THE EFFECTIVENESS OF MAINTAINING A BLADDER DIARY FOR ELDERLY VASCULAR DEMENTIA PATIENTS: A CASE STUDY

Manami KAMIYAMA¹, Mitsuko USHIKUBO¹, Yoko UCHIDA¹, Kazuhisa SARUKI², Midori SHIMIZU³, Yukari TAKAI¹, Misako KOIZUMI⁴ (1. Health Science, Gunma University Graduate School, Japan; 2. Urology, Saruki clinic, Japan; 3. Nursing, Mihara Memorial Hospital, Japan; 4. Nursing, Niigata College of Nursing, Japan)

Introduction : The purpose of this study was to report the clinical potential and relevance of maintaining a bladder diary for elderly vascular dementia patients with urine retention. Method : A short-term urethral catheter was inserted in a 76-year-old vascular dementia patient who was admitted to hospital for pneumonia. The catheter was removed 7 days later, but urine retention was observed. The Mini-Mental State Examination and Functional Independence Measure scores were 0 and 18, respectively. This case study was approved by the hospital's ethics committee and consents from the patients' family members were obtained before the intervention. Results : A bladder diary, which comprises information on urine volume, urinary incontinence volume, and post-void residual volume, was maintained after catheter removal. For accurate urine volume measurement, sensor diapers were used for patients who could not communicate the urge to urinate, and a post-void residual volume of approximately 400 ml was observed. Clean intermittent catheterization (CIC) was also initiated, after which post-void residual volumes were found to be >300 ml. A cystometric examination revealed detrusor underactivity and a bladder capacity of approximately 350 ml. The patient was discharged after post-void residual volume was found to be <100 ml. Conclusion : A bladder diary can provide important information regarding urine retention and micturition that would aid in performing CIC effectively, especially in elderly patients with dementia; therefore, its effectiveness must be studied further. Keywords : bladder diary, post void residual, CIC

PP25 C-082

POSITIVE INFLUENCE OF OVERACTIVE BLADDER THERAPY ON GERIATRIC DEPRESSION

Ece ESIN¹, Ali ERGEN², Mustafa CANKURTARAN¹, Burcu YAVUZ³, Meltem HALIL¹, Zekeriya ULGER¹, Yusuf YESIL¹, Mehmetemin KUYUMCU¹, Eylem CANKURTARAN⁴, Servet ARIOGUL¹ (1. Geriatric Medicine, Hacettepe University Faculty of Medicine Department of Internal Medicine Division of Geriatric Medic, Turkey; 2. Urology, Hacettepe University Faculty of Medicine Department of Urology, Turkey; 3. Geriatric Medicine, Hacettepe University, Turkey; 4. Psychiatry, Ankara Oncology Training and Research Hospital, Psychiatry Clinic, Turkey)

Introduction : Overactive bladder (OAB), a frequent debilitating

condition in older adults, is defined as urgency, with or without urge incontinence, usually with frequency and nocturia. It causes morbidity in older adults including an increase in geriatric syndromes such as falls and depression. The aim of this study is to evaluate the effect of treating OAB on depression in geriatric. Method : 168 patients aged 65 years and over admitted to our Geriatric Medicine outpatient clinic with OAB were followed for 6 months. Overactive bladder was diagnosed according to International Continence Society definition criteria. Exclusion criteria were to be on any anticholinergic medication before enrollment, genitourinary operation, history of frequent urinary tract infection. All patients had negative urine cultures. Patients were evaluated in 5 groups which were the group receiving only Kegel exercises and life style changes, and the groups receiving one of 4 anticholinergic agents (Darifenasin, Oxybutynin, Tolterodine, and Trospium) in addition to exercise and life style modification. Patients were followed-up in a standardized protocol including routine visits at 2nd, 3rd and 6th months. Yesevage Geriatric Depression Scale (short form) was performed at initial evaluation and on follow-up visits. Results : Within 168 patients with OAB 56.1% had depression. When geriatric depression scale scores were compared, there was significant reduction in the post-treatment scores in all groups. Pre-treatment geriatric depression scale score of the total population was 4.44 ± 2.86 , and post-treatment score was 2.20 ± 2.16 ($p < 0.001$). Conclusion : OAB is an important geriatric syndrome which often coexists with depression. Treating OAB can have a positive effect on geriatric depression. Keywords : depression, incontinence, treatment

PP25 C-083

BLADDER SCAN HELPS IN SCREENING THE DIABETIC CYSTOPATHY OF THE FRAIL ELDERLY LIVING IN THE COMMUNITY SUFFERING FROM CHRONIC DIABETIC MELLITUS

Mei Yee Bonnie WONG, Chee Ping WONG, Po Chi Candice LI
(Integrated Elderly Care Services, Christian Family Service Centre, Hong Kong)

Introduction : Diabetes Mellitus (DM) is a common chronic metabolic disease in the elderly population. Long term high blood sugar damages the blood vessels and can cause serious health complications which can lead to blindness, stroke, chronic skin ulcers or even foot amputation. Therefore, routine screenings such as annual eye check up, ECG, Treadmill, blood taking for renal function test and daily foot inspection were strongly recommended to detect the early signs of complications. However, diabetic cystopathy is also a well recognized complication of diabetes mellitus (DM) but always being neglected. Without interventions, urinary incontinence, retention and repeated urinary tract infection may lead to serious psychological and social problems such as depression, embarrassment, low self-esteem and social isolation. Overall it is associated with significant poor quality of life for the elderly. Method : 20 frail elderly patients living in the community with chronic diabetic mellitus over 10 years ($n=20$) were included in this study, others causes such as Parkinsonism, BPH, etc were excluded in this study. Using non-invasive ultrasound equipment: bladder scan to measure the post void residue urine (PVRU) of the participants at least two times and obtain the basic informations of the participants by using simple questionnaires, including gender, age, blood sugar level, urinary symptoms complaints, etc. Results : This study demonstrated that the patients with long standing diabetic mellitus and poorly controlled disease easily prone to have diabetic cystopathy. Conclusion : Bladder scan can help in screening out the diabetic cystopathy for patients living in the community with long standing and poorly controlled diabetic mellitus.

Keywords : diabetic cystopathy, diabetes mellitus, DM, Bladder scan, post void residue urine, PVRU

ASSESSMENT OF PRESSURE ULCER - BASED ON NANDA-I

Steve STRUPEIT¹, Gonda BAUERNFEIND², Brigitte NINK-GREBE³
(1. Life Sciences, HAW Hamburg - University of Applied Science, Germany; 2. Nursing, Health Center Hamm, Germany; 3. Wound Healing, DGfW, Germany)

Introduction : In every nursing care setting people are at risk and/or suffering from pressure ulcers. In order to avoid pressure ulcers it is necessary that responsible nurses identify the individual pressure ulcer risk and provide appropriate prevention interventions based on current evidence-based nursing and medicine knowledge. Method : Based on NANDA I-nursing diagnoses relevant diagnoses and influencing and determinant attributes were exposed falling under individual pressure ulcer risk factors. Results : An assessment instrument was developed able to gather relevant risk factors and to support nurses in assessing pressure ulcer risk. A sum score was intentionally not applied. Conclusion : The current assessment instrument provides an individual risk assessment. Items can be used to plan and evaluate interventions. Keywords : Prussure Ulcer, Nursing diagnosis, Risk factors

SLEEP QUALITY IS ASSOCIATED WITH METABOLIC SYNDROME IN THE ELDERLY

Hao-Chang HUNG¹, Yi-Ching YANG², Horng-Yih OU¹, Jin-Shang WU², Feng-Hwa LU², Chih-Jen CHANG²
(1. Division of Endocrinology and Metabolism, Department of Internal Medicine, National Cheng Kung University Hospital, Taiwan; 2. Department of Family Medicine, National Cheng Kung University Hospital, Taiwan)

Introduction : The prevalence of metabolic syndrome (MS) increases with age, and aging results in the deterioration of sleep quality. Previous studies found self-reported global sleep quality is significantly related to the MS in adults. However, there is no study on the association between sleep quality and MS in the elderly. The aim of this study is to investigate their relationship in the Chinese elderly. Method : A total of 435 elderly (≥ 60 years) subjects were selected from the decoded database of the Prevention Health Center of National Cheng Kung University Hospital. The diagnosis of MS was according to the statement of the American Heart Association/National Heart, Lung, and Blood Institute. Sleep quality was assessed using the Pittsburgh Sleep Quality Index (PSQI). Results : Of the 435 subjects, 205 (47.1%) had MS. Subjects with MS had a significant higher global PSQI score than those without (7.0 ± 3.6 vs. 6.0 ± 2.5 , $p=0.001$). In the individual domains of PSQI, subjects with MS had higher scores of "subjective sleep quality" ($p=0.006$) and "the use of sleep medication" ($p < 0.001$). The multivariate logistic regression analysis showed significant association between female gender (OR=2.029, 95%CI=1.306~3.152, $p < 0.01$), global PSQI score (OR=1.095, 95%CI=1.026~1.168, $p < 0.01$), snoring (OR=1.916, 95%CI=1.223~3.002, $p < 0.01$) and MS. Of the individual domains of PSQI, "sleep latency" (OR=0.75, 95%CI=0.568~0.991, $p < 0.05$) and "use of sleep medication" (OR=1.751, 95%CI=1.233~2.487, $p < 0.01$) were independently related to MS. Conclusion : Higher sleep quality score is associated with MS in the elderly. In clinical practice, the elder subjects with sleep disturbance may be suggested to screen for MS. Keywords : Metabolic syndrome, Elderly, Sleep quality

PP25 C-086

FACTORS INFLUENCING THE DECISION TO START

CHEMOTHERAPY IN ELDERLY PATIENTS SUFFERING OF LUNG CANCER

Francoise ESCOUROLLE-PELTIER, Wassila KORRIBI-MERIBAI, Zakya FATHI, Yves WOLMARK (*Geriatric, Hospital Bretonneau, France*)

Introduction : The decision to start the chemotherapy is complex in elderly patients presenting cancer because they have comorbidities and cognitive deficiency. This decision should be taken after a global geriatric evaluation. The objective of this study is to determine factors influencing decision to start chemotherapy in elderly patients presenting a lung cancer. **Method :** It is a retrospective study of 50 patients (28 women and 22 men), mean age 89 years +/- 6,4 admitted in a geriatric palliative care unit between 2005 and 2011. We compared patients who underwent chemotherapy (group1) and patients without chemotherapy (group2). **Results :** Group 1 patients were younger, mean age 78,4 years +/-3,4 versus 85, 5 years +/-6,6 (p<0,01). No patient with dementia was present in group1, versus 7 patients in group 2 (p<0,01). No statistical difference appears between groups for comorbidities evaluated by age stratified Charlson index, depression, social support. The multivariate analysis using logistic regression confirmed the statistical effect of age and dementia in decision of chemotherapy. The analysis of the Kaplan Meier survival curve after the diagnostic shows a benefit of chemotherapy : group1 survival 11,7 months versus group 2 6,1 months (Log-Rank p=0,03). The difference of survival is more important in men but independent of age. **Conclusion :** New chemotherapies agents and the development of geriatric evaluation in oncology will probably improve the prognostic of patients suffering of lung cancer. **Keywords :** chemotherapy lung cancer

PP25 C-087 THE TREND OF INCIDENCE OF PROSTATE CANCER IN TAIWAN, 1979-2009

Yin-Ming LI (*Family Medicine, Buddhist Tzu Chi General hospital, Tzu Chi university, Taiwan*)

Introduction : As the aging population rises dramatically, cancer is a major health concern globally. Prostate cancer was historically low risk of development in Asians, but noted on the rise. Our object is to interpret the trend for prostate cancer incidence in Taiwan between 1979 and 2009. **Method :** Age standardized incidence of prostate cancer for the period 1979-2009 were obtained from the Taiwan National Cancer Registry. Joinpoint regression analysis was used to describe time trend of its incidence. **Results :** The average age-standardized incidence rate for prostate cancer was 2.6/100000 in year 1979-1983 and increased to 23.8/100000 in 2005-2009. The average annual percentage change was 8.7 (95% CI 7.9, 9.6) in 1979-2009. Joinpoint analysis of trend incidence of prostate cancer identified one joinpoint (year 1999). The estimated annual percent of change was 10.8% (95% confidence interval [CI 10.0, 11.6] in 1979-1999 and was 4.8% (95% CI 2.7, 6.9) in 1999-2008. The annual percent change and the average annual percentage change between two periods were significant different. More than 3000 prostate cancers were diagnosed yearly since 2006. **Conclusion :** The incidence of prostate cancer has increased by nine- folds in the last decades in Taiwan. The average annual percent change of prostate cancer incidence was about 5% increasing in the past five years. The burden of medical care and life quality of patients should be concerns. Primary prevention of prostate cancer is crucial for aging population. **Keywords :** incidence, prostate cancer, trend

PP25 C-088

CLINICAL AND ECONOMIC BURDEN OF HIP FRACTURE

Claire TAKIZAWA (*Health Economics, Nestle Health Science, Switzerland*)

Introduction : Hip Fracture is associated with a high mortality rate, need for long-term medical care, and prolonged disability. This study aimed to identify the reported burden of hip fracture. **Method :** Epidemiological data were collected from publications and included incidence of hip fractures. Economical data mainly included hospital costs. **Results :** About 1/3 of elderly individuals fall annually and 1% will suffer a hip fracture. The later were estimated to account for 54% of the costs of all osteoporotic fractures and quality of life in the subsequent years after hip fracture was assumed to be 80% of that of a healthy individual. Based on an annual hip fracture incidence of 8.1/10,000 population, there is an estimated 5.5 million hip fractures worldwide in 2009, of which almost 1.8 million occur in East Asia & Pacific (EAP), almost 300,000 occur in North America (NA) and more than 400,000 in the European Union (EU). Hospital costs were estimated at USD11,943/hip fracture, thus leading to a cost of more than USD65.5 billion worldwide, including more than USD21 billion in EAP, more than USD3 billion in NA and almost USD5 billion in the EU. These estimates do not take into account other costs, such as excess primary care and outpatient visits or work days lost by relatives while caring for persons with hip fracture. **Conclusion :** Hip fractures are associated with substantial healthcare consumptions. Specific nutritional interventions have shown clinical benefit and a potential economic benefit among elderly persons recovering from hip fracture. However, more research needs to be undertaken. **Keywords :** Hip fracture, Cost

PP25 C-089 TOTAL HIP ARTHROPLASTY OUTCOMES IN INDEPENDENT ELDERLY PATIENTS (>80) WITH HIP FRACTURE. MINIMUM 5 YEARS FOLLOW UP

Jose Ricardo JAUREGUI¹, Francisco PICCALUGA², Martin BUTTARO³, Daniel GODOY MONZON³, Carlos Guido MUSSO¹, Kenneth ISERSON⁴ (*1. Geriatric Medicine Unit, Hospital Italiano de Buenos Aires, Argentina; 2. Hip Unit, Orthopedic and Traumatology Service, Hospital Italiano de Buenos Aires, Argentina; 3. Orthopedic and Traumatology Service, Hospital Italiano de Buenos Aires, Argentina; 4. Emergency Medicine, Universidad de Arizona, USA*)

Introduction : Treatment for hip fracture in independent old people remains controversial. **Method :** January 2000 to August 2006, 93 patients assisted. Inclusion criteria : +80 years, range 80-95, average 83.2 able to walk for up to 0.5 km normal abbreviated Mini Mental Test Score hip without or minimal arthrosis. Clinicoradiological evaluation conducted at 90 days, 1 year and subsequent years. **Results:** Female/male ratio 65-28 Delay admission/surgery 1.67 days. Mean operative time 72 minutes. Average stay at hospital 14 days. Follow up 5-11 years, average 6.2. Postoperative walking distance ranged 0.5-5,7 km, average 1.7 Mini mental score 27-35, average 31,79 points. No patient died during surgery. 3 patients died during immediate postoperative period. 3 months 1 patient died due to pneumonia, 2 patients had stroke. One year 6 patients died due to causes unrelated to THA, with well working prosthesis. 86 patients evaluated, no modifications detected from initial radiographs, self walking ability report in 70.9 % normal, 23.2 % using a walking aid and 5.9% intradomiciliary activities. None reported pain. Mini mental test decreased to 28 points average, range 25-31. final evaluation 27 died at 5 years. total mortality 29.1%. 8 patients evaluated telephonically with a well functioning prosthesis. 58 evaluated patients, no radiographic changes were detected. No pain reported. Self reported

walking ability 46.5% maintained distance walking ability, 37.9 % using walking aid, 15 % performed intradomiciliary deambulation. Mini mental test decreased to 25 points, range 23-29. Conclusion : Total Hip Replacement is reliable, durable and safe, with years functional recovery to preinjury status. Keywords : hip fracture rehabilitation

PP25 C-090

USE OF PIRIFORMIS PRESERVATION IN POSTERIOR APPROACH AFTER HIP FRACTURE. LOWERING DISLOCATION RATE

Daniel GODOY MONZON¹, Francisco PICCALUGA², Martin BUTTARO², Alberto CID CASTEULANI³, Jose Ricardo JAUREGUI⁴, Carlos MUSSO⁴ (1. *Orthopedic and Traumatology Service, Hospital Italiano de Buenos Aires, Argentina*; 2. *Hip Unit, Orthopedic and Traumatology Service, Hospital Italiano de Buenos Aires, Argentina*; 3. *Orthopedic and Trauma Service, Centro Medico Fitz Roy, Argentina*; 4. *Geriatric Medicine Unit, Hospital Italiano de Buenos Aires, Argentina*)

Introduction : Dislocation is a feared complication following total hip replacement (THR) after fracture. We analyze in this study the effect of piriformis tendon preservation on reducing the dislocation rate. Method : 93 THRs were done using posterior approach and by the surgical team. All patients received the samiliar prosthetic design. After reaching the external rotators, the piriformis muscle wa identified and dissected on its inferior border from the gemellus superior and elevated by a retractor. Further stages were performed in the usual manner. Patients were followed up for a mean of 5 years. Results : 93 THRs were done for 93 patients, 65 females and 28 were males with a mean age of 83.2. Mean operative time 72 minutes. Average stay at hospital 14 days. Follow up 5-11 years, average 6.2. No intraoperative or long-term complications were found while preserving the piriformis. Postoperative hip X-rays showed good positioning of both the femoral and acetabular components. No patient died during surgery or in hospital stay. No cases of dislocation were identified after a mean follow-up of 5 years. Conclusion : Preservation of the piriformis tendon during the postero-lateral approach in THR is a possible surgical technique and reproducible position of components. It follows an anatomical intermuscular plan and permits full exposure of both the proximal femur and the acetabulum. Compared to the literature, preserving the piriformis tendon seems to be superior to repairing it in terms of dislocation of THR. Keywords : hip fracture dislocation

PP25 C-091

PREDICTORS OF EARLY POST-OPERATIVE COMPLICATIONS IN ELDERLY HIP FRACTURE PATIENTS IN SINGAPORE

Rani RAMASON¹, Mei Sian CHONG¹, Joanne KUA¹, Noor Hafizah ISMAIL¹, Wei Chin WONG¹, Natesan SELVAGANAPATHI¹, Ganesan NAIDU² (1. *Geriatric Medicine, Tan Tock Seng Hospital, Singapore*; 2. *Orthopaedic Surgery, Tan Tock Seng Hospital, Singapore*)

Introduction : The objective of the study was to assess if the conventional American Society of Anaesthesiologists (ASA) assessment predicted early post-operative complications in hip fracture elderly patients in Singapore. Method : We prospectively collected data on hip fracture patients admitted to the Orthogeriatric Service (1st September 2009 - 31st August 2010). We excluded those with non-fragility fractures and conservatively managed hip fractures. Data on demographics, co-morbidities, pre-fracture functional status (defined

as assistance required in instrumental and basic activities of daily living before fracture) and early post-operative complications (defined as post-operative complications during in-patient stay) were collected. Results : 358 patients were included. The mean age was 78 years (SD 8.8), of whom 69.9% (n=249) were women. 98% (n=351) were ASA III-IV. The early post-operative complication rate was 32.7% with urinary tract infection (13.1%), delirium (5.6%) and acute retention of urine (5.6%) being the most common. Univariate analyses showed that functional dependence (P<0.05) significantly predicted early post-operative complications. However, Charlson Co-morbidity Index Score and functional dependence were the only significant predictors of early post-operative complications in the multivariate model (P<0.05). Interestingly, ASA score did not significantly predict early post-operative complications. Conclusion : The ASA class once thought to be strongly associated with complications after hip fracture surgery was not a good predictor of early post-operative complications. This initial work warrants further study into a predictive model which encompasses function and co-morbidities potentially through a frailty measure to allow more accurate prediction of post-operative complications for this group of elderly hip fracture patients. Keywords : Hip fracture, post-operative, complications

PP25 C-092

THE ASSOCIATION BETWEEN SPECIFIC TYPES OF HABITUAL EXERCISE AND BONE MINERAL DENSITY AMONG COMMUNITY DWELLING ADULTS IN TAIWAN

Kang Ting TSAI¹, Wan Ting HSIEH¹, Fang Chi WANG¹, Jan Nan WANG² (1. *Geriatrics/Family Medicine, Chi Mei Medical Center, Taiwan*; 2. *Family Medicine, Chi Mei Medical Center, Taiwan*)

Introduction : We aim to explore the association between specific types of common habitual exercise and bone mineral density (BMD). Method : We analyzed data in a group of subjects receiving health exam in a tertiary medical center in Tainan, Taiwan. The participants were relatively well fit and high functioning. Exercise habits were collected through questionnaire, including the types, frequency and duration. Types of exercise were further classified into eight categories, including jogging, walking, climbing, swimming, ball games, biking, gymnastics or others. BMD were assessed by Dual-Energy X-ray absorptiometry (DXA). Results : There were 1024 subjects included in our study, the mean age was 50.34 (20~85) years, and 646 male participants represented 63.1% of the study population. Among the study participants, 597 (58.3%) subjects had a habitual exercise more than once a week, and 571 (55.8%) subjects had their exercise duration more than 30 minutes each time. After adjusting with age, gender, and body mass index, we found a significantly lower risk of osteopenia or osteoporosis in subjects who had habitual exercise more than once a week (Odds ratio (OR): 0.369, 95% confidence interval (CI): 0.148~0.920) and who exercise more than 30 minutes each time (OR: 0.420, 95%CI: 0.180~0.982). Among the eight categories of exercise, subjects with normal BMD preferred higher impact exercise (such as jogging or ball games) and subjects with osteopenia or osteoporosis reported higher rate of walking. Conclusion: Higher frequency, longer duration and specific higher impact common types of exercise were associated with lower risk of osteopenia or osteoporosis. Keywords : exercise, bone mineral density, osteoporosis

PP25 C-093

ARTHRITIS, DEPRESSION, AND FALLS AMONG COMMUNITY DWELLING OLDER ADULTS: EVIDENCE FROM THE HEALTH AND RETIREMENT STUDY

Lien QUACH, Jeffrey A BURR (*Gerontology, University of*

Massachusetts, USA)

Introduction : Little is known about how arthritis and major depression are associated with falls among older persons. The objectives of this study are to investigate the association of different types of arthritis and falls and to determine whether major depression conditions the association between arthritis and fall risk. **Method :** The study used data from the 2008 Health and Retirement Study, a nationally representative sample in the United States (n=7222, mean age 75, 63% female). Falls were measured by self-report (yes/no). Arthritis was measured through self-report as physician-diagnosed. Major depression was measured with the Center for Epidemiologic Studies Depression Scale (CES-D-8) (3 or more). Main effect and interaction logistic regression models were estimated to determine fall risk. **Results :** Descriptive analyses showed 42% of the sample experienced at least one fall in the two years prior to interview. The prevalence of osteoarthritis (OA) was 21.9%; 4.6% had rheumatoid arthritis (RA); 2.3% had both OA and RA, and 7.8% reported other forms of arthritis. More than one-fifth of respondents had major depression. OA increased the odds of falling by 17%, adjusting for age, gender, race, education, height, alcohol use, pain, vision impairment, functional limitation, physical activities, major depression, cognition, psychiatric medications, and health conditions. Major depression increased the odds of falling by 29%. **Conclusion :** OA and major depression were independently associated with falls. No evidence was found for the interaction between type of arthritis and fall risk. The results suggested that fall prevention programs should include attention to managing OA and major depression among older adults. **Keywords :** Arthritis, Depression, and Falls

PP25 C-094

ASSOCIATION BETWEEN BONE DENSITY, ANTHROPOMETRIC MEASUREMENTS AND PHYSICAL PERFORMANCE IN THE COMMUNITY-DWELLING OLDEST OLD IN JAPAN

Michiyo TAKAYAMA¹, Yasumichi ARAI², Yukiko ABE², Yuko OGUMA³, Nobuyoshi HIROSE² (1. Geriatric Medicine, Center for Preventive Medicine, Keio University School of Medicine, Japan; 2. Geriatric Medicine, Keio University School of Medicine, Japan; 3. Sports Medicine Research Center and Graduate School of Health Management, Keio University, Japan)

Introduction : As population of the aged has been expanding rapidly, one of the major concerns is how to maintain the health and function in late life. It is well-known that fracture is main cause for bed-ridden elderly. It is important to prevent fracture not only for individual level but also for social level. The objective of this study was to examine the association of calcaneal osteo-sono index (OSI), anthropometric measurements and physical performance in the community-dwelling oldest old who are at a high risk for physical disability. **Method :** This study is a part of the Tokyo Oldest Old Survey on Total Health, which is a community-based study among the oldest old living in Japan. Two hundred-seventy five individuals (122 men and 153 women) aged 85 years or older were assessed for OSI, anthropometric measurements, and physical performance including grip power (GP), timed up & go (TUG), and chair standing. Cross sectional relationship of OSI with measured parameters was assessed by Spearman's correlation coefficient. **Results :** For both men and women, OSI was significantly correlated with mid-arm circumference (MAC) and calf circumference (CC), (r=0.38 and r=0.39 for men, r=0.25 and r=0.41 for women, MAC and CC, respectively). Also, OSI was significantly correlated with GP and TUG (r=0.24 and r=-0.16 for men, r=0.25 and r=-0.22 for women, GP and TUG, respectively). **Conclusion :** These results

suggest that bone density is associated with musculoskeletal function in the oldest old. **Keywords :** bone density, musculoskeletal function, the oldest old

PP25 C-095

DETERMINATION OF THE EFFECT OF BODY MASS INDEX IN THE ELDERLY WITH OSTEOPOROSIS ON PAIN AND FUNCTIONAL CAPACITY

Betulay KILIC¹, Nalan AKBAYRAK¹, Huseym DORUK² (1. School of Nursing, Gulhane Military Medical Academy, Turkey; 2. Geriatrics, Gulhane Military Medical Academy, Turkey)

Introduction : This study was done as a cross-sectional study to determination of the effect of body mass index in the elderly with osteoporosis on pain and functional capacity. **Method :** The research was carried out in GATA, department of geriatrics polyclinic between December 2010 and May 2011. The sample of the study is consisted of 96 individuals. Patients were divided into four groups as according to body mass index. The data were obtained from Sociodemographic Data Collection Form, Six-minute walking test and Visual Analog Scale (VAS). **Results :** Average age of ninety-six participants, who constituted the sample of the research is 77.38±6.39. 77.1% of participants are women. 15.6% of patients are thin, 24% of patients are ideal weight, 29.2% of patients are fat, 31.3% of patients are obese. 85.4% of the elderly with osteoporosis participants in research declared that they feeled pain. When compared the participants's scores of body mass index and bone mineral density, L2-L4 bone mineral density findings of patients showed meaningful difference to femoral neck, total femoral and t score body mass index (F=2.900 p=0.039), (F=5.948 p=0.001), (F=8.776 p=0.001), (F=6.700 p=0.001). When compared the participants's scores of body mass index and 6-minute walking distance, statistical meaningful difference was found between patient groups and walking distance (F=6.631 p=0.001). **Conclusion :** It was determined that when body mass index in the elderly with osteoporosis reduced, bone mineral density reduced and functional capacity reduced. There was no relationship between pain and body mass index but, exercise reduced pain. **Keywords :** elderly, osteoporosis, functional capacity

PP25 C-096

PHYSICAL PERFORMANCE AND ITS ASSOCIATED FACTORS IN HONG KONG ELDERLY WITH KNEE OSTEOARTHRITIS

Eva SIU (Department of Health, Hong Kong)

Introduction : Physical performances (PP) are commonly affected in elderly with knee osteoarthritis (OA knee). This study aimed to measure PP of elderly with OA knee in Elderly Health Centres (EHCs) of Hong Kong and compare with published data. Factors affecting PP of elderly with OA knee were investigated. **Method :** Subjects with OA knee were recruited by using convenient sampling from three EHCs. PP was measured by Timed Up and Go (TUG) for mobility as well as 30-second Chair Stand (CS) for lower body strength. Data on socio-demographics, medical status, psychological factors and clinical knee assessment were collected. PP was compared with healthy population using t-test. Multiple linear regressions were performed with TUG and CS as the dependent measures. **Results :** 199 subjects (mean age 76 years) were included in the study. When compared with previous normative values, PP of elders was poorer in OA knee population. After adjustment for age and gender, poorer physical performance among OA knee patients were associated with more co-morbidities, swelling of the knee joint, decreased range of knee joint movement, increased perceived pain, increased exertion levels and poor balance.

In contrast, a physically active lifestyle is associated with better physical performance. Conclusion : This study provides evidence on the beneficial effects of physical activity and helps to dispel the myths that physical activity should be avoided among elders suffering from OA knee. Keywords : physical performance, osteoarthritis

PP25 C-097

A CROSS-SECTIONAL STUDY OF BONE DENSITY AND ASSOCIATED FACTORS AMONG MEN

Yin-Ming LI¹, Hui-Ling LAI² (1. Family Medicine, Buddhist Tzu Chi General hospital, Tzu Chi university, Taiwan; 2. Nursing, Buddhist Tzu Chi General Hospital, Tzu Chi University, Taiwan)

Introduction : Osteoporosis in men is substantially underestimated and undertreated worldwide. We aimed to assess the bone mineral density (BMD) and predicting factors of low BMD in community dwelling men. Method : This cross-sectional study was conducted from Jan 2004 to November 2005. The subjects were 519 men from 30 to 79 years old who underwent a checkup at a teaching hospital in eastern Taiwan. Anthropometric and lifestyle factors were investigated using a standard self-reported questionnaire. Bone mineral density of the posterior-anterior lumbar spine (L1- L4) (BMD) was measured by dual energy x-ray absorptiometry. Age groups were stratified. Results : The mean BMD in the 519 subjects was 0.951 g/cm², with no significant difference between age groups. The BMDL was correlated positively with body mass index (BMI) ($r=0.22$, $P<0.001$). Of the 390 men aged 50 or older, 17.4% had an osteoporotic lumbar spine. Their mean age was 59.4 years (SD 6.3), with a mean BMD of 0.758 g/cm², and a mean BMI of 23.1 (SD 3.5). Low body mass was noted as the unique factor associated with osteoporosis in multivariate analysis , after controlling for risk factors such as aging, smoking, alcohol intake and low physical activity. Men with a BMI less than 22.9 (the 25th percentile) were 2.9 times more likely to have osteoporosis than those with a higher BMI. Conclusion : Low bone mass is not uncommon in men in Taiwan. A low body mass index was a risk factor. Further investigation of the bone health of men and the effects of environmental factors is crucial. Keywords : Bone density, Men, Osteoporosis

INDOOR LIFE-SPACE MOBILITY CORRELATES WITH OUTDOOR LIFE-SPACE MOBILITY IN ELDERLY INDIVIDUALS WITH DIFFICULTY TO PERFORM OUTDOOR ACTIVITIES

Hiroyuki HASHIDATE¹, Takeshi OHNUMA², Keisuke SAWADA³, Tomoko INOUE³, Satomi SHIMAZAKI³, Miyuki CHIBA³, Norio SASAMOTO⁴ (1. Department of Physical Therapy, School of Health Sciences, Kyorin University, Japan; 2. Department of Physical Therapy, Itabashi Rehabili Home Visit Nursing Station, Japan; 3. Ohkuni Home-Visit Rehabilitation, Sasamotokai Medical Corporation, Japan; 4. Yamanashi Care Academy, Sasamotokai Medical Corporation, Japan)

Introduction : Enhancement of indoor life-space mobility may be important to improve outdoor life-space mobility in older individuals who have difficulty performing outdoor activities. The purpose of this study was to examine relationship between indoor life-space mobility at home and outdoor life-space mobility. Method : The participants were 52 community-dwelling older individuals who utilized home-visit rehabilitation. Indoor life-space mobility was assessed by home-based life-space assessment (Hb-LSA) which was scored by assigning a value to each of 5 indoor life-space levels and then summing the 5 scores. The each indoor life-space level scores were obtained by

multiplying the level number (1=on the bed, 2=inside bedroom, 3=inside house, 4=outside house but inside site of house, 5=outside site of house) by a value for independence (2=independent, 1.5=used equipment, 1=had personal assistance) times a value for frequency of movement. Life-space assessment (LSA) was used to assess outdoor life-space mobility. Results : Hb-LSA and LSA score were 71.5 ± 22.8 points and 32.9 ± 13.4 points, respectively. Single regression analysis showed significant correlations between LSA and Hb-LSA ($r=0.862$), each indoor life-space level score (level 1 ($r=0.346$), 2 ($r=0.449$), 3 ($r=0.514$), 4 ($r=0.762$), and 5 ($r=0.891$)). The multiple regression analysis revealed that explanatory variables for LSA were indoor life-space level score for level 3, 4, and 5. Conclusion : Indoor life-space mobility was correlated with outdoor life-space mobility. Indoor activities outside bedroom were important to facilitate outdoor activities in older individuals who have difficulty performing outdoor activities. Keywords : aged, indoor life-space, outdoor life-space

INTERACTIVE VIRTUAL REALITY WII IN GERIATRIC DAY HOSPITAL: A STUDY TO ASSESS ITS FEASIBILITY, ACCEPTABILITY AND EFFICACY

Hon Wai Felix CHAN (Medicine & Geriatrics, TWGHs Fung Yiu King Hospital, Hospital Authority, Hong Kong)

Introduction : Rehabilitation using interactive virtual reality Wii (Wii-IVR) was shown to be feasible in patients with different medical problems, but there was no study looking at its use in Geriatric day hospital (GDH). To test the feasibility, acceptability and efficacy of Wii-IVR in GDH. Method : It was a clinical trial with matched historic-controls. Patients of a GDH were recruited to participate in Wii-IVR by playing "Wii Fit". Participants used Wii controller to perform movements involved in arm-ergometer. Each participant received 8 sessions of Wii-IVR on top of conventional GDH rehabilitations. Feasibility was assessed by the total time receiving Wii-IVR, percentage maximal heart rate reserve (%MHR) and Borg perceived exertion scale (BS) after participating in Wii-IVR. %MHR and BS were compared with that after performing same duration of arm-ergometer. Acceptability was assessed by an interviewer-administered questionnaire. Efficacy was assessed by comparing improvements in Functional Independence Measure (FIM) between participants and matched historic-controls, who received conventional GDH rehabilitations only. Results : 30 patients completed the study. Participants completed a total of 1941 minutes of event-free Wii-IVR. The mean %MHR was $15.9\% \pm 9.9\%$ and the mean BS was 7.9 ± 2.3 . There was no significant difference in %MHR and BS between participating in Wii-IVR and arm ergometer. Most participants found Wii-IVR similar to arm ergometer and would like to continue Wii-IVR if they had Wii at home. Improvements in FIM of participants were significantly more than that of historic-controls. Conclusion : Wii-IVR in GDH was feasible and most participants accepted it. Participants had more improvements in FIM. Keywords : Rehabilitation, Geriatric Day Hospital, Virtual Reality,

EFFECTS OF SHOCK WAVE THERAPY ON REHABILITATION OF AGES WITH NON-CALCIFIC TENDINOPATHY OF ROTATOR CUFF

Mao-Hsiung HUANG¹, Tien-Wen CHEN¹, Chia-Hsin CHEN¹, Chia-Ling LEE², Ming-Cheng WENG¹, Shih-Hung CHUANG² (1. Department of Physical Medicine and Rehabilitation, Kaohsiung Medical University Hospital, Taiwan; 2. Department of Physical Medicine and Rehabilitation, Hsiao-Kang Hospital, Kaohsiung Medical University, Taiwan)

Introduction : High incidence of shoulder pain in ages which suffering their activity of daily life, and the most of them were noncalcific tendinopathy. There is evidence supporting the use of extracorporeal shock wave therapy (ESWT) in calcific tendinopathy of the rotator cuff, but the best current evidence does not support its use in non-calcifying tendinopathy. We conducted a randomized placebo-controlled trial to investigate the effects of low energy ESWT on rehabilitation of ages with non-calcifying tendinopathy of subscapular.

