarily from unripe avocados, to elicit many of both the long and short term beneficial effects of true CR. Studies have employed fruitflies, rodents, and dogs (very early work demonstrated antidiabetic effects in humans as well), and these include insulin/glucose control, improved body composition, increased strength/agility, immune/stress/inflammation protection, weight control and increases in median and maximal longevity. Conclusion : Clinical trials are being designed, and data from most recent studies will be reviewed. Keywords : glycolysis, calorie restriction, longevity

PS26 203-C

THE INTERPLAY BETWEEN FALLS, OSTEOPOROSIS AND MOBILITY DISABILITY: THEIR IMPACT IN SEVERAL POPULATIONS

PS26 203-C-1

UNDERSTANDING FALLS AND FRACTURES AS A LONG TERM CONDITION. THE ROLE OF GAIT VELOCITY AS AN EARLY SIGN OF DISABILITY

Manuel MONTERO ODASSO (*Director, Gait and Brain Lab, Lawson Research Institute, The University of Western Ontario, Canada*)

Falls and Fractures generate most of the disability associated with aging and expense in our health system. The approach has been fractionated and developed in silos. Osteoporosis was focused in to improve bone density with little attention of mobility and falls. In the same way falls research and prevention focused only in balance gait improvement with scarce attention to fracture risk. However falls and fracture are an indissoluble entity which should be approached as a whole. Falls and fractures present as a "acute catastrophic event" but need to be understood as a chronic condition where each increase the risk to suffer the other. It has been shown that early changes in gait strongly predict falls fractures and even mortality. The role of early gait and mobility assessment in high functional elderly will be reviewed and a proposal of screening will be shown. Keywords : falls, fractures, gait velocity

PS26 203-C-2

TARGETING "SARCO-OSTEOPOROSIS": A PRACTICAL APPROACH FOR THE PREVENTION OF FALLS AND OSTEOPOROTIC FRACTURES

Gustavo DUQUE (*Ageing Bone Research Program, The University of Sydney, Australia*)

Sarcopenia and osteoporosis affect older adults around the world and many times have devastating complications that affect their well-being and quality of life. Analysis of the pathophysiologic pathways of sarcopenia and osteoporosis reveal several overlapping features. These conditions are age-related, both are multifactorial processes and both are characterized by progressive loss of tissue mass. Additionally, physical inactivity, vitamin D deficiency and poor nutrition accelerate the progression of both conditions. Despite these similarities, most interventions to date target these conditions separately. In this symposium we will review the current state of knowledge about sarcopenia and osteoporosis and will analyze preventive measures and therapeutic interventions that can benefit both conditions simultaneously. We intend to go over the translational aspects of sarcopenia and osteoporosis research and highlight expected outcomes from different interventions for both conditions. We will initially review the mechanisms contributing to sarcopenia and osteoporosis including metabolic and cell signaling changes. For example, we will analyze how changes in protein and amino acid intake affect muscle and bone metabolism. Next, we will discuss the benefits and limitations of current diagnostic schemes for both conditions. For instance, the benefits and limitations of dual energy X-ray absorptiometry (DXA) as a diagnostic and research tool will be analyzed. Then, we will discuss evidence-based diagnostic and therapeutic interventions that pose promising opportunities for both conditions, which include the review of nutritional, physical activity and pharmacologic interventions. Finally we will translate this information into practical approaches that can improve older adult care. Keywords : falls, fractures, sarcopenia

PS26 203-C-3

SOCIO-ECONOMIC STATUS IMPACT, FRAILTY AND GAIT VELOCITY IN POOREST OLDER POPULATIONS

Jose Ricardo JAUREGUI (*Internal Medicine, Italian Hospital of Buenos Aires, Argentina*)

Introduction : We present some results from a study of frailty in a very poor and illiterate population of people 50 yr. old and more, compared with other group of rich and very educated persons. What happens in an elderly population living in extremely poor SES conditions (SES: Socio Economic Status) in Argentina with their gait velocity and frail conditions, and which are the other factors involved

to explain the findings. Method : Comparative and observational study. Two groups of 180 persons. We performed a comprehensive geriatric assesment, laboratory for nutritional status and an enviromental analysis, comparing functional performance and frailty status. Results : Those over 80 yr. poor and illiterates, compared with those without that condition, have worst results in physical performance, quality of life and frailty, as we expected. Those under 80 yr. have no significant differences between both groups. Conclusion : Till 80 yr. both populations have small differences in social impacts on gait velocity, functional status and frailty. We have not found specials differences between poor illiterates and people with high education and incomes. For those over 80 yr.`s poor people, functional status drops fastly and differencies are as we expected. More is needed to know about this poored old populations. Keywords : SES, Frailty, Gait Velocity

SENIORS, DISASTERS AND CLIMATE CHANGE: LESSONS FOR RESPONSE, RECOVERY, MITIGATION AND PREVENTION

PS26 206-R-1

ROLE OF ELDERLY IN DISASTER PREPAREDNESS: LINKING KNOWLEDGE TO CAPACITY DEVELOPMENT

Aslam PERWAIZ (*Disaster Risk Management System, Asian Disaster Preparedness Center, Thailand*)

The ageing population requires special attention in times of disaster and distinct role in building resilient societies. They have wisdom and experience in forging partnerships at the local level across political, institutional, government, NGOs, private sector and academic lines. With more than 11 percent of the global population, people over 60 are rising and are estimated to reach 2 billion (22% percent of world population by 2050). These numbers are equally important to Asia, which is one of the most disasters prone in the world. With the increase of disaster losses across Asia and facing unpredictable nature of hazards, the frontline role of old people through their formal or informal association is critical. One such initiative is called the Older People's Associations (OPA) in Asia, which have increased their representation in local and national disaster risk reduction bodies and engagement with local government in pre-disaster activities. The older people groups have been recognized as a key stakeholder in integrating disaster risk reduction and climate change adaptation in the local development planning. This session will showcase existing practices with empirical evidence of OPAs playing important roles in developing and implementing plans for community based disaster risk reduction (CBDRR) in Thailand, Philippines, Bangladesh, Nepal, Myanmar, Vietnam, India, Indonesia and Cambodia. Lessons derived from Japan, which has an 'ultra aged society' with 29.47-million older person, is equally important for other countries in incorporating disaster preparedness plans with specific focus on ageing population
Keywords : ageing, disaster preparedness, capacity development

PS26 206-R-2

OLDER PEOPLE INITIATIVES IN BUILDING RESILIENT COMMUNITIES AND THEIR CAPACITY IN TIMES OF EMERGENCY

Fransiskus KUPANG (*NGO, Coalition of Services of the Elderly, Inc, Philippines*)

Introduction : The Philippines is the country most prone to natural disasters. This situation has challenged communities, policy makers and various actors on how to cope with the growing number of natural

disasters. The situation becomes more challenging for the vulnerable groups especially the older people living in poor conditions. Despite this situation, in our experience working with older people we have discovered that older people have huge potentials for making communities resilient and can play a bigger role in disaster response and recovery. Method : My presentation will also deal on the potential to develop and harmonize community mechanisms that will sustain the capacity of older people. In addition, the presentation will highlight our basic principle in working with older people in addressing their rights as active participants in building communities responsive to the needs of the older people. Results : The presentation will highlight the features of community based programs of the older people and the leadership role of the older people. Aside from that, community based mechanism developed by older people in response to disaster. As result of advocacy of older people, indigent older people have received social pension. Conclusion : Since 1989, worked at communy level such developing community Gerotologist, older people reponsive livelihoods, home care volunteers among oder people and work at wider context for policy changes, COSE since 2009 pushed its effort to develop resilient communities with acitve participation of the older people. Since then, less casualties in recent calamities in our communities where lder people have been prepared. Keywords : Older people as actors, disasters, resilience, community development, capacity-building

PS26 206-R-3

MOVING TO RESILIENCE: THE EVOLVING ROLE OF HELPAGE INTERNATIONAL IN MULTI-RISK ENVIRONMENTS

Godfred PAUL (*Programme, HelpAge International, Thailand*)

Introduction : This presentation gives an overview of the work of HelpAge in building resilience of communities worldwide. As an international organisation focusing on the rights, needs and capacities of older people, HelpAge International responds to emergencies and supports older people and their communities in recovering after disasters. Method : Following growing understanding of why disasters happen and how to reduce their impact, HelpAge has gradually strengthened its commitment to disaster preparedness and mitigation with a particular focus on older people and people with disabilities. In the wake of climate change, HelpAge International has supported older people's response to this and other environmental risks through Disaster Risk Reduction approaches. This is done through direct implementation of projects, often in partnership with local partners, older people groups and international organisations, but also by advocating for the inclusion of older people in disaster risk reduction and climate change interventions and greater resource allocation with governments and the wider humanitarian community. Results : Helpage has come to realise that reducing people's vulnerability in an increasingly multi-risk environment with a range of economic and social shocks requires a two pronged approach. The first is to work directly with vulnerable people in the communities lead largely by older people. They have a strong commitment to the common well being of their families and communities. The second is to aggressively advocate for the inclusion of older people in policies, programmes and resource allocation. Conclusion : The resilience approach is premised on the need for integrated analysis and improved ways of working across multiple disciplines. Keywords : Older People lead DRR

U-HEALTH CARE IN AGING SOCIETY

PS26 303-C-1

ROLE OF HEALTH INFORMATION TECHNOLOGY AND US HEALTHCARE REFORM

Seong K MUN (*Arlington Innovation Center for Health Research, Virginia Tech, USA*)

The advances in communication technology have fueled intense research in the area of telemedicine, u-health, e-health and now m-health. These technology driven tools of health delivery methods will have powerfully unique role to play in all aspects of healthcare transcending traditional boundaries and silos. In the US, the adoption of telemedicine started with the success of teleradiology in the 90's. Introduction of video teleconference opened many new possibilities and innovations. As the Internet became popular the concept of e-health brought more innovative ideas for connecting health care delivery organizations and patients. Recently popularity of cell phones and mobile technology has triggered exploding interests in m-health. In recent years, as an integral part of the healthcare reform effort, the US government initiated incentive programs to promote the adoption of electronic health records. Meaningful use of health information technology is an umbrella term for rules and regulations that hospitals and physicians must meet to qualify for federal incentive funding under the American Recovery and Reinvestment Act of 2009. Meaningful use sets goals that are about healthcare, not about information technology. Under this program a wide range of technology based innovations, such as e-health, u-health and telemedicine will be deployed as an integral part of electronic health records for all aspect of healthcare. Keywords : Telemedicine, U health, E health

PS26 303-C-2

U-HEALTH TO KEEP PRODUCTIVITY IN AGING SOCIETY

Naoki NAKASHIMA (*Medical Information Center, Kyushu University Hospital, Japan*)

Introduction : The most problematic issue in Japan is how to keep labor productivity, because Japanese population aging rate (65 years old or older) reached 23% as a leading runner of the aging society in the world. This is spurred by chronic diseases in productive generation as diabetes mellitus and hypertension, which deprive productivity by causing serious complications. It would not be an exaggeration to say that the mission of healthcare/medical service is to keep and increase labor productivity. Method : A patent usually visits clinic once a month, thus the chance of professional assessments is limited. To get information of daily life we have conducted verification studies of "information as medicine (info-medicine)" by sensor network. Info-medicine concept proposes that if the information is provided in a timely and appropriate manner, information can be medicine. We are researching of the usability and sustainability of sensor sets with IEEE 802.15.6 BAN in an attache case named "Portable Health Clinic (PHC)" with info-medicine in Bangladesh. We have been providing health checkup service followed by telemedicine for affected subjects from July, 2012. Results : At the end of March 2013, we have finished 8690 subjects in urban (35%), suburban (33%) and rural area (31%). Results show healthy was 16%, cautious, 64%, affected, 17%, and emergent, 2% determined by international standard. We found about a half of affected subjects improved to caution or healthy levels at 2 months after telemedicine. Conclusion : Now, we are analysing about detail of the final results. We are also planning to use PHC for nursing home or private home with nursing care. Keywords : ubiquitous-health, body area network, sensor network

PS26 303-C-3

U-HEALTH EXPERIENCES IN SNUBH

Hee HWANG (*Department of Pediatrics, Seoul National University Bundang Hospital, Korea*)

Introduction : U-Health (or mobile healthcare) is one of the rapidly growing convergence industries of healthcare and information technology (IT). Advances in information, communication, and smart device technology have transformed the healthcare delivery system from a traditional episodic and reactive care to a continuous and proactive care. This is an irresistible paradigm shift in healthcare posing new challenges to the industry as it moves towards prevention and management of diseases. In the era of smart health, the mobile healthcare solution is an essential element in providing connectivity to healthcare services, anytime and anywhere. Method : We developed the mobile healthcare solutions for diabetes, asthma, wound, and mild cognitive impairment. The solutions consisted of a server platform, mobile applications for patients, applications for physicians or health managers, and interface with hospital information system. Results : From our pilot study and trial use of the mobile healthcare solutions, we've found technical feasibility and possible clinical effectiveness for the management of diabetes, asthma, wound, and mild cognitive impairment. Conclusion : Although there are still needed big clinical trial studies to prove clinical effectiveness of the mobile healthcare solutions, our experiences on developing various solutions can show the possibilities of developing further disease management solutions using IT and mobile devices. Keywords : Mobile healthcare, disease management

PS26 305-S

PROCESS OF RETIREMENT AND QUALITY OF LIFE OF BABY-BOOMERS FROM INTERNATIONAL PERSPECTIVE

PS26 305-S-1

WORK AND RETIREMENT HISTORIES OF FOUR SUCCESSIVE COHORTS IN THE NETHERLANDS: ARE BABY BOOMERS DISADVANTAGED?

Hanna VAN SOLINGE (*Work and Retirement, Netherlands Interdisciplinary Demographic Institute (NIDI), Netherlands*)

Introduction : The socio-economic structure has changed considerably over the past decades. As a result work and retirement opportunities of successive birth cohorts may differ from each other. Method : This paper explores the work and retirement histories of four successive birth cohorts in the Netherlands: the pre WW2 cohort (1935-1939), the WW2 cohort (1940-1945), the baby boom cohort (1946-1949) and the post baby boom cohort (1950-1951). Does the process of retirement and the quality of life in retirement differ across cohorts? Is there any indication that baby boomers are disadvantaged in this respect? Easterlin's hypothesis that members of large birth cohorts face more restricted life opportunities will be tested. Results : The paper is based on the NIDI Work and Retirement Panel. The panel followed more than 2.500 older workers and their partners over a period of at least 10 years in the years between 1995 and 2011. Baby boomers tend to be better educated and wealthier than their predecessors, and they are the last cohort that had access to the generous early retirement schemes that existed in the Netherlands till 2006. The baby boom cohort retired relatively early and many boomers re-entered the labor force after (early) retirement. Motives for this un-retirement were mainly intrinsic. Conclusion : There is no evidence that baby boomers are disadvantaged. Instead, they appear to use their retirement as window for new opportunities and personal development. Work in retirement is increasingly common. Keywords : retirement baby boomers quality of life

PS26 305-S-2

Angelique CHAN (*Sociology, NUS Faculty of Arts and Social Sciences, Singapore*)

PS26 305-S-3

ARE LUCKY BABY BOOMERS UNLUCKY IN LATER LIFE? A COHORT

Gyounghae HAN* (*Child Development & Family Studies, Seoul National University, Korea*)

Introduction : The main purpose of this study is to examine the labor market outcomes of Korean boomer cohorts, born right after the Korean War, in comparison to the older cohorts. Method : We analyzed 16 cohorts, utilizing two data sets: Data of 9 cohorts from the “Korean Baby Boomer Panel” and data of 7 cohorts from a study of a young-elderly generation born right before the boomers for comparison. Results : First, the boomers stayed longer in school and were able to accumulate more human capitals. 23.9 percent of the baby boomers advanced to college while only 10.1 percent of the young elderly experienced tertiary education. Second, it took 2.5 years less for the boomers to find major job after their final education compared to their previous generation. However, the duration of major jobs for the boomers became shorter to a significant margin and the belief of “lifelong employment” became a myth. Third, the boomers were often stuck between their old parents who needed care and children who failed to find jobs and stayed with them. Because of this sandwich burden, boomers were not able to retire as planned and were forced to remain in the labor market even after they left major jobs. Conclusion : The Boomers, once thought to be “lucky cohort” due to fast economic growth, turned out to be unlucky in labor market due to massive restructuring caused by the IMF economic crisis in late 1990s. Keywords : Baby boomers, Cohort Perspective

PS26 305-S-4

RETIREMENT EXPECTATIONS AND OUTCOMES AMONG THE BABY BOOMERS

James RAYMO (*Sociology, University of Wisconsin, USA*)

Introduction : Widespread concern about aging of the large U.S. baby boom cohort centers on rising costs of Social Security and Medicare, loss of workforce expertise, and increasing numbers of older Americans without adequate financial resources for retirement. However, both anecdotal and survey evidence suggest that baby boomers are more likely than previous cohorts to plan to continue working beyond typical retirement ages. Careful documentation of the retirement plans of baby boomers, success or failure in realizing plans, and the correlates of both retirement plans and outcomes is thus critical for understanding the broader social and economic impacts of the aging of this large cohort. Method : We contribute to this objective by using data from the Health and Retirement Study (HRS) to describe cross-cohort differences in retirement plans and outcomes. Results : Preliminary comparisons of the original HRS cohort (born 1931-1941), the War Baby cohort (born 1942-1947), and the Early Baby Boom cohort (born 1948-1953) indicate that the Baby Boomers are significantly more likely to expect to be working full time after age 62 and after age 65. Furthermore, nearly one-third of both the War Babies and the Early Baby Boomers say that they have no plans to ever stop working, three-times higher than the proportion in the original HRS cohort. Conclusion : We build upon these preliminary comparisons to describe cross-cohort differences in the realization of retirement plans and to project employment patterns of the baby boom cohort going forward. Results provide an empirical basis for contemplating the

implications of the aging of the baby boomers. Keywords : retirement, aging, baby boomers

PS26 403-C

PREVENTION OF DEMENTIA

PS26 403-C-1

WHY HAVE WE NOT YET IDENTIFIED EFFECTIVE WAYS TO PREVENT ALZHEIMER'S DISEASE? IMPLICATIONS OF RECENT FINDINGS FROM BRAIN AUTOPSIES DONE IN THE CONTEXT OF LONGITUDINAL, POPULATION-BASED RESEARCH.

Lon WHITE (*Neuro epidemiology, Pacific Health Research and Education Institute, USA*)

The development of effective strategies for prevention of late life dementia is a global medical, social, and economic imperative. So far we have made only marginal progress toward that goal. Nearly all of the clinical trials aimed at the pharmacologic prevention of AD/cognitive decline have failed to demonstrate significant effectiveness. In addition, there is a paucity of consistently identified, modifiable risk factors that might inform preventive intervention strategies. Since genetic factors appear not to be dominant, and since some individuals maintain good cognitive functioning and relatively lesion-free brains into their tenth decades of life, it seems likely that the blame lies with an incomplete understanding of dementia pathogenesis. Recent findings from autopsies on individuals participating in several longitudinal, population-based studies have identified six likely aspects contributing substantially to the problem: (1) pathogenic heterogeneity involving at least 5 common, independent pathogenic processes – each likely to have independent risk factors, (2) a very high frequency of clinical diagnosis misclassification of both cases and controls, (3) ambiguities in the correspondence of brain imaging measures to specific neuropathologic abnormalities representing distinct pathogenic processes, (4) imprecise measurement of the specific cerebrovascular lesions most proximately linked to dementia, (5) failure to recognize the great frequency and geometrically additive impact of co-prevalent neuropathologic processes, and (6) a possible role for primary atrophy and/or other cryptic pathogenic processes not yet recognized as primary dementing diseases, operating alone or in concert with other processes. Each of these will be illustrated using data accumulated from 8 examination cycles and 852 standardized research protocol brain autopsies accrued over the twenty year lifespan of the Honolulu-Asia Aging Study. Keywords : Dementia, Prevention, Autopsy

PS26 403-C-2

MULTISTRATEGIC MEMORY TRAINING IN ELDERS FOR PREVENTING DEMENTIA

Seung-Ho RYU (*Department of Psychiatry, Konkuk University School of Medicine, Konkuk University Medical Center, Korea*)

With the increase of the population of older people, the need for effective training programs to improve cognitive functions in the elderly has been increasing. These cognitive enhancing training programs may contribute to the prevention of elderly cognitive decline by aging and demented illness as well based on cognitive reserve and plasticity. This study aimed to examine the effectiveness of multistrategic memory training with the metamemory concept on cognitive functions in the normal health elderly in Korea. This multistrategic program was used in this study. We applied the training program to the community-dwelling elderly with subjective memory complaints and mild cognitive impairment. This program consisted of 10 sessions and was administered once a week. We examined the

effects of this memory training by neuropsychological functioning and multimodal imaging analysis. There were significant improvements in some neuropsychological functioning including memory and equivocal findings in neuroimaging. This study shows that multistrategic memory training with the metamemory concept may improve memory ability and these results suggest the possibilities that cognitive training can delay dementia onset in the elderly.

HOUSING DEVELOPMENT FOR SENIORS

PS27 201-R-1

ELDER COHOUSING IN DIVERSE COUNTRIES: CURRENT AND FUTURE PERSPECTIVES - ELDER COHOUSING: AN IDEA WHOSE TIME HAS COME?-

Anne P GLASS (*University of Georgia Institute of Gerontology, College of Public Health, USA*)

Introduction : Elder cohousing has existed for several years, primarily in northern Europe. Recently, the first elder cohousing communities have emerged in the United States (USA). Through these elder-only intentional communities, older adults proactively choose how and where they want to live, in a close-knit community where neighbors look after each other. Residents have their own homes, but share both inside and outside common space. Method : The results of research with the first three such communities in the USA will be presented, including the ongoing mixed-methods longitudinal study of one community since it opened in 2006. The distinctions of this living arrangement will be outlined, which include a physical design intended to promote social contact, self-management by the residents, and regular occasions to get together, such as common meals in the Common House. Results : While it has challenges, there are benefits to living in elder cohousing, which have led to creation of a model of how aging together in this setting helps participants have a better aging experience. The mutual peer support that is facilitated in these communities is particularly significant. The conceptual model, as well as several examples of these communities, will be shared. Conclusion : The presentation will highlight how these communities differ from other types of retirement communities. In addition, little research on elder non-kin caregiving exists, but the global caregiver shortage and desire for nursing home alternatives make understanding this housing alternative important. Lessons learned may help facilitate the efforts of others interested in "aging in community." Keywords : Elder Cohousing, Ageing in Community, Common House

PS27 201-R-2

AN INNOVATIVE ELDERCARE SYSTEM EVOLVED FROM SUPER AGING EXPERIENCE -MULTI-FUNCTIONALLY SERVICED LIVING COMPLEX IN CURRENT JAPAN-

Hideyo TAKAHASHI (*Community net Co., Ltd., Japan*)

Introduction : In the 80s', Japan reached rapid growth of senior business. Simultaneously, nuclear family became prevalent. Now, it is impossible for families to take care of the elderly at home without external service's help. This led various industries to join the eldercare business. Although many companies invested much to construct fine buildings, they suffered from management shortage, and went bankrupted. Different approaches were necessary. Method : A new innovative system evolved, which focused demands of elderly through participation and customization using various resources in their

surroundings. The elderly were consulted for life planning and took part in constructing senior housings Through accumulating and analyzing demands and following circumstances, and connecting related companies and customers, ideal housings for them have been developed. In this method, networking techniques were highlighted. Results : Because of the process, residents do not just move into housings, they participate throughout all stages from planning to housing management. Consequently, the housing is close to their ideals. Using this approach, Community-Net has been successful in realizing the idea of developing housings where users love to live. Various housing development cases in different situations will be shared for its logic, similarities, and dissimilarities. Conclusion : The elderly care system is not just composed of senior housings and in-home services. Exploiting social resources and involving government, residents, service users and companies, to overcome the super aging society are necessary to put in the system. Since it is time to share various models especially among fast aging Asian countries such as Japan, China and Korea, this innovative system has significant implications. Keywords : Innovative Eldercare System, Participation, Customized Senior Housing

PS27 201-R-3

CREATING NEW WELFARE INFRA THROUGH ARCHITECTURAL INTERVENTION -SOCIALLY INTEGRATIVE HOUSING INNOVATIONS FOR FAST AGEING KOREA-

Yeun Sook LEE (*Interior Architecture & Built Environment, Yonsei Univ., Korea*)

Introduction : For the past fifty years, over 9 million uniform apartments have been produced and now faced with population ageing which shows fastest speed in the world. Korea has little developed housing environments for seniors in a professional way. Therefore, innovative solutions which respect cultural context and social situations are needed urgently. The purpose of this presentation is to suggest an innovative socially integrated housing model. Method : The whole process of developing a model to cope with both social exclusion and fast ageing in a normal and effective way was planned. The process includes basic research, conceptual formation, social consensus, developing design ideas, disseminating, and validation research. The main concept is community shared space as a tool to innovate existing apartments, utilizing them as a social intervention. Results : The whole process of developing a model to cope with both social exclusion and fast ageing in a normal and effective way was planned. The process includes basic research, conceptual formation, social consensus, developing design ideas, disseminating, and validation research. The main concept is community shared space as a tool to innovate existing apartments, utilizing them as a social intervention. Conclusion : This research will have significant implication to many other countries who are facing rapid ageing especially who have enjoyed mass housing production like Korea in effectively dealing with ageing problems through housing. Keywords : Architectural Intervention, Social Integration, Housing Innovations

PS27 201-R-4

A CREATIVE PIONEERING NEIGHBORHOOD MODEL FOR DEMENTED ELDERLY -DE HOGEWYK, NORMAL LIVING FOR PEOPLE WITH SEVERE DEMENTIA-

Y.E. VAN AMERONGEN-HEIJER (*De Hogeweyk, Vivium Zorggroep, Netherlands*)

Introduction : De Hogeweyk is a real life example of how an innovative care vision united with a healthy environment maximizes

high quality of life for people with a severe dementia syndrome. The care vision is to offer people with dementia appropriate care in an environment which supports them in living life as usual, in a normal household, in a normal and safe society. Method : De Hogeweyk is built as a small village of 23 houses for between 6 and 8 residents each. It is a village community of 23 "normal" houses, a pub, a restaurant, a theatre, clubs, a supermarket, a beautician, and so forth. The environment supports people with dementia, which substantially enriches the lives of the 152 residents until the end of their life. Results: People with dementia very often show stress, anxiety, anger, fear and depression, largely because their environment does not fit in what these people know to be a normal house, a normal society and a normal life. The result of this vision is a strong increase of client satisfaction, as shown in the very high results of the satisfaction inquiry that is done every other year. Conclusion : This project is a balance of intimacy and support of a small "family" household and the experience of living in a normal society. De Hogeweyk offers a maximum of living life as usual and where the built environment acts as a safe, enclosing boundary. This showed the impact of environment on life quality of demented elderly in an empirical way. Keywords : Healthy Environment, Normal Lifestyles, Happiness, Demented Elderly

PS27 202-S

OLDER PERSONS' ATTITUDES TOWARDS INFORMATION TECHNOLOGY AND INFORMATION SOCIETY

PS27 202-S-1

THE USE OF INFORMATION TECHNOLOGY AND THE QUALITY OF LIFE OF THE ELDERLY IN KOREA

Youngjoon SEO (*Dept of Health Administration, College of Health Science, Yonsei University, Korea*)

Introduction : The elderly, in general, have been known to be isolated from using modern information technology. However, recent studies have revealed that many elderly persons are also interested in using information technology for improving the quality of their lives. We tried to examine what factors are related to the use of information technology of the elderly and how it is related to the quality of their lives. Method : A total of 30 articles which dealt with the use of information technology and its effects on the life of the elderly in Korea were selected from Korean journals of gerontology and geriatrics, information, health, and life-related science. Selected articles were systematically reviewed and analyzed in terms of the subjects, methods, results, and implications. Results : The use of information technology including internet by the elderly were found to have a significant impact on the quality of the life of the elderly. In detail, the following were obtained from the review. First, perceived ease of use, perceived usefulness, and self-efficacy have significant impacts on the intent to use IT of the elderly. Second, the use of IT was found to contribute to improving the level of self-esteem of the elderly which has a positive impact on the quality of life. Conclusion : The results imply that IT education program need to be connected to social welfare benefit for improving the IT use rate of the elderly, especially for the poor elderly. Furthermore, more systematic education system are needed for enhancing the quality of IT education for the elderly. Keywords : Information technology, The quality of the life of the elderly, Korea.

PS27 202-S-2

PREDICTORS FOR THE USE OF REMOTE TELECARE IN OLDER ADULTS

Angelo ANTONIETTI¹, Ryan BEST², Neil CHARNESS², Helianthe KORT³ (*1. Research Center for Innovations in Healthcare, Utrecht University of Applied Sciences, Netherlands; 2. Psychology Department of Psychology, Florida State University, USA; 3. Research Centre for Innovations in Healthcare, Utrecht University of Applied Sciences, Netherlands*)

Introduction : The requirement to use eHealth technology (eHT) in older adults is increasing, but they have greater difficulty learning to use this new technology than younger adults. Knowledge of predictors for the use of eHT in older adults can help to improve the acceptance process of eHT such as remote telecare (RTC) systems. We are attempting to identify predictors for the use of RTC in older adults who live independently at home in order to provide instruction that can enhance their digital literacy. Method : A battery of modified validated questionnaires is being used to measure the possible predictor items which includes: demographic data, general health, social influence, facilitators, technology experience, motivation for selfcare, perceived privacy/security, performance expectancy and effort expectancy. Our outcome measures are the willingness to use RTC and actual use of RTC. The Unified Theory of Acceptance and Use of Technology (UTAUT) model is used to group and better understand the interaction between the items listed above. An observation list was also developed to measure technology related skills in the homes of the subjects. Participants in this study are people age 65+. Experience with RCT was not required. Results : For the Dutch respondents who filled in the online questionnaire (n=183), 47.2% were male and 52.8% female. Most respondents were between 65-79 years (n=165) and only 9.8% were >80 years (n=18). Only 10.2% of these subjects (n=18) have experience with RTC. Conclusion : Understanding abilities and attitudes toward eHT can be used to structure appropriate training to enhance digital literacy in older adults. Keywords : digital literacy, ICT user acceptance, e-health

PS27 202-S-3

HOW DID THE ELDERLY UTILIZE ICTS AFTER TOHOKU'S BIG EARTHQUAKE AND TSUNAMI IN 2011?

Yasuko URANO (*Sociology, Teikyo University, Japan*)

Introduction : ICTs are powerful enabling tools for early disaster warning and safety confirmation. ICTs actually contributed to helping people in 2011 during the big earthquake and tsunami in the Tohoku region of Japan. For example, some people obtained necessary disaster warning information; other people used Twitter to tell family and friends that they remained safe. Since the elderly have a lower diffusion of ICTs than the general population, this research focuses on the elderly and examines how they utilized ICTs right after the disaster. Method : This research first reviews government surveys on ICTs and the 2011 disaster. Second, the research analyzes contents of news reporting in terms of the disaster management cycle. Results : The general population tends to rely on radio to obtain information, and they communicate with family and friends by using mobile phones and text messages immediately after a disaster. The elderly living alone have the lowest diffusion of ICTs such as mobile phones; thus, they are the most vulnerable population. When disaster strikes, it is more difficult for them to request help and communicate with family and friends. Conclusion : Senior-friendly ICT products and services that contribute to disaster relief need to be further developed. Keywords : elderly, ICTs, disaster response

PS27 203-C

HEALTH PROMOTION AND DISEASE PREVENTION FOR OLDER PERSONS

PS27 203-C-1

HEALTH PROMOTION FOR OLDER PEOPLE

Liang-kung CHEN (*Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taiwan*)

The importance of preventive services has been recognized extensively. However, the benefits of preventive services in this age group need extensive considerations which differed from the general population. The preventive services included screening, vaccination, chemoprophylax, and counseling. The benefits of preventive services among older people should be weighed by a number of factors, such as estimated life expectancy, time to benefits, and time to adverse effects. Older people had a significantly shorter life expectancy than adult population and may suffer from various physical and mental disabilities. All these factors may change the balance between risks and benefits of preventive services. Therefore, special attentions should be paid to individualized preventive services for older people. The phenomenon of "reverse epidemiology" has attracted extensive attentions in recent years. Traditional approach for disease prevention may not be effective as expected and the disability prevention approach should be implemented to the health promotion programs in older people. Moreover, selecting proper outcome indicators should be considered. The cost-effectiveness of health promotion activities for older people should be re-organized. Evidence-based approach to promote health for older people is of critical importance. Keywords : health promotion, elderly, geriatrics

PS27 203-C-2

CARDIOMETABOLIC HEALTH CARE IN OLDER PEOPLE IN JAPAN

Hidenori ARAI (*Department of Human Health Sciences, Kyoto University Graduate School of Medicine, Japan*)

Introduction : As age progresses, the prevalence of cardiometabolic risk factors, such as dyslipidemia, diabetes, hypertension, and metabolic syndrome increases. Ageing per se is also an important risk factor for cardiovascular disease (CVD). CVD represents the main cause of mortality, morbidity, and health resource utilization in the elderly. However, the role of some of these risk factors has not been clearly defined among the elderly; therefore, the effectiveness of interventions on modifiable risk factors to reduce CVD should be addressed. Method : Data from the Japanese nationwide survey conducted in 2000 and other cohort data will be presented. The strategy in the guidelines for diagnosis and prevention of atherosclerotic cardiovascular diseases for Japanese is also presented. Results : Among the risk factors the prevalence of central obesity and dyslipidemia was increased only in women, and that of high fasting glucose and high blood pressure increased in both genders with ageing. Blood pressure was increased and triglyceride was decreased in both genders, and non-HDL cholesterol was decreased in elderly men. The prevalence of dyslipidemia was decreased in elderly men. Conclusion : Aging is an important factor that affects the metabolic abnormality. Therefore, the development of better approaches to the prevention and management of cardiometabolic risk factors is necessary to reduce mortality, morbidity, and health resource utilization in the elderly. Because CVD prevention in the elderly could generate many benefits for people in this age range as well, the guidelines for CVD prevention should be established in each country or region. Keywords : dyslipidemia, risk factor, cardiovascular disease

PS27 203-C-3

A PROPOSED GUIDELINE FOR GERIATRIC HEALTH SCREENING IN KOREAN NATIONAL HEALTH SCREENING

PROGRAM

Jong Lull YOON¹, Yun Hwan LEE², Yong Kyun ROH³, Mee Young KIM³, Belong CHO⁴ (*1. Dept of Family Medicine and Geriatrics, Hallym University College of Medicine, The Korean Geriatrics Society, Korea; 2. Dept of Preventive Medicine, College of medicine, Ajou University, Korea; 3. Dept of Family Medicine, College of Medicine, Hallym University, Korea; 4. Dept of Family Medicine, College of Medicine, Seoul National University, Korea*)

Introduction : In aging and aged society, the ultimate goal of health care system should be improving the disability-free life expectancy by disease prevention and minimizing the functional disabilities. And this is also the goal of the National Health Screening Program. Under the present system of the National Health Screening Program in Korea, all of the adults have to take the same screening program without considering their ages and life cycles. Method : For older people, concept of health screening should be expended to aim to maintain their disabilities and improving their own functions. In this study, for development of adequate health screening program for the elderly, authors tried to pass through following 3 steps; 1) choose the target diseases or health problems of Korean elderly, 2) evaluated their validities, 3) reviewed the research data in Korea. Results : Stomach cancer, colon cancer, hypertension, hyperlipidemia, urinary incontinence, depression, memory impairment, obesity, dental problem, osteoporosis(female), functional status of daily living, nutrition, exercise and physical activity, ciga- rette smoking, alcohol intake, vision, hearing, fall, medication review and vaccination(influenza and pneumococcal) are the essential items for this program. Conclusion : With this National Health Screening Program for Korean Older Persons, we can expect to achieve these objects. But, it is needed to evaluate for cost-effectiveness and practical acceptability from the clinical fields. And more researches for the validities of each item are needed. Keywords : Health Screening, Older adults, National health screening program

PS27 204-R

ADAPTING LOW AND MIDDLE INCOME COUNTRY HEALTH SYSTEMS TO AGEING POPULATIONS

PS27 204-R-1

REORIENTING HEALTH SYSTEMS IN AFRICA FOR AN AGEING POPULATION

Robert CUMMING (*School of Public Health, University of Sydney, Australia*)

Introduction : The number of older people (defined as those aged 60 years and over) in sub-Saharan Africa will increase 4-fold between 2010 and 2050, from 40 to 160 million. But the number of children will also increase, so that by 2050 the proportion of people aged 60 years and over in sub-Saharan Africa will still be less than 10%. Health systems will need to cope with a dual burden of disease: conditions that affect children (mainly communicable diseases) and conditions that affect older people (mainly NCDs (non-communicable diseases)). In addition, HIV among older people will become an increasingly important health issue. Method : The World Health Organisation (WHO) describes six health system building blocks: service delivery, health workforce, information, medical products and technologies, financing and leadership/governance. Results : All the WHO building blocks will need attention as the number of older people in sub-Saharan Africa increases. Health services need to be accessible to older people; health workers must be trained in management of NCDs and in geriatric medicine; health information systems need re-design to capture the changing patterns of disease; medications to treat NCDs must be made available; financing

arrangements are needed that make health care affordable for older people; and local and national leadership is required to drive all these changes. Conclusion : Health systems in sub-Saharan Africa need to change to cope with a massive increase in the number of older people. However, unlike the rest of the world, health systems will need to continue to make considerable investments in maternal and child health. Keywords : health systems, sub-Saharan Africa

PS27 204-R-2
SOCIAL ORGANIZATION OF CARE FOR THE AGED CHINESE: CHALLENGES FOR A SOCIETY IN TRANSITION
Xiaomei PEI (*Sociology, Tsinghua University, China*)

Development of long term care (LTC) services for the rapidly growing aged population in China is a key dimension of required health systems adaptations to respond to population ageing. Little systematic examination thus far exists of developments in social policy, practice and resource allocation to meet the increasing demand for health and social care in old age in China, in contexts of social transition marked by decreasing family resources, changes in labor market, migration, health care reform, and public concerns about social justice. This systematic review of relevant literature found that much effort has been made in organizing LTC for the aged people by the Chinese government in the last two decades. Despite the achievements, the nation is still facing serious challenges not only from lack of public and professional resources, but also from the inappropriate use of available resources, the unprepared state of the current health system to address the chronic conditions, the reluctance in coordination among government sectors, the ineffective measures for management and regulation, and the absence of a legislative framework for organization and operation. The findings of this review prove that the organization of LTC in China is more than a health care issue, but also a political-economy issue. While the rapid economic growth may generate more resources, the accountability of the government for the wellbeing of the aged citizens and for a fair distribution is the key to overcome the barriers along the way. Keywords : LTC Provision, Equality, Efficiency

PS27 204-R-3
PERFORMANCE OF MEXICAN POPULAR INSURANCE “SEGURO POPULAR” ON PERSONS AGED 60 OR MORE
Martin ROMERO (*National Institute of Public Health, Mexico*)

Introduction : Seguro Popular (SP) is health insurance which is public and offers an explicit package of medical services. SP was launched on 2004, and SP is subsidized by the federal government, so SP is an affordable option for people that are disadvantaged economically. SP has two main goals minimize health care costs and improve health conditions. Method : National Health Surveys of Mexico are probabilistic surveys of households. We compared the results of the National Health Surveys of 2006 and 2012 about SP. Results : SP has increased its coverage of population and its services. SP coverage on people 60+ has increased from 9% at 2006 to 30% at 2012. But, coverage is slightly greater on younger people; SP coverage among people 20 to 49 was 35% at 2012; similarly, coverage is greater among people on economical disadvantage; SP coverage on the lowest quintile was 39% at 2012. On the other hand, the number of medical interventions of SP has increased from 154 to 284 during the period 2005-2012. Regarding user satisfaction, we do not see a significant change, 86% of SP user's would return to the same place to get medical attention. Conclusion : SP has helped to provide medical services to people aged 60 or more that had no other option, which is not a small achievement. But, SP still faces two challenges: to improve

the quality of its services and to guarantee its economic survival.

PS27 301-R
LEVERAGING RESEARCH TO INFORM PRACTICE AND HEALTH POLICY

PS27 301-R-1
LEVERAGING RESEARCH TO INFORM PRACTICE AND HEALTH POLICY
Melissa SIMON¹, Xinqi DONG² (*1. OB GYN, Northwestern University, USA; 2. AoA, DHHS, USA*)

Introduction : Elder Abuse include psychological, physical and sexual abuse, neglect (caregiver neglect and self-neglect) and financial exploitation. Globally, elder abuse has become increasing common, especially among those who are more vulnerable. Protection of these victims and prevention of elder abuse is critical. The overall objective of this invited presidential session is to highlight the global issues of elder abuse from 3 continents (North American, Asia and Europe). Method : Global scan on the state-of-science knowledge on elder abuse as well as existing practice and policy issues to protect the vulnerable older adults. Results : The symposium will be four renowned speakers: 1) Dr. Melissa Simon will discuss the scope of elder abuse through the lens of gender and health disparities focusing on existing work in North America. 2) Ms. E-Shien Chang will focus on the broad issues of social and health policy to protect the health, safety and wellbeing of vulnerable older adults, with emphasis on the US Elder Justice Act. 3) Dr. MinHong Lee will explore the issues of caregiving and elder abuse and dissect the pathway analyses that might lead to elder abuse in Asia countries. 4) Dr. Gloria Gutman will highlight the work of International Network on the Prevention of Elder Abuse (INPEA) with special emphasis on the European perspectives on the issues of elder abuse. Conclusion : Through this symposium, we hope the audiences and the international communities will bring more attention to this human rights issue. Keywords : elder abuse, global health, health policy,

PS27 301-R-2
ELDER ABUSE, GENDER AND HEALTH DISPARITY
Melissa SIMON (*Preventive Medicine, Northwestern University, USA*)

Introduction : Elder abuse is pervasive public health issue and has been associated with morbidity and premature mortality. Moreover, elder abuse is disproportionately affected among women and minority groups. However, very little international awareness focuses on the relationships among elder abuse, gender and health disparities. Method: Systematic review of the US literature on the issues of elder abuse, gender and health disparity. Analyses of original scientific research published in the English literature. Results : In this presidential symposium, we will highlight the differences in the prevalence and incidence of elder abuse by gender and race/ethnicity. We found that elder abuse is more common among women and among non-Hispanic blacks. In addition, the risk/protective factors associated with elder abuse differ by gender and race/ethnicity. Moreover, we found that adverse health outcomes associated with elder abuse differ by race/ethnicity; in that African American victims of elder abuse have significant greater mortality risks compared to whites. Furthermore, we will explore the cultural and gender specific differences in the socio-cultural context associated with elder abuse. Lastly, we will synthesize the above findings in order to set the foundation for future research and policy recommendations to advance the field of elder abuse. Conclusion : The field of elder abuse needs greater attention to the role of gender and health disparity. Future research and policy

recommendations will be discussed in order to advance the field of elder abuse and achieve better equity to protect human rights. Keywords : elder abuse, gender disparity, health disparity

PS27 301-R-3

SOCIAL AND HEALTH POLICY AND ELDER ABUSE

E-shien CHANG¹, Xinqi DONG², Melissa SIMON³ (1. *Chinese Health, Aging and Policy Program, USA*; 2. *Rush Institute for Health Aging, Rush University, USA*; 3. *Northwestern University, USA*)

Introduction : The WHO has declared that elder abuse is a frank violation of an older adult's fundamental rights to be safe and free of violence. In the US, it is estimated that 1 out of 10 older adults are victimized each year from elder abuse. However, there is a still inadequate policy to protect the vulnerable populations. Method : Systematic review of the US policies that have relevance to the issues of elder abuse. Results : There are five major federal legislations that are aimed to protect the vulnerable older adults: Older American Act, Elder Justice Act, Public Health Service Act, Social Security Act and Violence Against Women Act. In this symposium, we will highlight the relevance of the Titles II, III, IV, and VII of the Older American Act; Section 393,399,758 of the Public Health Service Act; Title XI,XVIII,XIX, and XX of the Social Security Act; provision of the Violence Against Women Act for older battered women; and all major titles of the Elder Justice Act. We will highlight the recent World Elder Abuse Awareness Proclamation by President Obama, Senate Committee on Aging Hearing, and formation and hearings of the Elder Justice Coordinating Council. Moreover, we will synthesize the key policies issues and emphasize the major gaps in research, education, practice and policy in relation to elder abuse issues. Conclusion : Despite the existing policies aimed to protect elder abuse victims and prevent elder abuse, there are major gaps, which necessitate the collective efforts of all disciplines to advance the issues elder abuse and protect human rights. Keywords : elder abuse, health policy, social policy

PS27 301-R-4

THE ROLE ON INPEA IN SHAPING THE GLOBAL RESEARCH, POLICY AND PRACTICE AGENDA ON ELDER ABUSE

Gloria GUTMAN (*Gerontology Research Centre, Simon Fraser University, Canada*)

Introduction : Elder abuse is a global health and human rights issue. Since its founding in 1997, the International Network for Prevention of Elder Abuse [INPEA] has worked to increase global awareness of elder abuse and neglect, lobby for policy action and legislation, foster/facilitate research and education, disseminate information and support services to assist victims and protect vulnerable older adults. Method : This presentation focuses on recent awareness-raising activities, cross-national research and information-sharing initiatives designed to sharpen and deepen national prevalence and risk-factor studies to facilitate data massing and comparison, disseminate information on cutting edge research in such areas as financial abuse of older persons and home care abuse, & identify new educational opportunities. Involvement in tool development will also be described as well as UN activities. Results : Launched in 2006 by INPEA, World Elder Abuse Awareness Day [WEAAD] is now celebrated June 15 around the world and in 2011 became an official UN day. 8 successful elder abuse world conferences have been held. INPEA routinely organizes symposia and workshops at events sponsored by other international ageing-related NGOs (e.g. IAGG, IFA). It is an active participant in UN NGO activities in New York, Vienna and Geneva.

Conclusion : As an international elder abuse organization, INPEA is uniquely positioned to bring together researchers, practitioners, policy makers and advocates from around the world to address issues of victim identification, mitigation and prevention of elder abuse and neglect and to assist national elder abuse NGOs to leverage research to inform practice, health and social policy at national and local levels.

Keywords : elder abuse prevention

PS27 301-R-5

CAREGIVING AND ELDER ABUSE ISSUES IN ASIA

Minhong LEE (*Dept of Social Welfare, Dong-Eui University, Korea*)

Introduction : The purpose of this paper is to provide research-based implications for practice and policy against elder abuse in Asia. Method : Based on an extensive review on elder abuse literature with Asian populations, this study addresses sources of caregiving for the elderly, results of family caregiving, prevalence of elder abuse, and risk factors for elder abuse. Results : Family is the primary source of support for older adults with impairments in Asian countries. Family caregivers for disabled older adults might experience caregiver strain, psychological distress, physical health problems, caregiving burden, or mistreatment of care-recipients. Previous research on the prevalence of elder abuse has shown varied results, which range from about 2 to 20 % annual incidence. However, rates of elder abuse in the above mentioned studies are difficult to compare because the prevalence studies on elder abuse used different definitions and included different types of elder abuse. Previous studies on elder abuse have found numerous risk factors including functional disabilities, cognitive impairments, problematic behaviors, caregiver burden and lack of social support. Conclusion : Based on the findings of this study, implications for practice and policy against elder abuse can be discussed, particularly for Asian family caregivers who provide care for disabled older adults. Keywords : caregiving, elder abuse, family caregiver, social support, Asia

PS27 301-R-6

EUROPEAN PERSPECTIVES ON PREVENTION AND INTERVENTION IN ELDER ABUSE

Bridget L PENHALE (*School of Nursing Sciences, University of East Anglia, United Kingdom*)

Introduction : This paper will provide an overview of elder abuse, with a particular focus on international and specifically European perspectives. The issues and developments that have occurred globally will be briefly explored. Over the last ten years there has been increasing global recognition of the abuse and neglect of older adults as a social problem in need of attention. Method : This paper aims to examine some of the pertinent issues. Responses to the problem of elder abuse from several countries across the world will be explored, although there will be a concentration on techniques of intervention from Europe. There will be an exploration of a number of prevention strategies. Possible future developments and the potential for international action to resolve this problem will be considered. Results: A number of European countries have been working in this area but are at different stages of development. The identification of abuse remains problematic. Defining and identifying abuse remain difficult tasks, perhaps even more so when the abuse occurs within an institutional setting. Techniques of intervention with victims of abuse and those who abuse are in comparatively early stages of development, although progress in the production of policies and procedures for health and social care professionals has been made in recent years. Conclusion : Interventions in elder abuse are under development. A number of national and international organisations have been

established to combat abuse. Various research initiatives are underway. Education and training for professionals is taking place concerning prevention, recognition and awareness of abuse. Further work is needed internationally to tackle this social problem. Keywords: Elder Abuse and Neglect, international and European perspectives

LIFELONG EDUCATION AND THIRD AGE LEARNING

PS27 305-S-1

THIRD AGE LEARNING IN AOTEAROA NEW ZEALAND

Brian Christopher FINDSEN (*Faculty of Education, University of Waikato, New Zealand*)

Introduction : This presentation focusses on third age learning in Aotearoa New Zealand. Initially, it will look at the broader context of New Zealand society, including its bi-cultural character, before briefly surveying the formal education institutions derivative of British/European colonization and the current diversity of forms of older learning activity and provision. Necessarily, this will involve consideration of non-formal learning contexts too. Next an exemplar of effective practice will be examined, followed by an analysis of trends and issues in third age learning. Method : This presentation is based on both a theoretical study of third age learning and observation of different forms of older adult learning in the New Zealand context. Results : The overall outcome for this presentation is a clearer understanding of the character of older adult learning in New Zealand. Conclusion : The overall view of learning in later life in New Zealand is a synthesis of historical, cultural and social analyses related to the life circumstances of older adults. The current issues which older people face and the trends in older adult education must be related to these wider social forces. Keywords : third age learning, lifelong learning, ageing

PS27 305-S-2

OLDER ADULTS EDUCATION FOR COMMUNITY WELL-BEING IN KOREA

Youngwha KEE (*Lifelong Education, Soongsil University, Korea*)

Introduction : This article investigates the Korean local government's older adults learning programs in the context of daily life. Some key questions I answer include: why and how did adult learning develop in Korea? How does older learning affect community development from a community wellbeing perspective. Method : The organization of this paper is as follows. First, I provide a history of senior education in Korea and highlight policies that have played a key role in senior education development. Second, I research influencing factors of senior citizen participation in education. In particular, I will focus on how local governments have managed lifelong education programs to encourage high participation rates. Third, I examine senior education programs in the context of community development and community wellbeing. Results : In detail, I identify community stakeholders of senior education and investigate how senior education programs utilize community resources to enhance community participation, and ultimately community wellbeing. Conclusion : Lastly, the paper will conclude with critical commentary on using adult learning to encourage bonding among senior citizens and with other generations in the community. Keywords : senior education, older adult learning, community well-being

PS27 305-S-3

THIRD AGE LEARNING IN HONG KONG

Hok KA, Carol MA, Cheung MING, Alfred CHAN (*Department of Sociology and Social Policy, Lingnan University, Hong Kong*)

This presentation focuses on the third age learning in Hong Kong. Following a visit to the Australian Universities of the Third Age (U3As) in 2005, Hong Kong began to implement a modified version of U3A called Elder Academies (EAs). EAs are the platform for cross-sectoral collaboration and inter-generational harmony within a school setting. EAs not only aim to promote continuous learning among elders, encourage them to expand their social networks, maintain mental and physical health while acquiring knowledge, but also enhance students' whole person development through organizing and participating in EA activities. The presentation will first provide an overview of third age learning in Hong Kong, and then will talk about the set up of EAs, its development, various models and effectiveness. Keywords : Third Age Learning

PS27 305-S-4

OLDER ADULT LEARNING IN EUROPE

Marvin FORMOSA (*European Centre for Gerontology, University of Malta, Malta*)

Introduction : Older adult learning has gained a solid presence in international and national policies on lifelong learning as it is regarded as a necessary lubricant to keep a dynamo of opportunity and activity in the lives of older adults functioning effectively. This is especially the case for the European context where continuous learning through life is regarded as a comprehensive strategy to meet the requirements for a Single European Market and address the repercussions of increasing structural unemployment. Method : This presentation reports the data emerging from a critical case study of practices in older adult learning in Europe. Results : This presentation highlights four results. The first focuses on the wide range of European policy on late-life learning, with special focus on the directives issued by the European Union. The second presents good practices in older adult learning in Europe, focusing on both formal avenues such as seniors' university programmes and non-formal contexts such the University of the Third Age, whilst also stressing the contribution of Grundtvig to informal learning. The increasing opportunities of older adults to engage in elearning - largely as the result of Grundtvig funds - will also be addressed. The third and fourth parts of the results provide a critical commentary on the ideological and pragmatic elements of older adult learning in Europe by highlighting their social, economic. Conclusion : Although EU policy on lifelong learning does hold some promise towards more optimum levels of active, successful, and productive aging, it fails to render the fast changing world more hospitable to elders. Keywords : older adult learning, educational gerontology

Monday June 24th

SS24 104-C

IMPROVING CARE IN NURSING HOMES: A SYMPOSIUM OF THE IAGG COMMITTEE ON NURSING HOMES

SS24 104-C-1

IAGG/WHO NURSING HOME RECOMMENDATIONS

John E. MORLEY (*Geriatric Medicine, Saint Louis University, USA*)

Introduction : Although nursing homes have evolved to be the centerpiece of the long term care continuum there is known variation in quality and experiences of care. We have a collective responsibility to address this situation to enhance confidence among older people and their relatives that the care provided within nursing homes is safe, clinically appropriate and delivered with respect and compassion by knowledgeable practitioners. **Method :** A Taskforce charged with identifying the main clinical concerns and quality of care issues within nursing homes was convened by the International Association of Gerontology and Geriatrics, with input from the World Health Organization. The group met in Toulouse, France, during June 2010. Drawing on the latest evidence, mindful of the international development agenda and specific regional challenges, consensus was sought on priority actions and future research. **Results :** Fifteen recommendations were agreed upon to serve as a guideline to help with the development of excellence in long term care. These focused on enhancing nursing home practice and leadership, developing clinical and quality indicators for nursing home care, educational approaches to change behavior of staff, improve care and increase prestige, and a research agenda. **Conclusion :** The Global Agenda developed by the Task Force on Nursing Homes represents a framework to enhance the quality of nursing home care. It is our hope that these recommendations will be embraced by politicians, physicians and other health care professionals throughout the world. If this occurs, the quality of life of all older persons needing nursing home admission will be improved. **Keywords :** Quality of Life

SS24 104-C-2
MEANINGFUL ACTIVITIES - EXERCISE IN THE NURSING HOME

Yves ROLLAND (*Gerontopole de Toulouse, CHU Toulouse, France*)

Introduction : Physical activity is one of the main factors that contribute to the maintenance of a healthy aging and the prevention of functional decline. Physical activity is already known as a cost-effective practice that has demonstrated numerous health benefits. Physical activity has also been shown to improve function even in frail nursing home residents and institutionalized Alzheimer's disease patients. **Method :** Review of the literature on physical activity in nursing home; **Results :** Physical activity yields an important and potent protective factor against functional decline, and various frequent and devastating complications that occurred in nursing home such as falls, fractures, malnutrition, or behavior disturbances. For demented patients living in nursing home, physical activity may also prevent these key problems that have a major impact on the burden of the disease and the quality of life of the resident. Institutionalized patients are very sedentary. Even a small amount of physical activity radically changes their way of life. It has been reported that in some institutions, demented residents spent only 12 minutes a day in any constructive activity other than watching television. Simple programs such as an aerobic exercise, twice a week, have been reported to slow the functional decline in nursing-home residents. Most randomized controlled trials suggest that aerobic exercise such as walking may promote cognitive and functional capacities in people with Alzheimer disease. Compliance is a major issue. The physical program has to be enjoyable. **Conclusion :** In this session, we will report evidences on the benefits and feasibility of physical activity in nursing home. **Keywords:** nursing home, physical activity, alzheimer

SS24 104-C-3
TECHNOLOGICAL ADVANCES AND THE NURSING HOME

John E MORLEY (*Geriatric Medicine, Saint Louis University, USA*)

Introduction : Modern technology is slowly transforming nursing home care. Technology is being used as a 'smart' monitor to allow older persons to stay in their own private environment and still be relatively safe. **Method :** Monitoring fall risk and sleep patterns can be done at a distance through 'the Cloud.' Nursebots such as Riba will become fixtures in nursing homes to allow safe transfer of residents. Companion robots such as AIBO the dog will also become more common. **Results :** Robots will be able to deliver medicine to the frail elderly and also to help feed the disabled. Exoskeletons will allow persons with paraplegia to walk. **Conclusion :** Robotics will enhance physical therapy. **Keywords :** Technology, Nursing Home

SS24 104-C-4
EVIDENCE BASED MANAGEMENT OF INFLUENZA-LIKE ILLNESS (ILI) IN NURSING HOMES

Jean WOO (*Department of Medicine & Therapeutics, The Chinese University of Hong Kong, Hong Kong*)

Introduction : ILI is a frequent cause of admission to hospitals, attendance at Accident & Emergency Departments, and of mortality. It is uncertain what proportions are due to acquired pneumonia of viral or bacterial origin, or to aspiration. Information regarding underlying etiologies would inform policies regarding vaccination and use of antibiotics. **Method :** A one year surveillance of 4 nursing homes was carried out. An ILI episode was defined as fever $\geq 37.8^{\circ}\text{C}$ or an acute deterioration in physical or mental ability, plus either new onset of one or more respiratory symptoms or an acute worsening of a chronic condition involving respiratory symptoms. **Investigations include:** sputum sample for bacterial culture including Mycobacterium; multiplex bested PCR for respiratory pathogens; paired sera for atypical pneumonia pathogens; urine sample for Legionella and Pneumococcal antigen; Chest X ray. **Results :** Infectious agents were identified in 61/4% of episodes (Bacterial 53.3%.viral 46.7%). The top 5 ranking pathogens were S. Pneumoniae, RSV, P.aeruginosa, Parainfluenza type 1 and Metapneumovirus.No significant differences were observed in any of the clinical characteristics between ILI of different etiologies. **Conclusion :** The findings support the recommendation of use of influenza and pneumococcal vaccines in nursing homes, but also highlight the potential value of RSV vaccines, if developed in future. The routine use of antibiotics as a first line treatment for nursing home associated pneumonia should be reviewed. **Keywords :** Nursing Home, influenza-like illness, pneumonia

SS24 108-R
HOW POLICY, ECONOMIC AND CULTURAL CONTEXTS SHAPE INTERGENERATIONAL LINKAGES IN FAMILIES

SS24 108-R-1
INTERDEPENDENCE AMONG LIVES AND SOCIAL POLICY

Gunhild Oline HAGESTAD (*NOVA, Norway*)

Introduction : Life course theorists have emphasized the need to recognize that people's lives are linked to others around them (Elder, 1994). Family members are "fellow life travellers", people with whom individuals travel through life as if in a convoy. Family members serve as resources available during times of need, but they are also recipients of help and care. Life course scholars, particularly in Europe, have also emphasized that where people live affects how lives unfold (Mayer, 2009). Political systems, educational systems, laws, social policy and social services shape the life course and structure interdependence. This presentation connects two theoretical strands: the notions of "linked lives" and "lives in context". It will address the dialectical interaction between (a) individual behaviour and choices (b)

households and family practices and (c) policy contexts. The concept of interdependence, which emphasizes the dynamic interplay between being embedded in a meso context of interconnected family ties and living in a macro context of policy arrangements will be elaborated. Examples from life course research serves to illustrate the usefulness of the concept of interdependence in studying late-life families. Method : Literature content overview. Results : Looking across differing welfare states, especially so-called care regimes and family responsibility laws, we find striking contrasts in degree of interdependence among parents and children; grandparents and grandchildren. Conclusion : In studying life pathways and extent of individual autonomy, it is essential that we carefully consider legal and policy contexts. Keywords : multigenerational interdependence, policy

SS24 108-R-2

FAMILY SOLIDARITY AND SUPPORT FOR POLICIES FOR THE ELDERLY: THE INTERPLAY BETWEEN PRIVATE PRACTICES OF INTERGENERATIONAL ASSISTANCE AND ATTITUDES TOWARDS PUBLIC WELFARE PROVISION

Pau MARI-KLOSE¹, Ines CALZADA², Antonio JAIME³
(1. *Psychology and Sociology, University of Zaragoza, Spain*; 2. *Institute of Policies and Public Goods, Spanish National Research Council, Spain*; 3. *Sociology, University of Malaga, Spain*)

Introduction : In this paper we used data collected through a survey-experiment conducted in Spain to assess how family experiences of intergenerational interaction shape support for public policies for the elderly among individuals who have no direct self-interest in the provision of such policies. We focus on an array of dimensions of family life: frequency and pattern of interaction in various activity types (communication, entertainment, care), the degree of affection and emotional attachment to family members belonging to other generations, the degree of commitment to family rules and to perform family roles, the degree of consensus (or conflict) among them (Bengston and Schrader 1982, McChesney & Bengston 1988). Our hypothesis is that such dimensions of family life shape the way individuals perceive the needs and empathize with the demands of older age groups. Our data allow us to test these propositions against alternative explanations on attitude formation which highlight the importance of the social, political and cultural background of individuals in determining their support for public welfare provision for the elderly. Method : Statistical analysis of a survey database. Results : The results of our research inform debates about the sources of social support for such policies in the face of the increasing fiscal burden that such policies entail. Conclusion : Our aim is to deepen our understanding about political reform options that may strengthen the legitimacy and social sustainability of public welfare provision. Keywords : family, welfare, elderly

SS24 108-R-3

INTERGENERATIONAL SOLIDARITY AND ELDERCARE

Cornelia MURESAN¹, Mihaela HARAGUS², Paul Teodor HARAGUS¹ (1. *Sociology and Social Work, Babes-Bolyai University, Romania*; 2. *Centre for Population Studies, Babes-Bolyai University, Romania*)

Introduction : Policy, housing contexts and norms of intergenerational solidarity shape the organization of caring and financial responsibilities for young and old family members. Our research intends to describe the state of re-familialization (Leitner 2003; Saraceno and Keck 2010) of the eldercare in Eastern Europe, with a focus on intergenerational support in Romania. First, we compare the formal support received by the individuals (supplied by state, market

or NGOs entities) with the family care, relying on concepts such as defamilialization (Lister 1993), and dedomestication (Kroger 2011). Second, we try to unravel the relationship between norms of family obligation and actual giving and receipt of financial support and care, in order to see if the norms of filial and parental obligations are rather a burden placed on family or if the family solidarity is changing character, as the resilience hypothesis states (Bengston et al 2002). Third, we investigate the type and direction of support in situations of intergenerational co-residence, as the co-residence of elderly with their adult children is considered a mechanism of social protection for the first (Lyberaki and Tinios 2005). Method : We adopt a micro-level perspective and use Generations and Gender Survey data from available countries. Demographic, socio-economic and attitudinal variables are taken into account for producing descriptive statistics and assessing explanatory regression models. Results : Our research supports, in some degree, the re-familialization hypothesis in Romania. Conclusion : Intergenerational support is shaped by policy, housing context and cultural tendencies. Keywords : re-familialization, intergenerational support, family obligation norms

SS24 108-R-4

GENERATIONAL SQUEEZES UNDER DIFFERENT LIFE COURSES AND THE STRUCTURAL AND CULTURAL CONTEXTS

Anita ABRAMOWSKA-KMON, Irena Elzbieta KOTOWSKA
(*Institute of Statistics and Demography, Warsaw School of Economics, Poland*)

Introduction : The paper focuses on strategies about care and financial intergenerational transfers to be chosen under different policy, economic and cultural contexts. Given the increased prevalence of families with three, four and even five generations, it is likely that the generation of adults at late-middle age, particularly women, will face commitments to simultaneous support for their elderly parents and their adult but still partly dependent children, i.e. so-called "generational squeezes". We would like to identify the life course patterns and contexts under which middle generations attempt to support equally up and down and those under which the young are prioritized over the old. An important question is whether the provision of support to parents reduces the likelihood of helping children (and vice versa). Method : The data used come from the Generations and Gender Survey. The logistic regression models will be applied. The dependent binary variable describes a fact of giving care/financial support both up and down generations. Results : One might expect that families differ in their commitment to intergenerational exchange and solidarity: more familialistic countries (with strong commitments to solidarity) and weak formal care provision tend to assist more both generations rather than prioritize recipients, whereas those with high level of de-familialisation of care and welfare are less likely to provide care and financial transfers to both generations, prioritizing the young ones. Conclusion : The revealed interdependencies between patterns of intergenerational transfers and the context may suggest how to ease "generational squeezes" by adapting social policy to changing relations between different generations. Keywords : sandwich generations, intergenerational transfers of care and financial support

ACTIVE AGEING IN THE HOME

SS24 109-R-1

EFFICACY OF INTENSIVE TAILORED HOME MODIFICATIONS AND ASSISTIVE TECHNOLOGY FOR

FALL REDUCTION IN OLDER PEOPLE PRESENTING TO US EMERGENCY DEPARTMENTS FOLLOWING A FALL

Susan STARK (Program in Occupational Therapy, Washington University School of Medicine, USA)

Introduction : Falls remain the leading cause of injury, long-term disability, premature institutionalization, and injury-related mortality in the older adult population. Home modification interventions, when delivered by occupational therapists are effective in reducing falls particularly in high-risk populations. However, few trials of home modifications to reduce falls have been conducted in the US where home modifications are self-pay. Method : We conducted a blinded, randomized sham-controlled clinical trial among 54 older adults to determine the efficacy of an intensive tailored environmental intervention to reduce the cumulative incidence of falls among community-dwelling older adults at high risk for fall. The intervention included intensive tailored home modifications prescribed to address problems with Activities of Daily Living (ADL) and Instrumental ADL and to maximize participants' functional performance. The home modifications will include assistive devices and architectural changes to the home and were delivered during a series of six 90-minute sessions. The control group received a sham treatment of equivalent time. All participants were assessed immediately post and at 6 months post intervention. Results : The average age of the participants was 78 years. Most (80%) were female and White (74%). The average number of daily activity problems addressed was 6. The intervention and assessment procedures were well tolerated. Home modifications do improve the performance of daily activities at home and may impact community participation. Preliminary analysis reveals a differential fall rate between the treatment and control group ($p=.01$). Conclusion : Home modifications, targeting ADL/IADL performance may reduce the rate of falls among older adults at high risk for a fall. Keywords : home modification, fall prevention

SS24 109-R-2

HOW SUPPORTIVE ARE AUSTRALIAN HOMES AND NEIGHBOURHOODS FOR HEALTHY AGEING? - FINDINGS FROM THE HOUSING AND INDEPENDENT LIVING STUDY (HAIL)

Julie E BYLES¹, Lynette MACKENZIE², Sally REDMAN³, Lynne PARKINSON¹, Lucy LEIGH¹, Cassie CURRYER¹ (1. Research centre for Gender Health & Ageing, University of Newcastle, Australia; 2. Faculty of Health Sciences, University of Sydney, Australia; 3. School of Public Health, University of Sydney, Australia)

Introduction : The NSW Government's Towards 2030: Planning for our Changing Population, emphasises appropriate housing, community and proximity to services as central to maintaining quality of life and independence as people age. This study sought to determine the extent to which home and neighbourhood environments of older community-dwelling people are "supportive" according to Australian AS4299 standards and to contrast these findings against people's expectations of their increasing needs as they age and of how these needs will be met. Method : Cross-sectional survey, in-home observation and interviews involving 202 participants (75-79 years). SF-36 Health Related Quality of Life and Late Life Function and Disability (LLFDI) scores, self-reported measures of home usability, accessibility, safety, and neighbourhood were assessed. Associations between home and neighbourhood characteristics were assessed using chi-square, t-tests and Pearson correlations. Results : Most people rated their homes and neighbourhoods highly on accessibility, usability and safety. Measures of neighbourhood satisfaction were also high (3.0 men, 3.2 women; 4 being the highest score). However, many homes failed objective

adaptability and safety ratings, particularly bathrooms: 77% did not have slip-resistant floors, 80% did not have a shower grab rail. 27% of homes scored ≥ 8 out of 25 possible hazards, and people living in these homes were considered at high risk of falls due to hazards in the home. There were significant correlations between perceptions of housing and neighbourhood and SF-36 and disability scores. Conclusion : Many homes and neighbourhoods of older people may not accommodate increased frailty or disability into the future. Keywords : Ageing, housing, independent living

SS24 109-R-3

IMPROVING FUNCTIONAL INDEPENDENCE FOR OLDER ADULTS THROUGH OCCUPATIONAL THERAPY DISCHARGE PLANNING: THE AUSTRALIAN HOME TRIAL

Lindy CLEMSON¹, Natasha LANNIN², Kylie WALES³, Collette DAVIES¹, Lynette MACKENZIE³, Ian CAMERON⁴ (1. Ageing, Health & Work Research Unit & Centre for Population Ageing Research, The University of Sydney, Australia; 2. Alfred Clinical School & Faculty of Health Sciences, La Trobe University, Australia; 3. Ageing, Health & Work Research Unit & Centre for Population Ageing Research, Faculty of Health Sciences, The University of Sydney, Australia; 4. Sydney Medical School & Ryde Rehabilitation Unit, The University of Sydney, Australia)

Introduction : Systematic reviews provide limited evidence but suggest discharge-planning practices should span hospital to home and include a flexible goal-oriented approach. We have shown there is huge diversity in who receives a home visit which is influenced by hospital policy, therapist experience or, very often, pragmatic reasons such as time or staff resources. Method : A randomised trial is recruiting 400 community-dwelling older people across five sites in NSW and Victoria, Australia. Intervention participants receive the HOME protocol (In-hospital assessment and rapport building, pre-discharge home visit, post discharge home visit and two follow up calls. The control group receive a structured hospital consultation. Results : To date 142 participants have been randomised. They had a mean Charlson Comorbidity score of 5.5 (SD 1.8), 50% reported restricting activities in the past 6 months due to medical conditions and 55% were female. A content analysis of collaborative goals ($n=223$) from the intervention participants developed around five main themes: incorporating health and physical activity goals into daily life activity; improving self-efficacy for ADLs at home and in the community; improving capability to walk, balance and mobilize; resumption of pre-hospital activities; and re-establishing social activity. Strategies used by therapists included negotiating and practising adaptations to tasks or routine with client and family; education with client/family; referrals including home modification and activity programs such as men's sheds; and, provision and trial of equipment to enhance independence. Conclusion : The HOME study provides the first evidence-based guidelines for occupational therapy discharge planning and has potential to impact on both policy and practice. Keywords : Discharge planning, occupational therapy, independence

SS24 109-R-4

THE APPLICATION OF TECHNOLOGY IN THE HOME FOR FALLS PREVENTION: PERCEPTIONS OF IRISH AND AUSTRALIAN OLDER PEOPLE

Lynette MACKENZIE¹, Amanda CLIFFORD² (1 Faculty of Health Sciences, University of Sydney, Australia; 2 Clinical Therapies, Faculty of Education and Health Sciences, University of Limerick, Ireland)

Introduction : Future initiatives to promote healthy ageing of older

people will need to incorporate the application of smart technology and e-health. Technology has potential to address better access to services for falls prevention. However, little is known about the perceptions of the current cohort of older people about their use of different technology. Whilst Australia has a high level of participation with technology, in Ireland take-up has not been as fast or comprehensive. This study will investigate the perceptions of Australian and Irish older people about the application of this technology for them, and will identify if any differences exist between these groups. Method : Three focus groups were held in Sydney, Australia, and three in Western Ireland. Participants were members of senior support community groups. Focus groups consisted of 6-8 older people and the discussion was recorded and transcribed. Examples of iPads and movement sensors were shown to group members to elicit their opinions. Transcripts were coded and key themes were identified. Results : Overall, participants recognised opportunities to prevent falls with technology, such as better access to exercise programs and health professionals, self-monitoring devices, falls detection devices and alert systems. Technology designers need to consider cost, user-friendliness, simplicity, speed of feedback, ease of visibility, incorporating familiar technology (such as TV), and education needs. A number of barriers to the use of technology were also identified. Conclusion : It is important to consider the opinions of key stakeholders when considering future technology, healthcare delivery, education and research in the context of falls prevention. Keywords : technology user-friendly, focus groups

SS24 110-R

BACK TO THE FUTURE: INNOVATIONS IN HOME-BASED PRIMARY CARE FOR FRAIL ELDERLS

SS24 110-R-1

A SYSTEMATIC REVIEW OF HOME-BASED PRIMARY CARE PROGRAMS

Nathan STALL¹, Mark NOWACZYNSKI², Samir SINHA³
(1. Department of Medicine, Faculty of Medicine, The University of Toronto, Canada; 2. Department of Family and Community Medicine, Faculty of Medicine, University of Toronto, Canada; 3. Division of Geriatric Medicine, Faculty of Medicine, University of Toronto, Canada)

Introduction : In Canada, 93% of older adults live at home and a substantial proportion of this population has complex and inter-related health and social problems. This sometimes renders them frail and homebound and poorly-served by predominantly office-based primary care delivery models. Several comprehensive and ongoing home-based primary care models have emerged internationally in order to address access-to-care deficiencies, postpone adverse health trajectories and reduce overall costs for homebound elders. Method : We completed a systematic review of studies investigating home-based primary care programs for community-dwelling older adults (age ≥ 65) that measured at least one of: hospitalizations, emergency department visits and long-term care admissions as an outcome of their intervention. Using the Cochrane, PubMed and MEDLINE databases from the earliest available date through January 13, 2013, we identified 346 abstracts, and 8 met our criteria for review. Results : The 8 reviewed interventions were all based in North America, with 4 emerging from the Veterans Affairs System in the United States. All eight programs demonstrated substantial effect on at least one of our inclusion outcomes, with four programs effecting two outcomes. All interventions were characterized by three common design principles: 1) house calls are made by the ongoing primary care provider, 2) the primary care provider leads an interprofessional care team, and 3) the

program provides after-hours support. Conclusion : Specifically designed home-based primary care programs can substantially affect patient, caregiver and systems outcomes. Adherence to the core design principles identified in this review could help guide the development and spread of these programs in Canada. Keywords : Home-based primary care, Homebound elderly, Physician house calls

SS24 110-R-2

THE EMERGENCE OF HOME-BASED CARE IN MEDICARE: OUTCOMES FROM THE DEPARTMENT OF VETERANS AFFAIRS

Dayna COOPER¹, Thomas EDES² (1. U.S. Department of Veterans Affairs, USA; 2. Office of Clinical Operations, U.S. Department of Veterans Affairs, USA)

Introduction : The frail and homebound elderly are poorly-served by predominantly office-based primary care delivery models, resulting in reliance on episodic alternatives such as emergency department visits and hospitalizations. Many of these high-cost episodes can be avoided through home-based primary care. Method : This presentation will explore the emergence of home-based care in Medicare in the United States by reviewing outcomes from the Department of Veterans Affairs. Results : We will begin by exploring how home-based primary care in the Veterans Affairs system differs from routine home care in the United States. We will then review clinical and economic outcomes as well as the growth of this model of care in the Veterans Affairs systems in recent years. Next we will explore the potential for proliferation of home-based primary care in the recent Independence at Home Act, part of the United States Patient Protection and Affordable Care Act. Finally we explore the novel Medical Foster Home model as well as overall opportunities for expansion and research. Conclusion : As we face the dual challenges of an unsustainable rise in healthcare costs concurrent with an increasing population with serious chronic disabling diseases, we need to recognize that the spectrum of geriatrics and extended care services are integral components of the solution. We can increase access, improve quality, and lower total costs of care, and we can achieve these goals by adding effective services rather than restricting services. Home based primary care is one of these key effective services that need to be increased. Keywords : Home-based primary care, Homebound elderly, Health care policy

SS24 110-R-3

THE LONGITUDINAL ONTARIO INTEGRATED HOME-BASED PRIMARY CARE STUDY

Tracy A. SMITH-CARRIER¹, Mark NOWACZYNSKI², Sabrina AKHTAR³, Thuy-nga PHAM², Samir SINHA³ (1. School of Social Work, King's University College at Western University, Canada; 2. Department of Family and Community Medicine, Faculty of Medicine, University of Toronto, Canada; 3. Division of Geriatric Medicine, Faculty of Medicine, University of Toronto, Canada)

Introduction : Health care systems will be increasingly challenged in the coming decades to meet the needs of an ageing population. Innovative methods are required to meet the complex and often inter-related health and social problems faced by one of the most marginalized populations in our society, the frail and homebound elderly. This presentation examines integrated home-based primary care (IHBPC), presented around two delivery models: one based in a hospital or community-based family health team and the other based in a community support service agency; different models that have emerged in the provision of IHBPC in Toronto (Canada). The presentation will address: (1) the purpose and objectives of IHBPC, and why this model of care is so important within our current context;

(2) the theoretical framework and methods used to evaluate the study's IHBPC models; (3) the preliminary findings from the qualitative and quantitative analyses; (4) the role of partnerships and dynamics of interprofessional care teams involved in IHBPC service delivery; and (5) the facilitators and barriers to replicating and scaling these models within and beyond national borders. Method : This research involves a mixed methods study. Interviews with patients, caregivers, team members and key external stakeholders were conducted and analyzed using a grounded theory approach. A retrospective matched cohort study was conducted using propensity matched scoring. Results : Greater access to care, increased satisfaction, decreased hospitalizations. Conclusion : This study is the first in Canada to track the outcomes of the IHBPC model, and to provide policy recommendations to facilitate its spread across Canada and beyond. Keywords : home-based primary care, elderly, interprofessional teams

SS24 110-R-4

LEVERAGING NEW POLICY AND FUNDING MECHANISMS TO SUPPORT THE DEVELOPMENT AND DISSEMINATION OF HOME-BASED PRIMARY CARE PROGRAMS

Samir SINHA (*Division of Geriatric Medicine, University of Toronto and Johns Hopkins University, Canada*)

Introduction : With the inability of traditional office-based primary care models to meet the needs of ever-increasing homebound populations, innovative and responsive policies and models for the provision of primary care will be required for them. Meeting the complex and inter-related health and social care issues faced by the frail and homebound elderly often requires a team-based approach to care that can be brought to these patients in their own homes. While these can be seen as time and resource intensive models, their ability to address access-to-care deficiencies, postpone adverse health trajectories and reduce overall costs, presents a value proposition to support the investment in the development and provision of home-based primary care. Method : This presentation explore health care policy and funding issues surrounding the uptake of home-based primary care. Results : We will first review established and emerging policy mechanisms, funding and payment models that are being developed in the United States, and Canada and elsewhere to facilitate the growth, development and spread of team-based models for the delivery of home-based primary care. The simultaneous development of evaluation and monitoring frameworks that promote quality and efficiency will also be reviewed. Finally, efforts to promote and develop the knowledge, skills and confidence of administrators and clinicians involved in delivering home-based primary care through the development of toolkits and manuals will also be presented. Conclusion : Levering new policy and funding mechanisms can support the uptake and widespread adoption of home-based primary care to meet the ever-growing needs of an ageing population. Keywords : Home-based primary care, Homebound elderly, Health care policy

SS24 113-S

THE MULTIPLE FACES OF SOCIAL INEQUALITY IN THE SECOND HALF OF LIFE: CONSEQUENCES FOR HEALTH

SS24 113-S-1

HEALTH TRAJECTORIES OVER 20 YEARS: EFFECTS OF EDUCATION, INCOME AND GENDER

Hiroko AKIYAMA¹, Ikuko SUGAWARA², Satoshi USAMI³, Jersey LIANG⁴, Sachiko KAMIYAMA⁵ (*1. Institute of Gerontology, The University of Tokyo, Japan; 2. Institute of Social Science, The University of Tokyo, Japan; 3. Department of Psychology, University of Southern California, USA; 4. School of Public Health, The*

University of Michigan, USA; 5. The KAITEKI Institute, Mitsubishi Chemical, Japan)

Introduction : Although it is known that social inequality affects health, the impact on health trajectory over years is not well understood. Using panel data, this study investigates pathways of social inequality to health. Method : The data came from two large national panel surveys: HRS (US) and Well-being of Japanese Elderly. By latent class analysis, typical health trajectories were identified for American and Japanese men and women by SES. Results : Across all groups, two patterns of health trajectories (early- and late-onset of disability) were identified. However, percentages of the early-onset of disability, average age experiencing disability, the speed of declining health were different by SES, gender and country. Conclusion : Policy and intervention programs need to consider differential pathways of social inequality to health. Keywords : Health trajectory, SES

SS24 113-S-2

INEQUALITIES AND HEALTH OVER THE LIFE COURSE: A LEBANESE PERSPECTIVE

Kristine AJROUCH¹, Toni ANTONUCCI², Sawsan ABDULRAHIM³ (*1. Sociology, Eastern Michigan University, USA; 2. Institute for Social Research/Psychology, University of Michigan, USA; 3. Health Sciences, American University of Beirut, USA*)

Introduction : In this paper we examine links between socioeconomic status, and health over the life course in Lebanon. Method : We use data from the Lebanon Family Relations and Aging Study (Ajrouch, Antonucci, & Abdulrahim, 2009) which included interviews with 500 community dwelling adults. Results : Regression analyses indicate that age is not associated with depressive symptoms, yet older age predicts lower self-rated health. A curvilinear effect of income is found with regard to both depressive symptoms and self-rated health. Both low and high levels of income predict more depressive symptoms and lower self-rated health. Conclusion : Findings illustrate the ways in which socio-economic status affects health over the life course. Keywords : health inequalities, life course, Lebanon

SS24 113-S-3

INEQUALITIES IN THE USE OF POTENTIALLY INAPPROPRIATE MEDICATIONS IN HC ELDERLY AND LTC RESIDENTS IN EUROPE: SOCIAL AND CLINICAL ASPECTS

Daniela FIALOVA¹, Jindra REISSIGOVA², Eva TOPINKOVA³, Graziano ONDER⁴, Roberto BERNABEI⁴ (*1. Department of Geriatrics and Gerontology and Department of Social and Clinical Pharmacy, 1st Faculty of Medicine and Faculty of Pharmacy, Charles University, Czech; 2. Department of Biostatistics- Euromise centre, Academy of Science, Czech; 3. Department of Geriatrics and Gerontology, 1st Faculty of Medicine, Charles University, Czech; 4. Centro Medicina dell'Invecchiamento, Universita Cattolica del Sacro Cuore, Italy*)

Introduction : The symposium presentation focuses on the role of socioeconomic inequalities, disability and psychosocial factors in the use of potentially inappropriate medications, patients' health and medication noncompliance in older home care (HC) and nursing home (NH) residents in Europe (EU). Method : ADHOC dataset (2707 EU HC patients 65+, mean age 82.2+/-7.2 yrs, prospective interRAI HC assessment between Sept 2001- Jan 2002, participating countries: Czech Republic-CZ, Denmark, Finland-FIN, Iceland, Italy-IT, the Netherlands, Norway and UK) and SHELTER dataset (4156 EU NH residents 65+, mean age 83.5 ± 9.4 yrs, prospective interRAI LTCF assessment in IT, CZ, UK, FIN, France, Germany and Israel between

Sept- Dec 2009) were analyzed to determine risk factors of potentially inappropriate prescribing (more than 350 demographic, functional, clinical and socioeconomic characteristics were tested). The multiple logistic regression model was created. Multicollinearity among risk factors was analyzed (x²-test and the coefficient of contingency) and interactions among them (Wald test and the likelihood-ratio test). Global model significance (x²-statistics) and ORs (95%CI, p<0.05) were computed. Results : Inappropriate medication use in the EU HC older adults was significantly associated with poor economic situation (OR=2.5(1.8-3.4)) and psychological factors- depression (OR=1.3(1.1-1.6)) and anxiolytic drug use (OR=2.2(1.7-2.8)). Polypharmacy was also a strong predictive factor (OR=2.2(1.8-2.7)). Among the EU NH residents, depression (OR= 1.3 (1.1-1.6)) and higher degree of disability (higher dependence on carer, OR=1.3 (1.04-1.6)) were associated with inappropriate prescribing along with polypharmacy 4+(OR=4.96(3.25-7.96)). Conclusion : Socioeconomic and psychological factors are highly associated with inappropriate prescribing and should be considered by new EU drug policy measures. Keywords : psychosocial and economic factors, inappropriate prescribing, home care, long-term care, Europe

SS24 113-S-4

SOCIOECONOMIC POSITION AND COGNITIVE ABILITY IN RELATION TO COGNITIVE AGEING

Martijn HUISMAN¹, Sean CLOUSTON², Scott HOFER²
(1. *Epidemiology & Biostatistics, VU University Medical Center, Netherlands*; 2. *Department of Psychology, University of Victoria, Canada*)

Introduction : The purpose of this study was to estimate the magnitude of associations of two indicators of socioeconomic position (SEP) - education and income - together with those of cognitive ability (CA = crystallised intelligence) with one of the most central features of the human ageing process: age-related decline in fluid intelligence. Method : Data were obtained from three longitudinal studies of ageing: the Longitudinal Aging Study Amsterdam (LASA), the English Longitudinal Study on Ageing (ELSA) and the Health and Retirement Study (HRS). We selected data covering largely overlapping time periods and age-ranges from their longitudinal databases. We performed full information multi-level, mixed-effects regression (MLM), to simultaneously model individual trajectories and to account for the impact that independent variables have on intra- and inter-individual intercepts and slopes. We estimated gross and independent effects of education, income and cognitive ability on the intercepts and slopes of fluid cognition. Results : SEP-CA associations differed between studies: there were stronger correlations in LASA and HRS than in ELSA, between education and income on the one hand and CA on the other. Results indicated that CA was strongly associated with baseline fluid intelligence and the rate of decline in fluid intelligence. Both SEP indicators remained independently associated with baseline fluid intelligence but not with its rate of decline. There was no evidence that depressive symptoms mediated any of these associations substantially. Associations were disparate between the studies. Conclusion : Aspects of SEP appear to influence cognitive ageing mainly through their association with cognitive reserve, not because they protect against cognitive decline. Keywords : Socioeconomic inequalities, Cognitive ability, Longitudinal analysis

GENETICS, ENVIRONMENTAL SUPPORT AND FUNCTIONING IN VERY LATE LIFE: INTERNATIONAL PERSPECTIVES ON CENTENARIAN RESEARCH

SS24 115-S-1

REGIONAL SIMILARITIES AND DIFFERENCES IN FUNCTIONAL STATUS IN JAPANESE CENTENARIANS

Yasuyuki GONDO¹, Yoshihiko SAITO², Hiroki INAGAKI³, Yukie MASUI⁴, Donald Craig WILLCOX⁵
(1. *Graduate School of Human Sciences, Osaka university, Japan*; 2. *Advance research institute for the sciences and humanities, Nihon university, Japan*; 3. *Research Team for Promoting Independence of the Elderly, Tokyo metropolitan institute of gerontology, Japan*; 4. *Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan*; 5. *International Public Health & Welfare and Gerontology, Okinawa International University, Japan*)

Introduction : Centenarians are believed to be a longevity phenotype. Recent studies, which explored environmental influence on longevity indicated warm climate, geometrical higher place influence longevity. Functional status in centenarians is not well maintained and higher frequencies of frail centenarians were reported in previous studies. This study aimed to explore the environmental influence on the functional status in centenarians. We compared regional difference and similarity of distribution of care level need among centenarians in Japan. Method : Distribution of nursing care level, which was rated 1 to 5 based on assessments of care requirements, was compared among 8 regions from north to south in Japan (Sendai city, Tokyo metropolitan, three regions in Hyogo prefecture, Yamaguti prefecture and Okinawa prefecture). These data were collected from published paper or presenter's own survey. Results : Over all, distribution of nursing care level were skewed to higher care level (4-5), except Okinawa, in which frequency of care level are centered on middle care level(2-3). Comparison between city area and rural area showed no difference in care level distribution. Conclusion : Warm climate might contribute not only longevity but also maintain health condition and functional status in centenarians. Compared to second highest yearly average temperature region (Yamaguti; 16.7 Celsius), Okinawa showed considerably higher yearly average temperature (23.1 Celsius). Lowest yearly average temperature region is Sendai (12.4 Celsius). Considering similarity of care level distribution between Yamaguti and Sendai, noticeable high temperature in Okinawa might contribute to maintain good functional status. Keywords : centenarian, longevity, function

Burns School of Medicine, University of Hawaii, USA*; 3. *Department of Research, Kuakini Medical Center, USA*; 4. *Research, Okinawa Research Center for Longevity Science, Japan*)

Introduction : To identify potentially modifiable risk factors predicting survival and healthy survival beyond age 90 years. Method : Candidate risk factors from the Okinawa Centenarian Study were identified as potential modulators of healthy aging from cross-sectional data. They were then tested using prospectively collected data from 8,006 Hawaii Lifespan Study participants, aged 45-68 years at the baseline exam in 1965, using regression analyses on survival and healthy survival, from both mid-life (mean age 54 years, 40 year follow-up) and late-life (mean age 76 years, 20 year follow-up). Results : Statistical analyses

demonstrated that survival and healthy survival were modified by several biological, behavioral, and social risk factors. Significant predictors ($p < 0.01$) included biological factors (e.g. BMI, fasting glucose and insulin, insulin sensitivity, fibrinogen, genotype), behavioral factors (e.g. diet, smoking, alcohol, physical activity), and social factors (e.g. marital status, education). Biological risk factors were increasingly dominated by markers of inflammation at older ages. Risk factors had cumulative effects such that those with no major risk factors had up to six-fold increased odds of survival or healthy survival versus those with 5-plus risk factors in analyses conducted from both mid-life and late-life. Conclusion : Several potentially modifiable factors in mid-life and late-life were significantly associated with healthy aging and survival into the nonagenarian and centenarian years. This suggests that the odds of healthy aging may be, at least in part, within our control. More research is needed to find interventions that might increase our odds of healthy aging. Keywords: Healthy Aging, Longevity

DISTAL AND PROXIMAL INFLUENCES ON MENTAL HEALTH AMONG CENTENARIANS

Peter MARTIN¹, Grace DA ROSA¹, Leonard W. POON² (1. *Human Development and Family Studies, Iowa State University, USA*; 2. *Gerontology Center, University of Georgia, USA*)

Introduction : Very little research has addressed the question whether centenarians are in good mental health and to what extent proximal and distal variables influence mental health functioning in centenarians. Utilizing data from the Georgia Centenarian Study, we investigated a number of distal and proximal influences on mental health. Method : Six alternative hypotheses (demographic, health, personality, social and economic support, stress and coping, distal influences) were tested for 137 centenarians and near centenarians (i.e., 98 years and older). Additional data were collected from proxies of these centenarians. Results : All but one hypothesis received at least partial support. None of the demographic variables (age, gender, ethnicity, and residence) predicted positive or negative affect. Health predicted negative and positive affect. Extraversion was significantly associated with positive affect, whereas Neuroticism was significantly associated with negative affect. Better social support was associated with more positive and less negative affect. Proximal life events related to negative affect only for the self reports, but coping was strongly associated with positive and negative affect for self- and proxy reports. Finally, distal events reduced negative affect for proxy reports, whereas engaged lifestyle was positively associated with positive affect for self reports. Conclusion : Distal and proximal variables are associated with mental health. Keywords : centenarians, mental health, distal and proximal influences

BLOOD BIOMARKER SIGNATURE OF FRAILTY IN THE

NUAGE COHORT

Pierrette GAUDREAU¹, Tamas FULOP², Helene PAYETTE³, Jose A. MORAIS⁴, Francois BELAND⁵ (1. *Department of Medicine, University of Montreal and Centre Hospitalier de l'Université de Sherbrooke, Canada*; 2. *Department of Medicine, University of Sherbrooke and Institut universitaire de gériatrie de Sherbrooke, Canada*; 3. *Department of Community Health Sciences, University of Sherbrooke and Institut universitaire de gériatrie de Sherbrooke, Canada*; 4. *Division of Geriatric Medicine, MUCH-Royal Victoria Hospital and McGill University, Canada*; 5. *Department of Health Administration, University of Montreal, Canada*)

Introduction : Aging is associated with frailty and several potential disturbances of circulating metabolic, hormonal and inflammatory biomarkers. However, it is still unclear whether or not a blood biomarker signature can predict or characterizes frailty. The objective of this study was therefore to quantify fasting serum levels of glucose, cholesterol, triglycerides, insulin, insulin-like growth factor 1 and binding protein 3, and markers of inflammatory status such as C reactive protein, tumor necrosis factor-alpha and interleukin 6 in a subset of 366 community-dwelling elderly people from the Quebec NuAge cohort. Method : The selection was performed according to a stratified (i.e. age strata and sex) random sampling frame. Blood biomarkers were measured at recruitment in the cohort (year 1) and at year 3. Serum glucose, cholesterol and triglycerides were analyzed in clinical biochemistry laboratories while immunoreactive levels of other biomarkers were quantified in our laboratories. Results : Appropriate data modeling and statistical analyzes is performed to determine whether or not blood biomarker regulations are associated with frailty components. Conclusion : Identification of a specific blood signature of frailty would be of great interest to develop pharmacological and/or lifestyle interventions to prevent or reduce its deleterious effects on functional autonomy. This research was supported the Canadian Institutes of Health Research and the Quebec network for Research on Aging. Keywords : biomarkers, elderly, cohort study

SS24 116-C-2

FRAILTY AS A CLINICAL TOOL: FROM RISK TO PREDICTION

Howard BERGMAN (*Family Medicine, McGill University, Canada*)

Introduction : The concept of frailty has received increasing attention among clinicians and researchers. In spite of a growing body of knowledge, there is no widely accepted definition of frailty. The literature abounds with different models, criteria and definitions. While consensus has yet to be attained, work accomplished to date while revealing exciting new horizons, has also raised important issues and questions. Although there remains debate on the conceptual and operational definition of frailty, there has been increasing interest to utilize frailty as a clinical prognostic tool in order to predict various outcomes in individual patients. Essentially all of the research on frailty to date has been based on secondary analyses examining explanatory ability, that is, testing frailty as a significant risk factor for adverse outcomes within a given population. Authors have used those results to infer predictive ability, that is, the ability of frailty to predict adverse outcomes in new out-of-sample subjects. However, even highly significant risk factors can make poor predictors for a prognostic tool. Little is known of the true predictive ability of frailty in new subjects in various clinical settings. Recently, there have been a few papers reporting the predictive ability of their frailty models. Yet we have yet to elucidate what frailty actually adds to basic demographic and medical information, such as age, sex and the

number of chronic diseases. Conclusion : The presentation discusses the complex relationship between the concepts of frailty, aging, and disability, and implications for developing relevant clinical instruments. Keywords : frailty; risk; prediction

SS24 116-C-3

SOCIAL FACTORS AS DETERMINANTS OF FRAILTY STATUS. BIOLOGIC MECHANISMS AND MEDIATORS.

Luis Miguel GUTIERREZ-ROBLEDO (*Director General, Instituto Nacional de Geriatria, Mexico*)

Introduction : Health inequities arising from the societal conditions, in which people live, are social determinants of health. These include early years' experiences, and current conditions. The dearth of available longitudinal, nationally representative data with extensive information on socioeconomic status and health status gives us an opportunity to understanding how early, middle, and late life factors influence the life cycle trajectory of health and thus of frailty. Method: We describe how social factors play a role in determining and modulating the adverse outcomes of frailty. Research in this field is still limited. Social factors, often ignored in the medical context, represent risk factors for the development of frailty we conducted a review and analysis of published studies. Results : Social factors influence health outcomes at a number of levels: biological, health behaviors, availability of social support, and access to healthcare. Mainly through allostatic load, as a function of greater SES adversity cumulated across the life course. We describe the evidence linking social factors to frailty, and the interplay of molecular, clinical, and social factors, including how social stress is expressed through epigenetic modulation or triggering of inflammatory processes. Conclusion : A life course approach to determine the correlates and trajectories of frailty is proposed. The allostatic load through life and chronic inflammation in the elderly are mediators of this relationship. Social profiling should be systematically performed and considered when evaluating an elderly person. So, the present review proposes how to include social factors as determinants, and modulators of adverse outcomes of frailty. Keywords : Frailty; Social factors; Allostatic load; Immunosenescence; Disability

IS FRAILTY IN THE EYE OF THE BEHOLDER?

Francois BELAND¹, Howard BERGMAN², Pierrette GAUDREAU³, Helene PAYETTE⁴ (*1. Ecole de sante publique, Universite de Montreal, Canada; 2. Family Medicine, McGill University, Canada; 3. CRCHUM, Universite de Montreal, Canada; 4. Centre de recherche sur le vieillissement, Universite de Sherbrooke, Canada*)

Introduction : In the classical sense, a "syndrome" is a set of characteristics running together. Two features define geriatric syndromes: 1) it is a unified manifestation of a phenotype, shared in a population by at least one group of persons, while at least another group will not; 2) the same etiological factors may contribute to more than one geriatric syndrome. Method : A measurement model for frailty as a geriatric syndrome has two parts: 1) heterogeneity among groups : with and without frailty; 2) "extra-correlations" among frailty components attributable to other geriatric syndromes. The two parts are modelled jointly with factor mixture analysis (FMA) were latent profiles analysis captures heterogeneity; and factor analysis, "extra-correlations". Thus, a counterfactual model for frailty as a geriatric syndrome implies: 1) rejection of heterogeneity : only one group is identified; and/or 2) rejection of "extra-correlations" : associations among frailty components are fully accounted for by latent profiles. Results : To test for the counterfactual, data from the FReLE, a

longitudinal study of 1643 elderly persons living in the province of Quebec - Canada, were used. Frailty was measured with continuous indicators specifically chosen to represent the five Fried's frailty components. Conclusion : FReLE reproduced Fried's results using Fried's measures and statistics procedures. However, using Montecarlo methods, the Bayesian Information Criteria (BIC), and entropy to identify the right model lead to a spiral of models. No single model performed well on all of the criteria. The best model with Montecarlo was not acceptable on the BIC, while the best on BIC was rejected. Keywords : Frailty; Geriatric syndrome; Factor mixed model

HEALTH AND LONGEVITY OF EAST ASIAN ELDERLY FEMALE

SS24 117-C-1

INTRODUCTION AND OVERVIEW OF THIS SYMPOSIUM

Koichiro INA (*Department of Geriatrics, Nagoya University Graduate School of Medicine, Japan*)

Introduction : In late elderly, atherosclerotic diseases like myocardial infarction become more often than malignancy as the cause of death. Oriental people suffer stroke more than myocardial infarction. The difference of gene mutation, life style, and food might affect the racial difference as above. In fact, adverse effects of hormone replacement therapy(HRT) for post-menopausal women are reported to be less in oriental people than those in caucasians. Female proceeds atherosclerosis after menopause rapidly compared with men, and consequently impaired their ADL in last several years. Method : In this symposium, we introduce our collaborative study supported by Japan Society of Promotion Science(JSPS). Prof. Yoon is most famous gynecologist on HRT in the world, and Dr. Zang introduces Chinese gender oriented medicine. I support Dr. Hayashi on this projective study at Nagoya Univ. Japan. Results : We evaluated genetic mutations through the observational study of about 700 Chinese (Chengdu and Kuming), Korean (Seoul) and Japanese (Nagoya) elderly women. Single nucleotide polymorphisms(SNPs) related to either blood coagulation(factor V Leiden etc.), metabolic syndrome (PPAR α Leu162Val etc.), or endothelium/estrogen system were investigated and has been followed 6 years in relation to atherosclerotic disease and death. Further, we compared their ADL and performed the examination of screening-detected depression and the association with QoL by self-reported questionnaires using GDS-15 and the EQ-5D of EuroQoL Group etc. Conclusion : Analyses focusing on postmenopausal elderly women are rare, and may result in improved fundamental understandings of older people. Keywords : Postmenopausal women, Hormone replacement therapy(HRT), Atherosclerosis

SS24 117-C-2

CHARACTER OF KOREAN MENOPAUSAL WOMEN

Yoon BYUNG-KOO (*Professor, Department of Ob/Gyn, Sungkyunkwan University School of Medicine, Korea*)

Introduction : I introduce two studies. First study estimated an association between cognitive impairment and bone mineral density(BMD), a surrogate marker for cumulative estrogen exposure. Second one examined the impact of HRT on 24-h ambulatory blood pressure(BP). Method : This cross-sectional study included 120 postmenopausal women, classified into three groups: those with subjective memory impairment(SMI,n=40), amnesic mild cognitive impairment(n=50), and early Alzheimer disease(AD,n=30). Medical history and spine x-ray was also obtained. The relation between BMD,

major osteoporotic fractures and cognitive status were tested. In second study, 67 postmenopausal Korean women received 2 months of HRT consisting of conjugated equine estrogen with or without micronized progesterone. Ambulatory BP monitoring was performed at baseline and after HRT. Subjects were divided into those with normal BP(NBP:n=25) and those with high BP(HBP:n=42). Results : There were no significant differences among groups with respect to other clinical characteristics. Cognitive impairment was associated with lower BMD. BMDs at both the lumbar spine and total hip were lower in the AD group than in the SMI group. Mini-Mental State Examination score was correlated with BMDs. In second, parity and BMI were higher in HBPgroup than in NBPgroup. For both systolic and diastolic BPs, negative correlations were observed between basal and after HRT BP. During daytime, HRT increased systolic and diastolic BP in NBPgroup and decreased both BPs in HBPgroup. Conclusion : Cognitive impairment is associated with lower BMD in postmenopausal women. Cognitive aging is multifactorial, but estrogen deficiency may contribute. HRT had either BP-elevating or BP-lowering effects in postmenopausal women, depending on basal BP. Keywords : Hormone replacement therapy, post-menopausal women, bone mineral density

SS24 117-C-3

HEALTH OF CHINESE ELDERLY FEMALE

Zhang JIE (*Dept. of Internal Medicine, Medical Information Institute of Yunnan province, China*)

Introduction : We have analyzed the relation of medical conditions to the cause of the death which changes in the fast rise period of the female average lifespan from 1990 to 2006 in the Kunming Area, China. Method : We compared average life span with that in Shanghai, Beijing and Japan from 1950 to 2006 and found the similarity of Kunming from 1990 to 2006 to Japan from 1950 to 1959. Results : Female average lifespan is 61.9 years old in 1990. The main death causes were malignancy, cardio- and cerebro-vascular diseases, and respiratory diseases in turn. However, according to statistical data in 2006, female average lifespan became longer to 68.6years, the main causes were cardio- and cerebro-vascular diseases, respiratory diseases, and malignancy in turn. Even, above 75 years old, the causes were same orders. The primary cause of prolonging average life span seemed to be strengthening the public healthcare system, and increase of the number of doctors and medical establishments. This situation is very similar with that of Japanese female from 1950 to 1959, namely, the term of Japanese rapid economic growth period. At present, in comparison with female long average lifespan in Beijing City(74y. o.), Shanghai City(77y. o.) and Japan(85y.o.), that in Kunming (69y.o.) was still in shorter level, but in the past 16 years the rise speed of the prolongation of mean life in Kunming female is quite notable. Conclusion : We expect that these analyses contribute to the future plan of promoting the welfare of people in developed city like Kunming City area. Keywords : average lifespan, female, China, Japan

SS24 117-C-4

EAST ASIAN RESEARCH FOR HEALTH AND LONGEVITY SUPPORTED BY JSPS

Toshio HAYASHI (*Dept. of Geriatrics, Nagoya Univ. Graduate Sch. of Med., Japan*)

Introduction : 163 Japanese, 223 Korean and 186 Chinese women with a mean age of 67.9 years recruited from outpatient clinics of Nagoya University, Japan, Samson medical center, Seoul, Korea, Sichuan Univ. Chengdu and Kunning Central Hosp. Kunning, China were followed up for 6 years. We show our data in three parts. First

one is single nucleotide polymorphism(SNP) effect on biomarker and/or ischemic heart diseases(IHD) and cerebrovascular diseases(CVA). Second is their ADL and the association with QoL. Third one is combined analyses. Method : First study evaluated ten SNPs, which acts in or is related to either blood coagulation, metabolic syndrome-related pathways, or endothelium/estrogen system. Their relation to clinical values including lipids, B-type natriuretic peptide(BNP), fasting plasma glucose, tumor necrosis factor- α , interleukin-6, cyclic GMP, and nitric oxide metabolites were examined. In second study, we examined self-reported questionnaires and conducted the study. Depressive symptoms were assessed using a 15-item geriatric depression scale(GDS-15). For the assessment of QoL, we used EQ-5D of EuroQoL Group. Results : Correlations of factor VIIArg353Gln with HDL-C and eNOS Glu298Asp with triglycerides are found on registration. Polymorphisms in endothelium/estrogen system and heart failure marker, BNP are also correlated with ER α IVS1-401. Further analyses in relation to IHD or CVA are performed. Using cut-off of 5/6 for GDS-15, the percentages of subjects with depression were 39.0% of Korean, 29.2% of Chinese, and 33.9% of Japanese. Depression was significantly associated with lower level of some dimensions of QoL. Conclusion : SNPs and QoL study may help understanding the pathophysiology of atherosclerotic diseases in elderly women. Keywords : Postmenopausal women, single nucleotide polymorphism, QoL

WHAT IT MEANS TO BE VERY OLD: A COMPARISON OF COUNTRIES AND CULTURES

SS24 118-S-1

SOCIAL ENGAGEMENT AND SOCIAL SUPPORT IN THE VERY OLD

Carol JAGGER¹, Jacobijn GUSSEKLOO², Yasumichi ARAI³, Ruth TEH⁴ (*1. Institute for Ageing and Health, Newcastle University, United Kingdom; 2. Department of Public Health and Primary Care, Leiden University Medical Center, Netherlands; 3. Division of Geriatric Medicine, Department of Internal Medicine, Keio University School of Medicine, Japan; 4. General Practice and Primary Health Care, University of Auckland, New Zealand*)

Introduction : Social engagement and social support are important for maintaining quality of life in old age. Poor social engagement has been shown to be associated with cognitive decline as well as a contributor to reduced survival in late old age. We compare levels of social engagement and social support in four longitudinal studies of very old people (aged 85+) from countries with very different life expectancies (Japan, the Netherlands, New Zealand and UK) to explore the extent to which social engagement contributes to longevity. Method : Four longitudinal studies of those aged 85+ are analysed: the Newcastle 85+ Study (n=849); the Leiden 85+ Study (n=599); the Living to Advanced Age in New Zealand (LILACSNZ) study (n=937); and the Tokyo Oldest Old Survey on Total Health (n=542). Social support variables included marital status, proximity of and contact with children, contact with formal social care services. Social engagement was assessed by self-report of activities grouped into mental, physical, social, and productive with frequency of activity coded as at least monthly and less than monthly. Results : Social support and social engagement between studies will be compared in relation to other potential confounders such as cognitive and physical functioning and depression. In the two studies with the longest follow-up, the effect of social engagement on mortality will be compared and contrasted. Conclusion : Social engagement is not only an important predictor of length of life but also quality and, as a potentially modifiable factor, it

could form the basis for future interventions to improve healthy ageing. Keywords : Social engagement, oldest old

SS24 118-S-2

THE NATURAL COURSE OF DISABILITY AND THE ROLE OF CHRONIC DISEASES IN THE VERY OLD; A COMPARISON BETWEEN 4 DIFFERENT COUNTRIES

Jacobijn GUSSEKLOO¹, Ngairé KERSE², Ruth TEH², Carol JAGGER³, Andrew KINGSTON³, Yasumichi ARAI⁴, Wendy Den ELZEN¹ (1. *Public Health and Primary Care, Leiden University Medical Center, Netherlands*; 2. *General Practice and Primary Health Care, University of Auckland, New Zealand*; 3. *Institute for Ageing and Health, Newcastle University, United Kingdom*; 4. *Geriatric Medicine, Keio University, Japan*)

Introduction : Disability in older people is associated with a shorter life expectancy, more dependency and morbidity. As the population in the Western world is ageing, the number of older people facing disability will increase in the coming decades. This increasing incidence of disability will be accompanied by rising health care costs, since health care for disabled is more expensive compared to health care for non disabled persons. The natural course of disability and its determinants are important to study, since prevention and pro-active care are important. Method : The natural course of disability was compared between four longitudinal studies of those aged 85 years and over: the Life and Living to advanced age a cohort in New Zealand (LiLACS NZ) (n=937); the Newcastle 85+ Study (n=849); the Leiden 85-plus Study (n=599); the Tokyo Oldest Old Survey on Total Health (n=542). The severity of disability was longitudinally measured in all cohorts. We will study the effects of gender, age and the presence of chronic diseases on the course of disability. Mortality will be taken into account. Results : The natural course of disability and the influence of gender, age and prevalence of chronic disease will be presented per study and integrated by Individual Patient data analysis. This gives us the possibility to compare the relationship between chronic diseases and disability between the different countries. Conclusion : Facing the ageing population, understanding the natural course of disability and its determinants becomes increasingly important for older people, their caregivers, and policy makers. Keywords : functional status, chronic diseases, natural course

SS24 118-S-3

THE CONTRIBUTION OF ORAL HEALTH TO MALNUTRITION IN THE VERY OLD

Yasumich ARAI¹, Toshimitsu IINUMA², Carol JAGGER³, Jacobijn GUSSEKLOO⁴, Ruth TEH⁵ (1. *Division of Geriatric Medicine, Department of Internal Medicine, Keio University School of Medicine, Japan*; 2. *Department of Complete Denture Prosthodontics, School of Dentistry, Nihon University, Japan*; 3. *Institute of Ageing and Health, Newcastle University, United Kingdom*; 4. *Department of Public Health and Primary Care, Leiden University Medical Center, Netherlands*; 5. *General Practice and Primary Health Care, University of Auckland, New Zealand*)

Introduction : Deterioration of oral health is common and potentially serious problems among older adults. Epidemiological observations have suggested contributions of poor oral health to age-related chronic conditions, including diabetes mellitus, functional limitation, and cognitive impairment. Poor nutrition and dietary restriction are possible mediators of this relationship. We examined the associations of oral health and nutritional status in longitudinal studies of very old people (aged 85+) from countries with different dietary habits and dental care systems. Method : The Tokyo Oldest Old Survey on Total

Health is a longitudinal study of those aged 85+ (n=542) with a particular focus on dental examination and dietary assessment. Oral health measures include tooth counts, denture status, oral health-related QOL, a 15-item food acceptance, and maximum bite force. Dietary habit was assessed with a validated food frequency questionnaire, and nutritional status was assessed with body composition (BMI, circumference of arm and calf, skinfold thickness) and serum albumin levels. A variety of self-reported oral health measures as well as detailed dietary record are available in the Newcastle 85+ Study. Results : Cross-sectional associations between oral health measures, dietary intake, and nutritional status will be examined. The results will be compared between studies in relation to other potential confounders such as cognitive and physical functioning and socioeconomic factors. In some studies, longitudinal impacts of oral health on nutrition and general health outcomes will be examined. Conclusion : Incorporation of oral health assessment into geriatric epidemiology will further our understanding of multidimensional components of health, and provide key information for prevention strategies. Keywords : very old, oral health, nutrition

SS24 118-S-4

THE RELATIONSHIP BETWEEN CARDIOVASCULAR DISEASE AND BMI IN THE VERY OLD

Ruth TEH¹, Ngairé KERSE¹, Carol JAGGER², Jacobijn GUSSEKLOO³, Yasumichi ARAI⁴ (1. *General Practice and Primary Health Care, University of Auckland, New Zealand*; 2. *Institute for Ageing and Health, Newcastle University, United Kingdom*; 3. *Department of Public Health and Primary Care, Leiden University Medical Center, Netherlands*; 4. *Division of Geriatric Medicine, Department of Internal Medicine, Keio University School of Medicine, Japan*)

Introduction : Cardiovascular disease (CVD) is a major cause of mortality, morbidity and disability in adults aged 85+. Obesity is one of the traditional CVD risk factors. The relative risk of CVD associated with greater body mass index (BMI, kg/m²) decreases with age but there appears to be a paradoxical relationship between BMI and mortality risk in advanced age though numbers of oldest old are few. We compare the prevalence of CVD and examine the relationship between CVD and BMI in four longitudinal studies of people in advanced age (aged 85+). Method : Four longitudinal studies of those aged 85+ are analysed: the Life and Living to advanced age a cohort in New Zealand (LiLACS NZ) (n=937); the Newcastle 85+ Study (n=849); the Leiden 85+ Study (n=599); and the Tokyo Oldest Old Survey on Total Health (n=542). CVD is defined similarly in all cohorts, and measurement of traditional risk factors and BMI was conducted in a similar way. Nutritional status is assessed using 24 hr dietary recall (in two studies) and food frequency (in one study). Results : The prevalence of CVD and obesity between studies will be compared and the relationship between CVD and BMI will be explored controlling for other traditional CVD risk factors. The relationship between BMI and mortality, controlling for nutritional status, will be compared and contrasted. Conclusion : Understanding the relationship between CVD and BMI in conjunction with nutritional status in advanced age will inform future intervention strategies to improve cardiovascular health in advanced age. Keywords : Aged, cardiovascular disease, BMI

EMPLOYMENT EXPERIENCES AMONG KOREAN OLDER IMMIGRANTS IN LOS ANGELES

Min-kyoung RHEE¹, Iris CHI¹, Jaehee YF² (1. *Social Work, University of Southern California, USA*; 2. *Social Work, University of Utah, USA*)

Introduction : With the rapid aging of the population in the United States and the nation's concern on the increasing costs of health care and Social Security, substantial amount of research has been done on the issue of how to recruit and retain older workers in the labor market. However, relatively very limited attention has been paid to the employment issues of ethnic minority older adults who often face dual risk of age and racial discriminations. **Method :** According to the U.S. Census, there were over one million Koreans in 2010 with approximately 20% of them being over age 50. This study attempts to fill the research gap by exploring the employment experiences among Korean older immigrants in Los Angeles. This study analyzes qualitative data of 36 Korean immigrants in Los Angeles who are 50 and above. **Results :** Based on six focus groups, and five individual interviews, the result of the study provides that Korean older immigrants experience diverse aspects of employment barriers such as structural, human/social capital, and cultural barriers. **Conclusion :** The study also provides foundation knowledge both for practitioners and policy makers in developing culturally competent employment services by exploring the employment barriers Korean older immigrants face both at individual and social level. **Keywords :** employment barriers, immigrants

SS24 119-S-2

HEALTH AND SOCIAL WELL-BEING OF PEOPLE OVER 50+ IN KOREA: EMPLOYMENT STATUS MATTERS?

Hongsoo KIM, Young-il JUNG, Moonhee SUNG (*Graduate School of Public Health, Seoul National University, Korea*)

Introduction : Work is a widely known factor affecting well-being of later-life; but only a few empirical studies examined its association with both health and social aspects of well-being in Asia countries, and fewer studies compared the association between the sexes. **Method :** Using a national representative sample of 4,972 (male 63.2%, female 36.8%) people aged 50 or older who participated in 2006 Korean Longitudinal Study of Ageing (KLoSA) study, we investigated how employment status affects self-rated health, depressive symptom, and social well-being. **Results :** Compared to those currently working, people who were unemployed or retired showed lower levels in self-reported health (OR=1.77, 2.49, p-value<.05) and depressive symptom (OR=1.98, 1.69, p-value<.05), but such difference was not observed in social well-being, while social-demographic and economic covariates were adjusted for. Between the sexes, the relationships between job status and social well-being were inconsistent. **Conclusion :** The findings imply employment status affects health and well-being of people over 50+ in Korea. Health and social policy should promote quality jobs for and active social engagement of mid-life and older people. Necessary are international comparative studies on work and well-being in later life. **Keywords :** Health, Social Well-being, Job status

SS24 119-S-3

PAID WORK AND SOCIAL CONNECTEDNESS AMONG JAPANESE OLDER ADULTS

Ikuko SUGAWARA¹, Naomi YATOMI², Hiroto MUROHASHI², Kouji SHIBASAKI², Katsuya IJIMA², Hiroko AKIYAMA² (1. *Institute of Social Science, The University of Tokyo, Japan*; 2. *Institute of Gerontology, The University of Tokyo, Japan*)

Introduction : It is well known that quite a few seniors wish to work beyond the average age of retirement not only for money, but also for psychological, social, as well as physical merits the workers might get from work. Among these benefits, social or relational merit of working may be critical for older people, considering the discussion that retirement can cause social isolation among older adults. However, little empirical research has been conducted on association between engagement / disengagement in paid work and social connectedness among the elderly. This study examined how paid work situation were associated with non-kin social relations. **Method :** Structural interviews were conducted with 1133 randomly selected people aged 55 and older living in Kashiwa, a suburban city of Tokyo. Work status, frequencies of going outdoors for social activities, and frequencies of meeting with friends and neighbors were used for this study. **Results :** The majority of the respondents retired or will retire from the paid work at around the age of sixty. Those who continued to work beyond the average age of retirement went out of their home more frequently and had more contact with friends than those who retired after controlling for the effect of gender, age, physical and mental health, contents of job, and income level. **Conclusion :** This result was compared with the longitudinal data obtained from seniors who attended a series of job seminars for retirees. The condition of post-retirement work to promote or deteriorate social connectedness will be discussed. **Keywords :** retirement, non-kin social relations, post-retirement work

SS24 119-S-4

A COMPARATIVE STUDY OF MATCHING PRINCIPLE TO VOLUNTEERING BETWEEN KOREAN AND AMERICAN OLDER VOLUNTEERS

Jihyun PARK (*Department of Social Work, Hanshin University, Korea*)

Introduction : The purpose of this comparative investigation is to determine whether planned "matching" of an older volunteer with an agency, based on the volunteer's skill set, results in greater volunteer satisfaction, commitment and role identity with the volunteering experience than when placement occurs without consideration of the volunteer's skill sets and/or organization's need both Korean and American older volunteers. **Method :** The availability sample is included; 274 volunteers engaged in volunteering at service organizations in Seoul and Gyeonggi Province, South Korea and 140 volunteers in Albany, New York, U.S.A. **Results :** In terms of mediating effects, both Korean and American highly motivated volunteers were associated with satisfaction on volunteering and enhancement of role identification. This suggests a significant mediator as the degree of matched skill set between motivation factors and satisfaction and role identification both Korean and American volunteers. However, in terms of personality factor, Korean extroverted older volunteers were more associated with volunteering activity than American volunteers, when mediated by degree of matching skill sets. **Conclusion :** A key implication at the individual level is that understanding the transitional phase of retirement and creating volunteer opportunities that match not only the level of willingness to volunteer but the skill set brought to the volunteer experience by the volunteer candidate will enhance volunteer outcomes both Korean and American older volunteers. Attention needs to be paid to the cultural aspects of older volunteering as it can compensate for personality related to enhancement of role loss thru volunteering in American older volunteers. **Keywords :** Volunteerism, Comparative Study, Retirement

GLOBALIZATION AND THE DECLINE OF THE 'SOCIAL' IN AGEING: NEW FORMS OF RISK AND INEQUALITY FOR OLDER PEOPLE

SS24 120-S-1

AGING IN A WORLD SOCIETY: FROM INDEPENDENCE TO INTERDEPENDENCE

Jan BAARS (*Interpretive Gerontology, University for Humanistic Studies, Netherlands*)

Introduction : Globalization forces us to think about global interrelations and interdependencies. These challenges imply another level of calibrating concepts such as autonomy or independence. In this paper the limited definition of autonomy as independence will be enlarged by including interdependence as its constitutive dimension. Moreover, autonomous choice will be placed in the context of structural preconditions which include distributional justice but also social justice in a broader sense, which addresses situations of vulnerability and (inter)dependency, rather than assuming that persons are independent and rational contractors. Such theorizing will be necessary to correct the dominant diagnosis of problems of aging in terms of the individualization of problems that are structurally constituted and to be able to embed such diagnoses in a broader perspective of social justice. Method : Conceptual analysis and theoretical development. Results : Theories of autonomy in aging need to be embedded in interpersonal contexts of interdependence and structural contexts of enabling preconditions. Conclusion : Theories of autonomy in aging need to be embedded in interpersonal contexts of interdependence and structural contexts of enabling preconditions. Keywords : interdependence, vulnerability, social justice.

SS24 120-S-2

IDEOLOGY ACROSS SOCIETIES: G-E INTERACTION, SOCIAL FORCES AND AGING

Dale DANNEFER (*Department of Sociology, Case Western Reserve University, USA*)

Introduction : Old ideas die hard. After demonstrating the importance of societal and cultural practices in shaping the character of age in both its biological and sociocultural dimensions, the seductive appeal of reductionist approaches has seemingly found a new path forward in the study of G-E interactions. It is clear the the initial enthusiasm and methodological intrigue surrounding the study of G-E interactions has outpaced critical and logical thought, creating a need for clear and cautious analysis. Method : In this paper , I analyze parallels between the initial introduction of cohort analysis which has been so influential and central to reframing the study of age, and the logic of G-E interaction. Results : I show that the dominant modes of work on G-E interaction in the social sciences is conducted without reference to an appropriately dynamic and interactive logic, and with little attention to the explanatory potentials of social forces in the regulation of gene expression. Evidence suggests that loneliness, for example, may have the power to regulate gene expression. Conclusion : In gerontology as elsewhere in the social scientists, the embrace of genetic explanation requires tempering by a full consideration of the interactive process through which genes and environments interact throughout the life course. Keywords : reductionism, ideology, gene-environment interaction

SS24 120-S-3

GLOBALISATION AND ECONOMIC CRISIS: NEW FORMS OF RISK AND SOCIAL EXCLUSION

Chris Raymond PHILLIPSON (*School of Social Science, The University of Manchester, United Kingdom*)

Introduction : The focus of this paper is on the crisis facing policies aimed at promoting social inclusion and combatting social inequality in later life. Global economic recession is promoting new forms of marginalisation in later life - ideological as well as economic. Economic crisis is re-shaping ageing in the twenty-first century, in respect of forms of state intervention, social behaviour and a deepening of inequalities within cohorts of older people. Method : The paper examines a range of government policies in the Global North to illustrate its broad theme regarding the impact of global economic crisis. It places the recession in the context of wider forces associated with globalisation and global social policy. Perspectives drawn from critical gerontology are used to examine new forms of social exclusion occurring in later life. Results : The paper will identify the emergence - in western economies - of a new 'moral narrative' for old age, one represented by a shift from the state to the market or from an ageing managed within 'private' rather than 'public' spaces. This new phase is by definition more open and less constrained by the traditional institutions supporting older people; it is also a more unequal old age - with new opportunities for inclusion on the one side, but varieties of exclusion on the other. Conclusion : Social policy is now faced with a different type of ageing underpinned by changing institutional forces. The move towards the promotion of markets to service old age is widening inequalities and promoting new vulnerabilities in later life. Keywords : social policy, globalisation, markets

SS24 120-S-4

DECONSTRUCTION OF "THE SOCIAL" IN OLD AGE POLICY

Carroll ESTES (*Institute for Health & Aging, UCSF, USA*)

Introduction : Attacks on US Social Insurance Schemes underscore contradictions between democracy and capitalism, with risk and inequality consequences. Method : Socio-historical methods of discourse, social movement, political economy, feminist, and race analyses examine Ideology, Power, Structure, and Agency. Results : Debates (2012 elections) suggest how corporations use their protected "free speech": Attacks on women, racial/ethnic minorities, workers, disabled, LGBT and voting rights. The Hegemonic Discourse of market individualism is interrupted and contested by a Resistance Movement opposing "privatized citizenship" (Somers 2008), increasing risk and inequality. Social Media and public intellectuals rise. Conclusion : Multiple frames (crises of capitalism, the state, globalization, demography) press radical state action to "save" Social Security and Medicare by destroying the universal "social" (privatization and cuts). Global reciprocal reverberations shadow all generations and vulnerable peoples. Research, theory, and praxis implications outlined. Keywords : Critical gerontology, policy

PERIPHERAL SERVICES OF COMMUNITY CARE FOR AGING IN PLACE; AIMING A MEANINGFUL LIFE FOR THE ELDERLY

SS24 121-S-1

THE POSSIBILITY OF EN-GAWA SERVICES; AN ATTEMPT TO INVOLVE THE ELDERLY WITH THE COMMUNITY

Naohiko HAYATA¹, Megumi KATAYAMA², Nana FUKUDA³
(1. *Information Media, Hokkaido Information University, Japan*; 2. *Design, Sapporo City University, Japan*; 3. *Media Arts and Design,*

Hokkaido Institute of Technology, Japan)

Introduction : 'EN-GAWA services' is lighthearted informal peripheral services of community care with formal core services for elderly, i.e., nursing home. The concept of 'EN-GAWA services' is elderly facilities encourage elderly people to social participation and networking among elderly through the peripheral services at the facilities. Method : In this presentation, some 'EN-GAWA services' will be compared to the several similar services of 'EN-GAWA services,' and discuss the differences of those services. Through this discussion, the definition of community-care will be reconstructed and theorized using the idea of EN-GAWA services. Results : The merits of 'EN-GAWA services' will be shown in this presentation. Community cafe and restaurant, educational programs for elderly, and other programs at a elderly facilities are able to be defined as one of the 'EN-GAWA services.' For define as 'EN-GAWA services,' the above services should have a function of mutual assistance among the elderly in the community. That is to say, the 'EN-GAWA services' have to be able to work for encourage elderly people to their community activities and to create a meaningful life of the elderly people. On the other hand, the elderly facilities have to give some effective assistance for the elderly to live permanently in their community. Conclusion : Removing the fear associated with aging, and creating a meaningful life in older age are very important for realizing 'aging in place.' Those are quite difficult problems in super-aged society. The idea of 'EN-GAWA services' is one of the best way to solve the problems. Keywords : aging in place, community care, meaningful life

SS24 121-S-2

INNOVATIVE DAY-CARE WITH COMMUNITY LIFE IN AN INNER CITY ENVIRONMENT IN TAINAN, TAIWAN: TAINAN CITY YMCA DAYCARE CENTERS

Potsung CHEN (*Institute of Gerontology, National Cheng Kung University, Taiwan*)

Introduction : The day care is one of the important services of community care services, which maintains the live of the elderly in their community and provides opportunities for the elderly and neighbors to interact. Considering diverse needs of the elderly in their life, implementing individualized care, providing the elderly with appropriate day care services and helping the elderly to extend original with community residents are the subjects that the institute concern the most. Method : This study investigated how the operators import the concept of community-based and mutual assistance in the initial stage of the environment design, to echo the original demands of the elderly in their community and home. YMCA Social Welfare Foundation in Tainan has set up three daycare centers for the elderly since 1988. Results : Further, by providing care services and community participation in the program activities for the elderly to create a safe and comfortable life in a variety of living spaces. Conclusion : Last but not least, the elderly have the access to independent life, maintain the appropriate intensity to interact with the community friends, and the institution can assist the elderly in getting the opportunity of continued aging in place. Keywords : day care, elderly, mutual assistance.

SS24 121-S-3

INTERGENERATIONAL COMMUNICATION OF "EN-GAWA SERVICE"

Megumi KATAYAMA (*School of Design, Sapporo City University, Japan*)

Introduction : Kyoto city has encouraged to built the complexes which combine the welfare facilities of elderly and children and investigated the effect of intergenerational communication. It is assumed that the

communication gives elderly self-respect, worth living and also reliefs progression of dementia such as enriching expression and utterance. Method : Kenkoen, social welfare service corporation in Kyoto, run the special elderly nursing home, the elderly day-care center and the after-school children's day-care center ("Gakudo hoiku-sho") in the same place. There are a salon space and a cafeteria in the entrance hall located in between the facilities. They also manage more than 100 volunteers to arrange many events to tie the both people inside and outside the complex. This system could be called "EN-GAWA service". We investigated the intergenerational communication of elderly and children in Kenkoen. Results : Elderly and children visit each other's facility to talk, play, take care and do the homework together. Those communications barely occur spontaneously. The caregivers always concern both generations and arrange activities to draw their common attention. Moreover some high school students who used to be the members of "Gakudo hoiku-sho" become the volunteers and continue the relationship with the community. Conclusion : We assume this place is the core of community welfare which supports "Aging in Place" and gives the children's growing environment focussing on the welfare experience. Keywords : Intergenerational Communication, Aging in Place

LONELINESS IN OLD AGE; WHO IS AT RISK?

SS24 122-S-1

DETERMINANTS OF LONELINESS OF OLDER CANADIAN IMMIGRANTS

Jenny GIERVELD¹, Suzan VAN DER PAS², Norah KEATING³, Janet FAST³ (*1. Social Demography, NIDI, Netherlands; 2. VUMC, VU University, Netherlands; 3. Human Ecology, University of Alberta, Canada*)

Introduction : Canada is one of the main migrant receiving countries. This study aimed at exploring the social integration versus loneliness of older immigrants in Canada, as compared to older adults born in the country. Method : We used data from the Canadian General Social Survey, Cycle 22 (N older adults = 4345). The study used the ideas of Bronfenbrenner's ecological systems theory to examine the individual and environmental factors affecting immigrant's integration after landing in the new environment. Dependent variable is the 6 ?item De Jong Gierveld loneliness scale. Determinants of loneliness included: sex, age, educational level, subjective health, experienced stress, several migration characteristics, the size and functioning of the network of familial and non-familial relationships, as well as Participation at the local level (in the community). Results : Results showed that immigrants are significantly lonelier than older adults born in Canada. Multivariate analyses identified the most important determinants; the language of childhood, experienced connectedness to the local community and the composition and functioning of the network of personal relationships are among the most decisive factors affecting loneliness among the migrant population of Canada. Conclusion : The ideas of Bronfenbrenner's ecological systems theory to examine the individual and environmental factors affecting immigrant's life course and integration after landing in the new environment are supported by the outcomes of this study. Keywords : loneliness, immigrants, participation

SS24 122-S-2

TALKING ABOUT LONELINESS

Christina VICTOR, Mary Pat SULLIVAN (*School of Health Sciences and Social Care, Brunel University, United Kingdom*)

Introduction : One consequence of the 'traditional' approach towards loneliness research with its focus on developing typologies and distinguishing types of loneliness, validating tools to determine its prevalence, outlining its negative consequences and evaluating interventions to reduce its negative impact on the lives of older people, is that we have effectively characterized loneliness as pathological and reinforced high levels of stigma for anyone who reports feeling lonely. **Method :** Secondary thematic data analysis of semi-structured in-depth interviews held with 45 older men (16), women (24) and married couples (5) between the ages of 66 and 91 in urban and rural areas of southern England. Prior to the interviews, all participants had identified themselves as lonely/ sometimes lonely using a self rating scale. Our aim was to explore the feelings and meanings associated with being lonely. **Results :** Participants were hesitant to disclose the loneliness experience and/or had difficulty in articulating this to the researcher. The variation in narratives reinforced the diverse ways this very intimate experience may be expressed. But age, gender and family status did not appear to be significant. The stigma of 'admitting' loneliness was evident but it was participant's awareness of loneliness and their feelings and meanings around physical, social, economic, and symbolic capital that characterised this complex human condition. **Conclusion :** Loneliness - although challenging to talk about - was a dynamic and multi-dimensional experience unique to each individual. The personal narratives illustrated an interaction between a range of external and internal factors that were both sources of strength to combat loneliness and sources of vulnerability for it. **Keywords :** loneliness

SS24 122-S-3

LATENT TRAJECTORIES IN LONELINESS

Marja AARTSEN¹, Marja JYLHA², Theo VAN TILBURG³ (1. Faculty of Social Sciences, VU University Amsterdam, Netherlands; 2. Tampere School of Public Health, University of Tampere, Finland; 3. Faculty of Social Sciences, dept. Sociology, VU University Amsterdam, Netherlands)

Introduction : This study aims to contribute to discussions about longitudinal trajectories of loneliness and factors that may shape these trajectories. The acknowledgement of different trajectories of loneliness is important for the theoretical and conceptual understanding of loneliness as well as for the development of intervention strategies. **Method :** Data came from the Longitudinal Aging Study Amsterdam, with observations between 1992 and 2009 among 3946 respondents. Latent class growth analyses were estimated with MPlus. **Results :** The analyses showed that we were able to identify different trajectories of loneliness, indicating four different subgroups. 65% of the respondents did not develop loneliness during the 18 years of follow-up, and 7% stayed at a constant high level of loneliness, 11% developed loneliness and 16% of the cases recovered from loneliness. **Conclusion :** Based on our study findings we can conclude that there are different trajectories of loneliness in older adults, and that most of the older adults are not lonely. Recovery from loneliness was also observed, indicating that loneliness can be reduced. Recovery from loneliness however is less likely if the partner dies and depressive symptoms (may be as a consequence) increase. Both situational factors and dispositional factors are related to the onset and chronicity of loneliness. Being or becoming lonely is thus not only a consequence of external factors, also personality characteristics are involved. **Keywords :** loneliness long term trajectories older adults

SS24 124-R A PRACTICAL TOOL FOR GLOBAL USE TO IDENTIFY AND RESPOND TO OLDER PEOPLE'S HEALTH

AND CARE NEEDS

SS24 124-R-1

CROSS CULTURAL ADAPTATION AND EVALUATION OF RELIABILITY AND VALIDITY OF EASY-CARE INSTRUMENTS IN MALAYSIA

Ee Ming KHOO¹, Valarmathi MASILAMANI², Sajaratulnisah OTHMAN¹, Wah Yun LOW³, Chirk Jenn NG¹, Karuthan CHINNA⁴, Ian PHILP⁵ (1. Department of Primary Care Medicine, Faculty of Medicine, University of Malaya, Malaysia; 2. Kinarut Health Centre, Ministry of Health Malaysia, Malaysia; 3. Faculty Of Medicine Dean's Office, University of Malaya, Malaysia; 4. Department of Social and Preventive Medicine, Faculty of Medicine, University of Malaya, Malaysia; 5. Warwick Medical School, University of Warwick, United Kingdom)

Introduction : EASY-Care Standard 2010 questionnaire is a patient-centered tool for assessing the functioning and well-being of the older people. It was initially developed for use in the European region. It consists of 49 items assessing seven domains and has three summary scores: the Independence score, Risk of Fall Score and Risk of Breakdown in Care Score. We evaluated the validity and reliability of this tool with elderly who attended a primary care clinic in Malaysia. **Method :** The face and content validity of this tool were first assessed by an expert panel. Subsequently, the questionnaire was modified, and face validity was conducted on a group of elderly patients and minor changes were made. The amended questionnaire was then administered to 337 elderly patients attending an urban public primary care clinic in Kuala Lumpur, Malaysia. Test-retest reliability of the questionnaire was performed in 32 respondents at an interval of two to three weeks. **Results :** The adapted version of the questionnaire has 7 domains with 47 items. Two items were dropped: vaccination status and financial allowances. The internal consistency of the Independence Score was good with a Cronbach alpha of 0.78. The mean scores for the Risk of Breakdown in Care Score and the Risk of Fall Score were 2.04±1.68 and 0.49±0.73 respectively. The kappa coefficient for most items ranged from 0.464 to 1.00. **Conclusion :** EASY-Care Standard 2010 questionnaire is a reliable tool with good face and content validity for use in the Malaysian primary care setting for assessing function of the elderly. **Keywords :** Easycare, validity and reliability, questionnaires

SS24 124-R-2

GLOBAL APPLICATION OF USE OF EASY-CARE

Vida ALIZAD¹, Ali ASGARI², Reza FADAYEVATAN¹, Maria Piedade BRANDAO³, Liliana SOUSA⁴, Alfred CHAN CHEUNG⁵, Carol MA HOK KA⁶, Rukie PINAR⁶, Ayse ERGUN⁷, Erol SAIME⁷, Kamer GUR⁷, Zeynep KURTULUS⁸, Katarzyna WIECZOROWSKA-TOBIS⁹, Ee Ming KHOO¹⁰, Ian PHILP¹¹ (1. Iranian Research Center on Ageing, The University of Social Welfare and Rehabilitation Sciences, Iran; 2. Department of Educational Psychology, The University of Kharazmi, Iran; 3. School of Health Sciences, The University of Aveiro, Portugal; 4. Health Sciences Section, The University of Aveiro, Portugal; 5. Department of Sociology and Social Policy, Lingnan University, Hong Kong; 6. Faculty of Health Sciences, Yeditepe University, Turkey; 7. Faculty of Health Sciences, Marmara University, Turkey; 8. School of Health, Namik Kemal University, Turkey; 9. Laboratory for Geriatric Medicine and Gerontology, Karol Marcinkowski University of Medical Sciences, Poland; 10. Department of Primary Care Medicine, The University of Malaysia, Malaysia; 11. Warwick Medical School, The University of Warwick, United Kingdom)

Introduction : EASY-Care is a holistic instrument designed to provide a brief and comprehensive assessment of needs of older people to calculate overall scores for risk of falling, independence and risk of breakdown in care. This study aimed to compare older people internationally to provide policy makers with a brief summary of elderly needs to specify what should be funded to ensure that resources are used for promoting older people's quality of life. **Method :** A sample of 2745 older people from Iran, Portugal, Turkey, Hong Kong, Malaysia and Poland completed EASY-Care. Data was analyzed based upon Classic Test Theory (CTT) and inference statistics. **Results :** The average internal consistency of scales of Independence, Risk of breakdown in care and Risks of falls were .91, .70 and .50 respectively. In all countries the indicators of shopping and walking outside had greatest effect on older people's independence, general health and experience of falling on risk of breakdown, while feet problems and feeling safe outside the home had the highest effect on risk of falls. Indicators of financial management and feeding had the lowest effect on older people's independence, using bath and toilet on risk of breakdown in care, whereas feeling safe inside the home appeared to have the lowest effect on risk of falls. **Conclusion :** EASY-Care is a reliable instrument for assessment of elderly when used in a global setting. More cross-cultural studies using appropriate sample size, including analysis of individual items in EASY-Care are needed to determine key indicators for policy planning and service development. **Keywords :** EASY-Care, Independence, Breakdown in care, Falls, Older people

SS24 124-R-3

EASY CARE STUDY AMONG OLDER PEOPLE AGED 65 YEARS OR OLDER IN KOSOVO

Naim JERLIU¹, Naser RAMADANI², Helmut BRAND¹
(1. *International Health, School for Public Health and Primary Care (CAPHRI), Faculty of Health, Medicine and Life Sciences, Netherlands*; 2. *National Institute of Public Health of Kosovo, Pristina, Kosovo, Albania*)

Introduction : Our aim was to assess the health status of older people aged 65 years or older in Kosovo; a transitional country in the Western Balkans currently experiencing a difficult period of political and socioeconomic changes. **Method :** A nationwide population-based survey using the EASY-Care Standard Instrument was conducted in Kosovo in January-March 2011. This included an age-sex and-residence stratified random sample of 1,890 individuals (83.5% response) aged 65 years and over. The EASY-Care Standard Instrument was used to assess the self-perceived health and care needs in conjunction with a questionnaire focused on the socio-demographic and socioeconomic aspects of older people. **Results :** Preliminary results suggest that 51% of participants have problems with their sight (47% males, 55% females), and 46% (43% males, 48% females) have hearing difficulties. Approximately 21% are unable to use the telephone (16% males, 25% females), whereas 41% can use it with some difficulties (34% males, 47% females). 15% had one fall in the last 12 months (11.5% males, 17.7% females); whereas 9% had two or more falls in the last 12 months (6% males, 11% females). Findings suggest that 6% of participants are unable to take their medicines as prescribed by their doctor (5% males, 7% females), and 41% need help in order to follow the instructions for how to take their medication (32% males, 50% females). **Conclusion :** These preliminary results from Kosovo indicate that the EASY-Care Instrument could be an appropriate tool for identifying older people with high and/or special needs in transitional countries of Southeast Europe. **Keywords :** EASY-Care Standard, older people, Kosovo

SS24 124-R-4

EVIDENCE BASE OF EASYCARE ASSESSMENT FOR DETECTING FRAILTY AND DEMENTIA, AND FOR DELIVERING INTEGRATED HEALTH CARE IN THE COMMUNITY

Marcel OLDE RIKKERT¹, Ian PHILIP², Marieke PERRY¹, Janneke Van KEMPEN¹, Rene MELIS¹ (1. *Geriatrics, Radboud University Nijmegen Medical Centre, Netherlands*; 2. *Warwick Medical School, The University of Warwick, United Kingdom*)

Introduction : In our aging societies we urgently need an evidence based and cost-effective feasible geriatric assessment instrument that supports primary care professionals in many countries to target and deliver integrated care to the needs and goals of the individual elderly. We conducted three Dutch trials on EASYcare, the Elderly Assessment System, to deliver a solid evidence base for it in international care and welfare for the elderly. **Method :** The first study was a cluster randomized controlled trial (RCT) in 151 community dwelling frail elderly on cost-effectiveness of EASYcare-based and problem-directed integrated care, delivered by a geriatric practice nurse in collaboration with general practitioner (GP) and geriatrician. The second RCT focused on improving dementia detection by EASYcare training of 105 pairs of GPs and primary care nurses (Perry, 2010). The third study validated the EASYcare Two Step Older frailty screen (EASYcare-TOS) for detecting frailty in older subjects (Kempen,2012). **Results :** Integrated care targeted by EASYcare was cost-effective as it improved wellbeing and functional performances (effect size>0.2; NNT:4.7), lessened hospitalization and institutionalization, and stimulated home care, adult day care, and meals-on-wheels. EASYcare training improved detection of dementia with 34% and improved adherence to diagnostic guidelines with 32% (p<0.01). EASYcare-TOS validly (correlation 0.63 with Rockwood's Frailty-index) and reliably (Cohen's Kappa:0.89) detected frailty more efficiently, as GPs' tacit knowledge was used. **Conclusion :** EASYcare assessment is evidence based for detecting frailty and dementia in older subjects and is cost-effective in delivering problem-based integrated care at home in frail older subjects, which warrants further implementation of EASYcare across similar health systems.

ESTABLISHING AN INTERNATIONAL UNITED FRONT OF MEDICAL SOCIETIES AND MEDICAL BOARDS AGAINST ANTI-AGING AND AGE-MANAGEMENT QUACKERY AND ORTHOMOLECULAR MEDICINE

SS24 125-C-1

DISEASE MONGERING AND LOW TESTOSTERONE: THE SELLING OF "ANDROPAUSE" AS REJUVENATION IN OUR TIMES

David J HANDELSMAN (ANZAC Research Institute, Univ of Sydney, Australia)

Introduction : Rejuvenation mania occurs when socio-economic affluence allows indulgence in the luxury hobby of health consciousness. The turn of the 20th Century rejuvenation quackery of Brown-Sequard (testis extracts), Steinach (vasoligation) and Voronoff (testis grafts) evaporated upon the discovery of testosterone (T) in 1935. But after the post-war golden age of steroid pharmacology failed to commercialize androgens by inventing an "anabolic steroid", androgen pharmacology stagnated until the major increases of T prescribing in recent decades. Without valid new indications, quasi-epidemic T prescribing is being driven by a renewed interest in rejuvenation, now termed "andropause" or synonymous neologisms. In

a classical disease mongering strategy to extend the boundaries of treatable disease, booming T prescribing is underpinned by clinical guidelines which deliberately blur the fundamental distinction between pathological and functional androgen deficiency. Method : Review of T prescriptions on per capita basis from Australia and 40 other countries over the last 1-2 decades. Results : The last 2-3 decades show a major, coordinated global increase in T prescribing with great regional & local variation. Conclusion : This unproven pathologizing of male ageing appears to be blindly emulating the misadventures of estrogen therapy for menopause. Decades of estrogen use claiming widespread health benefits were propelled by over-interpreted retrospective observational studies which were flawed by comparing healthier and wealthier estrogen-using women with non-estrogen using controls. This was only dispelled by the first prospective RCT and it can only be hoped that the equally expansive claims for health benefits of testosterone treatment for “andropause” does not take as long to be rigorously tested. Keywords : testosterone

SS24 125-C-2

TAKING A STAND: BRAZIL'S FEDERAL COUNCIL OF MEDICINE REJECTS ANTI-AGING AS A MEDICAL SPECIALTY AND BANS THE USE OF HORMONES AND PROCAINE FOR ANTI-AGING

Roberto D'AVILA¹, Gerson ZAFALLON², Elisa COSTA³, Milton GORZONI⁴, Maria DO CARMO LENCASTRE⁵, Jose Elias PINHEIRO⁶, Claudia BURLA⁶, Emelio MORIGUCHI⁷, Silvia PEREIRA⁸, Thomas PERLS⁹, Rubens DE FRAGA JR⁶ (1. Technical Chamber of Geriatrics, Federal Council of Medicine of Brazil, Brazilian Society of Geriatrics and Gerontology, Brazil; 9. Geriatrics Section, Department of Medicine, Boston University School of Medicine and Boston Medical Center, USA)

Introduction : Brazilians have been inundated with anti-aging marketing and multiple television appearances by physicians claiming to specialize in anti-aging medicine. Hormone and “bioidentical hormone” replacement therapy (HRT) and procaine hydrochloride (e.g. Gerovital) are claimed to stop and reverse aging and to effectively treat a broad range of age-related maladies. Method : In 2012, Brazil's Federal Counsel of Medicine (CFM) examined a request for anti-aging medicine to be sanctioned as a subspecialty and reviewed the typical practices of anti-aging doctors. Results : The CFM concluded that claims that hormone or “bioidentical hormone” replacement and other anti-aging treatments such as procaine are effective and benign are not substantiated by dependable published findings. The CFM also found that anti-aging, age management and longevity medicine are not recognized subspecialties by other governmental bodies in the world and given specific concerns that emerged in the CFM's investigation, the CFM rejected the recognition of anti-aging as a medical specialty. Conclusion : In October, 2012, the CFM's opinion was codified and it is now unlawful in Brazil to prescribe hormone replacement therapy and procaine hydrochloride

for anti-aging. Keywords : anti-aging hormone replacement therapy

SS24 125-C-3

ANTI-AGING MEDICINE: A NEW PUBLIC HEALTH PARDIGM OR A FASHION TREND?

Astrid STUCKELBERGER (Faculty of Medicine, University of Geneva, Switzerland)

Introduction : Biotechnologies and therapies that were unthinkable a decade ago are a reality today. The expectation by the public that practically anything is possible makes some people all too trusting. Besides the debate on the scientific evidence, anti-aging medicine questions our way of considering the “norm” of the aging process and healthy aging. The new paradigm presented no longer sets aging as an irreversible decline process leading to pathological conditions, but considers the aging body as a simple “biological machine” marked by time (chronological age), which can be kept to an optimal functioning through high tech detection and intervention. Method : A review of the evidence and risks of anti-aging medicine was commissioned by TA-Swiss and the Swiss Academy of Medical Science. This project reviewed scientific theories and findings as well as clinical practices in Switzerland, Japan and the USA. The objective was to review the interventions, products, the socio-economic and ethical consequences and what recommendations could be drawn for governments, health professionals, the medical community and patients. Results : This presentation will explore the rise of anti-aging medicine, its claims and discuss some of the public health and financial implications. Conclusion : Nine key recommendations stem from the review, including ethical and professional conduct considerations, the lack of evidence supporting safe and efficacious treatments that stop and reverse aging and legislation to protect the public. Global public health policy needs to support innovation and technology while ensuring the development of safe medical interventions and products for our aging societies. Keywords : anti-aging ethics public health

ESTABLISHING AN INTERNATIONAL UNITED FRONT OF MEDICAL SOCIETIES AND MEDICAL BOARDS AGAINST USE OF HORMONE OR 'BIOIDENTICAL' HORMONE REPLACEMENT FOR ANTI-AGING AND AGE-MANAGEMENT

David J. HANDELSMAN¹, Gerson ZAFALON², Roberto LUIZ D'AVILA³, Astrid STUCKELBERGER⁴, Thomas PERLS⁵ (1. Reproductive Endocrinology and Andrology, Anzac Research Institute, University of Sydney, Australia; 2. Technical Chamber of Geriatrics, Federal Council of Medicine and Regional Council of Medicine of Parana, Parana, SP, Brazil; 3. President, Brazil's Counsel Federation Medicine, Brazil; 4. Faculty of Medicine, Institut de medecine sociale et preventive, University of Geneva, Switzerland; 5. Medicine and Geriatrics, Boston Medical Center and Boston University School of Medicine, USA)

Introduction : The Fountain of Youth has been marketed to gullible people for centuries. In the late 1800's salesmen exclaimed the wondrous virtues of animal testicular extracts. Now with the pharmaceutical industry's ability to produce mass quantities of various hormones, these promotions have become particularly dangerous because of mass marketing on the internet and the oft-times indiscriminant administration of multiple hormones by some doctors who don't disclose the high risk and low benefit of these drugs which can cause increased morbidity. Method : (1) Recurrence of the rejuvenation fads of the late 1800's: selling the public on “andropause” and the provision of testosterone (D.J. Handelsman) (2) Brazil's

Federal Counsel of Medicine bans hormone replacement and procaine for anti-aging and refuses to recognize anti-aging medicine as a specialty (Reubens de Fraga, G. Zafalon) (3) Anti-aging claims (A. Stuckelberger) (4) Silence is endorsement: Medical professionals must form an international common front against misleading claims about hormone replacement for anti-aging for the sake of their patients and the public safety (Perls). Results : Regulatory (Brazil), Endocrinology (Australia), Geriatrics (USA) and Public Health (Switzerland) points of view will be presented along with proposed next steps. Conclusion : It is the responsibility of the medical care community to police themselves and to protect the public from unsupported and grandiose claims that can lead to both financial and physical harm. The IAGG is an important opportunity for different countries and organizations to galvanize their efforts to effectively stop the promotion and provision of hormone replacement as a means to stop or reverse aging. Keywords : anti-aging, procaine and gerovital, hormone replacement therapy

SS24 125-C-5

THE MEDICAL AND FINANCIAL HARM OF GROWTH HORMONE REPLACEMENT FOR ANTI-AGING, AGE-MANAGEMENT OR WHATEVER THEY CALL IT

Thomas PERLS (*Medicine and Geriatrics, Boston University Medical Center, USA*)

Introduction : Despite U.S. State and Federal laws that prohibit the distribution of growth hormone (hGH) for anti-aging, Furthermore clinical studies reveal very little if no benefit from growth hormone for weight loss and increased muscle strength in normally aging individuals while the adverse event rate is high (around 50%) with some risks such as those for diabetes and cancer risk far outweighing any little or no benefit. Method : Literature Review (pubmed and media). Results : Associated Press News (Caruso D, Donn J. Big pharma cashes in on hGH abuse, 12/21/2012) analyzed IMS Health collected data finding that hGH sales grew by 69% from 2005 to 2011 while average drug sales grew by 12%. Medicare payments for hGH increased by 78% over 5 years. The pharmaceutical industry sold \$1.4 billion worth of hGH last year and this does not include the profits made by clinics and compounding pharmacies in their resale of the drug to patients in what is nearly all a cash-only business. The authors concluded that half of sales went to people not meeting the legal criteria to receive the drug. Conclusion : Distribution of hGH continues to grow with more than half for illegal uses. Resultant fines pale in comparison to profits and thus it is clear that Congress must further investigate this threat to the public health and to determine adequate steps to end this deceptive and dangerous practice. Keywords : testosterone , growth hormone, anti-aging

SS24 126-C

THE INTERPLAY BETWEEN COGNITION AND MOBILITY: IMPLICATIONS FOR DISABILITY AND FALLS IN AGING POPULATION

SS24 126-C-1

OVERVIEW OF COGNITION AND PHYSICAL IMPAIRMENT IN DISABILITY MODEL AND FALLS, SCREENING TOOLS FOR HIGH RISK GROUP

Mooyeon OH-PARK (*Stroke Rehabilitation Research Laboratory, Kessler Foundation, USA*)

Introduction : As the population is aging globally, main goal of health care is being shifted from increasing overall life expectancy to disability-free life expectancy. Method : Two major health problems in

aging leading to disability are cognitive and gait impairments which were traditionally understood as involving processes in two separate domains (cognitive or physical). Both of these impairments are also well known risk factors for falls. However, interventions targeting one of these domains showed success rate to be desired. Results : During the past decade, there has been increasing evidence that cognitive, gait impairments, and falls are interrelated. Slow gait speed is shown to proceed up to 12 years before the clinical presentation of cognitive changes in older adults who later developed mild cognitive impairment (MCI). At the same time, impaired executive function and working memory of cognition is associated with decreased gait velocity and predicts falls. Conclusion : In this introductory session, overview of the symposium addressing interrelationship among cognition, gait, and falls will be discussed. This will include epidemiology of gait, cognitive impairment, and falls, a critical review of the current literature for the role of gait assessment in single and dual-task settings in predicting falls and cognitive decline. In addition, the practical usage of gait assessment including interpretation and risk stratification in clinical setting will be discussed. Keywords : cognition, gait, falls

SS24 126-C-2

COGNITIVE AND NEURAL MECHANISMS OF MOBILITY DECLINE AND FALLS IN OLDER ADULTS

Roe Holtzer HOLTZER¹, Joe VERGHESE² (*1. Neurology, Albert Einstein College of Medicine of Yeshiva University, USA; 2. Neurology, Albert Einstein College of Medicine, USA*)

Introduction : Recent evidence suggests that gait is influenced by higher order cognitive and cortical control mechanisms. executive functions (EF) that are subserved, in part, by the pre-frontal cortex play a key role in predicting mobility limitations in older adults. Specifically, dual-task methodology can be used to assess the causal effect of EF on mobility. Structural neuro-imaging studies identified regions in the frontal cortex as important in subserving mobility. However, due to technological limitations less is known about the functional correlates of cortical control of gait. The described here is designed to identify how the brain, specifically the prefrontal cortex, is functionally involved in higher order control of gait. Method: Participants are non-demented adults enrolled in our ongoing studies. Dual-tasks paradigms involving walking and cognitive interference tasks are used to assess the effect of EF on mobility. Using functional near-infrared spectroscopy we evaluate whether increased activations in the prefrontal cortex (PFC) are detected in walking while talking (WWT) compared with normal pace walking (NW). Specifically, we hypothesized that oxygenation levels in the PFC would increase due to dual-task interference. Results : As expected, compared to NW gait performance is decreased in WWT due to increased EF demands. As hypothesized, significant bilateral increased oxygenation levels in the PFC were observed in WWT compared to NW and to a talking alone condition. Conclusion : Oxygenation levels are increased in the PFC during WWT providing first evidence for the functional involvement of this brain region in attention-demanding locomotion tasks. Keywords : gait, brain, cognition

SS24 126-C-3

MODALITY SPECIFIC STRENGTHENING PROGRAM FOR PREVENTION OF MOBILITY DECLINE IN AGING POPULATION: BENCH TO PRACTICE

Jae-young LIM (*Rehabilitation Medicine, Seoul National University College of Medicine, Korea*)

Introduction : Recent studies have focused on the evidence based interventions to prevent mobility decline or to enhance physical

performance in older adults. Several specific modalities other than traditional strengthening program have been designed to take control of age-related functional decline more effectively. Main purpose of the presentation is to delineate the role of physical function to disability and falls and to discuss the modality-specific intervention programs. Method : Age-related change in human skeletal muscles and its relationship with physical performance are discussed from the results of the in-vitro physiologic studies to human biomechanics studies. Sarcopenia issues are overviewed through recent consensus about diagnosis and management of sarcopenia. In addition, I will introduce some outstanding reports emphasizing on gait speed and mortality. Results : Mobility decline in aging population is closely linked with the change of force-velocity relationship. Specific modality interventions based on increased velocity and eccentric strength can improve the function of aging population more effectively than traditional strengthening program. Power and eccentric strengthening program are discussed as a typical modality specific program to improve both force and velocity. Conclusion : Decreased gait speed is a major indicator of mobility decline or sarcopenia in geriatric population. Power and eccentric training are modality-specific intervention programs to improve both force and velocity. Keywords : Modality specific intervention, mobility decline, sarcopenia

SS24 126-C-4

NEW AND CURRENT COGNITIVE INTERVENTIONS TO ENHANCE MOBILITY IN AGING POPULATION

Joe VERGHESE (*Neurology, Albert Einstein College of Medicine, USA*)

Introduction : The greying of populations worldwide is accompanied by a higher prevalence of disability. While physical exercise is recommended to prevent mobility disability and to improve gait speed, only a minority of seniors engage in exercise at recommended levels, necessitating an urgent exploration of new approaches to improve mobility and gait. There is growing recognition of the relationship between cognitive and motor function in the context of normal aging as well as disease. However, enhancing cognitive function as a strategy to improve mobility is not well explored. This presentation will discuss new and current cognitive interventions to enhance mobility in aging population. Conclusion : This presentation will discuss new and current cognitive interventions to enhance mobility in aging population. Keywords : Gait, Cognition, Intervention

CHALLENGING ASPECTS OF DELIRIUM: NEW INSIGHTS IN RECOGNITION AND TREATMENT

SS24 127-C-1

HALOPERIDOL EFFECTS ON PERI-OPERATIVE CHANGES IN QTc-DURATION: A PROSPECTIVE IN-HOSPITAL STUDY

Sofie JANSEN¹, Marieke BLOM², Annemarieke DE JONGHE¹, Barbara VAN MUNSTER³, Ton DE BOER⁴, Sophia DE ROOIJ¹, Hanno TAN², Nathalie VAN DER VELDE¹ (*1. Department of Medicine, section of Geriatric Medicine, Academic Medical Center Amsterdam, Netherlands; 2. Department of Cardiology, Heart Center, Academic Medical Center Amsterdam, Netherlands; 3. Department of Clinical Epidemiology, Biostatistics and Bioinformatics, Academic Medical Center Amsterdam, Netherlands; 4. Division of Pharmacoepidemiology and Clinical Pharmacology, Utrecht Institute for Pharmaceutical Sciences (UIPS), Utrecht University, Netherlands*)

Introduction : Haloperidol may prolong QTc-interval, but is often prescribed peri-operatively to hip-fracture patients, who have several

risk factors for QTc-prolongation. We aimed to determine (1) how QTc-duration changes perioperatively, (2) whether low-dose haloperidol use influences these changes, and (3) the associations between clinical variables and potentially dangerous QTc-prolongation. Method : Design: Prospective cohort study in a tertiary university teaching hospital. Participants: 89 patients (mean age 89 years, 24% male), enrolled in the MAPLE-trial (RCT of melatonin versus placebo on the occurrence of delirium in hip-fracture patients). Measurements: ECGs were made before and after hip surgery, 39 patients were treated with haloperidol. QTc-duration was measured by hand, blinded for haloperidol and pre/post surgery status. Mixed model analysis was used to estimate changes in QTc-duration. Logistic regression analysis was used to determine risk factors for potentially dangerous QT-prolongation (increase by >50 ms or to >500 ms). Results : Patients with normal pre-surgery QTc-duration had a significant increase (mean 12 ms, SD 28) in post-surgery QTc-duration. A significant decrease (mean 19 ms, SD 34) occurred in patients with prolonged pre-surgery QTc-duration. Haloperidol use did not influence the course of changes in QTc-duration ($p = 0.351$). Potentially dangerous QTc-prolongation ($n=8$) was not associated with measured risk factors. Conclusion : QTc-duration changed differentially, increasing in patients with normal, but decreasing in patients with abnormal baseline QTc-duration. Potentially dangerous QTc-prolongation was not associated with haloperidol use or other risk factors. In conclusion, low-dose oral haloperidol did not affect peri-operative QTc-interval. Keywords : Haloperidol, Qtc-Interval, Surgery

SS24 127-C-2

REST-ACTIVITY PATTERNS IN PATIENTS WITH DELIRIUM

Janet L. MACNEIL, Miranda VAN UITERT, Annemarieke DE JONGHE, Barbara C. VAN MUNSTER, Sophia DE ROOIJ (*Department of Medicine, section of Geriatric Medicine, Academic Medical Center Amsterdam, Netherlands*)

Introduction : Delirium is a frequent syndrome in elderly hospital patients. Symptoms typically show a fluctuating course during the day, with patients exhibiting disturbances of their sleep/wake rhythm. Delirium is frequently underdiagnosed, especially the so-called hypoactive subtype. Devices measuring 24-hr motor patterns could contribute to the recognition of delirium. The purpose of this paper is two-fold. First, the results of a pilot study are presented, in which 24-hr motor patterns of delirious patients are measured with a wrist-actigraph. Second, studies reporting 24-hr motor patterns in delirious patients are systematically reviewed. Method : The pilot study included 9 patients, 65 years or older, with a hip fracture in need of surgical repair. For the review, MEDLINE and Embase were searched for studies on motor activity assessment in delirious patients. Results: In the pilot study, the 24-hr activity rhythm was severely disturbed during delirium, and most actigraphic sleep parameter estimates indicated significantly worse sleep during delirious nights. The systematic search resulted in 10 papers. In 3 papers, the sleep-wake rhythm of delirious patients was significantly different from that of nondelirious patients. In 5 papers, delirious patients could be classified into delirium subtypes. In the 2 remaining papers, 24-hr motor patterns of delirium subtypes were not significantly different. Conclusion : Activity patterns revealed differences between delirious and nondelirious patients and between the different subtypes, even in small samples of patients. Future studies, with preferably larger sample sizes, should confirm the potential of activity pattern measuring devices in the early detection of delirium. Keywords : Delirium, Electronic Movement Devices, Early Recognition

SS24 127-C-3

EFFECTS OF MELATONIN ON DELIRIUM IN HIP FRACTURE PATIENTS: REPORT OF A RANDOMISED, PLACEBO-CONTROLLED, DOUBLE BLIND TRIAL

Annemarieke DE JONGHE (*Internal Medicine, Geriatrics Section, Academic Medical Centre, Netherlands*)

Introduction : During delirium, a disruption of the sleep-wake cycle is frequently observed. Melatonin plays an important role in the regulation of the sleep-wake cycle, so this raised the hypothesis that alterations in the metabolism of melatonin might play an important role in the development of delirium. The aim of this study was to investigate with a randomised, placebo controlled double-blind trial effects of melatonin on delirium in older, postoperative hip fracture patients. Method : Acutely hospitalized patients, aged 65 years or more, admitted for surgical repair of a hip fracture were randomized in this placebo controlled double-blind trial. For the first five consecutive days of hospital stay, they received melatonin 3 mg or placebo. The occurrence of delirium was diagnosed according to the Confusion Assessment Method within eight days after start of the study medication. Results : We included 411 patients showing no differences in mean age, 84.4 vs 83.0 years and 26.9 vs 28.3% were male. Living at home: 41 vs 38.7%. Preadmission Katz ADL index score: 6.9 vs 6.5 points. The overall incidence of delirium was 32.2%. Outcomes are the incidence of delirium, the severity and duration of delirium, prevalence of subtypes of delirium, length of hospital stay, haloperidol and benzodiazepines used during delirium, in-hospital complications and post-discharge mortality, and they will be presented. Subgroup analysis will be performed in cognitive impaired patients. Conclusion : Studies on prophylactic treatment of delirium in elderly patients with and without cognitive impairment are still scarce and this RCT contributes substantially to our body of knowledge. Keywords : delirium, prophylaxis, melatonin

SS24 206-C

NECESSITY OF SPECIFIC TREATMENT OF LIFE STYLE RELATED DISEASE FOR LATE ELDERLY -LESSONS FROM 4014 DIABETIC ELDERLY COHORT STUDY

SS24 206-C-1

JAPAN CHOLESTEROL AND DIABETES MELLITUS STUDY-NEW FINDINGS IN LATE ELDERLY

Toshio HAYASHI (*Dept. of Geriatrics, Nagoya Univ. Graduate Sch. of Med., Japan*)

Introduction : LDL-cholesterol(LDL-C) and glucose levels are risk factors for ischemic heart disease(IHD) in middle-aged, diabetic individuals; however, the risk among elderly, is not well-known. We tried to identify factors that predict IHD and cerebrovascular attack(CVA) in elderly. Method : We performed a prospective cohort study(Japan Cholesterol and Diabetes Mellitus Study) with 5.5 years of follow up. 4,014 patients with type 2 diabetes without previous IHD or CVA (1936 women; age 67.4±9.5 years, <65 years old, n=1261; 65 to 74, n=1731; and ≥ 75, n=1016) were recruited on a consecutive outpatient basis from 40 hospitals throughout Japan. Lipids, glucose, and other factors, such as blood pressure (BP), were investigated using the multivariate Cox hazard model. Results : 153 cases of IHD and 104 CVAs(7.8 and 5.7/1000 /year) occurred over 5.5 years. HDL-C and female gender were correlated with IHD in patients ≥75 years old (HR:0.629 and 1.132). Systolic BP(SBP), HbA1C, LDL-C and non-HDL-C were correlated with IHD in subjects<65 years old, and LDL-C/HDL-C ratio was correlated with IHD in all subjects. HDL-C was correlated with CVA in patients ≥75 years old(HR:0.536). Kaplan-

Meier estimator curves showed that IHD occurred more frequently in patients≥75 years old, IHD and CVA were both most frequent among those with lowest HDL-C levels. Conclusion : IHD and CVA in diabetic, late elderly patients were predicted by HDL-C. The LDL-C/HDL-C ratio may represent the effects of both LDL-C and HDL-C. These age-dependent differences in risk are important for developing individualized strategies to prevent atherosclerotic disease. Keywords : Diabetes mellitus, Ischemic heart disease, HDL-C.

SS24 206-C-2

MEDICAL ECONOMICAL APPROACH FOR LIFE STYLE RELATED DISEASES IN LATE ELDERLY

Koichiro INA (*Department of Geriatrics, Nagoya University Graduate School of Medicine, Japan*)

Introduction : Prospective 4014 Japanese diabetic individuals' longitudinal cohort study (67.4±9.5y.o, JCDM) is carried out as primary endpoints of incidence of cardiovascular(IHD) or cerebrovascular(CVA) diseases. Further, increase of medical expenses is drastic according to increase of elderly and diabetic individuals. In Japan, every late elderly needs \$10,000/year for medical expenses, and \$80,000/year for hemodialysis or nursing home. Method : We calculated medical expenses based on JCDM data and supposed treatment effect of risk factors on long-term costs. First study is to investigate the effect of LDL-C control on IHD and CVA. Second is to investigate the various lipid control effect on medical and living costs. We supposed the initial condition as 67 year-old male, 100,000 Potential Cohort. We simulated LDL lowering cases, 1)Present case(LDL=125mg/dl). 2)Guideline level(LDL=110mg/dl.) 3)Ideal level(LDL=90mg/dl). In second study, we supposed the condition as 55, 65 and 75year-old male, 100,000 Potential Cohorts. On IHD and CVA, acute phase, chronic phase of rehabilitation, nursing home or home visiting medical care and outpatient clinic status were supposed and each probability and medical expenses are calculated. Results : On IHD for 10 years, incidence decreases by 40% in ideal case. Similarly, LDL control decreases CVA by 30%. In second study, in case of CVA(stroke), 55y.o., 30years survey, reduction of 20mg/dl of LDL-C will decrease 24% of stroke, 14% of death, 18% of total number of patients and 25% of medical and care expenses. Reduction of LDL-C/HDL-C to 1.5, decrease incidence and expenses of IHD less than half. Conclusion : This kind of study is very rare and necessary in this field. Keywords : Diabetes mellitus, atherosclerotic diseases, medical and care expenses

SS24 206-C-3

WHAT IS BEST MEDICATION FOR LIFE STYLE DISEASES IN LATE ELDERLY?

Hideki NOMURA (*Department of Geriatrics, Aichi Sinryousho Nonami, Japan*)

Introduction : We performed the case?cohort study aims to investigate how agents such as HMGCoA reductase inhibitors(statins) affect the incidence of ischemic heart diseases(IHD) and cerebrovascular attack(CVA) using the results of our cohort study. We also tried to identify whether the effect of statin is direct or indirect through control of plasma lipid profile. Method : Incident cases of IHD or CVA occurring in our cohort study of diabetic individuals, Japan Cholesterol and Diabetes Mellitus(JCDM) study between 2004 and 2010 from 40 hospitals in Japan were ascertained and verified. Users of statin were divided into 4 groups, non-users, continuous users, new users, and stopping users. Cox regression and random-effects meta-analyses were used to investigate differences in diabetes incidence by age. Results : A total of 257 verified incident cases of 153 cases of IHD and 104

CVAs, and randomly selected 405 subcohort individuals among 4014 type 2 diabetic individuals (1936 women; age 67.4±9.5 years; <65 years old, n=1261; 65 to 74 years old, n=1731; and ≥ 75 years old, n=1016) for 5.5 years followed up period. For IHD, incident rate (cases per thousand people year) is 43.24, 85.53 and 92.29 in non-user, new user and continuous user (Odds ratio/non-user, 1.92, 2.07 in new and continuous user). On the otherhands, for CVA, incident rate is 50.41, 17.9, and 26.91 in non-user, new and continuous user. Conclusion : The effect of statins on IHD and CVA in diabetic patients might be different. More detailed analyses including age-dependent differences are done. Trial Registration: UMIN-CTR, UMIN00000516. Keywords: Subsohort study, HMGCoA reductase inhibitor, diabetes mellitus

SS24 207-S

GERONTOLOGICAL AND GERIATRIC EDUCATION AND TRAINING: STUDENT AND RECENT GRADUATE PERSPECTIVES ACROSS MULTIPLE IAGG REGIONS

SS24 207-S-1

EDUCATION AND TRAINING OPPORTUNITIES IN CANADA

Shannon FREEMAN (*School of Public Health and Health Systems, University of Waterloo, Canada*)

Introduction : This presentation will provide an overview of the history and present state of education and training programs in gerontology and geriatrics across Canada. Both the growth of academic programs and recent issues will be highlighted. Method : National organizations with a mandate for education and training in gerontology or geriatrics will also be discussed. Results : Specific attention will be given to the following organizations and related initiatives: - the Canadian Association on Gerontology (L'Association canadienne de gerontologie) and its Student Connection (Connexion Etudiante) - the Canadian Geriatrics Society, the National Geriatrics Interest Group, and related resources for trainees - the Canadian Academy of Geriatric Psychiatry (L'Academie canadienne de psychiatrie geriatrique) and other education and training resources, including the National Review Course in Geriatric Psychiatry -the National Initiative for the Care of the Elderly (Initiative nationale pour le soin des personnes agees) and associated opportunities for students -the Canadian Gerontological Nursing Association -the Institute of Aging (Institut du vieillissement) of the Canadian Institutes of Health Research (Instituts de recherche en sante du Canada) and the annual Summer Program in Aging (SPA) - other related national organizations. Conclusion : Canada has a strong focus on education and training in gerontology and geriatrics, and many of these learning opportunities may be of interest to other countries as examples that can be adapted abroad. Keywords : Education, training, students

SS24 207-S-2

THE AUSTRALIAN EXPERIENCE OF GERONTOLOGICAL AND GERIATRIC EDUCATION AND TRAINING

Claudia MEYER (*Australian Institute of Primary Care and Ageing, LaTrobe University, Australia*)

Introduction : Australia's experience of gerontological and geriatric education and training relates to understanding the complexity of ageing; and the multiple factors and disciplines involved in age-related health and illness. It's history extends over many decades, with the emergence of nursing, allied health and social science complementing the traditional input of medicine and healthcare services. Method : Gerontological and geriatric education and training draws together researchers, educators, policy makers and providers. Delivered through courses, conferences, seminars, and online options by: Higher and

vocational education sectors; Not-for-profit organisations; Peak bodies and associations, including the Australian Association of Gerontology. Results : Australian gerontological and geriatric education and training recognizes the challenges of: The imperative for translational research, as a dynamic exchange between the generation and end-use of evidence; Delivering education and training that covers the expanse of subject areas, including niche areas; Addressing gaps in research and education to build capacity and meet future needs of practitioners/policy makers; Breadth of the workforce requiring education and training (including rural and remote areas); Need for consumer engagement and broad collaboration; and The nature of a fast-changing technological world. Conclusion : For students and early career researchers and practitioners in diverse, but related fields of ageing, Australia has the support of two initiatives - the Student/Early Career Group within the Australian Association of Gerontology and the Emerging Researchers in Ageing network. These groups recognize the need to engage with, and encourage participation of, students and early career researchers and practitioners whom may be working across several disciplines and across geographically challenging distances. Keywords : Student/early career researcher; participation; diversity

SS24 207-S-3

THE ROLE OF THE INTERNATIONAL COUNCIL OF GERONTOLOGY STUDENT ORGANIZATIONS (ICGSO) IN EDUCATION AND TRAINING

Anthony KUPFERSCHMIDT (*Executive Director, British Columbia Psychogeriatric Association, Canada*)

Introduction : In 2002, the International Association of Gerontology (IAG) approved the creation of the International Council of Gerontology Student Organizations (ICGSO) through a unanimous resolution in Valencia, Spain. As a standing committee of the IAGG, two objectives of the ICGSO are to: - Promote the study of aging among students and the training of highly qualified personnel in the fields of aging, and - Contribute to topics of interest to IAGG, including education, training and other substantive issues. Method : The ICGSO met for the first time in 2005 during the 18th IAGG World Congress in Rio de Janeiro, Brazil, and again in Paris, France at the 19th IAGG World Congress. The membership of the ICGSO is comprised of the student and new professional sections of IAGG member societies. Results : This presentation will first briefly review the history and current standing of the ICGSO. It will then build upon the preceding papers and summarize how national student sections can enhance education and training in gerontology and geriatrics both nationally and through IAGG regional councils. This paper will then explore the role of the ICGSO in gerontological and geriatric education and training within the structure of the IAGG, and address related opportunities and challenges. Conclusion : As the importance of gerontology and geriatrics increase with global population aging, it is also important that students and recent graduates can contribute meaningfully to international conversations about training and education in the fields of aging. Keywords : Education, training, students

SS24 209-R

LONG TERM CARE SYSTEMS IN EAST AND WEST. THE ROLES OF CLIENTS, FAMILY CARE, COMMUNITY CARE, AND STATE IN KOREA, JAPAN, NORWAY AND THE NETHERLANDS

SS24 209-R-1

CHANGING ROLES IN LONG TERM CARE IN THE

NETHERLANDS

Cretien VAN CAMPEN (*Care, Netherlands Institute for Social Research | SCP, Netherlands*)

Introduction : Around a quarter of the Dutch population aged 65 years and over are classed as frail, i.e. have a higher risk of adverse health outcomes (functional impairment, admission to an LTC institution, death). Their number is predicted to increase by 50% between 2010 and 2030. Dutch elderly policy is focused on frail older people. The Netherlands has had a state-funded LTC system since 1968. In 2007 the Dutch government partly reformed this system, transforming it from a central state-provided care system to a community-based system of social services. How is the Dutch health care system coping with the growing frail older population? Method : Using statistics and trends drawn from national surveys on the use of family care, community services, state-provided home care and institutional care by frail and vital older people, I will explain the complex situation of LTC for older people in the Netherlands. Results : Only six out of ten frail older people use state-funded LTC in the Netherlands. Four out of ten live independently with the help of family care, medical care, social services and self-care. Frail non-users of home care are younger on average and more often share a household than frail older persons receiving LTC. Conclusion : The conclusion is that independent community-dwelling frail older persons have multiple problems and use a variety of social, health and housing services. This calls for an integrated approach involving case managers. Keywords : Long-term care, frailty, Netherlands

SS24 209-R-2

AGEING POPULATION AND LONG-TERM CARE INSURANCE IN SOUTH KOREA

Hyun-sil KIM (*Department of Nursing, Daegu Haany University, Korea*)

Introduction : With global ageing, Korean population is also ageing more rapidly than many other countries. Population ageing has become one of the serious social concerns in our country. The rapid growth of ageing population can be attributed to a combination of decreased birth rates and increased longevity as a result of effective public health measures and advanced health care. However, the expenditures on care and support of frail older people can become a burden for the younger generations. Method : This presentation reviews the statistics concerning the Korean ageing population. Introduction of the Korean Long-term Care Insurance. Results : In response to the ageing population, the Korean government has introduced a long-term care insurance for older people in 2008. The Korean long-term care insurance covers in-home and institutional care services for senior citizens of 65 years and older. The interim evaluation showed that the Introduction of the long-term care insurance resulted in the creation of jobs such as care provider, an improvement of the recipients' health status, and the emergence of an elderly-friendly industry. However, a number of challenging tasks remains to be solved, including the activation of care management system, the development of a decision support system for eligibility, skill development of the care provider, improvement of the service quality and delivery system, and its cost control. Conclusion : It is concluded that international discussions on developing health care for older people and sharing of knowledge and experiences concerning this care from developed countries are needed in Korea. Keywords : Ageing population; Long-term care insurance; South Korea

SS24 209-R-3

COMMUNITY-BASED INTEGRATED CARE AND LTC

WORKFORCE IN JAPAN

Satoko HOTTA (*Career Development, The Japan Institute for Labour Policy and Training, Japan*)

Introduction : The need and demand for LTC services have been on the rise in Japan. Introduction of the Long-Term Care Insurance System in 2000. In order to respond flexibly to this growing demand and to consistently provide quality service, it is mandatory that sufficient personnel are secured, retained, and trained so that they can provide quality care service. Method : Using statistical figures and trends based on national surveys on LTC workers to understand the state of LTC workforce demand and market, workers attributes and working conditions. Overview of recent developments in governmental policies regarding professional caregivers and HRM improvement in care providers. Results : Attention was first drawn to the quantity. With the call for quality improvement, the focus then shifted to credential requisites and training. When the growth of the workers slowed down, attention was back on quantity, and on worker treatment to allow this to happen. Regarding treatment, the importance of not only long-term care fee levels but management by care providers was recognized as well. With the revision of long-term care fees in 2009, the scope has widened: Discussions are under way on how expertise which directly effects care service quality improvement shall be appraised, and how this appraisal shall be reflected in treatment; and training systems are being reviewed to for establishment of the community-based integrated care system. Conclusion : Emphasis is therefore no longer on "quantity or quality," but on examining the system as a whole and good combination between self-help, mutual help, cooperative help and public support. Keywords : Long-term care, workforce, Japan

SS24 209-R-4

SUSTAINABLE CARE, SCANDINAVIAN RESPONSES

Svein Olav DAATLAND (*Norwegian Social Research, NOVA, Norwegian Social Research, NOVA, Norway*)

Introduction : Long-term care is a mixed responsibility in all welfare states, but the balancing between public and private, formal and informal, is quite different. The Scandinavian model leaves the primary responsibility with the welfare state. Most other countries operate under a family care model, or some form of (state) assisted familism. Which is the more sustainable model for an ageing population? Method : Different models are compared. Main instruments are in Scandinavia universal, tax-funded services, normally provided by local governments (municipalities), and comparatively generous in access and standards. Other countries tend to give the state a more limited and indirect role. Results : Challenges and dilemmas are different, in the Scandinavian case not to overburden the state, in other countries not to overburden the family. Recent trends indicate some convergence between models, Scandinavia leaning more towards the private sector, other countries expanding the role of the state, in particular via mandatory LTC insurances (e.g. Netherlands, Germany, Japan). Conclusion : The paper provides a general review of developments over time. Special attention is given to recent reforms, with particular reference to Norway, and discussing the role of problem pressures, past legacies (path dependency), and more recent ideological and political controversies. Keywords : Long-term care, Welfare state, Scandinavian model

SS24 210-R

CIVIC ENGAGEMENT OF OLDER ADULTS: CROSS-NATIONAL PERSPECTIVES AND RESEARCH AGENDA

SS24 210-R-1

VOLUNTEER ACTIVITIES OF OLDER PEOPLE IN KOREA

Dong-bae KIM (*School of Social Welfare, Yonsei University, Korea*)

Introduction : As Korea transforms from a developing country to a developed country, many people voice that a recovery of community is vital to resolve current social issues. Volunteering is an effective way to recover a community, and the senior citizens, who have lost their roles within the society, are considered valuable assets to partake in the voluntary works. The goal for the Korean senior citizens' voluntarism issue is to raise the current participation rate of 5 % to 10%, equal to half of the ordinary grown person's volunteer participation of 20%. Method : This study will address barriers and facilitators, programs and policies, and future directions of Korean senior citizens' civic participation. Results : The "Korean Association of Seniors", the largest senior organization in Korea, has set up the "Support Center for Senior Volunteers" to encourage more senior citizens to participate in voluntary works. "Community Welfare Center for the Elderly", is setting up many different programs to provide professional volunteer opportunities to those senior citizens who are more active and have richer academic background. The city of Seoul and other City Governments recruit professional volunteers to provide opportunities to participate in such activities as culture narrators, assistant teachers, etc. Conclusion : The purpose of this study is to summarize the current status of Korea's senior citizens' volunteer participation, evaluate effects of volunteering to society as well as individuals, and review what more efforts can be done to promote their volunteer activities by the government, by social organizations, and at local society level. Keywords : civic engagement, volunteering, participation

SS24 210-R-2

THE COMPARATIVE ANALYSIS OF THE CIVIC ENGAGEMENT OF OLDER ADULTS IN CHINA, JAPAN AND SOUTH KOREA UNDER THE CROSS-CULTURE BACKGROUND

Gong CHEN (*Institute of Population Research, Peking University, China*)

Introduction : Geographically, China, Japan and South Korea all belong to the East Asian countries and adjacent to each other; in the aspect of cultural backgrounds, there are some similarities in these three countries. However, the three countries have more differences. Therefore, it is very important for us to compare the civic engagement of older adults under different cultural backgrounds of China, Japan and South Korea. From the view of the cross-cultural, in this paper we will analyze the civic engagement of older adults in these three countries. Method : All of China, Japan and South Korea scholars have carried a certain degree of research including not only quantitative survey but also qualitative interviews, from different angles and aspects of older people's social participation measurement and analysis. Based on the summary of the existing literature and research, this paper compares and summarizes the civic engagement of older adults in China, Japan and South Korea. Results : From the view of result, the cultural background has an important influence on the civic engagement of older adults. Ideas of the elderly in the three countries are very close in some respects, which reflect the commonality of the elderly. Conclusion : Overall, comparing the civic engagement of older adults in China, Japan and South Korea under different cultural backgrounds is important. By contrast, we found that the social participation of the elderly has different characteristics, forms and effects. Keywords : civic engagement, cross-culture, older adults

SS24 210-R-3

INCREASING SUSTAINABILITY OF VOLUNTEERISM IN LATER LIFE: A CASE STUDY OF SINGAPORE

Song Iee HONG (*Social Work, National University of Singapore, Singapore*)

Introduction : The rapid growth of aging population in Singapore has raised societal interest in promoting active aging. In particular, the strategies for social participation in later life have been implemented in multiple ways. As a distinctive strategy, volunteerism has been highlighted through planned events, programs, or campaigns designed by government, non-profit organizations, etc. Nevertheless, the rate of older volunteers is relatively low. Method : A systematic review on the current strategies for senior volunteerism is critical to identify barriers to volunteering and its sustainability over time. Therefore, this study reviews a wide range of data sources such as journal articles, web-based information, government reports, and newspapers on volunteering. Results : This comprehensive review identifies potential reasons for the low rate of senior volunteerism in terms of (1) volunteers' profiles and capability, (2) motivation and barriers to volunteering, (3) types of volunteering and programs, (4) program management, (5) public awareness and attitude towards volunteering, and (6) community and social resources for older volunteers. By and large, as compared to older adults' increasing capability, social strategies and professional management for volunteerism are less developed in Singapore. Furthermore, governmental interventions are slanted to indirect ways such as public education and campaigns. Conclusion : The stagnation of social strategies on volunteerism leads to disengagement, unsustainability, and barriers to volunteering. A better understanding of strategic planning and management for volunteer programs and policies is necessary to shape and advance more appropriate opportunities for older volunteers. More inclusive strategies should be institutionalized to recruit and retain older volunteers for active volunteerism in Singapore. Keywords : volunteering, active aging, social participation

SS24 210-R-4

VOLUNTEERISM OF OLDER ADULTS IN JAPAN: AN EXAMINATION OF DATA FROM 1995 ONWARDS

Li-mei CHEN (*Department of Social Work, Kwansei Gakuin University School of Human Welfare Studies, Japan*)

Introduction : This presentation will discuss the development of Japan's older adult volunteerism and how today's older adult volunteerism needs to change in the face of a super-aging society coupled with changing social and economic needs. Method : The literature and data from 1995 onwards were reviewed to summarize the development of Japan's volunteerism among older adults. Results : Volunteerism did not become a major policy focus nationally until 1995, following the Hanshin Awaji Great Earthquake. Today, approximately one out of every five adults ages 50 years and above volunteers in Japan, a higher rate than for their younger counterparts. Volunteerism is concentrated mainly among older adults in their 50s and 60s (25.2% and 25.1%), and the rate declines for those 70 years and older (14.1%). Areas of interest for volunteering include nature and environmental protection, local and neighborhood activities, and caring for older adults and persons with disabilities. Older adults' interest in social issues grows as they age; however, their willingness to take action declines with age. Conclusion : The presentation suggests that senior volunteerism is necessary for Japan's aging society to provide meaning in later life and sustain good health and well-being. However, to encourage volunteerism among aging baby-boomers, Japan needs to alter its traditional approaches, such as its

top-down approach to organizing volunteerism and its focus on moral citizenship. With unique lives and experiences, the largely middle class baby-boomer generation will probably seek an experience of older adulthood different than that of their predecessors. Keywords : volunteerism, Japan, productive aging

SS24 210-R-5

FUTURE DIRECTIONS FOR ADVANCING NATIONAL AND CROSS-NATIONAL WORK ON VOLUNTEERING IN LATER LIFE

Nancy MORROW-HOWELL (*Friedman Center for Aging, Washington University, USA*)

Introduction : Because volunteering is seen as a win-win for both society and individuals, there is rising interest in increasing the involvement of older adults as volunteers. Method : Types and amounts of volunteering vary greatly between countries, shaped by sociocultural values and governmental support. A conceptual model that includes four types of determinants (socio-demographic, economic, physical environment, and public policies and programs) is presented to guide cross-national comparisons of factors associated with volunteer engagement. Results : Differences in family structure, labor market needs, community infrastructure, and existing programs contribute to volunteer engagement, and strategies to increase engagement must consider these factors. The conceptual model also includes the effects of volunteering on individual, family, and community outcomes. Different institutional arrangements for volunteering influence the effects of this unpaid work on older adults and well as the communities they serve. An accurate understanding of these outcomes is important for cost-benefit analyses to guide policy and program development. Conclusion : There is great potential for cross-national research on volunteering in an aging population. Top priority questions to be pursued include: What antecedents are most strongly related to volunteer engagement; and which can be manipulated? What policies and programs are most effective in engaging older volunteers? Finally, what level of engagement is best for society and for individuals? Data to partially address these questions are becoming available as the number and availability of international data sets on older adults increase; but original data will be needed to understand the most effective ways to attract and support older adults in volunteer roles. Keywords : volunteering, civic engagement, social participation

SS24 213-S

MEETING THE CHALLENGES OF POPULATION AGEING THROUGH CAPACITY BUILDING : INTERNATIONAL PERSPECTIVES

SS24 213-S-1

MEETING THE CHALLENGES OF POPULATION AGEING THROUGH CAPACITY BUILDING IN ASIA/OCEANIA REGION

Peng DU (*Institute of Gerontology, Renmin University of China, China*)

Introduction : Asian and Oceania countries have the majority of world elderly population, both of the developed countries and developing countries in the region have been experiencing rapid population aging and comparatively lack of the trained professionals on policy making, service providers to the elderly and research professionals. Method : This paper will summaries the efforts and experiences of capacity building efforts in the region, especially the international collaborations with key international agencies on training and

education, the progress and the unmet needs, suggestions for further improvement. Results : Since 2011, great efforts have been made by IAGG to develop the training programs for the young professionals in gerontology and geriatrics, especially for the junior researchers, some of the participants are from this region, two intensive courses were ran in France in June, 2011 and Spain in June, 2012. There are three regional intensive courses were run in Taipei, Hong Kong and Beijing in the last two years. Based on two Master Classes on Ageing in Korea initiated by IAGG Asia/Oceania region, a new regional training program has been shaped as the Gary Andrews Academy. Conclusion : However, the reality is the huge gap of capacity building exists in the region, between the developed and developing countries, and especially in the rural or remote areas, more efforts need to be made in the region to meet the challenges; Therefore, the capacity building on meeting the challenges of aging is still top priority in most countries in the region. Keywords : Capacity building, Asia/Oceania, training

SS24 213-S-2

MEETING THE CHALLENGES OF POPULATION AGEING THROUGH CAPACITY BUILDING : THE ROLE OF WHO

John BEARD (*Department of Ageing and Life Course, World Health Organization, Switzerland*)

Introduction : Populations around the world are rapidly ageing, particularly in middle income countries. Maximizing the opportunities and minimizing the challenges of populations ageing will require significant capacity building, both in terms of human resources and the infrastructure to support them. Method : WHO has recently identified population ageing as a priority, and will apply a "Whole of Organization" approach to helping Member States prepare for this transition. Results : This presentation will outline WHO plans on ageing including: -building and strengthening research networks and communities of practice, -developing models of evidence informed policy development on ageing in low and middle income countries - developing norms and standards that can guide good practice. Keywords : Capacity building, international, networks

SS24 213-S-3

MEETING THE CHALLENGE OF GLOBAL AGEING THROUGH CAPACITY BUILDING: THE ROLE OF HELPAGE INTERNATIONAL

Mark Robert GORMAN (*Strategic Development Director, HelpAge International, United Kingdom*)

Introduction : For 30 years HelpAge International has been enabling and supporting older people to form organisations addressing their challenges. We have gone through a number of phases in building and supporting the capacity of our network. The first ten years could be characterised as building foundations, the second decade as developing outreach and delivery of services, and the last decade has been about leveraging the models of experience and building stronger movements of older people. Looking ahead we have a vision of continuing to build an open and inclusive network. We have learnt much from our work, and I will share these experiences and implications for policy and practice in ageing and development. Method : presentation and discussion. Results : A greater understanding of the opportunities and challenges of building networks of organisations, both formal and informal, which enable older people to have a voice. Conclusion : Overall this presentation aims to complement the other presentations to give a rounded picture of both the challenges and the opportunities of capacity building with older people in developing countries. Keywords : network capacity building

SS24 213-S-4

CAPACITY BUILDING AND MANPOWER TRAINING IN THE FIELD OF AGEING: THE INTERNATIONAL INSTITUTE ON AGEING, UNITED NATIONS-MALTA (INIA)

Joseph TROISI (*European Center for Gerontology, University of Malta, Malta*)

Introduction : Although 31 years have passed since the First World Assembly on Ageing, the implementation of the recommendations of the Vienna International Plan of Action on Aging, has not often met the expected results. As was emphasised in the Madrid International Plan of Action on Ageing twenty years later and in various UN General Assemblies, the very implementation of the Plan fundamentally requires two essential facets which though distinct are intrinsically related. These are: national capacity building and the mainstreaming of ageing into national development policies and programmes on ageing. Results : When referring to training in the various aspects of ageing, there is the danger of restricting it to high levels of specialisation given at universities. While not minimising this need, it is important to emphasise that training should be made available at all levels and for different functions. This includes all those who work with older persons at home, in the community or in institutions, be they volunteers or family members as well as the older persons themselves. Education in the field of ageing needs to be multi-sectoral in nature covering 1) the professionals; 2) those who directly work with older persons; and 3) the older persons themselves. Conclusion : This presentation aims at reviewing and analysing the work being carried out by the International Institute on Ageing (INIA), to meet this need emphasising the fact that a new orientation in capacity building and new skills among all those involved is required. Keywords : Population ageing, Capacity building, International perspectives.

SS24 214-S

GERIATRIC MENTAL HEALTH AND POSITIVE AGEING IN THE ASIA-PACIFIC REGION

SS24 214-S-1

LIVING WITH 'HWA-BYUNG': THE PSYCHO-SOCIAL IMPACT OF ELDER MISTREATMENT ON OLDER MIGRANTS IN NEW ZEALAND

Hong-jae PARK (*School of Counselling, Human Services and Social Work, The University of Auckland, New Zealand*)

Introduction : Elder abuse and neglect is an issue that adversely affects the health and well-being of older people in most societies. The purpose of this paper is to describe the psycho-social experiences of older migrants who are involved in elder abuse and neglect in New Zealand. Method : Data were collected from in-depth interviews with older Korean people in New Zealand. The lived experiences of elder abuse and neglect were investigated with older people who were, or had been, mistreated in their transnational family setting. Data were analysed using a concept mapping technique, with a focus on the broader cultural and social context of the information collected. Results : Elder mistreatment can cause both emotional and physical health problems. The findings of the study show that the older persons who were mistreated in family settings experienced a range of psychological distress and physical symptoms. Many of them identified Hwa-byung (literally, anger disease) as a health issue associated with suppressed emotions of anger, demoralisation, heat sensation, and other somatised symptoms. This culture-related anger syndrome often contributed to low rates of help-seeking among those people who were involved in elder mistreatment. Conclusion : Elder

abuse and neglect in the migrant setting is a traumatic event that has an adverse impact on the health and well-being of older migrants. It is important to address the issue in the social and cultural context within which older migrants and their families are embedded. Keywords : Older migrants, Elder abuse and neglect, Hwa-byung

SS24 214-S-2

MENTAL HEALTH CARE NEEDS OF AGEING POPULATIONS - A SITUATIONAL ANALYSIS OF POLICIES AND SERVICES IN DEVELOPING NATIONS

Ilango PONNUSWAM (*Department of Social Work, Bharathidasan University, India*)

Introduction : Geriatric Mental Health (GMH) refers to a sub-domain within the main domain of mental health. It is a multidisciplinary approach to assessment and treatment of mental illness or impairment of the older persons from a bio-psycho-social perspective. It primarily encompasses functional disorders or organic disorders among the elderly. It focuses primarily on persons who experience their first onset of mental illness around the age of 65 or over. Individuals under 65 whose cognitive impairment is related to a disease associated with aging may also be more appropriately served by GMH care. Method : This paper attempts to document the psychiatric morbidity rates among the elderly in developing nations and the extent of geriatric mental health services and the enormous mental health manpower needs in the developing world. Results : Three-quarters of those afflicted with mental disorders live in developing countries. Mental disorders are a leading cause of disability globally and represent 14 per cent of the global burden of disease. Despite the enormous health burden, it remains one of the most neglected diseases. Geriatric mental health is an area which is almost totally neglected in the mental health care policy framework and programming in the developing nations. Conclusion : the author argues for due attention by healthcare planners to the growing needs among older persons for mental health services, proper assessment of psychiatric morbidity rates among the elderly, training of geriatric mental health manpower and development of appropriate geriatric mental health services in the developing countries. Keywords : Geriatric Mental Health, developing country, bio-psycho-social perspective

SS24 214-S-3

MENTAL WEALTH IN OLD AGE: AGEING WELL IN AUSTRALIA

Wendy Wen LI, Daniel MILLER (*Department of Psychology, James Cook University, Australia*)

Introduction : This paper employs the model of mental wealth to investigate protective factors against mental disorders in older population using an Australian sample. The model of mental wealth captures two aspects of mental development: mental capital and mental well-being. Mental capital encompasses both cognitive and emotional resources. It includes people's cognitive ability, their flexibility and efficiency at learning, and their 'emotional intelligence' which can also be described as social skills and resilience in the face of stress. Mental well-being is a dynamic state that refers to individuals' ability to develop their potential, work productively and creatively, and build strong and positive relationships with others and contribute to one's community. This paper focuses on the role certain aspects of mental capital, such as resilience and proactive coping strategies, play in enhancing mental well-being among older Australians. Method : Using the Clinical Assessment Scale for the Elderly, this study examined mental health among 250 Australian

older adults. Particular attention was paid to the effects of resilience and proactive coping strategies on the participants' mental health. Results : Results reveal that high resilience scores and high proactive coping scores are negatively correlated with mental health indicators. Participants with a high resilience score and a high proactive coping score generally displayed better mental well-being. Conclusion : Resilience and proactive coping appear to act as psychological buffers. Both seem to be protective factors against mental disorders. Keywords: Resilience, proactive coping, mental health

SS24 215-S

CROSS-CULTURAL PERSPECTIVES ON PSYCHOSOCIAL SYMPTOMS AT THE END OF LIFE

SS24 215-S-1

CONTEMPORARY PERSPECTIVES ON THE ASSESSMENT AND TREATMENT OF DEPRESSION AT THE END OF LIFE IN THE UNITED STATES

Brian D CARPENTER (*Psychology, Washington University, USA*)

Introduction : While symptoms of depression are common among individuals with serious, life-limiting illness, they are also variable over time, within individuals, and across individuals. Adding to this complexity, cultural and contextual factors can influence the experience and presentation of depression at the end of life. Method : This presentation reviews several different perspectives, methods, and instruments to assess depression, each with their own strengths and weaknesses and cultural sensitivity. The presentation also summarizes the theoretical foundation of treatments for depression, empirical evaluation of their efficacy and effectiveness, and the extent to which they integrate cultural variations. Results : Traditional instruments to assess depressive symptoms have limitations among patients with life-limiting illness, often because the phenomenology of depression near the end of life is so variable. Several more recently developed instruments are more sensitive to the issues of patients at the end of life. Similarly, traditional psychological treatments may be effective with seriously ill patients, and treatments recently developed for this population may have more substantial benefits. To date, assessments instruments and treatments have not yet integrated cultural variability to any great extent. Conclusion : The phenomenology of depression at the end of life is complicated by biopsychosocial factors and variations. More research is needed to clarify the experience of disrupted mood near the end of life, and more research is needed to develop and evaluate assessment tools and treatments. Throughout this process, cultural issues deserve close attention. Keywords : End of Life Care, Depression

SS24 215-S-2

BEREAVEMENT AMONG CHINESE PEOPLE IN HONG KONG

Amy Yin Man CHOW (*Department of Social Work & Social Administration, The University of Hong Kong, Hong Kong*)

Introduction : Bereavement care is an integral part of palliative care. The care extends from the patient to the entire family holistically even after the death of the patient. Studies of effectiveness of bereavement care are found to have diversified result, thus there is a call for robust development and examination of bereavement care. Based on the Dual Process Model, the team of Utah University developed a bereavement group work intervention model. Method : Adopting a focus group method, information was collected from a group of Chinese professionals in Hong Kong to translate the Utah model into a Chinese Hong Kong model. Four pilot groups were carried out and data was

collected at pre-group and post group. Areas of assessment include emotional reactions, grief reactions, loneliness, dual process coping and social support. Results : The Utah model was converted from a 14-session group to an 8-session one. Cultural relevant content was added to the new model as well. A manual was produced. Forty-six widowed older adults joined the four pilot groups. They had statistically significant increase in coping ability and decrease in emotional loneliness after having the intervention. Conclusion : When adopting bereavement intervention model from another culture, modulations have to be made to fit in the contextual environment. The Dual Process Intervention Model for bereaved older adults is promising and found to have positive results in both United States and Hong Kong. Keywords: Bereavement Care, Dual Process Model, Chinese

SS24 215-S-3

END-OF-LIFE CARE AND EXISTENTIAL NEEDS IN INSTITUTIONS FOR OLDER PEOPLE IN SWEDEN AND JAPAN

Els-marie ANBACKEN (*Social and Welfare Studies, Social Work, Linköping University, Sweden*)

Introduction : Existential needs are often neglected in end of life care - also at care homes for older persons. Why is this so? How are such needs expressed and encountered in institutions which should provide opportunities for a good everyday life as well as a good end of life? The Japanese and Swedish empirical cases further question in what ways care cultures, settings and systems influence the care. Method : The study has three parts: a previous study in Sweden (2008), a pilot study (2012) and a new study in Japan (2013). While qualitative interviews were carried out in the previous and the pilot studies, participant observations in combination with interview talks will be central in the new study. Secondary data and policy documents will also be used. Results : The result from the Swedish study showed that existential needs were expressed in various ways, including themes of faith, hope, love and relations. The Japanese pilot study showed that more time was needed to observe the residents in their natural environment in order to better understand the existential nuances embedded in their accounts. Expected findings of the new study is that verbal and nonverbal expressions will show that older persons, with or without dementia, are able to express existential needs if the environment allows and supports it. Conclusion : In order to carry out existential care, staff needs opportunities to reflect on the value and sense of such care in the end of life, and be given tools to be able to accomplish it. Keywords : existential care

SS24 216-C

THE DIGITAL REVOLUTION AND THE PRACTICE OF GERIATRIC MEDICINE

SS24 216-C-1

USING ELECTRONIC RECORDS TO AID PATIENT TRACKING FOR HEALTH CARE IN RURAL AREAS IN A DEVELOPING COUNTRY

Shelley Ann DE LA VEGA (*Institute of Health Policy and Development Studies, National Institutes of Health University of the Philippines Manila, Philippines*)

Introduction : Telemedicine is a digital /electronic method of providing healthcare to patients in remote, hard to reach areas. Telehealth programs in the Philippines were established and strengthened thru the National Telehealth Center, National Institutes of Health, University of the Philippines Manila. The Community Health Information Tracking System (CHITS), is an electronic medical record

(EMR) for Rural Health Units also developed by the University of the Philippines. This customizable, user friendly software is free, thus lowering costs for the Local Government Units. It is now available in MMS form, where data is saved in the health worker's cellphone, making it useful for patient tracking in rural and remote areas. Method: Descriptive overview of program. Results : Doctors and selected nurses have been trained on how to present patients through videoconferencing and are referred to the Philippine General Hospital in Manila. Other avenues that have been utilized include SMS, and MMS. Sessions include diagnosis and management of stroke, poisoning, skin disease, etc. Conclusion : CHITS integrates health data from the ground level and organizes it in a manner that health workers, city/municipal health officers, and even the Department of Health (DOH) could use it for decision making and governance. Keywords : telemedicine , electronic records, governance

SS24 216-C-2

SUPPORTING CAREGIVERS VIA THE INTERNET: ISSUES AND EFFICACY

Philip Jun Hua POI (*Department of Medicine, University of Malaya, Malaysia*)

Introduction : The world is increasingly connected via the internet, and its usage in the practice of geriatric medicine is still at a rudimentary stage. Caregivers are provided with the versatility and accessibility of the internet to access information and medical opinion. Asian values of filial piety can be supported via the internet, by providing appropriate information, the caregiver is able to raise their threshold of providing care instead of institutionalising their parents. Method : Access to make enquiries via the internet to the doctor was provided to all caregivers attending a clinic and this mode of communication was evaluated. Results : Results of this pilot study will be discussed. Conclusion : The access to medical opinion and help is a useful tool for many caregivers who are internet savvy, allowing for ready access to medical information. However, this benefit is mitigated by the demands on the doctor's time, the increasing risk of medicolegal implications and a general preoccupation of the technology available. Keywords : internet, geriatrics, malaysia

SS24 216-C-3

USING TECHNOLOGY TO AID EDUCATION FOR UNDERGRADUATE AND POSTGRADUATE STUDENTS IN GERIATRIC MEDICINE

Roger Y WONG (*Faculty of Medicine, University of British Columbia, Canada*)

Introduction : Increasing the geriatric medicine exposure and learning experience in undergraduate medical education (UGME), postgraduate medical education (PGME), and continuing professional development (CPD) is essential when addressing the growing healthcare needs of the aging population. Method : Technology enabled learning (TEL) programs in geriatric medicine can promote the dissemination and translation of knowledge in a distributed medical education (DME) model within and across geographic regions. Results : Many TEL opportunities exist in the Asia-Pacific region for UGME, PGME, and CPD audiences. Live broadcast technologies of medical lectures and presentations via video-conferencing and webinar are commonly used, and can be archived by video recording and podcast for future retrieval. Interactive discussion can be made possible by simultaneous webcast technology. Live patient encounters especially in remote and rural areas can be broadcasted across geographic regions using tele-health, which also allows inter-professional health practices to flourish. Internet-based educational modules can be developed to

address both perceived and non-perceived learning needs of health professionals from different disciplines. Simulation technology can be used to promote geriatrics education, including both low fidelity (e.g. standardized patient) and high fidelity models (e.g. critically ill simulator with multi-system failure). Finally, communication and collaboration competencies can be taught by innovative technologic methods such as cinemeducation. Conclusion : Technology can be helpful in enhancing the learning experience in geriatric medicine across the educational continuum of UGME, PGME and CPD. Keywords : technology, education, geriatric

SS24 216-C-4

USING TECHNOLOGY TO ASSIST COMMUNITY GERIATRIC PRACTICE

Bernard Ming-hei KONG (*President, The Hong Kong Geriatrics Society, Hong Kong*)

Introduction : One of the most powerful clinical digital systems is the Hong Kong Hospital Authority Clinical Management System (CMS). This system is accessible by 29,000 clinical users at 43 hospitals and 120 clinics across the whole of Hong Kong. There are 8 millions patient records, image volume and patient data in terabytes, and half billion of lab records installed covering more than 93% of the population's health data. Method : This presentation covers the development of clinical information in the community and how geriatrician is able to link up health data between hospital and community settings especially in old age homes and patients' home . The use of tele-medicine, remote CMS, telephone nursing consultation service, call center and the use of HARPPE (Hospital Admission Risk Reduction Program for the Elderly) marked the revolutionary steps in management elderly medicine in a new digital world. Results : The Integrated Care Model (ICM) is the latest attempt to improve the care of older patients discharge from the hospital back to the community. IPAD2 are used to facilitate ICM nurses for documentation during hospitalization while case managers follow up high risk elderly patients with remote CMS. Conclusion : The present system is not perfect and there are still gaps to be filled up. The digital revolutionary will definitely benefit not just the clinicians but the overall quality of care of our elders. Keywords : digital, geriatric medicine

SS24 217-C

SARCOPENIC OBESITY: THE LINK BETWEEN SKELETAL MUSCLE AND ADIPOSE TISSUE

SS24 217-C-1

CHANGES IN MUSCLE STRENGTH AND MUSCLE FAT INFILTRATION WITH AGING

Seok Won PARK (*Department of Medicine, CHA Bundang Medical Center, School of Medicine, CHA University, Korea*)

Introduction : In modern societies, the prevalence of obesity in the elderly has dramatically increased. On the other hand, ageing results in a progressive loss of skeletal muscle mass and strength. Consequently, we are now encountering an epidemic of the combination of excess body fat and reduced skeletal muscle mass and/or strength with ageing which is often called as "sarcopenic obesity". Method : We have examined longitudinal changes in skeletal muscle mass and strength as well as regional fat mass, particularly inter-muscular fat infiltration with aging. We also explored the effect of type 2 diabetes on the changes in muscle mass and strength in community dwelling well functioning older adults aged 70 to 79 yrs at baseline who were enrolled in the Health Aging, and Body Composition Study. Whole body and regional lean and fat mass were assessed by dual-energy X-

ray absorptiometry and computed tomography. Results : The annualized rates of leg strength decline (2.6~4.1% depending on race and gender) were about 3 times greater than the rate of loss of leg muscle mass (~1% per year). High intermuscular fat (IMT) mass increased in older adults regardless of changes in weight or subcutaneous fat. Older adults with type 2 diabetes showed greater declines in leg muscle mass and strength than non-diabetic counterpart. Conclusion : In older adults, decline in muscle strength is greater than loss of muscle mass, which suggests a decline in muscle quality. Type 2 diabetes is associated with excessive loss of skeletal muscle mass and strength, resulting in even poorer muscle quality. Keywords : sarcopenic obesity, aging, type 2 diabetes

SS24 217-C-2

SARCOPENIC OBESITY: THE LINK BETWEEN SKELETAL MUSCLE AND ADIPOSE TISSUE

Kyung Mook CHOI (*Endocrinology and Metabolism, Korea University, Korea*)

Introduction : Recently, the prevalence of obesity in the elderly has dramatically increased. Aging results in a progressive loss of muscle mass and strength called 'sarcopenia', which is Greek for 'poverty of flesh'. A combination of excess body fat and reduced muscle mass and/or strength with aging is defined as 'sarcopenic obesity'. Since older persons with sarcopenic obesity are at special risk for adverse health outcome, a rapidly increasing obese elderly population may impose a growing financial burden in the health care system in Korea. Method : Muscle and fat mass are strongly inter-connected from a patho-physiological mechanism. Accordingly, a better understanding of these mechanisms which lead from gain of fat mass to loss of muscle mass or vice versa seems to be critical. Excess energy intake, physical inactivity, insulin resistance, changes in hormonal environment and low-grade inflammation may result in the development of sarcopenic obesity. Obesity and sarcopenia in the elderly people potentiate each other and amplify their impact on disability, morbidity and mortality. Consequently, identifying elderly patients with sarcopenic obesity might be important for attenuating its clinical impact. Results : Despite the growing importance of sarcopenic obesity, only a few studies evaluating the definition and prevalence of sarcopenic obesity was performed in Caucasian populations and studies in non-Caucasian populations were very limited. Therefore, we have been performed a prospective cohort study named 'Korean Sarcopenic Obesity Study (KSOS)' in Korean population. Conclusion : In this lecture, I will summarize previous studies about sarcopenic obesity and its relationship with metabolic disorders including metabolic syndrome and diabetes. Keywords : sarcopenic obesity

SS24 217-C-3

SARCOPENIC OBESITY: PREVALENCE AND ASSOCIATION WITH METABOLIC SYNDROME IN THE KOREAN LONGITUDINAL STUDY ON HEALTH AND AGING

Soo LIM (*Internal Medicine, Seoul National University Bundang Hospital, Korea*)

Introduction : This sarcopenic obesity (SO) is associated with deteriorations in physical disability, morbidity, and mortality. Therefore, sarcopenia and obesity might act synergistically on metabolic and functional impairments in the elderly. However, there have been few reports investigating the association of SO with metabolic syndrome, particularly in Asian ethnic groups. Method : We investigated the prevalence of SO and its relationship with metabolic syndrome in a community-based elderly cohort in Korea. In this study,

287 men and 278 women aged 65 or older were recruited. Sarcopenia was defined as the appendicular skeletal muscle mass (ASM) divided by height squared (Ht²) (kg/m²) or by weight (Wt) (%) of < 1 SD below the sex-specific mean for young adults. Obesity was defined as a visceral fat area \geq 100 cm². Results : The prevalence of SO was 16.7% in men and 5.7% in women with sarcopenia defined by ASM/Ht²; however, it was 35.1% in men and 48.1% in women by ASM/Wt. Using ASM/Wt, the homeostasis model assessment of insulin resistance of subjects with SO was higher and they were at higher risk for metabolic syndrome (odds ratio [OR] 8.28 [95% CI 4.45-15.40]) than the obese (5.51 [2.81-10.80]) or sarcopenic group (2.64 [1.08-6.44]). Conclusion : In conclusion, SO defined by ASM/Wt was more closely associated with metabolic syndrome than either sarcopenia or obesity alone. Keywords : Sarcopenic obesity, metabolic syndrome, Korea

SS24 217-C-4

INTERVENTIONS TO OVERCOME SARCOPENIC OBESITY

Anne B. NEWMAN (*Epidemiology, University of Pittsburgh, Graduate School of Public Health, USA*)

Introduction : Obesity in old age can be accompanied by a level of muscle mass and function that is inadequate for maintaining function and mobility. However, weight loss recommendations for older adults remain controversial as some excess weight seems to protect against mortality and some muscle mass is lost when weight is lost. Method : Review of the literature and presentation of results from two clinical trials of physical activity and weight loss. Results : The literature to date shows that older adults can safely lose weight and maintain muscle function. Aerobic physical activity seems to promote selective loss of visceral and muscle fat. Strength and power training may also be important in this subset of older people. Conclusion : Sarcopenic obesity is modifiable. Additional studies are needed to better define the optimal methods to successfully remodel body composition for maximal function. Keywords : Epidemiology; Sarcopenia; Obesity

PSYCHOLOGICAL WELL-BEING IN THE OLDEST OLD

SS24 218-S-1

NEW SUCCESSFUL AGING MODEL IN THE LONGEVITY SOCIETY

Yasuyuki GONDO¹, Yukie MASUI², Takeshi NAKAGAWA¹, Kazunori IKEBE³, Kei KAMIDE⁴, Yasumichi ARAI⁵, Ryutaro TAKAHASHI⁶ (*1. Graduate School of Human Sciences, Osaka University, Japan; 2. Human Care Research Team, Tokyo metropolitan institute of gerontology, Japan; 3. Graduate School of Dentistry, Osaka University, Japan; 4. Graduate School of Medicine, Osaka University, Japan; 5. School of Medicine, Keio University, Japan; 6. Research on Social and Human Sciences, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : In developed countries, the issue of aging and the elderly has recently been spotlighted in various academic disciplines. However, only a few studies have focused particularly on centenarians and the oldest-old, whose health status tends to be in decline, in contrast to that of individuals in early and middle old age. Successful aging is an important concept for the elderly, and sociologists, medical physiologists and psychologists have proposed their own theories of how this can be achieved. However, since it is difficult to apply these theories to centenarians and the oldest-old, new theories for successful aging are required. Method : Empirical findings related to successful aging were introduced and applied in the context of centenarians and

the oldest-old, and a new framework for successful aging emphasizing psychological development in old age is proposed. We conducted invitation survey for community dwelling septuagenarians (age ranged 69-71, men=477, women=523), and octogenarians (age ranged 79-81, men=457, women=516) recruited from four regions in Japan. They were 23 percent and 18 percent out of eligible individuals in septuagenarians and octogenarians cohorts respectively. Results : None of the previous models for successful aging were shown to be appropriate for adaptation to the long and unstable period of extreme old age. New model of successful aging fitted surveyed sample. Conclusion : To evolving new model for successful aging that considers age-related differences in functional status, new framework based on the findings investigated oldest-old and centenarian is proposed. Keywords : well-being, successful aging

SS24 218-S-2

IS SELF-RATED HEALTH STILL SENSITIVE FOR CHANGES IN DISEASE AND FUNCTIONING AMONG NONAGENARIANS?

Henrike GALENKAMP¹, Dorly J.H. DEEG¹, Martijn HUISMAN¹, Antti HERVONEN², Arjan W. BRAAM³, Marja JYLHA² (1. Department of Epidemiology and Biostatistics and the EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 2. Gerontology Research Center and Tampere School of Health Sciences, University of Tampere, Finland; 3. Department of Emergency Psychiatry, Altrecht Mental Health Care, Netherlands)

Introduction : With age, there is an increasing gap between relatively stable levels of self-rated health (SRH) and actual health status. This study investigates if SRH among nonagenarians still changes over time, and examines its sensitivity for changes in measures of disease and functioning. Method : In the Vitality 90+ Study, questionnaires were sent to all people aged 90 years and over living in Tampere, Finland. Included were respondents who provided data on the 2001 measurement and at least one follow-up measurement in 2003, 2007 or 2010 (N=334). Generalized Estimating Equations (GEE) analyses examined longitudinal change in SRH and the predictive value of number of chronic conditions and a functioning score, based on five activities. Results : Within two years, most people (56.3%) had unchanged SRH, but declined SRH (22.3%) was associated with worse baseline functioning and declined functioning. Clear declines in SRH after six and nine years were associated with increased diseases (OR=1.23) and decreased functioning (OR=1.28). The impact of diseases and functioning was smaller among institutionalized people (diseases OR=0.90; functioning OR=1.18) than among people living independently (diseases OR=1.30; functioning OR=1.44). Conclusion : SRH among nonagenarians was sensitive to changes in number of diseases and functioning, although more pronounced on the longer than on the shorter term. Keywords : Self-rated health, Oldest olds

SS24 218-S-3

AGE DIFFERENCES IN POSITIVE AND NEGATIVE AFFECT AMONG OLDEST-OLD ADULTS

Peter MARTIN¹, Jinmyoung CHO², Leonard W POON³ (1. Human Development & Family Studies, Iowa State University, USA; 2. Health Science Center, Texas A&M, USA; 3. Gerontology Center, University of Georgia, USA)

Introduction : The purpose of this study was to compare self- and proxy reports of positive and negative affect among two age groups: centenarians and octogenarians. Method : Data from 201 octogenarians and centenarians and 162 proxy informants who

participated in Phase III of the Georgia Centenarian Study were used. Factor analyses were computed to compare the factor structure of positive and negative affect. Independent samples t-tests were computed to assess age differences, and bivariate correlations and paired t-tests were computed to assess similarities and differences among self- and proxy reports. Results : A two factor solution was obtained for self- and proxy reports, dividing affect into positive and negative components. Self reports indicated mean age differences in positive but not negative affect. Centenarians showed significantly lower levels of positive affect. Proxy informants did not entirely replicate these differences. A direct comparison of self- and proxy reports indicated that for the whole sample proxies rated positive and negative affect higher than self reports. This was confirmed for centenarians, however, for octogenarians, only positive affect levels were rated significantly higher by proxy reporters. Conclusion : The results indicate that proxies may view affect levels somewhat differently than very old adults, particularly centenarians. Keywords : centenarians, mental health, proxy reports

SS24 219-S

GERONTOLOGY TRAINING IN LATIN AMERICA

SS24 219-S-1

GRADUATE PROGRAMS OF GERONTOLOGY IN BRAZIL

Anita Liberalesso NERI (Gerontology, State University of Campinas, Brazil)

Introduction : Graduate programs of Gerontology are a relatively new investment in Brazil. The first medical residency in Geriatrics was founded in 1976, at the Catholic University of Rio Grande do Sul, under the auspices of the Japanese Government. The first master and doctoral program was founded in 1997 at the State University of Campinas. Today, there are 7 master and 2 doctoral programs, whose establishment was influenced by the process of internationalization of Gerontology and by the actions of the Brazilian Society of Geriatrics and Gerontology, with the purpose of preparing human resources and enhancing research. Method : Aim and method. Identifying the main trends of the Brazilian Graduate Programs in Gerontology, supported by a content analysis of its documents. Results : All programs are identified as interdisciplinary and so are recognized by the research funding agencies. All them recognize that interdisciplinarity is the product of gradual construction made by teams engaged in the generation of new languages, methodologies and models, with a increasing blurring of the boundaries of traditional disciplines. Along time, the struggle for hierarchical and professional boundaries becomes increasingly weak, in favour of creativity and pragmatism. The influence of Geriatrics and other fields of Medicine, Biology and Psychology is greater than that exerted by the Social Sciences and Education. The dominant trend is to conduct population and epidemiological surveying and after, quasi-experimental studies. Conclusion : The paths of interdisciplinarity require great commitment. Among the challenges to be faced is the establishment of the professional and academic field of Gerontology. Keywords : Interdisciplinarity; Gerontological Education.

SS24 219-S-2

INTERDISCIPLINARITY AND RESEARCH IN MASTER'S PROGRAMS IN GERONTOLOGY IN COLOMBIA

Carmen-Lucia CURCIO (Gerontology and Geriatrics, University of Caldas, Colombia)

Introduction : Gerontology is inherently multidisciplinary field, incorporating a variety of perspectives, yet little systematic thought

has been devoted to exploring the implications of this diversity for research programs that are interdisciplinary in nature. Over the past several decades, gerontology has been in a search for self-definition. A variety of studies have been conducted in order to establish the focus of gerontology. These studies illustrate the evolution of gerontological knowledge is explained by continuity and progression in the study of biomedical, behavioral, and social aging. It is now critical to develop conceptual clarity about how interdisciplinary educational programs and research programs should be designed and implemented. Method : This presentation outlines a framework developed in Master's programs in gerontology in Colombia. Results : We are working an integrative model: The research approach and educational programs based in the disciplines related to gerontology with a life course perspective and interdisciplinary emphasis. First, the epistemology of interdisciplinary learning and research is analyzed. Then, the central role played by values in interprofessional and interdisciplinary relationships. Finally, specific techniques to stimulate skill and knowledge acquisition essential to the interdisciplinary team are suggested. Conclusion : Interdisciplinarity is a matter of disciplines, therefore the research. Interprofessionality is a matter of professions and occupations. Master degree training should be to prepare for both. Keywords : Interdisciplinary, Research, Colombia

SS24 219-S-3 GERONTOLOGY TRAINING IN ARGENTINA

Jose Ricardo JAUREGUI (*Internal Medicine, Italian Hospital of Buenos Aires, Argentina*)

Introduction : Gerontology development in Argentina is a challenge till today. Method : Intensive search in Universities and others sets where Gerontological education take place in the whole country. Analysis of programs, topics and certifications Clasification of them in categories State of the Art of Gerontological Educations in XXIst Century in Argentina. Results : 6 full courses in Public Universities 5 full courses in Privates Universities 1 full virtual course in a 'Distance Education Model' many little courses with no official support, or under ONG's supervision. Conclusion : Gerontological education in Argentina needs more development, official support and possibly more social visibility to stimulates community understanding about its importance. Keywords : Gerontology Education Argentina

SS24 219-S-4 INTERDISCIPLINARY COLLABORATION IN GERONTOLOGY IN LATIN AMERICA

Fernando GOMEZ (*Research Group on Geriatrics and Gerontology, Faculty of Health Sciences,, University of Caldas, Colombia*)

Introduction : Interdisciplinary collaboration and interdisciplinary care are terms used interchangeably to refer to a philosophy and process of care that brings together two or more individuals, often from different professional disciplines, who work to achieve shared aims and objectives. Method : The purpose of this study was to identify quantitative and qualitative studies about interdisciplinary collaboration in Gerontology in Latin America (LA). Results : A few studies on health interdisciplinary collaboration have been conducted in Latin America. All of them used qualitative approaches and emphasized aspects of health care teams, such as structuring, functioning and training. All of them highlighted the subjective component of teams. The provision of health care services in the region has been based for decades on a traditional organizational model grounded in individual practice. Each professional focused on a given object used to develop a task aimed at assessing, evaluating, and treating elderly people. However, there was no awareness about the

roles of other disciplines and as consequence mutual recognition is not common. Conclusion : The most important characteristic about interdisciplinary collaboration in gerontology in LA is their subjective-basis framework, who core consists in taking into account the internal and emotional dimensions of the team to solve "complex" problems of the elderly. This framework became necessary to hold a more holistic approach, not only incorporating biological and health aspects but also taking into account social resources and cultural and economic factors. Interdisciplinary collaboration facilitate the interaction between interdisciplinary health care team members and permit more comprehensive evaluation and support for older people. Keywords : Interdisciplinary collaboration, Latin America, health care team, gerontology

SS24 221-S INTERNATIONAL PERSPECTIVES ON THE MEASUREMENT OF HEALTH

SS24 221-S-1 MEDICAL ASPECTS OF SOCIETY 2030

Jeffrey HALTER (*Geriatrics Center, University of Michigan, USA*)

Introduction : Medical care in 2030 must address needs of the post-World War Two baby boom generation in their 80's. This cohort of octogenarians will likely be actively engaged in their own health care needs, but in many communities smaller numbers of younger people will be available to provide needed services and support for this rapidly aging population. Where rates of reproduction have become very low such as China and Europe, family caregiving support will rapidly be overwhelmed unless alternatives are developed. While future octogenarians may have less chronic disease and comorbidity than previous generations, various chronic conditions will likely accumulate leading to disability over time. Method : We apply a lifespan conceptual model in which the individual is one component of a much larger continuum that reflects its own biology at the cellular level but extends well beyond the individual to include the role of family and community, corporations, country, and overall culture. Results : Adaptations at the community, corporate, and country level will be needed to ensure that the medical care needs of a very different demographic mix in 2030 can be met. Prevention must be a key component. Culture and country through corporations and community can establish standards in which healthy diets, physical activity and preventive aspects of medicine are emphasized to a much greater degree than they are today. Conclusion : Such developments can help Society 2030 achieve a new balance in which a large aging population can be more functional while needing less help and support at the immediate family level. Keywords : caregiving, disability, prevention

SS24 221-S-2 SOCIAL AND BEHAVIORAL CONSIDERATIONS IN PLANNING FOR SOCIETY 2030

James JACKSON (*Institute for Social Research, University of Michigan, USA*)

Introduction : The aging of United States society is a reality, based upon the size of the unprecedented baby-boom generation, dramatic reductions in fertility rates at or near the replacement level, and increases in life expectancy. By 2030 or so, the United States population will consist of more people over the age of 65 than under 15 years of age. Political debates and public policies are often premised. Method : This paper addresses myths and facts about our coming aging society using a life-course framework with considerations of institutional changes, including intergenerational

family synergies, with special attention to the growing gap in opportunities and health between rich and poor in America. Results : Data are drawn from a variety of sources focused on existing and projected cleavages and disparities among those who are well-off and those who are less fortunate. Data focus on how the coming age transition may exaggerate differences that now exist in health and health care among social, racial and ethnic groups in this society. Conclusion : Social and behavioral science has an important role to play in helping the United States adapt to the challenges of the coming dramatic demographic transition and emerge with resilient and responsive institutions, including education, government, family and business. While the aging society will provide opportunities to harness the intellectual and experience-base of longevity gains, it also has the potential to fracture along existing lines of social, economic and racial and ethnic status disparities. Keywords : aging society, disparities, health

SS24 221-S-3

RESEARCH AGENDA FOR SOCIETY 2030

Marie A BERNARD (*National Institute on Aging, National Institutes of Health, USA*)

Introduction : It is difficult to predict accurately what a research agenda is likely to be in 2030. However, there are areas of current research that could lead to significant developments by 2030. Some of those areas are 1) Alzheimer's disease (AD), 2) basic biology of aging, 3) behavioral health, and 4) complex clinical issues. Method : Highlights of research in each of the following areas will be presented: 1) AD - In the USA, as in many other countries, a plan has been developed for the approach to AD, with a US goal to prevent or cure AD by 2025. Research is ongoing to better characterize, prevent and treat AD. 2) There are significant advances in understanding the basic biology of aging, which may underlay the predisposition to chronic illness with aging. Research is ongoing to remove senescent cells and extend lifespan. 3) A better sense of how to enhance healthful behavioral choices is being gained through the science of behavior change. 4) Research is pursuing answers to perplexing clinical issues ? e.g., how to prevent disability, prevent or ameliorate illness. Results : AD biomarkers and genetics are influencing ongoing clinical studies for prevention and treatment; senescent cell removal and pharmaceuticals lengthen life-span; exercise, built environments, facilitate healthful lifestyle choices; ongoing trials examine the role of vitamin D, aspirin, and testosterone in prevention/amelioration of illness. Conclusion : There are ongoing studies in aging that may lead to significant findings by 2030. The results of those studies will guide the direction of future research. Keywords : aging, society, measurement, health, behavior change

SS24 221-S-4

REDESIGNING COMMUNITIES FOR AGED SOCIETY

Hiroko AKIYAMA (*Gerontology, University of Tokyo, Japan*)

Introduction : Currently 24% of the Japanese population is age 65+. In 2030 it is predicted that one third of the population will be 65+ and one fifth will be 75+. The existing infrastructure of communities in Japan was built when the population was much younger. We need to redesign both hard and soft infrastructure of communities to meet the needs of the highly aged society. We want to build communities where people stay healthy and active and live with a sense of security. Method : One example is a project organized by Institute of Gerontology, the University of Tokyo aimed at turning the concept of "ageing-in-place" into reality in Kashiwa, which is a typical bed town 30 km away from Tokyo. Results : One of the major projects in

Kashiwa, is "Work places for the second life". A huge number of baby boomers who are working in Tokyo will soon retire and come back to the community. The project is creating age friendly work places and flexible scheme of employment that will allow the residents the options to work even up to the age over 80. The emerging evidence indicates that working after age 65 helps maintaining physical and cognitive functions and enhance social activities. We are also testing products which provide older workers with safe and productive work environment. Conclusion : This kind of social experiment requires not only the collaboration among researchers in different disciplines, but also full collaboration with local governments, business community, NPOs, and residents. Keywords : Housing, Communities, Japan

SS24 222-S

INTERGENERATIONAL SUPPORT AND NETWORK BETWEEN KOREA AND JAPAN: CROSS CULTURAL IMPLICATION

SS24 222-S-1

HOW SHALL WE 'HANDLE' OUR POPULATION AGING IN JAPAN?

Ryutaro TAKAHASHI (*Vice Director, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : By the end of 20th century, population aging in Japan had come out as a major social issue, not only in the country side but also in the urban cities. As many baby boomers had grown up in Tokyo, Osaka or other metropolitan areas, these cities are urgent for handling changes in society. Method : In this symposium, Japanese socio-demographic aspects and the need for inter- or intra-generational mutual support will be overviewed. In addition, mutual social support after the Great East Japan Earthquake (March 11, 2011) will be introduced based on the post-disaster support activities of Tokyo Metropolitan Institute of Gerontology. Results : Due to the health survey at the Tsunami-affected areas, trust in community and relation to neighbors are strong indicators of mental health conditions. Conclusion : Principles of our support activities are focusing on promoting self-motivation and independence through provision of educational program for health professionals and physical/mental health check of elderly and young people living there. Keywords : mutual support, community, disaster

SS24 222-S-2

RECIPROCAL EFFECTS ON SENIOR VOLUNTEERS AND ELEMENTARY SCHOOL CHILDREN THROUGH AN INTERGENERATIONAL HEALTH PROMOTION PROGRAM BY OLDER ADULTS "REPRINTS"

Yoshinori FUJIWARA (*RT for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : We have promoted an intervention study, called "REPRINTS" (Research of productivity by intergenerational sympathy) in which senior volunteers aged 60 years and over engage in reading picture books to school children since 2004. The purpose of this study was to examine reciprocal effects on senior volunteers and elementary school children. Method : Sixty nine volunteers and 72 participants in a control group aged 60 years and over participated in a baseline health check-up in June 2004. After a 3-month training seminar, volunteers visited public elementary schools in groups of 6-10 for an 18 month period. Baseline survey for 600 children of 2 schools was conducted one month after launching volunteer activity. First and second follow-up surveys were conducted every 6 months after baseline survey. Main measurements were emotional-like image scale of older adults by SD (Semantic Differential) method: subscales

of "evaluation" and "activity". Results : At follow-up, social network scores (frequency of contact with grandchildren and others around the neighborhood) and self-rated health improved or was maintained significantly among the 37 individuals volunteering most intensively. Students were divided into two groups in terms of frequency of interchange with volunteers (low and high-frequency groups) through three surveys. In the subscale of "evaluation", general linear model demonstrated significant interaction between the group and number of surveys adjusted for compounding factors. Conclusion : "REPRINTS" demonstrated reciprocal effects on senior volunteers and elementary school children through regularly intensive intergenerational relationships. Keywords : Senior volunteers, Elementary school children, Intergenerational relationship

SS24 222-S-3

A LONGITUDINAL STUDY OF CHANGE IN THE INFORMAL SOCIAL SUPPORT OF OLDER ADULTS IN KOREA

Hyunsook YOON¹, Jiyoung YOON² (1. Department of Social Welfare, Hallym University, Korea; 2. Hallym Aging Research Institute, Hallym University, Korea)

Introduction : This study examines the extent of change in informal social support and predictors associated with individual change in informal social support at baseline and overtime. Method : Data came from a four-wave panel study of Hallym Aging Study. The first wave was conducted in 2003, and each successive wave occurred exactly 2 years after. A self-weighted, two-stage stratified probability sampling design was used. The baseline data for this study was Wave 2 (2005) which consisted of the 1, respondents over the age of 65. Wave 2 (2007) became 942 and then 850 for Wave 4 (2009). The data of Wave 1 (2003) was excluded because of lack of information on received social support and depression. Social support consisted of perceived social support, received social support, and social contact with adult children and friends. Latent Growth Curve Model was used to analyze trajectories of social support and predictors of variability. Results : Age-related changes in informal social support varied across sources and types of support. Perceived social support from adult children declined with advancing age, whereas perceived social support from friends increased. Received emotional and instrumental support from adult children and friends, and social contacts with adult children and friends declined with age. Age, education, income, cognitive and physical functioning, and depression were more consistent predictors of variability in support at baseline and over time. Conclusion : The findings of this study highlight the declined social support from adult children in late life in Korea, reflecting decreased traditional family value regarding children's obligations to support their parents. Keywords : informal social support, longitudinal study

SS24 222-S-4

INTERGENERATIONAL SUPPORT EXCHANGE, FILIAL RESPONSIBILITY AND SUBJECTIVE WELLBEING OF KOREAN ELDERLY

Young Bum KIM (Hallym University Institute of Aging, Korea)

Introduction : Equity theory or social exchange theory insists that the supports from the children may have negative effect on the life of the elderly. Because of traditional ethic, hyo [filial piety], it is considered as ethical duty for children to take care of their old parents in South Korea. Thus supports from children to old parents may have positive effects on happiness of old parents in South Korea. Method : This work used Hallym Aging Panel Data which consist of 4wave survey. In the analysis, the data for 3 waves is included (2005, 2007, and 2009). The sample in the analysis includes persons older than 55 years

old. The dependent Variable is PGCMS. For the convenience of explanation, author recoded the score to mean high score to high morale. The Control Variables includes socio-economic and demographic variables. The independent variables include sum of giving support to children and sum of receiving support from children. Results : First, like other researches in this field, income, health, schooling and social activity show statistically significant relationship with morale in old age. However the cohabitation with children shows no relationship with morale in old age. Second, unlike researches in Western world, support from children had positive effect on morale of elderly in South Korea. Third, the giving support from children shows different effects according to cohort. In the industrial generation it shows stronger effects than in the colonial generation. Conclusion : In accessing the quality of life in old age, the culture is one of the most important considerations. Keywords : filial piety intergenerational support exchange South Korea cohort

SS24 223-S

PHYSICAL, MENTAL AND SOCIAL ASPECTS OF HEALTHY AGING - RESULTS FROM STUDIES IN RAPIDLY AGING ASIAN COUNTRIES

SS24 223-S-1

GLOBAL PHYSICAL ACTIVITY TRANSITIONS: EMERGING MEASUREMENT AND THERAPEUTIC OPPORTUNITY

Shuichi P. OBUCHI (Human Care Sciences, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : Super aged society means increasing physically disabled person in some extent. To greater of less, old people experience pain in their joints, weakness of muscle, and/or lack of control. The functional disabilities then gradually affect to their daily living with advancing age. It, however, is also true that stimulus makes change in their body even in the older age. To minimize physical frailty in the ageing societies, we have to promote older people start anything new to stimuli their life. In this symposium, I would like to share our experience that promoting physical activities in Japan. Method : In 2005, Japan renewed the Long-term care insurance policy to the preventive way called "Kaigo Yobou". More than 7 % of older person with frailty participated physical conditioning program, oral health program, or nutritional program with assist of obligation from care-manager. Results : About twenty percent of usage of the long term care insurance was suppressed after. Introduction of Kaigo Yobou. The person who received Kaigo Yobou service significantly increased physical and mental functioning as well as general health status. Conclusion : Countries in Asia now are young and vital but we also facing rapid progress of aging. We cannot avoid this fact and we cannot lose vitality of society. To keep, our society vital as much as possible, we have to spread movement to start physical and mental activity in older age without agiesm. Japan proved the effects of the activity, and we would like to happy if all countries share our experience. Keywords : Physical Disability, Prevention, Rehabilitation

SS24 223-S-2

DEPRESSIVE SYMPTOMS, PHYSICAL FUNCTION AND MORTALITY WITH AND WITHOUT DIABETES

Chih-cheng HSU (Division of Geriatrics and Gerontology, National Health Research Institutes, Taiwan)

Introduction : Diabetes is a prevalent disease among older adults. Depression is also a key contributing to functional disability. However, it remains unclear whether depression predicts functional decline and mortality after controlling for diabetes. The objective of

this study was to examine the relationship between depression and adverse health outcomes for the elderly with and without diabetes. Method : Data on 958 adults aged ≥ 54 years from the Social Environment and Biomarkers of Aging Study (SEBAS) 2000 were analyzed. Depressive symptoms were measured using the Center for Epidemiological Studies-Depression Scale (CES-D). Diabetes was defined by self-report or fasting glucose ≥ 126 mg/dl. The primary outcome was composite of mortality or functional decline over 6 years. A decline in function was defined as difficulty in more ADL or lower extremities tasks in 2007 compared with 2000. Multivariate analyses adjusted for sociodemographic variables, lifestyle factors and various medical conditions. Results : The mean age of subjects was 69 years. Forty-two percent were women. Nineteen percent of participants had depression, and twenty percent had diabetes. Among 958 participants, 561 (59%) died or had functional decline during the follow-up period. Adjusting for diabetes and potential confounders, subjects with depression were more likely to die or have functional decline. Depression independently predicted the composite event among older adults with diabetes (adjusted hazard ratio (HR), 2.89; 95% CI, 1.07-7.85) and among those without diabetes (adjusted HR, 1.59; 95% CI, 1.05- 2.41). Conclusion : Depression was an independent predictor of poor outcomes, including death and functional decline among older adults with and without diabetes. Keywords : depression, diabetes

SS24 223-S-3

SENSE OF CONTROL AND PHYSICAL FUNCTION IN OLDER ADULTS

I-chien WU, Chao A. HSIUNG, Ming-shiang WU, Chih-cheng HSU
(Institute of Population Health Sciences, National Health Research Institutes, Taiwan)

Introduction : Psychological well-being has large impacts on the course of chronic diseases. However, it remains unclear whether positive emotions have independent effects on the disablement process associated with chronic diseases such as diabetes. This study aimed at examining the relationship between sense of personal mastery and functional decline in persons with and without diabetes. Method : Data on 758 adults aged ≥ 54 years (mean age = 68 years) from the Social Environment and Biomarkers of Aging Study (SEBAS) 2000 were analyzed. Sense of personal mastery was measured using the Pearlin's mastery scale. Diabetes was defined by self-report or fasting glucose ≥ 126 mg/dl. The primary outcome was functional decline over 7 years. A decline in function was defined as difficulty in more ADL tasks in 2007 compared with 2000. Multivariate analyses adjusted for sociodemographic variables, lifestyle factors and various medical conditions. Results : Of all participants, 102 (13%) had diabetes. Adjusting for diabetes and potential confounders, subjects with a higher sense of mastery at base line were significantly less likely to have functional decline. Among older adults with diabetes, low sense of mastery strongly predicted the primary outcome. Conclusion : Low sense of mastery was an independent predictor of functional decline among older adults with and without diabetes. Keywords : Personal mastery, Disability, Diabetes Mellitus

SS24 223-S-4

PHYSICAL, NUTRITIONAL AND SOCIAL ASPECTS OF HEALTHY AGING IN JAPAN: FINDINGS FROM THE TMIG-LISA 1991-2010.

Shoji SHINKAI (Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : TMIG-LISA is the Longitudinal Interdisciplinary Study on Aging, which Tokyo Metropolitan Institute of Gerontology has conducted since 1991. Variables collected in this study covered all medical, physical, psychological and social aspects. It provides us with important messages regarding healthy aging in Japan. Method : The project comprised two study sites: Koganei City, a suburb of Tokyo, and Nangai Village, a rural area of Akita Prefecture. In Koganei City, about a thousand older persons were originally selected as one-tenth random sample ranging in age from 65 through 84 years. In Nangai Village, all residents aged 65 years and over were eligible to participate in the survey. The questionnaire of the interview survey consisted of comprehensive assessment of health status including psychological and social variables. The medical examinations at health-checkups included physical performance and blood measures. Variables administered to baseline surveys were repeatedly measured in follow-up surveys. Outcome measures were the onsets of death and ADL disability, and changes in higher-order functional capacity. Results : To date the project has identified significant predictors for respective outcome measure. The results demonstrate that body-built and physical performance, nutritional state assessed by biomarkers, lifestyles, mental and social functions such as social participation, and socio-economic status help predict longevity, independence and competence, and also that older persons lose their function with either of three major patterns: early- and late-onset decline, and successful aging. Conclusion : Good physical, mental and social functioning is a crucial component for healthy aging in Japanese elderly, which is largely compatible with evidences from Western countries. Keywords: healthy aging, community-dwelling elderly, longitudinal study.

SS24 224-S

A COMPARISON OF AGING PROCESS OF TWO COUNTRIES: USA AND SOUTH KOREA

SS24 224-S-1

THE DESIGN AND PRELIMINARY RESULTS OF KOREAN SOCIAL LIFE, HEALTH, AND AGING PROJECT (KSHAP)

Yoonsik YOUM (Sociology, Yonsei University, Korea)

Introduction : The Korean Social Life, Health, and Aging Project (KSHAP) has four distinct features that are believed to be essential for the examination of aging process based on inter-disciplinary approach. Method : First, it is designed to be compatible with the National Social Life, Health, and Aging Project (NSHAP) in the US. Many survey items are identical so that we can compare aging processes in the US and Korea. Second, unlike the NSHAP that is a representative sample of the US, the KSHAP only collected the data of one entire village. This allows it to collect a global social network data of an entire village. Third, in addition to detailed social network information, it also collects diverse biological data including blood sample. This enables us to examine aging process from a well-integrated approach of sociology and medical science. Fourth, it is designed to be a panel data so that we can solve many reverse causation issues to some extent by design. Results : The first wave was conducted in 2011. The size of the population that was the person who were 60 or older at the time of interview and their spouses was 860. Out of 860, 814 were interviewed for the survey that lasted 75 minutes on average: 95.65% response rate. Also 711 respondents took physical exam that produced many bio-markers including bp, BUN, albumin, Triglyceride, insulin, CRP: 82.7% response rate. Conclusion : We believe the KSHAP provides good opportunity to examine the relationship between social networks and physical health. Keywords : KSHAP, NSHAP, aging, network, social

SS24 224-S-2

THE NATIONAL SOCIAL LIFE, HEALTH AND AGING PROJECT

Linda WAITE¹, Edward LAUMANN² (1. *Sociology, University of Chicago and NORC, USA*; 2. *Sociology, University of Chicago, USA*)

Introduction : The National Social Life, Health and Aging Project (NSHAP) focuses on the link between social connections and health at older ages. **Method :** The 2005 wave of NSHAP included an in-home interview with 3005 community-dwelling adults ages 57 to 85 in the United States. These people and their spouses or co-resident partners were reinterviewed in 2010 (N=3372). NSHAP includes detailed information on each person's social networks, their formal and informal social participation, social support and social demands, social relationships, relationship quality, and sexuality. Biological, physical and physiological measures were collected for each person, including blood spots, saliva, urine, vaginal swabs, height, weight, waist circumference, blood pressure, walking speed, vision, taste, touch and smell. NSHAP also obtained a complete log of all medications. **Results:** These biomeasures provide researchers with indicators of prodromal disease processes, helping us understand how the social world 'gets under the skin' to produce disease and poor health. The second wave of NSHAP repeated the measures of social networks and social connections, added measures of personality and health, including a detailed measure of cognitive function, and expanded measures of frailty. **Conclusion :** Thus, NSHAP now provides detailed information on a population of older adults in the US as they age. It allows researchers to examine health disparities among social groups, to trace changes in health and social relationships over time, and to assess health and relationships in dyads. NSHAP data are publicly available through the National Computerized Data on Aging repository at ICPSR at the University of Michigan. **Keywords :** Relationships Health Survey

SS24 224-S-3

THE DESIGN AND CHARACTERISTICS OF KOREAN URBAN AND RURAL ELDERLY (KURE) STUDY

Hyeon Chang KIM (*Dept. of Preventive Medicine, Yonsei University, Korea*)

Introduction : With an exceptionally rapid population aging, geriatric diseases and disabilities cause an increasing burden on the Korean population. Therefore, the Korea National Institute of Health planned a cohort study to investigate etiologic and contributing factors of major health problems in the Korean elderly population. We designed the Korean Urban and Rural Elderly (KURE) study in 2011 and started recruitment and baseline examinations in 2012. **Method :** The KURE study is a community-based cohort study recruiting 5,000 Koreans aged 65+ years. The study includes one baseline examination and two follow-up examinations over 10 years. Baseline examinations include questionnaire interview, social network survey, anthropometry, blood pressure, electrocardiogram, carotid ultrasonography, bioimpedance analysis, bone densitometry, depression score, mini-mental state examination, fasting blood chemistry, urinalysis, and selected physical function tests. The questionnaires include personal and family medical history, health-related habits, daily activity, disability index, and stressful life events. Major outcomes include cardiovascular diseases, osteoporosis, depression, cognitive impairments, urinary dysfunction, and mobility impairments. **Results :** In 2012, a total of 927 participants living in urban (northwestern part of Seoul) and rural (Yangsa-myeon, Kangwha) areas completed health baseline examinations. The participants were 72.1 years old on average and female dominant (67.4%). Common prevalent disorders were hypertension (61.9%),

cataract (39.2%), osteoporosis (30.6%), dyslipidemia (29.5%), and diabetes (20.9%). Additional characteristics of the participants will be presented. **Conclusion :** This study will improve our understanding of the current health status of Korean urban and rural elderly populations. The KURE study will also identify genetic, environmental, and social determinants of elderly's health and their interactions. **Keywords :** Cohort study, Population, Prevention

SS24 225-C

TOWARDS OPTIMAL PRESCRIBING OF OLDER PATIENTS IN ASIAN COUNTRIES

SS24 225-C-1

TOWARDS APPROPRIATE PRESCRIBING TO OLDER PEOPLE IN TAIWAN

Ming-yueh CHOU (*Geriatric Medicine Center, Kaohsiung Veterans General Hospital, Taiwan*)

Taiwan, as one of the fastest aging countries in the world, is facing a huge challenge of health care system, as well as geriatric pharmacotherapy. In previous researches, in Taiwan, potentially inappropriate medications (PIMs) are common to the elderly in Taiwan. The prevalence of PIMs reached 60% in outpatient services, which may be the highest on the world. The most common PIMs included antihistamine, muscle relaxants, and longer-acting benzodiazepines. Situations are similar in the emergency department or in rural countries. In inpatient setting, by using STOPP/START criteria, both PIMs and potential prescribing omissions (PPOs) were common, but less than outpatient basis. The most common PPOs included statin in diabetic patients, aspirin in diabetic patients, and Calcium blocker use in constipated patients. Moreover, it has been reported that anticholinergic burden was high in people with dementia, and the anticholinergic load can be successfully reduced without adverse outcome. Through non-pharmacological approach, antipsychotics can be successfully reduced with improved behavioral and psychotic symptoms. In conclusion, the inappropriate prescribing for older people was common in Taiwan and more intervention trials should be done. **Keywords :** potentially inappropriate medications, potential prescribing omissions, prescription

SS24 225-C-2

POTENTIALLY INAPPROPRIATE MEDICATION PRESCRIBING FOR ELDERLY OUTPATIENTS IN ASIA

Aulia RIZKA (*Internal Medicine, Faculty of Medicine University of Indonesia, Indonesia*)

Introduction : Potentially inappropriate medication (PIM) prescribing for elderly outpatients have been widely documented in US and Europe but only limited information exist in Asia. Besides causing adverse drug events that linked to higher hospitalization rate, morbidity and mortality in elderly, PIM is also responsible for high healthcare cost and increased falls, confusion and depression. Since prescribing practice is influenced by socioeconomic, cultural and specific pharmaceutical policies, studies exploring the prevalence of PIM in different regional setting is important. The objective of this study is to assess the prevalence of PIM and its associated factors in Asian elderly outpatients. **Method :** A cross sectional study involving patients from 4 Asian countries (Japan, Indonesia, Korea, Taiwan) using outpatients database from July to December 2012 is performed to assess the prevalence of potentially inappropriate medication (PIM) and potentially prescribing omission (PPO) defined by the START/STOPP list. Associated factors with PIM and PPO, as well as anticholinergic burden, will also be analyzed. **Results :** The result will

be presented at the symposia. Conclusion : To our knowledge, this is the first multi-centered study comparing PIM in four Asian countries. The result of the study will be presented at the symposia. Keywords : inappropriate medication, outpatient, STOPP-START

SS24 225-C-3
INAPPROPRIATE PRESCRIBING IN ASIAN LONG-TERM CARE SETTINGS

Hyuk GA (*Dept. of Geriatric Medicine, Incheon Eun-Hye Hospital, Korea*)

Introduction : STOPP(Screening Tool of Older Person's Prescriptions) and START(Screening Tool to Alert doctors to Right Treatment) criteria can be used as a measurement tool for potentially inappropriate medicines(PIMs) and potential prescribing omissions(PPOs), respectively, among older patients who take prescribed medicines. This criteria has been proved to be a useful tool in estimating the prevalence of inappropriate prescription(IP) among inpatients and outpatients from many countries. However, we could not find any study to have analyzed IP status of residents in long-term care settings yet. In this session, we will present the results of our research of analyzing and comparing prescription status of nursing home residents from three Asian countries. Method : Case records of at least six hundred patients aged 65 years or older residing in nursing homes from Korea, Japan, and Taiwan will be reviewed based on STOPP and START criteria and compared each other. Results : We will present the results at the symposium. Conclusion : This survey would be the first comparison study analyzing PIMs and PPOs status with STOPP and START criteria applied on long-term care settings located in three Asian countries. Keywords : nursing home, STOPP-START, inappropriate prescription

SS24 225-C-4
INAPPROPRIATE PRESCRIBING IN ASIAN GERIATRIC INPATIENTS

Taro KOJIMA (*Department of Geriatric Medicine, The University of Tokyo, Japan*)

Introduction : Adverse drug reaction (ADR) is a significant cause of hospitalization and it is associated with prolonged hospital stay in elderly people. Hospitalized elderly adults are present with acute diseases and tend to be physically or functionally impaired, which may increase their vulnerability to ADRs or intensify the severity of them, and accordingly lead to serious clinical and economic consequences in elderly inpatients. Meanwhile, inappropriate prescribing (IP) of medicines is a major risk factor for ADRs, and evaluating IP in elderly could potentially lead to both clinical outcomes improvement and medical expenditure reduction by preventing ADRs. Recently, screening tools for detecting IP have been developed in Europe and North America, although they are not still prevalent in most of the Asian countries. Method : The purpose of the present study was to assess the clinical conditions and their current management for elderly inpatients in 4 Asian countries (Indonesia, Japan, Korea, and Taiwan), and also to analyze the problems within them. In each country, comorbid conditions, drugs, frequency of potentially inappropriate medication (PIM) and potentially prescribing omission (PPO) defined by the START/STOPP list, and anticholinergic burden were assessed for elderly inpatients in a tertiary hospital. This ongoing cross-sectional research is expected to be completed by 2013. Conclusion : This presentation will discuss the result of an inpatients study of the cross-national comparison studies in 4 Asian countries. Keywords : Inappropriate prescribing, Polypharmacy

SS24 226-C
LATE LIFE OBSTRUCTIVE SLEEP APNEA SYNDROME (OSAS): UPDATE 2013

SS24 226-C-1
CLINICAL ASPECTS OF OSAS IN OLDER ADULTS

Fannie ONEN (*Geriatrics, University of Paris, Bichat Hospital, APHP, France*)

Introduction : Obstructive sleep apnea syndrome (OSAS) is a highly prevalent condition in older adults. Despite its high prevalence, OSAS is significantly under diagnosed and under treated in this population. Method : Several factors underlie the lack of recognition of OSAS in older adults. One important factor may be the atypical clinical presentation of the disorder. Age-related physiological changes, multiple comorbidities with possible disease-disease interactions, and the effects of multiple medication may be responsible for atypical manifestations of OSAS. Older individuals with sleep apnea are often unaware of the night-time symptoms of this condition and rarely complain of daytime sleepiness. However, falls, cognitive impairment, stroke, glaucoma, and impaired quality of life are unspecific but frequently associated conditions in the elderly with OSAS. Results : Screening the OSAS is possible with simple tools such as observation based nocturnal sleep inventory (ONSI) and a targeted interview with the patient and his/her family. A detailed geriatric assessment is required for polysomnography and continuous positive airway pressure (CPAP). Conclusion : Tolerance to continuous positive air pressure in elderly symptomatic OSAS patients is similar to that of younger patients. Older patients with untreated OSAS have high healthcare utilization because of cardiovascular disease morbidity and use of cardiovascular and psychotropic medication. In this presentation the importance of individualized management approach OSAS will be discussed. Keywords : aging, sleep apnea, cognitive impairment

SS24 226-C-2
ASSESSMENT TOOLS TO USE IN OLDER ADULTS WITH OSA SYNDROME

S.-hakki ONEN (*Geriatric Sleep Medicine, University of Lyon, Hospices Civils de Lyon, Hoipital Geriatrique A. Charial, France*)

Introduction : Obstructive sleep apnea (OSA) syndrome is a common disorder in older adults. However, it is still underdiagnosed and not always appropriately assessed in geriatric settings. Method : Polysomnogram (PSG) is the gold standard for diagnosing OSA. However, it is unavailable to many older patients. Furthermore, this test is costly, time consuming, labor intensive and cannot be applied as a screening tool on a mass level for large populations. The Epworth sleepiness scale widely used to assess excessive daytime sleepiness is not validated in geriatric settings and inappropriate for many frail older adults as it relies on cognitive status and memory to answer the questions. Results : New simple clinical tools to screen OSA and assess OSA-related excessive daytime sleepiness in older adults are now available. Thus, two main tools designed for geriatricians and gerontologists will be presented. 1) The Observation-based Nocturnal Sleep Inventory (ONSI). The ONSI requires the nursing observations in 5 standardized hourly visits in one night. 2) The Observation and interview based Diurnal Sleepiness Inventory (ODSI). Conclusion : As the numbers of the older adults increase worldwide, the prevalence and significance of OSA will also increase, demanding greater attention and allocation of the financial resources. The ONSI and the ODSI are both important for managing patients with OSA and controlling health care cost. References: 1) Onen et al. J Am Geriatr Soc. 2008; 56(10):1920-5. 2) Onen et al. of print]. Keywords : sleep apnea, ONSI, ODSI

SS24 226-C-3

OSAS AND COGNITIVE IMPAIRMENT IN OLDER ADULTS

Donald BLIWISE (*Neurology, Emory University School of Medicine, USA*)

Introduction : This presentation will focus on the complex array of data that speak to cognitive impairments associated with OSAS. Method : Literature Review. Results : First we will provide an overview of cross-sectional studies in middle aged adults that suggest neuropsychological impairments in conjunction with OSAS and the potential reversibility of those deficits with nasal CPAP. Next we will briefly review neuroimaging studies that suggest that higher order brain structure and function may be compromised with sleep apnea. We will then move into the more equivocal area of impaired cognition in the elderly, including dementia syndromes such as Alzheimer's Disease, Parkinsonism, as well as Mild Cognitive Impairment, and review new longitudinal data, as well as some recently published randomized clinical trials that speak to issues of potential reversibility of cognitive impairment associated with OSA. Special attention will be placed on comorbidities, such as cardiovascular disease and impaired glucose control, that can be associated both with OSAS and impaired cognition. Finally, we explore the possibility that sleep may be an important mediator of memory consolidation on a short-term (i.e., an hour-to-hour) basis and review the newest findings on this exciting topic. Conclusion : Studies will be synthesized. Keywords : Obstructive sleep apnea, cognitive impairment

SS24 227-C

THE WAR AGAINST POLYHARMACY (1) - LET US TREAT THE PATIENTS, NOT THE NUMBERS

SS24 227-C-1

THE TSUNAMI IN 21ST. CENTURY HEALTH CARE: THE AGE-ASSOCIATED VICIOUS CIRCLE OF CO-MORBIDITY MULTIPLE SYMPTOMS ? OVERDIAGNOSIS-OVER TREATMENT-POLYPHARMACY

Doron GARFINKEL (*Palliative Geriatric, Shoham Geriatric Medical Center, Pardes Hana, Israel 37000, Israel*)

Introduction : Paradoxically, modern medicine may harm healthy people as a result of over-diagnosis (OD). Improved medical technology is associated with an alarming increase in the number of potentially unnecessary tests. OD occurs when people are diagnosed with diseases that ultimately will not cause them to experience symptoms, morbidity or mortality. Results : The main reasons for the increase in OD: Improved screening technologies detect early pathological processes enabling identification of less severe forms of diseases in people with or even without symptoms; these earlier "abnormalities" may never progress to cause symptoms, morbidity or death. OD may also result from excessively widened disease definitions that, at least in part, is highly fuelled by the drug & diagnostics Industries. Changing diagnostic criteria for many conditions increase the numbers of people defined as sick and, with increasingly lower risks, receive medical labels as being sick. Conclusion : Then, based on Clinical Practice Guidelines (CPGs) for each 'disease' many more are being treated by preventive/curative therapies sometimes until death. The benefit/risk ratio of these CPGs is decreasing and becomes negative as age increases and particularly as life expectancy shortens. Apart from negative psychological, social and economic effects of erroneous labeling, OD results in over medicalization, overtreatment and subsequently inappropriate

medication use (IMU) and polypharmacy. These in turn, may cause adverse effects, new symptoms, more medications, hospitalizations due to IMU with the associated unnecessary substantial costs for both. In three symposia, members of the International Group for Reducing IMU/Polypharmacy (IGRIMUP) will discuss the ways or improving IMU/Polypharmacy. Keywords : Over-diagnosis, overtreatment, Polypharmacy

SS24 227-C-2

STOP MEDICATING BEYOND THE EVIDENCE ? GUIDELINES FOR GUIDELINES ON PREVENTIVE TREATMENTS

Marcella Angelina EVANS (*School of Medicine, University of California Irvine School of Medicine, USA*)

Introduction : All tests and treatments bear risks as well as benefits. Historically, many widely used or recommended preventive measures were later found not to confer benefit, or even to produce harm, overall or in subgroups. Known instances could have been prevented, by adopting Guidelines for Guidelines on Preventive Measures. Method : 1.Consider All-Cause Mortality: The patient must be the unit of interest for preventive measures. Benefit to one system or outcome is inadequate, and may be offset (or worse) by distributed harms to other outcomes. Emphasize all-cause mortality, which objectively and equitably balances major risk and benefit. All-cause serious morbidity commonly tracks mortality. 2. Consider Effect Modifiers: If a group reflecting the sex, age, and health status of that patient has not been separately studied, that patient group must not be included in recommendations. Further factors like age (within a group), frailty, comorbidities, polypharmacy, affect (typically adversely) risk-benefit and merit formal consideration in clinical decisions. 3.Require Consistent, Nontrivial Benefit from Non-industry Sources. Publication and presentation bias make published findings likely favorable relative to reality; and self-selection for participation renders study participants, even those who appear similar, generally healthier with better risk-benefit balance than typical "similar" patients. If apparent benefits aren't consistent and sizeable (for that group), real benefits cannot be presumed. 4.Reject Authority of Guidelines Involving Participation by Industry-Conflicted Individuals. Conclusion : Adoption of these Guidelines for Guidelines will help protect from current and future instances in which recommended measures harm, rather than benefit, patients. Keywords : Guidelines for Guidelines, Prevention, Polypharmacy

SS24 227-C-3

THE MANNER OF OUR DYING: PREVENTION AND POLYPHARMACY

Dee MANGIN (*Dept of Public Health and General Practice, University of Otago, New Zealand*)

Introduction : Preventive health care aims to delay the onset of illness and disease and to prevent premature deaths. But the theory and rhetoric of prevention do not address the problem of how such health care applies to people who have already exceeded an average lifespan. Current systems of research and clinical guidelines where preventive treatments are encouraged regardless of age mean the 'Good Doctor' may end up providing care that is meaningfully worse for the person, with polypharmacy almost inevitable. This situation is fuelled by several factors; single disease perspectives, sensitivity about age discrimination and financial gains for pharmaceutical companies from expanding markets. Method : Recommendations for statin use in the elderly are examined to illustrate these issues: While there is a clear effect on mortality and morbidity from cardiovascular disease, all

cause mortality remains the same, and rates of cancer diagnosis and death are higher in the statin treatment group than in the placebo group. Conclusion : Treatments to prevent particular diseases in older people may simply be selecting for other causes of death and increased morbidity, without improving health or longevity. A more sophisticated way of assessing the benefits and harms of prevention and treatment of risk factors is required that takes a wider perspective. Overdiagnosis and overtreatment are real threats to health older age. Providing good care in the future will be defined by a new approach to prevention ? one that values and supports decisions not to investigate, label and treat, and where comparative safety is as valued as comparative efficacy. Keywords : Polypharmacy, Prevention, Statins

SS24 227-C-4

ACKNOWLEDGING FRAILTY WITH GUIDELINES: A FRAILTY SPECIFIC APPROACH TO THE TREATMENT OF DIABETES, HYPERTENSION, AND DYSLIPIDEMIA

Laurie MALLERY¹, Paige MOORHOUSE¹, Michael ALLEN², Isobel FLEMING², Kim KELLY³, Brian STEEVES⁴, Brenda COOK⁵, Peggy DUNBAR⁵, Tom RANSOM¹, Pam MCLEAN-VEYSEY³ (1. Department of Medicine, QEII Health Sciences Centre, Dalhousie University, Canada; 2. Continuing Medical Education, Dalhousie Academic Detailing Service, Dalhousie University, Canada; 3. Drug Evaluation Unit, Department of Pharmacy, Capital Health, QEII Health Sciences Centre, Canada; 4. Continuing Care Nova Scotia, Guysborough Antigonish Strait Health Authority, RK MacDonald Nursing Home, Canada; 5. Diabetes Care Program of Nova Scotia, Canada)

Introduction : Frailty is a common condition that results in vulnerability, decreased life expectancy, and functional decline. As such, medical therapies that work well for healthier patients might not be applicable for the frail. For this reason, those with multiple chronic health conditions and frailty deserve frailty-specific treatment protocols that carefully consider the harms and benefits of treatment on the background of frailty. Method : In response to this need the Palliative and Therapeutic Harmonization (PATH) program, the Dalhousie Academic Detailing Service, and the Diabetes Care Program of Nova Scotia developed and disseminated guidelines for the treatment of frail older adults with hypertension, hyperlipidemia and type II diabetes. Conclusion : This presentation describes these guidelines and reviews the evidence that was used to justify liberalizing targets for these conditions. Keywords : Frailty, Clinical-Guidelines, Palliative

SS24 227-C-5

PALLIATIVE AND THERAPEUTIC HARMONIZATION: SHINING A LIGHT ON PHARMACOTHERAPY

Laurie MALLERY, Paige MOORHOUSE (Division of Geriatric Medicine/Department of Medicine, QEII Health Sciences Centre, Dalhousie University, Canada)

Introduction : The intricate web of complex issues associated with frailty can find traction in custom-built processes that consider the vulnerability and prognosis of frailty. Method : Palliative and Therapeutic Harmonization (PATH) is a set of services and protocols that improves the organization of health services and guides health professionals, frail older adults, and families towards appropriate decision-making with frailty using a standardized process. This presentation describes the PATH framework and how it can be used to address polypharmacy. We review the need to develop and popularize frailty-specific treatment guidelines to offset the influential messaging of conventional clinical practice guidelines, which often overshadows

more sensible approaches that would be pertinent for the frail. Conclusion : By juxtaposing the properties of frailty against available evidence for benefit and harm from drug treatment, we review an evidence-informed approach for creating new treatment guidelines that fit the special circumstances of frailty. Keywords : polypharmacy, frailty, guidelines

SS24 306-R

AGEING AND THE POST-2015 GLOBAL FRAMEWORK

SS24 306-R-1

STRENGTHENING THE EVIDENCE BASE ON AGEING AND HEALTH IN LOW AND MIDDLE INCOME COUNTRIES

John BEARD (Department of Ageing and Life Course, World Health Organization, Switzerland)

Introduction : Population ageing is an almost inevitable consequence of socioeconomic development. In its early stages, development leads to falls in childhood mortality and these have typically been followed by falling fertility. This results in a population bubble that temporarily boosts the proportion of the population of traditional working age and reinforces economic growth. But this bubble eventually ages. Countries have the brief period between falling fertility and population ageing to put in place the infrastructure and policies that can meet the needs of these older populations. This period is getting briefer as these transitions are taking place much more rapidly than in the past. Planning for these predictable population dynamics needs to be a central component of the global strategies that will replace the Millennium Development Goals. Method : Review of evidence on ageing and health in less developed countries. Results : Current knowledge of the health and needs of older people in low and middle income countries is very limited and monitoring frameworks that can guide this process have rarely been designed to consider the key challenges for older populations. Conclusion : This presentation will examine the opportunities and challenges for strengthening evidence gathering, data collection and analysis at a global level. Particular attention will be paid to new evidence emerging from low and middle income countries and to the development of a more appropriate monitoring and surveillance frameworks. Keywords : development, socioeconomic

SS24 306-R-2

TOOLS FOR STRENGTHENING GLOBAL AGEING-RELATED STATISTICS IN THE POST-2015 DEVELOPMENT AGENDA

Asghar ZAIDI (Social Sciences, University of Southampton, United Kingdom)

Introduction : Rising life expectancy has been observed across the globe, in poorer and wealthier countries alike. The emphasis in many policy agendas is increasingly about ensuring that the potential of older people is fully realised, not just in employment but also in their social activities (such as volunteering and care provision) and in their abilities to ensure healthy, independent and self-reliant living. The global development framework that is set to replace the Millennium Development Goals at the end of 2015 must take this emerging policy agenda into account. Method : In this context, there is a clear need for a high-quality and independent evidence base in all countries to understand better the experience of ageing at individual and societal levels and improve the well-being of older people. The better the evidence, the easier it is to formulate policy responses and persuade the policymakers as well as the public about the benefits of more effective policies and interventions targeting the needs of people in

later life. Results : This presentation will focus on two specific tools that will help facilitate better data and evidence gathering and its analysis: the Global AgeWatch Index project of HelpAge International provides national and international quantitative evidence, data and analysis on population ageing and will advance the global call for key datasets to be disaggregated by age and sex. The Active Ageing Index project's core endeavour is to operationalize the multidimensional concept of active ageing and present evidence that rising longevity can become an asset for the societal progress. Keywords : evidence-based policymaking, ageing

SS24 306-R-3

AGEING IN SUB-SAHARAN AFRICA'S POST-2015 AGENDA? THE ROLE OF EVIDENCE AND GERONTOLOGICAL PERSPECTIVES

Isabella ABODERIN (*African Population and Health Research Center (APHRC), Kenya*)

Introduction : Being among the world's poorest and least 'developed' nations, sub-Saharan Africa (SSA) countries have, over the last decade, oriented their health and social sector action primarily toward the priorities set by the Millennium Development Goals (MDG). The goals focus on enhancing the survival and human capital of children and young adults and have been seen as compatible with core socio-economic development objectives in SSA. In contrast, concerns of older persons, omitted in the MDGs, are typically viewed as marginal, at worst a distraction from these interests. A key challenge is to promote the inclusion of ageing issues in the UN framework that will succeed the MDGs after 2015 and whose content will be determined - much more than were the MDGs - by UN member states themselves. Method : A critical review of recent international and Africa-regional and national development policy agendas and debates. Results : Convincing SSA governments of the need for an ageing-responsive post-MDG agenda, will hinge on the building of incisive, evidence-based arguments, which illuminate the relevance of ageing to central SSA development interests, and which provide directions on policy responses and measurable targets. Conclusion : A spectrum of evidence on four key areas of older people's circumstances in SSA is required. Drawing on gerontological concepts and perspectives is vital in this regard - both to fashion sound 'understandings' of empirical realities in SSA and, in the process, to advance and refine theoretical debates on global ageing. Keywords : sub-Saharan Africa, development, local ageing

LONG-TERM CARE, SOCIAL WELFARE AND SOCIAL LAW: KOREA AND GERMANY

Wolfgang SCHUETTE (*Economics and Social Affairs, HAW-Hamburg, University of Applied Sciences, Germany*)

Introduction : Security systems which function well in one country, will not necessarily gain acceptance in another. In this vein I would

like to look at Korea and Germany, where long-term insurances have been introduced some years ago. What are the effects, what is similar, what is different? Method : For this reason I would present some details about the complex constraints surrounding the long-term care insurance Germany introduced in the mid-1990's and our experience with it, and also about some impressions from interviews and researches in Korea during this summer semester. The theoretical approach is grounded on the legal sciences and their way to compare law-institutions in different countries. But further I would explain my results in a socio-cultural view, asking questions like these: Long-term care: The relevance of families in traditional and modern settings? Legislation and social policy: Why people trust in law? Financing: Contributions for social security and the willingness to share personal incomes? Implementation of health care services for the elderly: Based on public services, civil society or private assistance? Results : Comparing social law may content the reconstruction of the social and political context, when government and parliament decided about long term care insurances. Also it means analyzing the experiences in the following years, the organizational conditions of implementation, and the cultural and social context for providing assistance for elderly people. Keywords : Social Law, Long-Term Care Insurances, Korea and Germany

SS24 307-S-3

DEVELOPMENT AND CHANGES IN THE SYSTEM OF QUALITY ASSURANCE IN THE JAPANESE LONG-TERM CARE

Koichi HIRAOKA (*Department of Sociology, Ochanomizu University, Japan*)

Introduction : The Purpose of this study is to describe the development and changes of the system of quality assurance in the Japanese long-term care, to analyze the challenges that this system is faced with and to raise some issues for discussion as to its future direction of development. Method : Review of academic literature; examination of documents published by the central and local governments, research institutions and care agencies; analysis of statistics on long-term care in Japan. Results : After the description of the development and changes of the system of quality assurance in the Japanese long-term care, the achievements and the limitations of each of the following measures for assuring the quality of care in the long-term services were examined; regulation and inspection, third-party evaluation, mandatory disclosure of information, training and certification of care workers, care management, complaints procedures and economic incentives. Conclusion : The measures adopted by the government for the improvement of the quality of care have been diversified since the time of the launch of the LTCI scheme. Traditional types of regulatory mechanisms still play an important role. Major improvements are needed in the new innovative measures for the quality assurance. The importance of introducing program evaluation needs to be stressed. Keywords : Long-Term Care Insurance, quality assurance, evaluation

A STUDY ON TWO DIFFERENT WELFARE STATES' CARE-GIVING POLICIES FOR THE INFORMAL CAREGIVERS AND ITS IMPLICATION ON KOREA'S LONG TERM CARE INSURANCE SCHEME

Keun-hong KIM¹, Youngjun CHOP² (*1. Graduate School of Social Welfare, Kangnam University, Korea; 2. National Institute of Dementia, Korea*)

Introduction : In 2008, Korea established its National long-term care insurance for the aged. For the last years, the insurance has shown

some defects to be improved, especially regarding to providing benefits for informal caregiving. This study aims to suggest policy alternatives by analyzing two countries which have developed and modified their long-term care policies for decades. Method : Policy analysis with literature review. Results : The means test welfare state, which typified by the U.K, provides benefits for informal caregivers with the benefit program named 'Carer's Allowance', while the subsidiarity welfare state, typified by Germany has integrated informal caregiving into policy area along with the history of Pflegeversicherung. Conclusion : The result showed that the two different countries have developed their own policies to assist informal caregivers in long-term care schemes, being affected by unique factors, such as; cultural backgrounds, political ideologies, and the way how they treat the demand of caregivers. Those differences are full of policy suggestions for Korea's long term care policy, which has to find a way to deal with informal caregivers' demand and difficulties. Especially, considering the Germany's Bismarck's scheme of social safety net with Pflegeversicherung allowing informal caregiving, has a positive impact on caregiving issues, Korea, which traditionally have emphasized family role on caregiving, might consider policy options of embracing informal caregiving into the scheme of its long-term care insurance compensation mechanism. Keywords : Informal caregiving, Welfare states, Comparative study

CRITICAL ISSUES OF EQUITY AND WELLBEING FOR OLDER PEOPLE

SS24 308-R-1
WEALTH, RETIREMENT AND WELLBEING: AN EXAMINATION OF THE PATTERNING OF INEQUALITY IN THE US AND ENGLAND

James NAZROO, Stephen JIVRAJ, Alan MARSHALL, Bram VANHOUTTE (CCSR, University of Manchester, United Kingdom)

Introduction : There is a strong suggestion of a U-shaped relationship between age and wellbeing in later life, with wellbeing improving in the years around retirement age. However, this evidence is not uniform across subgroups of the population. An examination of the relationship between retirement and wellbeing needs careful consideration of the heterogeneous nature of the retirement process and how it relates to employment circumstances, socioeconomic position and institutional factors, including at a national level. Method : These issues will be examined using panel data from the English Longitudinal Study of Ageing and the US-based Health and Retirement Study. Both are nationally representative studies of the population aged 50 and over, designed in parallel to enable comparative analysis, and will provide five waves of data covering the period 2002-2010. In addition, because of their multidisciplinary design, both studies contain detailed information on health, economic and social circumstances, allowing an in-depth investigation of the correlates of changes in wellbeing around the retirement transition. Results : Findings focus on the relationship between retirement and wellbeing in relation to: -Transitions from both employment and from non-employment into retirement; -The quality of work pre-retirement (eg, the balance between effort/reward and control/demand at work); -The nature of the retirement transition (eg, voluntary, involuntary, routine); -Post-retirement economic circumstances, and change in economic circumstances around retirement; -Differences in the distribution of these factors and their relationship with wellbeing in the contrasting welfare systems of the UK and US. Conclusion : The impact of retirement on wellbeing relates to strongly inequality, but sometimes in unexpected ways. Keywords : Retirement, Wellbeing, Inequality

SS24 308-R-2
IDENTITY AND WORK VULNERABILITY IN LATER MIDLIFE, BALANCING AGE, WORK AND LIFE-PRIORITIES
Simon BIGGS¹, Helen KIMBERLEY², Dina BOWMAN² (1. School of Social and Political Sciences, University of Melbourne, Australia; 2. Research and Policy Centre, Brotherhood of St Laurence, Australia)

Introduction : The dynamics, lived experience and outcomes of involuntary non-participation and under-participation in the labour market by Australians in midlife are becoming a critical social and economic issue. A project, funded by the ARC Linkage program, focuses on understanding pathways undertaken by people in later midlife which are often is not of their own choosing. The relationship between attitudes to work, ageing and life-priorities will be examined. The research involves inter-agency collaboration between Universities of Melbourne, Canberra NATCEM, Brotherhood of St Laurence & Jobs Australia. Preliminary findings will be discussed. Method : Integrated quantitative and qualitative findings from this project will be used to inform policy and practice developments to better target interventions and support for this group of vulnerable baby-boomers. Results : A number of research questions will be addressed during the study: 1. What are the trajectories of workforce participation and non-participation across the course of mid and later life? 2. What factors best predict pathways into or out of involuntary non-participation and under-participation in the labour market? 3. How does the experience of non-participation or under-participation in paid work affect mature age. Conclusion : Preliminary results will be described from the first phase of the project. These will examine the relationship between lifecourse experience, attitudes to ageing, work and work-life balance. Keywords : underemployment, lifecourse, attitudes

SS24 308-R-3
THE VIEWS OF OLDER PEOPLE AND CARERS ON EXCLUSION FROM PARTICIPATION IN CLINICAL TRIALS: RESULTS FROM THE PREDICT STUDY

Bernadette BARTLAM¹, Peter CROME², Lally FRANK³, Andrew BESWICK⁴, Antonio CHERUBINI⁵, Mark CLARFIELD⁶, Albert FARRE⁷, Cees HERTOOGH⁸, Vita LESKAUSKAITE⁹, Mills GARY¹⁰, Martin MULLER¹¹, Joaquim ORISTRELL¹², Gabriel PRADA¹³, Carmelinda RUGGIERO³, Judith SINCLAIR-COHEN¹⁴, Katarzyna Szczerbinska¹⁵, Eva TOPINKOVA¹⁶, Zbigniew ZALEWSKI¹⁵ (1. Institute of Public Health, Jagiellonian University Medical College, Poland; 16. Department of Geriatrics, Charles University, Czech)

Introduction : Concern over the inappropriate exclusion of older

people from clinical trials is longstanding. The PREDICT study used mixed methods to investigate the extent of this exclusion and to explore the views of those directly involved. This paper reports findings from that aspect of the study investigating the views of older people and carers. Method : Focus groups were held across nine countries: the Czech Republic, Israel, Italy, Lithuania, Holland, Poland, Romania, Spain and the United Kingdom (n=42) using a structured interview schedule. Discussants were those living with conditions commonly affecting older people: hypertension, cancer, dementia, heart failure, stroke and depression (n=285). Data were analysed using a thematic approach based on questions in the interview schedule. Issues raised fell into four themes: ageism; advantages and disadvantages to participation; the relationship between the participant and their research team; practical features to support participation. Results : Findings confirm that older people and carers see chronological age as insufficient reason for exclusion from trials. They highlight the complex relationship between healthcare professionals and trial participants, the need for cultural and generational sensitivity in trial design and the importance of including quality of life as an outcome measure. Conclusion : Exclusion of older people from trials leads to inappropriate prescribing, a common and serious global healthcare problem among older populations. Transparent and appropriate methods for obtaining and maintaining consent among diverse populations need to be developed. Older people have the right to evidence based treatments and exclusion from trials on the basis of age alone is an infringement of human rights. Keywords : Clinical trials, Exclusion, Older people

SS24 308-R-4

DIFFERENCES IN INCOME, ASSETS AND HOUSING AND THEIR POLICY IMPLICATIONS FOR HEALTH AND WELLBEING AMONG OLDER CITIZENS

Charles WALDEGRAVE (*Family Centre social Policy Research Unit, Family Centre, New Zealand*)

Introduction : The aim of this research is to identify the drivers of wellbeing and quality of life among the older population from the theoretical perspective of Amartya Sen's capabilities approach. The objective of the research reported here has been to analyse the statistical associations between income poverty and non-poverty, asset accumulation and housing tenure on the one hand and wellbeing, health and depression on the other. Method : The results of the first wave of the New Zealand Longitudinal Study of Ageing (NZLSA) will be reported. The study has a national random sample of 3,317 New Zealand citizens aged between 50 and 84 years. Objective measures of income, wealth and housing tenure are compared with 2 measures of wellbeing WHOQoL-8 and CASP-12, 2 measures of health SF-12 Physical and Mental Health and a measure of depression CES-D-10. Results : The results demonstrate consistently significant relationships between income, asset accumulation, housing tenure when compared with measures of quality of life and health status. Income above the poverty thresholds, greater asset accumulation and home ownership were consistently associated with greater wellbeing, better health and less depression. Conclusion : These results demonstrate the serious policy challenges if large numbers of older people drop below the poverty thresholds, have few assets to fall back on and/or have to rely on the market for rental accommodation. Given the worldwide demographic shift in ageing that is currently taking place, these challenges centre around ongoing income adequacy, education about and opportunities for savings and asset accumulation and adequate social housing provision. Keywords : poverty, housing, health

SS24 309-C

APPROACH TO THE FRAIL ELDERLY PATIENTS

SS24 309-C-1

EPIDEMIOLOGY AND IMPACT OF FRAIL ELDERLY IN THE AGING AND AGED SOCIETY

Yong Kyun ROH (*College of Medicine, Department of Family Medicine, Hallym University, Korea*)

Frailty is a common clinical syndrome in the elderly that carries an increased risk for poor health outcomes including falls, incident disability, hospitalization, and mortality. Frailty is theoretically defined as a clinically recognizable state of increased vulnerability resulting from aging-associated decline in reserve and function across multiple physiologic systems such that the ability to cope with everyday or acute stressors is comprised. Based on frailty criteria developed in CHS, the overall prevalence of frailty in community-dwelling older adults aged 65 or older in the United States ranges 7-12%. The prevalence of frailty in Korea is 11.7% in the Cardiovascular Health Study (CHS) and 13.4% in the Study of Osteoporotic Fractures (SOF). In this symposium, I will introduce the Questionnaire assessments such as Vulnerable Elders Survey, Frailty Wheel, Korean frailty index, and The 15 item Kaigo-Yobo Check-List (Japan) for evaluation of frailty. And I will describe the prevalence of frailty in the aging and aged society and how it affects the health of the elderly.

SS24 309-C-2

CLINICAL MANAGEMENT OF FRAILTY

Belong CHO (*College of Medicine, Department of Family Medicine, Seoul National University, Korea*)

Clinical management of frail older individual is challenging because there is no firm consensus how to assess and manage it. Therefore, Functional Research Group of Korean Geriatric Society made manual and tool for management of Geriatric Functions. We will introduce the manual and tool to update current clinical management of frailty. This tool approached frailty with index and component of frailty to detect and manage because frailty consists of many kinds of different health problems. It focused on identification and management of the underlying cause of frailty. Even though much clinical management couldn't reverse the frail status per se, some interventions such as nutrition and exercise have shown good results in some clinical trials. There are more to prevent and delay frailty because we have many clinical interventions and tools which showed delay of frailty. Keywords : Frailty, Comprehensive geriatric assessment, frailty management

SS24 309-C-3

FRAILY IN THE LONG-TERM CARE FACILITY

Hyuk GA (*Institute of Geriatric Meidicine, Incheon Eun-Hye Hospital, Korea*)

Introduction : Korea is one of the most rapidly aging countries in the world. Between 1990 and 2010, the percent of Koreans aged 65 years or older rose from 5.1% to 11.0%, and is estimated to reach 24.3% by 2030. In a study among Korean elderly people aged 65 years or older, 86.7% had at least one chronic disease, 5.3% were dependent in all activities of daily living(ADL). Accordingly, the number of elderly people who are frail and need institutionalized care has also increased abruptly. Method : I will search for the recent studies about Korean elderly people's status of frailty and the long-term care facilities providing services for them. Results : I will describe and summarize above research concerning the epidemics of Korean elderly people's

frailty. Conclusion : I will conclude my talk suggesting comprehensive care of frail elderly patients who need long-term care in facilities. Keywords : long-term care, nursing home, long-term care hospital, frail

SS24 310-R

ACTIVITY ENGAGEMENT AND HEALTHY AGING

SS24 310-R-1

PATTERNS OF ACTIVITY INSIDE AND OUTSIDE THE HOME BY CHRONIC HEALTH CONDITIONS AND AGES

Carolyn BAUM (*Program in Occupational Therapy, Washington University School of Medicine, USA*)

Introduction : Biological changes may limit older adult's participation in activity. In addition they are increasingly challenged with chronic diseases. Older adults may eventually lose the ability to perform activities as they used to, but their capacity to engage in activities and derive a sense of wellbeing from them still exists. This paper introduces a simple valid measure of activity participation that can be used to document changes in activity participation as people age and experience chronic health conditions. Method : Common data elements in approved studies provided 460 people age 55-100 living in the community. Sixty four percent were female, 86% Caucasian, 14% African American, and 36% lived alone. The Activity Card Sort (ACS) is a validated and culturally appropriate tool that measures instrumental leisure, fitness and social activities. For the purpose of this study, the activities were coded as those performed at home and those performed in the community. Results : Older adults under 65 spend less time in home and community activities than those 75-80. Between 65-75 years, they increase activities in both. The number of chronic diseases does not impact home and community activities, but their perception of health does. Older adults with more education are more active in community and home activities. There no differences in male and female home activities, but men engage in more community activities. Conclusion : The data demonstrate the usefulness of the ACS for clinical and research purposes. There are 8 culturally valid versions of the ACS that can be used in global studies. Keywords : Participation, home, community

SS24 310-R-2

CROSS-CULTURAL DESCRIPTION OF ACTIVITY PARTICIPATION AMONG ADULTS AND OLDER ADULTS

Gunilla Margareta ERIKSSON (*Neurobiology, Care Sciences and Society, Karolinska Institutet, Stockholm, Sweden*)

Introduction : Activity Card Sort is developed into culturally relevant versions in 8 countries. Inspired by the ACS the Occupational Gaps Questionnaire (OGQ) was developed, measuring to which extent people do what they want to do. The ACS and the OGQ have been used to describe participation in everyday activities. The ACS identified central activities across cultures and central activities for older adults in Asian and Western cultures. Occupational gaps were identified in persons with stroke in Sweden and Iran. Comparison was made to a Swedish reference sample. Method : Samples of older adults responded to culturally relevant versions of the ACS (n=558; aged 60-104). The OGQ-samples were Swedes with stroke (n=200; mean age 69) Iranians with stroke (n=102; mean age 58) and a Swedish reference sample (n=170; aged 65-86). The ACS and the OGQ are validated and culturally appropriate tools. The OGQ assesses perceived gaps in instrumental ADLs, leisure and social activities and work. Results : Older adults shared 10 central activities; shop in a store, do grocery shopping, do dishes and laundry, read books or

magazines, sit and think, watch television, listen to radio or music, visit with friends and relatives, and talk on the telephone. People with stroke in Iran predominantly perceived gaps in instrumental ADLs; in Sweden people with stroke perceived most gaps in leisure and social activities. The Swedish reference sample reported gaps in instrumental ADLs and social activities. Conclusion : These descriptions provide a starting point for further exploration of everyday activities among older adults and persons with disabilities across cultures. Keywords : activity engagement, disability,

SS24 310-R-3

ANTECEDENTS AND HEALTH OUTCOMES OF ACTIVITY PATTERNS OF OLDER ADULTS IN THE U.S.

Nancy MORROW-HOWELL¹, Michelle PUTNAM², Yungsoo LEE³ (*1. Friedman Center for Aging, Washington University, USA; 2. Social Work, Simmons College, USA; 3. Brown School of Social Work, Washington University, USA*)

Introduction : The current literature has been limited by focusing on one or two activities at a time to explain health outcomes among older adults. In this study, we advance knowledge about activity engagement by considering many activities simultaneously to identify patterns of activity among older adults. Further, we use cross-sectional data to explore factors associated with activity patterns and prospective data to explore activity patterns and well-being outcomes. Method : We used the core survey data from the years 2008 and 2010 as well as the 2009 Health and Retirement Study Consumption and Activities Mail Survey (HRS CAMS). The HRS CAMS includes questionnaires assessing individual activities, measured by hours per week or hours per month. We used factor analysis and cluster analysis to identify activity patterns and structural equation modeling to assess antecedents and outcomes associated with activity patterns. Results : We identified five activity patterns: Low-Activity, Moderate Activity, High Activity, Retired, Working and Physically Active. These patterns varied in amount and type of activities. Demographic and health factors are related to patterns. For example, lower SES older adults are more likely to be in the Low-Activity group. Activity patterns were associated with self-rated health, depression symptoms, and functioning but not life satisfaction. Conclusion : The use of a five-level categorical activity pattern variable allows more complex analyses of activity that capture the "whole person." Older adults adapt different patterns of activities and identifying the most optimal patterns for well-being outcomes can guide program and policy development. Keywords : activity patterns; activity engagement

SOCIAL CLASS AND INEQUALITIES IN RETIREMENT

SS24 313-S-1

CLASS, CARE AND CARING IN LATER LIFE

Christina VICTOR (*School of Health Sciences and Social Care, Brunel University, United Kingdom*)

Introduction : Older people, those aged 65 years and older, experience a range of age-related conditions such as arthritis, respiratory disease, circulatory disease and mental health problems such as depression and dementia. The prevalence of these conditions increases with age as does multiple pathology. One consequence of this age-related increase in morbidity is that older peoples' ability to remain living independently in the community may be compromised as they experience difficulties with essential activities of daily living. Method: Only a minority of older people, 5-10% receive formal community services provided by statutory, voluntary or private sector

organisations and informal carers provide 90% of help provided with activities of daily living and health care tasks. Results : Informal or family care is fundamental to any community care policy for older people and the contribution of the family generally in providing care is well established both qualitatively and quantitatively. Approximately 12% of adults self-define themselves as 'informal carers' whilst 56% of adults expect their family to provide care and support in old age. Conclusion : In this paper we examine how health care needs are differentially distributed within the older population and the importance of class (and gender and ethnicity) in the distribution of both longevity and morbidity. We then examine how the typology of caring about, taking care, care giving and care receiving extends our understanding of the formal and informal care sectors and how these dimensions of caring are linked to the key socio-structural factors of class, gender and ethnicity. Keywords : Class Caring

SS24 313-S-2

CLASS, COMMUNITY AND INEQUALITY IN LATER LIFE

Ian Rees JONES (*Social Sciences, Cardiff University, United Kingdom*)

Introduction : The roles, social relations and material circumstances of older people have been focal points for many community studies in the past. In the new contexts that have accompanied the economic and technological changes of second modernity older communities of propinquity and attachments to locale and place remain, but in different circumstances. At the same time communities of interest become increasingly important. It is here also that our understandings of the relationship between class and later life are being challenged empirically and theoretically. Method : This paper reviews the literatures on community and class in later life and addresses the scope for exploring concepts of class and community together within the complex interplay of locality and identity as a means of understanding the construction of inequalities and exclusion in later life. Results : Research on community and later life has produced ambiguous results reflecting how, for older people, the profound social changes that have accompanied nascent globalization throw up contradictions and tensions. For example, being linked to local communities may have beneficial aspects and be desired but may also be associated with being stuck, unchanging and old. For some, who have financial, social and cultural capital, community may involve active choices; for others it may be part of an experience of isolation and exclusion. Conclusion: The paper will argue that considerations of the implications of the emergence of a relatively lengthy post-working life are not yet fully incorporated into studies of community and social cohesion. Keywords: Class, Community, Inequality

SS24 313-S-3

SOCIAL CLASS DYNAMICS IN LATER LIFE: A MALTESE CASE-STUDY

Marvin FORMOSA (*European Centre for Gerontology, University of Malta, Malta*)

Introduction : The purpose of this presentation is to address the evanescent character of social class in social gerontology. Following a discussion of the travails of the class concept in ageing studies, this article reports upon an empirical study on class structures and identities in later life carried out in Malta. Drawing inspiration from Pierre Bourdieu's sociology of class, results indicate that although in second modernity it is not longer possible to regard retirement as a residual component of the class structure, class structures and identities in later life have not melted in thin air. Method : The method consisted of a case-study of class structuring amongst older persons in

Malta. Definitions of case studies vary but, in essence, all promote the notion that the researcher aims at knowing a single entity or phenomenon - that is, the case - through the collection of data through various procedures. Results : Qualitative data highlight three key classes inhabited by older people in Malta - namely the working class, the middle class, and the dominant class. Subjects also held distinct class identities which arose in 'cultural' and 'implicit' ways. This article demonstrates that although older persons no longer spontaneously and unambiguously use the language of class as obvious, elders do not constitute thoroughly individualised beings who fly completely free of class relations. Conclusion : This article confirms that modern conceptualisations of class, especially those championed by the political economy standpoint, are no longer relevant on their own to understand diversity and inequality in later life. Keywords : class, inequality, retirement

SS24 314-S

USING TECHNOLOGY FOR THE CARE OF OLDER ADULTS

SS24 314-S-1

INTERNET VIDEO CONFERENCING SUPPORT GROUPS OLDER ADULTS WITH CHRONIC DISEASE AND THEIR CAREGIVERS

Elsa MARZIALI (*Rotman Research Institute, Baycrest, Canada*)

Purpose: At Baycrest we have developed and evaluated two web-based video conferencing intervention programs; Caring for Other (CFO)©; Caring for Me (CFM)©. Objectives of the programs include, a) helping family caregivers manage more effectively the care of persons with neurodegenerative diseases, b) help patients with chronic diseases e.g. cardiovascular, Type II diabetes maintain adherence to prescribed rehabilitation regimes, and c) improve health outcomes and quality of life for caregivers and chronically ill patients. Programs: Participants in each program access a password protected web site that is user-friendly with a structure and functionality that includes, a) peer group e-mail link; b) threaded discussion forum; c) videoconferencing link for one-on-one and group meetings, and d) posted educational materials and links to disease-specific websites. A simplified computer training manual is used to train participants to negotiate the web site. Each intervention program consists of ten weekly online group meetings facilitated by a professional clinician. Intervention training manuals are used to insure reliable adherence to protocol for each intervention program. Results : Caregiver and Patient Response: For all groups, participants responded positively to using technology to communicate with health care professionals and peer-group members. Analysis of group process extracted key issues of concern. Participants reported reduction in stress, reduction in feelings of isolation, improved self-efficacy for caregiving and for self-care, and an improved quality of life. Conclusion : Practical Implications: Our Internet-based, video conferencing intervention programs for caregivers and for patients with chronic disease are evidence-based, easily accessible for clinicians, patients and informal caregivers regardless of geographic location. Keywords : internet video conferencing intervention chronic disease

SS24 314-S-2

DEVELOPMENT AND EVALUATION OF AN E-LEARNING PROGRAM FOCUSED ON NURSING ASSISTANTS' MANAGEMENT OF WORKPLACE STRESS

Anthony LOMBARDO¹, Elsa MARZIALI², Corey MACKENZIE³, Illia TCHERNIKOV⁴ (1. *Research, National Initiative for the Care of the Elderly (Nice), Canada*; 2. *Faculty of Social Work & Department of Psychiatry, Faculty of Medicine, University of Toronto, Canada*;

3. *Department of Psychology, University of Manitoba, Canada;*
4. *Research, Baycrest, Canada)*

Introduction : An e-learning program for nursing assistants (NAs) with a focus on management of stress arising from relationship conflicts with residents, families and co-workers was evaluated in a national survey of participant responses to the content, e-format, and applicability of the program to care practices. **Method :** NAs and their nursing supervisors were recruited from 17 long term care institutions across Canada (N=117). The e-learning program in DVD format could be viewed on computers or TVs at times convenient for NAs. Modules focused on NAs' management of work-related relationship conflict and self-care, nursing supervisor's support of NAs' management of work-related stress, and animations of NAs management of conflict situations. At each institution an educator recruited participants, arranged time and equipment for viewing DVDs, and arranged conference call follow up focus groups that were audio recorded and analyzed qualitatively. **Results :** Overall the NAs viewed the e-learning content and format as useful and relevant to their work situations. NAs reported greater confidence in managing conflicts with residents and less comfort dealing with families, co-workers and supervisors. Many NAs felt that their input to care planning was ignored and/or rarely solicited. Due to resident care demands, team meetings did not exist in many institutions and were infrequent in most others. **Conclusion :** This readily accessible e-learning program is useful as an initiation tool for new hires and a refresher course for more experienced NAs. The program will be revised to reflect gaps in institutional support of NAs management of work-related stress. **Keywords :** stress, technology, nursing

**SS24 314-S-3
DEVELOPMENT AND EVALUATION OF DEMENTIA
PATIENTS' RESPONSE TO PERSONAL MULTIMEDIA
BIOGRAPHIES**

Elsa MARZIALI (*Rotman Research Institute, Baycrest, Canada*)

Introduction : The purpose of this feasibility pilot project was to observe Alzheimer's disease (AD) and mild cognitive impairment (MCI) patients' responses to personalized multimedia biographies (MBs). We developed a procedure for using digital video technology to construct DVD-based reflective histories of persons with AD or MCI, documented their responses to observing their MBs, and evaluated the psychosocial benefits. **Method :** An interdisciplinary team consisting of multimedia biographers and social workers interviewed 12 family members of persons with AD and MCI and collected archival materials to best capture the families' and patients' life histories. We filmed patients' responses to watching the MBs and conducted follow-up interviews with the families and patients at 3 and 6 months following the initial viewing. Qualitative analytic strategies were used for extracting themes and key issues identified in both the filmed and the interview response data. **Results :** Analysis of the interview and video data showed that viewing the DVDs evoked long-term memories and stimulated reminiscing, brought mostly joy but occasionally moments of sadness to the persons with cognitive impairments, aided family members in remembering and better understanding their loved ones, and stimulated social interactions with family members and with formal caregivers. **Conclusion :** This study demonstrates the feasibility of using readily available digital video technology to produce MBs that hold special meaning for individuals experiencing AD or MCI and their families. **Keywords :** Alzheimer's disease

SS24 314-S-4

**ONLINE EVIDENCE-BASED INFORMATION TOOLS FOR
OLDER ADULTS**

Lynn MCDONALD (*Institute of Life Course and Aging, University of Toronto, Canada*)

Introduction : The purpose of this paper is to report on the development of digital evidence-based pocket tools for older adults, their families, professionals and students. The tools were created by an international knowledge exchange network established in 2005 by the National Centres of Excellence, Canada to improve the care of older adults in light of lagging professional education, research and community participation. The aim of NICE is to develop evidence-based knowledge in the form of pocket tools in both paper and digital formats. **Method :** The development of over 200 tools by eight knowledge teams (mental health, dementia, elder abuse, financial literacy, ethnicity, end-of-life, law and aging, and care giving) according to the guiding conceptual and the goal, targets, end users and outcomes and their evaluation is presented. **Results :** Tracking mechanisms using Google Analytics, shows that the tools page has had over 300 visitors in the first month of operation, with 32% of this total being return visitors. The average visit has been 4.5 minutes. The top 5 pages are the 1) landing page; 2) the paper ordering form 3) the elder abuse digital tools page; 4) the caregiving digital tools page; and 5) the end of life issues digital tools page. **Conclusion :** This is a promising start of digital knowledge dissemination and it is expected that the demand will be equivalent to surpass the paper tool demand of an average 6,000 tools per month. **Keywords :** Digital pocket tools, Knowledge exchange

**SS24 316-C
TREATMENT OF FRAILTY: PRACTICAL ASPECTS**

**SS24 316-C-1
TREATMENT OF FRAILTY: DEFINITIONS AND CONCEPTS**
Ian CAMERON (*Rehabilitation Studies Unit, University of Sydney, Australia*)

Introduction : Frailty is now well accepted as a concept relevant to older people. This term is widely used clinically and there is a substantial body of scientific literature available. Viewing this syndrome from a clinical perspective, the question of ability to "treat", or at least ameliorate, frailty readily arises. **Method :** Over the past decade, frailty has been clearly conceptualised and studied using systematic literature review and observational cohort studies. Intervention studies with the goal of "treating" frailty are infrequent but increasing in number. **Results :** Two main types of frailty model are available. These are an accumulated deficit approach and a phenotypic approach. Using either model it is established that frailty has a substantial incidence and prevalence in older people. Limited numbers of intervention studies have been performed in which frailty is specifically defined and very few studies have had frailty (specifically defined) as an outcome. There are also some studies investigating whether intervention is feasible in "pre frail" older people. Some studies suggest that "treatment" of frail and pre frail older people is beneficial. **Conclusion :** While frailty is well recognised and accepted clinically, treatment studies of frailty are at an early stage. **Keywords :** frailty, intervention study, exercise

**SS24 316-C-2
EFFECTS OF STRENGTH TRAINING IN PRE-FRAIL OLDER
ADULTS**
Susan KURRLE (*University of Sydney, Australia*)

Introduction : Aging is often paralleled by sarcopenia and loss of muscle mass and makes up a cornerstone of the (physical) frailty syndrome. Using the definition of frailty by Fried et al (2001), frailty can be scored in non-frail, pre-frail and frail. Whereas physical activity programs may serve in younger ages as a primary prevention for sarcopenia and therefore frailty, such programs ? often in conjunction with nutritional interventions to help to prevent aggravation of pre-frail older adults to suffer from the full blown frailty syndrome. **Method :** See above. **Results :** See above. **Conclusion :** There is good evidence that strength training has significant positive effects to achieve the goals stated above. Open research questions nevertheless still include several areas such as: When should strength training be started? How often and to what extent has it to be applied? What is the impact of strength training alone or in conjunction with nutritional interventional therapies? Are there specific populations achieving better versus worse results? How can strength training programs be implemented in selected patient groups (e.g. neurodegenerative disorders like Parkinsonism or dementia)? These questions will be discussed within the talk with a special focus on pre-frail older adults, meaning those entering clinically the frailty spiral. **Keywords :** frailty, intervention study, exercise

SS24 316-C-3

EFFECTS OF A HOME-BASED EXERCISE PROGRAM ON FRAILTY AND MOBILITY DISABILITY IN PEOPLE WHO HAVE BEEN IN HOSPITAL

Monica PERRACINI¹, Cathie SHERRINGTON² (1. *George Institute for Global Health, Australia*; 2. *The George Institute for Global Health, Musculoskeletal Division, Sydney Medical School, University of Sydney, Australia*)

Introduction : There is evidence that disability severity and frailty can be reduced by interventions including exercise. However, the potential for exercise to reduce frailty or mobility disability in older people who have spent time in hospital has not been established yet. The aim of this presentation is to discuss the potential effects of home exercise on frailty and report the results of a trial testing the impact of a home exercise program on frailty and mobility disability in older people recently discharged from hospital. **Method :** This is a secondary analysis of data from a randomized controlled trial of home exercise conducted among older adults recently discharged from hospitals in Sydney, Australia, aiming to reduce falls and disability. Participants were aged 60 years and had been admitted to and subsequently discharged from hospital wards. Participants in the intervention group were submitted to a program consisted of 10 home visits from an experienced physiotherapist in the 12-month study period. Participants were asked to undertake a 20 – 30 minute program of lower limb balance and strengthening exercises up to 6 times per week at home for 12 months. The exercise intervention program was based on the Weight-bearing Exercise for Better Balance (WEBB) program. The control group received usual care. **Results :** The study sample was composed of 340 patients with a mean age of 81.2 (7.9 SD) years. The distribution of participants according to frailty status in baseline was 63 (19%) non-frail, 171 (52%) pre-frail and 97 (29%) frail. Frailty and mobility disability status after 3 and 12 months of exercise will be presented. **Conclusion :** Frailty and mobility disability are important concepts and can potentially be treated with exercise. **Keywords :** frailty, exercise, disability

SS24 316-C-4

THE FRAILTY INTERVENTION TRIAL: A MULTIFACTORIAL INTERDISCIPLINARY INTERVENTION REDUCES FRAILTY

Susan KURRLE (*Northern Clinical School, University of Sydney, Australia*)

Introduction We hypothesized that frailty, defined using the Cardiovascular Health Study (CHS) criteria (three or more of weight loss, self-reported exhaustion, slow walking speed, limited energy expenditure and limited strength), can be treated and ameliorated in many patients. We have conducted a randomized controlled trial utilizing a multifactorial interdisciplinary intervention targeting CHS frailty components, and including goal setting and improving functioning. **Method :** 241 people aged 70 years and over, living in the community in Northern Sydney, Australia, who were frail using the CHS study criteria, were recruited and followed for 12 months. Their mean age was 83.3 years and two thirds were women. Participants were randomized to receive either the multidimensional frailty intervention, or usual care. The CHS classification of frailty in older people was compared at baseline, three months, and 12 months in both groups. Other outcome measures included functioning and health related quality of life. **Results :** Ninety percent of the sample completed the study. The mean CHS study frailty score was significantly improved at 12 months in the intervention group and improvements in the intervention group were also seen in the co-primary outcome which was mobility as assessed by the Short Physical Performance Battery. **Conclusion :** This study demonstrates, for the first time to the knowledge of the authors, that frailty as specifically defined using recognized criteria can be treated and reversed. These findings should be replicated. Efforts should be made to apply the techniques utilized to frail people in other countries and also to 'pre-frail' people. **Keywords :** frailty, disability, randomized trial

INTERVENTIONS FOR PROMOTING HEALTHY AGING

SS24 317-B-1

HEALTHY AGING WITH BOTANICAL EXTRACTS: THE IDENTIFICATION AND MECHANISTIC EVALUATION OF OF ANTI-AGING BOTANICALS

Mahtab JAFARI (*Pharmaceutical Sciences, University of California, Irvine, USA*)

Introduction : The focus of our research team is to screen and identify compounds and botanicals that can extend lifespan and improve health. We use the fruit fly, *Drosophila melanogaster*, as our main model system. **Method :** We then use cell culture, fly, and mouse models to evaluate potential molecular mechanisms. **Results :** To date, we have tested over 75 candidates and identified 5 botanicals capable of extending lifespan in the fly: green tea, cinnamon, curcumin, *Rosa damascena*, and *Rhodiola rosea*. In this presentation, data on the impact of these botanicals on lifespan, healthspan and pathways that may modulate aging such as the sirtuins, the target of rapamycin, and insulin signaling will be presented. **Conclusion :** Our results suggest these extracts may present novel therapeutic for aging and age-related diseases. While the precise mechanism through which these botanicals extend lifespan in flies is not yet clear, our findings with *Rhodiola rosea* largely rule out an elevated general resistance to stress and DR-related pathways as candidates. The latter conclusion is especially relevant given the limited potential for DR to improve human health and lifespan, and presents *R. rosea* as a potential viable candidate to treat aging and age-related diseases in humans. **Keywords :** lifespan, healthspan, dietary restriction, plant extracts

SS24 317-B-2

CRANBERRY SUPPLEMENTATION AS AN INTERVENTION

FOR PROMOTING HEALTHY AGING

Sige ZOU (*Translational Gerontology Branch, National Institute on Aging, USA*)

Introduction : Diet composition plays a critical role in modulating health and lifespan. Dietary custom varies among humans in different geographic regions. Nutraceuticals, such fruit extracts, contain high antioxidant and other bioactivities, and are ideal for promoting healthy aging. Whether and how diet composition, such as macronutrient composition, influences any potential longevity properties of nutraceuticals or pharmaceuticals are largely unknown. In the symposium, we will discuss our studies on investigating the effects of a cranberry-containing nutraceutical on health and lifespan in multiple model organisms, including flies and rodents. **Method :** We fed animals 2% cranberry extract and measured lifespan and gene expression changes in flies, morphological changes in pancreatic cells of rats and immune and morphological change in the brains of a mouse model of Alzheimer's disease (AD). **Results :** We found that cranberry can extend lifespan in flies. This lifespan extension, however, depended on dietary macronutrient composition since cranberry only extended lifespan in flies fed a high sugar-low protein diet but not a low sugar-high protein diet. In rats, cranberry supplementation delayed age-related loss of pancreatic beta-cells and improve insulin secretion in beta-cells. In the AD mouse model, cranberry supplementation reduced expression of some immune response proteins and delayed age-related accumulation of Abeta aggregates in the brain. **Conclusion:** Our findings suggest that cranberry can be used as an efficient and cost-effective intervention for promoting healthy aging. Our studies also point out the challenges and importance to consider diet composition or dietary customs in developing effective interventions for humans. This study was supported by IRP of NIA. **Keywords :** Nutraceutical; Diet composition; Oxidative stress

SS24 317-B-3

THE GEOMETRIC FRAMEWORK, MACRONUTRIENTS AND AGEING IN MICE

David LE COUTEUR¹, Samantha SOLON², Aisling MCMAHON², Kari RUOHONEN³, J. William BALLARD⁴, David RAUBENHEIMER⁵, Stephen SIMPSON⁶ (*1. Centre for Education and Research on Ageing, University of Sydney, Australia; 2. ANZAC Research Institute, University of Sydney, Australia; 3. EWOS Innovation, Norway; 4. School of Biotechnology and Biomolecular Sciences, University of NSW, Australia; 5. Institute of Natural Sciences, Massey University, New Zealand; 6. Charles Perkins Centre, University of Sydney, Australia*)

Introduction : Diet influences ageing yet its complexity has impeded the development of an overarching schema that reconciles the diverse and contradictory observations about the effects of dietary macronutrients and caloric intake on ageing. Here the Geometric Framework was used to interpret the influence of diets differing in energy, protein, fat and carbohydrate content on food intake, cardiometabolic phenotype and longevity in ad libitum-fed mice. **Method :** 858 mice were ad libitum-fed over a lifetime on one of 25 diets differing in content of protein (5-60%), fat (16-75%), carbohydrate (16-75%) and energy (8, 13 or 17 kJ g⁻¹ of food). These dietary compositions were chosen to sample a representative number of nutritional vectors and nutrient concentrations within protein-carbohydrate-fat diet space. One third of the mice were culled at 15 months of age and the remainder continued until they died naturally. **Results :** Longevity and late-life health were optimized by diets low in protein and high in carbohydrate. These diets were associated with lower activation of mTOR in the liver, lower insulin levels, improved

mitochondrial function and favorable lipid and blood pressure profiles. A clear association between diet, appetite and health outcomes was the circulating level of branched chain amino acids. **Conclusion :** The influence of dietary energy and macronutrients longevity can be reconciled by considering how the entire dietary landscape titrates food intake and regulatory pathways. **Keywords :** macronutrients, geometric framework, ageing

SS24 317-B-4

SYRINGARESINOL, A LIGNAN ISOLATED FROM PANAX GINSENG BERRY PULP DELAYED ENDOTHELIAL CELLULAR SENEESCENCE VIA UPREGULATION OF SIRT1 GENE

Si Young CHO (*Health Science Research Institute, R&D center, Amorepacific corporation, Korea*)

Increased SIRT1 expression exerts beneficial effects in transgenic animal models, ameliorating the onset and progression of aging-related disease phenotypes in various organs including the heart. The potential beneficial effects of SIRT1 have made SIRT1 a prime therapeutic target for age-related diseases and considerable efforts led to the identification of small molecule activator of SIRT1 protein. Thus far, however, a small molecule activator of SIRT1 gene expression has not been reported. Here, we report that syringaresinol, isolated from Panax ginseng berry pulp, is an activator of SIRT1 gene expression. Using human umbilical endothelial cells (HUVECs), we show that syringaresinol treatment induced binding of FOXO3 to the SIRT1 promoter in a sequence-specific manner, leading to induction of SIRT1 expression. Increased SIRT1 expression in HUVECs by syringaresinol treatment delayed cellular senescence and improved various markers of endothelial functions in a FOXO3 dependent manner. Collectively, these findings bring to light a new transcription activator of SIRT1 that may have therapeutic potential. **Keywords :** SIRT1, Small Molecule Activator, Senescence

AGEING INTERVENTIONS AND MECHANISMS

SS24 318-B-1

MOLECULAR MECHANISMS OF ANTI-AGING ACTIVITY IN ASHWAGANDHA LEAF EXTRACT

Sunil KAUL, Renu WADHWA (*Biomedical Research Institute, National Institute of Advanced Industrial Science & Technology (AIST), Japan*)

Introduction : Ashwagandha (*Withania somnifera*) is a tropic herb that is extensively used in Indian traditional home medicine to promote health and quality of life. Though sustained through experience and history, there are only a limited laboratory studies and experimental evidence to its effects. **Method :** We prepared alcoholic extract (i-Extract) of Ashwagandha leaves and investigated its anti-cancer and anti-aging activities in the cultured normal and cancer cells. Methoxyacetic acid (MAA) was used to induce premature senescence. **Results :** We found that the lifespan of normal cells got extended in the presence of low dose of i-Extract in the culture medium. This effect was mediated by protection of cells against oxidative damage and induction of proteasomal degradation pathway resulting in decreased accumulation of molecular damage. Furthermore, the effect was mostly reproduced using a pure phytochemical, withanone, but not withaferin A, from the extract. In a stress model, human fibroblasts were induced to undergo premature senescence by exposure to an industrial toxin, methoxyacetic acid (MAA), known as a major metabolite of ester phthalates that are commonly used in industry as

gelling, viscosity and stabilizer reagents. We have found that the cells were protected against MAA-induced premature senescence that involve ROS generation, DNA and mitochondrial damage. Furthermore, in vivo models of old-age pathologies such as Parkinson's and Alzheimer's disease, i-Extract showed prophylactic and therapeutic activities providing evidence to its anti-aging potentials. Conclusion : Alcoholic extract of Ashwagandha leaves and its component, withanone, are good candidates for anti-aging interventions. Keywords : Ashwagandha, leaf extract, anti-aging

SS24 318-B-2

MOLECULAR CHARACTERIZATION OF ANTI-METASTASIS AND ANTI-ANGIOGENESIS ACTIVITY IN THE LEAF EXTRACT OF ASHWAGANDHA

Chaek YUN (*Department of Bioengineering, College of Engineering, Hanyang University, Korea*)

Introduction : Ashwagandha is a plant-derive compound used as an important source of several useful anti-cancer agents in the Indian. We undertook a study to investigate the anti-metastasis and anti-angiogenesis activity in the extract of Ashwagandha leaves. Results : Endothelial cell chemotactic migration assay and tube formation assay were significantly inhibited by Ashwagandha extract, demonstrating the antiangiogenic effect. In addition, expression level of VEGF protein was down-regulated, and the anti-invasion and anti-migration activities which were assessed by transwell was also markedly reduced by Ashwagandha extract. Moreover, Ashwagandha extract elicited potent cytotoxic effect in several cancer cells lines, implying the therapeutic potential of an Ashwagandha as an anti-cancer drug. Furthermore, Ashwagandha up-regulated expression of epithelial marker genes, while it down-regulated mesenchymal marker genes. Conclusion : In sum, these data support the existence of anti-proliferative, differentiation-inducing, and anti-migratory/anti-metastasis activities in Ashwagandha that could be used as potentially safe and complimentary therapy for solid tumors. Keywords : Ashwagandha, VEGF, mesenchymal marker genes

SS24 318-B-3

ASHWAGANDHA LEAF EXTRACT RECOVERS SCOPOLAMINE INDUCED MEMORY LOSS: BIOCHEMICAL, CELLULAR AND MOLECULAR INSIGHTS

Mahendra THAKUR (*Department of Zoology, Banaras Hindu University, India*)

Introduction : Brain aging and associated neurodegenerative pathologies are accompanied with drastic decline in memory and cognition. However, the underlying mechanisms and appropriate remediation strategies are still elusive. Animal models of memory impairment have been widely used to understand these mechanistic aspects and screen therapeutic agents. Over this background, the present study was designed to investigate the therapeutic potential of a well known herb in the Indian traditional system of medicine, Ashwagandha (*Withania somnifera*) in scopolamine induced mouse model of memory loss. Method : We have investigated the effect of alcoholic extract of Ashwagandha leaves (i-Extract) on scopolamine induced alterations in (i) brain acetylcholinesterase activity, (ii) spatial memory by Morris water maze task (iii) expression of neuroplasticity genes in male Swiss albino amnesic mice, and (iv) cytotoxicity of brain derived cell lines. Results : We found that scopolamine increased AChE activity, impaired spatial memory, and drastically downregulated the expression of neuroplasticity genes including BDNF, Arc, Neuropsin and these effects were markedly attenuated in response to i-Extract treatment. Scopolamine also induced cytotoxicity

in IMR32 neuronal and C6 glioma cells. It was associated with downregulation of neuronal cell markers NF-H, MAP2, PSD-95, GAP-43 and glial cell marker GFAP. Furthermore, these molecules showed recovery when cells were treated with i-Extract or its purified component, withanone. Conclusion : Our study provides insight into the biochemical , cellular and molecular basis of recovery potential of i-Extract in scopolamine-induced memory loss and warrants its further exploration in age related memory dysfunctions. Keywords : Memory, Scopolamine, i-Extract

SS24 319-S

ACTIVE SENIOR'S PLACE AND ROLE IN SUPER AGING SOCIETY

SS24 319-S-1

ACTIVE SENIOR'S PLACE AND ROLE IN JAPAN

Yuji WADA (*Institute for Future Technology, Japan*)

Introduction : Japan is already super aging society (population aging rate is over 23%). Active senior will be a majority in the near future. I focus on the active senior's social roles and places in the various fields. Method : I have made fifty case studies through interviewing the each player, senior citizen, NPO, local governmental staff and so on. Results : Among them I introduce the following cases; transfer of the urban retired people's knowledge and skill to the younger generation, community business by senior citizen via ICT, and care volunteer activities by active elderly citizen. Conclusion : In Japan, active senior's social participation is a very important key factor toward super aging society. Keywords : active senior, super aging society

SS24 319-S-2

URBAN RETIRED PERSONS AND INTERGENERATIONAL EXCHANGE

Shino SAWAOKA (*Research Planning, The DIA Foundation for Research on Aging Societies, Japan*)

Introduction : Since many Japanese people, often called "working bees," have lives centered around work, they tend to become isolated from a society after the retirement. There is an urgent need for measures to find new places for them to play a role that could replace work. Method : The author conducted interviews with members of "Kanagawa Kids' Class (K Club)" which consists mainly of corporate retirees and is engaged in science education for children at elementary schools and other places. Results : In K Club, roles are divided while considering each member's previous career. For example, members with science backgrounds prepare materials for and teach at science classes, and others with PR experiences advertise the program. K Club is also developing new programs recently: members with liberal arts backgrounds now provide classes on social systems, such as lives, money, and the world. During the interviews, K Club members identified the sources of energy they gain from this activity, including: challenges in teaching science and social systems to children while keeping the subjects interesting, sense of achievement and joy when children understand what they teach, as well as new stimulation they receive from children. Conclusion : The activities where retirees provide educational assistance for children are expected not only to improve academic achievement of children but also to create meanings of lives (Ikigai) through intergenerational exchange. Keywords : Retired Person, Intergenerational Exchange

SS24 319-S-3

COMMUNITY BUSINESS BY SENIORS IN JAPAN

Kiichiro HORIIKE¹, Yuji WADA² (1. Ex-representative of Senior SOHO Salon Mitaka, Japan; 2. Institute for Future Technology, Japan)

Introduction : Recently, Japanese government had started 'promotion community/social business' and in 2010 provided 12 social worker training project with citizen and NPO, spending 7 thousand million yen. Now cooperation networks among promoting citizens, industries, schools and local government in especially 3.11 disaster area are created know-how shared. It is worthwhile to notice that several unique local business by participated seniors took place and successfully continued. Against their hope, seniors didn't have opportunity to fulfil the social role. So, active seniors were borne up by success of these activities. Method : We have visited to following cases several times. (1) Irodori (elderly women's leaf business); (2) Ageo ABCEC (retiree's job matching to local company); (3) Senior SOHO Mitaka (Senior ICT assisting business and so on); (4) BABALabo (grandmother's workshop for grandchild raising goods); and (5) Chofu Island Club (isolated island food supply) will be introduced. We have studied the key for success from our next points of view. a) Independent business model; b) Leader's management and character; c) Using ICT and visualization; d) Human Network; e) Making use of senior's role. Results : The tips for those successes are to have purpose in life and worthwhile works. Those systems are called community business promotion and has the following five characteristics: 1) change of mind from centralized, big corporate society to realization of personal quality; 2) share community information by learning ICT; 3) paid work system with shouldering responsibility; 4) group activities combining producers, players and supporters; and 5) tackling with problems in the community in cooperation with local government. Conclusion : The good schema for using senior's wits is important in super aging society. These tips will be transferred to all over the country and the social capital increase by active seniors. Keywords : Community Business, ICT visualization, Senior's Traditional Wit

SS24 319-S-4 YOKOHAMA'S CHALLENGE FOR AGING SOCIETY- VOLUNTEER OPPORTUNITIES FOR SENIOR CITIZENS

Shiro SEKIGUCHI (Kanagawa Welfare Association, Kanagawa Welfare Association, Japan)

Introduction : Japan has one of the fastest aging populations and lowest birthrates in the world. The segment of the population over 65 is expected to be over 40 percent by 2045, which is currently a little over 23 percent. Preparing for upcoming super aging society is one of the most important issues that have to be solved in Japan. Let me introduce a local program for seniors that have been implemented since 2009. Method : City of Yokohama, in which over 3.6 million people live, has offered its own volunteer program for local senior citizens since October 2009. The ultimate goal of the program is to restrain social security spending that has been increasing. Results : Over 6,700 local senior citizens have registered for the program (as of Nov. 2012). Conclusion : Offering social participation for seniors may be one of the best solutions that have to be considered in order to cope with upcoming aging society in Japan. Keywords : Aging society, senior citizens, volunteer, social participation

SS24 321-S PAIN ASSESSMENT AND PAIN MANAGEMENT AMONGST THE OLDER POPULATION

SS24 321-S-1 MANAGEMENT OF PAIN: BEST PRACTICE AND AREAS

FOR FUTURE RESEARCH

Pat SCHOFIELD (Health & Social Care, University of Greenwich, United Kingdom)

Introduction : We are expecting to see a huge increase in the numbers of older adults within society by 2050 and it is anticipated that the numbers of those over the age of 85 will increase dramatically. We already know that pain is under-reported in this group (Yates et al 1995, Schofield 2005). Estimates of persistent pain in this group range from 7-54% of those living in the community and this number increases to 45-83% amongst the institutionalised population. Furthermore, persistent pain is associated with more pain sites, usage of greater number of pain descriptors, less response to interventions, more sleep disturbance and greater emotional distress including anxiety and depressive symptoms compared with acute pain. Coupled with the potential for social isolation that can occur in the older age group in the presence of pain and as mentioned previously, the potential for under-reporting pain, it is essential that we begin to assess pain more appropriately in this group to ensure more effective management. Method : This presentation will highlight the latest evidence regarding the management of pain in the older population based upon recent systematic reviews of the evidence. Alongside this, some of the latest technological approaches that have been developed in the UK and are currently being evaluated will be discussed. Results: The presentation will highlight the results of systematic reviews of the literature and evaluation of technology such as the iPhone Application for pain assessment in dementia and the dementia carers website. Conclusion : Recommendations will be made for future research. Keywords : management, guidelines, Application, Dementia

SS24 321-S-2 MANAGEMENT OF CHRONIC PAIN FOR OLDER PERSONS: MULTISENSORY STIMULATION AND EXERCISE PROGRAMME

Mimi TSE (School of Nursing, The Hong Kong Polytechnic University, Hong Kong)

Introduction : The prevalence of chronic pain among the elderly is high and reduces their quality of life; effective non-pharmacological pain management should be promoted. Method : The purpose of this quasi-experimental pretest and posttest control design was to enhance pain management via an 8-week multisensory stimulation and exercise programme (MSE). Residents from two nursing homes were randomised into an experimental group with MSE and a control group with regular care but without MSE. Relevant data were collected from both groups before and after the MSE. The MSE consisted of an 8-week programme, with one session per week consisting of exercise programme and practising multisensory stimulation therapy. Results : There were 59 and 82 older people in the experimental and control groups respectively. No significant differences were found in their demographic characteristics, pain parameters, number of non-pharmacological strategies for pain relief, effectiveness scores on the non-pharmacological therapies, and psychological wellbeing at the baseline. Upon completion of the MSE, there was a significant decrease in pain scores and in the use of non-drug methods to control pain; also, a significant improvement was observed in all psychological parameters in the experimental group, but not for the control group. Conclusion : The MSE proved to be effective in reducing pain, enhancing psychological wellbeing and increasing the use of non-pharmacological therapies for the elderly. Keywords : Multisensory stimulation, exercise

SS24 321-S-3

ASSESSMENT OF PAIN

Sandra ZWAKHALEN (*Health Services Research, Maastricht University, Netherlands*)

Introduction : The last decade pain in older persons with dementia predominantly focused on the development of behavioral pain tools. The aim of this study was to critically appraise all systematic review and evaluate the evidence available on pain assessment scales for elderly people with severe dementia. **Method :** Relevant publications in English, German, French or Dutch, were identified by means of an extensive literature search. The search period focused on January 2002 to July 2012 and included 3 electronic databases (Medline, Psychinfo and CINAHL), supplemented by screening citations and references. Reviews were defined as systematic if they had explicitly defined their search strategy and clear inclusion and exclusion criteria for studies. **Results :** Eight systematic reviews were finally included in the synthesis. Reviews varied in recommendations of most preferable tools. However, PACSLAC, PAINAD, Abbey, DOLOPLUS-2 and DS-DAT were frequently mentioned. All concluded that no single scale was recommendable and further psychometric testing was needed. **Conclusion :** The progression we made last decade is the development of behavioral tools is limited. Meanwhile pain in dementia remains a problem. **Keywords :** BAHAVIORAL ASSESSMENT, PAIN, DEMENTIA

SS24 322-S

QUALITY OF LIFE OF KOREAN OLDER CANCER PATIENTS

SS24 322-S-1

QUALITY OF LIFE IN ELDERLY CANCER PATIENTS IN KOREA

Dae Ro CHOI¹, Hyunsook YOON², Dae Young ZANG¹, Yeon Ok LIM², Yojin KIM², Hoon-sik BAE³, Jaejung LEE⁴, Young Suk PARK⁵, Seok Yun KANG⁶ (*1. Department of Internal Medicine, Hallym University College of Medicine, Korea; 2. Department of Social Welfare, Hallym University, Korea; 3. Dept of Radiation Oncology, Hallym University College of Medicine, Korea; 4. Department of Surgery, Hallym University College of Medicine, Korea; 5. Department of Hematology and Oncology, Samsung Medical Center, Korea; 6. Department of Hematology-Oncology, Ajou University School of Medicine, Korea*)

Introduction : There are lots of studies about quality of life in cancer patients. While most of the studies focused on a specific disease group, we designed to study characteristics of quality of life (QoL) in diverse elderly cancer patients. **Method :** We interviewed a diverse group of elderly cancer patients from Jan 2012 to Jul 2012. The patients were enrolled at 5 university hospitals in 3 areas of Korea (Seoul, Gyeonggi, Gangwon). Quality of life was evaluated by the quality of life questionnaire QLQ-C30, version 3.0 of EORTC. We designed to evaluate QoL serially every 6 months. **Results :** About 600 patients participated. We planned to evaluate the change in QoL during treatment course. We interviewed some colorectal cancer & gastric cancer group at short-term interval. We will search for the impact of chemotherapy on patients' QoL. Through the cross-sectional analysis, patients in stage IV, of old age (≥ 60), who have poor performance status (ECOG PS ≥ 2) have low QoL score (physical, cognitive, social functioning). Patients who survived for over 36 months from the initial diagnosis were lower on cognitive function than patients who survived < 36 months from the initial diagnosis. **Conclusion :** QoL of cancer patients was affected by stage, age, and performance status regardless of the primary cancer origin. The impact of chemotherapy on colorectal & gastric cancer patients' QoL will be discussed at the

seminar. **Keywords :** quality of life, elderly cancer patient

SS24 322-S-2

CHANGES OF THE QUALITY OF LIFE OF OLDER KOREAN CANCER PATIENTS: A PRELIMINARY ANALYSIS

Yojin KIM¹, Hyunsook YOON¹, Yeon Ok LIM², Hyen Joo LEE³, Kyoungwon CHOI¹ (*1. Dept. of Social Welfare, Hallym University, Korea; 2. Hallym University Institute of Aging, Hallym University, Korea; 3. Dept. of Social Welfare, Hallym Polytechnic University, Korea*)

Introduction : The purpose of this study is to understand the quality of life older Korean cancer patients based on cross-sectional and longitudinal data. Korea became an aging society and even with fast increase of older cancer patients in Korea, few studies have looked into their quality of life. **Method :** The data is from the Longitudinal and Multidisciplinary Study on the Quality of Life of the Older Cancer Patient Project (collaboration of social work, medical discipline, and statistics) at Hallym University funded by Korean Foundation Institute. Since January 2012, wave 1 (600) and wave 2 data have been collected from cancer patients (55 years old and older). Quality of life (QoL) was measured with EORTC-QLQ30. Independent variables include medical (e.g. stage of cancer), social (e.g. social support), psychological factors (e.g. optimism, depression) and SES. Descriptive statistical analysis, t-test, ANOVA, and Multiple Regression Analysis are main analytic tools. **Results :** At wave 1, the regression analysis suggested that satisfaction with the process of the treatment, the burden of medical costs, the worries on the cancer, and optimism were statistically associated with QoL. The social support from friend was found to be positively correlated with QoL and support from the medical staff is related with general quality of life of the older cancer patients. Some changes are observed where QoL of physical and social function decreased and support from friends increased. **Conclusion :** The results indicated that various factors, such as social, psychological, medical factors are to be examined to better understand the quality of life of the Korean elder cancer patients. Also, important is to understand the changes. **Keywords :** Older Cancer Patients, Quality of Life

SS24 322-S-3

THE THERAPY EXPERIENCE OF OLDER KOREAN PATIENTS WITH STOMACH CANCER

Hyenjoon LEE¹, Hyunsook YOON², Yeonok LIM³, Yojin KIM², Kyoungwon CHOI² (*1. Social Welfare Department, Hallym Polytechnic University, Korea; 2. Dept. of Social Welfare, Hallym University, Korea; 3. Hallym University Institute of Aging, Hallym University, Korea*)

Introduction : The purpose of this study is to extensively understand the diversity of experience related to the older patients' quality of life, the subjective recognition and the needs in therapeutic process in the context of Korean socio-cultural context. **Method :** The 14 research participants were all diagnosed as stomach cancer after the age of 65. They are all in the middle class and all under chemotherapy or in the process of passage observation after the therapy. The research has been carried out for 4 months and by one to one in-depth interview once or twice. Also, the data analysis depends on the Colaizzi's phenomenological methodology. **Results :** The outcome of this study is 'a painful life by the operation and chemotherapy', 'a stifling and lethargic life,' 'a tied life by medical examination and treatment schedule,' 'change to a health-centered life,' 'a buttress of struggling life' and 'a new understanding on life and the ambivalence.' **Conclusion :** On the basis of that above, this study proposes an idea of

the service construction for the elderly with stomach cancer and a data base for further quantitative research. Keywords : Older Korean Patients with Stomach Cancer), Therapy Experience, Phenomenological Methodology

SS24 322-S-4

STATISTICAL IMPUTATION METHOD OF MISSING DATA ON ESTIMATION OF MORTALITY RATES FOR KOREAN OLDER CANCER PANEL

Hyun Suk PARK¹, Yoon Tae KIM¹, Hyunsook YOON² (1. Dept. of Statistics, Hallym University, Korea; 2. Dept. of Social Welfare, Hallym University, Korea)

The aim of this talk is to address the danger of exclusion of cases with missing data, and to highlight the importance of imputation of missing data. Multiple imputation is a well-estimated technique for analysing panel data sets where some units have incomplete observations. Provided that the imputation model is correct, the resulting estimates are consistent. An alternative, weighting by the inverse probability of observing complete data on a unit, is conceptually simple and involves fewer modelling assumptions, but it is known to be both inefficient and sensitive to the choice of weighting model. Over the last decade, there was been a considerable body of theoretical work to improve the performance of inverse probability weighting, leading to the development of 'doubly robust' estimators. Although Robins and colleagues have proposed improved inverse-probability-weighted estimates which are theoretically more efficient under the assumption of data missing at random, its use in the analysis of the older cancer patients panel sets with incomplete observations is far less well-estimated. This is partly because the estimates may be unstable because certain subsets of the sample have low response probabilities. Therefore we consider multiple regression model to estimate mortality rate of patients across risk groups. The mortality rate and multiple regression imputations depend on the doubly robust model of the older cancer patients panel. We present an intuitive review of these developments and contrast these estimators with the proposed multiple imputation by using mortality rate from both a theoretical and a practical viewpoint. Keywords : Missing data; Multiple imputation; Mortality rate; Doubly robust model; Older cancer patients panel

SS24 322-S-5

IMPACT OF CANCER ON QUALITY OF LIFE AMONG VERY OLD JAPANESE: PRELIMINARY RESULTS FROM THE SONIC STUDY

Michiyo TAKAYAMA¹, Yasumichi ARAI¹, Ryutarō TAKAHASHI¹ (1. Center for Preventive Medicine, Keio University School of Medicine, Japan; 2. Geriatric Medicine, Keio University School of Medicine, Japan; 3. Vice Director, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : To clarify the multidimensional structure of health and QOL of the older adults in relation with chronic conditions including cancer, we have conducted the Septuagenarian, Octogenarian, and Nonagenarian Investigation with Centenarian (SONIC) study since 2010. Method : The SONIC study is a longitudinal population-based cohort study, and it involves multidisciplinary fields, such as psychology, geriatric medicine, dentistry, and nutrition. A total of 1000 septuagenarians (479 men and 521 women) and 973 octogenarians (457 men and 516 women) were randomly recruited from the basic registry of residents of four differential regions in Japan, rural area and city area in the western part and in the eastern part, respectively. The participants were completed the baseline examination including demographics, life style, socioeconomic status,

past and present medical history, physical and cognitive function, subjective health, and well-being during 2010 and 2011, and will be followed up by three year interval. Results : We will present our preliminary data regarding subjective well-being and factors associated with quality of life of Japanese community-dwelling elderly. Moreover, we will focus on QOL and subjective well-being of participants suffering from cancer and compare those with other chronic conditions such as diabetes and cardiovascular disease in relation with their chronological age. Conclusion : International comparison of QOL of older cancer patients obtained from multidisciplinary studies will provide important clinical implication, and further our comprehensive understanding of complexity of QOL at old age. Keywords : well-being, the very old, community-based study

SS24 323-S

INTIMACY, ROMANCE AND SEXUALITY IN LATER LIFE

SS24 323-S-1

ATTITUDES, EXPERIENCES AND EXPECTATIONS ON NEW INTIMATE RELATIONSHIPS IN LATER LIFE ? RESULTS FROM A SWEDISH NATIONAL SURVEY

Torbjorn BILDGTGARD¹, Peter OBERG² (1. Department of Social Work, University of Stockholm, Sweden; 2. Department of Health and Occupational Studies, University of Gavle, Sweden)

Introduction : More than a million, or almost half, of the 60+ population (46%) in Sweden today are singles (never married, divorced, widows/widowers), a majority are women and the actual number as well as the proportion of divorcees is increasing. Still, we know very little about the intimate lives of non-married elderly people or about re-partnering in later life. This presentation focuses attitudes to, expectations on, and experiences of new intimate relations in later life. Method : It is based on results from a new representative survey of 3 000 Swedes, 60-90 years old (boosted with regards to non-married people), that was developed from questions generated by a recent qualitative interview study with 28 Swedes who had established a new relationship after the age of 60. Results : We describe attitudes, expectations and experiences in the older population generally, but also in different groups defined on the basis of gender, class, life-course phase, sexual orientation, degree of urbanization and intimacy career. We also focus the importance of intimate relationships for older people's quality of life, and reason about how structures of informal support may look for older people who enter new intimate relationships. Conclusion : As of november 2012 we are still in an early phase of the survey work, thus conclusions are pending. Keywords : Intimacy, Later life, National survey

SS24 323-S-2

TIME AS A STRUCTURING CONDITION FOR NEW INTIMATE RELATIONSHIPS IN LATER LIFE - A QUALITATIVE STUDY OF ELDERLY SWEDES

Peter OBERG¹, Torbjorn BILDGTGARD² (1. Department of health and occupational studies, University of Gavle, Sweden; 2. Department of social work, University of Stockholm, Sweden)

Introduction : Social gerontology about intimacy in old age has almost exclusively focused on institutionalized life-long marriages. However, mobility in and out of intimate relationships has become more common in late modern societies also in later life. In this paper the research questions are: What characterizes the formation of new intimate relationships in later life? Are there any specific, more or less universal, conditions that separate them from relationships in earlier life phases? Method : Qualitative interviews were used with a

strategical sample of 28 63-91 year old Swedes, who have established a new intimate heterosexual relationship after the age of 60 or who are dating. Results : The results showed time as constituting a central structuring condition for new intimate relationships in later life. In the results three aspects of time, Available free time, Lived time and Remaining time, which all have a constituting and formative power on new late in life relationships are discussed in relation to theories of late modernity and the Third Age and in relation to changing demographical conditions. Conclusion : The concluding discussion will be about the time theoretical frame as a model for understanding experiences of ageing. Keywords : intimacy, later life, time

SS24 323-S-3

CHALLENGING NORMATIVE EXPECTATIONS OF INTIMACY: LGB AND CHILDLESS AGEING

Gerardo ZAMORA (*Departamento de Ciencias de la Salud, Universidad Publica de Navarra (UPNA); ETORBIZI, Spain*)

Introduction : Ageing as a childless or childfree individual is an increasing phenomenon in Europe and many other societies. Even though most current elderly childless individuals are heterosexuals, a great part of current self-identified LGB elders are childless because of the widespread oppressive structures they have faced throughout their life trajectories. Method : This paper explores the discourses around intimacy of childfree/childless LGB individuals aged +50 that emerge from twelve qualitative in-depth interviews in Spain and is complemented with the analysis of childless individuals in waves 1 and 2 from SHARE (Survey of Health, Ageing and Retirement in Europe) by looking into their aspirations, caring for a partner or closed one, perceptions of being cared for by a partner or closed one, and engagement in social life for meeting other people. Results : Whether in a couple or as a single person, childlessness is pervasive for each individual's intimacy and social relationships in that it challenges normative ageing assumptions as well as self-image, identity and sexuality issues. Conclusion : Childfree or childless individuals face the heteronormative ageing process, especially if these individuals are self-identified LGB. The strategies developed by current LGB middle-aged and elderly people for self-care from early ages on, for building intimacy relationships outside traditional family structures and for coping against stigma can provide useful examples and information for further analysis of childlessness in our societies. Keywords : LGB ageing; , childlessness-childfree, mixed methods

AGEING AND PAID WORK: NEW RESEARCH PERSPECTIVES AND THEORIES

SS24 324-S-1

AGEING, PAID WORK, AND THE POLICY-PRACTICE PARADOX

Julie Ann MCMULLIN (*Sociology, Western University, Canada*)

Introduction : Many Western countries are modifying their social welfare regimes by increasing the age at which older adults become eligible to receive age based social security. The logic behind these changes centres on fears of impending labour force shortages and demographic challenges regarding the ability of a smaller working-age population to pay for the health care and pensions of older adults. Although there is little doubt that increasing the eligibility age for age based pensions will save governments money, these changes could also negatively affect the health and well being of older adults. This will be particularly true for those who are unable to find suitable employment either because they lack the necessary skills or other

abilities to actively engage in paid work, or because employers construct old age as a barrier to employment opportunities. Method : This paper draws on policies, data, and reports from Canada to assess whether the country is likely to face a policy-practice paradox when the changes to old-age security policies take effect. Assessments about the kind of jobs that are available now and will be available in the future (labour force shortages) in relation to the chances of older adults holding these jobs will be evaluated. Results : Evidence is presented which suggests that there is and will be a mis-match between available jobs and the likelihood that older adults will hold these jobs. Conclusion : The policy-paradox is that older workers may be ineligible for their public pensions while at the same time being unable to work. Keywords : ageism, work, labour shortages

SS24 324-S-2

WEAK GEEZERS OR EXPERIENCED COLLEAGUES? ON OLDER MEN AND HEGEMONIC MASCULINITIES

Clary KREKULA (*Dept of Social studies, Karlstad University, Sweden*)

Introduction : The Swedish fire service is a workplace where women are especially in younger ages while men can be found in the whole scale of ages. While the political debate has focused on gender equality, age relations within the group of male fire-fighters have not been paid attention. Method : The analyses are based on a focus group interview and on written comments that were provided in conjunction with questions in a survey conducted among 1176 employees at 25 randomly selected fire stations. Results : The results show that age codings are central. They organize activity and are institutionalized in the form of horizontal age segregation. Notions of physical qualities such as strength and agility are further used to construct age groups and to create a normative image of what a fire-fighter is like. Older fire fire-fighters are made out to be deviants due to their physique, although they do gain advantages in situations where experience is south. The group that emerges as the norm in this context is men at some "average age". Conclusion : Old ages and ageing can mean different things depending on how the actual workplace is age and gender coded. The results discussed provide insight into those age patterns that can be expected in a similar place of employment. They illustrate the importance of scrutinizing, not only the situation for different age groups, but also how notions of age categories are used to organize work places. Keywords : ageing and masculinity

SS24 324-S-3

'ALL THAT CHANGES STAYS..' SUPPORTING THE OCCUPATIONAL TRAJECTORIES AND HUMAN CAPITAL OF OLDER WOMEN WORKERS

Elizabeth BROOKE, Deborah TOWNS (*Business Work and Ageing, Swinburne University of Technology, Australia*)

Introduction : The growth in women's workforce participation has made a major contribution to national labour forces in advanced industrial nations. Yet critical issues exist regarding employers' support for older women's career trajectories whether ascending, descending or stable. Using theories based in Acker (2006), inter-related organisational actions, processes and meanings are identified by stakeholders in three industry sectors including human resources managers, equal opportunity managers, unions and professional organisations. The paper asks: How do stakeholders perceive and explain older women's career trajectories in interaction with organisational policies? How do these perspectives inform discourse on the intersectionality between age, gender and class relations in organisations? Method : Structured key informant interviews were

undertaken with a purposefully selected sample of 95 managers and key external stakeholders in three sectors: tertiary education, public administration and financial services. Interviews were coded and analysed using NVivo. Results : Similarities in processes across sectors included ambiguities between discouraging and encouraging diversity policies, responses to career flexibilisation across the life course including phased retirement and superannuation and support for organisational hierarchies interrelated with gendered and ageist practices. Age and gendered trajectories reproduced cumulative class inequalities. Human resources managers' practices utilised competitive rights discourse to discipline older women's class and equality claims. Conclusion : Unintegrated policy strands containing covert references to human capital values and unconscious biases influenced structured policies. The findings point to policies recognising the intersectionality of gender, age and class processes with human capital reward systems to reinstate the human capital value of older women workers. Keywords : older women workers careers human capital

SS24 325-C

IAGG GLOBAL INITIATIVE IN DIABETES MELLITUS

SS24 325-C-1

KEY ISSUES IN DIABETES AND OLDER PEOPLE

Trisha Trisha DUNNING (*Faculty of Health, Deakin University and Barwon Health, Australia*)

Introduction : Managing diabetes in older people is complex but there is little evidence to guide care. Method : Key management issues concern: service delivery, individual physical, mental and social factors, maintaining independence as long as possible, health professional's knowledge and competence, ageist attitudes, and impeccable and regular assessment. We will discuss key lines of evidence derived from literature review and the results of surveys and focus groups. Results : Significantly, older people are not a homogenous group, this care must be individualised and holistic. Care focuses on quality of life and risk minimisation and encompasses pharmacovigilance to achieve quality use of medicines and reduce polypharmacy, recognising atypical presentations and symptoms including pain, cognitive changes, grief, loss, loneliness and depression. Education strategies must suit the individual's learning style and capabilities. Family and other carers may need to be involved. Conclusion : Panning for key transitions in older age is essential. Common transitions include supported care moving from independent to supported care in the home or an aged care facility, planning to stop driving and planning for end of life care. Keywords : older people, diabetes, frailty

SS24 325-C-2

MANAGING FRAIL OLDER PEOPLE WITH DIABETES

Leocadio RODRIGUEZ-MANAS (*Geriatrics, Hospital Universitario de Getafe Servicio Madrilenio de Salud, Spain*)

Introduction : The forecasted increase in the number of older people for this century will be accompanied by an increase of those with disabilities. Disability is usually preceded by a timely and highly topical condition named frailty, a disorder that encompasses changes associated with ageing, life styles and chronic diseases. Detect frailty and intervene on it is of outstanding importance to prevent disability, as recovery from disability is unlikely. Diabetes Mellitus is one of the chronic conditions leading to both frailty and disability. Method : We will present some issues of concern on the evidence about the distinct profile of these patients, its main consequences and how to proceed in their evaluation and management. Results : The coexistence of frailty

and disability raises several issues in the implications and management of older people suffering from both conditions: as frailty increases the risk of death and limits the life expectancy, it has a direct effect on therapeutic decisions, that need a tiem to exert their beneficial effects. Moreover, frailty, per se, has a high predictive value in people with diabetes. Finally it puts to older patients in risk of other adverse outcomes, including hospitalization, permanent institutionalization and secondary effects of drugs. This is of special concern in older people with Diabetes Mellitus, which are prone to hypoglycemias and other adverse effects of drugs. Conclusion : Frail Older People shows a clinical profile that deserves special considerations in its management. Keywords : Frailty, Diabetes Mellitus, Assessment, Therapeutic Approach

SS24 325-C-3

HOW THE IAGG HAVE TACKLED CONCERNS ABOUT DIABETES THROUGH THEIR GLOBAL INITIATIVE

Alan James SINCLAIR (*IDOP, Beds and Herts Postgraduate Medical School, United Kingdom*)

Introduction : The IAGG Global Initiative in Diabetes Mellitus represents an international effort to enhance the health status and well-being of all older citizens with diabetes by a focused strategy of education and training of health and social care staff. Method : We will create a series of educational materials that increase knowledge and skills of clinicians and demonstrate how these can be implemented in routine clinical practice. This initiative will be informed by latest evidenced-based clinical guidance for older people with diabetes. Results : None as yet. Conclusion : Following implementation of the Initiative, we hope to be able to measure an increase in the knowledge and skills of clinicians and a resulting improvement in the health and well-being of older people with diabetes. Keywords : diabetes, older people, education

SS24 326-C

TREATMENT OF DIABETES MELLITUS IN THE ELDERLY

SS24 326-C-1

SERUM LEVEL OF PLASMALOGEN IS ASSOCIATED WITH COGNITIVE IMPAIRMENT AND IS DECREASED IN ELDERLY DIABETIC PATIENTS

Yoshiaki TAMURA¹, Yoshinori FUJIWARA², Ryouta MAEBA³, Hideki ITO¹, Atsushi ARAKI¹ (*1. Department of Diabetes, Metabolism, and Endocrinology, Tokyo Metropolitan Geriatric Hospital, Japan; 2. Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan; 3. Department of Biochemistry, Teikyo University School of Medicine, Japan*)

Introduction : Although diabetic patients are vulnerable to dementia, there exists no effective diagnostic plasma biomarker for detecting cognitive impairment. Plasmalogen (Pls) is a glycerophospholipid widely distributed in brain. Here we performed a cross-sectional study to investigate whether plasma Pls were associated with cognitive function or cardiovascular risk factors in the elderly. Method : We measured plasma Pls levels in healthy population (H, n=60), outpatients at memory clinic (n=48), and diabetic inpatients (DM, n=19). (All participants > 60 years of age.) Plasma levels of two types of Pls, ethanolamine plasmalogen (EtnPls) and choline plasmalogen (ChoPls) were determined by the HPLC method. Cognitive function was assessed using the MMSE and MoCA-J. Then we investigated correlations of Pls with cognitive function and cardiovascular risk factors by Spearman's correlations. Student's unpaired t-test was used

for the comparison of Pls levels between H and DM. Results : In the whole participants (mean age 76 ± 7 y.o.), EtnPls, but not ChoPls, positively correlated with MMSE and MoCA-J ($p < 0.001$ both). In multivariate analysis using age, sex, education, HbA1c as covariates, EtnPls was independently associated with MOCA-J. (2)DM showed lower MMSE and MoCA-J scores ($p < 0.001$ both), and lower EtnPls than H ($p < 0.001$). (3) EtnPls correlated positively with HDL-C ($p < 0.001$), and negatively with HbA1c ($p < 0.01$), whereas ChoPls positively correlated with HDL-C and LDL-C ($p < 0.01$), but not with HbA1c. Conclusion : Plasma EtnPls are decreased in diabetic patients. Although affected by several vascular risk factors, they were independently correlated with cognitive function. EtnPls could be a useful plasma biomarker for detecting cognitive impairment in the elderly. Keywords : plasmalogen, diabetes mellitus, cognitive impairment

SS24 326-C-2

FACTORS ASSOCIATED WITH COGNITIVE DECLINE IN OLD DIABETICS

Hiroyuki UMEGAKI (*Department of Geriatrics, Nagoya University Hospital, Japan*)

Introduction : Recent evidence has indicated that type 2 diabetes mellitus (T2DM) in the elderly is a risk factor for cognitive dysfunction or dementia. In the current study we attempted to determine the the clinical indices associated with cognitive decline in Japanese Elderly Diabetes Interventional Trial (JEDIT) participants. Method : Analysis 1: The subjects were 261 participants who were administered the Mini-Mental State Examination (MMSE) at baseline and after 6 years. The cognitive decline was determined as a 5 points or greater decline in MMSE scores during the observation period. Logistic regression analysis to find the factors associated with cognitive decline was performed. Analysis2: The subjects were 63 participants who were administered the Mini-Mental State Examination (MMSE) at baseline, at the 3rd year, and at the end of the 6-year follow-up period. We applied pooled logistic analysis method to consider the changes of clinical indices during observation period and tried to identify the associated factors with cognitive decline during 6 years in elderly type 2 diabetics. Results : Analysis 1: We found that the existence of diabetic nephropathy, higher systolic blood pressure, and higher serum triglycerides (or lower HDL cholesterol) at baseline were significantly associated with cognitive declines after 6 years. Analysis 2: High density lipoprotein-cholesterol (HDL-C) and higher diastolic blood pressure (DBP) were significantly associated with cognitive decline by pooled logistic analysis in 6 year observation of older diabetic subjects. Conclusion : We found several factors associated with cognitive decline in old diabetics. Keywords : cognition, HDL-cholesterol, diastolic blood pressure, diabetic nephropathy

SS24 326-C-3

GLYCEMIC VARIABILITY AND NEPHROPATHY IN TYPE 2 DIABETES

Chih-cheng HSU (*Division of Geriatrics and Gerontology, National Health Research Institutes, Taiwan*)

Introduction : HbA1c variability has been shown to be an independent risk factor of nephropathy in type 1 diabetes. We aim to explore the association between HbA1c variability and microalbuminuria development in type 2 diabetes. We also intend to test the applicability of serially measured HbA1c in 2 years for this risk assessment. Method : We recruited 821 middle-aged and older type 2 diabetes patients with normoalbuminuria between 2003 and 2005 and followed

them through the end of 2010. Average follow-up time was 6.2 years. We defined microalbuminuria as a urine albumin-to-creatinine ratio ≥ 30 mg/g (3.4 mg/mmol). HbA1c variability was calculated by the standard deviation (SD) of serially measured HbA1c. The Cox proportional hazards model was used to evaluate association between quartile of HbA1c SD and development of microalbuminuria. Results : The incidence of microalbuminuria for overall subjects was 58.4, 58.6, 60.8, and 91.9 per 1000 person-years for Q1-Q4 adjusted HbA1c SD, respectively (P for trend = 0.042). Compared to those in Q1, the patients in Q4 were about 37% more likely to develop microalbuminuria. The hazard ratio derived from a series of 2-year HbA1c measurements was similar to that from data collection for longer than 4 years. Conclusion : In addition to mean HbA1c values, HbA1c variability, even measured as early as 2 years, is independently associated with development of microalbuminuria in type 2 diabetes. Keywords : nephropathy, microalbuminuria, HbA1c variability

SS24 326-C-4

IMPROVED GLYCEMIC CONTROL WITHOUT HYPOGLYCEMIA IN OLDER ADULTS WITH DIABETES USING U-HEALTHCARE SERVICE

Hak Chul JANG (*Department of Internal Medicine, Seoul National University Bundang Hospital, Korea*)

Introduction : To improve quality and efficiency of care for elderly with type 2 diabetes, we introduced elderly-friendly strategies to the clinical decision support system (CDSS)-based u-healthcare service, which is an individualized health management system employing advanced medical information technology. Method : We conducted a randomized, controlled, clinical trial involving 144 patients aged over 60 years for 6 months. Participants were randomly assigned to receive routine care (control, $n=48$), self monitoring blood glucose (SMBG, $n=47$), or u-healthcare group ($n=49$). The primary endpoint was the proportion of patients achieving A1C $<7\%$ without hypoglycemia at 6 months. U-healthcare system refers to an individualized medical service in which medical instructions are given through patients' mobile phone. Patients receive a glucometer with public switched telephone network-connected cradle that automatically transfers glucose test results to a hospital-based server. Once the data is transferred to the server, an automated system called CDSS engine rule generates and sends patient-specific messages via mobile phone. Results : After 6 months follow-up, mean A1C level was significantly decreased in the u-healthcare and SMBG group ($7.8 \pm 1.3\%$ to $7.4 \pm 1.0\%$, $p < 0.001$, $7.9 \pm 1.0\%$ to $7.7 \pm 1.0\%$, $p = 0.020$, respectively) compared with control group ($7.9 \pm 0.8\%$ to $7.8 \pm 1.0\%$, $p = 0.274$). The proportion of patients with A1C $<7\%$ without hypoglycemia was greater in the u-healthcare group (30.6%) than the SMBG (23.4%) or control groups (14.0%) ($p < 0.05$). Conclusion : CDSS-based u-healthcare service achieved better glycemic control with less hypoglycemia than the SMBG and routine care groups, and may provide effective and safe diabetes management in the elderly diabetic patients. Keywords : Diabetes, Elderly, u-Healthcare.