Method : 30 patients with non-calcifying supraspinatus tendinopathy (NCST) were randomized to an active or a sham treatment group. Physical, blood, roentgenographic, and musculoskeletal sonography were conducted to verify that patients met the inclusion and exclusion criteria. These examinations were repeated six and twelve weeks after treatments. Effectiveness was determined by comparison of the mean improvement in the Constant and Murley score (CMS) between the treatment and the placebo groups at three months.

Results : All the patients completed the investigation protocol. At the final follow-up, significant improvement in the total CMS score and most of the CMS subscales was observed in the ESWT group when compared to the baseline values. Significantly higher total CMS, and significantly higher scores for CMS pain and ROM were observed in the ESWT group when compared to the controlled.

Conclusion : Patients suffering from NCST may benefit from low energy ESWT. The application protocol of ESWT is likely to play a key-role in a successful rehabilitation. Further study should be warranted on the long-term effects of NCST.

Keywords : Shock wave therapy, noncalcific tendinopathy, rotator cuff

EFFECT OF AEROBIC TRAINING AND THE COMBINATION OF RESISTANCE AND AEROBIC EXERCISES IN INFLAMMATORY ACTIVITY IN HYPERTENSIVE OLDER INDIVIDUALS

Leandra Goncalves LIMA, Jose Maria Thiago BONARDI, Paulo Louzada JUNIOR, Julio Cesar MORIGUTI, Eduardo FERRIOLLI, Nereida Kilza Costa LIMA (*Medical Clinic, Faculty of Medicine Ribeirao Preto, Brazil*)

Introduction : Increased inflammatory activity is strongly associated with sarcopenia, weigh loss and susceptibility to infection. The aim of this study was to determine the effect of aerobic training (AT) and resistance aerobic training (RAT) in hypertensive older individuals on serum levels of interleukin 6 (IL-6) and tumor necrosis factor α (TNF- α). **Method :** Forty-four volunteers were randomly divided into 3 groups: Group 1 - TA, Group 2: ART and Group 3: Control. The protocol lasted for 12 weeks and sessions were performed with a frequency of 3 times weekly, with the intensity and duration progressively increased over the course of training. IL6 and TNF α levels were analyzed by ELISA (Kits R & D Systems, Minneapolis, MN, USA) before the intervention (baseline) and after 12 weeks of training. **Statistical Analysis:** ANOVA and Fisher's exact test. **Results :** Mean age was 68.5 ± 5.1 years, with no difference between groups ($p = 0.44$), with a predominance of women (84%) in the 3 groups ($p = 0.32$). There was no difference between groups regarding baseline values of TNF α and IL6. After training, the TNF α remained similar between groups and there was a greater reduction in serum IL6 in G1 (G1: 11 ± 9 pg / mL; G2: 14 ± 9 pg / dL and G3: 22 ± 14 pg / dl , $p = 0.026$, Bonferroni: G1 vs G3 $p = 0.029$). **Conclusion :** Concluding, the TA significantly reduced serum levels of IL6 after 12 weeks of training. Supported by FAPESP and CNPq. **Keywords :** interleukin 6 (IL-6), tumor necrosis factor α (TNF- α), Exercise

PP25 C-102

DEVELOPMENT OF MOBILITY AND QUALITY OF LIFE AFTER DISCHARGE FROM A CLINICAL GERIATRIC SETTING

Steve STRUPEIT¹, Karin WOLF-OSTERMANN², Arne BUSS¹ (*1. Life Sciences, HAW Hamburg - University of Applied Science, Germany; 2. Nursing Science, ASH Berlin, Germany*)

Introduction : The loss of mobility is a major risk factor for disability and/or nursing care dependency and thus also for the admittance to a long-term nursing home (Brunnett, Hasseler, Strupeit, & Deneke, 2009). After discharge from rehabilitation, as a result of illnesses associated with mobility impairment, needs of those affected are different. Some stay at home with or without professional care and some have to be admitted to a nursing home (Gaugler, Duval, Anderson, & Kane, 2007). **Method :** Quality of life was assessed using the WHOQOL-Bref, activities of daily living (ADL) were measured using the Barthel-Index (BI). Independent variables were demographic characteristics as well as cognitive impairment, nutritional status and self-efficacy. Descriptive statistics and generalized linear models were used for statistical analysis. **Results :** Functional status as well as overall quality of life increased from admission to 6 months post-admission but decreased at 12 months follow-up however statistical analyses did not show significant changes. Quality of life significantly increased in psychological domain ($p = .010$). Men showed a better functional status over time ($p = .010$). Higher quality of life-scores were associated with higher MMSE ($p = .031$)- and self-efficacy-scores ($p = .019$) at admission. **Conclusion :** The Findings of this study suggest a need of interventions with the aim of improving mobility and quality of life in the population studied especially after 6 months discharge. Gender differences should be considered in planning and implementing programs. **Keywords :** mobility, quality of life, functional impairment

SEDENTARY BEHAVIOUR, STRENGTH AND MUSCULAR QUALITY OF NON-FRAIL AND FRAIL ELDERLY

Jose Ailton Oliveira CARNEIRO¹, Andre Filipe Junqueira Dos SANTOS², Juliana Cristina Lemos De Souza MARCHESI¹, Fernanda Pinheiro Amador Dos Santos PESSANHA², Rutineia Fatima MICHELETTO², Karina PFRIMER², Nereida Kilza Costa LIMA², Julio Cesar MORIGUTI², Eduardo FERRIOLLI² (*1. Department of Internal Medicine, University of Sao Paulo, Brazil; 2. Internal Medicine, University of Sao Paulo, Brazil*)

Introduction : Sedentary behaviour (SB), defined as time spent sitting or lying, has been shown to be a major modifiable risk factor for chronic disease, disablement and frailty. **Objective:** To study sedentary behaviour, strength and muscular quality of non-frail and frail elderly separated by gender. **Method :** Exploratory cross-sectional study. **Participants of the study:** 36 elderly (non-frail 12 women and 7 men and 10 women and 7 men frail) aged over 65 years. Sedentary behaviour (sitting/lying spent time) was evaluated using an activity monitor (ActivPAL). The elderly were considered frail according with the criteria of Fried et al. The appendicular skeletal muscle mass (ASMM) was evaluated using dual-energy X-ray absorptiometry (DXA), handgrip strength (HS) and lower limb strength (LLS) (isometric chair) were measured. The muscle quality (MQ) was calculated dividing the muscle strength of the limb by the muscle mass of the corresponding limb. **Results :** Age and mean BMI of the groups were: non-frail elderly women 72.1 ± 5.6 years and 27.4 ± 5.2 kg/m²; frail elderly women 77.6 ± 5.7 years and 31.1 ± 5.3 kg/m²; non-frail elderly men 72.7 ± 4.8 years and 25.5 ± 5.3 kg/m²; frail elderly men 79.1 ± 6.8 years and 25.0 ± 5.3 kg/m². The frail elderly groups presented

higher sedentary time than the non-frail elderly groups ($p < 0.05$ and $p < 0.001$), respectively. The ASMM presented no significant differences between the groups. The frail elderly groups had worse performance in the HS, LLS and upper and lower limb muscle quality ($p < 0.05$) compared to the non-frail elderly groups. Conclusion : The frail elderly groups presented higher sedentary time and worse muscle strength and quality. Keywords : Elderly, frailty, sedentary behaviour

UNDERSTANDING AND IMPROVING PATIENT EXPERIENCE OF GOUT IN PRIMARY CARE

Jane Crompton RICHARDSON, Christian David MALLEEN, Jennifer LIDDLE, Edward RODDY (*Arthritis Research UK Primary Care Centre, Keele University, United Kingdom*)

Introduction : Gout is one of the most common arthritic conditions in primary care. There is a range of helpful treatments, but these are not always used effectively by patients. The reasons for this are not known. Lay understanding of gout can create problems with stigma, shame and identity and sufferers may trivialise the impact of the disease. This can lead to undertreatment, allowing the gout to develop further. Previous research has found that sufferers want more information about the condition and treatment. Method : The aim is to enhance understanding of people's experiences of living with gout, in order to improve treatment and outcomes. A secondary aim is to provide an information resource, through the website HealthTalkOnline, for those with gout, families, friends and health professionals. The study uses qualitative research methods to explore United Kingdom patients' experience of gout, carrying out semi-structured interviews with a diverse sample of 40-50 people. Interviews are video-recorded and transcribed. A thematic analysis is carried out and summaries written for presentation on the website. Results : Results will present oral histories of each person's experience of gout, identifying respondents' own concerns, meanings and priorities. Findings will also be presented on issues including communication with health professionals, information and support needs, treatment decisions and use of complementary approaches. Conclusion : Our research aims to explain and fill the gap between clinical/ physiological knowledge and patient experience, with the aim of improving patient experience. Keywords : gout, patient experience

PP25 C-105

ADDITIVE EFFECT OF ISOFLAVONES WITH AN EXERCISE TRAINING PROGRAM ON INFLAMMATORY CYTOKINES AND BODY COMPOSITION IN OVERWEIGHT OR OBESE POSTMENOPAUSAL WOMEN? A RANDOMIZED CONTROLLED TRIAL

Johann LEBON¹, Stephane CHOQUETTE¹, Eleonor RIESCO¹, Daniel TESSIER², Isabelle J. DIONNE¹ (*1. Centre de Recherche sur le Vieillessement (CSSS-IUGS), University of Sherbrooke, Canada; 2. Faculty of Medicine and Health Sciences, University of Sherbrooke, Canada*)

Introduction : Exercise has been shown to reduce inflammation and body composition. However, when combined with isoflavones (ISO), results are discrepant: 1) aerobic+ISO: significant reduction in TNF- α and 2) resistance training or mixed exercise (Ex)+ISO: no additive effect on CRP and body composition. Nevertheless, mixed Ex+ISO produced significant improvement in body fat and lean mass, both producers of inflammatory markers such as TNF- α and IL-6. To investigate the synergistic effect of isoflavones and a 6-month mixed exercise program on IL-6, TNF- α , and CRP and body composition in overweight or obese postmenopausal women. Method : Thirty-four

postmenopausal women (50 to 70 years) were randomly assigned to Ex+placebo (Ex+PLA=15) or Ex+isoflavones (Ex+ISO=19). At baseline and after 6 months, waist and hip circumference (WC and HC), fat mass (total, %, trunk and leg FM), fat-free mass (total and leg FFM) and muscle mass index (MMI) were assessed. Inflammatory markers (Elisa) were obtained after a 12h overnight fast. Results : WC, %FM and muscle mass (IMM and total FFM) changed significantly in both groups. However, only Ex+ISO showed significant changes in FM or FFM distribution (HC: -2,51 cm, $p=0,019$; leg FM: -1,16kg, $p=0,037$; trunk FM: -0,72kg, $p=0,006$; total FM: -1,70kg, $p < 0,0001$; leg FFM: +0,56kg, $p=0,022$ and total FFM: +0,88kg, $p=0,018$). In accordance, only Ex+ISO showed significant changes in inflammatory biomarkers (CRP: -1,14mg/L, $p=0,029$ and TNF- α : +0,29pg/mL, $p=0,010$). Conclusion : The combination of isoflavones and mixed exercise seems to enhance the beneficial effects of mixed exercise on some inflammatory biomarkers, potentially through beneficial changes in fat and lean mass distribution in postmenopausal women. Keywords: Cytokines, Isoflavones, Exercise

EFFECTS OF LOW-LEVEL DIODE LASER IRRADIATION ON EXPRESSIONS OF GENES RELATED TO ALVEOLAR BONE HEALING OF EXTRACTION SOCKETS IN AGED RATS

Joon Bong PARK¹, Kyung Lhi KANG¹, Yumi CHOI² (*1. Department of Periodontology and Institute of Oral Biology, School of Dentistry, Kyung Hee University, Korea; 2. Department of Periodontology, School of Dentistry, Kyung Hee University, Korea*)

Introduction : With the explosive increase of the number of the elderly, the number of patients with senile diseases has also risen. The decreased capacity for wound healing of aged people can cause additional complications and discomforts. The aim of this study is to evaluate the effects of low-level laser therapy (LLLT) with 980-nm diode laser on genes related to osteogenesis during the healing of tooth extraction sockets in young and aged rats. Method : Twelve-week-old young rats ($n=12$) and 80-week-old aged rats ($n=12$) were used in this study. The left and right maxillary first molars of all rats were extracted and only right sockets were irradiated daily for 3, 5, 7 or 14 days with laser after extraction. Specimens acquired were evaluated with real time RT-PCR for quantitative analysis of genes related to osteogenesis, Runx2, collagen type I, osteocalcin(OCN), interleukin(IL)-1 β , IL-4, IL-6, transforming growth factor(TGF)- β , receptor activator of nuclear factor kappa-B ligand (RANKL), osteoprotegerin (OPG), and tumor necrosis factor(TNF)- α . Results : The gene expressions of Runx2, collagen type I, OCN, TGF- β , RANKL, OPG, and IL-4 were increased in LLLT groups compared with those in non-LLLT groups for young and aged rats. The gene expressions of IL-1 β , IL-6, and TNF- α in LLLT groups were decreased compared with those in non-LLLT groups for young and aged rats. Conclusion : LLLT increased the expressions of genes related to bone formation and mineralization and decreased the expressions of genes related to inflammation and bone loss. Therefore, we suggest that LLLT can stimulate the alveolar bone healing in young and aged rats. Keywords : LLLT, diode laser, alveolar bone healing, biostimulation

BODY COMPOSITION AND SARCOPENIC STATUS IN LEPROSY SURVIVORS IN COMPARISON WITH GENERAL POPULATION

Won KIM¹, Hee Won PARK², Byung Kwan HWANG¹, Soon Ook BAE¹, Sun Gun CHUNG¹ (*1. Department of Rehabilitation Medicine,*

Seoul National University Hospital, Korea; 2. Department of Rehabilitation, Kangwon National University Hospital, Korea)

Introduction : Sarcopenia is related to metabolic syndromes and poor quality of life. Because of the chronic nature of the disease and relatively poor living environment, leprosy survivors might be in high risk sarcopenia. However, little is known about body compositions or sarcopenia of leprosy survivors. The aim of this study was to evaluate the body composition and sarcopenic conditions of leprosy survivors and compare with those of age, sex, height matched general population. **Method :** 31 leprosy survivors aged 65 years or over were recruited. We measured anthropometric parameters and conducted DEXA scans for body composition analysis. Control subjects were selected from the Fourth Korea National Health and Nutrition Examination Survey (2009) by direct sex matching and propensity score matching on age and height. We compared anthropometric and body composition parameters between leprosy survivors and sex, age, height matched controls. Sarcopenia was defined as modified skeletal muscle index (SMI) being lower than the mean value of sex-specific young normal people (20-39 years-of-age) by more than 2 standard deviations. **Results :** The leprosy survivor group showed statistically significant higher body mass index, body fat mass and body fat percentage than the control group. The modified SMI was significantly lower in the leprosy survivor group (25.78 % vs. 28.96 %). Sarcopenia was more frequently observed in the leprosy survivor group than control group. **Conclusion :** Leprosy survivors showed higher BMI, higher body fat mass, higher body fat percentage and lower SMI than general population. This results suggest that sarcopenia might be more frequent in leprosy survivors than general population. **Keywords :** sarcopenia

THE EFFECT OF ACUPUNCTURE ON PAIN AND DEPRESSIVE SYMPTOMS OF ELDERLY PATIENTS

Yolanda Maria GARCIA¹, Miriam Gondim Meira TIBO², Lidiane Midori KUMAGAI³, Bernardo AYRES⁴, Douglas HIRAOKA³, Helga SILVA³, Wu Tu HSING⁵, Wilson JACOB F¹ (1. Geriatrics Division of Clinical Medicine Department, Sao Paulo University Medical School, Brazil; 2. Geriatrics Division of Clinical Medicine Department, University of Sao Paulo Medical School, Brazil; 3. Acupuncture Center, Clinics Hospital - Medical School of Sao Paulo University, Brazil; 4. Acupuncture Center, Clinics Hospital - Medical School of Sao Paulo University, Brazil; 5. Patology, Sao Paulo University Medical School, Brazil)

Introduction : Pain and depressive symptoms are common complaints of elderly patients. Those are preliminary results of an ongoing study to test efficacy and endurance of acupuncture in the elderly, for both problems. **Method :** Out-patients of the Geriatrics Division of Clinics Hospital of Medical School of Sao Paulo University, Brasil were studied. They were invited from a waiting list for treatment of pain with acupuncture. They were evaluated on eight different times: ten weeks before treatment, on first, tenth and 20th week of treatment, and every three months during one year follow-up. Evaluation included numerical rating of pain, in a range from zero to 10 and presence of two depressive symptoms of DSM-IV. Results were evaluated with ANOVA and Chi squared test, with a significance level of 5%. **Results:** 58 patients were included with a mean age of 75,16 (range of 64 to 93). Age did not vary between genders. Mean rates of pain, from first to 8th evaluations were: 7,23 ; 6,60; 3,822; 3,390; 3,875; 5,182; 6,136; 5,810; (p=0,000). Differences were significant between 2nd and 3rd (p=0,000); 2nd and 4th (p=0,000); 2nd and 5th (p=0,000); 2nd and 6th; (p=0,038); 2nd and 7th (p=0,040); 4th and 6th (p=0,007); 4th and

7th (p=0,000); 4th and 8th (p=0,002); depressive symptoms decreased significantly in frequency, returning to initial levels in the last evaluation. **Conclusion :** Results suggest that acupuncture is an efficient and lasting treatment for pain in the elderly, with positive impact on depressive symptoms. **Keywords :** pain, acupuncture, depression

FEAR OF FALLING AND QUALITY OF LIFE IN ELDERLY WITH CATARACT

Barbara Gazolla MACEDO¹, Fabio Lopes ROCHA², Leani Souza PEREIRA³, Aldemar Brandao CASTRO⁴ (1. Physiotherapy, IPSEMG, Brazil; 2. Psychiatry, IPSEMG, Brazil; 3. Physiotherapy, UFMG, Brazil; 4. Ophthalmology, IPSEMG, Brazil)

Introduction : Fear of falling is defined as low self-efficacy or self-confidence in one's own balance to avoid falls. It causes limitations in the physical and functional performance, balance and walking impairment, and negative impact on quality of life. Visual deficit is one of the factors that contribute to falls and fear of falling. **Method :** This is a observational and transversal study. 139 elderly patients with cataract were included. Interviews were made by means of the Falls Efficacy Scale International (FES-I Brasil) to evaluate the concern with falling. Vision-related quality of life was assessed through the Visual Function Questionnaire (VFQ). **Results :** Fear of falling was proportional to the functional visual impairment and to the vision-related quality of life (p=0,00 and p=0.003, Kruskal-Wallis). **Conclusion :** Elderly patients with cataract and fear of falling show less self-confidence in their balance to avoid falls and worst functional vision and related-vision quality of life. **Keywords :** fear of falling, vision, quality of life

PP25 C-110

CHRONIC EXERCISE DIFFERENTIALLY IMPACTS PERCEPTUAL OR MOTOR INHIBITION AS A FUNCTION OF AGE: A CROSS-SECTIONAL STUDY

Cedric T. ALBINET¹, Geoffroy BOUCARD¹, Fabienne COLLETTE², Cedric A. BOUQUET¹, Michel AUDIFFREN¹ (1. CerCA, CNRS, University of Poitiers, France; 2. Unite de Neuropsychologie, Universite de Liege, Belgium)

Introduction : The objective of this study was to evaluate the influence of age and regular physical activity (PA) on the performance of cognitive tasks differentially assessing perceptual and motor inhibition. **Method :** Twenty-six young (Y, 20±2 yrs) and 24 older (O, 72±3 yrs) were classified as physically active (A) or sedentary (S), according to measures of past (hours/week and METs-h/week) and present (steps/day and time spent/day in moderate to vigorous PA) PA. They performed the tasks developed by Nassauer and Halperin (2003), which assessed perceptual and motor inhibition. Performance in the inhibition tasks was assessed by Reaction Time (RT in ms) and response accuracy (% of correct responses) as a function of condition (no conflict vs. perceptual or motor conflict). **Results :** Overall, older were slower than young adults, and active people were faster than sedentary people. The results showed that PA impacted perceptual inhibition in the young participants and motor inhibition in the older participants. In the perceptual conflict condition, YA were significantly (p<0.05) faster (485±64 ms) than YS (550±69 ms), although there was no RT difference in the no-conflict condition. In the motor conflict condition, the OA group was significantly (p<0.05) more accurate (95%) than the OS group (91%) and tended to be faster (693±154 ms vs. 734±84 ms; p=0.09). **Conclusion :** The effects of PA on inhibition appear to be moderated by both age and type of

inhibition measured, deserving future research to understand the functionality of this dissociation. Keywords : Physical activity, cognition, aging

PP25 C-111

PSYCHOMETRIC PROPERTIES OF THE CLOCK DRAWING TEST IN IRANIAN OLDER PEOPLE

Masoumeh SADEGHIPOUR ROODSARI¹, Ahmad Ali AKBARI KAMRANI², Mahshid FOROUGHAN³, Farahnaz MOHAMMADI SHAHBOLAGHI⁴, Masoud KARIMLO⁵ (1. PhD Student of Gerontology, University of Social Welfare and Rehabilitation Sciences, Iran; 2. Associate professor, Iranian Research Centre on Aging, University of Social Welfare and Rehabilitation Sciences, Iran; 3. Assistant Professor, Iranian Research Centre on Aging, University of Social Welfare and Rehabilitation Sciences, Iran; 4. Assistant Professor, Nursing Department, University of Social Welfare and Rehabilitation Sciences, Iran; 5. Associate Professor, Department of Biostatistics, University of Social Welfare and Rehabilitation Sciences, Iran)

Introduction : Clock Drawing Test (CDT) is a simple inexpensive cognitive screening tool which can be used in primary care settings delivering health services to the elderly. The aim of this study was to assess psychometric properties of the CDT in Iranian elderly population. Method : In this cross sectional study the CDT and Mini Mental State Examination (MMSE) were concurrently performed on 74 literate participants aged 60 and over. Participants were recruited from the clients of Iran Alzheimer's Association (30 demented patients and 44 non-demented clients, including other patients or care givers). The CDT was performed by two trained raters using Shulman's six points scoring method. Using SPSS version 20, reliability was assessed measuring kappa statistics as well as intra class correlation coefficient. Concurrent validity between CDT and MMSE were statistically analyzed by spearman's rank correlation coefficient. Sensitivity and specificity were also calculated. Results : Mean age of the participants was 72 years with a range of 60 to 90 and 37 (50%) of them were male. Spearman's rank correlation coefficient for MMSE and CDT scores was 0.782, statistically significant at $p < 0.001$. Kappa statistics for two raters CDT scores were 0.768 ($p < 0.001$). Intra class correlation coefficient was 0.964 ($p < 0.001$). The best cutoff point for this scoring method was 3 of 0-5 scores with best sensitivity (90%) and specificity (73%). Conclusion : : CDT is a valid and reliable test that can be used as a cognitive tool in Iranian population. Further studies are required for using the CDT in illiterate people to detect cognitive impairment. Keywords : Clock Drawing Test- MMSE - validity - reliability

FEASIBILITY OF THE CLEVELAND SCALE FOR ACTIVITIES OF DAILY LIVING IN ELDERLY JAPANESE INDIVIDUALS WITH COGNITIVE IMPAIRMENTS

Risa TAKAYAMA¹, Tomoko KAMIMURA² (1. Occupational Therapy, Shinshu University, Azumi-sougo Hospital, Japan; 2. School of Health Sciences, Shinshu University, Japan)

Introduction : With regard to inpatient rehabilitation programs for elderly patients with cognitive impairments, it is essential to obtain data about ADL performance before their hospitalization. CSADL is a standardized ADL scale for elderly patients with cognitive impairments, and it is rated by the caregivers of these patients. This study aimed to investigate the feasibility of using such a standardized scale in Japanese population. Method : The family caregivers of elderly inpatients with cognitive impairments rated their patients in

terms of their ADL performance before hospitalization using CSADL. After the scale was administered, the family caregivers were asked if they had any difficulties in answering them. The patients were also undergoing occupational therapy; therefore, the ratings were shared with occupational therapists (OTs) in charge of the patients, following which the OTs were questioned whether these ratings gave them any additional information and if they incorporated any changes in their patients' rehabilitation programs on the basis of these ratings. Results : A total of 8 family caregivers rated their patients (mean age 82.3 years [SD 2.3]) on the CSADL, and none of them faced any difficulties. All the OTs answered they could obtain additional information on their patients, including telephone, medications, shopping, hobbies, and social behavior. Two OTs answered they also changed their patients' rehabilitation program. Conclusion : This study suggests standardized ADL scales provide OTs with more comprehensive information about their patients' ADL, which can help them in improving inpatient rehabilitation programs. Furthermore, this study also demonstrates the feasibility of the CSADL in elderly Japanese population. Keywords : cognitive impairments, ADL, rehabilitation

APOLIPOPROTEIN E AND PHYSICAL FUNCTION AMONG OLDER PEOPLE WITH MILD COGNITIVE IMPAIRMENT

Takehiko DOI¹, Hiroyuki SHIMADA¹, Hyuma MAKIZAKO¹, Hyuntae PARK², Kota TSUTSUMIMOTO¹, Kazuki UEMURA¹, Daisuke YOSHIDA¹, Sangyoon LEE², Yuya ANAN¹, Tadashi ITO¹, Takao SUZUKI³ (1. Section for Health Promotion, National Center for Geriatrics and Gerontology, Japan; 2. Section for Physical Functioning Activation, National Center for Geriatrics and Gerontology, Japan; 3. Research Institute, National Center for Geriatrics and Gerontology, Japan)

Introduction : Mild cognitive impairment (MCI) is conceptualized as a prodromal of Alzheimer's disease (AD). Declined physical function was one of the risk factors for progression to AD, while genetic factor, especially apolipoprotein Eε4 allele (APOE4), was also risk of AD and a major confounder among MCI. However, the association between APOE4 and physical function among MCI was still unclear. To elucidate the association, we conducted the study to compare physical function between APOE4 carrier and non-carrier in MCI. Method : The study included 386 MCI subjects (mean age: 71.6 years) and was classified APOE4 carrier and APOE4 non-carrier groups. Subjects characteristics were measured in interview. Grip strength, five chair stands test, walking speed and six minutes walking test were measured as a physical function. Results : The prevalence of APOE4 carrier was 20.2% among older adults with MCI. In univariate analysis, walking speed was decreased in APOE4 carrier subjects compared to non-carrier ($p < 0.05$) and other measures of physical function were not significant different between groups. The differences of walking speed between groups remained after adjusted for covariates in multivariate analysis ($p < 0.05$). Conclusion : Our study revealed that APOE4 associated with physical function, particularly walking speed. This result suggested that measures related to walking speed among MCI would potentially have confounder of APOE4 among MCI subjects. Further studies were required to clarify relationship between physical function and genetic factor among MCI. Keywords : mild cognitive impairment, physical function, Apolipoprotein E

APOEε4 ALLELE FREQUENCY IN VARIOUS KINDS OF COGNITIVE IMPAIRMENTS IN 997 CASES

Yongxing MA, Yue ZHU, Qingwei RUAN, Peifang LU, Zhansun WANG (Department of Aging, Antiaging and Cognitive Function,

Shanghai Institute of Gerontology and Geriatrics, Affiliated Huadong Hospital, Shanghai Medical College, Fudan University, China)

Introduction : To observe the APOE genotypes in AAMI, MCI, AD and VD in large series. **Method :** AAMI [The diagnosis of AAMI met the generally used criteria (AAMI: Textbook of Geriatric neuropsychiatry. 1994, P145-158)]421 cases and 398 controls; MCI [(The diagnosis of MCI met the generally used criteria (MCI: JAGS 2000, 48:1601-1606)]307 cases and 675 controls; AD 205 cases and 200 controls, VD 60 cases and 248 controls. The clinical diagnosis of probable AD and VD were similar to the DSM-IV and NINCDS-ADRDA. APOE gene was amplified by PCR and the PCR product was digested with 5 units of Cfo I and was separated by a 20% polyacrylamide non-denaturing gel. **Results :** (1) AAMI: No significant difference between the allele frequency of APOEε4 in AAMI (6.89%, 58/842) and control group (7.04%, 56/796). (2) MCI : ①APOEε4 in MCI 9.12% (56/614), control group 6.44% (87/1350) ($X^2=4.48, P<0.05$); ②APOEε2: MCI 7.33% (45/614), control group 5.26% (71/1350) ($X^2=3.25, P>0.05$); ③APOEε3: MCI 83.55% (513/614), control group 88.30% (1192/1350) ($X^2=8.30, P<0.01$) ④APOEε4、APOEε2、APOEε3 allele frequency: $X^2=8.31, P<0.05$. (3) AD: APOEε4 allele frequency of AD and controls were 21.0% (86/410) and 7.75% (31/400), The allele frequency of APOEε2, 3 and 4 in the AD group was 6.8%, 72.2% and 21.0% respectively and 6.3%, 86.0% and 7.7% in controls, $X^2=29.5, P<0.001$. (4) APOEε4 allele frequency of VD 15.0% (18/120) and 7.5% (37/492) in controls, $P<0.05$. **Conclusion :** APOEε4 allele frequency of MCI, AD and VD were significantly higher than that of controls, but no significant difference between the allele frequency of APOEε4 in AAMI and control group were found. It is suggested that APOE genotype determination should be used clinically for diagnosis. **Keywords :** AAMI MCI Dementia APOE

COMPARISON OF THE SLUMS, CMMSE AND MOCA-B IN DETECTION OF COGNITIVE IMPAIRMENT IN CHINESE ELDERLY FROM GERIATRIC DEPARTMENT

Li CAO (Center of Gerontology and Geriatrics, West China hospital, Sichuan University, China)

Introduction : The Saint Louis University mental status examination (SLUMS) is rarely studied in Chinese. The aim of the study is to compare consistency of the SLUMS with the Chinese version of mini mental status examination (CMMSE) and the Beijing version of Montreal Cognitive Assessment (MoCA-B) in Chinese elderly. **Method :** 278 Chinese elderly from the geriatric department of a general hospital were screened for cognitive impairment, including dementia and mild cognitive impairment (MCI), using SLUMS, CMMSE and MoCA-B. The modified education level cutoffs in diagnostic criteria of SLUMS (mSLUMS) were also used. Values and judgment to the cognitive status from the scales were compared using spearman and kappa statistics respectively. **Results :** Spearman correlation coefficient between values of the scales were 0.747 (SLUMS vs CMMSE, $p<0.001$), 0.839 (SLUMS vs MoCA-B, $p<0.001$) and 0.773 (CMMSE vs MoCA-B, $p<0.001$). For judgment of dementia, kappa values were 0.462 (SLUMS vs CMMSE, $p<0.000$) and 0.484 (mSLUMS vs CMMSE, $p<0.000$). For MCI, kappa values were 0.123 (SLUMS vs CMMSE plus MoCA-B in parallel, $p=0.089$) and 0.148 (mSLUMS vs CMMSE plus MoCA-B in parallel, $p=0.031$), for total impaired cognitive status, kappa values were 0.562 (SLUMS

vs MoCA-B, $p<0.000$) and 0.650 (SLUMS vs MoCA-B, $p<0.000$). **Conclusion :** Findings from our study indicate that the scores of SLUMS are fairly consistent with MoCA-B and CMMSE in Chinese elderly. Discrepancies of classifications for cognitive status by SLUMS and the other 2 scales implies that further work is needed to explore optimal cutoffs of SLUMS for screening mild cognitive impairment and dementia in elderly Chinese. **Keywords :** SLUMS, cognitive impairment, Chinese

PP25 C-116
THE UTILIZATION OF AMBULATORY CARE BEFORE DIAGNOSIS OF ALZHEIMER'S DISEASE IN TAIWAN

Chia-Ming LI (Family Medicine, National Taiwan University Hospital, Bei-Hu Branch, Taiwan)

Introduction : To assess if ambulatory care utilization within three years before diagnosis of Alzheimer's disease patients is significantly different to non-Alzheimer's patients. **Method :** The data were drawn from 2005 National Health Insurance Research Database (NHIRD, 2005) from 1996 to 2007. A case-control design was employed. 845 patients treated with Alzheimer's disease medicine (cholinesterase inhibitor and NMDA receptor antagonist) were case group. The other 1,677 patients who randomly matched with age, sex, and Charlson index were control group. Ambulatory care utilization of case group within three consecutive years before diagnosis was explored and compared to that of the control group. **Results :** Alzheimer's disease patients significantly used more ambulatory care (neurology and psychiatry clinics, diagnosis fee, drug fee, treatment fee) than control group within the first year before diagnosis. Especially, drug fees within three consecutive years before diagnosis were all higher than the fees of control group significantly. **Conclusion :** Alzheimer's disease patients significantly use more ambulatory care than non-Alzheimer's patients before diagnosis. **Keywords :** Alzheimer's disease, ambulatory care utilization,

PP25 C-117
CLINICAL AND ECONOMIC BURDEN OF ALZHEIMER'S DISEASE IN THE USA

Claire TAKIZAWA (Health Economics, Nestle Health Science, Switzerland)

Introduction : Alzheimer is associated with high healthcare consumptions, both from direct and indirect cost perspective. This study aimed to identify the reported economic burden of Alzheimer disease (AD) in the USA. **Method :** Economic data were collected from publications and included both direct and indirect costs. **Results :** AD is the most common dementia, accounting for 50% to 70% of cases. Average per person Medicare costs for those with Alzheimer's and other dementias are three times higher than for those without these conditions (USD13,207 versus USD4,454 per beneficiary). Beneficiaries with Alzheimer's and other dementias had 3.4 times more hospital stays; their costs for hospital care were 3.2 times higher than the average for other Medicare beneficiaries (USD7,704 versus USD2,204). They also visited a physician 1.3 times more often than other Medicare beneficiaries. In 2011, 15.2 million family and friends provided 17.4 billion hours of unpaid care to those with Alzheimer's and other dementias care valued at USD210.5 billion. Due to the physical and emotional toll of caregiving on their own health, Alzheimer's and dementia caregivers had USD 8.7 billion in additional health care costs in 2011. In 2012, the direct costs of caring for those with Alzheimer's to American society will total an estimated USD200 billion, including USD140 billion in costs to Medicare and Medicaid. **Conclusion :** Alzheimer results in significant economic burden. Unless

something is done, the costs of Alzheimer's in 2050 are estimated to total \$1.1 trillion (today's dollars). Costs to Medicare and Medicaid will increase nearly 500%. Keywords : Alzheimer, Costs

TIME COURSE ANALYSIS OF VERBAL FLUENCY PROCESSING IN MILD AD PATIENTS: STORAGE LOSS, OR RETRIEVAL SLOWING?