SS24 327-C

PAIN MANAGEMENT IN GERIATRIC PATIENTS IN GERMANY

SS24 327-C-1

THE PHARMACOKINETICS OF OPIOID ANALGETICS ? MISSING DATA IN THE ELDERLY

Manfred GOGOL (*Geriatric Department Hospital Lindenbrunn, German Society of Gerontology and Geriatrics, Germany*)

Introduction : Pain in elderly patients is common. Due to side effects of different analgetics, e.g. NSAID's. Introduction of opioid analgetics (OAs) are recommended. Method : OAs are effective in pain treatment but data about pharmacokinetics and pharmacodynamics in the elderly (80 years +) are lacking. A Pubmed research revealed only data for oxycodone and fentanyl. Results : In the light of a growing awareness of OAs side effects like increasing numbers of emerging room admissions, hospitalizations, falls and fractures, traffic accidents and mortality it seems essential that the use of OAs in the elderly requires basic data about pharmacokinetics and pharmacodynamics in this patients. Conclusion : First data of a research project to this topic in our department will be provided. Keywords : Pain, opioid analgetics

SS24 327-C-3

PAIN ASSESSMENT IN PEOPLE WITH COGNITIVE IMPAIRMENT- A CHALLENGING TASK IN HOSPITALS

Erika Gisela SIRSCH (*Witten, German Center for Neurodegenerative Diseases (DZNE), Germany*)

Introduction : A sufficient pain therapy for persons with dementia in hospital often fails because their pain is not even recognized. Pain self-assessment should be carried out systematically but because of a restricted ability of verbal expression persons with dementia often do not benefit from this at all or only to a limited extent. It is often unclear which patients are capable of giving self-report and which require an external assessment. Method : Based on an integrative review was participants' observations and focus group interviews are conducted. Aim was to identify how the decision-making on pain assessment in patients with dementia was performed by nurses. Data were analyzed qualitatively. Results : Semi-structured observation protocols were carried out during early, late and night shifts. Three wards in two general hospitals were included (surgery / internal / special ward for people with dementia). The diagnosis of 'dementia' or specification of dementia has almost not been determined systematically. Even in the ward for people with dementia in half of the cases the diagnosis of dementia was unknown by the staff. The analysis of the hand-over communication revealed that nearly no communication took place about pain. (Facial Expressions (e.g. grimacing/groaning) of pain were often misdiagnosed. Focus group interviews had shown that key phenomena, which are known from the literature, often received no consideration during pain assessment. Conclusion : Key phenomena such as co-morbidity and surrogate reporting have to be taken into account. Advanced knowledge about pain and pain symptoms simplifies the pain assessment in persons with dementia; a pathway for nurses dealing with pain assessment is needed for patients with dementia. Keywords : Dementia, Painassessment, Hospital

SS24 407-R

HOME & COMMUNITY SUPPORT FOR OLDER PERSONS IN DEVELOPING COUNTRIES

SS24 407-R-1

A NEW MODEL FOR CONTINUOUS HEALTH CARE IN AGING CHINA SOCIETY

Minglei ZHU, Xiaohong LIU (*Geriatric department, Peking Union Medical College Hospital, China*)

Introduction : The health care system in China is not continuous, with most of the work handled in hospitals. As a geriatric center, we have established several service models in Peking Union Medical College hospital. How to expand the geriatric work, to provide an efficient health care with geriatric interventions for the elderly in communities

is still on the way. There are many health care models for community elder residents, like PACE, House Call in the US. But most of the at-home health care services are not covered in Chinese medical insurance system and Chinese older people has a traditional will of "ageing at home". We need to develop a new model of geriatric health care for community elder people, especially for those disabled, under the present system. Method : A new care model was established in collaboration with community health care organizations (non-public), which can combine geriatric health care with community service, including team call consultation, making and following geriatric interventions, geriatric education for community organization staffs. Results : Carrying out the geriatric interventions in the communities for the disabled elderly may achieve better older patients' satisfaction, function, health status and more efficient usage of medical resources. Conclusion : Providing continuous health care for community elder residents by means of the collaboration of geriatric center and community organizations may offer a new model under the present system. Keywords : geriatric intervention,community health care, care model

SS24 407-R-2

INTEGRATING RESOURCES TO SATISFY OLDER PERSONS' NEED FOR CARE: A POLICY MAKING PERSPECTIVE

Guohong LI (*School of Medicine, Shanghai JiaoTong University, China*)

Introduction : Following the global trend of population aging, China became an aging society at the end of the 20th century. The ever-growing medical demands of the elderly and the late development of aged care services make the present situation of health care for elderly in China worrying. As the first city which enters into aged society in China, Shanghai faces the higher proportion of ageing population, the longer average life expectancy, the higher elderly dependency ratio, and the higher health needs of elderly, the Shanghai municipal government has actively adjusted its development strategies and has been improving the capacity of aged care, but there is still some remaining problems. Method : The study select senior experts related to elderly long-term care services filed for expert consultation and expert interview, and by taking using of Analytic Hierarchy Process (AHP) method chose the priority policy area of long-term care for elder in Shanghai. Results : According to the results of the hieratical analysis, system design, improve long-term care services system and financing and payment system have higher priority for meeting the needs of long-term care of elder, it also needs the support of technical reform on the elder care needs evaluation system and elderly long-term care system. Conclusion : The perfect system does not accomplish at one stroke, is the process of gradual reform; but integrating resource related to long-term care should be highest priority at present, at the same time need elderly care needs assessment system and other technical reforms as the basis. Keywords : long-term care, policy, Integrating Resource

SS24 407-R-3

ENABLING THE LAST-100-METERS WITH COMMUNITY DAY CARE AND IN-HOME LONG-TERM CARE

Ninie Yan WANG (*LTC Research & Training Center, Gerontological Society of China, China*)

Introduction : Rapidly ageing population in China presents great challenge to long-term care. A new model of providing community and home based care was piloted to address the challenge. The team consisted of geriatricians, nurses, rehabilitation doctors, pharmacists,

nutritionists and Chinese therapists. Care was provided based on need/assessment of the elderly. Method : Desktop research, field visits, industry expert interviews, random sampling assessments. Over 10,000 community residents over 80 years of age in Beijing and Shanghai were assessed, among whom the most dependent and frail elderly received seamless integrated restorative care at home. Transition services were provided when needed. Results : Overall physical (ADL) and mental (MMSE) health of the serviced elderly scored better than control group, satisfaction towards life quality and healthcare services improved over 1 year period. Transition care also reduced readmission rate after hospitalization and overall healthcare cost. Conclusion : Integrated care system provides more accessible, affordable services with better outcomes and experience. Keywords : long-term care, home care,

SS24 407-R-4

HOME & COMMUNITY SUPPORT FOR OLDER PERSONS - A RE-IMAGINATION AND REPORT ACROSS 14 COUNTRIES

Wai Chiong LOKE¹, Edwards NIGEL² (1. *Global Healthcare Practice, KPMG, Singapore*; 2. *Global Healthcare Practice, KPMG, United Kingdom*)

Introduction : Many economies are facing an aging society, which has the potential to cripple entire health systems, and new approaches are needed fast. Method : A study was commissioned by Lien Foundation to help inform and stimulate the global dialogue on elder and long term care. Interviews were conducted with 46 thought leaders, professionals and practitioners in the aged care sector from 14 selected countries, during August and September 2012. The individuals chosen to participate in were selected through KPMG's professional network and recommendations from experts in long term care. Interviewees were asked to offer their views on current and emerging demand and supply trends, and to identify innovative approaches and models of long term elderly care delivery. A team of in-house researchers collected supporting background data. Results : Three findings stand out: funding is a critical issue as most governments are cash-strapped and innovative mixes of public and private finance are needed; the medical model has to change and care has to be integrated; new conversations must occur and involve government, private and non-governmental bodies, providers and the public. Conclusion : It is apparent that there is no single, breakthrough idea. However, we have found number of highly innovative approaches that together can form the building blocks of a new era in elderly care. As with all complex interventions, many of these blocks have to be put in place concurrently, which calls for a high level of implementation expertise. Keywords : long term, elderly care, demand, innovation, funding, financing

SS24 408-R

CROSS NATIONAL PERSPECTIVES ON OLDER COUPLE'S FINANCIAL AND HEALTH SECURITY

SS24 408-R-1

BEHIND CLOSED DOORS: OLDER COUPLES AND THE MANAGEMENT OF HOUSEHOLD MONEY IN THE UK AND THE USA

Debora PRICE¹, Kriston T. D'AMURO², Dinah BISDEE¹, Lynne LIVSEY¹, Tom DALY¹ (1. *Social Science, Health and Medicine, King's College London, United Kingdom*; 2. *Sociology, University of Buffalo, USA*)

Introduction : This paper compares the institutional, cultural, social and political structures of two advanced welfare states, the UK and the

USA, to understand how and why older couples manage money in the ways that they do. Method : We combine documentary and policy analysis with qualitative interviews of older couples. Results : Both these countries are considered 'individualistic' family and societal cultures, and cultures of high levels of consumption for pleasure, with an active 'third age' in retirement, yet their welfare states provide very differently for older citizens, particularly in the realms of pensions and health care. Conclusion : We consider what impact these structural issues have on the ways that older couple think about, talk about and manage money, how they interact with cultural and biographical influences, and the different implications for fiscal welfare in old age. Keywords : couples, money, UK/USA

SS24 408-R-2

PERCEPTIONS ON SAVING AND SPENDING BY OLDER COUPLES IN SINGAPORE AND JAPAN

Debra STREET, Yumiko FUJITA (*Department of Sociology, State University of New York at Buffalo, USA*)

Introduction : Using data from an adaptation of the survey for the original Behind Closed Doors study, we compare experiences of older couples in Singapore and Japan, two Asian countries with very different arrangements for health and income security in old age. Method : Survey data are from nonprobability samples of individuals in Singapore and Japan who are members of married couples, where at least one partner is 65 years old. Data are analyzed using multivariate statistics. Results : In both countries, concerns about saving and spending are associated with living arrangements, education, and income. Conclusion : Similarities in perspectives among elders from both Singapore and Japan on some items may be associated with the philosophy of filial piety prominent in Asian countries. Differences may be attributed to two influences distinctive to each country: continuous economic growth in Singapore compared to a period of economic stagnation in Japan; and, differences in the policy mechanisms associated with income support and health care in the two countries. Keywords : older couples, retirement

SS24 408-R-3

FRIENDS AND NEIGHBOUR(HOOD) INFLUENCES ON THE LIVES OF OLDER SINGAPOREANS AND AMERICANS

Debra STREET, Christopher MELE (*Department of Sociology, State University of New York at Buffalo, USA*)

Introduction : Using pilot data from an adaptation of the survey for the original Behind Closed Doors study, we compare experiences of older couples in Singapore and the United States. Realization of the expectation in Singapore that families "take care of their own" elders and in the United States that older Americans "take care of themselves," depends on the social context and a range of other resources for support at older ages. Method : Survey data are from nonprobability samples of individuals in Singapore and the United States who are members of married couples, where at least one partner is 65 years old. Data are analyzed using descriptive and multivariate statistics. Results : In both countries, relationships with family members are associated with similarities in how older people think about saving, spending, and economic adequacy in later life. Broader social networks of friends and neighbors are associated with differences in older American's perceptions of income security associated with saving and spending. Conclusion : Similarities in perspectives among elders from both Singapore and the United States on some items are associated with the importance of family relationships in later life. Differences may be attributed to two influences distinctive to each country: different ideologies associated

with “successful aging” and the relative importance of social networks beyond families in the U.S. context. Keywords : older couples, retirement

SS24 409-C

SMOKING CESSATION IN THE ELDERLY

SS24 409-C-1

CIGARETTE SMOKING MAY NOT BE ASSOCIATED WITH MORTALITY RISK FOR THOSE OLDER THAN 75 YEARS: A 20-YEAR PROSPECTIVE COHORT STUDY

Chih-cheng HSU (*Division of Geriatrics and Gerontology, National Health Research Institutes, Taiwan*)

Introduction : It is well known that smoking is related with mortality risk; however, the health effects of smoking or quitting smoking in those older than 75 remain unclear. We aimed to delineate impacts of smoking status on mortality for the elderly in Taiwan. Method : We selected 1344 males (≥ 65 years) from the TLISA (Taiwan Longitudinal Study in Aging) study. The smoking status was self-reported in the recruitment period in 1989. We followed this cohort through to the end of 2008 and identified 1028 deaths. We used multivariable Cox proportional hazards models to investigate mortality risk for different smoking status. Results : Mortality rate and 95% confidence interval (95% CI) for non-smokers, ex-smokers, and current smokers was 6.27 (5.45-7.18), 7.06 (6.22-7.98), and 7.83 (7.21-8.49) per 100 person-years, respectively. Compared to non-smokers, current smokers had higher all-cause mortality for those in 65-69 and 70-74 years, but not for those older than 75 years (hazard ratio [HR] was 1.67 [1.27-2.21], 1.52 [1.08-2.15], and 1.07 [0.79-1.45], respectively). Similar trend was found for cancer mortality (HR for those in 65-69, 70-74, and ≥ 75 years were 3.52 [1.78-6.97], 3.71 [1.39-9.91], and 1.11 [0.49-2.55], respectively). A significant dose-response relationship between cigarette smoking and mortality risk was observed only in those younger than 75 years. Conclusion : This study shows cigarette smoking is not associated with mortality risk for those older than 75 years. More research is needed to further investigate if cigarette smoking would deteriorate physical or cognitive function for those who are 75 years or above. Keywords : smoking, mortality

SS24 409-C-2

SMOKING AND SMOKING CESSATION AMONG THE ELDERLY IN TAIWAN

Li-chuan CHANG¹, Yi-wen TSAI¹, Shu-ti CHIOU², Liang-kung CHEN³ (*1. Institute of Health Welfare and Policy, National Yang Ming University, Taiwan; 2. Bureau of Health Promotion, Department of Health, Executive Yuan, ROC, Taiwan; 3. Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taiwan*)

Introduction : In 2009, the Taiwan government implemented the Tobacco Hazards Prevention Amendment. The main aim was to identify the high risk group of smoking among the elderly and to assess the impact of Taiwan's 2009 Act on smoking behavior of the elderly ? smoking prevalence, cessation and intensity. Method : We analyzed data of 12479 people aged 65 years or above from the 2007-2011 Taiwan Adult Smoking Behavior Surveys. We identified 3206 recent smokers who were either current smokers (N= 1,428) or former smokers who had quit smoking for 2 to 12 months (N= 1,778). Logistic regressions were used to examine the impact of the 2009 Act on (1) current smoking prevalence among all the elderly and (2) smoking cessation among recent smokers. Results : The 2009 Act

showed a significant impact on reducing current smoking prevalence during the post-Act period from 2009 to 2011 compared to the pre-Act period from 2007 to 2008 (OR=0.66, 95%CI=0.57-0.75). Smoking was significantly associated with lower education degree (high-school: OR=1.43, 95%CI=1.03-2.00; elementary school: 1.66, 95%CI=1.23-0.24) compared to the elderly with college degree. Married persons were less likely to smoke than the unmarried (OR=0.77, 95%CI=0.62-0.95). Smoking cessation among recent smokers increased after 2009 (OR=2.78, 95%CI= 1.63-4.73). Conclusion : The multi-policy tobacco control legislation of the 2009 Act significantly decreased smoking prevalence and increased smoking cessation among the elderly in Taiwan. The elderly who were unmarried and had lower education levels were the high risk groups of smoking. Clinical practice or future policy design should take this evidence into consideration to reduce the tobacco harm on health among these elderly. Keywords : smoking, smoking cessation, elderly

SS24 409-C-3

SMOKING CESSATION IN JAPANESE ELDERLY SMOKERS

Yuko TAKAHASHI (*Health Care Center, Nara Women's University, Japan*)

Introduction : Smoking has been considered a major public health issue in Japan. Since 1970's, smoking rate among Japanese adult males has been falling down slowly to 29.8% in 2011 and under 25% in the elderly (over 60 yo). Method : Clinic-based cessation program has been developing since 1994. Now the health insurance covers the clinic based therapy with nicotine patch and varenicline subscription under the guidance of physicians for 12 weeks. Nicotine patches and nicotine gums were also available in pharmacy. 1 year success rate of the clinic based program was reported 29.7% in 2006 and 36.4 % in the elderly (over 70yo). Results : Although the clinic based program had been effective to elderly smokers, there still are many problems. Elderly smokers tend to suffer from the uncomfortable side effects of varenicline and nicotine patch. In addition to that, many elderly smokers feel fear to change their life style and persist smoking. Conclusion : The better program for the elderly smokers should be established. The total smoking ban and the raise of tobacco price should be needed besides of social education and social support. Keywords : smoking cessation, Japan, Clinic-based cessation program

SS24 409-C-4

SMOKING CESSATION INTERVENTIONS IN THE ELDERLY

Seung-kwon MYUNG (*Cancer Information & Education Branch, National Cancer Center, Korea*)

Introduction : It has been well known that smoking causes cancer, cardiovascular diseases, respiratory diseases, and many other diseases. Especially, smoking is the leading cause of premature death among the elderly, primarily due to cardiovascular disease and cancer. Method : The current presentation includes a brief review of smoking cessation interventions in the elderly established or being potentially considered so far and the two major smoking cessation programs operated by the Korean government, i.e., smoking cessation clinics at the community health center and a Quitline service for smoking cessation. Results : In summary, effective interventions smoking cessation include physician's brief advice, behavioral counseling, and pharmacotherapy such as NRT, bupropion, and varenicline. Conclusion : These interventions are being used at the smoking cessation clinics (esp., family medicine clinic) in the private or public hospitals in Korea. Keywords : smoking cessation intervention, elderly

AGING IN THE FOREIGN LAND: UNDERSTANDING THE MULTIPLE CONTEXTS OF AGING IMMIGRANTS

SS24 410-R-1

SOCIAL EXCLUSION AND AGING IMMIGRANTS IN CANADA

Daniel LAI, Hongmei TONG (*Faculty of Social Work, University of Calgary, Canada*)

Introduction : The well being of aging immigrants is often forgotten in service delivery system. This paper examines the social exclusion and systemic determinants that challenge the well being of the aging Chinese and will highlight the challenges and determinants of exclusion in different global and socio-cultural contexts. **Method :** Secondary data analysis was used, using data from surveys conducted in Canada, the USA, Mainland China, Hong Kong and Taiwan (n=4,240) to synthesize key themes emerged from social exclusion and related indicators experienced by aging older Chinese in the different social contexts. Exclusion related to finance, wellbeing, attitude toward aging, and social relations were the indicators examined. Data analysis was conducted by comparing the social exclusion variables across the different samples, using bivariate statistics and multivariate regression analysis, depending on the level of measurements of the dependent and independent variables. **Results :** Social exclusion related to social resources, attitude toward aging, financial resources, and service barriers were the significant correlates of various well being outcomes. Attitude toward aging correlated significant with mental health of the aging Chinese. Financial adequacy was significantly related to more negative health outcomes. Social exclusion illustrated through service barriers also correlated with more negative physical and mental health of the aging Chinese. **Conclusion :** Strategies for promoting well being and fulfilling needs of the aging Chinese should be expanded beyond the use of individual interventions and treatments. Elimination of social exclusion and systemic barriers should be the top priority for creating a more positive social and structural environment for this vulnerable minority group. **Keywords :** social exclusion, immigrants, aging, Chinese

SS24 410-R-2

OLDER MIGRANTS AS A CHALLENGE: PERSPECTIVES FROM SWEDISH NEED ASSESSORS IN ELDERLY CARE

Sandra TORRES¹, Anna OLAISON², Emilia FORSSELL³ (*1. Dept. of Sociology, Uppsala University, Sweden; 2. Dept. of Social Welfare, Linköping University, Sweden; 3. Dept. of Social Work, Ersta Sköndal University College, Sweden*)

Introduction : The globalization of international migration has brought about increased ethnic and cultural diversity amongst elderly care recipients around the world. This poses challenges to the formulation and deliverance of high quality and user-friendly care in general, but also to specific welfare practices in particular. In this presentation we will address the way in which need assessors (also called care managers) handle the diversity in question as they go about the business of assessing needs in the older population and deciding if elderly care is to be provided to people or not. **Method :** The project upon which this presentation is based departs from focus group data with 60 need assessors and 200 case management files. Both of these data sets have been analyzed through qualitative content analysis. **Results :** The presentation will address how these welfare representatives (i.e. need assessors or care managers) experience the need assessment process when dealing with older migrants and how their documentation practices are affected by the way in which their understandings of ethnic 'Otherness' intersect with the other

understandings of social positions (such as age and gender) that they uphold. **Conclusion :** The findings suggest that need assessors' understandings of old age differ depending on which other social positions elderly people 'inhabit'. The presentation will contribute to the debate on institutional categorization by focusing on how lack of an awareness of the implications on ethnic/cultural 'Otherness' influence power differentials in old age within the context of the specific welfare practice in focus here (i.e. need assessment). **Keywords :** need assessment, older migrants

SS24 410-R-3

SOCIAL SUPPORT AND QUALITY OF LIFE OF AGING CHINESE IMMIGRANTS IN NEW ZEALAND

Jingjing ZHANG (*Sociology, The University of Auckland, New Zealand*)

Introduction : This study aims to explore the social support obtained by elderly Chinese migrants in New Zealand, and how the support contributes to their perceived quality of life. **Method :** Data is collected from semi-structured in-depth interviews with 35 Chinese migrants who aged 60 years old and over and have been living in New Zealand for at least 3 years. Interviewees were asked about their socio-economic backgrounds, social networks, difficulties they encountered in New Zealand, supports they provided and obtained, and their satisfaction with their quality of life. **Results :** Findings suggest that the majority of these elderly Chinese migrants leave China out of family obligation to provide care for their grandchildren and domestic support for their children's household in New Zealand. Reciprocal support is exchanged between generations within Chinese families but the support provided by elderly migrants to their children's household does not equal the support they receive. The significance of children's support declines over time, especially when living arrangements change due to the children's further migration to a third country. A large proportion of these elderly migrants are living independently on the social benefit from New Zealand government and social services from the well-established Chinese communities. **Conclusion :** The research further reveals that social benefit and support from the host society appear to be essential and more significant to the quality of life of these elderly Chinese migrants than family support because they are more likely to perceive quality of life on the material level. **Keywords :** social support, quality of life, elderly Chinese immigrants

SS24 410-R-4

A LIFE-COURSE PERSPECTIVE ON ELDERLY RESIDENTIAL MOBILITY IN SOUTHERN CHINA: AN ADAPTATION OF THE AMENITY RETIREMENT MIGRATION MODEL

Nelson CHOW¹, Xue BAI² (*1. Department of Social Work and Social Administration, The University of Hong Kong, China; 2. Department of Applied Social Sciences, The Hong Kong Polytechnic University, China*)

Introduction : It is a widely acknowledged fact that tens of thousands of older Hong Kong residents have lived either periodically or permanently in the Mainland of China since the relaxation of restrictions on cross-border mobility and the increasing interaction, in all aspects, between Hong Kong and the Mainland. This article, based on the findings of interviews with 30 older migrants conducted between 2003 and 2004, examined the migration pattern of Hong Kong residents retiring in the Pearl River Delta of Southern China. **Method :** Purposive snowball sampling method was used. Semi-structured in-depth interviews were conducted on 30 Hong Kong older participants who were retiring in the Pearl River Delta. Each interview

took about one and a half hour. All the interviews were audio-taped while the responses were also written down in as much detail as possible. Results : Results show that the decision to move often starts with some early thoughts about the possibility to move and when retirement comes near, potential movers would then seriously consider the pros and cons of the various options. Factors identified to have influenced the decision include differences in the cost of living, better environment and amenities, desirable life-style, family background and financial resources, past life experiences, and other contextual matters. Conclusion : Haas and Serow's (1993) model of the Amenity Retirement Migration Process can be successfully applied to examine the process of older Hong Kong residents' moving to Pearl River Delta in Southern China from a life-course perspective. Keywords : older Chinese; retirement migration; life-course perspective

SS24 410-R-5 ON MIGRANT OLDER ADULTS IN URBAN CHINA

Shan LI (*College of Public Administration and Social Science, Dalian Maritime University, China*)

Introduction : The problems of migrant older adults in China used to be ignored compared with the young floating population from rural to urban areas since 1980s. It is estimated that people aged over 60 who experienced residential movement in the late 10 years has achieved 11%. Current researches focused on factors affecting elderly movement and the characteristics of migrant elderly. Yet analysis on the social problems of migrant adults in new environment is rarely conducted. Method : This research examined several hypotheses on migrant older adults with a questionnaire survey of 455 older adults conducted in Sep.2009 in Dalian city. Results : The main idea in this thesis is that compared with the native older adults, migrant older adults usually hold more social problems originated from rural-urban structure, social construction, social security system. And also social-economic status, social network and social participation are main factors influencing their social adaptation toward new community for migrant older adults. Conclusion : The main conclusion is that factors affecting migrant older adults include individual factors, social networks, SES, and rural-urban social structure, social insurance system as well. Keywords : migrant older adults, urban China, social adaptation

SS24 413-S GEROTRASCENDENCE: EMERGING CONCEPT IN DESCRIBING LIVES OF OLDER PEOPLE

SS24 413-S-1 TEN YEAR COURSE OF COSMIC TRASCENDENCE IN OLDER ADULTS IN THE NETHERLANDS: RESULTS FROM A FOUR WAVE STUDY

Arjan W. BRAAM¹, Dorly J.H. DEEG², Henrike GALENKAMP²
(1. Longitudinal Aging Study Amsterdam, Vrije Universiteit Medical Centre / University of Humanist Studies, Netherlands; 2. LASA, Vrije Universiteit Medical Centre, EMGO+ Institute, Netherlands)

Introduction : A core aspect of gerotranscendence, consistent across studies, is represented by cosmic transcendence. Cosmic transcendence can be regarded as the tendency among older adults to an increased feeling of unity with the universe; a redefinition of the perception of time, space, life, and death; and a growing affinity with past and future generations. Method : Four interview cycles, with three year intervals, of the Longitudinal Aging Study Amsterdam provided data on cosmic transcendence (CosT, 6-item scale), religious affiliation, social network size, depressive symptoms and physical

limitations. Complete scores were available for 787 respondents. Results : The mean scores of cosmic transcendence were stable, but the variability between the assessments was relatively high. Using dichotomized scores, 31% never had a high CosT score (mean age 66.3 at start of the study), and 29% had three or more times a high CosT score (mean age 68.7). Attaining stable high CosT scores was associated with age, also after adjustment for religious affiliation. Respondents with a religious background had higher CosT scores. The association between frequency of praying/meditation and CosT was highly significant, especially among those without religious affiliation. Conclusion : About one third of the older aged in this sample from The Netherlands never had high levels of CosT: presumably, this part of the sample may lack affinity to this contemplative stance in life. Although the mean Cosmic transcendence scores did not show any increase over time, attaining stable high CosT levels occurred more among the more aged respondents, and was strongly associated with prayer/meditation, also among the non-religious. Keywords : gerotranscendence, religiosity, spirituality

SS24 413-S-2 GEROTRASCENDENCE AND DIFFERENT CULTURAL SETTINGS: STUDIES OF RELIGIOUS AND SECULAR ELDERLY IRANIANS, TURKS AND SWEDES

Fereshteh AHMADI (*Department of Social Work and Psychology, University of Gavle, Sweden*)

Introduction : Within the framework of an international research project aimed at studying the impact of different cultural settings on gerotranscendent development, six groups namely religious Iranians, religious Turks, religious Swedes, secular Iranians, secular Turks and secular Swedes were studied. Method : A life history approach, followed by thematic semi-structured interviews, was applied. One of the objectives of this research project consisting of three explorative studies was to inquire about the possible impact of religion, conceived of as a cultural setting, on development towards gerotranscendence. Results : The findings of this inquiry gave rise to two assumptions as to the relationship between gerotranscendence and religiosity. Conclusion : The first assumption is that the internalization of mystical-type ideas in individuals' ways of thinking is probably a factor involved in the development of a gerotranscendent view of life. On the other hand, whether individuals practice their "religion" in a spiritual, nonorganizational way or in an organizational way may play a role for development towards gerotranscendence. The second assumption is that certain characteristics, such as the secular and individualistic features of modern societies, may delay development towards gerotranscendence. Keywords : gerotranscendence, spirituality, Sufism

SS24 413-S-3 GEROTRASCENDENCE AMONG THE YOUNG-OLD, OLD- OLD, AND OLDEST-OLD IN JAPAN: RESULTS FROM THE SONIC STUDY

Takeshi NAKAGAWA¹, Yukie MASUI², Yasuyuki GONDO¹, Madoka OGAWA³, Yoshiko ISHIOKA¹, Megumi TABUCHI³, Yukiko TATSUHIRA¹, Marina KOZONO¹, Kazunori IKEBE⁴, Kei KAMIDE⁵, Yasumichi ARAI⁶, Ryutaro TAKAHASHI⁷
(1. Graduate School of Human Sciences, Osaka University, Japan; 2. Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan; 3. Department of Psychological Science, Kwansai Gakuin University, Japan; 4. Graduate School of Dentistry, Osaka University, Japan; 5. Graduate School of Medicine, Osaka University, Japan; 6. School of Medicine, Keio University, Japan; 7. Research on Social and Human Sciences, Tokyo Metropolitan

Institute of Gerontology, Japan

Previous studies suggest that older Japanese adults show cultural-specific gerotranscendence signs. So, a Japanese version scale was developed to measure gerotranscendence among older Japanese people. This study examined whether the scale captures the adaptive development with aging, and what predicts gerotranscendence among older Japanese. This study was based on data from samples of the Septuagenarian, Octogenarian, Nonagenarian Investigation with Centenarian (SONIC). 1,000 septuagenarians and 973 octogenarians participated, and nonagenarians are currently participating. A questionnaire survey and health checkups were administered. Gerotranscendence was assessed, using the Japanese Gerotranscendence Scale consisting of 8 subfactors. We measured subjective well-being indices, and sociodemographic, social, and health predictors of six subfactors of gerotranscendence were positively related with subjective well-being indices. Next, stepwise regression analyses were conducted, using each subfactor of gerotranscendence as dependent variables and sociodemographic (i.e., age, gender), social (i.e., social support, religious activities), and health (i.e., diseases, instrumental activities of daily living) indicators as independent variables. The results showed that age was the strongest predictor of the 6 subfactors. Among social indicators, religious activities were positively related with the 4 subfactors. The role of health predictors was inconsistent. However, the link between poor health status and the two subfactors unrelated to subjective well-being was observed. This study suggests that six of eight subfactors of gerotranscendence can capture the adaptive development. Gerotranscendence seems to be promoted by normal aging, whereas some facets of gerotranscendence can be modified by religiosity. Using the data of nonagenarians, these findings will be duplicated at the symposium. Keywords : gerotranscendence, spirituality, psychological development

SS24 414-S
APPLICATIONS OF ICF FOR HEALTHY AGING IN JAPAN AND THE USA

SS24 414-S-1
ICF AS A CONCEPTUAL FRAMEWORK: DEFINITIONS, MEASUREMENT, BARRIERS AND FACILITATORS TO HEALTHY AGING

Kristine MULHORN (*Department of Health Administration, Drexel University, USA*)

Introduction : Attendees will be introduced to ICF, its framework and specific definitions used for aging, including the concept of barriers and facilitators. Method : This is an introduction to the ICF itself and not a study or a research project. The speaker will use hands-on materials as well as references to the WHO website to familiarize the audience with the ICF, an overview of the classification system and it is organized. Results : At the end of the presentation, attendees will be able to understand the reasons for the development of ICF, the basics of the framework, the outline of the definitions, with examples and a description of barriers and facilitators for specific classifications linked to aging. Conclusion : Concluding remarks will summarize the main points of this short introduction. Keywords : ICF

SS24 414-S-2
ICF-BASED ASSESSMENT TOOL USING RASCH METHOD-IMPLICATIONS FOR PRACTICE

Jiro OKOCHI (*Tatsumanosato Geriatric Facility, Japan*)

Introduction : This study focuses on the development of ICF-based scales for practice using Rasch method and functional staging model.

Method : ICF codes were selected initially based on the previous test-retest reliability study. Then the ICF items were divided into categories of the ADLs such as mobility, walking, eating and bathing. In each category, ICF codes were tested to fit the Rasch model and the level of difficulty. , Four ICF items were selected and incorporated into one Guttman-type scale to enable the staging of functioning for each category of measurement. The participants for scale development and validation were Japanese over 65 years old with functional disabilities. Results : 1164 elderly persons were eligible for scale development. To stage the functional performance of elderly persons, 10 Guttman-type scales of ADLs and cognitive functions were developed. The order of item difficulty was validated using 3507 elderly persons. There were no differential item functioning about study location, gender and age-group in the newly developed scales. These scales divide functional performance into five stages according to four ICF codes, making the measurements simple and less time-consuming. Illustrations were added to facilitate the sharing of patient images among health care providers. Conclusion : With the scales developed, patients are assigned to one stage in each scale. This was achieved by hierarchically rearranging the ICF items and constructing Guttman-type scales according to item difficulty of the Rasch model. By using ICF as a common taxonomy, these scales could be used internationally as assessment scales in geriatric care settings. Keywords : ICF, functioning, measurement

SS24 414-S-3
MEASURING THE ELDERLY'S PARTICIPATION IN THE COMMUNITY

Kenichiro ORIMO (*Nisi-Agatsuma Welfare Hospital, Japan*)

Introduction : The goal of community based care for the elderly persons is to retain their activity and participation levels in the community. Aim of this study is to incorporate participation domain of the ICF as a goal of rehabilitation for case-management. Method : To construct a care-management tool based on the ICF, we developed list of participation in three domains, leisure activity (12 items such as watching TV), social participation (7 items such as participation in voting) and communication (9 item such as conversation with friends). The Participants were 3499 elderly persons using institutional or day services of long-term care insurance in Japan. Rasch analysis was performed with RUMM2030 software. Results : Data were obtained from 1590 institutionalized (man 317, female 1273, average age 86) and 1818 day service users (man 317, female 1041 average age 81). Of these randomly selected 300 data were used for Rasch analysis. Of leisure activity items, traveling was the most difficult item, while Watching TV was the easiest items. Conclusion : With these new tools, we can now have a clear image of patients are participating in leisure and communication. Most of the participation related items of leisure, social activity and communication showed good fit to the Rasch model and therefore these items can be used for scaling participation of the elderly persons. These scales are used in a case-management system at Geriatric Rehabilitation Facilities in Japan. Keywords : Participation ICF Care-managements

SS24 414-S-4
COMPARISON OF US AND JAPANESE POPULATION: USE OF ICF TO ASSESS SOCIAL FUNCTIONING OF ELDERLY LIVING IN THE COMMUNITY

Kristine MULHORN (*Department of Health Administration, Drexel University, USA*)

Introduction : How can ICF be used as a link across cultures to compare social and physical functioning of elderly in the community.
Method : The method used is cross-walking from different assessment tools to the ICF which provides a mechanism for defining the meaning of areas of classification.
Results : The results demonstrate a close approximation of key items on the TMIG-IC scale with categories and specific codes in ICF. Some items require a specified code to demonstrate the meaning of the social interaction.
Conclusion : There are different assessment tools for measuring various concepts of functioning and cross-walking is the first step for consideration of which assessment tools may be used.
Keywords : ICF; social functioning; assessment tool; cross-walking

SS24 417-B
ANTAGONIZE CARDIOVASCULAR AGEING

SS24 417-B-1
ANTAGONIZING CARDIOVASCULAR AGEING BY CALORIC RESTRICTION AND CR MIMETICS

Ken SHINMURA (*Department of Internal Medicine, Keio University School of Medicine, Japan*)

Introduction : Caloric restriction (CR) is an established intervention, of which anti-ageing effects are scientifically proved. CR profoundly affects age-related physiological and pathophysiological alterations and markedly increases both mean and maximal lifespan in several species including mammals. In addition, CR exerts pleiotropic effects on the cardiovascular system.
Method : At first, CR could prevent the progression of atherosclerosis and “vascular aging” via direct and indirect mechanisms. Secondly, CR could improve myocardial tolerance against ischemic stress. Thirdly, CR could partially retard cardiac senescence and ameliorate age-associated left ventricular dysfunction.
Results : The exact mechanisms by which CR exerts anti-ageing effects have not been fully elucidated, but increasing evidence demonstrates that 4 intracellular signaling pathways; insulin/insulin-like growth factor (IGF) axis, mammalian target of rapamycin (mTOR) signaling, AMP-activated protein kinase (AMPK)-mediated pathways, and sirtuins (mammalian homologues of Silent Information Regulator 2), play an essential role in the development of CR effects, independent and/or dependent of each other. Furthermore, it becomes clear that mechanisms underlying cardiovascular effects of CR are more complicated, including improvement in systemic risk factors for atherosclerosis and exertion of direct effects on the vasculature and myocardium via different signaling pathways.
Conclusion : Therefore, identifying the specific cellular target responsible for each effect afforded by CR and developing more selective compounds to the downstream targets of CR will be useful in translating the CR research into clinical setting for managing patients with cardiovascular diseases. Although it has not proven yet, we expect that CR and CR mimetics reduce morbidity and mortality of cardiovascular events even in human.
Keywords : caloric restriction, cardiac senescence, vascular ageing

SS24 417-B-2
MTOR SIGNALING INDUCES VSMC SENESCENCE THROUGH P53 AND P21

Hyoung Chul CHOI, Jin Young SUNG (*Yeungnam Univ., College of Medicine, Pharmacology, Korea*)

Introduction : Cellular senescence is related to aging and stable proliferative arrest with active metabolism. Senescent cells can activate mammalian target of rapamycin (mTOR) pathway, which plays a crucial role in the regulation of cell metabolism, cellular

growth and autophagy affected in senescence-associated cardiovascular diseases. We examined whether mTOR pathway is considered to induce cellular senescence by inhibiting autophagy in vascular smooth muscle cells.
Method : We found that VSMC senescence was accompanied by increased activity of mTOR pathway, a major controller of cell growth and a negative regulator of autophagy.
Results : Senescent VSMC to Adriamycin (ADR) treatment induced activation of mTOR pathway and reduced protein levels of signal associated autophagy. In addition, inhibition of mTOR pathway drastically decreased stained cells of senescence-associated beta-galactosidase (SA beta-gal). Moreover, inhibition of mTOR reversed levels of autophagy-related proteins and SA beta-gal stained positive cells. mTOR regulates ADR-induced senescence by up-regulating the expression of p21, which plays an important role in the induction of senescence. Autophagy suppressed VSMC senescence possibly through mTOR-dependent induction of p53 and p21.
Conclusion : As a regulator of metabolism, aging and cardiovascular diseases, mTOR-autophagy are still elusive, we tried to find evidence supporting the role of mTOR-autophagy in senescence.
Keywords : Vascular senescence, mTOR, Autophagy

SS24 417-B-3
MECHANISMS OF VASCULAR AGING AND ITS REGULATION BY SIRTUIN ACTIVATION

Katsuya IJIMA (*Institute of Gerontology, The University of Tokyo, Japan*)

Introduction : Vascular damages according to aging manifest several features, namely ‘atherosis’ and ‘sclerosis’, finally leading to cardiovascular (CV) events with atherosclerosis. Longevity gene, Sir2 (silent information regulator-2), a histone deacetylase, is associated with vascular aging, especially oxidative stress-induced vascular endothelial cell (EC) dysfunction and vascular smooth muscle cell (SMC) calcification.
Method : First, the oxidative stress induces senescent phenotypic change of EC, as detected by senescence-associated β -galactosidase activity. Oxidative stress-induced EC senescence was associated with a decline in SIRT1, a mammalian Sir2 homolog, with eNOS down-regulation. Notably, statins could protect the EC senescence via restoration of SIRT1 expression, leading to up-regulation of mitochondria biogenesis and catalase, MnSOD expression. These observations suggest that the SIRT1-eNOS axis has a fundamental protective effect against senescence-related EC dysfunction.
Results : Second, SMC calcification in arterial media leads to Monckeberg’s-like arteriosclerosis and makes management of hemodynamics more difficult in the elderly. Few reports have addressed whether cellular senescence is correlated with SMC calcification. In the condition of renal failure with hyperphosphatemia, we show the induced SMC senescence was associated with SIRT1 downregulation and subsequent p21 activation, and excessive SMC calcification is attributable to senescence-related osteoblastic trans-differentiation. SIRT1 dynamically protects SMC calcification via inhibition of phosphate-induced Runx2, a transcriptional factor of many osteoblastic genes, finally leading to balance of the SMC phenotype.
Conclusion : Taken together, we review the regulatory protective mechanisms of SIRT1 for vascular aging. Our new findings suggest that strategies to maintain SIRT1 activity level higher may provide us novel therapeutic opportunities for the prevention of athero/arterio-sclerosis.
Keywords : Vascular calcification, Senescence, Longevity gene sirtuins

SS24 417-B-4
MOLECULAR MECHANISM OF VASCULAR AGING AND ITS INTERVENTION BY BETAINE AND PPAR AGONIST

Hae Young CHUNG (*Department of Pharmacy, Pusan National University, Korea*)

Introduction : Our present study was launched to further elucidate the molecular aspects of aortic proinflammatory genes regulation during aging by utilizing two experimental paradigms; anti-inflammatory calorie restriction (CR) and dietary supplementation of phytochemical betaine and a novel PPAR agonist on aged rats. **Method :** Aged rats were calorie restricted or diet supplemented of phytochemical betaine and a novel PPAR agonist. Many biochemical experiments were done to check molecular aspects of aortic proinflammatory genes regulation. **Results :** Result showed that reactive species (RS) and lipid peroxidation products 4-HNE / MDA levels were all increased, accompanied with decreased total thiol contents. In addition, the aortic anti-oxidative capacity was also found to be decreased in old rats. The treatment with betaine and PPAR agonist effectively suppressed these oxidative stress related markers. To further look into the molecular event involved in proinflammatory gene activation in aging aorta, levels of various inflammation biomarkers were determined, including PGE2, TXA2, COX-2, PGES, PGIS, P-/E-selectin, VCAM-1 and ICAM-1, as well as TNF α and IL- β . Results show that those genes are all increased with age, and importantly, they were attenuated by CR and supplementation of betaine and PPAR agonist. **Conclusion :** Based on these finding and others, we concluded that the protection of aging vasculature by anti-aging action of CR and treatment with betaine and PPAR agonist is mediated through its anti-inflammatory property. **Keywords :** vascular aging, PPAR, betaine

DAILY STRESS IN MIDLIFE AND OLD AGE: IMMEDIATE AND LONG-TERM IMPLICATIONS FOR HEALTH AND WELL-BEING

SS24 418-S-1

DOES DAILY LIVING WEAR YOU OUT? COMBINING SELF-REPORTED AND BIOLOGICAL INDICATORS OF STRESS

David ALMEIDA (*Human Development & Family Studies, Pennsylvania State University, USA*)

Introduction : Current stress theories suggest that chronic exposure to hormones elicited by stressors leads to accumulated wear and tear on the body, referred to as allostatic load. **Method :** In this paper we use diary methods that obtain repeated measurements from individuals during their daily lives to assess associations between real-life stressors and salivary cortisol in the National Study of Daily Experiences. Respondents completed nightly interviews about daily stressors at two time points across a 10 year period. **Results :** The analyses differentiated between individuals who were high at both occasions versus low at both occasions in stressor exposure and reactivity. The results showed that individuals who were high in their exposure to stressful events at both time points had dysregulated cortisol rhythms. Compared to their younger counterparts, chronically stressed older adults showed the greatest amount of cortisol dysregulation. **Conclusion :** Discussion will focus on how daily stress processes may contribute to an increased risk of illness and mortality. **Keywords :** Stress, Cortisol, Health

SS24 418-S-2

AFFECTIVE REACTIVITY TO DAILY STRESSORS PREDICTS LONG-TERM MENTAL AND PHYSICAL HEALTH OUTCOMES

David ALMEIDA¹, Jennifer PIAZZA², Susan CHARLES³, Jacqueline MOGLE¹, Martin SLIWINSKI¹ (*1. Human Development &*

Family Studies, Pennsylvania State University, USA; 2. Health Science, California State University, Fullerton, USA; 3. Psychology and Social Behavior, University of California, Irvine, USA)

Introduction : Daily stressors, such as an argument with a spouse or an impending deadline, are associated with short-term changes in physical and mental health. Whether these minor hassles have long-term physical and mental health ramifications, however, is largely unknown. **Method :** In two separate studies, we examined whether exposure and reactivity to daily stressors is associated with long-term risk of reporting a chronic physical health condition (Study 1) or an affective disorder (Study 2). Participants from the National Study of Daily Experiences (NSDE) completed a series of daily diary interviews between 1995 and 1996 and again 10 years later. **Results :** Results revealed that heightened affective reactivity to daily stressors at Time 1 was related to a heightened risk of reporting a chronic physical health condition at Time 2, as well as an increased likelihood of reporting an affective disorder. **Conclusion :** Findings suggest that how people respond to seemingly minor events in their lives has long-term implications for their physical and mental health. **Keywords :** stress, reactivity, health outcomes

SS24 418-S-3

ASSESSING THE PERSONAL ECONOMIC COSTS OF DAILY STRESS REACTIVITY

David M. ALMEIDA, Soomi LEE (*Human Development and Family Studies, Penn State University, USA*)

Introduction : Our daily lives expose ourselves to stressful experiences. Yet, we differ from each other in the amount of negative affect we feel in response to stress as well as the amount of stress to which they are perceived (Mroczek & Almeida, 2004). Stress reactivity, how much people react to stressors, has been studied in the association with personality and age. However, no study examined the effects of stress reactivity on economic outcomes. This study assessed the personal economic costs of daily stress reactivity. **Method :** Data are from the Midlife in the United States (MIDUS), a nationally representative survey. Of the 7,108 participants completing the phone survey in 1995-1996, 4,963 were reassessed in 2004-2005. At both waves, respondents also completed short phone interviews about their daily experiences. Respondents who completed daily and main interviews at both waves were included in the analysis (N=3,096). **Results :** To account for inter- and intra-personal variations in the amount of negative affect and the effects stressors on negative affect, we used multilevel modeling. After controlling for personal income, personality, and demographic characteristics at wave1, heightened stress reactivity at wave 1 predicted a significant decrease in personal income at wave2. **Conclusion :** Results indicate that heightened stress reactivity in our daily lives has personal economic costs. Personal income is an objective marker of individual well-being and it affects quality of life by providing security, confidence, and a buffer against the effects of ill health. Addressing personal income as an outcome affected by stress reactivity may provide a new perspective in stress research. **Keywords :** Negative affect, Stress reactivity, Personal income

DAILY STRESS AND PHYSIOLOGICAL MARKERS OF STRESS OF FAMILY CAREGIVERS: EFFECTS OF ADULT DAY CARE USE

Steven ZARIT¹, David M. ALMEIDA¹, Elia E. FEMIA¹, Laura Cousino KLEIN², Kyungmin KIM¹, Courtney WHETZEL² (*1. Human Development & Family Studies, Pennsylvania State University, USA; 2. Biobehavioral Health, Pennsylvania State*

University, USA)

Introduction : This study examines the effects of daily stressors on physiological markers and well-being in a sample of people exposed to high levels of chronic stressors, family caregivers of people with dementia. Unique to this study is that all participants used an Adult Day Services (ADS) program on some observation days, which lowers stressor exposure, and allows us to examine within-person differences in physiological and behavioral responses on high and low stress days. **Method :** Participants were 174 family caregivers of persons with dementia who attended ADS at least two times a week. Caregivers completed telephone interviews for 8 consecutive days, including days when their relative used ADS (low stress days) and when their relative did not (high stress days). They also provided 5 saliva samples each day. Outcomes were measures of affect and two stress biomarkers: cortisol and dehydroepiandrosterone-sulfate (DHEA-S). **Results :** Findings were analyzed using multi-level modeling. Results showed that ADS days were associated with lower negative affect and more normative cortisol patterns than on non-ADS days. Caregivers had higher DHEA-S on days following ADS use, and also had higher positive affect on those days. **Conclusion :** These results confirm the association of daily variability of stressors with behavioral and physiological outcomes in the context of high chronic stress. Lowering stressor exposure resulted in improvements in daily stress responses on affective and physiological markers. These results suggest that respite services such as ADS that lower stressor exposure may reduce the risk of poor health outcomes for family caregivers. **Keywords :** Daily stressors, cortisol, caregivers

SS24 419-S **THEORETICAL PERSPECTIVES ON AGEING IN** **TRANSNATIONAL FAMILIES**

SS24 419-S-1 **INBETWEENNESS: IDENTITY RECONSTRUCTION OF** **OLDER CHINESE MIGRANTS IN THE TRANSNATIONAL** **CONTEXT**

Wendy Wen LI (*Department of Psychology, James Cook University, Australia*)

Introduction : Chinese immigrants make up one of the largest ethnic groups within the older New Zealand population. However, their everyday experiences of settling in a new and unfamiliar environment have been largely overlooked. This paper seeks to remedy this by exploring the biographies, identities and everyday experiences of older Chinese migrants. **Method :** The research utilised a narrative approach. Three waves of interviews were conducted with 32 older Chinese immigrants to New Zealand. **Results :** The findings revealed that Older Chinese immigrants did often experience biographical disruptions and status discrepancies when they moved from China to New Zealand. However, in response, participants engaged in positive activities such as gardening and art, along with other local and transnational community activities, as a means of cultivating a new sense of self in a new land. This new sense of self is shown to be compatible with participants' existing identities as older Chinese adults. **Conclusion :** Living between China and New Zealand, between homes and between languages, participants did not merely insert or incorporate themselves into existing spaces in New Zealand. Rather, they also create 'inbetweenness' where they experience multiple identities which unify nearness and remoteness, here and there. **Keywords :** Identity, inbetweenness, multiplicity, Chinese, ageing

SS24 419-S-2 **MIGRATION, HOMELAND AND BELONGING: NORMATIVE**

INFLUENCES ON TRANSNATIONAL RELATIONSHIPS OF **SIX MIGRANT GROUPS IN THE UK**

Vanessa BURHOLT¹, Christina VICTOR², Christine DOBBS¹, Wendy MARTIN² (*1. Centre for Innovative Ageing, Swansea University, United Kingdom; 2. School of Health Sciences and Social Care, Brunel University, United Kingdom*)

Introduction : Taking a symbolic interactionist perspective, this paper examines the transnational relationships of two generations (45-64 years; 65+ years) in six migrant groups (Bangladeshis, Indians, Pakistanis, Chinese, African, and African-Caribbean) living in the UK and their relatives abroad. We consider how the perceptions of one's identity ? captured through the sense of belonging to family, ethnic or cultural group, the UK, or country of origin ? influences transnational. **Method :** The number of active transnational relationships is used as the dependent variable. Regression models determine whether migrant status (either migrated to the UK, or born in the UK) and sense of belonging to the UK, the homeland or a cultural group influences these relationships. **Results :** Bivariate analysis showed that migrants with a strong sense of belonging to the UK have significantly fewer active transnational relationships than migrants with a strong sense of belonging to their country of origin or their ethnic or cultural group. However, regression models indicated that this relationship is accounted for by migrant status: older people that migrated to the UK have a greater number of active transnational relationships than those that were born in the UK (even after controlling for total number of inactive and active transnational relationships). **Conclusion :** In the UK, the sense of identity and belonging for people in these six ethnic groups is associated with place of birth. In this respect, the social construction of ethnic identity within the UK and a sense of belonging decreases the likelihood that a person will have active transnational relationships. **Keywords :** Ethnicity , Generational comparison, Transnational

SS24 419-S-3 **CARING ACROSS BORDERS: TAIWANESE IMMIGRANTS** **TO THE UNITED STATES AND THEIR OLDER PARENTS** **LEFT BEHIND**

Yu-kang FAN¹, Merril SILVERSTEIN² (*1. Sociology, University of Southern California, USA; 2. Department of Sociology, Maxwell School of Citizenship and Public Affairs, School of Social Work, Syracuse University, USA*)

Introduction : Migration research has not shed light on intergenerational relations between first generation immigrants and their elder parents left behind. This paper in particular examines familial organization of elder care, understanding the status obligations and practices of the sandwich generation immigrant adults. **Method :** This study identifies different ways of caring across border with mixed methods. In-depth interviews capture a diversity of meanings and care practices, generating significant patterns among Taiwanese immigrants in the U.S. Survey data, on the other hand, are used to point out basic trends and possible explanations for transnational caring. **Results :** Taiwanese immigrants incorporate family networks for elder care. Life course perspectives help understand the shifting practices and meanings of family transitions and elder care throughout migration. **Conclusion :** Taiwanese immigrants in the Southern California have negotiated and performed their status obligation with their elder parents in Taiwan in varying ways in order to compensate for their physical absence of elder care. **Keywords :** Immigration, intergenerational relations, parent care, Asia

SS24 419-S-4

FIRST-GENERATION MIGRANTS AND EXPERIENCES OF PLACE: TRANSNATIONAL TIES IN TWO URBAN NEIGHBOURHOODS

Tine BUFFEL¹, Chris PHILLIPSON² (1. *Adult Educational Sciences / School of Social Sciences, Vrije Universiteit Brussel / the University of Manchester, Belgium*; 2. *School of Social Sciences, The University of Manchester, United Kingdom*)

Introduction : This contribution aims to explore experiences of 'place' among first generation migrants living in deprived urban neighbourhoods. The data for the present research are derived from two qualitative studies in inner-city neighbourhoods in England and Belgium. **Method :** Drawing on semi-structured interviews with older Pakistani and Somali people in Manchester and Liverpool, and Turkish and Moroccan elders in Brussels, the paper reviews the variety of ways in which the idea of "home" is created, the constraints and environmental pressures which may prevent people from developing a sense of "home," and the meaning of transnational ties for the experience of place. **Results :** The findings suggest that many first generation migrants connect their sense of local attachment to their transnational ties and practices, suggesting that these enable them to create a sense of belonging to place, rather than preventing it. **Conclusion :** This implies that transnational and local ties cannot be seen as mutually exclusive, but that 'new places of belonging' to the neighbourhood can be created through the trans-nationalisation and production of space. The final part of the paper discusses conceptual as well as policy issues raised by the research. **Keywords :** older migrants, transnationalism, place attachment

SS24 420-S

CROSS-CULTURAL COMPARATIVE STUDIES ON THE EFFECTIVENESS OF POSITIVE PSYCHOLOGY APPROACH IN PREVENTING LATE-LIFE DEPRESSION AMONG OLDER ADULTS RESIDING IN JAPAN, CHINA AND KOREA

SS24 420-S-1

THE STABILITY AND CHANGE OF DEPRESSIVE SYMPTOMS OVER THE 7 FOLLOW-UP STUDY AMONG KOREAN ELDERS

Yong-jin SOHN (*Department of Humanities, Catholic University of Pusan, Korea*)

Introduction : Along with the population increases in older adults, the prevalence of health problems such as depression has received increased attention in recent years. The main purpose of this study is to determine the presence of depression among Korean elders over the years and to investigate the interlocking aspects of depressive symptoms, self-esteem and suicidal thoughts. **Method :** Data were drawn from the 1~7 wave of Korea Welfare Panel Study (KOWEPS) whose data collection started from the year of 2006 and was continuously surveyed each year since then. A group of 2,670 Korean elders over 65 years old were used to tap the determinants of depressive symptoms and its influencing factors. Linear mixed model was utilized by including demographic dimensions, health status, social relations, health-seeking behaviors, psychosocial factors (self-esteem scale, life satisfaction dimension, suicidal thoughts, and depression). **Results :** As with consistent with previous studies, those who were lower in self-esteem were more likely to report depressive symptoms and had suicidal thoughts. It was also found that the higher level of depression was slightly moderated by having higher dimensions of social networks. However, elders who were experiencing greater depression tended to have more comorbidities and seek less assistance for health-related behaviors, experienced a

lower level in life satisfaction. **Conclusion :** The results of this study support the rationale that depression is determined by various factors. Policy makers need to make health care professionals more aware of the various problems in the mental health sphere. They should offer more substantive support for providing a good psychosocial quality of life in older age. **Keywords :** Depression, Quality of Life

SS24 420-S-2

PREVENTING LATE-LIFE DEPRESSIVE SYMPTOMS IN THE ELDERLY - EFFECTIVENESS OF HAPPY PROGRAM-

Jin YU (*Department of Research, The Dia Foundation for Research on Aging Societies, Japan*)

Introduction : Importance of Depression Prevention in Late Life: Depression is a serious mental illness in late life that underlies a high suicidal rate of the elderly in Asia. It is estimated that one in every four community dwelling elderly are depressed but often they are unrecognized or untreated. **Method :** Depression Prevention Intervention Program for the Elderly: We developed "Happy Program" based on positive psychology approach, and evaluated its effectiveness in reducing depressive symptoms among the community dwelling healthy and frail elderly. The program consisted of group work and home work to learn about late-life depression and how to increase positive emotions and experiences. **Results :** Successful Outcomes of the Program: Compared with the control, the intervention group reduced symptoms of depression, insomnia and anxiety and increased happiness regardless of frailty. The significant improvement remained at one year follow-up among the healthy elderly. **Conclusion :** Our findings suggest that Happy Program can reduce depressive symptoms and improve other mental health indicators among community dwelling elderly. **Achievement:** Two municipalities adapted this program and conducted 31 times in 13 communities between 2009 and 2012. Autonomous working groups are formed by the graduates. **Keywords :** Depression Preventing Positive psychology

Introduction : To investigate the prevalence of cognitive impairment and mood disorder in elderly and to establish the national norm of

common neuropsychological measurements for old people. Method : 15 sites from eight provinces participated the research. Mini Mental State Examination (MMSE), the Montreal Cognitive Assessment (MoCA), Neuropsychological Tests Battery (NTB) and other assessments were used. Diagnosis was based on the DSM-IV and related criteria. Results : 3514 subjects Completed baseline assessments, The average age was 71.17 ± 7.78 years. 1659 were male (44.6%). 1945 were female (55.4%). The educational level was 8.24 ± 5.34 years. The prevalence of amnesic mild cognitive impairment (aMCI), vascular mild cognitive impairment, sub-clinical depression, Alzheimer's disease (AD), vascular dementia, mixed dementia, successful aging, major depressive disorder, mild depression, dysthymia, subclinical dysthymia, panic attacks, generalized anxiety, pain disorder, hypochondriasis, primary insomnia and mislanious was as followings: 13.2%, 2.3%, 0.9%, 2.8%, 1.6%, 0.5%, 4.3%, 0.9%, 2.3%, 0.6%, 1.2%, 0.3%, 0.9%, 0.3%, 1.0%, 2.5%, 4.0%. The rates for major depressive disorder and anxiety disorders were 9.7% and 2.6% respectively according to self rating scale. The risk and protective factors for cognitive disorders and common psychological disorders were analyzed, and The NORMs of MMSE, MoCA and NTB were established by age, gender and education. Conclusion : The cognitive disorders and psychological problems are common in the elderly in China The prevalence of anxiety or depressive disorder which meet the diagnostic criteria is relatively low but higher by self-rating scale. The national norms of some cognitive and psychological assessments are established. Keywords : prevalence, cognition, norms

SS24 421-S

WELLBEING IN LATER LIFE: HOW DO WE MEASURE IT AND WHAT ARE ITS DETERMINANTS?

SS24 421-S-1

MEASURING SUBJECTIVE WELL-BEING IN LATER LIFE: AN INTERNATIONAL COMPARISON

Bram VANHOUTTE, James NAZROO, Alan MARSHALL (*Centre for Census and Survey Research, University of Manchester, United Kingdom*)

Introduction : Subjective well-being is often seen as a multidimensional concept. In this paper we will test to what extent different measures of hedonic and eudaimonic well-being can be used to compare the subjective well-being in later life between countries. Method : A confirmatory factor approach using comparable data from ELSA, HRS and SHARE will be used to look at measurement equivalence across countries of commonly used instruments to assess subjective well-being. Results : Multiple instruments can be used to compare different aspects of well-being between countries, as long as the correct form of the instrument is used and a number of less suitable items are excluded from the comparison. Conclusion : A multidimensional measurement of subjective well-being in later life is not only theoretically grounded, but is also empirically feasible. Although levels of subjective well-being between countries vary considerably, this seems to have only limited implications on the reliability of measurement instruments. Keywords : subjective wellbeing, comparative, measurement

SS24 421-S-2

SURVEY MEASURES OF EXPERIENCED WELL-BEING: WHAT CONTRIBUTES TO A GOOD DAY AFTER AGE 50?

Jacqui SMITH, Lindsay H RYAN, Tara L QUEEN, Sandra BECKER, Richard GONZALEZ (*Institute for Social Research, University of Michigan, USA*)

Introduction : Kahneman and colleagues (2004) devised the Day Reconstruction Method (DRM) which adapts detailed time use diaries to assess experienced well-being. They reported discrepancies between this measure of one day's hedonic experiences and global evaluations of life and advocated the addition of DRM and life satisfaction measures to population surveys to assess subjective well-being. Method : We developed and tested several short survey measures of experienced wellbeing in national and local samples of older adults. Participants are asked a) to think about yesterday; b) to report the time they woke up, had lunch, and went to sleep at the end of the day; c) to rate their overall experiences the previous day; and d) indicate their participation in 10 activities. We follow-up this overall reconstruction with a detailed recall of the times throughout the day that each activity occurred and ratings of the feelings experienced while doing each activity. Results : We report age, health, and wealth differences in experienced well-being (activities, affect, and the time spent on activities) revealed in the Health and Aging Study (HRS), a representative panel of the US population over age 50 (N = 5200; Age 50-97), and a related study, ROBUST (N = 968, Age 50-97). The valence and mixture of emotional experience differed by activity profiles, age, health, and education. Conclusion : Our findings highlight measurement issues in understanding the complexity of emotional experience in older adults. They provide important unique information beyond global measures of life satisfaction that enhances our understanding of sources of wellbeing in later life. Keywords : Wellbeing, Time use, affective experience

SS24 421-S-3

DETERMINANTS OF INEQUALITIES IN SUBJECTIVE WELLBEING IN LATER LIFE IN THE UK AND US

Stephen JIVRAJ (*CCSR, School of Social Sciences, University of Manchester, United Kingdom*)

Introduction : The promotion of ageing well in later life is becoming a key strategy of public health policy in many developed countries. In the UK and US, this is accompanied by a shift by health authorities from measuring successful ageing as the absence of physical and mental health conditions towards assessing what is commonly referred to as subjective wellbeing. Method : This paper examines relative difference in three subjective wellbeing outcomes (quality of life, depressive symptoms and life satisfaction) by analysing the determinants in the UK and US using harmonised data from the English Longitudinal Study of Ageing (ELSA) and the Health and Retirement Study (HRS). Results : The analysis focuses on the importance of later-life transitions, including retirement, widowhood and declining health status and determines how these contribute to the relative differences in subjective wellbeing outcomes in ELSA and HRS. We control for other correlates of subjective wellbeing in old age, including gender, ethnicity, wealth, education and social support. Conclusion : Cross-country differences are important in enhancing our understanding of the subjective wellbeing determinants that are universal and those that are a result of national public policy. Keywords : Subjective wellbeing, Cross-country comparison, Ageing

SS24 421-S-4

CROSS NATIONAL COMPARISON OF WEALTH SATISFACTION, WEALTH AND WELLBEING AMONG OLDER ADULTS IN KOREA, THE UNITED STATES AND AUSTRALIA

Sarang KIM, Kerry A. SARGENT-COX, Davina J. FRENCH, Hal KENDIG, Kaarin J. ANSTEY (*Centre for Research on Ageing, Health and Wellbeing, The Australian National University, Australia*)

Introduction : The positive relationship between wealth and wellbeing has received considerable attention over the last three decades. However, little is known about how the significance of wealth for the health and wellbeing of older adults may vary across societies. Furthermore, researchers tend to focus mainly on income rather than other aspects of financial resources even though older adults often rely on fixed income, particularly after retirement. **Method :** Using data from the Household, Income and Labour Dynamics in Australia (HILDA) survey (N=1,431), the Health and Retirement Study (HRS) in the United States of America (USA; N=4,687), and the Korean Longitudinal Study of Ageing (KLoSA; N=5,447), this exploratory cross-national study examined the relationship between wealth satisfaction and objective wealth and wellbeing (measured as self-rated health and life satisfaction) among older Australians, Americans and Koreans (50+ years). **Results :** Regression analyses showed that wealth satisfaction was associated with wellbeing over and above monetary wealth in all three countries. The relationship between monetary wealth and self-rated health was larger for the US than Australian and Korean samples, while the additional contribution of wealth satisfaction to life satisfaction was larger for the Korean than the Australian and US samples. **Conclusion :** These findings are discussed in terms of the cultural and economic differences between these countries, particularly as they affect older persons. **Keywords :** Subjective wellbeing, Wealth

SS24 422-S

HEALTH LITERACY AND ITS IMPACT ON THE LIVES OF OLDER ADULTS: IMPLICATIONS FOR INTERVENTION, PRACTICE, AND POLICY

SS24 422-S-1

HEALTH LITERACY AMONG ENGLISH-AS-A-SECOND-LANGUAGE KOREAN IMMIGRANT ELDERS

Hee Yun LEE, Mihwa LEE (*School of Social Work, University of Minnesota, Twin Cities, USA*)

Introduction : This study investigates levels of health literacy and factors predicting health literacy among older Korean immigrants. **Method :** A total of 208 elderly Korean American immigrants residing in New York City were recruited. Chew et al.'s 16-item health literacy screening scale was employed. Ordinary least squares (OLS) regression analysis was used. **Results :** Based on the scale used, the overall health literacy level was found to be low; more than 60% of the participants were found to be at the inadequate (31.7%) or marginal (29.8%) level. Those with inadequate health literacy struggled with understanding written health care information and filling out medical forms. English proficiency was found to be the most significant predictor of health literacy, followed by education. **Conclusion :** This study highlights the urgent need for health literacy interventions for older Korean American Immigrants. Health care professionals should be aware of low level of health literacy of older immigrants, specifically those who cannot speak English well and have low level of education. Cultural competency training and patient-centered care approach should be provided for those who work with immigrant older patients. **Keywords :** Health literacy, older Korean immigrants, patient-centered care, cultural competency

SS24 422-S-2

PREDICTING HEALTH LITERACY AMONG OLDER KOREAN ADULTS: FINDINGS FROM ANDERSEN'S HEALTH BEHAVIOR MODEL

Byunghyun PARK¹, Youngsun KIM², Songsik CHOI¹, Hee Yun LEE³ (*1. School of Social Work, Pusan National University, Korea;*

2. School of Social Work, Yonsei University, Korea; 3. School of Social Work, University of Minnesota, Twin Cities, USA)

Introduction : Health literacy has been considered to be a critical factor impacting health and mental health disparity. Although health literacy has been evidenced for health disparity among older adults, there is a dearth of empirical research on this topic. This study aims to investigate levels of health literacy and factors predicting health literacy among Korean older adults. **Method :** This study adopts the Andersen's Behavioral Model. A total of 507 Korean American immigrants residing in Korea were recruited. Chew et al.'s 16-item health literacy screening scale was employed. Ordinary least squares (OLS) regression analysis was used. **Results :** The overall health literacy level was found to be low; more than 60% of the participants were found to be at the inadequate (31.7%) or marginal (29.8%) level. Those with inadequate health literacy struggled with understanding written health care information and filling out medical forms. Being female and having lower level of modesty were significant factors for having higher level of health literacy among predisposing factors. Of enabling factors, English proficiency, education, and having a primary physician were found to be significant predictors of health literacy, followed by education. None of the need factors were found to be significant. **Conclusion :** This study highlights the urgent need for health literacy interventions for older Korean adults. Cultural competency training for health professionals and a patient-centered communication approach would reduce health disparity in this vulnerable population with limited health literacy. **Keywords :** Health literacy, Andersen's Behavioral Model, health disparity

SS24 422-S-3

SUNLIGHT EXPOSURE BEHAVIOR AND HEALTH LITERACY AMONG OLDER ADULTS IN HONG KONG

Angela Yee Man LEUNG¹, Mike Kwun Ting CHEUNG², Sophia Siu Chee CHAN¹ (*1. School of Nursing, Li Ka Shing Faculty of Medicine, The University of Hong Kong, China; 2. Centre on Research and Advocacy, The Hong Kong Society for Rehabilitation, China*)

Introduction : Suffering from vitamin D deficiency is common among older adults in Hong Kong, but many of them are reluctant to expose to sunlight. Little is known about the reason of this behavior and how health literacy (HL) is related to this behavior. This study aims to examine the relationship between HL and sunlight exposure behavior, and to identify factors mediating the relationship. **Method :** This is a cross-sectional study conducted in 7 local community centers and 23 residential care homes from May 2011 to January 2012. Path analysis was used to investigate the relationships among the variables of interest. **Results :** Among the 648 older adults surveyed, half of them had inadequate HL and 57% had less than 15-minute sunlight exposure per day in the last 7 days. HL was shown to have direct relationship with the respondents' sunlight exposure (direct effect = 0.075) and an indirect relationship through their knowledge about vitamin D (KVD) and their attitude towards sunlight exposure (ATSE) (indirect effect = 0.015). **Conclusion :** The findings implied that purely improving older adults' KVD or changing their ATSE may not help to rectify their behavior in sunlight exposure. On the contrary, HL seems to play a relative important role in behavior change. **Keywords :** health literacy, vitamin D

SS24 422-S-4

HEALTH LITERACY TRAINING FOR HEALTH CARE PROFESSIONALS: A SYSTEMATIC REVIEW

Nan XIA, Angela Yee Man LEUNG (*School of Nursing, Li Ka Shing*

Faculty of Medicine, The University of Hong Kong, China)

Introduction : Healthcare provider-patient communication could be interfered by the misunderstanding of individuals' health literacy (HL) by healthcare providers. The purpose of this systematic review is to identify the characteristics of effective training in HL and examine the outcomes of these trainings to healthcare providers. **Method :** A search in the online databases, including PubMed, Ovid, and CINAHL, was conducted. The following keywords: nurse, doctor, healthcare provider, healthcare professional, medical student, nursing student, health literacy, training, education, and professional development were used. **Results :** A total of 13 articles were retrieved and were included in the analysis. The reviewed articles illustrated the efforts made to enhance healthcare providers' concern about patients' health literacy. Most of the health literacy training programs (n=8) were conducted to health professional trainees, including medical students, nursing students, dietetics students, and pharmacy students. Another five training programs were held for healthcare practitioners. Face-to-face training was the major method to conduct health literacy training, and evaluation of the effectiveness of health literacy training were mostly surveys before and after the training. **Conclusion :** There is an urgent need to refine the contents of health literacy training. Appropriate design of evaluation such as randomized controlled trial could be used in future studies. **Keywords :** health literacy, training, systematic review

SS24 423-S

CREATIVITY AND LEISURE IN ASIAN SOCIETIES: AN INTERDISCIPLINARY AND LIFESPAN APPROACH

SS24 423-S-1

CREATIVITY & LEISURE: AN ACTIVITY AND ENGAGEMENT PERSPECTIVE

Anna N. HUI (*Applied Social Studies, City University of Hong Kong, Hong Kong*)

Introduction : The purpose of the present study is to investigate that elderly actively or passively engage in art and creative activities will facilitate their quality of life (QoL). It is hypothesized that the awareness of elder's creative values, included: intention determinants of creativity, creative self-efficacy, perceived reward for creativity in society are intrinsic motivators to art and creative activities and also contributing to improve elderly QoL. **Method :** Participants included 439 Chinese participants from 17 elderly day centers across different districts in Hong Kong SAR. Participants completed a questionnaire with assistance from trained researchers. The questionnaire consisted of subjective norm of creativity (4 items), creative intention (2 items), perceived reward for creativity in society (8 items), creative self-efficacy (3 items), quality of life (21 items), passive participation in creative and cultural activities (3 items), and active participation in creative and cultural activities (5 items). **Results :** Reliabilities analyses had indicated that all the scales were reliable. Significant correlations were found between participation in creative and cultural activities and various dimensions of QoL, creative self-efficacy and QoL. Multiple regression analyses had shown that active participation, creative self-efficacy and subjective norm of creativity were significant predictors of the achievement-recognition dimension of QoL, explaining 34% of the variance. Creative self-efficacy and perceived reward for creativity significantly predicted the dimension of subjective wellbeing and interpersonal relation, explaining 10% of the variance. **Conclusion :** Engagement of healthy individuals in creative and cultural activities in their leisure can significantly enhance the quality of life in older adulthood. **Keywords :** Creativity,

Participation, Quality of Life

SS24 423-S-2

CREATIVITY & LEISURE: A CULTURAL-PHILOSOPHICAL PERSPECTIVE

Yuh-cheng FAN (*Leisure Management, Minghsin University of Science & Technology, Taiwan*)

Introduction : In life, we accumulate experience, express our creativity, to solve problems and improve our lives. The accumulation of our expression of creativity results in our culture. Under the leisure condition, creative ability emerges, thus culture develops. This paper aims to provide the relationship between creativity and leisure from the cultural-philosophical perspective and the theories in leisure studies. **Method :** The concept of leisure has deep roots in both Eastern and Western traditional thoughts. Western scholars usually trace back their discussions to Aristotle, and Eastern scholars to the concept of xiaoyao in Zhuangzi. Also Josef Pieper's *Musse* has been considered a classic in leisure studies. This Paper starts with literature analysis of this three thinkers and then to summarize the modern definitions of leisure, creativity and culture, before attempting to investigate the relationship between creativity and culture from the three perspectives of time, activity and experience. **Results :** In this paper, I also stress that viewpoints of leisure, selection of leisure activities, and leisure experiences vary according to cultural contexts. The essence of leisure is to use your free time to engage in activities for it's own sake, in order to enjoy a meaningful way of life. Also leisure is a condition most conducive to the expression of creativity, both individual and collective. **Conclusion :** From the viewpoint of leisure, we see people of societies with different cultural backgrounds setting times differently preferable, having partiality for different activities, expecting different experiences. Thus cultural communities manifest creativities differently and lead to special features of cultural development and achievement. **Keywords :** Creativity and culture; concept of leisure; intercultural studies

CREATIVITY & LEISURE: AN AESTHETIC AND ARTISTIC PERSPECTIVE - GRANDPA GRANDMA MEMORY BOXES

Evelyna LIANG (*Founder, Art for All, Hong Kong*)

Introduction : Since 2010, with the support of 'i-dArt' of Tung Wah Group of Hospitals, artists from 'Art for All' has started a multi-disciplinary arts group to engage and interact with a batch of elderly with visual impairment or dementia through different art media, multi-sensory activities and games. **Method :** This group of senior citizen is over 85 years old on average. Their work might seem naive and their craftsmanship might be unpolished. However, with a closer look, the works conceal secrets deep within. **Results :** From passive observers, the participatory activities encouraged the elderly to devote and reassume their autonomy and decision-making power. Their perseverance and open-mindedness have deeply touched us. Visual impairment did not hinder their passion to create. Although they cannot see clearly, with their understanding from the past and under the fun and encouraging ambience of the group, they have created large paintings, embellished some gorgeous outfits and even taken portraits for one another. The elderly can express their personal, cultural and spiritual experiences through acts of creation, through which they can also regain their value and respect. Multi-sensory art activities stimulating sight, touch, hearing, taste and even smell reignite and recall the joy of living, through which the memories of the elderly can be revived. **Conclusion :** Creativity not only can motivate us, it also brings people together and enrich relationships. The ability

to create is man's greatest power. It is our legacy. It is a blessing for the elderly to live their lives freely and contently. Keywords : Art participation, dementia, creativity, community

SS24 423-S-4

LEISURE AND CREATIVITY - SOCIAL PARTICIPATORY PERSPECTIVE

Elaine Suk Ching AU LIU¹, Constance CHING² (1. *Department of Applied Social Studies, City University of Hong Kong, Hong Kong*; 2. *Department of Applied Studies, City-Youth Empowerment Project, City University of Hong Kong, Hong Kong*)

Introduction : With the advance of industrialization, non-work time has increased overtime. One of the social concerns that have arisen was that leisure may be unsatisfactory or of sub-standard quality. Method : Operating from a non-obligatory and non-credit-bearing model to ensure that the voluntary operational value is synonymous to the leisure theoretical construct, City-Youth Empowerment Project encourages youth to engage their leisure in meaningful social participation. Since leisure activity has also been found to be an influential determinant of successful aging, the elderly home visit service is a social participation that crisscrosses the youth and the elderly, past and present, history and future. Results : The creative design of this home visit service allows youth to learn through the conventional "serving" role (providing assistance in daily living), it also provides a platform for the elderly to be the role of the "well of wisdom" to pass on life experiences, personal narratives, and hopes for younger generations instead of the passive role only to be served and helped. Conclusion : Overtime, the elderly have creatively found ways to express their gratitude and to participate more proactively. The social interaction borne out of this service promotes feelings of self-esteem while mediating loneliness and isolation for the elderly, and the participatory role provides a continuity of social role so they can experience competence and recognition (Zimmer & Lin, 1996). In addition, creative arts elements are also utilized with volunteers to specifically process their views on the aging process, relationship with elderly family members, and issues on death and dying. Keywords : volunteer, youth, elderly, social participation, creativity, leisure

FALL DETECTION WITH BODY-WORN SENSORS: A SYSTEMATIC REVIEW

Clemens BECKER (*Departement of Clinical Gerontology, Robert-Bosch Hospital, Germany*)

Introduction : Falls in older people remain a major public health challenge. Body-worn sensors are needed to improve the understanding of the underlying mechanisms and kinematics of falls. The aim of this systematic review is to assemble, extract and critically discuss published information on studies focusing on study-, reporting- and technical characteristics. Method : The exploration of public accessible electronic literature databases on fall detection with body-worn sensors identified a collection of 96 records (33 journal articles, 60 conference proceedings and 3 project reports) published between 1998 and 2012. Information was extracted into a custom-built data form by independent reviewers and processed via SPSS. Results : Main findings were the lack of agreement in most of the considered domains (study-, reporting- and technical characteristics) as well as a substantial lack of real-world fall recordings. A methodological pitfall

in not using an established fall definition was given in most articles. The sensor types and technical specifications of the devices varied considerably between studies. Conclusion : Limited methodological agreement in sensor-based fall detection studies using body-worn sensors was identified. A published evidence-base for existing commercially available fall detection devices is still missing. A consensus process of research groups worldwide on fundamental questions including, e.g., fall reporting guidelines for incident verification, a shared fall definition, and a shared fall detection concept is hence needed. Keywords : Fall detection, body-worn, sensor

SS24 424-S-2

TECHNOLOGY ACCEPTANCE IN GERMANY: INSIGHTS INTO THE ROLE OF PSYCHOLOGICAL FACTORS, TECHNOLOGY GENERATION, AND THE TYPE OF DEVICE

Katrin CLASSEN¹, Frank OSWALD², Hans-werner WAHL¹ (1. *Department of Psychological Ageing Research, Heidelberg University, Germany*; 2. *Faculty of Educational Sciences, Goethe University Frankfurt/Main, Germany*)

Introduction : Although technology is increasingly seen as a means to support successful aging, little is known about the role of psychological factors influencing older adults' technology acceptance. Method : The project aimed at identifying differences in technology acceptance between two technology generations. The so-called "mechanical generation" (MG, born before 1939) and the "household appliance generation" (HAG, born 1939-1951) were compared in terms of technology usage intention and acceptance, i.e. perceived usefulness and perceived ease of use. The internationally renowned Technology Acceptance Model (TAM; version 3) in a modified version was applied as theoretical background. Study participants were 357 German persons aged 60 to 99 (MG N=165; HAG N=192). Three technological devices, representing the areas of care and prevention (sensor mat), household management (robotic vacuum cleaner), and leisure time (video game console) were selected. Results : No technology generation differences appeared in terms of the perceived usefulness. However, members of the HAG rated the three devices as easier to use. Device specific analyses showed that particularly the robotic vacuum cleaner and even more the video game console were evaluated differently in ease of use. Regarding the role of psychological factors, neuroticism as well as obsolescence were related positively to the usefulness of prevention technology as well as to the intention to use it. On the other hand they came along with lower perceived ease of use ratings of technologies requiring more interaction on the part of the user. Conclusion : Findings underscore that psychological aspects and affiliation to technology generations are both important to explain variability in technology acceptance. Keywords : technology acceptance, technology generations, type of device

SS24 424-S-3

TECHNOLOGICAL SUPPORT TO PROVISION OF INCLUSIVENESS OF TRANSPORT SYSTEMS

Ralf RISSER, Daniel BELL (*Factum Chaloupka & Risser OG, Austria*)

Introduction : During the years following the Commission's first White Paper on a common transport policy, personal mobility has increased and is now seen as an acquired right. It is an ethical and economic necessity that future transport systems and public spaces be designed to be inclusive, so that all segments of the ageing European populations can be safely mobile and lead autonomous lives as long as possible. Method : The EU project CONSOL aims at advancing

knowledge by combining current knowledge on mobility behaviour and needs and traffic safety with newest evidence from basic research, e.g., gender studies, social gerontology and findings on health and functionality with age, while also covering some less well-known elderly safety issues such as single-pedestrian and non-crash public transport accidents. Austrian projects such as Ways2Navigate, TellMeTheWay and TrafficCheck provide state of the art knowledge on basic user needs and usability issues regarding intelligent transport and information systems and evaluate the potential of utilizing these systems to support older road users. Results : Results of current national and international research projects provide insight in both mobility behaviour and traffic safety and the potential of technological innovations to increase the inclusiveness and usability of modern transport systems. Conclusion : A combination of basic research on traffic safety and mobility behaviour of older road users and development and evaluation of modern intelligent transport systems have the potential of utilizing these systems to support older road users in participating in traffic systems and prolong an active lifestyle
Keywords : road safety, its

TECHNOLOGY AND AGING: RECENT ADVANCES IN GERMAN-SPEAKING COUNTRIES: THE PERSPECTIVE OF SWITZERLAND

Stefanie BECKER¹, Luigi CORRADO² (*1. Institute on Ageing, Swiss Society of Gerontology Bern University of Applied Sciences, Switzerland; 2. Corporate Departments of FSASD help and home care foundation, President of the Association Romande de Biotelevigilance (ARBT), Switzerland*)

Introduction : Research and development as well as the use of Gerontechnology in the practice of everyday life is a very actual topic in Switzerland at the moment. In 2011 experts and organisations have founded the 'Association of Biotelevigilance in Western Switzerland (ARBT)' in order to promote the development and use of technology for old age. These activities resulted in the foundation of a working group within the Swiss Society of Gerontology. Method : Parallel to that development in the field of everyday life, European research programs like AAL (Ambient Assisted Living) or the European Research Programm 6/7 have stimulated research aiming at the development and implementation of products, services and systems mainly based on information and communication technology (ICT) and web 2.0. For Swiss enterprises this provides new possibilities for the development and distribution of new products. Also the improvement of the efficiency and the effectivity of the patient-centered health system is an important aim. Results : However research of the working group 'Gerontechnology' showed that there are a lot of technological solutions for the promotion of everyday life of senior citizens, their (caring) family members and for professional nursing and health care already available, but less of them are known and even lesser expand into everyday life. Conclusion : Since Switzerland has a lot of highly qualified research groups as well as powerful enterprises, the future development in Gerontechnology has to focus in bringing them more closely together with the end-users' needs in order to really unfold their full potential. BODY WEIGHT MANAGEMENT IN OLDER ADULTS: IS IT RELEVANT AND SAFE?

SS24 426-C-1
OBESITY IN ELDERLY: METABOLIC ALTERATIONS AND THEIR CLINICAL IMPACTS

Eleonor RIESCO (*Kinanthropology, Faculty of Physical Education and Sport, University of Sherbrooke, Research Centre on Aging, Canada*)

Introduction : Currently, 7% of the world's population is over 65 years of age and it is projected to rise to 12% by 2030. During the past 30 years, the proportion of older adults who are obese has doubled. Hence, the problem of obesity in the elderly is becoming of greater relevance and will require more attention. However, the World Health Organization guidelines for identification and treatment of obesity have not given specific details about how to define obesity in the elderly. Method : Although the number of studies showing that obesity is not a trivial condition in older individuals has increased over the past few years, there are still some inconsistencies about the harmful effect of obesity in this population. In fact, while the negative impact of high BMI on all-cause mortality is now well recognized, this relationship tends to be weaker in the elderly. Mortality is not the only end point that should be considered in the evaluation of the impact of obesity on health profile in older individuals. Results : Several studies have demonstrated that obesity, more particularly visceral fat, is related to metabolic alterations even in "older" older individuals. Actually, metabolic syndrome is more common in older than in younger individuals leading to an increased risk of chronic diseases such as type 2 diabetes or cardiovascular diseases. Finally, obesity in old age seems to be associated with disabilities which have been shown to be predictive of earlier mortality. According to these different findings, weight management in elderly should receive more attention. Keywords : Obesity prevalence, metabolic alteration, elderly

SS24 426-C-2
CONSEQUENCES OF OBESITY IN OLDER INDIVIDUALS

Martin BROCHU (*Kinanthropology, University of Sherbrooke/Research Centre on Aging-Health and Social Services Centre, Canada*)

There is a high prevalence of obesity in older adults up to age of 80 yrs in North America. While women generally gain body weight during menopause transition, men tend to accumulate an excess of fat mass earlier in life. In consequences, an increasing proportion of older adults are now obese. It is widely recognized that obesity is associated with metabolic syndrome, Type 2 diabetes, and cardiovascular diseases in younger populations. However, recent evidences show that in older adults, obesity is also related to metabolic diseases, Alzheimer disease, functional impairment and decreased quality of life. Based on the current scientific literature, studies are needed to better understand the impact of obesity in elderly in order to prevent or better treat obesity-related complications. Keywords : Obesity, Body composition, Body fat distribution

SS24 426-C-3
HOW TO DEFINE IDEAL BODY WEIGHT IN OLDER ADULTS: THE PERSPECTIVE OF A GERIATRICIAN

Daniel M. TESSIER (*Medicine, University of Sherbrooke, Research Center on Aging, Sherbrooke Geriatric University Institute, Canada*)

Introduction : With the aging phenomenon, body composition changes are characterized by a diminution in muscle mass, an increase in adipose tissue with central distribution and frequently, a diminished time spent in exertion. In the elderly, obesity may be associated with an increased risk of metabolic syndrome but in contrast, a diminished risk of hip fracture. Weight gain later in lifetime (after the 50's) and some genetic factors are determinant of the intensity of the metabolic syndrome. **Method :** Reasons for weight loss in the older population may be to obtain a better glycemic, blood pressure and lipid control, decrease weight bearing on lower limb in presence of arthrosis and in some cases, for cosmetic reasons. However weight loss by caloric restriction without a regular exercise program may result in muscle mass loss. Randomized studies on weight loss in older diabetic individuals have shown that the initial benefit in terms of weight diminution and improvement in HbA1c is frequently lost in the year following the end of the study protocol. Weight loss may also be unintentional and undesirable: this phenomenon has been associated with frailty, co morbidities and an increased risk of mortality. **Conclusion :** In conclusion, the decision to suggest weight loss in the elderly should be made on an individual basis. Frailty status and life expectancy should be taken in account in this situation. **Keywords :** Ideal body weight, elderly, geriatrics

SS24 426-C-4

THE ROLE OF PHYSICAL ACTIVITY IN BODY WEIGHT MANAGEMENT OF OLDER ADULTS

Isabelle J. DIONNE (*Faculte d'education physique et sportive, University of Sherbrooke, Canada*)

In "young" older adults, including post-menopausal women, it seems that the reason for recommending to lose weight is mostly related to metabolic outcomes whereas later on, the impact of obesity may be more important on physical functioning. Overall, it is the quality of life and physical dependence that is at stake in obese older adults. The controversy about recommending weight loss in older adults is highly present in the "older" older population. Indeed, studies rarely examined individuals older than 65 yrs of age with only a few going above 60 yrs old. In these, however, it is usually observed that combining diet and exercise provides the most positive outcomes such as a decrease in metabolic risk factors and improvement in physical function. **Method :** This presentation will overview the literature pertaining to the impact of exercise in body weight management in older adults and provide some recommendations in terms of exercise modalities. **Keywords :** Exercise, physical activity, weight loss, weight management

SS24 427-C

CARDIOVASCULAR RISK FACTORS, FRAILTY AND DEMENTIA: IS THERE A LINK?

SS24 427-C-1

ASSOCIATION BETWEEN CARDIOVASCULAR RISK FACTORS AND FRAILTY

Julio Cesar MORIGUTI (*Internal Medicine, University of Sao Paulo, Brazil*)

Association between cardiovascular risk factors and frailty Frailty is described as a syndrome of loss of muscle mass and strength, energy and exercise tolerance, and decreased physiologic reserve with associated increased vulnerability to physiologic stressors, such as acute illness, hospitalization, or extreme heat or cold. Hypertension, diabetes, obesity and dyslipidemia could be associated with frailty in older persons. This presentation plan to show this possible association.

Frailty occurs more frequently in patients with metabolic syndrome, which is also increasing their risk for atherosclerosis. Advanced atherosclerosis is associated with arterial stiffness and vascular calcification. The relationship between atherosclerosis and frailty could be in the aetiopathogenesis of the atherosclerosis since as a state of chronic inflammation, may result in a catabolic state with its systemic manifestations contributing to frailty. High body mass index (BMI) and obesity are associated with frailty phenotype indicators. High BMI is also associated with increasing likelihood of a prefrail state, although overweight status is least associated with frailty. Frailty was associated with diabetes mellitus, congestive heart failure, peripheral vascular occlusive disease, and osteoarthritis. Coronary artery disease, although significantly associated with prefrail status, was not associated with frail status. Because obesity is also associated with diabetes mellitus, atherosclerotic diseases, and osteoarthritis, it was hypothesized that these diseases would confound the association between the frailty syndrome and obesity, but contrary to this hypothesis, obesity was related independently to prefrail and frail status, even after controlling for comorbid chronic diseases. **Keywords:** Frailty, Older person

SS24 427-C-2

HYPERTENSION AND COGNITIVE DECLINE

Nereida Kc LIMA (*Internal Medicine, School of Medicine of Ribeirao Preto - University of Sao Paulo, Brazil*)

Introduction : Both high blood pressure and cognitive decline have been associated with frailty syndrome. We have recently showed that frail individuals had higher blood pressure than pre-frails and non-frails of same age. Being frail is also a risk for worse cognitive performance. **Method :** It will be discussed the potential effect of hypertension in cognitive decline and the influence of the treatment in preventing dementia. **Results :** There are many evidences that hypertension is associated with increased risk of Alzheimer's disease and other dementias, especially vascular. Wysocki et al. evaluated very elderly individuals and found hypertension as a risk factor for more rapid progression of loss of cognition in individuals with mild cognitive impairment. Another study only found hypertension in middle age associated with higher risk of dementia in old age, finding even a possible protective role of mild hypertension on cognition in older individuals. Regarding the role of treating hypertension in the prevention of dementia, the results are more contradictory. In the study Syst-Eur, with use of calcium channel antagonist versus placebo, there was a 55% reduction in the risk of Alzheimer's, vascular or mixed dementia. In PROGRESS study, there was a 19% reduction of dementia secondary to stroke, using inhibitor of angiotensin converting enzyme with or without diuretics. However, SHEP, SCOPE and HYVET-COG studies showed no reduction in risk of dementia. **Conclusion :** There is evidence that uncontrolled hypertension may promote cognitive decline, perhaps contributing to the development of the syndrome of frailty; **Keywords :** hypertension, dementia, frailty

SS24 427-C-3

(PRE)DIABETES, BRAIN AGING AND COGNITION

Jarbas De Sa RORIZ-FILHO (*Clinical Medicine, Federal University of Ceara, Brazil*)

Introduction : Persons who have diabetes mellitus (DM) tend to have an accelerated aging process that places them at greater risk for developing frailty at an earlier age. Cognitive dysfunction and dementia have recently been proven to be common (and underrecognized) complications of DM. **Method :** Revision of evidence-based literature. **Results :** Several studies have evidenced that

phenotypes associated with obesity and/or alterations on insulin homeostasis are at increased risk for developing cognitive decline and dementia, including not only vascular dementia, but also Alzheimer's disease (AD). These phenotypes include prediabetes, diabetes, and the metabolic syndrome. Diabetes is also important risk factor for decreased performance in several neuropsychological functions. Chronic hyperglycemia and hyperinsulinemia primarily stimulates the formation of Advanced Glucose Endproducts (AGEs), which leads to an overproduction of Reactive Oxygen Species (ROS). Protein glycation and increased oxidative stress are the two main mechanisms involved in biological aging, both being also probably related to the etiopathogeny of AD. AD patients were found to have lower than normal cerebrospinal fluid levels of insulin. Besides its traditional glucoregulatory importance, insulin has significant neurotrophic properties in the brain. Hyperglycemia and hyperinsulinemia seems to accelerate brain aging also by inducing tau hyperphosphorylation and amyloid oligomerization, as well as by leading to widespread brain microangiopathy. Diabetes subjects are more prone to develop earlier leukoaraiosis (White Matter High-Intensity Lesions - WMHL). Conclusion : People with more advanced WMHL are at increased risk for executive dysfunction, cognitive impairment and dementia. Clinical phenotypes associated with insulin resistance possibly represent true clinical models for brain and systemic aging. Keywords: diabetes, brain aging, cognition

SS24 427-C-4

FRAILITY AND COGNITIVE IMPAIRMENT

Eduardo FERRIOLLI (*Internal Medicine, School of Medicine of Ribeirao Preto at University of Sao Paulo, Brazil*)

Introduction : Although cognitive deficit is not included among the diagnostic criteria of the frailty syndrome as proposed by Fried et al., many recent works have shown association between frailty and cognitive decline. Macuco et al. (2012) have shown, in 384 Brazilian community dwelling older people, worse performance on the Mini-Mental State Examination (MMSE) between those with the frailty phenotype. The pathophysiology of frailty has, indeed, common pathways with well described risk factors for cognitive decline, including inflammation, hormonal factors, malnourishment and low energy expenditure. Method : We have examined the association between frailty, as defined by Fried's criteria, with cognitive performance measured by the MMSE and the function of different systems, including the variability of heart rate and blood pressure, body composition and spontaneous physical activity. Results : Frail older persons have impaired function of the different systems studied, and worse performance on the MMSE. Direct association between worse cognition and isolated system dysfunction was not observed. Conclusion : Low cognitive performance may become a relevant marker of frailty and vice-versa. More studies are needed to verify if cognitive decline itself is involved in the pathogenesis of frailty, to improve knowledge about the common pathogenesis of both syndromes and to evaluate potential interventions. Keywords : Frailty, Cognition, function

THE IMPACT OF DIFFERENT FINANCING MODELS ON CARE INTEGRATION

SS24 507-R-2

THE NEED FOR NEW FUNDING MODELS AND INTEGRATED DELIVERY - A KPMG STUDY ACROSS 14 COUNTRIES

Wai Chiong LOKE¹, Nigel EDWARDS² (*1. Global Healthcare*

Practice, KPMG, Singapore; 2. Global Healthcare Practice, KPMG, United Kingdom)

Introduction : In rapidly ageing societies, governments increasingly cannot afford to bear the extra costs needed to provide long-term care, and insurers' premiums are often prohibitively high due to risks involved. An over-emphasis upon costly residential care in certain markets distances the elderly from their communities, stretches budgets and falsely raises the expectation that the state can care for all its older citizens. Clearly new models of funding and delivery are needed. Method : As part of a study commissioned by Lien Foundation to help inform and stimulate the global dialogue on elder and long term care. interviews were conducted with 46 thought leaders, professionals and practitioners in the aged care sector from 14 selected countries, during August and September 2012. The individuals chosen to participate in were selected through KPMG's professional network and recommendations from experts in long term care. Interviewees were asked to offer their views on new funding and delivery models. A team of in-house researchers collected supporting background data. Results : Ideas being tested include savings programs, long-term insurance, equity release, personal budgets. The focus of medical care needs to shift from providing a 'cure at all costs' to managing a gradual decline, and emphasize on wellbeing and happiness as important outcomes. Many are rebalancing their long term care systems by shifting from institutional to home and community care. Conclusion : Different countries are considering various mixes of public and private models to ensure sustainability, yet the scale of the challenge calls for innovative approaches to both funding and care delivery. Keywords : funding, delivery, elderly care, sustainability, innovation, cost

SS24 507-R-3

PRELIMINARY EXPERIENCE PILOTING COMMERCIAL LTC INSURANCE IN CHINA

Ninie WANG (*LTC Research & Training Center, Gerontological Society of China, China*)

Introduction : Without any social policy framework for funding of long-term care services, China had no choice but to encourage commercial insurance companies to offer innovative products that may help its aging population pay for most needed care services. While the impact of such a model would need further study, preliminary feedback has been unclear whether partnership in the private sector can improve care integration. Method : A team of insurers, policy makers and care providers gathered to manage pilot project design, execution and analysis; phone calls, group interviews were carried out to assess the impact. Results : Early stage pilots of commercial insurance offerings seem to do very little to the existing system of healthcare, there are still a lot of blind spots in long-term care education, unavailability of care services especially for the eldest seniors today. There is limited incentive for public and private healthcare providers to integrate their efforts. Conclusion : In a country like China were traditional healthcare system is more resilient to change and new services are yet to be developed, financing model may have an important role in shaping how care is provided to the ageing population. Without strong government commitment, the private sector would find it very difficult to drive the changes necessary for modern care integration. Keywords : care integration, commercial insurance

WHAT HAVE WE LEARNED FROM EACH OTHER IN LONG TERM CARE POLICY DEVELOPMENT? COMPARATIVE

ANALYSIS OF STABILIZED SYSTEMS IN GERMANY AND JAPAN AND THE CONTINUING SEARCH FOR SOLUTIONS IN ENGLAND AND AUSTRALIA

SS24 508-R-1

PROMOTING ACCESS, QUALITY AND COST CONTAINMENT IN JAPAN'S LONG TERM CARE SYSTEM: CURRENT POLICIES AND FUTURE DIRECTIONS

Takako TSUTSUI¹, Naoko MURAMATSU² (1. Department of Health and Social Services, National Institute of Public Health, Japan; 2. Division of Community Health Sciences, School of Public Health, University of Illinois, USA)

Introduction : Japan implemented a mandatory social long-term care insurance (LTCI) system in 2000. Quickly accepted in the Japanese society, this LTCI system has developed into one of the largest LTC programs in the world. However, it faces a number of challenges as Japan experiences rapid population aging and economic recessions. Method : The goals of this presentation are to review the contexts and key aspects of Japan's LTCI system over its 12-year history, and to discuss its emerging opportunities and challenges as it implements the 2012 law "Comprehensive Reform of Social Security and Tax". Results : The LTCI implementation of 2000 has significantly improved LTC access by making every Japanese person aged 65+ eligible for benefits (institutional and community-based services for 10% co-pays; but not cash benefits) based strictly on physical and mental disability. The 2006 LTCI revision emphasized prevention-oriented LTC and introduced measures to contain costs. The Community-based Integrated Care, established in 2012, is intended to develop a community-based comprehensive care system that integrates medical and long-term care. Central in this system are municipalities (local governments), which have played essential roles as LTCI insurers since 2000. Japan precedes other countries in becoming a 'super-aging' society and implementing this innovate community-based integrated health care system. Conclusion : Maintaining LTC access, containing costs, and promoting care quality through this integrated care system constitute major opportunities and challenges of the LTCI system in Japan. Keywords : Japan's long-term care insurance system, long-term care insurance act revision, community-based integrated care

SS24 508-R-2

LONG-TERM CARE REFORM IN ENGLAND: A LONG AND VERY UNFINISHED STORY

Caroline GLENDINNING (Social Policy Research Unit, University of York, United Kingdom)

Introduction : Debates about reforming the funding of long-term social care in England have a long history; over the last 2 decades there has been a succession of reports and proposals from organisations representing older people, think tanks and official government-appointed Commissions. All agree that present arrangements are inadequate, inequitable and unsustainable, particularly given evidence of current extensive under-funding and anticipated future demographic pressures. Meanwhile, major reforms have taken place in the organisation and delivery of long-term care, as all older people eligible for publicly funded care at home are now offered a personal budget with which to arrange their own personalised support. This represents a further step in the individualisation and marketisation of care services. Method : The paper describes these developments and then reflects on the failure of successive governments to achieve funding reform. Results : The paper suggests a number of possible cultural and organisational barriers to reform, including the fragmentation of

responsibilities for long-term care between different sectors and levels of government; cultural traditions and legacies; and the difficult political challenges of raising (additional) revenue to fund care, particularly during a global recession. Conclusion : The paper argues that the fragmentation resulting from the introduction and elaboration of markets in care services has actually increased the political and institutional barriers to achieving funding reform. Keywords : long-term, care; funding; markets

SS24 508-R-3

AGED CARE REFORM IN AUSTRALIA: ARE WE THERE YET?

Anna HOWE (Consultant Gerontologist, Australia)

Introduction : Australia has seen major reforms in aged care around every 15 years since the mid 1980s when the current aged care system was established by the Labour Government's Aged Care Reform Strategy. Shortfalls in capital funding for residential care emerged by the early 1990s, but radical reforms proposed by the Liberal Government met with strong opposition and were substantially modified in the Aged Care Act 1997. After returning to office in 2007, the Labour Government commissioned an Inquiry into Care of Older Australians by the Productivity Commission and a major reform agenda Living Longer, Living Better was announced in April 2012. Measures proposed to address capital funding relied on increased user payments and there is continuing doubt as to whether they will generate adequate capital funding. Method : This paper examines the causes and consequences of successive failures to resolve this area, including default options that have developed by way of adjustments to target levels of provision and growth of assisted living accommodation. Results : Notwithstanding progress in containing residential care and expanding community care, the current 'narrow band' policy approach has given insufficient attention to the impact of external factors, including the wider investment context and structural changes in the aged care sector. This approach contrasts with the implementation of a National Disability Insurance Scheme to cover the younger population. Conclusion : The paper argues that similar 'broad band' solutions are required in aged care, but the prospects for further reform appear uncertain in the foreseeable political and economic climate. Keywords : insurance, capital funding

SS24 509-R

INNOVATIVE WOUND MANAGEMENT FOR OLDER PEOPLE: CHALLENGING CURRENT PARADIGMS AND PRACTICES

SS24 509-R-1

CHANGING POLICY AND PRACTICE TO EMPOWER OLDER PEOPLE WITH CHRONIC WOUNDS

Ellie LINDSAY (Independent Specialist Practitioner and Visiting Fellow, Queensland University of Technology, The Lindsay Leg Club Foundation, United Kingdom)

Introduction : The experience of diagnosis, psychological support and attitudes from both professionals and society represent critical chapters in the lives of people living with chronic wounds. Patients living with a heavily exuding leg ulcer often experience social stigma, lack of wellbeing and poor quality of life as leg ulcers can be unsightly, painful and malodorous. Method : The Leg Club model was developed to address limitations of existing mechanisms, such as home visits and leg ulcer clinics, in meeting patients' needs. It provides a highly cost effective framework in which, in a departure from the traditional nurse dominant / patient passive relationship, patients are educated and empowered to take ownership of their care and make informed

decisions regarding treatment. Results : Research has demonstrated significant improvements in a range of 'quality of life' indicators, including healing rates, pain levels, mobility, and morale, for patients attending Leg Clubs. A patient (member) satisfaction questionnaire has identified high levels of satisfaction with all aspects of the model, in particular their enhanced ability to understand and cope with their chronic lower limb problems. Conclusion : The introduction of Leg Clubs has demonstrated positive changes achieved through the commitment and motivation of nurses and communities working together. A partnership that delivers true patient empowerment, enabling members to become expert partners in the process of their care, de-stigmatising their condition, encouraging informed behaviours and facilitating the sharing of sensitive and/or emotional concerns in a supportive empathic environment. Keywords : Patient Empowerment, Wellbeing

SS24 509-R-2

CLINICAL AND COST EFFECTIVENESS OF SPECIALISED AND INTERDISCIPLINARY CHRONIC WOUND SERVICES

Helen EDWARDS (*School of Nursing, Queensland University of Technology, Australia*)

Introduction : The purpose of this study was to evaluate clinical and cost effectiveness of service pathways to facilitate implementation of evidence-based management for older people with chronic leg ulcers. Method : 104 patients were recruited for a 12 month retrospective study of usual service pathways and outcomes related to healing of leg ulcers. 70 of these patients were then recruited for a follow up prospective study of 24 weeks to examine outcomes of health services pathways specifically designed to implement evidence-based wound management. Results : The retrospective analysis revealed that patients accessed an inconsistent variety of health providers, received wound care from up to eight different health care disciplines/organisations during one ulcer period and that implementation of evidence was low. The prospective analysis demonstrated that improved healing outcomes were associated with implementation of evidence based guidelines. The economic analysis showed there was a significant incremental cost saving for weekly costs of care between the retrospective (usual care) and prospective (evidenced-based) phases of the study. Conclusion : Findings indicated there were no consistent service pathways for these patients and that once they received care services following evidenced based guidelines healing rates improved. Further, these pathways reduced costs to both the patients and service providers. Implementing optimal care pathways for this population will improve healing outcomes and result in more efficient use of health resources. Keywords : wound management; effective pathways; reduced costs

SS24 509-R-3

EFFECTIVENESS AND ECONOMIC EFFICIENCY OF A NOVEL PROTOCOL FOR PREVENTING THE PROGRESSION OF DEEP TISSUE INJURY

Hiroki SANADA (*Dept. Gerontol Nurs/Wound Care Manage, The University of Tokyo, Japan*)

Introduction : Pressure ulcer occurs as a result of prolonged pressure and shear. Deep tissue injury (DTI) is now considered as a new type of pressure ulcer resulting from deterioration of skin from deeper tissue. To prevent the progression of DTI, a translational research strategy was introduced. Method : To establish the novel protocol for preventing the progression of DTI, we elucidate its molecular mechanism, developed ultrasonographic assessment technique and a treatment device using vibration. Finally, management protocol for

DTI using these techniques are established and evaluated by controlled clinical trial. Results : Insufficient blood flow which contributes to the upregulation of hypoxia inducible factor-1 and its related downstream gene expression for degrading the deep tissues was the main cause of DTI progression. Ultrasound with high frequency probe can detect the structural and functional changes in deeper tissue and the vibration therapy can rescue these abnormal changes by modulating the blood flow. These attempts are beneficial for managing the DTI in laboratory base. Based on this basic research approach, we then established a management protocol for DTI using these techniques and trained the nurses, who are specialized in pressure ulcer management, that is a wound, ostomy, and continence (WOC) nurses to perform this protocol. We proved the high effectiveness and economic efficiency of the protocol for preventing the progression of DTI by clinical trial. Conclusion : From these studies in basic, clinical, and policy sciences, I will provide some suggestions for future perspective on nursing research in wound management field. Keywords : Pressure ulcer, Translational research, Clinical trial

SS24 510-R

THE ROAD MAP FOR EUROPEAN AGEING RESEARCH: ADDRESSING THE GRAND CHALLENGE OF AGEING

SS24 510-R-1

THE EUROPEAN AGEING RESEARCH ROAD MAP

Alan WALKER (*Sociological Studies, University of Sheffield, United Kingdom*)

This paper provides an overview of the Road Map for Ageing Research in Europe. It begins by summarising the demographic context of advanced ageing and the European policy goal of increasing healthy life expectancy. Then it describes the process by which the Road Map was designed, which involved a novel inclusive and iterative series of workshops comprising scientists and research end users. The fundamental principles underpinning the Road Map are explained, as is the core purpose to promote active ageing across the life course. Finally the four key implementation assumptions are discussed and justified: infrastructure, capacity building, user involvement and knowledge exchange. Keywords : Active Ageing, Road Map, Knowledge Exchange

SS24 510-R-2

REDUCING UNHEALTHY LIFE YEARS, FROM CELL TO SOCIETY

Carol JAGGER¹, Stuart PARKER² (*1. Institute for Ageing and Health, Newcastle University, United Kingdom; 2. Sheffield Institute for Studies on Ageing, University of Sheffield, United Kingdom*)

Introduction : The challenge of our ageing populations is to maximise the quality of the extra years of life and reduce the number of unhealthy life years. The new science of ageing requires a more multidisciplinary approach with a recognition that interventions for healthy ageing may be targeted anywhere within the spectrum from cell through individual to neighbourhood and society. Method : Seven major research priority themes were identified by FUTURAGE and explained in the Road Map according to a standard format covering: the significance of the theme; the fundamental insights necessary for future research; an overview of current research knowledge; and the main priority topics within the general theme. This presentation focuses on the 'Healthy Ageing For More Life In Years' theme, highlighting its breadth. Results : Seven challenges related to future European ageing research were identified in the area of healthy ageing for more life in years: Healthy ageing and frailty; understanding the

process and defining the concepts; Organising and delivering interventions for health promotion; The ageing process and early markers of ill-health; Modelling links between disease and functioning over the lifecourse; Effectiveness and efficiency of clinical and social care; Education and lifelong learning; Environmental conditions for ageing well. Examples of specific research questions within these will be given. Conclusion : Understanding the risk factors and optimal interventions at a cellular, individual and societal level to reduce unhealthy life years is crucial to inform policy makers on planning for ageing populations and to maximize the health of our growing older populations. Keywords : healthy life years

SS24 510-R-3

HOME AND AWAY: HOW PHYSICAL-SPATIAL-TECHNICAL ENVIRONMENTS CAN SUPPORT HEALTHY AGEING

Hans-Werner WAHL¹, Susanne IWARSSON², Torbjorn SVENSSON²
(1. Department of Psychological Aging Research, Heidelberg University, Germany; 2. Department of Health Sciences, Lund University, Sweden)

Introduction : Environmental gerontology takes the interrelations between ageing persons and their physical-spatial-technical (P-S-T) environments serious. A key issue of the field is how P-S-T environments shape outcomes of healthy ageing such as functional competence, well-being or participation. Method : The platform for the ageing and environment component of the FUTURAGE roadmap has been laid by two 2-day workshop events in Heidelberg (Germany) and Lund (Sweden), including a wide scope of scholars from various disciplines, who came from 20 countries from all over Europe as well as the U.S. and Japan. Workshop outcomes were discussed, synthesised and refined at various meetings including stakeholders and a range of ageing scientists. They were also backed by a world-wide scanning and analysis of existing research agendas and a compilation of core publications in the area. Results : Based on these analytic activities, overarching issues have been identified as critical in the area such as: development of new theory; method development and refinement; implementation; and young scholar promotion. Identified research themes for a roadmap on ageing and the environment include the need for differentiated knowledge on the enabling and constraining characteristics of P-S-T environments at the home and community level and the better understanding of the meanings of P-S-T environments for older adults' lives. Conclusion : It is our hope that the environmental gerontology component of the roadmap will nurture respective ageing research in Europe at large and lead to a better balance of considering the ageing person and his/her P-S-T environment, at the theory, method, empirical, and implementation level. Keywords : environmental gerontology, person-environment fit processes, healthy ageing

SS24 510-R-4

INCREASING INCLUSION AND PARTICIPATION OF THE YOUNG-OLD AND THE OLD-OLD

Francesco BARBABELLA¹, Carlos CHIATTI², Giovanni LAMURA¹
(1. Centre for Socio-Economic Research on Ageing, INRCA - National Institute of Health and Science on Aging, Italy; 2. Scientific Direction, INRCA - National Institute of Health and Science on Aging, Italy)

Introduction : While healthy ageing represents a pre-condition for older people to enjoy a longer and disability-free life span, quality of life in older age is dependent also upon society's ability to grant individuals social protection, as well as to promote their active participation in the community until the very end of life. These issues

constitute a challenge for current and future research on ageing. Method : A 2-year consultation process with over 70 international experts was conducted within the FUTURAGE work-stream focussed on social and economic resources in ageing research. This process allowed a comprehensive discussion on most relevant social participation and protection issues involving scientists, users' organisations, policy makers and other stakeholders, which led to a set of specific research priorities. Results : The main challenges identified for future ageing research concerning social participation are: ageism; migration; life-long learning; digital divide; spirituality; volunteering; mobility and accessibility; discrimination in the labour market; consumption and access to products and services; and work-life balance. As for social protection, the following core issues have been spotted: sustainability; support to informal carers (also through ICT-based services); efficiency; access to care; cost-effectiveness and quality of interventions; initiatives to improve intergenerational solidarity. Conclusion : Societal challenges related to social participation and sustainability of social protection systems clearly urge new actions in research, practices and policy on ageing. In particular, the identification of over-arching issues, barriers and enablers contributes to strengthen scientific research in the field, as well as to support policy makers in improving social life and quality of life of older people. Keywords : social participation, social protection, research priorities

SS24 513-S

MIGRANT CARE WORKERS IN THE CONTEXT OF AN AGEING WORLD

SS24 513-S-1

MIGRANT CARE WORKERS AS ETHNIC 'OTHERS': A STUDY OF CROSS-CULTURAL INTERACTION IN SWEDISH ELDERLY CARE

Sandra TORRES¹, Jonas LINDBLOM² (1. Dept. of Sociology, Uppsala University, Sweden; 2. Dept of Sociology, Malardalen University, Sweden)

Introduction : The globalization of international migration is changing how we think about aging and old age across Europe. In some parts of Europe we are seeing increased ethnic and cultural diversity among elderly care recipients and elderly care providers. This is the case in Sweden, a society known for both a relative generous and inclusive elderly care regime and a relatively welcoming migration regime. In this presentation we explore what Swedish daily newspaper articles focusing on elderly care have written about migrant care workers. Method : The project upon which this presentation is based uses quantitative as well as qualitative content analysis of all daily newspaper articles published by one of the Swedish major national daily newspapers between 1995 and 2011 (n=123). Results : The results show that the newspaper articles analyzed construct elderly care recipients with migrant backgrounds as a challenge to the elderly care sector. In contrast, they construct care workers with the same backgrounds as an asset to the sector. The media representations in focus here are, in other words, characterized by an ambivalent understanding of who migrants are and what migrant backgrounds mean to the sector's capacity to deliver high quality and user-friendly care. Conclusion : By exploring how the position of migrantship is constructed in newspaper articles focusing on elderly care, this presentation will argue that migrant care workers are constructed by the media as ethnic 'Others' in relation to elderly care. This is the case despite the fact that these workers are regarded as assets to the sector. Keywords : migration, elderly care

SS24 513-S-2

OPPORTUNITIES AND CHALLENGES OF MIGRANT WORK IN THE ITALIAN LONG-TERM CARE SYSTEM

Francesco BARBABELLA¹, Mirko DI ROSA¹, Carlos Juan CHIATTI², Maria Gabriella MELCHIORRE¹, Giovanni LAMURA³ (1. Centre for Socio-Economic Research on Ageing, INRCA - Italian National Institute of Health and Science on Ageing, Italy; 2. Scientific Direction, INRCA - Italian National Institute of Health and Science on Ageing, Italy; 3. Centre for Socio-Economic Research on Ageing, INRCA, Italy)

Introduction : Italy is one of the most aged countries in the world, with a longstanding tradition of family care of the dependent elderly. In recent times, however, Italy has been witnessing in-depth social and cultural changes, which have been negatively impacting on informal care provision. In addition, the public long-term care (LTC) system highly relies on cash-for-care schemes for supporting older people, whereas “formal” care services are characterised by weak coverage and intensity. This situation has led to a remarkable increase in the private employment of migrant care workers (MCWs), whose number increased by four times in the last two decades. Method : An overview of MCWs phenomenon in Italy is provided through the analysis of empirical data retrieved by available official sources at national level, as well as by results from own surveys conducted in recent years on large samples of MCWs. Results : The following opportunities and challenges concerning MCWs’ employment in the LTC sector were identified: improve MCW’s capacity to deliver quality care; reduce the risk of elder abuse and neglect and of meeting MCWs’ own care needs; increase their social integration in destination countries and reduce “care drain” in sending countries; and how to improve stakeholders’ involvement for a better exchange of good practices and more effective policy measures. Conclusion : In these years, privately-employed MCWs have contributed to change the traditional Italian “family care model” into a new “migrant-in-the-family care model”. However, the issue concerning the sustainability of this model within the Italian LTC system in the future is still open. Keywords : migrant care workers, informal care, Italy

SS24 513-S-3

THE ROLE OF FOREIGN DOMESTIC HELPERS IN FAMILY CARE OF THE ELDERLY IN HONG KONG

Alice Ming Lin CHONG (Department of Applied Social Studies, City University of Hong Kong, China)

Introduction : There is an increasing trend in Hong Kong to employ foreign domestic helpers (FDHs) to take care of frail community-dwelling older people who require assistance in their daily living due to physical and/or cognitive impairments. The number of foreign domestic helpers rose from 21,500 in 1982 to 292,473 in June 2011; the majority came from Indonesia (50%) and the Philippines (47.5%) (Ng, 2011). Yet, the impacts of FDHs on family care of frail elders are under-researched. The main objective of the study is to identify similarities and differences in views among the frail elders, their family caregivers and the FDHs on the expectations on caregiving tasks and on decision-making issues relating to caregiving. The reasons behind the differences in views and in practice would also be explored. Method : A qualitative study using indepth interview will be conducted with a total of 10 matched triads of frail elders, their primary family caregivers and the FDHs. Results : The interviews will be audio-recorded with respondents’ consent. The content of the interviews will be transcribed and analysed. Conclusion : This study will provide much needed and indepth information and recommendations to plan relevant training and support to the FDHs,

and to design community care services in order to enable the frail older people to age-in-place with the support of the FDHs. Keywords : Foreign domestic helper, ageing-in-place, family care

SS24 513-S-4

A STUDY OF FAMILY MEMBERS COMPLIMENTED BY MIGRANT CARE WORKERS IN SINGAPOREAN AGEING FAMILIES

Kalyani Kirtikar MEHTA (School of Human Development and Social Services, SIM University, Singapore)

Introduction : The first part of the paper focuses on the national policies relating to migrant care workers in Singapore. As Singapore is ageing rapidly in terms of its demographic profile, and there are manpower shortages both in the community as well as in institutional settings, the reliance on migrant care workers has been on the increase. The government has to design policies that protect both the care recipients i.e. the elderly as well as the caregivers i.e. the migrant care workers. The second part of the paper discusses the findings from a recent qualitative study on intergenerational relationships, and caregiving for older people in the family context. The experience of foreign domestic workers as care workers in the family is captured in the study by interviews with 15 foreign domestic workers. Method : A total of 73 qualitative interviews were conducted (30 with adult children caregivers, 28 grandchildren and 15 domestic workers). In addition, two interviews were conducted with spousal caregivers. The interviews were transcribed verbatim, coded and analysed. Central themes that emerged were identified and the experiences of the migrant care workers were examined. Results : The paper analyses the triangulation of caregiving functions by various family members and migrant care workers. The central themes that emerged are: a. Intergenerational dynamics of caregiving b. Stress experienced by family and paid caregivers c. Meaning of caregiving. Conclusion : Caregiving for an older relative within the family impacts upon each generation differently. Implications for future research and policies conclude the paper. Keywords : Care workers, Asia

SS24 514-S

MANAGING AN AGEING WORKFORCE IN EASTERN AND WESTERN CONTEXTS: A COMPARATIVE AND INTERNATIONAL PERSPECTIVE

SS24 514-S-1

INSTITUTIONAL CONDITIONS FOR THE SUCCESSFUL REVERSAL OF EARLY EXIT IN EAST AND WEST: A COMPARISON OF OECD COUNTRIES

Dirk HOFACKER (Mannheim Centre for European Social Research, University of Mannheim, Germany)

Introduction : In previous decades, early exit from work had turned into a widespread political practice as a consequence of expanding welfare states programs and economic challenges. However, in view of foreseeable demographic ageing, policy makers increasingly consider this trend as being financially unsustainable. Since the 1990s, an international consensus to reverse early exit from work has emerged. Recent reform measures have encompassed diverse political programs, ranging from raising retirement ages and eliminating attractive early retirement options to improving the conditions for older workers’ continued employment, e.g. through measures of life-long learning or other active labour market policies. Yet, hitherto it remains unclear which institutional configurations can be considered as viable pathways to a successful reversal of early exit. Method : Against this background, our paper will provide a comparative

historical analysis of the cross-national variations in the institutionalization of early exit regimes and its recent reversal using macro-indicators on early exit trends and time-variant qualitative information on accompanying institutional arrangements. Results : Using Qualitative Comparative Analysis (fuzzysset/QCA) that allows modeling the configurational interaction of social policy and economic institutions, the paper seeks to delineate the differences in welfare state 'pull' factors, economic 'push' factors and employment-supportive 'stay' policies that have led to early exit from work and more recently contributed to its reversal. Conclusion : By contrasting institutional configurations and their labour market outcomes in Japan and Korea with those in other OECD countries, the paper will contribute to the debate about 'Eastern' and 'Western' approaches to deal with the implications of demographic and labour market changes. Keywords : Retirement, institutions, QCA, international comparison

SS24 514-S-2

WORKING BEYOND RETIREMENT AGE IN CONTRASTING INSTITUTIONAL SYSTEMS- PERSPECTIVES FROM JAPAN AND THE UK

Heike SCHRODER (*Institute for Human Resource Management, Vienna University of Economics and Business, Austria*)

Introduction : Throughout the developed world, real retirement ages are rising. Previous research suggests that this trend is partly a result of changes to state pension systems and employment laws closing off early retirement routes and facilitating work beyond pension age. State institutional systems including welfare and business systems can help shape workers' career and retirement trajectories. In this paper, we explore the experiences of older workers in the productivist/developmentalist system of Japan and the liberal-residual/regulatory system of the UK. Method : This paper is based on semi-structured interview data drawn from 45 older workers from each of the two countries (90 older workers in total). Results : Based on a life course framework for analysing the relationship between institution and human agency, we explore the ways in which individuals in these two different countries make decisions as to how and when to retire. Our questions include how they navigate their way towards preferred retirement outcomes; and the impact of employers, government and family on their retirement outcomes. Conclusion : We argue that, while the Japanese institutional system offers some older workers clear routes to phased retirement, the UK system offers workers more scope for tailoring their retirements. Keywords : retirement; Britain; Japan

SS24 514-S-3

OPPORTUNITIES TO RECEIVE AND PROVIDE TRAINING: EMPLOYEE OUTCOMES IN THE UNITED STATES AND JAPAN

Jungui LEE¹, Marcie PITT-CATSOUPHES², Tay K MCNAMARA³, Haenim LEE³ (*1. Division of Policy Research, Gyeonggido Family & Women's Research Institute, Korea; 2. The Sloan Center on Aging and Work, Boston College, USA*)

Introduction : The body of literature investigating job training in cross-national perspective has grown. However, while some scholars suggest that mentoring others is associated with increasing work outcomes, less than adequate attention has been paid to the relative importance of opportunities to provide training, as opposed to opportunities to receive training, across two or more cultures. In this paper, we examine the effects of two aspects of training (i.e., opportunities to improve skills and opportunities to teach others) on three employee outcomes (i.e., job satisfaction, work engagement, and organizational

commitment) in the United States and Japan. Method : We used a subsample drawn from the 2009-2010 Generations of Talent study. Separate models were estimated for respondents in the United States and Japan and random-effects models were used to adjust for nesting within sites. Results : Our results showed the importance of opportunities to improve skills for job satisfaction, organizational commitment, and work engagement, and highlighted the importance of opportunities to teach or train others for job satisfaction and work engagement. However, the relationship between opportunities to teach or train others and organizational commitment was not significant. Conclusion : Contrary to concerns that older adults value training less than their younger counterparts, our results suggest that workers of all ages value both training given and received. In addition, our results underline the importance of designing training programs that allow employees to both receive and provide training. Keywords : training, employee outcomes, job satisfaction, organizational commitment, work engagement

SS24 514-S-4

BARRIERS AND OPPORTUNITIES TO PHASED RETIREMENT IN THE UK AND HONG KONG- WHAT THE CAPABILITIES APPROACH CAN TELL US

Matthew FLYNN (*Centre for Research into the Older Workforce, Business School, United Kingdom*)

Introduction : This paper explores the degree of choice older workers feel that they have over how and when they retire in the UK and Hong Kong. In both contexts, government has sought to encourage employers to create phased retirement opportunities using a light regulatory approach, and both labour markets are flexible. As such, just as careers are protean, retirement outcomes are also highly individualised and dependent on the worker's ability to negotiate preferred retirement outcomes. Using Sen's Capability Approach, we explore the barriers and opportunities older workers face by way of their organisations' HR policies; managers' attitudes; and their own retirement planning; as well as how they use their own skills and commodities to construct their retirements. Method : Data is derived from a survey of older workers on work and retirement planning in four case study organisations (two public and two private in both countries); as well as data gathered through four action research "innovation groups" of older workers within the case studies organised to identify ways to facilitate phased retirement. Results : The study investigated the different approaches which older workers used in both countries to use their skills sets, or commodities, to advocate for workplace adjustments which would facilitate extended working lives. While cultural factors played a role, institutional factors such as employment law and, in the case of the UK, the abolition of the default retirement age, shape older workers' retirement planning. Conclusion : The study showed the impact of external factors at the macro, meso and individual level on older workers' agency. Keywords : older workers, cross-cultural

SS24 514-S-5

OLDER WORKERS' EMPLOYMENT AND SOCIAL SECURITY: A COMPARATIVE STUDY BETWEEN CHINA AND GERMANY

Yuxin LI¹, Dirk HOFACKER², Wing-kit CHAN³ (*1. Institute for Employment Research, University of Warwick, United Kingdom; 2. MZES, Mannheim University, Germany; 3. School of Government, Sun Yat-sen University, China*)

Introduction : Although China currently still has a young population, it is aging fast. The country is running the risk of "getting old before

rich". Consequently, the period within which organisations can prepare for ageing workforces is much shorter. The need for a more fully covered and effective social security system and more employment opportunities for older people becomes pressing. Method : The main characteristics of the demographic structure, employment pattern of older workers and social security system between China and Germany will be compared both quantitatively and qualitatively. Using two comparable surveys from China and Europe, the China Health and Retirement Longitudinal Study (CHARLS) and the German Ageing Study (DEAS), we will compare the employment structure, retirement pattern, pension and elderly care in these two countries. Results : Differences in terms of institutional context, traditional value and relevant historical facts related to ageing will also be discussed in order to elaborate how China can learn from Germany to transfer to an active ageing society with proper social protection. Conclusion : We argue that Germany's social security policies and its experience in changing from encouraging early retirement to active ageing can have applicability in a Chinese context with practical significance. Keywords : older workers, employment, social security

SS24 515-S
EXCHANGES OF SUPPORT WITHIN FAMILIES ACROSS THE LIFE SPAN

SS24 515-S-1
INTERGENERATIONAL EXCHANGES ACROSS THREE GENERATIONS

Karen FINGERMAN¹, Steven ZARIT² (1. *Human Development & Family Sciences, UT Austin, USA*; 2. *Human Development and Family Studies, Pennsylvania State university, USA*)

Introduction : Few studies have considered the middle-aged adults' support of multiple family members. This talk describes the multidimensional intergenerational support model. We consider elements that distinguish support between parents and grown children. In Western countries, support typically flows from parent to adult children. Factors that elicit parental support include everyday needs, other family members (e.g., babysitting), and assistance to further future achievements. Offspring also support parents support, and filial motivation to provide support includes beliefs about obligation and personal rewards derived from supporting parents, in addition to parental perceived needs or reciprocating support received. Method : This study involves data from the Family Exchanges Study, an ongoing longitudinal study of over 600 three generation families in the US including middle-aged adults, their aging parents, and their grown children (overall N = approximately 1700). The first wave took place in 2008 and a second wave is ongoing in 2013. Findings illustrate the complexities of support to multiple generations. Results : Multilevel models revealed that most participants provided more support to the average grown child than to the average parent. Yet, a proportion of the sample reversed this pattern, providing more support to parents. Mediation models revealed that middle-aged adults provided greater support to offspring because they viewed offspring as more important than parents and offspring had greater everyday needs (e.g., being a student, not married). Parental disability accounted for greater support to parents in some families. Conclusion : Discussion focuses on complexities in patterns of support across three generations. Keywords: intergenerational support

WHY FAMILY MEMBERS VIEW INTERGENERATIONAL EXCHANGES DIFFERENTLY: EFFECTS OF GENERATION, BELIEFS AND QUALITY OF RELATIONSHIPS

Kyungmin KIM¹, Steven H. ZARIT¹, Kira S. BIRDITT², Karen L. FINGERMAN³ (1. *Department of Human Development and Family Studies, The Pennsylvania State University, USA*; 2. *Institute for Social Research, University of Michigan, USA*; 3. *Department of Human Development and Family Sciences, University of Texas, USA*)

Introduction : This study investigated how dyadic discrepancies in reports of support that parents and their adult offspring exchanged with one another vary within and between families. We examined what factors explain the within- and between-family variations of dyadic discrepancies. Method : Data from 929 parent-child dyads nested within 458 three-generation families were analyzed. Using multilevel models, we examined between-family factors (e.g., race, size of family, and average levels of family obligation and relationship quality) and within-family factors (e.g., generational position, gender composition, living arrangements, relative levels of family obligation and relationship quality) to explain variations in dyadic discrepancies. Results : There were substantial between-family differences as well as within-family differences in dyadic discrepancies in reports of support exchanges. For downward exchanges (from parent to child), both within-family factors and between-family factors revealed significant effects on the dyadic discrepancies. However, for upward exchanges (from child to parent), only within-family factors (e.g., gender composition, coresidence, parent's family obligation, and parent's and offspring's positive relationships) were significant. Conclusion : Although reporting discrepancies in support exchanges were mainly associated with dyad-specific characteristics, it also appears to be influenced by family emotional environments. Families with better relationships among family members tended to be more congruent in their perspectives about support given to offspring. Keywords : Intergenerational exchanges, Within-family differences, Between-family differences, Dyadic discrepancy

SS24 515-S-4
INTERDEPENDENT FAMILY LIVES OF MIDDLE-AGED COUPLES

Jeong Eun LEE (*Human Development and Family Studies, Penn State University, USA*)

Introduction : To date, most research on intergenerational help exchange has been almost exclusively based on wives' report on their help or intergenerational relationship with family. This study attempts to advance the current understanding of help exchanges through analysis of couple data examining the relationships and contributions of spouses who are exchanging help with their adult children. Method : The sample consisted of 197 couples from Family Exchange study, who had one or more children over the age of 18. Husband and wife independently completed telephone interviews that included measures of the help each gave to and received from their aging parents and adult children and their relationship with each other. Results : As expected, wives gave and received more support from adult children. Different patterns of exchanges of support husband and wife had with adult children was associated with marital satisfaction. Exchanges of each child also had implication on the couples' relationships with children such as ambivalence. Parental feelings of stress and rewards

moderated the association between helping offspring and parental ambivalence towards adult children. Conclusion : In conclusion, findings demonstrated the shared family experiences of middle-aged couples and the implications of involvement in the lives of adult children and spouse on individuals' well-being. Further this study underscores the importance of considering both spouses' perspectives in examining exchanges of support and relationship qualities between parents and adult children. Keywords : Dyadic analysis, couples, family support

SS24 517-B

MOLECULAR MECHANISMS LINKING ALZHEIMER'S DISEASE AND ITS NON-GENETIC RISK FACTORS - TOWARDS NOVEL THERAPEUTIC STRATEGIES

SS24 517-B-1

PATHOLOGICAL INTERACTION BETWEEN ALZHEIMER'S DISEASE AND DIABETES MELLITUS

Naoyuki SATO (*Clinical Gene Therapy, Geriatric Medicine, Osaka University, Japan*)

Introduction : Epidemiological studies suggest that diabetes mellitus increases the risk of onset of Alzheimer disease (AD). However, the underlying mechanisms have not been fully understood. Retrospective studies indicate that diabetes does not increase senile plaques. On the other hand, a Japanese cohort, Hisayama study suggested that insulin resistance in midlife increased the risk of development of senile plaques. Therefore, the aim of this study is to understand the mechanisms by which diabetes increase the risk of AD by dividing them into two phases; 1) before and 2) after the development of senile plaques. Method : 1) To test whether insulin resistance increases Abeta accumulation in the brain, we fed wild-type mice with a high-fat diet and measured the levels of Abeta in the brain. 2) To investigate the effects of diabetes on AD, we further analyzed the phenotypes of APP+ob/ob mice, which showed the increased cerebral amyloid angiopathy and impaired insulin signaling (Takeda, Sato, et al. Proc Natl Acad Sci U S A, 107, 7036-41, 2010), especially focusing on tau phosphorylation. Results : 1) Six months high fat diet increased Abeta40 in B6C mice brain. 2) 18 month old APP+ob/ob mice showed highly increased level of tau phosphorylation in the brain. Conclusion : Tau phosphorylation is increased by diabetes in APP mice, suggesting that Abeta is prerequisite, but insufficient to cause tau phosphorylation in vivo. Abeta accumulation, insulin signaling and tau phosphorylation might play essential roles in the pathological interaction between AD and diabetes. Keywords : Abeta, Insulin signal, tau

SS24 517-B-2

ROLE OF INFLAMMATION IN THE PATHOGENESIS OF ALZHEIMER'S DISEASE

Makoto HIGUCHI (*Molecular Imaging Center, National Institute of Radiological Sciences, Japan*)

Introduction : Accumulating evidence has supported mechanistic implication of microglial activation in the pathogenesis of Alzheimer's disease (AD), while key molecules regulating deleterious and protective microglial responses to the hallmark AD pathologies are largely unknown. We recently demonstrated the significance of 18-kDa translocator protein (TSPO) as a biomarker for detrimental microgliosis, and utilized two distinct microglial clones expressing TSPO at low and high level for identifying neurotoxic and neuroprotective neuroimmune systems. Method : Microglial clones were implanted in the hippocampus of amyloid precursor protein

transgenic mice, and amyloid β peptide (A β) deposition and TSPO-positive microgliosis were assessed by longitudinal neurimaging and then by postmortem immunohistochemistry. Results : Low TSPO expressor clone induced removal of A β aggregates by itself and by activating resident microglia in a TSPO-negative fashion, and enhanced production of brain-derived neurotrophic factor in host neurons. By contrast, implantation of high TSPO expressor clone accelerated A β amyloidosis. We also found that secretion of a proinflammatory chemokine, CCL-2, from high expressor was increased by 1,000 fold relative to low expressor. CCL-2 release from microglial culture was suppressed by co-treatment with TSPO ligand. Moreover, high TSPO expressor implant provoked upregulation of an isoenzyme of glytaminyl cyclase (isoQC) in neighboring glia. Since isoQC is known to catalyze conversion of A β and CCL-2 to more biostable forms, our result highlights parallel promotion of A β amyloidosis and deleterious microgliosis by a vicious cycle upregulating TSPO, CCL-2 and isoQC. Conclusion : The present findings provide evidence for contributions of microglia to enhancement and suppression of core AD pathologies via distinct signaling pathways. Keywords : Alzheimer's disease, Transgenic mouse, Microglia

SS24 517-B-3

AN EMERGING ROLE OF INSULIN RESISTANCE IN AMYLOID-BETA CASCADE HYPOTHESIS

Takeshi IKEUCHI (*Neurology, Brain Research Institute, Niigata University, Japan*)

Introduction : Alzheimer's disease (AD) is neuropathologically characterized by accumulation of extracellular amyloid-beta (Abeta) and intracellular phosphorylated tau. The question of how extracellular Abeta induces hyperphosphorylation of tau remains unanswered. Recent epidemiological studies have provided evidence that the insulin resistance associated with type 2 diabetes is a strong risk factor for AD; however, the underlying mechanisms are not fully understood. With these backgrounds, we attempt to address the role of insulin resistance in amyloid-beta cascade hypothesis associated with AD. Method : Neuroblastoma N2a cells were incubated in medium containing various concentrations of glucose (50 to 400 mg/dL) or high insulin (10 nM), and secreted Abeta was quantified under these conditions. We developed cell coculture system to assess the effect of extracellular Abeta at physiologically relevant levels secreted from donor cells on the phosphorylation of tau in recipient neuronal cells. Results : When cells were incubated in media containing high glucose or high insulin, the levels of secreted Abeta was markedly increased. Physiologically relevant levels of extracellular Abeta are sufficient to cause hyperphosphorylation of tau in primary culture neurons. The mechanism underlying the Abeta-induced tau hyperphosphorylation is mediated by the impaired insulin signal transduction because we demonstrated that the phosphorylation of Akt and GSK3beta upon insulin stimulation is less activated. Treating cells with the insulin-sensitizing drugs, PPARgamma agonists, attenuated the Abeta-induced hyperphosphorylation of tau. Conclusion : These findings suggest that insulin resistant may be implicated in the overproduction of Abeta and accelerating Abeta-induced hyperphosphorylation through impaired insulin signaling. Correcting insulin resistance in AD may offer a potential therapeutic approach. Keywords : Alzheimer disease, insulin signaling, insulin resistance

SS24 517-B-4

NEUROPATHOLOGIC ANALYSIS OF ALZHEIMER'S DISEASE AND RELATED DISORDERS

Shigeo MURAYAMA (*Neurology and Neuropathology, Tokyo*)

Metropolitan Geriatric Hospital and Institute of Gerontology, Japan)

Introduction : Neuropathological and clinical spectrum of age-associated cognitive decline forms continuous process and does not match disease- control paradigm. **Method :** Brain Bank for Aging Research (BBAR) Project combines clinical longitudinal follow ups and pathological extensive studies. Immunocytochemistry with anti-Abeta, phosphorylated tau, 3 repeat and 4 repeat tau isoforms, phosphorylated alpha- synuclein, phosphorylated TDP43 and ubiquitin antibodies were applied to all the cases registered to BBAR. Half of the brain was frozen for biochemical and molecular studies and apoE genotyping and RIN were determined. Peripheral autonomic nervous system (PANS) was also included in the regime of banking for alpha-synucleinopathy. **Results :** The project confirmed amyloid cascading hypothesis, role of apoE4 in enhanced deposition of Abeta, positive effect of aging on accumulation of all the abnormal proteins examined, and frequent multiple proteinopathy in aged brains. The project also confirmed Braak's dual hit hypothesis, elucidating that alpha-synucleinopathy in olfactory system is independent from that involving PANS and brain stem. **Conclusion :** Our study confirmed continuous and combined process of proteinopathy, reflecting age-related cognitive decline. BBAR resource may contribute to the study of human aging as a whole spectrum of continuous process from the standpoint of neurological disorders. **Keywords :** amyloid beta, tau, alpha- synuclein

WHO IS AT RISK FOR RISK? SOCIAL DETERMINANTS AND PREVENTIVE HEALTH BEHAVIOUR - THE CASE OF SINGAPORE

Paulin Tay STRAUGHAN (*Sociology, National University of Singapore, Singapore*)

Introduction : We will discuss the key social factors that contribute to variation in health screening behavior, and identify what facilitates successful ageing in a fast greying society. **Method :** This paper will draw information from a recently concluded large survey of a representative sample of 1500 Singaporeans aged 50-69. **Results :** Demographic factors continue to be important in differentiating preventive health behaviour in spite of community efforts to broadcast health prevention messages. **Conclusion :** Greater attention must be focused on address social inequalities to prevent entrenchment of disadvantages among the elderly population. **Keywords :** preventive health inequality

SS24 518-S-2

SOCIAL CAPITAL AND HEALTH SCREENING IN THE SINGAPOREAN ELDERLY

Joonmo SON (*Sociology, National University of Singapore, Singapore*)

Introduction : Social capital is a network-based resource that carries its own weight independently from economic capital and human capital. It is richly demonstrated in the literature that social capital is related to health outcomes at both individual and population levels. However, it has not been examined if it is associated with preventive health measures such as health screening. **Method :** position generator multiple regressions. **Results :** The multiple regression analyses based on a nationally representative sample in Singapore report that social

capital is significantly related to the number of health screenings for the whole sample. Further, social capital is related to the number of female-specific health screenings. Given that we dealt with elderly respondents, there was significant portion of the sample that did not have any social contacts (20% of the whole sample). The regression outcomes indicate that the elderly with no social capital are significantly less likely to get health screenings; and the same applies to female-specific screenings too. In addition, we also formed a separate social contact measure of medical professionals (doctors and nurses) from the position-generator. Having a doctor or a nurse in a social network significantly increased the chance of getting both general and female-specific health screenings. **Conclusion :** The study thus verifies that network-based social capital is a hidden mechanism that leads the Singaporean elderly to get health screenings controlling for other plausible confounders such as educational levels, income, or age. Comparative future studies are warranted to examine if this mechanism works in international contexts. **Keywords :** social capital; health screening

SS24 518-S-3

WHAT DOES SUCCESSFUL AGING REALLY MEAN FOR ASIA? THE PERCEPTION STRUCTURE OF "SUCCESSFUL AGING" IN THE SINGAPORE ELDERLY

Qiushi FENG (*Sociology, National University of Singapore, Singapore*)

Introduction : Current literature of successful aging is mostly based on Western societies, and the cultural varieties of this important notion come to be acknowledged in non-western contexts. This study focused on how successful aging is perceived by older adults in Singapore, a city county located in Asia. **Method :** The data were from a national survey in Singapore with interviewing 1,540 local residents aged 50 to 69. The respondent was asked to rate the importance of 12 specific standards used to judge "successful aging", all of which were coded based on extensive qualitative interviews from focus groups prior to the survey. Exploratory Factor Analysis was used to identify the perception structure of successful aging for local Singaporean of old age. Structural Equation Model was used to investigate the disparity of this perception structure across various sociodemographic subpopulations. **Results :** The results showed that three major perception domains of "successful aging" were adopted by old Singaporeans, namely personal health/economics, family relationship, and social relationship, with personal health/economics perceived as the most important one. We also found out that local elderly with spouse tended to emphasize the importance of family relationship in successful aging; education promotes acknowledgement of social relationship; and non-Chinese ethnicity was associated with more emphasis on both family and social relationship. **Conclusion :** In conclusion, the perception of successful aging in Singapore is featured by individual-based concerns, especially for the local Chinese elderly as the population majority. **Keywords :** successful aging. Singapore

SS24 518-S-4

SOCIAL DETERMINANTS OF HEALTHY AND SUCCESSFUL AGEING IN SEOUL

Eun Jin CHOI (*Health Policy Research Division, Korea Institute for Health and Social Affairs, Korea*)

Introduction : As the lifespan of the population has been extended, there has been increased burden of chronic diseases in Korea. The purpose of this study was to explore selected social determinants of successful aging in Seoul. **Method :** A household based, face to face interview survey was conducted for adults living in Seoul. A total of

1,203 representative sample of adults aged between 50 and 69 was surveyed in July and August in 2012, right after the official approval from IRB. The age group for this study included baby boomers in Korea as well. We had 70.7% female respondents and 29.3% male respondents. About 65% of the respondents reported that they were from outside of Seoul region. An SPSS 12.0.1 program was used for statistical analysis. Results : About one third of the respondents reported they face barriers for health screening. Overcoming barriers to health screening was positively related to increased physical activities. About 60% of the respondents had some social network of people with selected occupation, measured by the Treiman's Standard International Occupation Prestige Scale(SIOPS) and Ganzeboom et al's International Socio-Economic Index of Occupational Status(ISEI). Self-efficacy of getting regular health screening was significantly associated with the occupational prestige scores, successful aging, and life satisfaction. Conclusion : It is expected to give more attention to social capital in health promotion policy in Korea. It is suggested that government may incorporate and support informal social network in health promotion policy. Further research needs to get empirical evidence of social capital and healthy aging of the population in Korea. Keywords : healthy ageing, social capital

SS24 518-S-5

BETTER HEALTH BUT WORSE HEALTH BEHAVIOR? THE DILEMMA OF CHINA

Zhihong ZHEN (*Sociology, Shanghai University, China*)

Introduction : According to studies from the western societies, trends of functional health in later life generally show some gradual improvement in recent decades; meanwhile published reports on leisure-time physical activity of older adults reveal that old people of the western countries tend to be more active in recent years over time. However fewer studies were done to examine these two trends together, especially in a developing society. Method : The data were from the Chinese Longitudinal Healthy Longevity Survey (CLHLS: 2002, 2005, and 2008). Activity of Daily Living (ADL) was used for measuring disability. Regular exercise was used to examine leisure-time physical activity. The major independent variable was survey year. Random-effect models were applied to estimate trends over time, referenced to 1998. Results : The results showed that the Chinese elderly was less likely to be ADL disabled from 2002 to 2008; however the odds of engaging regular exercise also declined in the same period. Conclusion : We found out a unique pattern in China that old people are becoming physically healthier but more sedentary in daily life in the recent ten years. Keywords : China, disability

SS24 518-S-6

CONTEXTUALIZATION OF HEALTH INEQUALITY IN ASIAN SOCIETIES: A COMPARISON BETWEEN SINGAPORE AND KOREA

Minhye KIM (*Sociology, National University of Singapore, Singapore*)

Introduction : Although health inequality has been broadly investigated, most of the published studies are on North American and European societies. To better contextualize the conditions and mechanisms of health inequality among societies with different historical trajectories, this paper aims to examine the similarities and differences of health status between two Asian urban populations - the middle-aged and the young elderly (50 - 69 yrs.) in Singapore and Korea. Method : Two nationally representative data will be used (n=1,559 in Singapore; and n=1,203 in Korea) to address four research hypotheses. Results : First, the morbidity of main chronic diseases

(e.g. cancer, cardiovascular disease, hypertension, and diabetes) is higher among Korean males than Singaporean males. We suggest that this is due to the Korean economy's reliance on heavy industries, which is physically strenuous. On the other hand, the economy in Singapore is driven by knowledge-based, non-manual sectors such as finance. Second, depressive symptoms are more prevalent in Korea than in Singapore considering Korea has higher suicide rate and Singapore has lower tendency of emotional expressiveness. Third, an inquiry into the social determinants of health difference reveals that ethnicity plays the most prominent role in Singapore. However, education is the salient determinant in Korea. We posit that these respective determinants are indicative of the socio-political cleavages. Lastly, the effect of income on health disparities is higher in Singapore than Korea as Singapore has higher level of income inequality and less social welfare system. Conclusion : Health status is closely associated with historical development, culture, political cleavage, and welfare system. Keywords : health inequality, comparative analysis, Asian societies

SS24 518-S-7

SOCIOECONOMIC STATUS AND ITS ASSOCIATION WITH COGNITIVE IMPAIRMENT AMONGST COMMUNITY-DWELLING ELDERLY IN A LOW SOCIO-ECONOMIC NEIGHBORHOOD IN SINGAPORE

Gerald Choon-huat KOH¹, Liang-en WEE² (*1. Saw Swee Hock School of Public Health, National University of Singapore, Singapore; 2. Yong Loo Lin School of Medicine, National University of Singapore, Singapore*)

Introduction : Neighborhood socioeconomic-status (SES) can affect cognitive function. We assessed cognitive function and cognitive impairment amongst community-dwelling elderly in a multi-ethnic urban low-SES Asian neighborhood, comparing against a higher-SES neighborhood. Method : The study population involved all residents aged ≥ 60 years in two housing estates comprising owner-occupied housing (higher-SES) and rental-flats (low-SES) in Singapore in 2012. Cognitive-impairment was defined as < 24 on the Mini-Mental-State-Examination. Demographic/clinical details were collected via questionnaire. Multilevel linear regression was used to evaluate factors associated with cognitive function, while multilevel logistic regression determined predictors of cognitive impairment. Results : Participation was 61.4% (558/909). Cognitive-impairment was 26.2% (104/397) in the low-SES community and 16.1% (26/161) in the higher-SES community. After adjusting for other sociodemographic variables, living in a low-SES community was independently associated with poorer cognitive function ($\beta = -1.41$, S.D=0.58, $p < 0.01$) and cognitive impairment (adjusted odds ratio, aOR=5.13, CI=1.98-13.34). Amongst cognitively-impaired in the low-SES community, 96.2% (100/104) were newly-detected. Conclusion : Living in a low-SES community independently associated with cognitive-impairment in an urban Asian society. Keywords : socioeconomic-status, cognitive impairment, elderly

SS24 519-S

GRANDPARENTS AS A RESERVE ARMY: GLOBAL PERSPECTIVES ON THE ROLE OF GRANDPARENTS IN DUAL-EARNER FAMILIES

SS24 519-S-1

TO CARE OR NOT TO CARE: GRANDPARENTS MEETING DEMANDS OF GRANDCHILD CARE IN SINGAPORE

Leng Leng THANG (*Japanese Studies, National University of Singapore, Singapore*)

Introduction : With the norm in dual-working couple families, grandparents are generally regarded as suitable caregivers for their grandchildren in Singapore. On the one hand, this seems to parallel the 'traditional' role expected of grandparents, while on the other hand, they may not be roles entirely accepted by today's grandparents. This paper explores the voices of the grandparents and their responses to the grandchild-caring expectations and examine the strategies adopted by the grandparents to achieve a balance in childcare. **Method :** The data from a qualitative study of 16 grandparents in a three-generational family research conducted in 2004, insights from literature review and observations from recent news relating to grandparenting issues in Singapore will be engaged for analysis. **Results :** The analysis suggests an ambivalent attitude towards caring for grandchildren among the grandparents. While grandparents see the responsibility to care for their grandchildren as a way to relief the burden of their working children, they also lament over the lack of freedom as a result of their commitment. Some grandparents feel that extra help in the form of foreign domestic helper is necessary to help relief their burden, while others set a clear boundary on the limits about caring for the grandchildren. **Conclusion :** Does the emergence of grandparents suggest about the changes that may be observed among contemporary grandparents? The paper ends with an examination of a group of grandparents who have initiated a network to combine childcare responsibility with personal desire for learning and development, and question the shift in the 'traditional' role expected of grandparents. **Keywords :** grandparents, Singapore ambivalence

SS24 519-S-2

GRANDPARENTS CARING FOR GRANDCHILDREN IN RURAL CHINA: THE IMPORTANCE OF FAMILY STRUCTURE AND PERSONAL RESOURCES

Merril SILVERSTEIN¹, Zhen CONG² (1. *Department of Sociology and School of Social Work, Syracuse University, USA*; 2. *Human Development and Family Studies, Texas Tech University, USA*)

Introduction : We examine whether changes in family structure and improvements in the health and economic well-being of older adults have altered the likelihood that grandparents in rural China provide care for their grandchildren. This issue is salient because unprecedented rural-to-urban migration of working age adults has resulted in a record number of grandparents caring for grandchildren left behind in their native villages. **Method :** We used the Longitudinal Study of Older Adults in Anhui Province, first fielded in 2001 with a replenishment sample added in 2009. We compared similarly aged grandparents (60-68) from 2001 (N= 553) and 2009 (N= 370). Multinomial logistic regression identified whether grandparent caregiving has changed and how much of the change is attributed to changes in family structure and well-being. **Results :** Grandparents in 2009 were less likely than their 2001 counterparts to provide part-time care for their grandchildren but more likely to provide full-time care. Part-time care declined primarily because of reduced demand for childcare (smaller families and increased education of children); full-time care increased because improved well-being enhanced the capacity of grandparents to provide custodial care (improved physical, mental, cognitive, and economic status). **Conclusion :** The involvement of rural grandparents as custodial caregivers appears to be robust, heightened by the confluence of improved well-being of older adults and continued economic incentives for adult children to migrate. Part-time care is less often engaged because of reduced opportunities and is not sensitive to improvements in well-being. Results are discussed in terms of migration patterns, reduced fertility, and family policy in a changing China. **Keywords :** intergenerational relations, grandparenting, Asia

SS24 519-S-3

GRANDPARENTS CARING FOR GRANDCHILDREN IN CHINA AND KOREA: FINDINGS FROM CHARLS AND KLOSA

Pei-chun KO¹, Karsten HANK² (1. *SOCLIFE PhD training group, University of Cologne, Germany*; 2. *Institute of Sociology, University of Cologne, Germany*)

Introduction : The study provides an overview of the prevalence and profiles of grandparents caring for their grandchildren in two East Asian countries, China and South Korea, sharing a similar cultural background but very different contemporary institutional, demographic, and socio-economic circumstances. **Method :** We apply logistic models to analyze pilot data from the China Health and Retirement Longitudinal Study (CHARLS) and data from the Korean Longitudinal Study of Aging (KLoSA; wave 2). Our analytic sample comprises 772 Chinese respondents and 4,958 Korean respondents aged 45 to 79. **Results :** The proportions of grandparents providing care for grandchildren differ considerably between China (58%) and South Korea (6%). Still, the determinants of grandparents' involvement in childcare (e.g. age, geographic proximity) are fairly similar in both countries. However, financial support from adult children to grandparents is found to be significant in China only, whereas Korean grandparents exhibit a greater propensity to care for their (employed) daughters' children than for their sons'. **Conclusion :** Our analysis suggests that patrilineal considerations may begin to lose some of their importance in shaping downward functional solidarity between generations in East Asia and that instead (grand-)children's actual needs, particularly such related to maternal employment, receive more attention. **Keywords :** Grandparenting , Intergenerational support, East Asia

SS24 519-S-4

WHERE DO GRANDPARENTS WORK THE BEST? EUROPEAN WELFARE STATE DIFFERENCES IN WORKING GRANDPARENTS' INVOLVEMENT IN CHILD CARE

Fleur THOMESE (*Sociology, VU University Faculty of Social Sciences, Netherlands*)

Introduction : Grandparents are increasingly seen as a reserve army, stepping in when working parents need (additional) child care. This paper explores when and for whom grandparent in European welfare states do so. (1) The more involved the parents, and the less involved grandparents, are in paid work, the more grandparents look after grandchildren. (2) The more involved the mother, and the less involved the grandmother, is in paid work, the more grandparents look after grandchildren. (3) Effects of (grand)parents' work situation are the largest in countries with the lowest level of public support for intergenerational obligations. **Method :** The 2005 wave of the Survey on Health and Retirement in Europe provides information on 4,468 grandparents' child care in the families of 6,102 children from 11 European countries. Frequency of child care for grandchildren by a maximum of 4 selected children is recoded into monthly or more versus less or never. Frequent child care is regressed on work status of grandparents, work and partner status of children, grandparents' and children's sex, and country. **Results :** Preliminary results: Grandmothers are more responsive to their own and their children's work status. This effect is stronger in countries with low support levels. **Conclusion :** Gender relations strongly inform both intergenerational support and women's occupational opportunities. This may bring grandmothers in a predicament between their own and their daughters' economic success. Intergenerational policies can

resolve this. Keywords : grandparents, child care, welfare state

SS24 524-C

DEMENTIA CARE: FROM DIAGNOSIS TO INSTITUTIONALIZED CARE

SS24 524-C-1

DIAGNOSIS DEMENTIA IN A DUTCH MIGRANT POPULATION: OBSTACLES AND SOLUTIONS

Ozgul UYSAL-BOZKIR (*Internal Medicine, Academic Medical Center, Netherlands*)

Introduction : With the aging society in the Netherlands, elderly migrants will form a substantial part of the Dutch elderly in the next decade. Cognitive decline and dementia are difficult to evaluate in elderly migrants because of their different cultural background, language barrier and low level of education, while prevalence of dementia is expected to be higher due to different contributing factors (hypertension, diabetes). In general, commonly used cognitive screening instruments are not applicable for non-Western migrants. Therefore, we developed a new non verbal dementia screening test. This Cross Cultural Dementia screening (CCD) exists of four subtests, which evaluate memory, executive functions and psychomotor speed. The test materials are non verbal and test instructions are given by computerized voice samples in the patients' language. Method : We tested 1000 cognitively healthy and demented subjects. We will present the latest data on sensitivity and specificity of CCD test results as well as data on the influence of age, cultural background, education and gender on the results. Results : Baseline data will be presented at the conference. Analysis of the CCD subtests yields a sensitivity of 90% and a specificity of 94% for the Turkish participants. Conclusion: The newly developed CCD can detect dementia in subjects with a different cultural background, with little or no education, and can be applied in situations in which a linguistic barrier needs to be overcome. Keywords : diagnosing dementia in minorities, health situation in minorities

SS24 524-C-2

COMPARING MODELS OF DEMENTIA CASE MANAGEMENT IN NETHERLANDS BASED ON PRELIMINARY RESULTS OF A TWO YEAR COHORT STUDY

Janet Lynn MACNEIL VROOMEN (*Internal Medicine, AMC Amsterdam, University of Amsterdam, Netherlands*)

Introduction : The Netherlands comprises of emerging and existing case management models to improve dementia care although it is unclear 1) whether case management is more effective than usual care and 2) which case management model improves functioning and well-being at the caregiver and person with dementia level. The objective is to present the clinical baseline data that compares two case management models against usual care. Method : Design: a prospective, observational, controlled, cohort study among 525 persons with dementia and their informal caregivers in several regions of the Netherlands to measure outcomes of case management, and a qualitative study design for the process evaluation. Inclusion criteria for the cohort study are individuals: with a dementia diagnosis, community-dwelling, not terminally-ill, not anticipated to be admitted for long term care facilities within 6 months, and who have an informal caregiver fluent in Dutch. Participants are monitored for two years. The primary outcome measure is the Neuropsychiatric Inventory scale for persons with dementia and the General Health Questionnaire for their caregivers. Quality of care indicators are used

to measure the care process in participants. Results : Baseline data will be ready and presented at the conference. Conclusion : What distinguishes this study from other case management studies is its ability to simultaneously describe the care processes and implementation of two case management models and compare the outcomes of the case management models with usual care. Keywords : Dementia, case management, geriatric care, community

SS24 524-C-3

IMPLEMENTATION OF PERSONALIZED SUPPORT IN DEMENTIA CARE: A COMPARISON OF CASE MANAGEMENT MODELS

Lisa Deborah VAN MIERLO (*Department of General Practice and Elderly Care Medicine, VU University Medical Center, Netherlands*)

Introduction : The process analysis that was conducted and described in this article was part of a large evaluation study (COMPAS-E) that investigates the effectiveness of case management for people with dementia and informal caregivers. The aim of this process evaluation was to provide insight into facilitators and barriers of the delivery of personalised care in two Case Management models, the linkage model and the combined intensive and joint-agency model. Insight into these facilitators and barriers in different models and regions is important to create guidelines for successful implementation of case management in other regions. Method : A qualitative study design was used with semi-structured interviews among 22 key figures in various phases of the implementation process. Key figures were representatives from different organisations involved in case management or the dementia collaboration network surrounding case management. The interviews were based on the theoretical model of adaptive implementation. Results : The results suggest that the implementation of the intensive case management model is preferred as case managers in this model are able to provide more quality of care, are less impeded by competitiveness of other care organisations and are more closely connected to the expert team than case managers in the linkage model. Conclusion : The results of this process evaluation provide insight into facilitating and impeding factors for implementation of different case management models and argue in favour of the implementation of the intensive case management model. Keywords : case management, dementia, proces evaluation

SS24 524-C-4

REVIEWING THE DEFINITION OF CRISIS IN DEMENTIA CARE

Janet MACNEIL VROOMEN (*Internal Medicine, Amsterdam Medical Center, University of Amsterdam, Netherlands*)

Introduction : Crisis is a term frequently used in dementia care but lacks a standardized definition. This work reviews definitions of crisis in dementia care literature to create a standardized definition that can be utilized for research, policy and clinical practice. Method : We systematically searched PubMed and EMBASE for articles containing definitions of crisis in the context of dementia care. We created an operational framework of crisis based on retrieved definitions. Recommendations to address crisis situations were reviewed and classified according to care settings. Results : Abstracts and titles of 1,113 articles were screened by two independent reviewers and narrowed down to 27 articles. Crisis was defined as a feedback loop where a stressor causes an imbalance requiring an immediate decision to be made which leads to a desired outcome and therefore a resolution of the crisis. If the crisis is not resolved, the cycle continues. Recommendations for resolving crisis involving persons with dementia and their informal caregivers include: structured support

after diagnosis, and increased contact with: general practitioners, case managers, caregiver support and education. Furthermore, healthcare professionals should be attuned to the environmental, physical and psychological needs of persons with dementia. Conclusion : This is the first work to review the definition of crisis in the context of dementia care. We used an operational framework to compile types of crisis stressors and recommendations from the crisis literature based on; the person with the dementia, the caregiver and the healthcare providers. Our framework may be usable to calculate costs of crisis. Keywords : crisis dementia care caregivers

THE ELDER FRIENDLY HOSPITAL: AN INTERNATIONAL RESPONSE TO THE AGING IMPERATIVE

SS24 526-C-1

DEVELOPMENT AND APPLICATION OF A FRAMEWORK OF AGE-FRIENDLY HEALTH CARE IN TAIWAN

Shu-ti CHIOU (*Director-General, Bureau of Health Promotion, Department of Health, Taiwan*)

Introduction : Older persons are important users of health care. Evidences have shown that health service utilization can impose risk to or add health gain for older persons. We aimed to develop a framework of age-friendly health care and help hospitals and health services identify their weaknesses, develop action plan, and continuously improve themselves to meet older persons' needs and expectations. Method : The contents of our framework were based on the WHO principles of age-friendly healthcare, the WHO Standards for Health Promotion in Hospitals, and the Elder-Friendly Hospital Initiative in Canada. There are 4 standards, 11 sub-standards and 60 measurable elements in the framework. After being pilot-tested and validated, it was used for recognition of "age-friendly hospitals and health services". Results : In 2011, a total of 20 hospitals applied for the recognition and 19 passed. We identified weakness on several elements, including IT support for implementation and evaluation of the age-friendly policy; training in core competence for clinical staff, and guidelines on multidisciplinary geriatric assessment and interventions on high-risk seniors. Scoring on organizational preparedness showed that hospitals demonstrated very high leadership support, allocated resources for age-friendly care, and were expected to have promising future development. Conclusion : A framework of age-friendly health care has been developed, validated and applied to 20 hospitals for recognition in Taiwan. Weaknesses in management policy and care processes were identified and can be highlighted as the focus of continuous improvement. The impact of this recognition program on the experiences and health gains for older persons should be evaluated in the future. Keywords : Age-friendly health care, Age-friendly hospital, Health Promotion

SS24 526-C-2

BUILDING SENIOR-FRIENDLY CARE HOSPITALS IN THE UNITED STATES: WHERE ARE WE AND WHERE DO WE NEED TO GO?

Marie BOLTZ, Elizabeth CAPEZUTI (*College of Nursing, New York University, USA*)

Introduction : NICHE (Nurses Improving Care for Healthsystem Elders) of the New York University College of Nursing provides over 350 hospitals with aging-specific staff training, clinical protocols, project management/evaluation tools, and inter-site collaboration. The NICHE Program Self-Evaluation is used on a bi-annual basis to plan and track progress toward a senior-friendly hospital. Method : Using

2011 survey data, the dimensions of a geriatric acute care model were evaluated to describe the scope and depth of NICHE implementation. Results : The sample (N=180) represented U.S. hospitals diverse in size (mean # beds: 348.7; +/- 263.9), teaching status (33% non-teaching, 37% teaching and 23% academic medical centers), and level of NICHE implementation (15 .6% early; 57.8% progressive; 23.3% senior friendly; 3.3%). The majority describe: an interdisciplinary and interdepartmental steering committee, leadership by a gerontological nurse active in policy committees, implementation of the Geriatric Resource Nurse Model, interdisciplinary rounds, a gerontological core curriculum provided to staff on several units, use of at least two evidence based guidelines, and policies that support family involvement in care. Key areas identified for improvement include the physical environment and program evaluation. No relationship was found between facility characteristics and either dimension scores or levels of implementation. Conclusion : The NICHE framework provides a blueprint to guide senior-friendly implementation in diverse hospital settings. There is a need to support hospital efforts to modify the physical environment and utilize data to improve care of hospitalized older adults. This symposium is co-sponsored by the Bureau of Health Promotion, Department of Health, Executive Yuan, Taiwan. Keywords : elder -friendly acute care

SS24 526-C-3

ADOPTING THE SENIOR FRIENDLY HOSPITAL FRAMEWORK IN THE NETHERLANDS: CARING FOR FRAIL OLDER PATIENTS IN THE ORBIS MEDICAL CENTRE

Herbert HABETS¹, Walther SIPERS² (*1. Clinical Geriatrics, Orbis Medical Centre / Zuyd University, Netherlands; 2. Clinical Geriatrics, Orbis Medical Centre, Netherlands*)

Introduction : - Objectives Hospitals in the Netherlands face an increase in older frail patients, vulnerable to loss of function and often experiencing adverse events during hospital stay. The Orbis Medical Centre aims to work towards better health outcomes for these patients and has adopted the Senior Friendly Hospital Framework (Parke, 2004) as a main strategy. In a strong cooperation with Zuyd University of Applied Sciences and the University of Maastricht a variety of projects are executed to develop and operationalise this concept. Maintaining and improving optimal health and function, improvement of patient and family satisfaction, facilitating discharge, targeted interventions to prevent complications are main objectives of this integrated model. Method : The five-domain framework for Senior Friendly Hospitals was translated in a so-called 5-C model. The five building blocs (C's) of this model are: Construction: physical environment; Communication / Attitude; Coach / Family; Continuity of care; Complication prevention. Facilitated by the support and commitment of the management of the hospital, in cooperation with older persons (or their advocates), with students from different background participating in studies and projects, the model is realized in a stepwise approach. Results : Hospitalbroad screening for frailty and complications. Multidisciplinary consultation team assessment and advices. An effectstudy of this approach is underway. The innovative physical environment offers new options with regard to family participation, delirium prevention and communication. Conclusion : An inspiring model, engaging professionals, students and older people in changing the entire hospital into a more senior friendly environment. Keywords : models of acute care

SS24 526-C-4

THE BUILDING OF A NATIONAL AGENDA FOR ELDER FRIENDLY HOSPITALS IN CANADA

Belinda PARKE¹, Barbara LIU², Angela JUBY³ (1. Faculty of Nursing, University of Alberta Scholar in Residence Vancouver Island Health Authority, Canada; 2. Geriatric Program, Toronto Regional Geriatric Program Associate Professor Medicine University of Toronto, Canada; 3. Geriatrics, Northern Alberta Regional (NARG) Geriatric Program Associate Professor University of Alberta, Canada)

Introduction : The concept of elder-friendly hospitals was developed in Canada in 1999. Since then many organizations have adopted the principles of older adult-hospital environment fit across Canada. We present the findings of a national collaborative to reach consensus on recommended standards for older adults in hospital. **Method :** Methods A multi phased approach beginning with the establishment of advisory committee, a literature review of modifiable factors in hospital; three networking national workshops; a round table meeting with key stakeholders and clinical experts; and Delphi electronic voting by two groups, those that attended the round table meeting and a second group that did not attend the meeting. The use of qualitative content analysis and coding was applied to the data collected at the round table meeting. **Results :** Results The five national standards and corresponding descriptive statements were drafted. Electronic voting showed that there was strong agreement in both groups that the descriptive summaries matched the standard statements. Relevant clinical topics were identified within each standard statement to target efforts toward elder-friendly hospitals innovations. **Conclusion :** Conclusions The national standards provide a framework to advance older- adult hospital environment fit. The standards enable us to narrow the care gap by providing a platform for advancing research in the area of elder friendly hospitals. **Keywords :** elder friendly hospitals, older adults, hospitalization

THE AMERICAN MEDICAL DIRECTOR ASSOCIATION: THE CERTIFIED MEDICAL DIRECTOR FOR LONG-TERM CARE. A MODEL TO ENSURE CORE COMPETENCIES OF MEDICAL STAFF, DRIVE QUALITY, PATIENT CENTERED CARE AND TEACH IN THE NURSING HOME SETTING

SS24 527-C-1

THE CERTIFIED MEDICAL DIRECTOR: UPDATE ON THE DEVELOPMENT OF CORE COMPETENCIES

Paul KATZ (Medical Administration, Baycrest, Canada)

Introduction : The nursing home has become a critical element of the health care continuum. The provision of medical care in the nursing home (NH) demands a unique skill set that recognizes the increasing complexity of patient care in an environment that is highly regulated and resource constrained. **Method :** The American Medical Directors Association has developed a set of competencies for Medical Directors and nursing home attending physicians that seeks to define the knowledge and skills necessary to provide optimum care to residents that are typically frail and experience multiple care transitions. **Results:** The symposium will review the rationale underpinning the NH competencies while at the same time distinguish them from broader based geriatric skills. Discussion will also focus on potential metrics to measure the NH competencies and explore the future possibility of specialization. Finally, the relationship between medical staff organization and physician competency will be explored. **Conclusion :** By the end of the session, participants will be able to: 1. Understand the rationale behind the development of NH competencies 2. Appreciate the roles and responsibilities of attending physicians in nursing homes 3. Understand the relationship between medical staff organization, physician competency and commitment to overall quality

of care. **Keywords :** Nursing Home, Medical Director, Core Competencies

SS24 527-C-2

THE CERTIFIED MEDICAL DIRECTOR: A DRIVER OF QUALITY IMPROVEMENT IN THE NURSING HOME

Sabine VON PREYSS-FRIEDMAN (Medicine, Division of Gerontology and Geriatric Me, University of Washington, USA)

Introduction : The Medical Director for Long-term Care is responsible for appropriate patient care. Quality Process Improvement is a continuous, proactive, self-monitoring process designed to analyze and improve existing processes with the goal to improve quality outcomes. Knowledge about the principals of Quality Improvement and integrating them into the practice of Medical Direction is fundamental to the role of the Certified Medical Director. The Objective of Quality Improvement is the provision of safe, timely, efficient and state of the art care for patients in Nursing Homes. **Method :** Data sets, including MDS, Infection control surveillance data, Incidents and Accidents, Re-hospitalization data as well as patient and family satisfaction data are monitored systemwide to determine areas needing improvement. Outcomes that do not meet determined goals are examined for root causes of failure in an interdisciplinary fashion that involves the entire team. A corrective plan of action is then developed and implemented and monitored until necessary. **Results :** Data will be presented showing clinical outcomes affecting quality of life, health status and patient safety. The Medical Director leads the interdisciplinary team via root cause analysis and interdisciplinary efforts to address underlying causes improvements are demonstrated in the areas of infection control, overprescribing of antibiotics, accidents and falls, pressure ulcer development, pain management and diabetes management. **Conclusion :** The Certified Medical Director is uniquely positioned to lead the team in the analysis of system wide data and develop processes that effect improved outcomes in the entire population of the Nursing Home via the Quality Improvement process. **Keywords :** Nursing Home, Medical Director, Quality,

INTERDISCIPLINARY GERIATRICS EDUCATION IN A TEACHING NURSING HOME

Irene HAMRICK (Family Medicine, University of Wisconsin, USA)

Introduction : Our population is aging, living longer and healthier. Demographic shifts will cause a decrease in the number of caregivers, necessitating more nursing home care in the future. Nursing homes are a link in the transition to and from homes and hospitals and are the ideal setting to teach the full spectrum of geriatrics. The objective is to improve geriatric and gerontology instruction for health professionals, students and staff (collectively called: learners). **Method :** Learners, including but not limited to nursing, medicine, pharmacy, social work, therapy, physicians in training in internal-, rehab- and family medicine get a hands on experience by pre-rounding on patients followed by team rounds. Geriatric didactic lectures add to the educational experience. Evaluation tools include: University of California Los Angeles geriatric knowledge and attitude scale, team evaluation tool, nursing home aggregate data and qualitative information from learners and nursing home staff. **Results :** By working together participants learn from each other and learn to respect each other's knowledge and skill. Geriatric knowledge increased during the rotation. Care for frail and disabled elderly improved. Additionally, attitudes towards geriatrics and team building will be evaluated. The continuing presence of the teaching team is expected to benefit the nursing home by decreasing transfers to the hospital and staff turnover, as well as

increasing patient satisfaction and facility fill rate. Conclusion : The teaching nursing home is an optimal way to teach geriatrics to various disciplines while improving care to nursing home patients. Keywords : Education, nursing home, multidisciplinary

SS24 527-C-4

THE ROLE OF THE SKILLED NURSING HOME IN REACHING THE TRIPLE AIM

Robert J. SCHREIBER (*Department of Medicine, Hebrew SeniorLife, USA*)

Introduction : The nursing home is becoming a very important delivery system of care in the United States as the aging population expands dramatically. Acute hospital care is under siege as penalties for rehospitalizations have taken hold and the focus is now on improving the health of the population an organization or system serves, The quality of care and the cost of care per person. Hebrew Seniorlife (HSL) has two main post acute care skilled nursing facilities (50 beds each) and a smaller unit of 15 beds at one of our housing sites. Method: The approach we have taken to reduce the 30 day acute care readmission rate from skilled nursing care includes a systematic approach to managing patients which ensures high quality and standardized discharge plans. The actual components of this program include standardized geriatric admission templates, palliative care consults done on patients with multiple issues, holding TIPS Conferences, connection with specialists and/or Primary care providers about issues and using Project RED as a discharge tool on the skilled units. Results : The results of this program have resulted in significantly lower rehospitalizations, increased discharges to the community and lower nursing home admissions, high patient satisfaction and lower cost of care. As a result of these outcomes, HSL has become a preferred provider of skilled nursing care for all the major academic and community hospitals in the greater Boston, Massachusetts region. Conclusion : The skilled nursing home can be a highly valued care delivery system in a health care system when value and quality of care can be demonstrated. SMART WALKERS: TOWARDS AUGMENTING THE AUTONOMY OF THE ELDERLY

SS25 108-R-1

SMART-WALKER FOR THE ELDERLY: INTUITIVENESS COMES FROM FORCE SENSORS, A PRELIMINARY STUDY

Viviane PASQUI¹, Didier MARIN¹, Ludovic SAINT-BAUZEL¹, Blandine BOUDET², Pierre RUMEAU³, Nadine VIGOUROUX⁴
(1. Institut des Systemes intelligents et de Robotique, Universite Pierre et Marie Curie, France; 2. Gerontopole de Toulouse, UMR 1027 Inserm, France; 3. Gerontopole de Toulouse, Hopital La Grave, France; 4. IRIT, Universite Paul Sabatier, France)

Introduction : The RobuWalker developed by RoboSoft is a robotic walker for the handicapped elderly. It is designed bearing in mind those who can not stand-up without physical human aid but then can use efficiently a walker. RobuWalker uses to move two rear driving wheels and two caster wheels at the front. It has two motorized arms to help the elderly to stand from seated. Note that RobuWalker obeys the space standards for wheelchairs. This robotic device will interact

mechanically with the user in order to assist to stand up and when walking. An intuitive haptic control has been developed in order to reduce the cognitive load and cope better with the needs of those with cognitive impairment. Method : The intuitive control has been tested by 4 younger (28-49) healthy subjects and 4 elderly patients (80-93) in the rehabilitation ward of Toulouse Hospital. The tests are made from normalized test used in geriatric medicine to diagnose frailty and walking difficulties: the 4 meters walking test. and the Time Gait up and Go test. Results : We could see that RobuWalker was readily accepted by the elderly patients and was usable. Moreover, we could observe in a 93 years old lady ending a one month period non-weight bearing the correction of a weight bearing asymmetry after a 30 mn session performing 4m walk and modified get up and go tests with a regular walker then with RobuWalker. Conclusion : A preliminary study about an intuitive control to drive the RobuWalker was conducted with elderly patients and showed the usefulness of the robot and its possible use in rehabilitation. Keywords : smart-walker, evaluation.

SS25 108-R-2

DEVELOPMENT OF SMART MOBILE WALKER FOR ELDERLY AND DISABLED, CAPABLE OF SIT-TO-STAND ASSISTIVE FUNCTION

Hyunseok YANG¹, Woonghee CHO¹, Inho KIM¹, Byunghoon MIN², Byeong Rim JO² (1. School of Mechanical Engineering, Yonsei University, Korea; 2. Convergence Lab, LG Electronics, Korea)

Introduction : Walker, or rollator, is well known walking aid for seniors or disabled. Sit-to-stand (STS) motion is another difficult task for the walker users. Smart mobile walker (SMW) is aimed at combining walking support and STS support function on the same device. Method : SMW has four wheels (two driving wheels and two dummy wheels). Four legs, having a wheel on each end, support top plate which users put their arms on. All legs are independently controllable by linear actuators. Users can walk with SMW by pushing or pulling the top plate. Multiple force sensors attached on the top plate and legs, catch user intention and state of SMW, make SMW keep up with the user's step while walking. The sensors are also used while performing STS motion to keep the user posture stable during the motion. Results : SMW is useful not only on planar fields but also on slopes with various angles and bumpy surfaces. SMW helps users sit and stand with reduced force requirements on their lower bodies while keeping stable posture. Conclusion : SMW has ability to help people with weakness on their lower bodies by assisting walking and STS tasks. We expect SMW will have many potentials in rehabilitation and clinical supports. Keywords : Walking and STS assistance, Smart Mobile Walker

SS25 108-R-3

A NOVEL ROBOTIC WALKER FOR OVER-GROUND GAIT REHABILITATION

Kyung-ryoul MUN, Haoyong YU (*BIOENGINEERING, National University of Singapore, Singapore*)

Introduction : Robotic assisted gait rehabilitation not only can reduce labor intensity for therapists, but also can potentially provide better functional outcome than conventional therapy. Current rehabilitation robots are expensive and not available to community centers or chronic patients at home. In this talk, we present a novel robotics walker platform that enables patients post stroke or with Parkinson's Disease to perform gait training at home or community rehab centers. Method : The system consists of an omni-directional mobility platform, an active body weight support (BWS) unit, and a pelvic and

trunk support and assist module. The omni-directional motion coupled with the pelvic support allows unrestricted natural trunk posture and gait. The user of the system interacts with the system through a six degree-of-freedom force/torque sensor. An admittance controller enables a natural and intuitive interface. The adaptive shared controller enables several control modes depending on the patient condition. Results : The system can provide stability, balance, and assistance. It can also provide resistance and error augmentation training methods to enhance training efficacy. Wearable motion capture sensors based on inertia measurement units are used to monitor the user gait kinematics and provide quantitative measures of gait recovery. Surface EMG sensors are used to monitor muscle condition and activation pattern. A functional electrical stimulation module can also be implemented on the system to provide simulations for patients with severe drop foot to enhance gait recovery. Conclusion : In this torque, we will present the system design and the preliminary testing results. Keywords : Robotic assisted gait, stroke patients, omni-directional, over-ground, pelvic support

SMART-WALKER FOR THE ELDERLY: NEW OPPORTUNITIES IN GERIATRIC REHABILITATION

Pierre RUMEAU¹, Viviane PASQUI², Ludovic SAINT BAUZEL², Nadine VIGOUROUX³, Blandine BOUDET¹, Christine LAFONT⁴, Isabelle FERRANE³, Frederic LERASLE⁵, Fati NOURHASHEMI¹ (1. La Grave Gerontechnology Lab - Gerontopole, CHU Toulouse, France; 2. Institut des systemes intelligents et de robotique, Universite Pierre et Marie Curie, France; 3. Institut de Recherche en Informatique de Toulouse, UMR 5505 CNRS Universite Paul Sabatier, France; 4. Rehabilitation department - Gerontopole, CHU Toulouse, France; 5. Laboratoire d'Analyse et d'Architecture des Systemes, CNRS, France)

The perception of robots is by large conditioned by sci-fi movies and comics yet they remain a kind of tool that may adapt, with the smallest effort from the user, to its scheduled task in a foreseen environment. We like to consider that they should be part of a global service as an aid to relieve human work force of "low value" tasks. Intelligent walking aids are a good example where the physiotherapist will be allowed to observe the patient during standing up and walking giving a better qualitative assessment and improved rehab. Such a goal requires a throughout coop within a multidisciplinary team where each role is well identified to the volunteers (according to the ethical counsel of the French society of technology for autonomy). But acceptance, in comparison to that of humanoid companion robot or even animal-like toys, by elderly people is excellent as we could see in our experiments. Eventually, it seems that when users are not afraid by a massive device they will focus on service and expected benefits. Service is most linked to interaction between the robot and the human, ideally this should be fully transparent (understanding of the movements and gestures, voice recognition, haptic control...), respecting the physiology of movement (compliant links to avoid trauma, geometric limits...) and avoid energy transfers from the walker to the human other than mechanical support required to control gait and balance. Preliminary tests with elderly people without and with cognitive impairment are showing that intelligent walkers have the greatest potential in geriatric rehabilitation but still need improvements. This paper is reporting work funded by Agence Nationale de la Recherche, Caisse Nationale de Solidarite pour l'Autonomie and the Ambient Assisted Living Program. Keywords : robotized aids, acceptance, walkers, rehabilitation

SS25 109-R

INPEA/ILC GA: ADDRESSING ELDER ABUSE, THROUGH A HUMAN RIGHTS LENS A MULTI-COUNTRY COMPARISON OF PERCEPTIONS, INTERVENTIONS AND AWARENESS AMONG DIVERSE CULTURES AND DISCIPLINES

SS25 109-R-1
INVESTIGATING ISSUES OF ELDER ABUSE IN KOREA THROUGH A HUMAN RIGHTS LENS

Mee Hye KIM (Graduate School of Social Welfare, Ewha Womans University, Korea)

Introduction : Korea had been a society where the elderly was respected and cared for by family. Increase of the elderly changed the value and family structure based to care for the elderly. The covered elder abuse emerged in Korean society and awaked the society being chanted by the myth of respecting the elders. The power of the Confucianism culture is no longer influencing on relationship between persons and family members especially younger and older. The purpose of this study is to understand elder abuse with the respect of human right in Korean society. Method : The study employs literature research method. Relevant reports from personal research, articles to official statistics are collected. This date is analyzed to find out the reasons, results and responses to elder abuse in Korea. Results : The reasons of elder abuse are characteristics and dependency of the abused elders, personal problems of abusers, care burden, lack of support systems, etc. The results are psychological damages of abused elders such as depression, fear, withdrawal, etc. The reponses are legislation, centers for abused elders which provide the service, education, public relations. Conclusion : The reasons and results are not reviewed with human rights so that the strategies improving the human rights of abused elders need to be developed. Keywords : Elder Abuse in Korea, Human Rights

SS25 109-R-2
A HUMAN RIGHTS APPROACH TO PREVENTION OF ELDER ABUSE IN LATIN AMERICA

Lia Susana DAICHMAN (ILC-Argentina and UN ILC-GA Representative, ILC-Global Alliance, Argentina)

Introduction : Since first identified more than forty years ago as a social and health problem, elder abuse, like other forms of violence has been recognized as a public health and human right issue, and a criminal justice concern. Elder abuse has become a worldwide phenomenon and the discrimination and mistreatment of older persons and its nature as a hidden problem, is no longer unusual. Consequently elder abuse is acknowledged as an issue in most Latin American countries. Results : Today, concern about elder abuse has driven a worldwide effort to increase awareness about the magnitude of the problem and encourage development of prevention and intervention programs. This is predicated on the belief that older people are entitled to live out their advancing years in peace, dignity, good health, and security. Conclusion : Further research on the prevention and intervention of elder abuse is essential in Latin America to examine elder abuse, within a local and cultural environment, and should lead to contextualized policies which are sensitive to their own regional needs. Keywords : Elder Abuse, Human Rights, Latin America

SS25 109-R-3
ADDRESSING ELDER ABUSE IN THE LIGHT OF MIPAA + 10 FROM SOUTH KOREA. MEDICAL,LEGAL AND SOCIAL ISSUES. THE CARIBBEAN VIEW

Rosy Elvira PEREYRA (Policy and Practice, ILC-DR. INPEA, Dominican Rep)

Introduction : One of the fundamental rights of every human being is the enjoyment of the highest standard of health without distinction of race, religion, political believe and economic or social condition. In view of this, we will focus on elder abuse and its medical, legal and social issues. **Method :** We decided to study the different conditions that may contribute to elder abuse in the Caribbean region knowing the fact that men and women are the fastest growing group in the world and that our population is growing old before becoming rich or even educated. **Results :** Women are discriminated against on the basis of age at younger ages than men and are routinely perceived as weak, vulnerable and dependent. Those on the seventh decade have a higher incidence of illiteracy and this, together with the negative image, make older women more susceptible to abuse. Policy makers, physicians, citizens and even families misunderstand or neglect older persons. **Conclusion :** In order to achieve a diminution in the cases of abuse and neglect, we have to ensure efficient and adequate health and social services, the necessary legislation that can penalize abuse and an improvement in the socioeconomic status of our people to make them aware of their rights and able to report the violations that may appear. We know that there are differences among countries in our region but we also know, that only by joining forces we might be able to achieve a binding legislation that may ensure the protection of this portion of the population. **Keywords :** Elder abuse

SS25 109-R-4

GAPS IN STANDARDS AND SERVICES IN LTCS IN KOREAN: APPLYING RESEARCH TO PROTECT VULNERABLE OLDER PERSON'S RIGHTS

Sooyoun K. HAN¹, Taehyun KIM² (1. Executive Director, CARE the Right, USA; 2. Social Welfare, Sungshin University, Korea)

Introduction : The purpose of this study is to develop an Elder Abuse Protection Protocol (EAPP) for Demented Elders (DE) and their Family Caregiver (FC), who are placed in LTC facilities with medical co-morbidity scored under 13 on MMSE (Max; 30). **Method :** First, this study analyzed the nationwide annual report conducted by Korean Elder Protection Agency (EPA, 2012), and institutional elder's abuse report done by ChoongChung Nam Do's EPA (2012). The study characterized the relationship between the abuser and the abused, the types of abuse for both community and Long Term Care (LTC). Second, this study analyzed the annual LTC survey (2012) inspected by the National Health Insurance Corporation (2012). The study reviewed the areas on the Resident's Right (RR) and Quality of Life (QOL). **Results :** This study discovered there is no direct channel to process LTC abuse reports for DE who have no a FC or someone who can represent them. Their abuse cases suffer as a result. They were more easily exposed to unnecessary life sustaining treatments and/or excluded from comfortable End of Life Care. This observation was also found to be true for their QOL and personal care. **Conclusion :** The study contends that developing an EAPP for DEs as well as their FCs is necessary for, who not only often coordinate multiple services for them, but also play a critical role in maintaining their RR and QOL. To make short the Gaps for vulnerable older person's Rights, encouraging healthcare policy maker to be cognizant for some extension services- public guardianship, institutional Ombudsman program, watch-dog grass rooted agency programs. **Keywords :** Demented Elder, Elder Abuse Protection Protocol

POSTURAL INSTABILITY & REDUCED SENSORI-MOTOR FUNCTION IN MID-LIFE/OLDER DECADES OF WOMEN SUPPORT PRE-EMPTIVE INTERVENTIONS FOR HEALTHIER AGEING: CAN TESTS OF POSTURAL STABILITY PREDICT FALLS?