Claudia RODRIGUEZ-ARANDA¹, Ann-Helen HOLMEN¹, Guro Strand THORBJORNSSEN¹, Stein Harald JOHNSEN², Knut WATERLOO³ (1. Dept. of Psychology, University of Tromsø, Norway; 2. Dept. of Neurology, University Hospital North, Norway; 3. Dept. of Psychology and Dept. of Neurology, University of Tromsø and University Hospital North, Norway)

Introduction : Reduced word production on verbal fluency tasks (VFT) is an important clinical feature in early Alzheimer's disease (AD). This reduction could be due to a storage loss deficit or to a retrieval slowing deficit. The present study uses a detailed time course analysis to understand changes in word production in early AD. Method : Participants were 24 healthy elderly and 18 mild AD patients. The phonemic and semantic VFTs were employed. Spectrographic analyses were performed on the sound waves of the recorded data. Measurements included inter-response latencies, correct answers, errors and perseverations. Parameters were quantified by 10-second periods and analyzed with two-way mixed ANOVAs. Results : Correct words were generated at a similar rate than controls in phonemic but not in semantic VFT. Errors did not differ between groups. In contrast, significant interactions were obtained on perseverations, which were mainly produced during the last 30 sec in patients. A significant interaction on semantic latencies was found showing that patients produced words at the same rate during the entire task while controls have shorter latencies at the beginning and enlarged latencies at the end. Latencies on phonemic VFT were shorter at the initial part and enlarged in the last 30 sec. However, patients showed longer phonemic latencies compared to controls. Conclusion : Patients display considerably larger latencies than controls all along testing. Also, they commit significantly more perseverations after the first 20-30 seconds. These data indicate that reduced VFT performance in early AD is related to a retrieval slowing deficit and a disorganized retrieval of information. Keywords : Verbal fluency, neuropsychology, Alzheimer's disease

THE SANDWICH GENERATION AND CARING FOR AGING ALZHEIMER PARENTS: A GENERATION STORY ?-THE FRENCH ALZHEIMER ALERT STUDY-

Dominique HUVENT-GRELLE, Claire PAGNIEZ, Isabelle DELABRIERE, Juliette PODVIN, Eric BOULANGER, Francois PUISIEUX (Geriatric, CHRU LILLE, France)

Introduction : There are only a few drugs for the treatment of Alzheimer's disease (AD) which temporarily reduce the symptoms. The people who interact most with AD patients are their primary caregivers. There is a need to look after the patients and their caregivers as well. Method : - The current study examines the socio-demographic characteristics and the quality of life of the sandwich generation, defined as providing care to both grandchildren and old demented parents. - Multicentric, prospective study over one year (2011). - Setting : Eleven dementia and geriatric clinics across the north of France. - Participants: Family caregivers (99). Results : 79 % of our caregivers are women. They are "boomers" in their late fifties with parents in their mid-eighties and grandchildren aged 7 on

average. 74 % of them take medications. 57 % of them feel stressed. The AD patient is most frequently the caregiver's mother, or mother-in-law, (69 %). Care givers have three grand-children (ranging from 1 to 9) on average. 38 percent of our respondents have a full-time job to which must be added many hours to take care of their parents and grand-children at home. Most helpers report that they like to help their parents but they nevertheless prefer to look after their grandchildren. Conclusion : Women-in-the-middle as helpers and caregivers for the elderly have to face care demands from three generations. We wonder whether the phenomenon doesn't reflect a larger social problem. Future research should focus on the specific conditions under which Women-in-the middle may experience stress and role overload. Keywords : sandwich generation, Alzheimer disease, care giver, grand parent, grand children, quality of life

RELATION BETWEEN CHOLINESTERASE INHIBITORS AND PISA SYNDROME IN A COHORT OF TEN FRENCH ELDERLY ALZHEIMER PATIENTS

Dominique HUVENT-GRELLE, Claire PAGNIEZ, Isabelle DELABRIERE, Juliette PODVIN, Eric BOULANGER, Francois PUISIEUX (Geriatric, CHRU Lille, France)

Introduction : The Pisa syndrome (or pleurothotonus) is an acquired, persistent truncal dystonia which appears to be potentially reversible. It is characterized by an involuntary side flexion (on the right hand side or on the left) of the body and head and associated with a backward axial rotation, so that the person seems to be leaning like the leaning tower of Pisa. Patients are not aware of the dystonia. This syndrome had been attributed first to a rare side effect of long term classic neuroleptics medications. Method : Objectives: We describe ten cases of Pisa syndrome with Cholinesterase inhibitors (CI) use. Then we analyse the differences and the similarities between our findings and others, found in various articles (11 cases describes in the literature). Design: Descriptive Setting: 3 hospitals in the North of France Participants: 10 patients with probable Alzheimer's disease Measurements: Description without statistical analysis of 10 cases of French Pisa syndrome patients on CI observed by clinicians who treat Alzheimer's patients. Results : 4 patients were prescribed Donepezil, 2 patients received Galantamine and 4 were given Rivastigmine. The Pisa syndrome is attributed to a very rare side effect of CI medication. This persistent truncal dystonia appears to be potentially reversible with CI discontinuation as reported in the literature. Conclusion : The relation between CI treatment and Pisa syndrome may be considered as likely because dystonia stopped with CI discontinuation in most cases which suggests that CI alone can induce reversible Pisa syndrome in Alzheimer's disease patients. Keywords : Pisa syndrome, Alzheimer's disease, Cholinesterase inhibitor, France

PP25 C-121

CHARACTERIZATION OF DEMENTIA ASSOCIATED WITH DIABETES

Haruo HANYU, Tomohiko SATO, Kazumasa KUME, Soichiro SHIMIZU, Hidekazu KANETAKA, Hirofumi SAKURAI, Toshihiko IWAMOTO (Geriatric Medicine, Tokyo Medical University, Japan)

Introduction : Several diseases that cause brain damage, such as cerebrovascular disease (CVD), Alzheimer disease (AD), and diabetes mellitus (DM)-related neuronal injury, are associated with dementia in subjects with type 2 DM. Since clinical features might differ depending on the predominant brain pathology, we attempted to define possible subgroups of AD associated with DM based on brain imaging. Method : We classified 154 patients with probable or

possible AD and type 2 DM into 4 subgroups on the basis of the presence or absence of CVD on magnetic resonance imaging (CVD or no CVD) and posterior cerebral hypoperfusion on single photon emission computed tomography (AD pattern or no AD pattern). The clinical characteristics of the subgroup with no CVD and no AD pattern were compared with those of the other subgroups. Results : The subgroup showing neither CVD nor AD pattern accounted for 28% of patients. This type of dementia was characterized by old age, high hemoglobin A1c level, long duration of diabetes, high frequency of insulin therapy, low frequency of apolipoprotein E4 carriers, less severe medial temporal lobe atrophy, more impaired attention, less impaired word recall, and slow progression of cognitive impairment. These features were clearly different from the characteristics of the subgroup showing AD patterns. Conclusion : Among subjects with AD and type 2 DM, there may be a dementia subgroup with characteristics predominantly associated with DM-related metabolic abnormalities. Characterization of dementia associated with DM (diabetic dementia) may affect diagnostic and therapeutic strategies. Keywords : Dementia, Diabetes mellitus, Brain imaging

PP25 C-122

DIFFERENCES IN HIPPOCAMPAL AND PARAHIPPOCAMPAL ATROPHY BETWEEN ALZHEIMER'S DISEASE PATIENTS WITH SHORT-DURATION VERSUS LONG-DURATION DIABETES MELLITUS

Hidekazu KANETAKA, Hanyu HARUO, Hirofumi SAKURAI, Tomohiko SATO, Souichirou SHIMIZU, Kazumasa KUME, Kentarou HIRAO, Toshihiko IWAMOTO (Department of Geriatric Medicine, Tokyo Medical University, Japan)

Introduction : Some previous studies showed that type 2 diabetes mellitus (DM) increases the risk of Alzheimer's disease (AD), although it has apparently not yet been demonstrated that DM increases hippocampal atrophy in patients with AD. We investigated the association between DM duration and gray matter volume of the hippocampus and parahippocampus by magnetic resonance imaging (MRI). Method : The subjects consisted of 62 patients with AD comorbid with DM. They were classified into two groups, the long-duration group (over 10 years with DM; n=33) and the short-duration group (under 10 years with DM; n=29). The hippocampal and parahippocampal cortex Z-score for each patient was calculated using voxel-based morphometry software (VSRAD, Voxel-based Specific Regional Analysis System for Alzheimer's Disease) with 3D T1-weighted MRI. Results : As a result of comparing the long-duration group with the short-duration group, the mean Z-score of the long-duration group (2.40±0.94) was significantly greater than that of the short-duration group (1.83±0.92). Conclusion : After the onset of AD, DM is associated with hippocampal and parahippocampal atrophy. This would suggest that DM directly affects the progression of neuropathology in Alzheimer's disease. Keywords : VSRAD Alzheimer diabetes

PP25 C-123

PAIN EVALUATION AND ANALGESIC TREATMENT IN SEVERE DEMENTED PATIENTS: AN ITALIAN NURSING HOME EXPERIENCE

Jacopo TAGLIABUE, Monica AGOSTONI (Centro di Ricerche e Cura dell'Invecchiamento, IRCCS Istituto Auxologico Italiano, Milano, Italy - RSA Mons. Bicchierai, Italy)

Introduction : In severe dementia is difficult to detect pain: we tested Pain Assessment in Advanced Dementia (PAINAD) scale. Method : 106 Italian nursing home patients (pts) observed from January (t0) to

December 2011 (t4). Functional and cognitive status evaluated through Barthel Index (BI), Tinetti Balance and Gait Scale (Tinetti), MMSE, CDRS-SB. Statistical analysis: χ^2 , t-student. Results : 106 pts (87.6±6.4 ys, F 81, M 25) divided in order to cognitive assessment. 1-mild dementia group (MD): 40 pts, MMSE \geq 20, CDRS-SB \leq 9.5, pain evaluation through Visual Analogue Scale (VAS) and Facial Pain Scale (FPS). 2-severe dementia group (SD): 66 pts, MMSE <20, CDRS-SB >9.5, pain evaluation through PAINAD. No differences in BI and Tinetti. Persistent pain pts at t0: in MD 25 pts (63%), in SD 27 pts (40%) (χ^2 , p<0.05). At t4: in MD 26 pts (65%), in SD 33 pts (50%) (χ^2 , p<0.05). In MD 19 pts (76%) experienced nociceptive pain, 6 pts (24%) neurological pain; in SD 15 pts (55%) nociceptive, 12 pts (45%) neurological (χ^2 , p<0.05). In MD 14 pts (56%) with pain had analgesic treatment, 8 pts (30%) in SD (χ^2 , p<0.05). Analgesic treatment was most frequently prescribed in nociceptive vs neurological pain pts, also in MD and SD: 9 (64%) vs 5 (36%), 5 (62%) vs 3 (38%) (χ^2 , p<0.05). Conclusion : There is a statistically different pain distribution in MD vs SD. A systematic PAINAD use increased pain detection in SD at t4. Analgesic treatment is statistically most frequently prescribed in MD and in nociceptive pain pts. Keywords : pain, dementia

PP25 C-124

VALIDITY AND RELIABILITY OF THE REVISED ALZHEIMER'S DISEASE-RELATED QUALITY OF LIFE (ADRQL) IN JAPANESE VERSION

Miho MATSUI (School of Nursing, Nara Medical University, Japan)

Introduction : The Alzheimer's Disease-Related Quality of Life (ADRQL) revised instrument was developed to assess health-related quality of life in people with Alzheimer's disease using assessments from family caregivers or professional staff. validity and reliability of the original form was examined, a revised ADRQL has not done although various care setting for dementia are needed to assess the effects of treatments and care. The purpose of this study was to examine validity and reliability of the revised ADRQL for Japanese elderly. Method : Original version of the ADRQL including 48 items was translated into Japanese. The revised ADRQL consists of 40 of the 48 items that assess 5 domains; social interaction, awareness of self, feeling and mood, enjoyment of activities, response to surroundings. Scoring was made for the overall ADRQL scale and for each of the five domains according to user's manual in group home setting in Japan. Results : The revised ADRQL exhibits very low missing data and good reliability for total score. Cronbach's alpha of the total score was .769 and each domain showed .806 for social interaction, .431 for awareness of self, .700 for feeling and mood, .193 for enjoyment of activities, and .490 for response to surroundings. Concurrent validity was examined between the revised ADRQL and level of dementia and ADL. Strong associations were shown between both level of dementia (r=-.539, p<0.001) and ADL (r=.675, p<0.001). Conclusion : The revised ADRQL indicated good reliability and validity although some domain's Cronbach's alpha were low. Keywords : ADRQL, measurement development

ASSESSMENT OF PATIENTS WHO CONSULT FOR COGNITIVE COMPLAINT IN A GERIATRIC HOSPITAL

Rolando Olegario ALTAMIRANO¹, Marcela Andrea BARRENECHEA², Ricardo Roger VILLALBA², Sandra Elizabeth BERNACHEA², Estela Sanchez MANCIONI³ (1. Servicio de Psicogeriatría, Hospital Geriátrico de Agudos Juana Francisca Cabral, Argentina; 2. Hospital Geriátrico de Agudos Juana Francisca Cabral, Argentina; 3. Instituto Tercera Edad, Argentina)

Introduction : Know the population characteristics of patients who consult for cognitive complaint. Determine the utility of the psychometric test: Mini Mental State Examination and the clock drawing test in the evaluation of these patients. **Method :** Were included 66 outpatients had been evaluated for cognitive complaint, it was done a preformed tab for each patient, the tab included: birth data, cardiovascular risk factors, history of depression and anxiety. The cognitive function was evaluated with MMSE and CDT. It was valued the functional status with Katz Index, and emotional status with Yesavage Scale. It was used SPSS Program for statistical analysis. **Results :** The average age was 71,98 years old with regard to the sex of the population the 66,7% were F, the educational level more frequent was primary school in 71,2%, previous diagnosis of hypertension 66,7%, DBT 18,2%, previous history of depression 47% and anxiety 65,2%, postevaluation for GSD the 4,5% had depression set and the 22,7% had mild depression. The MMSE showed a cognitive impairment in 24,25 % of the patients with a punctuation <24 with an S:65% and E:87%, with CDT the 27,3% had cognitive impairment with a punctuation <6 with S:67% and E: 83%. Combined both test improved the S:76% with an E:86%. The functional autonomy was 83,3% and functional dependency in 9%. **Conclusion :** The patients who consulted for cognitive complaint had a high frequency of history of hypertension and depression. The psychometric test MMSE and CDT were useful to determine a good sensitivity and specificity. The use of both test improved the sensitivity to assess and set the cognitive impairment. **Keywords :** Cognitive - outpatients - impairment

APPLICATION ELISA KIT FOR THE DETECTION OF URINARY AD7C-NTP LEVEL IN ALZHEIMER'S DISEASES

Rong WANG¹, Shuli SHENG² (1. Central Laboratory, Xuanwu Hospital, Capital Medical University, China; 2. Xuanwu Hospital, Capital Medical University, China)

Introduction : Alzheimer's diseases (AD) is a common neurodegenerative diseases. AD7C-NTP is a kind of neurofilament protein, can be found in early AD in urine, so it can be used as a marker of AD for early diagnosis. In this research, we used the ELISA kit, which made by ourself, for the detection of urinary AD7C-NTP level in AD. **Method :** Immunogenicity AD7C-NTP peptide fragments had synthesized by solid-phase methods, then immunized animals and prepared antibodies. After matching screening, mouse antibody as packets antibody, while biotin-labeled rabbit antibody as testing antibody, horseradish peroxidase labeled avidin, the urine AD7C-NTP ELISA detective method was established. The morning urine samples of 121 AD patients and age-matched control group 118 were collected. **Results :** AD7C-NTP antibodies were identified. Mouse anti-AD7C-NTP antibody ELISA titer was 1:8 000, and rabbit anti-AD7C-NTP antibody ELISA titer is 1:32 000; WB detected human brain specimens found a single band. in the relative molecular mass of 41 000. The sensitivity of ELISA methodology was 0.5 µg/L, the linear range was 0~10 µg/L, normal reference value ≤1.5µg/L, the average recovery rate was 100.2%, approved of CV 3.8%, 4.5%, and inter CV 7.6%, 6.8%. AD group [2.250(0.43-8.62) µg/L] was higher than control group [0.82(0.47-2.77) µg/L, P<0.0001]. The positive rates of AD group and control group were 89.3% and 15.3% respectively, the sensitivity was 89.3% and specificity was 84.7%. **Conclusion :** This ELISA diagnostic kit is high precision and sensitive, and can be used as an assistant examination in clinical diagnosis of AD. **Keywords :** Alzheimer diseases, Urinalysis, Enzyme-linked immunosorbent assay

PP25 C-127

NON-TRADITIONAL RISK FACTORS PREDICT DEMENTIA

AND MORTALITY IN HEALTHY INDIVIDUALS

Roxanne STERNICZUK¹, Olga THEOU², Melissa K. ANDREW², Benjamin RUSAK³, Kenneth ROCKWOOD² (1. Psychiatry, Dalhousie University, Canada; 2. Medicine, Division of Geriatric Medicine, Dalhousie University, Canada; 3. Psychiatry, Psychology & Neuroscience, Dalhousie University, Canada)

Introduction : The age-associated accumulation of health deficits over time can lead to various adverse outcomes, such as Alzheimer's disease (AD) and death. Previous work re-analyzing a 1990s database suggested that in addition to traditional risk factors (TRF) for these outcomes, non-traditional risk factors (NTRF) also play an important role in determining an individual's level of frailty and with that, their risk of AD. Here, we examined whether a NTRF index was associated with incident AD or dementia, and mortality, and how this compared with TRF's, in a large contemporary sample. **Method :** Secondary analyses were conducted on data from the Survey of Health, Ageing, and Retirement in Europe (SHARE), and consisted of health individuals 50 years or over from 11 European countries (N = 14,469). **Results :** While controlling for age, sex, education, and TRF's for AD and mortality (i.e., 6 factors individually or in combination as a TRF index) the NTRF index was associated with dementia (odds ratio = 1.39; 95% CI = 1.01-1.92) and mortality (hazard ratio = 1.63, 95% CI = 1.40-1.89), at 2 years. Considered individually, physical inactivity was the only significant TRF associated with both dementia and mortality, while controlling for age, sex, and education. Of the 27 individual NTRF's, 8 and 12 of them significantly predict dementia and mortality. **Conclusion :** Although individually NTRF's may not contribute significantly to the risk of AD, dementia, and mortality, they accumulate to be strongly predictive. Multivariable risk models must not ignore important cumulative effects, especially in relation to late life illness and death. **Keywords :** Alzheimer's disease, dementia, mortality, risk factors

PP25 C-128

DIFFERENCES IN ACTIVITY PATTERNS IN THREE TYPES OF DEMENTIA MEASURED BY THE IC TAG MONITORING SYSTEM

Takahiro NONAKA¹, Shunji SUTO², Miyae YAMAKAWA¹, Kazue SHIGENOBU³, Kiyoko MAKIMOTO¹ (1. Nursing, Osaka University, Japan; 2. Medical and Welfare Management, Seibi University, Japan; 3. Psychiatry, Asakayama General Hospital, Japan)

Introduction : Frontotemporal dementia (FTD) and semantic dementia (SD) patients tend to manifest in compulsive behaviours. The study aim was to evaluate compulsive behaviour by objective measurements of activity. **Method :** Sixty-bed dementia care unit at the general hospital in Japan cooperated with the study. The IC tag monitoring system was used to monitor dementia patients' temporal movement between 2008 and 2011. Of 75 patients monitored, there were 7 FTD and 2 SD patients. 9 controls were selected from Alzheimer's disease (AD) patients (one to one matching with age and median distance moved /day). The number of detection by the monitoring system per minutes and per hour was generated. Demographic characteristics and Mini Mental State Examination (MMSE) were obtained from medical record. Spearman correlation coefficients were obtained to examine correlations. This study was approved by Osaka University, School of Allied Health Science Ethics Committee and the study hospital. Written informed consent was obtained from the patient's proxy. **Results :** Mean age of the FTD/SD cases was 69.0(±5.9) years. The mean distance moved per day was 3655.0±(2691.0)m. In AD patients, MMSE was highly correlated with the number of movements detected/hour, while no

correlation was found in FTD/SD patients. One SD patient had typical clock watching behaviour and showed sharply increased activity count around 18:00, and the activity counts rose at 35th minutes of the hour. Conclusion : In AD patients, decreased cognitive function was correlated with increased fragmentation of the activity. Pronounced clock watching was found in one SD patient. Keywords : Objective measurement, Activity patterns, Frontotemporal Lobar Degeneration

PP25 C-129

REMINDER DEVICES TO AID ELDERLY PATIENTS WITH MILD DEMENTIA AND MILD COGNITIVE IMPAIRMENT IN REGULAR AND INDEPENDENT INTAKE OF MEDICATIONS

Tomoko KAMIMURA¹, Risa TAKAYAMA¹, Kana MAEHARA¹, Takenobu INOUE², Rina ISHIWATA² (1. School of Health Sciences, Shinshu University, Japan; 2. Department of Assistive Technology, Research Institute, National Rehabilitation Center for Persons with Disabilities, Japan)

Introduction : Among the activities of daily living in elderly patients with mild dementia and mild cognitive impairment, independent intake of medications remains a major problem. Reminder devices reportedly aid these patients in this task; however, the efficacy of such devices remains unexplored. Therefore, we evaluated the efficacy of a medication reminder device. Method : Examiners first trained community-dwelling elderly subjects with Clinical Dementia Rating scores of 0.5 or 1 and their caregivers to use the device at home. Each caregiver loaded the device with the medications. The self-administration medication rate (SAMR) prior to use of the device was compared with that after 3 months of device use for all patients. SAMR was defined as the ratio of the number of doses taken independently to the number of all prescribed doses during a week. Results : Nineteen subjects (81.1 ± 6.0 years) participated in this study. After 3 months, SAMR improved to 100% in 11 (57.8%) patients and <100% in 3 (15.8%) patients. However, it remained unchanged in 1 (5.3%) patient. Four patients (21.1%) ceased to use the device during this period. Nine patients modified their usage of the device during the 3 months because they aimed at stepwise adoption of the device; in addition, they were required to respond to changes in their prescriptions and daily routine. Conclusion : These results indicate that medication reminder devices combined with support from caregivers and professionals can aid elderly patients with mild dementia and mild cognitive impairment in regular and independent intake of medications. Keywords : mild dementia, mild cognitive impairment, medication

CSF Aβ42, TAU, P-TAU AND Aβ OLIGOMERS IN CHINESE ALZHEIMER'S DISEASE PATIENTS

Yat-Fung SHEA (Medicine, Queen Mary Hospital, Department of Medicine, Queen Mary Hospital, Hong Kong)

Introduction : To investigate the validity of cerebrospinal fluid (CSF) amyloid-beta (Aβ42), Aβ oligomers, tau and phosphorylated-tau (p-tau 181) as biomarkers of Alzheimer's disease (AD) in Chinese. Method : Design: A cross-sectional study with baseline lumbar puncture and cognitive assessment. Setting: Memory Clinic of an university hospital in Hong Kong. Patients: 14 patients with probable AD and 8 patients with non-AD conditions Main outcome measures: We compared the CSF tau, p-tau 181, Aβ42, Aβ oligomers levels, and Aβ42/ tau, Aβ42/ p-tau181 ratios between AD and non-AD subjects (Mann-Whitney U test), followed by ROC curve analyses. Results : We found that AD patients had higher median levels of CSF tau (p=0.014) and p-tau (p=0.003), and lower median CSF Aβ42 level

than those of non-AD patients (p=0.034). AD patients had lower Aβ42/t-tau and Aβ42/p-tau ratios than non-AD patients (p=0.001 for both). A higher proportion of AD patients had CSF Aβ oligomers levels above the median level of 1.98 pmol/L than that of non-AD patients (35.7% versus 0 %; p=0.021, Chi-square statistics). In ROC curve analyses, the area-under-curve (AUC) of CSF levels of Aβ42, tau, p-tau181, Aβ42/ tau and Aβ42/ p-tau181 ratios ranged from 0.777 to 0.929, being highest for the ratios of Aβ42/ tau and Aβ42/ p-tau181. The sensitivity and specificity of CSF Aβ42/ tau and Aβ42/ p-tau ratios were 86%, 88%, 79% and 100% respectively. Conclusion : CSF tau, p-tau 181, Aβ42 and Aβ oligomers levels, particularly the ratios of Aβ42/tau and Aβ42/p-tau levels, are useful diagnostic biomarkers of AD in Chinese. Keywords : CSF, Alzheimer's disease, Chinese

NURSING CARE FOR EXCESSIVE WANDERING IN EARLY-ONSET DEMENTIA PATIENT : EVALUATION OF CARE USING OBJECTIVE INDICATORS

Yukiko YOSHIDA¹, Miyae YAMAKAWA¹, Shunji SUTO², Kazuo SHIGENOBU³, Kiyoko MAKIMOTO⁴ (1. Health sciences Graduate School of Medicine, Osaka University, Japan; 2. Medical and Welfare Management, Seibi University, Japan; 3. Neuropsychiatry, Asakayama General Hospital, Japan; 4. Health Sciences Graduate School of Medicine, Osaka University, Japan)

Introduction : Distances of wandering are difficult to quantify, frustrating efforts to develop nursing intervention. Excessive wandering is found in some Alzheimer's disease (AD) patients. The purpose of this study was to evaluate nursing care to reduce excessive wandering in an AD patient. Method : Wandering was measured by the IC monitoring system which measured the distance moved and location of the patient. Monitoring was conducted in a dementia ward in 50 days at a general hospital in Osaka, Japan in 2012. Sleep quality was measured by nonwear actigraphy. The study was approved the ethical committee of Osaka University's School of Allied Health Science and the study hospital. Written informed consent was obtained from patient's proxy. Participant was 62-year-old woman, diagnosed with early-onset AD, hospitalized in 2012 due to irritability and agitation. Mini-Mental State Examination: 5/30. Clinical Dementia Rating: 3 (severe). Results : When Olanzapine (2.5 mg) was prescribed, she developed nighttime wandering, and distance moved increased from 10km to 20km/day, on some days exceeding 30km. Then, Olanzapine was increased to 7.5 mg to manage irritability, mood swings and insomnia. These problems persisted. Nurses discovered triggers for wandering and insomnia. She was highly sensitivity to odor and noise in the living room or her room. Changing the environment to meet her needs, distance moved per day decreased to <15km and mean number of awakening decreased and sleep efficacy increased from 87% to 95%. Conclusion : Attentive nursing observation and appropriate medication seem to be effective in decreasing excessive wandering and eliminated sleep-disturbances. Keywords : Alzheimer's disease, Excessive wandering, Nursing intervention

ALZHEIMER'S CAREGIVERS HEALTH STATUS IN AGRICULTURE-RELATED POPULATION OF BRITTANY (FRANCE)

Herve GOARIN¹, Patrick MORVAN¹, Olivier MICHEL², Dominique SOMME³ (1. Coordination Medicale Regionale, Mutualite Sociale Agricole Des Portes de Bretagne Rue Charles Coudraie 35027 Rennes Cedex 9, France; 2. Hotel-Dieu Geriatric department, Rennes University Hospital, France; 3. Geriatric Department, Rennes

University Hospital, France)

Introduction : The French national agricultural social security service covers pensions and health expenses for active and retired farmers and agriculture-related employees, i.e. 595.000 people in Brittany (western France). The study: to analyze the health-related resources consumption of spouses/care-givers of people suffering from Alzheimer's disease. **Method :** The regional database was checked to obtain patients population. Spouses/care-givers in this study had to be covered by the same social security service and live at the same address. Patients were defined by reference to Alzheimer's diagnosis or the prescription of a specific drug. Co-morbidity of patients and health status of spouses/care-givers was established through payment exonerations and drugs consumption. **Results :** 4 112 patients are known to have Alzheimer's, 953 men (mean age: 81.4) to 3159 women (mean age:84.3). Only 29% (1196) are currently married, 2509 (61%) widowed. Patients psychotropic drug consumption : SSRIs(4.3%), hypnotics(3.84%), benzodiazepines(3.78%), anti-convulsive(2.40%) other anti-depressive (2.35%) anti-psychotics(0%). Spouse/care-givers health status: among the 1196 married patients, 457 live with their spouses. 322 care-givers (only 3 women) have serious affections. 179 (58%) have severe cardio-vascular problems and 87 (27%) have cancer. 369 care-givers(78%) benefit from paramedics interventions. 12% receive psychotropic drug, mostly hypnotics and benzodiazepines. **Conclusion :** Discussion will emphasize on specific drug prescription, high rate of cancer in care-givers and the low prescription of psychotropic drug in this agriculture-related population **Keywords :** Alzheimer's / caregivers' health

PP25 C-133

DIAGNOSIS OF MIXED DEMENTIA USING MEASUREMENT OF REGIONAL BENZODIAZEPINE RECEPTOR BINDING

Tomohiko SATO, Haruo HANYU, Kazumasa KUME, Hidekazu KANETAKA, Hirofumi SAKURAI, Toshihiko IWAMOTO (Department of Geriatric Medicine, Tokyo Medical University, Japan)

Introduction : We examined regional benzodiazepine receptors (rBZR) using single photon emission CT (SPECT) in patients with Alzheimer disease (AD), vascular dementia (VaD), and mixed AD/VaD dementia (MD) and compared the changes in the availability of rBZR with those of regional cerebral blood flow (rCBF). **Method :** A total of 7 patients with AD, 6 with MD, and 9 with VaD underwent SPECT studies with N-isopropyl-p-[(123)I] iodoamphetamine and (123)I-iomazenil to measure rCBF and rBZR. The ratios of rCBF and rBZR uptake in brain subregions to the average global activity were compared among these diseases. In addition, we acquired z-score maps using 3-dimensional stereotactic surface projections of SPECT data. **Results :** Compared with AD, VaD and MD showed rCBF and rBZR reduction predominantly in the frontal lobe, but rBZR images revealed more extensive and severe defects than rCBF images. In contrast, AD showed rCBF and rBZR reduction predominantly in the parietotemporal lobe compared with VaD and MD, but rCBF images revealed more extensive defects than rBZR images. **Conclusion :** rCBF imaging can detect parietotemporal abnormalities in AD, while rBZR imaging may enable the demonstration of underlying pathophysiological differences in the frontal lobe between VaD, MD and AD, reflecting neuronal integrity in the cerebral cortex. **Keywords:** dementia, benzodiazepine receptor, SPECT

PSYCHOTROPICS FOR PATIENTS WITH DEMENTIA

Hidetada SASAKI, Masahiko FUJII (Geriatrics, Sendai-tomizawa hospital, Japan)

Introduction : Cares using minimum doses of psychotropics including antipsychotics have been recommended to care patients with BPSD. In the present study, we report how psychotropics including antipsychotics could be reduced in Sendai Tomizawa Hospital, a psychiatric hospital for dementia patients. **Method :** Psychotropics including antipsychotics have been prospectively compared in dementia patients of 48 beds on the second floor of Sendai Tomizawa Hospital, between psychotropics before inpatient and one month after inpatient from April 2011 to March 2012. Seventy two patients were new inpatients during one year and prospectively followed up for one month. **Results :** Psychotropics were reduced markedly one month after inpatients and in about half of patients psychotropics were decreased to zero. Antipsychotics were prescribed in 44 patients before inpatients and reduced to zero one month after inpatients. Neuropsychiatric Inventory (NPI) were 21 +_ 12 out of 120 point of full scale before inpatients and reduced to 11 +_ 8 one month after inpatients (p< 0.01). Restrictions of body or hands using restriction bands were performed in 13 +_ 2 patients per day. **Conclusion :** We have previously shown that favorite and emotional stimuli could care BPSD without any side effect. The present study would be the first report of caring BPSD with minimum doses of psychotropics and without antipsychotics in psychiatric hospital. **Keywords :** Psychotropics, dementia

PP25 C-135

RIVASTIGMINE PATCH AND MASSAGE FOR ALZHEIMER'S PATIENTS

Masahiko FUJII, Hidetada SASAKI (Geriatrics, Sendai-tomizawa hospital, Japan)

Introduction : Behavioral and psychological symptoms of dementia (BPSD) is another hard problem of dementia as well as cognitive impairments. BPSD may be improved by rivastigmine capsules and by pleasant stimulations to the limbic system via tastes, smells, sounds or massage. We aimed to determine if simultaneous administration of rivastigmine patches and massage (patch-massage) improved BPSD, compared to rivastigmine patches alone (patch only). **Method :** We randomly assigned twenty patients with BPSD into patch-massage (n=10) and patch only (n=10) group. Caregivers applied the patch to the patient's back once daily and at the sametime administered massage on an acupoint ("Shinchuu" in Japanese, "Shenzhu" in Chinese, GV 12, between 3rd and 4th thoracic vertebrae). **Results :** At four weeks, the MMSE were not significantly different from baseline in either group; nor was the NPI in the patch-only group. However, in the patch-massage group, The NPI was significantly lower compared to baseline (p< 0.05). **Conclusion :** Present study suggested that the combination of rivastigmine patches and massage may improve BPSD. When caregivers treated the patch every day, simultaneous massage on the back would not be hard because both patients and caregivers agreed to the treatment. **Keywords :** Rivastigmine patch, massage, Alzheimer's patients

THE PERFORMANCE OF SHORT FORM GERIATRIC DEPRESSION SCALE (GDS-15) IN CHINESE ELDERLY

Dan TANG (Gerontology Institute, Renmin University of China, China)

Introduction : The short form Geriatric Depression Scale (GDS), consisting of 15 items is a widely used self-report instrument for measuring depression in the elderly. This scale has been translated into Chinese and its reliability and criterion validity have been established in Hong Kong and Beijing. Thus far, no study has been conducted in

rural of Mainland China to ascertain the reliability and validity of the GDS-15. Furthermore, the structures of GDS-15 varied among different language versions. The structure of Chinese GDS-15 has never been explored. This study examined the psychometric properties of GDS-15, particularly the structure of the scale, among elderly in mainland China rural and urban communities. Method : The 10 percent Data from the 2006 Survey on the Living Condition in Chinese Rural and Urban Elderly was used. Results : Item analysis showed that all the 15 items of GDS had met psychometric criteria; The Cronbach's α coefficient was 0.793; the total score of GDS-15 positive correlated with ADL, and could effectively differentiate those needing taking care from the normal; Exploratory factor analysis indicated the scale was not unidimensional and the structure was dissatisfied; after two items being deleted, three factors were extracted, named 'depression symptoms', 'positive emotion' and 'mental status'; the Cronbach's α coefficient of revised scale was 0.795. Conclusion : The Chinese GDS-15 shows acceptable reliability and validity and can be used in research of depression symptoms in the Chinese rural and urban communities, but deleting the items will improve the scale structure and made the scale more applicable to Chinese elderly. Keywords : Chinese, GDS-15, rural community

DEPRESSION IN ELDERLY LIVING IN THEIR OWN ENVIRONMENT ? 7 YEARS FOLLOW-UP

Hana MATEJOVSKA KUBESOVA, Jan MATEJOVSKY, Hana MELUZINOVA, Pavel WEBER, Katarina BIELAKOVA (*Dept. of Internal Med., Geriatrics and General Practice, Medical Faculty, Masaryk University, Czech*)

Introduction : Many data explaining high but underdiagnosed occurrence of depression in elderly population are available. Depression accelerates the cognitive impairment, decreases the independency and overall quality of life. The aim of our work was to realize the real situation among seniors living in their own environment and the development during 7 years lasting follow-up. Method : We studied the group of 161 seniors, 60 men and 101 women of average age 73.2±5.9 years living in their own environment in a rural area. The study started by complex geriatric assessment (MMSE, ADL, IADL, Geriatric Depression Scale- GDS) in 2006 and data obtained were compared with results of further assessments realized at 18th, 48th and 72nd months of the follow up. Data were analyzed by statistical methods ? Student T-test, χ^2 ? quadrate test, regression analysis. Results : We found 24 seniors of studied group (14.9%) achieving GDS between 6 and 10 points and 6 seniors (3.7%) with GDS above 11 at the start of the study. Altogether 30 seniors of studied group (18.6%) showed pathological results of GDS in 3 only this diagnosis appeared in patient's sheet. Further development showed up to 30% seniors achieving GDS value between 6 and 10 points and 15% above 11 points. MMSE, ADL and IADL values were strongly negatively dependent on GDS. Conclusion : Depression is much more frequent in elderly population as really diagnosed ? it means worse cognitive performance, loss of independency and worse quality of life. The active screening of depression could be useful in this population. Keywords : depression; geriatric assessment; independency

PP25 C-138
INFLUENCE OF SOMATIC SYMPTOMS ON THE SEVERITY OF DEPRESSIVE SYMPTOMS IN ELDERLY

Changsu HAN, In Kwa JUNG, Hyun-Ghang JEONG (*Department of Psychiatry, Korea University, Korea*)

Introduction : Older adults commonly experience somatic symptoms, and those who do are more likely to have depressive disorders as well. Our goal in this study is to examine the influence of the number and severity of somatic symptoms on the severity of depressive symptoms, including suicidality, in elderly adults. Method : Setting: A community-based cohort study in Ansan City, South Korea Participants: A total of 3210 elderly adults aged 60 years or over (1388 males and 1770 females) participated in this study. Results : Both mild and severe somatic symptoms significantly increased the risk for severe depression and high suicidality. Severe somatic symptoms doubled the risk for severe depression and suicidal intent. Conclusion : Somatic symptoms not fully explained as medical illnesses are closely associated with late-life depression, even after adjustments for comorbid physical illnesses and other confounding factors. The presence of somatic symptoms concurrent with, but not fully explained by, comorbid physical illness or disability seems to be an independent marker for predicting the severity of late-life depression and suicidality. Keywords : somatic symptom, late-life depression, suicidality

PP25 C-139
CLINICO-EPIDEMIOLOGICAL STUDY OF DEPRESSION IN INDIAN ELDERLY

Indrajeet Singh GAMBHIR, Abhinandan MISHRA (*Medicine, Banaras Hindu University, India*)

Introduction : The prevalence of depression in elderly patients varies from 15 to 50% in various studies. This study is to determine the prevalence of depression among Indian elderly patients in hospital and assess various risk factors associated with depression using Geriatric Depression Scale (GDS). Method : In this prospective study Patients 60 years and above were selected according to defined criteria and enquired about the various demographic and socioeconomic data. GDS was used as a screening tool to identify depression. Analysis was done using Chi-square test. The value of 'p' indicating the probability of significant difference was taken as <0.05 for comparison. Results : Total 504 patients were included in the study with age from 60 to 95 years (mean age 66.47±6.855 yr, 60.3% were males). In our study statistically significant association (p<0.05) was observed between depression and female sex, low literacy, widowhood and the patients with multisystem morbidities. With GDS scores, 42.9% of the elderly patients were found to be depressed with 20.8% having mild and 22.0% having moderate to severe depression. Depression was present in 38.4% of male and 49.5% of female patients. Depression was found to be more prevalent among patients with malignancies (64.3%), osteoarthritis (58.1%), chronic obstructive pulmonary disease (46.2%), Koch's infection (46.2%), cerebrovascular accident (45.9%), coronary artery disease (45%) and diabetes mellitus (43.4%). Conclusion : The study revealed that depression is a common health problem in Indian elderly patients and even more in particular risk groups. Use of GDS would detect a lot of patients with depression. Keywords : Depression, elderly, co-morbidities, Geriatric depression scale

SPECIALIST MEDICAL AND MENTAL HEALTH UNIT COMPARED WITH STANDARD CARE FOR OLDER PEOPLE WITH DELIRIUM AND DEMENTIA:RANDOMIZED CONTROLLED TRIAL

John GLADMAN¹, Rowan HARWOOD², Sarah GOLDBERG¹, Lucy BRADSHAW¹, Katherine WHITTAMORE¹, Pippa FOSTER¹, Davina POROCK³, Robert JONES⁴, Catherine RUSSELL² (*1. Division of Rehabilitation and Ageing, University of Nottingham, United Kingdom; 2. Health Care of Older People, Nottingham University*)

Hospitals NHS Trust, United Kingdom; 3. Center for Nursing Research, Buffalo University, USA; 4. Division of Psychiatry, University of Nottingham, United Kingdom)

Introduction : Patients with delirium and dementia admitted to general hospitals experience poor outcomes. Family caregivers often report dissatisfaction with care. **Method :** A Medical and Mental Health Unit was developed on an acute geriatric medical ward. Mental health professionals were employed; staff received enhanced training in delirium and dementia care; a programme of purposeful activity was introduced; the environment was modified; and an inclusive approach to caregivers adopted. Six hundred patients over 65 admitted for acute medical care, identified on admission as 'confused', were randomized to the Unit or standard care. Primary outcome was number of days spent at home over 90 days. Structured non-participant observations were undertaken to ascertain patients' experiences. **Results :** There was no statistically significant difference in days spent at home between settings (median 51 vs 45 days, 95% for difference CI -12 to 24, $p=0.3$); median index hospital stay was 11 vs 11 days, mortality 22% vs 25%, readmission 32% vs 35%, and new care home admission 20% vs 28%, for the Unit and standard care respectively. None of these differences was statistically significant. However, participants on the unit spent significantly more time with positive mood (79% vs 68%), experienced more staff interactions that addressed emotional and psychological needs (median 4 vs 1 per observation), more caregivers were satisfied with care (overall 91% vs 83%), and severe dissatisfaction was reduced (5% vs 10%). **Conclusion :** Specialist care for people with delirium and dementia can improve patient experience and caregiver satisfaction, but does not change health outcomes. **Keywords :** dementia, delirium, person centred care

Dentistry, Mannari Hospital (*Present affiliation: Tottori Municipal Hospital), Japan; 6. Dentistry, Morita Dental Clinic, Japan)

Introduction : Support for aged psychiatry patients is one of the important problems. Neuroleptic malignant syndrome (NMS) is the serious side effect by psychotropic drugs characterized by high fever, perspiration, and tachycardia, etc. Here, we show a case that nutritional condition of a NMS patient was improved by dysphagia rehabilitation provided by dentists and oral hygienists, and discuss on the importance of appropriate dental intervention for psychiatric patient. **Method :** The patient was a 57-year-old woman who had been entered because of schizophrenia. Risperidone, levomepromazine and tandospirone medication had been performed. During the treatment, she developed NMS. Acute dystonia characterized by the dislocation of heads of mandible and dysphagia appeared. Antipsychotic was stopped, and a neuromuscular junction blocking drug medication was started. The weight was 37.5 kg and poor nutritional condition at this time. Tube feeding was also started. Manipulative reduction of mandible was tried, but could not be improved. The collaborative

intervention of dental staff was started. Indirect dysphagia rehabilitation and oral care was started. **Results :** Her mouth-closing disturbance was improved gradually. After one month, direct swallowing training was started. After two month, prosthodontic treatment was started to feed normal texture of foods. After seven month developing NMS, her nutritional condition and the neurological was improved and she could discharge our hospital. **Conclusion :** Mouth-closing disturbance and poor nutrition of a NMS patient was improved by dental interventions consisted of dysphagia rehabilitation and oral care. Typical case that dental staff could contribute to improve general condition of psychiatry inpatients is shown. **Keywords :** Neuroleptic malignant syndrome - Dysphagia rehabilitation - Dental intervention

PSYCHOTROPIC DRUG CONSUMPTION IN ELDERLY WITH DEMENTIA: A CASE-CONTROL STUDY (COHORT PACAL-ALZ)

Sylvie BONIN-GUILLAUME¹, Xavier THIRION², Joselyne ZAFACK², Veronique ALLARIA³, Joelle MICALLEFF⁴ (1. Medecine Interne Geriatrie, Aix Marseille Univ. Assistance Publique Hopitaux de Marseille. 270 Bd Sainte Marguerite, France; 2. Laboratoire Sante Publique, Aix Marseille Univ. Assistance Publique Hopitaux de Marseille, France; 3. Direction Regionale du Service Medical, Assurance Maladie Provence - Alpes - Cote d'Azur-Corse, France; 4. CIC-Centre de Pharmacologie Clinique et d'Evaluations Therapeutiques, Aix Marseille Univ. Assistance Publique Hopitaux de Marseille., France)

Introduction : Aim Describe psychotropic medications delivered to an AD elderly population compared to a non-AD matched population, in 2010, from the French General Health Care (GHC) insurance Data Base (South East of France). **Method :** In 2008, was created the cohort PACA-Alz that enrolled all subjects aged 60 y.o. and more affiliated to the GHC insurance Provence-Alpes-Cote d'Azur and Corsica (i.e. 75% of the total population of the area), with an AD diagnosis and/or specific AD treatment. In 2010, the cohort population was matched with a non-AD population from the data base. Psychotropic drugs consumption was exhaustively registered in the data base as there is no under-the-counter delivery for these medications in France. Each delivery was considered to be given for one month. Chronic consumption was defined by three or more consecutive deliveries. **Results :** 34064 of the cohort population were matched to non-AD subjects; 68.6% aged 80 y.o and over; 73.2% were women. In the cohort population, 73.1% of the patients had at least one psychotropic drug delivery for only 53.4% in the non-AD population ($p<0.001$). All of the psychotropic classes were more frequently delivered in the AD patients. The most common psychotropic association was benzodiazepine-antidepressant in both population (23.5% for AD; 13.1% for non-AD, $p<0.001$). More than 50% of the AD and non-AD patients with a psychotropic drugs prescription were chronic consumers. The psychotropic drugs most frequently prescribed were: escitalopram, meprobamate and zopiclone in AD patients; bromazepam, zolpidem and zopiclone in non-AD patients **Conclusion :** In France, elderly persons are highly concerned about psychotropic consumption. **Keywords :** Psychotropic- consumption- elderly

SEVERITY OF PARKINSON'S DISEASE AND MEMORY FUNCTION: CORRELATION AND INFLUENCING FACTORS

Maryam NOROOZIAN¹, Leila KOUTI² (1. Geriatric Medicine, Tehran University of Medical Sciences, Iran; 2. School of Pharmacy, Ahvaz Jondishapour University of Medicine, Iran)

Introduction : There is a high prevalence of Parkinson's disease(PD) and cognitive impairment therefore routine screening of patients with PD is essential.This study was designed to evaluate the severity of disease (evaluated by unified PD rating scale (UPDRS)) and its correlation with level of memory function(evaluated by Mini-Mental State Evaluation (MMSE)). **Method :** Fifty three patients with PD and 24 healthy volunteers entered this study. UPDRS and MMSE tests were used for this study. The patients were assigned to three different groups regarding their MMSE scores (Alzheimer's disease,MIC and normal), the correlation of UPDRS scores with these states were also assessed. Other factors such as age, duration of the disease, age of onset, level of education and drug side effects correlations with these scores were assessed as well. **Results :** Mean UPDRS scores,MMSE scores,duration of the disease,age of onset,level of education and side effect scores in patient group are 29.38 ± 18.43 , 27.08 ± 2.59 , 5.68 ± 3.76 years, 58.63 ± 11.51 years, 12.68 ± 5.19 years and 1.51 ± 1.5 respectively.The higher the UPDRS score, the higher the MMSE score(P value ≤ 0.0001).Three patients had AD,24 had MCI and 26 were with normal memory function.There was no correlation between level of education and duration of disease with MMSE scores(P value= 0.260 and 0.058 respectively) but age and age of onset influenced MMSE score(P value=0.008 and 0.046 respectively). **Conclusion :** There's a correlation between higher scores of UPDRS and higher scores of MMSE.It seems patients with more severe PD have more loss of memory function. Patients with PD should be monitored for their memory function and anti-Alzheimer therapy should be considered for those who suffer from memory decline. **Keywords :** parkinson's disease, MMSE, UPDRS

PP25 C-144

THE PARKINSONIAN PERSONALITY: A ROLE OF DEPRESSION?

Malene Flensburg DAMHOLDT¹, Mette Buhl CALLESEN², Arne MOELLER² (1. Unit for Psychooncology and Health Psychology, Aarhus University Hospital/Aarhus University, Denmark; 2. PET-Centre, Aarhus University Hospital, Denmark)

Introduction : Parkinson's disease (PD) has been associated with the existence of a so-called 'parkinsonian personality', a personality profile characterized by increased introversion and neuroticism. However, such constellations of personality traits are also associated with depression, a common comorbid disorder to PD. A previous study suggests that only patients with PD and comorbid depression display evidence of a 'parkinsonian personality'. The objective of the current study was to compare patients with and without concomitant depression on personality measures and severity of motor symptomatology. **Method :** 409 patients with PD (290 non-depressed patients and 119 depressed PD patients), identified through the National Danish patients' registry, participated and were compared on the NEO-personality inventory revised short version and measures of motor functioning. **Results :** Preliminary results suggest that patients with PD and comorbid depression display a personality profile characterized by reduced extroversion and conscientiousness, and increased neuroticism compared to PD patients without comorbid depression. Greater number of motor symptoms, increased neuroticism, and reduced extroversion predicted the presence of depression in a regression analysis. **Conclusion :** The study found depression in PD to be related to specific personality traits. The study design does not allow for causal interference as to whether more pronounced symptoms of depression leads to the specific expression of personality traits or whether pre-existence of such traits makes development of depression more likely. These results resemble personality traits found in non-parkinsonian depression and hence may

be general risk factors for depression. The usability of the 'parkinsonian personality' as a theoretical and clinical construct in PD research can be questioned and assessment of personality should take depression into account. **Keywords :** Parkinson's disease, personality, depression.

PP25 C-145

CLINICAL AND GENETIC CORRELATES OF DEPRESSIVE SYMPTOMS IN PARKINSON'S DISEASE

Xiaojuan DAN¹, Piu CHAN², Zhuqin GU³, Chaodong WANG¹ (1. Neurobiology and Neurology Department, Key Laboratory of Ministry of Education on Neurodegenerative Disorders, Beijing Key Laboratory on Parkinson's Disease, Xuanwu Hospital of Capital Medical University, China; 2. Geriatrics and Neurobiology Department, Key Laboratory of Ministry of Education on Neurodegenerative Disorders, Beijing Key Laboratory on Parkinson's Disease, Xuanwu Hospital of Capital Medical University. Beijing Institute of Geriatrics, China; 3. Neurobiology, Chinese National Human Genome Center, China)

Introduction : Depression is common among individuals with Parkinson's disease (PD) and has a major impact on quality of life. The detail underlying mechanism of depression in PD(dPD) remains unclear, but changes in brain structure and neurotransmitters suggest depression might be an intrinsic element of PD. Although several factors have been associated with dPD, the determinants of dPD are still complex and controversial. We aimed to investigate clinical and genetic correlates associated with depression in the context of sporadic Parkinson's disease(sPD) in a large Chinese Han population. **Method :** 1120 individuals with a primary diagnosis of sPD were recruited. Demographics, UPDRS, Mini-mental Status Examination(MMSE) and Hamilton Rating Scale for Depression (HAMD-17) were obtained as well as nine variants located in six risk susceptibility genes to PD were determined in all subjects. Logistic regression was used to identify study variables that individually and collectively best predicted the presence of depressive symptoms(HAMD>13). **Results :** Depression occurred in 20.9% of patients with sPD. After correcting for multiple tests, depressive symptoms were significantly associated with H&Y stage and motor impairment as well as other clinical measures. Female, UPARS Part II score, motor fluctuation and TC genotype of GBA L1444P mutation were found to best predict depressive symptomatology. **Conclusion :** We discovered PD risk variant of GBA gene was also a risk factor for presence of depression and demonstrated motor impairment and functional disability are strongly correlated with depressive symptoms. **Keywords :** Depression, Parkinson's disease, correlates

PP25 C-146

EFFECTS OF 3-MONTH COMBINED FUNCTIONAL TRAINING ON LOWER EXTREMITY MUSCLE STRENGTH AND GAIT PERFORMANCE IN COMMUNITY-DWELLING INDIVIDUALS WITH CHRONIC STROKE HEMIPARESIS

Hiroyuki HASHIDATE¹, Taizo SHIOMI², Hiroyuki SHIMADA³, Norio SASAMOTO⁴ (1. Department of Physical Therapy, School of Health S, Kyorin University, Japan; 2. Department of Physical Therapy, School of Health Sciences, Kyorin University, Japan; 3. Center for Development of Advanced Medicine for Dementia, National Center for Geriatric and Gerontology, Japan; 4. Yamanashi Care Academy, Medical Corporation Sasamoto, Japan)

Introduction : The purpose of this study was to examine the effectiveness of a 3-month low-frequency combined functional training on lower extremity muscle strength and gait performance, and

to assess the relationship between the changes of lower extremity muscle strength and gait performance in community-dwelling individuals with chronic stroke hemiparesis. Method : Twenty-three individuals with chronic stroke hemiparesis who are using an adult day-care facility were enrolled in a combined functional training program consisting of stretching, strengthening, postural balance training, and gait training once or twice a week for 3 months. The main outcomes measured before and after intervention were leg muscle strength measured using a leg press machine at one repetition maximum (1RM), normal gait speed (NGS), maximal gait speed (MGS) were assessed. In addition, the difference between MGS and NGS (Δ GS) was calculated to indicate the range of controlling gait speed. Results : Comparison of each outcome before and after intervention revealed significant increases in 1RM, NGS, MGS, and Δ GS. Significant correlations were found among the percentage changes of 1RM, NGS and MGS. The change rate of the Δ GS was correlated only with that of MGS. Conclusion : Three-month low-frequency combined functional training was effective in enhancing lower extremity muscle strength and gait performances, and the Δ GS was increased with enhanced MGS in community-dwelling individuals with chronic stroke hemiparesis. Keywords : chronic stroke, combined functional training, gait performance

ASSOCIATION OF SEVERE HYPERTENSION WITH PNEUMONIA IN ELDERLY PATIENTS WITH ACUTE STAGE CEREBRAL INFARCTION

Masashi OKURO, Shigeto MORIMOTO (*Geriatric Medicine, Kanazawa Medical University, Japan*)

Introduction : Cerebral infarction is often observed in the elderly, and that complication with acute pneumonia rise the rate of death. However, there are few studies of hypertension on admission related with cerebral infarction. Method : A total of 118 patients (58 men; 60 women; mean age \pm SD:85 \pm 5 years, range 72-96 years) with acute stage cerebral infarction admitted to the Geriatric Emergency Ward were recruited into the study. Patients were classified (categorized) according to hypertension on admission: 65 control normotensive or mildly hypertensive (<160/100mmHg); 43 moderate hypertension (160-199 / 100-119mmHg); 10 severe hypertension(\geq 200 / 120mmHg). According to the results of magnetic resonance imaging, 62 patients were classified as having large-artery atherosclerosis, 22 small-vessel occlusion, 34 cardiac embolism and were stratified analysis. Pneumonia definition includes chest radiograph showing evidence of rales, fever, evidence of an infiltrate /consolidation /cavitation on x-ray or purulent sputum, and necessity of treatment and antibiotics. Results : Acute stage pneumonia occurred in 13(21.5%) out of 62 patients with control, 17 (39.5%) with moderate hypertension, 7(70%) with severe hypertension. After adjustment with ages, sex, Glasgow coma scale, WBC count, log (serum C-reactive protein), dysphagia, the incidence of pneumonia was significantly higher in severe hypertension than controls(OR:2.83, 95%CI:1.14-7.05, p=0.025). Conclusion : We conclude that severe hypertension on admission is one of the risk factors for developing acute pneumonia in elderly patients with acute-stage cerebral infarction. Keywords : Cerebral Infarction, Severe Hypertension, Pneumonia

OVERESTIMATION OF COMMUNICATION SKILLS BY STROKE SURVIVORS WITH APHASIA: COMPARISON OF SURVIVORS VERSUS CAREGIVERS

Mooyeon OH-PARK¹, A.M. BARRETT² (*1. Stroke Rehabilitation Research Lab, Kessler Foundation Research Center New Jersey*

Medical School, USA; 2. Stroke Rehabilitation Research Lab, Kessler Foundation Research Center, USA)

Introduction : Patient-reported information may be valuable in post-stroke care, however, self-reported data may underestimate the magnitude of disability. Cognitive anosognosia, unawareness of illness caused by a neuropsychological inability to self-monitor can create barriers to neurorehabilitation. The objective of this study is to investigate whether stroke survivors with aphasia overestimates their communication skills, relative to caregiver ratings. Method : Stroke survivors with aphasia lives with their caregivers participated in the study. The Communicative Effectiveness Index (CETI), a validated measure of reported communication ability, was administered to assess whether stroke survivors overestimate their own communication ability relative to their caregivers. Results : Data from 52 individuals with mean time since stroke of 6.2 years was analyzed. Stroke survivors were older (60.2 \pm 14.1 vs 51.7 \pm 12.2) and included higher proportion of male (61.5% vs 32.7%) compared to caregivers without difference in educational years between the two groups. The mean survivor self-ratings of CETI was significantly higher than caregivers (65.3% vs 58.7%). The largest overestimation was shown in the items; 1) initiation of conversation with people not close family and 2) participating in a conversation with strangers. Conclusion : Stroke survivors with aphasia overestimate their communication ability compared to caregivers. This information will help clinicians to make care planning. Further research comparing self-overestimation to rehabilitation participation and success as well as underlying neural mechanism of unawareness is needed. Keywords : stroke, anosognosia, rehabilitation

PP25 C-149

EFFICACY OF INTRAVENOUS THROMBOLYSIS WITH TISSUE PLASMINOGEN ACTIVATOR IN ELDERLY PATIENTS WITH ACUTE ISCHEMIC STROKE - FUKUOKA STROKE REGISTRY (FSR)

Ryu MATSUO, Masahiro KAMOUCI, Tetsuro AGO, Junya KURODA, Takahiro KUWASHIRO, Hiroshi SUGIMORI, Takanari KITAZONO (*Department of Medicine and Clinical Science, Graduate School of Medical Sciences, Kyushu University, Japan*)

Introduction : Intravenous tissue plasminogen activator (t-PA) therapy is efficacious to improve clinical outcomes in patients with acute ischemic stroke. However, the benefit of its use for elderly patients remains unclear. The aim of this study is to elucidate the efficacy of t-PA therapy for Japanese elderly patients. Method : In the database of Fukuoka Stroke Registry, a prospective multi-centered study for acute stroke in Japan, 13529 of stroke patients were registered from June 1999 to June 2012. In this study, we included 152 elderly patients (>80 years old) with acute ischemic stroke treated with t-PA therapy (tPA group) and age- and sex-matched 152 patients with acute ischemic stroke without t-PA therapy (non-tPA group). Neurological severity was assessed by NIH stroke scale (NIHSS) score. Good recovery was defined as decrease in NIHSS more than 4 during hospitalization or NIHSS 0 at discharge. Good functional outcome was defined as modified Rankin Scale 0-1. Results : The frequency of good recovery and good functional outcome at discharge was significantly higher in tPA group (68% and 18%) than in non-tPA group (51%, p=0.006 and 7%, p=0.006). The prevalence of in-hospital mortality was significantly lower in tPA group (11%) than in non-tPA group (23%, p<0.001). In multivariable analysis, t-PA therapy was independently associated with good recovery (OR 2.7, 95% CI 1.9-4.1, p<0.001), good functional outcome (OR 11.2, 95% CI 5.7-21.9, p<0.001) and in-hospital mortality (OR 0.57, 95% CI 0.31-0.98, p=0.04). Conclusion :

Elderly patients may be treated efficiently with intravenous t-PA.
Keywords : tissue plasminogen activator, elderly, outcome

PP25 C-150

PREDICTION METHOD FOR FUNCTIONAL RECOVERY OF STROKE PATIENTS USING A TIME CONSTANT MODELING

Shotaro SASAKI¹, Yoshitsugu OMORI¹, Seiichiro SUGIMURA¹, Mayumi HATAKEYAMA¹, Eri NAKAMURA¹, Makoto SUZUKI², Masuo SASA¹, Setsu IJIMA³ (1. Dept. of Rehabilitation Medicine, St Marianna University School of Medicine Yokohama City Seibu Hospital, Japan; 2. Faculty of Medical Technology, Niigata University of Health and Welfare, Japan; 3. Graduate School of Comprehensive Human Science, University of Tsukuba, Japan)

Introduction : We conducted a Longitudinal study to examine the validity and applicability of time constant modeling for predicting functional recovery of stroke patients. Method : The data for one hundred twenty-four inpatients with post-stroke were used in this study. The mean time after stroke event was 5.2 days (standard deviation 5.1days). Functional Independence Measure (FIM) scores were periodically assessed during hospitalization. These measurements were carried out on 4 occasions: initial assessment within 1 weeks following stroke onset, and at weeks 2,3 and 4 following the initial evaluation. Recovery of FIM scores at the 4th week was predicted using a time constant equation derived from the initial 3 evaluations. To assess the general applicability of time constant modeling, a conventional linear regression analysis was performed to compare the model prediction with the actual values for the FIM scores. Results : Although the samples in our analysis showed a wide variety of disability levels on admission (FIM scores 18-118), the predicted FIM scores derived from the time constant modeling agreed well with the actual FIM scores at the 4th week. Regression analysis showed a good correlation between the prediction and actual FIM scores ($R^2 = 0.937$). The number of patients with the predicted FIM scores higher than the actual scores was 18 out of 124. Conclusion : Provided with three initial time-point samplings, the time constant modeling allows good prediction of functional recovery for individuals. Since this modeling is mathematically simple, it can be widely applied in daily clinical practice. Keywords : activity of daily living, prognosis, stroke

PP25 C-151

A COMPARISON OF COMMUNITY-ONSET BACTEREMIC ISOLATES BETWEEN THE ELDERLY AND THE YOUNGER: A SIX-YEAR LONGITUDINAL STUDY

Ching-Chi LEE, Wen-Chien KO (Departments of Internal Medicine, National Cheng Kung University Hospital, Taiwan)

Introduction : To investigate the difference of the pathogen distribution of the community-onset bacteremia between the elderly and the young patients. Method : A case-control study of bacteremic patients sampling were conducted retrospectively in the emergency department, during the period between 2005 and 2010. A trend of major bacteremia-causing pathogens was analyzed by years. Results : Of 80,058 patients with blood culture sampling, 1526 (1.9 %) elderly patients (>65 years) was case patients and 919 younger patients (<65 years, 1.1%) was regarded as control patients. Of the total 2729 bacteremia-causing isolates (case patients, 1722 isolates; control, 1007), similar distribution of major pathogens in the case and control patients were observed; majority was Escherichia coli (37.9% and 33.9%, respectively), followed by Klebsiella pneumoniae, Staphylococcus aureus, Pseudomonas aeruginosa, Proteus mirabilis, Enterococci faecalis, Streptococcus viridans, Streptococcus agalactiae, Bacteroides fragilis and Salmonella enteritidis. In further analyses,

these was a increased trend of the proportion of extended-spectrum β -lactamase(ESBL)-producers among the case patients with Enterobacteriaceae bacteremia by years ($\gamma=0.95$, $P<0.001$), dissimilar to a decreased trend in the control patients ($\gamma=-0.16$, $P=0.04$). Moreover, these was also a increased trend of methicillin-resistant S. aureus (MRSA) among the case patients with S. aureus bacteremia ($\gamma=0.61$, $P<0.001$) and no trend of MRSA in the control patients ($\gamma=-0.004$, $P=0.96$). Conclusion : With increased trends of MRSA and ESBL-producing Enterobacteriaceae in the elderly with community-onset bacteremia, the further investigations discussed the risk factors and clinical impact of these resistant pathogens and the antimicrobial strategy for the elderly community-onset bacteremia were needed. Keywords : community-onset bacteremia, the elderly

ALZHEIMER'S DISEASE RULED OUT BY NO ERRORS IN POCKET SMELL TEST

Ib TRANE CHRISTENSEN¹, Elna-marie LARSSON², Ida HOLM³, Ole NIELSEN⁴, Stig ANDERSEN⁵ (1. Geriatrics, Aalborg University Hospital, Denmark; 2. BFC/Rontgen, Akademiska sjukhuset 751 85 Uppsala, Sweden; 3. Patologisk, Randers Hospital, Denmark; 4. Geriatrisk Afd., Aalborg Sygehus / Arhus Universitetshospital, Denmark); 5. Dept. of Geriatric Medicine, Aalborg University Hospital, Denmark)