Nancy LOW CHOY (Physiotherapy, Australian Catholic University & TPCH (Q-Health), Australia)

Introduction : Knowledge of age-related changes in postural stability and balance and sensori-motor function could enable rationale for pre-emptive interventions to foster healthier ageing. **Method :** Cross sectional sampling from decade age cohorts of women aged 20 to 80 years using postural stability tests and sensori-motor measures and follow-up 10 year survey. **Results :** Postural stability in bipedal stance (firm surface) was reduced by the 60s and on foam and one leg (eyes open) by the 50s. Bipedal stance (Foam eyes closed) and one-leg stance (eyes open) yielded low rates of failed trials in mid-life decades and higher failure rates in older decades. Strength of quadriceps and hip muscles gradually reduced from the 40s with women in their 70s being significantly weaker than younger decades. Reduced somatosensation (vibration sensitivity, joint position error; tactile acuity) and vision occurred by the 40s with further reductions in subsequent decades. Some women presented with gaze instability in the 40s/50s with significantly more women unable to maintain focal gaze in the 60s/70s. Women who failed the postural stability tests were usually older, less active, had poorer health and reduced strength, somato-sensation, vision and gaze instability. The prospective survey study 10 years after baseline measures demonstrated that bipedal stance (Foam eyes closed) was predictive of single and multiple fallers, while balance, health and bone density were predictive of fractures in these women. **Conclusion :** These findings could be used by physiotherapists to develop rationale for pre-emptive interventions for delivery to women during the pre-clinical period of change in balance to foster healthier ageing. **Keywords :** postural stability, sensori-motor function, healthier ageing, predicting falls

SS25 110-R-2

DOES AGE AFFECT POSITION OF CENTRE OF GRAVITY WHEN THE SENSES ARE MANIPULATED USING THE MODIFIED CLINICAL TEST OF SENSORY INTERACTION IN BALANCE IN A REPRESENTATIVE SAMPLE OF COMMUNITY AMBULANT WOMEN?

Jill BOUGHEN (Division of Physiotherapy, School of Health and Rehabilitation Sciences The University of Queensland, Australia)

Introduction : This study investigated if changes in the centre of gravity (COG) start location in the antero-posterior direction occurred across age-decades and if start location differed under altered visual input and surface compliance. **Method :** Independent community-dwelling women (N=481) aged 40 to 80 years were categorised in four age-decades (40s, 50s, 60s and 70s) and completed the modified Clinical Test of Sensory Interaction in Balance (mCTSIB) using NeuroCOM Balance Master™ (BM). The mCTSIB included 4 tests in quiet stance: firm surface, eyes open (FiEO) and eyes closed (FiEC) and foam surface, eyes open (FoEO) and eyes closed (FoEC). These data were used to allocate COG start locations to forwards or backwards categories for each test condition. Pearson's Chi Square test was used to test if start location was related to age-decade, visual condition or surface compliance. **Results :** There was no change in start location related to age-decade or visual condition on each surface

type ($p>0.05$). There was a significantly increased likelihood of the position shifting to the forward start location ($p<0.001$) when standing on a foam surface. Conclusion : The location of COG within the base of support does not change with age or under different visual conditions. The start location did change from a firm to a foam surface with a significant shift to an anterior rather than a posterior location of COG on a foam surface. Additional research might further explore the use of this method of tracking COG location in the presence of different pathologies. Keywords : centre of gravity, position, sensory

SS25 110-R-3

TREATMENT TO PREVENT FALLS AND FRACTURES: TARGETING AGE RELATED SENSORI-MOTOR DECLINE THROUGH BALANCE STRATEGY TRAINING OR INTERACTIVE VIDEO GAMING

Jennifer NITZ (*Physiotherapy, The University of Queensland, Australia*)

Introduction : To investigate the impact of a balance strategy training program (BSTP) of exercise devised by physiotherapists to address the age-related sensori-motor and bone density decline contributing to falls and fractures. Self-directed home-based application of the BSTP and the impact of home-based participation in the WiiFit balance program were also investigated for potential utility for sustained preventive health action. Method : Three RCTs of the BSTP in adults over 60 who had fallen ($N=73$), osteopenia ($N=98$) and younger sedentary women ($N=50$) are reported. A controlled trial of the BSTP in osteopenic women as a self-directed home program ($N=23$) and a small study of Wii Fit training in healthy women <60 years ($N=10$) are also reported. Results : Significant improvement in balance and strength measures was found in all studies. Falls and fear of falls were reduced in the faller study and bone density improved in the two osteopenia studies. Sedentary women additionally showed improvement in somato-sensation not measured in the other two RCT studies. The Wii Fit study showed significant improvement in balance and strength but not somato-sensory measures. Conclusion : The BSTP has been demonstrated to reduce fall and fracture risks in a variety of vulnerable patient groups. Wii Fit also has positive benefit on balance but not on somato-sensation. Further comparative studies are indicated to determine benefit from these interventions. Home-based and self-directed BSTP in the osteopenic women aged between 40 and 80 was protective for falls and fractures and might be considered as a cost effective preventive intervention. Keywords : balance bones exer-gaming

SS25 111-R

MODEL OF SOUTH KOREAN SENIOR WELFARE CENTERS FOR A SUCCESSFUL OLD-AGE AND HEALTHY AGED SOCIETY

SS25 111-R-1

THE MEANING AND ROLE OF SENIOR WELFARE CENTERS IN POPULATION AGING AND IN ELDERLY WELFARE DEVELOPMENT

Gyeong-seok Seo (*Woori Mapo Community Welfare Center/Woori Mapo Community Senior Club, Korea*)

Introduction : Studies on the role of senior welfare centers that have dealt with the issues related to elderly people while keeping up with the government policy regarding the aging process of the South Korean society have been insufficient. As such, studies on such matters must be conducted. Method : This study aims to suggest the role of senior welfare centers in the aging of the society by exploring

the changes in the elderly welfare system and in the development of senior welfare centers, looking into the role of such centers in the changes undergone by the society and by the welfare policy for the elderly, and finding the meaning of such role, based on the year 2000, when South Korea became an aging society. Results : This study will be conducted to pave the way for a better understanding of the role of senior welfare centers in the South Korean society's aging process and in the country's elderly welfare development, by analyzing the data regarding the changes in the government's welfare policy for the elderly and regarding the development of welfare programs for the elderly, as well as the senior welfare center evaluation results. Conclusion : It can be said that senior welfare centers have been quantitatively and qualitatively expanded due to the need for them owing to the aging of the South Korean society and the country's political needs, rather than based on the studies and thorough strategies for the advent of an aging society. Keywords : Population aging, welfare policy for the elderly, senior welfare center

SS25 111-R-2

THE ROLES, FUNCTIONS, AND TASKS OF SENIOR WELFARE CENTERS IN THE AGED SOCIETY

Ho-gyeong LEE (*Korean Association of Senior Welfare Centers, Korea*)

Introduction : Senior welfare centers, which are being used by 15% of the elderly in South Korea, are the places where the South Korean elderly culture is reflected as it is. As determined in 2012, about 270 senior welfare centers are in operation nationwide, and it is expected that the number will further increase to keep up with the speed of aging in the country. Method : It is comforting to know that the directors of the senior welfare centers in the country are taking the initiative to reform their centers to keep up with the changes in the elderly welfare environment, and are working hard to raise the level of satisfaction of their users with their facilities, having recognized that reforming their respective centers is not a matter of choice but of survival. Results : This study aims to explore the roles and functions of future senior welfare centers amidst the changes in the elderly welfare environment in the country and in the external environment of elderly welfare by. Conclusion : (1) exploring the current situations of the senior welfare centers operating in the country; (2) analyzing the problems regarding the functions and roles of senior welfare centers prescribed in the Elderly Welfare Act; (3) attempting to redefine the roles and functions of senior welfare centers (i.e., their essential value and purpose); and (4) suggesting ways of developing and maintaining the essential value and purpose of senior welfare centers. Keywords : Senior Welfare Centers, roles and functions, leisure facility

SS25 111-R-3

CASE STUDY OF SERVICE USER ORIENTED PRACTICE IN KOREAN SENIOR WELFARE CENTER- FOCUSED ON TARGET AGE-SPECIFIC SPECIALIZED PROGRAM CASE -

Jun Woo LEE (*Dean of College and Graduate School of Social Welfare of Kangnam University, Korea*)

Introduction : the purpose of this study is to examine present state of the age-specific specialized program among the senior welfare service performed in Korean senior welfare center and seek for directions in service practice which should be pursued by Korean senior welfare center. Method : This study classifies the elderly into pre old, young old, and old old from service user centered perspective, thoroughly analyzes the state of age-specific specialized program practiced in Korean senior welfare center, and seeks for desirable direction of age-specific customized senior welfare service practice of Korean senior

welfare center. This study will collect data by selecting centers practicing specialized age-specific program among Korean senior welfare center and carry out focus group interview of specialists and survey service users. Results : In the past 22 years of history, senior welfare center concentrated on general welfare programs of the elderly like the senior job placement project, volunteer program, leisure culture program, home-care service, day-care service and suicide prevention program. Conclusion : First, Korean senior welfare center should initiated the new senior welfare paradigm from 'service user-centered'. Second, it is significant in that the study is analyzing the status of service practice and grasping the flow by dividing the elderly into pre old, young old, and old old when Korea is facing the entrance of babyboom generation and super-aged society. Third, furthermore, this study provides senior welfare practice service principles which the Korean senior welfare center should pursuit and Korean senior welfare center must position itself as the new front-runner of senior welfare facility. Keywords : Korean Senior Welfare Center, Service User, Target Age-Specific Specialized Program Case

SOCIAL WELL BEING OF OLDER PEOPLE BY DIGITAL LIFE

SS25 112-R-1

DIGITAL AGEING POLICIES IN KOREA

Jeong-hyeun KO (*National Information Society Agency, Digital Inclusion Policy Division, Korea*)

Introduction : Korea is the fastest ageing country and the most informatized country in the world. So, Korean government has carried out various digital ageing policies in the perspective of digital welfare from early 21 century by the cooperation of the public and private parts. Method : Government annual white paper and public reports and statistics. Results : Firstly, we've made great efforts for seniors excluded from the Internet to freely access and use it. Thus, we have supported refurbished PCs to low-income seniors and IT education to the elderly for free. Secondly, we've launched Senior IT Volunteer Groups composed of skilled elderly internet users to help provide them with the opportunity to participate in the society using IT. They're volunteering as IT tutors for seniors who don't use internet, or as Silvernet News producers, PC repairs, etc. And we hold senior's IT contest in June annually throughout the country. Finally we established ubiquitous sensing care system to prepare for the emergency, secure safety of seniors who live alone. Therefore Internet usage rate of elderly people rose from 2.3%(2002) to 22.9%(2011). And a lot of seniors make good use of Internet in their lives including running online shopping malls, teaching IT, making videos. Conclusion : Still, there are some problems which have to be solved. Many elderly people yet do not come into the digital world. Besides we have to develop and suggest various models and ways to make full use of Internet to senior Internet users. And finally, we have to deal with the mobile digital divide. Keywords : digital-divide e-inclusion digital-ageing

SS25 112-R-2

PROMOTING ICT PROGRAMS USING SENIORS AS INTERNET NAVIGATORS

Dong Hee HAN (*Research & Development, Research Institute of Science for the Better Living of the Elderly, Research Center for Anti-Aging, Korea*)

Introduction : This study focuses on promoting active aging by using "Internet Navigators" at the Wellaging Center of Busan's RISBLE Institute. The use of Internet Navigators is a way of providing digital education by older people to other older people and to demonstrate

how seniors can serve as role models in the community. Method : Survey and interview 20 Internet Navigators. Results : This study assessed internet navigators' activities. Respondents were asked about their involvement in education and training, social activities and workforce related activities. Internet Navigator was determined to be a role demonstrating a positive image of older persons. This role was also found to be a good way to promote active aging. The program was developed 10 years ago and is deemed a best practice approach in the Nam-gu community of Busan, Korea. The activities of the Internet Navigators will be discussed in terms of several of its activities such the cyber family, e-life monitors, 1080 family game festivals, green walking programs. It was a role model for digital aging in Busan Korea. Conclusion : This presentation also discusses the future direction and development of digital aging to improve the quality of life of older people and how this program can promote Internet Navigators as a new role for seniors seeking an active aging lifestyle. It is suggested that older people can learn and teach computer technology and this in turn will enhance their sense of wellbeing in society. Keywords : Digital Aging, Active Aging, Internet Navigator, Cyber Family

SS25 112-R-3

CLIENTS OF MEDICAL ALERT SERVICE: WHO ARE THEY AND WHY DO THEY CALL FOR HELP?

Cullen T HAYASHIDA (*Kupuna (Elder) Education Center, Active Aging Consortium in Asia Pacific (ACAP) and Kapiolani Community College, USA*)

Introduction : The growth of the frail elderly in home settings, the increase in falls and the tendency for older adults to be at home alone can result in premature hospital and nursing home placements. Nations are also struggling to address the cost of healthcare workers and the challenges of finding good workers. Medical alert service is an important cost effective means of summon help quickly in the event of falls to prevent small problems from becoming medical disasters. While there have been studies on the efficacy of this service, there has been little in the literature on the characteristics of the clients. Who are the clients? What is their average age? What is their typical disability level? How long do they typically stay with this type of service and why do they summon help? Method : Data was collected from about 1000 medical alert subscribers in Hawaii from 2010 to 2011 from a total census of all subscribers served. In addition, a more detailed survey was conducted on one program that managed about 500 subscribers with a survey in April 2012 with a 50% response rate. Results : Most clients are women who are using the services for approximately 31 months before they they need to be placed into a different type of setting. Disability levels on a 1 - 5 scale indicates that most are generally independent (average score ranging from 3.15 to 4.49). Thirty percent of calls are for falls. Conclusion : Understanding client characteristics can help better link PERS services with other needed services. Keywords : Disability Level, Medical Alert, Falls

SS25 112-R-4

SENIORS WITH CHRONIC DISEASE CAN BENEFIT FROM TECHNOLOGY TOOLS TO ENHANCE SELF-MANAGEMENT SKILLS AND IMPROVED HEALTH

Bonnie K. CASTONGUAY (*Health Navigation and Care at Home, Ho'okele Health Navigators, LLC, USA*)

Introduction : Eight of 10 Americans age 65 or older are living with heart disease, diabetes or some other form of chronic illness, according to a new report by the U.S. Centers for Disease Control and Prevention (CDC). Individuals with multiple and complex medical and social

conditions (“complex individuals”) are disproportionate drivers of healthcare costs and are generally experiencing poor individual health outcomes due to lack of a methodical and holistic approach to coordinating their care. Method : Over 100 individuals with multiple chronic illnesses were a part of studies under several grants to determine the effectiveness of care coordination and health coaching enabled with technology. The technology reinforced the care coordination and health coaching efforts to help individuals develop self-management skills through daily biometric monitoring, maintaining meal logs, using educational tools and contact with their care coordinator and or health coach. The initial results have shown improvement in their ability to manage their chronic diseases, specifically diabetes, congestive heart failure, and hypertension. Results : The grants are in progress with preliminary results demonstrating improvement in all measures ranged from 7% to 25%. Of note, those with the greatest improvement were individuals with the worst baseline measures. There was one readmission to the hospital and no ED visits up to this point of the study. Conclusion : The use of technology tools in combination with care coordination and health coaching is effective in helping individuals, particularly seniors with improving the management of their chronic diseases and validates studies performed that have been performed by the VA and Geisinger. Keywords : Self-management, care coordination and health coaching

THE BABY BOOMER'S QUALITY OF LIFE AND THE RETIREES OF BABY BOOMER GENERATION

SS25 113-S-1
THE BABYBOOMERS' USING INFORMATION TECHNOLOGY AND ITS EFFECT ON THE DIGITAL LIFE SATISFACTION

Meeryoung KIM (*Department of Community Development and Welfare, Daegu University, Korea*)

Introduction : In the digital period, online community works as support group such as exchanging information and support. Also, users work one another as resources of support and information. This study examined the effect of Korean babyboomers' adaptation abilities on the use of information technology who live in the borderline of the digital and analog period. Method : The sample size of this study was 400 and it was selected by the ratio of region, age, gender based on the population census of the country(except Jeju island) who can use internet. As adaptation abilities, the recognition of the effect of digital life and self-efficacy were used. Results : The research results indicated that there were differences in the approach of information technology, communication through the information technology and the ability of using information technology by self-efficacy and the recognition of the effect of digital life. The results of the regression indicated that self-efficacy and the recognition of the effect of digital life affected on the approach of information technology in a statistically significant level. Also, self-efficacy affected the communication through the information technology and the ability of using information technology in a statistically significant level. The approach, communication and use of information technology have mediating effect on the digital life satisfaction. Conclusion : Since the recognition of the effect of digital life comes from their experiences of using IT, it is important for Babyboomers to have a chance to learn and use the internet. Also it is important to raise their self-efficacy to use IT usefully and effectively. Keywords : competence-environmental press model of adaptation, self-efficacy, use of information technology,

SS25 113-S-2
DIFFERENCES IN ECONOMIC WELL-BEING AMONG KOREAN BABY-BOOMERS: THE SELF-EMPLOYED VS. EMPLOYEES

Jeungkunn KIM (*Dept. of Public Policy, Samsung Economic Research Institute, Korea*)

Introduction : The main purpose of this study is to analyze whether and why there is income difference between employees and self-employed among Korean baby-boomers. Method : Many Korean baby-boomers are forced to retire earlier than other OECD countries. Average retirement age in Koreans is 53. After exiting from their main jobs, many Korean baby-boomers are more likely to run the small size of self-employed business. Using Korea Welfare Panel Study, this study investigates differences in income status between the self-employed and employees and analyzes which factors affect income status among Korean baby-boomers. Results : The results find that the self-employed are more likely to be males and married than employees among Korean baby-boomers. Age and education level are significantly related to differences in income status between a self-employed and an employee. Among Korean baby-boomers, one interesting finding is health status and relationships between family members are positively related to income status of the self-employed, not employees. Conclusion : Social policy for baby-boomers needs to focus on the types of work status in order to maintain their economic status after their retire. In particular, because social safety net does not cover well self-employees in Korea, it is important for government-based social insurance to be modified to fill gaps in the coverage of social insurance and to protect baby-boomers from various social risks. Keywords : Economic Well-being, Baby-boomers, self-employee

SS25 113-S-3
A STUDY ON A NEW WELFARE MODEL FOR ENHANCING BABY BOOMERS' QUALITY OF LIFE

Yeong-ran PARK (*Division of Silver Industry, Kangnam University, Korea*)

Introduction : This study aims to develop a new conceptual welfare model for enhancing quality of life of the Korean baby boomers as they retire. Method : Based upon literature review, secondary analysis of existing data and focus group interviews, this study delineates the socio-demographic characteristics and welfare needs of the Korean baby boomers focusing on their income security, health, social engagement and care issues. Results : According to the analysis of the data, the Korean baby boomers showed ‘diversity’, ‘lack of preparation for retirement’, and ‘blind spot of welfare policy’ as three major characteristics of the group. Conclusion : In order to overcome the limitations of the existing old age security system, this study suggests an alternative model of so called 'Affirmative Action for Active Ageing.' This conceptual approach includes expansion of services for senior life design, development of transitional support programs for the retirees, and reconstruction of the old age security system from an active ageing perspective. Keywords : Korean baby boomers welfare model affirmative actions

SS25 113-S-4
THE SEARCH FOR PURPOSE AMONG US BABY-BOOMER RETIREES

Eldon WEGNER (*Department of Sociology, University of Hawaii at Manoa, USA*)

Introduction : The Baby-Boomer generation in the U.S. has always been distinctive due to the unique social conditions which have shaped their values and their personal characteristics. They are more educated

and enjoy much better health than earlier generations. They have also been characterized as more consumer-oriented, self-indulgent and less compliant with traditional roles. The meaning of retirement is undergoing redefinition due to their generational characteristics as well to rapidly changing economic conditions. Most persons will experience several decades of retired life due to increased longevity, but will individuals be able realize a high quality of life during these years? This paper will focus on finding purpose and personal fulfillment in retirement, which may be a mixture of productive activities as well as leisure and passive activity traditionally associated with retirement. However, many baby-boomers will want to pursue encore careers or volunteer activities which make use of their skills and expertise and give them a sense of purpose. The paper will cover the following: 1) noting the challenge which retirement poses to maintaining economic and psychological quality of life, 2) describing emerging trends towards post-retirement employment in phased retirement arrangements or in a variety of encore careers; 3) describing new efforts to broaden pre-retirement planning beyond financial issues to finding activities which offer purpose and meaning 4) describing efforts to expand the opportunities for meaningful employment and voluntary civic engagement which utilize the education, experience and skills of older adults. Method : Qualitative interviews with experts Results : Funding and information needed. Conclusion : Retirees offer potential productivity. Keywords : retirement planning, volunteer engagement

PRODUCTIVE AGEING: AN ASIAN PERSPECTIVE

SS25 114-S-1

TRUST AND VOLUNTEERISM IN HONG KONG: A LIFE COURSE PERSPECTIVE

Alice Ming Lin CHONG, Susu LIU (*Applied Social Studies, City University of Hong Kong, China*)

Introduction : In many conceptualizations of social capital, the construct of 'trust' is considered one of its most important components, and is linked to a stronger involvement in social activities and public affairs (Putnam, 1993). This study aims to examine the effect of trust (societal trust and individualized trust) and age on volunteerism from a life course perspective. Method : The respondents were Hong Kong Chinese aged between 15 and 79 (N=1170), which were divided into three age groups: the youth group (N=455), adult group (N=464) and elder group (N=251). A self-constructed questionnaire was distributed to the participants through a randomized household survey. Results : Age was found to be positively related to individualized trust, but negatively correlated with participation in voluntary work. Significant differences were found between the three age groups in terms of volunteer hours in past month, volunteer motivations and individualized trust. Hierarchical regression analysis showed that societal trust positively predicted voluntary work, while individualized trust indicated negative effect. The two types of trust explained 0.9% variances of voluntary work after age, gender and educational level were controlled ($p < .001$). Conclusion : This study is one of the very few to examine the effect of trust on volunteerism. Generally speaking, Chinese people hold a higher level of trustworthiness towards individuals than society. People endorsing individualized trust might stick to personal and family values, and were less inclined to participate in voluntary work. Strengthened efforts should be taken to raise societal trust and appropriate measures are suggested to promote elderly volunteerism. Keywords : individualized trust, societal trust, elder volunteerism

SS25 114-S-2

PARTICIPATING AND SUSTAINING VOLUNTEER WORK: THE PERSPECTIVES OF OLDER CHINESE VOLUNTEERS

Iris LEE, Diana LEE, Doris YU, Lisa LOW (*The Nethersole School of Nursing, The Chinese University of Hong Kong, Hong Kong*)

Introduction : There is substantial evidence to suggest the positive benefits of senior volunteering. Yet, it is always a challenge to sustain the volunteering effort among older adults. This study explored the motivators and barriers to continued volunteering among the Chinese senior volunteers in Hong Kong. Method : This was an exploratory descriptive qualitative study. Semi-structured interviews were conducted with 26 senior volunteers from various community elderly centers. They were aged above 60 and had participated in volunteer work for at least three months. Content analysis was adopted as the analytic strategy. Results : Altruism was identified as the key motivator for senior volunteers to engage in and continue with the volunteer work. The informants reported three other motivators that encouraged their continuation with volunteer participation. These motivators were 'offering help to others', finding enjoyment in the process' and 'building social relationship with co-volunteers'. On the other hand, declining physical health and family commitment were reported as the major barriers that hinder their continuation in volunteering work. However, majority of the informants neither regarded senior volunteering as a formal role function in later life nor an experience that enable them to achieve life goals. Conclusion : The study provided directions on ways forward to sustain senior volunteering among Chinese older adults. Making the volunteering as a meaningful experience in helping the others and filling the later life years with joys and friendships would be important incentives. Optimizing the physical health of senior volunteers and allowing flexibility in their commitment will also promote continuing participation in senior volunteering. Keywords : Senior volunteering, Chinese older adults, Social participation

SS25 114-S-3

PRODUCTIVE AGING IN SINGAPORE

Treena WU (*Research and Evaluation, Tsao Foundation, Singapore*)

Introduction : Productive aging is an effort to come to a better understanding of individual involvement in society and / or the economy as one option during the later years. This is as opposed to the prevailing myth of a period of frailty, disengagement and the consumption of resources in late life. From the Singapore perspective, productive aging is viewed in terms of continued employment in late life, volunteerism and care-giving. Method : From a meta-review of the literature and policy concerning the aging population of Singapore, older Singaporeans are expected to remain employed longer. The aim is to ensure that older Singaporeans will be able to meet their own increasing social security needs, given longer life expectancy. In addition to employment, the state aims to promote a spirit of volunteerism among older Singaporeans. Also there are older persons who provide care for their spouses or for their grandchildren. Results : Policies tend to be focused on promoting more employment opportunity for older adults, lifelong learning and outreach to reduce age discrimination in the workplace. To a much lesser extent, there are aspects of productive aging in the form of volunteerism and care-giving. Conclusion : While there are various ways for older Singaporeans to be actively engaged within society, there is the concern that there may be too much emphasis on continued employment in late life. The individual should not be expected to take on a disproportionate amount of personal responsibility for old age social security. There should be more state intervention. Keywords :

Productive Aging Singapore

SS25 114-S-4

POST-RETIREMENT ADAPTATION AND PRODUCTIVE AGING: A QUALITATIVE STUDY OF COMMUNITY-DWELLING ELDERLY IN HONG KONG

Susu LIU (*Applied Social Studies, City University of Hong Kong, Hong Kong*)

Introduction : A body of previous research on the impact of retirement typically converged on the view that retirement was a life crisis for older people because of the loss of identity and independence (Braithwaite & Gibson, 1987). However, evidence from productive ageing practice has shown that older retirees are able to maintain social roles and generate societal benefits in modern times. Against this background, this study aims to examine how older adults look upon and adjust to the stage of post-retirement and their approaches to lead a productive ageing life. Method : A total of sixteen older adults aged from sixty-five to ninety living in the community was invited to individual interviews. Participants were selected from two elderly community centres in two districts of Hong Kong respectively. Semi-structured interviews were taped and the dialogues were transcribed verbatim. Results : Research has shown that most of the participants can accept the vital transition to retirees and take their initiative to adjust to post-retirement life. Half of the respondents approved of the notion of productive ageing and practiced it after retirement. Findings revealed that undertaking paid jobs and participating in volunteering work were two major forms of productive ageing among the respondents. Besides, lifelong learning and leisure pursuits in the community were also prevalent approaches to distract loneliness derived from retirement. Remarkably, a few senior citizens were still exercising their civil rights and engaged in civic affairs in the Hong Kong context. Conclusion : Retired older people can continue to make contributions to society by ways of productive aging. Keywords : Retirement, Productive aging, Transition

PILOT STUDY ON ABUSE AND NEGLECT OF OLDER ADULTS IN CANADA: PRECURSOR TO A NATIONAL PREVALENCE STUDY

SS25 115-S-1

WHAT IS UNIQUE ABOUT THE CANADIAN STUDY?

Lynn MCDONALD (*Faculty of Social Work; Institute for the Life Course and Aging, University of Toronto, Canada*)

Introduction : The overarching aim of pilot research program, Defining and Measuring Elder Abuse and Neglect was to examine the main problems associated with the conceptual definitions and measurement of mistreatment of older adults; the difficulties on the theoretical front, the current challenges associated with identifying risk factors for abuse and neglect and the issues surrounding the collection of reliable and valid data related to the prevalence of abuse and neglect. Method : The methods included a community consensus approach that integrated the views of major stakeholders from across Canada at the inception of the project and finished with a knowledge transfer event for these stakeholders to share in the results and plan for the future. Results : The Canadian study is unique because: it introduced a theoretical perspective that served as a framework for the study and which was tested in the study; it tested the validity of the measurements for the first time in the elder mistreatment field; the major issues of over and under estimation of the rates of elder mistreatment were examined. Conclusion : An extensive ethics manual was developed that could be

used by both practitioners and researchers in any aspect of intervention through practice or research that afforded the protection and resources older adults might require. Keywords : Elder abuse, Ethics manual

SS25 115-S-2

THE THEORY BEHIND THE STUDY: THE LIFE COURSE PERSPECTIVE AS A FRAMEWORK

Ariela LOWENSTEIN (*President, Yezreel Valley College, Emek Yezreel; University of Haifa, Israel*)

Introduction : Although in recent years more prevalence data on elder abuse is available, there is lack of a unified conceptual paradigm which might help in developing more unified definitions to understand the factors related to elder abuse and neglect, especially in domestic settings. Method : The paper will focus on an attempt to develop such a framework based on linkages between the life course perspective and paradigms of intergenerational family solidarity-conflict and ambivalence, and the ABCX model of coping with stress situations, linking care giving and elder abuse. Results : The paper will present some background information on issues involved in populations ageing and the need for care; the meaning and outcomes of family care for frail elders focusing on abuse in informal care settings, mainly within family systems. Conclusion : Finally, data will be presented and analyzed from a large qualitative Israeli study which followed the first national prevalence study. Keywords : elder abuse, life course, intergenerational family solidarity-conflict and ambivalence

SS25 115-S-3

ISSUES ASSOCIATED WITH MULTILINGUAL AND MULTICENTRIC DATA COLLECTION IN ELDER ABUSE IN CANADA

Marie BEAULIEU (*Gerontology, University of Sherbrooke, Canada*)

Introduction : Canada is a bilingual country of 34 000 000 inhabitants. Conducting a prevalence study on elder abuse necessitates validated material in both official languages (English and French) as well as a research process that allows synchronised modification in both languages. The aim of this presentation is to present the linguistic adaptation (from English to French, back to English) and the research process respecting these adaptations. Method : Our pilot study of elder abuse required 5 steps in both languages. 1) Defining concepts and choosing the "correct" words. 2) Question development. 3) Focus group on comprehension of questions. 4) Cognitive testing. 5) Data collection. Results : 1) Even is the research term for elder abuse is "maltraitance" in French, we decided to ask question using the term "abus" which is mainly used in common language. 2) Questions were designed in both languages. 3) A synchronised phase of focus groups in both languages permitted to modify questions that were not correctly understood. 4) Cognitive testing permitted to test the actual material and to evaluate the length of the interviews (significantly longer in French). 5) Due to recruitment strategies, more French respondents than English ones had experience abuse. What could be considered a bias in another study is seen as strength because it allows ascertaining the capture of abuse experience. Conclusion : This pilot study has permitted to develop and validate a questionnaire in both languages (English and French) that leads us to proceed to a population study on prevalence of elder abuse in Canada. Keywords : elder abuse multicentric study multilingual study

SS25 115-S-4

EXPERIENCES OF ABUSE & NEGLECT AMONG STUDY PARTICIPANTS & VALIDATION OF THE COMMUNITY SURVEY AND RISK FACTORS FOR ABUSE

Cynthia THOMAS (*Human Services, Westat, USA*)

Introduction : The 267 respondents who participated in a community survey were classified into two groups: 39 who indicated that they had experienced abuse or neglect and 228 who said they had not. The main objectives of the analysis were to validate the measures and to determine the extent to which the questions could be answered easily. **Method :** We conducted several analyses to assess the construct validity of the questionnaire (1) An analysis of whether the two groups responded differently to particular items in the instrument (2) A summation of the items on which the two groups differed (3) A Cronbach's alpha computation to determine if the abuse and neglect items constituted a single construct of a particular type of abuse. **Results :** Respondents in the 'known abuse' group answered yes to more items on abuse and neglect than those known not to have experienced abuse, regardless of gender, education level, or marital status. We investigated the risk factors for abuse and found that minorities were more likely to experience abuse than Caucasians. Individuals with one or more ADL or IADL limitations were more than twice as likely to have experienced abuse compared with those with no such limitations. The odds of abuse for individuals who were depressed was more than four times higher than for those not depressed. Having experienced abuse during childhood was associated with a heightened risk of experiencing abuse as an older adult. **Conclusion :** The questions could be answered by the respondents, and the measures in the instrument were validated. **Keywords :** elder abuse prevalence

SS25 116-R
LONG TERM CARE POLICY: CROSS-NATIONAL COMPARISON

SS25 116-R-1
MEETING THE WORKFORCE NEEDS OF THE LONG TERM CARE POPULATION
Edward F. LAWLOR (*Dean, The Brown School, Washington University in St. Louis, USA*)

Introduction : Numerous U.S. national commissions and studies have documented problems of a workforce shortage, high turnover, poor training, and poor quality of care from professionals and paraprofessionals in long term care. These problems will be exacerbated by demographic changes, increasing chronic conditions, and potential reductions in family and community supports for a rapidly aging population. Because the majority of formal long term care expenditures come from public sources, it is important that public policy addresses these workforce shortfall and composition problems. No "market" solutions to training and populating the long term care workforce are in sight. **Method :** Using data from the U.S. Department of Labor Bureau of Labor Statistics, Health Resources Administration, long term care industry sources, and state administrative data, this study constructs four analytic scenarios to estimate different workforce size and composition implications of alternative institutionalization, community and family supports, and long term care eligibility criteria. **Results :** Dramatic differences in the size, composition, and cost trajectories of the long term care workforce result from choices of institutional/professional/quality/and eligibility determinations for service. The hardest and most consequential policy choices will arise in choices about care composition and staffing for dementia and the growing prevalence of serious chronic conditions. **Conclusion :** Federal and state governments, families, and long term care consumers all bear the cost and poor quality consequences of the absence of workforce policy. The paper concludes with proposals for Medicare,

Medicaid, and other public financing alternatives for workforce development. **Keywords :** Policy, Long-term Care

SS25 116-R-2
LONG TERM CARE POLICY IN THE UNITED STATES: THE LAST GREAT HEALTH POLICY CONUNDRUM
Timothy MCBRIDE (*The Brown School, Washington University in St. Louis, USA*)

Introduction : The problems of access, cost containment, and quality have been facing the long-term care (LTC) system in the U.S. for decades. Paradoxically, these problems remain even after the passage of health reform in the U.S., and are becoming more acute with retirement of the baby boom generation. **Method :** This paper uses data from the Health and Retirement Study (HRS) over time (from 1998-2010) to explore the needs for LTC as well as how elders meet these needs through community-level and institutional sources. Using descriptive and multivariate methods to measure how demand for LTC has changed in the U.S. over time, the paper explores the relationship between individual, socioeconomic, and supply-level variables and the utilization of LTC services over time. **Results :** There has been a significant change in the way U.S. elders obtain formal LTC services over the last decade. In general, elders have shifted along the LTC continuum from nursing homes to less intensive formal or informal care. Nevertheless, the cost of these services remains very high, and the burden of LTC costs remains a key problem. **Conclusion :** The U.S. recently passed significant health reform in 2010 to deal primarily with problem of access to care for the uninsured under age 65. The access, cost and quality issues facing the LTC sector remain as they have for decades, and paradoxically an attempt to begin to deal with these problems contained in the Affordable Care Act was put on hold. **Keywords :** Long-term Care Policy

SS25 116-R-3
THE IMPACT OF LONG-TERM CARE INSURANCE IN JAPAN
Naoki IKEGAMI¹, Tomoaki ISHIBASHI², John Creighton CAMPBELL³ (*1. School of Medicine, Keio University, Japan; 2. Department of Health Policy & Management, Keio University School of Medicine, Japan; 3. Political Science, University of Michigan, USA*)

Introduction : Public long-term care (LTC) insurance was implemented in Japan in 2000. The amount of benefits is set according to seven eligibility levels. There is a ten percent copayment, plus some hotel costs in institutional care. Cash benefits are not available because the objective lay in decreasing the family's care burden. The program was projected to expand as new providers, including for-profits, were allowed entry. Consumer choice of providers is the main mechanism for quality control. **Method :** Impact analysis of government data using an internationally comparative framework. **Results :** From 2002 to 2010, the monthly number of users increased 1.8 times, and as a proportion of the population 65 and over, from 9.9% to 14.3%. The share of HCBS (home and community-based services) increased from 57.5% to 67.3% but the composition of services, two-thirds day care, two-fifth home-helpers, and one tenth respite care has remained the same. But in institutional care, hospital based inpatient care has decreased from 12 to 6%, while the proportion in Alzheimer's group homes and private nursing homes has increased from 2% to 11%. The increase in annual expenditures is less than the number of users: 1.4 times between 2002 and 2010 with the ratio of HCBS expanding from 26.2% to 35.7%. **Conclusion :** The government has tried to contain costs by changing the composition of institutional care and limiting

benefits for those requiring only light care. However, more radical reforms may be needed to maintain the sustainability of the program.

REBALANCING LONG TERM CARE IN HONG KONG

Terry LUM¹, Ernest CHUI², Vivian LOU¹, Mandy LAU³ (1. *Social Work and Social Administration & Sau Po Centre on Ageing, The University of Hong Kong, Hong Kong*; 2. *Social Work and Social Administration, The University of Hong Kong, Hong Kong*; 3. *Sau Po Center on Ageing, The University of Hong Kong, Hong Kong*)

Introduction : Hong Kong is aging very fast. Approximately, 14% of its population were 65 year or older in 2011. By 2030, 1 in every 4 people in Hong Kong will be aged 65 and over. The dominating mode of long term care (LTC) in Hong Kong is residential care with community care as supplement. Our center was appointed by the HK Government to conduct a comprehensive review of the LTC system in HK in 2010. We will present findings from this study in this presentation. Method : We reviewed all LTC policy documents and administrative data. We conducted a survey with 4,000 people to assess their LTC needs and preference. We also conducted focus groups with stakeholders. Results : The LTC system in HK is imbalance. The ratio of public spending between community care and residential care was \$1.0 to \$6.7 in 2010-11. In 2010-11, there were 24,746 publicly funded residential vs. 7,098 community care places. About 6.8% of all residents age 65 years or older were in nursing home. While there is still a long waiting list (more than 26,000 people) for government funded residential care, very few older people want to move to nursing home. We found that the government policies provide a strong incentive for family members to send their elderly family members to nursing home. We proposed a LTC voucher system for the HK Government to rebalance the LTC system. Conclusion : The HK Government accepted our recommendation and will implement a pilot LTC voucher system in 2013. Keywords : Long term care, Voucher, Hong Kong

TEACHING NURSING HOMES: PAT, PRESENT AND FUTURE

SS25 123-C-1

TEACHING NURSING HOMES: PAST, PRESENT AND FUTURE

Paul R. KATZ¹, John E. MORLEY², Sabine Von PREYSS-FRIEDMAN³, Daniel SWAGERTY⁴ (1. *Geriatrics, Baycrest Health Centre and University of Toronto, Canada, Canada*; 2. *Geriatrics, St. Louis University, USA, USA*; 3. *Geriatrics, University of Washington, USA*; 4. *Geriatrics, University of Kansas, USA*)

The Teaching Nursing Home (TNH) has remained conceptually appealing over the last several decades but remains difficult to operationalize and sustain. The role of individual disciplines in creating the link between research, education and clinical care remains ill-defined. This symposium seeks to highlight the core elements of TNHs including evaluation metrics and models of University affiliations that are predictive of success. Objectives of the session include: 1. Review of historical trends in the context of new governmental sponsored models (i.e. Province of Ontario) of Centres for Learning Research and Innovation. 2. Review of successful research models and the link to quality improvement initiatives. 3. Highlighting approaches to the integration of research, care and education through enhanced interprofessional competencies and 4. Review of successful educational modalities based on learner needs,

experience and length of exposure to nursing home setting. Presenters are internationally recognized nursing home specialists with expertise as researchers, clinicians and educators. Replication of successful TNH models is key to sustaining a competent and dedicated professional workforce with academic credibility. Keywords : Nursing home, education, research

SS25 123-C-2

KEYS TO SUCCESSFUL RESEARCH IN THE NURSING HOME

John E. MORLEY (*Geriatric Medicine, Saint Louis University, USA*)

Overall research in the nursing home is relatively rare compared to other health care venues. The most common areas researched are pressure ulcers, fractures, weight loss, restraints, delirium, polypharmacy and behavioral disturbances. Most intervention articles are small care best practice type articles. There is a paucity of multisite randomized controlled trials. Studies showing the efficacy of education on improving care are also lacking. Research in nursing homes has a cost to the nursing home (which needs to be reimbursed) and also raises a variety of ethical issues. Keys to conducting successful research include: a) Obtaining administration, staff and family/resident support; b) Design and pilot the project carefully and at highest scientific standards; c) Train staff to perform research tasks and reward them for their participation; d) Make the need for surrogate consent clear; e) Make sure all costs are covered; f) Provide feedback on outcomes to all involved; and g) Consider using SQUIRE (<http://squire-statement.org>) guidelines for quality improvement projects. Research in the nursing home is desperately needed and can be highly rewarding for all involved. Keywords : Nursing Home

SS25 123-C-3

USING QUALITY IMPROVEMENT TO ENHANCE INTERDISCIPLINARY COMPETENCIES

Sabine VON PREYSS-FRIEDMAN (*Medicine, Division of Gerontology and Geriatric Me, University of Washington, USA*)

Quality Improvement is an integral part of Long-Term Care. The Centers for Medicare & Medicaid Services (CMS), an agency within the US Department of Health & Human Services responsible for administration of several key federal health care programs is currently piloting new models of quality assessment and process improvement (QAPI). Integrating Quality Improvement projects into the LTC setting enables learners to collect and evaluate data critically, do root cause analysis of quality problems and integrate available evidence and best practice models into clinical practice. Quality improvement is an excellent teaching tool for learners of different disciplines, such as nursing, dietary services and Geriatric Medicine Fellows. Examples of successful rapid cycle improvement processes from different disciplines will be presented. Keywords : Long-Term Care

SS25 123-C-4

TEACHING NURSING HOMES: PAST, PRESENT AND FUTURE: NH RESIDENTS

Daniel SWAGERTY (*Department of Family Medicine, American Medical Directors Association, USA*)

Introduction : NH residents, with their wide spectrum of care needs, offer an ideal substrate upon which the basic principles of geriatric care can be demonstrated. Despite significant frailty, NH residents remain quite heterogeneous and provide health care professionals significant opportunity to enhance physical and psychological function and to positively impact on quality of life. Method : A trainees

experience in a TNH is dependent on a number of variables including the learner's needs and expectations, duration of the exposure, availability of role models and characteristics of the NH resident population. The trainees experience is also linked to the specific teaching modalities employed in the NH setting. These modalities may vary from traditional didactic and apprenticeship approaches to simulation labs, role modeling and distance learning. Results : Interprofessional and team based competencies are key targets regardless of specialty focus. Conclusion : Research is desperately needed which will provide insights into the targeting of educational approaches based on the mandates specific to a given profession. Priority must also be given to studying the impact of training on the development of a competent long term care workforce and on resident based quality measures. Keywords : Teaching Nursing Home

SS25 124-R

ADDRESSING END-OF-LIFE CARE ISSUES: A GLOBAL PERSPECTIVE ON RESEARCH, POLICY AND PRACTICE

SS25 124-R-1

PREFERENCES REGARDING END-OF-LIFE CARE AMONG OLDER ADULTS IN SINGAPORE

Chetna MALHOTRA¹, Terry FLYNN², Assad FAROOQUI³, Marcel BILGER³, Eric FINKELSTEIN¹ (1. *Lien Centre for Palliative Care, Duke-NUS Graduate Medical School, Singapore*; 2. *Centre for the Study of Choice, University of Technology, Australia*; 3. *Program in Health Services and Systems Research, Duke-NUS Graduate Medical School, Singapore*)

Introduction : Understanding end-of-life (EOL) care preferences is important for policymakers and EOL service providers. The objective of this paper was thus to quantify the EOL care preferences among community-dwelling Singaporeans aged 50 years and above using a stated preference conjoint survey. Method : A conjoint survey was administered to 522 older adults who were asked to choose between two hypothetical EOL care scenarios as a result of advanced cancer. The scenarios were described through 7 attributes with between 2 and 4 levels for each: severity of pain, amount of care required from family-members or friends, expected length of survival, quality of health care experience, expected cost of treatment from diagnosis to death, source of payment, and place of death. Ten hypothetical scenarios were presented to each respondent. Conditional logistic regression was used to estimate relative intensity of preferences. Results : Respondents showed a strong preference toward spending money from their own Medisave (a health savings account) account and were most averse to paying from family member's out-of-pocket. There was a higher willingness to pay to avoid being in severe pain and to be able to die at home compared to paying for treatments to extend life by one additional year. Conclusion : These findings have implications for health insurance design, quality standards for EOL care, pain management, and other EOL care policies in Singapore. Keywords : End-of-Life Care, Preferences

SS25 124-R-2

END-OF-LIFE CARE-RELATED PREFERENCES, COMMUNICATION, PRACTICE AND THE LAW IN ISRAEL

Sara CARMEL (*Center for Multidisciplinary Research in Aging, Ben-Gurion University of the Negev, Israel*)

Introduction : End-of-life care in Israel will be presented through findings of a number of studies. Method : Studies were conducted on preferences for use of life-sustaining treatments in various illness conditions of older persons, the general public, and physicians.

Results: Results of comparative analyses between doctors and patients, and differences in preferences of various population groups will be portrayed. Conclusion : We will present conclusions, legal developments and practical implications. Keywords : End-of-life care, policy, physician practice

SS25 124-R-3

END-OF-LIFE CARE FOR PERSONS WITH DEMENTIA

Iva HOLMEROVA¹, Hana VANKOVA² (1. *Faculty of Humanities, Charles University in Prague, Czech*; 2. *CELLO, Faculty of Humanities and The 3rd Medical Faculty, Charles University in Prague, Czech*)

Introduction : Dignity is stipulated by many international documents as a principal human right. The presentation will be concentrated on importance of dignity support in dementia care along the trajectory of the syndrome of dementia including terminal stages. Method : Consensus on care for persons with dementia. Results : Two consensus on dementia will be presented: Strategy of care for persons with dementia suggested by the Czech Alzheimer Society (responsive support or P-PA-IA, care responding to needs of persons with dementia) and consensus on palliative care for persons with dementia of Alzheimer Europe. Conclusion : Alzheimer Europe set up a working group in 2007 to look at the practical issues linked to the good care of people dying with/from dementia. Recommendations on palliative care for persons with dementia were written in the context of ongoing consultation with Alzheimer Europe's member associations, reflecting available literature and international documents. Strategy P-PA-IA - care and support of persons with dementia has been a result of many discussions in the Czech Alzheimer Society, workshops and meetings of our contact points during the recent three years. We have consulted also staff members in different institutions and organisations in our country and abroad (in Austria, Germany, Norway, Switzerland etc). Experience with deployment of the P-PA-IA strategy in Long Term Care institutions in the Czech Republic will be discussed. Supported by the grants NT11325 and NT13705 of the Ministry of Health of the Czech Republic. Keywords : dementia, palliative care, dignity

SS25 124-R-4

THE END-OF-LIFE CARE AND ROLES OF PROFESSIONALS IN NINE COUNTRIES

Kanao TSUJI (*President, Life Care System, Japan*)

Introduction : The issues surrounding the end-of-life care in contemporary Japan is not limited to terminal cancer cases. Care for patients with communication difficulties due to dementia, especially the issue on provision of artificial nutrition, is also becoming a big challenge. The presenter proposes that influencing factors behind these issues include not only the asymmetrical availability of information between professionals and patients/families but also other factors such as differences in professional philosophy, view of life and death, and national system. Through analyses of data, the presenter shows how not only the country itself but also profession and view on life and death affect the judgment of professionals. Method : This survey was administered to doctors, nurses, caregivers, social workers and others in Japan, United States, France, United Kingdom, the Netherlands, Israel, Czech Republic, South Korea, and Australia. We viewed two common clinical cases to see their choices in treatment and what they thought was ideal. At the same time, we asked about laws and regulations for end-of-life care to the collaborating organizations in each country. Results : Data were drawn from a sample of 2,117 physicians, nurses, and caregivers from 9 countries (Australia, Czech

Republic, France, Israel, South Korea, Netherlands, UK, USA and Japan) in 2010-2011. The presenter also shows that differences across countries can be categorized into 3 groups: European countries, Japan and South Korea, and Czech. Conclusion : These findings suggest the necessities for interdisciplinary efforts in the end-of-life care and for establishment of common base for mutual communication. Keywords : end-of-life care, international comparison, death and dying

PHENOTYPE CONSIDERATIONS WHEN ASSESSING EXCEPTIONAL LONGEVITY IN HUMANS

Nir BARZILAI¹, Sofiya MILMAN², Jill CRANDALL² (1. *Medicine & Genetics, Albert Einstein College of Medicine, USA*; 2. *Medicine, Albert Einstein College of Medicine, USA*)

Introduction : We hypothesize that people with exceptional longevity may harbor genetic factors that protect them from age-related diseases. Method : Phenotyping this group is important for three reasons: 1) Identification of a phenotype that leads to candidate gene approach; 2) Establish phenotype after discovery by an un-biased approach; 3) Identification of major environmental interactions that may contribute to longevity. Results : We will demonstrate examples for these considerations such as the identification of the phenotype of increased HDL cholesterol in families of centenarians lead to the discovery of a longevity genotype for HDL; discovery of GH/IGF-1 mutations, phenotypic expression and environmental factors in centenarians. Conclusion : We conclude that detailed phenotyping of individuals with exceptional longevity is central for establishing inferences based on genetic discoveries. Keywords : Centenarians, phenotype

SS25 125-C-2

DEMOGRAPHY AND BIOMEDICAL CHARACTERISTICS OF SUPERCENTENARIAN IN JAPAN

Nobuyoshi HIROSE, Yasumichi ARAI (*Department of Internal Medicine, Keio University, School of Medicine, Japan*)

Introduction : Once centenarian was considered to be a human model of healthy aging. However, the number of centenarian is exponentially increasing and the function of the increasing centenarians is usually low. Base on these finding, we think that the real human model of healthy aging is supercentenarian. The investigation of supercentenarian is quite difficult, because of their small numbers. We accumulate the data of over 60 centenarians. Here we present the demography and biomedical characteristic of supercentenarian in Japan. Method : we use the data of national census for the demography of supercentenarian. We visited 25 supercentenarians and check their function and medical record. We also draw the blood for biochemical and genetic research. Results : The number of supercentenarian is increasing from 5 in 1991 to 78 in 2010. The ratio of male to female in 2010 is 1 to 25. The increase of supercentenarian is due to the increase of female supercentenarian. The probability of men to become supercentenarian is approximately 1 out of 400,000. However, the probability of women to become supercentenarian is 1 out of 20,000. The medical history of supercentenarian shows that they usually do not contract chronic diseases. As the example of healthy supercentenarian, the data of the oldest man in Japan will be presented. Conclusion : The supercentenarian is increasing due to the increase of female supercentenarians. They usually do not contract chronic diseases.

These extremely long-lived people is the best candidate for whole genome sequencing to identify the longevity genes. Keywords : supercentenarian , woman, model of healthy aging

SS25 125-C-3

CENTENARIANS UP REGULATE THE EXPRESSION OF MICRO-RNAS

Jose VINA¹, Consuelo BORRAS¹, Eva SERNA¹, Juan GAMBINI¹, Kheira MOHAMMED¹, Juan Antonio AVELLANA², Angel BELENGUER², Leocadio RODRIGUEZ-MANAS³ (1. *Department of Physiology, University of Valencia, Spain*; 2. *Servicio de Geriatria, Hospital de La Ribera, Spain*; 3. *Department of Geriatrics, Hospital Universitario de Getafe, Spain*)

Introduction : Centenarians not only have an extraordinary longevity, but also show a compression of morbidity. They preserve the capacity of maintaining homeostasis, and this is the reason for them to reach such a long life. We hypothesized that centenarians should be extremely well regulated at molecular level, and studied their microRNA expression profile, because microRNAs are directly involved in the regulation of gene expression. Method : We compared microRNA expression profiles of 33 centenarians, 80 octogenarians and 80 young individuals, by analysing the expression of 15,644 mature microRNAs and, 2,334 snoRNAs and scaRNAs in peripheral blood mononuclear cells. Results : Principal component analysis showed that centenarian microRNA expression profile was similar to that of the young individuals, but different from octogenarians. Moreover, centenarians show an up-regulation of the expression of 102 microRNAs when compared to octogenarians and only one down-regulated, and even when compared to young individuals, 7 microRNAs are up-regulated and none down-regulated. Conclusion : Centenarians up-regulate the expression of small non-coding RNAs like microRNAs and scaRNAs. This may explain their exceptional ability to maintain homeostasis even in extreme aging. Acknowledgements: This work was supported by grants SAF2010-19498, ISCIII2006-RED13-027, PROMETEO2010/074, 35NEURO GextGent and EU Funded COSTB35 and CM1001. This study has been co-financed by FEDER funds from the European Union. Keywords : Small non-coding RNA, Extreme longevity, Regulation of transcription

SS25 125-C-4

MISSENSE MUTATIONS ON BPIFB4 ASSOCIATE WITH HUMAN LONGEVITY AND HAVE BENEFICIAL EFFECTS ON ENDOTHELIAL VASCULAR FUNCTION

Annibale PUCA, Carmine VECCHIONE (*Medicine, University of Salerno/ITB-CNR, Italy*)

Introduction : The genome of exceptionally long-lived individuals (LLIs) is thought to be enriched/depleted in polymorphisms that influence aging, which is associated with progressive reduction in nitric oxide and impairment of endothelial function. Method : Previously identified genetic risk variants were validated across two additional populations, followed by testing the effect of mutated proteins on vascular function. Results : Using a recessive model, a missense mutation in bactericidal/permeability-increasing (BPI) fold-containing family B member 4 (BPIFB4) was the only variation found consistently associated with human longevity in sets of individuals from Germany (1,628 LLIs vs 1,104 younger controls: OR=1.43; 95% CI=1.12-1.80; p=0.0037, Bonferroni adjusted p=0.015) and the USA (1,461 LLIs vs 526 younger controls: OR=1.62; 95% CI=1.15-2.27; p=0.0053; meta-analysis on German- and US-American-set: OR = 1.49; 95% CI=1.22-1.81; p<1x10⁻⁴) during a replication attempt

conducted on the top four missense polymorphisms or taggers identified previously in the Southern Italian Centenarian Study (OR=2.42; CI=1.56-3.77; p=5.8x10⁻⁵). The mutation significantly enhanced endothelial vasorelaxation; this effect was coupled with activation of endothelial nitric oxide synthase, through phosphorylation on Ser1177. Moreover, expression of the mutated protein in vessels of heterozygous methylenetetrahydrofolate reductase knockout mice rescued the impaired nitric oxide-induced vasorelaxation encountered in these mice. Conclusion : Mutations in BPIFB4 are associated with longevity and may represent a new focus for therapies aimed at reducing vascular endothelial dysfunction. Keywords : Centenarians, Nitric Oxide, Vasorelaxation

SS25 125-C-5

ACCELERATED AGEING OF THE BRAIN FROM 70 TO 101 YEARS OLD

Zixuan YANG, Wei WEN, Melissa SLAVIN, John CRAWFORD, Perminder SACHDEV, Charlene LEVITAN, Henry BRODATY (Centre for Healthy Brain Ageing (CHeBA), School of Psychiatry, University of New South Wales, Australia)

Introduction : Understanding changes of brain structure in exceptional longevity is crucial to differentiate normal versus pathological ageing and disclose the secrets of preserved cognition. We aim to examine the effect of age on cerebral atrophy and cognition in a very elderly sample. Method : 499 non-demented subjects (283 females, age range=70.4-101.1 years) with brain MRI were selected from our two study cohorts. Volumetric segmentation of grey matter (GM), white matter (WM), total brain volume (TBV), intra-cranial volume (ICV) and hippocampal volume was performed. Cognition was measured by Mini-Mental State Examination (MMSE) and then divided into high (>27/30) and low-performance groups (≤27/30). Results : Regression analysis showed a linear decrease in TBV/ICV ratio and hippocampal volume with age while controlling for gender, education, MMSE, APOE ε4 status and ICV. A significant non-linear effect of TBV/ICV ratio was also shown, indicating a greater rate of decline among older subjects. Older age, together with a better MMSE performance, were significantly associated with an increase in GM/WM ratio. A significant relationship between a higher TBV/ICV ratio and high MMSE performance was only observed in younger participants (<80 years old); whereas the significant relationship between hippocampal volume and MMSE scores remained constant across the eighth to eleventh decades of life. Conclusion : Our study is the first to show an accelerating pattern of cerebral atrophy from 70 - 101 years old. Results suggest that the brain structure-cognition relationship in exceptional longevity is different from younger elderly, and hippocampal volume may be a stronger neuroimaging marker of cognition than general atrophy. Keywords : exceptional longevity, cerebral atrophy, cognition

SS25 125-C-6

LONGEVITY BLUE ZONES: A FIRST ATTEMPT TO COMPARE LONGEVITY BETWEEN DIFFERENT POPULATIONS

Michel POULAIN¹, Gianni PES² (1. IACCHOS, Universite catholique de Louvain, Belgium; 2. Department of Clinical and Experimental Medicine, Universita degli Studi di Sassari, Italy)

Introduction : The concept of Longevity Blue Zone (LBZ) has been defined as a rather limited geographical area where people share the same lifestyle and environment and whose exceptional longevity has been validated convincingly. This study is a first attempt to compare longevity across the four LBZs identified so far: Sardinia, Okinawa,

the Nicoya peninsula in Costa Rica and the island of Ikaria in Greece. Method : The apparent longevity of a population can be measured by a number of indicators. The Centenarian Prevalence (CP), i.e. the number of centenarians reported to the total resident population, largely used in the literature, is sensitive to biases owing to migration and changes in fertility. More reliable indicators are the Life tables (cohort life table and period life table), the Extreme Longevity Index (ELI), i.e. the proportion of newborns in a given municipality who reach age 100, and the Centenarian Rate (CR), i.e. the ratio between centenarians and the persons who were 60 years old 40 years earlier in the same population. Results : As a preliminary result of our investigations we confirm the exceptional level of male longevity in the Sardinian LBZ and female longevity in Okinawa. Conclusion : We observed that LBZ populations are geographically and/or historically isolated and characterized by a traditional lifestyle including intense physical activity beyond age 80, a reduced level of stress and large family support for the oldest olds. These people have succeeded in creating a delicate balance between the benefits of the traditional lifestyle and those of modernity (increased wealth, better medical care). Keywords : Longevity Blue Zones

SS25 125-C-7

CENTENARIAN STUDIES NETWORK: AN INTERNATIONAL COLLECTION OF STUDIES -LEARNING FROM OUR SIMILARITIES AND DIFFERENCES

Paola SEBASTIANI (Biostatistics, Boston University, USA)

Introduction : There is strong evidence that genetics is a major factor for extreme survival and centenarian studies are ideal to discover genetic variants that predispose to extreme lifespan. Method : We analyzed genome wide genotype data from approximately 2,000 subjects enrolled in the New England Centenarian study to identify rare and common variants associated with extreme longevity. Both linkage analysis of sib-pairs concordant for extreme longevity and association studies of multiple generations were used to identify new longevity associated variants and chromosomal regions that should be enriched of rare longevity variants. Meta-analysis of results published from other longevity and healthy aging studies were used for replication. Results : The analysis confirmed known longevity associated variants, such as SNPs in APOE, but also identified new loci in several chromosomes that should be targets for focused sequencing. Conclusion : Centenarian studies are ideal for discovering genes associated with longevity, and collaborations from multiple studies is needed to discover longevity variants that are robust across different populations. Keywords : centenarian, genetics

ARTHRITIS AND COMORBID CONDITIONS: IMPACT ON MANAGEMENT ACROSS THE GLOBE

SS25 126-C-1

ARTHRITIS AND COMORBID CONDITIONS: IMPACT ON MANAGEMENT

Sun CHUNG (*Rehabilitation Medicine, Seoul National University Hospital, Korea*)

Introduction : Recent advances in soft tissue imaging has enabled epidemiologists and clinical researchers to identify that relatively minor breakdown of soft tissue integrity not only causes common, self-limiting musculoskeletal pain, but also initiates a cascade of musculoskeletal deterioration that can lead to chronic pain and disability. Musculoskeletal pain and disability caused by life-long deterioration of soft tissues impose serious problems in a longevity society because a person with a longer life expectancy means longer suffering than one with a shorter life span. Successful management of lifelong, widespread, repetitive soft tissue breakdown is crucial to maintain the quality of life in modern longevity societies. **Method :** Early diagnosis is very important to detect which connective soft tissues is pathologic and underlying patho-mechanism. Even with recent advances in soft tissue imaging, it is still challenging to diagnose a soft-tissue lesion that is truly responsible for current symptoms because most of soft tissue lesions are very subtle and co-exist with many asymptomatic lesions. **Results :** A comprehensive approach to clinical problems is necessary to identify the source of pain accurately. Development in dynamic and/or functional evaluation will help to solve this challenge in the near future. **Conclusion :** Because soft tissue lesions are progressive with numerous injury-healing-reinjury cycles throughout a whole life, a treatment approach with one big operation may not be appropriate. Self management with a comprehensively designed exercise and postural correction will be the most appropriate way to facilitate healing processes and prevent re-injury. Minimally invasive local interventions can be used as adjunctive treatments. **Keywords :** arthritis, soft tissue, management,

SS25 126-C-2

SARCOPENIA, OBESITY AND FRAILITY: A TROUBLING TRIAD

Debra L. WATERS (*Preventive and Social Medicine, University of Otago, New Zealand*)

Introduction : Healthcare systems worldwide are vulnerable to the increasing prevalence of obesity, sarcopenia and frailty in older adults. These conditions, coupled with increasing longevity and rising health care costs, will challenge public health capacity in the future. Self-management of these chronic conditions, through appropriate interventions, will be critical for meeting this challenge. **Method :** Community-based and intensive life-style interventions have been used to combat the loss of physical function, frailty and sarcopenic-obesity in older adults. Results from evaluations of peer-led exercise programs in New Zealand and randomized controlled trials of life-style interventions in the US will be presented. **Results :** Community-based peer-led exercise classes in New Zealand have been shown to reduce frailty through improved, and maintained, physical function, while also reducing falls incidence. These long-running classes are both effective and sustainable, and need to be trialed in other settings. Intensive lifestyle interventions (exercise and diet) in the US, which achieve a 10% weight loss over 6 months, result in improved physical function, body composition, and decreased frailty in obese older adults. These results are encouraging, but research on long-term weight maintenance and translation into communities are needed. **Conclusion :** Peer-led exercise classes and life-style interventions appear to be promising self-management interventions that reduce the burden of physical disability and frailty related to obesity and sarcopenia in older adults. Coordinated efforts are needed to promote and translate these interventions, and while also evaluating their efficacy and cost effectiveness. **Keywords :** Sarcopenia Frailty Obesity

SS25 126-C-3

THE PUBLIC HEALTH IMPACT OF ARTHRITIS

Carol JAGGER (*Institute for Ageing and Health, Newcastle University, United Kingdom*)

Introduction : With continued increases in life expectancy, the key question is whether the extra years are spent healthy and free from disability. Major causes of disability in later life are chronic diseases such as stroke, coronary heart disease (CHD), dementia, and arthritis. We explore the public health impact of arthritis, compared to the other three diseases, by disability-free life expectancy (DFLE), a population health indicator which permits comparison of the impact of fatal and non-fatal diseases on disability on the same metric. **Method :** A dynamic macro-simulation model (SIMPOP) has been developed to estimate future numbers aged 65+ with disability to 2030 under different health/disease scenarios. Pathways between chronic disease, disability and death were modelled with data from the nationally representative MRC Cognitive Function and Ageing Study and then applied to the 1992 national population data to simulate the next two years and repeated to 2030. SIMPOP produces projections of absolute numbers with and without disability and DFLE. **Results :** Arthritis had the highest prevalence at baseline (53%). Although not the most disabling disease, arthritis had the greatest population attributable risk of disability, at around 25%. Scenarios for trends in incidence, risk factors and treatment of disease were devised from systematic reviews and applied in SIMPOP. This presentation focuses on the level of health improvements necessary to produce compression of disability over the next twenty years. **Conclusion :** Reducing the disabling effect of arthritis will have significant gains in years without disability in later life and could result in a compression of disability. **Keywords :**

disability-free life expectancy

SS25 126-C-4

ARTHRITIS AND COMORBIDITIES: INTERPLAY AND IMPACT ON MANAGEMENT

Lynne PARKINSON¹, Julie Ellen BYLES², Lynn FRANCIS²
(1. Health CRN, CQUniversity, Australia; 2. Research Centre for Gender Health and Ageing, University of Newcastle, Australia)

Introduction : Arthritis is a leading cause of disability, particularly in older people, but is often overlooked when impacts of chronic disease on health service use and health outcomes are considered. The majority of arthritis may not directly lead to increased mortality, however, these common, enduring conditions lead to significantly decreasing quality of life over time. Simply by virtue of being so common or, perhaps, due to common etiological pathways, arthritis is often associated with multiple comorbidities. We provide an overview of current international research into the impact of arthritis on management and health outcomes for three comorbidities (cardiovascular disease, asthma, diabetes), and present data from older Australian women as a case study. Method : A literature review will be presented, and data from older participants (born 1946-51) in the Australian Longitudinal Study on Women's Health. This project explores the development of cardiovascular disease, asthma, and diabetes in relation to development of arthritis; the degree to which this order of development explains health care use; and how having arthritis impacts on treatment (hospitalisations, medicines use) for other conditions. how arthritis impacts on management for three selected comorbidities (cardiovascular disease, asthma, diabetes). Results : There are many patterns of comorbidity development in relation to development of arthritis; with order of development explaining some patterns of health care use. Arthritis can impact on treatment for other conditions. Conclusion : It is imperative that arthritis is not overlooked in health care settings as both a cause of disability in its own right and as a serious comorbidity. Keywords : arthritis, comorbidity, management, hospitalisations, medicines

SS25 127-C

DEFINING SARCOPENIA: ASIAN PERSPECTIVES

SS25 127-C-1

SARCOPENIA: EPIDEMIOLOGY AND PREVENTION IN JAPAN

Takao SUZUKI (Res. Inst, NCGG, Japan)

Introduction: The European Working Group on Sarcopenia (EWGSOP) developed a practical definition for age-related sarcopenia with the algorithm based on measurements of gait speed, grip strength and muscle mass. However presentation and clinical attributes of sarcopenia in older Asian adults may differ. We would like to introduce the prevalence of sarcopenia of the elderly in Japan according to different definition of this age-related condition. Method : A total of 5,104 elderly people aged 65 and over living in the Obu city participating to the OSHPE were assigned to the study for estimating the prevalence of sarcopenia and establishment for the prevention of sarcopenia. They were underwent whole-body dual energy X-ray absorptiometry (DXA) for estimation of muscle mass. Among these participants, 4,811 elderly could be examined all of measurements for diagnosis of sarcopenia. Results : Regarding to the estimation of prevalence of sarcopenia in OSHPE, (1) according to the definition and algorithm proposed by EWGSOP, it was calculated as 8.0%(387/4811), but (2)when removed the measurement of gait speed partly because only 3.4% (174/4811) was less than 0.8m/s and partly

because gait speed is likely to be the indicator of the frailty rather than of sarcopenia, the prevalence was calculated as 7.8% (376/4811). All of these 376 elderly persons were included in the 387 elderly diagnosed as sarcopenia by the algorithm of EWGSOP. Conclusion : This study has revealed that the algorithm for age-related sarcopenia particularly among the community dwelling elderly persons should be considered and modified in the Asian perspective. Keywords : Sarcopenia, Community- elderly,

SS25 127-C-2

EPIDEMIOLOGY AND ASSOCIATED FACTORS OF SARCOPENIA IN CHINESE ELDERLY

Tiemei ZHANG¹, Ping ZENG², Sinan WU², Yiwen HAN¹, Yi ZHANG², Yan ZHANG¹, Enyi ZHANG¹, Jian LI³ (1. Cell Biology, Beijing Institute of Geriatrics, China; 2. Epidemiology, Beijing Institute of Geriatrics, China; 3. Biochemistry, Beijing Institute of Geriatrics, China)

Introduction : To investigate Sarcopenia-related information for diagnosis of sarcopenia in Chinese elderly. Method : Changing of muscle mass, detected by BIA, and muscle strength with aging was analysis from two separated national cross-section survey. Data related to physical performance and associated factors of sarcopenia was collected in communities population aged over and above? 60 years with 5000 individuals from 6 areas in China. Results : The decline of handgrip strength was about 4% every five years initiated from 35-years old in men and 40-years old in women; the decline rate increased to 16.4% and 14.5% after 70-years in men and women, respectively. Muscle mass, determined by BIA, changed with aging also. The differences of muscle mass and muscle strength was found between Chinese and Caucasian. The relationship between change of gait speed with aging and functional limitations and difficulties was discussed. Factors of income, disease history and life style associated with sarcopenia-related symptoms and sign. Conclusion : Sarcopenia-related symptoms and sign closely related with quality of life in Chinese elderly. A suitable diagnostic criteria, which should be differed from that for Caucasian, for sarcopenia in Chinese should be realized. Keywords : Sarcopenia, Chinese,Diagnosis

SS25 127-C-3

PREVALENCE OF SARCOPENIA AND SARCOPENIC OBESITY ABOVE 60 YEARS OLD KOREAN BASED ON EWGSOP GUIDE

Kwang-min KIM¹, Yunhwan LEE², Yoon-sok CHUNG³, Duck-joo LEE¹, Kyu-nam KIM¹, Yong Jun CHOI¹ (1. Department of Family Medicine, Ajou University School of Medicine, Korea; 2. Department of Preventive Medicine and Public Health/ Institute on Aging, Ajou University School of Medicine/ Ajou University Medical Center, Korea; 3. Department of Endocrinology and Metabolism, Ajou University School of Medicine, Korea)

Introduction : Sarcopenia is an important factor of functional impairment related to aging. This study is conducted to investigate the prevalence of sarcopenia and sarcopenic obesity above 60 years old using The European Working Group on Sarcopenia in Older People (EWGSOP) guide. Method : Korean men (232) and women (268) aged 60 years or older were analyzed from peoples who visited Ajou University Hospital Health Promotion Center to make annual or biannual health examination. Sarcopenia was defined by the presence of both relative skeletal muscle mass loss below 2 SD of the gender-specific mean for healthy young adults plus the presence of low muscle function (strength or performance). Relative skeletal muscle mass was represented by the appendicular skeletal muscle mass

adjusted by height and body weight. Sarcopenic obesity was considered present in sarcopenic participants whose waist circumference was more than or equal to 90 cm for men and more than or equal to 85 cm for women, respectively. Results : The prevalence of sarcopenia using methods by EWGSO in this study population was 11.2% for men and 0.7% for women by height-adjusted definition and 15.9% for men and 7.5% for women by weight-adjusted definition. The prevalence of sarcopenic obesity was 9.5% for men and 6.3% for women by weight-adjusted definition but 1.3% for men and 0.4% for women by height-adjusted definition respectively. The prevalence of sarcopenia increased with age for men but for women only when applied with weight-adjusted definition. Conclusion : The prevalence of sarcopenia and sarcopenic obesity differs by gender and definition criteria. The height-adjusted definition may tend to underestimate the prevalence of sarcopenia and sarcopenic obesity. Keywords : Prevalence, sarcopenia, sarcopenic obesity

SS25 127-C-4

SARCOPENIA IN TAIWAN AND ITS ASSOCIATION WITH COGNITIVE FUNCTION

Liang-kung CHEN¹, Li-kuo LIU¹, Wei-ju LEE², Li-ning PENG¹
(1. Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taiwan; 2. Department of Family Medicine, Taipei Veterans General Hospital Yuanshan Branch, Taiwan)

Taiwan has become an aging country in 1993, and is estimated to become an aged country in 2017, which makes Taiwan one of the fastest aging countries in the world. Sarcopenia has been described as a phenomenon of age-related skeletal muscle loss, which was mainly a description of morphologic changes in the beginning. However, the decline of muscle strength has been recognized as a key feature of sarcopenia, which formulate the modern definitions of sarcopenia. The epidemiological study regarding to sarcopenia in Taiwan is scarce and the most optimal diagnostic criteria for sarcopenia remained uncertain. Nevertheless, in I-Lan Longitudinal Aging Study (ILAS), we clearly identify a strong association between reduced muscle mass, physical performance and poorer cognitive function. All those declines in physical and cognitive function were significantly associated with older age. Moreover, the brain MR imaging for the study subjects disclosed a high prevalence of subcortical arterosclerotic encephalopathy (SAE), i.e. white matter lesion, among sarcopenic subjects. White matter lesions were considered closely associated with cardiometabolic risk factors, and this association was also clearly shown in ILAS. In conclusion, more studies are needed to establish outcome-based sarcopenia definitions in Taiwan, and the association between aging, skeletal muscle loss, reduced physical performance, declined cognitive function, the presence of SAE and higher cardiometabolic risk deserve further investigations to explore the pathophysiology of sarcopenia. Keywords : Sarcopenia

QUALITY INDICATORS OF NURSING HOMES IN HONG KONG: OBSERVATIONS AND IMPLICATIONS

Vivian W.Q. LOU¹, Chi Wai KWAN², Iris CHI³ (1. Soc Work & Soc Admin, Sau Po Centre on Aging, The University of Hong Kong, Hong Kong; 2. Statistics and Actural Science, The University of Hong Kong, Hong Kong; 3. Social Work, University of Southern California, USA)

Introduction : Nursing homes in Hong Kong play a significant role in

helping frail older adults with their nursing, personal, and social needs. Ever since 2000, seven nursing homes in Hong Kong have been conducting assessments of their residents on an annual basis by using the Chinese version of the Minimum Data Set - Nursing Home (MDS-NH) 2.0. The present study aimed at examining the care quality of nursing homes by using quality indicators (NHQIs). Method : Data from residents from seven nursing homes were assessed with MDS-NH2.0 (a total of 8204 assessments) and then used to calculate a series of quality indicators as guided by the MDS2.0 manual. Results : Areas that recorded comparatively low prevalence of NHQIs included new fractures (0.53%), symptoms of depression without antidepressant therapy (1.02%), fecal impaction (0.65%), urinary tract infection (0.81%), dehydration (0.06%), hypnotic use more than two times in the last week (2.68%), and low-risk residents with pressure ulcers (0.84%). Areas that recorded comparatively high prevalence of NHQIs included occasional or frequent bladder or bowel incontinence without a toileting plan (78.9%), little or no activity (27.4%), moderate to severe pain (27.0%), low-risk residents who lost control of their bowels or bladders (26.7%), use of nine or more different medications (18.6%), and residents who have become more depressed or anxious (18.5%). Conclusion : Findings of the present study showed both merits and weakness of care provided by nursing homes. Discussion will be made corresponding to areas of care that showed needs of improvement. Keywords : quality of care, nursing home, Hong Kong

SS25 206-R-2

QUALITY INDICATORS OF NURSING HOMES IN SEOUL

Jia LEE (College of Nursing Science, Kyung Hee University, Korea)

Introduction : Since the long-term care insurance has begun in 2008, the number of nursing homes has increased in South Korea resulting in quality management issues. The national health insurance corporation evaluated long-term care facilities and home care services every other year. The purpose of this study was to identify quality of long-term care facilities in Seoul district. Method : The study employed a retrospective design. Data were extracted from year 2011 evaluation materials of 561 long-term care facilities registered at Seoul headquarter, national health insurance corporation. A total of 98 indicators (19 of administration, 24 of environment and security, 10 of right and responsibility, 40 of service providing process, & 5 of service result) were used to evaluate the facilities. Results : Areas having quality issues were; regular meetings with staff or committees, staffing, health examination, and employee benefits from the administration session; infection control, hospice, counseling space, security devices, and disaster training from the environment and security session; counseling and meeting with customers, and contract and bill provision from the right and responsibility session; assessment, infectious disease examination, need identification, care planning, service provision, bath care, diaper change, indwelling catheter management, pressure ulcer management, recreation program, community activities, restraint, physical therapy, physician examination, dementia prevention, medication management, and case management from the service providing process session; satisfaction survey, class improvement, and elimination improvement from the service result session. Conclusion : Quality improvement programs should be developed for each area having quality issues based on facility scale and staffing size. Keywords : quality of care, long-term care, Seoul

SS25 206-R-3

CAN CONTINUOUS, INTER-GENERATIONAL COOPERATION POSITIVELY IMPACT THE QUALITY OF LIFE OF ELDERLY ALZHEIMER'S SUFFERERS?

Ryoko ROKKAKU (*School of Health Sciences, Tokyo University of Technology, Japan*)

Introduction : In Japan, interaction between children and senior citizens has been decreasing, particularly with dementia sufferers. Inter-generational interventions have been attempted internationally. An early study, (Tokyo Gerontological Synthetic Lab, 2004) focused on 'inter-generational social contribution programs' and Kamei (2010) qualitatively revealed a care process to "facilitate daytime, inter-generational exchanges in urban environments". Alzheimer's-targeted research finds (1) environmental changes, sickness, and improper caregiving combine to confuse Alzheimer's sufferers, predisposing them to psychiatric symptoms and behavioral disorders; (2) communities do not understand or interact well with Alzheimer's-suffering neighbors; and (3) guidelines exist for Alzheimer's treatment. However, proof of non-drug therapy effectiveness is lacking. **Method :** **Purpose:**This study questions inter-generational cooperation's impact on elderly Alzheimer's sufferers' quality of life. Reporting on the first year of a continuous, two-year intervention (2012.6-2014.6), a target group of elderly patients diagnosed with Alzheimer's disease attend day care services in two locations within city A: **Intervention group:** 10 patients participate in an inter-generational program with children. **Control group:** 10 patients forego intervention. **Analysis:**interview, FAST,HDS-R,ADL,ADCS-ADL . Behave-AD,mood condition assessment is ABS (The affect balance scale),QOL-AD (Quality of Life-AD). **Results :** **Expected results:**Inter-generational cooperation should help maintain and improve Alzheimer's sufferers' quality of life: 1. On-going interaction with children stimulates their mental functions such as cognition, emotion, motivation, and vitality. 2. Experiencing the role of a life-mentor to the children, their self-esteem can be maintained. 3. The interaction improves understanding of Alzheimer's disease in the community. **Conclusion :** Given these results, the program should be continued, followed by modeling inter-generational cooperation to clarifying its effect on Alzheimer's. **Keywords :** inter-generational cooperation, Alzheimer's sufferers, the quality of life

SS25 207-R **EMERGENT MIDDLE EAST GERIATRIC MEDICINE**

SS25 207-R-1
THE MIDDLE EAST ACADEMY OF MEDICINE OF AGEING
Hashim Hasan BALUBAID (*Internal Medicine, King Abdulaziz Medical City, Saudi Arabia*)

Introduction : A serious disparity exists between the growing ageing population and the number of health care providers being trained to meet the unique health care needs of older adults. This problem is both in developed and developing world. The key to alleviating the shortage, according to researchers, is for medical schools to lead the change in giving geriatric medicine the attention it deserves, cultivating programs where there are none, improving existing ones. There is a major deficiency in the number of physicians trained in geriatrics, in addition to limited paramedical personal trained in the field. The Middle East Academy for Medicine of Ageing was founded in 2002 to stimulate the development of health care services for older people in the region. It was established by a number of professors and teachers from the Middle East and Europe. The Model of MEAMA was taken from the European Academy for Medicine of Ageing (EAMA). The mission of MEAMA is to create a hub for education and training in the field of ageing in the Middle East. **Method :** powerpoint presentation. **Results :** powerpoint presentation.

Conclusion : powerpoint presentation. **Keywords :** hhb

SS25 207-R-2
HEALTH CARE SERVICES FOR THE OLD MIDDLE EAST POPULATION
Salwa Abdulla ALSUWAIDI (*Geriatrics, Dubai Health Authority, United Arab Emirates*)

Introduction : Health Care Services for the Old Middle East Populations The world is experiencing a major demographic transformation globally and the Middle East is not an exception of the same. Today, about two third of all older people are living in the developing world; mainly Asia, and particularly China and India. **Method :** In the Arab countries the number of elderly is increasing due to the improvement in health care services as well as the eradication of most of the infectious diseases that was causing early death. Middle Eastern countries have certain cultural, social and economic characteristics in common with similar aspiration and this affect how to view the elderly and their needs. **Results :** Geriatric Medicine is a relatively new branch of medicine in the Middle East that has recently started getting attention. However some Middle East countries lack geriatricians and others have highly specialized geriatric clinics! The general insufficient numbers of trained geriatricians and gerontologists among health professionals seriously undermines the ability of the country's health care system to adequately assess, treat, and rehabilitate the growing aging population. **Conclusion :** The aim of this oral presentation is to introduce the audience to the different health care services available in the Middle East countries as well as the challenges and opportunities facing health care services for the elderly in the Middle East. **Keywords :** Middle East, Geriatric, Services

SS25 207-R-3
GERIATRICS IN QATAR
Marwan RAMADAN (*Geriatrics, Hamad Medical Corporation, Qatar*)

Introduction : The number of elderly is fast increasing in Qatar and the region. This brings out many problems for the governments and for healthcare. What is being done? **Method :** Statistics obtained from official sources and the national strategy for the elderly. **Results :** The number of elderly is increasing substantially in Qatar and the region. The age of survival has gone over 70 when it was around 50, few decades ago. The number of elderly needing long term care is skyrocketing. The government is trying to deal with the problem and has produced a national strategy. **Conclusion :** The future of the elderly in Qatar should be fine due to the commitment of the state to their health. Problems will still exist though. **Keywords :** Qatar, elderly

SS25 207-R-4
INITIATING A GERIATRIC RESEARCH NETWORK IN THE GULF REGION
Abdulrazak Bachir ABYAD (*Geriatric, Middle East Academy of Ageing, Lebanon*)

Introduction : There is a substantial research need in the ageing field in the Middle-East. Research is an essential prerequisite in developing the speciality further in the area, and in developing evidence-based practice. Therefore the Middle East Network on Ageing Research (MENAR) was established. In addition the Middle East network on elderly care services MENECS and Middle-East Association on Aging and Alzheimer's - MEAAA The aim of these research networks is to develop Geriatrics and Gerontology Research. **Method :** The main reason for selecting this instrument is the fact that it is easy to apply in

the community and it is a good. Introduction to the various instruments of InterRAI. Results : The goals of the study include among others collecting data on the elderly living in the community in the Middle East, in addition by using this instrument to be able to compare various elderly community in the region and comparing the region to the rest of the World. We were granted the permission to use the instrument for research from InterRai. Conclusion : During the last Middle East Academy for Medicine of Ageing MEAMA meeting in Doha ?Qatar several countries from the gulf region showed interest to replicate the community study in their own countries including Dubai, Sultanate Oman, Riyadh, and maybe Bahrain. We hope that, with these studies, we will be able to compare elderly within the region and internationally. In addition, we aim at making an MEAMA interRAI database for research and from all these efforts it will be possible to start InterRAI-Middle East. Keywords : Emergent Geriatric Middle East

SS25 208-R

THE ACSM SYMPOSIUM: IMPROVING QUALITY OF LIFE AND PROMOTING PHYSICAL ACTIVITY FOR OLDER ADULTS—INTERNATIONAL PERSPECTIVES

SS25 208-R-1

US INITIATIVES TO PROMOTE PHYSICAL ACTIVITY: MEETING CHALLENGES OF AN AGING NATION

Marcia ORY (*Health Promotion & Community Health Sciences, Texas A&M University, USA*)

Introduction : The American College of Sports Medicine (ACSM), a membership organization of 45,000 members and certified professionals from 90 countries around the world, is dedicated to helping people worldwide live longer, healthier lives. This presentation will discuss some of the College's initiatives that are particularly relevant to global aging. Method : ACSM has established a Strategic Health Initiative on Aging (SHAI) to focus attention on professional education issues, programming, partnership engagement, and identifying research-related opportunities related to promoting physical activity in the aging population. Results : This presentation will discuss several SHAI initiatives, including the National Institute on Aging's Go4Life public information campaign targeted directly at older adults, the Exercise is Medicine Campaign directed at health care professionals, and the availability of screening tools (e.g., Easy For You) that assist both older adults and their care providers to identify the most appropriate exercises based on underlying conditions. Conclusion : There is worldwide recognition of the importance of physical activity in health promotion and disease prevention efforts throughout the life-course. National strategies for promoting physical activity in older adults should be multi-level with attention directed toward the public and well as health care providers. Keywords : American College of Sports Medicine, Strategic Health Initiative on Aging, Physical Activity

SS25 208-R-2

THE CHALLENGES AND OPPORTUNITIES FOR THE TRANSLATION OF EVIDENCE-BASED ACTIVITY PROGRAMS

Chae-hee PARK (*Sport and Healthy Aging, Korea National Sport University, Korea*)

Introduction : For many seniors, aging is associated with chronic disease and functional decline leading to disability and low quality of life. Insufficient participation in physical activity is known to shorten the life span, increase morbidity/ motility, and undermine quality of

life, general well-being, and prospects for independent living. According to WHO, physical activity is the single most efficient means by which seniors can influence their own health and functional capacities and, therefore, sustain a high quality of life in old age. Method : Evidence-based physical activity programs developed and tested in academic research settings have become the gold standard in producing measurable health benefits and positive outcomes for seniors. An important national health promotion priority is to encourage the adoption of evidence-based programs at the community level to improve quality and ensure the safety and effectiveness of physical activity programming. Results : Programs such as Healthy Moves Aging Well, Fit & Strong, and Standing Strong were developed, tested, and reviewed with the goal of improving interventions provided to older adults for greater health benefits. Evidence-based programs usually includes a researched rational for the intervention, a well-defined program structure and timeframe, required staffing needs and skills, specific facility and equipment requirements, and program evaluation tools to measure program quality and health outcomes. Conclusion : The speaker will discuss some of the challenges and opportunities associated with the translation of evidence-based activity programs in community settings, focusing on adaptations that would need to be made for international adaptation. Keywords : Evidence-based physical activity programs, Health Promotion, Seniors

SS25 208-R-3

AUSTRALIAN RECOMMENDATIONS FOR PHYSICAL ACTIVITY FOR OLDER PEOPLE: DEVELOPMENT, IMPLEMENTATION AND ONGOING CHALLENGES

Keith HILL¹, Jane SIMS² (*1. School of Physiotherapy, Curtin University, Australia; 2. Healthy Ageing Research Unit, Monash University, Australia*)

Introduction : Although recommendations for physical activity levels and type have been available for many years for adults, there have criticisms that a single set of guidelines may not be directly relevant for younger and middle aged adults as for older adults. This presentation reports development of the Australian recommendations for older people. Method : Existing guidelines and consensus statements, systematic reviews, meta-analyses and research articles were reviewed. Draft recommendations were circulated to stakeholder agencies and to an expert advisory group. Results : Five recommendations were developed, that align with the current National Physical Activity Guidelines for adults, but address additional issues relevant to older people. The Australian Government launched the recommendations in 2009. However, there has been limited systematic approach to population level implementation, and data suggest levels of physical activity among older Australians remain low. Factors influencing low uptake, and potential application internationally will be discussed. Conclusion : Physical activity recommendations for older people provide a useful focus for this important population group, but require a sustained implementation plan to be likely to influence low physical activity participation rates among older people. Keywords : Physical activity, guidelines, older people

CLINICAL DIAGNOSIS IN GERIATRICS

SS25 209-C-1

CLINICAL DIAGNOSIS AND IMPORTANCE OF INFECTIOUS DISEASES IN ELDERLY PATIENTS

Chang Oh KIM (*Internal Medicine, Yonsei University College of Medicine, Korea*)

Introduction : Infectious diseases frequently present with atypical or asymptomatic features in elderly. Serious infections may be heralded by nonspecific declines in functional or mental status, or anorexia with decreased oral intake. Recent studies have implicated human cytomegalovirus (HCMV) infection as a possible etiologic pathogen causing cardiovascular disease. Essential hypertension is a major risk factor for CVDs. We evaluated the relationship between HCMV antibody status, and hypertension and functional status among elderly. **Method :** Patients aged ≥ 65 years were prospectively enrolled from March 2011 to February 2012 at a 2,000-bed university hospital. We collected data including CD4+ and CD8+ T-lymphocyte count, and functional status by measuring basic activities of daily living and instrumental activities of daily living for all patients. In addition, HCMV IgG levels were analyzed using enzyme-linked fluorescence assay. **Results :** During the study period, 103 patients, who were admitted for treatment of infections or other diseases, were enrolled. Multivariate analysis showed that body mass index and HCMV IgG antibody titers were independent factors associated with hypertension in elderly patients. In univariate linear correlations, HCMV antibody levels were positively correlated with systolic blood pressure levels, CD8+ T lymphocyte count, and IADL scores. In addition, CMV IgG titers were inversely associated with estimated glomerular filtration rate. These four variables remained independently significant in multivariate correlation analysis. **Conclusion :** These findings may provide insight into the important role of HCMV in the pathogenesis of essential hypertension and decreased functional status in the elderly. **Keywords :** elderly patients, infectious diseases, functional status

SS25 209-C-2

MANAGEMENT OF COMORBIDITIES IN THE ELDERLY PATIENTS WITH HEART FAILURE

Kwang-il KIM (*Department of Internal Medicine, Seoul National University College of Medicine, Seoul National University Bundang Hospital, Korea*)

As the population continues to age, a growing proportion of elderly patients present with multiple coexisting medical conditions. Multimorbidity in the elderly requires more intensive diagnostic work-up and is associated with unexpected in-hospital events. As a result, multimorbidity is the major contributor to the increased medical costs among the elderly. In addition, multimorbidity is significantly associated with higher mortality, increased disability, declines in functional status, and a lower quality of life (QOL). Heart failure is one of the common medical conditions in the older patients and is a major cause of morbidity and mortality. Heart failure in older patients may also be difficult to treat because of the multiple comorbidities, the presence of polypharmacy, and a greater prevalence of adverse drug effects. Heart failure can be caused by many different cardiovascular diseases such as hypertension, coronary artery disease, valvular heart disease, and arrhythmia. Furthermore, heart failure is the commonly associated with other medical condition including COPD, chronic kidney disease, anemia, and malnutrition. These comorbidities contribute to the poor clinical outcome of heart failure in the elderly patients. Accordingly, effect management of the comorbidities is required for the optimal care of the elderly patients with heart failure. In this talk, I will present the clinical significance of common comorbidities in the elderly heart failure patients, and then briefly introduce the recent advances in the management of comorbidities in older patients with heart failure. **Keywords :** Aged, Heart failure, Comorbidity

SS25 209-C-3

CLINICAL DIAGNOSIS AND IMPORTANCE OF

MUSCULOSKELETAL DISEASES IN ELDERLY PATIENTS

Jung Soo SONG (*Department of Rheumatology, Department of Internal Medicine Chung-Ang University Medical school, Korea*)

Introduction : Musculoskeletal disorders are among the most common problems affecting the elderly people. With age, musculoskeletal tissues show increased bone fragility, loss of cartilage resilience, reduced ligament elasticity, loss of muscular strength, and fat redistribution decreasing the ability of the tissues to carry out their normal functions. The loss of mobility and physical independence resulting from arthropathies and fractures can be particularly devastating in this population, not just physically and psychologically, but also in terms of increased mortality rates. In this presentation, clinical diagnosis and importance of common musculoskeletal diseases in Elderly patients will be discussed. **Method :** It is important that physicians be familiar with musculoskeletal disorders that are seen more frequently in or are unique to this population, know the differences between elderly-onset and younger-onset disease, and be prepared to treat their elderly patients with strategies different from those used for younger patients. Common musculoskeletal diseases in elderly include osteoarthritis, rheumatoid arthritis, osteoporosis, gout, pseudogout, fibromyalgia, polymyalgia rheumatica, and septic arthritis. **Results :** For proper diagnosis, elderly patients with musculoskeletal complaints should be evaluated with a thorough history, comprehensive physical and musculoskeletal examinations, radiologic examinations and laboratory testing. **Conclusion :** Elderly patients have various causes of musculoskeletal symptoms. Accurate diagnosis and careful treatment considering polypharmacy, comorbidity, drug interactions, optimal drug dosage, and drug side effects are essential for enhancing quality of life in elderly patients. **Keywords :** musculoskeletal diseases, elderly

SS25 209-C-4

CLINICAL DIAGNOSIS IN NEUROSCIENCE; TARGET FOR PRECLINICAL SPORADIC ALZHEIMER'S DISEASE

Dehua CHUI¹, Liying PIAO², Hui ZHANG², Weizhong XIAO² (*1. Neuroscience Research Institute, Health Science Center, Peking University, China; 2. Neurobiology & Neurology & Neuroscience research Institute, Health Science Center, Peking University, China*)

Introduction : One of the most important neurodegenerative diseases is Alzheimer's disease (AD). Cognitively normal elderly individuals without complaints or objective evidence of cognitive decline may have neuropathological changes in the brain consistent with the diagnosis of AD, indicating that there is a preclinical stage of the disease. **Method :** A deficit in the coordination mechanism of the central executive may be a preclinical marker for the early detection of AD due to the E280A presenilin-1 gene mutation. Preclinical diagnosis of Alzheimer's disease using biomarkers has become an area of great interest for both clinicians and researchers because, among other advantages, this would increase the response to new disease modifying drugs. A preclinical stage of AD (PCAD) has been described in which subjects show no overt clinical manifestations of AD but demonstrate significant AD pathology at autopsy. **Results :** The genetic biomarker, apolipoprotein E (apoE) $\epsilon 4$, and on certain neuroimaging biomarkers, delineating the extent and distribution of amyloid-beta ($A\beta$) deposits in the brain, that can be useful in identifying cognitively normal people who are at enhanced risk of developing PCAD. The core AD biomarkers, A β and phosphor-tau, on different methods and modalities of assessing them w e.g., cerebrospinal fluid analysis and PET imaging and on their diagnostic and predictive value in PCAD. **Conclusion :** The most opportune time for preventive intervention in AD is early in its PCAD. **Keywords :** geriatrics, diagnosis, clinical

COGNITIVE FUNCTION IN OLDER POPULATIONS: RESULTS FROM LONGITUDINAL STUDIES OF AGEING IN EUROPE AND ASIA

SS25 210-C-1

AGE-TRAJECTORIES OF COGNITIVE FUNCTION AND THEIR PREDICTORS AMONG OLDER ADULTS IN ENGLAND

Paola ZANINOTTO (*Epidemiology and Public Health, UCL, United Kingdom*)

Introduction : At older ages cognitive capability is a key factor in functioning and independence. It is known that cognitive functioning declines with age, therefore it is important to know the determinants and consequences of cognitive impairment/decline. The aim of this study is to explore age-trajectories of cognitive function and influences on them over six year time (2002-03 to 2008-09) among older adults participants of the English Longitudinal Study of Ageing. **Method :** Latent growth curve models and ageing-vector graphs are used to describe both individual differences and average population age-trajectories in cognitive function measured by memory and executive function. **Results :** The mean cognitive function at baseline is 41, which declines by 6 points per each additional wave of the study. Cognitive function declines more rapidly for older individuals, for females, for people without educational qualification and those in the poorest wealth. Factors that have a negative impact on cognitive function are depression, difficulty with instrumental activities of daily living, diabetes, increased body mass index, cigarette smoking. Daily alcohol consumption has a positive effect on cognitive function. **Conclusion :** Cognitive function is poorer for older than younger respondents and declined more rapidly in women, in people from low socioeconomic groups, those with poor physical health, psychological health and poor health behaviors. **Keywords :** memory, executive function, older ages

SS25 210-C-2

EARLY-LIFE CIRCUMSTANCES AND COGNITIVE FUNCTIONING DYNAMICS IN LATER LIFE

Chiara DAL BIANCO¹, Christelle GARROUSTE², Omar PACCAGNELLA³ (*1. Department of Economics and Management, University of Padua, Italy; 2. Institute for the Protection and Security of the Citizen, European Commission - Joint Research Centre, Italy; 3. Department of Statistical Sciences, University of Padua, Italy*)

Introduction : The association between early life conditions and cognitive changes in old age is not yet well documented. This paper aims at enriching the literature evaluating and comparing across many European countries the influence of early-life circumstances on cognitive functioning in later life. **Method :** We exploit life-history data on childhood socioeconomic status at the age of 10 and educational attainments collected in the SHARELIFE survey, as well as longitudinal cognitive test performances collected over time by the SHARE surveys. In particular, the focus is on the verbal fluency test, which consists of naming as many distinct animals in one minute, and the 10 word-list-learning test, which is a standardized modified version of the Rey's Auditory Verbal Learning Test-RAVLT. **Results :** Exploiting the longitudinal dimension of the data, we plan to document the evolution over time and across countries of the association between the cognitive abilities of respondents and the

social environment where they grew up. We study whether there is any correlation between these aspects of individuals' life history and the changes/declines over time of the cognitive functioning. Regardless the time span between the data collection, low correlations between cognitive declines and childhood socio-economic conditions appear. **Conclusion :** Direct relationships between childhood characteristics and late cognitive skills are weak, while potential indirect relationships between childhood characteristics and late cognitive skills (e.g. through educational attainment levels) need to be further investigated. This may suggest a role of education policies in explaining the observed differences across countries and over time. **Keywords :** Childhood conditions, Cognitive decline, SHARE survey

SS25 210-C-3

UNDERSTANDING GENDER DIFFERENCES IN COGNITION AMONG THE ELDERLY IN CHINA: EVIDENCE FROM CHARLS

Xiaoyan LEI¹, James SMITH², Xiaoting SUN¹, Yaohui ZHAO¹ (*1. National School of Development, Peking University, China; 2. Labor and Population Group, Rand Corporation, USA*)

Introduction : Cognitive ability is essential to many domains of life, including income and health. At older ages in many Asian societies, women have a cognitive deficit compared to men. Since they typically live longer than their husbands they may be at a particular deficit when widowed. **Method :** In this paper, we use the CHARLS baseline data collected in 2011-12 to examine the reasons for the female cognitive deficit using a new sample of middle aged and older Chinese respondents. Modeled after the American HRS, CHARLS is a national representative survey of the Chinese population ages 45 and over. We will relate both these cognition scores to individual schooling, urban residence, family and community levels of economic resources, and height and examine cohort specific changes by gender in the cognition outcomes of both Chinese women and men. **Results :** We find strong gender differences in cognition that become smaller with each new birth cohort in the 45+ age range. **Conclusion :** Education explains a significant part of the female cognitive disparity which is also larger in rural areas. The amount of resources both in the family as well as the community plays a significant role. **Keywords :** Cognition, Education, China

SS25 210-C-4

WORK EXPERIENCE AND COGNITIVE FUNCTION AMONG KOREAN ELDERS

Sung-il CHO¹, Hyorim LEE¹, Soong-nang JANG², Heeran CHUN³, Susan PARK⁴ (*1. Graduate School of Public Health, Seoul National University, Korea; 2. College of Nursing and Nursing Science Research Institute, Choong-Ang University, Korea; 3. Department of Medical Information and Administration, Jungwon University, Korea; 4. Institute of Health and Environment, Seoul National University, Korea*)

Introduction : Cognitive function includes several domains such as memory, attention, language, and spatiality. Throughout the life course, certain types of work more strongly require specific domains of cognitive function, and thus may lead to different trajectories during the period of age-associated decline. This study explored the association between lifetime work experiences and the patterns of cognitive function among Korean middle-aged and elderly people. **Method :** Data was used from Korean Longitudinal Study of Aging (KLoSA) including 3,985 men and women aged over 55 years. Cognitive function was assessed by Korean version of MMSE (Mini-Mental State Exam). Lifetime patterns of work experiences were

categorized into 13 groups by combining the duration, continuity (continuous vs. intermittent), job categories (mental vs. manual; complex vs. simple), regularity (regular vs. irregular), and changes of job categories over time. Multiple regression analysis was conducted to assess the effect of work patterns on cognitive function. Results : Continuous regular work experience in mental work was significantly associated with higher ability at memory and language ($p < 0.01$), and continuous manual work or mixed irregular work was associated with generally lower cognitive function ($p < 0.05$). When there was change in job categories, more complex work during the middle age was associated with better cognitive function in the later period. Conclusion : Specific experience in certain time windows in the life course appeared to have relatively stronger influence on later patterns of cognitive decline. Keywords : cognitive function, occupation, life course, MMSE

SS25 211-R
IDENTITY, POLICY AND CHANGE: EXAMINING THE THEORETICAL IMPLICATIONS OF THEMES ARISING FROM NATIONAL CONTEXTS AND INTERNATIONAL DISCOURSE

SS25 211-R-1
MIGRATION, WORK AND AGE IN AUSTRALIAN PUBLIC POLICY

Simon BIGGS (*Social & Political Science, University of Melbourne, Australia*)

Introduction : Perceptions of older people are changing both nationally and internationally, with policy developments that emphasise the value of older workers and the extension of working life to accommodate a longer life-course. For national economies older workers produce benefits of increasing tax dollars and personal savings and reduce claims on the state through pensions. In terms of migration, affluent older adults bring assets and skills generated elsewhere into the host economy. Nations that create barriers to older migration, such as is currently the case for Australia, run the risk not only perpetuating age discrimination, but failing to take advantage of population change in a global context. Method : Critical textual analysis. Results : Key narratives plus boundaries and overlaps between discourses are identified. Their relationship to global trends and policies of nation states are compared. Conclusion : Perceptions of older people are changing both nationally and internationally, with developments that emphasise the value of older workers. While internal Australian Government policy emphasises the contribution of older citizens, this has not been reflected in migration policies. In terms of migration, older adults bring assets and other benefits generated elsewhere into the host economy, as skilled workers or as active retirees. Nations that create barriers to older migration run the risk of perpetuating age discrimination and failing to adapt to global population trends. Keywords: migration, policy, workers Keywords : migration, policy, workers

SS25 211-R-2
ON THE THRESHOLD OF OLD AGE - A COMPARISON BETWEEN TWO COHORTS

Antti KARISTO¹, Ilkka HAAPOLA² (*1. Department of Social Research, University of Helsinki, Finland; 2. Palmenia Centre of Continuing Education, University of Helsinki, Finland*)

Introduction : The post-war Baby Boom was exceptionally strong in Finland, and, since then, the boomers have been very visible in Finnish society. Now, most of them have retired and they are on the threshold of a young old age. Their pension years are expected to be different

from those of earlier birth cohorts. But are they? This is what we are going to study with the help of the longitudinal data that describes the ageing of three birth cohorts. Method : Two birth cohorts - the baby boomers (born in 1946-50) and the cohort born ten years earlier - will be compared, at a similar age, when they were 62-66 years old (in 2002 and 2012 respectively). Life chances to make life choices will be compared, as well as real participation in different cultural and social activities. Results : We have just begun the data analysis, and the first results show that there are considerable differences between the two birth cohorts. Baby boomers' possibilities to live an active life in terms of health, material and non-material resources are better than among the cohort born in the late 1930s. However, this is not so much reflected in actual life styles. Conclusion : Because the results are just tentative, definite conclusions cannot be made at the moment. In the presentation, they will be made in terms of the generational characteristics of the compared groups, as well as by looking critically at the public discourses around old age (such as discourses on active ageing and third age). Keywords : baby boomers, generational effects, discourses on ageing

SS25 211-R-3
ACTIVE AGEING AND SINGAPORE'S BABY BOOMERS
Mui Teng YAP (*Institute of Policy Studies, Lee Kuan Yew School of Public Policy, National University of Singapore, Singapore*)

Introduction : Life expectancy among Singapore's elderly has improved significantly over the 40+ years since the country's independence, along with that of the general population. Longer life expectancy along with delayed onset of degenerative disease and disability are causes for celebration. While there is concern about the "burden" of eldercare in the face of smaller families sizes and smaller proportions of working age population (due to persistent below-replacement fertility), and the coming of ("old") age of the large cohorts of baby boomers born around 1947-64, attention is also being turned to the more positive aspects, to successful or active ageing. The Council for Third Age (C3A) was established in 2007 to champion active ageing in Singapore. Policies to prolong work life and programmes aimed at promoting health and social wellbeing at the community level are also instituted. A project to create age-friendly urban environment is being piloted. Method : literature review and secondary data analysis. Results : A study in 2007 show that Singapore's baby boomers want to prolong their work life and remain socially engaged even as they continue to expect their family to care for them (though in a different way from current elderly). Conclusion : Baby boomers, the new elderly, are likely to be more self-reliant, have more spending capacity and are more likely to want to remain active in old age, hence policies and programmes to promote active ageing are moves in the right direction. Keywords : Active Ageing; Baby boomers; Singapore

SS25 211-R-4
IS "ACTIVE AGEING" MORE THAN "LIVE LONGER, WORK LONGER" ? EUROPEAN ATTEMPT'S TOWARDS "SOCIAL PARTICIPATION" AND "INDEPENDENT LIVING" THROUGH THE BELGIAN LENS

Thibault MOULAERT (*IACCHOS, National Fund for Scientific Research & Universite Catholique de Louvain, Belgium*)

Introduction : European institutions have considered "active ageing" as a policy answer to rethink ageing population since 1990's. If the 1999 momentum opens a theoretical avenue for a holistic vision of "active ageing", policy translation reduced it to "working longer" during the 2000's. Ten years later, 2012 European Year of Active Ageing and

Solidarity between Generations (EY2012) keeps “work longer” at the agenda but adds two other avenues for “active ageing” : “social participation” and “independent living”. Method : Financed by the Belgian Social Security for supporting the Belgian version of EY2012, we collected all belgian applications of 'active ageing' policies in early 2012. Results : The three different avenues for “active ageing” illustrates a specific national context characterized by a high institutional complexity. We show that a) “working longer” options are still numerous and mainly institutionally organized, b) “social participation” opens the more avenues for the “holistic” translation of “active ageing” with a special interest for the empowerment of older people via the emergence of a specific “Federal Consultative Board for Seniors” (Conseil Consultatif Federal des Aines) at the occasion of EY2012, many actions from older citizen groups like the Flemish Elderly Council (the Vlaamse Ouderenraad) to consider “active ageing” as a “win-win” strategy showing the diversity of elderly’s activities and the Walloon Region’s inspiration from “Age Friendly Cities” by WHO as a renewed option to organize local government policies towards ageing population, c) “independent living” refers to little innovative measures. Conclusion : Conclusion focusses on challenges and social conditions for an 'active ageing' reform. Keywords : active ageing ; Belgium ; public policies

SS25 212-R

HAPPY LIVING IN DARKNESS! LIGHTING IN OLD AGE IS RELATED TO THRIVING AND HEALTHY AGEING IN 75 YEAR OLD NORWEGIANS

SS25 212-R-1

LIGHTING OLD AGE: AGE-RELATED VISION CHANGES REQUIRE INCREASED LIGHTING AND UNIVERSAL DESIGN

Osp EGILSDOTTIR¹, Helle K FALKENBERG², Gunnar HORGEN², Grethe EILERTSEN³ (1. Faculty of Health Science, Buskerud University College, Norway; 2. Department of Optometry and Visual Science, Buskerud University College, Norway; 3. Department of Nursing Science, Buskerud University College, Norway)

Introduction : The growing ageing population emphasizes the importance of healthy ageing. Arranging for the elderly to stay in private housing as long as possible may result both in significant social economic effects, and improved quality of life. Because of normal age changes, most elderly have reduced eyesight and need more light. However little is known about how they consider how lighting affects everyday tasks and thriving. The objective of this talk is to discuss: 1) normal age-related vision changes; 2) lighting in the homes of elderly, including the apparent limitations in international standards and 3) how optimal vision in relation to lighting can reduce the risk of accidents at home and lead to better quality of life. Method : In addition to our study, an overview of research related to the objectives will be presented. Results : In our study we investigated the effect of optimizing the indoor light levels on vision, health and ADL. We found that thriving is high, in spite of living in the dark well below recommended light levels. Qualitative interviews reveal that participants have not increased the light levels necessary to maintain the ability to perform several everyday tasks. However, they have adjusted their behavior by no longer performing visually demanding tasks in the evening. The intervention showed that thriving is even higher with optimal lighting. Conclusion : We conclude that there is limited awareness of how lighting affects the ability to perform ADL, and that there is a need for further research on how to universally design lighting in private housing. Keywords : lighting, vision, ageing

SS25 212-R-2

HAPPY LIVING IN DARKNESS: THE INDOOR LIGHTING AT HOME IN RELATION TO ACTIVITIES OF DAILY LIVING AND HEALTH - A DESCRIPTIVE STUDY

Grethe EILERTSEN¹, Gunnar HORGEN², Tor Martin KVIKSTAD³, Øsp EGILSDOTTIR⁴, Helle FALKENBERG⁵ (1. Department of Nursing Science, Buskerud University College, Norway; 2. Department of Ophthalmology and Visual Science, Buskerud University College, Norway; 3. Department of school of business and social sciences, Buskerud University College, Norway; 4. Department of Nursing Institute, Buskerud University College, Norway; 5. Department of Ophthalmology and Visual Science, Buskerud University College, Norway)

Introduction : To describe the ambient indoor lighting, and how lighting relates to health, activities of daily life (ADL) and well-being among healthy 75-year olds living at home. Method : 112 residents born in 1934 participated with informed consent. All had normal vision (Snellen VA > 0.7) and did not receive any public health care. Self-reported visual and general health (SF-36) and the ability to perform ADL in regards to lighting were measured using a questionnaire. Lighting levels were measured in several rooms and compared to home lighting standards. A subsample of 20 participated in qualitative interviews. Results : The results showed that the ambient indoor light levels in the homes of healthy 75 year olds are surprisingly poor, and significantly below recommended lighting levels for senior living. Those with higher income had better lighting levels than those with low income. Participants perceive their visual and general health to be good, and are unaware of any problems related to lighting and everyday tasks. The interviews reveal that although participants are thriving, most describe some change in behaviour of performing ADL. Women in particular, report indoor lighting to be insufficient for certain tasks such as ironing or sawing. Despite living in darkness, 75 year olds are happy, healthy and thriving. However, interviews reveal that everyday tasks have been sacrificed in regard to lack of lighting. Further, they have little awareness of how light levels will affect vision and ADL in the future. Conclusion : To ensure healthy ageing at home, information on how to optimize ambient indoor lighting is needed. Keywords : aging, lighting, vision

SS25 212-R-3

HAPPIER LIVING IN THE LIGHT: THE EFFECT OF OPTIMIZING THE INDOOR LIGHTING ON ACTIVITIES OF DAILY LIVING AND HEALTH - AN INTERVENTION STUDY

Helle K; FALKENBERG¹, Gunnar HORGEN¹, Tor Martin KVIKSTAD², Osp EGILSDOTTIR³, Grethe EILERTSEN³ (1. Department of Optometry and Visual Science, Buskerud University College, Norway; 2. School of Business and Social Sciences, Buskerud University College, Norway; 3. Department of Nursing Science, Buskerud University College, Norway)

Introduction : To investigate the effect of optimized ambient lighting in the living room related to abilities of performing ADL and quality of life. Method : From the participants in the baseline study, 30 single and co-habitant men and women (equally divided) were selected. Self-reported visual and general health and ability to perform ADL in regards to lighting were measured before and after the four month intervention period (same questionnaire as in baseline). The intervention optimized the ambient lighting in the living room by providing new lamps and a lighting control system. The participants chose one of three preset light levels (normal, medium, low) and kept a diary. Finally, participants assessed the intervention answering eight

questions. Results : The participants were very happy with the increased lighting, and that it improved quality of life. They reported using higher light levels, which increased comfort. As they now perform more visually demanding tasks, they realized their vision had been poor. The lighting control system was easy to use and they cherished the different preset levels, and pointed out that it is imperative that such systems are universally designed. Conclusion : Improved lighting has a positive effect on healthy aging at home. There is a lack of knowledge and awareness of the effect of lighting on vision and ability to perform ADL in healthy seniors. Even this relatively basic intervention, show that, universally designed lighting and control systems can be easily achieved and lead to better quality of life. More attention on regular eye examination is needed. Keywords : lighting, ageing, vision

SS25 213-S

LIVEWELL: DEVELOPING INTERVENTIONS TO IMPROVE HEALTH AND WELLBEING IN LATER LIFE

SS25 213-S-1

THE LIVEWELL PROGRAMME: AN INTEGRATED SUITE OF INTERVENTIONS TO PROMOTE HEALTH AND WELLBEING IN LATER LIFE

Paula MOYNIHAN¹, Claire CLELAND¹, Ben HEAVEN², Nicki HOBBS², Jose LARA¹, Alan GODFREY¹, Elizabeth EVANS¹, Suzanne MOFFATT², Martin WHITE³, Lynn ROCHESTER¹, Falko SNEIHOTTA³, Thomas MYER⁴, John MATHERS¹ (1. *Institute for Ageing and Health, Newcastle University, United Kingdom*; 2. *Institute for Health and Society, Newcastle University, United Kingdom*; 3. *IHS/FUSE UKCRC Centre for Translational Research in Public Health, UK, Newcastle University, United Kingdom*; 4. *Institute of Neuroscience, Newcastle University, United Kingdom*)

Introduction : Dietary choices, physical activity and social relationships influence health and wellbeing in later life but there is little evidence about interventions which produce appropriate changes in such behaviours. The LiveWell programme aims to: (i) develop and pilot an integrated suite of interventions to improve the health and wellbeing of people in the retirement transition, and (ii) develop a panel of outcome measures. We report the prototype of an integrated suite of interventions, with a focus on personalisation tools and interventions to promote Mediterranean dietary patterns. Method : Integration of four methodologies: (i) systematic reviews (n=3), (ii) qualitative study using methods of grounded theory, (iii) co-design workshops (n=3), (iv) expert consultation event; (v) pilot testing of interventions. Results : Drawing on the evidence of three methodologies (i-iii above) we produced a prototype personalisation tool designed to: (i) collect relevant personal information from service users, (ii) assist retirement planning and (iii) set achievable goals, (iv) provide feedback on progress towards goals. We have produced prototype tools in each behavioural domain (Mediterranean diet, physical activity, social relationships). In the Mediterranean dietary domain tools were designed to assist with budgeting and shopping for food, meal planning, and running cooking groups with a focus on socialisation and acquisition of skills. An expert consultation event assisted with the identification of suitable outcome measures to test the emerging suite. Conclusion : Interventions developed through the LiveWell programme hold promise as an effective, acceptable and evidence-based means of improving health and wellbeing in later life. Keywords : Health promotion; Wellbeing; later life; behaviour change; intervention, Mediterranean dietary pattern

SS25 213-S-2

NARRATIVES ON RETIREMENT TRANSITIONS, LATER LIFE, AND WELLBEING: IMPLICATIONS FOR INTERVENTION DEVELOPMENT

Ben HEAVEN¹, Martin WHITE², John MATHERS³, Suzanne MOFFATT¹ (1. *Institute of Health and Society, Newcastle University, United Kingdom*; 2. *Institute of Health and Society, Newcastle University; Fuse, UKCRC Centre for Translational Research in Public Health, United Kingdom*; 3. *Institute of Ageing and Health, Newcastle University, United Kingdom*)

Introduction : Retirement transitions are increasingly diverse. Nevertheless, significant changes to behaviours associated with health outcomes are typical. The LiveWell programme aims to improve health and wellbeing in later life, by intervening as people make transitions into retirement. Social relationships, physical activity and diet all influence health and wellbeing, but there is little evidence about: (i) which social components to target; (ii) how wellbeing is defined by people around retirement; and (iii) how to effectively intervene to improve wellbeing in each domain. Method : Mixed-methods: systematic review; qualitative study (n=52) using focus groups (n=7), interviews (n= 25) and methods of grounded theory. Results : Provision of explicit 'social roles' can improve health and wellbeing for those looking for structure or purpose in retirement. However roles should be tailored to meet the needs of different populations. Resources cited in the literature such as good health, wealth, and rewarding social relationships underpin wellbeing in later life. However the 'capability' to mobilise resources to achieve outcomes was key in participants' accounts of wellbeing-in-practice. Wellbeing was experienced through the capacity to enjoy life, plan and respond confidently to challenges, rather than a static state of contentment. 'Later life' was conceptualised as a period of decline in an uncertain future. Conclusion : Health and wellbeing in retirement can be promoted through role-provision for those who want a role. Assistance with building capability to achieve desired outcomes, in addition to accumulation of resources, may be an effective intervention strategy. Short term benefits should be emphasised in addition to longer-term outcomes. Keywords : Wellbeing, Intervention, Later Life

SS25 213-S-3

INTEGRATING EVIDENCE WITH CO-DESIGN METHODS TO DEVELOP PROTOTYPE INTERVENTIONS IN LATER LIFE

Nicola HOBBS¹, Ben HEAVEN¹, Gemma TEAL², Claire CLELAND³, John MATHERS³, Falko SNEIHOTTA¹, Martin WHITE¹, Paula MOYNIHAN³ (1. *Institute of Health & Society, Newcastle University, United Kingdom*; 2. *Glasgow School of Art, Glasgow School of Art, United Kingdom*; 3. *Human Nutrition Research Centre, Newcastle University, United Kingdom*)

Introduction : The LiveWell programme aims to develop pragmatic and acceptable interventions to improve the health and wellbeing of people in the retirement transition. Co-design methods promote service user involvement maximising opportunities to develop acceptable and usable interventions. A co-design process should be informed by the behavioural and social evidence base for interventions to ensure that the generated design ideas are theoretically sound. Method : Through information integration from qualitative research and systematic reviewing, researchers accumulated evidence for service opportunities and effectiveness of interventions in the retirement transition. Effective behaviour change techniques and modes of delivery of interventions were identified. Three workshops were conducted using co-design methods. Co-designers were potential intervention-users, deliverers, commissioners and researchers. The workshops involved

persona-building, brainstorming and storyboarding new ideas for possible interventions using a variety of prompts informed by the evidence base. Developing ideas, prototyping and integrating the evidence base occurred iteratively. Results : Key emerging design themes were intervention personalisation through identification of needs and desires, and the role of a mentor in identifying resources and setting goals. Integration of design ideas and prototyping was achieved through structured opportunities for discussion and a diversity of interactive methods. Conclusion : Co-design methods integrated multiple sources and types of data, generating design recommendations for theoretically sound and evidence-based interventions. Intervention prototypes will be tested for acceptability and feasibility with older adults. The resulting interventions are more likely to be adopted by intended target groups. Keywords : co-design, behavioural intervention, retirement

SS25 213-S-4

CHARACTERISING THE HEALTHY AGEING PHENOTYPE

Jose LARA¹, Alan GODFREY², Elizabeth EVANS², Ben HEAVEN³, Laura BROWN⁴, Evelyn BARRON¹, Lynn ROCHESTER², Thomas D. MEYER⁵, John C. MATHERS¹ (1. *Human Nutrition Research Centre, Institute for Ageing and Health, Newcastle University, United Kingdom*; 2. *Clinical Ageing Research Unit, Institute for Ageing and Health, Newcastle University, United Kingdom*; 3. *Institute of Health & Society, Newcastle University, United Kingdom*; 4. *Psychology Department, Research Institute for Health and Social Change, Manchester Metropolitan University, United Kingdom*; 5. *Institute of Neurosciences, Newcastle University, United Kingdom*)

Introduction : Given the biological complexity of the ageing process, there is no single, simple and reliable measure of how healthily someone is ageing. Intervention studies need a panel of measures which capture key features of healthy ageing. Our focus is on outcome measures which can be deployed in community-based, lifestyle interventions such as those we are developing in the LiveWell Programme. We adopted the concept of the "Healthy Ageing Phenotype" (HAP) to frame our research. We aimed i) to identify the most important features of the HAP and ii) to identify tools for measurement of those features. Method : We reviewed the literature on assessment of healthy ageing. We aimed to identify both the most important features of the HAP and tools which could be used for their measurement. Our focus was on outcomes which are expected to change with age, may be responsive to lifestyle interventions and with evidence for strong association with ageing-related phenotypes including morbidity, mortality and, lifespan. Results : The HAP is multidimensional and may be characterised by measurement of markers of physiological and metabolic health, physical capability, cognitive function, social wellbeing, and psychological wellbeing. Within LiveWell we are currently selecting core features of the HAP and identifying tools for their measurement. Conclusion : A minimum set of measures to characterise the HAP is proposed. Such set of measures may have wider utility and could facilitate comparisons across diverse study designs and populations. LiveWell is funded by the Lifelong Health and Wellbeing programme, which is a Cross-Research Council initiative in partnership with Health Departments. Keywords : Healthy ageing phenotype, biomarker, intervention studies

SS25 214-S

COMBINING CAREGIVING AND EMPLOYMENT: THE END OF FAMILY SOLIDARITY / FILIAL PIETY? OR ITS REINCARNATION?

SS25 214-S-1

COMPARING WORKING CARERS' RECONCILIATION STRATEGIES IN 4 EUROPEAN CARE REGIMES

Monika REICHERT¹, Andreas HOFF² (1. *Institute of Sociology, University TU Dortmund, Germany*; 2. *Department of Gerontology, Zittau/Goerlitz University, Germany*)

Introduction : An increasing number of international researches address the importance of the reconciliation of elder care obligations and employment. However, there is still a lack of knowledge on conflicts, strategies and effective instruments to enable the combination of work and care in the light of different care regimes. The aim of this paper is to present the empirical findings from the international research project "Carers@Work": Between Job and Care? Conflict or Opportunity?" (funded by the Volkswagen Foundation) with partners in Germany, Italy, Poland and the United Kingdom. Special emphasis is put on problems, strategies and most effective measures inherent to both work and care for older individuals. Method : In all, 226 semi-structured interviews with working carers were conducted in the participating countries. Important data and information regarding working carers and the key themes of the interviews - especially the strategies working carers use to combine work and care - are compared in a cross-national perspective. Results : The empirical findings show that country-specific socio-political and cultural framework conditions play an important role regarding strategies working carers use to reconcile work and care. Therefore, welfare state policies respectively care regimes in individual countries may support and/or supplement caregivers in different ways, generating different outcomes for the individual, the society and the economy. Conclusion : Against the background of different welfare and care regimes the project "Cares@work" provides specific recommendations for companies and social policy how to help individuals to better reconcile work and family care. Keywords : combining work and care, family solidarity

SS25 214-S-2

WORKING CARERS IN EUROPEAN SURVEY DATA

Jolanta PEREK-BIALAS¹, Andreas HOFF² (1. *Institute of Statistics and Demography, Warsaw School of Economics/Jagiellonian University Cracow, Poland*; 2. *Division of Social Sciences, Zittau-Goerlitz University of Applied Sciences, Germany*)

Introduction : There is an urgent need - due to population ageing and so shrinking and ageing workforce - to design, implement and monitor adequate policy in many European countries focused on reconciliation of employment and elderly care. The aim of such policy is to support those who work and at the same time they are caregivers. To suggest specific solutions there is a need to have proper analysis which could be based on accurate, updated and comparative data on working caregivers: their current work and care situation, possibilities and restrictions related both work and care. Method : There are more and more studies and surveys in Europe which include this topic like: EUROFAMCARE, SHARE, Carers@Work and others which will be used in analysis to match information from various sources but also to identify missings which should be imputed. Results : Analysis revealed a lot of significant results as for example most of the caregivers are carrying out their caring tasks on daily basis, which certainly hinders their flexibility and deprives them of free time, causing stress and so - based on employers' opinions - the working caregivers 50+ rather than choose sick leaves and reduction of working time. Conclusion : A set of recommendations not only for researchers of ageing but also for policy makers will be given, not only suggestions for existed surveys, but also as solutions of new surveys

designed at the European level, but with an option to be comparable beyond the Europe. Keywords : working caregivers survey

SS25 214-S-3

DYNAMICS OF RECONCILING WORK AND CARE: LONGITUDINAL EVIDENCE FROM THE KOREAN RETIREMENT AND INCOME STUDY

Seung-min PARK (*Oxford Institute of Population Ageing, University of Oxford, United Kingdom*)

Introduction : This research analyses the dynamics of reconciling work and care of working women by exploiting the Korean Retirement and Income Study. Method : The research analyses the dynamics of two groups (those who care for either grandchildren or parents) according to working types. Results : [working and caring for grandchildren](1)the overall rate of caring for grandchildren is low and it decreases across time(2)the rate of either stopping or decreasing working time due to caring for grandchildren decreases across time(3)the overall rate of receiving payment for caring for grandchildren is small and it decreases across time.[working and caring for parents](1)the vast majority of working women do not care for their parents and the decreasing trend continues across time(2) the ratio of either stopping work or decreasing working time due to caring for parents decreases across time. Conclusion : [working and caring for grandchildren](1)working women are less likely to care for grandchildren across time(2)working women do not give up or cut working time to care for grandchildren, rather they balance working and caring for grandchildren(3)traditional norms indicating that caring for grandchildren should not be paid work but an obligation among family members do not decrease across time.[working and caring for parents](1)the practice of traditional norms regarding caring for parents decreases across time(2)working women do not give up work or cut working time to provide care for parents instead balancing work with caring for parents. In conclusion, policy implications are suggested. Keywords : Work, Care, Korean Retirement and Income Study

SS25 216

KOREAN RED GINSENG FOR LONGEVITY

SS25 216 -1

KOREAN RED GINSENG FOR REJUVENATION OF CHRONIC ATROPHIC GASTRITIS

Ki Baik HAHM (*Department of Gastroenterology, CHA University of Medicine and Science, Korea*)

Gastric cancer is one of troublesome cancers world-widely as well as Korea, affecting 20-50/100,000 cancer death annually, in spite of remarkable programme to detect early gastric cancer as well as endoscopic treatment. Helicobacter pylori infection has been implicated in either the development of precancerous lesion, chronic atrophic gastritis or gastric cancer, but whole eradication of bacteria was not the answer to prevent gastric cancer. However, tackling the way to chronic atrophic gastritis has been generally considered to be effective alternate to prevent gastric cancer, for which nutritional rejuvenation can be anticipating intervention. In this symposium, how Korean red ginseng can alleviate H. pylori-associated gastritis and the molecular or clinical evidence Korean red ginseng imparted ameliorated result of rejuvenated atrophy,, a precancerous lesion of gastric cancer. Furthermore, Korean red ginseng has shown augmented eradication rates of H. pylori with conventional triple therapy. Though extensive clinical trial will be needed to draw evidence-based outcome regarding these benefits of Korean red ginseng, quite high level of

preclinical and in vivo data signified the rejuvenating action of gastric atrophy, a very target of chemoprevention with a natural product.

SS25 216 -2

EFFECT OF KOREAN RED GINSENG ON SENILE TESTICULAR DYSFUNCTION

Si-kwan KIM¹, Yu-jin WON¹, Young-kyu SHIN¹, Seock-yeon HWANG² (*1. Department of Life science, College of Biomedical & Health Science, Konkuk University, Korea; 2. Department of Biomedical Laboratory Science, College of Applied Science and Industry, Daejeon University, Korea*)

The root of Panax ginseng improves testicular function both in humans and animals. However, the molecular mechanism by which ginseng exerts this effect has not been elucidated. Male Sprague-Dawley rats were divided into three groups: Young rat control group (YC, 4 months), aged-rat control group (AC, 12 months) and KRG-WE treated aged-rat group (G-AC, 200 mg/kg b.w.). KRG-WE was administered orally for 4 months. Number of sperm, Sertoli cells and germ cells and the Sertoli Cell Index decrease in the testis of AC relative to YC. However, those parameters were completely restored in G-AC. Changes in protein expression in rat testis in response to Korean red ginseng-water extract (KRG-WE) were identified using 2-dimensional electrophoresis (2-DE) and MALDI-TOF/TOF MS. A proteomic analysis identified 15 proteins that were differentially expressed between AC and G-AC. Out of these, the expression of glutathione-S-transferase (GST) mu5, glutathione reductase (GR) and glutathione peroxidase (GPx) were significantly up-regulated in G-AC. Lipid peroxidation (LPO) levels, antioxidant enzymes namely superoxide dismutase (SOD), catalase (CAT), activities and non-enzymatic antioxidants such as reduced glutathione (GSH), vitamin C and E levels were investigated to elucidate the antioxidant efficacy of G-AC. These results suggest that the administration of Korean red ginseng enhances testicular function in aged rats by elevating GPx and GST activity, thus resulting in increased glutathione and preventing LPO intestis. Overall, serum sex hormone levels were improved by treatment with KRG-WE. In particular, expression levels of receptors for FSH and LH in G-AC group were significantly up-regulated to almost normal. Keywords : Korean red ginseng, Aged rat testis, Enzymatic and non-enzymatic antioxidant activity, Steroid hormone

SS25 216 -3

WHAT DO HEALTHCARE PROVIDERS NEED TO UNDERSTAND ABOUT KOREAN RED GINSENG?

Gyeongho HAN (*Korea Ginseng Research Institute, Korea*)

Introduction : Ginseng is the root of Panax ginseng C.A. Meyer, which has been used as tonic, prophylactic and restorative agent as a medicinal plant in Korea for thousands of years. In addition, not a few Korean and Chinese ancient medical books referred to the benefits and prescription of ginseng. There are two different ways of processing ginseng: white ginseng, the root is peeled and dried in the sun, which bleaches it white. Red ginseng is steam-processed ginseng which is manufactured without being peeled but steamed and subsequently dried for several weeks. Ginseng is cooked and gelatinized to increase the number of ginsenosides remarkably by the steaming process. While a total of 32 ginsenosides have been found in red ginseng, a total of 25 ginsenosides in white ginseng. There are differences of effects on human health between red ginseng and white ginseng. Method : Red Ginseng has been proved to have multiple pharmacological effects such as immunomodulation, preventing cardiovascular diseases, neuroprotection, anticancer and antifatigue by showing the various solid scientific evidences. It has been identified

that red ginseng possess the multiple constituents such as polysaccharides, polyacetylenic compounds, peptides and other chemical constituents. These non-ginsenosides have been investigated as the bioactive materials in red ginseng as well as ginsenosides. Korea Ginseng Institute has conducted several clinical studies to acquire more reliable data about the red ginseng, and pharmacological effects of it has been investigated by advanced biochemical and molecular biological techniques. The Korea Food and Drug Administration has certified five health claims of Korean Red Ginseng as the health functional food: 'Supports Immune System', 'Enhances Physical Energy', 'Improves Memory Ability', 'Helps Blood Circulation' and 'Provides Antioxidation Effects'.

SS25 216 -4

CLINICAL EFFECT OF KOREAN RED GINSENG ON CLIMACTERIC DISTURBANCE

Seok Kyo SEO, Byung Seok LEE (*Department of Obstetrics and Gynecology, Yonsei University College of Medicine, Korea*)

Introduction : For many years, women have used herbal extracts to relieve menopausal symptoms. Recent research results have been mixed regarding the efficacy of these approaches. In addition, the actions of herbal preparations have not been sufficiently investigated, and there are limited data regarding the safety of these preparations. Method : Red ginseng (RG) has been widely used to treat diseases such as cancer and cardiovascular disease in East Asian countries, especially Korea, China, and Japan, for the past 2,000 years. Previous studies have shown that RG is effective against the psychological and emotional symptoms that are common in postmenopausal women. However, no clinical study has investigated the efficacy of RG as an alternative therapy for postmenopausal women. Results : We investigated the effects of RG on menopausal symptoms and cardiovascular risk factors in postmenopausal women. We also investigated the anti-proliferative effects of RG extracts on endometrial stromal, and epithelial cells to confirm safety. Our study demonstrated menopausal symptomatic responses and significant changes in some cardiovascular markers. Serum estradiol levels were not influenced by RG supplementation. RG extracts inhibited cell proliferation in endometrial stromal, and epithelial cells. These results suggest that RG could be an attractive herbal dietary supplement for relieving menopausal symptoms and conferring favorable effects on markers of cardiovascular disease in postmenopausal women. In addition, RG could also be safely used in postmenopausal women.

LONGEVITY GENES

SS25 217-B-1

GADD45 IS THE KEY PLAYER IN AGEING AND LONGEVITY OF DROSOPHILA AND MAMMALS

Alexey MOSKALEV, Ekaterina PLYUSNINA, Mikhail SHAPOSHNIKOV (*Molecular radiobiology and gerontology, Institute of biology of Komi Science Center of Ural division of RAS, Russia*)

Introduction : There is a relationship between various cellular stress factors and aging. Gadd45 proteins stand at the crossroad of the cell fates by controlling the balance between DNA repair, eliminating (apoptosis) or preventing the expansion of potentially dangerous cells (cell cycle arrest, cellular senescence), and maintaining the stem cell pool. However, the biogerontological aspects have not thus far received sufficient attention. Method : Data obtained with using of standard Drosophila gerontological and genetical approaches, RNASeq,

RT-PCR, bioinformatics tools (Ingenuity, MetaCore, R packages DESeq and GoSeq). Results : Our data revealed an increase of *Drosophila melanogaster* lifespan due to D-GADD45 overexpression in the nervous system as well as the role of D-GADD45 in oxidative, thermal and genotoxic stress resistance. We conducted RNASeq of transcriptomes of flies with conditional overexpression of D-GADD45 and observed differential expression of some evolutionary conservative longevity genes. We also analyzed the pathways and modes of action by which Gadd45 members are involved in aging, longevity and age-related diseases in mammals. Conclusion : Although further wide-scale research is warranted, it is becoming increasingly clear that Gadd45s are highly relevant to aging, age-related diseases and to the control of life span, suggesting them as potential therapeutic targets in age-related diseases and pro-longevity interventions. Keywords : GADD45, stress-response

SS25 217-B-2

INDY MUTATIONS MAINTAIN FLY HEALTH AND HOMEOSTASIS

Blanka ROGINA¹, Ryan P. ROGERS¹, Nicola NERETTI², Pei-yu WANG³, Stephen L. HELFAND²

(*1. Genetics & Developmental Biology, University of Connecticut Health Center, USA; 2. Department of Molecular Biology, Cell Biology and Biochemistry, Division of Biology and Medicine, Brown University, USA; 3. Neurodegeneration Laboratory, Institute of Neuroscience, National Chengchi University, Taiwan*)

Introduction : Indy (I'm not dead yet) encodes the fly homolog of a mammalian transporter of the Krebs cycle intermediates. Mutations in the Indy gene extend life span of the fruit fly. In addition, decreased expression of two of the worm Indy homologs extend worm longevity. INDY is predominantly expressed in places where intermediary metabolism takes place suggesting that INDY has a role in metabolism. Method : We determined survivorships, starvation resistance, weight, egg production and mobility of control and Indy mutant flies on high and low caloric food. We examined longevity of Indy206 heterozygous flies in genetic backgrounds of Hyperkinetic1, short- and long-lived Luckinbill lines. We backcrossed old and new Indy alleles into yw genetic background and determined their longevity. Results : We found similarities in the physiology of calorie restricted flies with Indy mutant flies on high calorie diet; similarities include lower weight, egg production, decreased starvation resistance and increased spontaneous physical activity and increased mitochondrial biogenesis. The Indy206 heterozygous allele extends life span in different genetic backgrounds. Several new Indy heterozygous alleles extend longevity in yw background. Conclusion : Our data suggest that Indy mutations create genetic calorie restriction and extend longevity by a similar mechanism. Indy206 heterozygous flies live longer in a number of genetic backgrounds. In addition, several new Indy alleles live longer in yw background conferring the role of the Indy mutation in longevity. Keywords : *Drosophila melanogaster*, Indy

NEURONAL GENES IN LIFESPAN CONTROL: LESSONS FROM DROSOPHILA

Elena G. PASYUKOVA¹, Alexander V. SYMONENKO¹, Natalia V. ROSHINA¹, Mikhail V. TROSTNIKOV¹, Ekaterina R. VESELKINA¹, Anna V. KREMENTSOVA², Olga Y. RYBINA¹ (*1. Laboratory of Genome Variation, Institute of Molecular Genetics of Russian Academy of Sciences, Russia; 2. Department of Biochemistry and Physical Chemistry of Biological Processes, Emmanuel Institute of Biochemical Physics of Russian Academy of Sciences, Russia*)

Introduction : One of the organ systems that play a major role in maintaining homeostasis and regulating aging and longevity is the nervous system. Earlier, we have shown that several genes involved in regulation of neuron development and specification affect lifespan. These genes encode transcription factors and are known to be most important during embryogenesis. We supposed that their involvement in lifespan control could be based on both alterations in their own expression and their effects on expression of other genes. **Method :** Longevity, reproduction and locomotion were evaluated in lines with mutations in shuttle craft, escargot, inscrutable, abrupt, Lim3 and some other Drosophila genes. Real-Time PCR was used to measure gene expression on different stages of development and in adults of different age. The functional meaning of natural variation in the regulatory region of Lim3 gene was assessed in experiments with cell culture and transgenic flies. **Results :** We demonstrated that 1) embryonic transcription of neuronal genes can be associated with changes in adult longevity; 2) neuronal genes interact with each other, both in lifespan control and in regulation of transcription; 3) polymorphisms found in natural population and associated with longevity determine the level of transcription of the relevant genes. **Conclusion :** Our findings indicate that genes affecting early development of the nervous system could influence longevity of Drosophila adults through alteration of gene expression and genetic interactions. This work was supported by RFBR grants #12-04-01182 and #12-04-31529, RAS Program “Wildlife: Current State and Development” and Ministry of Education and Science of RF grant #8593. **Keywords :** Longevity neurons transcription

SS25 217-B-4

GENE NETWORK STABILITY AND AGEING

Peter O. FEDICHEV (*Research Director, Quantum Pharmaceuticals, Kosmonavta Volkova 6A-1205, Russia*)

Introduction : There is a growing number of examples among the very different animal species yielding ever increasing number of animals exhibiting what can be called a negligible senescence. The age dynamics of mortality data followed by the recent transcriptomics studies, suggest that the genetic networks of at least some of the animals can extremely stable on very long time scales. On the contrary, most of the animals including humans show an exponential increase of mortality with age, which could be a signature of underlying genetic regulatory network instability. **Method :** In this work we show that there may be two distinctly different types of aging. To do that we provide a minimalistic, possibly the simplest mathematical model of aging in a genetic network and analyze the gene expression levels stability in the presence of environmental or metabolic perturbations. **Results :** Under a very generic assumptions we establish a possibility of a dynamic instability associated with the gene network connectivity, leading to exponential accumulation of the genome regulation errors and, subsequently, to a very fast aging in organisms where the efficiency of the reparation systems is insufficient to correct errors. On the other end of the spectrum the model predicts existence of organisms capable of boosting the repairs strong enough to stabilize the gene network and establish a very different aging dynamics, much closer to that observed in naked mole types. **Conclusion :** The model lets us analyse the roles of various genes in lifespan extending experiments with model organisms and prioritise targets for future pharmacological interventions. **Keywords :** mechanisms of ageing, longevity genes, system biology of ageing, gene network stability

INVESTIGATION OF THE ROLE OF GENES OF

EPIGENETIC REGULATION AND OF TUMOR SUPPRESSOR IN AGING AND LONGEVITY ON THE DROSOPHILA MELANOGASTER MODEL

Mikhail SHAPOSHNIKOV¹, Leonid OMELYANCHUK², Sergey KOPYL², Anna LUKINA³, Alexey MOSKALEV⁴ (*1. Laboratory of Molecular Radiobiology and Gerontology, Institute of Biology, Komi Science Center of RAS; Syktyvkar State University, Russia; 2. Laboratory of Genetics of the cell cycle, Institute of Molecular and Cellular Biology, SB RAS, Russia; 3. Institute of Natural Sciences, Syktyvkar State University, Russia; 4. Laboratory of Molecular Radiobiology and Gerontology, Institute of Biology, Komi SC, UB RAS; Syktyvkar State University, Russia*)

Introduction : The revealing of evolutionarily conserved genes that may affect aging process is a priority of biogerontology. The products of Polycomb and Trithorax group genes are implicated in regulation of many processes associated with aging: epigenetic regulation of gene expression, regulation of stem cell self-renewal and in cancer development. Tumor suppressor genes are involved in insulin signaling and may participate in the control of longevity also. The purpose of this study is to determine the role of genes controlling epigenetic regulation of gene expression and tumor suppressors in the mechanisms of aging and longevity on the Drosophila model. **Method:** We investigated the effects of mutations in Polycomb, Trithorax and tumor suppressor genes on lifespan and stress resistance of Drosophila. **Results :** We found that mutations in genes Su(z)2, z, asx, trx, and brm increased the age of 90% mortality ($p < 0.05$) in heterozygous males (by 40-80%) and females (by 50%). Mutations in tumor suppressor genes ex, ft, hem, hyd, gd caused a reduction of median life span (by 13-46%) and the age of 90% mortality (by 11-33%) in heterozygous flies of both sexes ($p < 0.001$). Mutations in genes Su(z)2, z, asx, Psc, sxc, trr and Trl increased the resistance of males and females to heat shock ($T = 34^{\circ}\text{C}$) and oxidative stress (20 mM paraquat), but decreased the resistance to starvation. **Conclusion :** Thus the genes of epigenetic regulation and tumor suppressors involved in the modulation of longevity and stress resistance. This work was supported by the Presidium of the Russian Academy of Science, grant number 12-C-4-1019. **Keywords :** epigenetic regulation, tumor suppressor, longevity

SS25 217-B-6

STRESS-RESPONSE GENES IN LIFESPAN REGULATION AND FORMATION OF LONG-TERM EFFECTS INDUCED BY IONIZING IRRADIATION IN DROSOPHILA MELANOGASTER

Ekaterina PLYUSNINA, Lyubov SHILOVA, Alexey MOSKALEV (*Laboratory of Molecular Radiobiology and Gerontology, Institute of Biology, Komi Science Center, Ural Branch of RAS, Russia*)

Introduction : The purpose of this research was to study the role of genes of DNA break recognition (ATM, ATR), base and nucleotide excision repair (PCNA, XPC, XPF, Gadd45), double-strand break repair (BLM, Rad50, Rad51, Rad54), and apoptosis (p53, Gadd45) in the lifespan regulation and formation of specific long-term effects of gamma-irradiation in Drosophila melanogaster. **Method :** We estimated the lifespan of wild-type Canton-S flies and flies with mutations of stress-response genes under different irradiation conditions: 1) without irradiation; 2) chronic exposure by low 40 cGy dose rate during preimaginal developmental stages; 3) acute exposure by 30 Gy dose rate after imago eclosion; 4) successive irradiation by both doses. In addition, we studied the age-dependent dynamics of stress-response gene expression after chronic low-dose irradiation using qRT-PCR method. **Results :** In contrast to the wild-type Canton-S strain, chronic 40 cGy gamma-irradiation didn't induce the hormetic

effect in flies with mutations in stress-response genes. Radioadaptive response to acute 30 Gy irradiation was less expressed in flies with mutations in PCNA, Rad50, Rad51, Rad54 genes compared with wild-type flies, and was absent in flies with ATM, ATR, XPF, XPC, Gadd45, BLM, p53 mutations. The expression levels of investigated genes were increased by 1.5-2.6 times after chronic low-dose irradiation. High activity was persisted in ATM, PCNA, XPF, BLM genes during *Drosophila* lifetime. Conclusion : The obtained results demonstrated that investigated components of cellular stress signaling pathways are involved in the lifespan modulation in response to ionizing irradiation, and in the formation of long-term biological effects such as radioinduced hormesis and adaptive response. Keywords : Stress-response genes, gamma-irradiation

SS25 223-C

THE NATIONAL AUDIT OF DEMENTIA: QUALITY IMPROVEMENT IN THE ACUTE HOSPITAL

SS25 223-C-1

NATIONAL AUDIT OF DEMENTIA IN ENGLAND AND WALES

Peter CROME (*Primary Care and Population Health, University College London, United Kingdom*)

Introduction : The majority of patients in acute hospitals are older people and at least 30% have dementia or other cognitive impairments. It is a priority to improve the care of this group of patients who are at greater risk of complications and prolonged hospital stay. Method : The study involved 99% of acute hospitals in England and Wales. The experience of the treatment of people with dementia was reviewed by case-note inspection (n=7934) and an organisational check list (n=210). A smaller number of hospitals submitted staff and relative questionnaires, environmental and organization checklists. Practice was measured against standards developed from existing legal requirements and clinical guidelines. Results : No hospital met all of the standards considered essential. There was a major gap between what hospitals said they did and practice identified by case-note review. Care pathways for dementia patients were infrequently in place. Access to timely psychiatry support was limited. Inadequate training and staffing levels were reported. Recommendations were made on: care pathways, the appointment of clinical leads, improved assessment, nutrition, training, the environment and staffing. The observations identified that there were elements of person-focused communication underpinning best practice. Conclusion : Overall the results were disappointing and indicate there is much scope for improvement. Key to success will be accepting that the treatment of patients with dementia is, and will increasingly be, core business for acute hospitals. A second round of the audit is now underway and initial results suggest that progress has been made. Making hospitals (and all health services) dementia-friendly is a key priority. Keywords: Dementia, Quality improvement, Hospital

SS25 223-C-2

A NATIONAL AUDIT OF PERSON-CENTRED CARE FOR PEOPLE WITH DEMENTIA IN HOSPITAL

John YOUNG¹, Rosemary WOOLLEY², Mary GODFREY³, Jill HOYLE⁴ (*1. Academic Unit of Elderly Care and Rehabilitation, Bradford Teaching Hospitals NHS Foundation Trust / University of Leeds, United Kingdom; 2. Academic Unit of Elderly Care and Rehabilitation, Bradford Teaching Hospitals NHS Foundation Trust, United Kingdom; 3. Academic Unit of Elderly Care and Rehabilitation, Bradford Teaching Hospitals NHS Foundation Trust / University of Leeds, United Kingdom; 4. Division of Medicine,*

Bradford Teaching Hospitals NHS Foundation Trust, United Kingdom)

Introduction : Real time care observations are particularly helpful to inform quality improvements for people with dementia who may not be able to reliably self-report. We wished to include such observations in a national audit of dementia care in hospitals but there were no existing observation tools suitable for use. Method : Based on a literature review and consultations with hospital staff and older people, we developed a qualitative observational tool called 'PIE' (to look at the 'Person', their 'Interactions' with staff and the immediate 'Environment'). The aim was to help hospital staff understand patients' experiences in real time and to develop action plans to improve person-centred practice in their wards. It was successfully piloted in seven NHS Trusts, then used by ward staff with 608 patients in 43 Trusts (105 wards) for the National Audit. The data was qualitatively analysed to compare and contrast the findings between and within hospitals. Results : Clear descriptions of day-to-day ward care were reported. The concept of person-centred care was poorly understood by staff. Only five wards provided evidence of sustained person centred care practices. Importantly, the staff observed in the audit lacked the necessary communication skills to support person centred care. Conclusion : Improving the communication skills of staff working with people with dementia may be a simple and practical route to improving person centred care practices. Keywords : dementia; hospitals; audit

SS25 223-C-3

THE DEMENTIA CARE IN HOSPITALS PROGRAM - A STATEWIDE DEMENTIA AWARENESS AND COMMUNICATION PROGRAM LINKED TO A BEDSIDE ALERT FOR COGNITIVE IMPAIRMENT

Mark William YATES¹, Meredith THEOBALD², Michelle MORVELL³ (*1. Geriatric Medicine, Deakin University, Ballarat Health Services, Australia; 2. Subacute Medicine, Ballarat Health Services, Australia; 3. Cognition Service, Ballarat Health Service, Australia*)

Introduction : The Dementia Care in Hospitals Program (DCHP) is an all of hospital education program linked to a unique bedside graphic alert, the Cognitive Impairment Identifier (CII). It has been shown to improve the awareness of and communication with hospitalised people with cognitive impairment (CI). It was designed and tested at Ballarat Health Services in 2004 with the support of people with dementia, their families and the Alzheimer's Association. In 2006 it was re-tested in 7 other hospitals. This program has now been introduced to 22 public hospitals. With grant funding from the BUPA Foundation the DCHP had now been re-evaluated in three private acute hospitals. Method : The original evaluation compared carer perception, staff confidence and practice change. Introduction of the DCHP. Further roll-outs evaluated staff confidence with care. The recent re-evaluation in the private sector assessed transferability, staff and carer perception and risk exposure such as falls, medication error and requirement for one-on-one staffing. Results : The original study found 80% of staff with daily or weekly patient contact reported the CII and education had improved their practice and 40% reported it had improved their response to carers. Carer satisfaction shifted positively by 23.6%. Subsequent roll-outs have demonstrated improved staff confidence. Data from the private sector re-evaluation will be completed in March 2013 and presented. Conclusion : The use of a bedside graphic to alert hospital staff to CI, when linked to an all of hospital education program, is acceptable to people with dementia and carers and improves care and patient safety. Keywords : Hospitals, Dementia,

Quality

SS25 223-C-4

DEMENTIA AND THE FUTURE OF THE ACUTE HOSPITAL

Kenneth ROCKWOOD (*Department of Medicine, Dalhousie University, Canada*)

Introduction : Despite a burgeoning elderly population, acute-care hospitals still view as normative the patient with single system illness, who can give a good history, enjoys uncomplicated social circumstances and can perform as a self-actualized participant in decision making about care. Most older people with dementia challenge each of these key assumptions, especially when they are acutely ill. This symposium considers how the acute hospitals cope now and what options they have to make care better. Conclusion : The concluding presentation will discuss implications for the science and practice for dementia care. Keywords : Dementia, Acute Care

SS25 224-R

TOWARDS ASIAN PACIFIC LONG-TERM CARE CERTIFICATE

SS25 224-R-1

TOWARDS ASIAN PACIFIC LONG-TERM CARE CERTIFICATE

Kathryn Lenzner BRAUN¹, Takeo OGAWA², Cullen HAYASHIDA³, Tri Budi RAHARDJO⁴, Thelma KAY⁵ (*1. Ha Kupuna Center for Native Hawaiian Elders, University of Hawaii, USA; 2. Social Work, Kumamoto Gakuen University, Japan; 3. Kupuna Education Center, Kapiolani Community College, USA; 4. Center for Aging Studies, Universitas Indonesia, Indonesia; 5. Senior Advisor, Ministry of Community Development, Youth and Sports, Singapore*)

Introduction : Asian and Pacific population ageing has progressed at rapid speed, so the percent and number of older adults in the region have grown considerably. Along with this is an increasing need for long-term care for the elderly. The traditional ethic of filial piety is still honored, but families cannot meet all the long-term care needs for the growing number of elderly. Method : A new long-term care system must be constructed, and it will require a quality workforce for long-term care. Every country is constructing its own domestic system of long-term care, with different standards for worker training and competency. Results : Some countries in the Asia-Pacific region are confronting difficulties recruiting enough domestic workers for long-term care. Thus, they are recruiting foreign long-term care workers, and the international migration of the elder care workforce is a big issue in Asia/Pacific. To ease migration of care workers, the harmonization of their qualifications and training standards should be discussed internationally. The dialogue for the harmonization of worker qualifications should be based on the competence in long-term care for the elderly and standardized gerontological knowledge and skills. Conclusion : This issue should be of concern not only to policy makers and teachers of the care workforce, but also more researchers should focus on this international long-term care agenda. Keywords : immigration, elder care, workforce

SS25 224-R-2

FRAMEWORK FOR THE ANALYSIS OF TRAINING PROGRAMS FOR LONG-TERM CARE

Takeo OGAWA (*Faculty of Social Welfare, Kumamoto Gakuen University, Japan*)

Introduction : The need to secure LTC workers from international labor markets will be intensified in order to prepare for aging world.

However, standardization of the quality of LTC workers in international labor markets has not yet been implemented. The quality and quantity of LTC worker training vary by country, so this agenda has yet to achieve shared recognition among policymakers and business managers. The training programs for long-term care in each country should be harmonized in order to maintain the quality of LTC workers and to facilitate their international mobility. Method : Targeted training programs are Japanese, Korea, China, Hawaii and German one. Some programs focus on trainings for informal care givers, and other programs focus on training for paid workers. Each training program is compared around some issues. Especially, the training period and the ranking system is compared with each others. Results : There are big differences between training programs for LTC workforce internationally. As each country has its own strategy for recruiting long-term care workforce, it is very hard to integrate it into the standardization of training programs. Then, differences of training period should be harmonized in the international certificate system at least. It needs to utilize the ranking system, in which the long-term care competence will be evaluated on the knowledge and skills. Conclusion : Gerontological world, including researchers, policy makers, service providers, and communities will have to take responsibilities for establishing a systematic training program for long-term care workforce, whichever paid workers or non-paid care givers. Keywords : Long-term Care Work Force, Training Program, Certificate

SS25 224-R-3

TRAINING PROGRAM FOR THE ELDER CARE WORKFORCE IN SINGAPORE

Thelma KAY (*Former Senior Advisor, Ministry of Social and Family Development, Singapore*)

Introduction : Singapore is ageing rapidly and by 2030, one fifth of the population is projected to be over 60. This demographic trend will be compounded by smaller household sizes, an increase in the older old requiring more care, and an increased chronic disease burden. Care is provided through the "many helping hands" approach with the family as the first line of support, followed by the community and the government. However, with the realization that the family will be less extended, more care provided at the community level will be needed. Method : An analysis of elder care needs and the measures being taken to address elder care workforce requirements will be provided. Conclusion : As the issue of an eldercare workforce will be increasingly urgent, it is important that timely measures be taken to produce caretakers at the appropriate levels and with the requisite level of skill and training. With initiatives ranging from whole of government policies, innovative and alternative work arrangements, competency and capability improvements, and use of technology, Singapore's programme for an eldercare workforce would strive to meet the needs of its ageing population. Keywords : care workforce, community-based care,

SS25 224-R-4

TRAINING PROGRAM FOR THE ELDER CARE WORKFORCE IN INDONESIA

Tri Budi W. RAHARDJO (*Centre for Ageing Studies, University of Indonesia, Indonesia*)

Introduction : As people age, the proportion of with middle and heavy disabilities increases. Government policy in Indonesia emphasizes three generation under one roof, with the assumption that the family will take care of older persons, particularly when they get frail. However, there is a tendency of increasing number of working young

women, which leads to limitations of family care givers. Hence, and eldercare workforce for is highly needed. Method : We analyzed data from the Survey 2010 and Basic Health Research of 2007. Results : Findings indicated that the level of participation among older persons in the community is very high (80%), while the participation in workplace is about 55 %. On the other hand, it found that the level of disability is also high (70% with light, 27.1% middle, and 2.9% heavy disability. Most of care givers in Indonesia are untrained, particularly family care givers. Recently, caregiver training has been offered by some foundations. Training for the trainers is also conducted by Integrated Geriatric Team of National and Province Hospitals. In addition, In addition, HelpAge Indonesia, under supervision by HelpAge International and HelpAge Korea has been regularly conducting Care Workforce Training in collaboration with hospitals. The curriculum includes theory and practice. Conclusion : Since the quality of training is relatively sufficient to international standards, there is an opportunity to send the caregivers abroad. To accelerate the quantity and quality of caregivers in Indonesia, it is recommended that future training program be conducted at the grassroots level by Primary Health Care institutions following international standards. Keywords : Care Work Force, Training for the Trainers, Grassroots Level of Training

TRAINING PROGRAMS FOR DIRECT CARE LONG TERM CARE WORKERS IN HAWAII: ISSUES AND DIRECTIONS FOR CHANGE**

Cullen T HAYASHIDA (*Kupuna (Elder) Education Center, Active Aging Consortium in Asia Pacific (ACAP) and Kapiolani Community College, USA*)

Introduction : Hawaii's challenges related to the training of direct care workers reflect those of the USA where there is rapid population aging, smaller family size and chronic and growing worker shortages. Low pay, lack of a progressive career ladder, educational barriers between credit and non-credit programs and regulatory barrier abound. This report address two areas of progressive policy changes that are underway. First, paraprofessional direct care workforce development is addressed by creating a multi-level approach for entry training to address skills competency and career articulation. Second, online continuing education training for small residential homes. Method : This presentation reports on its experiences with the Schmieding Model for Direct Care Worker training. This model addresses the need to training at the entry level and trains workers in an articulated multi-level approach using a well-designed competency based curriculum used in several states in the USA. The Schmieding Model has the ability to create educational pathways into specialty tracks. Second, efforts was made to convert training into an online format. Results : This report will document the numerous issues and challenges that the Center has encountered for these two training initiatives. These include regulatory, cultural and marketing considerations. Conclusion : Over the next 5 years, there will be a on-going challenge to expand the Center's efforts at improving the efficacy of the training of direct care paraprofessional worker both for entry into the field and for continuing education. Increasingly, these workers are being recognized as the primary workers that will be caring for an increasingly frail and disabled population. Keywords : Direct Care paraprofessional training, competency, standardization

UNDERGRADUATE AND POSTGRADUATE TEACHING IN MEDICINE FOR OLDER PATIENTS: THE CURRENT SITUATION AND IMPLICATIONS FOR FUTURE**

DEVELOPMENT, LESSONS FROM TWO EUROPEAN COUNTRIES

**SS25 226-C-1
ARE WE TEACHING BRITISH UNDERGRADUATES WHAT THEY REALLY NEED TO KNOW ABOUT AGEING?**

Adrian G BLUNDELL, Adam L GORDON (*Department of Health Care of Older People, Nottingham University Hospitals NHS Trust, United Kingdom*)

Introduction : The 1st UK National Survey of Undergraduate of Teaching in Ageing and Geriatric Medicine was conducted in 2008 and revealed shortcomings in undergraduate teaching in ageing and geriatric medicine in the UK. We are currently conducting the 2nd UK national survey and look forward to presenting these to the IAGG in 2013. Method : As with the previous iteration, learning outcomes from the British Geriatrics Society Recommended Curriculum for Medical Undergraduates were mapped to the guidance of the UK General Medical Council and used to compile an electronic questionnaire covering the whole curriculum which was hosted online. All 31 UK medical schools were invited to respond. For each outcome, we asked whether and how it was taught and examined, the disciplines involved in teaching and the amount of time devoted to teaching. Only teaching delivered to all students was included. Results : Previously we found that common presentations, the geriatric giants, were taught in most medical schools but only 8/21 learning objectives were taught - and none examined - in all schools. Elder abuse was taught formally in only 8/17, pressure ulcers in 14/17, social ageing in 9/17 schools, cellular ageing in 7/17 and physiology of ageing in 9/17. These represent important deficiencies. We will present to conference the findings of the second iteration currently in progress and describe trends in teaching over time. Conclusion : Teaching in geriatric medicine in the UK has previously been shown to be deficient. We will, at this symposium, describe trends over time and consider their implications for teachers. Keywords : Ageing, Geriatric medicine, Teaching, Assessment

**SS25 226-C-2
DEMENTIA IN THE UK MEDICAL CURRICULUM: REFLECTIONS ON PAST, PRESENT AND FUTURE RESEARCH**

Ellen TULLO (*Newcastle NIHR Biomedical Research Centre in Ageing, Newcastle University, United Kingdom*)

Introduction : Dementia is an increasingly common condition and all doctors, in both hospital and community care environments, must be prepared to competently manage patients with this condition. It is unclear whether medical education about dementia in the UK, or elsewhere, is currently fit for purpose in this respect. Method : Review of national and international policy documents followed by an electronic questionnaire sent to UK medical schools to survey and evaluate the nature of dementia-specific teaching and learning for medical students. Results : Review of policy documents suggested that shortcomings in dementia care are affected, in part, by shortcomings in dementia education. 23/31 UK medical schools responded to the survey. All provided some dementia-specific teaching but this focussed more on knowledge and skills than behaviours and attitudes. Assessment of dementia-specific learning outcomes was inadequate. There was a widespread failure to adequately engage the multidisciplinary team, patients and their carers in teaching, presenting students with a narrow view of the condition. Conclusion : Although most UK medical schools currently teach about dementia, a number of shortcomings were identified. Based upon these, we recommend:

embedding dementia as a core curriculum topic, evaluating attitudes and behaviours towards people with dementia, assessing dementia-specific learning outcomes, and involving people with dementia and their carers in teaching. Keywords : dementia, undergraduate medical education, attitudes

SS25 226-C-3

AN AXIS OF OLD AGE MEDICINE - TEACHING DUTCH DOCTORS ACROSS THREE SPECIALTIES ABOUT THE MEDICINE OF OLDER PEOPLE

Jos SCHOLS (*Dept. GP and Dept. HSR, Maastricht University, Netherlands*)

Introduction : Western societies show a demography of more and more elderly people. In addition, the number of frail and disabled old people throughout the total care chain (community care - care homes - hospitals) is growing as well. The main trend is to keep frail elderly in their own home living environment as long as possible. Next to working on improving the quality of medical care for the elderly, this requires also much more medical and multidisciplinary collaborative working throughout the care chain. Method : Literature study and expert consultations to explore and describe the development and background of the rather unique Dutch medical axis for older patients as well as the relevant aspects of the postgraduate teaching programmes. Results : Since 1990, officially a medical axis for the elderly exists, consisting of General Practitioners, Nursing Home Physicians and Hospital Geriatricians. Initially, because they are educated separately, they indeed worked rather separately from each other. Currently, collaborative working becomes more visible. As intermediate between general practitioners and hospital geriatricians, nursing home physicians have evolved towards specialists in elderly care medicine, working not only in care homes but also more and more as consultants and supporting physicians for general practitioners in the community. In the three postgraduate teaching programmes attention for collaborative working is growing as well to ultimately achieve an increasingly better continuity of medical care in daily practice. Conclusion : The unique medical axis for frail and disabled elderly in the Netherlands with its related educational aspects may be an example for other countries. Keywords : medical axis, frail elderly

DEVELOPING A TAIWANESE FELLOWSHIP IN GERIATRIC MEDICINE: LESIONS SO FAR AND FUTURE DEVELOPMENTS

Li-Ning PENG (*Center for Geriatrics and Gerontology, Taiepei Veterans General Hospital, Taiwan*)

Introduction : Taiwan has become an aging country in 1993, and is estimated to become an aged country in 2017. Until 2004, the National Health Research Institute (NHRI) started to promote the training of geriatricians to cope with the need for geriatric health care professionals. Due to the lack of sufficient geriatric teaching resources, the NHRI invited the Mt. Sinai Medical School of New York to pilot a geriatric fellowship training program in Taiwan but the collaboration of Mt. Sinai Medical School ended in 2006 due to the limitation of funding support. Results : The Veteran Affairs (VA) Commission in Taiwan officially launched the geriatric service programs for training more geriatric healthcare professionals and was affiliated with the British Geriatrics Society and other international teaching resources since 2006. All trained geriatricians were working in various health care facilities. Till 2012, there were 9 certified geriatric fellowship training programs across different areas of the country. The success of Taiwanese VA geriatric fellowship training program has attracted

international attentions and has been reported to the British Geriatrics Society, IAGG regional meeting, and EUGMS annual meetings. In 2011, the training program extended to the Asian countries by hosting the Master Class on Ageing (MCA) of IAGG, attracting young geriatricians with research potentials to develop their research career. More MCAs have been held in Hong Kong and Beijing. Conclusion : The active development of geriatric training will facilitate Asian countries to face challenges of aging. Keywords : Taiwan, Geriatric training

LIVING ARRANGEMENTS AND HEALTH SPENDING OF THE ELDERLY IN INDIA

Tannistha SAMANTA (*Humanities and Social Sciences, Indian Institute of Technology-Gandhinagar Ahmedabad, Gujarat, India*)

Introduction : Do multigenerational extended families have protective health effects on the elderly in India? Does household wealth mediate the relationship between co-resident elderly and their health outcomes? Demographic literature on health care access/spending of the elderly in developing countries remains scant because of the common assumption that they are provided for by their children, with whom overwhelming majority of the elderly reside. Method : Drawing data from the India Human Development Survey (2004-05)-a nationally representative, multitopic dataset of 41,554 households-findings from this study reaffirm the importance of multigenerational families to the elderly wellbeing while underscoring the "wealth effect" and providing indirect evidence of intra-household allocation of resources. Results : Drawing data from the India Human Development Survey (2004-05)-a nationally representative, multitopic dataset of 41,554 households-findings from this study reaffirm the importance of multigenerational families to the elderly wellbeing while underscoring the "wealth effect" and providing indirect evidence of intra-household allocation of resources. Conclusion : Drawing data from the India Human Development Survey (2004-05)-a nationally representative, multitopic dataset of 41,554 households-findings from this study reaffirm the importance of multigenerational families to the elderly wellbeing while underscoring the "wealth effect" and providing indirect evidence of intra-household allocation of resources. DETERMINANTS OF RECEIVING PAID HELP AMONG DISABLED ELDERLY PEOPLE IN TAIWAN

Li-jung Elizabeth KU¹, Li-fan LIU² (*1. Institute of Public Health, College of Medicine, National Cheng Kung University, Taiwan; 2. Institute of Gerontology, College of Medicine, National Cheng Kung University, Taiwan*)

Introduction : The elderly population in Taiwan is estimated to double from 10% in 2007 to 20% in twenty years' time. As the population ages, more elderly people will need some form of caregiving support and a greater demand for long-term care services. The objective of this study is to examine predictors of receiving paid help among disabled elders who stayed in their own homes in Taiwan. Method : Data were drawn from three waves of the Taiwan Longitudinal Study on Aging (TLSA) (1999, 2003, and 2007) to examine the receipt of help with activities of daily living (ADLs) in a nationally representative sample of Taiwanese elderly people aged 65 and older. Results : The increasing trend of receiving paid help may be supplemental to family

support and vice versa brought up the issue that social inequality of unmet care needs of disabled elderly. Factors associated with higher likelihood of paid help use included better socio-economic status and more ADLs. However, those living with spouse only were much less likely to use paid help than those living with adult children. Conclusion : Our finding of a positive association between higher socio-economic status and more paid help is in line with the literature on social inequalities of unmet health care needs. Findings also suggest that future long-term care (LTC) policy in Taiwan should focus more on providing elders who live alone or with spouse only additional caregiving resource. Keywords : family support, activities of daily living (ADLs), paid help

SS25 305-S-3

A COMPARISON OF SOCIOECONOMIC DIFFERENCE IN HEALTH AMONG OLD POPULATION IN INDIA AND KOREA

Soong-Nang JANG (*College of Nursing, Chung-Ang University, Korea*)

Introduction : Most of comparative studies of health have been produced from European countries and the US. Comparison study for Asian countries is rare and a few studies have only focused on race/ethnicity or immigrant as Asian in Western countries, with limited health outcome not general health status. We examine gender, age and educational level differences in health at ages 45 years and older in India and Korea. Method : We use the Korean Longitudinal Study of Ageing (KLoSA) for Korea and Longitudinal Aging Study in Asia (LASI) pilot data for India to examine gender, age and socioeconomic differences in self rated health, disability. Results : Women in Korea are more likely than men to have self rated poor health (OR 2.01), disabling including ADL difficulties (OR 1.45-2.94), and depressive symptoms (OR 1.45-3.35). On the other hand, Gender difference in self rated health was not detected for Indian middle aged men and women. Disparity of self rated health in India was similar level to Korean men and women (OR for Indian =1.12, OR for Korean = 1.40), and these differences are not eliminated by controlling gender, age and other covariates. While age difference of self rated health, disability were not quite severe in India, Korean middle aged men and women showed steeper gap between age groups in self rated health and disability rate. Conclusion : There is remarkable consistency in direction of educational differences in health across two countries, but gender difference is only detected in Korean population. Keywords : International comparison, Socioeconomic disparity

SS25 305-S-4

MOBILITY, CONSUMPTION AND WELL BEING IN THE LIVES OF OLDER ADULTS IN GUJARAT, INDIA

Michal ISAACSON¹, Tannistha SAMANTA², Lisa A. D'AMBROSIO¹, Joseph F. COUGHLIN¹ (*1. New England University Transportation Center & MIT AgeLab, MIT, USA; 2. Social Sciences, Indian Institute of Technology Gandhinagar, India*)

Introduction : The objective of this study is to gain a broad understanding of the day-to-day lives of older adults in India. Understanding that the behavior and the habits of this growing population will impact many realms of life this study proposes collecting a unique data set that will explore what those impacts may be. The study focuses on three main themes: mobility, consumption and well being. Method : This study uses a theoretical sample of 30 persons aged from 50 to 80 living in Ahmedabad, Gujarat that has been generated using a snowball technique, creating three groups of older adults. Three separate methods are employed to collect data on

each of the factors that this study examines. 1. Mobility ? data regarding mobility is collected using GPS technology. Participants carry GPS loggers with them for one week during which the logger will record their location. 2. Consumption ? Participants keep a diary that records activities that they take part in, services that they utilized and goods that they purchased. 3. Well Being ? The Gallup well-being index is administered as a measurement of personal well being. Results : As this is an on going study, results will be presented exploring the differences between household composition and mobility as well as between gender and the association between mobility and well-being. Conclusion : Mobility is a key factor in realizing roles both within the family and within society at large and is thus has a strong connection with culture, gender and household composition. Keywords : Mobility, Well-being, Consumption

THE SEOUL INSTITUTE SPECIAL SYMPOSIUM: AGING PEOPLE'S LIFE IN SEOUL -PAST, PRESENT AND FUTURE

SS25 306-R-1

AGING PEOPLE'S LIFE IN SEOUL-PAST, PRESENT AND FUTURE-

Min-Suk YOON (*Department of Future and Social Policy Research, The Seoul Institute, Korea*)

Introduction : Seoul is the largest city in Korea, and it is getting old. The population of adults over the age of 65 now consists of 10% of the population and it is expected to increase to over 20% by 2030. Older citizens in Seoul will become a significant portion of society. Method : This study was started from this point of view and tries to explain this issue by multidisciplinary study based on literature reviews and secondary analysis of available data. This analysis will try to show the past and present situation of aging peoples lives in Seoul. We will show you their life in a social, economic, financial, health, and physical activities perspective. Results : The contents of study by each field is presented as follows. Taken from the social aspect of elderly life of those who live in Seoul, we have used the data which was product by The seoul institute, such as the change in the elderly population and the change in the number of users of social welfare in order to predict the potential problems anticipated and suggest solutions for the future. We will also show you the life style of seoul's aging peoples by picture and other materials. Conclusion : Our analysis will conclude with thoughts on the future for the aging population in Seoul. Keywords : Seoul city life, Social and physical change

THE EMERGENCE OF A NEW ELDER CARE DISCOURSE IN SEOUL

Wonjee CHO (*Translational Gerontology and Retirement Research Center, Seoul National University, Korea*)

Introduction : In South Korea, the family has traditionally been considered as the primary source for caring for a financially dependent or functionally impaired older adult. However, dramatic demographic changes and rapid industrialization and urbanization in Korean society, especially in Seoul, have led to changes in family size, family living arrangement, and family-related culture. Declines in multigenerational living arrangements and numbers of children contributed to weaken traditional cultural moral values and practices of parent-child relationship that obligated adult children to take primary responsibility for their aging parents. These socio-cultural changes continue to fuel interests in an issue of the responsibility for elder support - individual, social, or filial obligations toward older adults. Method : This study is to understand changes in needs and preferences of older people in relation to old-age support and eldercare in rapidly changing Seoul city by using data from Seoul Survey and Korean population households census. Results : The number of single-elderly and couple-elderly households has been constantly growing. The responsibility for elder support or care has gradually shifted from adult children to aging parents themselves in the absence of social support. Conclusion :

Through considering the issues caused by changing family attitudes and practice to old-age support and care, this study will portray the socio-cultural model for managing current and future challenges associated with parent-child relationship and elder care and for enhancing the quality of life in the later life in Seoul city. Keywords : Eldercare, old age

PROTECTING AND PROMOTING THE HEALTH AND HUMAN RIGHTS OF OLDER PERSONS: THE ROLE OF CIVIL SOCIETY AS AGENTS OF CHANGE IN MOVING TOWARDS A NEW CONVENTION ON THE RIGHTS OF OLDER PERSONS

SS25 308-R-1

PROMOTING THE PROCESS: HUMAN RIGHTS CONVENTIONS AS A TOOL FOR SOCIAL CHANGE

Ken BLUESTONE (*Age International, United Kingdom*)

Introduction : It can be argued that the highest expressions of international human rights legislation are UN Human Rights Conventions. Conventions set global standards and are legally binding for those countries that ratify them. Yet governments are only held accountable by their own citizens and civil society ensures these global standards can become a legal certainty at national level.

Method : Drawing on the experience of the creation and implementation of human rights conventions for women, children and people with disabilities, this paper will demonstrate that greater civil society involvement is part and parcel of creating greater legal certainty of the rights of older persons through a Convention.

Results : Civil society has a fundamental role to play in enshrining these legal standards. The process of bringing about a Convention on the Rights of Older Persons requires the fundamental involvement of civil society at a number of levels: 1) Awareness raising - do people know these rights exist?; 2) Political action - governments need to know that a Convention is necessary; 3) Accountability - a Convention must become a living legal tool at national level requiring the accountability of governments to its citizens.

Conclusion : The impact of a Convention on the Rights of Older Persons extends far beyond the legal standards it will set. Participation of civil society is an integral part of creating that legal standard and the bedrock for its implementation.