Introduction : Hyposmia may be an early symptom of Alzheimer's disease (AD). Tests of olfaction are cheap, fast and simple and may add valuable information in the work-up on patients with cognitive decline. The purpose of this study was to assess Pocket Smell Test (PST) for discriminating patients with AD from healthy controls and to evaluate the contribution to the AD-diagnosis in patients referred for suspected dementia. Method : Study I comprised 20 patients with mild to moderate AD compared to 20 healthy age- and gender-matched controls. Study II comprised 50 consecutive patients referred for cognitive impairment. We performed 2 different PSTs, mini mental state examination test and assessed Geriatric Depression Scale. The AD diagnosis was given according to the ICD-10 criteria. Results : Healthy controls and AD patients differed markedly in olfaction performance based on the two PST's in study I ($p<0.001$). In study II, AD was diagnosed in 24 while minimal cognitive impairment was detected in 8, vascular dementia in 7, alcohol induced impairment in 6, depression in 4 and Parkinson's disease and Lewi body dementia in 1 each. AD/non-AD had 2.4/3.2 correct answers ($p=0.06$). None in the AD group had 0 smell errors and odds ratio for AD was 0.08 (95%-CI: 0.009-0.7) in patients with 0 or 1 smell error ($p=0.023$) after adjusting for age. Conclusion : AD had more scent errors than healthy controls and 0 error was seen only in non-AD patients with other causes of cognitive impairment. This suggests the inclusion of PST in first line examination of patients with cognitive decline. Keywords : Alzheimer's disease , Diagnostic smell Test

THREE-DIMENSIONAL QUANTIFICATION OF DENTAL PLAQUE USING SWEEP-SOURCE OPTICAL COHERENCE TOMOGRAPHY

Yoshihiro HESHIKI¹, Yuki KANEHARA¹, Kousuke KIRIHARA¹, Nobuyoshi OZAWA¹, Junji TAGAMI², Yasunori SUMI¹ (1. Department for Advanced Dental Research, National Center for Geriatrics and Gerontology in Japan, Japan; 2. Department of Restorative Sciences, Graduate School of Medical and Dental Sciences, Tokyo Medical and Dental University, Japan)

Introduction : The major causes of tooth loss are caries and periodontal

disease. The pathogenic factor of these diseases is dental plaque. There have been many indices in the literature for measuring or quantifying dental plaque. However, most of these indices are assessed by dentists using visual examination, having a subjective component due to investigator interpretation. An objective method for the evaluation of dental plaque is required in clinical practice. The purpose of this in vivo study was to investigate swept-source optical coherence tomography (SS-OCT) as a new tool for evaluating 3-dimensional dental plaque more objectively. Method : The National Center for Geriatrics and Gerontology has developed a new swept-source optical coherence tomography (SS-OCT) system (dental OCT) jointly with Santec Corporation in Aichi Japan in an official collaborative relationship between industry and government. We evaluated dental plaque in 25 patients using the dental OCT at the Division of Oral and Dental Surgery, National Centre for Geriatrics and Gerontology. The 3-dimensional data provided by SS-OCT were analyzed by analysis software (AVIZO®). The study was approved by the Institutional Review Board of the National Center for Geriatrics and Gerontology in Japan. Results : Three-dimensional data of dental plaque were clearly observed by SS-OCT, and it was possible to calculate the area and volume of dental plaque. Conclusion : This method has the potential for objective quantitative measurement screening of dental plaque. SS-OCT may, therefore, be an appropriate method for objective evaluation of dental plaque. Keywords : SS-OCT, Dental plaque, Quantification

PP25 C-154

TWO-DIMENSIONAL DETECTION OF DENTAL PLAQUE USING SWEEP-SOURCE OPTICAL COHERENCE TOMOGRAPHY (SS-OCT)

Yuki KANEHARA¹, Yoshihiro HESIKI¹, Kousuke KIRIHARA¹, Nobuyoshi OZAWA¹, Junji TAGAMI², Yasunori SUMI¹ (1. Department for Advanced Dental Research, National Center for Geriatrics and Gerontology in Japan, Japan; 2. Department of Restorative Sciences, Graduate School of Medical and Dental Sciences, Tokyo Medical and Dental University, Japan)

Introduction : The main causes of tooth loss are caries and periodontal disease, both of which are plaque-related. One of the most effective means of preventing tooth loss is evaluating the adhesion condition of the dental plaque exactly and removing it. However, because most dental plaque indices have a subjective component due to investigator interpretations, almost all of them lack objectivity. Optical coherence tomography (OCT) has emerged as a high-resolution, noninvasive, and objective clinical imaging application. The purpose of this in vivo study was to show 2-dimensional OCT images of dental plaque obtained using a swept-source OCT (SS-OCT) system. Method : The National Center for Geriatrics and Gerontology (NCGG) has jointly developed a new SS-OCT system with Santec Corporation in Aichi Japan in an official collaborative relationship between industry and government. Dental plaque OCT imaging was carried out using our new SS-OCT system with 10 healthy volunteers using a hand-held in vivo OCT scanning probe. The dental plaque was extracted by Photoshop, and the analysis of the thickness, length and cross section of the plaque was carried out. Results : Vertical and horizontal OCT dental plaque images were capable of providing simultaneous and noninvasive structural information with high resolution. In addition, a clear distinction between plaque, enamel and dentin was possible with OCT images. Conclusion : It is possible to obtain clear images of dental plaque with SS-OCT, and OCT is concluded to be an objective method for detecting the thickness, length, and cross section of dental plaque. Keywords : OCT, Dental plaque, Plaque index

PP25 C-155

OUTCOMES IN CLINICAL NURSING PRACTICE THAT INCORPORATES TRAINING OF SINGING IN GERONTOLOGICAL NURSING EDUCATION

Junko ANDO (Graduate School of Nursing, Hiroshima Bunka Gakuen University, Japan)

Introduction : Music has been incorporated into gerontological nursing education to enable patients to share positive experiences with students through singing old songs and facilitate communication between students and the elderly. This study was conducted to evaluate outcomes in clinical nursing practice incorporating training of singing. Method : Longitudinal survey. Collaborators: Nursing students (n=109). Contents of the survey: Age, Wada's personality inventory (1996), and mood (Sakano, et al., 1994). Analytical methods: Emotional instability and harmony between groups were compared. In addition, from the results of clinical nursing practice, and the results of exploratory factor analysis, we extracted three subordinate concepts (comprised of 13 items). Data were analyzed using SPSS version 19.0. Results : The subjects' mean age was 20.0 (±0.4) years. Regardless of the subjects' emotional instability (high or low), and harmony between groups, after singing all subjects felt more invigorated (p <.05). Subjects with high emotional instability had significantly lower tension, fatigue, and depressive feelings after singing (ts (13) > 14.0, p <.05). Tension, fatigue, and depressive feelings were reduced by singing. Then, results at the end of the training shows the results and valid 'surrounding behavioral change' point 5.4, 'relaxation of tension and time share' point 5.3, 'started talking' 4.8 points. Item, the song of the past 5.8 points and is effective means of communication. Conclusion : The incorporation of singing in gerontological nursing education, it is effective in elderly clinical nursing practice. Keywords: gerontological nursing education, training of singing, clinical nursing practice

THE LEADER DEVELOPMENT SEMINAR TO PROMOTE HOME CARE MEDICINE WITH EMPHASES IN GERIATRIC INTERDISCIPLINARY TEAM CARE IN JAPAN

Young-Jae HONG¹, Kazuyoshi SENDA¹, Hisayuki MIURA¹, Aya SEIKE¹, Yuko GOTO¹, Hiroko OHSHIMA², Osamu FUKADA³, Kenji TOBA⁴ (1. Division of Home Care Promotion, National Center for Geriatrics and Gerontology, Japan; 2. Center for Gerontology and Social Science, National Center for Geriatrics and Gerontology, Japan; 3. Office of Strategic Planning and Integration, National Center for Geriatrics and Gerontology, Japan; 4. Director of the Hospital, National Center for Geriatrics and Gerontology, Japan)

Introduction : In the most aged society, Japan, huge health care needs of the elders are not met with conventional clinical practice in hospitals and clinics. One of promising remedies for gap is home care medicine (HCM) with geriatric interdisciplinary team care (GITC). However, infrastructure of HCM remains unprepared, especially in human resources. Method : The first leader development seminar for promotion of HCM with emphases in GITC was held in Tokyo, October 13-14, 2012. From all of 47 prefectures, 78 of physicians, 23 of nurses, 22 of medical social workers, a dentist, two phamasists, 61 of regional executives of Japan Medical Association, and 61 of government officers attended as candidates for leaders in promotion of HCM. The program consisted of didactic lectures, video-based learning on discharge planning conference and home visit, and problem-oriented small group discussions followed by presentation on obstacles to promotion of HCM at their own communities and strategies to conquer them. Results : Nine experts lectured #1. essence

of HCM, #2. principles and skills in GITC, care for geriatric syndrome, and end-of-life care, #3. demographic aspects and administrative considerations on HCM, #4. examples of HCM promotion at metropolitan suburbs. It was the first time for the leader candidates from three different sectors to gather and discuss promotion of HCM. Conclusion : It was the first step to motivate local leaders in promotion of HCM. Next step is to strengthen each of practitioners' knowledge and skills in HCM at their communities with the leadership of attendants. Keywords : home care medicine, geriatric interdisciplinary team care, leader development

EDUCATION PROGRAM FOR OCTOGENARIANS TREATED WITH VITAMIN K ANTAGONIST

Marie-Line GAUBERT-DAHAN¹, Dominique BONNET-ZAMPONI², Eric PAUTAS³, Claire BAL DIT SOLLIER⁴, Marie-Claude AUMONT⁵, Sylvie LEGRAIN⁶ (1. *Geriatric, APHP Hopital Bretonneau, France*; 2. *Observatoire des Medicaments des Dispositifs Medicaux et des Innovations Therapeutiques, Agence Regionale de Sante Ile de France, France*; 3. *Geriatric, APHP Hopital Charles Foix, France*; 4. *Centre de Reference et d'Education des Anti-Thrombotiques d'Ile de France, APHP Hopital Lariboisiere, France*; 5. *Cardiologie, APHP Hopital Bichat-Claude Bernard, France*; 6. *Direction de l'Offre de Soins et Medico Sociale, Agence Regionale de Sante Ile de France, France*)

Introduction : The aim of this poster is to present a new therapeutic education program for octogenarians treated with vitamin K antagonist (VKA). Method : The program was developed by several health professionals involved in education for octogenarians treated with VKA in 4 hospitals of the Assistance Publique - Hopitaux de Paris, because existing programs for patients treated with VKA were not suitable for octogenarians. First, a repository of skills (especially safety skills) needed to the octogenarians treated with VKA was created. The program includes 3 sessions. The messages focus on major risk factors of treatment's destabilization; they are adapted for each patient's situation. Several educational tools were created: a questionnaire and a clinical case for patient's evaluation, a workshop about the therapeutic range of the International Normalized Ratio, a personalized document given to the patient at the end of the session. Results : Seventeen patients (82 ± 5 years old) were included since the beginning of the program. Fifteen patients were evaluated at program's end. Six patients acquired all the skills chosen at their initial individual assessment; the acquisition was incomplete for 9 patients, the most difficult skills to acquire were 'recognize and respond to situations of treatment's destabilization' (7 patients) and 'recognize and respond to warning signs' (6 patients). The notion of occult bleeding was difficult to understand by patients. Conclusion : For comorbid patients, it appears necessary to agree with them about their chronic diseases and their long-term treatment before starting the program and to set up individual sessions. Keywords : patient education, vitamin K antagonist

PP25 C-158

EVALUATION OF AGING RATE BASED ON THE INDIVIDUAL BIOLOGICAL AGE FOR HEALTHY MEN AND WOMEN IN CHINA

Xiaojuan BAI¹, Bing WU¹, Lulu HAN¹, Xiangmei CHEN² (1. *Departments of Gerontology and Geriatrics, The First affiliated Hospital of China Medical University, China*; 2. *Department of kidney, General Hospital of Chinese PLA, China*)

Introduction : Aging can be defined as a phenomenon of progressive

and cumulative decline in the body's physiological function, so aging rate is related to Chronological age (CA). However, aging is a highly individualized process. There is no study about the aging rate according to biological age (BA). The purpose of this study is sought to evaluate the aging rate between CA and BA which derived from biological age score (BAS) equation in healthy Chinese adults. Method: The BAs of 699 individuals (308 men, 391 women) from 30-85 years of age were computed based on the BAS equation. A narrow age cohort design was applied to examine the relationship between CA and BA, whereas BA<CA, BA=CA and BA>CA represent the slower, parallel and faster aging rate, respectively. Co-variant analysis was applied to assess the difference aging rate among the slopes of regression lines of BA to CA. Results : According to the relationship between BA and CA, women were divided into slower (30-45 y), parallel (>45-65 y) and faster aging rate groups (>65-85 y), men were divided into slower (30-50 y), paralleled (>50-60 y), fastest (60-75 y) and faster aging rate groups (>75-85 y). The slopes of the regression line of BA to CA for women and men showed significant difference among aging-rate groups (p<0.05) respectively. Conclusion : The aging rate is not constant during different life stage for healthy people in China. In order to evaluate the aging rate we should pay more attention to the important role of BA besides CA. Keywords : Aging rate; Chronological age; Biological age

PP25 C-159

THE CO-OCCURRENCE OF MULTIPLE GERIATRIC CONDITIONS AND THEIR ASSOCIATED FACTORS AMONG OLDER ADULTS IN TAIWAN: RESULTS FROM A NATIONALLY REPRESENTATIVE SURVEY

Chia-Lin LI¹, Hsing-Yi CHANG², Hui-Hsuan WANG¹, Kuang-Hung HSU¹ (1. *Department of Health Care Management, Chang Gung University, Taiwan*; 2. *Division of Preventive Medicine and Health Service Research, Institute of Population Health Sciences, National Health Research Institutes, Taiwan*)

Introduction : Geriatric conditions, such as falls, urinary incontinence, cognitive impairment and depressive symptoms, are highly prevalent and are associated with adverse health outcomes in older adults. There were two aims of this study. First, we investigated the co-occurrence of multiple geriatric conditions in the older adult population. Second, we explored factors associated with the co-occurrence of multiple geriatric conditions in older adults. Method : We analyzed data from a nationally representative sample of people aged 65 years and over (N=2727), participating in the 2005 National Health Interview Survey in Taiwan. We used self-reported data on the following geriatric conditions: (1) falls: one or more injurious fall in the past year; (2) urinary incontinence: loss of urine beyond the participant's control in the previous year; (3) cognitive impairment; (4) depressive symptoms. The Mini-Mental State Examination was used to assess cognitive function. The Center for Epidemiologic Studies Depression Scale was used to assess depressive symptoms. Results : Of participants aged 65 years or older, 56.1% had at least one of the four geriatric conditions, and 22.4% had two or more conditions. Respondents with two or more conditions were more likely to be female, have two or more other chronic diseases, and have been hospitalized in the past year, and less likely to have high education, high social support, and positive self-rated health. Conclusion : The co-occurrence of multiple geriatric conditions is prevalent in older adults, suggesting that disease-orientated geriatric care might not be enough. Comprehensive assessment and coordinated management of common geriatric conditions is important. Keywords : geriatric conditions

THE EFFECTS OF CAROTENOID INTAKES ON INTELLIGENCE IN COMMUNITY-DWELLING JAPANESE MIDDLE-AGED AND ELDERLY

Fujiko ANDO¹, Yukiko NISHITA², Chikako TANGE², Yuki KATO², Tomoko IMAI³, Rei OTSUKA², Hiroshi SHIMOKATA² (1. Faculty of Health and Medical Sciences, Aichi Shukutoku University, Japan; 2. Department for Development of Preventive Medicine, National Center for Geriatrics and Gerontology, Japan; 3. Faculty of Human Life and Science, Doshisha Women's College of Liberal Arts, Japan)

Introduction : The purpose of this study is to evaluate the longitudinal effects of carotenoid intakes on intelligence in Japanese middle-aged and elderly. **Method :** The subjects were 2,104 men and women who participated in a population-based cohort study (NILS-LSA), and were examined biannually to 8 years later. Intakes of vegetables, fruits and carotenoids were estimated by 3-Day dietary record at baseline. Intelligence was assessed with the Japanese Wechsler Adult Intelligence Scale-Revised Short Forms, subtests including; Information (possible range of score 0-29), Similarities (0-28), Picture-Completion (0-21), and Digit-Symbol (0-93), at each examination. General linear mixed model comprised of fixed effects of each carotenoid or food intake controlled for season, time from baseline, their interaction and covariates (age at baseline, education levels and smoking status). Individual variance (intercept and slope to time) assigned as random effects. **Results :** The main effects of beta-carotene and vegetables (especially carotene-rich vegetables) on Information were significant in men and women. Those of fruits and alpha-carotene were also significant only in men. The scores of Information in the 1st tertile of beta-carotene and vegetables in men were -1.02±0.34 (lsmeans and s.e., p=0.0031) and -0.91±0.34(p=0.008) compared with those in the 3rd tertile, respectively. There were no significant interactive effects on Information. As for Similarities in men, the main and interactive effects were significant in beta-carotene and cryptoxanthin and the effects of these carotenoids attenuated gradually. **Conclusion :** Carotenoid rich food intakes may keep crystallized intelligence at high level in the middle-aged and elderly. This work was supported by KAKENHI(23500974) from the MEXT, Japan. **Keywords :** carotenoids, intelligence, longitudinal study

RELATIONSHIP BETWEEN FASTING PLASMA GLUCOSE AND FUNCTIONAL FITNESS PERFORMANCE IN ELDERLY MALES LIVED IN RURAL COMMUNITY

Meng-Tzu HOU¹, Jin-Jong CHEN², Chih-Hsing WU³ (1. Physical Therapy and Assistive Technology, National Yang-Ming University, Taiwan; 2. Exercise and Health Science Research Center, Nation Yang-Ming University, Taiwan; 3. Department of Family Medicine, National Cheng Kung University Hospital, Taiwan)

Introduction : The purpose of this study was to disclose the relationship between physical fitness performance and serum biochemistry parameters focusing on the fasting plasma glucose in old male lived in rural community in Taiwan. **Method :** An epidemiological survey was performed for 1033 men aged 65 and over lived in Tianliao District, Southern Taiwan. A total of 414 subjects were enrolled, the respond rate was 60.8%. Structured questionnaires were inquired by face-to-face for each subject. The physical fitness tests included grasp test of dominant hand (grip-D, TKK 5401, Japan), muscle strength/endurance (30-s chair stand test), balance (open-eye stand on right foot), flexibility (chair sit-and-reach test), and reaction (8-feet walking test) were measured accordingly. After an overnight fast, fasting glucose, albumin, GOT, glomerular filtration rate (GFR-MDRDs) and high density lipoprotein cholesterol (HDLc) were

measured through venous blood test. **Results :** There were 402 subjects completed the study, the average age was 74.5±6.0 (range=65-98) y/o. Using multiple linear regression models, the fasting glucose was negatively independent factor (β coefficient) for different physical performance tests: 30-s chair stand test (-0.102), Open-eye stand on right foot (-0.168), 8-feet walking test (0.106), grasp test (-0.090). **Conclusion :** Fasting plasma glucose is highly correlated with functional fitness performance in the elderly. The biochemistry parameters can be used to screen the status of physical functions, especially the fasting plasma glucose, in the old males lived in rural community. **Keywords :** Functionl fitness, Fasting glucose, Epidemiological survey

CHANGES OF PHYSICAL TEST RESULTS AMONG COMMUNITY LIVING ELDER JAPANESE PEOPLE DURING A 5-YEAR FOLLOW-UP

Motohiko HARA¹, Hiromi NAKAMURA-THOMAS¹, Takahashi KUNIYASU¹, Hiroko IWAMITSU¹, Hiroaki NOBUHARA¹, Ikuo MUROHASHI¹, Chiyo FUJII¹, Shiori GOJYO¹, Koichi KOMAKI¹, Takahiro UENO², Masayoshi SOMA² (1. School of Health and Social Services, Saitama Prefectural University, Japan; 2. Department of Medicine, Nihon University School of Medicine, Japan)

Introduction : This study addressed changes of physical test results among community living elder Japanese people during a 5-year follow-up by comparing the group who lived in a downtown area (group D) and in a rural area (group R). **Method :** There were 132 participants in group D (40 men and 88 women, mean age 71.7) and 52 in group R (16 men and 36 women, mean age 73.7). Physical tests for analysis were Grip power (GP), Muscle strength of leg extension (MSLE) and time duration of one-foot standing with eyes closed (OFS). Data were analyzed between groups, and between the baseline and re-test within each group. **Results :** The mean age in group R was significantly higher than in group D. In comparison between the initial test and re-test, no significant difference was identified in GP and MSLE data both within the groups. Concerning the OFS, group D showed significant improvement during the 5-year follow-up and group R showed no significant difference between the baseline and re-test results. In comparisons between the groups, significant differences were not identified in GP and MSLE at the baseline while group R showed significant declines in GP and MSLE results during the 5-year follow-up than group D. **Conclusion :** It was suggested that age, opportunities of health education and flat geographical characteristics would contribute to the differences in OFS results between the groups. **Keywords :** physical test, 5-year follow-up

PP25 C-163

FACTORS ASSOCIATED WITH DIABETIC CONTROL AMONG THE MIDDLE-AGED AND ELDERLY WITH TYPE 2 DIABETES PATIENTS IN KOREA

Myung KI¹, Sujin BAEK², Youngduk YOON², Baegju NA³ (1. Department of Preventive Medicine, Eulji University, Korea; 2. Health Insurance Policy Research Institute, Korean National Health Insurance Corporation, Korea; 3. Department of Preventive Medicine, Konyang University, Korea)

Introduction : A better glycemic control in the elderly compared to the middle-aged type-2 diabetes patients is well-known, despite the increases in impaired insulin secretion and comorbidities. Notwithstanding this, hospitalization among diabetes patients has been higher for the aged. **Method :** 13,969, newly diagnosed with diabetes

during 2002-2006, aged 40-79 years, were drawn from a retrospective cohort study with about 1 million people from Korean National Health Insurance Data. Factors associated with diabetic control including continuity of care(COC) indicators (i.e., Usual Provider Continuity(UPC)) were measured over first two years of three years follow-up(2007-2009) and outcome measures including both health utilization measures (i.e., hospitalization) and clinical outcomes (i.e., fasting blood sugar(FBS)) for the last year of follow-up. Using logistic regression, we investigated risk factors associated with poor diabetic control. Results : While other factors such as COC were consistently associated with hospitalization and poor diabetic control, age was seen for having opposite effects on these outcomes; negatively with hospitalization and positively with diabetic control. This persisted after adjustments for other covariates such as comorbidities but substantially attenuated by the adjustment for body mass index. Further, the positive association between age and diabetic control was not uniform across age groups. COC indices were negatively associated with FBS level and hospitalization; e.g. odds ratio(OR)s associated with UPC were 0.59(0.44-0.81) for hospitalization and 0.90(0.82-0.99) for FBS control. Conclusion : Age plays a different role for hospitalization and diabetic control and reversal of obesity with ages partially accounts for the disparity. Increase in COC benefits the elderly and middle-aged to similar degree. Keywords : diabetes management, continuity of care, glycemic control

PP25 C-164

EFFECTS OF 12-WEEK CIRCUIT EXERCISE TRAINING ON PHYSICAL FITNESS OF OLDEST OLD PEOPLE

Chun-Fang CHAN¹, Meng-Tzu HOU¹, Jing Jong CHEN², Hsuei-Chen LEE¹ (1. Department of Physical Therapy and Assistive Technology, National Yang-Ming University, Taiwan; 2. Exercise and Health Science Research Center, National Yang-Ming University, Taiwan)

Introduction : Physical fitness is considered as an essential factor of successful aging, and circuit training, a combination of aerobic and resistance training, is recommended to optimize the goal. This study aimed to examine the dose-response effects of 12-week circuit training on performance for oldest old people. Method : This was a quasi-experimental study. The participants were recruited from the Veterans Homes in Taipei. Exercise group (EG) received the circuit training twice per week for 12 weeks. Each program contained the warm-up, cardiopulmonary fitness, strengthening and balance training for 50minutes. The control group (CG) was asked to maintain their daily life. Measurements contain chair stand, arm-curl, 2-minute step, one-leg standing (1LS), back scratch, sit-and-reach and 8-foot up-and-go (8FUG). Results : One hundred and thirty-nine males (age 83.3 years) were recruited: 41 in exercise group (age 83.3 years) and 98 in control group (age 83.2 years). After 12-week intervention, exercise group had better performance than control group in chair stand ($p=.004$); arm-curl ($p=.037$); 2-minute step ($p<.001$); one leg standing ($p=.011$); back scratch ($p=.023$) and 8FUG ($p=.019$). Conclusion : After 12-week exercise intervention, exercise group showed significant improvements on aerobic endurance and muscle strength than other oldest old people in Veterans Homes. More studies are recommended to find out the exercise intensity and protocol for the oldest old people in the long term care facility. Keywords : physical fitness, circuit training, oldest old people

PP25 C-165

VELOCITY OF TRAINING AND BODY COMPOSITION OUTCOMES: A PILOT STUDY

Melissa POWERS, Paul D. HOUSE, Kristin BOGDA, Kelsey HUBBLE, Megan SMITH (Kinesiology & Health Studies, University

of Central Oklahoma, USA)

Introduction : High-velocity resistance training is a useful way to improve or maintain body composition and functionality among older adults. However, this information has not been successfully translated into practice. The purpose of this pilot study was to determine the feasibility of conducting high-velocity resistance training in the community using free-weights with the primary outcome being body composition. Method : Thirteen participants (age 71.46 ± 5.33 years) were randomly assigned to a high-velocity (HV) or low-velocity (LV) group. Both groups trained for 12 weeks at 60% of 1-repetition maximum. The only difference between groups was the instruction given for the concentric phase of each lift. The HV group was instructed to "lift as quickly as possible." A total body iDXA scan was conducted at baseline and following training to determine measures of fat mass (FM) and lean tissue mass (LTM). Results : ANOVAs with repeated measures indicated no significant interaction or main effects for any dependent variable ($p > .05$). Effect sizes, calculated due to the small sample size, indicated a small increase in arm FM in the HV ($d = 0.20$) and LV ($d = 0.18$) groups. Conclusion : HV appears to be feasible in the community, however, HV nor LV significantly impacted body composition outcomes. No change in LTM may be positive as older adults would be expected to lose LTM. This study is limited by the small sample size and lack of control group. Further study is warranted in order to determine if HV can be successfully translated into the community setting. Keywords : exercise, resistance training, body composition

PP25 C-166

THE EFFECTS OF COMBINED AEROBIC AND RESISTANCE EXERCISE ON ANTHROPOMETRIC PARAMETER AND PHYSICAL FUNCTION IN VETERAN INSTITUTION OLDEST-OLD MALE

Meng-Tzu HOU¹, Jin-Jong CHEN² (1. Physical Therapy and Assistive Technology, National Yang-Ming University, Taiwan; 2. Exercise and Health Science Research Center, National Yang-Ming University, Taipei, Taiwan, Taiwan)

Introduction : The purpose of the study was to evaluate the effectiveness of exercise intervention that combined aerobic and resistance in male elderly. Method : We collected 114 men aged 75 and older in veteran institution. People who are bed-ridden, impaired walking, or communication disorder were excluded. The subjects will be randomized assessed to the combined training (CT) group ($n=41$) or control group ($n=73$), CT group accepted the resistance training and aerobic exercise twice per week. The items of assessment included: Anthropometric parameter: waist to hip ratio, calf and arm circuit; Rapid Assessment of Physical Activity (RAPA) was estimated quality of physical activity. Senior fitness test was measured to assess physical function. All tests were done at baseline and 12 weeks later. Results : The mean age of CT group ($y/o=83.3$) and control group ($y/o=84.5$). The base-line characteristics of the two groups were similar. RAPA didn't have different between two groups. After 12 weeks intervention, senior fitness performance improved significantly in CT group: 30 sec chair stand test ($p=0.002$), arm curl test ($p=0.034$), 2-minute step test ($p=0.004$) and 8-foot up-and-go test ($p=0.002$). CT group was significant better than control group: 30 sec chair stand test ($p=0.001$), arm curl test ($p=0.011$), 2-minute step test ($p<0.001$), chair sit-and-reach test ($p=0.041$), single leg stand ($p=0.041$) and 8-foot up-and-go test ($p=0.01$). The control group maintained physical function and physical activity. Conclusion : After 12 weeks combined aerobic and resistance exercise training, physical functions and muscle strength improved in veteran institution oldest-old male, but anthropometric

parameter had no change in a short time. Keywords : Combined training, Senior fitness test, Oldest-Old Male

PP25 C-167

FINDINGS REGARDING RELATIONSHIPS BETWEEN SOCIO-DEMOGRAPHIC, PSYCHOLOGICAL AND COMORBIDITY FACTORS, WITH THE FUNCTIONAL STATUS IN OUR GERIATRIC INPATIENTS

Ana CAPISIZU¹, Sorina AURELIAN², Andreea ZAMFIRESCU³, Ioana OMER⁴, Monica HARAS⁵, Camelia CIOBOTARU⁶, Liliana ONOSE⁷, Tiberiu SPIRCU⁸, Gelu ONOSE⁸ (1. *Geriatrics, Chronic Diseases Hospital 'Sfantul Luca', Romania*; 2. *Gerontology and Geriatrics, The 'Titu Maiorescu' University, Romania*; 3. *Geriatrics, Hospital of Chronic Diseases 'Sf. Luca', Romania*; 4. *Psychology, The 'St.Lucas' Hospital, Romania*; 5. *Physical Medicine & Rehabilitation, The University of Medicine and Pharmacy 'Carol Davila', Romania*; 6. *Rehabilitation, The University 'Ovidius', Romania*; 7. *Occupational Medicine, The Medical Service of 'Metrorex', Romania*; 8. *Biostatistics, The University of Medicine and Pharmacy 'Carol Davila', Romania*)

Introduction : To our knowledge, there are no reported research data regarding the relationships between depressive disorders and functional status in Romanian elderly. Aim: To statistically assess the impact of socio-demographic and quantified depressive symptoms, and co-morbidity factors on disability in our inpatients. Method : Observational cross-sectional study including a number of 80 elderly (16 males,64 females; mean age 72.48 years; standard deviation 9.95 years) admitted in our Geriatrics Division between May-July, 2012. We used the: Functional Independence Measure, Geriatric Depression Scale and an array of socio-demographic and polipathology parameters, respectively. Statistical analysis included Somers'D for ordinal variables, linear bivariate correlations, general linear model analysis, ANOVA and Kruskal-Wallis, tests. Results : FIM scores were negatively correlated with age ($R=-0.301$; 95%*c.i.*-0.439;-0.163 $p=0.007$), GDS score had a weak, negative impact on FIM ($D=-0.188$; 95%*c.i.*-0.324;-0.052 $p=0.006$). An univariate general linear model, including the other variables (education, living conditions, provenance, gender, matrimonial state) as factors, found living conditions ($p=0.027$) and the combination of matrimonial state and gender ($p=0.004$) to significantly influencing the FIM score. ANOVA showed significant differences in FIM scores stratified by the number of chronic diseases ($p=0.035$). Conclusion : Our study objectifies the negative impact of depression on functional status. Interestingly, education had no influence on FIM scores; the living conditions and the combination of matrimonial state and gender had an important impact on functional scores: patients with living spouses performed better than the divorced/widowers; the number of chronic diseases also affected FIM scores, which were lower in patients with significant polipathology. Keywords : elderly, depression, disability

PP25 C-168

SENIOR FITNESS PERFORMANCE AND NORMATIVE SCORE OF ELDERLY MALE RURAL DWELLERS

Ken-Rung TU¹, Meng-Tzu HOU¹, Chih-Hsing WU², Jin-Jong CHEN¹ (1. *Physical Therapy and Assistive Technology, National Yang-Ming University, Taiwan*; 2. *Family Medicine, National Cheng Kung University Hospital, Taiwan*)

Introduction : In Taiwan, there is no national consensus on the normative score for assessing physical fitness performance in elderly people living in rural communities. The study thus endeavored to set up the normative score and to understand the current status of physical

fitness of elderly male rural dwellers in Taiwan. Method : The study first surveyed the 1,033 men aged 65 up in Tianliao township of Kaohsiung County. After an entire township sampling, 414 subjects were selected to receive examination, resulting in a response rate of 60.8%. Twelve subjects were excluded due to use of assistive devices or severe joint disease. Each subject had completed questionnaires and received physical fitness assessment. The subjects were divided into five 5-year-age subgroups. The normative physical fitness scores were listed by nine-rank percentile distribution (5%, 10%, 25%, 30%, 50%, 70%, 75%, 90%, 95%). Results : The average age of the 402 subjects read 74.5±6.0 years old. The 50 percentile of each physical fitness assessment were listed such as BMI 24.1 kg/m², percent body fat 20.6%, grasp test of dominant hand 33.3 kg, 5-time sit-and-stand 11.2sec, 30-s chair stand test 14 time, open-eye stand on right foot 19.6sec, chair sit-and-reach test -1.2cm, and 8-feet walking test 8.0sec. All physical fitness performance was observed to decrease with ageing. Conclusion : Elderly males in different age groups demonstrate different levels of physical fitness as indicated by the disparities in the normative physical fitness scores, and it seems sensible to adopt different normative physical fitness scores for elderly males living in rural and urban areas. Keywords : epidemiological survey, socioeconomic status , physical activity

PP25 C-169

LARGE PROPORTION OF FRAIL INDEPENDENT OLDER PATIENTS WITH COGNITIVE IMPAIRMENT SHOW FUNCTIONAL DECLINE AFTER EMERGENCY DEPARTMENT VISITS FOR MINOR INJURIES

Veronique PROVENCHER, Marie-Josée SIROIS, Marcel EMOND, Stephanie CAMDEN, Nadine ALLAIN-BOULE (*Unite de traumatologie-urgence-soins intensifs, Centre de recherche du CHA, Hopital de l'Enfant-Jesus, Canada*)

Introduction : Minor injuries such as falls are a common reason for emergency department (ED) visits by seniors and can trigger functional decline. However, predictors of functional decline following ED visit for minor injuries among independent seniors remained unclear. Our hypothesis is that seniors at high-risk of functional decline are more frail and cognitively impaired. Our objective was to compare functional decline of seniors admitted in ED for a minor injury, according to their frailty and cognitive status. Method : 426 participants (≥65 years) who were independent at baseline in basic activities of daily living (BADL) have been consecutively recruited in six Canadian ED. The Older American Resources and Service was completed at 3 months after minor injury to ascertain functional decline (≥1 point-drop in BADL score). Participants were considered as 'frail' based on the CHSA frailty scale (≤level 4:'vulnerable'). Cognitive impairment (CI) was defined as a performance below cut-offs on the Montreal Cognitive Assessment or the Telephone Interview for Cognitive Status. Four subgroups were created: 1-Frail with CI; 2-Frail without CI; 3-Non-frail with CI; 4-Non-frail without CI. Results : Respectively 7.7% and 16.1% of non-frail participants without and with CI showed functional decline. 25.0% of frail patients without CI demonstrated a decrease in BADL score, while loss of independence was observed in 38.5% of frail patients with CI. The difference between groups was significant ($p<0.001$, Fisher exact test). Conclusion : Our study will help identify independent seniors at high-risk of functional decline after minor injury, so that appropriate services may be provided to prevent deterioration in BADL. Keywords : Frailty; functional decline; emergency department

DEVELOPMENT OF THE COMPREHENSIVE GERIATRIC ASSESSMENT SCALE FOR CHINESE ELDERLY

Xiu-Ying HU, Na LONG, Lin-Na WU (*The Center of Gerontology and Geriatrics, West China Hospital, Sichuan University, China*)

Introduction : Comprehensive Geriatric Assessment(CGA) is important for the elderly. The domestic research mostly uses the single scale or some specific functional scale for evaluation, and it is difficult to understand older people's comprehensive health status. This article is to establish a comprehensive geriatric assessment scale which fits the situations of Chinese old people most, and to provide an evaluation tool for the proposal and intervention of functional health problems for the elderly. **Method :** The comprehensive geriatric assessment scale was produced by Delphi method combining with Chinese cultural background, some methods such as literature review and experts evaluation were conducted. The manuscript of this questionnaire was developed through Delphi and pre-experiment. Then the manuscript questionnaires were used among 300 old people, to analyse and assess the reliability, validity and reactivity. **Results :** The experiment analysis showed that the total Cronbach alpha coefficient was 0.909 and that of each index ranged from 0.718-0.960, most of the dimension-related coefficients were over 0.5. The construct validity was validated by factor analysis and the cumulative contribution rate was up to 76.88%. Results of non-parametric test on reactivity showed that the differences of total scores and each dimension scores and substitute scores between the elderly from different institutions are statistically ($p < 0.01$). **Conclusion :** The comprehensive geriatric assessment scale owns a reasonable reliability, validity and reactivity, and this scale can be used as an evaluation instrument discovering and intervening the elderly's health problems. **Keywords :** Elderly, Health Function, CGA (Comprehensive Geriatric Assessment)

ORTHOSTATIC DIZZINESS, NOT ORTHOSTATIC HYPOTENSION, IS ASSOCIATED WITH FUNCTIONAL DISABILITY IN COMMUNITY ELDERLY IN SOUTHERN TAIWAN

Ying Hsiang HUANG, Feng Hwa LU, Yi Ching YANG, Chih Jen CHANG, Jin Shang WU (*Department of Family Medicine, National Cheng Kung University Hospital, Taiwan*)

Introduction : To evaluate the associated factors of functional disability in the community elderly population. **Method :** A cross-sectional study design with stratified randomized systematic cluster sampling throughout the Tainan city in southern Taiwan, was conducted from Nov. 2000 to May 2001. A total of 1438 elderly aged ~65 years were included. All subjects were interviewed according to a structured questionnaire and received a complete physical examination and measurement of seated blood pressure (BP). Orthostatic hypotension (OH) was defined as a decline in systolic blood pressure of at least 20 mmHg and/or a decline in diastolic BP of at least 10 mmHg after either 1 or 3 minutes of standing after a person changed from a supine to a standing position. Orthostatic dizziness (OD) was defined as dizziness, lightheadedness, or faintness during the standing procedure with any change in systolic or diastolic BP. Functional disability was defined by at least one impairment in ADLs or IADLs contents, respectively. **Results :** Of the 2146 eligible elderly, 1438 (801 men and 637 women) agreed to participate, representing a response rate of 68.2%. Multivariate analysis showed age, lower education, hypertension, cerebrovascular disease, and osteoporosis were independently related to disability in ADLs. Female gender, age, lower education, and cerebrovascular disease were the associated

factors of disability in IADLs after adjusting for other confounders in two different models. Besides, orthostatic dizziness, not orthostatic hypotension, is independent factor associated with functional disability in different models. **Conclusion :** Orthostatic dizziness, not orthostatic hypotension, is independent factor associated with functional disability in different models in community elderly. **Keywords :** functional disability, orthostatic hypotension, orthostatic dizziness

DEMOGRAPHIC COMPARISON OF IRANIAN AND PORTUGUESE OLDER PEOPLE: RESULTS FROM THE EASY-CARE PROJECT

Vida ALIZAD¹, Ali ASGARI², Reza FADAYEVATAN¹, Farshad SHARIFI³, Maria Piedade BRANDAO⁴, Liliana SOUSA⁵, Ian PHILP⁶ (*1. Iranian Research Center on Ageing, The University of Social Welfare and Rehabilitation Sciences, Iran; 2. Department of Educational Psychology, The University of Kharazmi, Iran; 3. Elderly Health Research Center, Tehran University of Medical Sciences, Iran; 4. School of Health Sciences, The University of Aveiro, Portugal; 5. Health Sciences Section, The University of Aveiro, Portugal; 6. Warwick Medical School, The University of Warwick, United Kingdom*)

Introduction : Population ageing can be seen as a success story from 20th century public health policies. In the 21st century, a key policy challenge for public health is to promote independence in old age. The EASY-Care assessment instrument generates an independence score which is valid for cross-cultural comparison. The aim of this study was to explore relationships between demographic variables and the independence score in two disparate populations of older people from Iran and Portugal. **Method :** An Ex-Post Facto study was designed. A demographic page and the 18-item Independence Score of the EASY-Care assessment was performed on 460 participants from Portugal and 319 from Iran aged 65 years and over by trained interviewers. Data was analyzed using SPSS version 16. **Results :** Portuguese men were more independent than their Iranian peers while Portuguese women were more dependant in comparison with Iranian women. Iranian literate older people were more independent than Portuguese. Iranian single and divorced participants were more independent in comparison with Portuguese. There were no significant relationship between living arrangement and independence in both countries. **Conclusion :** Findings of this study suggest that independence for older people is a concept related to both cultural and demographic variables. The Independence Score from an EASY-Care assessment is a valuable tool for exploring these relationships. Further studies using data from a larger number of countries should be carried out to explore the determinants of independence in old age. **Keywords :** Independence, EASY-Care, Cross-cultural study, Demographic variables, Older people

THE EASY-CARE STANDARD: IS IT SUITABLE FOR USE WITH TURKISH OLDER ADULTS?

Rukiye PINAR¹, Ayse ERGUN², Saime EROL³, Kamer GUR³, Zeynep KURTULUS³, Havva SERT⁴, Zeynep ERDOGAN⁵, Ian PHILP⁶ (*1. Nursing, Yeditepe University Faculty of Health Sciences, Turkey; 2. Nursing, Marmara University Faculty of Health Sciences, Turkey; 3. Nursing, Namik Kemal University, School of Health, Turkey; 4. Nursing, Sakarya University, School of Health, Turkey; 5. Nursing, Marmara University, Faculty of Health Sciences, Turkey; 6. South Warwickshire, NHS Foundation Trust, United Kingdom*)

Introduction : The assessment of elderly people's needs is an important

indicator for planning health and social services that promote independency, well-being and quality of life. A review of the literature on measuring physical, mental, and social needs perceived by elderly yielded no instrument appropriate for use in Turkey. The aim of this study was to evaluate reliability and validity of Easy-care among Turkish elderly. Method : The Easy-care was administered to 400 elderly. Internal consistency, item-total correlations, and test-retest stability were used to investigate the reliability. Construct validity was examined by comparing correlations between subdomains of Easy-care, and using convergent, and divergent validity. Results : Internal consistency was 0.93, 0.75 and 0.64 for the subscales of independence, risk of breakdown in care, and risk of fall respectively. The ICC was found to be 0.87, 0.88 and 0.88 for the three subdimensions. All of the items, except two, correlated significantly with their subscale. Correlation coefficients among sub-domains were ranged from 0.67 to 0.71. Convergent validity supported by high-moderate correlations between EASY-care scores and two main component scores in SF-36. EASY-care subdomains scores were discriminated by living arrangements, educational status, perceived health, urinary incontinence, depression, malnutrition, and history of hospital admission. Conclusion : Turkish Easy-care is a reliable and valid instrument; it can be used to measure functional status of Turkish elderly. Keywords : EASY-Care, Reliability, Validity

Introduction : Numerous studies have analysed the relationship between the thyroid function and cognitive decline, but they gave contradictory results. In Romania, to our knowledge, there haven't been any published data from clinical studies investigating the connection between thyroid status and cognitive decline in elderly. Method : Observational cross-sectional one year study (2011-2012), on 93 geriatric inpatients (69 females, 24 males, mean age 79.95±6.60 years) with cognitive decline. We assessed the cognitive deficit by psychological tests: MMSE, Clock test, Reisberg scale and the thyroid function by determining thyrotropin/TSH, total triiodothyronine/tT3, and free thyroxine/FT4 plasma levels. Statistical analysis included linear correlations, general linear models and data comparison, using t test or Mann-Whitney test. Results : We found no significant linear correlations between cognitive scores and thyrotropin/thyroid hormones ($R \leq 0.090$, $p \geq 0.050$, for all bivariate correlations investigated). To further investigate we stratified the patients by TSH tertiles. The analysis showed that patients in the low TSH tertile had significantly better MMSE scores than those in the middle ($p=0.045$) and high tertile (0.039); we found no significant differences between MMSE scores for patients in the middle TSH tertile versus the third

one ($p > 0.050$). The Clock test and Reisberg Scale scores were similar in the 3 groups ($p > 0.050$). Conclusion : There were no linear relationship between cognitive scores and thyroid function. After stratification MMSE scores were significantly higher for patients with lower TSH. There were no significant differences between the Clock test's and Reisberg scale's scores, even if stratified by TSH tertiles. Keywords : elderly, cognitive decline , thyroid function

PP25 C-175

ORAL SENSATION ,SALIVARY SECRETION AND TONGUE STRENGTH FOLLOWING ENDOTRACHEAL EXTUBATION Han SU (National Taiwan University, School of Nursing, Taiwan)

Introduction : Loss of oral sensation, declined salivary secretion, and decreased tongue strength may occur after prolonged endotracheal intubation. All the above may affect oral intake following endotracheal extubation. The aim of this study was to assess the functional recovery of oral sensation, salivary secretion, and tongue strength in patients with prolonged endotracheal intubation. Method : A prospective observational study was conducted to assess the functional recovery of oral sensation, tongue strength, and salivary secretion among patients aged 20 years and older following endotracheal extubation. In keeping with previous research, we only included patient who had been intubated for at least 48 hours. Data were assessed at three points in time, 48 hours within extubation, and 7 days and 14 days postextubation. Specifically, salivary secretion was measured by oral Schirmer test ; oral sensation was measured by oral stereognosis and two-point discrimination on the tongue; tongue strength was measured by the Iowa Oral Performance Instrument (IOPI) System. Results : Preliminary results from this on-going study have shown that oral sensation, salivary secretion ,and tongue strength were all at the lowest point 48 hours within extubation. Oral sensation was gradually recovered 14 days after extubation, while salivary secretion and tongue strength did not improve even at 14 days after extubation. Conclusion : Functions of oral sensation, salivary secretion ,and tongue strength affected significantly after prolonged endotracheal intubation and most did not recovered even after 14 days. This prolonged dysfunction is likely affect oral intake. More attention is needed in this important area. Keywords : Oral sensation, salivary secretion , tongue strength

RCT OF SPECIALIST GERIATRIC MEDICAL ASSESSMENT FOR HIGH RISK PATIENTS DISCHARGED FROM HOSPITAL ACUTE MEDICAL UNITS

John GLADMAN¹, Judi EDMANS¹, Lucy BRADSHAW¹, Simon CONROY² (1. Division of Rehabilitation and Ageing, University of Nottingham, United Kingdom; 2. Geriatric Medicine, University Hospitals of Leicester/University of Leicester, United Kingdom)

Introduction : Specialist geriatric medical assessment may improve patient outcomes for older people presenting to hospital Acute Medical Units (AMU) discharged after a short stay (< 72 hours). Method : Patients aged ≥ 70 discharged from two UK AMUs and scoring ≥ 2 on the Identification of Seniors At Risk tool were randomised to receive specialist geriatric medical assessment and after care or usual care. Follow up was by postal questionnaire 90 days. Outcomes included mortality, institutionalisation, dependency in activities of daily living (ADL), mental well-being, and quality of life. Results : 433 participants were recruited: 217 control and 216 intervention. At 90 days there was no difference in mortality (6% control v 7% intervention) or the proportion of participants moving to care homes (3% both groups). There were also no differences in dependency in

ADL (median Barthel ADL: 16 both groups), psychological well-being (median General Health Questionnaire ? 12: 12.5 control, 12 intervention), or quality of life (mean EQ-5D: 0.45 both groups). Conclusion : Specialist geriatric medical input to high risk patients discharged from AMUs made no difference to these measures of health and well-being. Keywords : comprehensive geriatric assessment, emergency medicine

THE KINEMATIC ANALYSIS OF TRUNK AND PELVIS MOVEMENT DURING WALKING USING A SMARTPHONE - COMPARISON OF COMMUNITY-DWELLING ELDERLY WOMEN AND HEALTHY YOUNG WOMEN-

Kosuke MIZUNO¹, Yoshitaka SHIBA², Noriaki IKEDA², Haruhiko SATO², Naoto KAMIDE², Yoshikazu SUZUKI¹, Michinari FUKUDA², Akihiro TAKEUCHI¹ (1. Department of Rehabilitation, Kitasato University East Hospital, Japan; 2. School of Allied Health Sciences, Kitasato University, Japan)

Introduction : We developed an application using the built-in sensor of the iPod touch (Apple Inc., USA), to analyze the kinematics of the trunk and pelvis movement during walking and standing. The purpose of this study was to analyze kinematically the trunk and pelvic movement in healthy young women and elderly women while walking using a smartphone. Method : Thirty healthy young women (mean age, 21.3 ± 1.0 years) and 41 community-dwelling elderly women (mean age, 71.8 ± 4.5 years) participated in our study. Subjects were instructed to perform a 10-m gait test at comfortable and maximum speed. The tilt angle and rotation angle of the trunk and pelvis were measured using smartphones during the 10-m gait. Results : Anterior, posterior and lateral tilt angle of the pelvis in elderly women were significantly greater than that in young women in both conditions of comfortable and maximum speed. In addition, when the gait speed was increasing, the rotation angle of the pelvis was increasing in the elderly women. In the young women, the rotation angle of trunk increased at higher gait speed. Conclusion : We found that kinematic analysis using a smartphone could detect the movement of the trunk and pelvis during walking, and could discriminate the difference in movement between healthy young women and elderly women. Keywords : Gait, Kinematic analysis, Smartphone

A COMPARISON OF SWALLOWING FUNCTION RECOVERY AFTER PROLONGED ORAL ENDOTRACHEAL INTUBATION BETWEEN THE YOUNGER AND OLDER PATIENTS

Min-Hsuan TSAI (School of Nursing, National Taiwan University, Taiwan)

Introduction : Swallowing difficulty after endotracheal extubation occurred commonly and affected patients across all diagnostic categories, particularly for patients who are older and sicker. Because oral intake is an important component of patient recovery after critical illness, the aim of this study was to compare signs and symptoms of swallowing difficulty over time in younger (20-64 years) and older patients (~65 years) with prolonged oral endotracheal intubation. Method : A prospective observational study was conducted to assess the recovery of swallowing function among patients aged 20 years and older following endotracheal extubation. In keeping with previous research, we only included patient who had been intubated for at least 48 hours. Data was assessed at four points in time, 48 hours within extubation, 7 days, 14 days, and 21 days postextubation. Swallowing difficulties were measured by symptom checklist, tongue strength,

repetitive saliva swallowing test, 3 steps swallowing screen, and functional oral intake scale. Results : Preliminary results from this ongoing study (n=30, as of 10/31/2012) have shown that older patients (~65 years) had slower recovery on all swallowing difficulty indicators compared to younger counterparts. For younger patients, swallowing difficulty was uncommon 7 days within extubation, while most older patients had signs and symptoms of swallowing difficulty last till 2 weeks after extubation. Conclusion : Recovery trend of swallowing difficulty significantly differ between younger and older patients. This result emphasize the importance of screening and intervening swallowing difficulty for older patients with prolonged oral endotracheal intubation. Keywords : elderly, swallowing difficulty, prolonged intubation

EXAMINING THE FACTORS THAT INFLUENCE PAIN-RELATED BEHAVIORS AMONG OLDER ADULTS WITH DEMENTIA IN JAPAN

Yukari TAKAI¹, Yu FUJIMAKI², Ayami SATO¹, Yoshie FURUTA³, Mizue SUZUKI³, Noriko YAMAMOTO-MITANI⁴ (1. Graduate School of Health Sciences, Gunma University, Japan; 2. Faculty of Medicine, Gunma University, Japan; 3. Faculty of Nursing, Hamamatsu University School of Medicine, Japan; 4. Graduate School of Medicine, The University of Tokyo, Japan)

Introduction : The purpose of this study was to examine the factors influencing pain-related behaviors among older adults with dementia in Japan. Method : All older adults from dementia wards at a hospital and 2 aged care facilities were asked to participate in this study. Data were collected on demographics, prescribed medications, Mini-Mental State Examination (MMSE) score, Gottfries-Brane-Steen Scale score, and Checklist for the Assessment of Pain in Elderly People with Communication Impairment-Japanese Version (PACSLAC-J) score from the participants or from their medical charts. The PACSLAC-J scores were compared by each factor using the Mann-Whitney U test or Spearman's rank correlation. The design of the present study was approved by the ethical committee at the Hamamatsu University School of Medicine, and consents from the older adults' families or guardians were obtained before data collection. Results : A total of 117 older adults participated in this study. The average age was 82.3 (SD 9.5) years, and women comprised 74.4% (n = 87) of the study population. Almost all the participants were diagnosed with dementia, including Alzheimer's disease (n = 54) and/or vascular dementia (n = 35). The average MMSE score was 11.3 (SD 8.8). Sex, psychiatric medication prescription, and the necessity of total transfer assistance were factors that significantly contributed to the total and/or subscale scores of the PACSLAC-J. Conclusion : Adequate pain management for older adults with dementia, especially those with contracture and motor-related diseases, is necessary. Keywords : Pain, Dementia, Scale

A NEW TOOL FOR ASSESSMENT OF ELBOW ARTICULAR AMPLITUDE IN GERONTOLOGY: ACTIGRAPH AGAINST INCLINOMETER

Cecile CRIDELICH¹, Jean-Michel TURPIN², Laure BOSCHER³, Audrey MARTEU², Bernard TEBOUL³, Charlotte SAKAROVITCH⁴, Patrick MALLEA⁵, Olivier GUERIN¹ (1. Plateforme Partenariale d'Innovation, Universite de Nice Sophia-Antipolis, France; 2. Hopital de Cimiez, Centre Hospitalier Universitaire de Nice, France; 3. Plateforme Patient, Centre Hospitalier Universitaire de Nice, France; 4. Departement de la recherche clinique et de l'innovation, Centre Hospitalier Universitaire de Nice, France; 5. Centre National de Reference Sante a domicile et Autonomie,

Centre National de Reference Sante a domicile et Autonomie, France)

Introduction : Different techniques exist for the evaluation of articular angles, but present some drawbacks. Actually the main method for this measure is the inclinometer. We hypothesize that an actigraph used as inertial sensor (Motion Pod developed by Movea), coupled to the specific software Bioval, developed by RM-Ingenierie (MP-BV), is an interesting alternative for assessment of articular amplitude in gerontology. **Method :** The validity of the MP-BV was evaluated for elbow against an inclinometer by calculating the proportion of measures for which the difference between the two tools is below 10 degrees for the four movements (flexion, extension, pronation, supination). We compared too the measurement time between the MP-BV and the inclinometer. Finally the acceptability of the MP-BV was assessed using visual analogue scales. **Results :** The proportion of valid measures by the actigraph is only between 60% and 70% regardless of the movement studied. With regard to patient comfort and adherence to the tool, there is no significant difference between the two tools. For tool use (Δ EVA (acti-incli) : $1,42 \pm 2,1$ $p < 0,0001$) and results export (Δ EVA (acti-incli) : $1,52 \pm 2,8$ $p < 0,0001$), there is a significant difference between the two instruments in favor of actimeter. Measure time with an actimeter is higher than with an inclinometer: $117,4$ seconds $\pm 26,9$ / $104,4$ seconds ± 34 ($p < 0,0001$). **Conclusion :** According to various results, we can conclude that actigraphy is not a valid instrument for measuring range of motion of the elbow, under the joint assessment in gerontology. **Keywords :** actigraph, articular amplitude, inclinometer

PP25 C-181

TRANSITION CARE FOR HIP FRACTURED ELDERLY PATIENTS WITH ANTICOAGULATION THERAPY

Jung-Ah LEE (*Program in Nursing Science, University of California Irvine, USA*)

Introduction : The risk of venous thromboembolism (VTE) is highest in elderly patients undergoing hip fracture surgery. These patients are expected to receive extended VTE prophylaxis using anticoagulants after hospital discharge. The purpose of the study was to identify elderly patients' satisfaction and adherence to anticoagulation therapy during hospitalization and after discharge. **Method :** We conducted surveys on elderly hip-fractured patients aged 65 or older immediately before discharge from a community hospital and performed one-month phone follow-ups. **Results :** A total of 24 elderly patients without cognitive impairment participated in the discharge survey and 19 patients responded to follow-up surveys. The VTE knowledge score was 62.1%. Patient satisfaction with anticoagulation education was 3.6 out of 5. Patients reported that they need to know more about anticoagulation medication and its side effects. Most hip-fractured patients (73%) reported being discharged to a skilled nursing home for rehabilitation. The majority of patients reported their general health was very good or good at one month after surgery. Patients who lived alone reported lower general health than those living with others ($p < 0.05$). One-third of patients reported that they had a minor bleeding episode and missed at least a dose of warfarin prescribed. **Conclusion :** The results of the study show that hip-fractured older adult patients need more education about anticoagulants in the transition period in order to enhance anticoagulation safety after hospital discharge. Focused discharge education including during transition from acute care to home or long-term care should be considered in the development of a hip fracture program for older adults. **Keywords :** hip fracture; anticoagulation; transition care

PP25 C-182

THE STATUS QUO OF HOW WELL THE NURSES IN GENERAL HOSPITALS GRASP THE HEARING ABILITIES OF THE ELDERLY PATIENTS

Keiko MORITA¹, Aiko FURUTA², Sumie FUJISAKI³, Tomoko SANO³, Naoko ITOH¹, Hisao OSADA⁴, Tazuko KAMIBAYASHI³, Yukiko MOGAMI³, Miyuki SATO⁵ (*1. School of Nursing, Faculty of Health Care, Nihon Institute of Medical Science, Japan; 2. Nursing department, Tokyo Metropolitan Geriatric Hospital, Japan; 3. Faculty of Social Work Studies, Josai International University, Japan; 4. Graduate School, J.F.Oberin University, Japan; 5. School of Nursing, Faculty of Health Sciences, University of Human Arts and Sciences, Japan*)

Introduction : The number of hearing-impaired elderly in Japan is estimated at around 15 million according to the National Institute for Longevity Sciences (NILS-LSA). Among them, the number of hospitalization is expected to increase in the future. In this study the authors investigated the present situation of how well the nurses in general hospitals grasp the hearing abilities of the aged. **Method :** Information related to inpatients' sensory functions found in the nursing database of about 500 hospitalized cases (present illness affecting hearing ability, past medical history, drug treatments, presence or absence of hearing impairment) as well as that related to their usage of hearing aids were investigated for analyses. (Ethical considerations) This study was approved by the Ethical Committees of the TOKYO METROPOLITAN GERIATRIC HOSPITAL and J.F.Oberin University Graduate School (№1154). **Results :** Our hypothesis is being examined that the information regarding patients' sensory organs at the time of hospitalization has not been sufficiently grasped. Presently, data collection for analyses is still in progress. **Conclusion :** Improvements in nursing database description should be necessary. **Keywords :** elderly patients nurses hearing abilities

PP25 C-183

ASPECTS OF EATING AND QUALITY OF CARE AMONG ELDERLY IN SHORT-TERM ACCOMMODATIONS - BEFORE AND AFTER AN INTERVENTION

Lena OLAI¹, Eva CARLSSON², Mona PERSENIUS³, Katri STAHLNACKE⁴, Mary HAGG⁵ (*1. School of Health and Social Studies, Dalarna University, Sweden; 2. School of Medicine and Health Sciences, Orebro University, Sweden; 3. Nursing Department, Karlstad University, Sweden; 4. Public Dental Health Service, Orebro County Council, Sweden; 5. Speech & Swallowing Centre, Otorhinolaryngology Department, Hudiksvall Hospital, Sweden*)

Introduction : Lately, oral health-related quality of life (OHRQoL) and the mealtime situation for elderly people living in special accommodations have been placed in focus. In addition, it has been shown that the prevalence of dysphagia, an important aspect of the eating process, is high among frail elderly people. However, the knowledge on how frail elderly people in general perceive oral health and the mealtime situation is scarce. To our knowledge, there is no research on which eating and oral health related experience, older people regard as important factors in short-term accommodations. A simple and innovative training method for people with dysphagia has been successfully tested among people with stroke. In the present study the aims are (1) to describe OHRQoL, the prevalence of dysphagia and eating difficulties among elderly people in short-term accommodations, as well as their perceptions of care quality related to oral health and eating, (2) to compare elderly peoples' and nursing staffs' perceptions of quality, and (3) to evaluate a training program for dysphagia. **Method :** In this prospective study 400 older people will be examined with validated instruments measuring OHRQoL,

perception of care quality, swallowing capacity and eating ability (OHIP14, QPP, SCT, MEONF-II). Patients with dysphagia will be included in an intervention program and tested before and after the training period. Results : Preliminary results will be presented. Conclusion : Eating and oral health is a multidisciplinary responsibility and key factors of importance for this process will be identified. Keywords : oral health related quality of life, mealtime situation, dysphagia

ENTITLED TO COERCIVE TREATMENT? - REGISTERED NURSES' EXPERIENCE AND PERCEPTIONS' OF HOW DIGNIFIED NURSING ARE MET WHILE THE DEMENTED PERSONS' HUMAN RIGHTS AND FREEDOMS ARE MAINTAINED

Margareta WESTERBOTN¹, Eva LEJMAN¹, Ulrica PODER², Barbro WADSTEN² (1. *Sophiahemmet Hogskola, Sweden*; 2. *Department of Public Health and Caring Sciences, Uppsala University, Sweden*)

Introduction : In everyday dementia care, there are severe ethical dilemmas, in that legitimate demands for good and safe nursing conflict with national and international legislation. Preserving the dignity and integrity of older people with dementia, registered nurses must balance between legislation and safe gerontological nursing. The aim of the present study was to describe how registered nurses in nursing homes ensure legal security, good and safe nursing care without violating legal integrity of demented residents. Method : This qualitative study involved audio-taped semi-structured interviews with ten charge nurses in a county in central Sweden. The transcribed interviews were examined using manifest and latent content analysis. The manifest analysis identified local routines involving coercive treatment, registered nurses' descriptions of related complications and alternative measures. Three different nursing strategies to ensure legal integrity of demented residents emerged from the latent analysis. Results : Findings revealed that some registered nurses' could not see how coercive measures limited the resident's rights and freedom. Others were aware of the need for informed consent before the use of constraint. However, some registered nurses used prevented interventions to avoid coercive treatment. Conclusion : The results indicate that despite the delegalization of coercive treatment in Sweden, registered nurses' still use constraint as a way to ensure high quality nursing. Registered nurses interpretations of legal terms, inadequate staff and lack of gerontological nursing in dementia care seem to preserve the use of coercive measures. Keywords : constraint, dementia, older people, nursing home, physical restraints

PP25 C-185

HOW DO ELDERLY PEOPLE, LIVING AT HOME, EXPERIENCE MEDICINE MANAGEMENT?

Margareta WESTERBOTN, Asa CRAFTMAN GRANSJON (*Sophiahemmet Hogskola, Sweden*)

Introduction : Aging is frequently accompanied by age related chronic conditions and multi-morbidity, resulting in a higher use of medication. A majority of elderly persons live at home, and often have cognitive, visual or physical limitations that may decrease their ability to take medicines accurately, which makes taking prescribed drugs a complex task. The aim of this study was to describe how older people living at home in Stockholm, Sweden, experienced the management of their own medication regimen from their own perspective. Method : This qualitative study involved audio-taped interviews with 25 persons, aged 85 years and older, and were cognitively intact (Mini-Mental State Examination >23), living at home, and taking medicines

regularly. Data was analysed using content analysis. Results : Findings revealed that most participants managed their medicines by themselves and were very content with this. Older people who received help were also very pleased with that help. The most important components for older people were to have good cognitive ability, to be independent, and to get support with their medicines from a close person as a backup. Conclusion : To observe the life of an older person as a whole is important in nursing care, so that the person's behaviour can be understood, since how older people manage to handle their medicines may have an impact on their autonomy and on health-care resource utilisation. Without proper medication many of them would not function well and would not be able to remain in their own homes. Keywords : very old people, experience, management of medicines, community dwellers

PP25 C-186

NURSES' UNDERSTANDING LEVEL OF THE RISKS AND THE RISK FACTORS ASSOCIATED WITH ELDERLY WHEELCHAIR USERS

Masako SOTOMURA, Midori SHIRAI (*Graduate School of Nursing, Osaka City University, Japan*)

Introduction : A variety of risks caused by improper sitting posture of the elderly in a wheelchair are reported. Nurses are in charge of lessening the risks and preventing accidents. The purpose of this study is to clarify the nurses' understanding level of the risks and the risk factors associated with elderly wheelchair users. Method : Twelve working nurses in the nursing home of six facilities in Osaka Prefecture were collected as subjects. Then the subjects were interviewed about the risk and risk factors about the elderly wheelchair users in a semi-structured form. Their answers were recorded verbatim and analyzed. Results : Such risks as falls, pressure ulcers, injury, etc. were extracted. Possible risk factors for the main three factors were as follow, Fall: the physical features and function of the elderly users, behavior of the users, the recognition of their physical condition or ability of the users, nursing care. Pressure ulcer: the users' skin condition, sitting posture, sitting time, Injury: wheelchair specifications, nursing care. Different understandings among nurses on risks and risk factors were found. These differences seem to be caused by the nurses' experience and knowledge. Conclusion : Different risk factors are observed among extracted risks. The recognition about the risk factors are different among nurses. The differences seem to be contributed by the nurses' experience and knowledge. The result would suggest that the education of the nursing method for elderly wheelchair users should be needed. Keywords : elderly wheelchair risks

PP25 C-187

BEST PRACTICE POTENTIALS FOR THE MANAGEMENT OF OLDER PEOPLE WITH COGNITIVE IMPAIRMENT PRESENTING TO EMERGENCY DEPARTMENTS: A SYSTEMATIC REVIEW

Linda Maria SCHNITKER¹, Melinda MARTIN-KHAN¹, Elizabeth BEATTIE², Len GRAY¹ (1. *The Centre for Research in Geriatric Medicine, The University of Queensland, Australia*; 2. *School of Nursing, Queensland University of Technology, Australia*)

Introduction : This paper reviews the research-based literature to identify care practices that meet the specific care needs of the older cognitively impaired ED population. Method : The study was a systematic literature review of papers describing ED interventions aiming to prevent adverse events and improve health outcomes for older ED patients with cognitive impairment. Interventions carried out

in acute care hospitals were also considered. Relevant papers' reference lists were hand searched for additional articles. Two authors independently reviewed the papers by abstract and full text. Discrepancies were decided by consensus discussion. Results : The literature outlines a number of strategies to improve the care for older ED patients with cognitive impairment, including interventions to improve cognitive impairment recognition and clinical approaches to reduce falls and delirium. Supplemental studies carried out in acute care settings regarding primary and secondary prevention of delirium were also relevant. Intervention studies that reduced the prescription of potentially deliriogenic drugs in older persons, reduced behavioural symptoms, and improved patient comfort and nutritional intake in hospitalised older persons with dementia were also identified. Conclusion : Useful information was available from several studies testing interventions that improved cognitive impairment recognition and a single study that investigated the effectiveness of a fall prevention program. Other than this, there is little research carried out to improve the quality of care of older ED patients with cognitive impairment. Although this study found additional evidence obtained from the acute care setting, additional research is needed to identify whether these interventions are beneficial in fast-paced emergency settings. Keywords : Older Persons with Cognitive Impairment, Emergency Department, Best practice

PP25 C-188

DEVELOPMENT OF A PRACTICE ALGORITHM FOR EMERGENCY NURSING CARE TO ELDERLY STROKE PATIENT IN NURSING HOME

Mi So KIM, Sung Ok CHANG, Eun Young KIM (*College of Nursing, Korea University, Korea*)