Keywords : Human Rights, Civil Society, Participation

ENSURING THE RIGHT TO HEALTH AND TO ENJOY LONGEVITY IN DIGNITY: A GLOBAL EFFORT

Lia Susana DAICHMAN (*ILC-Argentina and UN ILC-GA Representative, ILC-Global Alliance, Argentina*)

Older persons are important and valuable members of Society who are entitled to an effective and efficient Health Service and to promote not only Health but a minimisation of disability in later life. Providing many times "safe care" has been used as an excuse to sacrifice Older person's dignity and Human Rights. Relevant principles of good medical and social care for older people are: To promote good health in late life a-That health and social care delivery will be based on need rather than age and avoid Discrimination. b-The prevention of illness c-The reduction of disability. d-Involvement of older people in the management choices of their illness and decisions on future care, to support them while in hospital and in their own homes should help with the preservation of their Dignity , Autonomy and Respect. Keywords : Dignity

SS25 308-R-3

EFFECTIVE ADVOCACY BY AND ON BEHALF OF OLDER PERSON: INPEA SURVEYS STUDIES, EXPERIENCES AND LESSONS LEARNED

Susan SOMERS (*Secretary General, International Network for the Prevention of Elder Abuse (INPEA), USA*)

Recently there is a focus of attention towards a New Convention on the Rights of Older Person. However, while UN Conventions are agreed to by Governments, support cannot be build without the backing and advocacy of Older Persons, themselves. Professionals and para professionals as well as all Civil Society Organizations can play key roles in raising awareness and educating both individuals and policy makers that older persons right are being violated and deserve protection. Through a comparison of soft vs hard laws, delegates will come to understand the gaps in protection with respect to older persons. Delegates will learn what efforts being made at the Regional and National Levels towards an international instrument. Delegates will have the tools and information to join in the protection of the rights of older persons. Keywords : Human Rights of Older Persons

GOLDEN AGING FORUM: AGING IN PROPRIOCEPTION AND ROLES OF PROPRIOCEPTION IN REHABILITATIONS

SS25 309-C-1

CONFIDENCE IN MOBILITY OF OLDER ADULTS THROUGH THE PROPER ASSESSMENT AND REHABILITATION OF ANKLE PROPRIOCEPTION

Gahyun YOUN (*Department of Psychology, Chonnam National University, Korea*)

Introduction : Age related subtle deteriorations in proprioception and the effects of proprioception in rehabilitations for the patients with mobility limitations such as acute stroke and total ankle arthroplasty are not well understood, while the significance of proprioception in the normal aging and in the recovery process of those conditions is widely emphasized. Method : This symposium reveals subtle but significant changes in ankle proprioception that are evident in normal aging through the new assessing technique developed in the Baltimore Longitudinal Study of Aging (BLSA). Following two clinical studies performed in Chonnam National University examined the relationships between proprioception and rehabilitations. Results : Age-associated declines in ankle proprioception were found in older adults in the tasks of rotation detection and rotation tracking. Patients of total ankle arthroplasty showed deficit of motor control due to dynamic postural imbalance and ankle proprioception loss. Clinical study also showed that proprioception training can have improved effect on walking ability restoration in acute stroke patients compared to conventional balance training. Conclusion : Together these findings highlight the biomechanical roles of proprioception which are not only age-associated, but also strongly related with rehabilitation procedures. Keywords : Aging, Proprioception, Rehabilitation

SS25 309-C-2

SEX-SPECIFIC AGE-ASSOCIATION IN THE ANKLE PROPRIOCEPTION OF OLDER ADULTS: RESULTS FROM THE BALTIMORE LONGITUDINAL STUDY OF AGING

Seung Uk KO¹, Eleanor M. SIMONSICK² (*1. Mechanical Engineering, Chonnam National University, Korea; 2. Clinical Research Branch, National Institute on Aging (NIA/NIH), USA*)

Introduction : Proper functioning in ankle proprioception is essential

for normal gait and posture given that awareness of position and motion in the most distal segment of lower extremity is fundamental for feedback control in those activities. The aim of this study was to identify gender specific age-associations in ankle proprioception in older adults with custom-designed proprioception test instrument. Method : Testing protocol was based on passive and passive-to-active ankle rotational tasks from 289 participants (131 women) in the Baltimore Longitudinal Study of Aging (BLSA) who were between 51 to 95 years old. Threshold for detecting slow ankle angular movement in women and men were 0.97, and 1.13 degree, respectively, and were significantly higher with older age ($p < 0.001$, for both). Results : No age-association was found for ankle positional matching. Ankle tracking performance in women and men, in a cross-correlation coefficient were 0.91 and 0.89, respectively, and were lower with older age both in women and men ($p = 0.018$, and $p = 0.011$, respectively). Conclusion : Findings in the present study prompt future studies to determine whether these age-associated declines in ankle proprioception are still evident in the longitudinal study, and also how these specific declines of ankle performance are related with age-associated chronic disease such as knee or hip OA, and type II diabetes, thus affecting daily activities such as gait. Keywords : proprioception, aging, mobility limitation

SS25 309-C-3

EFFECT OF BIOFEEDBACK BALANCE TRAINING ON WALKING ABILITY IN ACUTE STROKE PATIENTS

Sam-Gyu LEE, Min-Keun SONG, Hyun-Sik YUN, Jae-young HAN, In-sung CHOI (*Department of Physical & Rehabilitation Medicine, Research Institute of Medical Sciences, Chonnam National University Medical School & Hospital, Korea*)

Introduction : Well-equipped biofeedback balance training (BBT) revealed positive effects on meaningful functional activities such as walking ability in elderly and chronic stroke patients. We aimed to evaluate the effect of BBT on walking ability in acute stroke patients. Method : Seventeen first-ever acute hemiplegic stroke patients were recruited. Nine patients were assigned to experimental group and eight patients were assigned to control group. All patients could walk under supervision or independently. Experimental group performed BBT using 3-dimension dynamic posturography system, which can provide visual biofeedback and quantify the proprioceptive sense and balance function. In experimental group, BBT was performed for 30 minutes a day, 3 days a week, for 2 weeks. In control group, conventional balance training (CBT) using balance board and weight shifting exercise program was performed, instead of BBT. NeuroRehabilitation program for all stroke patients was done for 30 minutes per session, two sessions a day, 5 days a week, for 2 weeks. Timed up and go (TUG) test and 10 meter walking test were conducted, and Berg balance scale (BBS) was evaluated in both groups before and after study program. Results : 1) TUG test, 10 meter walking test and BBS were not different between both groups before study program. After study program, Δ TUG test, Δ 10m-walking test and Δ BBS were more significantly improved in experimental group than control group, respectively ($p=0.022$, $p=0.023$ and $p=0.029$). Conclusion : BBT would be more effective to improve balance function and walking ability than CBT in acute stroke patients. Keywords : Stroke, Balance, Walking

SS25 309-C-4

STATIC AND DYNAMIC POSTURAL BALANCE AFTER SUCCESSFUL MOBILE-BEARING TOTAL ANKLE ARTHROPLASTY

Keun-Bae LEE (*Department of Orthopaedics, Center for Ageing and*

Geriatrics, Chonnam National University Medical School and Hospital, Korea)

Introduction : Osteoarthritis can affect normal locomotion and postural balance via a proprioceptive mechanism. And because arthroplasty can partially restore joint sensation and motion, it can also enhance motor coordination and functional stability. The purpose of the present study was to investigate static and dynamic postural balance after successful total ankle arthroplasty by using dynamic posturography. **Method :** Thirty patients (21 men, 9 women; mean age, 58 years) who underwent unilateral total ankle arthroplasty with a cementless mobile-bearing ankle prosthesis and 30 age- and sex-matched healthy control subjects were included. Using computerized dynamic posturography, sensory (sensory organization test [SOT]), and motor (limit of stability [LOS], rhythmic weight shift [RWS], and weight bearing) impairment assessments were performed at an average of 15 months after total ankle arthroplasty. **Results :** In the SOT, results of the SOT-2 test reflecting mainly proprioception showed no significant difference between patients and controls, but patients demonstrated significantly lower scores for SOT-4, -5, and -6 as a measure of dynamic postural balance and required more hip movement to maintain balance. In the motor-control tests, patients showed significantly lower measures in indices of LOS test except the mean reaction time and the forward/backward directional control and on-axis velocity of the RWS test. Weight bearing was observed asymmetrically in patients. **Conclusion :** Patients had a higher degree of dynamic postural imbalance and relied less on ankle strategy to maintain balance than controls. Also, patients showed the deficit of motor control ability as compared with age- and sex-matched healthy controls. **Keywords :** Postural balance, Ankle osteoarthritis, Total ankle arthroplasty

INFLAMMATORY BIOMARKERS AND FRAILTY: THE STATE OF THE ART

SS25 310-C-1
INFLAMMATION AND FRAILTY: WHAT LINK?

Tamas FULOP¹, Anis LARBI², Graham PAWELEC³, Janet MCELHANEY⁴ (1. Medicine, Universite de Sherbrooke, Canada; 2. Singapore Immunology Network (SIgN), Biopolis, A*STAR, Singapore; 3. Internal Medicine II, University of Tubingen, Germany; 4. Geriatric Research, IRSC, Canada)

Introduction : Age-associated frailty is a collection of clinical observations that still lacks consensus in the field of geriatrics, with no specific biomarkers identified yet and where controversies exist. The main reason is that we do not understand the patho-physiological mechanisms underlying frailty. One of the most often evoked mechanisms is inflammation due to the relationship between aging and low grade inflammation (“inflamm-aging”). **Method :** Revision of the literature in relation to the inflammatory markers (biomarkers) related to frailty. Measurement of the frailty index in 40 healthy elderly and 40 type 2 diabetic elderly subjects and correlate it to various inflammatory markers: pro-inflammatory cytokines, CRP and beta microglobulin. **Results :** Our data confirm the findings of the literature as the frailty index is strongly correlated to the inflammatory markers measured in our study. The literature revision showed that the most consensual pathophysiological pathway leading to frailty is the inflamm-frailty. Inflammatory parameters may serve as biomarkers for frailty. **Conclusion :** Frailty is partly caused or associated with systemic inflammation. Whether this is an independent process from aging is still unresolved as aging is also associated with inflamm-aging. Thus further studies are needed to unravel the exact relationship

between frailty and inflammation and determine the specificity of the inflammatory biomarkers. , biomarkers

INFLAMMATION AND FRAILTY IN A CHINESE POPULATION

Anis LARBI¹, Shwe Zin NYUNT², Anusha VASUDEV¹, Feng LIANG², Crystal Tze Ying TAN¹, Shamini AYYADHURY¹, Tze Pin NG² (1. Singapore Immunology Network (SIgN), A*STAR, Singapore; 2. Gerontological Programme, NUHS, Singapore)

Introduction : Frailty is limiting the autonomy of elderly individuals and may account as a co-morbidity. Because of its chronic and worsening characteristics, frailty should be considered as a major condition in the elderly that requires attention. Most of age-related conditions are associated with certain pro-inflammatory molecules suggesting an immunological component in chronic conditions. **Method :** Within the Singapore Longitudinal Aging Study (SLAS), we have stratified the elderly based on age, gender and frailty. A comprehensive clinical assessment enables an accurate stratification of these Chinese population based on nutrition, cognition, lifestyle and medical history. Additionally we investigated immunological history as well as SNPs profile of these individuals. Finally, we tested the level of a series of molecules associated with inflammation and metabolism. **Results :** We identified associations between frailty and sIL-4R, CCL7 and CCL1. These molecules are mainly produced by T cells suggesting an activation of the adaptive immune system. The fact that CD57+ gamma/delta T cells are also associated with frailty score confirms this assumption. The data also shows that frailty is more prevalent in demented individuals (MMSE<25). The association with other molecules will be discussed. **Conclusion :** We identified molecules significantly associated with frailty. The complexity of aging and the association with multiple conditions reinforce the necessity to stratify the elderly population further in order to better understand healthy aging vs. age-related diseases. **Keywords :** Inflammation , Genetics, Frailty

SS25 310-C-3
BIOMARKERS OF INFLAMMAGING: “BGRZB” IN INFLUENZA AND CHRONIC DISEASE PROGRESSION

Janet Elizabeth MCELHANEY (Medicine, Advanced Medical Research Institute of Canada, Canada)

Introduction : “Inflamming”, the chronic elevation of inflammatory mediators, appears to critically weaken the immune system as we age. Cytomegalovirus (CMV) persistently stimulates and exhausts the immune system, driving CD8+ T cells to a late stage or terminally differentiated (senescent) state. CD8+ T cells clear influenza from infected lung tissue. **Method :** We measured granzyme B (GrzB), a key component of this response, in resting and influenza-stimulated CD8+ T cells. **Results :** We observed that a high proportion of senescent CD8+ T cells accumulate with persistent CMV infection and abnormally express GrzB. This led us to the discovery of a biomarker called, “bGrzB”, the level of which increases with age and is 3-4 fold higher in CMV+ve vs. CMV-ve older adults. Older people with chronic lung disease (CLD) or heart failure (HF) also have increase levels of bGrzB. GrzB is co-localized with CD8+ T cells in atherosclerotic lesions in humans and leads to plaque instability by inducing apoptosis in vascular smooth muscle cells and by degrading the extracellular matrix. A similar role in the progression of CLD has been postulated. Our studies showing that in HF, GrzB is released from CD8+ T cells in the presence or absence of influenza, presumably due to the chronic inflammatory stimulus associated with

HF. Conclusion : In consequence, bGrzB may be a common thread between the immune dysfunction, the increased risk of complications from influenza and pneumonia, and progression of frailty in heart and lung disease in older adults. Keywords : Granzyme B, Older adults, Chronic Disease

VISION AND HEARING IMPAIRMENTS IN OLDER PEOPLE ? WHO CARES?

SS25 312-R-1

IS THE VISION CARE PROVIDED TO NORWEGIAN NURSING HOME RESIDENTS ADEQUATE?

Helle K. FALKENBERG, Irene LANGEGGEN, Janne DUGSTAD (*Department of Optometry and Visual Science, Buskerud University College, Norway*)

Introduction : The Norwegian health care act requires all nursing homes to provide high quality health care, based on individual needs. We measured the vision and hearing of residents at Eikertun nursing home in order to assess whether the eye and ear care provided is adequate. Method : Vision was measured in 45 nursing home residents aged 70-101 years and 49 age-matched controls living at home. All performed with informed consent. Visual functions were assessed by an optometrist. 30 residents also had pure tone audiometry measured by an audiologist. Vision and hearing aids and/or referrals to an ophthalmologist/ENT specialist were provided as appropriate. Results: Nursing home residents suffer from dual sensory loss. Visual functions and pure tone hearing thresholds are impaired. 20 of the residents had not had an eye test during the last 5 years, 17 residents were visually impaired, and 18 were referred to an ophthalmologist. 30 residents were given new glasses. 27 residents had impairment hearing in one or both ears; only 3 of these had a hearing aid. All 30 residents were recommended a new hearing aid. Conclusion : Visual loss due to uncorrected refractive errors is a major cause of visual impairment in nursing home residents, and dual sensory loss is common. Our results indicate that the eye/ear health care could be improved by regular examinations to ensure appropriate vision and hearing aids. Moreover, skill development of nursing staff is necessary on how to recognize and care for patients with vision and hearing loss. Keywords : vision, hearing, ageing, dual sensory loss

SS25 312-R-2

HEARING LOSS IN THE ELDERLY - WHO CARES?

Jorunn SOLHEIM (*Ear-Nose-Throat Department, Lovisenberg Diakonale Hospital, Norway*)

Introduction : Because the elderly population is growing, the number of hearing-impaired persons and the need for appropriate audiological rehabilitation services to alleviate this impairment are increasing. Many elderly people experience particular difficulty because their hearing loss comes as an extra burden in addition to other health problems. Institutionalized elderly are a vulnerable group due to physical and mental impairment. Health professionals could be the ones who identify sensory loss, initiate intervention and ensure that

aids are being used among those receiving residential care, if they had more knowledge and skills. However, studies have shown that health professionals in nursing homes have limited knowledge of hearing loss and the use and maintenance of hearing aids. Method : In the present study, 220 health professionals working in nursing homes in Norway were asked to complete a questionnaire related to hearing loss in the elderly and practical use of hearing aids. Results : The results showed that none had sufficient knowledge of function and handling of hearing aids. Scarcely half knew how to place a hearing aid battery and 5% knew how long it would last. Almost 50% stated that they believed that institutionalized elderly likely became isolated due to hearing loss. Conclusion : A major challenge for audiological rehabilitation is facilitating the use of fitted hearing aids. The limited knowledge and skills of caregivers must be addressed in order to meet the needs of hearing-impaired elderly in residential facilities. Keywords : Elderly, hearing impaired, nursing home, audiological rehabilitation

SS25 312-R-3

CHANGES IN QUALITY OF LIFE AMONG OLDER SENSORY IMPAIRED PATIENTS - ONE YEAR AFTER A HIP FRACTURE

Else Vengnes GRUE (*Nursing and Health, Diakonhjemmet University College, Norway*)

Introduction : Persons who experience a hip fracture are at high risk of impaired quality of life. Our aim was to identify changes in health related quality of life (HRQOL) in patients with hip fracture one year after the incidence. Method : During 2004-2006 a number of 331 hip-fracture patients were recruited from two acute-care-hospitals. Inclusion criteria were age 65 years or older and admitted from own home. Information about pre-fractured period was collected retrospectively using the Inter Resident Assessment Instrument for Acute Care and Short-Form 12-Item Health Survey (SF-12) at day three post surgery. Follow-up assessment was done after one year. Results : Pre-fractured mean value on SF-12 Physical Health Composite Scores (PCS) and SF-12 Mental Health Composite Scores (MCS) was, 42.8 (SD 11.3) and 43.8 (SD 6.2) respectively. The PCS mean value, follow up, was lower [38.4 (SD10.7), $p < 0.001$] but not MCS mean value [44.5 (SD 6.3), $p = 0.153$]. Regression analysis showed that severe pain, inactivity, dependent in stair-climbing and outdoor-walking explained 21% of the variance of low (< mean value) PCS scores. The latter variable had also an impact on the MCS scores. Persons with dual sensory impairment had lower mean PCS score pre- and post fractured, 3.3, $p = 0.010$ and 4.3, $p < 0.001$ respectively. Conclusion : Interdisciplinary intervention programs aimed at providing adequate sensory and pain management, inspire and empower people with hip fracture to maintain daily activity and regain an active lifestyle, stair-climbing and walk outdoors may improve HRQOL. Keywords : Hip fracture, HRQOL, Sensory impairment

EXERCISE AND COGNITION IN OLDER ADULTS: TESTING THE CARDIORESPIRATORY HYPOTHESIS WITH FUNCTIONAL NIRS

Cedric T. ALBINET¹, Kevin MANDRICK², Pierre Louis BERNARD², Stephane PERREY², Hubert BLAIN² (*1. CerCA, CNRS, University of Poitiers, France; 2. Movement to Health (M2H), Euromov, Montpellier-1 University, France*)

Introduction : This study examined whether cardiorespiratory fitness (high maximal oxygen uptake - VO₂max - level) in older women improves executive processes associated with a better prefrontal cortical functioning. To test this so-called cardiorespiratory hypothesis, we measured local hemodynamic parameters in the bilateral dorsolateral prefrontal cortex (DLPFC) of all the participants using functional near-infrared spectroscopy (fNIRS) during the execution of a Random Number Generation (RNG) task, involving executive processes. **Method :** Forty women (61-77 years) performed a progressive maximal exercise on an ergocycle with gas analyzer and were classified as aerobically fit (VO₂max = 29.8 ml/kg/min) or unfit (VO₂max = 20.1 ml/kg/min). All the participants performed the RNG task and a control counting task at two different rates paced by a tone. A two-channel NIRS device (NIRO-200, Hamamatsu Photonics) recorded simultaneously in the right and left DLPFC, variations in oxygenated hemoglobin (HbO₂) during the experimental and control counting tasks. **Results :** The results revealed that, whatever the rate, high fit participants scored better ($p < .05$) on the RNG task than unfit participants. Also, during the RNG task, unfit participants showed a significantly ($p < .05$) reduced HbO₂ level in the right DLPFC compared to the left DLPFC, while high fit participants showed a similar cortical activation in the bilateral DLPFC. **Conclusion :** These preliminary results could be interpreted as the ability for the high fit women to recruit additional brain resources for improving their cognitive performance. This will be discussed as a potential form of compensation according to recent models of neurocognitive aging. **Keywords :** VO₂max, Executive Functions, Cerebral oxygenation

SS25 313-S-2

THE MODERATING ROLE OF 3 GENETIC POLYMORPHISMS ON THE EXERCISE/COGNITION RELATIONSHIP IN THE ELDERLY

Michel AUDIFFREN¹, Cedric ALBINET¹, Nathalie ANDRE², Romuald BODIN³, Marie-Helene JACQUES³, Claude FERRAND⁴, Alain KITZIS⁵ (1. Sport Sciences, University of Poitiers / UMR CNRS 7295, France; 2. Sport Sciences, UMR CNRS 7295, University of Poitiers, France; 3. Social Sciences, University of Poitiers, France; 4. Psychology, University of Tours, France; 5. Biology, University of Poitiers, Poitiers University Hospital, France)

Introduction : Several epidemiologic studies conducted in North America and in Europe have shown that the regular practice of a physical activity, in opposition to a sedentary lifestyle, is associated with a reduced risk of developing neurodegenerative diseases such as Alzheimer Disease (AD). These results have been strengthened by cross-sectional and interventional studies, which have shown that physical activity slows down the decline of cognitive functions typically observed in normal and pathological aging and retards the onset of dementia. Apolipoprotein E (ApoE), brain-derived neurotrophic factor (BDNF) and catechol-o-methyltransferase (COMT) genotypes have also been associated with cognitive performance and AD in elderly. The principal aim of this study was to examine the interactive effects of these three genetic polymorphisms with lifestyle factors on cognition in older adults. **Method :** Retired older people (Age > 54 years; N > 300) from Poitou-Charentes (France) provided buccal cells sample to allow for assessment of the ApoE, BDNF and COMT genotypes, completed cognitive tests and physical activity questionnaires (Historical Leisure Activity Questionnaire). Primary outcome variables were the cognitive performances measured in the Stroop test, the Logic Memory test and the Letter Comparison task. Secondary outcomes were variables related to cognitive reserve and metacognitions. **Results :** Analyses of variance and regression analyses were conducted to examine the

association of physical activity with cognitive performance as a function of genotype profile and other moderators. **Conclusion :** The preliminary results from this study suggest an association between lifestyle factors related to physical activity and cognitive performance in older adults at most genetic risk for neurodegenerative disease. **Keywords :** Physical activity; Episodic memory; Executive function

SS25 313-S-3

BENEFITS OF EXERCISE TRAINING ON COGNITION AND QUALITY OF LIFE IN SEDENTARY AND FRAIL OLDER ADULTS

Louis BHERER (PERFORM Centre, Concordia University, Canada)

Introduction : An increasing number of studies have suggested that people should adopt physical activity and exercise as part of their lifestyle to alleviate the negative impact of chronic disease and aging on the body and mind. Studies with healthy senior suggest that physical exercise can help improve cognition and quality of life. Whether frail older adults can show such benefits remains to be documented. We assessed the impact of 3-month exercise training program on cognition and quality of life in sedentary and frail older adults. **Method :** Participants aged 61-89 years were assigned to an exercise-training group (3 times a week for 12 weeks) or a control group (waiting list). Frailty was determined by a complete geriatric examination using specific criteria. Pre- and post-test measures assessed physical capacity, cognitive performance, and quality of life. **Results :** Compared with controls, the intervention group showed significant improvement in physical capacity (functional capacities and physical endurance), cognitive performance (executive functions, processing speed, and working memory), and quality of life (global quality of life, leisure activities, physical capacity, social/family relationships, and physical health). Benefits were overall equivalent between frail and nonfrail participants. **Conclusion :** Physical exercise training leads to improved cognitive functioning and psychological well-being in frail older adults. **Keywords :** Physical exercise, Cognitive function

SS25 313-S-4

MODERATORS AND MEDIATORS OF EXERCISE-RELATED BRAIN PLASTICITY IN THE ELDERLY

Kirk ERICKSON¹, Louis BHERER² (1. Psychology, University of Pittsburgh, USA; 2. Montreal Geriatric Institute, University of Quebec, Canada)

Introduction : Physical activity has been associated with a reduced risk of dementia, enhanced executive function and episodic memory, and improved mood. Yet, only recently have the consequences of physical activity on neural systems been more thoroughly described in humans. In this talk I will review the effects of physical activity on brain health throughout the lifespan, with an emphasis on mediators and moderators of the effect. **Method :** A number of moderators and mediators have been examined including molecular factors like BDNF and inflammation as well as behavioral effects like sleep. We have also examined genetic moderators of the effect including BDNF and COMT polymorphisms and dietary factors such as omega-3 levels. **Results :** Through a series of studies we have found that both molecular pathways and behavioral pathways likely influence the ways in which exercise influences the brain. Specifically, changes in serum BDNF levels with one-year of exercise is correlated with changes in hippocampal volume. In addition, the BDNF polymorphism moderates the association between physical activity and working memory function. Finally, we find that plasma levels of omega-3 moderated the effect of physical activity on cognitive function. **Conclusion :** Our

studies indicate that several factors modify the effects of physical activity on cognitive and brain health throughout the lifespan and that mediators of the effect can be examined on multiple levels including molecular pathways and behavioral pathways (e.g. sleep). Keywords : physical activity, moderators, mediators

SS25 316-R

GLOBAL APPROACHES TO POLICY SUPPORTING WORK AND CARE IN LATE MIDDLE AGE

SS25 316-R-1

HARMONISATION OR DIVERGENCE IN EUROPE'S WELFARE SYSTEMS? IMPLICATIONS FOR POLICY ON FAMILYCAREGIVING

Sue YEANDLE¹, Madeleine STARR² (1. *Sociology and Social Policy, University of Leeds, United Kingdom*; 2. *Head of Innovation, Carers UK, United Kingdom*)

Introduction : This contribution will address the question of whether European welfare systems are converging or diverging in how they address growing care needs among their populations, which arise in large part as a result of population ageing. Method : It will review dimensions of social policy where approaches are becoming increasingly differentiated, and at common trends and patterns in support to older people and those who provide care for them within their families and neighbourhoods. The trends explored will include the tendency to involve both third sector (not-for-profit) organisations and private companies in the delivery of services to older people, both in domiciliary and residential settings, and the growing awareness that family members (and others who care unpaid for older people in their kin groups or communities) include many people of working age who need support - through public policy, accessible services, or flexibility at work - to reconcile their participation in paid work, or their ability to progress in their career, with the often unpredictable and sometimes temporary care needs they wish or need to meet. Results : The contribution will consider how and why the profile of family caregiving has risen up the policy agenda in the EU in the past decade, paying particular attention to the role of the supranational voluntary organisation Eurocarers in shaping policy thinking and debate at EU level, concluding with some reflections on the challenges of current economic conditions in Europe. Conclusion : The speaker will draw on her knowledge/membership of the 'Employers for Carers' group in presenting concluding remarks. Keywords : carers; employment; ageing

SS25 316-R-2

REFLECTIONS ON AUSTRALIAN AND NEW ZEALAND POLICY INITIATIVES IN THE INTERFACE BETWEEN WORK AND CARE

Kate O'LOUGHLIN¹, Hal KENDIG² (1. *University of Sydney, Australia*; 2. *Centre for Research on Ageing, Health and Wellbeing, The Australian National University, Australia*)

Introduction : Workforce participation and informal caregiving are central to global capacities to respond constructively to rapid population ageing yet they are inadequately researched and understood. This paper will review the impacts and uptake of national initiatives implemented by governments in both Australia and New Zealand (NZ) in the last five years to address the interface between work and care, particularly as they apply to carers in late middle age. These initiatives are intended to better support family carers to retain or regain access to paid work, while maintaining their caregiving roles as family members. Method : Consideration will be given to the five

objectives contained in the NZ Carers' Strategy (2008) and Five Year Action Plan including the 5th objective: 'Provide training and pathways to employment for carers'. The effects of the legislative amendment allowing employed family carers to request "flexible working hours" will also be reviewed. For Australia, consideration will be given to the six priority areas in the National Carer Strategy Action Plan (2011-2014), with particular emphasis on reviewing Priorities 3 and 6 which address carers' economic security and opportunities to participate in paid work and health and well-being respectively. Results : In combination, these policy initiatives and their outcomes raise questions about the effectiveness of each mechanism to modify the work-care interface in a meaningful way. To date, the strategies in both countries appear to have not gained much policy or practical traction, in terms of implementation or impacts. Conclusion : The utility of comprehensive carers' strategies needs to be critically assessed. Keywords : Caregiving, older workers, Australia/New Zealand

SS25 316-R-3

CARING IN THE FACE OF A RAPID CHANGING SOCIETY: POLICY IMPACT OF DEMOGRAPHIC AND ECONOMIC SHIFTS IN CHINA

Xiaomei PEI¹, Hao LUO¹, Dale YEATTS², Haowei WANG¹ (1. *Sociology, Tsinghua University, China*; 2. *Sociology, University of North Texas, USA*)

Introduction : This study examines the impact of demographic and economic transitions on intergenerational support within families and the implications for policies on social care in China. Specific focus is given to explore the expectations of family support for the aged and the reality of flows of care, resource allocation, sharing and obligations within Chinese families. Method : The study used selective national survey data to illustrate current gaps between social beliefs in family care and the reality. Regression analysis was used to examine factors such as family size, household income, migration of adult children, geographic location, etc... on financial transfer and reciprocal support between generations within families. A comparison of intergenerational support by region intended to identify the impact of economic development on intergenerational exchanges. Results : The analyses indicate increasing difficulties of maintaining close family ties, weakening of traditional beliefs in family care for aged members, and efforts to reconstruct intergenerational care under the impact of economic, social, and cultural transitions. Gaps between beliefs in family care and realities have been found to exist. Regional variation seems to point to the positive effect of economic development on intergenerational support. Conclusion : It has been confirmed by the evidence that traditional practice of family support for the age people is seriously challenged by the rapid demographic and economic changes in China. Implications for policy development are discussed and an attempt is made to theorize family relations of societies experiencing rapid modernization under the framework of intergenerational solidarity. Keywords : family care, social transition, internengational relation

SS25 316-R-4

CAREGIVING FOR OLDER PEOPLE IN CONTEXTS OF POVERTY IN SUB-SAHARAN AFRICA: RECOGNIZING AND ADDRESSING A 'CULTURAL LAG'

Isabella ABODERIN¹, Jaco Retief HOFFMAN² (1. *APHRC/ OIPA, APHRC / Oxford University, Kenya*; 2. *AUTHeR / OIPA, NWU / Oxford University, South Africa*)

Introduction : A small number of investigations of the realities of long-

term care for functionally dependent older persons in sub-Saharan Africa has recently emerged, highlighting the overwhelming role of informal care provided by family members of all ages, but often in middle- and old age. This paper critically examines the orientation and findings of this body of work with a view to distilling key implications for policy discourses and further research. Method : A systematic review of existing empirical research and content analysis of regional- and national-level policy documents on long-term care for older persons in SSA. Results : There is a marked disconnect between the realities of long-term care in contexts of poverty and dominant African policy discourses on this issue. Empirical evidence shows profound inadequacies in care provision, major economic, mental, and physical caregiver strain and a clearly emerging demand for formal care services. Official African policy discourses, which remain unconstested, continue to underline the 'asset' of traditional family care as part of a broader emphasis on customary African values as a bedrock for 'homegrown' development in the region. Conclusion : Research on long-term care of older people in SSA must engage critically and actively with the dominant African realities and discourses on the issue, in order to address the 'cultural lag' inherent in them, and to enable a proper debate on formal policy options to mitigate caregiver strain and care inadequacies. Keywords : Caregiving; poverty; sub-Saharan Africa

SS25 317-B **RISK PROFILE AND GENETICS IN HEALTHY AGING**

SS25 317-B-1 **LOW CARDIOVASCULAR DISEASE RISK PROFILE AND HEALTHY LIFESTYLE IN A MIDDLE AGED AND OLDER COHORT STUDY IN TAIWAN**

Marion M. LEE¹, Kiang LIU², Chu-chih CHEN³ (1. Department of Epidemiology and Biostatistics, University of California at San Francisco School of Medicine, USA; 2. Department of Preventive Medicine, Feinberg School of Medicine, Northwestern University, USA; 3. Institute of Population Health Sciences, National Health Research Institutes, Taiwan)

Introduction : To determine the association between cardiovascular disease (CVD) low risk profiles (LRP: untreated cholesterol < 200 mg/dL, untreated blood pressure < 120/80 mmHg, non-smoker, and no history of diabetes and myocardial infarction) and healthy lifestyle (HLF: body mass index < 25 kg/m², moderate physical activity, no or moderate alcohol drinking, higher healthy diet score) and CVD in elder Taiwanese aged 55 and above. Method : The study design is cross-sectional and the setting is community-based. The participants were 2935 community-dwelling adults aged 55 and older, who participated in the Healthy Aging Longitudinal Study in Taiwan (HALST). In this talk, the measurements were fasting plasma glucose, serum cholesterol (CHOL) and its subfractions, systolic/diastolic blood pressures (SBP/DBP), triglycerides, and BMI. Results : A total of 692 diseased subjects were identified, with 268 (9%) and 52 (<2%) subjects met the LRP and HLF criteria, and 48 and 8 of them had CVD, respectively. The mean (untreated) CHOL and SBP were higher in non-CVD participants aged 75 years and older (195.6 vs. 182.4 mg/dL and 131.7 vs. 125.9 mmHg, respectively). In contrast, the CVD prevalence decreased with the number of factors of HLF (including a higher psychosocial score of sum of social network and psychological health scores) and was consistent for all the age groups. Conclusion : Participants with HLF of non-obese, moderate physical activity, and well psychosocial functioning had lower CVD prevalence. However, the associations between CHOL < 200 mg/dL had reverse association with CVD for the individuals aged 65 and older, as well as

SBP/DBP < 120/80 mmHG for those aged 75 and older. Keywords : likelihood ratio; psychosocial; reverse association

SS25 317-B-2 **LIFETIME GENETIC RISK OF VARIOUS CANCERS PREDICTED BY GERIATRIC EXOME-WIDE ASSOCIATION STUDY OF 2306 CONSECUTIVE AUTOPSIED CASES IN TOKYO**

Masashi TANAKA¹, Motoji SAWABE², Tomio ARAI³, Seijiro MORI⁴, Masaaki MURAMATSU⁵, Makiko Naka MIENO⁶, Takuma TANAKA⁷ (1. Department of Genomics for Longevity and Health, Tokyo Metropolitan Institute of Gerontology, Japan; 2. Section of Molecular Pathology, Tokyo Medical and Dental University, Japan; 3. Department of Pathology, Tokyo Metropolitan Geriatric Hospital, Japan; 4. Department of Internal Medicine, Tokyo Metropolitan Geriatric Hospital, Japan; 5. Department of Molecular Epidemiology, Medical Research Institute, Tokyo Medical and Dental University, Japan; 6. Department of Molecular Informatics, Jichi Medical University, Japan; 7. Department of Computational Intelligence and Systems Science, Interdisciplinary Graduate School of Science and Engineering Tokyo Institute of Technology, Japan)

Introduction : Under the multistage carcinogenesis hypothesis, the accumulation of mutations in cancer stem cells is influenced by the combination of both genetic and environmental factors. To elucidate the molecular mechanisms underlying the gene-environment interaction in carcinogenesis, we analyzed organ-specific lifetime genetic risks of various cancers by performing a geriatric exome-wide association study (G-EWAS) at Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology. Method : The subjects were 2306 consecutive autopsy cases with various geriatric diseases, collected from 1995 to 2012. We performed exome-wide functional SNP genotyping with HumanExome BeadChips (Illumina Inc.) by use of DNA extracted from kidneys. The average call rate was 99.8%. A total of 110M missense and nonsense SNPs were detected among 16,000 genes. Associations were analyzed by the Fisher exact probability tests according to the recessive, dominant, and additive models. Results : Because females and males were exposed to different lifestyle factors, we selected the top 30 SNPs with significance levels of $p < 5 \times 10^{-4}$ for each gender and phenotype. These selected genes harboring the risk or protective SNPs associated with geriatric diseases were subjected to gene ontology analysis. These analyses suggested that distinct pathways are involved in the development and expansion of cancers in different organs. Comprehensive probability tests for multiple rare variants in each gene will be useful for integrating the results from the various East Asian countries participating in the International G-EWAS Project. Conclusion : G-EWAS is expected to reveal novel molecular targets of therapeutics not only for various cancers but also for and neurodegenerative disorders. Keywords : exome-wide association cancer

SS25 317-B-3 **IDENTIFICATION OF GENETIC VARIANTS FOR SUCCESSFUL AGING AND RELATED PHENOTYPES IN HALST ELDERLY BASED ON METABOCHIPS**

Chao Agnes HSIUNG¹, I-chien WU², Wen-chang WANG¹, I-shou CHANG³ (1. Institute of Population Health Sciences, National Health Research Institutes, Taiwan; 2. Division of Geriatrics and Gerontology, Institute of Population Health Sciences, National Health Research Institutes, Taiwan; 3. National Institute of Cancer Research, National Health Research Institutes, Taiwan)

Introduction : Both genetics and environmental factors play important

roles in successful aging and related phenotypes. In this talk we will identify genetic variants for traits such as “successful aging” or physical functions using metabochips, which is a customized chip with around 200K probes based on existing informations related to metabolic or cardiovascular endpoints. Method : The subjects were 1828 elderly with age older than 65, collected from 2008 to 2012 in the HALST (Healthy Aging Longitudinal Study in Taiwan). We performed SNP genotyping with MetaboChip (Illumina, Inc.) The average call rate was above 95%. Associations were analyzed by the PLINK software. Successful aging includes 3 major components: low probability of diseases and disease-related disability, high cognitive and physical functional capacity and active engagement with life. Results : The analysis revealed an association of the SNPs on chromosome 11 with “successful aging”. The results hold after adjusting for age and gender. The p-values are $<7 \times 10^{-6}$. The genes harboring the SNPs associated with successful aging are studied by the Model-based Gene Set Analysis (MGSA) and compared with those associated with physical functions including hand grip strength, summary performance score, gait speed, 6-min walk distance, time up-and-go. The results will be replicated on independent samples. Conclusion : A few genetic variants were identified for successful aging and related physical functions in Taiwanese elderly population. Replications to other elderly populations are planned. Keywords : association, successful aging, metabochip.

SS25 318-S

PROMOTING MENTAL HEALTH AMONG CHINESE OLDER ADULTS IN TRANSNATIONAL COMMUNITIES: CHALLENGES AND INNOVATION

SS25 318-S-1

MENTAL HEALTH AMONG CHINESE OLDER ADULTS IN HONG KONG: THE ROLES OF SLEEP DISTURBANCE AND LIFESTYLE FACTOR

Doris YU, Diana LEE (*The Nethersole School of Nursing, The Chinese University of Hong Kong, Hong Kong*)

Introduction : Older adults are more susceptible and vulnerable to mental health problem such as mood disturbance and depression. With increased advocacy on primary health promotion, this study examined the association between potentially modifiable lifestyle factors (including sleeping pattern, daily physical activity level, sport and exercise habit, and hobbies) and mental health of community-dwelling older adults. Method : The study was based on secondary analysis of data from two community-based surveys. Data was obtained from a total of 1,387 Chinese older adults in Hong Kong. They were recruited from elderly community center in different geographic regions. Questionnaires on lifestyle factors, sleep pattern, mental health and depression were administered. Results : Over 56% of Chinese older adults (mean age: 76.3+/-7.2) reported poorer mental health and about 28% had depression. After adjusting for demographic and disease-related characteristics, poor sleeping pattern was found to independently predict a three-fold increase in depression among the Chinese older adults. On the other hand, maintaining physically active lifestyle, doing regular exercise, maintaining hobbies such as practicing Tai Chi and watching television, and participating in group-based leisure activities were found to protect the mental health of Chinese older adults. Conclusion : The results of this study suggested that an active lifestyle with hobbies and an improved sleep pattern are important to protect the mental health of Chinese older adults. Interventions which target at modifying these lifestyle factors are not only acceptable to Chinese older adults, but are also considered as incurring less cost as compared with other professional therapeutic

intervention. Keywords : Lifestyle factors, mental health, Chinese older adults

SS25 318-S-2

SOCIO-CULTURAL DETERMINANTS OF MENTAL HEALTH OF AGING CHINESE IN CANADA: CHALLENGES AND INTERVENTION STRATEGIES

Daniel LAI (*Faculty of Social Work, University of Calgary, Canada*)

Introduction : Research findings on aging immigrants in Canada have consistently indicated that this population is less mentally healthy than their Canadian born counterparts. This presentation aims to examine the key social determinants of mental health as indicated in research on aging Chinese in this country. Method : This presentation is based on a comprehensive search of published research results addressing the specific challenges and needs faced by aging Chinese Canadians. In addition, secondary data analysis was conducted based upon an earlier survey of a random sample of aging Chinese of 55 years and older in Canada (n=2,272). Mental health variables measured include general mental health measured by the SF-36 and depressive symptom, measured by the Chinese version of the Geriatric Depression Scale. Various multiple regression analyses were used. Results : The results indicated that financial adequacy, acculturation variables, and barriers to accessing health services were particularly significant factors affecting health of the respondents. The challenges and needs that are identified in research findings have resulted in an innovative coalition of community partnership launched a community-based mental health promotion program to address the mental health needs of the aging Chinese in a medium Canadian city for over ten years. Conclusion : It is important to address the missing components and challenges in the existing health care and intervention systems. A strategic and systemic approach to sustain mental health promotion for culturally diverse older adults is needed for the improvement of mental health of the aging Chinese immigrants. Keywords : mental health, Chinese, immigrants, older adults, aging

SS25 318-S-3

SOCIAL EXCLUSION AND MENTAL HEALTH OF OLDER PEOPLE IN RURAL CHINA

Ai Mei GUO¹, Hongmei TONG², Daniel LAI² (*1. Ginling Women's College, Nanjing Normal University, China; 2. Faculty of Social Work, University of Calgary, Canada*)

Introduction : The growth of the aging population in China is an important reality facing professionals and policy makers working with older adults. The challenges and needs related to mental health faced of older adults, particularly those in rural areas in China have been understudied. Method : This research is based upon a cross-sectional research study of 499 older adults randomly selected from rural Jiangsu Province of China. Social exclusion was presented by the family adequacy, housing condition, social relations, participation and basic services. Mental health indicators include depression, loneliness, happiness, worries and life satisfaction. Bivariate statistics and multivariate regression analysis were used to examine the association between the social exclusion variables and mental health variables. Results : Using a social exclusion framework, this study finds that exclusions related to family adequacy, housing condition, social relations, participation and basic services are associated with various mental health indicators of the aging Chinese in rural communities. But, the contribution of the social exclusion variables to mental health varies among the various mental indicators when demographic and physical health variables are controlled. Conclusion : The results have pointed to the emerging mental health needs of the aging rural Chinese

population while this presentation will further discuss the structural factors related to mental health interventions and services for this population group. Keywords : aging Chinese social exclusion, mental health

SS25 318-S-4

MENTAL HEALTH AND DAILY FUNCTION AMONG OLDER ADULTS IN CHINA

Lili HU, Huali WANG, Xiaozhen LV, Xin YU (*Clinical Research Division, Peking University Institute of Mental Health, China*)

Introduction : Functional limitation is prevalent among older adults. In addition to the physical conditions, mental health status also plays an important role in maintaining the functional activity. This study was designed to explore the effects of depressive symptoms on the functional levels among older adults in China. Method : We used a new sample of 2685 middle-aged and older Chinese respondents (aged over 45 years) recruited in the CHARLS pilot survey in two quite distinct provinces --- Zhejiang, a high growth industrialized province on the East Coast, and Gansu, a largely agricultural and poor Province in the West. The 10 item version of Center for Epidemiological Studies Depression Scale (CES-D) was used to evaluate the presence of depressive symptom. A CES-D-10 cutoff score of 11 is indicative of "significant" or "mild" depressive symptomatology. The functional limitation scale was used to assess the level of daily function. Results : The prevalence of significant depressive symptoms was 29.2%. There was no gender difference in the prevalence of depressive symptoms. The individuals presenting significant depressive symptoms had more severe functional difficulty in daily activities ($P < 0.001$). There was a significant relationship between the severity of depressive symptom and the functional limitations ($r = 0.305$, $P < 0.001$). Conclusion : The depressive symptoms are common among older adults in China. The presence of depressive symptoms is associated with the functional disability among older population. The findings imply the significance of improving mental health status among older adults to improve their functional capability. Keywords : depression, functional limitation, older adults

SS25 323-C

GERIATRIC SURGERY: ADVANCES IN THE PERI-OPERATIVE MANAGEMENT OF GERIATRIC PATIENTS

SS25 323-C-1

PHYSIOLOGICAL CHALLENGES IN THE GERIATRIC SURGICAL PATIENT

Emile WOO (*Surgery, The University of British Columbia Providence Health Care, Canada*)

Introduction : The ageing patient presents unique challenges when undergoing surgery. This presentation will review the common physiological changes that occur in the geriatric patient and the relevance these changes have on perioperative management both from an anaesthetic and surgical viewpoint. Method : Literature and case series review. Conclusion : The ageing patient presents specific challenges when surgery is contemplated. However, if properly assessed, the resultant perioperative risks can be managed. Keywords: physiology, surgery

SS25 323-C-2

RISK STRATIFICATION AND SURGICAL CONSIDERATIONS IN GERIATRIC SURGERY

Kok-Yang TAN (*General Surgery, Alexandra Health, Khoo Teck Puat Hospital, Singapore*)

The management of elderly surgical patients has to be at a higher level compared to a younger patient. Geriatric surgical patients demand multi-faceted, holistic care. Considerations should include the physiological changes associated with ageing. Surgical management and planning for these patients must thus be holistic and all encompassing. It should be anticipatory of not only medical and surgical problems that may arise but also address the psychosocial issue that may arise. The aim should not only be to reduce morbidity and mortality in this group of patients but more importantly, their postoperative functional status should be addressed aggressively so as to preserve the independence of these patients. Indeed, in an elderly patient, failure to address all these issues may have a negative impact on the patients' outcomes. Treatment goals have to be clear when the elderly are treated. Appropriate informed consent is important to ensure a satisfactory outcome for all sides. Risk stratification takes an extra level of importance in the context of geriatric surgery. Risk stratification is not only essential for predicting perioperative morbidity and mortality, but, equally important is to predict return to baseline function. The heterogeneity of the elderly population provides added complexity of this risk stratification process. Surgical scoring systems, geriatric tools and frailty will be discussed here. Keywords : Surgery, risk, considerations

SS25 323-C-3

TRANSDISCIPLINARY CARE IN GERIATRIC SURGERY

Phyllis Xiuzhuang TAN (*Nursing Administration, Khoo Teck Puat Hospital, Singapore*)

Management of the elderly surgical patient is complex owing to the higher incidence of co-morbidities and reduced functional reserves. Many of these complexities go beyond the boundaries of an individual surgeon's expertise and team approach must take precedence. A coordinated and seamless transdisciplinary care model is a product of evolution from multidisciplinary care to a more integrated, collaborative and less compartmentalized approach. It dispenses of hierarchy, and communication is freeflowing and ongoing. This model aims to provide an integrated and coordinated assessment and care plan with an ultimate unified management. In order to provide the most holistic care to an elderly surgical patient, many interacting factors need to be considered. There are physiological changes associated with aging. Functional reserves of elderly surgical patients are poorer reducing the margin of error that could be allowed in the patient management. There are also other issues such as psychosocial, financial, chronic illnesses associated with polypharmacy, malnutrition and hygiene related problems that need to be considered in the setting of major surgery. Furthermore, geriatric surgery should aim not only to reduce morbidity and mortality but more importantly, post operative functional status should be aggressively addressed to preserve their independence. Failure to address all these issues may have a negative impact on the patient's outcomes. In this session, we describe how a transdisciplinary model of care enhances the recovery process and facilitates the early return to pre-morbid functional status during the peri-operative period of an elderly patient undergoing major surgery.

SS25 323-C-4

PREHABILITATION AND REHABILITATION

Janet KUSHNER-KOW (*Geriatric Medicine, Providence Health Care, Vancouver BC, Canada*)

Introduction : Little evidence exists to support whether the type and targeting of physical and functional optimization before surgery can improve outcomes, and whether it can prevent the need for extensive rehabilitation. Method : A retrospective review of perioperative

outcomes was done. A pilot prospective trial of geriatric prehabilitation was done at a community hospital in patients over 70 who were booked for general surgery. Results : Results will be presented of the preliminary outcomes of patients who had prehabilitation. Conclusion : Data will be incorporated into a full trial of prehabilitation and future directions will be presented. Keywords : prehabilitation rehabilitation surgery

CURRENT STUDIES BY THE ASIAN WOMEN'S HEALTH RESEARCH NETWORK

SS25 324-R-1

A POPULATION STUDY OF THE SELF-CARE BEHAVIORS AND THEIR ASSOCIATED FACTORS AMONG KOREAN ELDERLY WOMEN WITH HYPERTENSION

Seung Hee LEE¹, Soon-Ok YANG² (1. Department of Nursing, The University of Ulsan, Korea; 2. Division of Nursing, Hallym University, Korea)

Introduction : Hypertension is one of the most common chronic illnesses in Korean older adults and the complications have been a major health concern to the patients, their family, and society. The purpose of this study was to examine the self-care behaviors and their associated factors among elderly Korean with hypertension. Method : Data for this study came from the 2009 Korea National Health and Nutrition Examination Survey. Subjects with hypertension diagnosed by medical doctors, aged 60 years or older were included. Self-care behaviors included the following: taking medicine regularly, taking care of the diet to control hypertension, trying to lose or maintain the weight, exercising, avoiding cigarettes, avoiding alcohol. The factors considered were demographic factors including age, sex, education, income, cohabitation, and health related factors including smoking, drinking alcohol, body mass index (BMI), self-perceived health, other chronic diseases, duration of hypertension, and limitation of activity of daily living (ADL). Results : There were 1,031 subjects aged 60 years or older who were confirmed with hypertension. Hierarchical multiple regression showed that those who were younger, obese, non-smoker, who had higher level of education, who had longer duration of hypertension were more likely to have higher self-care behavior scores. Conclusion : The findings suggest that attention should be given to the patients who were older, smoker, who had lower level of education, and who had shorter duration of the disease in providing hypertension intervention program. Keywords : Self-care behavior, Hypertension, Korean

SS25 324-R-2

PREVENTIVE HEALTH CARE PRACTICES (INFLUENZA VACCINATION, MAMMOGRAM, AND PAP TEST) AMONG KOREAN AMERICAN WOMEN

Young-Shin LEE¹, C. Richard HOFSTETTER², Veronica L. IRVIN³, Melbourne F. HOVELL³ (1. Nursing, San Diego State University, USA; 2. Political Science, San Diego State University, USA; 3. Public Health, San Diego State University, USA)

Introduction : Of the total U.S. population, 10% are estimated as the first generation of immigration. Migrant populations face challenges in accommodating new cultures and environment which result in health risk. The study purposes were to examine the characteristics of preventive health care practice behaviors (influenza vaccination, mammo gram, and Pap smear) under the Behavioral Model among Korean American women residing in California. Method : A representative probability sample of 1,786 Korean American women

residing in California, U.S. was explored the three preventive health care practices by telephone interview. Independent variables included acculturation; years living, a primary care provider; health status and health concern of participants; and demographic items. Results : Compared to young KA women, the older adults aged 60+ were more likely to perform three preventive health care practices with those who were married, who were born in Korea, resided in the United States longer, and had a primary care provider. Conclusion : Our findings indicate that older KA women were better aware about the preventive health practices than the counter part and that a behavioral model was suitable to explain the three preventive health care practices. Keywords : Preventive health practice

SS25 324-R-3

THE EFFECTS OF PHYSICAL ACTIVITY ON MENOPAUSAL SYMPTOMS AMONG FOUR ETHNIC GROUPS IN THE UNITED STATES

Sun Ju CHANG¹, Wonshik CHEE², Eun-ok IM² (1. Gachon University, Korea; 2. School of Nursing, University of Pennsylvania, USA)

Introduction : Although the hormone replacement therapy (HRT) has been reported to effectively alleviate some menopausal symptoms, the interests in alternative management strategies for menopausal symptoms have recently increased because of potential serious risks involved in the HRT. Alternative management strategies including physical activity also have high potential to improve women's health in their later life. The purpose of this study was to determine the effects of physical activity on menopausal symptoms and to provide directions for physical activity as a management strategy for menopausal symptoms. Method : This was a secondary analysis using the dataset of a nationwide Internet survey study on attitudes toward physical activity among four ethnic groups of midlife women in the U.S. For the study, data from a total of 481 women (113 Hispanics, 114 Non-Hispanic [NH] Asians, 113 NH African Americans, and 141 NH Whites) were retrieved from the original dataset. The instruments included the Midlife women's Symptom Index for assessing menopausal symptoms and the Kaiser Physical Activity Survey for assessing physical activity. Hierarchical multiple regression analyses were used to analyze the data. Results : The household physical activity was a significant factor that influenced both the prevalence and severity scores of the psychological menopausal symptoms in NH Asians and NH African Americans. Also, the occupational physical activity score was a statistically significant predictor of the physical menopausal symptoms of Hispanics and the psychosomatic menopausal symptoms of NH Whites. Conclusion : Health care providers should consider ethnic-specific types of physical activity when developing physical activity promotion programs to alleviate menopausal symptoms. Keywords : menopausal symptoms, physical activity, ethnic group

SS25 324-R-4

RELATIONSHIPS BETWEEN PHYSICAL ACTIVITY AND AWARENESS AND TREATMENT STATUS AMONG ADULTS WITH LOW FEMORAL BONE DENSITY IN THE U.S.

Young-Shin LEE¹, Jong-Duek BAEK², Kyeongra YANG³, Saunjoo YOON⁴ (1. Nursing, San Diego State University, USA; 2. Public Health, San Diego State University, USA; 3. Nursing, University of Pittsburgh, USA; 4. Nursing, University of Florida, Gainesville, USA)

Introduction : Low bone mass is common and serious bone disorder from mid to later life. In the U.S., more than 44 million adults have

low bone mass and the number is increasing. While low bone density increases the risk for fractures, many are not aware of their condition that delays controlling the bone condition and prevention of injury. The purpose of this study was to examine relationships between physical activity (PA) and awareness and treatment status of low bone mineral density (BMD) among adults aged 50 years and older. Method: A cross-sectional stratified sample of 1928 adults who participated in the National Health and Nutrition Examination Survey [NHANES] 2005-2006 was included in the analysis. Variables by objective measures - Femoral neck BMD, duration of PA, and step counts and those by self-report - strength exercise, and awareness and treatment of low bone density were employed. Results : Despite a high prevalence of low BMD, self-reported awareness, treatment, and PA were very low. After controlling socio-demographic and health related factors, those who were aware of their low bone density status and who received its treatment were less physically active than those who were unaware of their bone condition or who did not have any treatment. Conclusion : PA levels are below the recommended level for bone health benefits. Healthcare providers should consider screening individuals at risk of low bone density and encourage them to implement prevention and treatment regimen including increasing daily levels of PA. Keywords : Physical activity, bone density

THE FUTURE PERCEPTIONS AND INTERVENTIONS OF ANTIAGING

SS25 325-C-1

EVIDENCE-BASED ANTI-AGING MEDICINE: NEW ALLIANCE BETWEEN RESEARCH, PRACTICE, THE INDUSTRY AND THE CLIENT?

Astrid STUCKELBERGER (*Faculty of Medicine, University of Geneva, Switzerland*)

Introduction : Technological progress - from biotechnologies to assistive devices onto engineered solutions - is characterized by the rapidity of its evolution: what was unthinkable a decade ago is today not only on the 'medical market' but more and more in the home of the consumer. While some interventions and products have become part of the daily health care routine, other practices and devices hold high risks for the population or remain science-fiction. Method : Recently, a study on the level of evidence and risks of anti-aging medicine was conducted in Switzerland, USA and Japan supported by TA-Swiss and the Swiss Academy of Medical Science. Results : Findings show that biological and clinical findings are proliferating along with a growing market of technological and engineered high tech medicine and products, from therapeutic cloning, stem cells, genomics, human engineering, biogerontology to dietary supplements, to engineered solutions for a smart home and age-friendly environment. Furthermore, reversal of aging symptoms, stem cell and regeneration processes, human enhancement, body parts replacement, bioengineering and bionic prostheses are a reality. Conclusion : Beside the debate on the scientific evidence, anti-aging medicine questions our way of considering the 'norm' of the aging process. The new paradigm no longer sets aging as an irreversible decline process leading to pathological conditions, but aging as a simple machinery marked by time (chronological age), which can be kept to optimal functioning through high tech interventions. The presentation will present the current situation and giant steps between research, practice, the industry and the client/patient and discuss some of its implications. Keywords : Anti-Aging, medicine, industry

SS25 325-C-2

PERSONALIZED CANCER CARE: THE NEW FRONTIER

Gregory Stanislaw BURZYNSKI (*Internal Medicine, Burzynski Clinic, USA*)

Introduction : The arrival of molecular profiling technology has ushered in the age of personalized cancer treatments. Being cognizant of the underlying molecular mechanisms, pathways, and intricate tumor characteristics allows us to begin to tailor our therapy more precisely. Due to genetic testing methods developed from the Human Genome Sequencing Project, practitioners can one day depart from 'one size fits all' treatment plans. Method : By using targeted approaches based on the genetic signature of a tumor and known data from prior clinical research, we can combine Antineoplastons (ANP) with targeted agents to enhance the treatment response and duration. ANP are a group of anti-tumor agents which act on approximately one hundred different genes and pathways involved in the cancer process. The targets of ANP include tumor suppressor genes, oncogenes, genes of the cell cycle, metabolic pathways, and those governing apoptosis. ANP regulate the gene expression via epigenetic mechanisms. Results: We describe the response of over 2,000 evaluable patients treated at the Burzynski Clinic using the principles of personalized care which include analysis of gene expression across the entire tumor genome, gene products, and clinical knowledge. Conclusion : This personalized approach to cancer treatment ideally should be complemented by proper nutrition, exercise, and mind/body balance for a improved patient outcome. Keywords : Personalized cancer care, targeted therapy, antineoplastron, gene expression

SS25 325-C-3

EPIGENETICS IN AGING

Azad RASTEGAR (*Anti-Aging, Burzynski Clinic, USA*)

Introduction : The epigenome controls genetic expression, either silencing or activating the genes, by essentially three mechanisms. One of these epigenetic changes to gene expression occurs by RNAi. The other way epigenetics adjusts cellular behaviors is by chromatin remodeling by means of acetylating & deacetylating histones. The final manner in which epigenetics control a gene's expression is via DNA methylation which is the binding of methyl groups to the genes promoter region. The ideal anti-aging intervention involves restoration of optimal gene expression. This means activation of genes which have become silenced due to the aging process, and normalization of genes which have become over-active in aging. Method : Our group isolated a number of small molecules existing in human blood, dairy products, and royal jelly, which act as epigenetic switches and help regulate gene expression. These molecules were used in cell cultures, animal studies, and human clinical trials. Among them are amino-acid derivatives: 3-phenylacetyl-amino-2,6-piperidinedione (A10), phenylacetylglutamine (PG), phenylacetylisoglutamine (isoPG), phenylacetate (PN) and phenylbutyrate (PB). Clinical trials were performed on a topical formulation at the University of Bordeaux in France with PG and IsoPG. Results : Extensive biochemical and cell culture research has revealed that these substances decrease overexpression of RAS, AKT and MYC oncogenes and activate the tumor suppressors PTEN, p21, p53, and INI110. Conclusion : Epigenetic mechanisms will silence or activate our gene expression and greatly influence the aging process as well as susceptibility to disease. Certain molecules interfere with this process and lead to anti aging results. Keywords : Epigenetics, Methylation, Gene Expression

THE STUDY OF DEVELOPMENT OF MATERIALS AND DEVICE FOR PREVENTION OF AGING ASSOCIATED MUSCLE FUNCTION DECREASE

Cheolmin KIM¹, Nam Deuk KIM², Yung Hyun CHOI³, Jai-heon LEE⁴, Chang-hyung LEE⁵, Byoung Chul KIM⁶, Duk-young JUNG⁷ (1. School of Medicine, Pusan National University, Korea; 2. Department of Pharmacy, Pusan National University, Korea; 3. Department of Biochemistry, Dongeui University College of Oriental Medicine, Korea; 4. Department of Genetic Eng., Dong-A University, Korea; 5. Department of Rehabilitation Medicine, Pusan National University Yangsan Hospital, Korea; 6. Department of applied IT Engineering, Pusan National University, Korea; 7. Senior Products Industrial Center, Busan Techno-park, Korea)

Introduction : The sarcopenia, aging associated muscle loss, is a major problem which affect life quality of elder peoples. Even though natural maintenance of muscle function by exercise is the best way, some people needs medical support by exercise mimetics. **Method :** We tried to develop helpful functional food from natural resources including herb and seaweed. For functional evaluation, we established in-vitro system using myoblast cell lines and in-vivo system using drosophila and mice models. Genetically engineered animal models are used also. We developed convenient devices for analysis of muscle mass change and muscle stimulator. For clinical test, we used dynamometer and CT scanning or standard measure of muscle function and muscle mass. **Results :** Some materials from our research showed beneficial effect on muscle function increase in in-vitro and in-vivo models. Data from device using BIA showed very good correlation with cross-sectional area in CT scan. Modules in muscle stimulator are consisted of muscle relaxation and stimulation for safety and efficiency. **Conclusion :** We developed some functional food and devices as exercise mimetics. Synergistic effects are consisted of general effect by functional food and local effect by devices. **Keywords :** muscle, exercise, mimetic

SS25 325-C-5

ANTI-AGING MEDICINE: A NEW PUBLIC HEALTH PARADIGM OR A FASHION TREND?

Astrid STUCKELBERGER (*Facutly of Medicine, University of Geneva, Switzerland*)

Introduction : Anti-Aging Medicine” emerged in the US in the 1990s, promoting the ability to stop and reverse aging. Biotechnologies and therapies that were unthinkable a decade ago are a reality today. The expectation by the public that practically anything is possible makes some people all too trusting. Beside the debate on the scientific evidence, anti-aging medicine questions our way of considering the “norm” of the aging process and healthy aging. The new paradigm presented no longer sets aging as an irreversible decline process leading to pathological conditions, but considers the aging body as a simple “biological machine” marked by time (chronological age), which can be kept to an optimal functioning through high tech detection and intervention. **Method :** A review of the evidence and risks of anti-aging medicine was commissioned by TA-Swiss and the Swiss Academy of Medical Science. This project reviewed scientific theories and findings as well as clinical practices in Switzerland, Japan and the USA. The objective was to review the interventions, products, the socio-economic and ethical consequences and what recommendations could be drawn for governments, health professionals, the medical community and patients. **Results :** This presentation will explore the growing academic and industrial field of anti-aging medicine and discuss some of its. **Conclusion :** Nine key recommendations stem from the analysis of the study, from ethical research to professional practices issues, from evidence-based information to safety measures and international legislation. Global public health policy needs to support innovation and technology while ensuring the development of safe medical interventions and products

for our “longevity society”. **Keywords :** Anti-Aging, Technology, Prevention

SS25 326-C

POOR ORAL HEALTH IN FRAIL OLDER PEOPLE: A NEW GERIATRIC GIANT

SS25 326-C-1

POOR ORAL HEALTH AND ITS EFFECT ON GENERAL HEALTH IN (FRAIL) OLDER PEOPLE

Claar D. VAN DER MAAREL-WIERINK, Gert-jan VAN DER PUTTEN, Cees DE BAAT (*Oral Function and Prosthetic Dentistry, Radboud University Nijmegen Medical Centre, Netherlands*)

Introduction : Oral health influences mastication, food selection, weight, speech, taste, hydration, appearance, and psychosocial behaviour and is therefore an essential part of general health with an impact on a person’s quality of life during his entire lifespan. Several worldwide reports have shown that the oral health of older people, in particular that of frail and disabled older people, is rather poor. **Method :** Oral surfaces are continuously bathed with saliva, which supplies nutrients, keep conditions warm and moist at neutral pH, suitable for growth of many microorganisms. The complexity of oral health status, oral mucosal lesions, systemic diseases, and multiple medication use make (frail) older people more vulnerable to oral problems than younger age groups. **Results :** Associations have been reported between oral health and general health, for instance with respect to cardiovascular and respiratory diseases, and diabetes mellitus. The theories behind the associations are that microorganisms act as opportunistic pathogens in cases where they gain access to normally inaccessible sites of the body, and that subgingival biofilms in periodontal disease contain numerous Gram-negative bacterial species with inflammatory cell surface components. In cases where the host’s defence mechanisms are compromised, transportation of these pathogens and components potentially can affect distant sites in the body. **Conclusion :** In addition, various studies have suggested that between 50% and 75% of care home residents have some difficulty in swallowing, and as a consequence have a high risk of choking and developing an aspiration pneumonia from anaerobic bacteria which are present in the mouth. **Keywords :** oral health, microorganisms

SS25 326-C-2

THE SUBJECTIVELY AND OBJECTIVELY ASSESSED PREVALENCE OF DYSPHAGIA IN CARE HOME RESIDENTS

Jos SCHOLS¹, Claar VAN DER MAAREL-WIERINK², Judith MEIJERS³, Gert-jan VAN DER PUTTEN⁴, Luc DE VISSCHERE⁵, Ewald M. BRONKHORST⁶, Ruud HALFENS³, Cees DE BAAT⁷ (1. Dept. GP and Dept. HSR, Maastricht University and on behalf of BENECOMO, Netherlands; 2. Dept. of Oral Function and Prosthetic Dentistry, Faculty of Medical Sciences, Radboud University Nijmegen AND on behalf of BENECOMO, Netherlands; 3. Dept. Health Services Research, Maastricht University, Netherlands; 4. Birkhoven Care-estate and on behalf of BENECOMO, Netherlands; 5. Dept. of Oral Function and Prosthetic Dentistry, Radboud University Nijmegen, Netherlands)

Introduction : To assess the prevalence of subjective as well as objective dysphagia in Dutch care home residents and to assess the association with relevant risk factors of dysphagia. **Method :** To assess subjective dysphagia, a retrospective data analysis of a multi-centre,

cross-sectional study (Dutch National Prevalence Study on Care Problems-LPZ) was performed. Data of 8,119 care home residents aged 65 years or older were analyzed. For the second objective, five experienced speech therapists assessed systematically 115 primarily physically-disabled and 88 primarily cognitively-impaired care home residents aged 60 years or older in the first week after admission to the care home. First, they interviewed the residents. Second, a water swallowing observation was performed. In addition, relevant resident data were also collected from the medical records. Results : Subjective dysphagia was present in 751 (9%) residents. A final prediction model for subjective dysphagia after multivariate backward stepwise regression analysis revealed several significant variables related to care dependency, malnutrition, main diagnosis and comorbidity. Objective dysphagia was present in 43 (21.2%) residents. The final prediction model for dysphagia, using multivariate logistic regression analysis, showed Parkinson's disease as a significant factor. Conclusion : Both subjectively assessed dysphagia and objectively assessed dysphagia are relevant care problems in care home residents in the Netherlands. The prevalence of objectively assessed dysphagia is higher than subjectively assessed dysphagia. Taking into account some variables that are significantly related to dysphagia, seems relevant for daily practice. Keywords : dysphagia, nursing home

SS25 326-C-3

EFFECTIVENESS OF AN ORAL HEALTH CARE GUIDELINE ON ORAL HEALTH OF CARE HOME RESIDENTS.

Gert-jan VAN DER PUTTEN¹, Cees DE BAAT², Luc DE VISSCHERE³, Jacques VANOBBERGEN³, Jos SCHOLS⁴ (1. Oral Function and Prosthetic Dentistry, Radboud University Nijmegen Medical Centre, Netherlands; 2. Department of Oral Function and Prosthetic Dentistry, Radboud University Nijmegen Medical Centre, Netherlands; 3. Department of Community Dentistry and Oral Public Health, Ghent University, Belgium; 4. Department of General Practice, Section Nursing Home Medicine, CAPHRI, Maastricht University, Netherlands)

Introduction : The aim of this study was to compare a supervised versus a non-supervised implementation of the Dutch "Oral health care Guideline for Older people in Long-term care Institutions" (OGOLI) and a daily oral health care protocol derived from the OGOLI. Method: The study involved a single-blinded cluster randomized controlled trial in 12 care homes with a care home as the unit (cluster) of randomization. The intervention consisted of a supervised implementation of the OGOLI and a daily oral health care protocol derived from the OGOLI. In every care home oral examinations were carried out on a random sample of, initially, 30 residents. Primary outcome variables were dental and denture plaque scores of the participating care home residents. Results : At baseline, the overall random sample comprised 343 residents. At 6 months, the trial results showed statistically significant differences between the intervention and the control group. The intervention reduced mean plaque scores with 0.44 or 30% for dental plaque, and 0.39 or 20% for denture plaque. Unknown care home characteristics were of significant influence and it is difficult to assess which care home characteristics might explain the variance in mean plaque scores at 6 months. Conclusion : This study proved that a supervised implementation of the OGOLI and derived daily oral health care protocol was more effective than a non-supervised implementation in reducing mean dental and denture plaque scores at the end of the 6 months study period. However, the reduction of mean dental plaque scores could not be explained by the intervention exclusively. Keywords : Oral health care, dental care, care homes

SS25 326-C-4

BARRIERS AND ENABLING FACTORS FOR DAILY ORAL HEALTH CARE IN CARE HOMES, A QUALITATIVE APPROACH IN GERIATRIC ORAL HEALTH RESEARCH

Luc DE VISSCHERE¹, Gert-jan VAN DER PUTTEN², Lize DE MEYER¹, Bart PEETERS³, Bjorn SODERFELT⁴, Jacques VANOBBERGEN¹ (1. Community Dentistry and Oral Public Health, Dental School Ghent University, Belgium; 2. Oral Function and Prosthetic Dentistry, Radboud University Nijmegen Medical Centre, Netherlands; 3. Pharmaceutical Care Unit, Faculty of Pharmaceutical Sciences Ghent University, Belgium; 4. Department of Oral Public Health, Faculty of Odontology Malmo University, Sweden)

Introduction : Oral health care in care homes in Flanders (Belgium) is inadequate. This study reports on a qualitative study designed to identify and understand what influencing factors nurses and nurses' aides believe are related to the practice of oral health care and how they impact on their oral health care behaviour. Method : Qualitative data were obtained from nurses employed in 13 care homes involved in two randomised controlled trials in Flanders-Belgium. Data were collected by focus group and face-to-face interviews during April 2005 and December 2009. All transcripts were analysed with support of NVivo 8 (Version 2008). Transcripts were analysed in an inductive way. Results : Most revealed barriers were consistent with previous findings in the literature. Newly reported barriers were respect for residents' self-determination, experience based oral health care by nurses, residents' oral health status and nurses' inability to notice residents' oral health status. Demand driven oral health care was found to be a strong enabling factor. Conclusion : The integration of oral health care into day-to-day care seemed to be a major problem due to a multitude of barriers. Integration of oral health care in nurses' curriculum and continuous internal education in the intramural care should be seriously considered focusing on knowledge, practical oral health care skills and nurses and residents attitude to oral health care. Keywords : oral health care, oral health guideline, care homes, dental care, implementation

OPTIMIZING MEDICATION USE IN NURSING HOMES - EUROPEAN PERSPECTIVES

SS25 327-C-1

POLYPHARMACY IN NURSING HOME RESIDENTS WITH SEVERE COGNITIVE IMPAIRMENT: RESULTS FROM THE SHELTER STUDY

Graziano ONDER (Geriatrics, Universita Cattolica del Sacro Cuore, Italy)

Introduction : Pharmacological treatment of older adults with cognitive impairment represents a challenge for prescribing physicians and polypharmacy is common in these complex patients. The aim of the present study is to assess prevalence and factors related to polypharmacy in a sample of nursing home (NH) residents with advanced cognitive impairment. Method : We conducted a cross-sectional analysis on 1,449 NH residents with advanced cognitive impairment participating to the Services and Health for Elderly in Long TERM care (SHELTER) project, a study collecting information on residents admitted to 57 nursing home in 8 countries. Data were collected using the interRAI instrument for long-term care facilities. Polypharmacy status was categorized in 3 groups: non-polypharmacy (0-4 drugs), polypharmacy (5-9 drugs) and excessive polypharmacy (≥ 10 drugs). Results : Polypharmacy was observed in 735 (50.7%) residents and excessive polypharmacy in 245 (16.9%). As compared

with non-polypharmacy, excessive polypharmacy was directly associated with ischemic heart disease (OR 3.68; 95% CI 2.01-6.74), diabetes (OR 2.66; 95% CI 1.46-4.84), Parkinson's disease (OR 2.84; 95% CI 1.36-5.85), gastrointestinal symptoms (OR 1.20; 95% CI 1.43-3.39), pain (OR 3.12; 95% CI 1.99-4.89), dyspnoea (OR 2.57; 95% CI 1.31-5.07) and recent hospitalization (OR 2.56; 95% CI 1.36-5.85). An inverse relation with excessive polypharmacy was shown for age (OR 0.74; 95% CI 0.59-0.93), ADL disability (OR 0.79; 95% CI 0.63-0.99) and presence of a Geriatrician in the NH staff (OR 0.36; 95% CI 0.20-0.64). Conclusion : Polypharmacy and excessive polypharmacy are common among NH residents with advanced cognitive impairment. Determinants of polypharmacy status includes not only comorbidities, Keywords : nursing home, polypharmacy, older adults

SS25 327-C-2

WHAT KIND OF RESIDENTS RECEIVE ANTI-DEMENTIA DRUGS IN NURSING HOMES

Harriet FINNE-SOVERI¹, Eva TOPINKOVA², Daniela FIALOVA³, Andrea FOEBEL¹, Graziano ONDER³ (1. Ageing and Services, National Institute for Health and Welfare, Finland; 2. Geriatrics, Charles University, Czech; 3. Geriatrics, Universita Cattolica del Sacro Cuore, Italy)

Introduction : Cognitive impairment among nursing home residents is prevalent, majority of those suffer from possible Alzheimer's disease. Diagnoses may be unreliable or missing and little is known whether old persons residing in these settings benefit from this kind of drugs or not. In addition to cognitive deficits, anti-dementia drugs may relieve non-cognitive symptoms, such as behavior problems, that also are prevalent in these settings. We therefore used EU-funded SHELTER database to investigate in which extent anti-dementia drugs were used and what kind of European nursing home residents received them. Method : Cholinesterase inhibitors will be used as dependent variables and variables for age, sex, payment source, country, concomitant diseases, degree of dementia, behavior, mood, depression, social activities, ADLs, antipsychotic, and sedative medications as independent variables. Chi square analysis will be used for dichotomous and logistic regression for continuous variables to find out the associations. Multiple regression analyses will be performed to investigate the independent predictors for anti-dementia drug use. Results : 23,3% of residents who potentially could benefit from anti-dementia drugs received these medications. Most prevalent was memantine (10,5%) followed by donepezil and rivastigmine (6,9%), and less prevalent was galantamine (3,4%). Both cholinesterase inhibitor and memantine was received by 3,8%. The variation in the use of anti-dementia drugs between 59 facilities was 0 - 85,7%. If payment source was self or family (n=222, 10,4%), use of anti-dementia drugs was 45,4% (p<0,0004), if payment source was public (244, 11,4%) the corresponding figure was 48,2% (p<0,0001). Conclusion : Results may depend on local patterns. Keywords : Dementia, nursing homes, medications

SS25 327-C-3

LONG-TERM CARE IN EUROPE AND APPROPRIATENESS OF THE MEDICATION USE-RESULTS FROM THE EU SHELTER PROJECT

Daniela FIALOVA¹, Jindra REISSIGOVA², Graziano ONDER³, Eva TOPINKOVA⁴, Harriet FINNE-SOVERI⁵, Jacob GINDIN⁶, Roberto BERNABEI³ (1. Department of Geriatrics and Gerontology, Department of Social and Clinical Pharmacy, 1st Faculty of Medicine and Faculty of Pharmacy, Charles University, Czech; 2. Department of Biostatistics- EUROMISE centre, Academy of Science, Czech; 3. Centro Medicina dell'Invecchiamento, Universita Cattolica del

Sacro Cuore, Italy; 4. Department of Geriatrics and Gerontology, 1st Faculty of Medicine, Charles University, Czech; 5. Institute for Health and Aging, Institute for Health and Aging, Finland; 6. Laboratory for Research in Geriatrics and Gerontology, Faculty of Health and Social Studies, University of Haifa, Israel)

Introduction : The incidence of potentially inappropriate prescribing (PIP) in nursing home (NH) residents in Europe (EU) varies substantially across the EU countries. Symposium presentation focuses on theory, best clinical practice and reality of PIP in LTC setting in Europe. Different criteria, guidelines and recent analytical results from the EU SHELTER project (Services and Health for the Elderly in Long Term Care, 7th FP, 2008- 2011) are presented. Method : Criteria and guidelines of PIP published between 1997 and 2012 yrs were applied in analyses of appropriateness of the medication use in 4156 EU NH residents aged 65+ from 7 EU countries (Italy- IT, Czech Republic- CZ, England- EN, Finland- FIN, France- FR, Germany- GER, The Netherlands- NL) and Israel (ISR). Patients' data were gathered prospectively by trained research staff at the baseline study period (Sept- Dec 2009) using standardized and validated InterRAI-LTCF instrument (see www.inter-rai.org). A Pearson χ^2 -statistics and Cochran-Mantel-Haenszel statistics were used to test homogeneity across study samples. Results of multiple logistic regression models were adjusted for age, gender and polypharmacy. Results : Mean age of participants was 83.5 ± 9.4 yrs (73% were women). 40.5% of NH residents used potentially inappropriate medications- the prevalence ranged from 28.0% in GER to 62.9% in FR. Beers's 2003 criteria gained the lowest prevalence (16.6%, except in FR- 31.6%). Specific prescribing habits were (p<0.001): extensive use of vasoactive agents (CZ); high dosing of brotizolam (ISR)/temazepam (FIN)/lorazepam (IT)/zolpidem (FR, CZ) and zopiclon (GER, ISR, FIN); frequent use of sotalol (NL), hydroxyzine and meprobamate (FR). Conclusion : NewEU guidelines must respect recent prescribing habits. Keywords : inappropriate prescribing, Europe, nursing homes

SS25 327-C-4

PREVALENCE AND DETERMINANTS OF INFLUENZA AND PNEUMOCOCCAL VACCINE COVERAGE IN NURSING HOME RESIDENTS IN 8 COUNTRIES. THE SHELTER STUDY

Eva TOPINKOVA¹, Francesco LANDI², Daniela FIALOVA¹, Martina VLACHOVA¹, Graziano ONDER², Henriette VAN DER ROEST³, Harriet FINNE-SOVERI⁴, Roberto BERNABEI² (1. Department of Geriatrics, First Faculty of Medicine, Charles University, Czech; 2. Centro Medicina dell'Invecchiamento, Universita Cattolica del Sacro Cuore, Italy; 3. Department of Nursing Home Medicine, EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 4. National Institute for Health and Welfare, Finland)

Introduction : Influenza outbreaks and lower respiratory tract infections represent serious health concern in nursing homes. Immunization of residents with influenza and pneumococcal vaccines prevent both morbidity and mortality caused by influenza and invasive pneumococcal infections. The aim of this study is to explore the influenza and pneumococcal vaccination rates and associated factors in a sample of NH residents participating in SHELTER study, www.shelter-elderly.eu using interRAI LTCF assessment system. Method : Influenza vaccination in the last year and Pneumococcal vaccination in the last 5 years were recorded in total 4156 residents in 59 NHs in 8 countries (Czech Republic, England, Finland, France, Germany, Italy, The Netherlands and Israel). Binary logistic regression and multivariate regression analyses will be used to detect associations

and relationships between client -related (age, gender, cognitive status, depression, diagnoses, functional limitations) as well as facility-related factors (presence of geriatrician, physician's visits). Results : Mean age of the sample was 83.4 ± 9.4 years, 73% were female. Influenza vaccination was reported in 82.1% of residents (range 56.6 in CR to 93.2 in Italy) compared to much lower pneumococcal vaccination rates 27.9% of residents, ranging from 1.7% in Finland to 72.4% in Israel. However, for both vaccines usage there was a great inter-facility variation in all countries. Factors significantly associated with individual vaccines will be presented as well as potential barriers. Conclusion : The majority of NHs does not comply with recommended preventive use of vaccines. This study enables to identify barriers and facilitators of vaccine use and may help in developing strategies to improved vaccination. Keywords : influenza vaccination, pneumococcal vaccination, nursing homes

NURSING CARE PHENOMENA IN THE ELDERLY, A EUROPEAN APPROACH

SS25 404-C-1

WHICH CHARACTERISTICS OF NURSING HOME RESIDENTS PREDICT MALNUTRITION? AN INTERNATIONAL COMPARISON IN NURSING HOMES IN THE NETHERLANDS, GERMANY AND AUSTRIA

Noemi VAN NIE¹, Judith MEIJERS¹, Jos SCHOLS², Christa LOHRMANN³, Sabine BARTHOLOMEYCZIK⁴, Marieke SPREEUWENBERG¹, Ruud HALFENS¹ (1. Department of Health Services Research, Faculty of Health, Medicine and Life Sciences, Maastricht University, Netherlands; 2. Dept. HSR and Dept. GP, Faculty of Health, Medicine and Life Sciences, Maastricht University, Netherlands; 3. Institute of Nursing Science, Medical University Graz, Austria; 4. Institute of Nursing Science, University Witten/Herdecke, Germany)

Introduction : Prevalence rates of malnutrition vary internationally considerably, partly due to differences in measurement methodology and instruments. The aim of this study was to investigate whether resident characteristics predict and explain possible differences in malnutrition prevalence between countries, using the same methodology and instruments. Method : The study followed a cross-sectional, multi-centre design measuring malnutrition in nursing home residents from the Netherland, Germany and Austria. Patient data were gathered using a standardised questionnaire. Malnutrition was operationalized and validated according to Meijers (2009) and based on BMI, unintentional weight loss and nutritional intake. Data were analysed using a predictive as well as an association model, both built up using stepwise logistic regression. Results : The prevalence of malnutrition in the Netherlands, Germany and Austria was respectively 18.3%, 20.1% and 22.5%. The multivariate (backward) logistic regression analysis showed that gender, age, care dependency and some specific diseases predict whether a resident is malnourished or not. The association model showed that the odds ratio of malnutrition in the three countries declined after including the predictive resident characteristics. Conclusion : This study reveals that differences in malnutrition prevalence rates are not only determined by differences in resident characteristics but also by other country related factors. More research is needed to assess the contribution of these factors. Keywords : malnutrition prevalence, care homes, country comparison

SS25 404-C-2

PRESSURE ULCER CARE IN NURSING HOMES: A COMPARISON BETWEEN THE NETHERLANDS AND

GERMANY

Esther MEESTERBERENDS¹, Ruud HALFENS¹, Christa LOHRMANN², Jos SCHOLS¹ (1. Department of Health Services Research, Maastricht University, Netherlands; 2. Department of Nursing Science, Medical University of Graz, Austria)

Introduction : In the Netherlands and Germany annual national pressure ulcer prevalence surveys have been conducted over the past years. Results of these surveys reveal a large disparity between both countries in pressure ulcer prevalence rates, especially for the nursing home sector. Reasons for this discrepancy have been examined by previous studies, but exact causes have not been found yet. This study aimed to investigate whether the incidence of pressure ulcers in nursing homes in the Netherlands and Germany differs too and, if so, to identify resident-related risk factors, nursing-related interventions and structural factors associated with pressure ulcer development in nursing home residents. Method : A prospective multicenter study was performed in which a cohort of newly admitted nursing home residents in 10 Dutch and 11 German nursing homes was followed for a period of 12 weeks. Data were collected weekly by research assistants using questionnaires on four different levels; resident, staff, ward and organisation. Results : A significantly higher pressure ulcer incidence rate was found for the Dutch nursing homes compared to the German nursing homes. Six factors that explain the difference in pressure ulcer incidence rates were identified: dementia, analgesics use, the use of transfer aids, repositioning the residents, the availability of a tissue viability nurse on the ward and regular internal quality controls in the nursing home. Conclusion : Pressure ulcer incidence was significantly higher in Dutch nursing homes than in German nursing homes. Factors related to residents, nursing care and structure explain this difference in incidence rates. Keywords : pressure ulcer, nursing homes

SS25 404-C-3

NUTRITIONAL CARE IN AUSTRIAN HOSPITALS AND NURSING HOMES: A COMPARISON OF THREE YEARS

Silvia SCHONHERR¹, Ruud J G HALFENS², Jos M G A SCHOLS³, Christa LOHRMANN¹ (1. Department of Nursing Science, Medical University of Graz, Austria; 2. Department of Health Service Research, School for Public Health and Primary care, Maastricht University, Netherlands; 3. Department of General Practice and Health Service Research, School for Public Health and Primary care, Maastricht University, Netherlands)

Introduction : Malnutrition is a common health care phenomenon which leads to serious consequences for those who are affected. International studies report considerable deficiencies in nutritional practice across health care institutions. Audit & feedback, as a summary of clinical performance over a specified period of time, delivered in written or verbal formats (Jamtvedt et al. 2006), may promote improvement in practice. However, the literature provides only limited information on the effect of audit & feedback on nutritional practice in health care institutions. The aim was to investigate nutritional care in Austrian hospitals and nursing homes during a three-year period of audit & feedback. Method : From 2010 to 2012, the Annual National Prevalence Measurement of Care Problems (LPZ) was performed in Austrian hospitals and nursing homes. The LPZ measurement involves a comprehensive audit and feedback system using standardized questionnaires and procedures. 9 hospitals and 3 nursing homes took part continually from 2010 to 2012. Results: The sample across the years showed no clinically relevant demographic differences. The prevalence of malnutrition dropped from 22.1% to 17.5% in hospitals and from 21% to 20.5% in nursing homes. The use of validated screening tools increased from 17.1% to

43.2% in hospitals and from 3% to 95.2% in nursing homes. Conclusion : Malnutrition prevalence rates decreased from 2010 to 2012 in institutions participating repeatedly in the LPZ measurement, while an increase in nutritional screening rates was observed. Participation in the LPZ audit & feedback may have played a critical role in increasing malnutrition awareness and, consequently, leading to these results. Keywords : Nutritional care, hospitals, nursing homes

RISK-ADJUSTED HOSPITAL COMPARISONS OF PRESSURE ULCERS AND FALLS: CONTRIBUTION TO THE KNOWLEDGE ON RISK FACTORS IN OLDER AGE, DATA FROM SWITZERLAND

Christa VANGELOOVEN, Dirk RICHTER, Sabine HAHN (*Health, Berne University of Applied Sciences, Switzerland*)

Introduction : Comprehensive data regarding the quality of health care in Switzerland are still scant. The first annual National Point Prevalence Measurement Project, which includes the quality indicators for pressure ulcers and falls, was conducted in Swiss acute care hospitals in 2011. Method : The indicators, pressure ulcers and falls, were assessed with the International Prevalence Measurement of Care Problems Questionnaire from Maastricht University in the Netherlands. This instrument also contains institutional, ward and patient level items. The data were analyzed descriptively and by utilizing hierarchical logistic regression analysis. Results : 112 hospitals with 1,042 wards, and 10,606 patients participated in the measurement. Patients were, on average, 65 years of age and 58% were over 65. The prevalence of nosocomial pressure ulcers grades 1-4 and grades 2-4 were relatively low in comparison with other studies. The prevalence of falls was relatively high. Regression analyses revealed several significant factors related to these adverse patient outcomes. Patients over 75 years of age had more than a twofold risk of pressure sores compared to patients younger than 55. Similarly, the risk of falls was 1.5 times higher in older age. Length of stay, surgeries and various diseases, each independently increased the risk for pressure ulcers and falls. Conclusion : The results may underestimate prevalence rates due to a relatively high non-response rate. However, the results are useful in gaining first insights into adverse events in an elderly hospital population. Older age is a significant risk factor; therefore, this vulnerable population requires special attention in acute care hospital settings. Keywords : pressure ulcers, falls, risk factor, older age

SS25 406-R

IMPLICATIONS OF THE "DISABILITY WAVE" IN GLOBAL AGING

SS25 406-R-1

INTERSECTIONS OF AGING AND DISABILITY POLICY IN THE UNITED STATES

Michelle PUTNAM (*School of Social Work, Simmons College, USA*)

Introduction : This presentation identifies key intersections of aging and disability policy in the United States and discusses how and why they are relevant to individuals aging with long-term disability and older adults aging into disability. Conceptually, this discussion takes a life course approach to assessing existing and needed public policies for the growing aging population in the United States. Method : Specifically, policies are reviewed from across sectors, but primary emphasis is placed on evaluating health and social care policies that influence positive and active aging outcomes. Results : Findings from this review suggest a greater need to evaluate existing capacity to meet

the needs of persons aging with and into disability and to reconsider the assumptions that underlie existing aging and disability policies which segment the life course and these populations. Conclusion : Redefining policy outcomes may guide this process. However critical to this work is a new view of our national 'investment' in people with disabilities of all ages. Keywords : aging, disability, public policy

SS25 406-R-2

THE STATE OF AGING AND DISABILITY IN AUSTRALIA

Christine BIGBY (*Social Work and Social Policy, LaTrobe University, Australia*)

Introduction : In Australia, an increasing proportion of people with intellectual disability are surviving into later life and outliving their parents, who have been their lifelong primary carers. The demographic bulge of the baby boom generation has contributed to the increasing number of older people with intellectual disability. Despite the long term care and support of middle aged and older people with intellectual disability being flagged as an important issue for families, services and policy makers for more than 20 years, there remains a fragmented and ad hoc approach from both the aged care and disability sectors. Both sectors have been subject to significant policy reform since 2010 and Australia is about to embark on a National Disability Insurance Scheme which will have various launch sites by mid-2013.

Method : This presentation will review these reforms and consider the implications for people aging with an intellectual disability. The challenges that stem from some of the unique issues associated with aging of this population and their often very disadvantaged position as they embark on the aging process will be considered. Results : The presentation will suggest that Australia has taken a different path from some other countries and rather than efforts to bridge aging and disability sectors, the two are becoming more separate. Conclusion : Strategies to counteract this trend and ensure adequate support is available for people aging with intellectual disability to live health and active lives will be put forward. Keywords : aging, disability, bridging

SS25 406-R-3

PARTICIPATION OF PEOPLE WITH DISABILITIES WHO ARE GETTING OLDER IN JAPAN

Kimika MASUDA (*The Japanese Red Cross Kyusyu International College of Nursing, Japan*)

Introduction : The purpose of this study is three folds: 1) to find out whether there are differences in the extent of participation among the types of physical disabilities; 2) to identify differences in the level of participation across age categories; and 3) to analyze the factors that influence the extent of participation. Method : A questionnaire survey comprised of the Revised Craig Handicap and Reporting Technique (R-CHART) and the Community Integration Questionnaire (CIQ) was distributed to 3,200 people with physical disabilities who were 30 years of age and older. Results : Valid responses were received from 1,653 people. The following results were obtained. First the level of participation was the lowest among people with cerebral palsy compared to the other types of disabilities. Second, occupational scores on R-CHART were found to decrease significantly after the age of 70. Finally social integration scores on R-CHART were found to be influenced by marital status and economic self-sufficiency was affected by the level of education. Conclusion : Based on these findings, the author proposes the following suggestion. As marital status affected the level of participation by people with disabilities, support systems and group activities are required. As most people with cerebral palsy have had disabilities since birth or early childhood, they have not had as many opportunities to develop friendships. Therefore,

it is necessary to establish a social support system that takes into consideration following the death of the parents of people with disabilities. Because the level of education affected the level of economic self-sufficiency, it is necessary to promote educational opportunities for people with disabilities. Keywords : Aging, Disability, Participation

SS25 406-R-4

AGING WITH INTELLECTUAL DISABILITIES IN HONG KONG

Terry Yat Sang LUM (*Social Work & Social Adm & Sau Po Center on Ageing, The University of Hong Kong, Hong Kong*)

The Hong Kong Census and Statistics Department estimated that the number of persons with intellectual disabilities in Hong Kong was between 67,000 and 87,000 people in 2008. Although we do not have any data on age distribution of people with intellectual disabilities, the Census and Statistics Department reported that in 2001, 22.9% of people with intellectual disabilities living in residential care settings were age between 40 years and 49 years, and 9% were age 50 years or older. In 2008, that figures increased to 27.7% (40 years - 49 years) and 20.9% (50 years or above). Although people with intellectual disabilities are aging rapidly, the HK society still treats most intellectual disabilities, such as Down syndrome, as pediatric health problems. Using a community-university collaboration between the Sau Po Center on Ageing at the University of Hong Kong and the Hong Kong Down Syndrome Association as a case example, I will present our effort to advocate for providing ageing services to people with Down syndrome and to reduce ageism and disability-related discrimination among the general population in Hong Kong. Keywords : Aging

VASCULAR AGING I: BASIC MECHANISMS

SS25 407-B-1

LIFESPAN REGULATORY SYSTEM AS A POTENTIAL THERAPEUTIC TARGET FOR CARDIOVASCULAR DISEASE

Minamino TOHRU (*Department of Cardiovascular Biology and Medicine, Niigata University Graduate School of Medical and Dental Sciences, Japan*)

Introduction : Epidemiological studies have shown that age is the dominant risk factor for lifestyle-related diseases. The incidence and the prevalence of diabetes, heart failure, coronary heart disease and hypertension increase with advancing age. However, the molecular mechanisms underlying the increased risk of such diseases that is conferred by aging remain unclear. Cellular senescence is originally described as the finite replicative lifespan of human somatic cells in culture. Cellular senescence is accompanied by a specific set of phenotypic changes in morphology and gene expression including negative regulators of the cell cycle such as p53. Primary cultured cells from patients with premature aging syndromes are known to have a shorter lifespan than cells from age-matched healthy persons. It is also reported that the number of senescent cells increases in various tissues with advancing age. Interestingly, such accumulation of senescent cells in aged animals is attenuated by caloric restriction that regulates the lifespan regulatory system and delays age-associated phenotypes. I therefore hypothesize that cellular senescence in vivo is regulated by the lifespan regulatory signals and that accumulation of senescent cells contribute to the pathogenesis of age-associated cardiovascular disease. Conclusion : Here I will present our recent data on the role of cellular senescence and the lifespan regulatory system in

cardiovascular disease and will discuss the potential of anti-senescence as a novel therapeutic strategy for age-associated diseases. Keywords : Aging, cellular senescence

SS25 407-B-2

ENDOTHELIAL CELL SENESCENCE: INFLAMMATION, MITOTIC DYSREGULATION AND P53

Jae-Ryong KIM (*Aging-associated Vascular Disease Research Center, Department of Biochemistry and Molecular Biology, College of Medicine, Yeungnam University, Korea*)

Introduction : Cellular senescence is a stress-response phenomenon in which cells lose the ability to proliferate; it is induced by telomere erosion, activation of oncogenes or tumor suppressor genes, or exposure to a sub-lethal dose of DNA damaging agents or oxidative stresses. Method : Our cDNA microarray analysis on endothelial cell (EC) senescence revealed that inflammation and mitotic dysregulation might be the underlying basis for the molecular alterations that link EC senescence and age-related cardiovascular pathological processes. Results : While diverse inflammatory mediators such as insulin-like growth factor binding proteins (IGFBPs), interferons (IFNs) and inflammatory cytokines were up-regulated, mitotic proteins such as aurora kinase B (Aurora B), mitotic centromere-associated kinase (MCAK), Holliday junction recognition protein (HJURP), and polo-like kinase 1 (PLK1) were down-regulated during replicative senescence. We found that IGFBP-3, IGFBP-5, and IFN-gamma accelerated EC senescence through a p53-dependent DNA damage signal pathway. Conversely, Aurora B, MCAK, HJURP and PLK1 were found to inhibit EC senescence via a p53 pathway. These results suggest that inflammatory mediators and mitotic proteins might play important roles in EC senescence through a p53-dependent pathway and contribute to the pathogenesis of age-related cardiovascular diseases. Conclusion : These results suggest that inflammatory mediators and mitotic proteins might play important roles in EC senescence through a p53-dependent pathway and contribute to the pathogenesis of age-related cardiovascular diseases. Keywords : endothelial cell senescence, inflammation, mitotic dysregulation, p53

SS25 407-B-4

ROLES OF SUMOYLATION IN ENDOTHELIAL DYSFUNCTION

Chang-Hoon WOO (*Department of Pharmacology, Yeungnam University College of Medicine, Korea*)

Introduction : Atherosclerosis is readily observed in certain areas where disturbed blood flow (d-flow) is known to occur. A positive correlation between PKC ζ activation and d-flow has been reported, but the exact role of d-flow-mediated PKC ζ activation in atherosclerosis remains unclear. We test a hypothesis that PKC ζ activation by d-flow induces endothelial cell (EC) apoptosis by regulating p53-sumoylation. Method : We have shown that hydrogen peroxide (H₂O₂) and advanced glycation end products (AGE) inhibit steady laminar blood flow (s-flow)-induced ERK5 transcriptional activation as well as the subsequent anti-inflammatory KLF2 and eNOS expression via ERK5-sumoylation in endothelial cells (ECs). Results : Lysine residues 6 and 22 of ERK5 have been identified as SUMO targeting sites. Depletion of PIAS1 (SUMO E3 ligase) and ERK5-K6/22R mutant reversed the

inhibition of KLF2 and eNOS expression in response to diabetic stimuli. In addition to ERK5-sumoylation in ECs, we also found that PKC ζ -mediated p53-sumoylation is key regulator in peroxynitrite(ONOO⁻)-induced EC apoptosis. ONOO⁻ significantly increased PKC ζ activation, which subsequently induced p53-sumoylation, p53-Bcl-2 binding, and EC apoptosis. En face confocal microscopy revealed increases in non-nuclear p53 expression and apoptosis in aortic EC located in d-flow areas compared with those present in steady laminar flow areas. Conclusion : We propose a novel mechanism for ERK5-sumoylation and p53-sumoylation mediated by PKC ζ -PIASy interaction during d-flow-mediated EC apoptosis, which contributes early events of atherosclerosis. Keywords : blood flow, endothelial dysfunction, atherosclerosis

MILD COGNITIVE IMPAIRMENT IN THE ELDERLY - DIAGNOSIS AND MANAGEMENT

SS25 409-C-1

SCREENING AND IDENTIFYING FOR MCI

Yun-Hee KIM (*Physical and Rehabilitation Medicine, Sungkyunkwan University School of Medicine, Samsung Medical center, Korea*)

Introduction : Mild cognitive impairment (MCI) is considered as a cognitive disturbance representing a transitional phase between normal aging and dementia. MCI demonstrated estimated conversion rate of 10-15% within 1 year and 40% within 2 years to dementia. The relevance of improved identification of MCI is that these individuals are at higher risk of developing dementia and are potential candidates for initiation of intervention. Method : The neuropsychological tests are the most classic methods of detecting the degree of cognitive impairment, however, the test protocols are diverse and time consuming, or lack of sensitivity and specificity. Differences among studies in prevalence or conversion rate of MCI are influenced by methodological differences. The MMSE, CDR, clock drawing test (CDT), MoCA, and AVLT were commonly used test methods separately or in combination to improve detection rate of MCI. Results: Different neurochemical markers from CSF or serum as well as the biochemical markers using PET, SPECT, and MRI were also used as adjuvant diagnostic methods of distinguishing MCI or early dementia. Recently, combined use of neuropsychological measures and morphometric analysis of neuroimaging findings was found to potentially facilitate the early identification of MCI from normal cognition. Conclusion : More recently, broader conceptualization of MCI have emerged delineating clinical subtypes that commonly include amnesic and nonamnesic forms, the single and multiple cognitive domains. With these broader classification schemes, diagnostic challenges related to MCI have increased. There is a need to develop objective, cost-effective and normative screening tests which could effectively evaluate cognitive problems for older individuals at risk of dementia. Keywords : Mild cognitive impairment, neuropsychological test, neuroimaging method

SS25 409-C-2

BRAIN NETWORK CHANGES IN MILD COGNITIVE IMPAIRMENT AND ALZHEIMER'S DISEASE

Andrew T. REID, Alan C. EVANS (*McConnell Centre for Brain Imaging, Montreal Neurological Institute, Canada*)

Introduction : Alzheimer's Disease (AD) has been characterized as a "disconnection syndrome", which propagates in a predictable manner along the anatomical network structure. This suggests that the structural network changes associated with mild cognitive impairments

(MCI) can be used to elucidate the disease mechanisms at an early time point. Such associations have clinical importance as potential surrogate endpoints for clinical trials, and may also provide insight into mechanisms by which brain networks subserve cognitive functions. Method : Groupwise correlations in regional cortical thickness, derived from MRI, have previously been used to investigate brain connectivity changes underlying MCI and AD. We extended this method by extracting individual residual error and associating this with cognitive performance. Data was obtained from the Alzheimer's Disease Neuroimaging Initiative (ADNI). Results : Group differences in subject residuals for Normal, MCI, and AD groups revealed a network centered on the parahippocampal gyrus (PHG). This pattern largely matched that of correlation coefficients between subject residuals and performance on the Alzheimer's Disease Assessment Scale (ADAS-cog). We further found distinct networks associated with performance on the Category Fluency and Digit Symbol Substitution measures. Conclusion : These results provide a means by which group-wise associations in structural morphometry can be related to individual outcomes, such as cognitive performance. This presents the possibility of using structural MRI to infer connectivity changes in individuals, and use these to predict cognitive decline and dementia. The residuals method might also be generalized to other forms of neurodegenerative disease. We intend to extend these preliminary findings to investigate the feasibility of such approaches. Keywords : brain networks, mild cognitive impairment, cortical thickness

SS25 409-C-3

PHYSICAL ACTIVITY, LIFESTYLE AND COGNITIVE FUNCTION

Hyuntae PARK (*Section for Physical Activity and Health, National Center for Geriatrics and Gerontology, Japan*)

Introduction : Physical activity may have a protective effect against development of cognitive impairment and dementia. This presentation will discuss our research related to the cognitive benefits associated with objectively measured physical activity, behavior patterns and lifestyle. Method : I will highlight which physical activity is effective in promoting cognitive health and preventing MCI among older adults (the overall pattern, quality, quantity, and timing of activity), and the factors determining whether older adults should continue with the necessary physical activity as a means to delay or prevent the onset of cognitive impairment (emphasizing personal, social, and environmental determinants). I will also highlight the relationships between physical activity, cognition, and brain activation. Results : We found daily physical activity was associated with multiple aspects of cognitive functioning, suggesting that both the quality and quantity of the habitual physical activity (daily duration at an intensity >3 metabolic equivalents, the daily step count and interrupting prolonged periods of sedentary activity) may be important factors for cognitive benefits. Subjects actively participating in habitual physical activity tended to have larger total brain volume than sedentary subjects. A higher-level of physical activity predicted greater volumes of prefrontal regions after the 1-year intervention. Conclusion : Associations between habitual physical activity and cognitive function are strongly suggestive, and greater amounts/intensity of physical activity are associated with greater prefrontal gray matter volume, which is associated with a reduced risk of cognitive impairment. More randomized controlled intervention studies are needed to make a causal interpretation of the relationships that we have demonstrated. Keywords : physical activity, mild cognitive impairment, brain activation

SS25 409-C-4

NON-PHARMACOLOGICAL THERAPY FOR MCI: A RCT OF EXERCISE AND COGNITIVE STIMULATION

Hiroyuki SHIMADA (*Section for Health Promotion, National Center for Geriatrics and Gerontology, Japan*)

Introduction : An association has been proposed between regular participation in physical activity and a variety of cognitive benefits. Current results of RCT were conducted to determine the effect of exercise or physical activity on cognitive functions in the mild cognitive impairment (MCI) older adults. These studies identified the effect of exercise or physical activity on cognitive function including general cognitive function and executive function in the older adults with MCI. We designed the present randomized trial to test whether 6 months supervised multicomponent exercise to improve cognitive function among older adults with MCI. **Method :** Subjects were 100 older adults (mean age, 75 years) with MCI. Subjects in each group were randomized to either a multicomponent exercise or an education control group using a ratio of 1:1. Subjects in the multicomponent exercise group exercised under the supervision of physiotherapists for 90 minutes/day, 2 days/week, 40 times for 6 months. The exercise was included aerobic exercise, muscle strength training, and postural balance retraining which was conducted under multitask conditions to stimulate cognitive functions. **Results :** The exercise program improved the ADAS-cog and logical memory score. However, this improvement did not reach significance group×time interactions. A sub-analysis of amnesic MCI patients for group×time interactions revealed that the exercise group exhibited significantly better MMSE and logical memory scores, and reducing whole brain cortical atrophy compared to the control group. Similar results were found for amnesic MCI subgroup after 12 months. **Conclusion :** Exercise intervention improves or maintains cognitive performances, at least partly, in the older adults with amnesic MCI. **Keywords :** Prevention, Dementia, Mild cognitive impairment

SS25 409-C-5

SYMPTOMATIC AND PREVENTIVE THERAPIES FOR AMNESTIC MCI

Sangyun KIM (*Department of Neurology, Seoul Nation Univ Bundang Hospital / Seoul National Univ College of Medicine, Korea*)

Introduction : Mild cognitive impairment (MCI) is very useful term for the clinical research and clinical diagnosis. But the diagnosis of MCI is not so easy and relatively subjective, which is affected by the content of operational diagnostic criteria. Persons with MCI are at high risk of developing Alzheimer disease (AD), and the rate of annual progression from the amnesic form of MCI to clinical AD estimated at approximately 10%-15%. And now, MCI has moved from research into clinical practice. **Method :** Although the economic and emotional burden of Alzheimer's disease itself are well recognized, the pre-dementic state of Alzheimer's disease is not the primary target of drug therapy because of the insufficient data on the effects of pharmacological managements. But these may be due to the lack of effective clinical study methods for this stage of cognitive impairment. **Results :** According to the recently proposed criteria, MCI of the Alzheimer's type and prodromal Alzheimer's dementia are very useful concepts for the clinical and basic research field. Initiating treatment and care management in the MCI phase could improve the health and well-being of patients and caregivers and possibly offset certain costs. **Conclusion :** In this presentation, we are going to review the clinical concepts of MCI due to AD briefly and some clinical trials for these patients group. Lastly I'd like to propose a new concept of management of this stage of Alzheimer's disease before dementia,

"AD control". **Keywords :** mild cognitive impairment. treatment. amnesic MCI. MCI due to Alzheimer's disease

SS25 414-S

NEW DIRECTIONS IN RESEARCH ON OLDER PEOPLE AND SOCIAL EXCLUSION

SS25 414-S-1

SOCIAL EXCLUSION OF OLDER PERSONS: A SCOPING REVIEW AND TESTABLE MODEL

Kieran WALSH¹, Thomas SCHARF¹, Norah KEATING² (*1. Irish Centre for Social Gerontology, National University of Ireland Galway, Ireland; 2. Department of Human Ecology, University of Alberta, Canada*)

Introduction : As a concept, social exclusion has come to dominate policy discourse on marginalisation in Europe and other world regions. Understanding exclusionary processes and outcomes can provide valuable insight into how mechanisms of disadvantage can impact on and shape older people's lives. However, much of the existing discourse is based on loose conceptualisations of social exclusion that rarely account for or addresses an ageing population. In part, this is due to the lack of critical engagement with the concept in the social gerontology literature. Nevertheless, social exclusion is potentially a useful frame not just for exploring multi-dimensional disadvantage in later life, but in informing the development of policy and practice interventions. **Method :** This paper draws on a scoping review of international literature to present a conceptual exploration of age-related social exclusion. The review, which focused on material published within the last 15 years, involved two steps: first, a review was conducted of all conceptual frameworks on social exclusion and ageing to establish the primary domains of exclusion for older people; second, these results were used to structure a review of empirical material relating to each domain. **Results :** Bridging the disciplinary traditions of the Anglo-Saxon and French sociological perspectives, the scoping review's findings were used to inform the development of a testable model of age-related social exclusion. **Conclusion :** The paper closes with a consideration of potential drivers of social exclusion for older people and sets out requirements for future gerontological research. **Keywords :** social exclusion, older people, conceptualisation

SS25 414-S-2

SOCIAL INCLUSION OF ELDERS IN FAMILIES: A EUROPEAN PERSPECTIVE

Jim OGG (*Unite des Recherches sur le Vieillessement, Caisse nationale d'assurance vieillesse, France*)

Introduction : Demographic and social trends such as population ageing, falling fertility rates, transforming welfare states, globalisation and economic crises, are placing new challenges on families with particularly repercussions for elders. **Method :** European data from the SHARE survey (Waves 1 to 4) are examined in relation to the household composition and geographical proximity of older individuals to other family members, the exchange of social support and subjective measures of isolation. **Results :** Although principles and mechanisms of intergenerational solidarity remain intact, research reveals areas of concern where older people may be at risk social exclusion because of a deficit in family support. This risk appears to arise as a result of changes at the macro level - such as the consequences of migration flows and the institutional contexts that regulate them, or initiatives related to combining family responsibilities with labour force participation - rather than family

members becoming more independent and self-reliant. Conclusion : The risks of social exclusion from family life can be addressed by effective social policy that helps families to undertake the tasks that are integral to them, namely caring for vulnerable members. This does not mean to say that so-called "traditional" approaches to social care in families, whereby women are heavily involved in personal care tasks, are the solution. The family can ensure the social inclusion of its older members in other ways, notably by providing important links to external sources of support and community engagement. Keywords : exclusion, elders, Europe

SS25 414-S-3

SOCIAL EXCLUSION AND AGEING IN THE AUSTRALIAN REGION: CRITICAL REFLECTIONS

Jeni WARBURTON (*John Richards Initiative, La Trobe University, Australia*)

Introduction : Social exclusion has been identified as a major challenge facing older Australians, yet one that is not yet being addressed in federal policy. Despite the establishment of the federal Social Inclusion Board in 2008, older people were not identified as a priority area. This paper seeks critically to explore the relevance of social exclusion in considering an ageing Australia; and to identify issues associated with the development of more socially just ageing policies. Method : Defining social inclusion as capacity to be involved in key activities of the society in which people live (Burchardt et al., 2002) demonstrates the risks of social exclusion faced by older people. A social inclusionary approach highlights core issues such as civil engagement, an ageing workforce, age-friendly communities, and civic involvement. Results : Three key areas signal the importance of social exclusion to an ageing population. First, older people are vulnerable to economic deprivation through the processes of ageing and retirement, making social inclusion far less dynamic. Second, disadvantage can be cumulated across the lifecourse, and can have a long-term impact on social groups such as women, Indigenous people, or those from disadvantaged regions. Third, there is considerable diversity in the ageing population, yet ageist stereotypes remain powerful psychological barriers to social inclusion. Conclusion : The discourse of social inclusion provides important new perspectives on ageing policy, including economic, social and civic considerations. Addressing these issues is complex and requires a multidimensional approach, however, as new cohorts of people age, it becomes even more critical. Keywords : social exclusion, Australia, ageing policy

SS25 414-S-4

OLDER PEOPLE IN SUB-SAHARAN AFRICA: CONTEXTUALIZING SOCIAL EXCLUSION

Nana Araba APT (*Academic, Ashesi University, Ghana*)

Introduction : Concerns about later life are rapidly rising even in Africa where children and youth dominate the population policy landscape. Any policy strategy to reduce the growing divide in contemporary Africa between young and old, rich and poor, urban and rural with regard to Africa's ageing spectrum will ultimately rest on an adequate conceptual framework and current literature. In the latest Ghana Human Development Report (UNDP, 2007) for a more inclusive society, it was concluded that a number of structural, cultural and institutional factors have tended to push older people into the exclusion zone. Method : The paper draws on case studies of older people in rural and urban areas in Ghana. Results : The paper explores and analyzes the construction and meanings of exclusion from the perspective of Sub-Saharan Africa as well as the major underlying forces behind these developments, showing how these differ from the

more usual interpretations from western nations. Conclusion : The paper concludes by highlighting the need for social gerontology to consider non-western interpretations of inclusion and exclusion in relation to population ageing. Keywords : social exclusion, Ghana, Sub-Saharan Africa

ACTIVE AGING: A PERSPECTIVE OF KOREA-JAPAN CENTENARIAN STUDIES

SS25 416-R-1

FACTORS ASSOCIATED WITH ADL AND IADL DEPENDENCY AMONG KOREAN CENTENARIANS

Keon Yeop KIM (*Preventive Medicine, Kyungpook National University, Korea*)

Introduction : Centenarians represent a special life stage that a small but growing number of people are reaching worldwide. This study aims to examine the functional status of Korean centenarians. As functional health is one of the essential components of healthy aging, our primary objective is to identify the correlates of two aspects of functioning, activities of daily living (ADL) and instrumental activities of daily living (IADL). Method : Using a census survey conducted by the Korean National Statistical Office (KNSO) in 2005, we documented ADL and IADL limitations and analyzed their relationship to sociodemographic factors (age, educational attainment, residence, past occupation, religion), health behaviors (alcohol, smoking, physical activity), social connectedness, and presence of diseases. Results : The study participants were 796 adults aged 100 years or older. The mean age was 101.5 ± 1.8 , and females were 89.9% of the sample. Regarding ADL, the disabled group represented 58.8% of the participants, and for IADL the disabled groups represented 90.9% of the subjects. Both ADL and IADL dependences were more common among females, those who did less physical activity, those who had more diseases, and those who did not participate in social activities. Conclusion : Intervention programs designed to address life-stage issues such as focusing on initiating healthy behaviors from youth, managing chronic diseases in mid-life, and fostering social participation in later life are recommended ways to improve functional independence and promote healthy aging among current and future generations of Korean centenarians. Keywords : centenarians, activities of daily living (ADL), instrumental activities of daily living (IADL)

SS25 416-R-2

THE HEALTH-LONGEVITY REGIONAL PLAN IN KOREA

Sung Kook LEE (*Dept. of Preventive Medicine, School of Medicine, Kyungpook National University, Korea*)

Introduction : The objectives of this study were to: (1) select the area of healthy longevity in Gyeongsangbuk-do, Korea and (2) develop a model for promoting healthy longevity of the elderly, especially in the aspects of the health, welfare and self-supporting development using local resources. Method : The study was conducted in all areas in Gyeongsangbuk-do and used methods in three parts: (1) Selecting the healthy longevity area in Gyeongsangbuk-do was identified from Bureau of the Census (2) Assessing the actual conditions on areas of the healthy longevity was based. Results : We found significant characteristics of healthy longevity for the elderly in jangsumyeon of Yeongju city, bukhumyeon of Andong city, homyeongmyeon of Yecheon Gun, and mulyamyeon of Bonghwa Gun as the healthy longevity areas of Gyeongsangbuk-do. The critical contributors of healthy longevity for the elderly were clear water, refreshed air from

the forest, available organic food such as wild edible greens, etc. As the data from diverse factors of healthy longevity for the elderly and environmental characteristics of healthy longevity areas, we are planning to develop a model of health longevity area. Conclusion : In order to sustainably maintain and develop the environmental characteristics of healthy longevity in Gyeongsangbuk-do, it is required the holistic and systematic management system. Therefore, it is necessary to build the Healthy Longevity Support Center, which will be a central place to play a major role in developing educational programs for promoting healthy longevity, fostering health care professionals and even driving much of the research on the impacts of healthy longevity for the elderly. Keywords : Area for healthy longevity, healthy resources, Health Longevity Support Center

SS25 416-R-3

THE DAILY LIVES OF CENTENARIANS : THROUGH AN ANALYSIS OF INTERVIEWS

Hyeweon KIM (*Faculty of Intercultural Studies, Yamaguchi Prefectural University, Korea*)

Introduction : This research focused on the daily lives of centenarians of Korea and Japan, in particular focusing on the aspects of autonomous and the support they have received and the perceptions of longevity. Method : This study consists both of case studies carried out on the super-elderly (those over age 85, including centenarians), and the document analysis of previously conducted interviews of centenarians. The case studies were carried out on the super-elderly in Korea and Japan. For the document analysis, 'Portrait of a Centenarian' (No.1-68) was used. Results : It was discovered that many super-elderly people continue to try to act autonomously in their daily lives. Analysis showed that this effort was highly-valued by family care-givers, which in turn led to a good care relationship. In particular, in the case of elderly people that consciously maintained contact with the outside world, health levels were relatively good, and the subjects showed positive perceptions of longevity. In regards to the norms of family care, has been more strongly supported in Japan than Korea. Conclusion : It can be concluded that maintaining control of one's daily living activities and continued contact with the outside world are very important factors in ensuring one's healthy life expectancy. The role of the family and others around the super-elderly is to manage the resources and reinforce the care system for their continued support. Keywords : the perceptions of longevity, contact with the outside world , Autonomous attitude

SS25 416-R-4

HEALTH OF CENTENARIANS: AN ANALYSIS OF AN ACTUAL LIFE SITUATION

Makiko TANAKA (*Graduate Division of Health and Welfare, Yamaguchi Prefectural University, Japan*)

Introduction : In the Asian countries such as Japan or Korea, aging is taking place at a rapid pace, which in turn is influencing their social health. Therefore, there is a need to clarify the life actual situations of centenarians, which represent the quality of health welfare, and to examine factors affecting health and longevity from the viewpoint of active aging. Method : A questionnaire using the Likert scale was developed by the present author to identify factors affecting health and longevity. It was administered to 626 centenarians who live in Yamaguchi, which has the third highest rate of aging. The questionnaire items pertained to the degree of ADL, the living environment, life habits, and the sense of happiness. Results : Responses were obtained from 348 participants. 35% of them lived at home while 19.3% of them lived in hospitals and 45.4% in welfare

facilities. The sense of happiness was significantly higher among those who lived at home, those who were autonomous in terms of ADL, those who cared about their eating habits, and those who cared about longevity. Conclusion : Continuing to live in a life environment one is used to, living with people who one feels comfortable with, being aware of health, and caring about autonomous lifestyle--these show significant relationships to health and participants, which are concepts often pointed out in active aging. The perspective of active aging, therefore, is an important factor to health and longevity. Keywords : Centenarian, Health ,Life situation

CHROMOSOMES AND AGING

SS25 417-B-1

PEPTIDE BIOREGULATORS INDUCED REACTIVATION OF 'AGED' CHROMATIN

Teimuraz LEZHAVA, Maia GAIOZISHVILI (*Department of Genetics, Tbilisi State University, Georgia*)

Introduction : In the present investigation are considered eligible the modification of heterochromatin (total heterochromatin, constitutive - pericentromeric and telomeric heterochromatin, nucleolus organizer regions - NORs and facultative heterochromatin) under the influence of peptide bioregulators (tetrapeptides Ala-Glu-Asp-Gly; Lys-Glu-Asp-Ala and dipeptide Lys-Glu) and heavy metal in lymphocytes cultured from individuals at the age of 80 and over. Method : We have studied chromosomes of metaphases lymphocyte cultures obtained from healthy individuals aged 80 years and over (control - 20-40 years old). The peptide bioregulator (tetrapeptides Ala-Glu-Asp-Gly; Lys-Glu-Asp-Ala and dipeptide Lys-Glu) at a concentration of 0.01 µg/ml were added to the cultures at the onset and left for an entire period of incubation (72h). We have used: differential scanning microcalorimetry for study of heterochromatin denaturation parameters; NOR - heterochromatin by Ag- staining intensity and the frequency of association acrocentric chromosome; the structural pericentromeric C-, and telomeric heterochromatin; frequency of sister chromatid exchanges for definition the level of facultative heterochromatin. Results : The results showed: 1) progressive heterochromatinization of total heterochromatin occurs at aging; 2) peptide bioregulators induce unrolling deheterochromatinization of total heterochromatin; each peptide bioregulator selectively effect definite the deheterochromatinization of chromosomes; 4) Co²⁺ ions in combination with the bioregulator tetrapeptide (Lys-Glu-Asp-Ala) has induced deheterochromatinization of the telomeric heterochromatin regions in lymphocytes of old individuals. Conclusion: Our data may be important as new information on the remodeling of constitutive and facultative heterochromatin induced by bioregulators (Ala-Glu-Asp-Gly; Lys-Glu-Asp-Ala; Lys-Glu) and bioregulator - Lys-Glu-Asp-Ala with Co²⁺ ions in aging and aging pathology and may lead to the development of therapeutic treat. Keywords : Aging, , Heterochromatinization, Peptide Bioregulators.

SS25 417-B-2

THE STUDY OF FRAGILE SITES IN AGED INDIVIDUALS

Tetsuji KADOTANI (*Medicine, The Kadotani Medical Research Foundation, Japan*)

Introduction : Chromosome fragile sites were studied in the middle-aged and women over 60 years and old. Method : The lymphocytes were cultured for 72 hours in the minimal essential medium without folic acid (MEM-FA) supplemented with 5% calf serum. The slides were made by means of the flame-drying technique.the chromosome

observation was made with the frequency of the break and/or gap and also the satellite association. The locations of the break points were identified by G-banding technique after decolorizing them. Results : The satellite associations and the frequency of the break and/or gap both the 40-45 and 60-76 year old group statistical was not recognized. In the aged women over 60 years old, 8 fragile sites were observed. Keywords : Fragile sites, satellite association, gap

SS25 417-B-3

CHROMATIN CHANGES BY HEAVY METALS IN AGING

Tinatin JOKHADZE, Tamar BUADZE (*Department of Genetics, Tbilisi State University, Georgia*)

Introduction : The modification of chromatin in eukaryotes is the basis of epigenetic variability. Epigenesis is important factor in the regulation of the genome in eukaryotes. Modification of the chromatin can be programmed. For example, the programmed heterochromatinization of chromatin occurs during aging. The modification of the chromatin can be induce by different chemicals. Method : We studied the effect of ions of nickel, zinc and cobalt on chromosomal parameters - the frequency of sister chromatid exchanges (SCE), the activity of nucleolar organizer regions (NORs) and the level of expression fragile sites of chromosome. The study was conducted with the use of the lymphocyte cultures of individuals - 20-30 and 75-86 years. Results : Zinc causes an increase of the frequency of SCE in the cells of senile individuals (11.1 ± 05 exchange/cell, in intact cultures - 5.9 ± 0.4). Cobalt induce increase the frequency of pericentromeric exchanges (15.4% of the total number of exchanges, in intact cultures - 4.5%). Variability of the level of activity NOR was observed only by influence zinc, which induces decline of this parameter in control, and in old age group - increases. All studied metals increased the level of expression of chromosomal fragile sites in the first age group and also in elderly. Cobalt induces increase in the frequency pericentromeric fragile sites (69.1% of the total; in intact cultures - 21.7%). zinc and nickel - subtelomeric (11.3% and 10.5%, respectively, in intact - 4.8%). Conclusion : All three studied metal have a specific modifying effect that depends on the variability of chromatin in age. Keywords : Heavy metal, Chromatin, Heterochromatinization

SS25 418-S

DISASTER SUPPORT FOR ELDERLY INDIVIDUALS: BASED ON EXPERIENCES IN ASIA

SS25 418-S-1

A MID TO LONG-TEM NURSING CARE GUIDELINE FOR THE ELDERLY VICTIMS AFTER DISASTERS

Chiyo MATSUOKA (*Department of Nursing, Bukkyo University, Japan*)

Introduction : In a catastrophic natural disaster such as earthquake, tsunami and typhoon, elderly people have high vulnerability and have various and particular health issues and living problems not only immediately after but also in the mid- to long-term wake of a disaster. For example, concerning the health issue, it is known that the elderly have frequently experience onset of disaster associated diseases, such as high blood pressure, cerebrovascular disease, and cardiac disease. Method : Moreover, after a disaster, since neither medication nor rehabilitation are as readily available as before, it is known that health conditions and physical functional status will get worse. Especially in case of evacuation living in shelter or temporary housing is prolonged, these health issues tend to deteriorate. As for living problem, it is difficult for the elderly to return to their former lives because of their

social and economic issues. Results : In Japan, after the Great Hanshin-Awaji Earthquake in 1995, research of the disaster nursing advanced and scientific knowledge about care of elderly victims accumulated. That scientific knowledge was used efficiently in the Great East Japan Earthquake in 2011. Conclusion : In this symposium, I will present a nursing care guideline for elderly victims based on the scientific knowledge related to disaster elderly care gathered from researches in not only Japan but also the rest of the world. Through the discussion at this symposium, this care guideline will be further refined as well as particularly helping participants to prepare to respond in disaster situations. Keywords : disaster nursing, natural disaster, care guideline

SS25 418-S-2

THE ELDERLY IN A DISASTER - THE LONGITUDINAL STUDY OF ELDERLY SURVIVORS' DAILY LIVES AND HEALTH STATUS AFTER SICHUAN EARTHQUAKE

Xiu-ying HU (*West China Nursing School /West China Hospital, Sichuan University, China*)

Introduction : The elderly are particular vulnerable to the adverse affects of disasters. This study aimed to understand the daily lives and health status of elderly survivors in affected areas after Sichuan earthquake, find out the influence factors for the elderly health, and propose corresponding nursing methods based on the problems. Method : The longitudinal investigation started from 2008, conducted 355 elder survivors who aged 60 and over, experiencing Sichuan earthquake and living in temporary housing after the earthquake, without cognition impairment. The main contents of questionnaire included the survivors' socio-demographics, damage of the disaster and the physical and mental health status. The data were analyzed by SPSS 13.0. Results : During the 1st to 4th year, the daily lives of elder survivors changed 88.8%, 72.2%, 72.1% and 70.6%, about their self-rated health, the mean value of IES-R score were respectively 33.1, 24.1, 13.5 and 14.8 ($P < 0.05$); the IES-R rates were found to be 53.8%, 36.6%, 9.2% and 0.5%. It was influenced from greatly to a little by time after the disaster, having unpleasant symptoms, preparation for further disaster, self health, residence before the earthquake, housing damage. Conclusion : The elder survivors' daily lives and health status were clarified during the 1st to 4th year after the earthquake. The study demonstrates the elderly survivors need much more attention on their health, and point out the key points and details of nursing instructions about their daily lives, including disaster-preparedness care, the specific care in different time after disasters and psychological nursing after disasters. Keywords : the elderly, disaster, nursing

SS25 418-S-3

PERCEPTIONS OF THE ELDERLY ON DISASTER PREPAREDNESS IN SOUTH KOREA : FOCUSED ON RURAL AREAS

Myoung Ran YOO (*Nursing Science Department, Armed Forces Nursing Academy, Korea*)

Introduction : Under normal conditions, the elderly need special assistance due to their impaired physical mobility and they take medication for their chronic health conditions. In times of disaster, situation becomes worse because the primary care giver for the elderly person may not fulfill their special needs so the elderly person can be in such poor condition that they might not even survive. It is vital for the elderly to be adequately prepared for disasters. Therefore, this study is to investigate perception of the elderly of what they should do to prepare for a disaster event. Method : Data will be gathered and analyzed by using focus group interview on people who are older than

60 years old and live in rural areas. Results : Nursing interventions will be addressed that can improve the preparedness of the elderly in rural areas. Conclusion : Based on the results of the study, the nursing interventions that can improve the preparedness of the elderly will be identified so that not only care givers but also the elderly themselves can be aware of what they need to prepare for a disaster event. Furthermore, this study can provide the basic data to develop educational program for disaster preparedness of the elderly. Keywords : Disaster, Older people, Disaster preparedness

SS25 419-C
CURRENT STRATEGY ON ORAL REHABILITATION FOR EDENTULOUS PATIENTS

SS25 419-C-1
EDENTULISM AND QUALITY OF LIFE OF EDENTULOUS PATIENTS

Yong-Geun CHOI (*Epidemiology and Biostatistics, EB dental clinic, Korea*)

Introduction : Edentulism is generally considered to be the result of removal of all teeth because of caries and periodontal disease. The ability to chew is not only an important dimension of oral-health-related quality of life, but also it is increasingly recognised that there are connections with general health. The ability to masticate food may affect dietary choices and nutritional intake and have consequences for general health. This may be reflected in generic health-related quality of life. In addition, there is a positive aspect to health, measured through aspects of well-being. These positive life influences may also be influenced by basic biological conditions and related functions such as the ability to chew. The aims of this presentation is to investigate the relationship between tooth loss and chewing ability and their association with oral- and general-health-related quality of life and life Method : Quantitative evidences from systematic studies regarding the quality of life and tooth loss were collected and analyzed. The impact of number of teeth on the quality of life was ascertained. Results : 27.4% of elderly aged more than 65 years old was edentulous. Number of teeth were both significantly associated with oral- health related quality of life. Those with a larger number of missing teeth were more likely to experience poor quality of life (OR=4.0, 95%CI= [2.6-6.3]. for edentate, OR= 3.4 95%CI=[2.4-4.9] for 1-19 teeth holder). Edentulism demonstrated a 40.0% loss in quality of life. Conclusion : Prosthodontic health care should be provided for the impaired oral function that deteriorates the quality of life by 40%. Keywords : edentulism, quality of life, aging population

SS25 419-C-2
RESTORATIVE OPTIONS & TREATMENT PLANNING FOR EDENTULOUS PATIENTS

Kung-Rock KWON (*Dept. of Prosthodontics, School of Dentistry, KyungHee University, Seoul, Korea, Korea*)

Introduction : The number of edentulous persons over 65 in highly industrialized countries is projected to decrease considerably. However although the absolute number of persons over 65 is expected to double by the year 2030, the actual number of those needing treatment with complete dentures will remain almost constant. This means that knowledge and clinical skills in complete dentures prosthodontics will still be important in the next century. Method : Furthermore given that the age of candidates for a first set of complete dentures will increase continuously in the coming years patient's difficulty in developing the necessary levels of neuromuscular skill to manage conventional complete dentures will also increase. To overcome these difficulties

the dentist needs to have great clinical skills and a patient-centered approach. Results : The range of treatment options for a person needing or already wearing complete dentures who requests such treatment includes the following; -Referral for a specialist opinion or treatment -Immediate placement of a complete denture -Modification of existing dentures -Construction of new dentures copied from existing dentures -Placement of a new complete dentures -Placement of implant-supported complete dentures. Conclusion : Before commencing treatment with complete dentures the patient should be examined thoroughly and possible risk factors identified. In addition, a careful examination of existing dentures should be carried out. This examination serves to determine whether prosthodontic treatment should be carried out and if so, which type of treatment might be appropriate. Keywords : edentulous person, complete denture, diagnosis

SS25 419-C-3
MANDIBULAR IMPLANT SUPPORTED OVERDENTURES
Jeong-Yol LEE (*Department of Dentistry(Prosthodontics), Korea University Medical Center, Guro Hospital, Korea*)

Introduction : The restoration of the edentulous mandible with a conventional denture is a much poorer alternative than the use of an implant-supported prosthesis. There is now a large body of evidence that supports the proposal that a two-implant supported mandibular overdenture should be the minimum offered to edentulous patients as a first choice of treatment. This clinical trial is aimed to compare the effect of ball attachments on the treatment outcomes of mandibular implant overdentures. Method : Fifty-one patients from 177 complete denture patients were selected for this study by inclusion and exclusion criteria. The number of subjects who took part in the trial was 40. They received two implants (Simpline II, Dentium, Korea) in mandibular canine region. Two months later after implant placement, randomly assigned 2 ball attachments (Ball attachment of Dentium Co. or Anchor attachment of Straumann AG) were placed on the implants and the respective matrices were incorporated in existing lower complete denture. The following clinical parameters were assessed: 1) implant success rate, 2) peri-implant tissue status, 3) prosthetic maintenance and complications, and 4) patient satisfaction. Results : Implant success rate was 100% at stage II surgery. For implant mobility, ISQ value at implant installation was 78.10±3.370, and 2month later, 78.35±3.02. The data of marginal bone loss, peri-implant tissue status, prosthetic maintenance and complications have been collecting for further evaluation. Conclusion : There were no significant differences of treatment outcome between Ball attachment group and Anchor attachment group in terms of implant success rate, implant mobility, patient satisfaction. Keywords : Edentulism, Mandibular implant overdentures, Ball attachment

SS25 419-C-4
FUTURE DIRECTION OF PROSTHODONTIC REHABILITATION FOR EDENTULOUS PATIENTS
Sang-Wan SHIN (*Department of Prosthodontics, Institute for Clinical Dental Research, Korea University Guro Hospital, Korea*)

Introduction : Edentulous patients can have substantial difficulties using conventional complete dentures and in oral function. Implant-supported prostheses can be accepted as treatment options for edentulous patients recently. However, issue on decision-making on the selection of prostheses is still in debated among clinicians in terms of function, esthetics, patient's satisfaction, and cost efficiency. Literature reviews and a clinical study were undertaken to evaluate current treatment modalities for edentulous patients. Method :

Literature search was conducted by PubMed search strategy and hand-searching of relevant journals considering inclusion and exclusion criteria up to year 2012. RCT and clinical trial studies on prosthodontic rehabilitation for edentulous patients were selected and data on implant survival rate, prosthetic maintenance and complications, patient satisfaction were evaluated. A clinical research on the treatment outcomes of mandibular implant supported overdentures for edentulous patients was conducted at KU Guro Hospital from March, 2011 to March, 2013. Information obtained by the literature reviews and clinical study was evaluated. Results : Literature reviews on mandibular implant overdentures presented a high level of effectiveness and efficacy as a restorative option for edentulous patients. A modern approach utilizing mandibular two-implant supported overdentures to prosthetic treatment of edentulous patients was recommended as the first choice of treatment for edentulous patients at the 2002 McGill Consensus and 2009 York Consensus. In addition, our clinical research on the treatment outcomes of mandibular implant overdentures for edentulous patients confirmed the idea suggested by the consensus. Conclusion : A mandibular two-implant supported overdenture may be suggested as the first of treatment of choice for edentulous patients. Keywords : Mandibular, Implant, Overdentures, Edentulous, Treatment outcome

CAREGIVING OF PEOPLE WITH DEMENTIA IN ASIA: PAST, PRESENT AND FUTURE

SS25 424-R-1

CAREGIVERS OF PEOPLE WITH DEMENTIA IN CHINESE COMMUNITIES:A SYSTEMATIC REVIEW OF FINDINGS AND THE WAY AHEAD

Claudia Ky LAI (*School of Nursing, The Hong Kong Polytechnic University, China*)

Introduction : This review intends to identify the relationship between stress management and the quality of life (QOL) of family caregivers of elderly people with dementia in the community among Chinese populations in Asian countries. Method : We searched the literature for the period January 1990 to Dec 2011 in 4 databases (CINAHL, MEDLINE, PSYINFO, and Social Work Abstracts). The articles were defined as relevant when they: (a) were related to the caregivers of people with Alzheimer's disease or dementia; (b) studied informal caregiving in the community; and (c) discussed caregiving experiences, including the concepts of stress and coping and burden and quality of life, but did not address instrument validation. The review of the literature is in progress. The systematic review processes used by the Cochrane Library will be adopted. Results : The studies identified will be classified into three categories: (1) examining Chinese caregivers living in a foreign country as a minority group; (2) comparing Chinese and non-Chinese caregivers with data collected in their respective countries; and (3) studying Chinese caregivers in their country of origin. Conclusion : Studies on caregivers of people with dementia in Chinese communities are a lot fewer than those from Western countries. When considering the Chinese population alone, the findings are quite consistent: caregivers are burdened by their caregiving roles and the behavioural problems of dementia. What needs further attention is the potential impact of specific contexts and the changing culture in particular Chinese countries where assumptions of traditional Chinese values like filial piety and collectivism are becoming less valid. Keywords : Caregiving, Chinese, systematic review

SS25 424-R-2

CAREGIVING OF PEOPLE WITH DEMENTIA IN KOREA: CURRENT ISSUES AND DIRECTIONS FOR FUTURE

Jun-ah SONG (*College of Nursing, Korea University, Korea*)

Introduction : As in other advanced countries, Korea is rapidly approaching the stage of an aged society with an estimation of 20.8% in the number of persons over 65 years of age by 2026. Accordingly, it has been reported that an estimated 703,899 (21.1% of people over 65) Korean elders would be affected by Alzheimer's disease (AD) and other dementias by 2020. Being based on Confucianism, most people with dementia (PWDs) used to be cared for at home by family caregivers, resulting in a lot of burden to the family. Due to changes in family structure, recognition of PWDs, and societal needs for the governmental responsibility on PWD caregiving, a political involvement called "National Long-Term Care Insurance for Elderly" has begun since July, 2008. However, Korean society is still facing many challenges to caregiving of PWDs. Caregiving of PWDs is a multidimensional concept affected by various components such as caregivers' perception, characteristics of PWDs, cost of caregiving, supports from society, and quality of life of both PWDs and caregivers. Method : Therefore, this study was performed to identify recent changes and related issues in caregiving of PWDs in Korea using a systematic review of literature. Results : The following themes were reviewed and discussed: 1) perception and attitude towards dementia and PWDs; 2) caregiving responsibility and burden; 3) management of behavioral psychological symptoms of PWDs; and 4) National Long-Term Care Insurance for Elderly. Conclusion : Findings of this paper would be able to provide valuable information about cross-cultural differences or similarities in caregiving issues of PWDs. Keywords : caregiving, dementia, issues

SS25 424-R-3

CAREGIVER ISSUES FOR PEOPLE WITH DEMENTIA IN MALAYSIA

Philip Jun Hua POI (*Department of Medicine, University Malaya Medical Centre, Malaysia*)

Introduction : There are three main ethnic groups in Malaysia; we studied selected factors of dementia patients and their caregivers that were associated with the burden of being family caregivers. Method : This cross-sectional study involved face-to-face interviews with family caregivers of patients with dementia. Participants were recruited through convenience sampling from geriatric and psychiatry outpatient clinics in three government hospitals, one university hospital, one rural health centre and Alzheimer's Disease caregivers' support groups. Seventy caregivers took part. Measures included patient and caregiver demographic variables and caregiver burden using the Zarit Burden Interview (ZBI). Results : Caregiver burden was found to be significantly associated with both ethnicity and informal support. Chinese caregivers were found to have a higher level of burden compared to Indians and Malays. Informal support, in particular assistance from family members, was significantly associated with a lower perceived burden. The study showed that formal support such as assistance from maids and private nurses did not alleviate caregivers' burden. Results highlighted the importance of improving the coping skills of burdened caregivers, particularly among family members of dementia relatives. Interventions should be tailored to the specific needs of caregivers of different ethnicities. Conclusion : It is important to counsel caregivers to join caregiver support groups, seek assistance from relatives, and access information from easy-to-read leaflets and websites. The paucity of medical and nursing specialists in dementia care, the lack of Alzheimer's support groups and possible reasons for the apathy of family members towards shared care will be discussed.

Keywords : dementia, Malaysia, caregiving

SS25 424-R-4

PERSON-CENTERED CARE FOR THE ELDERLY WITH DEMENTIA: A QUALITATIVE ANALYSIS OF HONG KONG

Vivian W.Q. LOU¹, Xuebing ZHONG², Gemma Kam Chu LAW³
(1. *Social Work & Social Administration, Sau Po Centre on Aging, The University of Hong Kong, Hong Kong*; 2. *Social Work & Social Administration, The University of Hong Kong, Hong Kong*; 3. *Nursing Studies and Health Care, Division of Health and Applied Science, SPACE, The University of Hong Kong, Hong Kong*)

Introduction : The senile dementia population in Hong Kong reached 110,000 in 2010. Dementia care has become a more pressing issue, calling for a scientific and efficient care model to ensure quality of care. Person-centered care (PCC) was developed in response to the need for patient-oriented healthcare service, and has been adopted as a key standard for dementia care in many developed countries. This study aims to achieve a better understanding of stakeholders' attitudes toward PCC, thereby contributing to policy-making. **Method :** A qualitative research method was applied. 14 focus groups and 21 in-depth interviews were conducted among 106 participants who were elderly with mild cognitive impairment (MCI), family caregivers, care workers, and professionals from 17 care units provided by 9 local NGOs. This study adopted a tripartite model of attitude (affective, behavioral, and cognitive) and Brooker's PCC=V+I+P+S model as its theoretical framework. **Results :** Elderly with MCI have strongly negative impressions of care homes, mainly because of the lack of PCC. Family caregivers are willing to provide good quality care, but lack knowledge about PCC, as well as social and psychological support. Formal caregivers have a more pessimistic attitude towards realizing PCC, due to a strained workforce and current policy. Innovative management can help to promote care workers' motivation for practicing PCC. **Conclusion :** Understanding about PCC among both formal and informal caregivers is neither clear nor sufficient. Dementia care provision is limited and inflexible, leaving a big gap in meeting the real needs of elderly people with dementia. Systemic promotion of PCC is urgently in need. **Keywords :** Person-centered care; dementia; caregiver

SS25 425-C

COGNITIVE THERAPY AS A COMPLEMENTARY WAY TO REDUCE FALL RISK

SS25 425-C-1

DO WE NEED A NEW APPROACH TO IMPROVE GAIT AND REDUCE THE RISK OF FALLING IN OLDER ADULTS?

Manuel MONTERO ODASSO (*Gait and Brain Lab, Lawson Health Research Institute, The University of Western Ontario, Canada*)

Until recently, clinicians and researchers have performed gait assessments and cognitive assessments separately when evaluating older adults. Increasing evidence from clinical practice, epidemiological studies, and clinical trials shows that gait and cognition are inter-related in older adults. Quantifiable alterations in gait among older adults are associated with falls, dementia, and disability. At the same time, emerging evidence indicates that early disturbances in cognitive processes such as attention, executive function, and working memory are associated with slower gait and gait instability during single and dual-task testing, and that these cognitive disturbances assist in the prediction of future mobility loss, falls, and progression to dementia. There is evidence that gait assessments can provide a window into the understanding of cognitive function and

dysfunctions, and fall risk in older people in clinical practice. We postulate that the complementary approach for reducing the risk of falls by improving certain aspects of cognition through both non-pharmacological and pharmacological treatments are feasible. Untangling the relationship between early gait disturbances and early cognitive changes may be helpful for identifying older adults at higher risk of experiencing mobility decline, falls and the progression to dementia. **Keywords :** falls, gait, dual-task

SS25 425-C-2

COGNITIVE REMEDIATION TO IMPROVE GAIT AND REDUCE FALLS

Anne Felicia AMBROSE (*Rehabilitation Medicine, Mount Sinai School of Medicine, USA*)

Introduction : Falls are a leading cause of injury and death among older adults and a significant public health issue. Annually it affect one in three adults over the age of 65 and 50% of adults over the age of 80. Falls are a major cause of injury, morbidity, mortality, loss of function and independence. This talk will explore the recent evidence and clinical trials using cognitive therapy to improve attention and executive function to improve mobility and reduce the risk of falling., including the study described below. **Method :** Using a randomized single-blind control design, 24 sedentary older adults (exercise less than or equal to once weekly and gait velocity <1 m/s) were randomly assigned to an 8-week computerized cognitive remediation program or wait-list. Primary outcome was change in gait velocity during normal pace and 'walking while talking' conditions. We also compared the proportion of improvers (velocity change ≥ 4 cm/s) in each group. **Results :** The 10 participants who completed cognitive remediation improved gait velocity from baseline during normal walking (68.2 ± 20.0 vs 76.5 ± 17.9 cm/s, $p = .05$) and walking while talking (36.7 ± 13.5 vs 56.7 ± 20.4 cm/s, $p = .002$). The 10 intervention participants improved gait velocity over the 8-week intervention both during normal walking (change: 8.2 ± 11.4 - 1.3 ± 6.8 cm/s, $p = .10$). **Conclusion :** The findings of this pilot trial are promising and suggest that cognitive remediation may improve mobility in sedentary seniors. **Keywords :** Cognitive Remediations, falls, geriatrics

SS25 425-C-3

DUAL-TASK, MOTOR IMAGERY AND BRAIN IMAGING: DIFFERENT BUT COMPLEMENTARY WAYS TO ASSESS HIGHER LEVELS OF GAIT CONTROL

Cedric ANNWEILER (*Neuroscience and Geriatrics, Angers University Hospital, France*)

Introduction : The central nervous system plays an essential role in walking through two different aspects: first acting in the open-loop control of locomotion by receiving and integrating multiple sensory inputs to produce coordinated movements; and second as being the seat of cognitive higher-levels of motor control to present motor response adapted to environmental constraints. The purpose of this talk is to review different ways to assess the higher levels of gait control. **Method :** Literature review using the Medline database. **Results :** The dual-task paradigm ("walking while talking"), showing that performing an attention task while walking results in the deterioration of gait performance, helped understand that walking, especially in older adults, involves cognitive resources, specifically attention demands. Similarly, motor imagery, which is defined as mentally simulating a given action without actual execution, has demonstrated that age-related gait disorders are not only associated with classic motor disorders in the basal ganglia, cerebellum and primary motor areas, but also with a central misprocessing of information mainly

related to executive dysfunction. Finally, recent neuroimaging studies have reported that age-related gait disorders could be explained not only by subcortical age-related white matter hyperintensities, but also by neurodegeneration and dysfunction of several cortical regions including the frontal, temporal, parietal and motor cortex. Conclusion : Studying the neuroanatomical correlates of higher-level gait disorders can improve the risk assessment of gait disorders and falls, and give rise to new rehabilitative procedures to maintain independence and quality of life in older adults. Keywords : gait control, dual-task, neuroimaging

SS25 425-C-4

THE POTENTIAL OF PHARMACOLOGICAL INTERVENTIONS TO IMPROVE GAIT: WHICH DRUGS FOR WHICH PATIENTS?

Olivier BEAUCHET (*Department Neuroscience, Angers University Hospital, France*)

Introduction : During the past decade increasing evidence have underscored that pharmacological interventions may improve gait and balance in older adults with and without neurodegenerative disease such as Alzheimer's disease and related disorders (ADRD). The purpose of this work was to review the pharmacological-related changes in gait in patients with ADRD. Method : An English Medline search was conducted in June 2012 using the Medical Subject Heading terms 'Gait' AND 'Pharmaceutical Preparations'. Results : Among the 75 found and screened abstracts, it has been found that acetylcholinesterase inhibitors (AChEIs) (i.e., donepezil, galantamine and rivastigimine) and NMDA receptor antagonists (i.e., memantine) may improve gait performance. In particular, a decrease in gait variability (i.e., equivalent to better dynamic stability) has been reported in demented patients using either donepezil or memantine.. AChEIs-related improvement of gait performance has been explained by enhancements of the attention resource allocation involved in gait control. In parallel, memantine-related gait improvement has also been explained by its dopaminergic effect. More recently, it has been reported that the anti-dementia drugs-related beneficial effect depends on the walking condition. Indeed, a significant memantine-related decrease in gait variability under single-task and an AChEIs-related decrease in gait variability under dual-task have been shown in patients with ADRD. Conclusion : All preliminary interventional studies provide a basis of evidence of an improvement related to anti-dementia drugs in patients with ADRD. This evidence needs to be confirm with larger randomized controlled trials. Keywords : Gait, Dementia, drugs, older patients

SS25 426-C

ROLE OF PALLIATIVE CARE IN DYING WITH DEMENTIA

SS25 426-C-1

PALLIATIVE CARE IN DEMENTIA: CONCEPTUAL ISSUES

Jenny T. VAN DER STEEN (*Department of General Practice & Elderly Care Medicine, EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands*)

Introduction : Palliative care in dementia is distinct; dementia is incurable but patients may live years before they die from or with dementia. The presentation focusses on applicability across dementia stages. Method : Two data sources are used: (1) the Dutch End Of Life in Dementia study (DEOLD, 2007-2011) which recruited 372 nursing home residents with variable dementia stages upon admission with prospective follow-up until death (59%), along with 119 residents included retrospectively after death; (2) an international Delphi study

among 64 experts from 23 countries to achieve a set of recommendations about palliative care in dementia for the European Association for Palliative Care (EAPC). Results : Research so far has focussed on the advanced stages. In DEOLD, pain in the last week of life was more common (52% had pain on 2 or more days) than shortness of breath or agitation (both 35%). There was no difference between advanced versus less advanced dementia; neither did cause of death differ (e.g., infections 35% versus 42%). The EAPC definition of palliative care in dementia comprised eleven domains. Almost all (95%) experts agreed that palliative care is important in dementia, but there was controversy on whether it applied to advanced ("severe") dementia "only" (25% agreed), "equally" (51%), or "more" so (64% agreed). Conclusion : Palliative care may address needs in dying with advanced dementia as well as less advanced dementia. Future work should focus on how to give shape to palliative care across dementia stages against the framework of a clear definition of palliative care in dementia. Keywords : dementia, palliative care

SS25 426-C-2

HUNGRY FOR EVIDENCE: THE ISSUE OF ARTIFICIAL NUTRITION AND HYDRATION

Giovanni GAMBASSI (*Internal Medicine - Geriatrics, Università Cattolica, Italy*)

Introduction : An increasing proportion of older adults with Alzheimer's disease or other dementias are now surviving to more advanced stages of the illness. Advanced dementia is associated with feeding problems, including difficulty in swallowing and respiratory diseases. Patients become incompetent to make decisions. As a result, complex situations may arise in which physicians and families decide whether artificial nutrition and hydration is likely to be beneficial for the patient. Method : Systematic review of available evidence. Results: Only observational controlled studies have been conducted and mainly assessing mortality. Overall, there is no evidence of increased survival in patients receiving enteral tube feeding. None of the studies examined QoL and there is no evidence of benefit in terms of nutritional status. More recent studies have documented that most feeding tubes are inserted in an acute care hospital and that insertions are associated with poor survival and significant rate of health care use after insertion. Also, feeding tubes are not associated with prevention or improved healing of a pressure ulcer. Rather, the use of PEG tube is associated with increased risk of pressure ulcers among NH residents with advanced dementia. Conclusion : Despite the very large number of patients receiving this intervention, there is insufficient evidence to suggest that enteral tube feeding is beneficial in patients with advanced dementia. The decision-making process is complicated, however, and involves the clinician considering such issues as advance directives, ethical considerations, legal/financial concerns, emotional factors, cultural background, religious beliefs, and the need for a family meeting incorporating all of these principles. Keywords : Advanced Dementia, Palliative care, Artificial nutrition.

SS25 426-C-3

TREATMENT OF PAIN IN DEMENTIA

Katarzyna WIECZOROWSKA-TOBIS (*Department of Geriatric Medicine and Gerontology, Karol Marcinkowski University of Medical Sciences in Poznan, Poland*)

Introduction : Pain is one of the most important problems in old age, as it decreases the functional status of the subject. Individuals with dementia do not seem to be different in this respect. The aim of the presentation is an analysis of the approach to pain treatment in dementia. Method : The frequency of pain in patients with dementia

has not been studied intensively. It is especially an issue in those who are not able to communicate verbally. Moreover, there is growing evidence that analgetic drugs are underused in these patients. However, it was found in the study on representative population for Poland (PolSenior), that the percentage of subjects treated with opioids was the same in subgroups of cognitively intact individuals and those who had dementia, no matter how severe the dementia was. Results : In patients with dementia, pain needs to be taken into account in those individuals who have acute onset of behavioral or psychiatric problem, as antipsychotic agents are very frequently used in this subpopulation. This raises the question if analgesia should be administered routinely in dementia in case of acute onset of neuropsychiatric problems. Nevertheless, it is obvious that in order to treat pain in individuals with dementia pain must be diagnosed first and subsequently the question about its possible causes should be answered. Conclusion : In conclusion, as the necessary feature to treat pain is to be aware of its presence in first place, education is needed to give the doctors tools for dealing with pain in elderly subjects. Keywords : dementia, palliative care, pain

SS25 426-C-4

JAPANESE SITUATION OF PALLIATIVE CARE IN DEMENTIA: SUGGESTIONS FROM A FAMILY BOOKLET ADAPTATION AND ACCEPTABILITY STUDY

Miharu NAKANISHI (*Research Department, Institute for Health Economics and Policy, Japan*)

Introduction : In Japan, a majority of people dies in hospitals (78.5% in 2011). Persons whose cause of death was Alzheimer's disease, cerebrovascular, or other dementia also frequently die in hospitals (51.0%), or residential facilities (34.1%). Special nursing homes are residential facilities under the public long-term care insurance program, and are the only facilities available for permanent residence for elderly persons. However, half of decedents in special nursing homes (53.4% in September 2010) has been transferred to hospitals in the dying phase. We surveyed staff of special nursing homes to evaluate an adapted Japanese version of an originally Canadian booklet to guide and inform families on palliative care in dementia, and assessed their attitudes towards end-of-life care for residents with dementia in these settings. Method : We adapted the booklet where necessary to the Japanese environment, e.g., regarding legal requirements and adding explanation in view of prevailing ethical principles, retaining guidance on palliative care where possible. An anonymous self-administered paper questionnaire survey was conducted during October-December 2010, using a 1-5 point scale on agreement with 26 statements about the booklet. Among a total of 255 staff members from the 5 homes sampled, 157 members (response rate 61.6%) evaluated the booklet. Results : Evaluations of the revised booklet were unfavorable regarding statements on withholding or stopping medical treatment such as cardiopulmonary resuscitation, intravenous feeding, and tube feeding. Conclusion : The results suggest some culturally sensitive issues on palliative care in dementia compared to Canada, some of which we encountered also in, for example, Italy. Keywords : Dementia, Nursing homes, Palliative care

RELATING MUSCLE MASS WITH FUNCTIONAL CAPACITY AND INSULIN RESISTANCE: WHAT IS APPARENT IS NOT ALWAYS REAL

SS25 427-C-1

EXERCISE, BODY COMPOSITION AND GLUCOSE METABOLISM IN OLDER ADULTS

Isabelle J. DIONNE (*Faculte d'education physique et sportive, University of Sherbrooke, Canada*)

Aging is associated with a decline in glucose metabolism, leading to an increased risk of Type 2 diabetes. The age-related gain in fat mass in various compartments likely explains this risk. The Canadian Guidelines for the management of Type 2 diabetes have now proposed physical activity as a first-hand part of the treatment of Type 2 diabetes, supporting the importance of this lifestyle change for body composition and glucose metabolism. This presentation will review the scientific evidence that physical activity participation plays a key role in body composition and glucose metabolism management in older adults. Keywords : glucose metabolism, exercise, type 2 diabetes

SS25 427-C-2

SKELETAL MUSCLE, FUNCTIONAL CAPACITY AND INSULIN SENSITIVITY IN THE ELDERLY.

Mylene AUBERTIN-LEHEUDRE (*Kinesiology, University of Quebec in Montreal (UQAM), Canada*)

Introduction : With the increasing number of seniors, type 2 diabetes and loss of autonomy become two major health concerns. Age related changes in body composition (reduction in muscle mass (MM; sarcopenia) and in muscle strength (MS; dynapenia) are associated with functional capacity and insulin sensitivity. In addition, there is evidence indicating that when combined with obesity, these changes (sarcopenic-obesity and dynapenic-obesity) have worse impact on physical impairments and metabolic disorders. Method : However, controversies exist about the role of MM as predictor of functional incapacities in elderly people. We observed that for the same amount of MM index, dynapenic women had significantly poorer cardio-respiratory functions than non-dynapenic women. In addition, it is still unclear if the loss of MS when combined or not with obesity is associated with an unfavorable metabolic profile. We observed that dynapenic-obese women have a more favourable metabolic profile than non-dynapenic-obese women. Thus, when associated with obesity, dynapenia and sarcopenia seem to have similar effects on the insulinemic profile. Results : Our understanding about these associations is that insulin resistance plays a key role in the development of type 2 diabetes, and in the loss of MM and MS. In addition, aging is associated with loss of muscle type II fibers, which are known to be positively associated with MS and insulin resistance. Conclusion : This presentation will review the scientific evidence that MM and MS play different key roles in regard to functional capacity or insulin sensitivity in elderly people and the potential mechanisms related to these phenomena. Keywords : sarcopenia, dynapenia, aging, functional capacity and metabolic disorders

SS25 427-C-3

BODY COMPOSITION CHANGES AND ITS RELATIONSHIP WITH THE DEVELOPMENT OF INSULIN RESISTANCE IN PARTICIPANTS OF THE NUAGE COHORT

Jose A. MORAIS¹, Joane MATTA², Tamas FULOP³, Isabelle J. DIONNE⁴, Pierrette GAUDREAU⁵ (*1. Division of Geriatric Medicine, McGill University, Canada; 2 School of Dietetics and Human Nutrition, McGill University, Canada; 3. Division of Geriatric Medicine, University of Sherbrooke, Canada; 4. Department of Kinesiology, University of Sherbrooke, Canada; 5. Faculty of Medicine, University of Montreal, Canada*)

Introduction : Aging is associated with a loss of muscle mass and a gain in fat that is centrally distributed. Fat mass has been linked with insulin resistance (IR), and since muscle is the primary site of glucose

disposal, its loss has been proposed to contribute to IR as well. Method: Using non-diabetic participants of the Quebec Longitudinal Study on Nutrition and Successful Aging (NuAge) Study we sought to explore the independent relationships between components of body composition and IR using cross sectional and longitudinal data, while controlling for known covariates, such as energy and protein intake, sex, age, chronic diseases and physical activity. Results : Cross sectional data relating all variables using path analysis revealed that IR as assessed by the HOMA-IR score was associated with both muscle mass index (MMI; kg/m²) and %body fat. Physical activity was associated with lower fat and higher MMI. Protein intake sources affected indirectly and differently the HOMA-IR score through MMI and fat mass since plant protein intake was negatively associated with IR but with MMI as well whereas the reverse holds for animal protein. Longitudinally, using developmental trajectories to determine changes in insulin sensitivity status and logistic regression analyses to determine baseline predictors, we found that the independent predictors of IR were MMI= [OR (95% CI): 1.72 (1.26-2.3)], %body fat [1.18 (1.12-1.25)] and sex [women versus men: 0.15 (0.04-0.45)]. Conclusion : Taken together, these results suggest that both higher muscle mass and % body fat confer increased risks of developing IR with aging, while being a woman is protective. Keywords : insulin resistance; muscle mass; predictors of insulin resistance.

SS25 427-C-4

BLOOD BIOMARKER PROFILE OF INSULIN RESISTANCE IN THE NUAGE COHORT

Pierrette GAUDREAU¹, Tamas FULOP², Jose A MORAIS³
(1. Department of Medicine, University of Montreal and Centre Hospitalier de l'Université de Montreal Research Center, Canada; 2. Department of Medicine, University of Sherbrooke and Institut universitaire de gériatrie de Sherbrooke, Canada; 3. Division of Geriatric Medicine, MUHC-Royal Victoria Hospital and McGill University, Canada)

Introduction : The decrease in physical performance with aging is mediated, at least in part, by changes in body composition and metabolic status including insulin resistance. However, it is still unclear whether or not a blood biomarker signature can predict or characterize these conditions. The objective of this study was therefore to quantify fasting serum levels of glucose, insulin, cholesterol, triglycerides, insulin-like growth factor 1 and binding protein 3, leptin and adiponectin, and markers of inflammatory status such as C reactive protein, tumor necrosis factor-alpha and interleukin 6 in a subset of elderly people of the Quebec NuAge cohort. Method : Biomarkers were measured in 288 participants that were not insulin-resistant (IR) at recruitment in the cohort (year 1) but became (n=96) or not (n=192) IR at year 3. The two groups under study were paired for age and sex. Serum glucose, cholesterol and triglycerides were analyzed in clinical biochemistry laboratories and immunoreactive levels of other biomarkers were quantified in our laboratories. Results: Appropriate data modeling and statistical analyzes is performed to determine whether or not a blood biomarker signature characterizes each group at year 1. Conclusion : Identification of a specific blood signature predicting IR would be of great value to develop pharmacological and/or lifestyle interventions to prevent or reduce the deleterious effects of IR on physical performance decline in aging. This research was supported by the Canadian Institutes of Health Research and the Quebec Network for Research on Aging. Keywords : biomarkers, elderly, cohort study

CAREGIVING FOR THE ELDERLY IN ASIA

SS25 502-R-1

EXPECTATIONS ABOUT BEQUEST AND INFORMAL CARE

Young Kyung DO, Kelvin FOO (Program in Health Services and Systems Research, Duke-NUS Graduate Medical School Singapore, Singapore)

Introduction : Although informal care provided to a functionally dependent elderly is oftentimes uncompensated and can be motivated by altruism, individual decisions on informal care may be associated with an exchange motive involving intergenerational transfers between elderly parents and their adult children. Method : This study uses data from the 2006 and 2008 Korea Longitudinal Study of Aging to investigate the relationship between expectations about bequests and informal care, from the perspectives of both parents and adult children. Results : We find that daughters providing informal care to their parents have approximately 30 percentage points higher probability of expecting an inheritance of 100 million Korean Won (approximately USD 88,000) or more compared with those who do not provide care for parents. We also find that elderly parents with a higher expected probability of leaving at least inheritance of 100 million Korean Won are more likely to report that at least one of their adult children will be willing and able to help them with basic daily activities in the future. The associations are statistically significant for non-coresiding parent-child relationships only, not for coresiding ones, suggesting that among those who are currently not coresiding, bequests may influence the behaviors of parents and adult children on informal care. Conclusion : Given the decreasing rates of intergenerational coresidence in South Korea and other Asian countries, bequests and other intergenerational transfers are likely to play an increasingly important role in informal care provision in the future. Keywords : Informal care, Intergenerational transfers, Coresidence

SS25 502-R-2

MODELING DEPRESSION AMONG CAREGIVERS OF OLDER INDIVIDUALS WITH PHYSICAL, COGNITIVE AND BEHAVIORAL DISABILITIES

John Pastor ANSAH, David Bruce MATCHAR (Health Services and Systems Research, Duke-NUS Graduate Medical School, Singapore)

Introduction : Caring for an older person who has physical, cognitive or behavioral disabilities is recognized as a source of burden and distress for family caregivers (Knight 2000). A significant body of literature documents the effects of caregiving on self-reported emotional distress and depression. Our contemporary understanding of caregiver distress is based on the stress and coping theory developed by Lazarus and Folkman and their colleagues (Folkman et al. 1987; Lazarus 1984). However, the stress and coping models of the caregiver depression process that have emerged tend to be static in nature and focus on correlating primary stressors and primary and secondary appraisal to depression outcome (Yates, Tennstedt, and Chang 1999; Malhotra et al. 2012). Understanding how caregiver depression develops over time is difficult to decipher from these static models. In addition, the static nature of the current models makes it difficult to evaluate the potential impact of policies on depression. The purpose is to operationalize the conceptual stress and coping model in a simulation. Method : The depression model presented herein is a deterministic, differential equation type model built using the methodology of system dynamics combining local and expert evidence and insights from previous research. Results : Depression among caregivers is projected to increase as the number of caregivers and care burden increase. Conclusion : The effort will be deemed successful to the extent that the content experts are satisfied that the model expresses their theory with good fidelity and the resulting calculational

model offers outputs deemed useful for policy makers and other stakeholders. Keywords : system dynamics, caregiver depression, singapore

SS25 502-R-3

IMPLICATIONS OF ELDERLY SOMATIC AND MENTAL DETERIORATION ON THE PHYSICAL AND PSYCHOLOGICAL CONDITION OF CAREGIVERS

Trinidad Sarao OSTERIA (*Yuchengco Center, De La Salle University, Philippines*)

Introduction : Population ageing has become a distinctive demographic development in the Philippines. This phenomenon raises a range of economic, political and social concerns. Fertility and mortality declines reflect an increase in elderly dependence. Increasing numbers of women in the labor force, geographic mobility and high incidence of separation and non-marriage strain the family's capacity to care for the aged. These dramatic trends imply that there will be fewer family caregivers. Method : Empirical research on the caregivers of the elderly in selected areas in the Philippines dichotomized family members and domestic helpers. Particular attention is given to their relationship with their elderly wards, the extent of double burden, stressors, adjustments, anxiety, and depression. Caregiver's burden was measured through assessment of anxiety and depression scores of caregivers and elderly. Results : The physical nature of elderly caregiving can be particularly exhausting. Women who care for the elderly with limited mobility are particularly affected. They also suffer from the psychological and emotional demands of caregiving. Depression sets in. This has been reinforced by the different psychological tests on anxiety and depression. (Zarit, ADL, Hamilton) Conclusion : Long term burden, anxiety and stress exhaust the caregivers. It is important for them to stay healthy, be active, and have some along time regularly. One source of stress among caregivers is the lack of knowledge/training about proper elderly care. Training can be provided to equip the caregivers with management of health problems. Keywords : Elderly, caregivers, anxiety

SS25 502-R-4

BEHAVIORAL AND PSYCHOLOGICAL SYMPTOMS AND FUNCTIONAL LIMITATIONS MEDIATE THE ASSOCIATION BETWEEN OLDER PERSON COGNITIVE IMPAIRMENT AND CAREGIVER DEPRESSION

Rahul MALHOTRA, Choy Lye CHEI, Truls ØSTBYE, Angelique CHAN, David Bruce MATCHAR (*Health Services and Systems Research, Duke-National University of Singapore Graduate Medical School, Singapore*)

Introduction : Caregivers of older persons with cognitive impairment (CI), versus caregivers of those without CI, are more likely to be depressed. Behavioral and psychological symptoms of dementia (BPSDs) and functional limitations (FLs) are more common among older persons with CI than those without CI. We assess BPSDs and FLs as mediators of the effect of older person CI on clinically significant depressive symptoms (CSDS) in their caregiver. Method : Data from Singapore for 1,111 older persons (75+ with ≥ 1 activity of daily living(ADL) limitation)-caregiver dyads was used. Caregiver CSDS (yes/no) was based on CES-D Scale score, and older person CI(yes/no) on SPMSQ score or on RMBPC memory-problem subscale score. Older person BPSDs were operationalized through combining RMBPC disruptive-behavior and depression subscale scores, and FLs through OARS ADL score. The causal steps approach was utilized to assess for mediation of the effect of older person CI on caregiver CSDS through the two potential mediators and a bootstrapping

approach for calculating point estimates and significance of the indirect effect. Results : The causal steps approach supported older person BPSDs and FLs as mediators of the effect of older person CI on caregiver CSDS. The bootstrapping approach confirmed both as significant mediators, though BPSDs (indirect effect odds ratio 1.31 [95% bootstrap CI 1.18,1.44]; %mediation:75.0%) was a much stronger mediator relative to FLs (1.05 [1.01,1.11]; %mediation:11.7%). Conclusion : While caring for an older person with CI is detrimental for the caregiver's mood, management of associated BPSDs and FLs among such older persons may reduce depression or depressive symptoms among their caregivers. Keywords: Disruptive behavior; Mediation analysis; Activities of Daily Living

COMPARATIVE ANALYSIS ON SOCIAL PARTICIPATION AND HEALTH IN ASIA-PACIFIC REGIONS

SS25 504-R-1

SOCIAL PARTICIPATION AND HEALTH OF KOREAN RETIREES

Yoon Shin KIM (*Institute of Aging Society(IAS), Hanyang University, Korea*)

Introduction : Korea has been undergoing population aging, in a speed unparalleled in world history. Retirement of middle aged bring about change of social structure in social and economic aspects, therefore required to approach various perspective and active aging. Method : The purpose of this research is to determine the appropriate direction for Social Participation and Health of education program for Korean retirees in public and private aspects and to suggest realistic improvement plans. Results : This study has established the following as research topics : Firstly, to review and analyze social participation and health of education program for Korean retirees to identify problems and areas that call for improvement. Secondly, The social participation and health of education program for Korean retirees in public sectors and in private sectors are analyzed separately, especially focusing on retirees education programs of hanyang university in Korea. Conclusion : The implications of this study were as follows : A life-long learning program needs the follow-up management system and rewards for maximizing it's performance after retirement. Second, it needs rewards for maximizing it's performance. It seems to supplementation and development of systematic curriculum for retirement education in different types. Keywords : Social Participation, Health, Retirement Education Program

SS25 504-R-2

SOCIAL PARTICIPATION AND HEALTH OF JAPANESE RETIREES

Masataka KURAOKA (*Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan*)

The percentage of the population over 65 years of age in Japan is projected to reach 30% in 2024. As costs for medical and long-term care insurance grow, it is vital to prevent disease, provide for long-term care needs, and maximize healthy life expectancy. In 2012, baby-boomers reached 65, and from 2013 continuing employment of people who wish to work after retirement age until age 65 will begin to be required of corporations. In the same year the starting age of pension payouts will be raised to 65. In this political transition, it is a national priority to respond to the vast number of people who continue actively seeking jobs as well as securing their long-term healthy living. The promotion of health for Japanese retirees has been implemented through vitalizing senior's awareness, social participation, and

enhancing promotion of health programs at both national and local government levels. Social participation to enhance the health of Japanese elderly has been promoted through exercise and dementia prevention projects such as cooking and a read-aloud program. Although the proportion of Japanese elderly who have not experienced volunteer activities is high (52%) compared to the US (33%), lifelong learning, volunteer programs and community activities by seniors have become more important. Our research indicates a positive effect of social participation on the participants' health. Social involvement has now become the critical factor in constructing all the social services from employment reference service for the active elderly to long-term care for the frail elderly at facilities. Keywords : Social Participation Japan

SS25 504-R-3

SOCIAL PARTICIPATION AND HEALTH OF USA RETIREES Colette BROWNE (Social Work, University of Hawaii, USA)

This presentation will provide an overview of social participation patterns and their relation to health and health status among varied groups of older adults in the United States of America. The relationship between social participation and health is critical to better understand as poor health, more than most other changes associated with ageing, can lead to reductions in a person's satisfaction and competence in mastering his or her environment. In the USA, the vast majority of older adults hope to "age in place" in their own homes in age-friendly communities that promote social participation, and that offer affordable and accessible health/healthcare information. Based on US Census and other data, we will discuss a number of innovative living arrangements that promote elder friendly and livable communities; among them, naturally occurring retirement communities (NORCs), Assisted Living Facilities, Intentional communities, and others. Keywords : Health

VASCULAR AGING II: TRANSLATIONAL RESEARCH TO CLINICAL APPLICATION

SS25 507-B-1

TARGETING INFLAMMATION TO TREAT VASCULAR AGING IN HUMANS

Gary L PIERCE (Health and Human Physiology, University of Iowa, USA)

Introduction : Cardiovascular disease (CVD) remains a major cause of global morbidity and mortality of which older age is a primary risk factor. The increased risk of developing CVD with advancing age in humans has been attributed in large part to two fundamental alterations in arterial structure and function associated with normal aging: 1) stiffening of the large elastic thoracic central arteries (e.g., aorta, carotid), and 2) impaired vascular endothelial function. Method : The mechanisms responsible for these adverse vascular physiological changes with aging are not completely understood, but strong epidemiological and experimental evidence suggests that inflammation and oxidative stress may be common mechanisms that contribute to both. Results : Recent evidence suggests that chronic activation of nuclear factor kappa B (NF κ B), a key proinflammatory transcription factor that regulates expression of hundreds of inflammatory genes, contributes to vascular dysfunction with aging in part related through the development of vascular oxidative stress. We will advance the idea that that vascular NF κ B may be a novel target in the treatment of vascular dysfunction with aging and related co-morbidities such as obesity and prediabetes. We will describe recent pre-clinical (animal

models) and clinical (human studies) evidence that select pharmacological (e.g., salsalate) and lifestyle (e.g., aerobic exercise) strategies prevent or reverse vascular aging in part through inhibition of vascular NF κ B signaling and suppression of oxidative stress. Furthermore, preliminary data on pilot clinical studies using salsalate to treat vascular aging will be discussed. Conclusion : Inflammation may be a novel therapeutic target to treat vascular aging in humans. Keywords : nuclear factor kappa B, oxidative stress, endothelial function, arterial stiffness, exercise

SS25 507-B-2

VASCULAR SENESENCE-RELATED MODIFICATION OF HIGH-DENSITY LIPOPROTEIN FROM ELDERLY: PRO-ATHEROSCLEROTIC AND PRO-SENESCENT PROPERTIES WITH INCREASED CHOLESTEROL INFLUX

Kyung-hyun CHO (School of Bioscience, Yeungnam University, Korea)

Introduction : High-density lipoprotein (HDL) is a strong antioxidant, anti-inflammatory, and anti-senescence molecule. To compare the change in lipoprotein metabolism with vascular aging, we analyzed the lipid and protein compositions of individual lipoprotein fractions. Method : We analyzed the lipid and protein compositions of individual lipoprotein fractions. Healthy and non-obese elderly subjects (elderly group, n=26) had a serum lipid profile within the normal range, although slightly higher than in young subjects (control group, n=18). Results : The elderly group had a 2-fold higher serum uric acid level and triglyceride (TG)/high-density lipoprotein (HDL)-cholesterol ratio. The elderly group had less antioxidant ability and elevated TG content in HDL with enhanced cholesteryl ester transfer activity. An elevated level of advanced glycated end products in lipoproteins and fragmentation of apoA-I were present in the elderly group, with detected lower apoA-I level and more multimerized apoA-I in HDL. The protein levels of apoA-I, apoC-III, and serum amyloid A in lipoprotein-deficient serum were increased in the elderly group. Treatment of human dermal fibroblasts (HDFs) and macrophages with elderly-HDL caused more severe cellular senescence and foam cell formation, respectively; however, treatment with HDL from a young group (Y-HDL) and native apoA-I (nA-I) suppressed senescence and atherosclerosis. Conclusion : In conclusion, E-HDL and glycated apoA-I-rHDL share similar physiologic properties in macrophages and HDFs. They exacerbated cellular senescence and atherosclerosis with increased cellular cholesterol influx. Keywords : high-density lipoproteins, apolipoprotein A-I, glycation, senescence, vascular aging

SS25 507-B-3

TELOMERE BIOLOGY IN CARDIOVASCULAR DISEASE - AN UPDATE 2013

Peter M. NILSSON (Clinical Sciences, Malmo, Lund University, Sweden)

Introduction : Telomeres are protecting the end of the DNA helix between cell divisions. With every cell division the telomere tends to shorten and therefore telomere length (TL) has been regarded as a marker of biological ageing. TL is also determined by enzymatic activity of the enzyme telomerase against a background of genetic programming. Method : A literature search has been carried out to search for publications on telomere and TL in relation to cardiovascular (CVD) and coronary heart disease (CHD), as well as hypertension and diabetes until December 2012. Results : A number of cross-sectional studies have documented an association between shorter TL and early onset manifestations of CVD, CHD and type 2 diabetes complications. Prospective studies have shown a shortening

of TL in most studies with repeated measurement, and an association between TL at baseline and predictive risk of CHD, as well as nephropatic complications to type 1 diabetes. Some paradoxical findings have been published, for example that left ventricular hypertrophy, being a marker of target organ damage and elevated risk in hypertensives, is associated with longer TL and not shorter. The influence of cardiovascular drugs on TL is not well studied. In the LIFE study in hypertensives there was no effect of losartan or atenolol on changes in TL, but in the WOSCOP study pravastatin therapy protected men with hyperlipidemia from future CHD. Conclusion : Telomere biology is complicated and even if there are numerous findings to support the concept of early cardiovascular ageing in risk patients we still do not know the exact mechanisms. Keywords : Cardiovascular, Coronary, Telomere

NEW MODELS OF HOME AND COMMUNITY CARE. REQUIREMENTS AND APPROACHES

SS25 508-R-1

HEALTH PROMOTION IN LONG TERM-CARE

Annett HORN¹, Doris SCHAEFFER² (*1. Health sciences research and nursing research, University of Bielefeld, Germany; 2. Health services research and nursing research, University of Bielefeld, Germany*)

Introduction : In order to meet the challenges that result from demographic changes and influence particular the Long Term-Care (LTC) setting, new concepts for preventing loss of independence are required - concepts which can be applied early in the course of a chronic illness instead of later, when loss of function has already begun. Method : An explorative study was carried out to find out if this demand is taken into account in practice. For this purpose 14 interviews with General Practitioners (GPs) and 12 expert interviews with nurses working in home care services in the OWL (Ostwestfalen-Lippe) region of Germany were carried out and analyzed. Results : The results show on the one side the large extent to which chronic illnesses and multimorbidity dominate the work of the GPs and the work in home care settings. On the other side they demonstrate that finding ways to prevent loss of independence has become more important than ever. Conclusion : The potentials preventive and health promoting approaches hold for the rising number of older people are rarely seen and picked up in practice. In the future, more efforts have to be taken to develop concepts and competences and there is a need for qualification of nursing personnel as well as GPs. Keywords : Health Promotion, Long Term-Care, Expert Interviews

HOME CARE OF ELDERLY IMMIGRANTS - SITUATION AND PERSPECTIVES IN GERMANY

Elke OLBERMANN¹, Gerhard NAEGELE² (*1. University of Dortmund, Institute of Gerontology, Germany; 2. Institute of Gerontology, TU Dortmund University, Germany*)

Introduction : Older People with migration background are the group with the highest growth rate in German society and the number of

elderly immigrants in need of care is rapidly increasing. With this development, the migrant families and the German health and social care system are facing many challenges on how to provide care. While home care is the most common type of elderly care, the knowledge base about the situation of home care of older migrants in Germany is rather low. Method : An analysis of research findings and model projects was conducted to gain an overview on the situation of home care of older migrants in Germany, to identify problems as well as good practice. Results : Immigrant elderly show a lower use of home care services. There are diverse barriers for access to professional help and offers in need of care especially for people with a migration background. But there are also approaches and innovative intervention strategies to improve access to health and social care system and to enhance the quality of life of older migrants in need of care and their relatives who provide care. Conclusion : Special efforts of care providers and policy makers are necessary to develop a home care system with respect to the needs of older migrants and their family caregivers. Interventions should include the provision of culturally sensitive care services and the empowerment of older migrants and their relatives. Keywords : older migrants, home care

SS25 508-R-3

HOME AND COMMUNITY CARE IN RURAL REGIONS - MODELS AND APPROACHES IN CANADA AND FINLAND

Kerstin HAEMEL¹, Doris SCHAEFFER² (*1. Institute of Nursing Science, Bielefeld University, Germany; 2. Public Health Nursing & Health Sciences Research, Bielefeld University, Germany*)

Introduction : Rural regions are concerned with fast aging population, but access to health and social care is still underdeveloped. Specific conditions in rural settings, like sparse population density, wide distances, less differentiated care structures and higher concerns with health professional shortage are challenging the implementation of aging in place strategies. The research project "Rural care models - An international perspective" focuses on developments in Canada and Finland: countries with extensive rural areas and a strong policy focus on home and community care. Method : In the first phase of the project semi-structured interviews with rural health care experts in Canada and Finland were conducted to identify recent developments, problems as well as innovative models. To explore selected models, field visits and interviews with health care planners and providers were undertaken. Results : Different care models are implemented in both countries alongside different state/regional health systems. Examples of selected models and their contributions to strengthening home and community care will be outlined. Beyond the differences in services provided, scope, and functioning of the models there are recurring elements in addressing the health needs of elderly people living in their homes and communities; that are fostering continuity of care, building interprofessional teams, shaping new and extended professional roles, and cultivation of community partnerships. Conclusion : The models show common elements, but there is no single one-fits-all approach. Care models have to be adaptable to established community care structures and cultures. Community health assessments can be a key approach providing a systematic development. Keywords : rural regions, home and community care, community health

EVALUATING SERVICE NETWORKS FOR PEOPLE WITH DEMENTIA AND THEIR INFORMAL CAREGIVERS: THE "EVIDENT"-PROJECT

Monika REICHERT (*Institute of Sociology, University TU Dortmund, Germany*)

Introduction : In an ageing society efficacy of care provision and other outpatient support services for people with dementia and their informal caregivers is of particular importance. Against this background, the project "EVIDENT" (funded by the German Ministry of Health) aimed to evaluate the work of six dementia care networks in Germany. The principal purpose of these dementia care networks - which were regarded as 'good practice' - was to decrease the fragmentation of community based services by linking the different parts of dementia care supply (e.g., medical and nursing services, consultation, self help.) **Method :** Six case studies were conducted to document structure and processes of each network and analyse facilitators for and barriers to the development and functioning of dementia networks. Data refer to the institutional and individual drivers for participating in networks, the development of networks in community care systems, the conditions necessary for success and sustainability, and the restrictions of networks referring to institutional and financial framework. **Results:** Results show, for example, that dementia networks have to be adapted to the regional parameters, case management has to be developed more systematically and family doctors and other medical specialists have to be included into the networks more strongly. **Conclusion :** To overcome fragmentation in dementia care supply and to increase the service use by informal carers different actions and actors are necessary. In this connection an important role can be attributed to the local community, which, however, has to be supported by an efficient national care policy. **Keywords :** dementia care services, networks, evaluation,

CHANGES IN PHYSICAL ACTIVITY LEVEL AND COGNITIVE DECLINE IN OLDER KOREAN ADULTS

Yunhwan LEE (*Dept. of Preventive Medicine and Public Health; Institute on Aging, Ajou University School of Medicine; Ajou University Medical Center, Korea*)

Introduction : Physical activity in late life may be beneficial in maintaining cognitive health. This study examined the association between changes in physical activity levels and cognitive decline in community-dwelling older people. **Method :** Data were from the Korean Longitudinal Study of Aging, with participants aged ≥ 65 years interviewed at baseline (2006) and 2-year follow-up ($n=3,511$). Cognitive decline was defined as below -1.96 on the Reliable Change Index of the Mini-Mental State Examination. Physical activity level was categorized as sedentary (0: 0 min/week), low (1: 1-149 min/week) and recommended (2: ≥ 150 min/week). Changes in physical activity levels were classified into active (1 to 1, 2 to 2), increaser (0 to 1, 0 to 2, 1 to 2), inactive (0 to 0), and decreaser (2 to 1, 2 to 0, 1 to 0). Logistic regression was used to analyze the influence of changes in physical activity on cognitive decline. **Results :** Overall, 7.3% of the participants had a reliable deterioration in cognitive function during the interval. The decreaser showed the highest percentage of cognitive decline (9.8%), followed by inactive (7.5%), increaser (6.8%), and active (4.5%). Compared with the active group, the inactive (odds ratio [OR] = 1.75, 95% confidence interval [CI]: 1.00-3.02) and decreaser (OR=1.98, 95% CI: 1.14-3.46) demonstrated a significantly higher likelihood of cognitive decline, adjusting for sociodemographics and health-related covariates. **Conclusion :** Among older adults, reduced levels of physical activity were associated with an elevated risk of cognitive decline. Maintaining physical activity in later life may be protective against cognitive decline. **Keywords :** cognition, physical activity, longitudinal studies

SS25 509-C-2

ASSOCIATION BETWEEN URINARY INCONTINENCE AND PAIN IN COMMUNITY-DWELLING ELDERLY WOMEN

Hunkyung KIM (*Epidemiology, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : Urinary incontinence and pain are common problems experienced by elderly people, and chronic pain has been associated with mobility limitations, and future dependence in activities of daily living. The aim of this study was to explore the relationship between urinary incontinence and pain in elderly community-dwelling Japanese women. **Method :** Subjects included 1,399 women aged 75 or older who participated in a comprehensive health examination including a face-to-face interview and physical fitness tests. To evaluate the relationship between urinary incontinence and pain, urinary incontinence was defined as those who experienced urine leakage episodes more than once a week. **Results :** The prevalence of urinary incontinence was 18.5%. The subjects with urinary incontinence were significantly older, heavier, had higher fat mass, lower level of walking ability and balance function, were more likely to report osteoarthritis (OA) and greater levels of pain. The prevalence of urinary incontinence was significantly higher in subjects with pain (21.9%) than without pain (12.5%; $p<0.001$). The most common pain sites were in the lower back and knee. Urinary incontinence was significantly associated with age (odd ratio(OR)=1.08, 95% confidence interval (CI)=1.03-1.14), usual walking speed (OR=0.37, 95%CI=0.21-0.64), fat mass (OR=1.05, 95%CI=1.02-1.09), OA history (OR=2.38, 95%CI=1.06-5.16), and lower back pain (OR=1.56, 95%CI=1.11-2.22). **Conclusion :** Urinary incontinence was significantly associated with lower back pain and OA history. Our data suggest that elderly women who have urinary incontinence should have a multifactorial risk assessment that includes a pain and/or OA history assessment. **Keywords :** urinary incontinence, lower back pain, elderly women

INTERVENTION TRIAL FOR PREVENTION OF COGNITIVE DECLINE AMONG THE COMMUNITY ELDERLY IN JAPAN

Takao SUZUKI¹, Daisuku YOSHIDA², Hyuma MAKISAKO², Hyuntae PARK², Sangyoon LEE², Hiroyuki SHIMADA² (*1. Director, National Center for Geriatrics and Gerontology (NCGG), Japan; 2. Independent Support for Elderly, NCGG, Japan*)

Introduction : Population-based studies in older adults performed in North America, Europe, and Asia report a prevalence of mild cognitive impairment (MCI) ranging from 11% to 17%, and a prevalence of the amnesic MCI (aMCI) subtype between 3 and 5%. Epidemiological data suggests that moderate exercise and physical activity are associated with a lower risk of dementia including AD. We conducted the randomized controlled trial to examine the effects of a multicomponent exercise program on the cognitive function of older adults with aMCI. **Method :** Subjects were the fifty older adults with aMCI ranging in age from 65 to 93 years (mean 75). These subjects were randomized into either a multicomponent exercise ($n=25$) or an education control group ($n=25$). The intervention group had exercise including aerobic muscle strength training using multiple conditions to stimulate cognitive functions for 90 min/d, 2d/w, for a total of 80 times over 12 months. Measurements from both physical and mental tests were administered before, after the 6-month, and after the 12-month intervention period. **Results :** The mean adherence to the exercise program was about 80%. Improvements of cognitive function following multicomponent exercise were significantly increased at treatment end such as MMSE ($p=0.04$), logical memory of immediate

recall ($p=0.03$), and letter verbal fluency test ($p=0.02$). Conclusion : This study indicates that exercise improves or supports, at least partly, cognitive performance in older adults with aMCI. Keywords : MCI, RCT, Japan

INTERGENERATIONAL LEARNING SERVICE PROGRAM FOR ELDERLY HEALTH PROMOTION

Jin-jong CHEN (*Department of Physical Therapy and Assistive Techn, National Yang-Ming University, Taiwan*)

Introduction : This IGSL program, in cooperation with the Community College of Beitou, was approved and financially supported by the Ministry of Education, Taiwan Government to meet the demand for intelligent life for elderly, and to promote smart health care technology in medical education system. Method : The IGSL is divided into two stages: (1) before the midterm(preparing stage) - to complete the basic knowledge, theories and techniques of teaching, including: physical activity epidemiology, basic exercise physiology, sports injury prevention, health physical fitness test, exercise and chronic disease, exercise and aging, exercise prescription, USB digital pedometer / scales / sphygmomanometer health management technology; (2) after midterms(practical stage) ? to make a cooperative internship arrangements with the Community College for students. Results : Learning achievement assessment included: midterm (30%), class participation (40%) and case studies (30%). Class participation included attendance rate, the amount of physical activity and physical fitness maintained or improved of students themselves. Case studies, including oral and written reports, focused on the reflection of the learning process of their own services, as well as suggestions for community elderly care. By providing opportunities for students through practical problem-solving process and knowledge integration, students can experience the true wisdom of health medical care, and fostering the sense of responsibility of the young people to the elderly. Conclusion : By the implementation of the case studies to deepen the connotation of service-learning courses, this IGSL program do promote university students actively participate in social and national affairs to the life of the late elderly care and learning needs. Keywords: medical education, service-learning, elderly

SS25 510-R

AGEING IN CHINA: CHALLENGES AND OPPORTUNITIES

SS25 510-R-1

HEALTH CARE REFORM IN CHINA: WILL IT MEET THE NEEDS OF AN AGEING POPULATION?