Introduction : The purpose of this study was to develop a practice algorithm for emergency nursing care to elderly stroke patient in nursing home. Method : This study was a methodological research to develop a practice algorithm. In order to construct preliminary algorithm, detailed items were deducted from literature review and interviews with 30 experienced nurses in 12 nursing home. And then, the preliminary items were evaluated for validity and modified by expert group. Results : The developed preliminary algorithm was composed of total 3 categories (assessment, intervention, and evaluation) with 54 detailed items. The preliminary algorithm for emergency nursing management related to stroke in the elderly in nursing home had assessment category which included verification underlying diseases involved with stroke such as hypertension/diabetes mellitus, appearance (ex. dysbasia/ parathria/ paralysis), and physical examination (ex. check of level of consciousness and vital signs, assessment of neurologic status using GCS). Intervention category included underlying diseases care, nursing care of patients with stroke. Lastly, through evaluation category, nurses could make a decision to transfer to ER or keep managing the elderly in nursing home. Conclusion : The algorithm developed in this study could be utilized as knowledge to be help to nurses when they offer rapid and appropriate emergency nursing care to elderly stroke patient. Through this study, this algorithm will contribute to quality enhancement of emergency nursing care by increasing efficiency of nursing practice. This research was supported by Basic Science Research Program through the National Research Foundation of Korea(NRF) funded by the Ministry of Education, Science and Technology(2010-0009022). Keywords : Stroke, Nursing Home, Emergency Nursing, Algorithm

SITTING POSTURE SUPPORT FOR FRAIL ELDERLY USING WHEELCHAIRS:SEATING GUIDELINES FOR NURSES AND

CARE WORKERS

Midori SHIRAI¹, Yachiyo SASAKI², Yuka KITAMURA³, Yoshie SUGIMOTO⁴, Kimika USUI⁵, Hideyuki HIROSE⁶ (*1. Graduate School of Nursing, Osaka City University, Japan; 2. School of Nursing, Sonoda Women's University, Japan; 3. School of Nursing, Osaka Medical College, Japan; 4. Graduate School of Nursing, Osaka Prefecture University, Japan; 5. Graduate School of Nursing, Konan Women's University, Japan; 6. Department of Assistive Technology, Research Institute, National Rehabilitation Center for Persons with Disabilities, Japan*)

Introduction : Although maintaining a proper sitting posture is one condition for improving activity in frail elderly, many elderly people who use wheelchairs have difficulty maintaining or correcting their sitting posture. There is therefore a need to provide seating to help them maintain a proper sitting posture. This report outlines Seating Guidelines we created for nurses and care workers. Method : The Guidelines were created based on the results of past intervention studies (a) and a survey study (b). a) Effects of seating care for frail elderly sitting in a regular wheelchair (2 studies) b) Seating care provision by nurses and care workers in advanced facilities. Results : From the intervention studies, we clarified the efficacy of seating provided by nurses and care workers. In addition, we confirmed validity of methods for observation of posture and behavior and method for seating. From the survey study, we were able to derive the following information for the guidelines: effects of sitting posture on health and lifestyle of elderly people, observation and assessment of sitting posture, selection and adjustment of sitting device, methods for confirming and correcting sitting posture, and intervention examples. Conclusion : We were able to create practical guidelines from the results of intervention studies and a survey study. We are currently testing the validity of the guidelines. Keywords : Seating Elderly Wheelchair

CASE CONFERENCES CHANGED HOSPITAL NURSE PERCEPTIONS AND USES OF PHYSICAL RESTRAINTS FOR ELDER INPATIENTS

Sadami KURATA, Kumiko MAKINO, Shizuko MURAKAMI (*Gerontological Nursing, Hamamatsu University School of Medicine, Japan*)

Introduction : In Japan with the highest proportion of elderly, hospital nurses tend to use physical restraints (PRs) to protect the safe implementation of therapies for the elderly. We organized case conferences utilizing person-centered care (PCC), and evaluated their effects on frequencies of PRs and perceptions of nurses about PRs. Method : In a hospital with an acute care ward, we organized lectures for learning PCC and case conferences of elder inpatients with impaired cognition and PRs. Before and after the course, nurse perceptions of PRs were assessed with questionnaire. Results : Four cases restrained with mittens, arm fixation, bedrails, and straitjackets were discussed in total 5 conferences held from September 2010 to January 2011, and each conference included 13 to 19 nurses. In September 2009 and September 2011, 70% (52/60 nurses) and 69% (51/74 nurses) returned a questionnaire, respectively. Falls over bedrails were significantly more frequently perceived as harmful PR effects of in 2011 than in 2009 (p=0.043). In 2011, all nurses perceived muscle weakness, arthrogyposis, and decubitus, falls from wheelchairs, and falls over bedrails as harmful PR effects, and PR perception were changed in 31 nurses (61%), 28 (90%) of whom reported changes in their behaviors. The prevalence of nurses reporting that they used PRs by themselves significantly decreased from 90% to

73% ($p=0.029$). On the other hand, PRs were removed, changed to alternatives, or their durations were shortened in all 4 cases discussed. Conclusion : Case conferences utilizing PCC may raise the nurse perception of harmful PR effects and decrease inappropriate PRs by nurses. Keywords : physical restraint, case conference, acute care ward

PP25 C-191

SYMPTOM SEVERITY AND SYMPTOM INTERFERENCE IN OLDER PEOPLE WITH CANCER AND THEIR RELATIONSHIP WITH DEPRESSION, FIGHTING SPIRIT AND SOCIAL SUPPORT

Hee Sun KIM, Soo Jung CHANG (*Dept. of Nursing, Woosuk University, Korea*)

Introduction : The objectives of this study were to (1) examine the levels of symptom severity, symptom interference, depression, fighting spirit and social support (2) identify the predictors of symptom severity and symptom interference 65 years of age and older people with cancer. Method : This cross-sectional descriptive design used secondary data from 113 older cancer patients recruited from the J university hospital in Korea. Measurements used included M. D. Anderson Symptom Inventory (MDASI), Hospital Anxiety and Depression Scale (HADS), Fighting subscales of the Mental Adjust to Cancer (MAC) and Medical Outcome Study Social Support Survey (MOS-SSS). Data were analyzed using descriptive statistics, Pearson correlation and multiple linear regression. Results : The participants had multiple symptoms, with a mean number of 11.8 out of 13 symptoms. Fatigue and numbness were the most severe, while vomiting and distress were the least severe. The most prevalent area of daily life interfered by symptoms was general activity followed by work. A significant relationship was noted among symptom severity, symptom inference, depression, fighting spirit and social support. Depression and fighting spirit were significant predictors of symptom severity. Living with family, advanced cancer, follow up cancer treatment status, depression and fighting spirit were significant predictors of symptom inference. Conclusion : Most of the older people with cancer suffered from various symptoms. Depression and fighting spirit are important factors in predicting symptom severity and symptom interference. These findings support the need for assessment of severe symptoms and tailored interventions to manage symptoms severity and symptom inference in older people with cancer. Keywords : neoplasms, symptoms severity, symptom interference

PRE-DISCHARGE PLANNING AND POST-DISCHARGE SUPPORT PROGRAM (PPPSP) IN A REGIONAL HKSAR HOSPITAL

Stephen Shing-Fai WONG¹, Yu Pak CHAN¹, Wing Lan NGAI¹, L. CHAN², S.M. WONG², S.M. CHEUNG¹, S.H. YEUNG¹, S.K. LI¹ (*1. Medicine, Hospital Authority, Hong Kong; 2. Community Nursing Service, Hospital Authority, Hong Kong*)

Introduction : Discharge planning of older patients is important to facilitate timely and appropriate discharge from hospital. We had piloted Pre-discharge Planning and Post-discharge Support Program (PPPSP) to determine its effectiveness in reducing the attendance to the Accident and Emergency Department (AED) and unplanned readmissions (UPR) after discharge. Method : Older adults aged 65 or above who were admitted through AED were screened. Those who were at risk of unplanned readmissions, defined as emergency admission through AED within 28 days after discharge, were recruited. They were then randomized into either PPPSP or usual care (UC). In PPPSP group, an Advance Practice Nurse (APN) would

formulate discharge plans, and a community nurse (CN) would then provide support and counseling at home by means of home visit and telephone follow-ups within 28 days of discharge. Results : We had recruited 1,346 patients, 898 were assigned to PPPSP and 448 to UC. UPR rates (the percentage of patients being readmitted through AED within 28 days of hospital discharge) were 38.0% and 59.7% in PPPSP and UC group respectively. There was an absolute reduction of 1.2 days per patient in PPPSP group compared with UC group. The AED attendance rate was 1.4 episodes per patient in PPPSP group compared with 1.7 in UC group. Conclusion : A nurse-led discharge planning program with community nurse support could lead to fewer UPR, shorter average total LOS of UPR and fewer AED attendances, and these favourable outcomes could have financial implication. Further analysis of its cost-effectiveness is warranted. Keywords : discharge planning, unplanned readmissions

PP25 C-193

DIFFERENCES IN BEHAVIORAL PROBLEMS AND CAREGIVER HEALTH OUTCOMES BETWEEN PATIENTS WITH VASCULAR DEMENTIA AND ALZHEIMER'S DISEASE

Yea-Ing Lotus SHYU¹, Lin-Min KUO² (*1. School of Nursing, College of Medicine, Chang Gung University, Taiwan; 2. School of Nursing, Hsin Sheng College of Medical Care and Management, Taiwan*)

Introduction : Little is known about whether the behavioral problems and family caregiver's responses being different between patients with vascular dementia (VaD) and Alzheimer's dementia (AD). Thus, the purpose of this study was to explore the differences between patient's behavioral problems and caregiver's self-efficacy and health-related quality of life (HRQoL) between patients with VaD and AD. Method : Secondary data analysis on the baseline data of 46 VaD and 86 AD patients from a large clinical trial which recruited from neurological clinics and community care centers was conducted. Patient's behavioral problems was measured by using Cohen-Mansfield Agitation Inventory, caregivers' self-efficacy was measured by the Agitation Management Self-efficacy Scale, and caregiver's HRQoL was measured by Taiwan version of the Medical Outcomes SF-36. Results : For behavioral problems, AD patients had significantly more verbally non-aggressive behaviors (VNAB) than VaD patients ($P=0.01$). At the same time, family caregivers reported higher self-efficacy in handling verbally non-aggressive behaviors ($P=0.01$) and verbally aggressive behaviors ($P=0.04$) for patients with VaD than AD. However, poorer HRQoL in many dimensions including role physical ($P=0.01$), bodily pain ($P=0.02$), social function ($P=0.04$), and physical summary score ($P=0.02$) for family caregivers of patients with VaD than AD was found. Conclusion: More attention might need to be paid to HRQoL for family caregivers of patients with VaD. Conclusion : More attention might need to be paid to HRQoL for family caregivers of patients with VaD. Keywords : Family caregiver, Health related quality of life, Vascular dementia, Alzheimer's disease

ORTHOGERIATRICS IN TAIWAN: A PILOT MODEL OF CARE FOR HIP FRACTURES

Li-Ning PENG, Liang-Kung CHEN (*Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taiwan*)

Introduction : Hip fracture is a common clinical condition of older people and early mobility is of great importance to these patients. The purpose of the study is to evaluate the clinical benefits of post-acute rehabilitation for older patients with hip fractures in Taiwan. Method : This is a prospective cohort study. Patients hospitalized for hip

fracture between Jan 1, 2007 and Dec. 31, 2011 in Taipei Veterans General Hospital (TVGH), a tertiary care hospital, were eligible for the study. Basic characteristics, Barthel Index, Instrumental Activities of Daily Living, Mimi-Mental State Examination, Geriatric Depression Scale, time to surgery, length of stay, mortality were recorded. Results: During the study period, 467 hip fracture patients participated in this study with the mean age of 82.1 ± 10.0 years, and were male predominant (270/467, 57.8%). Every patients may be discharged back to the communities receiving home-based rehabilitation (HBR) program, long-term care facilities for institute-based rehabilitation (IBR) or back home for conventional care (CC) (no fixed rehabilitation program being involved). Among all patients, 28.9% (135/467) patients received HBR, 25.3% (118/467) patients received IBR, and 45.8% (214/467) were back to the communities for CC. Survival status of all patients were surveyed, which disclosed that 28.7% of all patients died within a mean of 880.6 ± 482.8 days. Adjusted for age, gender, baseline physical function, patients receiving CC were significantly more likely to die than HBR group (H.R.=1.750, 95% C.I.: 1.11-2.76, P=0.016). Conclusion : Post-acute rehabilitation for hip fracture patients was of great survival benefits, either through home-based or institute-based rehabilitation. Keywords: hip fracture, home-based rehabilitation

PP25 C-195

ADVERSE OUTCOMES AND EVENTS IN OLDER ED PATIENTS: A SYSTEMATIC REVIEW

Linda Maria SCHNITKER¹, Melinda MARTIN-KHAN¹, Elizabeth BEATTIE², Len GRAY¹ (1. The Centre for Research in Geriatric Medicine, The University of Queensland, Australia; 2. School of Nursing, Queensland University of Technology, Australia)

Introduction : The aim of this systematic review was to identify adverse health outcomes and negative events experienced by older persons presenting to emergency departments. Method : Electronic databases were searched for relevant English references. Search terms included: 'older person'; 'emergency department'; 'health outcome'; and 'adverse event'. Relevant systematic reviews from the Cochrane library, which were not detected by the search in the other databases, were added to the results. A hand search of reference lists was carried out. Two authors independently reviewed the selected papers at exclusion levels by title and full text. Any discrepancies were decided by consensus discussion. Results : After removal of duplicates, 2193 papers were reviewed in a culling process (by title, abstract and full text). Thirty-seven papers were considered relevant to this review. Conclusion : Common adverse health outcomes in the older ED population are functional decline, ED re-admission, institutionalisation, and death. Examples of adverse events included 1) under triage of illness severity, 2) medication errors, and 3) lack of recognition of geriatric syndromes, including cognitive impairment. Keywords : Older Persons, Emergency Department, Outcomes and Events

PP25 C-196

EFFECTIVENESS OF NOVEL MULTIDISCIPLINARY DISCHARGE PLANNING AND COMMUNITY SUPPORT PROGRAM FOR HIGH RISK OLDER PATIENTS

Oi Yee LIN, K.H.J. LUK, W.M.W. MOK, T.C. CHAN, F.H.W. CHAN (Queen Mary Hospital, Hong Kong)

Introduction : In Jan 2012, Hong Kong West Cluster has launched the Integrated Care and Discharge Support for Elderly Patients (ICDS) which comprised of 2 important components: Integrated Care Model Case Management (ICM Case Management) and Integrated Discharge

Service Program (IDSP). In this program, link nurses and geriatricians perform multi-dimensional assessments for home dwelling elderly aged 60 or above admitting to medical wards through Accident and Emergency Department. Pre discharge planning is performed on high risk elderly and they are recruited into either ICM Case Management, IDSP or ECNS depending on their needs. Method : It is a prospective cohort study. Baseline data, will be collected when these subjects joining the ICDS program. The number of AED attendances; hospital admissions and duration of hospital admission 6 months after joining the ICDS program will be obtained. Subjects will be divided into 2 groups. One group will be those having reduced admission when compared to 6 months before joining the program while the other group will be those who are having either increased or static admissions. These 2 groups of patients will be compared to identify any independent factors that predicts the efficacy of the program. Motor and functional status after the completion of program by using MFAC and BI 20 respectively and the proportion of elderly discharged to institution will also be studied as secondary outcomes. Results : This 18-month prospective cohort study is still in progress. The outcome result will be available in the end of 2012. Conclusion : Result will be available in the end of 2012. Keywords : Integrated Care and Discharge Support for Elderly Patients, ICDS, reduce readmission

PP25 C-197

HEALTH CARE USE DURING THE LAST YEAR OF LIFE AMONG OLDER DECEDENTS

Tatsuro ISHIZAKI, Masaya SHIMMEI, Ryutaro TAKAHASHI, Ryo HIRAYAMA (Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : From 1960 to 2010, the proportion of Japanese people who died at hospital quadrupled from 18% to 78%. However, these statistics do not depict how much and what kinds of healthcare services non-surviving older adults spent before death. We explored time spent in hospital during a quarterly period in the last year of life among older decedents stratified by their characteristics. Method : Using claim data of medical and long-term care insurance plans provided by a local government and death certificate data provided by the national government, we analyzed 570 decedents who died at hospital at the age of 65 or older between 2005 and 2007. We examined health care use before death and compared cumulative bed days during a quarterly period in the last year of life by sex, age at death, long-term care use, and proximity of death. Results : Decedents spent a median of 50 days in hospital during the last year of life. Most of the total occupied bed days were accumulated during the quarterly period immediately before death. Cumulative bed days during a quarterly period significantly increased as death approached. Decedents who used any long-term care services had significantly shorter bed days than those who did not. Conclusion : This study shows that, regardless of sex and age, bed days during the quarterly period increased as death approached. We should cautiously interpret the association between long-term care use and shorter bed days, because some patients might be in too serious condition to use long-term care services. Keywords : resource use, bed days, end of life

PP25 C-198

LONG-TERM CARE ARRANGEMENT AND CONTINUITY OF CARE

Wen-Chiung CHANG, Shwu-Chong WU (Institute of Health Policy and Management, National Taiwan University, Taiwan)

Introduction : Long-term care arrangement and continuity of care

(COC) both have important effects on health care utilization of older adults. This study aimed to investigate the effect of long-term care arrangement on COC. Method : The data analyzed in this study came from the "2002 National Assessment of Long-Term Care Need" survey and the outpatient claims data of the National Health Insurance of the same year. A total of 14,094 individuals aged 50 or older who had long-term care need were included. COC was defined by outpatient visit concentration which was measured by the Bice-Boxerman continuity of care index (COCI) with increasing scores indicating higher continuity. Long-term care arrangement was categorized as: no caregiver, family caregivers only, using home- and community based services, hiring care aides, and institutionalization. Multiple linear regression was applied to examine the association between long-term care arrangement and COC, controlling for sex, age, number of diseases, disability level, family income, and educational level. Results: Comparing with being cared by family caregivers only, hiring care aides was associated with lower COC ($B = -0.018, p = 0.002$), and institutionalization was related to higher COC ($B = 0.025, p = 0.002$). Other significant factors included number of diseases ($B = -0.013, p < 0.001$), middle ($B = 0.023, p < 0.001$) and severe ($B = 0.021, p = 0.003$) disability, low family income ($B = 0.021, p = 0.014$), and educational level of elementary school ($B = -0.010, p = 0.037$) or high school or above ($B = -0.019, p = 0.011$). Conclusion : Long-term care arrangement may affect the COC of middle-aged and older adults. This finding had major implications for long-term care policy. Further studies should investigate the mechanism resulting in this phenomenon. Keywords : Long-term care arrangement; Continuity of care, Taiwan

PP25 C-199

HOME CARE FOR ED ELDERLY: OUT-OF-POCKET COSTS IS A MAJOR BARRIER TO BOTH SERVICE UPTAKE AND CONTINUATION

Zheng Jie TOH, Chik Loon FOO, Su Xian LEE, Tse Ling TAN
(Emergency Department, Tan Tock Seng Hospital, Singapore)

Introduction : Post-acute care at home (PACH) is a home medical and nursing service. We describe our experience with emergency department (ED) referrals to PACH, and examine if out-of-pocket expenses pose an impediment to service continuity and evaluate its efficacy in reducing repeat ED visits. Method : This was a retrospective study conducted between Mar 2010 and Aug 2012. The control group had the first PACH visit cost waived, while the intervention group enjoyed waivers for their first five visits. Baseline demographics and number of PACH visits were compared, together with ED reattendance and hospitalisation at 4 weeks. Results : There were 63 and 52 patients in the the control and intervention groups respectively. There was no difference in baseline age, gender, mobility status and acuity between the two groups. Patients who enjoyed five visit-waivers were more likely to continue PACH visits beyond the first visit (41.3% vs 75.0%, $OR = 5.1, CI = 2.048$ to 12.601). They were also more likely to continue the service beyond 5 visits, even when the subsidy ended (1.6% vs 26.9%, $OR = 82.6, CI = 5.52$ to 1236.495). This was accompanied by a trend towards lower 4-week ED reattendance (34.9% vs 23.1%; $p = 0.24$) and hospital admission (28.6% vs 19.2%; $p = 0.35$), but these were not statistically significant. Conclusion : Elderly patients are highly sensitive to out-of-pocket expenses. They are far more likely to accept, as well as continue, home care services if this barrier is removed. Keywords : Home Care, Geriatrics, Emergency Department

PP25 C-200

PROMOTE THE MANAGEMENT OF THE HEALTH FOR THE OLD BY DISTANCE CARE

Chiu Yu CHEN¹, Tu Shih TE² (1. Community of Development Nurse, Changhua Christian Hospital Lukang Branch, Lukang, Taiwan; 2. Superintendent, Changhua Christian Hospital Lukang Branch, Lukang, Taiwan)

Introduction : With the increase of the elderly population and the prolonging of the average life, the elders' health can't be overlooked. Method : By distance physical care and the management, measure the blood pressure, build the data of the blood sugar and care every month; manage the abnormal process changes from the individual case. By way of hospital distance physical care and the information management, help the old take medical treatment, care consultation, and health situation on a regular time schedule. Results : 39 people joined the distance care. After 10 months' management model, 18 people improve the blood pressure, 17 people improve the blood sugar, and keep tracking their situation now. Conclusion : The increase of the elderly population means the increase of the medical need. Let the old realize the physical situation by the website construction of Distance Care Service to assist improvement of lifestyle and medical change and achieve the function of the health care and the promoting the health-life quality. Keywords : distance care, elders' health

PP25 C-201

AN ASIAN CULTURE-ROOTED NATURALISTIC SPIRITUALITY AND ITS ROLE IN POSTOPERATIVE HOSPITAL STAY IN THE UNITED STATES

Amy Lee AI¹, Paul WINK², Hyejin KIM¹ (1. College of Social Work, Florida State University, USA; 2. Department of Psychology, Wellesley College, USA)

Introduction : Despite the surging interest in the faith-health connection in aging, understanding this link is complicated by the growing diversification of the American religious landscape (Pew Forum, 2008) coinciding with the coming of age of the Baby Boomers. The present study investigated the influence of traditional religiousness and of experiencing reverence in religious and secular (e.g., naturalistic, moralistic) contexts in postoperative hospital length of stay among patients undergoing open-heart surgery 400+. Reverence was broadly defined as "feeling or attitude of deep respect, love, and awe, as for something sacred." Method : Information on demographics, faith factors, sense of reverence, mental health, and medical comorbidities was collected from 400+ patients (age 62+12) around two weeks before surgery via personal interview. Measures included depression, social support, optimism, religiousness, spirituality, and reverence. Standardized medical indices, including hospital length of stay, were retrieved from the Society of Thoracic Surgeons' national database. Results : Hierarchical multiple regression showed that reverence in secular contexts predicted shorter hospitalization, after controlling for demographics, medical indices, depression, and psychosocial protectors. Other hospital length of stay predictors included female gender, age, medical comorbidities, low left ventricular ejection fraction, perfusion time, and coronary bypass graft surgery. Conclusion : Secular reverence exerts a protective impact on an objective measure of cardiac health. More investigation is warrant on naturalistic view of spirituality in older patients with diverse beliefs. If the finding can be replicated, health providers may integrate a naturalistic perspective of spirituality in cardiac aging care. Keywords : Posttraumatic growth; cardiovascular diseases and surgery; religious coping and spiritual support

PP25 C-202

MOBILE HEALTH APPS FOR OLDER ADULTS WITH ANTICOAGULATION THERAPY: AN INNOVATIVE WAY TO

REDUCE ADVERSE DRUG EVENTS AND INCREASE SAFETY IN TRANSITION FROM THE ACUTE CARE SETTING TO THE COMMUNITY/HOME

Jung-Ah LEE¹, Alpesh N. AMIN², Mark BACHMAN³ (1. Program in Nursing Science, University of California Irvine, USA; 2. Medicine, University of California Irvine, USA; 3. Electronic Engineering and Computer Science, University of California Irvine, USA)

Introduction : Anticoagulation-associated adverse drug events are one of the most common medication errors in hospitalized patients. Despite the strong evidence that the use of anticoagulation therapy in older adults with cardiovascular disorders reduces thromboembolic events such as stroke or pulmonary embolism, challenges for anticoagulation therapy in elderly patients remain. Advances in the area of mobile Health (mHealth) via smartphones or tablet computers allow the design and development of new patient-centric models for the provision of personalized healthcare services, increase of patient independence, and improvement of patients' self-control and self-management capabilities. The overall aims of the study are to design an elderly-centered, interactive game-based mhealth program for older adults with anticoagulation therapy and examine the satisfaction with and feasibility of the program in order to improve adherence to anticoagulation therapy and quality of life in this vulnerable population. **Method :** A multidisciplinary research team including experts from medicine, nursing, pharmacy, information and computer science, and electrical science, has been working together on the development of this innovative, multifaceted system approached mHealth apps and will conduct a pilot testing of its feasibility and effectiveness in older adults with anticoagulation. **Results :** Preliminary results from the study phase 1 development of the system will be presented at the conference. **Conclusion :** Findings from the study can be used to ensure continuum of care for older adults requiring anticoagulation therapy by providing tailored coaching by healthcare providers from inpatient stays to outpatient clinics to enhance adherence, communication, and quality of life and reduce adverse drug events associated with anticoagulants. **Keywords :** mobile health; self-care; anticoagulation therapy

PP25 C-203 RELATIONSHIP BETWEEN HANDICRAFT AND SUBJECTIVE HEALTH IN ELDERLY PEOPLE

Masayo AYUKAWA, Shunyue CHENG, Hiraoka KEIKO (School of Nursing, Hiroshima Bunka Gakuen University, Japan)

Introduction : The aim of the present study was to clarify the relationship of engaging in handicrafts to subjective health status among elderly people in Japan. **Method :** The data were obtained from elderly people who participated a public seminar "to keep being healthy ever after" conducted in Kure, Hiroshima, Japan on February, 2011. A questionnaire survey regarding hobby activities and self-reported health status was carried out. The data of 418 (83%) elderly who completed the questionnaire were available for the statistical analysis. This study was approved by the committee of Ethics in Hiroshima Bunka Gakuen University and all participants were received informed consent for this survey. Multiple regression analysis was performed with the level of subjective health as independent variable and leisure activities (27 leisure activities that included handicraft) as dependent variables by gender. **Results :** Results showed that elderly people who engaging in handicrafts had a significantly higher subjective health scores than others even after adjusting for age and other leisure activities such as swimming, community activities and etc. (B=0.208, p<0.01) in the female but not male. The mean ± SD

age of 66 ± 9.9. People 281 women (67.2%). **Conclusion :** This result indicates that engaging in handicrafts have a positive effect on subjective health in female elderly people. Our findings also suggest that it is likely to increase subjective health by providing the place which can enjoy the handicraft especially in female elderly people. **Keywords :** elderly, subjective health, handicraft

PP25 C-204 EFFECTS OF PROFESSIONAL ORAL CARE ON HEALTH OF THE ELDRLY IN NURSING CARE

Sato MATSUKAWA¹, Katsuo YAMANAKA², Kumiko SUGIMOTO³ (1. Oral and Maxillofacial Surgery, The University of Tokyo Hospital, Japan; 2. Faculty of Human Science, University of Tsukuba, Japan; 3. Basic Oral Health Science, School of Oral Health Care Sciences, Faculty of Dentistry, Tokyo Medical and Dental University, Japan)

Introduction : It is generally recognized that maintenance and improvement of oral hygiene is important for elderly people to prevent from aspiration pneumonia and keep physical health. Professional oral care by dental hygienists is expected to be much more effective for oral health of the elderly comparing with self-care. In this study, therefore, we investigated the efficacy of professional oral care for the improvement of physical status as well as mental status in the elderly in need of nursing care. **Method :** Nine individuals using nursing care facilities underwent professional oral care by a dental hygienist once a week for three months. Before the intervention, oral care was carried out by themselves for one month as the baseline period. The status of oral hygiene and oral functions such as salivation and taste and mental stress level were assessed throughout the baseline period and the intervention period. **Results :** Professional oral care resulted in improvement of oral hygiene and increases in salivary secretion and concentration of secretory immunoglobulin A which is a dominant immunoactive substance in saliva. Regarding taste function, the recognition thresholds for saltiness and sweetness were lowered during intervention period showing improvement of taste sensitivity. Measurement of autonomic nervous activities demonstrated elevation of parasympathetic nervous activities during the intervention period, which was consistent with the decrement of salivary amylase activity, another stress index. **Conclusion :** The present results suggest that professional oral care of elderly persons in need of nursing care is effective for improvement of oral hygiene, oral function and mental comfort. **Keywords :** Professional oral care, Mental health, Oral health

PP25 C-205 DIAGNOSTIC DETERMINANTS OF VITAMIN D DEFICIENCY IN INDONESIAN POSTMENOPAUSAL WOMEN

Vera VERA¹, Siti SETIATI², Arya Govinda ROOSHEROE² (1. Internal Medicine, Maranatha Christian University, Indonesia; 2. Geriatric Medicine, Department of Internal Medicine University of Indonesia, Indonesia)

Introduction : Although Indonesia is a tropical country, previous studies on Indonesian elderly indicate high prevalence of vitamin D deficiency. Measurement of serum vitamin D level is very costly, so cheaper and simpler screening method is required to detect vitamin D deficiency. **Method :** 240 community-dwelling postmenopausal women were screened for vitamin D deficiency. History of falls, history of diabetes mellitus, history of postmenopausal fracture, medication list, diffuse bone pain, difficulty of climbing stairs, creatinine clearance, sun exposure score, sun protection score, tandem test, 5 timed chair stands (TCS), body mass index were assessed. For

each variables, bivariate analysis was performed, subsequently followed by multivariate analysis. Results : 15,8% of subjects had 25(OH)D < 25 nmol/L. Diagnostic determinants of vitamin D deficiency were: history of diabetes mellitus (OR 2,66), sun protection score (OR 5,26), TCS (OR 2,38). Based on these determinants, scoring system was made to screen subjects with vitamin D deficiency at sensitivity of 84,2% and specificity of 51,5%. Score ≥ 2 increased the clinical suspicion of having vitamin D deficiency. Conclusion : Diabetes mellitus, sun protection, muscle weakness of lower extremities were associated with vitamin D deficiency. Scoring system based on these determinants may be useful for primary care physicians to screen vitamin D deficiency in postmenopausal Indonesian women. Keywords : vitamin D deficiency, postmenopausal, determinants

PP25 C-206

PROMOTING AND ADVOCATING AGE-FRIENDLY HEALTHCARE IN THE THAR DESERT, INDIA

Prakash TYAGI (Admin, GRAVIS, India)

Introduction : The second most populous country in the world, India, is home to second largest population of older people. India is a country of villages as 70% of its population live in villages, which are underserved, less developed and are home to large number of older people. Impacted by chronic droughts and severe food, water shortages, Thar is one of the least developed regions. Older people live in most difficult conditions in Thar. They are impoverished, malnourished and isolated. Method : GRAVIS, an NGO, has been focusing strongly on older people's health. To identify the challenges, in 2000, a survey covering over 5,000 older people was organized, aiming on gathering information on older people's health needs. In the year 2000, GRAVIS set up a fully-equipped hospital in a remote village with special facilities for older people. The hospital staff goes through age-friendly healthcare trainings at least once in a year. In 2003, GRAVIS launched eye-care program for older people. A network of Village Health Workers (VHWs) has been developed. Currently, 564 VHWs are active serving in remote areas. They get specialized trainings on geriatric health. GRAVIS has been advocating older people's health at local, national, regional and global levels. Results : GRAVIS programmes have directly benefited over 150,000 older people of the region and in improved awareness levels among older people. The efforts have also resulted in increased attention for older people at government health facilities. Conclusion : Integrated approach is crucial to address older people's health needs in remote settings with scarce facilities. Keywords : aging, rural health, integration

PP25 C-207

INCIDENCE AND CHARACTERISTICS OF METABOLIC DISORDERS AND VASCULAR COMPLICATIONS IN WERNER SYNDROME PATIENTS IN JAPAN

Emiko OKABE, Minoru TAKEMOTO, Shunichiro ONISHI, Takahiro ISHIKAWA, Ryoichi ISHIBASHI, Masaki FUJIMOTO, Harukiyo KAWAMURA, Kazuki KOBAYASHI (Department of Clinical Cell Biology and Medicine, Chiba University Graduate School of Medicine, Japan)

Introduction : Werner syndrome (WS) is an autosomal recessive disorder and considered as a representative type of progeroid syndrome, highly prevalent in Japan; however, the recent status of WS has not been clarified. Method : We initiated a nation-wide epidemiologic survey to obtain the current picture of clinical of WS patients. Of 6,000 survey sheets sent to hospitals with more than 200 beds as the primary survey, we confirmed new 336 patients. As

secondary survey, we sent questionnaire to hospitals responded in the primary survey, we obtained detailed clinical data for 185 cases. Results : Of 185 patients, the morbidity rates of diabetes were 55.7%. The morbidity rate of hyperlipidemia was 51.6%. The morbidity rate of hypertension was 25.9%. Morbidities of vascular diseases in WS were found to be 1.1%, 2.7%, 10.3%, and 17.3% for brain hemorrhage, cerebral infarction, angina or myocardial infarction, and arteriosclerosis obliteration, respectively. We divided the WS patients into 2 groups: with (n=45) and without vascular disease (n=140) and we examined the correlation among diabetes, hyperlipidemia, and hypertension with a critical value of 3.84: $\chi^2 = 4.24$ ($p = 0.039$), $\chi^2 = 7.90$ ($p = 0.005$); and $\chi^2 = 11.16$ ($p = 0.0008$); respectively. These data confirmed that metabolic disorders were closely related with vascular diseases. Conclusion : We confirmed a much higher prevalence of metabolic disorders and vascular diseases in Japanese WS patients. Keywords : Progeria, Werner syndrome, Cardiovascular disease

PP25 C-208

DIAGNOSTIC CRITERIA FOR WERNER SYNDROME BASED ON JAPANESE NATIONWIDE EPIDEMIOLOGICAL SURVEY

Minoru TAKEMOTO¹, Seijiro MORI², Masafumi KUZUYA³, Shinya YOSHIMOTO⁴, Akira SHIMAMOTO⁵, Masahiko IGARASHI⁶, Yasuhito TANAKA⁷, Tetsuro MIKI⁸, Koutaro YOKOTE¹ (1. Department of Medicine, Division of Diabetes, Metabolism and Endocrinology, Chiba University Hospital, Japan; 2. Center for Promotion of Clinical Investigation, Tokyo Metropolitan Geriatric Hospital, Japan; 3. Department of Community Healthcare & Geriatrics, Nagoya University Graduate School of Medicine, Japan; 4. Department of Plastic Surgery, Showa University, Japan; 5. Department of Cellular and Molecular Biology, Hiroshima University Graduated School of Biomedical Sciences, Japan; 6. Department of Endocrinology, Yamagata City Hospital Saiseikai, Japan; 7. Department of Orthopaedic Surgery, Nara Medical University, Japan; 8. Department of Geriatric Medicine, Ehime University Graduate School of Medicine, Japan)