Colette BROWNING¹, Tuohong ZHANG² (*1. School of Primary Health Care, Monash University, Australia; 2. Department of Health Policy and Management, Peking University, China*)

Introduction : By 2011 the number of people aged 60 years and over living in China reached 165 million. The rate of increase in the older population is three times that of the overall population increase and compared to developed countries the rate of population ageing is occurring at a much higher rate. This demographic change is occurring in the context of lower economic prosperity compared to other countries that have undergone this transition. China is now facing the challenge of increasing pressures on the health system. Method : This paper presents an overview of the health and disability issues for older people in China and a policy analysis of current health care reforms in China to address these issues with a focus on primary health care reforms. Results : The most common chronic conditions for older people in China are hypertension, cerebrovascular disease, hearing

loss, coronary heart disease, osteoarthritis, cataract, type 2 diabetes, and chronic bronchitis. The current reforms are focussed on chronic illness management in community settings and the training of doctors and nurses to deliver patient centred care. Conclusion : New approaches in primary care in China have the potential to deliver high quality services to older people to promote healthy ageing. However significant investment in the training of health care professionals in patient centred care and chronic illness management is required. Keywords : China, health care reforms

SS25 510-R-2

FUNDING RETIREMENT IN CHINA

Hui YANG (*School of Primary Health Care, Monash University, Australia*)

Introduction : Our qualitative studies in China have shown that having sufficient financial support is an important determinant of health ageing. The aim of this presentation is to explore the challenges of pension and social security reform in China. Social security for older people in China is a high priority on the political agenda. Fair and equitable pension schemes as well as medical insurance schemes are needed to promote quality of life in old age. Method : We will use China Family Panel Study data to explore older people's financial security and will review current policy reforms in the provision of retirement income in China. Results : 81.6% of Chinese retirees have an annual income below 7,500 Chinese Yuan (approximately 1,200 US\$). Those living in developing regions have lower income than retirees in developed areas and rural older people have significant lower income than urban older people. Older women are more disadvantaged financially than men. Major sources of income for older urban people are 'retirement pensions' while major sources of income for older rural people are family support or labour income. Given that on average 11% of a person's income in China is used for medical care and older people will spend more than the average, financial security is critical for older people to maintain and improve their quality of life and their health. Conclusion : Chinese retirees will face more difficulty in having sufficient income, as a consequence of a rapidly ageing population, insufficient social welfare and reduction of family size due to the one child policy. Keywords : retirement schemes, rural, urban

SS25 510-R-3

VILLAGE SUSTAINABILITY AND SUBJECTIVE WELL-BEING OF THE RURAL CHINESE ELDERLY: A MULTILEVEL ANALYSIS USING THE CHARLS PILOT DATA

Dale Elgert YEATTS¹, Cynthia M. CREADY¹, Xiaomei PEP², Yuying SHEN³, Hao LUO² (*1. Sociology, University of North Texas, USA; 2. Sociology, Tsinghua University, China; 3. Sociology, Texas Tech University, USA*)

Introduction : The purpose of this study was to examine the relationship between characteristics associated with a sustainable village/community and the well-being of the rural Chinese elderly. Research suggests that environmental, economic, and social characteristics of the community/village affect the well-being of the elderly. Method : Data collected from the Chinese Health and Retirement Longitudinal Survey (CHARLS) Pilot Study were used to examine the relationship between (1) well-being of the Chinese rural elderly (measured as happiness, depressive symptoms, hopefulness) and (2) characteristics associated with a sustainable village/community. Villagers from a low-income province (Gansu) and a wealthy province (Zhejiang) were surveyed. The data were analyzed using multilevel regression models. Results : Factors

associated with higher happiness included better health, being married, and having the perception that help was available if needed. Factors associated with higher depressive symptoms included worse health, more rainy days, living in a village with lower per capita net income, not being married, having the perception that help was not available if needed, and living in Gansu. Higher hopefulness was associated with better health, a perception that help was available if needed, and more rainy days. Conclusion : An examination of the data does provide some support for the proposition that the characteristics associated with a sustainable village affect the well-being of the elderly. One economic, one environmental, and two social variables were found to be important. More research is needed to further clarify the relationship between the characteristics that support a community's/village's sustainability and the well-being of the elderly. Keywords : sustainability, elderly, Chinese, village, community

SS25 510-R-4

OLD AGE SECURITY AND SOCIAL STRATIFICATION AMONG AGED CHINESE

Xiaomei PEI¹, Hao LUO¹, Dale YEATTS² (1. *Sociology, Tsinghua University, China*; 2. *Sociology, University of North Texas, USA*)

Introduction : This paper is concerned with the distributive function of the old age security system in China and its impact on social stratification of the aged Chinese population. Method : A review of the development of old age security system in the context of the social transition in modern China outlines the demographic, economic, politic as well as cultural forces shaping this development. The review is followed by a presentation of the data available on the distribution of social security benefits among the aged Chinese. Using data collected from a large sample, the relationship between social security benefit and pre-retirement occupation has been investigated. Results : It has been found that wide gaps in old age security benefit status exist among the aged population and the reform of the system from work unit retirement pension program to social insurance program reinforced the gaps. Conclusion : The findings imply that changes in social policies on old age security during the economic transition period may well serve as mechanisms for income stratification among the aged Chinese population. Keywords : pension, stratification, market transition

A NEW HORIZON FOR CAREGIVER SUPPORT

SS25 514-S-1

CAREGIVING AND SOCIAL RELATIONS IN THE LEBANESE CONTEXT

Toni ANTONUCCI¹, Kristine AJROUCH², Sawsan ABDULRAHIM³ (1. *Institute for Social Research, University of Michigan, USA*; 2. *Sociology, Eastern Michigan University, USA*; 3. *Health Sciences, American University, Beirut, Lebanon*)

Introduction : In this paper we document experiences of caregiving by age in Lebanon, and also explore whether social relations matter in the context of caregiver stress. Method : We use data from the Lebanon Family Relations and Aging Study (Ajrouch, Antonucci, & Aldulrahim, 2009) which included interviews with 500 community dwelling adults. Results : Regression analyses indicate that high positive quality relations predict less stress while high negative quality relations predict low satisfaction with the care giving experience. A curvilinear link is found so that both low and high levels of positive and negative social relations predict higher depressive symptoms among those 60+, but not among these in middle age (40-59).

Conclusion : Findings illustrate the prominence of care giving and the differential effects of social relations on well-being by age. Keywords: caregiving, social relations, Lebanon

SS25 514-S-2

ROLE CONFLICT AND ITS LINKAGE TO MARITAL QUALITY OF WORKING WOMEN CARING FOR AN ELDERLY PARENT

Dafna HALPERIN¹, Ruth KATZ², Ariela LOWENSTEIN³

(1. *Health Services Management, Yezreel Valley College, Emek Yezreel, Israel*; 2. *Human Services, Yezreel Valley College, Emek Yezreel & University of Haifa, Haifa, Israel*; 3. *President, Yezreel Valley College, Emek Yezreel & University of Haifa, Haifa, Israel*)

Introduction : The purpose of this research was to examine the relationship between role conflict, stress, husband's support and marital quality of working women caring for an elderly parent. Today, many women, especially in midlife, are holding simultaneously multiple roles like mother, wife and employee. With the increase in the aging population, the caregiving role for an elderly parent is added to the woman's multiple roles. According to role theory, role conflict and role stress may result from this situation. How does the husband's support impact woman's ability to cope with the caregiving role and what are the linkages to her marital quality. Method : one hundred employed married women, caring for a dependent elderly parent, at least four hours per week, were interviewed face to face. The structured questionnaire included the following areas: care burden, work-family conflict, work-care conflict, marital quality and husband's support. Additionally, a short qualitative interview was conducted with 10 women. Results : Women who are holding the caregiving role in addition to their other roles, experienced stress feelings resulting from role strain and interrole conflict. Work and caregiving hours were directly positively correlated with the level of conflict. In addition, the overall stress feelings had a negative correlation with marital quality. On the other hand, husband's support was partially mediating between the overall stress feelings and marital quality. Conclusion : The results are discussed using role theory and previous research findings. Practice implications are suggested. Keywords : Caregiving, Role-conflict, Marital-quality

SS25 514-S-3

BEHIND THE SCENES: FAMILY SUPPORT FOR CAREGIVERS AND ELDERERS WITH MCI

Rosemary BLIESZNER, Karen A. ROBERTO, Nancy BROSSOIE (Center for Gerontology, Virginia Tech, USA)

Introduction : Although persons with mild cognitive impairment (MCI) do not display symptoms as severe as those with dementia, research shows that early memory loss can cause worry and frustration among diagnosed persons and their care partners. This longitudinal study examines coping strategies employed by elders with MCI and their care partners as well as sources of support for them as they manage the role shifts and uncertainties associated with MCI. We also look at changes over time in symptoms, coping, and support. Method : In-depth interviews were conducted with 125 family triads including the old person with MCI, the primary care partner (usually the spouse), and a secondary care partner (usually an adult child) shortly after diagnosis, 1 year later, and 2 years later. Results : Many social network members do not understand early memory loss. Secondary care partners varied in the extent to which they acknowledged the existence of MCI and in the types and amount of support they provided those with MCI and the primary care partners. Likewise, friends, neighbors, extended kin, church members, and professionals

furnished varying types and amounts of assistance. Support was most effective when it provided brief respite for primary care partners and reduced their worry about monitoring the person with MCI. Conclusion : Families dealing with MCI need ongoing support from social network members and professionals to sustain their ability to cope effectively with the uncertainties of early memory loss. Professionals should make information about MCI available and empower primary care partners to seek needed support from their networks. Keywords : mild cognitive impairment

SS25 514-S-4

CARING FOR PEOPLE WITH DEMENTIA: DIRECT CARE WORKERS IN ASSISTED LIVING

Dena SHENK (*Anthropology, University of North Carolina at Charlotte, USA*)

Introduction : Few studies explore the attitudes and views of direct care workers (DCW) who provide care for older adults with dementia in long-term care communities. This paper is based on the narratives and interview responses of twenty caregivers identified as the “best” caregivers in an assisted living community and a special care assisted living community for people with dementia in the southeast U.S. Method : Videotaped interviews and observation with fifteen caregivers were conducted from June 2006 through January 2007 and the remaining five were conducted in August 2008. Their words are used to provide insight into their social and personal identities as dedicated caregivers. Results : In their caregiving narratives, the direct care workers generally portray themselves not only as the ones providing care, but as the ones capable of moral agency and responsible behavior. The direct care workers, at the bottom of the assisted living community’s hierarchy in their jobs as resident assistants and med techs, see themselves as holding power and total responsibility for the residents in their care. Conclusion : This perception of agency allows the caregivers to find meaning in their work and counteracts their powerlessness in other aspects of their lives. This paper provides analysis of their perceptions of agency of themselves and as a force of agency for the elders for whom they provide care. Keywords : direct care workers, caregiving, dementia

SS25 516-R

ASSESSMENT ACROSS THE HOSPITAL CONTINUUM: THE INTERRAI MINI-SUITE FOR ACUTE CARE

SS25 516-R-1

THE INTERRAI HOSPITAL MINI-SUITE: OVERVIEW

Leonard C. GRAY (*Centre for Research in Geriatric Medicine, The University of Queensland, Australia*)

Introduction : Many older people experience a series of care episodes when they are hospitalized. Multiple sequential assessments may be required in the emergency department, acute and post-acute care settings and in the community after discharge from hospital. Harmonisation of assessment processes across this continuum is likely to improve efficiency and continuity of care. Method : The interRAI Network of Excellence in Acute Care is developing a “mini-suite” of assessment tools to serve the requirements of older people as they progress through the hospital continuum. Results : Four assessment systems have been developed, pertaining to the Emergency Department (interRAI ED); Acute Care (interRAI AC); Post-Acute inpatient Care (interRAI PAC); and Post Acute home Care (interRAI HC). These instruments share a core set of common clinical observations, and a set of “severity measures” that enable comparison with pre-morbid status and monitoring of progress across the

continuum of care. In addition, each instrument has its own unique set of diagnostic screeners, risk assessment tools, clinical protocols and quality indicators. Strategies to evaluate the psychometric properties of the clinical observations and the derivative “applications” is an ongoing process, which is well advanced. Conclusion : The interRAI Hospital Mini-Suite represents a “whole-of-episode” clinical information system for older people, which links strongly to other institutional and community systems developed by interRAI. It enables comprehensive assessment capability across settings without losing context sensitive functions offered by conventional tools. Keywords : Assessment; System; Care

SS25 516-R-2

GERIATRIC CASE FINDING AND ASSESSMENT IN THE EMERGENCY DEPARTMENT

Andrew P COSTA¹, Len GRAY², John P HIRDES³ (*1. School of Public Health and Health Systems; Department of Medicine, University of Waterloo; McMaster University, Canada; 2. Centre for Research in Geriatric Medicine & Centre for Online Health, The University of Queensland, Australia; 3. School of Public Health and Health Systems, University of Waterloo, Canada*)

Introduction : Studies have shown that emergency departments (EDs) are relatively ineffective at identifying common geriatric conditions and symptoms. Despite the fact that early identification and intervention has potential to prevent post-discharge adverse events, the screening and assessment of older ED patients remains limited. This presentation addresses the development and validation of a geriatric screener as well as risk measures for an existing geriatric ED assessment instrument. Method : A prospective cohort study was conducted with ED patients age 75 and older in 8 Canadian ED sites (N=2,101). A 90-day disposition was collected for all patients, including: death, hospital discharge, length or stay, and repeat hospital utilization. Decision tree models for adverse outcomes 90 days post ED discharge were identified using patient characteristics. The Canadian study occurred concurrently with parallel studies in six countries: Australia, Belgium, Germany, Iceland, India, and Sweden (N=1,750). Results : Findings show that disease-based and episodic models of emergency screening do not adequately capture important geriatric risk factors in the ED. The risk of adverse outcomes amongst older adults in ED is accurately measured with a geriatric screening tool, the interRAI ED Screener. Also, scalar measures from a focused geriatric assessment, the interRAI ED, provide for a more accurate determination of risk and need for follow-up with specialized geriatric services. Conclusion : Older adults in ED have medical and psychosocial challenges that could benefit from a more comprehensive screening and assessment protocol. The use of geriatric screening and assessment in the ED to advance referral decision-making is an essential strategy for improving patient outcomes. Keywords : emergency department, screening

SS25 516-R-3

QUALITY INDICATORS FOR CARE OF OLDER PEOPLE IN ACUTE CARE

Melinda MARTIN-KHAN, Leonard C. GRAY (*Centre for Research in Geriatric Medicine, The University of Queensland, Australia*)

Introduction : Measuring quality of care and providing feedback to clinical staff and other relevant stakeholders is an important aspect of improving care outcomes. This process relies on information being provided in a timely manner - challenging when the audit process is an ‘add-on’ data collection task. The development of quality indicators, based on patient outcomes and derived from clinical data collected at

the bedside, ensures meaningful information is available to support improvements in care practice. Quality indicators have been developed and adopted for the interRAI Acute Care (AC) assessment tool, which is one of the interRAI mini-suite of assessment tools. Method : A research team and expert panel was convened. Following a review of the scientific and gray literature, the expert panel developed a list of potential indicators. Field work results (9 hospitals; 645 patients) were presented to the expert panel at a second meeting where indicators were refined or rejected as unsuitable. Following voting, using the RAND/UCLA methodology, a final set of indicators was recommended. Results : The Outcome Indicator set includes 9 indicators relating to core geriatric issues. Topics include: catheter use at admission; falls; decline in mobility or functioning during the acute stay; presence of delirium at discharge; pressure ulcers; and pain management. Two final indicators relate to length of stay in hospital and patients newly discharged to residential care. Conclusion : Implementation of AC Quality Indicators within the interRAI AC assessment system enables patient outcomes to be derived directly from data that is routinely collected in the process of providing patient care. Keywords : Quality of Key, Acute Care, interRAI

SS25 516-R-4

IMPLEMENTATION OF AN EHEALTH SYSTEM INCORPORATING THE INTERRAI SUITE: OPPORTUNITIES AND CHALLENGES FOR HOSPITALS

Nathalie Isabelle Helena WELLENS¹, Els DEVRIENDT¹, Philip MOONS¹, Johan FLAMAING², Anja DECLERCQ³, Koen MILISEN⁴ (1. Public Health, Center for Health Services and Nursing Research, KU Leuven, Belgium; 2. Geriatric Medicine, University Hospitals Leuven & Department of Clinical and Experimental Medicine, Belgium; 3. Public Health, LUCAS, Center for Care Research and Consultancy, KU Leuven, Belgium; 4. Public Health, Center for Health Services and Nursing Research, Belgium)

Introduction : The BelRAI web-based system incorporates various interRAI instruments aiming to centralize geriatric assessment data of multiple disciplines and health settings. It enables to transfer standardized patient data in a privacy safe environment. Method : In a Belgian cross-sectional multicenter study, trained clinical staff (nurses, occupational therapists, physiotherapists, social workers, and geriatricians, n=133) assessed 410 inpatients in three hospitals, 49 clients of fourteen home care organizations and 471 residents in five nursing homes. The process of implementation and data exchange was evaluated by questionnaires and six focus groups. Results : For all participating organizations this study was a first. Introduction to standardized data exchange and the first use of a web-based patient record. Data transfer between hospitals and residential care was satisfactory. Home care encountered organizational problems (e.g. fragmentation of staff working at different locations) which hampered data exchange. For the hospitals, it was found very useful to receive a completed BelRAI-file at (re)admission of a patient. It informed clinicians accurately about the premorbid condition and the level of independence. If necessary, the care could be adjusted accordingly. Furthermore, previous assessments implied a gain of time for the subsequent assessment during hospital stay. There are some important prior conditions for communication across settings: user-friendly web-based software, collaboration between all care partners including physicians, and the appointment of staff for coordination tasks. Conclusion : The interRAI Suite is a powerful system to underpin continuity of care. The exchange of standardized data allowed hospital staff to adjust the care early after admission and to communicate patient's condition at discharge. Keywords : geriatrics, continuity of care, data transfer

RECENT PROGRESS IN THE BASIC AND CLINICAL RESEARCH ON PROGEROID SYNDROME: CHALLENGE TO MOLECULAR MECHANISM OF HUMAN AGING

SS25 517-B-1

CHANGING PATTERN OF AGE-ASSOCIATED PATHOLOGIES IN WERNER SYNDROME

Makoto GOTO (*Rheumatology, Tokyo Women's Medical University, Japan*)

Introduction : As ~75% of the Werner syndrome (WS) reported all over the world are Japanese, the most reports on WS has been published in Japanese journals. Thus, the detailed English-written clinical review on WS has been warranted. Method : The literature has been searched for publications on WS through a citation index in and out of Japan between 1904 and 2008. Bibliographies of each report were examined for additional references. Care was taken to exclude multiple reports of the same patient, recognized by details of family and personal histories and demographic characteristics. Diagnosis of WS was based on the presence of 3 of 4 criteria under age 35 as follows; 1)Characteristic habitus & stature, 2) Progeroid phenotypes, 3) Scleroderma-like skin changes, 4) Endocrine/metabolic abnormalities. Diagnosis of neoplasia was as given by the original authors. Results : A total of 1487 patients with WS has been coined worldwide, in which 1128 were reported in Japan. Japanese patients had 293 neoplasias and non-Japanese had 46. the ratio of epithelial to non-epithelial neoplasias was about 1:1.5 instead of the usual 10:1. Death occurred on an average of ~54 years in 2008, although the life-span of WS was ~38 years in 1966. The major causes of death are neoplasia and myocardial infarction. Conclusion : The literature search showed a changing pattern of age-associated pathologies in WS including life-span over time, in accordance with the increase in average life-span in general Japanese population. These result may suggest a common environmental effect on WS and general population. Keywords : Werner syndrome Cancer life-span

SS25 517-B-2

NEW DIAGNOSTIC CRITERIA AND TREATMENT GUIDELINE FOR WERNER SYNDROME

Koutaro YOKOTE, Minoru TAKEMOTO (*Department of Diabetes, Metabolism and Endocrinology, Chiba University Graduate School of Medicine, Japan*)

Introduction : Werner syndrome (WS), also known as adult progeria, is an autosomal recessive disorder caused by a mutation in the gene encoding the RecQ DNA helicase. It is characterized by various early aging symptoms and has been reported to die in their 40s due to premature atherosclerosis, and neoplasms. The major causes of death among patients with WS are malignant neoplasms and atherosclerotic vascular diseases such as myocardial infarction. At least a few versions of diagnostic criteria have been proposed for WS to date, but their validity has not been examined recently. Method : In order to evaluate the incidence as well as clinical symptoms of patients with WS, a nationwide epidemiological survey was performed involving 6,921 questionnaire sent to hospitals with more than 200 beds in Japan. Results : One hundred ninety four cases of WS have been newly identified. The patients were shorter in their height compared with Japanese average. Graying or loss of hair, bilateral juvenile cataracts, skin atrophy, clavus and callus, flat feet, bird-like faces and abnormal voice were found in > 85% of the confirmed cases of WS. It was also found that 80% of WS complicated with characteristic "segmental or flame-like" calcification of Achilles tendon, which

turned out to be highly useful for early diagnosis. Unexpectedly, 63% of the cases were at their 60s suggesting recent elongation of life-span. Conclusion : On the basis of these findings as well as recent reports on effective treatments for WS, a new diagnostic criteria and treatment guideline have been formulated. Keywords : Werner syndrome, diagnosis, treatment

SS25 517-B-3

GENERATION OF INDUCED PLURIPOTENT STEM CELLS FROM WERNER SYNDROME PATIENTS

Akira SHIMAMOTO, Hidetoshi TAHARA (*Cellular and Molecular Biology, Hiroshima University, Japan*)

Introduction : Werner syndrome (WS) is a rare autosomal recessive disorder characterized by premature aging, chromosomal instability and cancer predisposition. Fibroblasts derived from WS patients exhibit premature replicative senescence due to telomere dysfunction. Although WRN, a gene responsible for the disease, and encoding a DNA helicase was identified seventeen years ago, and function of a protein encoded by the gene had been extensively studied, the pathogenesis of Werner syndrome is remains to be elucidated. Method: Somatic cells can be reprogrammed into induced pluripotent stem cells (iPSCs) by ectopic expression of Yamanaka four factors. To develop a new therapeutic strategy for the treatment of WS, reveal the pathogenesis of WS and provide drug screening tools for WS, we have attempted to generate iPSCs from fibroblasts of WS patients. WS fibroblasts from two individual patients were transduced with the factors by retrovirus, subsequently seeded on feeder cells and maintained in human ES cell culture condition. Results : WS iPSC colonies exhibited alkaline phosphatase activity, and expressed not only pluripotent genes such as Nanog, Rex1 and DNMT3b, but also an immortalizing gene, hTERT. The cumulative passages of WS iPSC cells are proceeding for more than two years, supporting the notion that induction of telomerase activity during reprogramming endow parental cells of WS patients with indefinite proliferative potential, and overcome their premature senescence phenotype. Conclusion : Our results demonstrate that reprogramming restores telomere dysfunction-induced premature senescence in WS cells, including premature growth arrest and karyotype abnormality, and will provide an opportunity to study the pathogenesis of human premature aging. Keywords : senescence iPSC telomerase

OXIDATIVE STRESS, AGING AND PROGERIC SYNDROME

Takahiko SHIMIZU¹, Hirofumi KOYAMA¹, Shuichi SHIBUYA¹, Akira SHIMAMOTO², Minoru TAKEMOTO³, Koutaro YOKOTE³ (1. *Advanced Aging Medicine, Chiba University Graduate School of Medicine, Japan*; 2. *Cellular and Molecular Biology, Hiroshima University Graduated School of Biomedical Sciences, Japan*; 3. *Clinical Cell Biology and Medicine, Chiba University Graduate School of Medicine, Japan*)

Introduction : Superoxide dismutase (SOD), which catalyzes superoxide generated from cellular metabolism, is one of major antioxidant enzymes in cells. We have reported that genetic inactivation of Sod1, which distributed in the cytoplasm, caused increased cellular superoxide leading to aging-like phenotypes such as age-related macular degeneration, low turnover osteoporosis, skin atrophy, and age-dependent deterioration in Alzheimer's disease. In addition, genetic deletion of Sod2, which localized in mitochondrial matrix, also enhanced mitochondrial superoxide generation resulting in dilated cardiomyopathy and neurodegeneration. These phenotypes in knockout mice indicated that accumulation of intracellular superoxide

caused aging-like changes in several tissues, supporting the free radical theory of age-related diseases. Method : In this context, we investigated superoxide levels in skin fibroblasts derived from younger or older individuals. Results : We found significant increase of intracellular superoxide level in older cells compared to those of younger cells. Furthermore, we confirmed that aging promoted senescent phenotypes such as senescence associated-beta-galactosidase and interleukin-6, which is one of the senescence associated secretory phenotypes. Moreover, in vitro experiments revealed that passage culture accelerated replicative senescence concomitant with increased superoxide generation in progeric fibroblasts derived from Werner syndrome patients. Finally, we tested the protective effect of an antioxidant, vitamin C, on senescent cells. Vitamin C treatment significantly repressed intracellular superoxide generation and improved the phenotypes of senescent fibroblasts. Conclusion : These results suggested that redox regulation by antioxidants might protect cells from senescence via suppressing intracellular oxidative stress. Keywords : Werner syndrome, oxidative stress, antioxidants

A KOREAN CASE OF HUTCHINSON-GILFORD PROGERIA SYNDROME WITH G608G LMNA MUTATION

Hong Jin LEE (*Dept. of Pediatrics, Col. of Medicine, Hallym University, Korea*)

Introduction : Hutchinson-Gilford progeria syndrome (HGPS) is a rare condition originally described by Hutchinson in 1886. Death result from cardiac complications in the majority of cases and usually occurs at average age of thirteen years. Method : A 4-yr old boy had typical clinical findings such as short stature, craniofacial disproportion, alopecia, prominent scalp veins and sclerodermatous skin. This abnormal appearance began at age of 1 yr. On serological and hormonal evaluation, all values are within normal range. He was neurologically intact with motor and mental development. An echocardiogram showed calcification of aortic and mitral valves. Hypertrophy of internal layer at internal carotid artery suggesting atherosclerosis was found by carotid doppler sonography. Results : Gene study showed typical G608G (GGC- > GGT) point mutation at exon 11 in LMNA gene. Conclusion : This is a rare case of Hutchinson-Gilford progeria syndrome confirmed by genetic analysis in Korea. Keywords : Hutchinson Gilford Progeria Syndrome, LMNA, Progeria

OCCUPATIONAL GERONTOLOGY, A MULTI-DISCIPLINARY APPROACH

SS25 518-S-1

OCCUPATIONAL GERONTOLOGY: A NEW BRANCH OF GERONTOLOGY

Willem GOEDHARD (*Chairman, The Netherlands Foundation of Occupational Health and aging, Netherlands*)

Introduction : From research in gerontology it is well known that several physiological functions decrease with advancing age. This decrease may affect the functional capability of an employee. Retirement due to disability may be one of the inferences. In many industrial countries workers are encouraged to continue working until the age of 65 and even beyond that age. Little is known about the possible effects of work exposures on the aging process. Do work exposures affect the rate of aging of employees? Therefore it would be most useful to start gerontology studies among workers in different

professions. Employees are often exposed to possible harmful work environments. This is a major concern of occupational health care. Method : In the 1980s a useful instrument was developed by the Finnish institute of occupational health. This instrument called the workability index (WAI) is a questionnaire that is now widely used in many countries. The WAI proved to be as useful instrument to monitor health and work ability of aging employees. In this presentation results of different studies with the WAI will be given. Results : Conclusion : Functional capacities of workers usually show increased variability over time. The field of occupational gerontology can provide a usable framework for addressing the practical problems concerning the management of older workers and their transition from the working life into the third age (i.e. the post retirement period). Keywords : Aging workers WAI

SS25 518-S-2

A STRATEGY OF HEALTHY AGING: GARDENING AS A PHYSICAL ACTIVITY FOR HEALTH

Sin-Ae PARK (*Department of Environmental Health science, Konkuk University, Korea*)

Introduction : For healthy aging, a key factor is regular physical activity. Regular physical activity, which is an estimated 30 minutes of moderate intensity physical activity on the most days of the week, has been found to reduce the risk of coronary heart disease and chronic disease, including diabetes, high cholesterol and high blood pressure, stroke and declines in musculo-skeletal function. Exercise intensity of physical activity can be expressed by the term, metabolic equivalents (METs). The MET is a physiological measure for expressing the energy expenditure of physical activities in relation to the resting metabolic rate. Meanwhile, gardening is a popular leisure-time activity for adults age 65 or older. The objective of this study was to determine the exercise intensity of various gardening tasks in older adults. Method : Exercise intensity of various gardening tasks were measured by using a portable system (Cosmed K4b2) while the American and Korean adults aged over 65 years were conducted the gardening tasks. Results : The gardening tasks that used both upper and lower body such as digging, fertilizing, weeding, and raking were moderate-intensity physical activity and the gardening tasks that mainly used upper body such as mixing soil, sowing seeds, and harvesting were low intensity physical activity. Conclusion : The results will facilitate tailoring garden activities of older adults to achieve appropriate levels of physical activity for good health. The same health benefits from non-gardening form of physical activities can be expected by participating in a gardening intervention for older adults. Keywords : Exercise intensity, healthy aging, successful aging, horticultural activity

SS25 518-S-3

CREATE PRODUCTIVE AGING WORKER ON THE FOUNDATION OF ACTIVE AGING SOCIETY

Masaharu KUMASHIRO (*The Association for Preventive Medicine of Japan, Japan*)

The phenomenon of the aging of society engenders both a decline in the population of productive age and an increase in the number of aged workers among the population of productive age. The foundation for creating an active aging worker is preventing lifestyle-related diseases, and the determinant of that prevention is the habit of regular exercise. Thus, if this were to produce active aging workers, the next objective would be aged workers with a high level of work ability. In other words, it would be the creation of a society with an aged workforce with the emergence of productive aging workers in greater numbers.

To put it another way, controlling “absenteeism” and “Presenteeism” are the fundamental measure for a society with an aged workforce. The basic measure that would enable this achievement is an objective evaluation of the degree of individual worker health and life function, as well as workability, to prevent a mismatch between the worker’s capacity for labor and the work. In this report, the authors demonstrate the interrelationship among three factors, namely the habit for exercise, the state of mental and physical health, and workability based on a large quantity of study data. Next, based on this idea, we propose an ergonomics and management (ERGOMA) in occupational health activities strategy for a society with an aged workforce. Keywords : work ability, absenteeism, presenteeism

SS25 519-S

RIGHTTIMEPLACECARE: IMPROVING HEALTH SERVICE FOR EUROPEAN CITIZENS WITH DEMENTIA

SS25 519-S-1

THE DEMENTIA CARE SYSTEM IN THE EIGHT RTPC EUROPEAN COUNTRIES

Ingalill RAHM HALLBERG¹, David CHALLIS², Jan HAMERS³, Helena LEINO-KILPI⁴, Gabriele MEYER⁵, Kai SAKS⁶, Maria SOTO⁷, Adela ZABALEGUI⁸, Staffan KARLSSON⁹ (1. *The Pufendorf Institute of Advanced Studies, Lund University, Sweden*; 2. *Personal Social Services Research Unit, University of Manchester, United Kingdom*; 3. *Health Services Research, Maastricht University, Netherlands*; 4. *Department of Nursing Science, University of Turku, Finland*; 5. *School of Nursing Science, Witten/Herdecke University, Germany*; 6. *Department of Internal Medicine, University of Tartu, Estonia*; 7. *Department of Geriatric Medicine, Toulouse University Hospital, France*; 8. *Fundacio Privada Clinic per la Recerca Biomedica, Hospital Clinic of Barcelona, Spain*; 9. *Department of Health Sciences, Lund University, Sweden*)

Introduction : Exploring the care and service activities offered throughout the trajectory of dementia is an opportunity for countries to learn from each other. As part of the RightTimePlaceCare project’s general objective to develop best practice strategies this presentation describes development, content and application of a template to explore the dementia health, social care and welfare systems from early sign, diagnosis, intermediate and moderate stage and to the late stage of the disease. It also describes some of the findings with regard to the chain of care and service for people with dementia. Method : A step-wise consensus procedure was applied to identify, define and develop a template covering care and service throughout the disease trajectory. In addition the professionals involved were identified and defined as for their educational level. Results : In total 50 care and service activities compiled in seven groups were identified: 1) Screening, diagnostic procedure, treatment of dementia and complications; 2) Outpatient care facilities; 3) Care at home; 4) Institutional care; 5) Palliative care; 6) Informal caregiving and support; 7) Civic activities. The largest differences in terms of availability were found for care activities specifically for people with dementia. Non-pharmacological treatment was not commonly utilized in whilst pharmacological treatment for BPSD was common. Also education and social support to family caregivers was sparsely utilized. Conclusion : The care and service offered to people with dementia and family caregivers covers a wide range of activities. Facilities specifically for dementia varies among countries. There are more similarities among countries than differences. Keywords : dementia care system

SS25 519-S-2

PATTERNS OF TRANSITION FROM HOME CARE TOWARDS INSTITUTIONAL DEMENTIA CARE: A COMPARISON OF EIGHT EUROPEAN COUNTRIES

Jan HAMERS¹, Helena LEINO-KILPI², Adela ZABALEGUI³, Ingalill RAHM-HALLBERG⁴, Kai SAKS⁵, Maria SOTO⁶, David CHALLIS⁷, Gabriele MEYER⁸ (1. *Health Services Research, Maastricht University, Netherlands*; 2. *Department of Nursing Science, University of Turku, Finland*; 3. *Fundacio Privada Clinic per la Recerca Biomedica, Hospital Clinic of Barcelona, Spain*; 4. *Vice-Rector, Lund University, Sweden*; 5. *Department of Internal Medicine, University of Tartu, Estonia*; 6. *Department of Geriatric Medicine, Toulouse University Hospital, France*; 7. *Personal Social Services Research Unit, University of Manchester, United Kingdom*; 8. *School of Nursing Science, Witten/Herdecke University, Germany*)

Introduction : The aim of this study is to assess the factors associated with the institutionalisation of people with dementia at the time of admission to institutional long-term nursing care. **Method :** A prospective cohort study was conducted in eight European countries. Participants were people with dementia (PwD) newly admitted to institutional nursing care (group 1) and PwD who receive professional home care and were at risk of institutionalization (group 2) and their informal caregivers. Data (e.g., socio-demographics, cognition, behavior, ADL, resources, caregiver burden) were collected at baseline and at 3 months follow up. Data were analysed using bivariate testing procedures, hierarchical mixed-model logistic regression, and multivariate logistic regression. **Results :** The overall sample consisted of 2014 dyads of PwD and their informal caregivers. The mean age of PwD was 83 years, 67.5% were female and 42.7% were married. The analyses showed that there were many differences across countries in factors associated with institutionalisation. To illustrate: living condition (not alone versus alone) and relation to the PwD (spouse versus other) in some countries were associated with institutionalisation but not in other countries, and large differences in ADL performance were found. Caregiver burden seemed to be influential on institutionalisation in all countries. **Conclusion :** Although factors such as ADL, cognition, and behavior in general are expected to be associated with institutionalisation of PwD, this was not confirmed by the results of this study. The conclusion is that there is a wide variation across countries in Europe, with caregiver burden as the most consistent factor associated with institutionalisation. **Keywords :** Dementia, home care, institutionalisation

SS25 519-S-3 EMPIRICALLY BASED BEST PRACTICE RECOMMENDATION FOR DEMENTIA CARE IN EUROPE

Kai SAKS¹, David CHALLIS², Gabriele MEYER³, Jan HAMERS⁴, Dirk SAUERLAND⁵, Adela ZABALEGUI⁶, Helena LEINO-KILPI⁷, Ingalill RAHM-HALLBERG⁸, Maria SOTO⁹ (1. *Department of Internal Medicine, University of Tartu, Estonia*; 2. *Personal Social Services Research Unit, University of Manchester, United Kingdom*; 3. *School of Nursing Science, Witten/Herdecke University, Germany*; 4. *Health Services Research, Maastricht University, Netherlands*; 5. *Health Systems Management, Witten/Herdecke University, Germany*; 6. *Fundacio Privada Clinic per la Recerca Biomedica, Hospital Clinic of Barcelona, Spain*; 7. *Department of Nursing Science, University of Turku, Finland*; 8. *Vice-Rector, Lund University, Sweden*; 9. *Department of Geriatric Medicine, Toulouse University Hospital, France*)

Introduction : The aim of the study is to identify best practice strategies that can be employed within existing European health and social care systems so national policy makers may base their decisions

on the best comparative information in reviewing the organization of dementia care. **Method :** The balance of care (BoC) approach was chosen to identify optimal care solutions. Its core is the identification of groups of people whose needs could be met in multiple settings (i.e. people at the margins of care) and an examination of the resource implications of providing such care. Survey data from the project were used to specify typical cases of people with dementia who were at the margin of home care and long-term institutional care. Typical vignettes were created for 14 selected case-types. Experts in dementia care in 8 European countries were asked to decide upon the best possible placement and care package. The pattern of agreement within countries and between countries will be analysed and areas of marked variation reviewed by international panel. The cost of current and alternative care will be estimated. These data in conjunction with other study data will provide a basis for estimating alternative patterns of provision which will be compared with National Dementia Strategies. **Results :** First expert groups sessions took place in November 2012 and final results (review panel decision) are expected in March 2013. **Conclusion :** Best practice indications for planning care for people with dementia in Europe will be created combining empirical quantitative and qualitative methods. **Keywords :** Dementia, balance of care, best practice

SS25 523-C BRIDGING THE GAP BETWEEN GERIATRICS AND ONCOLOGY - GLOBAL EFFORTS TOWARDS BETTER CARE OF OLDER ADULTS

SS25 523-C-1 PROMOTING SHARED CARE OF GERIATRIC PATIENTS WITH CANCER

Beatriz KORC-GRODZICKI, Stuart LICHTMAN (*Medicine, Memorial Sloan Kettering Cancer Center, USA*)

Introduction : The incidence of cancer increases with age. The median age at diagnosis is 67 and at cancer-related death is 73 years old. The geriatrician may have a pivotal role in risk assessment, screening, prevention and treatment of geriatric syndromes in cancer patients. **Method :** A Geriatrics Consultation Service within the Department of Medicine in a Cancer Center was established in April, 2009 as part of an interdisciplinary '65+ program'. Since its inception it has provided inpatient and outpatient care for older adults undergoing cancer diagnosis, surveillance or treatment. The service strived to develop an educational curriculum for house staff, nursing staff and the public and to establish collaborations with researchers in the field of cancer and aging. **Results :** Between April 2009 and March 2012 a total of 2570 new outpatients were evaluated. 16% were 65-75, 70% were 76-85 and 14% were older than 85 years old. 46% were male and 84% were white. The inpatient load included 400 new consults. Three Geriatricians, one Geriatric Nurse Practitioner and two RNs were recruited. A yearly series of noon conferences, 'Geriatrics for the House staff', a twice-a-year course on "Advancing Nursing Expertise in the Care of Older Adults with Cancer" and monthly 65+ Educational Lecture Series for Cancer Patients and Caregivers were established as well as an annual Research Day. **Conclusion :** The establishment of a Geriatrics Service in a Cancer Center was very well received and embraced by the oncology community beyond all initial predictions which showed unmet needs in the care of the elderly with cancer. **Keywords :** Oncogeriatrics, Multidisciplinary

SS25 523-C-2 USEFULNESS OF COMPREHENSIVE GERIATRIC ASSESSMENT IN PREDICTION OF TOXICITY AND

COMPLIANCE OF CHEMOTHERAPY: SHARING KOREAN EXPERIENCE

Jee Hyun KIM¹, Jin Won KIM¹, Yu Jung KIM¹, Kwang Il KIM², Cheol-ho KIM² (1. Division of Hematology and Medical Oncology, Department of Internal Medicine, Seoul National University Bundang Hospital, Korea; 2. Division of Geriatrics, Department of Internal Medicine, Seoul National University Bundang Hospital Seoul National University College of Medicine, Korea)

Introduction : Older patients with cancer have increased risk of toxicities and functional decline after chemotherapy, leading to early termination of further active cancer treatment (TFACT). We aimed to assess the role of comprehensive geriatric assessment (CGA) in predicting toxicities and compliance of systemic chemotherapy in older patients with cancer in Korea. **Method :** We conducted baseline and follow up CGAs before and after systemic chemotherapy in patients aged 65 years and older. The association between CGA parameters and occurrence of significant toxicities was analyzed. We then assessed the TFACT, its association with survival and its predictors in a separate retrospective cohort receiving first line chemotherapy in palliative setting. **Results :** In the prospective pilot study, 64 patients were enrolled (median age: 71); significant toxicities were observed in 16 (25.0%) patients, significant decline was observed in ECOG PS (p=0.002), ADL (p<0.001), IADL (p=0.003), MMSE (p<0.001), and short form of GDS (p=0.017) after chemotherapy. The baseline ECOG PS was an independent predictor of significant toxicity (p=0.037), and mini-nutritional assessment was marginally associated with the significant toxicity (p=0.064). In a separate retrospective cohort of 98 patients who received first line chemotherapy (median age: 74) in a palliative setting, active treatment was terminated in 30 patients during median follow up of 15.1 months, which lead to shorter survival (3.1 vs 14.7 months). In multivariable analysis, malnutrition and dependent IADL were the independent predictors for TFACT after first line chemotherapy (OR: 5.03, 3.06). **Conclusion :** CGA parameters, especially IADL and malnutrition, were useful predictors of toxicity and TFACT after chemotherapy in Korean elderly. **Keywords :** comprehensive geriatric assessment, chemotherapy, older patients with cancer

SS25 523-C-3

RENAL FUNCTION. KEY ELEMENT IN EVALUATING THE OLDER CANCER PATIENT

Stuart LICHTMAN (Department of Medicine, Memorial Sloan Kettering Cancer Center, USA)

Introduction : Elderly cancer patients often have renal functional impairment due to physiologic decline and the effects of comorbidity. This requires that physicians show caution during the administration of renally excreted cancer drugs or those with established nephrotoxicity. **Method :** Before drug therapy, the assessment and optimization of hydration status and evaluation of renal function is required. Serum creatinine alone is insufficient as a means of evaluating renal function, and creatinine clearance should at least be calculated in every patient by the abbreviated modification of diet in renal disease or Cockcroft-Gault equations. In the extremes of obesity and cachexia and at very high and low creatinine values, no single tool is really accurate. Within each drug class, preference may be given to agents less likely to be influenced by renal clearance, which are minimally nephrotoxic, or for which appropriate methods of prevention for renal toxicity exist. Coadministration of known nephrotoxic drugs should be avoided or minimized. **Results :** An International Society for Geriatric Oncology (SIOG) task force was organized to formulate treatment recommendations for this group of patients. These guidelines will be

presented. **Conclusion :** Elderly patients with renal insufficiency can be safely and effectively be treated for cancer with appropriate supportive care. **Keywords :** renal insufficiency, Cockcroft-Gault, comorbidity

SS25 523-C-4

FUNCTIONAL RESERVE AND SURGICAL OUTCOMES IN THE OLDER CANCER PATIENTS

Sung Wu SUN¹, Beatriz KORC-GRODZICKI² (1. Department of Medicine, Memorial Sloan-Kettering Cancer Center Weill Cornell Medical College, USA; 2. Department of Medicine, Memorial Sloan-Kettering Cancer Center, USA)

Introduction : Cancer is a disease of the Elderly. Surgery remains the best cancer treatment modality to cure solid tumors. Today more geriatric patients undergo major surgery to achieve curative treatment. Recognizing factors which lead to poor outcomes has become very important. This study will determine the association between geriatric assessment (GA) variables with post-operative morbidity and mortality. **Method :** Patients older than 75 years who were referred for geriatric assessment (GA) before major cancer surgery at Memorial Sloan Kettering Cancer Center between 9/01/2010-12/31/2011 were identified. Pre-operative GA included: Mini-Cog Test (cognition), fall history, medication list, nutritional status (weight loss >10lbs, albumin), Charlson comorbidity index (CCI), activities of daily living (ADL) and instrumental activities of daily living (I-ADL). Outcomes included: postoperative delirium, 30-day hospital readmission, surgical adverse events, 30-day mortality and 6-month mortality. Utilizing bivariate analyses, the associations between GA measures and post-operative outcomes were evaluated. **Results :** 420 patients (median age 80) underwent major surgery for treatment of cancer during the period. CCI score, falls, dependence in I-ADLs and abnormal Mini-Cog test were associated with postoperative delirium. Lack of social support was associated with increased 30-day readmission. Dependence in ADLs was associated with risk of increased 30 day mortality. Dependence in ADLs/ I-ADLs, falls, weight loss, CCI score, low albumin level and abnormal Mini-Cog test were associated with increased 6 month mortality. **Conclusion :** Preoperative GA may promote a better understanding of older patients' perioperative risks. It can detect high-risk features for postoperative delirium and shorter survival. Further prospective studies with pre-operative GA and interventions are warranted. **Keywords :** Geriatric assessment, perioperative risk, cancer, surgery

SS25 524-R

ATTITUDES OF HEALTH CARE PROFESSIONALS IN GERIATRICS AND GERONTOLOGY TOWARDS USE OF TECHNOLOGY IN DAILY PRACTICE

SS25 524-R-1

HEALTHY AGEING THROUGH SERIOUS GAMING (HASEGA): RESEARCH ON SERIOUS (EXER)GAMING FOR ELDERLY

Boudewijn Hildo DIJKSTRA, Françoise HAAN DE - LYON, Ate DIJKSTRA (Care and Well-being, NHL University AS, Netherlands)

Introduction : Populations around the world are rapidly ageing. Between 2000 and 2050, the proportion of the world's population over 60 years will double from about 11% to 22%. We face the challenge to get grip on healthcare costs and at the same time improve quality of life for elderly. Staying physically active through serious (exer)gaming can contribute to Healthy Ageing, but application of this type of gerontechnology is not common in healthcare yet. In conjunction with

the main HASEGa study, which focuses on the outcome for elderly, this study tried to determine care professionals basic attitudes towards less client care dependency through application of serious (exer)gaming. Method : A compact multiple-choice questionnaire based on the ASE model (Attitude, Social influence, self Efficacy) has been sent (PASI) to all employees of the nursing home Erasmushiem (Leeuwarden-NL). Results : Of the 85 forms sent, 46 were returned. All over results showed positive basic attitudes towards application of serious (exer)gaming aiming for less client care dependency. Management reported the most positive attitudes where as nursing staff was more sceptical. Comments showed that negative attitudes seem to be connected to high experienced workload as most named obstacle for application. Conclusion : There seem to be notable differences in attitude between management and 'work floor employees'. Nursing staff seems to 'feel the pain' (higher workload) but have less appreciation for 'the gain' (less care dependency). When applying serious (exer)gaming in elderly care, there has to be more and special attention towards influencing the attitudes of 'work floor healthcare professionals'. Keywords: Healthy, Ageing, Serious,Gaming, Elderly

SS25 524-R-2

NURSES, TECHNOLOGY AND THE FUTURE OF CARE

Eveline Joanna Maria WOUTERS¹, Marianne Esther NIEBOER²
(1. Allied health Sciences, Fontys University of Applied Sciences, Netherlands; 2. Allied health Professions, Fontys University of Applied Sciences, Netherlands)

Introduction : In order to meet the demographic challenges, technology in health care processes is one of the solutions. Several 'stakeholders' are involved in the implementation process of technology. Apart from patients, also nurses, engineers, policy makers, and managers are involved. The aim of this study was threefold: (1) to explore the main values of nurses in several health care settings and several levels of technology implementation, (2) the perceived influence of the technologies on these values, and (3) the view on future of care by nurses with respect to technology. Method : Interpretative phenomenological analysis was applied on open and semi-structured interviews with over 50 nurses in several health care settings. Results : All nurses highly valued satisfaction of the needs of patients. They appreciated mutual inter-collegial respect and appreciation of supervisors. The possibility to do their work in an careful manner was an important value for nurses. Technology was appreciated for its ability to lower physical burdens, work planning possibilities and being able to prioritise work and support autonomy. Preconditions for successful implementation of technology were reliability of technology, training prior to implementation, being supportive to team cooperation, and the availability of a help desk. Views about the future of care were mainly related to financial cut backs and dealing with less health care personnel. No spontaneous thoughts about the role of new technology was part of these views. Conclusion : Nurses need support in relating technological solutions to patients' needs. The role of health care organisations, including technological expertise, can be crucial here. Keywords : health, technology, nurses, acceptance

SS25 524-R-3

PREDICTORS FOR THE USE OF REMOTE TELECARE BY CARE PROFESSIONALS (PETZ)

Thijs VAN HOUWELINGEN¹, Ansam BARAKAT¹, Ryan BEST², Walter BOOT², Neil CHARNESS², Helianthe KORT¹ (1. Research Centre for Innovations in Healthcare, Faculty of Healthcare Utrecht University of Applied Sciences, Netherlands; 2. Department of Psychology, Florida State University, USA)

Introduction : With the age of American and European countries rising, aging in place is becoming an increasingly important goal for the health care industry. Remote telecare technology, such as videoconferencing between professionals and clients, can help to meet the growing demand for care. These technologies support traditional care as well as facilitate older adults' ability to live longer independently in their own homes. Despite the apparent positive effects of this technology, there are still barriers for remote telecare adoption related to lack of knowledge and skills associated with use (Kort en van Hoof, 2012). The current project focuses on identifying predictors for remote telecare use in Dutch and American health care professionals. Knowledge gained from the identification of these predictors will then be used to inform training programs to promote greater adoption of remote telecare across the health care field. Method : Questionnaires were devised to collect information related to demographics, technology experience, as well as feelings, attitudes, experience, and preferences related to remote telecare from Dutch and American health care professionals. Results : Data were collected from 207 health professionals working in homecare in the Netherlands. Addition observational data was collected from 20 of the professionals from this sample. Data was fit to the UTAUT model (Venkatesh et al., 2003) to describe the relationship between predictor variables, intention to use, and current use of remote telecare. Conclusion : The identity and weight of the predictor variables and the resulting implications for the design of training programs will be discussed. Keywords : technology acceptance, interaction with older adults, telecare

SS25 524-R-4

EXPERIENCE OF THERAPISTS USING SILVERFIT GAMES AND IMPLEMENTATION IN DEMENTIA CARE

Yvonne SCHIKHOF (Centre of Expertise Innovation in Care, Rotterdam University of Applied Sciences, Netherlands)

Introduction : SilverFit is a virtual rehabilitation system for elderly users. The most important exercises that train gross motor movement have been incorporated into computer games, using a 3D camera that can trace the movements of one to four people. The physiotherapist can change the level to suit the client. The games are designed to be stimulating. SilverFit also started to develop games for people with dementia and a project to introduce the system in dementia care has started. The aim of this evaluation was to learn from the experience of early adopters and to help with the implementation in dementia care. Method : A Focus Group with a team of five therapists was conducted to explore their experience with SilverFit over one to four years. Results : The therapists discussed their professional values and the contribution of SilverFit to these values. They highly value the goal-oriented and appealing character of the games. They can work on both physical and psychosocial goals with their clients. Therapists also appreciate the competitive element when clients play against each other. They already have experience using SilverFit for people with dementia and are aware of the limitations of this group and safety conditions. They described preconditions for implementation in dementia care. Conclusion : This technology is much appreciated for its ability to help clients achieve goals as set by therapists. The connection between professional values and characteristics of the games is important for the acceptance of this technology. Experience from early adopters is valuable when starting new projects. Keywords: virtual rehabilitation system

SS25 525-C

CRITICAL FALL WITH INABILITY TO GET UP: SCREENING AND NEW PREVENTION STRATEGIES

SS25 525-C-1

CRITICAL FALLS: WHY REMAINING ON THE GROUND AFTER A FALL CAN BE DANGEROUS WHATEVER THE FALL

Frederic BLOCH (*Gerontology, Hopital Broca (AP-HP), France*)

Introduction : As people age, it becomes increasingly difficult for them to stand again after a fall. However, in addition to all the consequences of the fall itself, prolonged immobilisation on the ground will have many repercussions with poor prognosis for recovery. Method : A systematic review and meta-analysis were performed, and the OR and 95%CI to assess the mortality related to the inability to get up after a fall was estimated for each study and overall. The fixed-effects method of Mantel-Haenszel was used. Heterogeneity was assessed using the I² statistic. Results : A computer search strategy identified 3,401 articles. Were excluded 3,333 articles, retaining only 70 articles concerning prospective studies about consequences and prognosis after falls of the elderly. Selecting studies with numerical data on mortality in groups lying or not-lying on the ground for extended periods of time, four studies were included. The OR and 95%CI for the association between lying on the floor during a long period and mortality in all patients studied was 1.75 [95%CI 1.15-2.67], with I²= 33%. Conclusion : Published articles on the consequences or prognosis of falls give far too often results where falls are categorised by type, or subgroups of population or place of occurrence. Our strategy is limited and has to be used complementary to systematic review when studying consequences of falls. But it is still too restrictive to focus only on traumatic falls in this case. We thus propose the term 'critical fall' to characterize a fall with an inability to retain upright posture, whatever the reason. Keywords : critical fall, unable to get up

SS25 525-C-2

THE INABILITY TO GET UP: RISK FACTORS AND CONSEQUENCES IN A POPULATION-BASED STUDY OF OVER-90-YEAR-OLDS.

Jane FLEMING¹, Carol BRAYNE¹ and Cambridge City Over-75s Cohort Study Collaboration (CC75C)² (*1. Institute of Public Health, University of Cambridge, United Kingdom; 2. Public Health and Primary Care, University of Cambridge, United Kingdom*)

Introduction : A "long lie" can have serious consequences for an older person who falls and cannot get up. This study describes the incidence and extent of "long lies" in advanced old age, and explores older old people's use of call alarm systems in these circumstances. Method : 1 year prospective follow-up of n=110 over-90-year-olds (90 women), UK population-based Cambridge City Over-75s Cohort (CC75C) falls study. Data collection included: whether the fall occurred when alone, inability to get up without assistance, recalled time on the floor, availability and use of call alarm systems, and participants' views on using call alarms to summon help. Results : In 54% of fall reports the participant was found on the floor and 82% of falls occurred when alone. 80% of those who fell were unable to get up after at least one fall. 30% suffered "long lies" (1 hour or more). Cognitive impairment was the only factor predicting a "long lie". Comments from older people and their carers reveal the complexity of issues around the use of call alarms, including perceptions of irrelevance, concerns about independence, and practical difficulties. Conclusion : There are practical implications for the training and information needed by older old people about effective use of call alarms and strategies to get up off the floor. Design issues for alarm systems include access and activation: the development of automatic fall detectors may provide a solution for some at high risk for "long lies". Care providers need better understanding of older people's perceptions in order to provide acceptable support services. Keywords : Oldest old, Frail elderly,

Accidental falls, Dementia, Assistive technology

SS25 525-C-3

THE VIGIFALL DEVICE A NEW CUTTING EDGE FALL DETECTOR: RESULTS FROM A MULTICENTRE STUDY TO TEST IT IN COMMUNITY-DWELLING OLDER PEOPLES

Jean-Eric LUNDY (*Department of Emergency Medicine, Hopital Cochin (AP-HP), France*)

Introduction : Elderly patients unable to get up or to activate an alarm mechanism after a fall are particularly at risk of complications and need to be monitored with extreme care. This fact underscores the need to draw up early alert strategies for falls and explains the development of stand-alone devices facilitating early detection of falls. The Vigi'Fall system is a new fall detector associating a "passive release" mechanism attached to the patient and external sensors with embedded confirmation software. In the event of a fall, the system automatically triggers an alarm. After evaluating its acceptability and tolerability in elderly subjects, we present its efficacy under real-life conditions. Method : Prospective observational monocenter study to determine 6-month evolution of patients above 75 years, at home, wearing or not the VigiFall device. Results : We will present preliminary results of this study involving patients in real-life conditions to obtain enhanced sensitivity and specificity through use of the complete device including an accelerometric sensor, infrared, and a verification or confirmation system. Conclusion : Few studies have efficiently assessed the sensitivity and reliability of fall detection devices for the elderly from a real-life standpoint. Automatic fall detection systems for the elderly are at the heart of today's gerontechnology research. These novel technologies need to be harmonized with the subject's environment, and that a detector cannot advantageously replace the visits of family, friends and neighbors. This real-life condition allows therefore to approach with the highest possible relevance the acceptability and tolerability of the Vigi'Fall. Keywords : Fall detector; real-life conditions

ASSISTIVE TECHNOLOGY AND SUPPORTED CARE: ROBOTS AND MONITORING

SS25 526-C-1

SYMPOSIUM OVERVIEW

Ngairé KERSE¹, Bruce MCDONALD², Elizabeth BROADBENT³, Clemens BECKER⁴ (*1. General Practice and Primary Health Care, University of Auckland, New Zealand; 2. Engineering, University of Auckland, New Zealand; 3. Psychological Medicine, University of Auckland, New Zealand; 4. Robert Bosch rehabilitation hospital, Germany*)

Introduction : With the ageing of the population new ways are needed to support older people, and reduce the impact of disability. In all settings robot and monitoring technology has the potential to improve function, empower older people and reduce cost. Method : The symposium will showcase an international collaboration between South Korean, New Zealand researchers and European researchers and companies to develop technology and provide cognitive robotic assistants delivering; companionship and entertainment, medication reminding, vital signs; activity and location monitoring with falls detection; and a plan for a large repository of falls data. Funding has been by the NZ Government, the European Commission, and the South Korean Government. Results : The group has evaluated the acceptability, feasibility, benefits and risks of the technology in an aged care facility and recently trialed 30 robots deployed in a

retirement village. The falls and activity monitoring are part of an international collaboration to capture a large database of accelerometer recordings of activity and falls to develop algorithms for recognizing falls and categorizing activity. Conclusion : The novelty of this symposium is the application of technology in real life. A demonstration will be given of an older persons care robot by Yujin Robot Ltd, Seoul . Keywords : Robotics, Assistive technology, Falls monitoring, Accelerometers, falls repository

SS25 526-C-2

ROBOTS HELPING TO CARE FOR OLDER PEOPLE ? AN INTERNATIONAL COLLABORATION

Bruce MACDONALD¹, Elizabeth BROADBENT², Ngaire KERSE³, Kathryn PERI⁴, I Han (tony) KUO¹, Chandimal JAYAWARDENA⁵, Chandan DATTA¹, Catherine WATSON¹, Rebecca STAFFORD² (1. Electrical and Computer Engineering, University of Auckland, New Zealand; 2. Psychological Medicine, University of Auckland, New Zealand; 3. General Practice and Primary Healthcare, University of Auckland, New Zealand; 4. School of Nursing, University of Auckland, New Zealand; 5. Computing and Information Technology, Unitec, New Zealand)

Introduction : The presentation will briefly introduce our healthcare robotics work and summarize the development of the New Zealand testbed for trialling the Healthbots project software on South Korean robots for care of older people, plus 1 Paro robot. Method : We have designed applications to assist with entertainment and companionship, medication management, vital, signs monitoring, as well as activity and fall detection. Results : The recent study included robots in independent living, rest home, hospital, reception, cafe, doctor's waiting room, an observational study in the dementia unit, and accelerometer studies of falls and activity. Conclusion : Development of the project and recent activities will be summarized, including a planned robot deployment at a healthcare organization in the South Island of New Zealand. Keywords : Robotics, oldercare

SS25 526-C-3

THE PSYCHOLOGICAL AND SOCIAL INTERACTIONS BETWEEN OLDER PEOPLE AND ROBOTS

Elizabeth BROADBENT¹, Bruce MACDONALD², Ngaire KERSE³, Hayley ROBINSON¹, Kathy PERI⁴, Tony KUO², Chandimal JAYAWARDENA², Chandan DATTA², Catherine WATSON², Rebecca STAFFORD¹, Lynne TAYLOR³ (1. Department of Psychological Medicine, The University of Auckland, New Zealand; 2. The University of Auckland-ETRI joint laboratory for U-healthcare robotics, School of Engineering, The University of Auckland, New Zealand; 3. Department of General Practice and Primary Health Care, The University of Auckland, New Zealand; 4. School of Nursing, The University of Auckland, New Zealand)

Introduction : Few randomized controlled trials have investigated the effects of robots in aged care settings. The aim of these six studies was to investigate the benefits and dis-benefits of robots for staff and residents in a retirement village. Method : 1) a randomized controlled cross-over trial deployed healthcare robots to individuals' homes compared to a similar period without robots. 2) a controlled comparison trial deployed healthcare robots in two rest-home/hospitals compared to two rest-home/hospitals without robots. 3) healthcare robots were observed in the cafe, reception, and medical centre. 4) interactions with a healthcare robot were compared to interactions with a companion robot in a secure dementia unit. 5) a randomised controlled trial of a companion robot in a rest-home/hospital was conducted. 6) falls were monitored using wearable accelerometers.

Questionnaires, observations, interviews, robot logs, and accelerometer data were analysed. Results : Results showed that there were no dis-benefits of the robots. Many residents with individual healthcare robots saw them as companions and as useful. Most staff and residents in the rest-home and hospital reported positive comments and residents in lounges with robots slept less and interacted more with each other than residents in lounges without robots. Residents with dementia touched, smiled and talked to the companion robot more than the healthcare robot. The companion robot significantly reduced loneliness in rest-home/hospital residents, and increased social interactions compared to the control group. Five falls were captured using accelerometers. Conclusion : These findings indicate that robots can be successfully incorporated into aged care settings with promising indications of benefits. Keywords : robot, psychology, randomised controlled trial

SS25 526-C-4

DESIGN AND BUILDING OF A SHARED DATA BASE OF REAL WORLD FALLS IN OLDER PERSONS

Clemens BECKER, Jochen KLENK (Department of Clinical Gerontology, Robert-Bosch Hospital, Germany)

Introduction : The identification of fall risk factors and the development of fall prevention programs have made considerable progress over the last 10 years. A recent meta-analysis on risk factors (Deandrea 2010) and the updates of the corresponding Cochrane reports show a growing body of evidence and knowledge (Gillespie 2012). However, many relevant questions on the pre-phase of falls and what actually happens during a fall remain unanswered. This is mainly due to the fact that fallers cannot give accurate reports on the circumstances of a fall and contextual information is often biased. Less than 10 % of all falls are witnessed and reporting bias is a similar problem for proxies and other witnesses. Method : The FARSEEING project financed by the European Commission tries to fill some of these knowledge gaps and translates these findings into diagnostic tools and therapeutic interventions. This is based upon a consensus process on a standard fall data format to assess and store fall signals, the build up of a fall signal meta-database and a new model to study falls (Becker 2012). Results : This approach classifies falls into different phases and uses body-worn sensor data to examine body movement and impact during falls. Conclusion : The presentation will present findings from real-world fall signals and demonstrate how this might translate into new approaches for fall prediction, fall detection and fall prevention approaches. Keywords : Falls, older persons

SS25 526-C-5

DEVELOPMENT OF AN ACCELEROMETER BASED ACTIVITY AND FALL MONITOR FOR PRACTICAL DEPLOYMENT IN AN AGED CARE SETTING

Chankyu PARK, Jaehong KIM (Robot/Cognitive Convergence Research Department, ETRI, Korea)

Introduction : Many researchers have studied human activity (including fall detection) recognition techniques in various domains; however none released to a commercial product satisfying the old people requirements, which are comfortable to wear it, weight-lighted and having exact accuracy to detect emergency activity and longer battery durance. Thus, to address them, we propose a practical approach procedure for getting best minimum feature sets and classification accuracy for wearable fall monitor. Method : We do experiments for comparing the two features reduction techniques and four classification techniques in order to discriminate five each basic human activities, such as fall for the aged care, walking, hand related

shocks, walking with walker and lastly steady activity which includes no movement and slow arbitrary hand and body motions. Results : The results of recognition performance of SFS-SVM pair based activity and fall detector show the best performance. These results have been measured at both wrist and waist body positions. Most recognition rates over five categories are over 95% and robust be able to apply general nursing home. Conclusion : We can find two facts; one is that FFS based feature selection is more reliable than PCA based on transformation and the other is that we don't need a lot of features. In terms of recognition rates, the overall accuracy to each combination shows that the pair of SFS-SVM is the best of all in this paper and it is enough to have 10 numbers of features to achieve tolerable recognition performance rate 95%. Keywords : fall detection, activity recognition, aged care

SS25 527-C

CLINICAL CHARACTERISTICS OF SLEEP DISORDERS IN KOREAN ELDERLY

SS25 527-C-1

CHARACTERISTICS OF OSA PATIENTS IN KOREAN ELDERLY

Eui-joong KIM¹, Seong Ho KIM², Eun-jeong JOO², Kyu-young LEE², Young-jin KOO² (1. *Psychiatry, EMC Eulji University School of Medicine, Korea*; 2. *Department of Psychiatry, Eulji University School of Medicine, Eulji General Hospital, Korea*)

Introduction : Recent studies reported characteristics of OSA in elderly patients that might different with those of middle aged including the clinical impact of OSA severity on cardiovascular disease. Authors tried to figure out the characteristics of Korean elderly OSA by the demographic, sleep architectural, OSA severity related, and heart rate variability (HRV) differences. Method : Polysomnographically proved 345 OSA patients over 40 years old were included. They filled out the Horne and Ostberg Questionnaire(HOQ), Pittsburgh Sleep Quality Index-Korean(PSQI-K), and Epworth Sleepiness Scale(ESS). We compared mean values of ESS, HOQ, PSQI-K, sleep related variables, OSA severity related variables, and HRV variables between 252 middle aged (40-59 years) group and 93 elderly (≥ 60 years) group. ANCOVA was performed between two groups after adjustment with height and weight. Results : Elderly group showed significantly higher PSQI-K and HOQ scores. In sleep architecture elderly group showed significantly longer sleep latency and REM sleep latency; lower sleep efficiency, total sleep time, and slow wave sleep%; higher wake time after sleep onset(WASO), limb movement index than middle aged group. There were no differences in AHI, mean O₂ saturation, and total arousal index between two groups. In HRV analysis, NN50 count, percent of NN50, average total power, average low frequency power, average high frequency power, and HRV triangular index were significantly lower in elderly group. Conclusion : We could describe Korean elderly OSA patients as having more tendency of morningness, and poor sleep quality in subjective and objective measures. Elderly OSA patients have lower ANS activity and lower cardiac reactivity. Keywords : Korean elderly, OSA, HRV

SS25 527-C-2

RESTLESS LEGS SYNDROME IN KOREAN ELDERLY

Seung-gul KANG¹, Hong-beom SHIN² (1. *Department of Psychiatry, Gachon University, School of Medicine, Korea*; 2. *Department of Psychiatry, Komoki Sleep Center, Korea*)

Restless legs syndrome (RLS) is a bothersome sleep disorder manifested by uncomfortable sensations in the legs and an irresistible

urge to move the legs, which impairs the quality of sleep and life. The estimated prevalence of RLS varies widely, from 1% to 15%. The prevalence of RLS increases with age until 50 years old. Recently, the prevalence of RLS in Korean elderly was reported 8.3% and 9.5% in two independent community-based samples. We previously reported that the incidence of RLS in patients with schizophrenia is more than twice that in healthy controls. We also performed the pharmacogenetic studies investigating the association between antipsychotic-induced RLS and several candidate genes (G protein $\beta 3$ subunit gene, tyrosine hydroxylase gene, monoamine oxidase genes, dopamine D1, D2, D3, and D4 receptor genes, BTBD9 gene). In this symposium, we will present the clinical characteristics of RLS patients in a Korean sleep center and report interesting and difficult cases of elderly RLS patients. [Acknowledgement] This research was supported by Basic Science Research Program through the National Research Foundation of Korea(NRF) funded by the Ministry of Education, Science and Technology(grant number; 2012-0003429). Keywords : restless legs syndrome, Korean, elderly.

SS25 527-C-3

CHARACTERISTICS OF RBD PATIENTS IN KOREA

Hongbeom SHIN (*Psychiatry, Komoki Sleep Clinic, Korea*)

Introduction : REM sleep behavior disorder(RBD) is a parasomnia characterized by a history of excessive motor activities during sleep and is associated with pathological absence of muscle atonia during REM sleep. The frequency of RBD is much higher in certain neurodegenerative diseases, especially Parkinson's disease, dementia with Lewy bodies and multiple systems atrophy. In this study, the characteristics of RBD in Korean elderly is presented in terms of polysomnographic features, clinical symptoms and responses to the treatments. Method : The clinical records of 83 RBD patients who had been underwent clinical interview and polysomnography were analyzed. Age of symptoms onset, associated feature, comorbidities of other neurological conditions and severities of violent behavior during RBD episodes were classified and described. Results : The mean age of symptoms onset was 50.5 years old. Periodic limb movements of sleep(PLMS) was common with the frequency of 70.5%. A few of patients showed the symptoms of parkinsonism and were referred to neurology to managements. The severities of violent behavior during RBD were classified 3 groups and the percentages of mild, moderate and severe group were 64%, 22% and 14%, respectively. Conclusion : In this presentation, we could verify that characteristics of RBD in Korean were comparable to those of other countries. RBD is more prevalent in degenerative neurologic disorder. Thus more extensive study is needed to figure out in depth understanding of features of Korean RBD. Keywords : RBD, Sleep disorder, Elderly

SS25 527-C-4

CHARACTERISTICS OF INSOMNIA PATIENTS IN KOREAN ELDERLY

Yu Jin LEE (*Department of Mental Health (Psychiatry), Gachon university Gil medical center, Korea*)

Introduction : Architecture of sleep changes with aging. Insomnia is not a sleep disorder, but a sleep complaint secondary to or accompanying a medical, psychiatric, behavioral or psychosocial condition. It is crucial to identify the underlying cause of insomnia especially in elderly. Up to 40% of those over age 60 complain of disturbed sleep (Miles & Dement, 1980). Over 20% of elderly report severe insomnia (Mellinger, Balter & Uhlenhuth, 1985). Insomnia is more common in women than in men. Method : In this presentation, I will discuss various causes of insomnia in elderly, assessment,

common sleep disorders and pharmacological/ nonpharmacological treatments for insomnia in elderly. Keywords : Insomnia, elderly

NEW APPROACHES TO IMPROVING CARE IN NURSING HOMES: THE JAMDA SYMPOSIUM

SS26 107-C-1

HISTORY OF NURSING HOMES

John E. MORLEY (*Geriatric Medicine, Saint Louis University, USA*)

Introduction : The history of nursing homes will be briefly presented starting with the first nursing homes in the Byzantine Empire under the leadership of Saint Helen. Method : Nursing homes then spread throughout Europe, predominantly being created by religious organizations. The concept of the 'Teaching Nursing Home' was developed by Leslie Libow in New York in 1967. Results : A major change in nursing homes was the medicalization that occurred in the United States with the introduction of Medicare in 1965, and the OBRA 87 regulations. Conclusion : AMDA has become a major organization for nursing homes in the United States. JAMDA is the medical journal that specializes in nursing home care. Keywords : Nursing home history

SS26 107-C-2

NURSING HOMES AROUND THE WORLD: A COMPARISON

Paul KATZ (*Medical Administration, Baycrest, Canada*)

Introduction : While senior housing and care options continue to evolve, nursing homes (NH) remain a mainstay within the long-term care (LTC) continuum around the globe. Despite their prevalence, international comparisons are sparse, particularly as regards medical care practices. Such comparisons constitute the first step in identifying and then disseminating best practices. Method : A survey of LTC physician leaders in 10 countries will be conducted in the first quarter of 2013. The survey will explore common medical care practices germane to each jurisdiction focusing on medical staff organization and quality outcomes. The survey will be complimented by a review of LTC demographics and facility specific structural characteristics. Survey questions will be scored on a 5-point Likert scale. Results : Basic descriptive statistics will be employed. Differences in care practices germane to relevant clinical outcomes will be highlighted and potential best practices reviewed. The results will be discussed in the context of health reform initiatives taking place around the world. Conclusion : Identifying and disseminating medical care best practices is key to assuring the delivery of high quality care to NH residents around the world. The survey results presented will offer valuable insights into these best practices and, at the same time, work towards establishing a community of practice of physician leaders. Keywords : Nursing Homes Around the World

SS26 107-C-3

INTEGRATING PALLIATIVE CARE IN THE NURSING HOME: AN INTERPROFESSIONAL OPPORTUNITY

Daniel SWAGERTY (*Department of Family Medicine, American Medical Directors Association, USA*)

Introduction : There is considerable evidence that nursing home (NH) residents do not receive optimal end-of-life care. Internal palliative care programs and hospice services are being used more frequently in the NH. The interdisciplinary support of the palliative care or hospice

team can be invaluable in supporting the usual care at a time when staff, family members and the NH resident are facing the increased and urgent needs associated with the dying process. Method : A defined and well resourced palliative care program can make it easier for NH staff, physicians, and other providers to give comprehensive end of life care to terminally ill patients, in the form of a specific internal program developed and maintained by the NH or by contracting with community-based hospices. This session will address the barriers to palliative care and strategies to overcome them in the NH by identifying factors important to dying residents and their families; describing gaps in end-of-life care for residents; and comparing the respective opportunities and challenges of supplemental hospice service versus internally-developed palliative care programs for improving end-of-life care in the NH. Results : There is evidence that supplemental hospice services in addition to usual NH services in terminally ill NH residents will improve medical outcomes, and family and patient satisfaction. Internally-developed palliative care programs in NHs also offer the same end-of-life care benefits to the terminally-ill residents and their families, but have associated challenges. Conclusion : A commitment to interprofessional education and practice is essential to providing quality end-of-life care in the NH. Keywords : palliative care nursing home

SS26 108-C

CANADIAN GERIATRICS SOCIETY SYMPOSIUM: INITIATIVES TO IMPROVE THE CARE OF HOSPITALIZED ELDERLY PERSONS

SS26 108-C-1

ACUTE CARE FOR ELDERLY UNITS (ACE) AND RELATED NEW DEVELOPMENTS

Roger Y. WONG (*Faculty of Medicine, University of British Columbia, Canada*)

Introduction : Since the inaugural reports on Acute Care for Elders (ACE) units, many centres around the world have implemented such programs with variable success. Method : When implemented successfully, ACE can be associated with favourable clinical, educational and research outcomes. Results : The ingredients of successful ACE implementation include maintaining continuous patient flow, managing the impact of increased patient flow on resource capacity and staff workload, and optimizing utilization within finite resources available. Adequate staffing level is essential for sustainable workforce in ACE. Best practices in ACE should focus on knowledge translation with clinical outcomes that are patient-centred. New developmental trends on ACE include modified ACE programs for various patient cohorts (such as dementia, stroke, orthopaedic patients etc.) delirium room in ACE, ACE consultation programs, ACE tracker with e-geriatrician, and elder-friendly hospitals based on delivering ACE concepts within the hospital environment at large. The effectiveness of such new developments requires further studies. Creative educational opportunities to teach postgraduate and undergraduate learners about ACE help to disseminate important principles. Finally, ACE can provide the venue for original research, including the areas of clinical investigation, health systems research, and medical education research. In summary, favourable ACE outcomes can be feasible. Conclusion : Systematic implementation of ACE can hopefully improve hospital care for vulnerable older adults. Keywords : acute, hospital, care

SS26 108-C-2

A STRATEGY TO CREATE AN AGE-FRIENDLY HOSPITAL: THE MCGILL UNIVERSITY HEALTH CENTRE (MUHC)

EXPERIENCE

Jose A. MORAIS¹, Rita CRISANTE², Nadine LARENTE² (1. Division of Geriatric Medicine, McGill University, Canada; 2. Division of Geriatric Medicine, McGill University Health Centre, Canada)

Introduction : In developed countries, the elderly comprise ~50% of the in-patient population. Many are vulnerable and experience functional decline and/or delirium caused by inadequate hospital practices. A review of the literature helped establish the guiding principles for an Elderly-Friendly Hospital (EFH) concept, which includes: 1) A favourable physical environment; 2) Zero tolerance towards ageism; 3) An integrated process to develop comprehensive services using principles of the geriatric approach; 4) Assistance with appropriate decision-making, like Levels of care and Interventions; 5) Fostering links between the Acute Care Hospital and the Community. **Method :** The Geriatrics Division and the administration of the MUHC have designed a 2-year plan to test implementation of the EFH concept. An office and a structure to ensure sustainability and continuous improvement were created to oversee the implementation since the EFH care processes require multi-dimensional solutions and inter-professional collaboration from physicians and all of the allied health professionals. **Results :** Pilot implementation projects are underway in different wards. In these wards, interdisciplinary champions knowledgeable in the EFH principals serve as a reference person for the other personnel. To complete the practical aspects of the implementation, the Hospital Elder Life Program (HELP) for delirium prevention will be applied with the support of trained volunteers and team members. An education campaign will steer the changes required both in clinical practices and in the socio-cultural behaviours towards the elderly. **Conclusion :** We hope to improve the health outcomes of older in-patients with multiple chronic conditions and contribute to maintain the hospital mission of acute specialized state-of-the-art care. **Keywords :** Elderly Friendly Hospital; strategies of implementation

SS26 108-C-3

SENIOR FRIENDLY HOSPITALS: A PROVINCE-WIDE STRATEGY IN ONTARIO

Barbara A. LIU¹, Ken WONG², Ada TSANG², Rhonda SCHWARTZ², Gary NAGLIE⁴ (1. Medicine, Regional Geriatric Program of Toronto, Canada; 2. SFH, Regional Geriatric Program of Toronto, Canada; 3. Quality, Safety and Best Practice, Baycrest, Canada; 4. Medicine, Baycrest, Canada)

Introduction : Ontario has a total population of 12.1 million, with 1.5 million seniors. In 2010-11, the Local Health Integration Networks (LHINs) in Ontario endorsed a provincial senior friendly hospital (SFH) strategy. The strategy was guided by the Regional Geriatric Program's (RGP) SFH framework, which includes the domains-organizational support; processes of care; emotional and behavioural support; ethics in clinical care and the physical environment. **Method :** 155 hospitals completed a self assessment based on the SFH framework. After writing a summary report for each LHIN (14) and a provincial summary report, we used a modified Delphi process to identify tools and accountability indicators to support the strategy. **Results :** The provincial report is an environmental scan. In it we identified two priorities for action: prevention of functional decline through early mobilization strategies; and prevention and management of delirium. We developed a web-based toolkit with a short menu of enabling tools to support the priorities. The toolkit is organized according the SFH framework and the processes of screening, prevention, management and monitoring. Four indicators for monitoring and accountability have been drafted and are undergoing pilot testing. **Conclusion :** We have conducted an environmental scan,

developed a toolkit and indicators to support SFH care in Ontario. The work is guided by the principles of evidence, feasibility, interprofessional team work, and advancing care for frail seniors. The lens for decision making also includes applicability of tools and indicators across a range of hospital care settings that include urban and rural; academic and community; large and small; acute and post acute care. **Keywords :** senior-friendly, hospital, indicator

SS26 108-C-4

A REVIEW OF HOW INNOVATIVE MODELS OF CARE CAN ADDRESS THE UNIQUE RISKS OF HOSPITALIZATION IN THE ELDERLY

Angela G. JUBY (Medicine, Geriatrics, University of Alberta, Canada)

Introduction : Acute hospitalization presents unique risks to the elderly. For example: rapid functional losses with increased morbidity and mortality; atypical disease presentation; associated dementia; higher risk of delirium and pressure ulcers; impaired nutrition and; impaired bowel /bladder function. **Method :** Various care models have been developed to try and address these issues. Some strategies focus on individual medical conditions, eg. delirium care maps. Others, on individual functions such as bowel/bladder issues, skin care, providing glasses/hearing aids, or optimising nutrition. Still others focus on a system approach either at the level of an individual specialised ward, such as an ACE unit, orthogeriatric unit, or a comprehensive consultation/treatment team. Finally, an even more comprehensive approach would be that of a provincial or national strategy to ensure all hospitals provide a basic level of appropriate specialised geriatric care, and that this flows seamlessly into a geriatric focused discharge plan. **Results :** ACE units and two provincial strategies have already been discussed. Experience with some other strategies will be discussed, and the pros and cons of all these approaches reviewed. An international symposium at this meeting will discuss different national approach to elder friendly hospital standards. **Conclusion :** This symposium helps highlight the unique challenges for the elderly during acute hospitalization. It will provide information and experience using a number of possible strategies to address these challenges. The absence of one encompassing strategy highlights the need to individualise any model of care for the unique circumstances of local cultural considerations, as well as the funding environment. **Keywords :** acute, hospital, models

SS26 109-R

JOHNS HOPKINS UNIVERSITY-PEKING UNION MEDICAL COLLEGE INTERNATIONAL GERIATRICS COLLABORATION AND PARTNERSHIP WITH CHINA MEDICAL TRIBUNE IN CHINA: A MODEL FOR GERIATRICS PROGRAM DEVELOPMENT AND KNOWLEDGE DISSEMINATION IN DEVELOPING COUNTRIES

SS26 109-R-1

INTERNATIONAL COLLABORATION BETWEEN JOHNS HOPKINS AND PEKING UNION MEDICAL COLLEGE (PUMC) IN GERIATRICS PROGRAM DEVELOPMENT IN CHINA: HOPKINS EXPERIENCE

Sean X. LENG¹, Xiaohong LIU², Ti SHEN³, Samuel Chris DURSO¹ (1. Geriatric Medicine and Gerontology, Johns Hopkins University School of Medicine, USA; 2. Geriatrics Division, Department of Internal Medicine, Peking Union Medical College Hospital, Chinese Academy of Medical Sciences, China; 3. Internal Medicine, Peking Union Medical College Hospital, Chinese Academy of Medical Sciences, China)

Introduction : The aging imperative is global. This is best exemplified in China, where the largest aging population in the world resides and continues to grow fast. Despite the urgent need to care for this huge older adult population, China lacks quality geriatrics program, let alone well-trained geriatricians. **Method :** To begin to address this unprecedented challenge, Johns Hopkins University School of Medicine and Peking Union Medical College (PUMC) have started an international collaboration aiming to establish a leadership program that will spearhead the development of quality geriatrics care, education, and aging research throughout China. Funded by China Medical Board (06-836) and the Milstein Medical Asian American Partnership (MMAAP) Foundation and Irma and Paul Milstein Program for Senior Health. **Results :** As a key component of this collaboration, a total of sixteen Chinese physicians and nurses obtained geriatrics training in the Division of Geriatrics Medicine and Gerontology at Johns Hopkins University School of Medicine. These include eight internists, one physiatrist, one neurologist, one nutritionist, one neuropsychologist, and four nurses who will serve as the backbone of the multidisciplinary geriatrics care team at PUMC Hospital. Geriatrics demonstration ward was initially established and now an academic geriatric division has been established at the PUMC Hospital. **Conclusion :** This international collaboration has led to the establishment of a leadership geriatrics program in China. This will serve as a successful example and useful model for geriatrics program development in other developing countries. **Keywords :** International Geriatrics Collaboration, Partnership with media, Johns Hopkins, PUMC

SS26 109-R-2

GERIATRICS PROGRAM DEVELOPMENT AT THE PEKING UNION MEDICAL COLLEGE HOSPITAL

Xiaohong LIU (*Division of Geriatrics, Peking Union Medical College Hospital, China*)

Introduction : China, while facing the unprecedented need for quality geriatrics care for its large and rapidly growing elderly population, continues to use individual organ system-based traditional subspecialty care model in geriatrics. In collaboration with the Division of Geriatric Medicine and Gerontology at Johns Hopkins University (JHU) School of Medicine, the PUMCH has since 2006 started its effort in developing a model geriatrics program that will promote modern geriatrics in China. **Method :** While sending its faculties to JHU to obtain modern geriatrics training, PUMC established a geriatrics demonstration ward in 2007, which has now developed into the Division of Geriatrics in the Department of Internal Medicine. **Results:** The Division of Geriatrics at PUMCH has begun several geriatric services, such as Comprehensive Geriatrics Assessment, integrated multidisciplinary geriatric team work in both geriatrics ward and outpatient services, polypharmacy management and preoperative consultation services. PUMCH-JHU Geriatrics Conference 2011, 2012 were held successfully and about 50 lectures on Geriatrics were given. **Conclusion :** We have got some achievements and experience on the way of developing geriatrics, together with challenges. Two key external determinants of our success include close collaboration with JHU. Introduction of modern American geriatrics and partnership with China Medical Tribune for dissemination of modern geriatrics across China. It is evident that modern geriatrics program development in China requires concerted efforts from medical community, Chinese government, and the whole Chinese society. **Keywords :** Modern Geriatrics, Collaboration Model

SS26 109-R-3

PARTNERSHIP BETWEEN CHINA MEDICAL TRIBUNE AND

LEADING ACADEMIC MEDICAL CENTERS IN PROMOTING GERIATRICS KNOWLEDGE DISSEMINATION IN CHINA

Guixiang ZHENG (*Editor Department, China Medical Tribune, China*)

Introduction : Established by the Ministry of Health with funding contribution from the Arthur F. Sackler Foundation, China Medical Tribune (CMT) is a major medical newspaper published weekly in China. CMT has a unique position in Chinese media related to healthcare. CMT reaches out to not only two million Chinese physicians, but also policy makers, business leaders, and the public with widespread influence on the medical community and a variety of healthcare issues across China. **Method :** Partnering with the Division of Geriatric Medicine and Gerontology at Johns Hopkins University School of Medicine and Peking Union Medical College Hospital, CMT has established a special series on geriatrics since October 1, 2010, the annual Senior Day in China. **Results :** Through this ongoing monthly special series, CMT has thus far introduced key principles and care models of modern geriatric medicine to the Chinese medical community. Innovative geriatrics care models described thus far include comprehensive geriatrics assessment, Program for All inclusive Care for the Elderly (PACE), hip fracture service, just to name a few. **Conclusion :** This presentation will describe how CMT has recognized the importance of the aging imperative and modern geriatric medicine to the Chinese medical community as well as the society at large, and why is important to build the partnership between CMT and the leading academic institutions. It will also describe future steps for further strengthening this partnership in promoting geriatrics program development and quality care for seniors throughout China. **Keywords :** media geriatrics Partnership

SS26 110-R

PROMOTING INTERNATIONAL EXCHANGE IN GERONTOLOGICAL RESEARCH AND EDUCATION IN THE ASIA-OCEANIA REGION

SS26 110-R-1

REGIONAL COLLABORATIONS LED BY NURSING AND ALLIED-HEALTH ACADEMICS, STUDENTS AND CLINICIANS ACROSS FOUR COUNTRIES

Yun-hee JEON¹, Younhee KANG² (*1. Nursing, The University of Sydney, Australia; 2. Division of Nursing Science, College of Health Sciences, Ewha Womans University, Korea*)

Introduction : Asia-Pacific region is home to over sixty percent of the global population, constituting over three billion people, with a stark contrast in their cultural, socio-economic, political and health attributes. Similar to other regions of the world many nations in the A-P region experience a significant growth in the older population. Despite its diversity there is much to be shared and to learn from each other in tackling health issues arising from the graying of population. **Method :** In this paper we present two cases of collaboration led by nursing and allied-health academics, students and clinicians across four countries in the A-P region. Case 1 is a one-off education and research collaboration between South Korean and Australian nurse experts with a focus to facilitate best practice in aged care (A-K project). Case 2 is an on-going collaborative endeavour- the Asia Pacific Alliance of Health Leaders (APAHL) -initially developed to improve students' learning and competencies through regional collaborations, with an aim to prepare them to be prospective health leaders. **Results :** The A-K project provided unique and far-reaching opportunities for Australian and Korean nurses and academics who

engage in research, policy development and provision of health and aged care services. The APAHL has been a great success in enriching students' learning and recently taken a first step of academic staff collaboration, beginning with exploration and exchange of each other's interests and expertise in research, education and practice in their own culture. Conclusion : Lessons for the keys to success in developing and sustaining regional collaborations will be discussed. Keywords : Asia-pacific, collaboration, education exchange

SS26 110-R-2

PROMOTING INTERNATIONAL EXCHANGE IN GERONTOLOGICAL RESEARCH AND EDUCATION: EXAMPLES BETWEEN AUSTRALIA AND MALAYSIA

Rahimah IBRAHIM¹, Keith HILL² (1. *Institute of Gerontology, University Putra Malaysia, Malaysia*; 2. *School of Physiotherapy, Curtin University, Australia*)

Introduction : Australia and Malaysia are close neighbours in the Asia/Oceania region. While there are many similarities between the two countries, there are also many differences. In terms of the ageing of populations, Australia has a rapidly ageing population (approximately 14% aged over 65 years), while Malaysia's population ageing is at an earlier stage (approximately 6% aged over 65). Method: Establishing and building international relationships for research and practice can be very rewarding, however relatively few practitioners and researchers are successful in achieving effective international collaborations. This presentation provides perspectives from clinician / researchers in Australia and in Malaysia on their learnings in establishing and building an effective bilateral collaborations. Results : Examples of collaborative research and clinical activity that the presenters have been involved in between Australia and Malaysia will be presented, and factors considered to facilitate or impede success in this type of relationship will be considered. One example that will be discussed is in building relationships in the falls prevention area. It is important to note that some factors that might limit direct translation of successful research or practice from one country to another, and this will be explored in the presentation. The potential role of the IAGG Asia/Oceania regional council will also be discussed. Conclusion : There are many benefits associated with international collaboration in research and practice. Informal and formal strategies should be developed to further strengthen emerging international collaborative activity in the ageing area between Australia and Malaysia. Keywords: international; collaboration; research

SS26 110-R-3

PT 3: PARTNERSHIPS IN RESEARCH AND EDUCATION IN GERIATRICS. ZUBAIR AMIN¹ MD MHPE; RESHMA MERCHANT¹ MBBS, MRCP; SAMUEL C SCHERER² MBBS, DGM 1 NATIONAL UNIVERSITY OF SINGAPORE; 2 UNIVERSITY OF MELBOURNE

Zubair AMIN¹, Reshma MERCHANT², Gerald Choon-huat KOH³, Samuel SCHERER⁴ (1. *Pediatrics, Yong Loo Lin School of Medicine, National University of Singapore and National University Health System, Singapore*; 2. *Yong Loo Lin School of Medicine, National University of Singapore and National University Health System, Singapore*; 3. *Saw Swee Hock School of Public Health, National University of Singapore, Singapore*; 4. *Department of Medicine, University of Melbourne (Royal Melbourne Hospital), Australia*)

Introduction : Global and regional demographic imperatives demand advancements in geriatric medical education. There is preliminary evidence that focused strategies may improve student knowledge and overcome negative attitudes to older patients. Early undergraduate

exposure to geriatric medicine and experiential and mentoring approaches may be effective. (1). Method : In 2009 the Yong Loo Lin School of Medicine, National University of Singapore completed the development of a novel two-week 'Foundations in Geriatric Medicine' Module within the second year curriculum. Australian experience contributed to strong bio-psycho-social, functional and experiential components of the teaching. The Module was significantly based around three small group interactive workshops/tutorials that employ real-life immersive experience methodologies to address core geriatric medicine competencies. Results : Pre-planned evaluation of the Module provides evidence that these educational strategies are effective in improving both the geriatric knowledge and attitudes of the students (1). Conclusion : This approach may have degrees of trans-cultural applicability within the region. (1) Koh GCH et al. *Ann Acad Med Singapore* 2012; 41: 383-9. THE ROLE OF GERONTOLOGY JOURNALS IN THE ASIA-OCEANIA REGION

Lynne PARKINSON¹, Edward LEUNG², Anna HOWE³ (1. *Health Collaborative Research Network, Central Queensland University, Australia*; 2. *Faculty of Medicine, University of Hong Kong, Hong Kong*; 3. *Consultant Gerontologist, Australia*)

Introduction : In this presentation, the current editors of the Australasian Journal on Ageing and the Asian Journal of Gerontology and Geriatrics discuss their journals' contributions to promoting international exchange in research and education in the Asia-Oceania Region. Method : Both Journals began in the early 1980s, and the presentation begins with an account of their original objectives of developing a body of local knowledge based on research on ageing in regional countries. Publication in conjunction with professional associations in Australia and Hong Kong respectively advanced this objective and extended local readerships. Results : Factors driving wider regional interests are then canvassed, strategies for achieving this goal, such as expanding regional representation on editorial boards, are compared, and outcomes reported in terms of regional coverage in subscriptions, submissions and published papers, noting the extent of comparative research. Conclusion : Two very different challenges that now face the Journals will be addressed. The first is the impact of publishing in the digital age: both journals have readily embraced electronic access to greatly expand their regional reach, but e-access also opens up other, possibly competing avenues for research and educational exchange. The second challenge is more difficult: how can the journals provide a platform for exchange between academics and practitioners across a region that includes the world's oldest country, Japan, the rapidly ageing countries of north Asia and China, and some of the world's youngest countries such as Indonesia and the Philippines, where geriatrics and gerontology are as yet emerging disciplines. Keywords : electronic publishing

TRANSITION PROGRAMS: PERSPECTIVES FROM THREE CONTINENTS

SS26 111-R-1

AN AUSTRALIAN PERSPECTIVE ON TRANSITIONAL CARE
Leonard C. GRAY¹, Ian CAMERON², Maria CROTTY³ (1. *Centre for Research in Geriatric Medicine, The University of Queensland, Australia*; 2. *Rehabilitation Studies Unit, University of Sydney, Australia*; 3. *Rehabilitation, Aged and Extended Care, Flinders University, Australia*)

Introduction : Transitions from hospital to home are considered at a policy and service level to be events where older people are exposed to particular risk of adverse outcomes, including failure to recover, or placement in long term residential aged care. The Australian government responded to this risk by introducing a national program entitled "Transition Care Program" or TCP in 2006. In Australia, our research team undertook a 5 year program of research around the subject of transitions of care, with a particular focus on the TCP program. This presentation will provide an overview of our research and conclusions. **Method :** Studies were undertaken to examine the TCP program, including an evaluation of operation of the first year of the program, using data derived from the program and related data sets. In addition, a series of prospective studies examined the characteristics of the user group, and their outcomes. Several other projects examined other aspects of transitions. A project to develop quality indicators based on the interRAI Home Care assessment system was also completed. **Results :** The evaluations demonstrated that the program is well targeted to a high risk population, that functional recovery is generally achieved, and that the program appears to minimise the risk of transfer to long term residential care. A suite of quality indicators were successfully developed, which will be made available for general use in similar programs. **Conclusion :** Programs that are targeted at high needs patients in hospital are associated with good functional gains, and apparent minimisation of transfers to permanent residential care. **Keywords :** Transition; hospital; home

TRANSITION PROGRAMS: A UNITED KINGDOM PERSPECTIVE**

Stuart G. PARKER¹, Pamela M. ENDERBY², Susan NANCARROW³
(1. SchHARR, University of Sheffield and Barnsley Hospital NHSFT, United Kingdom; 2. SchHARR, University of Sheffield, United Kingdom; 3. School of Health and Human Sciences, Southern Cross University, Australia)

Introduction : Intermediate care was introduced in England in 2000/01 in the NHS plan and National Service Framework for older people's services. It exists to serve a need for transition support between hospital and community care and caters for acute, post acute and rehabilitation care needs. **Method :** Over the past decade, we have examined the place and models, outcomes, costs and staffing of intermediate care services using systematic literature reviews, observational methods and collection of data from consecutive patients referred to intermediate care services across the UK. **Results :** Intermediate care services are safe, with few deaths. Older patients recovering from acute illness and with rehabilitation needs benefit most. The care can be provided in the patients home and in institutional settings. Evidence of the effectiveness of using non-clinical residential care settings and nursing homes as places of care for intermediate care services is sparse although these settings are widely used in practice. The majority of patients return home after an episode of intermediate care. No particular model of care is shown to be more or less effective. However the delivery of care by inter-professional teams may improve use of resources. National audit suggests that people with dementia are under-represented among intermediate care clients. **Conclusion :** The English intermediate care system has been integrated into the range of services provided for older people with acute and post-acute care and rehabilitation needs. Taken together, the results of multiple evaluations suggest that the system is safe and effective, and provides viable alternatives in acute and post-acute care and rehabilitation. **Keywords :** intermediate care, transition care

**SS26 111-R-3
CARE TRANSITIONS PROGRAMS IN THE UNITED STATES: COMMON THEMES, LESSONS LEARNED, AND BROADER APPROACHES**

Alicia I. ARBAJE (*Geriatric Medicine and Gerontology, Johns Hopkins University School of Medicine, USA*)

Introduction : Care transitions in the United States (US) are common, complicated, and costly. Suboptimal care transitions across care settings are a significant threat to patient safety, and older adults are at especially high risk for safety problems during care transitions. Older adults transition frequently to places other than home, are more vulnerable to the hazards of hospitalization, and follow more complex therapeutic regimens, all of which result in more needs after discharge. **Method :** Many different models targeting improvement in care transitions of older adults have been implemented and evaluated within the US healthcare system. We present a compilation of these models, highlight common themes, and discuss lessons learned and broader approaches for future interventions. **Results :** Care transitions programs in the US often target hospitalized patients with complex chronic conditions. Programs share similar elements, such as assigning patients a navigator to follow them through selected care transitions. Much of the research is on interventions focused on improving care transitions from hospital to home, and programs are often disease-specific or focus primarily on hospital-based discharge planning. There is very little research conducted on transitions to/from other settings. **Conclusion :** Comprehensive models are emerging from long-standing research in the US. There remains a need for innovative studies that take a systems approach to investigate factors threatening patient safety during care transitions in order to develop effective, feasible, and sustainable interventions across a variety of care settings. **Keywords :** care transitions, older adults

STATE OF AGEING RESEARCH AND INNOVATION IN THE EUROPEAN REGION**

**SS26 112-R-1
EUROPEAN TRENDS IN BIOLOGICAL UNDERSTANDING OF AGEING AND APPROACHES FOR INTERVENTION**

Suresh RATTAN (*Laboratory of Cellular Ageing, Aarhus University, Denmark*)

In Europe, the research on the biological basis of ageing includes: (i) describing the phenotype of ageing at the level of organs, systems, tissues, cells, intra- and inter-cellular pathways, and molecules; (ii) unraveling the biochemical and molecular mechanisms of age-related changes; (iii) identifying genes that affect the quality and duration of lifespan; (iv) identifying the rate-limiting steps which lead to the emergence of age-related diseases; and (v) screening, testing and developing evidence-based effective interventions to modulate ageing and to extend the health-span. In Europe, different countries have different priority areas for research, which keep on changing and evolving in accordance with the changing social, political and economic trends. At the molecular biological level ageing is characterized by the stochastic occurrence and progressive accumulation of molecular damage. Failure of homeodynamics, increased molecular heterogeneity, altered cellular functioning and reduced stress tolerance are the determinants of health status, probability of diseases and the duration of survival. The inefficiency and imperfection of the maintenance and repair systems underlie the biological basis of ageing. Gene therapy, stem cells, and modulation through functional foods, nutraceuticals, cosmeceuticals and other life

style alterations are examples of ageing interventions. A promising healthy-ageing approach is that of hormesis by strengthening the homeodynamic ability of self-maintenance through transient and repetitive mild stress. Achieving the goal of extended health-span will depend on elucidating and exploiting successful and dynamic interactions among biological, clinical, psycho-social and environmental factors. Keywords : Biogerontology, healthspan, longevity

SS26 112-R-2
HEALTHY AND ACTIVE AGEING IN THE FOCUS OF EUROPEAN IAGG HEALTH GERONTOLOGY

Eva TOPINKOVA (*Department of Geriatrics, First Faculty of Medicine, Charles University, Czech*)

Introduction : European continent is aging. IAGG in collaboration with other professional bodies responds to this challenge and promotes a life-course approach to healthy and active ageing, which includes: promoting good health for all ages to prevent the development of chronic disease; early detection of chronic diseases to minimise their impact; creating physical and social environments that foster the health and participation of older people; and changing social attitudes to ageing. Redesign of care services to focus on prevention, early intervention, and active ageing is needed. Method : IAGG Global Aging Research Network of excellence (<http://www.garn-network.org>) has been launched recently, 253 research teams come from Europe. Results : This approach will facilitate participation of research teams in trans-national Europe-wide health research such as upcoming 'Horizon 2020 - the European Commission Framework Programme for Research and Innovation' 2012-2020. Research topics of high priority for IAGG were frailty, dementia and long-term care. In the frame of "2012 year of Active Ageing and Intergenerational Solidarity" the pilot European Innovation Partnership on Active and Healthy Ageing was started focusing on triple wins for Europe: (1) enabling EU citizens to lead healthy, active and independent lives while ageing; (2) improving the sustainability and efficiency of social and health care systems; (3) boosting and improving the competitiveness of the markets for innovative products and services, responding to the ageing challenge and creating new opportunities for businesses. Conclusion : Overall, healthy and active ageing stands firmly on European agenda. IAGG-European Region has to accept active partnership involving all three sections in these challenging activities. Keywords : Healthy Ageing, health gerontology, European Region

SS26 112-R-3
SOCIO-BEHAVIOURAL FACTORS FOR HEALTHY AND ACTIVE AGEING

Dorly J.H. DEEG¹, Clemens TESCH-ROEMER² (*1. LASA, VU University Medical Centre Amsterdam, Netherlands; 2. Social and Behavioural Sciences, German Centre on Ageing, Germany*)

Introduction : Since its early beginnings, socio-behavioural research on ageing has not only striven to describe the course of ageing and to understand basic mechanisms of ageing processes, but also to improve the process of ageing by changing the living situations of elders. One challenge of socio-behavioural ageing research concerns the question whether active ageing is possible and if so, which social and personal factors enable individuals, social groups, and societies to grow older healthily and actively. Method : We will give an overview on the socio-behavioural ageing research in Europe concerning this topic. Results : We start with discussing the conceptual foundations of the construct 'active ageing' and the relation between active ageing and quality of life, in which health, social integration, and participation are distinguished. The foundations for active ageing are laid in early life.

In particular education yields positive effects which are visible in old age. Nevertheless, also in middle and late adulthood interventions have been demonstrated to be possible (e.g. changing health behaviour, vitalizing social integration, stimulating volunteer activities). It should be emphasized, however, that the efficiency of interventions decreases with advancing age. Finally we discuss how societal frameworks may set the conditions for active ageing. Results from comparative surveys show that the extent of welfare state support - through social security systems like unemployment protection, pension system, health care system, and long-term care system - seems to be connected to opportunities for active ageing. Conclusion : European social and behavioural research on ageing is in good shape to address societal challenges. Keywords : Social, Behavioural, Active Ageing

SS26 112-R-4
GLOBAL POLICY ON AGEING AND THE HUMAN RIGHTS OF OLDER PERSONS

Astrid STUCKELBERGER¹, Astrid STUCKELBERGER² (*1. University of Geneva Public Health School, Faculty of Medicine BP CMU-IMSP 1211 Geneva 4 Switzerland, Switzerland; 2. Faculty of Medicine, University of Geneva, Switzerland*)

Introduction : The lack of progress globally in addressing old age and persistent problems of inequality and social exclusion of older persons in policy underlines the importance of addressing the human rights of older persons. Yet, there are many situations where older persons suffer from 'ageism' and multiple discrimination. Method : An analysis of global policies on ageing in the United Nations and at the European Union was conducted through a system analysis, a policy review, and the collection of documents and texts related to global policy and human rights of older persons. Results : Ageing and the human rights of older persons are rarely mentioned in the United Nations resolutions and agenda. Global ageing is not part of a regular budget in the vast majority of agencies. To date, no comprehensive international convention exists on ageing. Furthermore, there are slow progress and conflicting views on a Convention on older persons or a UN structure on ageing. On the other hand, the EU has, through its Charters and regulations been a pioneer in addressing older persons rights. Conclusion : Recently, encouraging steps have been taken at the United Nations Human Rights Council with new reports on the situation of older persons: extreme poverty, right to health, general CEDAW recommendation on older women, an open-ended working group and a consultation on human rights of older persons. A lot remains to be done to combat exclusion and discrimination of old age in global policies and to fully integrate older persons in the global agenda and the post-MDGs. Keywords : Global ageing, Human rights of Older Persons, United Nations

LUCKY AND UNLUCKY COHORTS AND LATER LIFE - CONTEMPORARY AND FUTURE OLD AGE IN DISTINCT WELFARE REGIMES

SS26 114-S-1
AGEING BABY BOOMERS AND COHORT EQUITY IN AUSTRALIA

Hal KENDIG (*Centre for Research on Ageing Health and Wellbeing, Australian National University, Australia*)

Introduction : This paper examines inter and intra-cohort equity among Australian baby boomers in the context of socioeconomic developments and public policy debates. Data were collected at a time of economic and political stress and amid concerns about retirement

incomes and the costs of population ageing. Method : Data were drawn from two sources. The Australian Survey of Social Attitudes (AuSSA) 2009-2010 (n=1525) provided generational views on between-cohort equity for baby boomers (aged 50 to 64 years) compared to 'now older/retired people' and to 'younger people'. The Life History and Health Survey 2011-12 (n=1249) provided comprehensive information on intra-cohort inequalities through investigating opportunity and disadvantage from childhood through late middle age for baby boomers aged 60 to 64 years at the time. Results : AuSSA data: overall boomers were perceived to have had had better life-long opportunities compared to those who were already 'older/retired' but worse than for those who were younger. Views differed between age groups and in terms of gender, income, and other social differences. Life history data: indicators of well-being on entry to later life were found to vary according to socioeconomic position in childhood and later occupational attainment and midlife health. Conclusion : Australia's welfare system is evolving during an uncertain economic outlook and rising concern for the adequacy of retirement incomes and fiscal sustainability along with increasing life expectancy and population ageing. Accumulating benefits in employer-funded superannuation will only partially benefit the baby boom cohort while a means-tested old age pension continues with 'pay as you go' tax funding. Keywords: Australia, baby boomers, intergenerational equity

INCOME DISTRIBUTION AND MOBILITY OVER THE LIFE-COURSE 1970-2005 - COMPARING FINNISH COHORTS 1905-1980

Marja VAARAMA¹, Pasi MOISIO¹, Susan KUIVALAINEN¹, Jani EROLA² (*1. Division of Welfare and Health Policies, National Institute for Health and Welfare, Finland; 2. Department of Social Research, University of Turku, Finland*)

Introduction : Birth cohorts born 1945-1950 were exceptionally large in Finland. This so-called baby boom generation entered labour market at the turn of 1970s, a period of welfare state expansion and period that is claimed to have been exceptionally good for young employees entering working life. This has evoked anecdotes on the "lucky baby boomers". In this paper we study in depth this fortunate generation hypothesis. Method : We utilize the Longitudinal Census Data 1970-2005 of Statistics Finland. It is a census-based register- dataset of all the consequent censuses collected gathered since 1970 until 2005. With this data we are able to follow how the cohorts born 1905-1980, who entered the labor markets during 1970-2005, and compare their socioeconomic trajectories over several decades. Results : The baby boom generation had a clearly higher position on the income distribution in their twenties, compared to those born the 1970s or later. However, when observing the life course trajectories, we can see that the good start of the baby boomers did not last. Already at the age of 35, the position of the baby boomers on the income distribution was not much different from that of the cohorts born before and after them at the same age. Conclusion : A general change during 1970-2005 seems to be that the under 30 years old age-groups have moved downwards, and the over 55 years-old age-group upwards, on the income distribution. Expansion of tertiary education, prolonged working careers and maturation of work-pension system are most

likely explanations for this shift. Keywords : Cohorts, life-course, welfare state

SS26 114-S-4

LIFE COURSES AND SOCIAL SECURITY IN LATER LIFE OF THE COHORTS 1936-1965 ? ARE THE GERMAN BABY BOOMERS WINNERS OR LOSERS?

Andreas MOTEL-KLINGEBIEL, Julia SIMONSON (*German Centre of Gerontology, Germany*)

Introduction : This paper addresses life courses of three German birth cohorts as well as their current and future outcomes in later life: the German war cohort 1936-45, the post-war cohorts of 1946-55 and the German baby boomer cohort 1956-65. Focusing on the German baby boomers and their altered life courses, resources and expectations, it is asked whether they, or relevant parts of them, are winners or losers of the ongoing economic changes and welfare state reforms. In a social policy perspective it is asked what societal, especially welfare state policies are necessary to deal with inter- and intra-cohort inequalities and inequity deriving from that. Method : To examine this question, we analyze longitudinal life course data, which combines information from survey and administrative data (namely the German Socio-Economic Panel and the Sample of Active Pension Accounts), and has been prepared within the joint research project 'Life Course, Ageing and Well-Being (LAW)'. Life courses of the baby boomers, now in the middle age, are projected until they reach age 67. Results : Results show more heterogeneous life courses and an ongoing decline in pension incomes with increases in intra-cohort inequality among the German baby boomers in the time to come. Conclusion : German baby boomers will probably be economically disadvantaged on average in future old age. Rising inequalities pose a challenge for welfare state policies. However, this comes along with a greater degree of self-government over life courses and living arrangements which may positively affect their quality of life. Keywords : future old age, lucky cohorts, life courses

SS26 115-S

WISDOM ACROSS CULTURES: AN ANCIENT CONCEPT IN DIGITAL AGE

SS26 115-S-1

WISDOM AND OLD AGE: A PROCESS VIEW

Shih-ying YANG (*Educational Policy and Administration, National Chi Nan University, Taiwan*)

Introduction : Wisdom enables us to live good lives which are not only satisfying and meaningful to ourselves but also generate positive effects for others. We tend to evaluate whether wisdom has been manifested through a person's endeavor by judging whether the results has helped both the person and those affected by the endeavor to live good lives. Hence, we must explore wisdom as it is manifested in real-life contexts. Method : I define wisdom as a real-life process manifested when a person integrates conflicting ideas, and embodies those integrated ideas in actions that generate positive effects for oneself and others. Rather than an individual trait, wisdom is a process manifested through the interaction between an individual and the real-life situation the individual faces. In real life, wisdom can be manifested in at least three forms: wisdom which (1) successfully resolves real-life problems and challenges, (2) manages one's overall life course in a satisfying way, and (3) contributes to the common good and transforms the good life. Results : The last form requires the longest period of time to manifest; this may explain the common association of wisdom with old age. Past empirical research has

focused on the other two forms of wisdom, which have a strong association with middle age. Conclusion : I use Mother Teresa's endeavor to embody an integrated idea? serving God through serving the poorest of the poor, which generated positive effects for both herself and others, and has transformed our conception of a good life, as an example of this form of wisdom. Keywords : Wisdom, Old Age, Good Lives

SS26 115-S-2

WISDOM OF EAST AND WEST: HISTORICAL INTERPRETATIONS AND PSYCHOLOGICAL DEFINITIONS
Masami TAKAHASHI (*Psychology, Northeastern Illinois University, USA*)

Introduction : One of the shortcomings in the wisdom field is that the researchers tend to ignore a potential impact of cultural contexts. That is, most of the intellectual archeology and implicit theory research involved only traditional Western literature (e.g., the Bible) and the Western populations (e.g., Americans). In this presentation, I will provide "archeological" evidences of wisdom documents both in the Western and Eastern civilizations and claim that in general the former emphasizes rationality while the latter is more concerned with affect/personality aspect of wisdom. Method : An "intellectual archeology" refers to excavating bodies of ancient literature to discover their traditional meanings while implicit theories can be discovered by simply asking people what the concept means to them. Results : The Western tradition offers an articulated yet relatively narrow definition of wisdom whereas in the East wisdom is defined more broadly with less articulation. In particular, the Eastern tradition emphasizes two unique principles: relatedness and void. Further, these differences are also implicated in how people in the respective cultures today conceptualize wisdom. Conclusion : Based on these investigations, a culturally inclusive developmental framework of wisdom will be presented with an emphasis on broadly defined Eriksonian interpretations. Keywords : wisdom inclusive developmental

SS26 115-S-3

WHAT PREDICTS WISDOM-RELATED PERFORMANCE? : FINDINGS FROM JAPAN
Midori TAKAYAMA (*Science and Technology, Keio University, Japan*)

Introduction : Wisdom has long been mentioned in developmental psychology as a favorable phenomenon associated the second half of life. Aside from research into the semantic meaning of wisdom and implicit theories about the attributes of wise persons, there have been a few empirical attempts to investigate wise judgment and the factors and processes that can be considered as antecedents, correlates, and consequences of the development of wisdom-related knowledge, especially in Asian countries. Method : In the present study, we examined the effects of social and psychological factors on wisdom using the Japanese version of the assessment of wisdom-related knowledge (Smith, & Baltes, 1990). The Participants of 197 Japanese men and women (60-85 years old) responded to eight wisdom-related tasks (four life planning tasks and four life review tasks) and completed the test battery involving personal characteristics (ex., intelligence, social intelligence, and personality traits), facilitative experiential contexts (education and former occupation), and social / daily activity (ex., present job, instrumental activity of daily living). Results : As expected, the analysis of life planning tasks revealed that wisdom score was related to intelligence, social intelligence, years of education, and instrumental activity of daily living, whereas the

analysis of life review tasks revealed that wisdom score was significantly related to intelligence and personality traits such as extroversion and agreeableness. Conclusion : The results suggested that wise judgment concerning life planning may be relatively strongly related to cognitive factors, whereas wise judgment concerning life review may be related to personality traits or emotional factors. Keywords : wisdom-related knowledge, psycho-social predictors

SS26 115-S-4

WISDOM AND WELL-BEING: AN EXTREME CASE ANALYSIS OF LAYPEOPLE'S CONCEPTIONS OF WISDOM AND WISE PERSONS, AND THE ROLES OF SOCIAL NETWORKS
Hunhui OH (*Sociology and Criminology & Law, University of Florida, USA*)

Introduction : Despite its role as a virtue for the cultivation of human growth, well-being, and greater common goods, wisdom is still a relatively new scientific construct in need of a generally applicable definition which can encompass its dynamic interplay in interpersonal and cultural contexts. This study covered new ground for its unique application of social network analysis to examine the relation among respondents' wisdom descriptors. Method : Using a sample of older and younger adults from the US and Canada (N=211), I investigated how adults with high scores on the cognitive, reflective, and affective dimensions of the Three-Dimensional Wisdom Scale (3D-WS) understand the concept of wisdom in contrast to participants with low scores on all three dimensions and how wisdom is related to well-being. Results : The findings showed that participants with high scores on all three wisdom dimensions tended to characterize wisdom as experiential knowledge and an understanding of life that was gained through learning from experiences and from others and helped them to understand other people's perspectives to develop pro-social attitudes and behavior and achieve interpersonal harmony. Those who scored low on all three wisdom dimensions also tended to characterize wisdom as (experiential) knowledge and an understanding of life but more for self-centered reasons, such as making the right decisions and knowing how to better one's situation rather than to better the situation of all. Conclusion : Overall, wisdom scores were positively related to subjective well-being, indicating that wisdom might benefit the individual through the development of eudemonic, self-transcendent welfare. Keywords : Wisdom, culture, optimal aging

SS26 116-R

LONG-TERM CARE - COUNTRIES IN THE PROCESS OF SEARCHING FOR SUSTAINABLE LONG TERM CARE POLICY STRATEGIES

SS26 116-R-1

QUO VADIS GERMANY'S LONG TERM CARE INSURANCE (LTI) ?
Gerhard NAEGELE (*Institute of Gerontology, University TU Dortmund, Germany*)

Introduction : Next year Germany's long term care insurance - which is the fourth pillar of the German social security system and which is organized according to the Bismarck model of social insurance - is celebrating its twentieth birthday. This seems to be a good time for an interim evaluation. This paper aims at informing about both (1) details of this "success model LTCI" and (2) reforms which are necessary in the near future. Since January 2013 the fourth reform is on its way. Method : This paper is based on a literature review and on secondary data analysis. Results : For most Germans the LTCI is regarded as a

success-model. However, this model needs to be adapted to economic, demographic and structural changes. The latter refers to persons being in need of long term care and their families. Significant challenges in the future are, for example, (1) stabilizing the financial basis of the LTCI, (2) helping caring families with new kinds of social services and (3) improving the benefits for people suffering from dementia. Conclusion : The LTCI in Germany is indeed a success model. If it is adapted regularly to changing framework conditions it can be "good practice" for other countries which have to manage the rising need of long term care among an ageing population. Keywords : long term care insurance, reforms in German care policy

SS26 116-R-2

TURKEY'S CHANGING DEMOGRAPHIC PROFILE AND NEED FOR SOCIAL CARE INSURANCE

Ismail TUFAN (*Gerontology Department, Chair, Akdeniz University, Turkey*)

Introduction : Demographic changes are a global phenomenon that affect societies today and promise to have very important impacts in the future. Turkey, from a socio-economic viewpoint, must be prepared for this period. While at present it has a young population, in light of its changing elderly profile, Turkey's social policies are in need of new information and innovative concepts. Based on a culture of solidarity and reliance on applied gerontological knowledge, "social care insurance" as tested in industrialized nations must be implemented. Method : GeroAtlas, a longitudinal study carried out between 2000 and 2012, provides empirical data for this research. Results : Results from GeroAtlas' 3,500 respondents from across Turkey suggest that roughly 80% of Turkey's elderly population require care insurance. Conclusion : In view of Turkey's 1.75 million bedridden care-dependent persons, it seems possible that implementation of a social care insurance program could help to establish better care and elderly services. Keywords : social care, social care insurance, care, applied gerontology

SS26 116-R-3

CURRENT LTC CHALLENGES IN ITALY

Giovanni LAMURA¹, Carlos CHIATTI¹, Francesco BARBABELLA¹, Mirko DI ROSA² (*1. Centre for Socio-Economic Research on Ageing, INRCA - Italian National Institute of Health and Science on Ageing, Italy; 2. Scientific Direction, INRCA - Italian National Institute of Health and Science on Ageing, Italy*)

Introduction : The rapid ageing of the Italian population is reflected by a growing demand for LTC services. As families are facing increasing difficulties in providing everyday elder care, the pressure on formal services is growing. At the same time, the current financial crisis is making the public response less and less able to provide the needed resources. As a consequence, the current approach of indirect public support to the private employment of migrant care workers (MCWs) through cash-for-care schemes is likely to continue. Method : The presentation is based on a detailed analysis of empirical findings and policy documents, outlining the crucial features characterising the Italian LTC system and describing also some of the main differences existing between different regional care approaches. Results : After a decade of increasing availability of publicly funded LTC services for older people, in some sectors, such as integrated home care, the audience of recipients has started receiving a lower number of hours of care. The mainly monetary focus of the Italian care regime has a clear incentivizing effect to employ foreign migrant care workers, often on an undeclared basis, to provide everyday elder care in Italian homes. Another crucial characteristic is the strong heterogeneity of Italian

regions, according to which today different clusters of regions can be identified, with strong inequalities in LTC provision. Conclusion : The lack of a coherent national LTC policy has been recently accompanied by an increasing focus on cash-for-care payments, which in the future will require a stronger attention to care quality issues. Keywords : Italy, long-term care

SS26 116-R-4

POLICY FOR LONG- TERM CARE INSURANCE AND THE STATUS OF LEGISLATION IN TAIWAN

Han-ping HUANG¹, Ku-yen LIN² (*1. Institute of Gerontology, Technical University of Dortmund, Germany; 2. Department of Social Sciences, National Open University, Taiwan*)

Introduction : Base on the definition from World Health Organization (WHO), Taiwan has become the ageing society in 1993; expectedly will entered aged society and superaged society in 2018 and 2025 respectively. With a well-deserved reputation, Taiwan earns a good service and high quality on its comprehensive Health Care Insurance around the world. However, facing the rapid demographic change, the current social security schemes would not satisfy the demand on long-term care service. Method : Since 2007 the Executive Yuan has established the Long- term Care Decade Plan, however, besides the economically disadvantaged family, the care receiver has to shoulder the copayments, which will occur the care receiver withdrawing out of the program. With the principle of social solidarity and intergenerational solidarity and the autonomous funds on social insurance scheme, by using the pay-as-you-go system, the establishment of long- term care insurance will ensure the national basic care need. Results : In order to draft a Long- term Care Insurance Act, which satisfy the demand on care service and conform the pattern in national health, currently, the Preparatory Task Force on Long-term Care Insurance extensively collects the opinions from the relative social welfare communities and holds a public hearing to seek the internal consensus on long-term care system. Conclusion : This article will discuss the following two issues: 1. To introduce the preparatory process and current situation; 2. Illustrate the contents and problem on Long-term Care Insurance Draft. Keywords : Long- term Care Insurance, Taiwan, demographic change

SS26 118-S

QUALITY OF LIFE IN OLDER ADULTS IN JAPAN AND BRAZIL

SS26 118-S-1

DETERMINANTS OF PHYSICAL HEALTH AND QUALITY OF LIFE IN OLDER ADULTS IN BRAZIL

Emilio MORIGUCHI (*Internal Medicine, UFRGS, Brazil*)

Introduction : Japanese immigrants from Okinawa living in Brazil have higher mortality from cardiovascular diseases and have their mean life expectancy shortened compared to their counterparts living in Japan. A cross-sectional study comparing Okinawans living in Okinawa (OO) and Okinawan immigrants living in Brazil (OB) was designed to characterize the dietary factors that could interfere with longevity. Method : 234 OO and 160 OB (45-59 y.o.) were recruited for medical and dietary history, blood pressure measurement, ECG, blood tests, and 24 hours food/urine collection. Results : OO presented 37% less obesity than OB. OO presented 50% less systemic hypertension than OB. OB used 3 times more anti-hypertensive medication than OO. Meat intake was 34% higher in OB than OO, while, fish intake was 7 times higher in OO than OB. Serum potassium levels were 10% higher in OO than OB. Urinary taurine (index of

seafood intake) was 43% higher in OO than OB. Urinary isoflavones (index of soy products intake) were significantly lower in OB than in OO. Among the plasma phospholipid fatty acids, EPA (20:5) and DHA (22:6) were 2 and 3 times higher in OO than OB, respectively. The rate of ischemic ECG changes in OO was only 50% of that of OB. There were no differences in the smoking rate between OO and OB. Conclusion : The results of this study suggest that coronary risk factors and cardiovascular health are not regulated only by genetic factors and that the impact of lifestyle (mainly diet) can be large enough to modulate the expression of genes. Keywords : Nutrition, longevity, dietary habits

SS26 118-S-2

THE QUALITY OF LIFE COMPARISON BETWEEN JAPANESE AND BRAZILIAN OLDER ADULTS

Priscila Yukari SEWO SAMPAIO (*Department of Human Health Sciences, Kyoto University Graduate School of Medicine, Japan*)

Introduction : Evidence showed that the quality of life (QOL) of older people differed considerably between societies due to the influence of the welfare systems; social indicators and wealth of the nation. Hence our study aimed to investigate the QOL in two different cultures, comparing the QOL between Japanese and Brazilian older adults. Method : We investigated a variety of cross-cultural studies regarding QOL in Japanese and Brazilians older adults. We selected the studies that used WHOQOL assessments because they were developed to be applicable cross-culturally. Results : In WHOQOL-100, Japanese had better scores in the physical and independence domains, while Brazilian had better score in the overall QOL and in the psychological, social, environment and spiritual domains. In WHOQOL-BREF, Brazilians had better scores in the psychological and the social domains, yet there were no statistical differences in other domains. Regarding the WHOQOL-OLD, the Brazilian had better scores in all domains (sensory abilities, autonomy; past, present and future activities; social participation; death and dying; and intimacy domains. Conclusion : Even though Japan is more developed than Brazil, the QOL comparison showed higher scores for Brazilians in most WHOQOL assessments and domains; the most evident difference was observed in the social domain. Therefore, we suggest improving wellbeing for Japanese older adults by restoring the human relations, engaging the elder in community, and providing opportunities to perform social roles and to exchange social support. Keywords : Quality of Life, Japan, Brazil

SS26 118-S-3

COMPARISON OF PHYSICAL HEALTH AND QUALITY OF LIFE IN OLDER ADULTS IN JAPAN AND BRAZIL

Ricardo Aurelio Carvalho SAMPAIO (*Human Health Sciences, Kyoto University Graduate School of Medicine, Japan*)

Introduction : Various factors are surrounding the physical health (PH), such as physical activity, physical fitness, and functional independence. One of the most investigated is the physical activity; evidence suggests that a regular practice preserves health, vitality, and social functioning, and postpones eventual functional disabilities, consequently increasing quality of life (QOL). Both PH and QOL are important issues among aged population; however, the influence of environment and lifestyle on those factors remains to be well clarified. Therefore, the purpose of this symposium was to discuss the differences of PH and QOL in Japan and Brazil and its associated factors in a cross-cultural perspective. Method : We analyzed PH and QOL in Japanese and Brazilian older adults and compared the factors that affect them. Results : We found that overall QOL scores in Japan

were lower than that found in other countries, including Brazil, but they presented better scores in the physical domain. Studies stated that QOL varies according to the activity level; in our observation, Japanese had a healthier lifestyle than Brazilian, but were lacking social activities as confirmed by the low scores in social domains. Conclusion : Environmental, cultural, and lifestyle factors are responsible for the variation in PH and QOL between Japanese and Brazilian older adults. We suggest the implementation of strong health improvement policies in both countries, extending the PA properties beyond the physical component, exploring the social component as well. Keywords : Brazil; Japan; physical health.

NEW DIGITAL DYNAMICS OF AGEING: TOOLS TO FACILITATE POLICIES AND PRACTICES TO ENHANCE WELL-BEING IN LATER LIFE

SS26 124-R-1

MALNUTRITION IN OLDER PATIENTS: DESIGNING A DIGITAL NUTRITIONAL MANAGEMENT SYSTEM THROUGH A MULTIDISCIPLINARY AND PARTICIPATIVE PROCESS

Paula MOYNIHAN (*Institute for Ageing and Health, Newcastle University, United Kingdom*)

Introduction : Forty per cent of older hospital patients in the UK are at risk of malnutrition whilst in hospital. To help address this, the mappal study aimed to re-design the food provision and nutritional management service for older patients using a multidisciplinary co-design process. Method : A research team comprising sociologists, designers, nutritionists and computer scientists worked alongside users (e.g. healthcare assistants, nurses, dieticians, older people) in an iterative co-design process. First, an ethnographic study identified the factors contributing to hospital malnutrition. These findings informed opportunities for service improvement which were developed into concepts for a novel nutritional management system. On-going feedback was elicited using qualitative and workshops methods. The concepts were developed into a prototype for a digital nutritional management system. Results : The factors that contributed to malnutrition identified included inefficient food ordering systems, lack of mealtime assistance, shortcomings in nutritional screening and monitoring, limited communication between staff and lack of accountability in nutritional care. These informed the development of the prototype, 'hospitalfoodie'; a nutritional management system comprising interactive, interlinked patient and staff digital interfaces. hospitalfoodie enables monitoring and tracking of food intake against individual targets in real time and prompts remedial action when a patient's nutritional requirements are not met. The system enables hospital-wide nutritional performance to be tracked and audited. Conclusion : A novel combination of qualitative and user-iterative design methods has produced a prototype digital nutritional management system that, based on qualitative evidence, is amenable to embedding in practice. Further research will test the system in a simulated clinical setting. Keywords : older patients hospitals nutrition

SS26 124-R-2

NEW DIGITAL DYNAMICS OF AGEING: TOOLS TO FACILITATE POLICIES - THE GREAT BRITISH PUBLIC TOILET MAP

Jo-Anne BICHARD, Gail RAMSTER (*Helen Hamlyn Centre for Design, Royal College of Art, United Kingdom*)

Introduction : The Tackling Ageing Continence through Theory Tools

and Technology (TACT3) is a 42 month multidisciplinary collaborative research programme whose overall aim was to reduce the impact of continence difficulties for older people. One of TACT3's outcomes is a digital resource for the many older people who need frequent access to toilet facilities. Method : The Great British Public Toilet Map (GBPTM) is an innovative information and service resource that utilises open data to provide information for people to access toilet provision when away from home. This interactive web based toilet locator, also acts as a campaign tool enabling citizens to request local authorities to make their data available. The publication of open data is in line with UK government policy. Results : Consolidating the information within one resource, that is accurate and frequently updated with key information, is designed to give confidence to people with continence needs. Mapping provision will enable toilet providers to identify areas of over and under provision, therefore enabling key planning decisions to be made at a local and regional level. In addition a temporal aspect to the map will highlight areas in which evening provision could be considered more problematic. Conclusion : Public toilet provision is costly and often sees no return on investment. Various attempts to privatise provision have not been successful. By consolidating the information on toilet provision through local authorities and key businesses, members of the public can see that their needs are being met through a partnership of services. Keywords : Ageing Continence Toilets

SS26 124-R-3 KEEPING SILVER SURFERS SURFING - DIGITAL INCLUSION AND AGEING WELL

Leela DAMODARAN¹, Wendy OLPHERT², Jo-Anne BICHARD³
(1. Department of Information Science, Loughborough University, United Kingdom; 2. Information Science, Loughborough University, United Kingdom; 3. Helen Hamlyn Centre for Design, Royal College of Art, United Kingdom)

Introduction : With expansion of digital services there are many challenges in promoting and achieving the widest possible digital participation. In particular digital technologies have the potential to enhance the quality of life for many older people, principally helping them to retain their independence. Keeping older people digitally 'connected' for as long as possible has wide ranging benefits to them as individuals, to societies and to our economies. Where web services are widely available many older people are already successfully using these technologies. However, their ability to sustain such usage in the face of the barriers identified (Sandhu et al, Nominet report), will depend upon the availability of appropriate learning opportunities and support. Method : 'Sus-IT' project (Sustaining the use of IT by older people to promote autonomy and independence) research is providing a rich understanding of what older people require to enable them to remain connected as they age. It has developed a comprehensive understanding of the nature of disengagement for older ICT users, developed and implemented innovative, user centred methods of engaging older people, used those tools in technology design including a framework to enable ICT users to access relevant assistive technologies and through a participative process developed a realisable specification for universal learning and support services for older ICT users, reflecting their diverse needs. Results : The argument for digital access being an important and integral part ageing well is confirmed by the research findings and is supported by the experiences of older people in Belgium and Sweden. The demand for digital inclusion exists now amongst older ICT users and it is likely to grow significantly as the next generation of much more ICT literate surfers start to encounter the barriers to being active online that become more prevalent in older age. Conclusion : The challenge now is how user

centred approaches can be used to inform technology and service design and ICT learning and support initiatives so that older ICT users can more easily remain active and independent citizens enjoying the benefits of digital inclusion ? Acknowledgements: This paper emerges from research conducted as a part of the Sus-IT Research Project which is funded by the ESRC's New Dynamics of Ageing Programme (Grant Number RES-353-25-0008) and led by Leela Damodaran and Wendy Olphert at Loughborough University, UK. Keywords : Ageing digital participation, older people

SS26 124-R-4 THE NEW DYNAMICS OF AGEING RESEARCH PROGRAMME

Alan WALKER (*Sociological Studies, University of Sheffield, United Kingdom*)

The main purpose of this short paper is to introduce the New Dynamics of Ageing (NDA) Research Programme - the largest and most complex of its kind ever mounted in the UK. The scope and coverage of the Programme are outlined and the core principle of multi-disciplinarity is discussed. Finally the important role of the digital agenda in the NDA Programme is explained. Keywords : Multi-disciplinarity, ICTs, Active ageing

SS26 125-C THE FALLS AND FRACTURES CLINIC: A PRACTICAL GUIDE TO IMPLEMENT ONE

SS26 125-C-1 HOW TO QUANTIFY RISK FOR FRACTURES, AND ACT ACCORDINGLY

Alexandra PAPAIOANNOU¹, Gustavo DUQUE², Manuel MONTERO-ODASSO³ (1. Geriatric Medicine, McMaster University, Canada; 2. Ageing Bone Research Program, The University of Sydney, Australia; 3. Geriatric Medicine, University of Western Ontario, Canada)

This presentation will summarize current evidence based recommendations for fracture prevention in the clinical setting. This symposium presentation will review treatments for individuals at high risk with prior hip, spine and non-vertebral fractures. We will review the evidence of therapeutic options for these individuals and discuss the benefits, harms and length of treatments. Risks to be discussed include osteonecrosis of the jaw (ONJ) and atypical fractures. Risk assessment for fracture will be reviewed. Keywords : Falls, Fractures, Osteoporosis

SS26 125-C-2 PREVENTING FALLS AND FRACTURES. AN UNIFIED APPROACH

Manuel MONTERO ODASSO (*Internal Medicine and Geriatrics, Gait and Brain Lab, University of Western Ontario, Canada*)

Introduction : Falls and fractures are a major issue in health care for the elderly. With ageing, the incidence of falls and osteoporosis and thus, osteoporosis fractures, increases dramatically. Several falls risk factors have been identified but it is not clear if all the risk factors should be targeted with the same intensity. Typically, the treatment of osteoporosis has been intended for increasing bone mineral density and decreasing fracture rates without a clinical approach to the prevention of falls, which, in geriatric populations, are the major factors for morbidity and mortality. Method : Current evidence indicates that the treatment of osteoporosis in older populations should include not only the gain in bone mass, but also the prevention of falls.

Recently, a new approach to the assessment and intervention of osteoporosis and falls has been implemented. This intervention consists of a risk quantification that combines both risk of falls and fractures. Depending on the level of risk, an intervention plan is designed. We consider this a most effective approach for the Geriatric population which could be easily implemented in geriatric clinics with outstanding results on the quality of care for the elderly. Keywords : gait, falls , vitamin D

SS26 125-C-3

THE FALLS AND FRACTURES CLINIC: A PRACTICAL GUIDE TO IMPLEMENT ONE

Gustavo DUQUE¹, Alexandra PAPAIOANNOU², Manuel MONTERO-ODASSO³ (1. Ageing Bone Research Program, The University of Sydney, Australia; 2. Geriatric Medicine, McMaster University, Canada; 3. Geriatric Medicine, University of Western Ontario, Canada)

The treatment of osteoporosis has been mostly intended for increasing bone mineral density and decreasing fracture rates without a clinical approach to the prevention of falls, which in geriatric populations are the major factors for morbidity and mortality. Current evidence has shown that the treatment of osteoporosis in older population should include not only the gain in bone mass but also the prevention of falls. Recently, a new approach to the assessment and intervention of osteoporosis and falls has been implemented, the "Falls and Fractures Clinic". Considering that both falls and fractures constitute major geriatric syndromes, these clinics are considered a major setting of practice and an important tool to increase the profile of geriatricians within the medical community. The suggested model for Falls and Fractures consists of a model of risk quantification that combines both risk of falls and fractures. Depending on the level of risk an intervention plan is designed. Method : In this symposium, the participants will be provided with a general overview on current evidence and practical recommendations for falls and fractures prevention in the clinical setting. Finally, a proposed model for a Falls and Fractures clinic that includes a comprehensive assessment and care planning will be presented. Keywords : Falls, Fractures, Osteoporosis

SS26 126-C

ORAL HEALTH AND ORAL HEALTH-RELATED QUALITY OF LIFE IN OLDER ADULTS: THE IMPACT OF CULTURE AND COGNITIVE FUNCTION

SS26 126-C-1

COGNITIVE FUNCTION AND ORAL HEALTH-RELATED QUALITY OF LIFE IN OLDER ADULTS

Kyung Hee LEE¹, Bei WU¹, Brenda L PLASSMAN² (1. School of Nursing, Duke University, USA; 2. School of Medicine, Duke University, USA)

Introduction : Oral health-related quality of life is an important determinant of quality of life as well as a key health indicator. The objective of this study was to examine the relationship between cognitive function and oral health-related quality of life in community dwelling older adults. Method : Two hundred twenty six residents of West Virginia completed a clinical dental examination, the Geriatric Oral Health Assessment Index (GOHAI) (score range of 12 to 60), and a comprehensive cognitive examination. We excluded individuals with moderate or severe dementia because the GOHAI has not been validated in this group. Hierarchical multiple linear regressions were performed with GOHAI total score as the dependent variable. Results : Participants with normal cognitive function had higher GOHAI total

scores (mean: 55.12), indicating better oral health-related quality of life, than participants with cognitive impairment without dementia (mean: 52.29) and mild dementia (mean: 50.95). The difference remained significant after controlling for covariates including socio-demographics, health status, comorbidity, and clinical dental status. Conclusion : It is important to evaluate oral health-related quality of life among cognitively impaired persons as a part of a screening tool for physicians to use at each routine physician visit in order to make necessary referrals. Keywords : Oral Health-related Quality of Life, cognitive function

SS26 126-C-2

THE IMPACT OF ORAL HYGIENE ON PERIODONTAL DISEASE IDENTIFIED BY CLINICAL EXAMINATIONS

Jersey LIANG¹, Bei WU², Brenda PLASSMAN³, Joan BENNETT¹, James BECK⁴ (1. School of Public Health, University of Michigan, USA; 2. School of Nursing, Duke University, USA; 3. Duke University School of Medicine, Duke University, USA; 4. School of Dentistry, University of North Carolina, USA)

Introduction : This study examined the linkages between oral hygiene and the trajectories of periodontal disease among older Americans. Data came from 810 dentate individuals aged 65 and over in North Carolina, observed repeatedly from 1988 to 1994. Method : Periodontal disease was assessed by the percentage of sites with attachment loss (AL \geq 3mm) and pocket depth (PD \geq 3mm), whereas oral hygiene was measured by brushing, flossing, and rinsing, with social stratification (e.g., education and income) and dental care use as covariates. Hierarchical linear models were employed in depicting intrapersonal and interpersonal differences in periodontal disease. Results : Although positively correlated, AL and PD exhibited distinct trajectories. On average, 49% of the sites had AL, which increased linearly over time. In contrast, PD characterized 19% of the sites and decreased with acceleration over time. Even with social stratification controlled, oral hygiene measures were significantly associated with periodontal disease. However, they had different linkages with AL and PD. In particular, flossing was correlated with less AL but not its rate of increase. Brushing and rinsing were not associated with AL. On the other hand, brushing and flossing were associated with less PD, with brushing and rinsing correlated with the acceleration of changes in PD. Conclusion : Age, gender, education, and income were significantly correlated with the levels of AL and PD but largely uncorrelated with their rates of change. Oral hygiene attenuated but did not fully account for the effects of social stratification. Supported by NIH/NIDCR (R21 DE019518-01 and 1R01DE019110). Keywords : oral hygiene, periodontal disease, elderly

SS26 126-C-3

IMPLEMENTATION SCIENCE APPROACHES TO IMPROVING ORAL HEALTH IN OLDER ADULTS WITH DEMENTIA

Eleanor S. MCCONNELL¹, Christine DOWNEY², Mary Victoria SPAINHOUR³, Eleanor MCCONNELL¹ (1. School of Nursing, Duke University, USA; 2. Geriatric Research, Education and Clinical Center, Durham Veterans Affairs Medical Center, USA; 3. Geriatrics and Extended Care and Nursing Service, Durham VAMC, USA)

Introduction : Despite availability of evidence-based practice guidelines for oral care in older adults with dementia, and well-developed training programs, serious gaps in oral hygiene care for older adults exist in residential long-term care (LTC). Implementation science methods hold promise to narrow the gap between this existence of evidence-based approaches and their implementation. Method : An inter-professional (dentistry and nursing) quality

improvement program in oral care was developed, as a platform for a research program on factors that influence implementation of evidence-based oral hygiene care. Using principles from the Diffusion of Innovation framework, we have engaged in a series of plan-do-study-act cycles, in collaboration with existing LTC staff, to identify promising implementation science questions, simultaneously identifying barriers to implementation of evidence-based oral care. Results : Barriers to implementation of oral hygiene care we have observed include patient-level factors, such as complex co-morbid illness; staff-level factors, such as knowledge of proper oral care techniques and adapting care for complex co-morbid illness, and unit-level factors such as competing priorities of managers in care. Research targets we identified include improved understanding of methods for linking specialized expertise in oral care and dementia with day-to-day implementation challenges faced by direct care staff. Raising visibility of oral care needs and the quality improvement collaboration has improved management-level support for oral hygiene care. Conclusion : Implementation science methods combined with quality improvement approaches represent a promising strategy to accelerate translation of evidence-based oral hygiene practices into routine care. Keywords : implementation science , dementia

SS26 126-C-4

ORAL HEALTH AMONG OLDER CHINESE IMMIGRANTS: ASSESSMENT OF THE LITERATURE

Weiyu MAO¹, Bei WU², Iris CHI¹ (1. School of Social Work, University of Southern California, USA; 2. School of Nursing, Duke University, USA)

Introduction : Oral health has been shown to influence quality of life and overall health status, especially among older adults. This study aimed to review the existing literature on oral health status among older Chinese immigrants and discuss interventions strategy for improving the oral health outcomes of older Chinese immigrants. Method : We conducted a systematic review of the existing empirical studies on oral health and dental care utilization among older Chinese immigrants. Articles that are written in English and published in peer-reviewed journals, older Chinese immigrants as study participants, and oral health measurements reported in the articles were included in the search. Results : There are limited studies published in the topic area. Most of the studies were published in the U.S., Canada, and UK. All studies were cross-sectional. The findings from those studies demonstrated that older Chinese immigrants had poorer oral health and less dental care use compared to the general population in their host country. English language proficiency, strong social support, and longer length of stay in the host country were positively related to dental care utilization. Individuals' cultural beliefs and knowledge were also related to oral health status. Conclusion : Overall, there is a need for further research to elucidate the complex relationships of ethnicity, socioeconomic status, and cultural factors that impact immigrants' oral health. The findings also support the need for considering the cultural characteristics and background of older Chinese immigrants when strengthening oral health promotion. It is critical to partner with Chinese community agencies to conduct community-based oral health promotion program. Keywords : older Chinese immigrants, oral health, dental care

SS26 127-C

FRAILITY IN COMMUNITY-DWELLING OLDER PEOPLE IN TAIWAN: PREVALENCE, NATURE COURSE, BIOMARKERS AND INTERVENTION

SS26 127-C-1

PREVALENCE AND CORRELATES OF GERIATRIC FRAILITY IN TAIWAN

Cheng-chieh LIN (School of Medicine, College of Medicine, China Medical University, Taiwan)

Introduction : Frailty is one of the greatest gerontological challenges faced by Taiwan. Method : A cross-sectional study was conducted in 1,347 Taiwanese elders who lived at 8 administrative units in Taichung City, Taiwan in 2009. Frailty was defined by 5 components: shrinking, weakness, poor endurance and energy, slowness, and low physical activity level. Results : Frailty was present in 17% of the Taiwan elderly population; there were substantial variations by age, education level, diabetes mellitus, stroke, and sleep impairment. Conclusion : Prevalence of frailty is high in Taiwan society. Screening programs for early detection on frailty should target at elders who own characteristics that are associated with higher risk of frailty. Keywords: frailty

SS26 127-C-2

PREDICTION OF FRAILITY AND MORTALITY BY SERUM INFLAMMATORY BIOMARKERS AND COMORBIDITY IN OLDER INSTITUTIONALIZED MEN

Hsiu-yun LAI¹, Shinn-jang HWANG², Yungling Leo LEE³ (1. Family Medicine, National Taiwan University Hospital Hsin-Chu Branch, Taiwan; 2. Family Medicine, Taipei Veterans General Hospital, Taiwan; 3. Graduate Institute of Epidemiology and Preventive Medicine, College of Public Health, National Taiwan University, Taiwan)

Introduction : The aim of the study was to determine whether serum interleukin -6 (IL-6), tumor necrosis factor- α (TNF- α), high sensitivity C-reactive protein (hsCRP), or comorbidity could predict frailty and mortality in the older institutionalized men. Method : We enrolled 386 institutionalized men aged 65 and older from a veterans home in Taiwan with 2 years follow-up. Frailty status was determined basing on the frailty phenotype including weight loss, exhaustion, slowness, and weakness except for physical activity indicator. Serum IL-6, TNF- α , and hsCRP levels were measured at baseline. Results : The mean age of the participants was 81.5 \pm 4.9, with 33.2% being frail at baseline. In the cross-sectional analysis, after adjusting for age, body mass index, use of anti-inflammatory drugs, smoking status, and comorbidities, middle and top tertile of IL-6 were associated with current frailty status [OR 2.28 (95% CI 1.24-4.18); 1.95 (1.04-3.64) respectively] . During 2-year study period, after adjusting for smoking status, use of anti-inflammatory drugs, and baseline frailty status, the predictors for deterioration in frailty status were underlying cardiovascular disease [4.93 (1.23-19.8)], mental disorders [20.7 (1.24-344.7)], and either pair of the three biomarkers levels being in top tertile [HR 7.60 (95% CI 1.01-56.0)]. The predictors for mortality were age [1.09 (1.01-1.17)], diabetes [2.39 (1.16-4.93)], chronic obstructive pulmonary disease [2.55 (1.25-5.20)], and mental disorders [2.22 (1.03-4.83)]. Conclusion : For institutionalized older men, higher serum level of IL-6 was associated with current frailty status. The comorbidity, instead of each inflammatory marker, may be a better predictor for deterioration in frailty status and mortality. Keywords : Frailty, inflammatory biomarkers, long term care facility

SS26 127-C-3

TRANSITION OF ACCUMULATION DEFICITS BETTER PREDICT OUTCOMES THAN PHENOTYPIC FRAILITY IN OLDER PEOPLE WITH CHRONIC DISEASES

Chin-Ying CHEN¹, Chih-Hsun WU², Yin-Chang WU², Ching-I CHANG³, Jaw-Shiun TSAI³, Ching-Yu CHEN⁴, Hsiu-Yun LAI⁵

(1. Family Medicine, National Taiwan University Hospital, Taiwan; 2. Psychology, National Taiwan University, Taiwan; 3. Geriatric Research, Population Health Science Institute, National Health Research Institute, Taiwan; 4. Family Medicine, National Taiwan University, College of Medicine, Taiwan; 5. Family Medicine, National Taiwan University Hospital Hsin-Chu Branch, Taiwan)

Introduction : Frailty is a dynamic process. Transition of frailty is seldom discussed for outcome prediction. Our objective is to compare the two-year outcome prediction between different frailty index transitions in older people with chronic diseases. **Method :** The elderly outpatients recruited for comprehensive geriatric assessment in a medical center of northern Taiwan were followed up for 2 years. The frailty was evaluated by Comprehensive Geriatric Assessment ? Frailty Index (CGA-FI), Fried Frailty Index (FFI), disease burden (major systemic disease number, DB) and their combination. **Results :** A total of 189 aged 65 and over outpatients enrolled into the study. After 2-year follow-up, 125 (66.1%) persons were left and 64 (33.9%) persons dropped-off, including 12 deaths (6.3%). During this period, there were 56 (29.6%) hospitalization, 64 (33.9%) Emergency Department (ED) visit, 87 (46%) falls and 13(6.9%) new care aid. Transition of CGA-FI with DB significantly predicted 12.9x risk of death. Transition of CGA-FI significantly predicted 2x risk of number of hospitalization, 3.2x risk of number of ED visits, and 1.4x risk of number of falls. Transition of CGA-FI with DB and FFI significantly predicted 6.3x risk of hospitalization. Transition of FFI significantly predicted 5.3x risk of ED visits. Transition of CGA-FI and FFI significantly predicted 20.2x risk of new foreign aid. **Conclusion :** No single frailty index transition predicts all outcomes. Transition of accumulation deficits better predict outcomes than phenotypic frailty in old people. **Keywords :** frailty, transition, aged

SS26 127-C-4

COMMUNITY FRAILTY INTERVENTIONS IN TAIWAN

Ding-Cheng CHAN¹, Hsiao-hui TSOU², Rong-sen YANG³, Jau-yih TSAUO⁴, Ching-yu CHEN⁵, Chin-fu HSIAO², Chao Agnes HSIUNG², Ken N KUO⁶ (1. Department of Geriatrics and Gerontology, Department of Internal Medicine, National Taiwan University Hospital, Taiwan; 2. Division of Biostatistics and Bioinformatics, Institute of Population Health Sciences, National Health Research Institutes, Taiwan; 3. Department of Orthopaedics, National Taiwan University Hospital, Taiwan; 4. School and Graduate Institute of Physical Therapy, College of Medicine, National Taiwan University, Taiwan; 5. Department of Family Medicine, National Taiwan University College of Medicine, Taiwan; 6 Institute of Population Health Sciences, National Health Research Institutes, Taiwan)

Introduction : We reported randomized controlled trials (RCTs) of interventions on frailty in Taiwan from 2008-2010. **Method :** Two-stage screening was applied to enroll older adults (65-79 years of age) who scored ≥ 1 on the Cardiovascular Health Study Phenotypic Classification of Frailty (CHS_PCF). The pilot RCT enrolled 117 participants in Toufen, Taiwan with 3 month interventions. The extended trial enrolled 296 participants in Toufen and Taipei with 6 month interventions. Interventions included exercise, nutrition, and problem solving therapy with various combinations. Educational booklets were provided to all. Follow up assessments were conducted at 3, 6, and 12 months. One hundred and one completed the pilot study and 259 completed the extended study. Primary outcome was improvement of the CHS_PCF by at least one category from baseline assessments. Intention to treat analysis was applied. **Results :** The exercise and nutritional program improved the primary outcome at 3 months (45% vs 27%, adjusted $p=0.008$) in the pilot study. The

program also resulted in more increase of serum 25(OH) vitamin D level and lower percentage of osteopenia at 12 months. There were no between group differences in primary outcome in the extended trial. However, intervention group subjects had better performances in several sarcopenia indices including timed up and go tests (3, 6, and 12 months), one leg stand time (6, and 12 months), and dominant hand grip strength (6 month). Site differences in several outcome measurements were observed. **Conclusion :** Both 3 and 6 month of community-based interventions improved frailty related outcomes among Taiwanese older adults. **Keywords :** frailty, community, aged

SS26 207-S

DEMENTIA IN A DEVELOPMENTAL-CULTURAL PERSPECTIVE-FROM POSSIBLE EARLY FACTORS TO LATE-AGE INTERVENTIONS

SS26 207-S-1

A WAY OF PREVENTION - EARLY EXPERIENCES

Roger Benjamin SAGES (Institute of Psychology, Lund University, Sweden)

Introduction : In China, the old saying '三看大, 七看老' means that early experiences of children can decide the later life. This can be connected to psychoanalytical theory where adult life depends in part of the child's early experience. Abnormal behavior in the adult can be traced back to childhood, and certain personality aspects can be considered beginning to take shape from a very young age. **Method :** A phenomenological approach, Meaning Constitution Analysis, was used for planning, data collection and data analysis. **Results :** Preliminary results show a beginning of repression of one's desires on controlling life. Further results will be presented at the congress. **Conclusion :** A developmental/cultural perspective will increase understanding of dementia and offer possibilities of preventing its outburst. **Keywords :** Phenomenology, dementia, early experiences, repression, procrastination, psychoanalysis

SS26 207-S-2

THE CAREMA CARE CASE - A DISCURSIVE STUDY

Peter BUSKAS (Department of psychology, University of Lund, Sweden)

Introduction : During 2011 several cases of severe maltreatment of patients (in at least one case severe enough to actually cause the death of the patient) were exposed within the Swedish system of elder care, causing quite a lot of media-driven outrage and, in response, some rather carefully worded defensive posturing among the corporate management and politicians responsible for the relevant parts of the health care system. **Method :** This paper is based on the assumption that dehumanizing language is an important factor in enabling an abusive process, by creating a discourse in which certain individuals can be seen as less-than-human and thereby making it easier or even natural for people acting through and within this particular discourse to maltreat the individuals belittled by it. Foucauldian Discourse Analysis (FDA) will be applied to a number of official debates, press releases and interviews from/with nurses, doctors, relatives of victims and corporate/political representatives of the Swedish elder care system taken from one year of newspaper articles regarding the Carema Care scandal. **Results :** The analysis will show how the article-series creates a discourse within which the elderly are repeatedly constructed as faceless, voiceless, even identity-less, victims. **Conclusion :** It will be argued that this particular discourse actually enables the nurses and doctors at the lower executive end of the system to maltreat and abuse the patients that have been placed within their care. **Keywords :** FDA,

elder abuse

SS26 207-S-3

THE PROTECTIVE FACTOR AND REDUCED RISK OF DEMENTIA: EVIDENCE FROM STUDIES ON ACTIVITIES ENGAGEMENT AMONG CHINESE OLDER PERSONS

Chuanfeng CHEN (*Psychology Department, Huzhou Teachers College, China*)

Introduction : Continued activities engagement and active social interaction are commonly believed to influence cognitive performance and dementia in old age. Although some programs of activities engagement have been shown to have positive effects for older people, there is insufficient evidence to be able to say whether or not all activities programs are beneficial for people with dementia; meanwhile the existing programmes in most studies focused on older people who suffered from dementia to examine the improvement of BPSD of dementia, while very few focused on the reduced risk of dementia in normal older people. Method : The multi-methods, such as sectional investigation, following-up investigation, retrospective investigation, and comparing study have been adopted in the research to examine the status, change, and history of the influence of different activities engagement on reduced risk of cognitive decline and dementia onset. Results : It have examined the relationship between the frequency, size and extent of physical activity, intellectual activity, social activity and amusement activity, respectively, and cognitive decline and dementia onset following an epidemiological investigation of dementia prevalence. Then the interaction between different activities engagement in the role of reduced risk of dementia have been explored and the activity model in reduced risk of dementia have been constructed. Conclusion : At last the programmes for the prevention of dementia using activities engagement have been suggested to the policy makers and service providers in society and government, and to family carers as well. Keywords : Activities engagement, risk of dementia, Chinese older person

SS26 207-S-4

CROSS-CULTURAL TECHNOLOGICAL SOLUTIONS TO INCREASE INDEPENDENCY FOR OLDER PEOPLE

Isa GUSTAFSSON JERTFELT (*Ningbo University/ Lund University, China*)

Introduction : The world is facing a demographic problem with an ageing population. In many countries the urbanization and modernization makes it difficult to keep the traditional ways to take care of the elderly. One possible solution to this problem is to use the advances we have made in technology to prolong older people's independency and decrease their need for assistance. Much has been done in this area, but it is often in form of testing new technology, instead of investigating what new technology or adaptations in old technology that is wanted and needed by the older people themselves. In this article the implications of a masculine view of technology and a single culture solution to elder care is discussed. It is proposed that the masculine view of technology might have as the effect that some type of technology is overlooked, especially household technology - a type of technology very important to older people. It is also proposed that a multiple cultural view of ageing can be beneficial. Finally a phenomenological study to see if older men and women in different cultures have need for different type of technology and what type of technology they themselves wish for is proposed. Method : Phenomenological, cross cultural. Results : Not yet finished, the results will be completed before the conference. Conclusion : The study is still ongoing. Keywords : technology, gender, cross-cultural

SS26 207-S-5

SHARING A RESIDENCE - ASSISTED LIVING FOR THE ELDERLY, DISABLED PERSONS AND CHILDREN

Ricarda LUTZ (*Psychology, Lund University / Mainz University, Germany*)

Introduction : In the past the whole family used to live together at the same place. Old people and disabled persons were not sent to special facilities. They could benefit from their different characters, knowledge and fitness. Nowadays the elderly and disabled persons often live in special facilities. Even if sometimes the family wanted to take care of their relatives they cannot do it. Another reason for sending family members with special needs in those facilities is that they need special care and treatment. Also some might think that these persons profit more if they live together with people with the same needs. But is that really true? It would be interesting to see if they could all live together. Maybe they could also benefit from each other and they would have a more normal live since it is kind of an artificial environment if they live in special residences. To see if a project like this could be realized it is important to ask the people who would be concerned. Which means the persons in charge or/and the people who are living in the facilities. Method : Qualitative research, Interviews, Software MCA Minerva. Results : Preliminary results will be presented at the congress. Conclusion : Preliminary conclusion will be presented at the congress. Keywords : residence elderly children

SS26 207-S-6

SUPPORT, LONELINESS AND WELL-BEING AMONGST VERY OLD PEOPLE IN THEIR LAST YEAR OF LIFE

Jane FLEMING¹, Jun ZHAO², Stephen BARCLAY³, Carol BRAYNE¹, Morag FARQUHAR³, Cambridge City Over-75s Cohort Study Collaboration (CC75C)² (1. *Institute of Public Health, University of Cambridge, United Kingdom*; 2. *Public Health and Primary Care, University of Cambridge, United Kingdom*; 3. *Primary Care Unit, Public Health and Primary Care, University of Cambridge, United Kingdom*)

Introduction : With increasing age social contacts often decrease. More people are dying in advanced old age, but data to inform planning for support needs are scarce. This study quantifies informal and formal support received by very old people in their last year of life, their emotional well-being, including reported loneliness. Method : UK population-based Cambridge City over-75s Cohort study: 102 men and 219 women who died < 1 year after interview (321 aged ≥85 incl. 161 aged ≥90). Results : Formal support services contact was highest for those dying aged 90+. 60% saw neighbours at least weekly. 58% of those < 90 and 73% ≥90 saw ≥1 relative ≥once a week. Regardless of age, 25% would have liked more family contact and 23% felt service support was not enough. 35% of 85/89-year-olds and 49% of ≥90-year-olds described themselves as very lonely/lonely/slightly lonely, nearly 1/5 as very lonely/lonely. Not enjoying life was three times as common for people dying after 90 (28%) as aged 85-89 (10%). Other measures of well-being confirmed this pattern: being interested, as happy as when younger or feeling things seem better than expected were less prevalent amongst those who died older. Strong predictors of loneliness were widowhood, living alone and poor self-rated-health, regardless of other factors including disability, cognition, support and social networks. Conclusion : Loneliness is common amongst very old people in the year before death. Frequency of contact with family, neighbours or services did not overcome this for those widowed, living alone or in poor health. Research is needed on supportive interventions. Keywords : Oldest old, End of life, Loneliness, Social networks, Service use, Well-being

SS26 208-C

DIABETES IN THE ELDERLY : A CHALLENGE IN MULTIPLE DOMAINS

SS26 208-C-1

COMPREHENSIVE GERONTOLOGICAL ASSESSMENT, A TOOL TO IMPROVE THE CARE OF OLDER PEOPLE WITH DIABETES, A HIGHLY HETEROGENEOUS POPULATION

Isabelle BOURDEL-MARCHASSON (*Geriatrics, CHU Bordeaux; UMR 5536 Univ Bordeaux Segalen, CNRS, France*)

Diabetes is a disabling chronic disease with an effect of accelerated ageing. Older people with diabetes have very different profiles according to their age, sex, socio-economic conditions and way of life, diabetes disease characteristics, complications and co-morbidities. Diabetes induces frailty and comprehensive gerontological assessment (CGA) is a useful tool to drive treatment targets choice, treatment strategy and follow-up fully adapted to each patient in his social context, along with interventions in other fields than diabetes when necessary. We will illustrate with clinical case reports the interest of CGA in different situations. Keywords : Diabetes

SS26 208-C-2

DIABETES, FRAILITY AND COGNITION : UPDATE ON EVOLVING CONCEPTS

Daniel TESSIER (*Medicine, Reserch Center on Aging - Sherbrooke Geriatric University institute, Canada*)

Introduction : Diabetes mellitus (DM) is a common condition in the older population. This disease has been associated with increased frailty, morbidity and mortality. DM physiopathology in the elderly is associated with sarcopenia, immobility, inflammatory state and pancreas beta cells exhaustion.. Recent large scale intervention trials on glycemic control failed to show a reduction in mortality in patients with type 2 DM on intensive treatment. Aging and cognitive dysfunction have been associated with an increased risk for severe hypoglycaemia. Multiple definitions and measurements of frailty have been proposed in the literature. Increased frailty has been associated with increased functional dependency and mortality. Hypoglycaemia recognition and management may be problematic in vulnerable elderly patients, especially when they live alone. DM has been associated with an increased risk of dementia (vascular and degenerative): the proposed mechanisms are complex and may involve the presence of genetic factors such as the presence of APO E4. Method : literature review. Results : see above. Conclusion : Management of DM in the frail elderly is a multifaceted problem: a multidisciplinary approach, the setting of reasonable goals centered on the patient condition, prognosis and early detection of cognitive problems are key elements for an optimal management in this population. Keywords : diabetesmellitus. elderly, cognition

SS26 208-C-3

PHARMACOLOGICAL THERAPY OF DIABETES IN THE ELDERLY: OLD AND NEW DRUGS

Andrej ZEYFANG (*Internal Medicine / Geriatrics, Bethesda Hospital Stuttgart, Germany*)

Introduction : Antihyperglycemic therapy in T2DM should be effective and as safe as possible for the patient. Different new oral diabetes medications have been introduced recently; their benefits and risks in older persons are discussed. The reevaluation of classical oral diabetes medication like metformin and insulin is part of this presentation. Method : We present an overview of old and new

diabetes medications in older persons. A focus is on patient safety concerning risk of hypoglycemia, errors with medication and risk of complications. Results : A review of studies on modern diabetes medications and data from the DPV-database, a standardized, prospective, multicenter, computer-based documentation of diabetes care and outcome containing 260,920 patients of all ages and diabetes-types are presented. We introduce also a new method for predicting the ability of correct insulin self-injection by the elderly using the timed-test of money counting. Conclusion : Some policies with antihyperglycemic drug treatment in older persons need to be revised. New drugs can be helpful to enhance patient safety, but older drugs like metformin or insulin still have an important rank in diabetes therapy for older persons as well. Keywords : Diabetes mellitus, pharmacotherapy, metformin

SS26 209-R

THE DEVELOPMENT AND APPLICATION OF INTERRAI IT SYSTEM FOR LONG TERM CARE SERVICES IN ASIA

SS26 209-R-1

JAPAN'S LAUNCHING OF THE HOME AND INSTITUTIONAL CARE INTEGRATED MANUAL IN THE CLOUD SYSTEM

Naoki IKEGAMI¹, Tomoaki ISHIBASHI², Takashi AMANO² (*1. Health Policy & Management, School of Medicine, Keio University School of Medicine, Japan, Japan; 2. Research, The Dia Foundation for Research on Aging Societies, Japan*)

Introduction : We have launched an integrated manual of the interRAI assessment instruments and accompanying clinical protocols (CAP) for home and > community care manager agencies, assisted living and institutional care in November, 2011. From April, 2012, the manual and the data can be accessed through the cloud system so that paper forms are no longer needed. Through the cloud system, assessment data and the manual can be accessed and data entered by tablet PC at the client's home or at the hospital. This has also allowed providers care management agencies to monitor changes in their clients' composition by using interRAI's ADL, Cognitive Performance, Pain and Depression Scales. Method : A system to transfer individual personal data from one agency to another as the person moves across the spectrum of home, assisted living and institutional care settings is being developed. A data clearing house which will enable agencies to evaluate their performance with their peer groups by the use of composite Quality Indicators is also being developed. Results : To be reported. Conclusion : Our greatest hurdle is that, since structured assessments are not mandated in Japan, care managers are not compelled to make assessments on a regular basis. Introduction of the interRAI system by the cloud system will incentivize them to do so by greatly decreasing the burden, and by providing positive feedback on their performance through the use of Scales and Quality Indicators. Keywords : cloud system, scales

SS26 209-R-2

CLINICAL BENEFITS OF SYSTEMWISE IMPLEMENTING RAI AMONG RESIDENTS OF VETERAN HOMES IN TAIWAN

Liang-Kung CHEN¹, Chung-fu LAN², Po-lun CHANG³ (*1. Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taiwan; 2. Institute of Health Welfare and Policy, National Yang Ming University, Taiwan; 3. Institute of Biomedical Informatics, National Yang Ming University, Taiwan*)

Introduction : Taiwan has become an aging country in 1993, and is

estimated to become an aged country in 2017, which makes Taiwan one of the fastest aging countries in the world. Method : From 2006, the interRAI MDS was systematically implemented in several selected veteran homes and the health care outcomes were followed periodically. In the mean time, a PDA (Personal Digital Assistant)-based RAI was developed and was then applied in this program. Overall, the veteran home residents were old (mean age over 82 years) and were all male who were physically independent and cognitive intact through the results of RAI. Results : the complexity in long-term care for these residents was clearly shown that the residents were carrying a median of 4 care problems (surrogated by RAP triggers) and the higher comorbidities with higher number of RAP trippers were significantly associated with 1-year mortality. On the other hand, for all residents participating in this program, the quality of life was significantly improved in a year of follow-up, together with a significant reduction in Emergency Department visit and acute hospital admissions although the utilization of outpatient services remained similar. Conclusion : Further research is needed to establish a comprehensive system for RAI application to cope with the challenge of population aging in the future. Keywords : long-term care, geriatrics, minimum data set

SS26 209-R-3

DEVELOPING A COMPUTERIZED RESIDENT ASSESSMENT SYSTEM USING INTERRAI TOOLS IN KOREA

Hongsoo KIM¹, Myeonggil CHOI¹, Young-il JUNG¹, Eunsoo JUNG², Monhee SUNG¹, Jiyeon KIM¹, Ahreum YOO¹ (1. Graduate School of Public Health, Seoul National University, Korea; 2. School of Business, Chung-Ang University, Korea)

Introduction : The benefits of comprehensive resident assessment for frail older adults at home or long-term care institutions are well known, but few such assessment tools are available in Korea. In this presentation we will present the newly-developed and psychometrically-tested Korean version of interRAI Home Care(interRAI-HC) and interRAI Long-Term Care Facility(interRAI-LTCF). We will also discuss the early experience of launching a web-based version of the tools. Method : interRAI-HC and interRAI-LTCF were developed through the instrument translation process that World Health Organization(WHO) recommended. Psychometric properties of the developed tools were evaluated using patient/resident assessment data collected by nurses at long-term care hospitals, long-term care facilities, or homes. Three versions of the instrument tools were developed: paper-based, Microsoft Access-based, and web-based(proto-type). Results : The newly-developed Korean version interRAI-HC and interRAI-LTCF were reliable and valid in an analysis with data of 714 resident/patients at 24 long-term care institutions: internal consistency of major scales(ADL, IADL, depression, cognition, etc.) were 0.81~0.96 and inter-rater reliability were 0.70 in most items. Concurrent validity for function and cognition were also good. In the survey on usability, usefulness, and efficiency of assessment tools, nurses gave higher score when using electronic-based than paper-based version. Conclusion : Korean version interRAI-HC and interRAI-LTCF were reliable and valid tools for comprehensive assessment of older people who need long-term care. Long-term care employees prefer the computerized version of the assessment tools, but individual, organizational, and market barriers exist, which prevent wide adoption of the tools. Necessary are collaborative efforts to overcome such barriers among policy makers, researchers. Keywords : interRAI, long-term care, geriatric assessment

SS26 209-R-4

THE DEVELOPMENT AND APPLICATION OF INTERRAI IT

SYSTEM FOR THE ELDERLY SERVICES IN HONG KONG

Raymond CHANG¹, Samson LEUNG² (1. Physiotherapy, Hong Kong Sheng Kung Hui Welfare Council, Hong Kong; 2. Information Technology Services Department, Hong Kong Sheng Kung Hui Welfare Council, Hong Kong)

Introduction : To echo the use of Minimum Data Set - Home Care in Social Welfare Department of Hong Kong in 2000, Hong Kong Sheng Kung Hui Welfare Council (the Council) has developed a localized computerized Integrated Care Plan Management System (ICPMS) for elderly services in 2004 by using interRAI instrument to enhance clinical practice and quality management. Method : The Council has launched the ICPMS in 7 residential care homes for the elderly in 2005 and 1 pilot scheme on home care services for frail elders in 2011. The ICPMS is a web-based system which allows staff to browse through the system without software pre-installed. The system enables both frontline professional staff and management teams to work collaboratively, share information in real time and facilitate consistent decision making in care planning. The system provides automated assessment and care plan, reminder to care plan review, quality indicators and outcome measures reports. Results : Information of about 1,900 elders had been included since the launching of ICMPMS. More than 3,000 initial assessments and 10,500 re-assessments were input in the system. About 12,430 care plans were generated. Regular analysis on the outcome of quality indicators, outcome measures and case mix reports are generated for service review and planning. Conclusion : Since the system is adopting the RAI 2.0 for residential care services in the Council, adopting the newest version of interRAI instrument is needed to align all items of the interRAI Home Care Assessment System in the ICPMS for outcome and quality evaluation of the services. Keywords : interRAI, Minimum Data Set, IT system, elderly service, Hong Kong

SS26 212-R

SOCIOECONOMIC INEQUALITIES IN HEALTH AT OLDER AGES: FINDINGS FROM BRAZIL, CHINA, ENGLAND AND THE US

SS26 212-R-1

SOCIAL INEQUALITIES IN BIOMARKERS: FINDINGS FROM THE ENGLISH LONGITUDINAL STUDY OF AGEING (ELSA)

Cesar DE OLIVEIRA (Epidemiology & Public Health, University College London, United Kingdom)

Introduction : The process by which the social environment becomes translated into physiological and psychological processes that influence health remains unclear. The aim of this longitudinal study is to compare changes over time and the relationship between socioeconomic position indicators and different biomarkers in a nationally representative sample of older adults in England. Method : The study population consisted of participants aged 50 and older who took part in the 2004 and 2008 waves of the English Longitudinal Study of Ageing (ELSA), a prospective national cohort study of people aged 50 years and over. The analysis focuses on biomarkers associated with adverse outcomes as well as those associated with improved health and well-being. Risk factors included indicators of cardiovascular disease (lipid profile, fibrinogen, C-reactive protein) and anthropometric measures such as body mass index and waist circumference. Protective factors included HDL cholesterol, IGF-1 and DHEAS. The changes in these markers over time were modelled using a measure of socioeconomic status called total wealth and level of education. Analyses were adjusted for age, sex and marital status.

Results : With increasing wealth, both inflammatory markers levels decreased. Prevalence of both overweight and obese categories and raised waist circumference decreases with increases in wealth. A socioeconomic gradient is evident for both IGF-1 and DHEAS markers, with increases in levels with increased wealth. Conclusion : The present findings suggest an association between biomarkers and socioeconomic position. However, the direction of the social gradient observed varied for the different biomarkers highlighting the need for further investigation. Keywords : Socioeconomic, inequalities, health, biomarkers, elderly

SS26 212-R-2

SOCIOECONOMIC INEQUALITIES IN HEALTH IN OLDER ADULTS IN BRAZIL AND ENGLAND

Maria Fernanda LIMA-COSTA¹, Cesar DE OLIVEIRA², James MACINKO³, Michael MARMOT² (1. *Epidemiology, Centro de Pesquisas Rene Rachou, Brazil*; 2. *Epidemiology & Public Health, University College London, United Kingdom*; 3. *Nutrition, Food Studies, and Public Health, New York University, USA*)

Introduction : We examined socioeconomic inequalities in health among older adults in England and Brazil. Method : We analyzed nationally representative samples of residents aged 50 years and older in 2008 data from the Brazilian National Household Survey (n =75 527) and the English Longitudinal Study of Ageing (n = 9589). We estimated prevalence ratios for self-rated health, functional limitations, and reported chronic diseases, by education level and household income tertiles. Results : Brazilians reported worse health than did English respondents. Country-specific differences were higher among the poorest, but also affected the wealthiest persons. We observed a strong inverse gradient of similar magnitude across education and household income levels for most health indicators in each country. Prevalence ratios (lowest vs highest education level) of poor self-rated health were 3.24 in Brazil and 3.50 in England; having 2 or more functional limitations, 1.81 in Brazil and 1.96 in England; and having 1 or more diseases, 1.14 in Brazil and 1.36 in England. Conclusion : Socioeconomic inequalities in health affect both populations, despite a less pronounced absolute difference in household income and education in Brazil than in England. Keywords : Socioeconomic, inequalities, health, elderly

SS26 212-R-3

HEALTH AND SOCIO-ECONOMIC STATUS OF MID-AGED AND ELDERLY CHINESE

Xiaoyan LEI¹, John STRAUSS², Xiaoting SUN¹, Yaohui ZHAO¹ (1. *National School of Development, Peking University, China*; 2. *Economics, University of Southern California, USA*)

Introduction : China has undergone a health revolution over the past 50 years. As a result, infectious diseases have replaced by chronic diseases as the major source of ill-health and mortality. It has also been undergoing a nutrition transition. Related to the health and nutrition transitions has been China's sharp demographic transition with a fast increasing in its elderly population, which will place stress on China's health system. Method : Using the 2011-2012 national baseline of the Chinese Health and Retirement Longitudinal Study (CHARLS), we document health outcomes of the Chinese elderly and examine the relation between these health outcomes and socioeconomic status. CHARLS has a very rich set of health indicators that include both self-reported measures and biomarkers. Results : we find that Chinese elderly are facing challenges from chronic diseases such as hypertension and underdiagnosis of it is common. Overnutrition has become a bigger problem than undernutrition, reflected as higher rate

of overweight but not underweight. The problem is generally more serious for women than for men. Disability rate is also high, especially for rural women, who also report to suffer more from pain. Moreover, we find different health gradients of socio-economic status measured by education and per capita household consumption expenditure. Conclusion : The findings in this paper highlight the challenges facing China during its transition. The health system in such transition apparently takes time to re-orient and treat chronic diseases of the aging and the aged. This is an important step that the Chinese health system will need to work out in the future. Keywords : SES health gradients

SS26 212-R-4

INEQUALITIES IN ACCESS AND USE OF HEALTH SERVICES AMONG BRAZILIAN AND US ELDERLY COVERED BY TWO DIFFERENT PUBLIC HEALTH SYSTEMS

James MACINKO (*Public Health, New York University, USA*)

Introduction : This study assesses how socioeconomic position affects access to and use of healthcare services among older adults in Brazil and the United States. Method : Analysis of nationally-representative health interview surveys, 2007-2009 NHIS (US) and 2008 PNAD (Brazil). Outcome measures (over the past 12 months) include: no doctor visit, number of doctor visits, any hospitalization, number of hospitalizations, usual source of medical care, and barriers to care. Multiple Poisson and Hurdle regressions were used to model healthcare use and the intensity of use, respectively. Independent variables include: income, schooling, age, gender, presence of a spouse, urban/rural residence, private and public health insurance, and self-reported health problems and limitations. Linear and quadratic interactions among age and schooling model the effects of social inequalities on healthcare access across different ages. Results : Utilization rates for most healthcare services were higher in the US than in Brazil, except among the highest users of services, where rates were similar. Within-county inequalities (comparing highest to lowest levels of schooling) were lowest in both countries for hospitalizations, and highest for having no doctor visits in the past 12 months. For most (but not all) outcomes, education-related inequalities were most pronounced in mid-life, and subsequently diminished with older ages. Conclusion : The two countries' different approaches to providing access to healthcare have implications for treatment and prevention of chronic and other conditions across the life course. However, even among the older (aged 65+) population, where both countries provide universal access, considerable social inequalities in meeting basic healthcare needs persist. Keywords : Healthcare access and utilization, Social inequalities

SS26 213-S

COGNITIVE TRAINING IN AGING: FROM NEAR TO FAR TRANSFER EFFECTS, FROM SINGLE TO MULTI-DOMAIN TRAINING, FROM NORMAL AGING TO ALZHEIMER'S DISEASE

SS26 213-S-1

BENEFITS OF ATTENTION TRAINING ON COGNITIVE PERFORMANCES AND POSTURAL CONTROL IN OLDER ADULTS AND PATIENTS AT RISK OF COGNITIVE DECLINE

Louis BHERER (*PEFORM Centre, Concordia University, Canada*)

Introduction : Numerous studies suggest that cognitive training can help improve cognitive performances. However, studies often exclude

participants at risk of cognitive decline due to chronic diseases (e.g., coronary heart disease). It is also well established that cognitive decline is associated with reduced mobility and postural control. Another important issue is to what extent cognitive training intervention leads to significant benefits that transfer to real life situation. Method : In all studies, older adults were assigned to a cognitive training intervention or a control condition. All participants performed experimental cognitive assessment, neuropsychological tests and in one study, balance and mobility tests. Assessments were completed at pre-test and post-test. Results : Results of these studies indicated that groups that completed the cognitive training program showed larger improvement than the control groups in the training tasks and that the benefits transfer to untrained tasks of attentional control. However, some limits were also observed on attentional costs improvements in transfer tasks. Despite these limits, dual-task training was associated with improved balance and postural control. Moreover, training was beneficial for patients recovering from coronary artery bypass graft surgery. Conclusion : Our studies suggest that dual-task training leads to more than just task specific learning and support the notion that cognitive plasticity for attentional control is preserved in late adulthood. Moreover, gain in attentional control can lead to significant improvement in mobility and postural control. Results with patients at risk of cognitive decline also suggest that cognitive training is a promising non-pharmaceutical tool to help improve cognition in older adults. Keywords : Cognitive training, Chronic Disease

SS26 213-S-2

DEVELOPMENT OF MULTI-DOMAIN COGNITIVE TRAINING FOR COMMUNITY ELDERLY IN SHANGHAI, CHINA: AN EVIDENCE-BASED PROCEDURE

Chunbo LI (*Biological Psychiatry, Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, China*)

Introduction : There are few studies on cognitive training for healthy aging in China one decade ago. We started to explore methods of cognitive training for community elderly in Shanghai since 2004. Based on the contents of western cognitive training, we adapted and combined with some Chinese cultural components during the training. Method : At first step, we collected related strategies and methods of cognitive training, and selected evidence-based contents, combined Chinese cultural components. In order to testify the feasibility and efficacy of 'compositive cognitive training' (multi-domain cognitive training) for community healthy elderly, we further conducted no control opened trial, controlled clinical trial and randomized controlled trial. Results : The results showed that compositive cognitive training (multi-domain cognitive training) can enhance memory proficiency, while single-domain CogTr augmented visuospatial/ constructional and attention abilities, and can help maintain community-living older people functioning over time. Multi-domain cognitive training may have more advantages in training effect maintenance. Conclusion : Multi-domain cognitive training is safe, well complied, and efficient for community elderly. Individualized cognitive training should be developed in the future. Keywords : cognitive training, clinical trial, Multi-domain

SS26 213-S-3

COGNITIVE TRAINING IN AGING AND MCI: EFFECT ON BRAIN FUNCTION AND STRUCTURE

Sylvie BELLEVILLE, Samira MELLAH, Chloe DEBOYSSON, Bianca BIER, Nicolas MOFFAT (*Research Center, Institut Universitaire de Geriatrie de Montreal, Canada*)

Introduction : There is increasing interest for the use of cognitive training as a way to promote cognitive health and reduce symptoms in normal aging and persons with mild cognitive impairment (MCI). It is however critical to better understand the cognitive and brain mechanisms of those interventions. Method : I will present studies that have used functional and structural brain imaging to assess the mechanisms that support changes due to cognitive interventions in aging. The reported studies use either attentional or memory training in healthy older adults and persons with MCI. Functional brain imaging and ERPs are used as markers of cognitive training efficacy and to investigate the effect of the training on brain function. Preliminary data on cortical thickness will also be presented. Results : Results indicate that both memory and attentional training change the pattern of task-related activation in healthy older adults and in persons with MCI suggesting that brain plasticity is still active in aging and in the early phase of Alzheimer's disease. Interestingly, whether this results in increased vs. decreased activation and whether specialized or alternative regions are recruited depend on population and on training modalities. Conclusion : Brain imaging can provide unique information regarding the processes and brain mechanisms that are involved and/or modified by cognitive training. The data suggests that the effect occurs through a combination of restoration and compensation processes and that the balance between those two mechanisms depends on whether training implicates learning new strategies or consolidating cognitive modes that were already used by participants. Keywords : Cognitive training, brain plasticity, mild cognitive impairment

SS26 213-S-4

THE ROLE OF EMOTION AS A FACILITATOR OF FACE-NAME MEMORY TRAINING IN PERSONS IN MILD ALZHEIMER'S DISEASE

Anne-Marie ERGIS¹, Anne-Sophie RIGAUD² (*1. Psychology, Universite Paris Descartes, France; 2. Service de Geriatrie, Hopital Broca, France*)

Introduction : Several studies have examined the relationships between memory and emotions in Alzheimer's disease (AD). Many of them have shown that using stimuli with emotional valence improves explicit memory performance, especially with positive ones. Others have demonstrated preserved implicit memory for emotional words and pictures. Recent data showed that the emotional content of stimuli influences memory for music. All these studies open up paths for new strategies in memory rehabilitation. However, clinical applications of these findings for memory rehabilitation or stimulation are still very infrequent. Method : We proposed a face-name associations learning intervention program to patients with mild AD. Each patient was his own control, and baselines were given before and after intervention. Absurd imagery and spaced retrieval were used, and stimuli were neutral and happy faces. Results : Results showed abilities to learn these new associations in patients, and learning was better for happy faces. Conclusion : These findings show the interest of relying on emotional stimuli in order to improve memory rehabilitation in Alzheimer's disease. Keywords : Alzheimer's disease, memory rehabilitation, emotions

FAMILY DIVERSITY IN CAREGIVING

SS26 214-S-1

THE PARADOX OF COMBINING INDEPENDENCE AND LONG TERM CARE ARRANGEMENTS IN THE CONTEXT OF LAT PARTNER RELATIONSHIPS OF OLDER ADULTS

Jenny GIERVELD (*Social Demography, NIDI, Netherlands*)

Introduction : Many older adults involved in LAT relationships intend to live independently for as long as possible. They are satisfied with the realization of a LAT intimate partner relationship, in which both partners have their one-person household and share living quarters for less than 7 days per week. In case of serious illnesses and being in need of daily care, how do LAT partners arrange their lives? **Method :** In this study results of qualitative interviews with a representative sample of 23 older adults in LAT relationships are presented. The 23 interviewees are sampled from the second wave of the Netherlands Kinship Panel Survey (2008/2009; N= 6109). **Results :** Many of the LAT interviewees expect to support their partners. The majority of the interviewee's mentioned that they expect their LAT partners to take care of them, but a not negligible minority insists on not accepting care from their partners. These attitudes do not correspond with the effectively given and received care in situations of serious illness. Most of the interviewees do care for their partners and do receive care from their partners. **Conclusion :** The interpretation of the paradoxical association between giving and receiving care in LAT partner relationships is central in the discussion section of this study. **Keywords :** care arrangements, LAT partners, attitudes and behavior

SS26 214-S-2

HOUSEHOLD CARE ARRANGEMENTS FOR OLDER ADULTS : AN INTERNATIONAL COMPARISON

Nobutaka FUKUDA¹, Jenny GIERVELD² (*1. School of Social Informatics, Aoyama Gakuin University, Japan; 2. NIDI, Netherlands Interdisciplinary Demographic Institute, Netherlands*)

Introduction : Research has shown the impact of living arrangements, social values, employment, health and wealth on the household care arrangements of old adults in countries of Europe. This paper fills the gap in our knowledge by including Japan as an example of a country with a less gender equality and characterized by strong Confucianism moral values. The paper addresses individual determinants (including personal value-orientation, work patterns, economic power, health condition, and living arrangement) on household care arrangements of older adults. **Method :** Data come from the Generations and Gender Surveys, encompassing Japanese and other European data sets. In investigating the influence of socio-economic, health, emotional, familial and attitudinal factors on the household care of older adults aged 60 and over. Multivariate analyses including structural equation modelling and latent class analysis have been carried out. **Results :** Results showed that household care is more value-oriented, and socio-economic factors are less intense in Japan than in Europe, and health factors play a important role in determining the division of old adults' household care both in Japan and in Europe. These findings suggest that cultural and value factors play a more crucial role in household care for Japanese old adults than European old adults. **Conclusion :** In conclusion, this study indicates that the determinants of old adults' household care arrangements differ between Japan and Europe. Hence, the arrangements of household care are affected by not only socio-economic but also cultural factors. **Keywords :** Intergenerational Relationships, Household Care, Japan and the Netherlands, Old Adults

SS26 214-S-3

CARE ARRANGEMENTS AND OUTCOMES FOR SANDWICH GENERATION CAREGIVERS IN CANADA

Arianna WAYE¹, Janet FAST² (*1. Faculty of Medicine, University of Alberta, Canada; 2. Human Ecology, University of Alberta, Canada*)

Introduction : Sandwich generation caregivers (caregivers responsible for caring for children and dependent adults simultaneously) often are identified as being especially vulnerable to negative economic and other outcomes. However, empirical evidence supporting this claim is scarce and often contradictory. This study attempts to identify which subgroups of caregivers are in fact most vulnerable to adverse negative outcomes. **Method :** Using data from Statistics Canada's 2007 General Social Survey on Family, Social Support and Retirement to compare care arrangements and employment and quality of life outcomes for Canadian sandwich generation caregivers, those with single generation care responsibilities, and those with neither child nor dependent adult care responsibilities. Analyses included cross tabulations and multinomial logistic regression. **Results :** The sub-sample of sandwich generation caregivers was small. Nonetheless, these caregivers were more likely than those caring for only a dependent adult to reduce their hours of paid work, to miss days of work, to decline a job offer or promotion, to quit a job and to postpone planned education or training. **Conclusion :** The small number of sandwich generation caregivers in the sample may have reduced the power of the statistical tests. Nonetheless, these caregivers appear to be at greater risk of negative employment consequences than their counterparts caring only for dependent adults, which will, in turn, place them at greater economic risk. Findings suggest a need for policy makers and employers to take differences in needs of sub-groups of caregivers into account when designing caregiver support policies and programs. **Keywords :** caregiving, employment, sandwich generation

SS26 214-S-4

I GET BY WITH A LITTLE HELP FROM MY FRIENDS AND NEIGHBORS: NON-KIN AS INFORMAL CARERS OF OLDER ADULTS

Tracey LAPIERRE¹, Norah KEATING² (*1. Sociology, University of Kansas, USA; 2. Human Ecology, University of Alberta, Canada*)

Introduction : The role of non-kin as informal carers is poorly understood. The purpose of this study was to investigate the context in which friends and neighbors provide informal care for older adults. Socio-demographic and network characteristics of older adults who require instrumental assistance or personal care due to a long-term health condition were analyzed as predictors of having a non-kin member of the care network, and as factors influencing the nature of non-kin care contributions. **Method :** Data come from the General Social Survey of Canada. To be included in the sample for this study the respondent had to be an adult age 65 or older who needed assistance with one or more of the following tasks due to a long-term health condition: meal preparation, housecleaning, home maintenance, grocery shopping, transportation, bills and banking, or personal care. Statistical techniques utilized include chi-square, ANOVA and multivariate logistic regression. **Results :** More than one-third of older adults needing instrumental or personal care assistance due to a long-term health condition were receiving at least some of that assistance from a friend or neighbor. Age, gender, marital status, living arrangements, socio-economic status, family composition, having close relationships with family and friends, and the composition of the care network were all significant predictors of older adults receiving informal care from non-kin. Multiple patterns of non-kin care were observed in the care networks. **Conclusion :** Based on current population trends these findings suggest that the presence and contributions of non-kin in the informal care networks of older adults will increase in the future. **Keywords :** informal carers, non-kin.

DETERMINANTS OF SOCIAL SUPPORT EXCHANGE BETWEEN KOREAN BABY BOOMERS AND THEIR PARENTS

Junghyun KIM¹, Miae CHUN² (1. Dept. of Welfare for the Aged, Yongin University, Korea; 2. Dept. of Social Work, Chongshin University, Korea)

Introduction : This study examined the determinants of social support exchanges between Korean baby boomers (born in 1955-1963) and their parents. **Method :** Using the 2010 data titled "Survey on the living condition and the welfare needs of middle aged" by the Korean Institute for Health and Social Affairs, the current study utilized 1969 respondents as the final sample for regression analysis. Dependent variables include the frequencies of providing and receiving instrumental support, and the frequencies of providing and receiving physical support. Independent variables include demographic and family characteristics (gender, age, the level of education, the number of siblings, the number of offspring, the level of burden for providing living expenses for their offspring), need variables (parent's age, parent's health, health of respondents), and variables of cultural values (values for caregiving responsibilities for their older parents, intention for the utilization of the long-term care support system). **Results :** Results indicated that 1) providing instrumental supports was determined by gender, the level of education, the number of offspring, health of respondents, intention for the utilization of the long-term care support system; 2) receiving instrumental supports was anticipated by the number of siblings, the number of offspring, the age of mother, and parent's health; 3) providing physical supports was explained by gender, the level of education, the number of siblings, parent's health, and values for caregiving responsibilities for their older parents placed to their parents themselves; and 4) receiving physical supports was predicted by health of respondents. **Conclusion :** Suggestions were made for the future aging policies in Korea. **Keywords :** baby boomer, social support exchange, determinants

SS26 215-S-2

THE EFFECTS OF RAISING GRANDCHILDREN ON RELATIONSHIP SATISFACTION WITH CHILDREN AMONG OLDER WOMEN: FOCUSING ON MEDIATING EFFECT OF HOUSEHOLD INCOME TRANSFER FROM CHILDREN

Jihye YEOM¹, In-hee CHOI² (1. Dept. of Social Welfare, Jungwon University, Korea; 2. Center for Family and Multicultural Society, Korean Women's Development Institute, Korea)

Introduction : The purposes of this study are to examine the current level of satisfaction with adult children in terms of family relationship and to explore how household income transfer from adult children to their mother mediates the link between raising grandchildren and level of relationship satisfaction with adult children among older women in Korea. **Method :** The data selected from the Korean Longitudinal Study of Ageing (KLoSA) in 2006 consisted of female older adults who were 60 years old and over (N=215). They were raising grandchildren. Multiple regressions were run because a dependent variable was relationship satisfaction with children which was continuous. **Results :** Those who were married and living in urban were higher level of relationship satisfaction with children. As education level increased from elementary to junior high school graduation, the level of relationship satisfaction with children grew up 0.12. As self-rated health increased by 1 unit, the level of satisfaction with children grew up 0.31. The relationship satisfaction with adult

children became lower after controlling household income transfer from adult children whose offspring was cared by grandmother. **Conclusion :** In conclusion, the link between raising grandchildren and level of relationship satisfaction with adult children were mediated through household income transfer from adult children in Korea. Appropriate income level among older women is very important in family relationship in Korea. Therefore, minimum level of income for Korean older women needs to be supported by public policy. **Keywords :** Raising grandchildren, children satisfaction

SS26 215-S-3

CHILDREN'S DIVORCE AND THEIR EXCHANGES WITH ELDER PARENTS IN RURAL CHINA

Zhen CONG¹, Merrill SILVERSTEIN² (1. Human Development and Family Studies, Texas Tech University, USA; 2. Social Work, Syracuse University, USA)

Introduction : Intergenerational support has been shown to be an important factor affecting elder parents' health and well-being, particularly for Chinese rural elders who have limited access to other sources of support. This study examined the influence of children's change of marital status on their financial and emotional support to parents, as well as their parents financial help to them. We also examined whether the influences were contingent to children's gender. **Method :** The sample derived from rural Anhui Province. Our working sample included 10181 observations from 3 stacked intervals (2001-2003, 2003-2006, 2006-2009), representing 4927 unique children with 1170 elder parents. The random effects models were used. **Results :** Results show that children's divorce significantly reduced their emotional closeness with parents and their financial support to parents, but not financial support from their parents. There is no interaction between gender and children's divorce. **Conclusion :** This paper discusses these findings in the context of changing rural Chinese families where patrilineal tradition was combatting with the process of modernization. **Keywords :** divorce; intergenerational relationships, China

SS26 215-S-4

LONGITUDINAL ANALYSIS OF INFORMAL AND FORMAL CAREGIVING BETWEEN 1999 AND 2009

Emiko TAKAGI¹, Yasuhiko SAITO² (1. College of Health Professions, Towson University, USA; 2. Advanced Research Institute for the Sciences and Humanities, Nihon University, Japan)

Introduction : The Introduction of national long-term care insurance in 2000 created a new public avenue of formal caregiving support to older adults in Japan. This study is intended to delineate longitudinal trends of informal and formal care utilization of Japanese older adults 70 years and older and describe demographic and family contexts that shape patterns of informal and formal care usage. **Method :** The analysis was based on sub-sample of data from the Nihon University Longitudinal Study of Aging (N=4997). The study sample consisted with those who reported at least one ADL or IADL disability in each of the five waves of data collected between 1999 and 2009. Caregiving pattern was assessed with three categories indicating whether the older adult received: informal care only, formal care only, or informal and formal care to assist their ADL and/or IADL difficulties. Frequencies of each care pattern as well as association of demographic and family-related factors with these caregiving patterns were examined across five waves. **Results :** After the implementation of national long-term care insurance, proportion of older adults who utilize formal care service steadily increased, especially for the assistance of ADL disabilities. Utilization of formal care service has become targeted

especially to those who live alone. Despite the increase of formal care service utilization, informal care remains prevalent for many older adults. Conclusion : Increased involvement of formal care providers and continuous presence of informal caregivers require further research on optimal collaboration of informal and formal caregiving for well-being of older adults and their families. Keywords : informal and formal caregiving, Japan

AGING-IN-PLACE ACROSS CULTURES

SS26 216-R-1

DEVELOPING AN AGING IN PLACE MODEL FOR LOW INCOME ELDERLY HOUSEHOLDS

Terry LUM¹, Vivian LOU¹, Tracy TONG², Nan LU³ (1. *Social Work and Social Administration / Sau Po Center on Ageing, The University of Hong Kong, Hong Kong*; 2. *Sau Po Center on Ageing, The University of Hong Kong, Hong Kong*; 3. *Social Work and Social Administration, The University of Hong Kong, Hong Kong*)

Introduction : Most older adults want to stay in their own homes, own community where they live while they age. However, older people in low income community are more likely to be admitted in nursing home. The goals of this study is (1) to understand the service needs of older people living in low income rental estates; and (2) to understand factors associated with the aging-in-place preference of older people in low income naturally occurring retirement communities. Method : Respondents of this study came from four low income public rental estates. We conducted 9 focus group interviews with residents, their services providers, and property management staff of these states. We also conducted face-to-face interview with 400 older residents in these estates. Results : Older people who reported a neighbour support network were 6.26 times more likely to prefer staying in the community and those who had received support from family member living together were 3.1 times more like to prefer staying in the community. Respondents who lived in an estate that had an elderly center were 2.75 times more likely to prefer staying in the community than those who lived in an estate that did not have an elderly centre. Conclusion : A strong neighbour support network and a nearby elderly center are positively associated with older people's willingness to stay in their community as they are. A new AIP services model was developed based on these findings to promote aging in place for frail low income elders in Hong Kong. Keywords : Aging in place, Low income elderly, Housing

SS26 216-R-2

ROLES OF NPOS TO PROMOTE AGING IN PLACE FOR THE ELDERLY LIVING IN URBAN AREA

Mie OHWA (*Department of Social Work, School of Human Welfare Studies Kwansei Gakuin University, Japan*)

Introduction : The percentage of Japanese people aged 65 and over was more than 23% in 2011, which is widely known as the highest ratio in the world. Among the older adults, more than 20% lived alone. In recent years, older people who lived either alone or only with a spouse have increased remarkably. In urban area, there are many frail elderly who are isolated from the community and consequently, they end up being institutionalized. These statistics indicate that it becomes more difficult to maintain life at home as one gets older. Although the Long-Term Care Insurance system has been established, it is not designed to meet every need of each frail elderly. Therefore, it is not sufficient to support the independent life of the elderly in their own homes. Accordingly, the informal sector, such as NPOs and volunteer

groups, is expected to give complementary support to those people in need. Method : Roles of NPOs are examined in this study based on the fact finding survey conducted by the NPOs in Kobe. Results : As a result, NPOs are giving various services, such as cooking, shopping, house cleaning, accompanying to clinics, housekeeping, etc. They provide considerable amount of home based services to the elderly. Conclusion : NPOs play significant roles in promoting aging in place for the elderly in urban area, however, most of them are small and fragile financially. Therefore we need to recognize the roles of NPOs and support them so that they can sustain their services for the elderly in the community. Keywords : aging in place, home and community based services, NPOs (non-profit organizations)

SS26 216-R-3

SMART TECHNOLOGIES TO PROMOTE HEALTH AND WELLBEING OF OLDER AUSTRALIANS LIVING AT HOME

Elizabeth OZANNE (*Social Work, The University of Melbourne, Australia*)

Introduction : This paper will report on two projects auspiced by the Institute for Broadband Enabled Society at The University of Melbourne. Method : The first was a systematic review and critical analysis of the state of implementation of smart home, telehealth, gaming, robotics and social connectedness technologies with the older population in Australia. The second explored the utilization of tablet technologies to ameliorate social isolation in older people working closely with an aged care service provider. Results : The first study found major gaps in the research and development infrastructure needed to fully implement available technologies that could be effectively utilized by older Australians in domestic settings and made some specific recommendations about how this situation might be improved. The second study developed an adapted tablet prototype which was successfully trialed with a very old group living at home and was seen to have significant impacts on reducing social isolation. With a national competitive grant this prototype and is now being rolled out to a larger population. Conclusion : Though there is a lot of local innovation going on in Australia in relation to the utilization of new smart technologies which can be used to support older people living in domestic settings, Australia lags behind other countries in implementing national research and demonstration projects. It is hoped that the rollout of National Broadband and increasing awareness of the impact of an ageing population will ensure increased focus in this area. Keywords : Ageing-in-place, smart technologies

SS26 216-R-4

HOME MODIFICATIONS FOR URBAN COMMUNITY DWELLING OLDER ADULTS WITH FUNCTIONAL LIMITATIONS IN THE UNITED STATES

Susan STARK¹, Emily SOMERVILLE² (1. *Program in Occupational Therapy, Washington University School of Medicine, USA*; 2. *Occupational Therapy, Washington University School of Medicine, USA*)

Introduction : Community-dwelling older adults with chronic conditions are at significant risk for disability in activities of daily living. Vulnerable to barriers in the physical environment such as stairs, low lighting or unsafe bathrooms, they may develop excess disabilities caused by environmental barriers. Notably, disabled older adults also report reduced community engagement. The purpose of this study was to determine if a home modification intervention can improve daily activity performance at home and in the community among chronically diseased older adults with mobility impairments. Method : We conducted a matched controlled trial of home

modifications in a sample of 40 older adults with chronic conditions. We measured their performance before and after the intervention with a 6 month follow-up. Treatment was provided by occupational therapists according to a manualized intervention protocol. Results : The average age of the participants was 78.8 years. Most (92%) were female and widowed (53%). The average number of comorbidities was 10. The average number of daily activity problems addressed was 6. For the primary endpoints of performance of activities and satisfaction with activities, as measured by the In-Home Occupational Therapy Evaluation, there is a main effect of improved performance and satisfaction in the treatment group ($p < .000$). Conclusion : Geo-coded maps of before and after intervention community participation indicate differential patterns of community participation. The intervention and assessment procedures were well tolerated. Home modifications do improve the performance of daily activities at home and may impact community participation. Limitations of the study include a brief activity monitoring period. Keywords : Aging-in-place, home modification, home and community based services

MAKING THE CASE FOR AGE-FRIENDLY ENVIRONMENTS: AN INTERDISCIPLINARY APPROACH

SS26 218-S-1

GLOBALIZATION AND THE DEVELOPMENT OF AGE-FRIENDLY CITIES

Chris PHILLIPSON¹, Tine BUFFEL², Fleur THOMESE³ (1. School of Social Sciences, The University of Manchester, United Kingdom; 2. Adult Educational Sciences / School of Social Sciences, Vrije Universiteit Brussel / The University of Manchester, Belgium; 3. Sociology, Vrije Universiteit Amsterdam, Netherlands)

Introduction : This contribution applies issues relating to globalization and its impact on urban life to the World Health Organization concept of 'age-friendly' cities. The paper examines data exploring the inter-relationship between urbanization and population ageing and the benefits as well as challenges which living in urban areas brings to older people. Method : The paper draws on population data from a number of OECD countries to illustrate the demographic diversity of urban populations in respect of people aged 60 and over. This analysis is also linked to the variety of socio-economic contexts presented by cities and the implications for those experiencing the range of changes associated with later life. Results : The paper will demonstrate a number of major issues for older people living within cities, examining in particular the contrast between those 'ageing in place' and the highly mobile populations characteristic of cities; evidence about the impact of global industrial change on everyday life in old age; and evidence for the role of amenities and services in cities in providing significant resources for old age. Conclusion : The findings indicate the need for a new strategy to be developed to support older people living in cities. The paper will explore this in relation to three areas: first, developing the idea of the 'social city'; second, developing 'rights to the city' to reflect changing needs across the life course; third, developing strategies for creating 'social networks' within cities. Keywords : urbanisation, globalization, ageing in place

SS26 218-S-2

AGEING AND PSYCHOLOGICAL WELL-BEING IN A GLOBAL CITY: THE ROLE OF AFC FACTORS IN TUEN MUN, HONG KONG

Elaine Yuen Ling YAU (Lingnan University, Hong Kong)

Introduction : Hong Kong is one of Asia's more demographically-aged

cities, with 14% of population aged 65+ in 2012, projected to be 23% by 2025. Facilities and transport are generally good by world standards although the urban environment may not be particularly 'age friendly'. This research was interested in socio-cultural variables and AFC characteristics in its predominantly Chinese population, and relationships with psychological well-being (PWB). Method : Drawing on a range of urban sub-areas, a modified AFC questionnaire collected 503 valid responses in Tuen Mun, a 'new town' of half a million population. Detailed analyses including explanatory factor analysis (EFA) and confirmatory factor analysis (CFA) were conducted to investigate relations in the data. Results : EFA identified four factors: Factor 1, "social participation"; 2, 'Community participation and information exchange'; 3 'transportation and housing arrangements'; 4, 'Social infrastructure'. However, CFA indicated the intuitively-acceptable four factor structure did not fit the empirical data well. Further exploration of the theoretical underpinning of the AFC items used a second-order model although again the fit was not good. Conclusion : Findings supported the notion that, when older dwellers reported positive perceptions of physical and social infrastructure, they also tended to report better PWB. Most AFC dimensions were positively related to PWB, though associations were statistically small to medium. Whilst social configuration and infrastructure might relate to PWB, other proximal factors, such as physical health, might be more salient determinants. As findings were mixed on latent dimensions underlying AFC characteristics, further analysis and eventually larger samples are planned. Keywords : Age friendly cities; psychological well-being; Hong Kong

SS26 218-S-3

BEYOND CITY LIMITS: EXPLORING AGE FRIENDLINESS IN NON-URBAN SETTINGS

Thomas SCHARF¹, Norah KEATING² (1. Irish Centre for Social Gerontology, NUI Galway, Ireland; 2. Research on Aging, Policies, and Practice (RAPP), Department of Human Ecology University of Alberta, Canada)

Introduction : The literature on age-friendly communities predominantly focuses on a model of urban ageing, failing to reflect the diversity of the community settings in which people age. This paper addresses this gap by examining the concept of community in non-urban contexts, asking what makes a good fit between older people and their environment. Method : The question is explored in relation to two types of non-urban context using data from separate empirical studies in Canada and England. In Canada, data encompass autobiographical and biographical accounts of older adults with different needs and resources ('marginalized' and 'active') living in two contrasting rural communities ('bucolic' and 'bypassed'). In England, data arise from interviews, observations and directed writing exercises with older adults living in a purpose-built retirement community that has recently undergone substantial redevelopment. Results : Comparative analyses at the interface of communities and older adults highlight two issues. First, people with similar characteristics and needs ('marginalized' or 'active') experience a good fit in some community settings, but not in others. Second, communities themselves benefit differently from their 'active' and 'marginalized' residents within the context of available community resources. Such features emerged in different ways in the rural communities in Canada and the retirement community in England. Conclusion : We argue that age friendliness should be reconceptualized, moving from the original WHO definition (2007) to explicitly accommodate different community needs and resources, to be more inclusive as well as more interactive and dynamic incorporating change over time in people and place. Keywords : age

friendly communities, comparative perspectives, non-urban settings

SS26 218-S-4

HOW DO URBAN ENVIRONMENTS INFLUENCE CHANCES FOR INDEPENDENT LIVING IN OLD AGE?

Josefine HEUSINGER¹, Birgit WOLTER² (1. SGW, University of Applied Sciences Magdeburg-Stendal, Germany; 2. Research, Institute for Gerontological Research - IGF e. V., Germany)

Introduction : Due to increasing frailty the radius of activity of most older people focuses more and more on the neighbourhood. Therefore the quality of nearby infrastructure such as medical care, shops, pleasant public spaces or public transport becomes more relevant for an independent live. Furthermore, empirical findings of several German studies provide evidence that the unequal distribution of cultural, economic and social resources among different social milieus generates specific strengths and weaknesses concerning the dealing with demands on support needed by elderly people (Blinkert/Klie 1999, Heusinger/Klunder 2005). Method : In the research project "Neighbourhood" (2008-2011 funded by the German Ministry of Education and Research) we investigated the sociospatial infrastructure of three neighbourhoods and the milieu specific resources and attitudes of old care recipients living in private households. We explored how these dimensions interact and influence a self-determined everyday life in spite of frailty. The three research areas were a working class tenement quarter in former West Berlin, a high density housing area in former East Berlin, and a rural area. Results : The results show that especially deprived old people with similar individual resources have different chances for care and everyday life organization according to their desires and needs in the compared neighbourhoods. Crucial is access to counseling, supporting services and medical care; an infrastructure for daily needs and opportunities for socializing; as well as the cooperation and networking of local stakeholders. Conclusion : The findings of our investigation show issues for further local political strategies strengthening more equitable chances for independent living in old age. Keywords : age-friendly environment, sociospatial resource, social milieu, frailty, self-determination

SS26 222-C

BUILDING A GERIATRIC-FRIENDLY EMERGENCY DEPARTMENT

SS26 222-C-1

GERIATRIC TRAINING IN EMERGENCY MEDICINE RESIDENT EDUCATION

Melissa STILES (Family Medicine, University of Wisconsin School of Medicine and Public Health, USA)

Introduction : Emergency medicine residents in training and practicing physicians are not prepared to deal with the "silver tsunami". In the US in 2006 there were 17 million geriatric emergency department visits. This number will grow exponentially as the number of US elders will increase to 71 million people by 2030. The Institute of Medicine (IOM) and the American College of Emergency Physicians (ACEP) have both advocated for a geriatric core curriculum for residents in training and practicing physicians. Method : The session will provide an overview of model geriatric curricula for residents and practicing physicians. The session will focus on specific competencies that comprise a core geriatric emergency medicine curriculum. We will also discuss novel ways of using emerging technologies for curriculum delivery (i.e. Simulation, IBooks and Podcasts). Additionally, we will discuss the evolution of geriatric emergency

medicine fellowships for practicing EM physicians, and models of continuing medical education in geriatrics for practicing EM physicians. Results : There are various models of geriatric curriculum that can be utilized for both residents and faculty physicians. In 2010, an expert panel developed the minimum geriatric competencies that should be included in future curricula. Conclusion : Emergency medicine physicians need to be trained to effectively manage the growing geriatric population. Enhanced training in geriatric emergency medicine will lead to higher quality of care, lower hospitalization rates and decreased medical errors. Keywords : Emergency Medicine, Education

SS26 222-C-2

THE GERIATRIC ED: ESSENTIAL INFRASTRUCTURE AND CLINICAL CARE PATHWAYS

Kathleen Eleanor WALSH (Emergency Medicine, University of Wisconsin, USA)

Introduction : The global population is aging at an accelerated rate. A central question is whether this aging population will be accompanied by sustained or improved health. The answer lies partly in the ability of families and communities, as well as health service delivery systems, to provide optimal support to older persons. Method : Various models of care have been developed to improve the pre-hospital and hospital medical evaluation and treatment of older geriatric patients in the emergency department. There have been variable results on functional and health outcomes, as well as health services utilization. These emergency department models include geriatric consult service, physician led assessment teams, nurse-led intervention and post-discharge review. Results : Older patients have distinct patterns of service use and care needs. Future emergency department geriatric care models will require a robust and adaptable organization that incorporates appropriately trained personnel; reliable streams of communication between prehospital, emergency department, inpatient, and outpatient services, valid protocols and a geriatric-friendly infrastructure. We will discuss evolving management models within the context of contemporary emergency care for geriatric adults. Conclusion : Emergency departments are at the front line to face the forthcoming increased use of the health care system by the world's aging population. Emergency care services will need to adjust system wide to manage the impact of these demographic changes. International collaboration between emergency care providers and health care systems is critical during this worldwide healthcare reform. Keywords : geriatric emergency department, clinical care models, systems

SS26 222-C-3

THE ROLE OF PALLIATIVE CARE IN GERIATRIC EMERGENCY MEDICINE

Mark ROSENBERG (Emergency Medicine, St Josephs Healthcare System, USA)

Introduction : People die and they die of one of four possible trajectories: sudden death, terminal illness, organ failure, and frailty. All but sudden death benefit by palliative care. Geriatric Emergency Medicine must include an understanding of disease trajectory, prognostication, and symptom management in end of life care. This presentation will define palliative care, discuss benefits of palliative care and how it can be incorporated into Geriatric Emergency Department patient care and management. Method : Research focusing on palliative care delivery in emergency medicine will be discussed with case study review. Surveys from around the globe find that most people want to die in familiar surroundings, in a place that is

comfortable both physically, psychologically, and spiritually. Results : Research supports the use of palliative care interventions early in the disease trajectory to promote quality of life as well as reduce costs associated with treatments. Studies have consistently demonstrated that palliative care consultations and interventions result in reduced symptoms, greater emotional support, and improved patient and family satisfaction. Conclusion : Palliative Medicine Programs in the Emergency Department focus on providing better care for patients with severe and life limiting illness. Implementing a palliative medicine program in the Emergency Department provides the opportunity to change the existing paradigm of care for chronic disease. Specifically, palliative care in Geriatric Emergency Medicine, may alter the trajectory of care by discussing treatment options with patients and their families. Keywords : Palliative Care, End of Life, Emergency Department

SS26 222-C-4

“SELLING” GERIATRIC EMERGENCY MEDICINE TO HOSPITAL ADMINISTRATORS: QUALITY METRICS AND COST-EFFECTIVENESS

Chik Loon FOO (*Emergency Department, Tan Tock Seng Hospital, Singapore*)

Introduction : Despite the imminent Epidemic of the Elderly, many emergency departments (EDs) continue to face resistance from administrators in establishing a geriatric emergency medicine (GEM) service. Showing cost-effectiveness of a GEM model is an uphill task: geriatric emergency interventions are time-consuming, results in the literature have been mixed, outcomes take months to demonstrate, and positive outcomes show limited sustainability. Method : GEM has two broad aims: to reduce inappropriate admissions, and to avoid high-risk discharges. In the face of current ED pressures of bed block and high litigation, these two goals may persuade administrators to relent. A small group of ED elders ? while unsuitable to return to their pre-morbid environment due to acute illness or injury ? may also not require acute high-level medical care. Their admissions can be avoided by right-siting them to cheaper yet competent alternatives such as subacute, transitional, community and home care. Results : On the other hand, GEM also serves as a safety net to prevent high-risk elders from being discharged from ED. To achieve this, there must be adequate and ongoing training of ED staff in the typically atypical presentations of elderly emergencies. Providing geriatric screening also unravels unmet needs otherwise hidden behind the primary complaint. Failure to address these needs put patients at risk of future ED reattendance and hospitalization. Conclusion : Pure health economics and quality indicators may not be helpful arguments for a GEM service. Instead, admission avoidance and reducing ED reattendance are more achievable outcomes and hence likely to be more persuasive. Keywords : geriatrics, emergency

SS26 222-C-5

ACUTE EMERGENCY DEPARTMENT PAIN MANAGEMENT IN THE GERIATRIC ADULT

Andrew K. CHANG¹, Christopher CARPENTER² (*1. Emergency Medicine, Montefiore Medical Center, USA; 2. Emergency Medicine, Washington University in St. Louis, USA*)

Introduction : Older adults are at high risk for untreated and undertreated pain. A pharmacologic regimen must combine satisfactory analgesia with sufficient safety. We compared a rapid, 2-step IV hydromorphone titration protocol against usual care in older ED patients. Method : ED patients ≥ 65 years with severe pain were randomized to the hydromorphone titration protocol or usual care.

Hydromorphone titration patients received 0.5 mg IV hydromorphone. Usual care patients received any dose of any IV opioid. At 15 minutes, both groups were asked, “Do you want more pain medication?” Hydromorphone titration patients who answered “yes” received a second dose of 0.5 mg IV hydromorphone. Usual care patients who answered “yes” had their treating attending notified, who then could administer any (or no) additional medication. The primary outcome was satisfactory analgesia defined as the patient declining additional analgesia at least once when asked at 15 or 60 minutes after administration of initial opioid. Dose was calculated in morphine equivalent units (MEU: 1 mg hydromorphone = 7 mg morphine). Results : 83.0% of 153 patients in hydromorphone titration group achieved satisfactory analgesia compared to 82.5% of 166 patients in the usual care group ($p=0.91$). Patients in the hydromorphone titration group received lower mean initial doses of opioids at baseline than patients in UC (3.5 MEU vs. 4.7 MEU, $p<0.001$) and lower total opioids through 60 minutes (5.3 MEU vs. 6.0 MEU, $p=0.03$). Conclusion : Titration of IV hydromorphone in increments of 0.5 mg provides comparable analgesia to usual care with less opioid over 60 minutes. Keywords : Pain, Emergency Department, Elderly

SS26 223-C

STRESS: PREVENTION OR INDUCTION OF AGEING AND AGE-RELATED DISEASES? AN INTERDISCIPLINARY APPROACH

SS26 223-C-1

CELLULAR STRESS IN BIOLOGICAL AGING: A DOUBLE-EDGED SWORD

Andreas SIMM (*Cardiothoracic Surgery, University Hospital Halle (Saale), Germany*)

Introduction : Biological ageing is induced by the gradual accumulation of cellular and molecular faults. An important cause of faults is intense stress like oxidative or glycolytic stress. Whereas high stress induces premature aging, low stress can induce the genetic repair/defense systems leading to increased life span. An example for such a stressor are advanced glycation endproducts (AGEs). AGEs can induce inflammation, oxidative stress, protein dysfunction and cell death. They are considered as biomarkers of ageing and are associated with cardiovascular diseases. Besides endogenous formation, significant amounts of AGEs are taken up with food. Although nutritional AGEs are considered as undesirable, proinflammatory agents, they may also enclose potentially beneficial antioxidants. Method : Mouse cardiac cells were stimulated with bread crust (high AGEs) and the activation of signal transduction pathways as well as gene expression were analysed. Mice were fed with bread crust containing diet to prove the in-vivo relevance for the heart. Results : In mouse cardiac fibroblasts, bread crust extract induced a moderate elevation of ROS production causing an activation of p42/p44MAPK, p38MAPK and NF- κ B, followed by increased expression of antioxidative enzymes. Preconditioning studies demonstrated that this was sufficient to protect cardiac fibroblasts and rat adult cardiac myocytes against severe oxidative stress. Furthermore, mice, fed a bread crust containing diet, exhibited a similarly improved cardiac expression of antioxidative defence genes. Conclusion : The consumption of AGEs can therefore contribute to an improved antioxidant status of the heart, thus exhibiting cardioprotective effects in case of severe oxidative stress as in ischemia reperfusion injury. Keywords : multidisciplinary, stress response, hormesis

SS26 223-C-2

AGING BABY BOOMERS: SOCIAL STRESS AND QUALITY

OF LIFE

Franz KOLLAND, Anna WANKA (*Institute of Sociology, University of Vienna, Austria*)

Introduction : The cohorts born in the first decades after World War II are on the basis of socio-demographic data referred to as the “Baby Boomer” generation. Baby Boomers, born between 1946 and 1964, are an important group in most western countries because they are numerous and entering the phase of life when morbidity is likely to become prevalent. Baby boomers will be ageing in a unique demographic context in which there has been a significant shift from a youth dominated age structure to one in which there are much higher percentages of people over 65. Baby Boomers, in general, have often been characterized in popular and scientific literature as narcissistic, individualistic, demanding, and focused on self-realization. These values are in contradiction to care taking and volunteering obligations, a misfit that causes stress. **Method :** Literature review and analysis of SHARE-Data. **Results :** For Baby Boomers research findings indicate cohort effects, effects of value changes, familial obligations and poor health behaviours as stressful events. In particular, Baby Boomers are getting stressed out by caring for different family members (parents, children, grandchildren), which causes a triple threat. Qualitative studies demonstrate (Guberman et al. 2012; Seaman 2012) that they feel stressed being obliged to care for their parents and to integrate themselves into volunteer work. And Baby Boomers are exhibiting worrying health trends, e.g. higher obesity rates, diabetes, and cardiovascular diseases. **Conclusion :** To moderate these stressors Baby Boomers intend to identify less with their family commitments and the obligation to care. **Keywords :** Baby Boomers, Social stress, health, care

SS26 223-C-3

STRESS OF LATE-LIFE SENSORY IMPAIRMENT: A DIFFERENTIAL VIEW

Hans-Werner WAHL¹, Vera HEYL², Philipp DRAPANIOTIS¹ (*1. Department of Psychological Aging Research, Heidelberg University, Germany; 2. Institut für Sonderpädagogik, University of Education, Germany*)

Introduction : The experience of vision and hearing loss is commonly considered as a major stress factor in advanced old age, because of its immediate impact on day-to-day functioning in dealing with spatial and social environmental interactions. We considered a broad range of successful aging indicators and simultaneously compared older adults with vision impairment, hearing impairment, and without sensory impairment. We also included a small group of dual sensory impaired older adults. **Method :** Data came from samples of severely visually-impaired (VI; N=121; mean age: 82.6 years), severely hearing impaired (HI; N=116; mean age: 82.7 years), dual sensory impaired (DI; N = 43; mean age: 83.4 years), and sensory-unimpaired older adults (UI; N=150; mean age: 82.3 years). Participants underwent a wide-scale assessment, including everyday competence, cognitive functioning, social resources, self-regulative strategies, as well as cognitive and affective well-being. We also assessed the 4-year survival status (except DI). **Results :** The most pronounced difference between groups appeared in the area of everyday competence (lowest in VI and DI). Multi-group comparisons in latent space revealed similar but also different strength of relations between health, everyday competence, social resources, self-regulation and overall well-being, depending on sensory status. After four years, mortality in VI (29%) and HI (30%) was significantly higher than in UI (20%) at the bi-variate level, but the difference disappeared after controlling for confounders in a multi-variate analysis. **Conclusion :** A multi-

dimensional approach to the understanding of stress related to the experience of sensory impairment in old age reveals a complex picture of loss and maintenance in psychosocial adaptation. **Keywords :** Stress, Coping, Sensory Impairment

SS26 223-C-4

STRESS AND HEALTHY AGING ? GERIATRIC PERSPECTIVES

Manfred GOGOL (*Geriatric Department Hospital Lindenbrunn, German Society of Gerontology and Geriatrics, Germany*)

Introduction : As stress can induce premature aging and chronic morbidities it is questionable how to manage this condition. **Method :** In cardiovascular disease there is a growing evidence that chronic inflammation constitutes a chronic stress situation which leads to structural organ damage, manifestation of disease and functional decline. **Results :** Because chronic inflammation is discussed as a possible mechanism of aging itself primary or secondary prevention strategies are required. **Conclusion :** The biological basis for this strategies is the fact that nutritional factors, activity and training, successful models of managing negative life events, and the active involvement in societal life are beneficial for healthy aging. **Keywords:** Stress, healthy aging

SS26 224-R

MALNUTRITION-, FALLS- AND SARCOPENIA-RELATED PROBLEMS IN FRAIL OLDER PEOPLE

SS26 224-R-1

PREDICTING FALLS IN THE ELDERLY RECEIVING HOME CARE: THE ROLE OF MALNUTRITION AND IMPAIRED MOBILITY

Judith Mm MEIJERS¹, Jos Mga SCHOLS², Jacques NEYENS¹, Yvette LUIKING³, George VERLAAN³, Ruud Jg HALFENS¹ (*1. Health Services Research, Maastricht University, Netherlands; 2. General Practice and Health Services Research, Maastricht University, Netherlands; 3. Centre for Specialised Nutrition, Danone Research, Netherlands*)

Introduction : Malnutrition and falls are major care problems in frail older people receiving home care, and may contribute to increased morbidity and care dependency as well as subsequent institutionalization. This study explores the relationship between malnutrition, mobility and falls in Dutch frail older people receiving home care. **Method :** This study is part of the annual National Prevalence Measurement of Care Problems of Maastricht University (LPZ). This cross-sectional prevalence measurement included 2971 clients (older than 65 years) from 22 home care organizations. The number of fallers was prospectively registered during 30 days; malnutrition was assessed by low BMI, undesired weight loss and low nutritional intake. The mobility item in the Care Dependency Scale (CDS) questionnaire was used to assess mobility dependency. Univariate and multivariate logistic regression analysis were used to test the relationships. **Results :** 2971 clients from 22 home care organizations participated. Clients had a mean age of 81.5 years (Sd 7.0) and received home care for about 2.75 years. The prevalence of malnutrition and falls was respectively 16.2% and 12.2%. Most importantly the study indicated by multivariate analysis that fallers could be predicted by the risk factors immobility ((OR 2.516 95% CI 1.144-5.532), high care dependency (OR 1.684 95% CI 1.121-2.532) and malnutrition (OR 1.978 95% CI 1.340-2.920). **Conclusion :** The findings of this study confirm that malnutrition, impaired mobility and care dependency are potential reversible factors related to falls.

Consequently early identification and management of nutritional status, impaired mobility and care dependency are vital facets for a potential fall prevention strategy. Keywords : Falls, Malnutrition, Mobility

SS26 224-R-2

MALNUTRITION IS ASSOCIATED WITH AN INCREASED RISK OF FALLS AND IMPAIRED ACTIVITY IN ELDERLY PATIENTS IN DUTCH RESIDENTIAL LONG-TERM CARE

Jacques NEYENS¹, Ruud HALFENS², Marieke SPREEUWENBERG², Judith MEIJERS², Yvette LUIKING³, George VERLAAN³, Jos SCHOLS⁴ (1. Health Services Research, Maastricht University, Belgium; 2. Health Services Research, Maastricht University, Netherlands; 3. Centre for Specialised Nutrition, Danone Research, Netherlands; 4. General Practice and Health Services Research, Maastricht University, Netherlands)

Introduction : Falls are frequent in long-term care, with considerable health consequences. This study explores the relationship between malnutrition, activity, and falls in Dutch long-term care (LTC) residents and the influence of nutritional intervention on this relationship. Method : A secondary data analysis of a cross-sectional, multi-centre point prevalence and incidence measurement. Setting: 81 long-term care settings in The Netherlands. Participants: 6.701 long-term care residents aged 65 and older; mean age 84; 70% female. Prevalence measurements of nutritional status and activity, and a 30 days incidence measurement of falls. Results : Of all participating residents, 9.8% sustained at least one fall, and 22.8% was malnourished. Malnourished residents were more often a faller (OR 1.78; $p < 0.01$) and inactive (OR 1.7, $p < 0.01$) than non-malnourished residents. Multivariate analysis confirmed the relation between malnutrition and fallers, without interference of activity. In the malnourished group with nutritional intervention, the percentage of fallers was lower than in the malnourished group without nutritional intervention (OR 0.738; $p = 0.056$). Conclusion : Malnutrition is associated with an increased risk of being a faller and with impaired activity in Dutch LTC residents. Malnourished residents who receive nutritional intervention have a lower risk of being a faller. Keywords : Nutrition, falls, LTC

SS26 224-R-3

RATIONALE AND DESIGN OF A CROSS-SECTIONAL STUDY ON THE PREVALENCE, CHARACTERIZATION AND HEALTH AND ECONOMIC CONSEQUENCES OF SARCOPENIA IN COMMUNITY-DWELLING OLDER PEOPLE IN THE NETHERLANDS

Donja MIJNARENDS¹, Judith MEIJERS¹, Ruud HALFENS¹, Sovianne Ter BORG², Yvette LUIKING², Sjors VERLAAN², Jos SCHOLS¹ (1. Health Services Research, School CAPHRI, Maastricht University, Netherlands; 2. Nutricia Advanced Medical Nutrition, Danone Research, Centre for Specialised Nutrition, Netherlands)

Introduction : Sarcopenia is defined as low muscle mass, muscle strength and physical performance, and has a negative impact on health outcomes. The aim of this study was to design a cross-sectional study with validated and feasible tools to measure the prevalence of sarcopenia, characterize lifestyle parameters and determine health and economic consequences of sarcopenia in community-dwelling older people. Method : A literature review was performed to select the most valid and reliable tools to measure muscle mass, strength and physical performance. Next, a pilot study was performed in two settings (community dwelling older people in homes for older people and in

assisted-living facilities; age ≥ 65 years). Home visits (n=8) were performed, applying the selected tools from literature, blood sampling and questionnaires. The feasibility of the study design was evaluated by two questionnaires, one filled in by each participating older person, one filled in by the researcher. Results : Based on the review, bio-electrical impedance, handheld dynamometry and the Short Physical Performance Battery were selected to measure muscle mass, strength and physical performance, respectively. Home visits took approximately two hours and all measurements were perceived as feasible according to both the participants and researcher. Overall, tests could be easily performed (n=7). Conclusion : The design of the cross-sectional study in community-dwelling older people was considered feasible, using validated and reliable tools to measure parameters of sarcopenia. The cross-sectional study will be executed in 2013. Keywords : Sarcopenia, feasibility

SS26 224-R-4

SARCOPENIA IN ACUTELY ILL HOSPITALIZED GERIATRIC PATIENTS. PREVALENCE AND FEASIBILITY STUDY

Walther SIPERS¹, Jos SCHOLS² (1. Geriatric Medicine, Orbis Medical Centre, Netherlands; 2. Caphri/ Faculty of Health, Medicine and Life Sciences, Maastricht University, Netherlands)

Introduction : Acute hospitalization is a hazardous event for frail elderly with 30 -50 % of the survivors decline in their level of daily function. Accelerated muscle loss is an important causal factor for functional decline and loss of physical performance. This loss of muscle mass, strength, and/or functioning with aging is called sarcopenia. Currently, clinicians do not look for sarcopenia as a target for treatment in hospitalized older people. In 2010 the European Working Group on Sarcopenia in Elderly People first came to a consensus on diagnostic criteria and on a diagnostic workup for sarcopenia. Yet, the workup is not completely suitable for clinical practice. For example to determine muscle mass Dual-energy X-ray absorptiometry (DXA) and Bio impedance analysis are advised, both methods with advantages and disadvantages. In this study was looked for the prevalence of sarcopenia and the feasibility of the diagnostic work up in acute ill hospitalized elderly admitted to a geriatric ward in Orbis Medical Centre in the Netherlands. Method : In this study, which started in April 2012, was chosen for the bio impedance spectrometry (BIS) because in contrast to DXA it is possible to measure separately intra-cellular and extra-cellular water. Subsequently, BIS may be less sensitive to changes in hydration state, inexpensive, easy to use and appropriate for bedridden patients. To determine muscle strength, assessment of hand grip strength was used and for muscle function the Short Physical Performance Battery. Results : The study is still on going. Conclusion : The preliminary results of this study will be presented. Keywords : sarcopenia, hospitalized geriatric patients

SS26 225-C

THE ACUTE CARE FOR THE ELDERLY (ACE) UNIT IN THE DIGITAL AGE: UNDERSTANDING THE INTERFACE BETWEEN "HIGH TECH" AND "HIGH TOUCH" IN ELDERS ADMITTED TO THE ACUTE CARE HOSPITAL SETTING

SS26 225-C-1

OVERVIEW OF INPATIENT CARE & THE ACUTE CARE FOR ELDERLY UNIT MODEL (DR. OAKES)

Sandra Liliana OAKES (Family and Community Medicine, University of Texas Health Science Center, San Antonio, USA)

Introduction : Acute care of the elderly unit is a specialty area of practice. This model of care has 3 major components. Specialized environmental design to tailor to the needs of older adults, daily inter professional team work, nurse driven protocols and emphasis on quality improvement systems of care. **Method :** Review of the evidence behind ACE units will be done and description of the ACE development and implementation in San Antonio Texas will be briefly describe. 1. initial steps in developing and ACE 2. Developing a business model 3. Building bridges in all inter-professional areas 4. ACE and technology 5. tracking outcomes 6. Quality improvement. **Results :** Ace units have demonstrated savings in hospital care in USA by decreasing length of stay, improving functional outcomes and making a difference in quality and patient center care. ACE can improve processes of care, satisfaction, and potentially function and discharge location **Outcomes** depend heavily on local environment, resources, commitment. **Conclusion :** ACE units are one of the hospitalized models that can make a difference in the care of older adults. The evidence suggest that the model is cost effective. ACE model units can take different shapes depending the sites. **Keywords :** ACE unit, Acute Care of Elderly, quality improvement

SS26 225-C-2

A REAL-TIME QUALITY IMPROVEMENT CHECKLIST: THE ACE TRACKER

Ariba KHAN (*Geriatrics, AUWMG, USA*)

Introduction : The Acute Care for Elders (ACE) unit is characterized by an environment that fosters patient self-care, guidelines to maintain and restore patient functional status, interdisciplinary team rounds, discharge planning and medical care review. There may be challenges to implementing and disseminating ACE principles through out the hospital. The electronic medical record (EMR) may be used effectively to meet these challenges. **Method :** "ACE Tracker" (Acute Care for Elders Tracker) is a real-time report electronic resource that summarizes information from the electronic medical record (EMR) of patients 65 years and older. This report requires no additional evaluations of the patient by the health care team. The geriatrician may collaborate with the inter-disciplinary team to identify vulnerable elderly. **Results :** Data from the electronic medical record is compared over 13 hospitals across a health care system. **Conclusion :** ACE tracker is a real-time report that accesses data from the electronic medical record that can widely disseminated across health care systems and improves the quality of care. **Keywords :** Hospital Care, EMR

SS26 225-C-3

BRIDGING THE GAP AND IMPROVING THE QUALITY: CARE TRANSITIONS BETWEEN THE HOSPITAL & NURSING HOMES

Yanping YE (*Division of GeriatricCommunity and Family Medicine, University of Texas Health Science Center at San Antonio, USA*)

Introduction : In ACE unit, new patients are screened for personal risk factors, which are closely monitored during their stay. An interdisciplinary team that meets daily to discuss every currently admitted patient, ensuring that all members of the ACE team are on the same page about treatment and discharge plan. For the hospitals that do not have a physical ACE unit, this process improvement concept can be used to facilitate a safe discharge and quality transitional care. **Method :** An interdisciplinary team (IDT) meets every week day for 30 minutes to discuss every admitted patient. Using risk assessment tools and ACE tracker, team members are able to identify the individual patient's risk for readmission. The

geriatrician works as a team leader to strategize the risk factors and collaborate with other team members to ensure the safety and quality of transitional care. The patients who are discharged to nursing homes will be seen by physician or nurse practitioner within 72 hours. **Results:** The average length of stay at our ACE unit is only 3.2 days. Our ACE unit 30-day readmission rate for the same diagnosis is just over 3 percent, compared with the national rate of 14 percent. **Conclusion :** Hospitals are full of hazards for our frail elders. ACE unit is designed to reduce all the complications that elders may suffer in hospitals. It is the first place to ensure a high quality of transitional care. The interdisciplinary team approach is proven an excellent model to facilitate the care transitions between the hospital and nursing homes. **Keywords :** ACE unit, transitional care, IDT

SS26 225-C-4

DELIRIUM REDUCTION PRACTICES IN THE ACE UNIT

Sandra Liliana OAKES (*Family and Community Medicine, University of Texas Health Science Center/ Christus Santa Rosa Hospital, USA*)

Introduction : Delirium is a sudden change in mental status characterized by severe confusion that can last hours or days. It is not a disease, but rather a set of symptoms that are usually caused by pre-existing diseases or medications. Delirium patients have increase morbidity and mortality up to 2 years from first episode, it increase length of stay, health care utilization, patients have high risk of institutionalization Delirium patients are only diagnose accurately by MD 20 % of the time, by the RN's 50 % of the time. The ACE unit has implemented evidence based delirium protocols to prevent it. **Method :** Implementing a culturally competent delirium protocol. Phase 1: (2/6) Increase utilization of the Cognition and Mobility components at the Acute Care of Elderly(ACE) unit by 90% in the next 3 months at a health care system in San Antonio, Texas Measure observations using Quality improvement tools: Shadow nursing personnel (day & night shifts) Figure out barriers/fish bone Illustrate ideal processes through flow charts Make decisions for implementation Standardization of procedures. **Results :** Implementation of cognition protocol perform by nurses increase by 67%. This include utilization of mini-cog. Development of bilingual communication boards to reinforce cognition, visual , auditory, hydration and sleep hygiene. Implement mobility protocol increase by 80% by optimizing the work of a trained restorative aid and nurse training in functional status and prevention of functional decline. Bilingual brochure was develop to engage and educate patients & families in delirium prevention. **Conclusion :** Delirium prevention protocols is achievable by promoting quality improvement processes. **Keywords :** ACE unit, delirium, quality improvement

ICT IN DEMENTIA: FROM ASSESSMENT TO STIMULATION

SS26 226-C-1

ALZHEIMER PATIENT ACTIVITY ASSESSMENT USING MULTI-SENSOR SYSTEMS

Francois BREMOND (*STARS, INRIA, France*)

Introduction : We present several sensor-based technologies to support the diagnosis and evaluation of dementia progress in early stage of Alzheimer Disease (AD). **Method :** We compare 2 systems based on the analysis of video and accelerometer data to assess older people performance in instrumental activities of daily living (IADL) and physical tests defined in the clinical protocol developed by the Memory Center of the Nice Hospital and the Department of Neurology at National Cheng Kung University Hospital ? Taiwan. This clinical

protocol defines a set of IADLs (e.g., preparing coffee, watching TV) that could provide objective information about dementia symptoms and be realistically achieved in the observation room of both sites. The proposed system uses a constraint-based ontology to model and detect events based on different sensor readings (e.g., 2D video stream data is converted to 3D geometric information which is combined to a priori semantic information, like defined zones of interest or posture estimations given by accelerometer). The ontology language is declarative and intuitive (as it uses natural terminology), allowing medical experts to define and modify the IADL models. Results : The proposed system has been tested with 44 participants (healthy=21, AD=23). A stride detection algorithm has also been developed by the Taiwanese team for the automatic acquisition of patient gait parameters (e.g., stride length, stride frequency) using a tri-axial accelerometer embedded in a wearable device. It has been tested with 33 participants (healthy=17, Alzheimer = 16) during a 40 meters walking test. Conclusion : This new system by combining accelerometer and video data can assess. Keywords : analysis of activities of daily living, multiple sensor monitoring systems, Alzheimer's dementia.

SS26 226-C-2

SWEET-HOME: WALKING PATTERN MEASUREMENT FOR ASSESSING ALZHEIMER DISEASE PATIENTS

Yu-Liang HSU¹, Chien-Wen LIN¹, Chun-Yao WANG¹, Ming-Chyi PAI², Hao-Li WU¹, Robert PHILIPPE³, Francois BREMOND³, Pau-Choo CHUNG¹ (1. *Electrical Engineering, National Cheng Kung University, Taiwan*; 2. *Institute of Gerontology, National Cheng Kung University, Taiwan*; 3. *Centre Mmoire de Ressources et de Recherche, Universit de Nice Sophia Antipolis, France*)

Introduction : Alzheimer disease (AD) is becoming one critical healthcare issue for the study of gerontology. Among the various approaches for the detection of AD, walking pattern has been considered as one invasive and convenient biomarker. Method : In our France-Taiwan integrated project, an inertial sensor based approach has been proposed to measure the walking patterns combined with video based behavior analysis for the assistance of clinical diagnosis of AD. In this presentation we will focus on the discussions of gait parameters obtained from the computation of the inertial sensors for the analysis of walking patterns when the subjects are under different mental loadings. Results : Our experiments show that with heavy mental loading, even the healthy control (HC) normal subjects will be disturbed causing the gait parameters change. However, some parameters show that the disturbances to the AD subjects are more influential than the normal subjects. Balance evaluation is also considered as a biomarker. Therefore, a balance measurement design with the inertial sensors is also developed. Conclusion : In the results of static balance test it shows that several balance postures demonstrate the difference between AD and HC. The AD group was easier losing their center of mass and could not maintain balance until fifteen second. Keywords : walking pattern, balance, Alzheimer's dementia

SS26 226-C-3

USE OF ICT FOR THE ASSESSMENT OF ACTIVITY OF DAILY LIVING

Athina KOKONOZI¹, Ioannis KOMPATSIARIS², Alexandr KONIG³ (1. *ITI - Information Technologies Institute, CERTH, Greece*; 2. *ITI, CERTH, Greece*; 3. *Neuropsychology, MHeNS School for Mental Health and Neuroscience, Maastricht, France*)

Introduction : The relation of behavioural, lifestyle and cognitive

monitoring parameters with dementia-specific patterns can provide a promising and objective dementia assessment due to the long-term nature of the measurements. On top of this, technologies that monitor activities of daily living can allow a person with dementia to remain independent, reducing the burden on family/friends and decreasing healthcare costs. They also increase the sense of safety, since emergencies can be detected with appropriate feedback provided. Method : Dem@Care is a four years EU funded research project, which started in November 2011 targeting the development of an integrated solution for the remote monitoring, diagnosis and support of people with very mild or mild dementia. Dem@Care investigates the use of multiple sensors (wearable sensor devices for physiological monitoring, ambient and wearable 2D and 3D optical sensors and microphones) for the recording, among others, of daily activities, lifestyle patterns, emotions, speech impediments, and vital signs, as well as the use of intelligent mechanisms for the assessment of the individual's condition and for the appropriate care treatment. Results : Dem@Care will evaluate its methodologies and system in different settings addressing various scenarios and use cases: a controlled lab environment simulating home activities, real homes and nursing homes. The project website is: <http://www.demcare.eu/>. Conclusion : Through intelligent processing of heterogeneous data, Dem@Care seeks to minimize the subjectivity characterizing current clinical diagnosis protocols and to enable the formation of a comprehensive and objective picture of the individual's overall condition. Feedback will be provided to the clinicians and directly to the patients and their carers. Keywords : Multi-parametric behaviour interpretation, Personalised health, Continuous multi-sensor monitoring

SS26 226-C-4

NON PHARMACOLOGICAL APPROACH USING ICT FOR TREATMENT OF BEHAVIORAL DISTURBANCES

Philippe ROBERT¹, Pierre David PETIT¹, Gregory BEN-SADOUN¹, Julie PIANO¹, Alexandre DERREUMAUX¹, Patrick MALLEA¹, George DRETTAKIS² (1. *CoBTeK, EA CoBTeK Memory Center, CHU Nice Sophia Antipolis University, France*; 2. *REVE unit, INRIA Sophia Antipolis, France*)

Introduction : Non pharmacological approaches are considered the first line treatment to manage behavioral disturbances in dementia (BPSD). This presentation will describe two research projects aiming the development of Information and Communication Technologies (ICT) tools in this field. Method : The studies presented come from the European Commission project FP7 and from the French Investissement d'Avenir first call (Az@game). Results : In the FP7 VERVE for Vanquishing fear and apathy through E-inclusion: Personalised and populated Realistic Virtual Environments for clinical, home and mobile platforms two serious game are in development: 1/ The autobiographical memory motivation scenario. The scenario use an immersive 3D environment that is being developed for participants with subjective memory complaints. It explore the acceptability of the setting and describes the parameters enhancing engagement and, in particular, autobiographical memory. 2/ The kitchen scenario was developed for mobile platform in order to equip Nursing Homes and have ambulatory patients practice in the outpatient during day clinic visits. To this end, the "Kitchen Scenario" is a serious game intended to serve as a support for patients suffering from Alzheimer's disease and related disorders. The basic concept is to involve subjects dealing with executive functions impairment by food recipes in a virtual environment. A virtual agent will intervene to help patients whenever the system should detect particular difficulties or errors while performing required actions. Conclusion : Within the Az@game project the development of the Serious Game is not patient oriented

but aims to teach professional nursing home staff members how to manage well BPSD in daily life situations. Keywords : ICT Behaviour Dementia

SS26 227-C
IMPROVING OUTCOME OF EMERGENCY CARE IN OLDER POPULATION

SS26 227-C-1
ANALYSIS OF ISSUES AND RECOMMENDATIONS FOR IMPROVING EMERGENCY CARE OF THE OLDER PATIENTS

A.B. DEY (*Geriatric Medicine, All India institute of Medical Sciences, India*)

Older people often face acute health problems which require emergency treatment. Accessing emergency room has several determinants: availability of care giver to accompany, financial allocation for such intervention and appreciation of the need for emergency care by the patient and care-giver. These socio-economic factors along with health system response may affect outcome of emergency care. Health professionals may not appreciate the gravity of the situation and older patients succumb to their illness during and after hospitalization. This indicates a serious lacuna in the health system in managing older patients in emergency. The area of geriatric emergency care remains largely underdeveloped as it is seen as unrewarding in frail older patients with multiple diseases and disabilities with atypical clinical presentation. It is not uncommon for the older patient to present with multiple and confusing symptoms that need a provider with at least the basic knowledge and training in care of older people to decipher the root cause. In the health system, Emergency Department is a critical unit, where appropriate and timely intervention can reduce mortality but also prevent life time morbidity in older patients. It is essential that the state of emergency health care for older people in different levels of health care and the determinants of health system response to such patients are analyzed. The strategy needs include develop standard operating procedure for common emergencies and health care providers need to be trained in handling older clients with life threatening health problems. Keywords : Emergency care, policy formulation, strategy

SS26 227-C-2
OLDER PEOPLE IN EMERGENCY

P.C. DAS (*Department of Geriatric Medicine, All India Institute of Medical Sciences, India*)

As a result of demographic transition, older patients account for a quarter of all emergency department attendance. Atypical clinical presentation of illness, a high prevalence of cognitive disorders, and the presence of multiple co-morbidities complicate their evaluation and management. Several age-associated issues lead to increased hospitalization, length of stay and resource utilization. The reasons for emergency room visit in old age can be grouped under three major groups: infection, vascular events and accidents and injury. However, there would always be a miscellaneous group which may be multi-factorial in causation. In old age infections may have typical features, patients may present with altered sensorium necessitating early broad spectrum, renal-safe parenteral antibiotics. Cardiovascular events, stroke, pulmonary embolism, peripheral vascular events are common vascular emergencies with high of risk adverse outcome. Accidents, injuries and falls are the common in urban and suburban centers and have major socioeconomic and health impact. A number of studies suggest that approximately a quarter of elderly patients have mental

status impairment, one sixth have potential depression, and two-thirds have some functional impairment. Older persons are at increased risk of adverse events, with higher rates of missed diagnoses, revisit after discharge and medication errors. Considering the high morbidity and mortality for older patients, evidence based management and systematization of emergency care needs to be considered as an universal requirement with attendant training in essentials of old age care for emergency room health professionals.

SS26 227-C-3
EMERGENCY CARE OF PATIENTS IN AIIMS HOSPITAL, NEW DELHI

Prasun CHATTERJEE (*Geriatrics, All India Institute of Medical Science, India*)

Introduction : Emergency attendance on the part of older patients has increased at par with rising number and proportion of older people in the society. However, information on this issue from India is scanty. Method : A prospective longitudinal study was conducted in the Emergency Department of All India Institute of Medical Sciences (AIIMS), New Delhi from 01/01/ 2009 to 30/06/2013 examine the status of older patients in emergency department. 1,643 (56% male) patients aged 60 years or more (self reported) who reported to emergency between 9 AM and 5 PM from Monday to Friday were subjects of the study. After initial data collection they are followed telephonically the next 1 year at the end of 1month, 6 month and 1 year. Results : Most common complaint was shortness of breath (~20%). 90% have one or more co-morbidities. 137(8.33%) patient died at emergency, 227 (13.82%) got admitted in ward for further management and 1118 (68.05%) discharged after stabilization. After one month 381 (24.72%) died of 1547 cases and after 1 year, 683 (48.51%) died of the 1408 cases. Physical inactivity, cancer, organ failure, coma and use of naso-gastric tube and urinary catheter were predictor of short term as well as long term mortality. Conclusion : Managing older patients in emergency department is challenging and needs special care as they have multiple co-morbidities, varied diagnosis and late presentation. Physicians/ primary care givers should be oriented in assessment and management of frail older patients especially in emergency setting. Keywords : comorbidity , organ failure, mortality

SS26 307-C
APPLYING QUALITY IMPROVEMENT PROCESSES AND MODELS OF CARE IN LONG TERM CARE PRACTICE: CHALLENGES AND OPPORTUNITIES FROM INTERNATIONAL PERSPECTIVES

SS26 307-C-1
BEST PRACTICES IN DIABETES MELLITUS MANAGEMENT IN LTC

Sabine VON PREYSS-FRIEDMAN (*Medicine, Division of Gerontology and Geriatric Me, University of Washington, USA*)

Introduction : Diabetes is highly prevalent in LTC patients in the United States and likely worldwide as Diabetes is an independent risk factor for LTC placement. About 26% of patients admitted to nursing homes carry the diagnosis of diabetes. Evidence suggests that patients with diabetes residing in LTC facilities do not receive medical care that meets recommended guidelines. Objective is a system wide analysis of care of patients with diabetes to devise interventions to meet standards of care in diabetes management in this vulnerable

population. Method : Medical Director of several LTC facilities in the Seattle , WA, USA conducted surveillance of Nursing Home patients with diabetes. The subsequent QI process focused on monitoring of diabetes control, appropriate medications, prevention of hypo- and hyperglycemia and complications via regular health maintenance exams. Special focus was on quality of life in frail elderly diabetic patients. Results : Surveillance confirmed evidence in the literature that diabetes management was suboptimal in the LTC setting. Blood sugar checks and sliding scale use was excessive, especially in frail elderly patients. There was a lack of individual goal setting appropriate to the health status of the patient and a lack of system wide approach to health maintenance. Several QI approaches were designed, including policies and procedures for uniform approach to glucose monitoring, elimination of sliding scale use and regular health maintenance. These resulted in significant improvement in glycemic control, health maintenance and quality of life. Conclusion : The Medical Director and the interdisciplinary team significantly improved standards of care for patients with Diabetes via CQI process. Keywords : Diabetes Mellitus, Quality Improvement, Nursing Home

SS26 307-C-2

SPICE-A DAY NURSING HOME PROGRAM FOR INTEGRATED CARE OF ELDERLY IN SINGAPORE

David Hock Hean YONG¹, Mui Lang LOW², Lay Lay PEE³
(1. Geriatric Medicine (Community Geriatrics Division), Changi General Hospital, Singapore; 2. PeaceHaven Nursing Home, PeaceHaven Nursing Home, Singapore; 3. Bedok MultiService Centre, PeaceHaven Nursing Home, Singapore)

Introduction : Singapore faces a rapidly ageing population with increased long term care needs. The most frail elderly are often cared for either in their own homes in the community or in nursing homes (NHs). Innovative care models allow for efficient use of resources to deliver cost effective long term care in a manner suited to and well received by the elderly and their family caregivers. Instead of an either community or nursing home choice for long term care, an integrated approach combining advantages of both allowed the older patient to remain living with their families and supported the caregiver as well as reduced strain on the healthcare system for nursing homes. Method : This is a description of a program that employed day-care for otherwise nursing home suited clients and assisted families to continue to provide care in their own homes and delayed nursing home admissions. This pilot program called Singapore Program for Integrated Care of the Elderly (SPICE) was adapted from the US On-Lok PACE model. Results : Preliminary results at 6 months showed that the program reduced caregiver stress, improved carer satisfaction, improved clients' self rated health scores and maintained their functional status. There was also a significant reduction in healthcare use in terms of emergency department visits, hospitalisations and lengths of stay for the clients. Conclusion : Instead of an 'either/or' approach to choice for long term care, a 'both/and' approach that integrated and utilised the combined community and institutional resources is successful in delivering care for frail elderly in Singapore. Keywords : long term care, day nursing home

SS26 307-C-3

IMPLEMENTING INTERPROFESSIONAL EDUCATION CURRICULUM TO REDUCE AVOIDABLE REHOSPITALIZATIONS (INTERACT) AT NURSING HOMES

Yanping YE (Division of Geriatric, Community and Family Medicine, University of Texas Health Science Center at San Antonio, USA)

Introduction : INTERACT is a quality improvement program designed

to improve the early identification, assessment, documentation, and communication about changes in the status of residents in skilled nursing facilities. The goal of INTERACT is to improve care and reduce the frequency of potentially avoidable transfers to the acute hospital. Such transfers can result in numerous complications of hospitalization, and billions of dollars in unnecessary health care expenditures. INTERACT program has targeted on the three domains of transitional care: Information, Destination, and Education. Method : Design: Quality Improvement Aim: Reduce the preventable acute care transfer at NHs Process: Charts were reviewed and baseline data were collected Interdisciplinary team (IDT) was formed at NHs Brain storm for root cause analysis by team members INTERACT tools were implemented Core IDT members attended live distance learning curriculum over 6-month period Acute care transfer cases were reviewed and discussed at weekly team meetings Acute care transfer rates were measured per 1000 residents' bed days. Results : Total number of acute care transfer from 4.72 to 3.69 per 1000 bed days. There is 21% reduction of all causes of 30-day re-hospitalization. This is about to reduce 37 transfers per year in this nursing home. Conclusion : INTERACT is a cost effective quality improvement program that can widely disseminated across health care systems and improves the quality of care at Long Term Care Facilities. Keywords : INTERACT, Nursing Homes, Quality Improvement

SS26 307-C-4

BEST PRACTICE IN REDUCTION OF PSYCHOTROPIC MEDICINES IN THE LTC

Sandra Liliana OAKES (Family and Community Medicine, University of Texas Health Science Center, Buena Vida Nursing Home and Rehab., USA)

Introduction : Inappropriate use of psychotropics can lead to significant adverse consequences in the elderly. New regulatory requirements, effective December 18, 2006, mandates that "each resident's drug regimen must be free from unnecessary drugs." Long Term Care centers (LTC) providing services under Medicare and Medicaid must meet minimum requirements structured by law in USA. AMDA's policy states that only an interdisciplinary team can make decisions to reduce inappropriate medications, such as psychotropics. Method : Buena Vida Nursing and Rehab Center (BV), a 230 bed community based long-term care facility in San Antonio, TX. At BV an independent psychiatry group (on contract) and the geriatrician medical director are responsible for all psychotropic prescriptions. INTERVENTION: Time: September 2007 to August 2012 Formation of an interdisciplinary team consisting of the medical director, consultant pharmacist, director of nursing, MDS coordinator, two social service representatives, the nurse manager and the psychiatry group's nurse practitioner. Team ensured that all prescribed psychotropic medications had a specific diagnosis linked to them. Team met every other month to review all psychotropic medications prescribed within the preceding month, discussed concerns about each patient and made recommendations for reduction or discontinuation of medications. Results : Change in prevalence rate of drug use over the years: Antipsychotics reduced from 21% to 5.6% Anxiolytics reduced by 22.8%. Stimulants reduced by 12.6%. A total of 90% reduction of global psychotropics use in low risk older adults in the LTC facility was achieved over 2 year period. Conclusion : Team approach is effective in systematic evaluation and reduction of psychotropics medications in the LTC. Keywords : psychotropic medication, drug reduction, long term car

SS26 309-R

A RESEARCH AND POLICY TRANSLATION PARTNERSHIP

FOR REDUCING FALLS AMONG OLDER PEOPLE

SS26 309-R-1

A FRAMEWORK FOR A TARGETED POLICY RESPONSE TO PREVENTING FALLS AMONG COMMUNITY-DWELLING OLDER PEOPLE

Lesley DAY (*Monash Injury Research Institute, Monash University, Australia*)

Introduction : Despite decreasing hip fracture hospitalisation rates in Victoria, the numbers and rate of fall hospitalisations are increasing. A new Australian grant program offered an opportunity for researchers and policy makers to work together on this issue to enable a more effective policy response to the falls prevention challenge in Victoria. **Method :** The RE-AIM framework was used to identify strategies required for an effective program. Research objectives were developed following an analysis of the current state of knowledge relative to these required strategies. **Results :** Planning and evaluation approaches for the five core RE-AIM dimensions as these related to falls prevention in Victoria were identified. Relevant research objectives included: (1) identification of sub-groups of older people most frequently admitted to hospital; (2) examining the acceptability of proven falls interventions to those sub-groups; (3) identification of factors that encourage and support relevant lifestyle changes; (4) identifying opportunities to incorporate proven falls interventions in existing programs and services; (5) developing and testing guidelines for sustainability within agencies and programs. The research results are guiding strategy details for falls prevention policy. **Conclusion :** Using a model which supports the whole process from planning a state-wide falls prevention approach, identifying the necessary evidence-base, through to designing the evaluation provides coherence, ensures systematic consideration of critical factors, and incorporates feedback into program planning from the outset. **Keywords :** falls prevention, research translation, policy

SS26 309-R-2

UPTAKE INTENTION AND PARTICIPATION IN HOME AND GROUP-BASED EXERCISE TO PREVENT FALLS

Terry HAINES¹, Lesley DAY², Trang VU³, Caroline FINCH², Lindy CLEMSON³, Keith HILL⁴ (*1. Allied Health Research Unit, Monash University & Southern Health, Australia; 2. Monash Injury Research Institute, Monash University, Australia; 3. Occupational Therapy, University of Sydney, Australia; 4. Physiotherapy Department, Curtin University, Australia*)

Introduction : Personal attitudes and beliefs towards falls and their prevention have previously been investigated in relation to intention to participate in exercise interventions to prevent falls. However, it is not known whether these attitudes and beliefs are prospectively related to actual participation. **Method :** Design: Prospective cohort study with baseline survey (n=394) and 1 year follow-up (n=244). **Participants:** Community-dwelling older adults (>70 years) in Victoria, Australia. **Measurements:** The health belief model was used as a starting theoretical model to guide development of items examining domains of threat appraisal, self efficacy, social norms, perceived intervention efficacy, confidence to participate, and intention to participate. Participation was classified as 'any' participation since the baseline assessment and 'current' participation. **Analysis:** A path development model analysis approach was employed using Bayesian Markov chain Monte Carlo modelling. **Results :** Key predictors of intention to participate in group exercise were a perception of personal effectiveness, having a broken bone since turning 60, previous exposure to group exercise in the past 5 years, and a heart condition other than congestive heart failure. Participation was associated with

intention to participate, previous exposure to group exercise, not being born in Australia, and not being married. Key predictors of intention to participate in home exercise were self-perceived risk of harm from falls, perception of personal effectiveness, and previous exposure to group exercise. However, intention was not associated with participation. **Conclusion :** Personal beliefs are predictive of participation in falls prevention exercise interventions though the assumption that participation follows intention did not hold for home exercise. **Keywords :** falls exercise intention

SS26 309-R-3

CHALLENGES IN IMPLEMENTING PERSON-ENVIRONMENT APPROACHES TO FALLS PREVENTION

Lindy CLEMSON¹, Alex DONALDSON², Lesley DAY³, Keith HILL⁴, Terry HAINES⁵ (*1. Ageing, Work & Health Research Unit, The University of Sydney, Australia; 2. Monash Injury Research Institute, Monash University, Australia; 3. Victorian Injury Surveillance Unit, Monash Injury Research Institute Monash University, Australia; 4. Head, Physiotherapy, Curtin University, Australia; 5. Southern Physiotherapy, Allied Health Research Unit, Southern Health Monash, Victoria, Australia*)

Introduction : Home safety assessments by occupational therapists are effective in reducing both rate of falls and risk of falling, particularly among at-risk people?for example, history of falling, recent hospitalisation or severe vision impairment. It is also one of two interventions proven to be cost saving by health economic cost effectiveness studies. Despite this evidence emergent over the past decade there is limited uptake within community services. Therefore, as part of our translational project we are exploring issues underlying the implementation of home safety services. **Method :** We are conducting in-depth interviews with stakeholders including program coordinators, delivery agents and occupational therapists from six community agencies contracted to deliver home safety services. The RE-AIM framework and Diffusion of Innovations theory underpinned the interviews which examine the enablers and barriers to adopting home safety falls prevention interventions and in integrating into routine community preventive practice. **Results :** Preliminary results suggest that investment in home safety is supported from management and therapists alike, however a number of themes emerged to slow adoption. These included diminished community capacity with funding and local staffing continuity issues, information and assessment resources not viewed as easily accessible or user-friendly and a mismatch between preventive approaches and core values of occupational therapy practice related to independence, a 'safety' versus 'doing' dilemma. We will present the final analysis and propose strategies to enable sustainability. **Conclusion :** This project provides insights and opportunities to increase the translation of the home safety research into practice and move to sustainability over the longer term. **Keywords :** translational research, falls prevention, home safety

SS26 309-R-4

A RESEARCH AND POLICY TRANSLATION PARTNERSHIP FOR REDUCING FALLS AMONG OLDER PEOPLE: FALLS PREVENTION SUSTAINABILITY GUIDELINES

Keith HILL¹, Freda VRANTSIDIS², Lindy CLEMSON³, Meryl LOVARINI³, Melissa RUSSELL⁴, Lesley DAY⁵ (*1. School of Physiotherapy, Curtin University, Australia; 2. Public Health Division, National Ageing Research Institute, Australia; 3. School of Occupational Therapy, The University of Sydney, Australia; 4. The School of Population Health, The University of Melbourne, Australia; 5. Monash Injury Research Institute, Monash University, Australia*)

Introduction : Many community-based falls prevention programs may not be sustained over time. This project, part of an NHMRC funded Partnership Grant Project co-funded by the Victorian Government Department of Health (DoH), aimed to develop and trial best practice sustainability guidelines and an associated training program to help organisations achieve falls prevention program sustainability. **Method :** A literature review informed guideline development (workbook and supporting document) and training program. The guidelines were trialled by four community organisations conducting falls prevention programs in four Victorian DoH regions. A training session was conducted prior to the guidelines trial. Following the session participants developed a sustainability plan for their program based on the guidelines. In monthly teleconferences (with written summary report updates), progress and issues were discussed. Post-trial interviews were conducted with participants to determine achievements, facilitators and barriers to embedding changes in their organisation. **Results :** Participants found the guidelines useful in targeting and tracking actions and in providing a framework for all areas to be considered. Aspects of sustainability targeted by trial participants included improving marketing/referrals, networks, and program documentation. Participants identified that management support was a key facilitator and time restrictions a key barrier to program sustainability. The trial resulted in modifications to the guidelines, with the final version available from the Monash University website: www.monash.edu/miri/. **Conclusion :** The Sustainability Guidelines and training program will assist agencies plan sustainability for falls prevention programs from the outset, improving likelihood of sustaining effective programs long term for older people at risk of falls. **Keywords :** falls prevention; sustainability; community

SS26 311-R
ART AND MUSEUM PROGRAMS FOR PEOPLE WITH DEMENTIA: AN INTERNATIONAL COMPARISON

SS26 311-R-1
ART AND ALZHEIMER'S PROGRAMS AT THE NATIONAL GALLERY OF AUSTRALIA

Adriane Victoria BOAG (*Learning and Access, National Gallery of Australia, Australia*)

Introduction : The success of the National Gallery of Australia's Art and Alzheimer's Pilot Program, conducted in 2007, compelled the Gallery to implement an ongoing program of tours for people living with dementia. In 2009 the Gallery implemented a national Art and Alzheimer's Outreach Program. **Method :** The knowledge and expertise gained at the NGA and through the findings of the evaluation was developed into a two-day workshop which has been delivered in diverse communities in regional and remote galleries across Australia. A training DVD has been developed to support and supplement this workshop, and a seminar has since been held to bring arts and health professionals together to reflect their shared experiences. **Results :** The evaluation of the Pilot Program was evaluated and a paper published summarising the findings in 2009. The evaluation demonstrated that participants were engaged in the tour from the outset and that they remained engaged for over 80% of the tour. The program has far-reaching benefits that reinforce the value of cultural engagement and the role of museums and galleries in promoting health and wellbeing in their communities. **Conclusion :** This program represents a unique approach to the non-pharmacological treatment of people living with dementia in Australia. The Art and Alzheimer's Program at the National Gallery of Australia exemplify how a holistic approach can assist not only the person living with dementia, but their carers,

healthcare providers and their community. **Keywords :** Dementia, Australia, Gallery programs

SS26 311-R-2
IMPLEMENTATION OF ARTS PROGRAM IN SENIOR CARE IN JAPAN: CHALLENGE OF ARTS ALIVE

Yoko HAYASHI (*Arts Alive, Japan*)

Introduction : Arts Alive started ACP, a discussion based art program for people with Dementia and their caregivers in Japan. We also trained ACP educators as facilitators. This paper deals with the issues of implementation of the program including its qualitative evaluation, public acceptance, logistical and operational issues at museums and care facilities. **Method :** We evaluated the responses and feedbacks of the participants and museum professionals who observed the programs. For logistical issues, the structure and financing of educational programs at Japanese museums are examined. Further, the required knowledge and skills, the content of the training program are analyzed. **Results :** Despite different cultural background ACP was well received both by people with dementia, care professionals and museum professionals. There are still issues of acknowledging benefits of the programs among people with dementia and public at large, transportation, financing and maintenance of quality of educators to be dealt with. The key elements of the training program and required qualifications for educators are communication skills and positive attitudes toward the program and the participants and strong interest in art. **Conclusion :** The initial implementation demonstrated great improvement to quality of life for the participants and possibility of educators who are neither art historian nor care professionals as facilitators. For further implementation, acknowledging the benefits of these programs and redefining the life with dementia among both museum and care professionals as well as public at large is necessary. Our study indicates more evidence based research on the impact of arts on aging would be very useful for further implementation. **Keywords :** arts, museum, dementia

SS26 311-R-3
ART AND DEMENTIA AT MOMA: PROGRAM DEVELOPMENT, EVALUATION, AND REPLICATION

Laurel HUMBLE, Meryl SCHWARTZ (*Education, The Museum of Modern Art, USA*)

Introduction : In 2006 The Museum of Modern Art (MoMA) developed gallery discussion programs for people with dementia and their caregivers and in 2008 partnered with New York University (NYU) to evaluate the efficacy of these programs. MoMA also developed in-person and online training resources for arts and health professionals on how to replicate their dementia programming. In 2011 MoMA commissioned Audience Focus, Inc. to survey museum programs developed with MoMA's support. **Method :** For the NYU study researchers administered self-rating and observer-rated scales, and conducted focus groups. For the Audience Focus, Inc. study researchers used case studies of select museum sites to create an online survey for additional museums. **Results :** The NYU evaluation quantitatively and qualitatively demonstrated the benefits of making art accessible to people with dementia and their care-partners. Moreover, it helped to identify the specific programmatic aspects that coalesce to create these benefits. Measurable quality of life benefits included positive changes to participants' mood directly after the program and in the days following the museum visit. Evaluators from Audience Focus, Inc. found that implementing an arts engagement program for people with dementia has far-reaching effects on practitioners and host institutions: programs lead many museum

educators to consider new ways of serving older adults, and to greater institutional awareness of the dementia audience. Conclusion : Together, these studies illustrate the many benefits of arts programming for people with dementia: programs improve quality of life for participants and contribute to an ideological shift in the way both institutions and practitioners think about the dementia audience. Keywords : Dementia, Museum, Art

GERONTECHNOLOGY: OPPORTUNITIES AND CHALLENGES

SS26 312-R-1

MOBILE COMPREHENSIVE GERIATRIC ASSESSMENT FOR OLDER PEOPLE IN DIFFERENT HEALTHCARE FACILITIES

Po-Lun CHANG (Taiwan)

No Abstract

SS26 312-R-2

TELE-SURVEILLANCE FOR FALLS IN AMBIENT ASSISTED LIVING FACILITIES

William D ;KEARNS¹, James L; FOZARD² (1. *Rehabilitation and Mental Health Counseling, University of South Florida, USA*; 2. *Ageing Studies, University of South Florida, USA*)

Introduction : Telesurveillance is the use of technology to monitor the activities of persons or objects at a distance. Telesurveillance capacities have advanced significantly. Introduction of wireless networked handheld devices whose processing and storage capabilities rival that of workstations but they have a long history of use. With increasing frailty elders are at heightened risk for injurious falls which may result in disability and death. A wide variety of telesurveillance devices are in use in community settings, formal care and private residences, ranging from devices employing coarse heat sensors that cover a few square meters to those employing radar to precisely assess an elder's position to within 20 cm. Not all telesurveillance technologies lend themselves to fall prediction, detection and prevention, however. Method : A brief history of telesurveillance and current commercial offerings for fall detection and prevention is followed by an overview of cutting edge technologies addressing the more difficult task of fall prediction. Results : The relative strengths and weaknesses of each technological approach are compared and contrasted in the context of the monitoring requirements. Conclusion : Low cost sensor systems have been most successful in circumstances where the identity of the monitored person is known by other means or highly detailed information on movement parameters is not required. Highly exact systems present opportunities for deriving movement information which can significantly improve fall prediction. Keywords: Elderly Fall Prediction.

SS26 312-R-3

BUILDING PHYSICS REQUIREMENTS (BPR) FOR LIFE ENRICHMENT CARE FACILITIES (LECF)

Helianthe KORT¹, William KEARNS², James FOZARD² (1. *Built Environment, Eindhoven University of Technology, Netherlands*; 2. *Department of Rehabilitation and Mental Health Counseling, College of Behavioral and Community Sciences University of South Florida Tampa, Florida 33612, USA*)

Introduction : LECF include all environments designed to improve the social and physical functioning of elderly people. Current building requirements (BR) focus on safety, security, energy requirements and

comfort. The increasing numbers of older people many with chronic diseases requires further BR modifications. Specifically, The International Classification of Functioning and disabilities(1) identifies BR requirements access to daylight, acoustics, cooling, heating and indoor air quality. Method : Older adults are the subject of gerontechnology research which includes the total technological environment supporting ageing people(2). In gerontechnology health, housing, and daily living fall within the five life domains for technology intervention goals: enhancement / satisfaction; prevention / engagement; compensation / assistance; care support/ organization(3). Results : The philosophical basis for a healthy environment can be traced to Epicurus (341 -270 v Chr) writings on the healing environment (HE) and LECF. HE is the theoretical basis of Evidence Building Design of structures that enhance patient recovery. Current literature provides few links between BPR and HE although access to proper lighting has a positive effect on patient recovery and daily living of older adult(4,5). Conclusion : Additional research according to gerontechnology principals with the broad perspective on older adults demands, needs to be conducted in order to determine whether more BPR has an effect on older adults functioning and to have evidence to create LECF. SS26 312-R-4

USE OF TELEPRESENCE ROBOTS TO FACILITATE AGEING IN PLACE

Jun-ming LU¹, Yeh-liang HSU² (1. *Gerontechnology Research Center, Yuan Ze University, Taiwan*; 2. *Dept. ME / Gerontechnology Research Center, Yuan Ze University, Taiwan*)

Introduction : Thanks to the rapid progress of robotics, now we have a wide variety of robots to help the elderly people to "age in place." Autonomous robots are often employed to assist or entertain the elderly people, but the elderly people may prefer staying with those who they are familiar with. Telepresence robots further help to take mental health care through interpersonal interaction, by means of serving as the agent or avatar of their family members who live far away. From this point of view, telepresence robots tend to have greater potential in the field of elderly care and assistance. Method : The purpose of this paper is to summarize such applications of telepresence robots, as well as the key factors contributing to the successful "ageing in place" with these robots. In the use of telepresence robots, the principle is to rebuild the experience of face-to-face interaction between the remote controller and the senior user who stays with the robot. This paper discusses the user acceptance at both ends in terms of robot factors and human factors. Results : From the robot's perspective, its anthropomorphism, physical characteristics, and personality are critical. From the senior user's perspective, the user's backgrounds, experiences, and attitude toward robots need to be emphasized. Conclusion : The findings can offer some practical guidelines for researchers, professionals and practitioners in this field. Finally, the current development of telepresence robots in Gerontechnology Research Center Yuan Ze University is presented as an example to illustrate how the guidelines can be implemented to facilitate ageing in place. Keywords : telepresence robot, aging in place, interpersonal interaction

SS26 313-S

LEARNING AND USING TECHNOLOGY IN ASIAN CHINESE COMMUNITIES

SS26 313-S-1

USING TECHNOLOGY IN SUPPORTING ELDERLY AT NEIGHBORHOOD LEVEL: A CASE IN SHANGHAI CHINA

Limei CHEN (*Scholl of Social Development, East China Normal University, China*)

Introduction : Technology can make important contributions to elder care and enhance the welfare of the elders. However, technology assisted living and technology assisted care have been usually seen in institutions. They are new and rapidly developing in communities. This paper is aimed at finding out the projects initiated by local government and the users' views upon them. Method : This research employs case study method to collect quantitative and qualitative data in neighborhoods in Shanghai. "Ankangtong" system and '96890 community service hotline' are the main projects this paper focus, relevant project officers, neighborhood organization staff and community dwell elders are interviewed. Results : This research finds that government plays important role in introducing the equipments to elders and providing subsidies for the technology assisted living. The equipment system is easy to use for elders. The technology makes important contributions in helping elders in occasions of emergency. Conclusion : Technology assisted living for elders is not widely spread in China but government-initiated projects are well accepted by elders. Elders in different ages have various needs and different views towards the technologies. Keywords : technology elder care

SS26 313-S-2

ADVOCATE A TECHNOLOGY-FRIENDLY ENVIRONMENT FOR OLDER ADULTS: A STUDY IN TAIWAN

Yen-jen CHEN (*Department of Health Care and Social Work, Yu Da University, Taiwan*)

Introduction : Baby-boomers in Taiwan are moving into the Age Wave. In the face of the current Technology Wave, how to employ the power of gerontechnology to enable the elderly of an aging society to live independently has become one important issue for promoting national elderly policies. In recent years, Taiwan has included elderly care industry in the national economic construction scheme in the hope of introducing the force of gerontechnology into the care market and reducing the pressures of care. Therefore, this study intends to investigate the development and employment of gerontechnology in Taiwan, such as the acceptance of gerontechnology, internet interaction and service resource employment. Method : It used the method of in-depth interview from qualitative research to collect first-hand data for a comparative analysis. Results : As this study finds, the primary task of aging policies is to build a technology-friendly environment for the elderly. Those who supply and demand must also change their concepts and behaviors. Elderly users must adapt themselves to the interactive model of a technological society and learn to use technology in their daily life. The suppliers must also invent elderly-appropriate and all-purpose technological products and develop service strategies. In this way, the goal of active aging can be reached. Conclusion : A technology-friendly for older adults is advocated so as to maximize participation of older adults in this digital area. Keywords : technology-friendly environment, Chinese, Taiwan

SS26 313-S-3

MOTIVATION & BEHAVIOR OF LEARNING TECHNOLOGY AMONG SOON-TO-BE AGED & OLDER ELDERS IN HONG KONG

Ko SIU FONG (*Elderly Service Department, Hong Kong Young Women's Christian Association, Hong Kong*)

Introduction : Just like other modernized cities, application of IT knowledge in Hong Kong has closely been linking up with almost every aspect of our daily life. Previous studies showed that learning and using computer would have positive impacts in dealing with daily tasks among the elders in the West (Adler, 2002, Kelly et al., 1999 Morrell et al. 2000). Our research aims to investigate the situations and motivation of IT knowledge learning among soon-to-be-aged and older adults in Hong Kong. There are four aspects of area that we have explored: 1) factors associated with their learning motivation ; 2) expectations toward learning ; 3) internet using behavior; 4) impacts of using computer on well-being. Method : Our research has conducted both quantitatively and qualitatively since June, 2011. Over 500 self-administered questionnaires from 500 HKYWCA service users have been collected. Besides, two focus groups had been implemented to investigate those computer users who have joined the learning program as well as those non-computer users who haven't joined learning program. Results : In our findings, we found that age, education level, income source and possession of computer are the variable factors which affect our elders' motivation of IT learning. Besides, the more the elders who had joined computer program thought learning computer was useful to them, the higher they rated in problem solving and meaning in life index. Conclusion : The findings are inspiring. We suggest improving the "hardware" and "software" of IT facilities in order to help them remove the barriers of learning technology. Keywords : Active Aging, learning and using technology, Asian Chinese

PALLIATIVE CARE EDUCATION FOR NURSES WORKING IN AGED CARE ENVIRONMENTS

SS26 315-S-1

PALLIATIVE CARE IN AGED CARE EDUCATION - AN AUSTRALIAN PERSPECTIVE

Margaret O'CONNOR¹, Edward WING-HONG POON², Hyun Sook KIM³ (*1. Palliative Care Research Team, School of Nursing, Monash University, Australia; 2. Nursing, Thye Hua Kwan Hospital, Singapore; 3. Social Welfare, Korea National University of Transportation, Korea*)

Introduction : Care of the older person who is dying is a perennially contentious health and social issue in Australia, akin to many other parts of the world. Community discourses and images about older people conflict, either focusing on happiness, independence and company, or neglect, dependence, frailty and dementia. Results : There are many commonalities in the client groups who are either in an aged care facility or in receipt of palliative care, most obviously that both groups are reaching the end of life. Despite this, both disciplines have historically developed independently with little connection to each other. However, the consequence is very visible organisational disparities in care models, access to medical and nursing care, funding and access to bereavement support services. The Aged Care Act (1997) introduced a range of sweeping changes in the system and was the beginning of work to bring palliative care and aged care services more closely together. The Australian Government, through its National Palliative Care Programme, provided significant funding for the development of 'Guidelines for a Palliative Approach in Residential Aged Care' (the Guidelines). Conclusion : This paper discusses these changes and the application of the Guidelines across the country, as well as issues arising in their dissemination, educational preparation and ongoing usage. Keywords : Education, end of life, aged care

SS26 315-S-2

THE USE OF NARRATIVE AND EXPLORATORY METHODS IN TEACHING PALLIATIVE CARE IN GERIATRIC SETTINGS

Wing Hong POON (*Nursing Service, Ang Mo Kio-Thye Hua Kwan Hospital, Singapore*)

Introduction : Every individual have tended to describe and define themselves by telling, receiving and holding stories about themselves. Such stories help to reflect on life and become a very powerful tool to educate people. In teaching older people issues, the older person's stories become a very important essence as the story is the key to understand older person's journey and suffering. The aim of this workshop is to demonstrate the power of using narrative and exploratory to teach older people issues. Method : Role play, videos, self exploration, poems will be used in this workshop. Results : Nil. Conclusion : At the end of this workshop, we hope that participants will have more inner exploratory of their own self and will be able to use their stories in teaching older people. Keywords : Narrative, older people

SS26 315-S-3

PALLIATIVE CARE IN AGED CARE EDUCATION : A KOREAN PERSPECTIVE

Hyun Sook KIM (*Department of Social Welfare, Korea National University of Transportation, Korea*)

Introduction : Over the last 10 years Korean government and academic societies have made significant progress in developing hospice and palliative educational programs for interdisciplinary team. Despite such progress, however, hospice palliative care services are currently available only for terminally ill cancer patients in Korea. The population of aged patients with chronic disease and long trajectory to death in long term care facilities has dramatically increased since 2008, the year Korean government introduced social insurance for long term care. The need for quality end-of-life care service should be available to any patients including the aged with incurable disease not just for terminal cancer patients. While the education courses for nurses in hospice palliative care have been relatively well established, few nurses are trained in palliative care for aged care settings. Method: NIL. Results : This presentation discusses nurse's education programs in Korea: they are, Hospice Advanced Practice Nurse (HAPN) program by Ministry of Health and Welfare, Certification Program by Korean Hospice Palliative Nurses Association, and End-of-Life Nursing Education Consortium (ELNEC)-Geriatric Program. Of those, ELNEC-Geriatric Program was initiated in February 2006 in the US to prepare nurses as educators and leaders to improve the quality of end-of-life care in geriatric care facilities, and introduced to Korea in 2010 through the ELNEC project-Korea (established in 2008). Conclusion : The effectiveness of all available palliative and hospice care education programs in Korea will be discussed. Keywords : End-of-life, nursing education, ELNEC project

SS26 316-R

NATIONAL PROGRAMME FOR HEALTH CARE OF THE ELDERLY (NPHCE): A MAJOR INITIATIVE IN OLD AGE CARE IN INDIA

SS26 316-R-1

INTRODUCTION AND SITUATION ANALYSIS OF OLDER PEOPLE IN INDIA

Indrajeet Singh GAMBHIR (*Head division of Geriatric Medicine, Banaras Hindu University, India*)

The increased longevity across the globe has also been experienced in India. 60+ population has tripled in last 50 years. In year 2013 there are 100 million Indian elderly and in the year 2050, the number will be over 300 million. National Sample Surveys have shown that there is high burden of morbidity in old age, mostly comprising of non-communicable diseases. Disabilities resulting from these non-communicable diseases compromise quality of life in later years. The management of these chronic diseases is very costly thereby making it out of bound for elderly whose income decreases post retirement, more so for persons in unorganized sectors and dependent elderly women. 8% of older Indians above 60 years are confined to home or bed. This figure rises to 27% in 80+ age group and women are worst affected. There is no model of health care for older people in India. Presently elderly are provided health care by the general health care delivery system in the country. The infrastructure is grossly deficient at the primary care level. Elderly suffer from multiple co-morbidities and require multidisciplinary, comprehensive and dedicated health care, such model is imperative to provide quality health care to meet elderly needs. In India, family is still the primary care giver and there is lot of scope for training this lot to improve elderly health care. Keywords : older people, healthcare delivery system

SS26 316-R-2

COMPONENTS OF NATIONAL PROGRAMME FOR HEALTH CARE OF THE ELDERLY

Arvind MATHUR (*Medicine, Dr S N Medical College, India*)

Introduction : NPHCE plans to address health needs of elderly comprehensively at primary, secondary and tertiary level of health care delivery. There is an effort to have continuum of care from institution to home. Besides providing therapeutic services there is an important objective of training for medical, paramedical and caregivers. Program also encompasses thrust on research in various areas of geriatrics. Method : In order to achieve its objectives NPHCE has various activities at different levels. Results : At Sub-centre health education related to healthy ageing, domiciliary visits for attention and care to home bound / bedridden elderly persons along with linkage with other support groups and day care centres. At Primary Health Centre there is provision of clinical services for common ailments, provision of medicines, proper advice on chronic ailments and referral for diseases needing further investigations. Community Health Centre is First Referral Unit (FRU) for the Elderly from PHCs and below. Besides Geriatric Clinic a rehabilitation unit for physiotherapy is provided. At District Hospital a regular dedicated OPD and ten bedded in patient services to the Elderly along with facilities for laboratory investigations is provided. Regional Geriatric Centre would be tertiary level institutions with Geriatric Clinic, 30-bedded Geriatric Ward and facilities for advanced multidisciplinary treatments. These centres would be actively involved in training and running post graduate degree courses. There are plans to establish two advanced institutes of ageing in the country. Conclusion : NPHCE envisages to provide health care to elderly at every level thereby promoting healthy and active ageing in India. Keywords : Health delivery Elderly NPHCE

SS26 316-R-3

NATIONAL PROGRAMME FOR HEALTH CARE OF THE ELDERLY (NPHCE): A MAJOR INITIATIVE IN OLD AGE CARE IN INDIA

A.B. DEY (*Geriatric Medicine, All India Institute of Medical Sciences, India*)

Responding to social needs, national policies and legislations; and international commitments, Government of India, announced the

National Programme for Health Care of the Elderly in 2010. The vision of the NPHCE was to provide accessible, affordable and high-quality long-term, comprehensive and dedicated care to an ageing population; creating a new "architecture" for ageing; to build a framework to create an enabling environment for "a society for all ages" and overall to promote the concept of active and healthy ageing. Core Strategies of the programme included community based primary health care by trained health workers, dedicated facilities at District Hospitals, and dedicated regional tertiary centers to provide postgraduate and undergraduate medical training. The NPHCE also aimed at promoting health awareness through mass media to reach out to the target community. Eight institutions were announced as regional centers; some with interest while others without. Inaccessible districts without functional health system were identified for the new activity without consultation with State Governments. While it sounded politically correct, in practice the programme had neither implementers nor takers. Large states showed no interest because of the financial implication. As the programme was stretched to its limit, the salaries were unattractive and contractual nature of appointment did not attract talent for faculty positions, essential to start post-graduate programme as per regulatory norms. Overall this national programme has nothing to show on the ground. This is typical of the current system of governance where political will is not translated to action in the ground. Keywords : National policy, implementation, appraisal

IDENTIFYING ELDER ABUSE AND NEGLECT- AN INTERACTIVE WORKSHOP

SS26 318-S-1

IDENTIFYING ELDER ABUSE: AN INTERACTIVE WORKSHOP

Sara ALON (*Eshel, JDC-ESHEL (The Association for planning and Developing Services for the Aged in Israel), Israel*)

Introduction : Elder abuse is defined as a single or repeated act. or lack of appropriate action, occurring in any relationship where there is an expectation of trust, that causes harm or stress to an older person (WHO, 2002). Elder abuse is underidentified and under reported by social and health care professionals. Screening for abuse, using validated and efficient tools, has been suggested for increasing the identification rate. Such a validated tool encompassing the three dimensions of identification of risk factors that has been developed recently (Cohen et al. 2006, 2007). Method : In order to implement the three dimensional risk assessment tool an interactive workshop was developed by the Ministry of Health and JDC-Eshel. During this workshop participants will learn about the assessment tool as well as be trained in the use of it through case examples in the same manner developed in Israel. Results : As a result of these workshops there was: 1. An increased willingness by the multidisciplinary professionals in the use of the assessment tool. 2. An improvement of elder abuse assessment skills. 3. Increased willingness to routinely use the assessment tool. Conclusion : The development of a risk assessment tool must be accompanied by training in order to understand the benefits of it and it's use. This will increase the rate of identification of abused elderly. Identifying abused elderly is the first step in helping these victims in realizing their rights and aiding in stopping the abuse. Keywords : abuse, screening, training

SS26 318-S-2

IDENTIFYING ELDER ABUSE: AN INTERACTIVE WORKSHOP

Barbara LANG (*Social Work, Ministry of Health, Israel*)

Introduction : Elder abuse is defined as a single or repeated act. or lack of appropriate action, occurring in any relationship where there is an expectation of trust, that causes harm or stress to an older person (WHO, 2002). Elder abuse is underidentified and under reported by social and health care professionals. Screening for abuse, using validated and efficient tools, has been suggested for increasing the identification rate. Such a validated tool encompassing the three dimensions of identification of risk factors that has been developed recently (Cohen et al. 2006, 2007). Method : In order to implement the three dimensional risk assessment tool an interactive workshop was developed by the Ministry of Health and JDC-Eshel. HOW TO ENGAGE ORGANIZED MEDICINE IN GERIATRIC EDUCATION, RESEARCH, AND KNOWLEDGE TRANSLATION

SS26 322-C-1

GETTING STARTED: ENGAGING THE LEADERSHIP OF ORGANIZED MEDICINE TO ESTABLISH GERIATRIC

SECTIONS

Mark ROSENBERG (*Emergency Medicine, St Josephs Healthcare System, USA*)

Introduction : The most rapidly growing portion of society is the geriatric age group. Populations have been experiencing longevity and improved health forcing health professionals around the globe to struggle to keep up with the effects of this shifting paradigm of aging. Elderly patients often present with vague complaints, comorbid conditions, coexisting chronic medical problems, and polypharmacy necessitating an alternate model of care. **Method :** Discuss strategies to embrace this segment of the population focusing on approaches to engage key individuals in the benefits of providing an environment for the older patient which may also benefit the general population. Case studies in the establishment of Geriatric Emergency Departments will be highlighted. **Results :** Infrastructure and design planning may demand significant attention from leadership considering improving care to geriatric populations. A paradigm shift is required in thought and action through leadership and training. Developing a Geriatric Emergency Department will improve operational efficiencies and will focus on improving healthcare for older patient. The success will be measured in better outcomes, improved patient satisfaction, and cost savings. **Conclusion :** In many situations, using existing resources and specific operational strategies will provide improved care to an aging population. With minimal investment geriatric programs can translate into better healthcare for both functionally Independent older persons as well as those institutionalized. Ultimately, the success of any Geriatric initiative rests with individuals from leadership positions to staff members. **Keywords :** Geriatric, Emergency Department, Cost Savings

SS26 322-C-2

DEVELOPING A VALUE-ADDED PRODUCT FOR DUES PAYING MEMBERS: THE AGEM JOURNAL CLUB EXPERIENCE

Alison SOUTHERN (*Emergency Medicine, Summa Akron City Hospital NEOMED, USA*)

Introduction : The Academy of Geriatric Emergency Medicine (AGEM) Journal Club product has been developed to give dues paying members of SAEM AGEM and the ACEP Geriatric Section (GS) an added membership benefit. High-yield clinically relevant geriatric emergency medicine (EM) articles are identified, and critically reviewed. The end result will be a repository of up-to-date, high-yield, geriatric EM educational material available to members. **Method :** Members from both AGEM and GS volunteered to participate in identifying high-yield geriatric EM articles, defined as either practice-changing or practice-affirming research. A PubMed search strategy was designed by two medical librarians. Surveys were created containing the abstracts of potentially high-yield manuscripts. Participants received bimonthly surveys with 20 manuscripts to rate using the BEEM Rater Tool. BEEM Rater scale $\geq 5/7$ was used to distinguish high-yield from others. A critical appraisal is written for high-yield articles and provided to the members as a valuable resource. **Results :** Analysis of the results from 5 surveys determined eleven articles were rated with a BEEM Rater scale $\geq 5/7$. This rating is given to articles which are deemed new and important and would probably change practice, would change practice, or are a "must" know for emergency physicians. Critical appraisals of these articles provided by leaders in the field were then distributed to the AGEM and GS members. **Conclusion :** This journal club product is an added benefit to geriatric interest group members. Providing this resource may encourage membership, provide quality continued education, and

result in research collaborations in geriatric EM. **Keywords :** Geriatrics, Critical appraisals

SS26 322-C-3

GERIATRIC SECTIONS IN SPECIALTY MEDICINE ORGANIZATIONS: THE PROS, THE CONS, AND HINTS FOR SUCCESS

Carrie CREGAR (*Emergency Medicine, Akron General Medical Center, USA*)

Introduction : Two North American Emergency Medicine professional organizations, American College of Emergency Physicians and Society of Academic Emergency Medicine have geriatric interest groups whose mission is to improve the quality of emergency care received by older patients. We explore barriers and successful tools and products within these specialty medicine organizations. **Method :** First, we will outline the goals of these specialty medicine organizations. Second, we identify value added tools such as journal clubs and continuing education modules. **Results :** This presentation highlights the favorable aspects of a specialty medicine organization including communication, idea sharing and education; and the difficulties including support, consensus and replication of work. **Conclusion :** The geriatric sections of Emergency Medicine offer education to students, residents, practicing physicians and educators through information summaries and videos of clinical topics pertinent to geriatric emergency medicine. These geriatric sections offer information to research funding opportunities, collaboration, and dissemination of information however they have a small base of physicians with a lack of interdisciplinary peers. **Keywords :** organized medicine, geriatric, education

SS26 322-C-4

PROFESSIONAL TRADE SOCIETIES: BRIDGING THE TRANS-DISCIPLINARY GAP TO IMPROVING GERIATRIC HEALTHCARE

Christopher Robert CARPENTER (*Emergency Medicine, Washington University in St. Louis, USA*)

Introduction : Professional trade societies, like the American College of Emergency Physicians and the American Geriatrics Society, are key allies for healthcare providers with overlapping missions to improve overall medical care delivery via education and research. We explore barriers and successful mechanisms to link geriatric healthcare efforts across professional organizations. **Method :** Identifying education and research opinion leaders across disciplines with active roles in their respective trade organizations is essential. A seasoned mentor and external funding sources facilitate collaboration, in addition to providing a mechanism to disseminate work products. **Results :** Via a collaborative effort between AAEM, CORD, EMRA, ACEP, SAEM, AMA, AGS, and others, we developed educational core competencies for three levels of physicians: medical students, emergency medicine residents, and post-graduate physicians. Similarly, the John Hartford Foundation funded New Frontiers to establish multidisciplinary, high-yield research priorities. We review the work products and ongoing efforts for both of these initiatives. Multinational geriatric-focused collaborations within emergency medicine are the next evolution of organized medicine's engagement in improving older adult care processes in the 21st Century. **Conclusion :** Organized medicine's trade societies traditionally function in isolated silos lacking consistent trans-disciplinary communication streams or recognition of complementary objectives. Efficient, cost-effective medical care of an aging society necessitates cross-disciplinary engagement at the individual provider, hospital, and trade organization level. We provide

successful examples of these principles. Keywords : Organized medicine, implementation science, geriatrics

THE WAR AGAINST POLYHARMACY (2): THE TRIPLE WIN-GAME OF REDUCING POLYPHARMACY - IMPROVED HEALTH AND REDUCED COST OF DRUGS & HOSPITALIZATIONS

SS26 302-C-1

THE OLDER THE BETTER: ARE ELDERLY STUDY PARTICIPANTS MORE NON-REPRESENTATIVE?

Marcella Angelina EVANS (*School of Medicine, University of California Irvine School of Medicine, USA*)

Introduction : Clinical guidelines are based on the results of clinical research. However, study participants can differ from the target population they are taken to represent. Individuals who are less healthy/vigorous may self-select to not participate in studies. We hypothesized that elderly individuals who elect to participate in research studies may be less representative of the general elderly population. Method : Using both a clinical trial sample (N=1,016 aged 20-85) and an observational study sample (N=2,404 aged 40-79), we assessed age-trends and health outcomes in how active participants deemed themselves to be relative to others their age. This self-reported measure was validated against assessments of actual exercise and objective tests with known relation to exercise. Results : Successively older study participants reported successively greater activity relative to others their age ($p < 0.001$). Relative activity significantly predicted actual activity, and numerous self-rated and objective health-predictors (general self-rated health, CES-D depression score, sleep, tiredness, energy, BMI, waist circumference, serum glucose and lipids, white cell count). Reference: Golomb et. al. *British Medical Journal Open*, 2012; 2(6):e000833. PMID: PMC3533104. Conclusion : Since healthier people have a better risk-benefit balance with drugs and procedures, our results suggest that departures from representativeness may be amplified with increasing age which could lead to studies that convey progressively more strongly (typically favorable) distorted estimates of risk-benefit balance. Even if studies are designed to focus on the elderly, increasing age of study participants and patients may increase the disparity between what is recommended based on 'evidence' and what is best for the patient. Keywords : Clinical guidelines, Elderly, Non-representative

SS26 302-C-2

REDUCING INAPPROPRIATE PRESCRIBING OF PSYCHOTROPIC DRUGS IN OLDER ADULTS

Mirko PETROVIC (*Geriatrics, Ghent University Hospital, Belgium*)

Introduction : Frailty at old age and institutionalization in nursing homes are often associated with multiple chronic diseases (multimorbidity) requiring multiple medications (polypharmacy). Among these chronic conditions, psycho-organic and mental health problems e.g. dementia with behavioural and psychological symptoms, insomnia and depression are common. Psychotropic drugs are frequently used as a treatment approach for these conditions. The prevalence of their use is high among community-dwelling older adults but even higher in nursing homes. Furthermore, within the problem of polypharmacy and inappropriate prescribing, psychotropic drugs (i.e. antipsychotics, benzodiazepines, antidepressants) constitute a significant proportion. Method : An overview of the main findings of several recent studies from own research group has been presented and supported by existing evidence with regard to (inappropriate

prescribing of psychotropic drugs in frail older people. Results : The use of psychotropics in older adults remains controversial given the risk of adverse effects, in contrast to the limited effectiveness and adverse effects. Guidelines advise a thorough risk-benefit analysis for psychotropics, in addition to time-limited use and discontinuation. It has been shown that the majority of chronic psychotropic drug users among frail older patients can be withdrawn from psychotropic medication without detrimental effects. Conclusion : In the future, more efforts should be undertaken to tackle the burden of inappropriate psychotropic prescribing in frail older adults by incorporating a multidisciplinary approach (physicians, nurses and pharmacists), and by offering convincing non-pharmacological and pharmacological alternatives. It is necessary to bridge the gap between evidence and clinical practice, making sure that the evidence has been applied in good clinical practice. Keywords : Psychotropic drugs, older adults

SS26 302-C-3

STRATEGIES TO REDUCE THE RISK OF IATROGENIC ILLNESS IN COMPLEX OLDER ADULTS

Graziano ONDER (*Geriatrics, Universita Cattolica del Sacro Cuore, Italy*)

Introduction : Older patients are particularly vulnerable to Adverse Drug Reactions (ADR) because age is associated with changes in pharmacokinetics and pharmacodynamics that may alter drug metabolism. In addition, other conditions, which may be observed in complex older adults, may increment the risk of ADR in the older population (including polypharmacy, comorbidity, cognitive and functional limitations). ADRs are frequently preventable, suggesting that screening and prevention programs aimed at reducing the rate of iatrogenic illness are necessary in this population. Method : We reviewed available approaches which may be used to screen and prevent the occurrence of ADR in older adults, including conducting medication review, avoiding the use of potentially inappropriate medications, using computer-based prescribing systems and performing comprehensive geriatric assessment. Results : Available evidence on the examined approaches is mixed and controversial and none of them showed a clear beneficial effect on patients' health outcomes. Limitation of these interventions is the lack of standardization and these differences may give reason for the variability of the results documented in randomized clinical studies. Most of the available research is focused on a single intervention targeting either clinical or pharmacological factors causing ADR. When these approaches are combined, positive effects on patients health outcomes can be shown, suggesting that integration of skills from different health care professionals is needed to address medical complexity of older adults. Conclusion : The challenge for future research is to integrate information obtained by existing instruments and methodologies in a complete and global approach targeting all potential factors involved in the onset of ADR. Keywords : ADR, polypharmacy, CGA

SS26 302-C-4

PRESIDENTIAL/SUBMITTED SYMPOSIUM LESS IS MORE - THE GARFINKEL METHOD FOR IMPROVING DRUG THERAPY IN THE ELDERLY

Doron GARFINKEL (*Palliative Geriatric, Shoham Geriatric Medical Center, Pardes Hana, Israel 37000, Israel*)

Introduction : Clinical Practice Guidelines (CPGs) are based on 'single disease model' studies performed in adults. Applying these CPGs to include elders with co-morbidity, dementia/disability and limited life

expectancy is inappropriate, increases the severity of polypharmacy leading to decreased quality of care. Method : The Garfinkel method combines ethics, EBM and clinical judgment; it involves comprehensive meetings with patient/guardian/family (PGF) to discuss benefit/risk ratios of all medications based on available EBM considering age, co-morbidities, functional, mental/cognitive status. Following rethinking/reevaluation for each drug while respecting PGF's preferences, simultaneous drug discontinuation (DD) of as many 'non-lifesaving' drugs as possible, is performed. Results : In nursing departments DD was performed for 332 drugs in 119 patients without significant adverse reactions (ADRs). DD failure rate was 10%. Annual mortality rate was 45% in controls, 21% in the DD group ($P < 0.001$), referrals to acute care facilities were also significantly reduced ($P < 0.002$). In community dwelling elders age 82.8 ± 6.9 consuming 7.73 ± 3.7 medications, DD was recommended for 57.5%, but eventually performed in 47% (3.7 ± 2.5 drugs/patient). Follow up was 19.2 ± 11.4 months. 5/256 drugs had been restarted (DD failure 2%), successful DD achieved in 80.7% without significant ADRs. 80% of PGFs reported medical functional- mental -cognitive improvements (significant in 37%). Conclusion : The sum total of negative effects of polypharmacy outweighs the sum of beneficial effects of the specific drugs. The Garfinkel method is highly ethical and beneficial having no significant risks. Applying the Garfinkel method globally may significantly decrease medication burden, improve quality of life with substantial cost reductions (a triple win-win game). Keywords : Polypharmacy, elderly, Garfinkel method, drug discontinuation

SS26 325-C

AGING IN A LIFE-SPAN DEVELOPMENTAL AND MULTIDISCIPLINARY PERSPECTIVE. THE PROS AND CONS OF LONGITUDINAL COHORT STUDIES

SS26 325-C-1

RESERVE AND LATE LIFE COGNITIVE TRAJECTORIES: EFFECTS OF DISTAL INFLUENCES AND SURVIVAL IN THE H70 AND LUND 80+ SWEDISH POPULATION-BASED LONGITUDINAL STUDIES

Boo JOHANSSON¹, Valgeir THORVALDSSON¹, Torbjorn SVENSSON² (1. Dept of Psychology, University of Gothenburg, Sweden; 2. Dept of Health Sciences, Lund University, Sweden)

Introduction : To compare late life (70+) cognitive trajectories in two Swedish population-based representative samples and their relations to education/SES and subsequent survival within the theoretical context of cognitive reserve in old age. Method : Data was drawn from the Gerontological and Geriatric Population Studies in Gothenburg (H70) and from the Lund 80+ Study. The cognitive battery in both studies included several tests common across the studies. Results : Despite large heterogeneity in cognitive trajectories on all measures we found a consistent pattern of terminal decline, based on within-person estimates, across all domains and within both study samples. Terminal decline accounted better for the data as compared with chronological age in all fitted models. Between-person estimates of cognitive decline were moderately to highly correlated across domains. Within-person estimates were attenuated, except on measures tapping similar cognitive domains e.g., recall and recognition. Education was a significant moderator of the decline processes across most domains, in both studies, where higher education was associated with later onset, but also steeper decline in cognitive functions. These moderating effects of education were somewhat stronger in the Lund 80+ sample. Conclusion : Cognitive decline in late life is associated with subsequent survival; a terminal decline pattern was confirmed in both

studies despite the fact that the samples vary considerably in overall health, demographics and other background variables. Notably, differential patterns of decline were related to distal education suggesting neuro-protective effects that seem to persist into very late life in terms of cognitive reserve. Keywords : Life-span development, Cognition, Longitudinal, Population-based

SS26 325-C-2

LONGER LIVES AND BETTER HEALTH? RESULTS CONCERNING CHANGES OF HEALTH IN THE SECOND HALF OF LIFE BASED ON THE GERMAN AGEING SURVEY (DEAS)

Clemens TESCH-ROEMER, Svenja M SPULING, Oliver HUXHOLD, Sonja NOWOSSADECK, Susanne WURM (Research Department, German Centre of Gerontology, Germany)

Introduction : Cohort-sequential surveys like the German Ageing Survey (DEAS) combine cross-sectional and longitudinal data collections. While it is possible to trace societal change using repeated cross-sectional surveys, longitudinal data allow the analysis of intra-individual change over time. Method : Cross-sectional data for the age groups 40 to 85 years come from three nationally representative DEAS waves in 1996, 2002, and 2008 (sample sizes vary between 3,000 and 6,000). Longitudinal data come from DEAS waves in 1996, 2002, 2008, and 2011 (comprising health trajectories between 3 and 15 years). Three health indicators were used: number of self-reported diseases, functional health, and self-rated health. Results : Healthy life expectancy increases between 1996 and 2008. For the indicator 'self-reported diseases' (good health: 4 or less diseases) the proportion of healthy life expectancy increased from 64 to 77 percent, and for the indicator 'self-rated health' (good health: ratings of good or very good health) from 79 to 84 percent. In a developmental perspective, health changed depending on educational status (the ISCED was used as indicator of educational status). There were substantial education related differences in health trajectories. While education related differences in the trajectories of 'self-reported diseases' and 'self-rated health' diminish with age, education related differences in the trajectories of 'functional health' expand with age. Conclusion : The results suggest that despite a trend toward compression of morbidity on the population level in Germany, there are still substantial inequalities in the decline of health in later adulthood due to educational status. Keywords : health, change, education

SS26 325-C-3

TIMES ARE CHANGING - AND DOES AGEING CHANGE WITH IT? RESULTS FROM TWO COHORTS IN THE LONGITUDINAL AGING STUDY AMSTERDAM

Dorly J.H. DEEG, Majoge VAN VLIET, Martijn HUISMAN (LASA, VU University Medical Centre, Netherlands)

Introduction : A longitudinal study per definition is performed over a longer period of time, which makes it important to acknowledge the disentanglement of ageing, cohort and period effects on the findings. In a cross-sequential design, where different cohorts are compared in periods when they have the same age, each of these three effects can be studied. One important question is, to what extent the often-observed decline in mobility with ageing has accelerated or decelerated as of the mid-2000's versus the mid-1990's. Method : Using data from the Longitudinal Aging Study Amsterdam (LASA), significant 3-year decline in mobility and ADL disability was compared across the periods 1996-1999 and 2006-2009 for two cohorts ($n=1634$ and $n=1103$, respectively) ages 68-87 years. Results: Using multinomial regression analyses adjusted for age, sex, and

mortality, the age group 68-77 years showed less decline in 2006-2009 as in 1996-1999. This difference in decline was for 20% explained by the increased level of education in the more recent cohort. There was an interaction effect of period with hypertension and of period with arthritis, indicating decelerated decline for hypertension and arthritis patients in 2006-2009 as compared to 1996-1999. In the oldest age group of 78-87 years, no period difference in disability was observed. Conclusion : These findings suggest more favorable courses of disease and disability in the recent cohort of younger-olds, partly due to higher levels of education reflecting a more favorable life course. Keywords : Disability decline, Period, Cohort

SS26 325-C-4

CANADIAN LONGITUDINAL STUDY ON AGING AS A PLATFORM FOR STUDYING TRANSITIONS AND TRAJECTORIES OF AGING AND HEALTH

Parminder RAINA¹, Christina WOLFSON², Susan KIRKLAND³
(1. *Clinical Epidemiology and Biostatistics, McMaster University, Canada*; 2. *Epidemiology and Biostatistics, McGill University, Canada*; 3. *Community Health and Epidemiology, Dalhousie University, Canada*)

Introduction : Despite long-standing awareness that the aging process involves complex changes during an individual's lifetime (from the cellular level, to individual behavioural and psychological factors, to broad social contexts) a clear picture of the combined effects has not yet emerged. Method : The CLSA plans to investigate the transitions and trajectories of aging and health that are influenced by the interrelationship among intrinsic and extrinsic factors. In recent years, our ability to study aging has increased with biological and technological advances, such as the sequencing of the human genome. Thus in this new era of longitudinal research, we are conducting a study that moves beyond a mere description of change over time to actually studying the dynamic determinants of change within and between individuals over time. Results : The CLSA is a 20-year longitudinal study of 50,000 Canadian men and women between the ages of 45 and 85 years at baseline. All participants are asked to provide a common set of information on demographic, social, physical/clinical, psychological, economic, and health service use aspects relevant to health and aging. Thirty-thousand of the 50,000 participants are also asked to provide additional in-depth information through series of unique physical examinations and biological specimen collection (blood, DNA and urine). The individual data will also be linked to administrative health service utilization records, disease registries, mortality files, as well as contextual and environmental indicators. Conclusion : This presentation will provide details about the design and preliminary results, and future application of this platform to understand the trajectories of aging population. Keywords : CLSA, longitudinal study, trajectories

Introduction : Lack of physical activity (PA) in earlier life is considered to be a risk factor for dementia. However, the long-term effect of midlife PA on various cognitive dimensions and mobility performance among dementia free older adults is still unclear. We explored the long-term associations between midlife PA with late-life cognitive function and mobility performance among Icelandic older adults. A population based cohort of men and women (born 1907-1935) participated in the Age Gene/Environment Susceptibility - Reykjavik Study. The interval between midlife and late-life was 26 years. Method : Study population included 5445 subjects (58% women; active=1664, and inactive=3781; mean age 77±6 yrs), after excluding individuals with dementia (n=319). Main outcomes were composite scores of speed of processing (SP), memory (MEM) and executive function (EF), created from a neuropsychological test battery. Measures of lower extremity function (LEF) in late-life included gait speed from 6m walk (meter per second, m/s), Timed Up and Go (TUG, second), and Knee Extension (KE) strength (kg) tests. Results : Compared to those who were inactive at midlife, those who were active at midlife had significantly faster SP, and better MEM and EF in late-life, after controlling for demographic and health risk factors. The active group also had significantly faster gait speed, TUG time, and greater KE strength in late life even with further adjustment of various cognitive functions in the secondary-analysis. Conclusion : Our study suggests that midlife PA is strongly associated with better cognitive function and better performance of LEF in later life. Keywords : physical activity, cognitive function, mobility

SS26 326-C-2

OBESITY AND COGNITIVE AGING: A SYSTEMATIC REVIEW

Linda HASSING (*Department of Psychology, University of Gothenburg, Sweden*)

Introduction : Obesity is a health problem that has reached epidemic proportions. Given the high prevalence of obesity, even a small adverse impact of obesity on cognitive aging might have a serious effect on public health. The purpose of the systematic review was to examine the relation between obesity and cognitive function in late life among persons not diagnosed with dementia and to evaluate the evidence for a causal association. Method : Medline was used to search for the following terms: obesity, overweight, cognition, cognitive, age, and aged. To be included, studies must have had a population-based, dementia-free sample and a 5-year minimum interval between measurement of the predictor and the outcome. Results : Only 11 studies met the criteria. Of these, 7 studies assessed obesity in midlife and cognitive function in later life, and 4 studies assessed obesity and cognitive function in late life. The reviewed studies showed clear evidence that midlife obesity was associated with

cognitive aging, whereas this association was weaker in late life; thus, no firm conclusions could be drawn. Conclusion : The findings of this review suggest that, although there is evidence for an association between midlife obesity and low cognitive abilities in late life, the direction of the association and the causality remain to be clarified. Keywords : Obesity, Cognitive function, Aging

SS26 326-C-3

MIDLIFE BODY MASS INDEX, GENETIC RISK OF OBESITY, AND LATE LIFE COGNITIVE FUNCTION

Anna K. DAHL¹, Chandra A. REYNOLDS², Linda B. HASSING³, Nancy L. PEDERSEN¹ (1. Dept. Medical Epidemiology and Biostatistics, Karolinska Institutet, Sweden; 2. Department of Psychology, University of California Riverside, USA; 3. Department of Psychology, University of Gothenburg, Sweden)

Introduction : A growing body of evidence links high midlife body mass index (BMI) to low late life cognitive function, but the effect of BMI on cognitive abilities and cognitive change in the presence of genetic risk of obesity has not been evaluated previously. Method : We investigated the association between midlife BMI and an individual obesity genetic risk score based on 32 single nucleotide polymorphisms and cognitive change in verbal and spatial abilities, memory, and processing speed across two decades in the Swedish Adoption/Twin Study of Aging (SATSA). Results : Latent growth curve models fitted to data from non-demented participants showed that both a higher midlife BMI and a higher genetic risk score were associated with significantly lower mean level cognitive performance across domains in late life, independently of each other. However, higher obesity genetic risk was not associated with cognitive decline. Conclusion : Being overweight/obese in midlife has a negative effect on cognitive abilities later in life. This study also indicates that higher genetic risk of obesity is associated with lower mean level cognitive function, even when midlife BMI is controlled for, but not with cognitive decline. Keywords : obesity genotypes cognition

SS26 327-C

B-PROOF SYMPOSIUM: THE EFFECT OF B-VITAMIN SUPPLEMENTATION ON OSTEOPOROTIC FRACTURE INCIDENCE IN ELDERLY

SS26 327-C-1

THE B-PROOF STUDY, RATIONALE AND METHODS

Nathalie VAN DER VELDE (Internal Medicine - Geriatrics, AMC, Netherlands)

Introduction : Elevated homocysteine is common in older persons and poor vitamin status is the main cause for this particular age group. Increased homocysteine in turn leads to increased risk of several diseases, including a.o. osteoporosis and cardiovascular diseases. Since vitamin B12 and folate intake and status play a large role in homocysteine metabolism, it is hypothesized that supplementation with these B-vitamins will reduce fracture incidence in elderly and potentially improve other homocysteine-related outcomes including physical function and cardiovascular disease. Method : The B-PROOF (B-Vitamins for the PRevention Of Osteoporotic Fractures) study is a randomized double-blind placebo-controlled trial. The intervention comprises a period of two years, and includes 2919 subjects, aged 65 years and older, independently living or institutionalized, with an elevated homocysteine concentration ($\geq 12 \mu\text{mol/L}$). One group receives daily a tablet with 500 μg vitamin B12 and 400 μg folic acid and the other group receives a placebo tablet. In both tablets 15 μg (600 IU) vitamin D is included. Keywords : Homocysteine

SS26 327-C-2

EFFECTS OF TREATMENT WITH HOMOCYSTEINE-LOWERING B-VITAMINS ON OSTEOPOROTIC MEASURES IN MILDLY HYPERHOMOCYSTEINEMIC ELDERLY

Anke ENNEMAN¹, Karin SWART², Carola ZILLIKENS¹, Suzanne VAN DIJK¹, Janneke VAN WIJNGAARDEN³, Natasja VAN SCHOOR², Paul LIPS², Rosalie DHONUKSHE-RUTTEN³, Lisette DE GROOT³, Joyce VAN MEURS¹, Andre UITTERLINDEN¹, Nathalie VAN DER VELDE¹ (1. Internal Medicine, Erasmus MC, Netherlands; 2. EMGO, VUmc, Netherlands; 3. Human Nutrition, Wageningen University, Netherlands)

Introduction : Osteoporosis and osteoporotic fractures are a major health problem worldwide. Mild hyperhomocysteinemia is associated with increased incidence of osteoporotic fractures. Whether this is a causal relationship and what the underlying mechanism is, remains uncertain. The B-PROOF study was designed to investigate whether supplementation with homocysteine-lowering B-vitamins is able to reduce fracture incidence in mildly hyperhomocysteinemic elderly people. Method : 2919 men and women aged 65 years and over with a plasma homocysteine level of 12 $\mu\text{mol/l}$ or higher were randomized to receive either a daily supplement containing 500 μg of vitamin B12 and 400 μg of folic acid or a placebo for 2 years. Both treatments also contained 400 IU of vitamin D. In subsamples, bone mineral density (BMD) and bone quality were measured. A DXA-device was used to measure femoral neck and lumbar spine BMD before and after the intervention ($n=\pm 1200$). Effects of the intervention on bone quality were assessed using quantitative ultrasound in the calcaneus ($n=\pm 1400$). Results : The B-PROOF-intervention will be finished in spring of 2013. Results of the intervention will be available in June 2013 and will be reported at the symposium. Conclusion : The B-PROOF-study is the first large trial with B-vitamins investigating the effect of lowering homocysteine levels on osteoporotic measures. If effective, it could be a relatively cheap and easy way to help maintaining bone health. Keywords : Hyperhomocysteinemia, osteoporotic fractures, bone mineral density

THE EFFECT OF 2-YEAR SUPPLEMENTATION OF B-VITAMINS ON PHYSICAL FUNCTIONING, MUSCLE STRENGTH, AND FALLING

Karin M. SWART¹, Anke W. ENNEMAN², Janneke P. VAN WIJNGAARDEN³, Evelien SOHL¹, Suzanne C. VAN DIJK², Elske M. BROUWER-BROLSMA³, Annelies C. HAM², Nikita VAN DER ZWALUW³, Carola M. VAN SCHOOR¹ (1. Department of Epidemiology and Biostatistics and the EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 2. Department of Internal Medicine, Erasmus Medical Center, Netherlands; 3. Department of Human Nutrition, Wageningen University, Netherlands; 4. Department of Endocrinology and the EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands)

Introduction : In the elderly, elevated homocysteine levels have been linked to a reduced physical functioning in several observational studies. In particular, inverse associations were reported between homocysteine and physical performance and muscle strength. Homocysteine-lowering by B-vitamin supplementation might provide insight in the causality of homocysteine in these associations. However, randomized clinical controlled trials are lacking until now.

Method : In this study, the effect of daily supplementation of 500 µg vitamin B12, 400 µg folic acid, and 600 IE vitamin D was compared with 600 IE vitamin D supplementation only within the B-Vitamins in the PREvention Of Osteoporotic Fractures (B-PROOF) study (n=2,919). The follow-up duration comprised a period of two years. Outcome measures were physical performance, hand grip strength, and falling. Physical performance was assessed with a timed walking, chair stands, and balance test. Falling was reported prospectively during follow-up, using a weekly calendar. Two-year change scores of physical performance and grip strength will be compared between the intervention and control group. Time to falling will be analyzed with Cox-regression models. Both intention-to-treat and per protocol analyses will be performed. **Results :** Follow-up will be completed in March 2013. The results will be presented in this symposium. **Conclusion :** This is the first study that examines the effect of homocysteine lowering on physical functioning in the elderly. Positive findings might prevent or delay physical decline in the elderly. **Keywords :** Homocysteine, B-vitamins, Physical functioning

SS26 327-C-4

THE EFFECT OF B-VITAMIN SUPPLEMENTATION ON ARTERIAL STIFFNESS IN ELDERLY

Suzanne VAN DIJK (*Internal Medicine - Section of Geriatrics, Erasmus Medical Center, Netherlands*)

Introduction : Homocysteine alone has been shown to be a better predictor of cardiovascular mortality in very old persons than models based on classical risk factors. The pathophysiological pathway is however still under debate. Current view is that hyperhomocysteinemia leads to impaired endothelial function, and finally arterial stiffness. Since several intervention trials reported a lack of short-term benefit of B-vitamin supplementation, arterial stiffness might be the link between hyperhomocysteinemia and adverse cardiovascular outcomes. B-vitamins may fail to demonstrate beneficial effects since arterial stiffness is a structural abnormality, which is not easily and rapidly reversible. The B-PROOF study forms an excellent opportunity to investigate the direct effect of B-vitamins on arterial stiffening processes. **Method :** Data of the B-PROOF study are used to determine the effect of B-vitamin supplementation on different outcomes of vascular function and structure. A subgroup of the B-PROOF study was included (n=560). We assessed carotid distensibility, using ultrasonography, and aortic pulse wave velocity (PWV) and augmentation index (AIX), measured with applanation tonometry. Furthermore, office blood pressure measurements (n=560) and 24-hour blood ambulatory pressure recordings (n=70) were performed. **Results :** This trial is still in progress and all follow-up measurements will be completed in March 2013. **Conclusion :** We will therefore present the longitudinal outcomes regarding the effect of B-vitamin supplementation on arterial stiffness at the B-PROOF symposium. **Keywords :** B-PROOF, B-vitamins, Arterial stiffness

INTEGRATED CARE APPROACHES AIMED AT OLDER ADULTS WITH COMPLEX AND LONG-TERM CARE NEEDS

SS26 407-R-1

COMPREHENSIVE CARE PROGRAMS FOR PATIENTS WITH MULTIPLE CHRONIC CONDITIONS: A SYSTEMATIC LITERATURE REVIEW

Simone Renate DE BRUIN¹, Nathalie VERSNEL², Lidwien C. LEMMENS¹, Claudia CM MOLEMA¹, Francois G. SCHELLEVIS², Giel NIJPELS³, Caroline A. BAAN¹ (*1. Centre for Prevention and Health Services Research, National Institute for Public Health and the*

Environment, Netherlands; 2. NIVEL, Netherlands Institute for Health Services Research, Netherlands; 3. Department of General Practice/EMGO+ Institute for Health and Care Research, VU University Medical Centre, Netherlands)

Introduction : To provide insight into the characteristics of comprehensive care programs for patients with multiple chronic conditions and their impact on patients, informal caregivers, and professional caregivers. **Method :** Systematic literature search in multiple electronic databases for English language papers published between January 1995 and January 2011. Wagner's chronic care model (CCM) was used to define comprehensive care. After inclusion, the methodological quality of each study was assessed. A best-evidence synthesis was applied to draw conclusions. **Results :** Forty-two publications were selected describing thirty-three studies evaluating twenty-eight comprehensive care programs for multimorbid patients. Programs varied in the target patient groups, implementation settings, number of included interventions, and number of CCM components to which these interventions related. Moderate evidence was found for a beneficial effect of comprehensive care on inpatient healthcare utilization and healthcare costs, health behavior of patients, perceived quality of care, and satisfaction of patients and caregivers. Insufficient evidence was found for a beneficial effect of comprehensive care on health-related quality of life in terms of mental functioning, medication use, and outpatient healthcare utilization and healthcare costs. No evidence was found for a beneficial effect of comprehensive care on cognitive functioning, depressive symptoms, functional status, mortality, quality of life in terms of physical functioning, and caregiver burden. **Conclusion :** Because of the heterogeneity of comprehensive care programs, it is as yet too early to draw firm conclusions regarding their effectiveness. More rigorous evaluation studies are necessary to determine what constitutes best care for the increasing number of people with multiple chronic conditions. **Keywords :** Comprehensive care programs, Effectiveness, Multimorbidity

SS26 407-R-2

EFFECTIVENESS OF CASE MANAGEMENT IN COMORBID DIABETES TYPE 2 PATIENTS

Nathalie VERSNEL¹, Caroline A. BAAN², Giel NIJPELS³, Francois G. SCHELLEVIS¹ (*1. NIVEL, Netherlands Institute for Health Services Research, Netherlands; 2. Centre for Prevention and Health Services Research, National Institute for Public Health and the Environment, Netherlands; 3. Department of General Practice/EMGO+ Institute for Health and Care Research, VU University Medical Centre, Netherlands*)

Introduction : Many people and especially elderly are multimorbid. They meet different care providers to manage specific illnesses, problems or care needs. Often, care programs are single-disease oriented and not designed to coordinated care between programs. Leaving patients at risk of receiving fragmented, incomplete and ineffective care, which could result in higher costs and worse quality of care. We designed an individualized care program according to the conditions of Wagners' Chronic Care Model. This is led by a trained practice nurse and includes evidence-based optimal care for all conditions tailored to the individual patients' preferences (case management). We aim to investigate whether this case management program, additional to a diabetes management program, will improve the quality of chronic care for comorbid T2DM patients. The effectiveness of the program will be established 12 months after the start of the intervention. **Method :** Between February 2011 and July 2012, we included 199 Dutch comorbid diabetes type 2 patients in a

randomized controlled trial. The patients already participate in a diabetes management program. Patients in the control group continue their participation in the diabetes management program and receive care-as-usual from their general practitioner. Patients in the intervention group receive case management in addition. Results : The case management program includes 6 elements; assessing health care needs, design of a care plan, monthly monitoring, coordination of care, facilitating access to other health care resources and recording of information. Conclusion : During the session we will show our results on the effectiveness of the case management program. Keywords : case management, comorbidity, diabetes type 2, effectiveness

IMPLEMENTING THE CHRONIC CARE MODEL FOR FRAIL OLDER ADULTS IN THE NETHERLANDS: STUDY PROTOCOL OF ACT (FRAIL OLDER ADULTS: CARE IN TRANSITION)

Maaikje E. MUNTINGA¹, Emiel O. HOOGENDIJK¹, Karen M. VAN LEEUWEN¹, Hein Pj VAN HOUT¹, Jos Wr TWISK², Henriette E. VAN DER HORST¹, Giel NIJPELS¹, Aaltje Pd JANSEN¹ (1. *General practice and elderly care medicine, EMGO Institute for Health and Care Research, VU University medical center, Netherlands*; 2. *Epidemiology and biostatistics, EMGO Institute for Health and Care Research, VU University medical center, Netherlands*)

Introduction : Care for older adults is facing a number of challenges: health problems could be identified at a more timely stage, older adults report a lack of autonomy in their care process, and coordination of care between professionals needs improvement. ACT aims to address these challenges by introducing the geriatric care model (GCM), based on the chronic care model (Bodenheimer). Method : Design: 2-year stepped-wedge cluster randomised clinical trial, carried out among 35 primary care practices in the Netherlands. Participants: 1147 older adults aged 65+ and their primary informal caregivers. Frailty is assessed using a composite definition of frailty and a polypharmacy criterion. Final inclusion criterion: scoring 3 or more on a disability case-finding tool. Intervention: Every 6 months participants receive a geriatric in-home assessment by a practice nurse, followed by a tailored care plan. Participants with complex care needs are reviewed in interdisciplinary consultations. Evaluation: primary outcome is quality of life as measured with the Short Form-12 questionnaire. Process measurements include the level of implementation and barriers and facilitators to successful implementation. Results : We will present the results of the effects of GCM implementation on quality of life, as well as the main qualitative and quantitative process outcomes. Conclusion : With this study we hope to contribute to the existing knowledge about integrative care models for community-dwelling, frail older adults with complex care needs. Keywords : integrated care, elderly, effectiveness

THE EFFECTS OF AN INTERVENTION TO INCREASE BED ALARM USE TO PREVENT FALLS IN HOSPITALIZED PATIENTS: A CLUSTER-RANDOMIZED TRIAL

Ronald I. SHORR¹, A. Michelle CHANDLER², Lorraine C. MION³, Teresa M. WATERS⁴, Minzhao LIU⁵, Michael J. DANIELS⁶, Lori A. KESSLER², Stephen T. MILLER⁷ (1. *GRECC (182), Malcom Randall VAMC, USA*; 2. *Physicians Research Network, Methodist Healthcare, USA*; 3. *School of Nursing, Vanderbilt University, USA*;

4. *Preventive Medicine, University of Tennessee Health Science Center, USA*; 5. *Statistics, University of Florida, USA*; 6. *Section of Integrative Biology, Division of Statistics and Scientific Computation, University of Texas, USA*; 7. *Medicine, University of Tennessee Health Science Center, USA*)

Introduction : Bed alarm systems intended to prevent hospital falls have not formally been evaluated. Method : We conducted a pair-matched cluster-randomized trial over an 18-month study period. The study took place in a urban community hospital. Sixteen nursing units were allocated based on fall rates during a baseline observation period; randomization sequence was computer generated. Patients were blinded to unit assignment; study personnel assessing outcomes were initially blinded but likely became unblinded. Intervention units received promotion of use of a standard bed alarm system (BedEx Occupancy Monitoring System) through education, training, and technical support. On control units, bed alarms were available for use on usual care nursing units but not formally promoted or supported. Results : Prevalence of alarm use was 64.41 days/1000 patient-days on intervention and 1.79 days/1000 patient-days on control units (P=0.004). Compared to control units, there was no difference in change in fall rates per 1000 patient-days (RR = 1.09, 95% Confidence Interval [CI]: 0.85 to 1.53; difference in differences [DID] = 0.41, 95% CI: -1.05 to 2.47), or in the number of patients who fell, injurious fall rates, or number of patients physically restrained on intervention units. Conclusion : An intervention designed to increase bed alarm use in an urban hospital increased use of the alarms but had no apparent statistically or clinically significant effect on fall-related events or physical restraint use. Keywords : Accidental Falls, Hospitals; Patient Safety

FALLS PREVENTION IN THE ACUTE HOSPITAL SETTING: AN OVERVIEW OF AND UPDATE ON THE 6-PACK PROJECT? LEARNINGS FOR DRIVING FALLS PREVENTION PRACTICE CHANGE

Anna BARKER¹, Renata MORELLO¹, Terry HAINES², Keith HILL³, Sandy BRAUER⁴, Cathie SHERRINGTON⁵, Mari BOTTI⁶, Patricia LIVINGSTON⁷, Jeannette KAMAR⁸, Fiona LANDGREN⁹, Caroline BRAND¹ (1. *Department of Epidemiology and Preventive Medicine, Monash University, Australia*; 2. *Monash University and Allied Health Research Unit, Monash University, Australia*; 3. *School of Physiotherapy, Faculty of Health Sciences, Curtin University, Australia*; 4. *Division of Physiotherapy, School of Health and Rehabilitation Sciences, The University of Queensland, Australia*; 5. *The George Institute for Global Health, The University of Sydney, Australia*; 6. *Epworth/Deakin Centre for Clinical Nursing Research, Deakin University, Australia*; 7. *Faculty of Health, Deakin University, Australia*; 8. *Injury Prevention, The Northern Health, Australia*; 9. *Project Health, Project Health, Australia*)

Introduction : Despite an increase in falls prevention activity over the last decade, rates of reported fractures from in-hospital falls remain stagnant. There is evidence from a longitudinal study that implementation of a targeted nurse delivered program, the 6-PACK, can decrease fall injuries. Method : The project incorporates a three-stage research plan: 1. A prospective mapping of current falls prevention practices; 2. A cluster RCT testing 6-PACK efficacy including economic and program evaluations; and 3. A longitudinal assessment of sustainability of practice change and outcomes. This project involves >40,000 patients from 24 acute wards in seven hospitals across Australia and is the largest falls prevention project to be conducted in the acute setting. The 6-PACK includes a nine-item

falls risk assessment and six nursing interventions. Results : Stage 1 data analysis includes 12,280 patients 775 falls, 305 fall injuries and 500 hospital staff. Key findings include: falls remain a prevalent problem in Australian hospitals, 1 in 15 patients fall during their acute admission and more than 1 in 4 falls result in injury. A review of the sensitivity of data sources identified that only 61% of falls are recorded on incident reporting databases. Identified enablers to effective falls prevention included: access to constant observers; leadership; regular on-ward face-to-face training; and use of audit and feedback. Barriers included: the physical ward environment; difficulty in accessing resources; inaccurate and lengthy risk assessments; health status of patients; and competing priorities. Conclusion : Learnings from the 6-PACK trial will be presented to assist clinicians to design and implement effective falls prevention programs. Keywords : Falls prevention, Implementation, Hospital care

SS26 408-C-3 ECONOMIC EFFICIENCY OF FALLS PREVENTION INTERVENTIONS IN HOSPITAL

Terry HAINES¹, Anne-Marie HILL², Keith HILL³, Sandra BRAUER⁴, Tammy HOFFMANN⁵, Christopher ETHELTON-BEER⁶, Steven MCPHAIL⁷ (1. Allied Health Research Unit, Monash University and Southern Health, Australia; 2. Physiotherapy Department, University of Notre Dame, Australia; 3. Physiotherapy Department, Curtin University, Australia; 4. Physiotherapy Department, University of Queensland, Australia; 5. Centre for Research in Evidence Based Practice, Bond University, Australia; 6. Medicine, University of Western Australia, Australia; 7. Centre for Functioning and Health Research, Queensland University of Technology and Queensland Health, Australia)

Introduction : Interventions designed to prevent in-hospital falls and have been tested in randomised trials have not yet been subjected to economic evaluation. Patient education has recently been shown to reduce falls amongst cognitively intact inpatients, but the cost effectiveness of this approach is likely to vary depending on the setting in which this intervention is provided. Method : Design: Cost-effectiveness study conducted alongside a randomised trial. Data sources: Patient records and reviews of incident reports and medical progress note entries related to falls. Target population: Older hospital inpatients (acute and subacute) who are cognitively intact. Time horizon: Period of inpatient care. Perspective: Health service provider. Intervention: Multimedia patient education with trained health professional follow-up. Outcome measures: Patient falls, acute and rehabilitation care costs, costs directly attributable to falls. Results : Results of base case analysis: The cost of one cognitively intact patient being a faller was up to \$14591 AUD (2008). The education program cost \$526 AUD (2008) to prevent one cognitively intact patient becoming a faller and \$294 AUD (2008) to prevent one fall. There was 52% probability that the education program condition dominated (both more effective and less costly) over usual care. Subsequent modelling indicated the program is more cost effective on wards with a higher proportion of patients who become fallers and would be cost saving where the proportion of these patients who fall is at least 4.0%. Conclusion : Patient education appears to be worthwhile on subacute / rehabilitation wards with longer lengths of stay and higher proportions of patients who fall. Keywords : hospital falls cost-effectiveness

SS26 409-R IS THERE A COMMUNICATIVE FRAILTY? OR: HEARING IMPAIRMENT AS AN ADDITIONAL RISK FACTOR FOR FRAILTY

SS26 409-R-1 COMMUNICATIVE FRAILTY AN UNDERESTIMATED DIMENSION OF FRAILTY IN THE ELDERLY

Michael LERCH (Geriatric Department, Ev. Krankenhaus Bethanien Iserlohn, Germany)

Introduction : According to Habermas (1) the normative base of a society is speech, which, as an interpersonal communication tool, enables social interaction. Tesch-Romer (2) postulates, that every person, esp. the elderly, requires the functionality of its “transmitter and receiver” organs to guarantee an every-day interaction and the prevention of a possible (social) frailty (depression, isolation, deprivation) (Strawbridge (3)) that arises from it. Method : In 2 geriatric departments the communicative abilities (aphasia (global, sensory, amnesic), hearing impairment) of all patients admitted were correlated with their amount of (social) frailty (Barthel index, MNA, IADL, GDS, MMSE etc.). Results : In our survey of > 1500 geriatric patients, we found approx. 18% with aphasia and approx. 69% with a relevant hearing impairment. In the majority of the communicative impaired patients we found a significant correlation between the degree of their reduced ability of interaction and the geriatric key figures like nutrition, self-sufficiency, mood, but not in cognition or the handgrip strength. Conclusion : An impaired communicative ability (“communicative” frailty) can be seen as “multiplier” for all risk factors for overall frailty, where its manner and manifestation determines the impairment of the amount of self-assertion in the geriatric clientele. Therefore the communicative decline constitutes an important, but frequently underestimated dimension of frailty in the elderly. Keywords : communication, frailty, geriatric assessment

SS26 409-R-2 COMMUNICATIVE FRAILTY AS A RISK FACTOR FOR IN THE GERIATRIC NURSING PROCESS

Mechthild DECKER-MARUSKA (Geriatric Department, Krankenhaus St. Barbara Attendorn GmbH, Germany)

Introduction : The professional, holistic orientated, nursing care process focuses on problems in activities of daily living. “To communicate” is one of the ADL’s and a precondition for the successful geriatric nursing care, based on an unimpaired hearing, speech and comprehension. Supported by the common understanding that increasing hearing loss is part of the “normal” ageing process, hearing impairment stays often unrecognized even in professional nursing, leading to inadequate care. Method : Within 1 month 50 geriatric patients were evaluated with a standardized nursing management and assessment questionnaire on admission either by nursing staff or a case manager specially trained in a hearing handicap-adjusted communication. Results : The nursing staff suspected a hearing impairment in 22 of the patients interviewed, but initiated an ENT examination in only 4 cases. After the examination and extraction of excessive cerumen 2 out of the 4 were tested with a pure tone/speech audiometry, both showed a relevant hearing impairment. As opposed to this, the case manager identified 41 of the patients as possibly hearing impaired, all of them were referred to an ENT physician and after examination and extraction of ceruminous obstruction 36 patients had an audiometry, which showed a relevant hearing impairment in 32 cases. Conclusion : The communicative frailty due to hearing impairment is correctly identified significantly more often by personal, trained in handicap-adjusted communication, during admission interviews as opposed to normal geriatric staff. Leading to a near-term evaluation of the auditive capabilities and the consideration of the resulting communicative limitations in the care process. Keywords : hearing impairment, communicative frailty,

nursing care process

SS26 409-R-3

IS THERE A COMMUNICATIVE FRAILTY?

Jane Maria OPIE (CEO Team, MED-EL GmbH, Austria)

Introduction : The World Health Organization estimates that 278 million people worldwide have moderate to profound hearing loss in both ears. The leading cause of adult-onset sensorineural deafness is age-related hearing loss, which affects approximately 80% of adults older than 65 years. Age-related hearing loss is attributed primarily to the accumulated effects of noise exposure and age-related changes in the auditory system, as well as to disease-related changes that affect the metabolic and cardiovascular systems. **Method :** Current technology to meet the hearing needs of older adults has improved considerably over the past twenty to thirty years. These new treatments address not only the psychoacoustic listening demands of older individuals but also the physical and social needs of elderly listeners. Hearing aids, semi-implantable hearing aids, and implantable electrical stimulation devices were applied to groups of elderly individuals and were compared on hearing benefit, usability, and subjective benefit. **Results :** When appropriately applied, the results showed improved hearing benefit in easy and difficult communication situations, improved subjective benefit, and usability. **Conclusion :** Communicative frailty can be reduced when an appropriate hearing treatment is applied. **Keywords :** hearing, hearing treatment, hearing aids, hearing implants, communicative frailty

SS26 409-R-4

COCHLEAR IMPLANTATION IN ELDERLY PATIENTS: INDICATIONS AND SURGICAL PROCEDURES

Thorsten ZEHLICKE (ENT, Hearing Center, Armed Forces Hospital Hamburg, Germany)

Introduction : The Cochlear Implantation (CI) has become a worldwide spread therapy method for patients with severe hearing loss through to patients who suffer from deafness. Furthermore, this method is beneficial for the recipient when it is placed in the hands of an experienced skilled surgeon who will perform the operation in a relatively short time. The increasing life expectancy leads to an increase in age-related hearing disorders. Especially the elderly patients are in need of their hearing to maintain their social contacts. It might be the case that uncared severe hearing loss can enhance geriatric diseases, e.g. dementia. **Method :** Presentation of our own results and giving an overview of the literature. **Results :** The results of postoperative hearing of elderly patients are comparable to those of younger patients, so it can be concluded that age is mostly no contraindication for Cochlear Implantation. **Conclusion :** In this talk we present the indications and surgical procedures suited for elderly patients. In our own experience and in the literature most authors could prove that the results regarding the speech perception are comparable in young and elderly patients. **Keywords :** cochlear implantation, speech perception

SUCCESSFUL MODELS OF INTERDISCIPLINARY TEAM TRAINING

Robert KAISER¹, Mark A. SUPIANO² (1. Geriatrics and Palliative Care, Washington DC VA Medical Center/ George Washington University, USA; 2. Division of Geriatrics, Department of Internal Medicine, University of Utah School of Medicine/ Salt Lake City VA Geriatric Research Education and Clinical Center, USA)

Introduction : The complex health problems of older adults often require the combined expertise of multiple health professionals as well as the coordination of care among the entire team of health professionals, direct-care workers, and family and other caregivers. **Method :** A systematic review was conducted by members of the Partnership on Health in Aging work group. **Results :** Interdisciplinary team training has been developed and implemented in a number of settings in the United States. A large team initiative sponsored by the John A. Hartford Foundation resulted in the development of innovative programs to educate and train health personnel and students to work in geriatrics interdisciplinary teams in 13 universities. A formal curriculum for team training, the Geriatric Interdisciplinary Team Training Program (GITT) has been developed, which included didactic materials and specific exercises to foster team development. To date, this initiative has been the largest commitment to team training and development outside of government-sponsored programs and has offered a very practical approach to team development in a variety of settings. Additional IDT training materials and websites have been sponsored by U.S. academic institutions and organizations, including the Bureau of Health Professions-sponsored Geriatric Education Centers. Further dissemination of these models and materials has been proposed. **Conclusion :** IDT training programs can improve learners' knowledge and attitudes about aging, geriatric care, team skills, interprofessional communication, and the benefits of IDT collaboration. **Keywords :** interprofessional, communication, aging

SS26 410-R-3

OVERCOMING BARRIERS TO IDT TRAINING IN HIGHER EDUCATION: KEYS TO EFFECTIVE IMPLEMENTATION

Katherine P. SUPIANO (College of Nursing, University of Utah, USA)

Introduction : Higher education institutions present unique challenges for the development, implementation, and continuation of interdisciplinary geriatrics team training programs. In spite of recent calls for the expansion of such programs, significant barriers remain to their long-term success. This paper develops a typology of such factors and integrates them into a conceptual framework suggesting some potential solutions. **Method :** The following are included in this framework: (1) factors related to each profession, such its unique cultural and historical background, power base, and willingness to embrace change, (2) factors related to interrelationships among the professions, including their status, ability and willingness to collaborate to achieve improved health care quality and outcomes, and (3) factors related to the context for IDT education, including acute, long term, and community care settings. **Results :** The Partnership for Health in Aging established a position statement to be used as an advocacy tool and resource for professionals interested in developing and expanding IDT training programs. **Conclusion :** Geriatrics offers a unique opportunity to develop successful strategies to overcome these traditional barriers, and this presentation summarizes recommendations for implementing them in higher education settings. **Keywords :** Higher education, Interdisciplinary training

WORKING LONGER IN A PERIOD OF ECONOMIC VOLATILITY: THE FLEXI-SECURITY OR FLEXI-INSECURITY OF GRADUAL RETIREMENT

SS26 411-R-1
GRADUAL RETIREMENT FOR WHOM? THE CASE OF THE AUSTRALIAN WORKPLACE

Philip TAYLOR¹, Elizabeth BROOKE² (1. Office of the PVC and President, Gippsland Campus, Monash University, Australia; 2. Faculty of Business and Enterprise, Swinburne University of Technology, Australia)

Introduction : At a time when public policy increasingly emphasizes the importance of longer work lives it is important to consider the role of the firm as either a promoter or inhibitor of older workers' employment. This paper, drawing on a recent survey of Australian employers, focuses on their use of flexible employment and phased retirement, much promoted as mechanisms whereby organizations can retain much valued human capital and workers can transition well to retirement. **Method :** This project included a computer assisted telephone interviewing (CATI) survey of 2,000 Queensland employers with more than 50 employees (29 per cent response rate i.e. 590), carried out in 2010. The sample included private and public employers of more than 50 people. The survey collected data on employer attitudes and practices towards older workers. **Results :** Evidence is reported on the degree to which employers are adopting measures aimed at the promotion of a flexible transition to retirement. We report significant differences between public and private sector organizations and a strong residual attachment to early retirement schemes in order to reduce head-count. Despite evidence of employers promoting flexible working in general, this is less likely to apply to older workers. **Conclusion :** Despite a strong public policy push towards allowing a gradual transition to retirement, the take up of such approaches by employers remains low, particularly those in the private sector with the implication that many older workers will continue to face an abrupt end to their working lives or be forced into job seeking at the end of their careers. **Keywords :** Employers, older workers

SS26 411-R-2
NEGOTIATING GRADUAL RETIREMENT: SELF MANAGEMENT AND ORGANIZATIONAL SUPPORT

Harvey Leonard STERNS¹, Philip TAYLOR² (1. Institute for Life-Span Development and Gerontology, Psychology, The University of Akron, USA; 2. Office of the PVC and President, Gippsland Campus, Monash University, Australia)

Introduction : It was apparent at a much earlier time that self-management of career and personal responsibility would be necessary to negotiate the world of full time and part time work in the future. However, the emphasis was on individuals being able to plan for the opportunities that would be available to shape one's later life work; and be creative in reshaping the later life period to fit continued work, retirement, and work in retirement. The design and redesign of one's later life has been a major theme in that context (Rothwell, Sterns, et.al. , 2008; Sterns & Sterns, 2013). We now recognize multiple exit patterns as opposed to single transitions in capturing the retirement process (Mutchler, Burr, Pienta, & Massagli, 1997). The continuously changing nature of retirement is also evidenced in retirement ages. The idea of a normal retirement age is an evolving concept. **Conclusion :** Self-management and personal responsibility are key concepts for the present and future. Personal decision making is complex and involves many different dimensions. A major issue is how middle-aged and older workers will negotiate the current challenging environment and how they will succeed and when assistance and support is needed. As Hall (2004) suggested in his protean career definition, both adaptability and self-awareness are important factors to successfully manage one's career. These factors make it possible for people to learn from their experience and develop new abilities on their own. In sum, workers, regardless of age, need to be more resilient and adaptable to new environments. **Keywords :** self- management retirement work

CAN WORKING LIVES BE EXTENDED? PROBLEMS AND PROSPECTS FOR WESTERN ECONOMIES

Chris PHILLIPSON (School of Sociology and Criminology, University of Keele, United Kingdom)

Introduction : Findings solutions to the economic pressures arising from ageing populations dominates policy agendas in the 21st century with extending working life emerging as an attractive option. 'Living longer' meant, according to the OECD (2006) that we should also 'work longer' ? a theme which had already been pursued in labour markets strategies in the 1990s but which became even more popular in the 2000s. **Method :** This paper examines historical studies of retirement and empirical investigations of labour force trends to assess potential obstacles to the policy goal of extending working life. The paper links studies of 'early exit' in the 1980s with more recent research on the impact of measures seeking to promote later life employment. **Results :** Results focus upon: (a) evidence that positive attitudes to retirement will continue to limit willingness to delay retirement; (b) evidence that employers will be selective in who they wish to retain in employment; (c) evidence that health conditions will continue to play a major role influencing the success or otherwise of policies for extending working life. **Conclusion :** The issues identified will indicate the basis for a research agenda around the theme of work/retirement transitions. Questions to be explored include: How will the work environment need to change to support individuals with responsibilities beyond paid employment, or those with long-term health conditions, or those interested in moving to new types of work? How will the training and education system respond to the needs of an ageing workforce? **Keywords :** Older workers, retirement

AGE-MANAGEMENT MEASURES AND THE IMPACT ON WORKABILITY, MOTIVATION AND PICTURES OF AGEING - FINDINGS FROM A GERMAN SURVEY

Gerhard NAEGELE (*Institut für Gerontologie, University of Dortmund, Germany*)

Introduction : In the course of demographic trends, older workers will continue to gain importance for economy and society. Findings show, that German staff executives primarily ascribe practical knowledge, work ethic, quality awareness, loyalty, theoretical knowledge and mental capacity to older employees. Teamwork, creativity, flexibility, willingness or ability to learn on the other hand is more likely seen among younger employees (Bellmann 2008, IW Köln 2009). Method : The paper will present key results from an own recent and representative German survey which was realized in a project financed by the Federal Ministry of Family, Senior Citizens, Women and Youth in 2010. Results : The paper will focus on: - age-management measures from the perspective of older workers - pictures of ageing in German companies from the perspective of older workers and of managers - the impact of age-management measures of workability, motivation and satisfaction. Conclusion : As well as conclusions for Germany, lessons for the Korean situation will be drawn. Keywords : Older workers, Germany

SS26 413-S

PREDICTORS AND MEDIATORS OF LONG TERM TRAJECTORIES OF COGNITIVE AGEING

SS26 413-S-1

DOES LONELINESS MEDIATE THE RELATION BETWEEN SOCIAL SUPPORT AND COGNITIVE FUNCTIONING IN LATER LIFE?

Lea ELLWARDT¹, Marja AARTSEN², Dorly DEEG², Nardi STEVERINK¹ (*1. Sociology, University of Groningen, Netherlands; 2. Sociology, VU University Amsterdam, Netherlands*)

Introduction : Research in gerontology has demonstrated mixed effects of social support on cognitive decline and dementia: Social support has been shown to be protective in some studies, but harmful in others. Little is known about the underlying mechanism between social support and cognitive functioning. We expect that subjective appraisals rather than received amounts of social support affect cognitive functioning. Loneliness is seen as an unpleasant experience that occurs when a person's network of relationships is felt to be deficient in some important way. As such, loneliness describes the extent to which someone's needs are being met and thus provides a subjective assessment of support quality. We expect that receiving instrumental and emotional support reduces social and emotional loneliness, which in turn preserves cognitive functioning. Method : Data are from the Longitudinal Aging Study Amsterdam (LASA) and include 2,255 Dutch participants aged 55 to 85 over a period of six years. Respondents were measured every three years. Cognitive functioning was assessed with the Mini-Mental State Examination (MMSE), the Coding Task, and the Raven's Coloured Progressive Matrices. The analytical approach comprised latent growth mediation models. Results : Greater levels of emotional support were associated with lower feelings of loneliness and higher levels of cognitive functioning. However, increase in instrumental support was related to more rapid cognitive decline. Conclusion : After ruling out the possibility of reversed causality in the analyses, we conclude that instrumental support relationships may be perceived as stressful in some individuals, and thereby potentially operate as a risk factor rather

than a protector of cognitive decline. Keywords : cognitive functioning, social support, loneliness

SS26 413-S-2

DEPRESSION AND COGNITION; HOW DO THEY INTERRELATE IN OLD AGE?

Tessa N. VAN DEN KOMMER¹, Hannie C. COMIJS², Marja J. AARTSEN³, Martijn HUISMAN¹, Dorly J. DEEG², Aartjan T. BEEKMAN² (*1. Department of Epidemiology and Biostatistics, EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 2. Department of Psychiatry, EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 3. Department of Sociology, VU University, Netherlands*)

Introduction : It is generally acknowledged that depression and cognitive impairment are closely associated in old age. The present study aimed to further disentangle the reciprocal effects between depressive symptoms and cognitive functioning over time and to study the association between changes in their trajectories using 13 years of follow-up. Method : Data were used from five waves of the population-based Longitudinal Aging Study Amsterdam (LASA). Subjects were included if data was present on depressive symptoms and cognitive performance on at least two occasions, which resulted in a study sample of N=2,299. Depressive symptoms were assessed with the Center for Epidemiologic Studies Depression Scale. Cognitive functioning was assessed using the Mini-Mental State Examination (general cognitive functioning) and timed coding task (speed of information processing). Cross-domain latent change analyses were performed. Results : We showed that depression at baseline predicted both decline of general cognitive functioning and information processing speed, independent of relevant covariates. Conversely, information processing speed at baseline, but not general cognitive functioning was related to the course of depressive symptoms. The course of cognitive functioning was not significantly associated with the course of depressive symptoms. Conclusion : Depressive symptoms in older patients flag an increased likelihood of cognitive decline. This effect is considerable and may be due to several underlying mechanisms. The likelihood of the relationship reflecting either a causal effect of depression on cognitive decline, or a common cause, or both, should be estimated. Likewise, older persons with more limitations in information processing speed specifically are more vulnerable to increases in depression. Keywords : cognitive decline, depression, bi-directional relationship

SS26 413-S-3

LATENT CLASS TRAJECTORIES OF COGNITIVE AGING

Marja AARTSEN¹, Graciela MUNIZ², Tessa VAN DE KOMMER³, Hannie COMIJS⁴ (*1. Faculty of Social Sciences, dept Sociology, VU University Amsterdam, Netherlands; 2. MRC Unit for Lifelong Health and Ageing, Medical Research Council, United Kingdom; 3. EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 4. GGZIngeest / EMGO Institute for Health and Care Research, VU University Medical Centre, Netherlands*)

Introduction : There is substantial heterogeneity in cognitive decline with ageing. Predictors of decline that have been identified are among others physical and mental health, age, gender, and the social network. There is some evidence that predictors of cognitive decline may have differential impact across different subgroups. The central question in this presentation is whether there is a differential effect of age, gender, loneliness, functional limitations and depression on different trajectories of cognitive decline? Method : Data (N=3107) are from the Longitudinal Aging Study Amsterdam and comprises older adults aged

55-85 at baseline (1992), with follow-up measures every three year until 2005. Results : Four trajectories of cognitive decline can be distinguished: no decline (69%), normal cognitive decline (25%), pathological decline(5%) and severe pathological decline, with starting levels below 24 of the MMSE (1%). Class membership, that is the type of trajectory, can be predicted by age, gender, education and depressive symptoms but not by loneliness and functional limitations. The magnitude of the effects on developments in cognition greatly differ across the four trajectories. (Severe) pathological decline can not be predicted by factors often found to be correlated with normal cognitive ageing (except for age and depression). Conclusion : Our results suggest that the aetiology is different for pathological and normal cognitive decline. In studies on cognitive ageing we should make a distinction between normal and pathological cognitive decline. Keywords : trajectories cognitive decline

SS26 414-S

IMPROVING CARE FOR ELDERLY IN SOUTH - EAST AUSTRIA

SS26 414-S-1

THE RELOCATION PROBLEM OF NURSING HOME RESIDENTS - A MIXED METHODS STUDY ON HOSPITAL TRANSFERS FROM NURSING HOMES

Herbert JANIG¹, Georg PINTER², Karl CERNIC³, Olivia KADA¹, Rudolf LIKAR³ (1. Institute of Psychology, University of Klagenfurt, Austria; 2. Department of Geriatrics, Klinikum Klagenfurt am WS, Austria; 3. Department of Anesthesie and Intensive Care, Klinikum Klagenfurt am WS, Austria)

Introduction : Due to demographic changes, a drastic rise in the need for institutional care is to be expected. Nursing homes are not always capable of providing the necessary medical care for residents, which often consequently leads to hospitalisation. Avoidable transportation should be reduced, due to the inherent health risks to the elderly discussed under the term 'relocation stress syndrome' and also from an economic view. Method : The present study investigated the current situation in Carinthia (Austria). Retrospectively the documentations of a regional hospital (N = 4149), a rescue service (N = 10754), and a social insurance agency (N = 7051) were analyzed; qualitative interviews with physicians (N = 25) and nursing administrators (N = 16) were conducted. Results : A considerable proportion of transportation was proven to be avoidable: for example, almost one third of inpatient stays lasted no longer than two days. The application of bladder catheters, which according to the Austrian Health Care and Nursing Act is deemed to be a jointly responsible task of nursing personnel, is not often carried out on male patients in nursing homes. About 40% of the ambulant treatments in the emergency department of the investigated hospital were inappropriate. Conclusion : The majority of those doctors and care service providers questioned considered hospital transportation to be a burden to the people concerned. On the basis of these findings, a wide spectrum of measures for the optimisation of care in homes is being discussed. Options for improving the current situation are discussed and an intervention project is presented. Keywords : hospital transfer, relocation

SS26 414-S-2

THE RELOCATION PROBLEM OF NURSING HOME RESIDENTS - AN INTERVENTION STUDY

Georg PINTER¹, Rudolf LIKAR², Karl CERNIC¹, Olivia KADA³, Herbert JANIG³ (1. Department of Geriatrics and Remobilisation, Klinikum Klagenfurt am WS, Austria; 2. Department of Anesthesia and Intensive Care, Klinikum Klagenfurt am WS 9020 Klagenfurt,

Austria; 3. Institute of Psychology, University of Klagenfurt, Austria)

Introduction : Nursing home residents are frequently hospitalized, many of these hospital transfers are potentially avoidable In Carinthia, Austria, a project was initiated, aimed at reducing hospital transfers by training physicians and nursing staff and by improving interdisciplinary cooperation. The measures were implemented in two nursing homes (intervention group; IG). Two comparable nursing homes without interventions were used as control groups (CG). Method : The summative project evaluation was realized in terms of a quasi-experimental pre-test-post-test control group design. In addition to transfer rates and perceived interdisciplinary cooperation, residents' quality of life was defined. At baseline 269 residents lived in the two intervention homes and the two control homes of the study. For a panel of 185 residents complete data could be obtained. At baseline (T1) and after the intervention period of 6 months (T2) the nursing staff rated the residents' quality of life. Results : Regarding communication, negative affect and aggression no significant differences could be revealed. Mobility decreased slightly in the intervention group and increased in the control group (significant interaction). In the IG there were significant less transportation to the hospital compared to the CG. Conclusion : Despite nursing home residents' multi-morbidity, quality of life remained stable over the intervention period of approximately six months. The communication between nurses and family doctors had been improved significantly during intervention. The diagnoses of patients transferred to the hospital were more accurate in the IG. Keywords : hospital transfer relocation

SS26 414-S-3

OUTREACH GERIATRIC REMOBILISATION_ THE HOSPITAL COMES TO YOUR HOME

Walter MUELLER, Rosemarie MOERTL, Heide LECHNER (Department of Geriatrics, EKH Klagenfurt, Austria)

Introduction : The "Hospital comes to your Home_Outreach Geriatric Remobilisation" project has been designed to remobilise patients with multimorbidities in their own homes and to reintegrate them into society, in order to increase their self-sufficiency and reduce their need for care, thus avoiding the cycle of hospital readmissions ('revolving door medicine'). Method : Patients are mobilised in a place where they spend their everyday lives and therefore learn how to cope with the different obstacles they may encounter in their daily routine. This service takes place in everyday surroundings; their living space is redesign; and they are encouraged to take the initiative to self-help and network. Treatment becomes part of their normal daily routine. Problems are solved where they occur. Results : The Outreach Geriatric Remobilisation project can contribute to reducing time spent as an inpatient, accelerate and encourage the re-integration of the patient in their familiar environment and help maintain the patient's social network. Conclusion : Comprehensive outreach therapy can be offered at a significantly lower price than institutional therapy. This means considerable cost reduction for the public health sector. Geriatric remobilisation in the home setting is able to greatly reduce or avoid the need for re-hospitalisation. However, proper cooperation between all the parties of outreach and institutional health care is fundamental. Keywords : outreach geriatric remobilisation

SS26 414-S-4

THE GECO PROJECT: EFFECTS OF A GERIATRIC CONSULTANT SERVICE ON ACUTE HOSPITAL ADMISSIONS OF NURSING HOME RESIDENTS

Walter SCHIPPINGER¹, Horst PILGRAM¹, Andrea HIERZER¹,

Martina BOHNSTINGL², Ingrid OSPRIAN³ (1. Department of Internal Medicine, Albert Schweitzer Klinik, Austria; 2. Department of Internal Medicine, Albert Schweitzer Hospital, Austria; 3. Department of Internal Medicine, Medical University of Graz, Austria)

Introduction : Hospital admissions are frequent within residents of nursing homes and can result in detrimental complications affecting the patients' somatic and psychological status. In this prospective controlled study we investigated the effects of a mobile geriatric consultant service (GECO) provided by specialists in internal medicine on frequency of hospitalizations in nursing home residents. **Method :** During a 10 month observation period we examined frequency, causes, and circumstances of hospital admissions in 2 urban nursing homes with similar population characteristics. Residents in the control nursing home received medical attendance by general practitioners as common in Austrian nursing homes. Residents in the intervention nursing home received in addition the medical service of GECO. GECO performed visits in the intervention nursing home once a week regularly and on demand in order to attend acutely ill residents. **Results :** In the intervention nursing home a statistically significant lower frequency of acute hospital admissions was seen in comparison to the control nursing home (mean number of hospital admissions/100 residents/month: 6.0 versus 11.3; $p < 0.01$). The number of planned non-acute hospital admissions was also lower in the intervention nursing home (mean number of hospital admissions/100 residents/month: 14.3 versus 17.4); this difference did not reach statistical significance. **Conclusion :** This study shows that a mobile medical geriatric consultant service based on specialists in internal medicine can improve medical care in nursing homes resulting in a statistically significant reduction of acute hospital admissions. Mobile geriatric consultant services for nursing homes should be considered as components within comprehensive geriatric support systems. **Keywords :** geriatric consultant service

SS26 414-S-5

PROJECT 'HOME HEALTH CARE'

Dieter SCHMIDT¹, Georg PINTER² (1. District Doctor, District of Voelkermarkt, Austria; 2. Department of Geriatrics and Remobilisation, Klinikum Klagenfurt am WS, Australia)

Introduction : The need for more home health care is steadily increasing, at the same time, nursing homes will be packed to capacity. Home health care can be of high quality, if the devices and faculties needed are at disposal. Moreover, home health care should be carefully coordinated and also include a quality assurances system. On the long run, the supply of home health care is definitely worth investing since it will help saving costs. As a side effect, it can also be considered a new market for general practitioners. **Method :** Main Message: Every patient whose family wants to support home health care and whose diagnosis would allow such a setting should actually receive it. The cooperation between doctors and nurses is fundamental. **Results :** Important components are: clear, consistent, patient documentation, joint medical rounds, team meetings. **Conclusion :** Target Groups: Health and social services Geriatrics networks Coordination among all stakeholders and organisations. **Keywords :** home health care

SS26 415-S

DEPRESSED MOOD AS A RISK FOR PSYCHOLOGICAL ADAPTATION IN OLD AND VERY OLD AGE

SS26 415-S-1

ROLE OF FUNCTIONAL ABILITY AND DEPRESSED MOOD FOR 2-YEAR CHANGE IN PSYCHOLOGICAL CONTROL IN

VISUALLY IMPAIRED OLDER ADULTS

Hans-Werner WAHL¹, Oliver Kar¹ SCHILLING¹, Kathrin BOERNER², Joann P. REINHARDT², Mark BRENNAN-ING³, Amy HOROWITZ⁴ (1. Institute of Psychology, Department of Psychological Aging Research, Heidelberg University, Germany; 2. Research Institute on Aging, Jewish Home Lifecare, USA; 3. Center on HIV and Aging, Aids Community Reserach Initiative of America, USA; 4. Graduate School of Social Service, Fordham University, USA)

Introduction : The lifespan theory of control is applied to study change in vision-specific control strategies in visually impaired older individuals, depending on performance in instrumental activities of daily living (IADL) and depressed mood. **Method :** Longitudinal data from visually impaired individuals (at baseline: $N = 364$; mean age 82.8 years; visual acuity less than 20/60) measured at 3 occasions with 1-year intervals in-between were analyzed. A newly established vision-specific control scale to assess selective primary control (SPC), selective secondary control (SSC), compensatory primary control (CPC), and compensatory secondary control (CSC) was used. Linear and nonlinear (quadratic and piecewise) generalized mixed models with gamma response distribution to fit the skewed data were applied. **Results :** CPC progressively increased as IADL capacity decreased up to a turning point, at which CPC plateaued, whereas all other strategies declined linearly with IADL decrease. Controlling for depressed mood did not change these relationships for CPC, SPC, and SSC, but absorbed IADL-related decline of CSC. Higher depression was associated with less SPC, SSC, CSC, but only slightly with less CPC. To conclude, IADL plays an important role triggering a shift in adaptational strategies from selective control to CPC in visually impaired older adults and possibly other disabled populations. Depression seems to show a differential relationship with psychological control strategies. **Conclusion :** Findings at large also support the view that IADL and depression may be better regarded as drivers rather than outcomes of control strategy use. **Keywords :** Visual impairment, control strategy, depression, IADL

SS26 415-S-2

ASSOCIATIONS BETWEEN MEMORY COMPLAINTS AND WELL-BEING AND CHANGES IN COGNITIVE FUNCTIONING IN THE OLDEST-OLD - THE ROLE OF DEPRESSIVE SYMPTOMS AND EMOTIONAL INSTABILITY

Anne Ingeborg BERG, Linda Bjork HASSING, Boo JOHANSSON (Department of Psychology, University of Gothenburg, Sweden)

Introduction : The presence of memory complaints have been found to interact with personality traits and depressive symptoms in its association with cognitive changes in the young-old population. Findings suggest that memory complaints in the oldest-old could be a single and more reliable marker of ongoing cognitive deteriorations that are independent of depressive symptoms and emotional instability. **Method :** The present study investigates the association between memory complaints and well-being at baseline and changes in general cognitive functioning as well specific cognitive domains across four measurement occasions over a six-year period. The sample consisted of 453 relatively healthy individuals aged 80 and over. **Results :** An association between memory complaints and changes in cognitive functioning over a six-year period was found with non-significant interaction effects with depressive symptoms and emotional instability. Also, baseline levels of well-being were related to changes in cognitive functioning, whereas the main effects of depressive symptoms and emotional instability were relatively weak. **Conclusion :** Subjective perception of changes in cognition is a reliable marker of changes in cognitive functioning in advanced age. Also, well-being

could be a better predictor of change as compared to negative emotionality. Keywords : Cognitive functioning, depressive symptoms, emotional instability, well-being

SS26 415-S-3

THE ROLE OF DEPRESSIVE SYMPTOMS IN SEEKING HELP FROM HEALTH SERVICES AMONG OLDER ADULTS WITH PARKINSON'S DISEASE

Yii-rong LEU (*Division of Gerontology Research, Taiwan Gerontological Health Society, Taiwan*)

Introduction : Depressive symptoms are one of the most common non-motor symptoms in Parkinson's disease (PD) and may have major impacts on patients' help-seeking behavior. The aim of this study was to investigate factors contributing to help-seeking behavior among older adults with PD in an outpatient setting in Taiwan. Method : 200 older adults with PD aged 65 and over (mean age = 75.1 years, standard deviation = 7.5) at outpatient clinics were recruited in this cross-sectional study. A Questionnaire was developed to assess socio-demographic factors, social factors and physical health. In addition, depressive symptoms were quantified using the Geriatric Depression Scale (GDS) and the PD severity was assessed according to the Hoehn and Yahr Scale. Results : Path analysis showed that socio-demographic factors and physical health had direct and indirect effects on help-seeking behavior of older adults with PD. Depressive symptoms were found to have a statistically significant direct effect on the outcome variable as well. High levels of depressive symptoms were more likely to be associated with an increasing frequency of seeking help from healthcare systems. The modified path model showed good fit with the data. Conclusion : Depressive symptoms are viewed as a frequently observed neuropsychiatric phenomenon in PD and are one of the major clinical determinants of seeking help from diverse health services. Accordingly, screening, prevention and treatment for depressive symptoms in PD are strongly recommended for clinical practice. Keywords : depressive symptoms, Parkinson's disease, health services

SS26 415-S-4

PHYSICAL DEGRADATION AND FUNCTIONAL COMPETENCE IN VERY OLD AGE: THE ROLE OF DEPRESSED MOOD

Oliver Karl SCHILLING, Ortrun REIDICK, Hans-Werner WAHL (*Institute of Psychology, Department of Psychological Ageing Research, University of Heidelberg, Germany*)

Introduction : At the end of the human lifespan, degradation of physical functioning threatens the very olds' functional competences to conduct activities of daily living (ADL). Also, increase of depressive symptoms has been observed among the very old. Depressed mood may be triggered by loss of ADL, however, it may also promote ADL loss by de-motivating individual investments to maintain functional competence under constraints of basic physical functioning. Method : Longitudinal data from the LateLine study (N=124, born 1911-1921, measured at 6 occasions between 2009 and 2012) is used to analyze change in basic physical functioning (handgrip strength, visual acuity), ADL, and depressed mood (Geriatric Depression Scale). By means of mixed modeling and structural equation modeling we analyze the effects of depressed mood moderating the relationship between loss of physical function and of ADL. Results : Intra-individual loss of ADL is linked with increase of depressed mood, but there is only weak evidence of depressed mood promoting the 'reactivity' of ADL to loss of vision or physical strength. Overall, decline of functional competence is highly prevalent in this sample of very old, but only

partially predicted by the variables analyzed. Conclusion : The processes aggravating functional health (ADL) and affective health at the end of the lifespan seem to be mutually linked, calling for more in-depth research on the causalities underlying this linkage. These processes may be triggered less as expected by constraints of basic physical functioning, such as vision and physical strength, hence suggesting other factors (e.g., psychological, social) crucial for late life functional declines. Keywords : functional competence, depressive symptoms, very old age

SS26 416-R

ONLINE AND OFFLINE: SOCIAL NETWORKS AND SUCCESSFUL AGEING

SS26 416-R-1

THE SOCIAL NETWORKS AND AGEING PROJECT (SNAP): INTEGRATED ONLINE AND OFFLINE RESEARCH METHODS IN THE STUDY OF SOCIAL NETWORKS IN A MATURE-AGE POPULATION

Heather BOOTH¹, Robert ACKLAND¹, Tim WINDSOR², Pilar RIOSECO¹, Mahin RAISSI¹, Lin CHEN¹ (*1. ADSRI, Australian National University, Australia; 2. Social Psychology, Flinders University, Australia*)

Introduction : The Social Networks and Ageing Project (SNAP) conducts multidisciplinary research on the role of social networks in successful ageing. The project integrates survey research with the collection of online data on web-based social networking structures. Method : The SNAP survey on social activity and wellbeing collected detailed data from a national sample of 2123 Australians aged 50+ in 2010-11 and 2012. This longitudinal survey focuses on the nature of the respondents' social networks and activities, distinguishing between family members and friends and between face-to-face, web-based and other types of communication, and on measures of health, mental health and wellbeing. The survey includes questions on physical and emotional distance to relatives, and the use of the Internet and online social networking for social communication. For consenting respondents who use Facebook, a purpose-built application collects data on the structure of their Facebook social network in relation to social capital. Snowball sampling is used among members of these networks to create an online social network for analytical purposes. This provides a comprehensive dataset including online social network, offline social network of family and friends including types, frequency and duration of communication, and indicators of health and wellbeing. The paper describes the research methods. Results : The paper includes an overview of findings. Conclusion : This study, which is among the first in the world to integrate offline and online research methods in the study of social networks in a mature-age population, demonstrates the feasibility and benefits of the integrated approach. Keywords : offline social networks, online social networks, integrated methods

SS26 416-R-2

PROFILES OF SOCIAL NETWORK CHARACTERISTICS AMONG OLDER AUSTRALIAN ADULTS: FINDINGS FROM SNAP

Tim WINDSOR¹, Pilar RIOSECO², Heather BOOTH², Katherine FIORI³ (*1. School of Psychology, Flinders University, Australia; 2. ADSRI, Australian National University, Australia; 3. Psychology, Adelphi University, USA*)

Introduction : In recent years researchers have adopted profile-based approaches to the study of social networks in later life. Such

approaches identify subgroups characterised by different combinations of network characteristics. We added to existing research by constructing profiles based on the experience of negative social exchanges as well as supportive exchanges. We also examined future time perspective as a predictor of profile membership. Method : SNAP data were used to examine social network profiles in older Australians (N = 1816). Cluster analysis pointed to a seven profile solution. Results : Those with a Low negative-supported profile (19%) reported moderate support, and few negative social exchanges. Diverse-supported participants (9%) reported high levels of support. Those with a household focused profile (15%) predominantly lived with a partner and reported low levels of both external support and negative exchanges. Low support-negative individuals (11%) reported low support, and frequent negative exchanges with family. Ambivalent individuals (21%) reported moderate support coupled with more frequent negative exchanges with friends. Live alone-high negative individuals (11%) were unpartnered and reported more frequent negative exchanges, whereas those with a live alone-low negative profile (12%) lived alone and reported few negative exchanges. A more restricted future time perspective was associated with a greater likelihood of living alone. Individuals classified into profiles characterised by higher levels of support, and fewer experiences of negative social exchanges reported better mental health, and greater satisfaction with life. Conclusion : Profile-based approaches provide a valuable means of examining heterogeneity in the social networks and well-being of older adults. Keywords : social networks, mental health

SS26 416-R-3

RETIREMENT AND SOCIAL CONNECTEDNESS: AGE PATTERNS AND SEX DIFFERENCES

Pilar RIOSECO (Australian Demographic and Social Research Institute, The Australian National University, Australia)

Introduction : Retirement constitutes one of the most significant transitions in the lives of older adults. Although the retirement process has been extensively studied in terms of its socio-economic and health predictors and effects, little is known about the relationship between retirement status and older adults' social connectedness. Research on social connectedness acknowledges its multidimensionality including social networks, social support and social engagement. The various dimensions of social connectedness have been established as important influences on older adults' health and well-being, but most research addresses only one or two dimensions. Method : Using data from the first wave of the SNAP survey on the Social Activity and Wellbeing of Older Australians, this study examines the relationship between the multiple dimensions of social connectedness and retirement status in older adults, focusing on age patterns (n=1860) and sex differences (n=1881). These indicators include measures of social networks, social support and social engagement. Results : Several indicators are observed to vary by sex, age and retirement status, and they do so in different ways. The results show a complex pattern of social connectedness and social connectedness differences across these groups. For example, women have a larger network of friends than men, and both retired men and women report higher levels of positive exchanges with household members compared with those not completely retired. Likewise, retirees show increasing positive social exchanges with family members with increasing age, whereas this pattern is not observed among those not retired. Conclusion : The implications of these findings for research in retirement and social connectedness are discussed. Keywords : social connectedness retirement

SS26 416-R-4

WHO USES ONLINE SOCIAL NETWORKING? OFFLINE SOCIAL CONNECTIVITY DETERMINANTS OF ONLINE ACTIVITY

Heather BOOTH (Aust Demographic and Social Res Inst, Australian National University, Australia)

Introduction : There is inconclusive evidence on the trade-offs between offline and online social connectivity. Few studies collect detailed data on both modes of social interaction. Method : The Social Networks and Ageing Project (SNAP) survey on the social activity and wellbeing of senior Australians (n=2123) includes a broad range of questions on offline social connectivity as well as details of the use of online social networking. This paper uses data from the first wave (2010-11) of the survey to examine the relationship between offline social connectivity and whether or not the respondent uses online social networking. Offline connectivity variables include aspects of social engagement and social interaction and details of social network characteristics including friends vs family members, emotional distance, confidants, frequency and duration of contact, and whether or not the contact is face-to-face. Regression models are used to identify the significant variables among those measuring the dimensions of social engagement, social interaction and network characteristics. These are then combined in a single model. Demographic and socio-economic covariates are taken into account. Results : Important predictors include time spent with family members in face-to-face contact, frequency of restrictions on social activity due to own health or disability, number of friends confiding in respondent, and frequency that friends criticise the respondent or create tensions or arguments. Conclusion : The implications of these findings are discussed. Keywords : online social networking, offline-online associations

IMPROVING PAIN MANAGEMENT FOR THE ELDERLY

SS26 418-S-1

DO RECOMMENDATIONS FOR IMPROVING PAIN MANAGEMENT IMPACT ON FUNCTIONAL PERFORMANCE IN NURSING HOME RESIDENTS?

Sonja KALINOWSKI¹, Andrea BUDNICK¹, Franziska KOENNER², Ronny KUHNERT³, Bianca HANNEMANN¹, Laura - Maria JORDAN¹, Reinhold KREUTZ², Dagmar DRAEGER¹ (1. Institute of Medical Sociology, Charite-Universitätsmedizin Berlin, Germany; 2. Institute of Clinical Pharmacology and Toxicology, Charite-Universitätsmedizin Berlin, Germany; 3. Associate collaborator/freelancer of Institute of Medical Sociology, Charite-Universitätsmedizin Berlin, Germany)

Introduction : Previous international data have shown that the majority of nursing home residents (NHR) suffer from pain. Studies in Germany identified that every second resident is affected. Pain is a modifiable factor that might play an important role on functional performance in NHR. Former investigations demonstrated statistically significant associations between pain and lower functional performance. The purpose of this study is to examine, if recommendations aiming to improve pain management impact on functional performance as well. Method : Design: Cluster randomized controlled trial. Setting: German Nursing homes. Study Population: NHR with a Mini-Mental-State-Examination Score ≥ 18 . Intervention: Recommendations for pain management for nurses in nursing homes (workshops) and for general practitioners of NHR (online). Two test intervals after baseline. Outcome measures in functional performance: Functional mobility using the Timed 'Up & Go'-test and performing activities of daily living (ADL) by the Barthel-Index. Results : Twelve

nursing homes participated in the trial (equal distribution in intervention and control group), while 815 NHR met the inclusion criterion. The presentation will address outcomes of the intervention on the individual level on functional mobility and ADL performance along with the test intervals. Potential cause-and-effect relationships will be discussed to determine the impact of the intervention on functional performance. Conclusion : Our results will extend previous findings using a longitudinal design to verify the direction of associations explored between pain and functional performance in NHR. Possible influencing factors (e.g. institutional) will be discussed. Keywords : pain, functional performance, nursing home residents

REFERRAL PATTERNS OF OLDER PRIMARY CARE PATIENTS TO SPECIALTY PAIN MANAGEMENT CENTERS: DISPARITIES BETWEEN MIDDLE-AGED AND OLDER ADULTS

Casey R. SHILLAM (*Acute and Chronic Care, Johns Hopkins University School of Nursing, USA*)

Introduction : Persistent pain is common in older adults with implications of depression, anxiety, fatigue, declines in physical function, increased disability, and declines in both quality of health and quality of life. While the prevalence of pain in older adults is estimated to be 70% of older adults, only 15% to 20% of the pain-management population is over 65 years. Method : This study explored differences in patterns of referral to pain management programs between middle-aged and older patients with chronic pain. A random sample of 995 patients over 50 years of age who had chronic pain in the past two years and used opioid for at least one year (65 years and older n=371) were identified from the electronic health record (EHR) system of an academic health system medical center. Results : Among the sample, 62.7% were < 65 years (total range = 50 to 98 years), and 62.1% were female. Older patients had significantly greater numbers of comorbid diagnoses in the past two years than the middle-aged group (18.0 ± 12.5 (mean \pm SD) vs. 14.6 ± 11.2 , $p < .01$). A negative binomial regression analysis indicated that younger age was significantly associated with higher rates of referral to pain management specialists ($p = 0.003$), as was higher numbers of comorbid diagnoses ($p < 0.0001$), and larger daily morphine doses ($p=0.0115$). Conclusion : These findings reveal the discrepancy in referring older adults with chronic pain to pain clinics and support the development of an interdisciplinary model of pain management in primary care. Keywords : Pain Management, Chronic Disease Management

SS26 418-S-3

EFFECTIVE SENSORY BASED PALLIATIVE INTERVENTIONS FOR REDUCING PAIN, AGITATION AND PHYSIOLOGIC STRESS IN PERSONS WITH ADVANCED DEMENTIA

Nancy A. HODGSON (*Acute and Chronic Care, Johns Hopkins University School of Nursing, USA*)

Introduction : Pain is a common cause of stress and neuropsychiatric symptoms in individuals with advancing dementia, yet it frequently goes unrecognized and undertreated. The severity of the response to pain in individuals with dementia patients increases with neurodegenerative changes in the hypothalamus, resulting in the dysregulation of the stress regulatory systems [e.g., hypothalamic-pituitary-adrenal (HPA)/sympathetic nervous systems (SNS)]. As dementia progresses or pain increases, neuroendocrine disruption increases resulting in lower stress toleration thresholds and negative

neuro-behavioral and functional symptoms. A growing body of empiric literature has provided evidence for the efficacy of sensory based palliative approaches to managing pain for reducing neuro-behavioral and functional symptoms. Method : This presentation provides an. Introduction and overview of sensory based palliative interventions in individuals with dementia. The state of research in their area is presented, including studies underway using tactile treatments and sensory-environmental modifications to further delineate the neurobiological mechanisms underlying the efficacy of these interventions. Results : Preliminary evaluations of sensory based modalities indicate a reduction in observed pain and neuro-behavioral symptoms and demonstrate a significant reduction in neuroendocrine measures of HPA and SNS activity, indicating a potential mechanism by which to treat painful stimuli. These modalities demonstrate promise for improving pain in AD patients by down-regulating HPA/SNS activity through the stimulation of C-fiber polymodal nociceptors. Conclusion : The current state of evidence supports the use of sensory based palliative interventions and suggests that consensual knowledge and further empirical research are needed to further elucidate the mechanism of action of these modalities. Keywords : Pain, Dementia, Palliative

SUCCESSFUL STRATEGIES TO INTEGRATE ALL HEALTH CARE DISCIPLINES TO IMPROVE PAIN MANAGEMENT IN NURSING HOME RESIDENTS

Andrea BUDNICK¹, Franziska KOENNER², Bianca HANNEMANN¹, Laura - Maria JORDAN¹, Sonja KALINOWSKI¹, Reinhold KREUTZ², Dagmar DRAEGER¹ (*1. Institute of Medical Sociology, Charite - Universitätsmedizin Berlin, Germany; 2. Institute of Clinical Pharmacology and Toxicology, Charite - Universitätsmedizin Berlin, Germany*)

Introduction : International studies have shown that up to 80% of nursing home residents (NHR) are affected by pain, while our recent study in Germany identified that every second NHR suffers from pain. Furthermore, we identified that pain medication for NHR is inadequate. Thus, 20% of NHR receive at least one potentially inappropriate medication. Non-pharmacological treatment of pain is also insufficient. Based on these results, interdisciplinary recommendations for pain management in nursing homes were developed in an interdisciplinary team. Method : In order to successfully include all health care disciplines as well as NHR in a trial to improve pain management in nursing homes, we chose a top-down-strategy and a cluster-randomised controlled trial. The intervention was conducted via two pathways: i) nurses had the option to participate in a full-time workshop; ii) and general practitioners could use a web based educational program online. Results : Twelve nursing homes participated in our trial and 815 NHR met the inclusion criterion (MMSE \geq 18). The presentation will focus on successful recruitment strategies to include all health care disciplines, legal representatives, and NHR in the trial. A special focus will be the recruitment process of general practitioners. Moreover, results on the implementation process and the effectiveness of the intervention to reduce pain in NHR will be presented. Conclusion : Despite the low human resources available in German nursing homes, it appeared possible to successfully conduct an interventional trial in that setting. Whether or not and to which extent this may lead to improve pain management will be discussed. Keywords : Pain Management, Nursing Home, Intervention Study, General Practitioner

URINARY CONTINENCE PROMOTION IN THE OLDER

ADULTS: GLOBAL RESEARCH PERSPECTIVES

SS26 422-C-1

URINARY INCONTINENCE AMONG OLDER WOMEN IN US RESIDENTIAL CARE FACILITIES

Jennie Chang DE GAGNE¹, Aeyoung SO², Jina OH³, Mary H. PALMER⁴ (1. School of Nursing, Georgia State University, USA; 2. School of Nursing, Gangneung-Wonju National University, Korea; 3. Department of Nursing, Institute of Health Science, Inje University, Korea; 4. School of Nursing, University of North Carolina, USA)

Introduction : By 2050, approximately 27 million older people are expected to live in residential care facilities (RCFs) in the U.S. Despite the growing demand and interest in this type of RCF setting, little information is available on urinary incontinence (UI) and its correlates in older women living in RCFs. Therefore, the purpose of this study was to describe the relationship among socio-demographic characteristics, health status, and UI in older women (> 65 years) living in RCFs. **Method :** A cross-sectional, retrospective survey of a population-based sample of 8,094 from the 2010 National Survey of RCFs was analyzed. **Results :** Data from 4,930 women were available for analysis, and 44.6 % of them had UI. Statistically significant differences were found between the samples of continent women and incontinent women by marital status ($p < .05$), educational level ($p < .05$), and length of stay ($p < .05$). Significant differences were also found between continent and incontinent women in activities of daily living (ADLs) scores ($p < .001$), overall health status ($p < .001$), and comorbidities ($p < .001$). The strongest association was severe impairment in ADLs with an adjusted odds ratio (OR) of 21.6 (95% CI 16.07-29.01), followed by moderate impairment in ADLs (OR = 3.41, 95% CI 2.61-4.44). **Conclusion :** UI is highly prevalent in older women residing in RCFs and is associated with severe impairment in ADLs. The comprehensive assessment including physical function status or early detection in physically functional impairment in RCFs is suggested to prevent or delay onset of or improve existing UI. **Keywords :** urinary incontinence, older women, residential facilities, survey

SS26 422-C-2

KNOWLEDGE, ATTITUDES, BELIEFS, AND PRACTICES IN KOREAN NURSES AND CARE-HELPERS ABOUT URINARY INCONTINENCE IN NURSING HOMES

Sunah PARK¹, Aeyoung SO², Jennie DE GAGNE³, Mary H. PALMER¹ (1. School of Nursing, University of North Carolina, Chapel Hill, USA; 2. Department of Nursing, Gangneung-Wonju National University, Wonju, Korea; 3. Byrdine F. Lewis School of Nursing and Health Professions, Georgia State University, USA)

Introduction : Urinary incontinence (UI) is a prevalent condition in older adults in long-term care settings, but evidence-based practices often fail to prevent, treat, or manage it. This study primarily aimed to describe levels of UI knowledge, attitudes, beliefs, and practices among Korean registered nurses (RNs) and care-helpers (CHs) and to identify correlates of continence care practices. **Method :** Data collected from 338 (135RNs and 203CHs) used an existing instrument (Henderson, 1996; Saxer et al., 2008) adapted for Korean nursing homes staff. The instrument consisted of knowledge (18-item) about UI, attitude (18-item) toward continence care, beliefs (17-item) about undesirable consequences to older adults with UI, and care practices (28-item). This study was approved by the University of North Carolina at Chapel Hill (USA) and Gangneung-Wonju National University (Korea) IRBs. **Results :** Mean and standard deviation

(M±SD) and range of scores were as follows: Knowledge (range 0-18) was 10.8±2.51 in RNs and 7.5±2.76 in CHs. In attitudes and beliefs (range 1-6), RNs' scores were 4.6±0.53 and 2.6±0.80 respectively; CHs' scores were 4.1±0.56 and 3.0±0.80. RNs and CHs had the same overall practice (range 1-4) mean score: 2.7±0.57 and 2.7±0.59 respectively. Attitude, bed capacity, and continuing education about UI significantly correlated with RN continence care practice ($R^2=.285$). CH practice significantly correlated with knowledge and attitude ($R^2=.163$). **Conclusion :** This study identified different correlates to continence care practices with RNs and CHs. Tailored UI education for each group is recommended as is further research on impact of improving knowledge and changing attitudes and beliefs on continence practices and patient outcomes in nursing homes. **Keywords :** urinary incontinence, nursing homes, nursing staff

SS26 422-C-3

INCONTINENCE-BRIEF USE IN ACUTE HOSPITALIZED PATIENTS WITH NO PRIOR INCONTINENCE

Anna ZISBERG¹, Efrat SHADMI¹, Gary SINOFF², Nurit GUR-YAISH¹ (1. The Cheryl Spencer Department of Nursing, Faculty of Social Welfare and Health Science Haifa University, Israel; 2. Department of Gerontology, Faculty of Social Welfare and Health Sciences, University of Haifa, Israel)

Introduction : The study aim was to evaluate the incidence and identify factors of in-hospital incontinence-brief use among older patients who did not use diapers prior to admission. **Method :** The current study is part of a larger prospective cohort study conducted in 2009 in 5 acute-care medical units of a 900-bed teaching hospital in Israel. A total of 465 patients (age≥70 years) who did not use incontinence briefs prior to Admission were interviewed on admission regarding their functional status, mobility, continence status, and type of voiding patterns prior to hospital stay. Interviews regarding in-hospital voiding and mobility patterns were conducted each day after the first 48 hours of hospitalization. Electronic medical records were extracted to calculate the severity of illness, comorbidity score, and length of hospital stay. **Results :** The incidence of in-hospital adult incontinence-brief use was 14% (65/465), whereas the rate of in-hospital commodes/urinals was 8.2% (38/465). The relative risk (RR) of incontinence-brief use versus self-toileting was 18.76 (95% CI: 4.36-43.72) and 10.12 (95% CI: 2.23-13.48) higher for patients with low or moderate in-hospital mobility, respectively, versus those who were highly mobile. Patients who used incontinence-briefs were more likely to be female (RR=1.65; 95%CI: 1.20-2.23) and were more likely to have low mobility (RR=1.59; 95% CI: 1.10-2.35) than patients who used commodes/urinals. **Conclusion :** Adult incontinence-briefs are frequently used in continent patients, especially women, with low mobility. The current literature identifies incontinence-briefs use as leading to multiple adverse outcomes. Therefore, the use of adult incontinence-briefs among hospitalized older adults requires more scrutiny. **Keywords :** Incontinence, Incontinence Brief Use, Hospitalized older adults

SS26 423-C

AGING AND ANTI-AGING: PERSPECTIVES OF THE DEVELOPMENT OF ANTI-AGING TECHNOLOGIES

SS26 423-C-1

APPLICATION OF BIO-GERONTOLOGICAL ACHIEVEMENTS IN PREVENTIVE ANTI-AGING MEDICINE

Roman PINAEV, David GORGILADZE, Valeriy ALEXANDROV (Scientific and Production Center of Revitalization and Health, Russian Society of Anti-aging medicine, Russia)

Introduction : Nowadays anti-aging medicine is first of all a complex of measures aimed at synchronous “fine-tuning” of functions of all organs and systems, contributing to a pronounced and stable revitalization effect. On the other hand, it also includes complex programs for correction of disorders in the organism, including new schemes of application of peptide preparations in treatment of different age-related pathology, such as cerebral atherosclerosis and diabetes mellitus type 2. **Method :** We have conducted a study of the effectiveness of a complex of peptides of the pineal gland, brain, liver, pancreas and vessels in treatment of 1249 patients suffering from cerebral atherosclerosis and 918 patients suffering from diabetes mellitus type 2 aged 52-65 y.o. **Results :** The obtained results show that new approaches are needed to existing traditional schemes of treatment of cerebral atherosclerosis and diabetes mellitus. It is necessary to introduce into existing schemes new complexes of highly effective organ or tissue specific peptide preparations, capable of expansion of reserve capacities of the organs and tissues involved into pathologic process. **Conclusion :** Taking into consideration that development of pathologic processes in cardio-vascular and endocrine systems depends on certain group of factors, it would be very important to affect them solely in a systemic way with help of a group of peptides, regulating vascular, metabolic, immune and neuroendocrine processes. This will help to achieve more pronounced and long-term therapeutic effect. **Keywords :** revitalization effect, peptides, pathologic process.

SS26 423-C-2

ANTI-AGING MEDICINE IN THE REPUBLIC OF KAZAKHSTAN: PATIENT-BASED CARE AIMED TO PROLONG HEALTHY LIFESPAN AND OPTIMIZE AGING PROCESS

Oleg IVKO¹, Elisaveta KACHAN², Valery BENBERIN¹, Kseniya IVKO¹ (1. Gerontological Society of the Republic of Kazakhstan, Kazakhstan; 2. Russian Society of Anti-Aging Medicine, Russia)

Introduction : Though recently anti-aging medicine has received criticism for advocating unproven and expensive methods to combat aging symptoms only, new approaches to the anti-aging medicine make it a new medical discipline which aspires to connect the advanced scientific and medical technologies for early detection, prevention, treatment and reversal of age-related dysfunction and diseases to clinical practice. That is why recent achievements in the field of gerontology and geriatrics, clinical medicine, physics and biology, social and other sciences should be united under the umbrella of anti-aging medicine, to contribute to the promoting and prolonging healthy life span, extending productive age and preventing age-related disorders. **Method :** Gerontologists and anti-aging specialists in the Republic of Kazakhstan develop a new patient-based strategy to be a part of global national strategy which aims to prevent diseases, including lifestyle-related diseases, to control factors that promote the occurrence of disease and to optimize aging process. **Results :** Taking into consideration that clinical practice of anti-aging medicine can be approved only by scientific evidences, we diligently work to accumulate and analyze aging- and anti-aging-related scientific data, as well as to conduct relevant scientific studies. **Conclusion :** Focusing on aging, anti-aging medicine should play a central role in health care policy focused not only on treatment of different diseases but mostly on prevention and early detection of age-related states. **Keywords :** anti-aging medicine, new medical discipline, patient-based care

SS26 423-C-3

ANTIOXIDANT ANTI-AGING STRATEGY AGAINST

OXIDATIVE CELL DAMAGE SLOWS AGING AND PREVENTS DISEASES

Cimen KARASU (Cellular Stress Response and Signal Transduction Research Laboratory, Department of Medical Pharmacology, Faculty of Medicine, Gazi University, Turkey)

Introduction : Reactive carbonyl compounds (RCCs) formed during lipid peroxidation and sugar glycooxidation accumulate by ageing or related diseases including metabolic (i.e. diabetes, obesity), cardiovascular or neurodegenerative diseases. RCCs induce “carbonyl stress” characterized by the formation of adducts and cross-links on proteins, which progressively leads to impaired protein function and damages in tissues, and pathological consequences including cell dysfunction, inflammatory response and apoptosis. Our research focused on discovering the phytochemicals and synthetic therapeutics that are capable of affecting multiple cellular redox mechanisms or etiological factors responsible for the development of diseases. **Method :** We measured lipo-glyco-oxidative and nitrosative stress, modified protein biomarkers and effects of treatment with pyridoindole antioxidants, herbal phenolic compounds and extract mixtures on cell/tissue functions and signaling proteins, apoptosis and protein adduct formations in vivo and in vitro. **Results :** Olive leaf, fruit extracts, oleuropein, hydroxytyrosol and quercetin reduced 4-HNE-toxicity, improved viability, attenuated ROS generation and protected $\Delta\Psi(m)$, inhibited stress activated transcription factors and DNA damage in cardiomyocytes. Olive polyphenols also prevented cytokine- or hydrogen peroxide-induced pancreatic β -cell toxicity and dysfunction. Pomegranate seed or hull extracts showed inhibitory action on aldose reductase and oxidative stress markers. Pomegranate seed oil, n-5 PUFAs, improved proteins against oxidatively modification in BV-2 microglia. Pyridoindolic stobadin and SMe1EC2 ameliorated diabetic complications and protected functions and viability in cellular or animal models of oxidative stress. **Conclusion :** The inhibition of carbonyl stress by free radical scavengers, natural or synthetic antioxidants, redox regulators or other carbonyl inhibitors may have a therapeutic strategy to delay ageing and the development of age-related diseases. **Keywords :** Antioxidants, Aging, Oxidative Damage.

SS26 423-C-4

APPLICATION OF PEPTIDE BIOREGULATORS IN VIETNAMESE VETERANS SUBJECTED TO DIOXINE INJURIES

Trinh Quoc KHANH¹, Pham Xuan NINH¹, Hoang Van HUAN¹, Pham Khac LINH¹, Galina RYZHAK², Anastasia RYZHAK², Vladimir KHAVINSON², Genrih SOFRONOV³ (1. Russian-Vietnam Tropical Centre, Viet Nam; 2. Saint Petersburg Institute of Bioregulation and Gerontology, Russia; 3. Institute of Experimental Medicine of the North-Western Branch of the RAMS, Russia)

Introduction : The study was conducted in 300 Vietnamese veterans who suffered dioxine injuries at the age of 55-75 years. The first group consisted of 150 men with benign prostatic hyperplasia. 150 patients with immunodeficiencies formed the second group. **Method :** Peptide bioregulators Vesilut (urinary bladder dipeptide), Vesugen (vessels tripeptide), Crystagen (thymus tripeptide) in the dose of 0,2 mg each and Ventfort (animal vessels extract) in the dose of 0,2 g were used for treatment of the first group. The second group was treated with Vesugen and Crystagen in the daily dose 0,2 mg of each and Vladonix (animal thymus extract) in the dose of 0,2 g orally for 20 days. In the first group we analysed the level of urination abnormalities according to IPSS scale and life quality QOL, urination speed, residual urine volume, prostate volume before and after treatment. In the second

group - humoral (IgA, IgG, IgM) and cellular immunity (CD3, CD4, CD8, CD19). Results : 80% of patients with BPH revealed good response to peptide therapy. Manifestation of bladder pain, frequent urination during the night time, difficult urination, low urine stream speed, residual urine significantly decreased. 70% of veterans with immunodeficiency showed positive response to peptide bioregulation therapy. The IgG level significantly increased. CD3, CD4 and CD8 levels increased alongside with resistance and immunity. Conclusion : High efficacy of peptide bioregulators wasn't accompanied with side effects. They may be recommended for treatment of immune system disorders and prostatic disorders in people subjected to extreme factors especially in Vietnamese veterans who suffered from dioxine injures. Keywords : dioxine, peptide bioregulators

SS26 423-C-5

DEVELOPMENT OF HEALTH-ORIENTED ANTI-AGING CENTERS

Alexander SINIGIBSKY, Alexander BURTIN (*International Anti-aging Center, Tez Tour, Turkey*)

Introduction : Inevitable aging of the world population makes maintenance of health and prevention of age-related diseases be the utmost goals of the anti-aging medicine. Searching for the new ways to introduce the latest achievements of anti-aging medicine into every day practice, we've launched a pilot project as part of the opening of the chain of international anti-aging medical centers in the resort centers of the Tez Tour company. Method : Due to the alliance of the Saint Petersburg Institute of bioregulation and gerontology and the Tez Tour company, the first specialized International Anti-aging Center on the Turkish coast is intended to be one of the centers for promotion of anti-aging technologies aimed to slow down aging and activate human biological reserves, developed by scientists of the St. Petersburg Institute of bioregulation and gerontology. The center is fully equipped with all necessary equipment, uses the latest achievements in gerontology and anti-aging medicine. Its employees have been trained under the guidance of the Russian Society of anti-aging medicine. Results : The center allows its guests to go through all necessary research to make a genetic passport, as well as undergo other diagnostic procedures for identifying biological age and aging pace, and get the appropriate bioregulating treatment to prevent age-related pathology. Conclusion : Developing a net of such centers at the most popular resorts will contribute to the popularization of health maintenance principles as well as make available to the general public the latest achievements of the anti-aging medicine. Keywords : health-oriented anti-aging centers, anti-aging technologies

SS26 423-C-6

THE ROLE OF GENETIC TESTS IN ANTI-AGING MEDICINE

Julia TITEL, Olga YAKOB (*Clinic of The Aesthetic and Anti-Aging Medicine 'The Fifth Element', Russia*)

Introduction : Aging at the systemic level is represented by hormonal and immune shifts associated with age-related pathologies, such as cardiovascular diseases, diabetes mellitus type 2. In 30% of the cases these diseases are genetically predetermined. Our study was aimed at finding tactics of treatment of patients depending on genetically predetermined states and metabolism intensity. Method : We examined 12 patients aged 36-72 y.o. (average age 48 ± 3.26 y.o.). The genetic analysis comprised tests for inherited diseases, genetically predetermined diseases, reaction on medical preparations, as well as metabolism assessment. Results : The results of our study showed that all the patients had risk of cardio-vascular and autoimmune diseases, all of them were predisposed to diabetes mellitus Type 2. After

conduction of clinical laboratory tests we divided patients in three groups depending on the severity of the risk of cardiovascular diseases development associated with atherosclerosis: group of high risk, group of moderate risk, group of low risk. The choice of preparations for correction of blood pressure was made basing on the genetic tests results: patients got sartans, beta-adrenergic blocking agents or ACE inhibitors. None of the patients suffered from any side effect of the treatment requiring its cessation. After treatment all patients reached target blood pressure indices. Conclusion : Thus, detection of the genetically predetermined states allows to start preventive treatment at the pre-clinical stage, to find proper therapeutic scheme of treatment taking into account the genetically predetermined sensitivity to medical preparations, as well as to adjust a dose of preparations according to the intensity of the metabolism. Keywords : genetic tests, genetically predetermined diseases, cardiovascular diseases

SS26 423-C-7

THE EFFECT OF PINEAL GLAND PEPTIDES ON AGING PACE

Sergey KONOVALOV (*Saint Petersburg Institute of Bioregulation and Gerontology, Russia*)

Introduction : Institute of Bioregulation and Gerontology The pineal gland and its hormone melatonin play a leading role in the aging of the organism. About 90% of melatonin are secreted with urine in the form of 6-oxysulfatamelatonin (6-COM), while 6-COM level correlates with level of melatonin in the blood at the time of urine samples collection. That is why 6-COM is often used for assessment of melatonin level. Melatonin is considered to be one of the most reliable marker of accelerated aging. Method : We studied the effect of peptides of the pineal gland on the level of melatonin in 254 patients aged 50+ suffering from neurodegenerative diseases. All patients were subjected to the administration of the peptide of pineal gland Endoluten (1 tablet twice a day for 20 days). Results : The primary assessment of the 6-COM level revealed that in 84% of the patients level of melatonin was lower than age norm, and only in 16% of the cases the level of 6-COM was within age norm. Application of Endoluten contributed to the increase of melatonin level in all patients with low initial indices. Moreover in 45% of the cases 6-COM level reached age norm. In patients with normal initial level of melatonin we didn't reveal any reliable changes of this index. Conclusion : The results of our studies revealed strong neuroprotective and antioxidant effect of Endoluten in all patients. Keywords : pineal gland peptides, melatonin.

SS26 423-C-8

A NEW METHOD OF PEPTIDE GEROPROTECTORS ADMINISTRATION - NEW APPROACH IN ANTI-AGING MEDICINE

Trofimova SVETLANA¹, Andrey SOROKIN², Alexandr TROFIMOV³ (*1. Russian Society of Anti-aging Medicine, Russia; 2. Academy of Scientific Beauty, Russia; 3. Saint Petersburg Institute of Bioregulation and Gerontology, Russia*)

Introduction : The skin is a complex organ that performs many functions - it protects the body from external factors, it is involved in the processes of respiration, excretion, thermoregulation, it plays a vital role in regulating metabolism of the body. Unlike cosmetic surgery or esthetic medicine, which take care only of external effects, geroprotectors have a rejuvenating effect not only on the skin but on the entire body, slowing down the process of aging. Method : Peptide geroprotectors influencing the expression of genes stimulate protein synthesis in cells and regulate the functional activity of human organs,

slowing down the aging process. Basing on this we've developed a special treatment program comprising application of the cream Vivax Biologic with a cocktail of peptides. Using the TDES electroporation device we administered peptide bioregulators noninvasively through derma. Such method of application has not only local but also an overall effect that contributes to the normalization of the anti-radical activity of the blood and the immune status of the patients. Results : Transdermal application of peptides triggered an activation of the immune cells of the skin, improving micro circulation and thermoregulation as well as antioxidant system of the epidermis. The recovery of neuro-immuno-endocrine system of the skin leads to the restoration of its functions, activation of lipolysis and synthesis of collagen and elastin within the molecular skeleton of the skin cells. Conclusion : Thus, the distinctive feature of the bioregulating therapy is its physiological effect on metabolic processes, not only of the skin, but of the body as a whole. Keywords : transdermal electroporation, peptide geroprotectors

SS26 423-C-9
ANTI-AGING TECHNOLOGIES FOR PROFESSIONAL ATHLETES

Vladimir KUDRYAVTSEV, Vladimir OSTROUKOV (*Centre of the New Medical Technologies, Russia*)

Introduction : Our research project was aimed at developing a method for bioregulation of the organism functions in professional athletes specializing in track and field athletics. Method : We've conducted clinical studies in 25 professional sportsmen specializing in athletics. Depending on the results of the complex medical examination all the sportsmen were divided into 2 groups. The first group was administered with physiologically active substances ? peptides in the form of biologically active food supplements (Crystagen, Vesugen) for immune system restoration, the second one - peptides in the form of biologically active food supplements (Pinealon, Vesugen) for antioxidant system restoration. After the treatment course all the athletes were examined using standard methods of examination. Results : The conducted studies revealed high clinical effectiveness of the studied peptide bioregulators (Vesugen, Pinealon, Crystagen). Administration of the complex of peptide bioregulators following individual schemes for each patient taking into account the general state of their health and psychological resistance allowed to lower the ARD and flu morbidity during the seasonal epidemic, to enhance physiologic reserve capacity, during the training period it contributed to the enhancement of physical activity and psychological resistance, during the competitions it contributed to the general stamina and physical working capacity, during the recovery period it contributed to faster recovery of physical and psychological reserves of the athletes. Conclusion : The results of the study show the effectiveness of the complex of peptide bioregulators when used to enhance biologic reserves of the organism in professional athletes. Keywords : anti-aging technologies, professional athletes, peptide bioregulators

SS26 423-C-10
THE EFFECTS OF PEPTIDE ANTI-OXIDANT COMPLEX ON THE BIOLOGICAL AGING OF THE SKIN

Irina BORZOVA (*Medical Centre of Therapeutic Cosmetology, Russia*)

Introduction : It is almost impossible to stop biologic aging of the skin, nevertheless it is possible to slow down this process. Method : We studied geroprotective activity of the peptide-antioxidant complex containing tripeptide Lys-Glu-Asp and ginseng extract. Our previous experimental studies on the model of mechanical and thermic damages

of the skin of experimental animals showed that geroprotective activity of this complex is based on its ability to normalize indices of the antioxidant defence. It was revealed that peptide-antioxidant complex contributes to the 1,5-fold acceleration of the epithelialization of the damaged surface of the animal skin if compared to the control. Results: Moreover we've registered a significant regenerative and antioxidant effect of peptide-antioxidant complex. Application of this complex in the area near the eyes in women contributed to a decrease in the number of wrinkles up to 60% already in 4 hours after application. Moreover we've registered normalization of the antioxidant status of the organism in patients aged 50+ after application of the peptide-antioxidant complex. Conclusion : Thus, the latest generation of the skin care products should not be considered as cosmetic products only, as they contain bioactive substances, exerting medicinal and preventive effect. Keywords : biologic aging of the skin, peptide-antioxidant complex

SS26 424-R
MEASURING AND TRANSLATING THE MECHANISMS OF FALLS IN OLDER ADULTS IN LONG-TERM CARE THROUGH VIDEO CAPTURE

SS26 424-R-1
VIDEO-BASED CASE STUDIES OF BEHAVIOURS LEADING TO FALLS IN OLDER ADULTS IN LONG-TERM CARE
Ryan WOOLRYCH, Andrew SIXSMITH (*Gerontology, Simon Fraser University, Canada*)

Introduction : Falls in long-term care represent a significant burden, both in terms of the cost of hospitalisation/post-fall care and the compromised independence and well-being of the individual. Despite this, our understanding of falls in long-term care is undermined by the absence of effective reporting procedures and the lack of real-time data of fall incidents. Method : This paper provides feedback on completed case studies of fall incidents occurring in long-term care care facilities in Metro Vancouver. This involves the collection of primary and secondary data, including video observations, fall incident videos, review of fall incident reports, interviews and focus groups with care aides and nurses (using a stimulated recall method), interviews with family members and the analysis of resident casenotes. The data is analysed within an ecological framework to examine the contributory factors of the fall incident. Results : Falls are the result of a complex interplay of social, behavioural and environmental factors across the personal, interpersonal and organisational level. Video data provides a powerful tool for helping to identify those factors, addressing some of the limitations with existing reporting mechanisms. Conclusion : The strength of developing case studies within an ecological framework eliminates the perception that any one factor alone is a risk factor in falls. This provides a key element in designing effective interventions for falls prevention across all levels of the ecological context. Video has a central role to play in the development of this understanding, yet also raises a number of ethical and practical issues that need to be considered further. Keywords : Falls, long-term care, video capture

SS26 424-R-2
A SYSTEMS APPROACH TO FALL SCENE INVESTIGATIONS IN LONG TERM CARE AND BENEFITS OF VIDEO FOOTAGE

Aleksandra ZECEVIC¹, Ryan WOOLRYCH², Andrew SIXSMITH², Stephen ROBINOVITCH³, Fabio FELDMAN⁴ (*1. Faculty of Health Sciences, Western University, Canada; 2. SFU Gerontology Research Centre, Simon Fraser University, Canada; 3. Biomedical Physiology and Kinesiology, Simon Fraser University, Canada; 4. Seniors Fall*)

and Injury Prevention Older Adult Program, Fraser Health Authority, Canada)

Introduction : Falls and injury due to falls in long term care (LTC) facilities are frequent and costly. Although intrinsic and extrinsic risk factors for falls in LTC are well known, the causes and circumstances of these adverse events are unexplored. Technology for Injury Prevention in Seniors (TIPS) project utilizes surveillance video as a part of dataset on circumstances of real-life falls in older adults in LTC. The purpose of this pilot project was to examine utility of video footage for in-depth system-wide investigations of causes and contributing factors to falls in LTC. **Method :** Following a case study design, an adverse event investigative and analysis tool called Systemic Falls investigative Method (SFIM) was used in conjunction with video footage to conduct comprehensive investigations of two falls in a LTC. **Results :** Real-life videos of falls are a useful data source to determine actions of people at the time of the event, to re-create accident scenario, to corroborate and triangulate with other data sources, to improve recall of the adverse event participants, and to establish potential divergence from standard protocols and procedures. **Conclusion :** Where available and ethically usable, video footage of real-life falls should be used in conjunction with system-based fall investigation tools such as SFIM, to identify both active and latent contributing factors to occurrence of falls. Video footage can also be combined with other data sources to create 3D animations of falls for simulation and education purposes. **Keywords :** falls investigations, long term care, video

KINEMATIC ANALYSIS OF FALL SEVERITY IN VIDEO-CAPTURED FALLS IN OLDER ADULTS IN LONG-TERM CARE

Woochol Joseph CHOI¹, Stephen ROBINOVITCH² (1. *Biomedical Physiology and Kinesiology, Simon Fraser University, Canada;* 2. *Biomedical Physiology and Kinesiology, School of Engineering Science, Simon Fraser University, Canada*)

Introduction : Falls are the number one cause of injuries in older adults, including 90% of hip fractures and 60% of head injuries. Risk for such injuries depends largely on the forces applied to the body during impact, which depend, in turn, on the impact velocity of body segments at landing. We analyzed video footage of real-life falls in older adults to determine impact velocities of the hip and head. **Method :** From a library of falls captured with surveillance cameras in long-term care (Robinovitch et al, 2012), we selected 12 falls. We digitized hip and head landmarks from fall initiation to impact, and reconstructed these landmarks using a 2-dimensional direct linear transformation algorithm, using calibration data specific to the fall orientation. We differentiated these data to estimate impact velocities. In lab-based falling experiments, our technique provided less than 10% error over a 30 to 150° range of falling directions. **Results :** The hip and head impact velocities averaged 2.9 ± 0.9 and 3.0 ± 1.0 m/s, respectively. **Conclusion :** Given the increased falling distance of the head, the impact velocity of the head was surprisingly similar to that of the hip. This likely reflects the protective effect of initial impacts to the pelvis, trunk, and/or outstretched arms, and possibly activation of neck muscles. Also, the hip impact velocities are remarkably similar to those observed in lab-based falling experiments with young adults (3.0 ± 1.0 m/s; Feldman et al., 2007). This reinforces confidence in use of these estimates in the design of helmets, hip protectors and compliant flooring. **Keywords :** Falls, Injury prevention, Hip fracture, Older adults, Head injury, Biomechanics.

SS26 424-R-4

SUPPORTING KNOWLEDGE FOR INJURY PREVENTION IN LONG-TERM CARE

Joanie SIMS-GOULD¹, Laura DILLEY², Alexandra ZECEVIC³, Vicky SCOTT⁴, Fabio FELDMAN⁵, Heather MCKAY¹, Stephen ROBINOVITCH⁶ (1. *Faculty of Medicine, University of British Columbia, Canada;* 2. *Education, Simon Fraser University, Canada;* 3. *Health Sciences, University of Western Ontario, Canada;* 4. *Injury Prevention, British Columbia Ministry of Health, Canada;* 5. *Falls and Injury Prevention, Fraser Health Authority, Canada;* 6. *Biomedical Physiology and Kinesiology, Simon Fraser University, Canada*)

Introduction : Falls are the number-one cause of injury in older adults, and are especially common in the long-term care (LTC) environment. In this presentation we highlight an end-of-grant knowledge translation project that involves the development and dissemination of a video-based training tool addressing the cause and prevention of falls in seniors. **Method :** Guided by principles of knowledge translation and adult learning theory we engaged stakeholders in the research process and in the development of a video-based training tool. We included a range of stakeholders including nurses, care aides, and physical therapists who work with older adults in LTC. A unique and powerful aspect of the tool is the inclusion of video footage of real-life falls (collected under our operating grant funded by the Canadian Institutes of Health Research) in a set of 'case studies'. **Results :** The 15 minute video-based training tool uses case studies to focus on current knowledge and best practices related to issue such as fall risk screening, mobility and balance assessment, exercise, fall-related injuries (especially hip fracture and head trauma), environmental hazards, and hip protectors. **Conclusion :** In conclusion, we describe the steps we undertook to engage stakeholders in the development and design of this unique KTE tool. We also highlight our dissemination and evaluation plan. **Keywords :** Long term care, knowledge translation, staff education

SS26 425-C

FRAILTY AS DEFICIT ACCUMULATION: SCALING FROM CELL TO SOCIETY

SS26 425-C-1

INTRODUCTION

Kenneth ROCKWOOD (*Department of Medicine, Dalhousie University, Canada*)

Introduction : The purpose of this symposium is to review how subcellular deficit accumulation corresponds to macroscopically observable health deficits, and how these vary across countries. **Method :** Three well-published speakers will address subcellular (Howlett), clinical (Hubbard) and country-level (Theou) deficit accumulation. A fourth presentation (Mitnitski) will show how each can be understood using readily comprehensible mathematical principles to account for environmental-organism interactions. The organizer (Rockwood) will provide a very brief concluding synthesis, emphasizing implications for science and practice. Each participant is a leader in the aspect of deficit accumulation on which they will present. **Results :** The symposium will present data from more than dozen countries, illustrating how widely generalizable the approach is, and how it can be readily applied in most existing health datasets. **Conclusion :** New results in relation to the determinants of deficit accumulation will be shown, and recent advances in understanding how deficit originate will be of wide interest. **Keywords :** frailty, deficit accumulation, aging, cellular, population health, clinical

SS26 425-C-2

A FRAILTY INDEX BASED ON CLINICAL MEASURES PREDICTS BEHAVIOURAL COGNITIVE AND DETERIORATION IN AGING MICE

Jocelyne C. WHITEHEAD¹, Barbara A. HILDEBRAND², Robert A. ROSE³, Kenneth ROCKWOOD⁴, Susan E. HOWLETT¹ (1. Pharmacology, Dalhousie University, Canada; 2. Carleton Animal Care Facility, Dalhousie University, Canada; 3. Physiology and Biophysics, Dalhousie University, Canada; 4. Medicine, Dalhousie University, Canada)

Introduction : We have shown that frailty can be quantified in aging mice with a frailty index (FI), in which an individual animal's deficits in health are counted and divided by the total number of items measured. Our objectives were: 1) to evaluate frailty in mice with an FI based on clinical assessment; and 2) to determine whether a high FI predicted deterioration in cognitive and behavioural function. **Method :** Frailty was quantified in C57BL/6J mice (6-28 mos) with a clinical FI based on 31 physical signs, diseases etc. Behaviour was assessed in an open field (EthoVision) and cognitive function was evaluated with a Barnes maze. **Results :** Results showed that the FI increased with age from 0.014 ± 0.006 to 0.382 ± 0.047 in 6 and 28 month-old mice, respectively ($p=0.008$; $n=14$). A high FI was correlated with a decrease in maximal distance travelled (within 5 mins; $r^2=0.71$) and an increase grooming duration ($r^2=0.40$). A high FI also was linked to a decrease in number of times animals crossed the centre of the field ($r^2=0.45$), an indication of anxiety. Barnes maze studies showed that a high FI was correlated with a reduction in time spent in the correct quadrant ($r^2=0.78$) and an increase in the number of times animals entered an incorrect hole ($r^2=0.54$). **Conclusion :** These results demonstrate that a FI based on a simple clinical assessment tool can be used to evaluate frailty in aging mice and suggest that deterioration in behavioural and cognitive function is more prominent in animals with a high FI. **Keywords :** frailty, aging, deficit

SS26 425-C-3

CLINICAL MEASUREMENT OF FRAILTY

Ruth Eleanor HUBBARD (Centre for Research in Geriatric Medicine, The University of Queensland, Australia)

Introduction : Physicians involved in the care of medical in-patients, irrespective of their sub-specialty area, will be responsible for the management of a significant number of older adults with complex care needs and multiple co-morbidities. These patients are vulnerable to poor outcomes, including falls, institutionalisation and death: they are frail. **Method :** In this presentation, the development of frailty as a concept is reviewed. Different approaches to the measurement of frailty are described, with particular emphasis on their potential clinical utility. **Results :** There are 3 main approaches to the measurement of frailty: as a clinical syndrome or phenotype, subjective opinion and the multidimensional risk state or deficit accumulation model. The most well-known and widely used phenotype is coherent and reproducible but relies on performance based tests which are not feasible for the most vulnerable older inpatients. Subjective opinion measures have strong face validity but their reliance on judgement limits their generalizability. On the other hand, the accumulation of deficits can be captured through information collected as part of comprehensive geriatric assessment - an FI-CGA. This measure is feasible for all inpatients, can predict rehabilitation potential and stratifies patients into groups with different risk states. **Conclusion :** The precise quantification of health status afforded by the FI-CGA may help us understand why our interventions work and for whom they are most successful. This may augment clinical judgement

in the risk stratification of vulnerable older people, improving the effectiveness of care in the acute sector. **Keywords :** frailty; inpatients; clinical

SS26 425-C-4

TRANS-NATIONAL VARIABILITY IN FRAILTY

Olga THEOU, Thomas D. BROTHERS, Michael R. ROCKWOOD, Arnold MITNITSKI, Kenneth ROCKWOOD (Geriatric Medicine, Dalhousie University, Canada)

Introduction : On an individual level, frailty is generally influenced by socioeconomic factors. On a population level, frailty may be related to per capita wealth. The purpose of this study was to examine the association of frailty with national economic indicators. **Method :** 37,546 individuals, aged 50+ years, residing in 15 countries (Austria, Belgium, Czech Republic, Denmark, France, Germany, Greece, Ireland, Israel, Italy, Netherlands, Poland, Spain, Sweden, Switzerland) participated in baseline interviews of the Survey of Health, Ageing and Retirement in Europe. A frailty index (FI) was constructed based on the accumulation of deficits approach from 70 health measures which were age-related and associated with adverse outcomes. Frail individuals were defined as those with an FI score of 0.25 or greater, and the fittest individuals as those with an FI score of 0.03 or less. **Results :** Across countries the FI score increased with age and was higher in women. Mean FI score ranged from 0.11 (Switzerland) to 0.24 (Poland). GDP ($r=-0.79$, $p<0.001$) and health care expenditure ($r=-0.63$, $p<0.05$) were negatively correlated with mean FI score. Higher income countries had a lower prevalence of frailty (16.1% vs 27.6%) and a higher proportion of adults classified as the fittest (7.2% vs 4%) compared to the lower income countries. **Conclusion :** There is a strong relationship between national economic indicators and a country's level of frailty in adults aged 50+ years. The least wealthy countries had the lowest health care spending and demonstrated the highest levels of frailty and lowest levels of fitness among middle-aged and older adults. **Keywords :** frailty, deficit accumulation, population health, aging

SS26 425-C-5

THE ORIGIN OF DEFICIT ACCUMULATION

Arnold MITNITSKI (Medicine, Dalhousie University, Canada)

Introduction : The frailty index (FI) based on the accumulation of health deficits (broadly defined) is known to be a valid characteristic of health in individuals and populations. In the number of studies, it showed strong association with adverse outcomes independently on chronological age. Despite its great utility in outcomes prediction little is known about the origin of the FI. Here we present a mathematical model to demonstrate that the properties of the FI are originated in the interaction of the organism with environment. **Method :** To represent how deficits accumulate over time we considered a stochastic dynamics model based on the organism-environment interaction. The environmental challenges are represented by a stochastic process with intensity λ ; the ability of the organism to recover after the damage is characterized by the average recovery time $1/\mu$. A similar model is widely used in the queuing processes (operation research). The model behavior is compared with the observational patterns of deficit accumulation (age-specific trajectories and their statistical distributions). **Results :** The average number of deficits is the product of the intensity of the environmental stresses to the average recovery time (λ/μ). This ratio increases when recovery time increases. The distribution of the number of deficits changes from extremely asymmetrical at younger ages (i.e., most people have little problems) to a skewed bell-shaped distributions in the advanced ages. Both mean

trajectories of the FI and its distributions closely resemble observational patterns. Conclusion : The FI based on deficit accumulation approach can be understood in terms of measurable organism and environmental characteristics. Keywords : aging, frailty, environment

SS26 426-C

ASSESSMENT AND TREATMENT OF SLEEP DISORDERS IN THE OLDER ADULT

SS26 426-C-1

HYPERSOMNIA(EXCESSIVE DAYTIME SLEEPINESS) IN THE OLDER ADULT: ASSESSMENT AND TREATMENT

Seung Chul HONG (*Department of Psychiatry, The Catholic University of Korea, Korea*)

Introduction : The high frequency of sleep complaints, especially excessive daytime sleepiness (EDS), in aged individuals may be related to the physiologic sleep changes of normal aging as well as to concomitant medical, psychiatric, neurologic, and other disorders that are prevalent in this group. Method : The prevalence of many sleep disease related with EDS are known to increase with age. EDS is often associated with fragmentation of nocturnal sleep which may have been due to sleep-disordered breathing and periodic leg movements in sleep (PLMS). Other factors are changes in the circadian rhythms of temperature, alertness and sleepiness and social time cues. Snoring is a common sleep-related respiratory disorder and OSA, its more severe feature, is increasingly seen among elderly people, too. Results : OSA is significantly associated with cardio- and cerebro-vascular disease, metabolic syndrome and cognitive impairment. An epidemiologic study ages 65 years observed 33% of men and 19% of women with snoring and 13% of men and 4% of women with observed apnea. In the study by Kripke and coworkers, 20-30% of subjects 65 years and older had PLMS. Narcolepsy, a disease of EDS, is usually beginning at the early age. However its onset could be any age and a lifelong condition. Conclusion : Clinical assessment and treatment of EDS of elderly patients is needed to improve their sleep and general medical condition. Keywords : EDS, Elderly, OSA, PLMS, Narcolepsy

SS26 426-C-2

CHRONOBIOLOGY AND INSOMNIA IN LATE LIFE: IMPLICATIONS FOR TREATMENT

Jung Hie LEE (*Psychiatry, Kangwon National University Hospital, Korea*)

Introduction : Aging is often associated with sleep complaints, including earlier awakening and decreased sleep consolidation at the end of the night. A change in the circadian timing system may contribute to age-related changes in sleep. It has been reported that the melatonin rhythm occurs later with respect to sleep in healthy older subjects compared to young subjects. We aimed to compare the sleep timing and melatonin rhythm between the older adults with insomnia and those without insomnia. Method : Thirty subjects with sleep complaints and 21 subjects without sleep complaints (Age: 56-79 years) were included. The circadian phase was assessed by dim light melatonin onset (DLMO), relative dim light melatonin onset (DLMO_{n25%}) and offset, and the fitted peak of melatonin. The phase angle between the habitual bedtime and circadian phase was also calculated. Results : There was no significant difference in the above melatonin phases and phase angles between the two groups. The amplitudes of 24 hour rhythms of core body temperature (CBT) and melatonin were lower in older subjects with sleep complaints

compared to those without sleep complaints ($p < 0.05$). Among 51 subjects, all measures of melatonin phase significantly predicted habitual bedtime and waketime ($p < 0.0001$). Conclusion : There was no change in the phase angle between the melatonin rhythm and habitual sleep timing in older subjects with sleep complaints. The alterations in self-selected sleep timing with respect to the timing of underlying circadian system may not contribute to sleep disruption. However, melatonin agents are recommended since lower melatonin secretion could impair sleep maintenance in older adults. Keywords : Insomnia, Melatonin, Phase angle

SS26 426-C-3

DIFFERENTIAL DIAGNOSIS AND TAILORING COGNITIVE-BEHAVIORAL THERAPY FOR INSOMNIA FOR THE OLDER ADULT

Sooyeon SUH (*Institute for Human Genomic Study, Korea*)

Introduction : Despite the impact that sleep disturbance has on older adults, they are often inadequately addressed in clinical settings. Identifying treatment components that are most helpful to older adults for insomnia treatment will be helpful for more effective treatment. Method : One hundred older adults 65 and older (mean 72.2 ± 6.2 , 47% male) received group cognitive-behavioral therapy for insomnia (CBTI) in a sleep medicine clinic. Pre- and post-treatment measures included the following: Insomnia Severity Index (ISI), Beck Depression Inventory (BDI), and Dysfunctional Beliefs and Attitudes about Sleep Scale-10 item version (DBAS-10). All patients completed a questionnaire post-treatment listing 24 therapeutic elements asking patients to rank how helpful each component was using a scale of 0 - 3. The components were organized by four conceptual therapeutic elements: sleep hygiene (5 items; reducing caffeine), behavioral (8 items; sleep restriction, anchoring wake-up time), cognitive components (5 items; accepting that I may not get as much sleep as I want), and non-specific therapeutic elements (6 items; receiving support from other group members, trusting treatment provider). Results : Paired t-test analyses revealed a significant reduction from pre- to post-CBTI in insomnia severity ($t = 4.06$, $p = 0.004$) and depression ($t = 8.33$, $p < 0.001$). Older adults identified the behavioral components as the most helpful ($X = 2.67$), followed by non-specific therapeutic elements ($X = 2.41$), cognitive components ($X = 2.07$), and sleep hygiene ($X = 1.87$). Conclusion : This suggests that older adults can benefit from group CBTI and can expect reduction in insomnia symptoms and depression. Future CBTI individualized for older adults should focus on capitalizing implementation of behavioral components. Keywords : insomnia, cognitive-behavioral therapy for insomnia, sleep disorder

HEALTHY AGEING AND LONGEVITY IN HUNGARY

SS26 427-C-1

WHY RESEARCH INTO HEALTHY AGEING AND LONGEVITY HAS A GREAT IMPORTANCE IN THE 21ST CENTURY (PRELIMINARY STUDIES IN THE 20TH CENTURY IN HUNGARY)

Karolina KOSA¹, Roza PROF. ADANY¹, Sandor Gyula IMRE² (*1. Department of Preventive Medicine, FPH, MHSC, University of Debrecen, Hungary; 2. 1st Department of Internal Medicine, (MHSC), University of Debrecen, Hungary*)

Introduction : One third of the population of the EU is projected to be aged 65 or over by 2060. Longer lives should be considered a major achievement of modern societies which allow the unfolding of human

capabilities and extend self-actualization, but at present the ageing of the population receives attention primarily because of the challenges it presents for the economy and welfare systems as it is reflected in the 2012 Ageing Report of the EU. Method : The joint actions of the European Innovation Partnership on Active and Healthy Ageing reflect the same concern addressing medication adherence, the prevention of falls, integrated care models, ICT independent living solutions - areas of fear and grief. The authors hereby propose an alternative, salutogenic approach with an emphasis on the vast possibilities of healthy ageing even after less than optimal health in younger years. Results : In order to build a comprehensive and coordinated policy for ageing, Whitehead's action spectrum of inequities of health could be used as a framework. The measurement and recognition of ageing have taken place, however, awareness raising has so far put a greater emphasis on fear and grief than on the positive aspects of getting to ripe age. Conclusion : To help salutogenic policy development, much wider and more positive awareness raising should be carried out by social marketing to introduce the growing number of old people as role models who demonstrated remarkable mental and physical performances such as Ernestine Shepherd or Oscar Niemeyer. Keywords : healthy ageing strategy

SS26 427-C-2

THE HAEMORHEOLOGICAL AND GENERAL LABORATORY STATUS IN OLDEST OLD RESIDENTS

Agnes KOVACS¹, Zita SZIKSZAI², Gyorgy PROF. PARAGH¹, Sandor Gyula IMRE¹ (1. 1st Department of Internal Medicine MHSC, University of Debrecen, Hungary; 2. Department of Ion Deam Physics, Institute of Nuclear Research of the Hungarian Academy of Sciences, Hungary)

Introduction : Among the elderly population the number and proportion of the oldest-old (years or older) will increase most significantly in the near future. Since there was no similar study on this target group in Hungary, we decided to make a systemic analysis of the social, clinical and biological conditions of them under this title: Debrecen Longevity Study. Debrecen is the second largest city in the country, and the oldest old residents represent 0.4 % of the total population (834 residents). Method : The probands were examined in their homes with an interview, based on a questionnaire. After the interview medical and laboratory investigation were performed in order to evaluate the general health status of the subjects. We examined 52 routine laboratory parameters. Since age-specific reference values are not available for the oldest-old persons our results could be compared only to the general, adult reference values. Results: Blood samples were obtained from 304 persons. Most of the investigated parameters were in the normal range. The alterations were not extreme, but they were statistically significant. We compared these results with our earlier laboratory screening test of Debrecen residents between 60-74 and 75-89 years respectively. Thus we had the opportunity to compare three age groups. We have experienced significant decreasing trends at cholesterol and triglyceride levels, while there is an increasing trend at HDL-cholesterol level. Conclusion: During aging the population becomes increasingly selected, namely over 90 years only the 'survivors' are alive. As the proportion of 'survivors' increases, some parameters stop worsening or even show some improvement. Keywords : hematology, longevity

SS26 427-C-3

THE ASSOCIATION OF HEALTH STATUS WITH DIETARY PATTERN AND PHYSICAL ACTIVITY IN THE OLDEST OLD GROUPS LIVING IN DEBRECEN, THE EASTERN PART OF HUNGARY

Hyun-Sang SHIN¹, Gyorgy PROF. PARAGH¹, Agnes KOVACS², Zita SZIKSZAI³, Sandor Gyula IMRE² (1. 1st Department of Internal Medicine, University of Debrecen, Hungary; 2. 1st Department of Internal Medicine MHSC, University of Debrecen, Hungary; 3. Department of Ion Deam Physics, Institute of Nuclear Research of the Hungarian Academy of Sciences, Hungary)

Introduction : The association between health conditions and physical activity and dietary pattern in the oldest old groups (aged 90 and over) living in Debrecen, the second largest town of Hungary. Method : 228 subjects (169 women and 59 men) were randomly selected from the total oldest-old population and given a questionnaire which contained 159 questions about their health status, physical activity and dietary pattern. The mini-mental state examination (MMSE) was used to examine their cognitive functions. Medical and laboratory investigations were performed to evaluate the general health status of the subjects. Results : Based on a self-evaluation, 67% of them had a good, very good or excellent health condition. 52.6% and 46.2% of the subjects consumed fruit and butter/margarine daily, respectively. 50% consumed vegetables and 65.4% consumed fowls several times a week. 36% do gymnastics regularly with 69.5% undertaking this daily. 50.5% are fully mobile. 40.5% are mobile, but have limited mobility are confined to their residence, while 9% are bedridden. Conclusion : Significant correlations were found between the laboratory parameters (RBC, Hgb, Hct, We, HDL-cholesterol, CCL), the cognitive functions (MMSE) and the physical activity of oldest old residents. Our findings suggest that physical activity has significant impact on preservation of health, leading to increased life expectancy. Keywords: longevity, physical activity

SS26 427-C-4

ANTIOXIDANT DEFENCE AND FREE RADICAL REACTIONS OVER 90 YEARS OF AGE

Sandor Gyula IMRE¹, Agnes KOVACS¹, Zsuzsanna VARGA¹, Zita SZIKSZAI², Gyorgy PROF. PARAGH³ (1. 1st Department of Internal Medicine MHSC, University of Debrecen, Hungary; 2. Department of Ion Deam Physics, Institute of Nuclear Research of the Hungarian Academy of Sciences, Hungary; 3. 1st Department of Internal Medicine, University of Debrecen, Hungary)

Introduction : It is well known that the toxic effects of oxygen free radicals contribute not only to the incidence of age-associated diseases, but also to the aging as a biological phenomenon. To study the damaging effect of oxygen free radicals and the efficiency of antioxidant defence in oldest old (defined as age 90 years or older) residents, three parameters were examined: plasma vitamin E and lipidperoxid contents as well as the carbonil contents of plasma proteins. Method : The laboratory results of 185 persons above 90 years old have been presented. For healthy controls in the evaluation of vitamin E contents 100 persons with an average age of 37.5 +/- 9.9 years have been used. For healthy controls in the evaluation of lipidperoxid and carbonil contents three age groups, 20 - 39 years of age (60 persons), 40 - 59 years of age (40 persons) and 60 - 80 years of age (40 persons) have been used. Results : Significantly higher levels of alfa- and gamma-tocopherol were observed in oldest old residents. The trend of significant increase was observed in the contents of lipidperoxid and carbonil as a function of age in healthy controls, but the increase was not significant over 80 years of age. Conclusion : It could be concluded that the oldest old residents had a native resistance to the damaging effect of oxygen free radicals. Keywords : longevity, antioxidant defence

THE AGING KOREAN TIGER: ANALYZING RETIREMENT POLICY CHALLENGES

SS27 124-R-1

RETIREMENT AND OLD AGE POVERTY IN KOREA

Jiyeun CHANG (*Korea Labor Institute, Korea*)

Introduction : Early retirement from main job is prevalent although the public pension scheme has not matured to support older people in Korea. Retired elderly people pass through miscellaneous jobs and the risks of poverty is quite high, although the level of labor force participation is high among older people. Method : Multinomial Logit Analyses using 'Korea Welfare Panel Study' Results : In this paper, we reveal that income instability and poverty of older people come from the precariousness of their mid-age employment statuses. The analyses suggest that the current Korean pattern of slower and later retirement is primarily a cohort phenomenon, with this pattern most prevalent among the oldest cohorts, and least prevalent among the youngest cohorts, of Korean men. The young olds tend to experience employment instability with higher rates than the old olds. Conclusion: Employment instability and informality in their prime age results in low pension income, and eventually increase the risk of old age poverty. Keywords : Retirement, Poverty

SS27 124-R-2

PROSPECTS OF REFORMING CONTRACTUAL MANDATORY RETIREMENT IN KOREA

Thomas KLASSEN (*Department of Political Science, York University, Toronto, CANADA, Canada*)

Introduction : The distinguishing feature for many workers in Korea is contractual?and often involuntary, retirement from one's main job at a young age, followed by a second career in self-employment or contract work. Workers in some white sector occupations and the sectors have coined the word "sa-o-jeong," which means age 45 is the de facto retirement age for them. Method : An analysis of current demographic, labour market, political and broader societal developments shows that pressure is mounting for policy reform. Results : A significant increase in the retirement age, and its ultimate abolition, is unlikely to occur naturally because business, labour and government are unable to find a compromise. Private interests, especially employers, will always prefer contractual mandatory retirement, because its benefits are retained by the firm, whereas its substantial costs are borne by the state and by individuals. Conclusion : The circumstances that have historically supported early contractual mandatory retirement in Korea, and some of its neighbours especially Japan, by maximizing its benefits and mitigating its problems, have changed in the past decade. Nevertheless, the policy reforms required to adapt to the new conditions remain elusive, creating increasingly dysfunctional conditions for individuals, employers and the government. Keywords : retirement, policy, Korea

SS27 124-R-3

CAN WOMEN EVER RETIRE? WORK AND RETIREMENT DYNAMICS IN A FAMILY CENTRED CULTURE

Yunjeong YANG¹, Soondool CHUNG² (*1. International Development Studies, Hankuk University of Foreign Studies, Korea; 2. Graduate School of Social Welfare, Ewha Womans University, Korea*)

Introduction : Where caring remains predominantly a woman's job, older women are often requested to provide unpaid care labour,

rendering their retirement, if ever from paid work, meaningless in its literal meaning of 'rest from work'. Method : From qualitative interviews with retired and healthy (relatively younger old) women in Korea, this study shows that women, regardless of their paid work experience, can 'retire in peace', i.e. even from family caring work, only when they judge themselves as having fulfilled their 'parental duty'. Results : Thus, retirement for women is intimately linked to family dynamics, which confirms the key point relating to women and retirement from earlier studies. A distinctive finding from the current study is that, in Korea, it is related more to 'parental duty' accomplishment for children, rather than to couple relationships as often emphasised from Western cases. Conclusion : The study concludes, though not newly, that only a new paradigm of 'universal caregiver model', can emancipate women, both young and old, from duties from work, both paid and unpaid. Keywords : Women, retirement, Korea

DIGITAL COMMUNICATION AMONG SENIOR GENERATION THE SENIORS' LIFESTYLE ADAPTATION TO DIGITALIZED CULTURES

SS27 302-S-1

DIGITAL TECHNOLOGY FOR HEALTH PROMOTION AMONG SENIORS IN KOREA

So-Young CHO (*Graduate School of Social Welfare, Kangnam University, Korea*)

Introduction : This study was to find if digital communication skills could be useful for seniors to solve health promotion needs. Entering 2000, numerous ITC training programs were provided for seniors in Korea, and shown the ITC trainees were motivated to find information collection and to share communication. The author analyzed if the ITC training networks and the digital communication skills could be applicable for health promotion programs(HPP), in reflection to Health Promotion Policy in Korea. Method : The ITC training programs at Senior-Welfare Centers and at Senior-Community Centers, which were called 'Life-Up' and sponsored by the Micro-Soft during 2004~2009 were analyzed with basis of survey with the program trainees and managers. 124 Centers in 10 regions were provided the Life-Up programs. 498 seniors of the trainees were selected and 20 managers in Metropolitan area were interviewed. Major health problems and behaviors of Senior-Welfare Center admittants were reflected for the analysis of health promotion needs and the ITC application. Results : Participants were composed females (62.2%) and males(37.8%), and shown 56.5% of trainees had multiple experiences of the ITC learnings. The ITC training programs were 'very satisfied' with 4.29 scores out of 5.0. key factors for success were shortening accessibility to the Centers, distance(42.4%); positive attitude using on-line communication(71%); and accustomed(70%) to use the digital communication more than once a day. Conclusion : As seniors felt pleasant and useful with the ITC, digitalized health promotion and security programs of health centers,such as Kangnam-Ku, are recommended for shortening accessibility and active participation of seniors, with adjusted to regional needs. Keywords : digital communication & technology for health promotion

SS27 302-S-2

THE DIGITAL LIFE PATTERNS OF KOREAN AGED PEOPLE AND SOME SUGGESTIONS FOR DIGITAL INCLUSION

Doojin Choi CHOI (*Digital Inclusion Policy Division, National Information Society Agency, Korea*)

Introduction : The access and usage of ICT become more and more important in our daily lives. With the advent of information society, we can not live a day without computer and internet. The capabilities of people to use ICT will decide their quality of the economic and social life. In this context, bridging the digital divide among people is a very important policy issues. This paper reviews current status of digital divide between generations in Korea and give a some suggestions for achieving digital inclusion. **Method :** This study examines some statistical data and find some useful patterns of digital divide between generations in Korea. We also review some policy literatures and give a some useful policy agenda for digital inclusion. **Results :** First of all, this paper shows some shapes of digital divide patterns between generations, especially focus on digital divide between the elderly and the young people. This study review four dimensions of digital divide which is consist of comprehensive digital divide index. The patterns and characteristics of access divide, Literacy divide and productivity divide were examined. This paper also presents the phenomena of mobile divide. **Conclusion :** this paper finds that the digital divide between generations is still lasting and new digital divide appears in mobile areas. Solving the digital divide problems is very close related to the social inclusion in information society. So It's time to make a new national policies for digital inclusion. **Keywords :** digital divide digital inclusion

THE ICT APPLICATION FOR SENIOR JOB ASSIGNMENT IN KOREA

Seok Kyong KIM (CEO, The Happy ICT Foundation, Korea)

Introduction : Entering the age of ageing in South Korea, the rapid increase of healthy elderly actively requires their advances in various fields in society. However, as the popularization of Smartphone the accessibility of IT infrastructure for elderly is getting vulnerable than ever, it's catch-up is more than ever an important social problem.. **Method :** This study is to verify how ICT can be utilized in development of senior jobs and their participation in society, From April 2011 to Feb. 2012, we have supported to the work assignments in the process of cleaning job with the elderly workers in the region of Gyeonggi-do and Seoul Korea. **Results :** The study found that more than 100 elderly workers could have utilized ICT technology to take care their jobs for three months and confirmed that the old people among 700,000 workers of the cleaning business, which is corresponding to 23% of simple labor workers 3 million (EST.), improving the quality of recognition and value for the labor effort through ICT service. In the near future, the ICT services will be utilized for the rural elderly, which is accounted for 75% the rural population, in the process of production and distribution to improve their net income and performance of working. **Conclusion :** The ICT is usefully applicable for seniors as they could use how to make digital communication for job application, duty order check, and achievement report, etc. Social supports should be provided for the digital job creating and management networks. **Keywords :** digital communication for job seekers.

THE 'LIFE-PROTECTIVE POLICY' ANALYSIS FOR SENILE SUICIDE PREVENTION AT GYEONGGI PROVINCE, KOREA
Hyeon Seog SHIN¹, Joon Woo LEE² (1. Planning and Finance Committee, Gyeonggi Provincial Assembly, Vice Chairman of Saenuri Party, Korea; 2. Social Welfare Graduate School, Gangnam University, Korea)

Introduction : According to the survey of National Statistical

Office(2011), 28.7 people in Korea committed suicide in 2010, marking the highest suicidal rate among the OECD countries. Particularly in Gyeonggi Province, 899 people older than 65 committed suicides reached its fourth number in country. The fact above requires to make practical and institutional strategy to prevent suicide of the Elderly. **Method :** - Analysis on Suicide Rate of Elderly People in Gyeonggi Province - Analysis on the Current status of Suicidal Prevention Programme for Elderly People in Gyeonggi Province. **Results :** By the benefit of Education and Counseling for the Suicide Prevention- Gyeonggi Province Senile Suicide Prevention-carried out for last 3years as one of the programs of " Life-Protective Policy", the number of suicide of 65 years old had increased to 96.9 in 2005 from 44.5 in 2000. But it decreased to 91.1. **Conclusion :** Through this results, this study based on survey on punditariat attempts to propose policies as follow: 1)The enactment of practical ordinance for 'Life-Protective Policy". 2) Expansion of support to Municipal Center for the Senile Suicide Prevention 3)Establishment Specialized Center for Senile Suicide Prevention and the regular education program 4). Introduction of the Refresh Home for Senile - specialized Counsellors 5)Provide the Living Home for suicidal people in range of temporary care, probation and high -risk of suicide. **Keywords :** Senile Suicide Prevention

RELATIONSHIPS BETWEEN REPRODUCTIVE HORMONE LEVELS AND SELF-RATED HEALTH AND HEALTH-RELATED QUALITY OF LIFE IN COMMUNITY-DWELLING OLDER MEN

Benjamin HSU¹, Robert G. CUMMING¹, Fiona M. BLYTH², Vasi NAGANATHAN², David J. HANDELSMAN³ (1. School of Public Health, Sydney Medical School, University of Sydney, Australia; 2. Centre for Education and Research on Ageing, University of Sydney and Concord Hospital, Australia; 3. Anzac Research Institute, University of Sydney, Australia)

Introduction : To examine relationships between reproductive hormones and changes over two-year follow-up in self-rated health and health-related quality of life in older men. **Method :** 1705 men aged 70 years and older from Concord Health and Ageing in Men Project were assessed at baseline (2005-2007) and 2-year follow-up (2007-2009). At baseline, testosterone (TT), dihydrotestosterone, estradiol (E2), and estrone (E1) were measured by liquid chromatography-tandem mass spectrometry, and SHBG, LH, and FSH by immunoassay. Self-rated health and health-related quality of life measures (SF-12) were obtained at baseline and follow-up. **Results :** In cross-sectional baseline data, univariate analyses revealed significant associations between many of the reproductive hormones and both quality of life scores and self-rated health. However, in multivariable analysis, only associations between TT, E1, and calculated free Testosterone (cFT) and self-rated health remained statistically significant. Compared to men in the highest TT quartile, men in the lowest TT quartile were 1.47-fold (95%CI: 1.04-2.06) more likely to

report fair, poor, or very poor health versus excellent or good health. The findings for E1 and cFT were similar. In the longitudinal data, compared to the highest E1 quartile, the lowest quartile of E1 was significantly associated with deterioration in self rated health: adjusted odds ratio 1.84 (95%CI: 1.10-3.06). There were no consistent associations between reproductive hormones and changes in quality of life scores. Conclusion : Lower levels of serum testosterone and estrone in older men are associated with deterioration in self-rated health and well-being over time. Further studies are warranted to clarify whether the hormonal findings are cause or effect. Keywords : testosterone estrogen self rated health quality of life

OP23 313-C-2

THE IMPACT OF SYMPTOM CLUSTERS ON OLDER ADULTS WITH CHRONIC VENOUS LEG ULCERS

Helen EDWARDS¹, Kathleen FINLAYSON², Helen SKERMAN², Kimberly ALEXANDER², Michelle GIBB² (1. School of Nursing, Queensland University of Technology, Australia; 2. Institute of Health and Biomedical Innovation, Queensland University of Technology, Australia)

Introduction : The incidence of chronic leg ulcers increases with age, up to 5 to 10% of those aged over 80 years. The ulcers are difficult to heal and many suffer from the condition for 15 or more years. Adults with leg ulcers suffer with many disabling symptoms and these symptoms, and potentially symptom clusters, may impact on health and quality of life. The aim of this study was to determine the impact of symptoms and symptom clusters on quality of life and wound healing in older adults with venous leg ulcers. Method : A sample of 318 patients with venous leg ulcers were recruited from hospital outpatient and community nursing leg ulcer clinics. Data were collected on socio-demographic variables, medical history, venous history, ulcer characteristics, symptoms and health-related quality of life. Exploratory factor analysis was used to identify symptom clusters. Generalized linear mixed models were utilised to determine their impact on healing and quality of life. Results : Nearly two-thirds (64%) of participants suffered with 4 or more symptoms, most frequently sleep disturbance (80%), pain (74%) and lower limb swelling (67%). Two symptom clusters were identified, a pain cluster and an inflammation cluster. Both clusters were significantly associated with decreased quality of life ($p < 0.01$), however, only the pain cluster was associated with delayed healing ($p = 0.003$). Conclusion : This study has explored the impact of symptom clusters on clinical and quality of life outcomes for patients with venous leg ulcers. This information may lead to more effective early interventions for patients with chronic leg ulcers. Keywords : symptom clusters, quality of life, leg ulcers

OP23 313-C-3

THE MEASUREMENT PROPERTIES OF THE DUTCH VERSION OF THE KEELE ASSESSMENT OF PARTICIPATION QUESTIONNAIRE IN OLDER ADULTS WITH JOINT PAIN AND COMORBIDITY

Lotte A.H. HERMSEN¹, Caroline B. TERWEE², Stephanie S. LEONE¹, Babette VAN DER ZWAARD¹, Joost DEKKER³, Martin SMALBRUGGE¹, Henriette E VAN DER HORST¹, Ross WILKIE⁴ (1. General Practice and Elderly Care Medicine and the EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 2. Epidemiology and Biostatistics and the EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 3. Rehabilitation Medicine and the EMGO Institute for Health and Care Research, VU University Medical Center, Netherlands; 4. Primary Care Sciences, Arthritis Research UK

Primary Care Centre, United Kingdom)

Introduction : The Keele Assessment of Participation (KAP) questionnaire measures person-perceived participation (restriction) in 11 aspects of life. Participation allows fulfilment of valued life activities and social roles, which are important to older adults. Since we aimed to use the KAP questionnaire in a larger Dutch cohort, we examined its measurement properties in a Dutch sample of older adults with joint pain and comorbidity. Method : The KAP was translated into Dutch and 3 items were modified. A cohort of Dutch older adults (≥ 65), with joint pain and comorbidity provided baseline data ($n=407$), follow-up data at 6 months ($n=364$) and test-retest data 2 weeks after 6 months ($n=122$) to measure: structural validity, internal consistency, reliability, construct validity and responsiveness. For the cross-cultural validity, comparable UK data were used ($n=404$). Results : Factor analysis revealed two domains: KAPd1 'participation in basic activities' (6 items; mobility inside home, mobility outside home, self-care, looking after belongings, looking after home, interpersonal interaction) and KAPd2 'participation in complex activities' (3 items; work, education and social activities), with Cronbach's alphas of 0.74 and 0.57 and Intraclass Correlation Coefficients of 0.63 and 0.57, respectively. Further analyses of KAPd1 showed poor construct validity and responsiveness. Despite the uniform DIF in item 'interpersonal relations', the total KAPd1 score seemed comparable between the Dutch and UK sample. Conclusion : Only KAPd1 'participation in basic activities' showed good internal consistency and sufficient reliability. Further work is required to understand the natural history of participation and how best to operationalize the concept 'participation' for measurement in (longitudinal) studies. Keywords : participation, elderly, quality of life

OP23 313-C-4

DEMENTIA-SPECIFIC CARE UNITS IN GERMAN NURSING HOMES: DO RESIDENTS HAVE A BETTER QUALITY OF LIFE THAN THOSE LIVING IN TRADITIONAL LIVING-UNITS?

Rebecca PALM, Kerstin KOHLER, Olga DORTMANN, Christian G. SCHWAB, Sabine BARTHOLOMEYCZIK, Bernhard HOLLE (Site Witten, German center for neurodegenerative diseases, Germany)

Introduction : Nursing homes have established dementia-specific care units (DSCU) to accommodate the special needs of residents with dementia, to encounter for challenging behaviors (CB) and to enhance their quality of life (QoL). Outcome evaluations of DSCUs are conflicting and results concerning the impact of the living concept on the QoL are sparse. The aim of this analysis is to investigate the influence of DSCUs on QoL in residents with dementia compared to traditional units. Method : The study had a cross-sectional design using a sample of 1671 residents from 47 German nursing homes. Nurses were trained to assess data for residents willing to participate. QoL was measured using the QUALIDEM, cognitive impairment was examined with the Dementia Screening Scale, and CB was assessed using the NPI-Q. Living concept was assessed using a dichotomous variable. Unbiased conditional inference trees were used to evaluate the relationship between single QUALIDEM-subcales and the independent variables. Differences between identified subgroups were analyzed with Mann-Whitney U Test. Results : Residents with severe dementia and severe CB were rated lower concerning the QUALIDEM subscale 'caregiver relationship' on DSCUs than on traditional living units. Residents with severe dementia and mild CB as well as with severe CB were rated better concerning the QUALIDEM subscale 'negative affects' on DSCUs. There were no significant differences

found for the group of residents with mild to moderate dementia. Conclusion : Taking the limitations into account, the results do not prove an evidence of a benefit for DSCUs. Keywords : quality of life dementia nursing home

OP23 313-C-5

HEART RATE VARIABILITY AND QUALITY OF HEALTH IN ELDERLY

Raden Irawati ISMAIL¹, Tendry SEPTA², Isa Multazam NOOR², Tri Budi W RAHARDJO³, Eva HOGERVORST⁴ (1. *Psychiatry, Center of Ageing Study, Universitas Indonesia, Indonesia*; 2. *Psychiatry, Faculty of Medicine, Universitas Indonesia, Indonesia*; 3. *Dentist, Center of Ageing Study, Indonesia*; 4. *Physiology, Loughborough University, United Kingdom*)

Introduction : Stress is a body reaction to physical and psychological condition that interfere with individual's equilibrium including the elderly. The equilibrium is affected by the quality of health and environment response. These conditions can cause distress. The aim of this research is to prove that Heart Rate Variability (HRV) can objectively assess inequilibrium or stress in conjunction to the quality of health dan environmental response in the elderly. Method : This research used cross-sectional design in integrated health care center (Posyandu) Jagakarsa, South Jakarta, September 2012. Sampling method being used is consecutive sampling. The subjects of research are elderlies who accepted invitation and came for a health examination. Stress was rated with Heart Rate Variability (HRV) within 5 minutes, health history, address and other demographic datas were collected using questionnaire. Results : Total respondents were 55 elderlies. HRV showed an inequilibrium in 12 respondents with 5 health problems, 8 respondents with 3 health problems, 5 respondents with 2 health problems. We found 15 respondents with 2 environmental problem and 8 respondents with 1 environmental problem. Conclusion : Heart Rate Variability in the elderly demonstrated inequilibrium associated with history of health and environmental problems in Posyandu for elderly with management of Puskesmas Jagakarsa, South Jakarta. Keywords : HRV, elderly, quality of health

ASSOCIATION BETWEEN BODY MASS INDEX AND SELF-RATED MENTAL HEALTH AMONG US OLDER ADULTS: DOES RACE/ETHNICITY MATTER?

Giyeon KIM¹, Patricia PARMELEE¹, Jamie DECOSTER², Ami BRYANT³, David CHIRIBOGA⁴ (1. *Center for Mental Health & Aging/Dept. of Psychology, University of Alabama, USA*; 2. *Center for Advanced Study of Teaching and Learning, University of Virginia, USA*; 3. *Psychology, University of Alabama, USA*; 4. *Child and Family Studies, University of South Florida, USA*)

Introduction : The present study examined racial/ethnic differences in the relation between body mass index (BMI) and self-rated mental health (SRMH) among community-dwelling older adults. Method : Drawn from the Collaborative Psychiatric Epidemiology Surveys, adults aged 60 or older from diverse racial/ethnic backgrounds were analyzed. Data were analyzed using chi-square tests, ANOVA, two-way ANOVA, and linear contrasts. Results : After controlling for covariates, there was a significant main effect of race/ethnicity ($p < .001$) on SRMH, but the main effect of BMI was not significant

($p = .362$). A significant interaction between BMI and race/ethnicity on SRMH was found ($p < .05$). The linear contrasts showed that Whites had a significant trend ($p = .02$) showing poorer SRMH with increases in BMI, whereas Blacks had a significant trend ($p = .04$) showing better SRMH with increases in BMI. The linear trends for Hispanics ($p = .10$) and Asians ($p = .76$) were not significant. Conclusion : Significant racial/ethnic differences existed in the relation between BMI and SRMH. Understanding the role of race/ethnicity as a moderator of the relation between BMI and mental health may help improve the treatment for older adults with unhealthy weights. Clinical implications are also discussed. Keywords : Body Mass Index; Self-Rated Mental Health; Race/Ethnicity, Self-Rated Mental Health, Race/Ethnicity.

OP23 314-S-2

ATTRIBUTIVE STYLES AND COGNITIVE FUNCTIONING IN AGING

Olga Y. STRIZHITSKAYA, Elena P. DAVEDYUK, Marina D. PETRASH (*Developmental and Differential Psychology, Saint Petersburg State University, Faculty of psychology, Russia*)

Introduction : Healthy, active and positive aging for the past few decades became a huge challenge for modern societies. There can be named quite a few factors, influencing these processes and subjective factors play here a significant role. Theoretical analysis showed that people, having different styles of information attribution could differ in terms of personal characteristics, that directed us to the idea that it could also effect cognitive functioning. In current study we approached this issue, trying to merge memory and attention, attributive styles and particular personality characteristics. Method : The sample used in this study were 42 participants, 25 women and 17 men aged 60-70, with no major health problems. Participants were divided into two groups according to their attribute styles: (1) positive; (2) negative. Attention was measured by 'Mixed Lines' test, Bourdon test. For a wider personality context we also used 'Subjectiveness test', Life Satisfaction Index, Lazarus coping-test. Results : Analysis showed that participants with positive attributive style differ in terms of attention characteristics. With due respect to limitations, related to a small size of a sample, significantly higher scores in several characteristics were revealed. Particular differences in personality characteristics among 'positive' and 'negative' participants were also discovered. Conclusion : Study revealed that subjective characteristics, such as the way we percept and process the information can effect not only social skills and personality, but also cognitive functions. With relevant future investigations, discovered results could be used to develop a new intervention program that could reduce cognitive impairment risks by dealing with attributive styles. Keywords : attributive styles, cognition, aging

OP23 314-S-3

A TIME-SAMPLING STUDY OF DAILY AFFECT IN THE OLDEST OLD: INTRAINDIVIDUAL VARIABILITY AND CORTISOL

Mary LUSZCZ¹, Helena CHUI¹, Christiane HOPPMANN², Denis GERSTORF³, Ruth WALKER⁴ (1. *Psychology, Flinders University, Australia*; 2. *Psychology, University of British Columbia, Canada*; 3. *Psychology, Humbolt University, Germany*; 4. *Public Health, Flinders University, Australia*)

Introduction : Intraindividual variability (IVV) is recognized as an increasingly important individual differences variable in adult development and ageing. Little is known about IIV in the oldest-old. Method : In a micro-longitudinal study, we examined IIV in everyday

positive (PA), negative (NA) affect and cortisol in a sample of the oldest-old (M age = 88.94, SD = 2.57), six times per day for seven days. Questions were: First, is IIV in affect a relatively stable individual difference? Second, does personality predict IIV in affect in the oldest-old? Third, do older men and women differ in IIV in affect? IIV in affect was assessed each day using the intraindividual standard deviation (ISD), yielding seven observations per participant for PA, NA and cortisol. Results : Results indicated substantial between- and within-person variability. The intraclass correlations were .46 and .36, respectively, for PA and NA and .63 for cortisol. Within-day IIV did not change across days for either positive or negative affect. This suggests that affective IIV is a relatively stable construct. Findings also show evidence of within-person coupling of IIV in PA and NA. For IIV in PA, IIV in NA was the only significant predictor. For NA, gender, daily NA level, and IIV in PA were significant predictors. In particular, women showed more daily variability in NA compared to men. Daily positive affect was negatively associated with daily cortisol AUC, but not daily negative affect. Conclusion : Considerable within person variability in emotion persists among the oldest-old, although fluctuations are independent of personality and mood. Keywords : oldest old, affect, intraindividual variability

OP23 314-S-4

A LONGITUDINAL COMPARISON OF DEPRESSION IN THE US AND ENGLAND

Stephen JIVRAJ, Bram VANHOUTTE, James NAZROO (*Centre for Census and Survey Research, University of Manchester, United Kingdom*)

Introduction : Depressive episodes are quite common in later life, and interrelated with stressful events in later life and conditions, such as cognitive impairment or chronic illness, that trigger similar symptoms. Since a lot of transitions occur when ageing, a longitudinal perspective, taking this dynamic into account, can inform us on the impact of these changes on the occurrence of depressive symptoms. Examining depressive symptoms in later life in the US and England, allows to investigate the relation between depressive symptoms and social factors, and how this relation is affected by the societal context. Method : A latent growth model, using 5 waves (2002, 2004, 2006, 2008, 2010) of the Health and Retirement Study (HRS) and the English Longitudinal Study on Ageing (ELSA) allows disentangling the effects of age and ageing, and examining the country context, on depressive symptoms using the 8 item Centre for Epidemiological Studies Depression scale (CES-D). Results : The largest country differences are reflected in the somatic aspects of depression, and less in mood symptoms. While mood symptoms seem to be more closely related to partnership status, somatic aspects of depression are more related to educational status and limits in daily activities. Country differences in the association between education, ethnicity, marital status and limits in daily activities with depression surfaced. Conclusion : Our study illustrates that it makes sense to distinguish somatic and mood aspects of depression in later life. Secondly, the country context matters both on the individual level and for social correlates of depression in later life. Keywords : depression comparative longitudinal

OP23 314-S-5

BRAZILIAN-PORTUGUESE VALIDATION OF THE AGING PERCEPTIONS QUESTIONNAIRE (APQ)

Laura Brenner MARIANO DA ROCHA¹, Marcelo Pio De Almeida FLECK², Newton Luiz TERRA¹ (*1. Institute of Geriatrics and Gerontology, IGG PUCRS, Brazil; 2. Psychiatry Department, UFRGS, Brazil*)

Introduction : Studies have shown that a more positive attitude or perception about aging is associated with both physical health benefits as emotional wellbeing. The APQ evaluates the self-perception of aging from eight different domains, seven of them involve opinions about their own aging while the eighth examines the experience of individuals with diseases and their relation to aging. Method : The validation was based on a crosssectional study of a random sample of 408 patients of both sexes over 60 years of age. Statistical analysis involved the Kolmogorov-Smirnov and Exploratory Factor Analysis (EFA) and the evaluation of basic assumptions by the Kaiser-Meyer-Olkin index and Bartlett's test of sphericity. The analysis of reliability and internal consistency was checked by Cronbach's alpha coefficient. Results : The Bartlett test of sphericity ($p < 0.0001$) and Kaiser-Meyer-Olkin (0.889) indicated the suitability of the data for the implementation of ERA, which detected the presence of 7 factors with eigenvalues above 1 explaining 57.3% of the variance. For the 29 items of the instrument commonalities proved superior to 0.500 achieving maximum 0.675. The analysis of reliability and internal consistency by Cronbach's alpha coefficient was equal to 0.884. The mean for the Identity score, was estimated at 43.6% (± 34.1), ie only 43.6% of the investigated believed that diseases present at the time of the study were due to aging. Conclusion : The APQ is a multidimensional instrument whose validation showed that the self-perception of aging is associated independently with psychological health and physical health and will help improve patients wellbeing and health outcome. Keywords : self perception aging health.

COGNITION AND AGING I

OP23 318-C-1

THE JOINT EFFECT OF PHYSICAL ACTIVITY AND BODY MASS INDEX AT MID-LIFE ON COGNITIVE FUNCTION IN LATE LIFE: AGE GENE/ENVIRONMENT SUSCEPTIBILITY - REYKJAVIK STUDY

Milan CHANG¹, Jane SACZYNSKI², Jon SNAEDAL³, Bjorn EIRNARSSON³, Sigurbjorn BJORNSSON³, Thor ASPELUND⁴, Maria K. JONSDOTTIR⁵, Vilundur GUDNASON⁴, Tamara B. HARRIS⁶, Lenore J. LAUNER⁶, Palmi V. JONSSON⁵ (*1. Geriatric Research Center, Landspítali University Hospital, University of Iceland, Dep. Sport Science, University of Reykjavik, Iceland; 2. Division of Geriatric Medicine and Meyers Primary Care Institute, University of Massachusetts Medical School, Worcester, USA; 3. Geriatric Research Center, Landspítali University Hospital, University of Iceland, Iceland; 4. Faculty of Medicine, University of Iceland, Icelandic Heart Association, Iceland; 5. Geriatric Department, Landspítali University Hospital, University of Iceland, Iceland; 6. Laboratory of Epidemiology, Demography and Biometry, National Institute on Aging, National Institute of Health, USA*)

Introduction : Physical activity (PA) and body mass index (BMI) are associated with cognitive function, however the long-term joint effect of mid-life PA and BMI on cognition has not been extensively examined among older population. We examined the joint effect of midlife PA and BMI on late-life cognition. Method : A population based cohort (born in 1907-1935) of men and women who participated in the Age, Gene/Environment Susceptibility - Reykjavik Study with an average of 26 years interval between midlife and late-life examinations. The four PA/BMI joint groups were defined as 1) No PA/overweight or obese (BMI ≥ 25), (NPAO, 34%), 2) No PA/normal BMI (18.5 < BMI < 24.9), (NPAN, 34%), 3) PA/ overweight/obese BMI (PAO, 15%), and 4) PA/normal BMI (PAN, 16%). Composite z-scores of speed of processing (SP), memory (MEM) and executive

function (EF) were created from a neuropsychological test battery. Results : Analyses were based on 4777 participants (women = 58%) after excluding dementia cases. Compared with NPAO group (reference), PAO and PAN groups had significantly faster SP (PAO, $\beta = 0.19$; PAN, $\beta = 0.25$, $p < 0.001$), higher MEM (PAO, $\beta = 0.14$; PAN, $\beta = 0.20$, $p < 0.001$) and EF (PAO, $\beta = 0.11$; PAN, $\beta = 0.12$, $p < 0.001$), after controlling for demographic, behavioral, cardiovascular factors and apolipoprotein E genotype. However, no significant difference was found with NPAN group. Conclusion : Being physically active at mid-life even in persons who were overweight or obese BMI contributed to better cognitive function 26 years later. Keywords : physical activity, BMI, cognitive function

OP23 318-C-2

GAIT VARIABILITY AT FAST-PACE WALKING SPEED: A BIOMARKER OF MILD COGNITIVE IMPAIRMENT?

Olivier BEAUCHET¹, Gilles ALLALI², Cyrille LAUNAY³, Francois R HERRMANN⁴, Cedric ANNWEILER¹ (1. *Neuroscience and Geriatrics, Angers University Hospital, France*; 2. *Neurology, Geneva University Hospitals, Switzerland*; 3. *Geriatrics, Angers University Hospitals, France*; 4. *Geriatrics, Geneva University Hospitals, Switzerland*)

Introduction : The interpretation of the increase in stride-to-stride variability of stride time (STV) regarding the evolution of cognitive deficits across the dementia spectrum is matter of debate. The aim of this study was to compare STV at usual and fast-pace walking speeds of MCI patients with that of cognitively healthy individuals (CHI) and Alzheimer's disease (AD) patients with mild dementia, while considering the effects of potential confounders. Method : STV while walking at usual and fast-pace walking speeds was recorded with the GAITRite® system from 116 older adults (mean age 75.6±6.5 years; 55.2% female) divided into 3 groups according to their cognitive status (44 CHI, 39 MCI patients and 33 AD patients with mild dementia). Results : The full adjusted multiple linear regression models showed that high STV was associated with slow gait speed at usual-pace walking speed ($P=0.002$) and with the MCI status at fast-pace walking speed ($P=0.015$). Conclusion : High STV at fast-pace walking speed was a specific gait disturbance of MCI patients in the sample of studied participants, and thus could be used in the future as a specific biomarker of MCI patients. Keywords : gait; gait variability; cognition; mild cognitive impairment; Alzheimer's disease; older adults.

OP23 318-C-3

WHICH COMBINATION OF POSTURAL PARAMETERS IS ASSOCIATED WITH FALLING IN OLDER ADULTS WHILE TAKING INTO ACCOUNT THE COGNITIVE DECLINE?

Jean-Baptiste MIGNARDOT¹, Olivier BEAUCHET², Cedric ANNWEILER², Thibault DESCHAMPS¹, Christophe CORNU¹ (1. *Laboratory 'Motricite, Interactions, Performance' (UPRES EA 4334), University of Nantes, France*; 2. *Department of Neuroscience, Division of Geriatric Medicine, UPRES EA 4638, UNAM, Angers University Hospital, Angers, France*)

Introduction : While it has been reported that cognitive decline leads to balance impairment, the cognitive decline-related changes in postural parameters associated with the occurrence of falls has been few studied in elderly. This study aimed to identify the combinations of postural parameters that were associated with falls in older adults while taking into account their cognitive status (i.e., Cognitive healthy individual [CHI]), with cognitive decline (i.e., Mild cognitive decline [MCI], mild and moderated dementia [MMD]). Method : Postural

variables using force platform were recorded in 620 older adults (mean age 77 ± 8 years; 51.8% women; 38% of fallers) divided into 3 groups according to their cognitive status (228 CHI, 140 MCI patients and 252 MMD patients). Using a principal components analysis, the most significant postural variables included in main eigenvectors were first submitted to one way ANOVA (between group comparisons). Then a logistic regression was performed to specify the association between the occurrence of falls (dependent variable) and baseline characteristics [age, depression, gender, drugs number, posture (n=6) including cognitive status (with CHI using as reference level)]. Results: The logistic model showed that falling risk was mainly associated with age ($p=0.0001$), depression ($p=0.007$) and Eyes Closed-Length in Function of Surface of postural oscillations ($p=0.015$). No significant impact of the cognitive status was observed. Conclusion : These findings confirmed the interest of postural parameters for assessing the falls risk in elderly. No effect of cognitive decline was reported in this sample of older adults, suggesting their low effect in term of falls risk compared to postural parameters. Keywords : Postural control, Mild cognitive decline, Risk of falling

OP23 318-C-4

VASCULAR LESIONS IN BRAIN AGING: TIME TO THINK LITTLE

Gabriel GOLD¹, Eniko KOVARI², Francois R. HERRMANN¹, Panteleimon GIANNAKOPOULOS², Constantin BOURAS² (1. *Internal Medicine, Geriatrics and Rehabilitation, Geneva Medical School and Geneva University Hospitals, Switzerland*; 2. *Psychiatry, Geneva Medical School and Geneva University Hospitals, Switzerland*)

Introduction : Cognitive consequences of large brain infarcts are well known. More recently, community-based autopsy studies in older people have demonstrated a high frequency of small and microscopic ischemic lesions in individuals with or without dementia. These include focal and diffuse gliosis, lacunes, cortical microinfarcts and demyelination. In order to determine the clinical impact of such small lesions on cognition, we performed several large clinicopathological studies in old and very old populations. Method : Cognitive status was assessed prospectively using the Clinical Dementia Rating (CDR) scale; neuropathological evaluation included Braak neurofibrillary tangle (NFT) and A β -protein deposition staging and bilateral semiquantitative assessment of microvascular ischemic pathology and lacunes; statistics included univariate and multiple regression models controlling for age. Results : In two studies totalling 127 cases with no or only minimal Alzheimer's disease (AD)-related NFT pathology, cortical microinfarcts were the strongest correlate of cognitive status, explaining more than one third of the clinical cognitive variability, followed by basal ganglia and thalamic lacunes. Another analysis of 156 mixed AD and vascular cases confirmed that microinfarcts were the most powerful correlate of dementia. Finally, in a study in the oldest-old (93 cases aged 90 to 103 years) with mixed AD and small vascular pathology, cortical microinfarcts proved to be the only vascular correlate of the presence of dementia. Conclusion : Small vascular lesions, particularly cortical microinfarcts are a major determinant of cognitive function in aging populations and represent an important new target for preventive and therapeutic interventions in vascular and mixed dementia. Keywords : microinfarcts, dementia, aging

OP23 318-C-5

BODY MASS INDEX OF 12,017 PATIENTS IN THE TIME OF DIFFERENT DEMENTIA DIAGNOSIS

Dorota RELIGA¹, Gerd FAXEN-IRVING², Helen GORANZON³,

Kristine WALLMAN³, Maria ERIKSDOTTER¹
(1. NVS/Geriatrics Clinic, Karolinska University Hospital/Karolinska Institutet, Sweden; 2. NVS, Karolinska Institutet, Sweden; 3. Department of Food, Nutrition and Dietetics, Uppsala University, Sweden)

Introduction : The study aimed to describe body mass index in the moment of diagnosis of dementia disorder based on data from SveDem, the Dementia Quality Registry in Sweden for the years 2007-2011. **Method :** Total 12,017 patients were included in analysis. SveDem is incidence-based dementia quality registry that aims to increase the quality of diagnosis, care and treatment of dementia patients in Sweden. **Results :** The mean BMI for all new diagnosed dementia patients was 24.6. Most patients was in the middle stage of dementia with MMSE of 21,2 and the mean age of 78.4. BMI did not differ significantly between dementia diagnoses, but was depended on age, gender and in smaller effect on cognition, measured by MMSE. **Conclusion :** In the time of diagnosis most of dementia patients had normal BMI of 24.6. However there is a large group with lower and higher BMI as normal. It will be important to follow BMI individually and try to prevent unwanted weight loss during dementia course. **Keywords :** body mass index, dementia, elderly

OP23 319-S **AGEING AND DISABILITY I**

OP23 319-S-1 **THE COMPRESSION OF MORBIDITY AMONG MEXICAN-ORIGIN ELDERLY IN THE UNITED STATES: SOCIAL AND POLITICAL IMPLICATIONS**

Angel JACQUELINE¹, Jacqueline ANGEL², Ronald ANGEL³, Terrence HILL⁴ (1. *Sociology and LBJ School of Public Affairs, University of Texas at Austin, USA*; 2. *LBJ School of Public Affairs, The University of Texas at Austin, USA*; 3. *Sociology, The University of Texas at Austin, USA*; 4. *Sociology, Florida State University, USA*)

Introduction : This study examines trajectory classes of physical mobility among 3,050 older Mexican-origin individuals employing a unique and important longitudinal data set, the Hispanic Established Epidemiologic Studies of the Elderly (H-EPESE). Our objective is both to characterize the morbidity trajectory and mortality experience of the original cohort over a 17 year period, and to identify those factors accounting for differences in performance-oriented mobility assessments trajectories, such as sex, immigration status, education, income, living arrangements, social support network, and other established risk factors in the modeling process. **Method :** The H-EPESE is a benchmark study includes the original cohort of 3,050, aged 65 and older who were re-interviewed in their home in 1995-96, 1997-98, 2000-2001, 2004-2005, and 2006-08, and 2010 for a total of seven observation waves. Re-contacting our respondents gave us the opportunity to study the needs and characteristics of a large number of oldest old Mexican Americans. Moreover, on approximately half of our subjects we have information from multiple contacts going back to 1993-1994. On the other half we now have information from 2004-2010 when they were added to the study. **Results :** Growth mixture models are used to estimate the POMA trajectory classes. We then use these trajectories to predict subsequently mortality. Implications of the compression of morbidity for the health and economic well-being of older Mexican Americans are discussed. Preliminary analyses reveal that older Mexican Americans exhibit unique classes of POMA trajectories. **Conclusion :** Implications of the compression of morbidity theory for the health and economic well-being of older Mexican Americans are discussed. **Keywords :** compression of morbidity,

minority aging, physical performance, demography of aging, aging and diversity, performance-oriented mobility

OP23 319-S-2 **FOLLOWING IN YOUR FOOTSTEPS: DEVELOPING A NOVEL METHODOLOGY TO EXAMINE MOBILITY AND THE BUILT ENVIRONMENT WITH COMMUNITY-DWELLING OLDER ADULTS**

Catherine TONG, Joanie SIMS-GOULD, Suman AULUCK, Callista HAGGIS, Anna CHUDYK, Meghan WINTERS, Maureen ASHE, Heather MCKAY (Centre for Hip Health and Mobility, University of British Columbia, Canada)

Introduction : Mobility impacts the health and wellbeing of an older person, and there are significant associations between mobility and the built environment. In qualitative studies of older adults' mobility, data have typically been gathered through interviews or focus groups. We sought to develop and test a "mobile methodology" that would allow us to more comprehensively understand how older adults experience their mobility in the local environment. Our mobile methodology coupled seated interviews with walks, in which participants led us through their neighbourhood. **Method :** We conducted in-depth, seated interviews with 27 community-dwelling older adults in an urban region of British Columbia, Canada. Twenty of these participants elected to undertake a walking interview. Walking interviews averaged 20 minutes (Range 10-60). Each walk included an interviewer and a note-taker, both of whom completed observational memos afterwards. **Results :** There was high concordance between what we heard in the seated interview, and what we observed on the walk. Extending what we heard in the seated interviews, walking interviews provided insight about: how features of the natural environment encourage mobility; the strategies that older adults employ to overcome challenges in the built environment; and the unique and unexpected routes and shortcuts that they use. **Conclusion :** Walking interviews elicited data that were sometimes not discussed or observed while sitting indoors. This is a strong observational tool, allowing researchers to see, not just hear, what participants do, where they go, and the challenges they face. Best practices for conducting walking interviews with older adults will also be discussed. **Keywords :** mobility; built environment; qualitative methods

OP23 319-S-3 **THE CHRONIC-DEGENERATIVE DISEASES AS A FACTOR OF ELDERLY SOCIAL EXCLUSION**

Zaida Aguiar Sa AZEREDO¹, Pornchai JULLAMAT²
(1. *UNIFAI, Portugal*; 2. *Nursing school of Burapha, University of Burapha, Thailand*)

Introduction : The world population becomes older and older. Although people can live with chronic diseases longer than before, we have an increase of co-morbidity and its complications. To think how society copes with this is important, special for health professionals and decision makers. **Method :** Based on a literature review and their own experiences the Authors make a reflexion, taking into account their own culture. They reflect about the impact of a high prevalence of chronic diseases in a society and how this society can improve the care of the patients trying to maintain their inclusion. **Results :** The chronic degenerative diseases can be an important factor for elderly social exclusion. The mental disorders are even more important. Most of the societies are not yet prepared to cope with a high prevalence of chronic-degenerative diseases and this is one of the reasons for excluding. Other reasons can be: economics, changes in the family structure and how the patient accept the disease. **Conclusion :**

The Authors after reflecting about this problem, they mention some strategies that society can use to maintain the patient and carer inclusion. The intergeneration communication is one of the strategies. Keywords : elderly, chronic diseases, social exclusion

OP23 319-S-4
ASSESSING THE HEALTH STATE/DISABILITY SCORE OF THE ELDERLY IN SUB-SAHARAN AFRICA: AN ANALYSIS USING THE FRONTIER METHOD

Ousmane FAYE (*Population, Consortium pour la Recherche Economique et Sociale (CRES), Senegal*)

Introduction : This paper uses a parametric stochastic frontier approach (coming from the economic literature) to explore the impact of the occupational activities and the living conditions in the slums on the health performance among the adult population aged 50 and up. Method : We measure the health performance using the disability scores from the WHO. In our estimation strategy, we first consider the WHODAS II - 12 items score and thereafter simultaneously analyze several dimensions of health state description (cognitive, mobility, pain and discomfort, sleep and affect, etc.). We use individual data from the WHO's Study on Global AGEing and Adult Health (SAGE) in partnership with the INDEPTH network. Results : The SAGE-INDEPTH survey provides longitudinal data on ageing in various Demographic surveillance sites (DSS) in South Africa, Kenya, Tanzania, and Ghana. This survey collects information on the older persons' health profiles, economic activities, cares and supports provided and received, and a broad range of self-reported assessments of health and well-being. Conclusion : This study explores the relationship between health score among older persons and occupational activities, defined in a broad sense (i.e., including professional, leisure, physical, and other activities), accounting the influence of age and educational attainment, as well as factors related to social and economic status. Keywords : Ageing , Disability, Africa

OP23 319-S-5
OPIOID USE AND HEALTH IN OLDER WOMEN FROM THE AUSTRALIAN LONGITUDINAL STUDY ON WOMEN'S HEALTH

Lynne PARKINSON¹, Samuel Louis BRILLEMANN², Julie Ellen BYLES² (*1. Health CRN, CQ University, Australia; 2. Research Centre for Gender, Health and Ageing, University of Newcastle, Australia*)

Introduction : Opioids have a well-recognised place in the treatment of persistent pain, however, they are associated with significant adverse events, including death. The broad aim of this project was to investigate the factors associated with opioid use over time for a cohort of women aged 76-81 in 2002. Method : Data for this project include Australian Longitudinal Study on Women's Health survey and linked Pharmaceutical Benefits Scheme (2002-2010) datasets. Results : An increasing percentage of older women were using opioids over time, from around 8% in 2002 to over 16% in 2010, predominantly due to increases in prescription of oxycodone and buprenorphine. Although the percentage of older women being prescribed codeine and tramadol did not markedly increase between 2002 and 2010, the quantities prescribed to women in this cohort using these medicines increased significantly. Opioid users tended to have high medicine burden from other potent medicines, and therefore an increased risk for adverse events, compared to those not using opioids. Opioid use was associated with poorer physical functioning and greater levels of bodily pain, poorer mental health and more falls when compared to women not using opioids. Conclusion : While the greater increase in

the quantities prescribed over this period may reflect the relatively greater impact ageing has on pain, it may also reflect increases in the accepted norm of prescribing quantity. The clinical challenge for providers is to consider broader pain management options, and exercise more caution in opioid prescription, particularly to individuals at increased risk for adverse effects. Keywords : opioids, women, community

NURSING HOME & LONG-TERM CARE

OP23 320-R-1
INVESTIGATING THE DECISION MAKING PROCESSES NURSES' USE IN THE MANAGEMENT OF PSYCHOTROPIC MEDICATIONS AS CHEMICAL RESTRAINTS IN NURSING HOMES

Lisa CLINNICK (*Nursing, Hepburn Health Service, Australia*)

Introduction : The prevalence of psychotropic medications use in aged care has been extensively researched over the past 20 years and controversial findings have consistently been reported (Snowdon, J., S. Day, et al. 2006; Westbury, Beld et al. 2010), however little research has been conducted on the nurses' role in administering psychotropic medications in aged care. The aim of this study is to gain an understanding of why nurses administer psychotropic medication as chemical restraints and what factors may be influencing their decisions. Method : Grounded Theory Method was used for analysing the data. From the analysis of the data a theory was developed that was grounded in the participants' experiences Research Setting Two nursing homes sites were chosen for the data collection process. One nursing home was regarded highly for the care provided to the residents and had passed all accreditation standards. The second nursing home had failed aged care accreditation. Procedures: in depth interviews; participant observation; field notes and documentation review. Data Analysis: data was analysed using the grounded theory method of coding, and constant comparative analysis. Results : Three major categories were identified that described what influenced the nurses' decision to administer a psychotropic medication; these included customs; knowledge and relationships. Conclusion : Nurses undertake a central role in the administration of medications and the decision making process regarding the use of psychotropic medications in aged care. This study has identified key areas that can be targeted which may result in better use of these medications and improve the care outcomes for aged care residents. Keywords : chemical restraint; residential care; psychotropic medication

OP23 320-R-2
AN EVALUATION FRAMEWORK FOR END OF LIFE CARE INTERVENTIONS FOR PEOPLE WITH DEMENTIA IN LONG TERM CARE

Claire GOODMAN, Sarah AMADOR, Elspeth MATHIE (*Centre for Research in Primary and Community Care, University of Hertfordshire, United Kingdom*)

Introduction : End-of-life trajectories of older people with dementia (OPWD) are often unclear. Despite the increasing uptake of dementia specific end of life care resources, more needs to be known about how the organisation of care influences outcomes . This paper reports on a longitudinal study that described the different trajectories to death and how different contexts and models of care influence residents' experience of end of life care. Method : Data were extracted from the 133 residents' care home notes at three time points over a year, and reviewed post-death. Analysis included resource use and, symptom

management, and place of death. Interviews with care home staff, visiting clinicians and where possible residents and relatives focused on how participants' role and involvement in end of life care for people with dementia. Results : 20% of the 133 residents died. End of life for OPWD was characterised by uncertainty in three key overlapping areas of care : Relational uncertainty between family members, residents, care home staff and visiting clinicians in how roles and relationships were negotiated and agreed, Pathway or prognostic uncertainty about whether the person was dying or not and service uncertainty that related to the ability of services and individuals to provide resources that could sustain care in the care home. Conclusion: Interventions designed to provide end of life for people with dementia of needs rightly focus on symptom management. There is however, a need to consider how the inherent uncertainty associated with dying from or with dementia is addressed. The study findings provide an evaluation framework to judge effectiveness of end of life care interventions for people with dementia in long term care settings. Keywords : dementia, end-of-life care, frailty

**OP23 320-R-3
NEW USERS OF ANTIPSYCHOTIC MEDICATIONS AMONG
RECENTLY ADMITTED LONG-TERM CARE RESIDENTS**

Andrea D FOEBEL¹, Nathalie WELLENS², Anna BALLOKOVA³, Daniela FIALOVA⁴, John P HIRDES¹ (1. School of Public Health and Health Systems, University of Waterloo, Canada; 2. Public Health, Centre for Health Services and Nursing Research, KU Leuven, Belgium; 3. Faculty of Pharmacy, Charles University, Czech; 4. Department of Geriatrics and Gerontology, Faculty of Pharmacy, Charles University, Czech)

Introduction : Many long-term care quality indicators recommend that the use of antipsychotic (AP) medications be avoided for individuals without documented psychiatric conditions. These medications continue to be used frequently in long-term care (LTC) settings, regardless of such warnings. Whether the transition into LTC settings is associated with new AP use is not well studied. Method : This study used interRAI Minimum Data Set data from the Canadian province of Ontario to study new users of AP among residents admitted to LTC in the past 3 months. Using this comprehensive data source, characteristics of new users were described and multivariate logistic regression analysis identified factors associated with new AP use. Results : In total, 69,139 individuals without a clear psychiatric indication for AP (mean age 82 years, 66% female) were newly admitted to LTC. Among them, 6% (n=3724) were new users of AP medications by their first follow-up assessment (85±15 days after admission). Factors found to be significantly associated with new use were: age less than 65 years (OR=1.47), female gender (OR=0.84), presence of behavioural issues (OR=1.96), delusions (OR=1.72), motor agitation (OR=1.25), dementia (OR=2.01), long-term memory problems (OR=1.26), functional independence (OR=1.11), conflicts with staff (OR=1.26) and roommates (OR=1.38), and reduced social engagement (OR=1.38). Conclusion : Both clinical and social factors were identified to be associated with new use of AP in a particularly vulnerable group of individuals, those who are newly admitted to institutional care. This work can help inform professional practice to reduce potentially inappropriate AP use at this time of transition. Keywords : Anti-psychoactive medications, long-term care

**OP23 320-R-4
THE INFLUENCE OF INSTITUTIONAL TEXTS ON THE
PROVISION OF PERSON-CENTRED CARE IN LONG-TERM
CARE SETTINGS**

Sienna CASPAR¹, Pamela RATNER², Alison PHINNEY² (1. ISGP,

University of British Columbia, Canada; 2. School of Nursing, University of British Columbia, Canada)

Introduction : The movement away from task-oriented care toward the consistent provision of person-centred care (i.e., care based on residents' needs and preferences) is widely recognized as the goal of long-term care (LTC) providers' culture change movement. The purpose of this study was to explore why the attainment of this goal has remained elusive for many LTC facilities, despite significant effort to alter practice. Method : We conducted an institutional ethnography to explore the textually-mediated work processes that influence the day-to-day work practices of front-line care staff in LTC settings. The social organization of LTC facilities was explored through the observation of care aides' practices and the interaction of those practices with institutional texts. Results : We found that, although they provided 80% of the care to residents, in all sites studied, care aides lacked practicable access to the institutional texts that contained important information relevant to the residents' care needs and preferences (e.g., assessments, care plans, social histories). The care aides primarily received and shared information orally, a process that was largely dependent upon the quality of their working relationships with one another and especially with management. Conclusion : Access to detailed knowledge of residents' needs and preferences is fundamental to the provision of person-centred care. The transfer of this knowledge to and between front-line care staff is dependent upon the quality of the relationships managers develop with and among care aides. Initiatives aimed at building positive and supportive work teams are essential to the attainment of the goal of person-centred care. Keywords : person-centred care; long-term care; institutional ethnography

**OP23 321-C
DEMENTIA I**

**OP23 321-C-1
TWO-TIER CLINICAL UTILITY OF THE CANTONESE
VERSION OF ADDENBROOKE'S COGNITIVE
EXAMINATION-REVISITED (C-ACER) IN DEMENTIA
ASSESSMENT**

Ray CHAN¹, Louise WONG², Jess LEUNG², Cho Yiu YUNG¹, Elaine CHENG¹ (1. Medicine & Geriatrics, United Christian Hospital, Hong Kong; 2. Psychiatry, United Christian Hospital, Hong Kong)

Introduction : Effective dementia management starts with timely recognition at the primary care and judicious confirmation at specialist level. However, this approach is compromised in our locality for lack of sensitive and handy screening tool and insufficient contact time at the clinics. Method : This is a two-phase study aiming at assessing the clinical utility of the C-ACER as a handy and useful tool for both screening and diagnostic purposes. The first (screening) phase 147 subjects (44 normal, 48 MCI, 55 dementia) were examined. C-ACER was validated against an expert diagnosis according to DSM-IV criteria for dementia and Petersen's criteria for MCI. Statistical analysis was performed using the receiver operating characteristic method and regression analyses. The second (diagnostic) phase is currently on-going to validate the five sub-domains of C-ACER against a semi-structured mental status examination. Results : The optimal cut-off score for the C-ACER to differentiate MCI from normal was 79/80 with sensitivity of 0.74, specificity of 0.84 and area under curve (AUC) of 0.84. At the optimal cut-off of 73/74, C-ACER had satisfactory sensitivity (0.93), specificity (0.95) and AUC (0.98) to identify dementia from normal. Performance of C-ACER was not affected by age and education level. Sub-domain analyses revealed

significant differences between the three groups on all except visuospatial ability subset ($p < 0.01$). Conclusion : C-ACER is a sensitive and specific bedside screening test to assess a broad spectrum of cognitive abilities, and to detect MCI and dementia of different severity. The promising empirical results of sub-domain analyses may indicate its further usefulness as a handy diagnostic tool. Keywords : C-ACER, Screening, Diagnosis

OP23 321-C-2

A NEW SIMPLE SCORE (ABS) FOR SCREENING BEHAVIORAL AND PSYCHOLOGICAL SYMPTOMS OF DEMENTIA

Koji ABE, Tomoko KURATA, Yumiko NAKANO, Kota SATO, Kosuke MATSUZONO, Yoshio IKEDA (*Neurology, Okayama University, Japan*)

Introduction : Dementia is an emerging problem not only in developed countries but also in many developing countries. In addition to cognitive impairment, behavioral and psychological symptoms of dementia (BPSD) are another important aspect of most dementia patients. Method : In the present study, a new BPSD score for dementia (ABS, Abe's BPSD score) is newly created based on the current status of BPSD in Japan, in which each BPSD item has a score already allotted with a different maximum score based on the frequency and severity of each of 10 BPSD items finalized with taking temporal occurrences into account. Results : This ABS is filled by main caregiver with full score of 44, takes only 46.5 ± 16.2 sec ($n=136$) to complete, but is still well correlated to a standard-detailed BPSD score neuropsychiatric inventory (NPI), tends to correlate with MMSE, and is sensitive to evaluate a change of BPSD after a drug therapy with ChEI for Alzheimer's disease (AD) in a baseline severity-dependent manner. Conclusion : Because ABS is good for mild to moderate AD and other types of dementia, ABS provides a simple and quick screening test for BPSD and thus be useful for evaluating BPSD in daily neurological dementia clinics or even in general medicine clinics. Keywords : dementia, BPSD, AD

OP23 321-C-3

LIVED EXPERIENCE OF MEDIA PRESENTATION FOR THE ALLEVIATION OF ANXIETY, AGITATION AND EMOTIONAL DISTRESS AMONG DEMENTIA PATIENTS IN NURSING HOME

Joohyun CHUNG¹, Seong-in CHOI², Jun KIM³ (*1. Department of Nursing, Utah Valley University, USA; 2. Psychology Department, Westminster College, USA; 3. Park Recreation Tourism Department, University of Utah, USA*)

Introduction : One's environment can offer support for cognitive impairment and emotional stability. Due to social environmental barriers such as policy, risk, health, safety, and staffing issues, it was not easy for dementia patients to connect with natural elements. The aim of this study was to explore dementia patients' experience of media presentation using natural scenes for the alleviation of anxiety, agitation and emotional distress. Method : Combining a phenomenological approach with quantitative data analysis were used to explore the meaning of experience with natural elements for dementia patients in nursing home. 28 Participants were exposed to fascinating natural scenes in a recreation room for 7-10 minutes once a day, three days a week, for two weeks. The patients' feelings and lived experiences with media presentation were investigated using semi-structured interviews with probing questions with 28 patients. Also daily chart review was used to count their weekly behavioral changes related to anxiety, agitation and emotional distress. Both Nvivo and

SPSS were used for data analysis. Results : The participants explained their experiences of media presentation using natural scenes as something make them happy, peaceful, calm, and the remind their youth/life. Quantitative data analysis supported that the number of hitting other residents ($p=.04$) and agitation ($p=.03$) were statistically significant different changes over the time. Conclusion : Understanding the phenomenon of "experience with watching natural for dementia patients" seems to influence a calming for them and to provide a feeling of relaxation and a sense of tranquility. It could provide valuable insight into the care of people with dementia. Keywords : dementia media presentation

OP23 321-C-4

PROFILE OF OLDER ADULTS IN MEMORY OUTPATIENT CLINIC SETTING AND APPLICATION OF NOVEL OCCUPATIONAL THERAPY TECHNIQUE IN PATIENTS WITH MILD TO MODERATE DEMENTIA

Prakash KUMAR¹, S.C. TIWARI², V. SREENIVAS³, Nand KUMAR¹, R.K. TRIPATHI², Prasun CHATTERJEE¹, A.B. DEY¹ (*1. Department of Geriatric Medicine, All India Institute of Medical Sciences, India; 2. Department of Geriatric Mental Health, King George's Medical University, India; 3. Department of Biostatistics, All India institute of Medical Sciences, India*)

Introduction : The prevalence of dementia in India is increasing rapidly with researchers and clinicians are working hard to prevent this disease and complications, but no definite remedy is available now. With drug therapy, occupational therapy (OT) may have some role at least in maintaining quality of life of patients having mild to moderate dementia. Method : 155 older subjects (new-95, old-60) in Memory clinic at AIIMS, New Delhi, India were included between June 2011-June 2012. After screened by a geriatrician, 99 were excluded [cognitive impairment with no dementia (CIND)], 56 patients were included (DSM IV criteria) and randomly assigned into experimental group received newly developed OT program along with the drug, control groups received only drug for a period of 5 weeks. Both groups were evaluated using a) Folstein MMSE, b) Geriatric Depression scale, c) Bristol ADL, d) Modified Physical Performance test, e) BEHAV-AD, f) WHO QOL for baseline and reassess after 5 weeks. Results : Mean age 68.16 having primary education (59.3%), up to class 12 (22.61 %), living with spouse (66.27%), living with spouse and family (24.40%), and married (72.09%), widowed (22.09%), unemployed (26.74%), retired (53.48 %). After application of novel OT experimental group show statistically improvement in domain of Depression ($p=0.044$), ADL ($p=0.031$), Physical performance ($p=0.042$), and quality of life ($p=0.043$), but within the Control group there is no significant difference in any of the six domains. Conclusion: The study reveals that the newly developed OT programme can improve behavioural status, ADL and quality of life domain in elderly dementia patients. Keywords : Dementia, Occupational Therapy

THE MEDICAL FOOD SOUVENAIID IMPROVES MEMORY PERFORMANCE AND PRESERVES FUNCTIONAL CONNECTIVITY IN MILD ALZHEIMER'S DISEASE

Philip SCHELTENS¹, Cees STAM², R. SHAH³, D. BENNETT³, Rico WIEGERS⁴, T. HARTMANN⁵, H. SOININEN⁶, Marcel OLDE RIKKERT⁷, Patrick KAMPHUIS⁴ (*1. Department of Neurology and Alzheimer Center, VU University Medical Center, Netherlands; 2. Department of Clinical Neurophysiology, VU University Medical Center, Netherlands; 3. Rush Alzheimer's Disease Center, Rush University Medical Center, USA; 4. Nutricia Advanced Medical*

Nutrition, Danone Research Centre for Specialised Nutrition, Netherlands; 5. Deutsches Institut für Demenz Prävention (DIDP), Neurodegeneration and Neurobiology, Experimental Neurology, Germany; 6. Department of Neurology, University of Eastern Finland and Kuopio University Hospital, Finland; 7. Radboud Alzheimer Centre, Dept Geriatric, Radboud University Hospital, Netherlands)

Introduction : In early Alzheimer's disease (AD), memory dysfunction is a key manifestation and thought to be associated with reduced synaptic contacts. Souvenaid® is a medical food, containing the nutrient combination Fortasyn™ Connect1, designed to improve synapse formation and function in AD. The nutrients in Fortasyn Connect are precursors and cofactors for the formation of neuronal membranes, and increasing their intake can promote the synthesis of new synapses. **Method :** The efficacy of Souvenaid is evaluated in the global clinical development program. **Results :** Two multi-country RCTs of 12- and 24-week duration demonstrated that Souvenaid improved memory performance in drug-naïve mild AD patients ('Souvenir I' and 'Souvenir II'). The 24-week open-label extension following Souvenir II showed a significant further improvement of the exploratory memory outcome and that Souvenaid was well-tolerated (compliance ≥95%) throughout 48 weeks. The S-Connect RCT did not show an effect on cognition in mild to moderate AD patients using AD medication. Electroencephalography (EEG) measures were included in Souvenir II2 to study neuronal activity and thus indirectly synaptic activity. Significant EEG differences suggest that Souvenaid preserves functional connectivity and brain network organization in mild AD, supporting the hypothesis of changed synaptic activity. **Conclusion :** These results suggest that Souvenaid might be most efficacious in early AD and warrant long-term trials in the very early AD process, like the currently ongoing 24-month LipiDiDiet study3 in prodromal AD. Main and recent findings will be presented. 1Souvenaid and Fortasyn are N.V. Nutricia trademarks. 2Partly funded by NL FND project N°10003. 3Funded by the EU FP7 project LipiDiDiet, Grant Agreement N°211696. **Keywords :** Alzheimer, clinical trial, nutrition

OP23 322-C **GERIATRIC ASSESSMENT I**

OP23 322-C-1 **INCIDENT ISCHAEMIC HEART DISEASE IN PERSONS WITH ALZHEIMER'S DISEASE IN A FINNISH NATIONWIDE EXPOSURE-MATCHED COHORT**

Anna-maija TOLPPANEN¹, Raimo KETTUNEN², Riitta AHONEN³, Hilikka SOININEN⁴, Sirpa HARTIKAINEN⁵ (1. Institute of Clinical Medicine/Neurology, University of Eastern Finland, Finland; 2. School of Medicine, University of Eastern Finland, Finland; 3. School of Pharmacy, Social Pharmacy, University of Eastern Finland, Finland; 4. Institute of Clinical Medicine/Neurology, University of Eastern Finland and Department of Neurology, Kuopio University Hospital, Finland; 5. Kuopio Research Centre of Geriatric Care and Pharmacology and Geriatric Pharmacotherapy Unit, University of Eastern Finland, Finland)

Introduction : Cardiovascular diseases are associated with Alzheimer's disease (AD), but the incidence of cardiovascular disease after AD has been studied less. We assessed whether persons with AD had more incident ischaemic heart disease (IHD). **Method :** We conducted an exposure-matched cohort study including all 28093 community-dwelling individuals with clinically verified diagnosis of AD, residing in Finland and alive on December 31, 2005. Participants were identified from the National Prescription and Special Reimbursement Registers. One matched comparison person was identified for each

participant with AD. We assessed the associations between AD and any IHD event (diagnosed IHD/revascularisation procedure), diagnosed IHD (myocardial infarctions and other IHD), and revascularisation procedure (angioplasty or bypass). Information on outcomes was extracted from the National Hospital Discharge Register. Analyses were restricted to incident events during 2006-2009 and 25325 AD-comparison person pairs were included in the analysis after excluding events occurring in 2002-2005. **Results :** People with AD were more likely to have incident IHD diagnosis than AD-free comparison persons (adjusted HR, 95% CI 1.16, 1.06-1.28) but less likely to undergo revascularisation procedures (0.12, 0.08-0.20). There were no differences in all incident IHD events (0.95, 0.87-1.04). **Conclusion :** Persons with AD had a higher risk of incident ischaemic heart disease when comorbidities and cardiovascular medication were taken into account, but they were less likely to undergo revascularisation procedures. This was not entirely explained by contraindications. We acknowledge the need for more detailed studies assessing whether this reflects undertreatment of cardiac problems among persons with AD. **Keywords :** Alzheimer's disease, cohort studies, cardiovascular

OP23 322-C-2 **EXPLORATION OF VARIATION IN VULNERABILITY ASSESSMENT OF OLDER PEOPLE BY INDIVIDUAL GENERAL PRACTITIONERS**

Yvonne M. DREWES¹, Jeanet W. BLOM¹, Willem J. ASSENDELFT¹, Theo STIJNEN², Wendy P. DEN ELZEN¹, Jacobijn GUSSEKLOO¹ (1. Public Health and Primary Care, Leiden University Medical Center, Netherlands; 2. Medical Statistics and Bioinformatics, Leiden University Medical Center, Netherlands)

Introduction : Although there are many definitions of vulnerability, GPs appeared to have an own internalized concept. The aim of our study is to investigate the variation in vulnerability concepts between GPs. **Method :** Seventy-seven GPs of the ISCOPE study, a prospective randomized controlled trial in general practices, categorized their 75-plus patients (n=11,392) in non-vulnerable, possible vulnerable and vulnerable patients. We collected personal and practice characteristics of the GPs and socio-demographic, medical, psychological, functional and social patient characteristics of 2828 patients. We tested the variance in GP's vulnerability assessments with mixed effects logistic regression. **Results :** GPs assessed vulnerability of 10,653 (93.5%) 75-plus patients. The median percentage 75-plus patients assessed as vulnerable was 32.0% (IQR 19.5-40.1%, range 2.4 - 81.0%). This variation is not only due to differences in patient population, of GPs but also depends on the weight GPs attribute to patient characteristics in the vulnerability assessment. GPs equally take into account medical patient characteristics (number of diseases, polypharmacy). We found heterogeneity in their weight on functional status (IADL median OR 2.8 (90% range 2.1-3.7), BADL median OR 2.4 (90% range 1.4-4.3) and residential status (median OR 2.7 (90% range 1.5-4.7)). **Conclusion:** The variation in vulnerability assessments by GPs is related to patient characteristics. GPs share a unique perspective on what defines vulnerability in the medical domain, but are heterogeneous in the weight on functional status. **Keywords :** vulnerability, general practice, assessment

OP23 322-C-3 **MOBILE GERIATRIC TEAM AND LENGTH OF HOSPITAL STAY AMONG OLDER INPATIENTS: A CASE-CONTROL PILOT STUDY**

Cyrille LAUNAY¹, Laure DE DECKER², Raphaelle HUREAUX-HUYNH¹, Cedric ANNWEILER³, Olivier BEAUCHET³

(1. Geriatrics, Angers University Hospital, France; 2. Geriatrics, Nantes University Hospital, France; 3. Neuroscience and Geriatrics, Angers University Hospital, France)

Introduction : The aim of this study was to determine whether the mobile geriatric team (MGT) intervention was associated with shorter length of hospital stay (LHS) amongst older adults admitted in Emergency Departments (ED) and discharged to acute care units. **Method :** Between March 15th and April 4th 2011, 43 inpatients (mean age 84.2±5.0 years, 62.5% women) who benefited from MGT intervention and 130 hospitalized controls without GMT intervention (mean age 84.9±5.5, 67.7% women) were prospectively included in this case-control study. The length of stay was calculated using the administrative registry of Angers University Hospital and corresponded to the delay in days between the first day of admission to ED and the last day of hospitalization in an acute care unit. **Results :** There were no significant differences between cases and controls participants regarding baseline characteristics. Inpatients who benefited from MGT intervention had a shorter LHS than controls (12.6±8.5 versus 18.8±10.7 days, P=0.001). Univariate and multiple linear regressions showed that MGT intervention was associated with shorter LHS (P=0.001 and P<0.001, respectively). MGT intervention was associated in our study with a reduction of LHS of about 6 days (i.e., approximately 33% of total LHS). **Conclusion :** MGT intervention was associated with shorter LHS amongst older adults admitted in Emergency Departments (ED) and discharged to acute care units. **Keywords :** geriatric assessment; mobile geriatric team; emergency; length of hospital stay; older adults

OP23 322-C-4

WHICH COMORBIDITY INDEX SHOULD BE USED WHEN ASSESSING MORTALITY?

Nicolas MARTINEZ-VELILLA¹, Berta IBANEZ-BEROIZ², Koldo CAMBRA-CONTIN², Javier ALONSO-RENEO³ (1. Geriatric Department, Complejo Hospitalario de Navarra, Spain; 2. Centro de Investigacion Biomedica, Fundacion Miguel Servet, Spain; 3. Servicio de Geriatria, Complejo Hospitalario de Navarra-A, Spain)

Introduction : There are several indices for the prediction of mortality of older hospitalized adults after discharge. Although these indices have been developed with high-risk patients, their use has not been incorporated into daily practice. The goal of this prospective study was to compare the performance of 7 comorbidity indices for the prediction of early and late mortality and to assess if the most used index (Charlson Index) is appropriate for older hospitalized patients. **Method:** We carried out a prospective study in a tertiary teaching hospital, in relation to 122 patients admitted to the Geriatric Department. After a comprehensive geriatric evaluation, 7 comorbidity indices were developed for every patient: Charlson Index (CI), Cumulative Illness Rating Scale-Geriatric (CIRS-G), Geriatric Index of Comorbidity (GIC), Number of Diagnosis (ND), Burden of Illness Score for Elderly Persons (BISEP), Index of Disease Severity (IDS) and Prognostic index for 1-year mortality (PI). The area under the receiver operator characteristic (ROC) curve was used to assess predictive power. **Results :** The prognostic ability of each index determines a pattern for early and late mortality. After one year, BISEP and GIC indices performed better (ROC 0.686 and 0.699), but at after 5 years BISEP and PI were the best (ROC 0.729 and 0.724). When age, cognitive impairment and Barthel index were considered as prognostic factors alone, the ROC was 0.80. **Conclusion :** The main prognostic factors for mortality are age, cognitive impairment and Barthel index. The best comorbidity index at one year are BISEP and GIC, and at five years BISEP and PI. **Keywords :** comorbidity scores,

mortality, multimorbidity

COMPARATIVE STUDY OF CO-MORBIDITY PROFILES AND PREDICTORS OF MORTALITY IN ELDERLY MALE AND FEMALE OF INDIAN URBAN POPULATION, ATTENDING TO EMERGENCY DEPARTMENT OF TERTIARY CARE SETUP

P.C. DAS, Amarendra Amar JHA, Prasun CHATTERJEE, Ramesh KANDEL, Prakash KUMAR, A.B. DEY (Department of Geriatric Medicine, All India Institute of Medical Sciences, India)

Introduction : Elderly people are prone to hospitalization and experience adverse outcomes after they are discharged from emergency department. Scientific data on mortality and morbidity profiles of elderly patients attending to Emergency Department(ED) is still lacking. This study was conducted at All India Institute of Medical Sciences (AIIMS) India to get an idea of gender variations in terms of the emergency attendance, associated demographic and health related factors and to find out the predictors of mortality after discharge. **Method :** A Prospective longitudinal study, conducted between July 2009 -December 2010. Patients aged 60 years or more, who attended Emergency department, were assessed for the above mentioned health related factors and followed up at one month after discharge. **Results :** Among the 999 elderly patients attending ED, 55% were males and 45% were females. Males presented with breathlessness (19%), altered sensorium (14.8%), chest pain (10.6%), diarrhea and vomiting (9%), fever (8.4%) and pain abdomen (5.1%). Females presented with breathlessness (20.4%), altered sensorium (12.2%), fever (11.7%), diarrhea and vomiting (11.7%), pain abdomen (8.8%) and chest pain (8.2%). One month after discharge from emergency visit, follow-up showed 26.2% of the patients had died. Cancer, falls, Hypertension and Chronic Obstructive Pulmonary Disease were statistically significant as a predictor of mortality whereas age, gender, polypharmacy, Diabetes, Cerebrovascular Disease and life style factors like smoking and obesity were not significantly associated with 1 month mortality in our study population. **Conclusion :** Health-care of the elderly require special attention irrespective of gender and age with an eye to prevent 30 days post-discharge mortality. **Keywords :** Co-morbidity, Geriatric Emergency, Post discharge mortality,

DEMENTIA II

OP23 323-C-1

FREQUENT PERIODIC LIMB MOVEMENTS ARE ASSOCIATED WITH DEMENTIA WITH LEWY BODIES AND A HIGHER RISK OF FALLS

Yasuhiro YAMAGUCHI, Shinichiro HIBI, Yumi UMEDA-KAMEYAMA, Hiroshi YAMAMOTO, Katsuya IJIMA, Masahiro AKISHITA, Yasuyoshi OUCHI (Department of Geriatric Medicine, CC0002, Japan)

Introduction : Although dementia with Lewy bodies (DLB) is a common form of neurodegenerative dementia, the clinical diagnosis is frequently difficult. This study evaluated the relationship of periodic limb movements (PLM) with DLB and its clinical phenotype because both REM sleep behavior disorders and Parkinson's disease have alpha-synucleinopathy similar to DLB, and show an increase in PLM. **Method :** Overnight polysomnographic recordings were performed for the inpatients who were suspected to have dementia. The PLM were compared among the patients clinically diagnosed with DLB,

Alzheimer's disease (AD) or as having no dementia. In addition, the study evaluated the association between the PLM and a past history of falling within 1 year. Results : Nine DLB patients, twelve AD patients and ten non-demented patients were enrolled in the study. The number of PLM during sleep per hour of total sleep time (PLMS index) was significantly higher in the DLB patients than the AD patients or the non-demented patients. In addition, the patients with a PLMS index > 15 showed a significantly higher incidence of falling than the patients with a PLMS index <15. Conclusion : The DLB patients exhibited a higher PLMS index than the AD patients. This index could be therefore clinically useful for the diagnostic differentiation of DLB from AD. In addition, a higher PLMS index was found to be associated with a higher incidence of falls, thereby possibly reflecting the existence of Parkinsonism. Keywords : periodic limb movements, dementia with Lewy bodies, fall

OP23 323-C-2

THE EFFECT OF CAROTID ARTERY STENTING ON COGNITIVE FUNCTION IN PATIENTS WITH CAROTID ARTERY STENOSIS: A PROSPECTIVE, 3 MONTHS FOLLOW-UP STUDY

Kyung Won PARK¹, Byel A. YOON¹, Myung-jin KANG², Dae-Hyun KIM³, Jae Kwan CHA³ (1. Neurology, Dong-A University College of Medicine, Korean Dementia Association, Korea; 2. Radiology, Stroke center, Dong-A University College of Medicine, Korean Dementia Association, Korea; 3. Neurology, Dong-A University College of Medicine, Korean Stroke Association, Korea)

Introduction : The effects of carotid artery stenting (CAS) on cognitive function in patients with carotid artery stenosis have not been fully addressed. The aim of this study is to assess the effect of CAS on cognitive function in patients with carotid artery stenosis compared with control subjects. Method : We consecutively recruited 30 patients underwent CAS with high grade carotid artery stenosis ($\geq 70\%$) and 10 control subjects at baseline. Twenty two out of 30 patients underwent CAS and 9 out of 10 control subjects were included in our analyses. Main cognitive outcome measures were the Seoul Neuropsychological Screening Battery-Dementia version (SNSB-D) test which containing several cognitive domains. We evaluated the mean differences of cognitive outcome measures using SNSB-D in our cases between patients with CAS and control group from baseline to 3 months follow-up period, respectively. Results : The demographic findings and general cognitive function in patients with CAS (n=22) and control group (n=9) at baseline were as follows: age (67.1 ± 8.2 vs. 61.1 ± 7.4) and the score of mini-mental state examination (25.5 ± 3.7 vs. 26.2 ± 2.6). Twelve out of 22 patients with CAS had asymptomatic CS. During 3 months follow-up period, the patients with asymptomatic CS (n=12) as well as all patients underwent CAS (n=22) did not show significant change differences in all cognitive outcome measures compared with control group (p>0.05). Conclusion : Our results suggest that the effect of CAS on cognitive function were not detected in patients with carotid stenosis as compared with control group during 3 months follow-up. Keywords : carotid artery stenosis , carotid artery stenting , cognitive function

OP23 323-C-3

LOW BMI PREDICTS INCIDENT ALZHEIMER'S DISEASE IN OLDER ADULTS WITH AMNESTIC MILD COGNITIVE IMPAIRMENT. A 3-YEAR PROSPECTIVE COHORT STUDY

Leung-wing CHU (Department of Medicine, Queen Mary Hospital, The University of Hong Kong, Hong Kong)

Introduction : Weight loss is associated with subsequent development of Alzheimer's disease (AD). The objective of the present prospective

study was to investigate BMI as a predictor of progression to AD in older adults with aMCI. Method : Design: A three-year prospective cohort study; Setting: Ambulatory setting. Subjects: Chinese older adults, aged 55 to 93 years old, with aMCI by the Petersen's criteria. Measurements: Baseline demographic, BMI and clinical factors, and apolipoprotein E genotype. All subjects were followed for three years. AD was diagnosed by the NINCDS-ADRDA criteria for probable AD. Results : 138 Chinese older adults with aMCI were recruited. 25.4% (n=35) of them progressed to Alzheimer's disease by the end of three years. In multivariate logistic analyses, after adjustment for age, sex and apolipoprotein E genotype, low BMI and ischemic heart disease (IHD) were independent predictors of progression to AD. IHD increased the risk (RR =3.17, 95% CI 1.01, 9.13), and BMI reduced the risk (RR=0.88, 95% CI 0.77, 0.99). Age but not apolipoprotein E genotype also increased the risk. Conclusion : In older adults, low BMI predicts an increased risk of AD. Low BMI represents a preclinical somatic sign of pre-AD among aMCI older adults. Keywords : BMI, MCI, Alzheimer's disease

OP23 323-C-4

IMPACT OF DEMENTIA ON HIP FRACTURE MANAGEMENT IN GERIATRIC DEDICATED UNIT. PRELIMINARY RESULTS

Lorene ZERAH¹, Judith COHEN-BITTAN¹, Frederic KHIAMI², Mathieu RAUX³, Anthony MEZIERE⁴, Marc VERNY¹, Bruno RIOU⁵, Jacques BODDAERT¹ (1. Geriatric Department, Peri-Operative Unit, Pitie-Salpetriere Hospital, APHP. UPMC Paris 6, France; 2. Orthopedic Surgery, Pitie-Salpetriere Hospital, APHP. UPMC Paris 6, France; 3. Anesthesiology Department, Pitie-Salpetriere Hospital, APHP. UPMC Paris 6, France; 4. Rehabilitation Unit, Charles Foix Hospital, APHP. UPMC Paris 6, France; 5. Emergency Department, Pitie-Salpetriere Hospital, APHP. UPMC Paris 6, France)

Introduction : Dementia and hip fracture are frequent in elderly patients. However, studies on weight of dementia on prognosis in hip fracture surgery are scarce. The aim of our study was to analyze clinical and functional outcomes, and mortality in elderly patients admitted for hip fracture with dementia compared to patients without dementia. Method : We present the preliminary results of our monocentre study during a 30 months period (09/2009 - 03/2012). Patients admitted to the Emergency department with hip fracture and to our Geriatric Peri-Operative Unit were included. Dementia was defined by a diagnosis prior to the admission and/or a specific treatment. In-hospital parameters were reported with a 6 months follow-up. Results : 187 patients (age 86 ± 7 years) were included, 76 with dementia and 111 without. Before admission, dementia was associated with a greater functional decline (IADL 5 ± 3 vs 5 ± 3 , p < 0.0001), without any difference for associated comorbidities. After surgery, dementia was only associated with delirium (59 vs 24 %, p<0.0001). There was no difference for in hospital (90 vs 86 %, p = 0.6) or 6 months (25 vs 26 %, p > 0.9) walk ability. We found no significant difference between demented and non demented patients for in-hospital (6% vs 2%, p=0.3) and 6 months (16% vs 11%, p=0.6) mortality. Conclusion : Our results suggest that a geriatric dedicated management in patients with hip fracture leads to a comparable prognosis between patients with and without dementia. Keywords : hip fracture, orthogeriatrics, dementia

OP23 323-C-5

A NOVEL FAMILIAL PRION DISEASE CAUSING COGNITIVE IMPAIRMENT, POLYNEUROPATHY AND PAN-AUTONOMIC INVOLVEMENT

Kosuke MATSUZONO, Yoshio IKEDA, Shoko DEGUCHI, Tomoko KURATA, Toru YAMASHITA, Kentaro DEGUCHI, Koji ABE (Neurology, Okayama University Graduate School of Medicine, Dentistry and Pharmaceutical Science, Japan)

Introduction : A 34-year-old Japanese female showed complex symptoms consist of polyneuropathy, memory disturbance, dysuria, alternate stool abnormality, and orthostatic hypotension started at age 26 years. Her mother had been suffered from similar disease, and died suddenly at age 49 years. **Method :** We performed neurological examination. The brain MRI and the single photon emission computed tomography (SPECT) with ^{99m}Tc -ethylcysteinate dimer (^{99m}Tc -ECD) were performed. The peripheral nerve conduction studies (NCSs) and the sural nerve biopsy were also performed. The 14-3-3 and tau proteins in CSF and the prion gene analysis were examined. **Results :** Tendon reflexes showed generalized areflexia. She had severe thermoanesthesia and hypoalgesia in lower limbs. Severe orthostatic hypotension was observed with changes of blood pressures from 115/80mmHg (lying) to 59/35mmHg (standing). Her cognitive function was mildly affected: Mini-Mental State Examination 27/30, and Frontal Assessment Battery 12/18. The brain MRI showed neither cerebral atrophy nor abnormal signal intensities. The SPECT showed decreased CBF mild diffusely. The NCS showed the compound muscle action potential in tibial nerves and the sensory nerve action potential in sural nerves were evoked. The CSF 14-3-3 and tau proteins were remarkably elevated 1125 $\mu\text{g}/\text{ml}$ and 2994 pg/ml , respectively. The prion gene analysis showed a 2 bp deletion in codon 178 that causes a premature stop codon and additional variable 25 amino acid C-terminal from the mutation. Unlike normal sural nerve, prion protein staining of the biopsy revealed ragged deposits in myelin. **Conclusion :** The novel prion gene mutation caused the characteristic complex phenotype of the peripheral neuropathy, cognitive disturbance and autonomic failure. **Keywords :** Prion disease, Novel gene mutation, HSN

OP23 323-C-6

DO THEY SUFFER? A STUDY OF THE PREVALENCE OF PAIN IN MODERATE TO SEVERE DEMENTED ELDERLY SUBJECTS RESIDING IN NURSING HOME

Doris Ka Ying MIU¹, Wendy Kc CHAN² (1. Medicine and Geriatrics, Kwong Wah Hospital, Hong Kong; 2. Private Practice, Hong Kong)

Introduction : Cognitively impaired elderly tend to have a decrease ability to communicate and report pain complaints which resulted in under-detection and under-treatment. We aimed to describe the prevalence of pain in moderate to severe demented nursing home elderly and to determine factors associated with pain. **Method :** Nursing home residents age >60 with MMSE <20 were recruited. Demographic data and comorbidity were recorded. Use of analgesics, restraints, presence of depression and behavioural disturbances were collected from medical records and from caretakers. Presence of pain was assessed by PAIN-AD. **Results :** 309 residents were included with a mean age of 85 (SD 7.5) and mean MMSE 9.6(SD 6.3). 61.5% experienced pain as defined by PAIN-AD>2. Only 30.7% have received analgesics. Subjects who experienced pain were more severely demented (mean MMSE 8.3 vs 11.2, $p=0.001$), male sex (45.3% vs 32.8%, $p=0.029$), poor mobility level (bed bound 71% vs walk with aids 35.2%, $p=0.003$), more likely to be put on restraints (74.2% vs 49.6%, $p<0.001$), prescribed with psychotropic drugs (38.1% vs 25.4%, $p=0.022$), presented with physical aggression (22.1% vs 10.9%, $p=0.012$) and non-communicable (41.6% vs 24.4%, $p=0.002$). The major predictors for pain were use of restraint (OR 3.1).and poor MMSE (OR 0.94). **Conclusion :** Pain is highly prevalent

among moderate to severe dementia nursing home residents and is associated with the use of restraints. However, only half of these subjects have been prescribed with analgesics. Improvement in carer's knowledge of pain assessment with provision of adequate treatment is necessary for caring of these groups of dementia subjects. **Keywords :** pain, dementia

MORTALITY RISKS OF OLDER PERSONS LIVING ALONE IN THE SINGAPORE LONGITUDINAL AGEING STUDIES COHORT

Jin AIZHEN¹, Tze-pin NG², Liang FENG³, Ma Shwe Zin NYUNT³, Feng LEI² (1. Research and strategic Planning, Health Promotion Board, Singapore; 2. Psychological Medicine, National University of Singapore, Singapore)

Introduction : Elderly individuals living alone are vulnerable to poverty, social isolation, and adverse psychological and health outcomes. In Singapore (5 million), the proportion of older persons living alone is expected to grow 2.4 fold by 2030. Many cohort studies have variously reported that living alone was associated with increased mortality that were either stronger among men than women, or only among men, or paradoxically, with decreased mortality risk. **Method :** We investigated the mortality risk associated with living alone among 2553 older adults using data from 8 years mortality follow up of the SLAS cohort, from September 2003 to December 2011. **Results :** Compared to participants living with others, participants living alone (N=189, 7.4%) included significantly more who were older, female, had depressive symptoms, and living in low-end housing, but not significantly different in number of medical conditions or IADL-ADL disability. A total of 227 (8.7%) participants died. Participants who lived alone showed significantly higher sex- and age-adjusted mortality (HR=1.79, 1.15-2.77), which remained elevated after adjustment for housing type, multiple co-morbidities, IADL-ADL disability and depressive symptoms: adjusted HR=1.85 (1.18-2.88). Higher sex- and age-adjusted mortality risks associated with living alone were particularly found among subgroups of men (HR=2.82, $p=0.0007$), younger old <75 years (HR=2.45, $p=0.0015$), living in lower end housing (HR=1.77, $p=0.029$), and with multiple comorbidities (HR=1.92, $p=0.007$). **Conclusion :** Among Singaporean older persons, living alone was associated with increased mortality, especially among men, the younger old, and those with social and health deprivations. **Keywords :** Mortality, elderly, living alone

OP23 324-C-2

HEALTH STATUS OF IRANIAN OLDER PEOPLE: A DEMOGRAPHICAL ANALYSIS

Fatemeh SHOAEI¹, Vida ALIZAD², Malihe SABOOR² (1. Department of Counselling, The University of Social Welfare and Rehabilitation Sciences, Iran; 2. Iranian Research Center on Ageing, The University of Social Welfare and Rehabilitation Sciences, Iran)

Introduction : Ageing is a challenging phenomenon due to the fact that older people are heterogeneous individuals with special needs declining health status and consuming more services. The aim of this study was to explain the physical and mental health of older people based on their demographic variables. **Method :** A correlation design conducted through logistic regression. A demographic page and the Short Form (36) Health survey were administered by trained interviewers to 250 participants in Tehran, Iran in 2012. Participants

were recruited based on a classified multi stage sampling procedure. Results : Compared to women, men had better physical health. Low-income elderly had lower score in general, physical and mental health. Elderly residing at home or with an extended family did not face the same general and physical health in comparison with their peers at nursing homes, though their mental health was similar. Marriage provided general, physical and mental health benefits for elderly whereas, high level of education were associated with physical and mental health. Being caregiver was related to better physical health while having caregiver was associated with better mental health. Age, income and education predicted both physical and mental health. Sex, mental health, marital status, being caregiver and having caregiver predicted physical health while physical health predicted mental health. All studied variables except sex and mental health predicted significantly place of residence. Conclusion : Demographic variables predict health status of older people like other mental and physical variables. Policy makers should focus on variables predicting health status of elderly to have successful ageing in future. Keywords : Physical and mental health, Demographic variables, Older people, SF-36

OP23 324-C-3

THE HEALTH STATUS OF OLDER PERSONS IN MONGOLIA
Oyunkhand RAGCHAA¹, Byambasuren ERDENEKHUYAG², Zandi NYAMJAV³, Ochir CHIMEDSUREN⁴, Batsereedene BYAMBAA⁵
(1. Administration, National Gerontology Center, Mongolia; 2. Health Systems Research, Center for Health Development, Mongolia; 3. Training, Research and Foreign Affairs, National Gerontology Center, Mongolia; 4. School of Public Health, Health Sciences University, Mongolia; 5. Administration, 'Etugen' Medical School, Mongolia)

Introduction : In Mongolia, the population ageing process will begin in about 15 years and will accelerate the following 20 years. Goal Determine the health status of Mongolian elders in terms of physical, social and mental health. Method : One cluster from each of the 5 economic-geographical regions of Mongolia was chosen randomly and was comprised of 1207 elderly. The research was conducted by using the internationally recognized GDS with 30 items, ADL, IADL and MMET tests. Results : Out of survey involved 1207 elderly, 392 (32.5 percent) referred to men, 815 (67.5 percent) women and their mean age was 68.1±8.1. In terms of morbidity, 81.2 percent was suffered from diseases of cardio vascular system, 60.5 from urogenital system, 55.8 percent from diseases of eye and its adnexure, and 39.3 percent from diseases of digestive system in duplicated number. The mental and behavioral diseases refer to be 9.7 percent among total morbidity. Sixty point three percent of respondents were with normal cognitive ability, while 2.2 percent were with severe type cognitive impairment. Depression found to be 188 and anxiety 165 per 1000 elders. Among survey involved elderly, 87.4 percent had kept their ADL, while the loss of IADL was found for 29.9 percent, of which using the telephone was impaired mostly. Conclusion : 1. Fourteen point four percent of elderly found to be physically healthy, while 85.6 percent were ill and had approximately 3-4 diseases per person. 2. The prevalence of mental and behavioral diseases refers 9.7 percent among elderly. Keywords : ageing, disease

OP23 324-C-4

A CROSS-SECTIONAL SURVEY ON DISEASE CONSTITUTION OF ELDERLY INPATIENTS IN XUANWU HOSPITAL, CAPITAL MEDICAL UNIVERSITY IN 2011
Chen LIU , Yuqin WANG (Department of Pharmacy, Xuanwu Hospital, Capital Medical University, Beijing, China)

Introduction : Aging has become one of the most important social problems all over the world. This study focuses on disease constitution of elderly inpatients in our hospital in 2011 to learn about the local diseases burden and provide baseline data for further study. Method : Elderly (patients more than 60 years old) inpatients records in our hospital in 2011 were collected. Based on all the diagnosis in medical record at discharge, the diseases were standardized and classified according to the International Classification of Disease, 10th Edition (ICD-10). Data including general information of the inpatients and discharge diagnosis were rearranged and analyzed by Microsoft Excel 2003. Results : ①The total number of elderly inpatients were 13807 in 2011, and males were more than females (1.26:1). The average kind of disease each patient was diagnosed with was 4.41, ranging from 1 to 11. ②For patients with only one disease, nervous system diseases (26.17%) ranked first. For patients with two diseases, circulatory system diseases ranked first both in the primary (21.51%) and secondary (45.57%) disease. ③All the diagnosis included 18 categories; circulatory system diseases (42.54%) ranked first. The primary diagnosis included 18 categories; circulatory system diseases (31.07%) ranked first. ④In the circulatory system diseases, cerebral infarction (17.90%) ranked first. Conclusion : The disease constitution of elderly inpatient in our hospital is comprehensive. The disease burden of circulatory system diseases is heavy. In the following studies attention should be paid on drug utilization of circulatory system diseases to provide evidence for making the China specific elderly caring clinical pathway. Keywords : Disease Constitution, Elderly Inpatients, Cross-sectional Survey

CLINICAL PROFILE OF THE ELDERLY PATIENTS VISITING TO GERIATRIC OUT PATIENT DEPARTMENT OF ALL INDIA INSTITUTE OF MEDICAL SCIENCES, NEW DELHI

A.K. AMBASHTHA, P.C. DAS, P. CHATTERGEE, A.B. DEY
(Geriatric Medicine, All India Institute of Medical Sciences, New Delhi, India)

Introduction : The clinical profile and the prevalence of "Geriatric syndromes" among older patients in India is uncertain both in community and hospital settings, which affect the quality of life of a patient and are associated with disability. This study was conducted to determine the prevalence of geriatric syndromes and the associated comorbidities in a dedicated outpatient clinic of All India Institute of Medical Sciences, New Delhi and to correlate their association with commonly encountered co-morbidities. Method : OPD records of 343 older patients of the Geriatric Clinic of All India Institute of Medical Sciences, New Delhi, India, were reviewed between August 2010 and January 2011. Data on prevalence of comorbidities and Geriatric syndromes were collected and statistically analyzed for the significance of their association. Results : The mean age was 70.19(+5.60 years). Males outnumber the females and most of the elderly patients were between the age group of 70 to 79yrs (50%). The commonly associated co-morbidities were hypertension (39.4%), diabetes (21.6%), cataract (12.5%), COPD (10.5%) and osteoarthritis (OA) (8.2%). The prevalence of geriatric syndromes: Depression 28(8.2%), Dementia 5(1.5%), Falls 26(7.6%), Incontinence 15(4.4%) and Functional dependency 37(10.9%) were found. In our study CAD and osteoarthritis were strongly associated with dementia (p=0.000) and falls (p=0.004) respectively. CVA was significantly associated with depression (p=0.010) and falls (p=0.007). Conclusion : Multiple comorbidities and Geriatric syndromes were very common in patients visiting to Geriatric OPD. Comorbidities are very often independently

associated with these geriatric syndromes. Hence early recognition and management of these conditions is needed to prevent disability in elderly. Keywords : Geriatric syndromes, elderly, comorbidities

COMBINED RESISTANCE AND BALANCE-JUMPING EXERCISE REDUCES OLDER WOMEN'S INJURIOUS FALLS AND FRACTURES: A 5-YEAR FOLLOW-UP OF A 12-MONTH RANDOMIZED, CONTROLLED TRIAL

Saija KARINKANTA¹, Pekka KANNUS¹, Matti PASANEN¹, Kirsti UUSI-RASI¹, Ari HEINONEN², Harri SIEVANEN¹ (1. The Musculoskeletal Research Group, The UKK Institute for Health Promotion Research, Finland; 2. Department of Health Sciences, University of Jyväskylä, Finland)

Introduction : Earlier, 1-year four-arm RCT study was conducted among 70-79 year-old home-dwelling Finnish women (the KAAMU study, n=149). Exercise groups did either resistance, balance-jumping, or combined resistance and balance-jumping (COMB) training. The COMB group benefited most and improved muscle strength, balance, physical functioning and bone strength - all important risk factors for falls and fractures. The current 5-year follow-up reports the rate of injured fallers, injurious falls, and fractures among the participants. Method : Participants' health care visits from the end of the intervention (2003) to end of the year 2008 were collected from the computerized patient files. An injurious fall was defined as an event in which the subject contacted the health care system, or was taken to a hospital, due to a fall. The rate of injured fallers was assessed by Cox proportional hazard model, and that of injurious falls and fractures by Poisson regression. Age was used as a covariate. Results : 81 injurious falls including 26 fractures occurred during the follow-up. The rate of injured fallers was 62% lower in the COMB group compared to the controls (HR 0.38, 95% CI 0.17 to 0.85). In addition, the COMB group had 51% less injurious falls (RR 0.49, 95% CI 0.25 to 0.98) and 74% less fractures (RR 0.26, 95% CI 0.07 to 0.97). Conclusion : A 12-month intensive multi-component exercise seems to reduce older women's risk for injurious falls and fractures for years after the intervention. The intervention can be recommended for home-dwelling older women to prevent functional decline and fall-induced injuries. Keywords : exercise, injurious falls, fractures

OP23 325-C-2

A PILOT STUDY IN PRIMARY CARE USING Pedometer TO PREDICT PROSPECTIVE FALLS AMONG COMMUNITY-DWELLING OLDER ADULTS

Boon Chong KWOK¹, Yong Hao PUA² (1. Clinical Service - Allied Health, National Healthcare Group Polyclinics, Singapore; 2. Department of Physiotherapy, Singapore General Hospital, Singapore)

Introduction : The aging population is estimated to triple in the next forty years. Early fall risk detection in the community is important. Older adults with decreased physical activity are at risk of falls. This prospective pilot study evaluates the use of pedometer to predict falls among community-dwelling older adults. Method : Fifty-three community-dwelling volunteers age 60-85 were recruited for the study. Falls occurrence was collected over a year. Participants were assessed with Physiological Profile Assessment (PPA), Timed-Up-and-Go (TUG) test and Falls Efficacy Scale-International (FES-I) short form questionnaire. Stride length was measured with a 10-metre

walk (adjusted with leg length). Participants recorded pedometer readings (steps per day) daily over a month. Results : There were 39 non-fallers and 14 fallers at the end of 1-year follow-up. Fallers were significantly associated with the five variables, average steps per day (OR = 3.82; 95% CI 0.99-1.00; p = 0.003), PPA score (OR = 1.92; 95% CI 1.16-3.17; p = 0.011), FES-I (OR = 1.33; 95% CI 1.07-1.66; p = 0.010), TUG (OR = 1.25; 95% CI 1.01-1.55; p = 0.038) and adjusted stride length (OR = 3.57; 95% CI 1.26-10.12; p = 0.017). ROC analysis identified the optimal cut-off steps per day at 4747 (AUC = 0.83; 0.72-0.95). Conclusion : This prospective pilot study found older adults taking less than 4747 steps per day at risk of falls. Keywords : pedometer, falls, aging

EFFICACY OF NINTENDO WII TRAINING ON MECHANICAL LEG MUSCLE FUNCTION AND POSTURAL BALANCE IN COMMUNITY-DWELLING OLDER ADULTS: A RANDOMIZED, CONTROLLED TRIAL

Martin Grønbech JØRGENSEN¹, Uffe LAESSOE², Carsten HENDRIKSEN³, Ole NIELSEN¹, Per AAGAARD⁴ (1. Department of Geriatrics, Aalborg University Hospital, Denmark; 2. Physiotherapy Department, UCN, Denmark; 3. Department of Integrated Health Care, Bispebjerg University Hospital, Denmark; 4. Institute of Sports Science and Clinical Biomechanics, University of Southern Denmark, Denmark)

Introduction : Older adults show increased risk of falling and major risk factors include impaired lower extremity muscle strength and postural balance. However, the potential positive effect of biofeedback-based Nintendo Wii training on muscle strength and postural balance in older adults is unknown. Method : This RCT examined postural balance and muscle strength in community-dwelling older adults (75±6 yrs.) pre and post 10 weeks of biofeedback based Nintendo Wii training (WII, n=28) or daily use of Ethylene Vinyl Acetate Copolymer insoles (controls: CON n=30). Primary endpoints were maximal muscle strength (MVC) and Center of Pressure velocity-moment (CoP-VM) during bilateral static stance. Results : Intention-to-treat analysis with adjustment for age, sex and baseline level, showed that the WII group had higher MVC strength (18%) than the control group at follow-up (between-group difference=269 N, 95% [CI]=122;416, P=0.001). In contrast, CoP-VM did not differ (1%) between WII and CON at follow-up (between-group difference=0.23 mm²/s, 95% [CI]=-4.1;4.6; P=0.92). For secondary endpoints, pre-to-post changes favoring the WII group were evident in RFD (P=0.03), TUG (P=0.01), short FES-I (P=0.03), and 30-s Repeated-Chair-Stand-Test (P=0.01). Finally, participants rated the Wii training highly motivating at 5 and 10 weeks into the intervention. Conclusion : Biofeedback-based Wii training led to marked improvements in maximal leg muscle strength (MVC; RFD) and overall functional performance in community-dwelling older adults. Unexpectedly, static bilateral postural balance remained unaltered with Wii training. The high level of participant motivation suggests that biofeedback-based Wii exercise may ensure a high degree of compliance to home and/or community-based training in community-dwelling older adults. Keywords : Nintendo Wii, Muscle strength, Postural Balance

EFFICACY OF TILTING EXERCISES ON THE MOBILITY AND BALANCE OF SEDENTARY ELDERLY WOMEN

Charlene Brito De OLIVEIRA¹, Veronica Baptista FRISON², Thais De Lima RESENDE², Irenio GOMES¹ (1. Instituto de Geriatria e Gerontologia, Pontificia Universidade Catolica do Rio Grande do Sul,

Brazil; 2. Faculdade de Enfermagem Nutricao e Fisioterapia, Pontificia Universidade Catolica do Rio Grande do Sul, Brazil)

Introduction : There are no studies on the use of dynamic tilting exercises for the elderly, which enable them to overcome the limits of their center of gravity, facilitating the early responses and motor learning required for optimum balance. The present study was carried out to evaluate the effects of a dynamic tilting exercise program on the balance and mobility of elderly sedentary women. **Method :** This randomized trial was conducted with 33 women randomly distributed into Control (CG; n=17; 74.3±6.8 years) and Intervention Group (IG; n=16; 73.0±4.1 years). They underwent mobility (Timed Up and Go test - TUG) and balance tests (Berg Scale - BBS and Functional Reach - FR), at the beginning and end of the study. The IG underwent 16 sessions of tilting exercises (2 times/week, 30 minutes/session of stretching, sit/stand, anterior and posterior tilting) in the Chordata Equipment, which was developed by one of the authors (Frison VB). **Results :** Pre-intervention, the groups did not differ in terms of age, marital status, cognition, TUG, BBS or FR. After, their mobility and balance differed significantly: the IG improved (TUG pre=10.4±2.2s and post=8.5±1.7s; BBS pre=50.2±3.5 points, post=54.7±1.3 points; FR pre=23.8±5.9 cm, AF post=28.9±3.3 cm), whereas the CG did not show any statistical differences. There were no complications or undesired effects during or after the training with tilting exercises in the Chordata Equipment. **Conclusion :** It is concluded, therefore, that tilting exercises, besides being safe to be carried out by elderly people, led to significant improvement in functional mobility and balance, thus can help to prevent falls. **Keywords :** Accidental Falls. Aged. Postural Balance