Introduction : Werner syndrome (WS), also known as adult progeria, is an autosomal recessive disorder caused by a mutation in the gene encoding the RecQ DNA helicase. WS is characterized by early aging phenotypes including graying and loss of hair, juvenile cataracts, skin ulcers, insulin-resistant diabetes, premature atherosclerosis, and neoplasms. The diagnostic guidelines of Japanese WS were released in 1984. However, the prevalence of WS in Japan and its diagnostic criteria have not been reviewed since. Therefore, the aim of this study was to revise the diagnostic criteria for Japanese Werner syndrome. Method : A nationwide epidemiological study was performed from 2009 to 2011, involving 6,921 surveys sent to hospitals with more than 200 beds to assess existing WS diagnostic criteria as well as additional signs of high incidence on the basis of clinical experience with WS. Results : The existing diagnostic criteria were reviewed, and signs with >90% incidence were listed as cardinal signs. Several criteria were added, including genetic testing and calcification of the Achilles tendon, whereas criteria that are practically difficult to obtain, such as measurement of urinary hyaluronic acid, were omitted. Conclusion : The 26-yr-old diagnostic criteria for WS were revised on the basis of the results of a nationwide epidemiological study. The proposed revised criteria will facilitate simpler, faster, and more robust diagnosis of WS in the Japanese population. Keywords : Werner syndrome, Adult progeria, Diagnostic criteria

PP25 C-209

RESPONSES OF THE ELDERLY WITH DEMENTIA TO SUGGESTION OF GASTROSTOMY

Kazuhiro NIIZATO¹, Gen OH², Hiroyuki UCHIYAMA¹, Tomonari KOTO¹, Yosuke YUMOTO¹, Ito KAWAKAMI³, Kenichi OSHIMA¹, Masahiko SAITO¹ (1. Tokyo Metropolitan Matsuzawa Hospital, Department of Psychiatry, Japan; 2. Professor Emeritus of the University of Tokyo, Matsuzawa Hospital, Japan; 3. Tokyo Metropolitan Institute of Medical Science, Department of Neuropathology, Japan)

Introduction : More than 560,000 patients in Japan are currently placed with percutaneous endoscopic gastroscopy (PEG), a controversial treatment for the elderly with advanced dementia. **Method :** As their preference for PEG installment seems routinely ignored, we asked 70 demented elderly (29 males, 41 females; 37 Alzheimer's Disease, 11 vascular dementia, 22 other types; MMSE 17.7 points; HDS-R 14.3 points) if they would have gastrostomy installed as a life-prolonging measure. **Results :** Eighty % promptly rejected the idea with frequent shows of disgust and the remaining 20% were unable to answer. None responded affirmatively. **Conclusion :** Their instant and emotional rejections may represent activation of a prior emotional experience in comparable situations. We believe that asking the intent of the demented elderly regarding initiating gastrostomy is an ethically valid and practical precaution to avert the controversial issue. **Keywords :** dementia, percutaneous endoscopic gastroscopy, emotional rejection

PP25 C-210 UNDERNUTRITION - SARCOPENIA - FRAILTY COMPLEX IN REHABILITATION HOSPITAL; INCIDENCE AND INFLUENCE TO OUTCOME

Sadao YOSHIDA¹, Jiro FUJIYAMA¹, Naoto HAMASAKI², Yoshikazu MIYAZATO³ (1. Department of Internal Medicine, Okinawa Rehabilitation Center Hospital, Japan; 2. Department of Orthopedic Surgery, Okinawa Rehabilitation Center Hospital, Japan; 3. Department of Neuropsychiatry, Okinawa Rehabilitation Center Hospital, Japan)

Introduction : Incidence of undernutrition, sarcopenia and frailty is high in elderly patients. It is not rare that 2 or 3 of them coexist. And they correlate between each other. We examined their incidence and influence to outcome in rehabilitation hospital patients. **Method :** Thirty three elderly patients (> 65 yr) admitted in our hospital were administered. Undernutrition was screened with Mini Nutrition Assessment (MNA-SF). Diagnosis of sarcopenia was undergone according to EWGSOP guideline. Cut-off values of muscle mass loss were 28.32 cm² (male) or 20.93 cm² (female) in arm muscle area (AMA) or 28.0 cm in calf circumference (CC). Frailty was defined as described previously. Insulin resistance was evaluated with HOMA-R (> 1.6). Outcome of rehabilitation was evaluated with FIM. **Results :** On admission, 27 patients (82%) were classified as undernutrition, 24 patients (73%) were diagnosed as sarcopenia, and all 33 patients (100%) were identified as frailty. Insulin resistance was detected in 5 patients (15%). On discharge, undernutrition was recovered in 11/27 patients, sarcopenia was recovered in 4/24 patients, and frailty was recovered in 7/33 patients. Undernourished patients on the period of discharge show less improvement of FIM (p=0.0002). All patients who show recovering of sarcopenia or frailty were well-nourished on discharge (p=0.04 and p=0.002). MNA score on admission correlates existence of frailty on discharge (p=0.011). **Conclusion :** Incidence of undernutrition, sarcopenia and frailty is extremely high in Japanese rehabilitation hospital patients. Nutrition care is important for recovering of sarcopenia and frailty. MNA predicts outcome and status of frailty on discharge. **Keywords :** MNA, sarcopenia, frailty

PP25 C-211

NUTRITIONAL STATUS AND RELATED FACTORS IN ELDERLY NURSING HOME RESIDENTS IN TURKEY: A CROSS-SECTIONAL STUDY

Zeynep KURTULUS¹, Rukiye PINAR² (1. Nursing, Namik Kemal University, School of Health, Turkey; 2. Nursing, Yeditepe University Faculty of Health Sciences, Turkey)

Introduction : The prevalence of malnutrition seems to be higher in hospital and nursing home settings. Determining the factors affecting malnutrition and evaluating the nutritional status of the elderly in these settings in particular may contribute to the solution of this problem. The aim of the study was to determine the prevalence of malnutrition in elderly nursing home residents and to investigate the association between malnutrition and socio-demographic variables, medical factors, cognitive impairment, and depression. **Method :** This study was conducted in all nursing homes located in Istanbul affiliated to the Prime Ministry Social Service and Institution of Child Protection (five nursing homes). **Participants:** Four hundred and ten elderly people who live in nursing homes were examined in a study. The Mini Nutritional Assessment (MNA), the Mini Mental State Examination for the educated and uneducated (MMSE), and the Geriatric Depression Scale (GDS) were used for data collection. **Results :** The mean age of the study population was 76.4 years. Among the participants, 42% were female, 18% were married, and 7% were with malnutrition, 24% were at risk of malnutrition, 32% had cognitive impairment and 53% had depression. The high number of chronic diseases (p<0.001), and number of medication used (p<0.001), low body mass index (BMI) (p<0.001), dental problems (p<0.01), cognitive impairment (p<0.01), and depression (p<0.01) seemed to be associated with malnutrition in elderly nursing home residents. **Conclusion :** The nutritional status of elderly nursing home residents, particularly the risk groups, should be evaluated and interventions aiming to improve their nutritional status should be planned. **Keywords :** Elderly, Malnutrition, Nursing Home

PP25 C-212 CHANGES OF THE EATING INDEPENDENCY IN ELDERLY PATIENTS WITH DEMENTIA IN LONG-TERM PROGRESS – COMPARISON OF AD AND VAD BY THE FOLLOW-UP SURVEY DURING SIX YEARS –

Ayako EDAHIRO¹, Hirohiko HIRANO², Toshiaki ABE³ (1. Toshima Dental Association Oral Health Center "Azalea Dental Clinic", Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Japan; 2. Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Japan; 3. Toshima Dental Association, Toshima Dental Association, Japan)

Introduction : We have been providing visiting dental care for elderly patients who needs care, from the Toshima Dental Association Oral Health Center "Azalea Dental Clinic" since 1999. We also have been performing continued dental health checkups every two years. We report comparisons of changes in eating independency between the Alzheimer's disease (AD) and vascular dementia (VaD), based on the information collected from continued dental health checkups. **Method :** Subjects included 88 elderly dementia patients requiring care who underwent the dental health checkups of this center from 2005 to 2011. All subjects were aged 65 and over at the first year, capable of eating orally, and who's investigation data over 6 continuous years was available. Patients underwent vital function tests (eating independency was included), cognitive assessment, and a basic information survey. **Results :** The data were compared with stratification by severity of dementia of the first year, and significant declines in eating independency were seen in AD in the moderate dementia group. In

VaD group, some patients declined in eating function, while some maintained eating function, regardless of dementia severity of the first year. Conclusion : This research suggested that it is necessary to offer predictive support for elderly patients with dementia, after taking into consideration functional decline over time can be different according to the cause of dementia. Keywords : Dementia, Eating independency, Functional decline

PP25 C-213

ASSESSING THE SITUATION OF PROBLEMS CONCERNING MEALS AND NUTRITION FOR THE ELDERLY UNDER HOME CARE

Koko UDAGAWA-RUSU¹, Toshikazu SUZUKI², Yukie YANAGISAWA² (1. Graduate School of Human Ecology, Wayo Women's University, Futaba Nutrition College, Japan; 2. Department of Health and Nutrition, Wayo Women's University, Japan)

Introduction : The purposes of this survey include: i) to analyze whether registered dietitians have a grasp of the problems understood by at-home care service providers with regard to meals and nutrition issues in care management, ii) to investigate whether registered dietitians can provide guidance and whether they are keen to acquire a higher level knowledge to improve the quality of their meals and nutritional guidance, and iii) to determine what information is required by the elderly under home care and to improve meals and nutritional guidance provided to them. Method : The survey was conducted by posting questionnaires to 197 at-home long-term care support providers operating in Tokyo, and 67 registered dietitians working for NPOs. Results : According to the at-home care services providers, "difficulty in swallowing" is experienced in many cases, where "choking and coughing" is a problem, and they select "effective means of rehydration" as necessary information. By way of comparison, while the registered dietitians are also aware of "choking and coughing" problems, only a few of them listed "effective means of rehydration" under such criteria as "able to provide nutritional guidance with confidence" and "wish to acquire a higher level knowledge." On the contrary, many of them answered that they are "able to provide nutritional guidance with confidence" in terms of "confirmation of food intake amount and nutritional balance." Conclusion : We consider that it is necessary to carefully consider their declining eating functions, and to acquire greater knowledge of what information they need, in order to provide such guidance with confidence. Keywords : eating functions, at-home care, nutritional guidance through visits

PP25 C-214

ELDERLY PATIENTS WITH HIP FRACTURE IN A REHABILITATION CENTRE: THE SOONER THE VISIT OF THE DIETICIAN THE BETTER FOR NUTRITIONAL STATUS

Marie-Line GAUBERT-DAHAN¹, Fatma SADOUDI-GAZOU¹, Yves WOLMARK¹, Agathe RAYNAUD-SIMON² (1. Geriatrie, APHP Hopital Bretonneau, France; 2. Geriatrie, APHP Hopital Bichat-Claude Bernard, France)

Introduction : Malnutrition is common in elderly hospitalized for hip fracture. Improving their nutritional status is a challenge for the professionals who work in rehabilitation centres. The aim of this retrospective study was to identify the potential predictors of improved nutritional status at 1 month of hospitalization and at hospital discharge. Method : All patients hospitalized between 2009 and 2011 for hip fracture in our rehabilitation centre and that stayed more than 3 weeks were included. Improved nutritional status was defined as an increase in weight greater than or equal to 0.5 kg or as a weight

stabilization (a change in weight between -0.5 kg and 0.5 kg). Nutritional status as described as worsening in case of weight loss greater or equal to 0.5 kg. Results : Seventy-seven patients (86 ± 6 years) were included, 60 (78%) had malnutrition on admission. After 1 month of hospitalization, 43 patients improved their nutritional status and 34 got worse. Improving nutritional status at 1 month of hospitalization was only associated with a shorter delay in the dietician visit (5 ± 6 days versus 14 ± 14 days; p = 0.009). The duration of hospitalization was 91 ± 66 days. At the hospital discharge, 42 patients improved and 35 got worse. Factors associated with improved nutritional status at hospital discharge were a better autonomy and a higher prealbumin at admission, a higher weight after 1 month of hospitalization and a nutritional status improving after 1 month of hospitalization. Conclusion : Malnutrition must be diagnosed and treated as fast as possible. Keywords : hip fracture, malnutrition

PP25 C-215

BLOOD LEVELS OF MICRONUTRIENTS VITAMIN B1 AND ZINC DECREASE WITH ADVANCING AGE IN NORMALLY-NOURISHED ELDERLY AGED 75 AND OVER

Michiyo TAKAHASHI¹, Toshikazu SUZUKI², Ayumi TAKAGI², Naotaka HASHIZUME³, Hikaru MATSUMOTO² (1. Graduate School of Human Ecology, Wayo Women's University, Japan; 2. Department of Health and Nutrition, Wayo Women's University, Japan; 3. Graduate School and Department of Health and Nutrition, University of Human Arts and Sciences, Japan)

Introduction : Many studies addressing nutrition in the elderly have concerned malnutrition and quality of life. In contrast, there are few studies assessing nutritional status in normally-nourished elderly persons. In this study, we investigated the changes in blood nutrient levels with aging in elderly persons 75 years and older, who were self-supporting and classified as normally-nourished. Method : The participants comprised 13 elderly adults (7 men, 6 women, mean age 82.5±5.2 years), living in I City, Chiba, Japan. Body composition, estimated nutrient intake, and blood levels of nutrients were measured in March 2009 and then in December 2011. Results : The estimated nutrient intake revealed that all participants were relatively well-nourished. However, the estimated intake of vitamin B1 and zinc was slightly lower than the recommended dietary allowance in men. During the 2 years 9 months, the intake was similar, but the levels of serum vitamin B1 had decreased by 73% in men and 65% in women, and the levels of serum zinc had decreased by 23% in men and by 19% in women. The levels had declined to near the lower limits recommended as optimal. Conclusion : The results presented here suggest that elderly people aged 75 and over become susceptible to vitamin B1 and zinc insufficiency with increasing age, even if they are considered normally-nourished. Dietary supplements to increase the intake of vitamin B1 and zinc may be effective to prevent their deficiency, to avoid a depressed innate immune response, and to reduce the risk of geriatric syndrome in the future. Keywords : elderly persons, vitamin B1, zinc

PP25 C-216

EVALUATION OF NUTRITIONAL STATUS USING ANTHROPOMETRY AND BIOCHEMICAL INDICES OF COMMUNITY DWELLING OLDER PERSONS

Ogechi Chinyere NZEAGWU, Ada Charity UWAEGBUTE (Human Nutrition and Dietetics, Michael Okpara University of Agriculture, Umudike, Abia State, Nigeria)

Introduction : Elderly population is on the increase while nutrition and health risks increase with age. Objective: Evaluate the nutritional

status of community dwelling older persons using biochemical and anthropometric indices. Method : Design:Cross-sectional.Setting:semi-urban and rural.Participants: 600 elderly community dwelling aged ≥ 60 years.Measurements:Nutritional status was assessed by body mass index(BMI),mid-upper arm circumference (MUAC),waist-hip ratio (WHR), waist circumference (WC), calf circumference (CC) for all the subjects; biochemical indices- serum haemoglobin (Hb), albumin, ferritin, total cholesterol (TC), low density lipoprotein (LDL), C-reactive protein (CRP) for 25% of the subjects using standard procedures. Results were compared with their recommended cut-off points. Results : Majority(62.7%)had normal BMI(18.5-24.9 kg/m²), 21.33% overweight, 11.5%underweight. More than 70%were at risk of heart disease using WHR. In MUAC 75.6% had normal, 24.33% malnourished. Also 69.5% had normal WC,15.8% increased risk, 14.7% substantially at risk of abdominal fat adiposity. More (56.2%) had normal CC,43.8% at risk of malnutrition.Anaemia was high as 78% had low Hb, 81.3% had serum ferritin below normal, 56.7% had abnormal albumin, 43.3% normal albumin levels. About 82.7% were in the lower risk, 18% moderate and high risk category in CRP.82% had desirable TC, 9.3% borderline high risk, 8.7% high risk, 53.3% optimal LDL levels, 14% had very high level. Age correlated ($p < 0.05$) negatively with CC ($r = -0.22$), MUAC ($r = -0.295$), positively with albumin ($p < 0.05$, $r = 0.214$) in females. Significant relationship ($p < 0.01$) existed between Hb and ferritin for both males ($r = 0.074$) and females($r = 0.339$). Negative relationship ($p < 0.05$) noted for Hb and CRP ($r = 0.361$). There was positive association ($p < 0.01$) between BMI and CC, MUAC, WC, TC and LDL for males ($r = 0.966$) and females ($r = 0.955$). Conclusion : Anaemia was prevalent as many had low Hb, albumin and ferritin. Most subjects had normal BMI, however many were at risk of heart disease with WHR. More subjects were malnourished with MUAC than BMI. Association existed between TC and LDL. Keywords : Nutritional status, Anthropometry, Older persons

PP25 C-217

DETERMINANT OF UNDERNUTRITION AMONG AGING IN WEST JAVA AND BANTEN INDONESIA

Charles SURJADI¹, Yunisa ASTIARANI¹, Annisa Riza CHAERUNISA² (1. Department of Public Health, Faculty of Medicine Atma Jaya Catholic University of Indonesia, Indonesia; 2. Health Promotion, Indonesian Society of Education of Health Promotion, Indonesia)

Introduction : Overnutrition is a problem among elderly in Metropolitan city Jakarta, it is about 31.3% elderly are overweight. Meanwhile we want to know the nutritional problems and its determinants in elderly in West Java and Banten, we do analysis based on 2007 Basic National Health Research data. Method : From basic national health research data, a total of 7176 elderly persons were asked of their characteristics (age, sex), socio-economic status, physical activities, vegetables and fruits intake, and measurement of BMI. The data was analyzed by using chi square and multiple logistic regression to look for the best model factors related to undernutrition among Aging. Results : The prevalence of undernutrition among elderly in West Java and Banten is 25.5%, normal nutrition is 58.9%, overweight is 12.3%, and obese is 3.3%. Further analysis using Multivariate logistic regression gave the result that undernutrition is significantly related to low socioeconomics status OR 1.5 (95% CI 1.2-1.8), unemployed OR 1.2 (95% CI 1.0-1.3), age older than 75 years OR 1.5(95%CI 1.3-1.8), living at district areas OR 1.2(95%CI 1.1-1.4), have not been eating fruit daily OR 1.8(95% CI 1.4-2.2), having mental health problems OR 1.1(95% CI 1.0-1.3). Conclusion : Contradictory with elderly at metropolitan city of Jakarta which is

faced with Overweight and Obesity, a quarter of elderly in West Java and Banten are undernutrition. This calls for the government to overcome undernutrition among elderly with specific attention to low socioeconomic and those who live in district areas and increase active aging policy and programs. Keywords : aging, nutrition, undernutrition

PP25 C-218

END-OF-LIFE ANGUISH: AMINOFF SUFFERING SYNDROME AND RELIEF OF SUFFERING UNITS

Bechor Zvi AMINOFF (Geriatrics, Geriatric Division, Sheba Medical Center, Tel-Hashomer & Minerva Center at Tel-Aviv University, Israel)

Introduction : Aminoff Suffering Syndrome (ASS) in end-of-life is the new proposed term for a pathological symptomatology and entity that is characterized by a high Mini Suffering State Examination (MSSE) scale score (1999), <6 months survival, irreversible and intractable aggravation of suffering and medical condition until demise. Method : Aminoff Suffering Syndrome was proposed as the key criterion for enrolling end-stage disease and dying patients to Relief of Suffering Units. Based on clinical experience, the following items were included in the MSSE: Not calm, screams, pain, decubitus ulcers, malnutrition, eating disorders, invasive action, unstable medical condition, suffering according to medical opinion, and suffering according to family opinion. The results of clinical experience with this scale were presented at world and regional congresses in Berlin (1999), Jerusalem (2000), Vancouver (2001), Stockholm (2002), Tokyo (2003), Las Vegas (2004), Rio-de-Janeiro (2005), Madrid (2006), Saint-Petersburg (2007), Trondheim (2008), Paris (2009), Honolulu (2010), Athens (2011) and in Copenhagen (2012). Results : This paper proffers a new, alternative approach and setting for terminal and dying patients with ASS that could pertain to the Israeli setting, and could possibly also be applicable in other countries. Short hospitalization periods of approximately 1 month, and treatment in Relief of Suffering Units may be a new, palliative approach and present a possible solution for coping with the horrendous burden of the anguish of terminal and dying patients, their families, and the medical and nursing staff. Conclusion : Relief of Suffering Units should be part of intensive care units of any hospital department. Keywords : Anguish, setting, end-of-life

PP25 C-219

POLYPHARMACY, INTERACTIONS AND RE-ADMISSIONS; A LIKELY TRIUMVIRATE

Clifford LISK, Muhammad MATIN, Ada OKOLI, Ahmed Javid NOORI (Medicine, Barnet Hospital, United Kingdom)

Introduction : Older adults are prescribed medications by Health Care professionals to treat chronic disease. They are aided by disease specific clinical guidelines which when applied to older adults can lead to polypharmacy. This has implications;related to medication costs and to the risk of adverse drug reactions and hospital readmission. Method: A review of case notes, medication charts and electronic patient records was done evaluating the prevalence of polypharmacy and patient readmission rates in a cohort of hospitalised older adults in a UK District General hospital. Potential adverse drug reactions were established using the Medscape Interaction checker. Results : 173 patients were identified. Of these 51% were female. 82% were above 60 years old. Patients were on a median of 9 medications (range 0-18) with nearly three quarters on >5 medications. The proportion of patients with 3 or more admissions was highest in the over 60 group (19%) when compared to the 15-59 group (3%). 74 patients on more than 5 medications were responsible for 193/198 admissions in the

previous year. The number of serious interactions totalled 94 compared to 817 significant interactions. Conclusion : This study highlights the increased risk of serious and significant medication interactions in patients with polypharmacy. It raises the concern that polypharmacy may play an important role in hospital readmission. It is therefore important that Healthcare professionals use clinical guidelines wisely placing an emphasis on weighing up the benefits, risks and burden of complex therapies in a process of shared decision making in order to improve the quality of prescribing to patients. Keywords : polypharmacy, interactions, readmissions

PP25 C-220

POLYPHARMACY AND NECESSITY OF MEDICATION INTEGRATION ON ADMISSION TO A LONG-TERM CARE HEALTH FACILITY

Chinori KURATA¹, Michio IHARA¹, Sadami KURATA² (1. Clinic, Care Center Hougawa, Japan; 2. Gerontological Nursing, Hamamatsu University School of Medicine, Japan)

Introduction : In Japan, as a rule, only physicians of long-term care health facilities (LTCHFs) can prescribe medication for LTCHF residents. LTCHF admission may thus be a golden opportunity to integrate medications, as well as to address polypharmacy. Method : In 108 residents aged ≥ 65 years (84.2 ± 6.8 years) on admission to a LTCHF in Japan, their drugs and diseases informed by prior physicians before admission were surveyed on whether prior physicians informed the LTCHF physician about medications and their indications. Results : The number of drugs in total, informed and not informed by prior physicians were 6.7 ± 4.1 (range 0-20), 5.4 ± 3.5 (0-16), and 1.4 ± 2.3 (0-15) per resident, respectively, and that without clear indications was 4.6 ± 3.6 (0-20). These numbers were not significantly different between females and males and between those transferred from hospital and from the others. On the other hand, the number of drugs in total was significantly larger in those with more recent than in those with less recent admission (7.5 ± 4.4 vs 5.9 ± 3.5 , $p=0.04$), and that not informed by prior physicians was significantly larger in those aged ≥ 86 years than in those aged ≤ 85 years (1.9 ± 2.9 vs 0.8 ± 1.4 , $p=0.02$) and in those with lower than in those higher care need levels (1.9 ± 2.9 vs 0.9 ± 1.5 , $p=0.03$). Conclusion : Polypharmacy has been getting more prevalent on LTCHF admission in Japan, and medication information provided by prior physicians was frequently insufficient. In Japan, medication reconciliation and integration may be required on LTCHF admission to address polypharmacy by reducing unnecessary drugs. Keywords : polypharmacy, medication reconciliation, long-term care

PP25 C-221

ANTICHOLINERGIC BURDEN AND TEN YEAR SURVIVAL WITHIN A COHORT OF ELDERLY MEXICAN AMERICANS

G. Blair SARBACKER¹, S. Liliana OAKES², Robert C. WOOD², Dheeraj ANAND², David V. ESPINO³ (1. Department of Pharmacy Practice, University of the Incarnate Word Feik School of Pharmacy, USA; 2. Department of Family and Community Medicine, University of Texas Health Science Center San Antonio, USA; 3. Department of Medicine, San Antonio State Supported Living Center, USA)

Introduction : The purpose of this study is to determine whether higher anticholinergic burden increases 10 year mortality in a cohort representative of all community-based older Mexican Americans in the United States. Method : The original Hispanic Established Populations for the Epidemiologic Study of the Elderly (HEPESE) cohort was a probability sample of 3050 Mexican American elders from five southwestern States followed from 1993 to 2012. Ten year mortality of

this cohort was assessed beginning at the time of their second interview in 1995 until their 5th interview in 2005 ($n=2438$). Each of up to 8 medications was classified for anticholinergic burden according to the modified-ADS. These categories were then summed across all reported medications creating a combined measure of total anticholinergic burden. This sum was then re-categorized into 5 levels representing total burdens of 0,1,2,3 and 4+. Anticholinergic burden was tested for association with 10 year mortality using survival analysis. Covariates examined included socio-demographics, interview language, cognitive status and self reported comorbidities. Results : The 1497 elders with any reported prescription medication had a mean age of 75.6, of which 63.3% were female. Multiple variable Cox regression survival analysis revealed a statistically significant ($p<0.05$) relationship between anticholinergic burden and increased mortality after adjustment for covariates. Conclusion : Anticholinergic burden is significantly associated with mortality in Southwestern Mexican American elders who report taking prescription medications. This relationship remains significant after covariate adjustment. This is the first study we are aware of examining anticholinergic burden in the older Mexican American population. Keywords : anticholinergic burden; Mexican-American

PP25 C-222

THE PREVALENCE OF POTENTIALLY INAPPROPRIATE MEDICATIONS (PIMS) IN TAIWAN

Hui-Tzu CHEN¹, Wen-Chiung CHANG², Ya-Fang ZENG¹, Tzuo-Yun LAN¹ (1. Institute of Hospital & Health Care Administration, National Yang-Ming University, Taiwan; 2. Institute of Health Policy and Management, National Taiwan University, Taiwan)

Introduction : Elderly patients commonly have multiple comorbid conditions and subsequent poly-pharmacy, which place them at higher risk of adverse drug events. AS the population in the world is aging rapidly, potentially inappropriate medications (PIMs) has become an important health issue. The aim of this study was to investigate the prevalence of PIMs in Taiwan. Method : Data were from the National Health Insurance Research Database and 2009 claim data for the sample drawn in 2005 was used. The 2002 Beers Criteria was used to analyze the individuals aged 65 and over on their health utilization (outpatient, inpatient and emergency). Basic characteristics of 3 different levels including prescription, patient, care provider between PIM and non-PIM were also compared. Results : At the individual level, the prevalence were higher for inpatient (67.8%) and Outpatient (65.5%) care, followed by emergency (41.3%) care. At the prescriptions level, the prevalence for inpatient (57.11%), emergency (30.6%), and Outpatient (14.7%) care were relatively lower. A number of characteristics among 3 levels were identified to be different between PIM and non-PIM. Conclusion : The prevalence of PIMs in Taiwan was higher than those in other countries. Further investigation is needed to further identify factors associated with PIMs. Keywords : The elderly, Potentially inappropriate medications (PIMs), Beers criteria

PP25 C-223

DUPLICATE MEDICATIONS OF CALCIUM CHANNEL BLOCKERS AND RELATED FACTORS

Ya-Fang ZENG¹, Wen-Chiung CHANG², Hui-Tzu CHEN¹, Tzuo-Yun LAN¹ (1. Institute of Hospital & Health Care Administration, National Yang-Ming University, Taiwan; 2. Institute of Health Policy and Management, National Taiwan University, Taiwan)

Introduction : Duplicate medications is a problem resulting from doctor-shopping and insufficient sharing of information in the health

care system of Taiwan. The aim of this study was to examine the prevalence and related factors of duplicate medications among the older adults in Taiwan. Method : We analyzed the 2009 outpatient visit claims data of a randomly sampled 1000000-person cohort from the National Health Insurance Research Database. The visit records of patients aged 65 or older claiming for prescriptions of calcium channel blockers, including generic and brand drugs, were analyzed. Duplicate medications was defined as three or more days of drug duplication for general prescriptions, or eight or more days of duplication for refill prescriptions. The independent variables in visits-level was drug expense in each visit; in patient-level included age, sex, and continuity of care index; and in provider-level were the accreditation level of medical institution, physician age and sex. Results : Among the 311,289 outpatient visits, 11.6% were defined as duplicate medications. The multiple logistic regression showed significant factors were drug expense (odds ratio=1.00, $p<0.001$) in visit-level; being male (OR=1.04, $p<0.001$) and continuity of care (OR=0.50, $p<0.001$) in patient-level; institutions accredited as local hospitals (OR= 1.26, $p<0.001$), area hospitals (OR=1.39, $p<0.001$), or medical centers (OR=1.59, $p<0.001$), and physician age of 40-49 (OR=0.93, $p<0.001$), 50-59 (OR=0.89, $p<0.001$), and 60 or older (OR=0.92, $p<0.001$) in provider-level. Conclusion : Duplicate medications was prevalent among older patients in Taiwan. Health care professionals should pay attention to the related factors identified in this study. Keywords : Duplicate medications; calcium channel blockers; Taiwan

PP25 C-224

MULTI-PROFESSIONAL MEDICATION REVIEW USING COMPUTERIZED MEDICAL RECORDS HELPS REDUCE THE NUMBERS OF DRUGS FOR ELDERLY IN-PATIENTS

Yuichi HAYASHI, Megumi YAMADA, Nobuaki YOSHIKURA, Naoko HARADA, Akihiro KOUMURA, Akio KIMURA, Takashi INUZUKA (*Neurology and Geriatrics, Gifu University Graduate School of Medicine, Japan*)

Introduction : Polypharmacy, usually defined as concurrent use of more than 6 drugs, is major problem in elderly patients in developed countries. Burns et al reported that multi-professional medication review helped reduces the numbers of drugs in elderly patients with polypharmacy. Therefore, we investigated whether multi-professional medication review using computerized medical records afforded similar results. Method : Four hundred and thirty-five elderly patients (ages, 65-74-year-old [269]; and >75-year-old [166]; 188 women, 247 men) were admitted to Department of Neurology, Gifu University Hospital, between 2004 and 2011. The numbers of drugs used at admission and at discharge, oral immunotherapy (e.g. corticosteroid use) history, fall experience in the past 1-year, and presence or absence of falling risk factors were examined using computerized medical records. The data were assessed using t-test, and P values of <0.05 were considered statistically significant. Results : The number of drugs used in all elderly patients was 5.1 ± 3.5 (range 0-16) at admission. At discharge, the number of drugs reduced by 1.3 ± 3.1 in patients with polypharmacy ($P<1.09\times 10^{-13}$). The number of drugs reduced by 0.5 ± 3.1 in patients with fall experience in the past 1-year ($P<0.04$), but increased by 1.7 ± 3.3 in patients undergoing oral immunotherapy ($P<1.08\times 10^{-8}$). Conclusion : Multi-professional medication review using by computerized medical records helps reduce the numbers of drugs in elderly patients with polypharmacy, and fall experience in the past 1-year except in those undergoing oral immunotherapy. Keywords: polypharmacy, multi-professional reviewing system, computed medical records

PP25 C-225

HEALTH-RELATED QUALITY OF LIFE MEASURES AS PREDICTORS OF FRAILTY INCIDENCE IN ELDERERS: A PROSPECTIVE STUDY OF COMMUNITY-DWELLING ELDERERS IN TAIWAN

Tsai-Chung LI¹, Cheng-Chieh LIN², Chih-Hsueh LIN², Wen-Yuan LIN³ (*1. Graduate Institute of Biostatistics, College of Public Health, China Medical University, Taiwan; 2. Department of Family Medicine & Geriatric Medicine, China Medical University & Hospital, Taiwan; 3. Department of Family Medicine, China Medical University & Hospital, Taiwan*)

Introduction : Frailty is a multidimensional syndrome that confers a high risk for adverse health outcomes. Little information exists on the predictors of frailty. The aim of the study is to examine the predictive ability of health-related quality of life (HRQOL) on frailty incidence in a Taiwanese metropolitan elderly population. Method : At baseline 1,099 subjects aged 65 years and over were recruited in 2009 from a metropolitan city in Taiwan. After excluding individuals with frailty or missing data, 471 older persons were evaluated one year later. Adopting the Fried criteria, frailty was determined by five components: shrinking, weakness, poor endurance and energy, slowness, and low physical activity level. HRQOL was assessed by the short form 36 (SF-36). The areas under the curve (AUCs) of receiver operating characteristic curves were used to predict the ability for correctly classifying elders with frailty incidence. Results : In total 27 persons (5.73%) have a frailty event during 1 year of follow up. Decreases in scores of physical functioning (PF), general health (GH), vitality (VT), social functioning (SF), and Physical Component Summary (PCS) were significantly associated with frailty incidence after multivariate adjustment (all p for trend <0.05). The AUC for considering scales of PF, GH, VT, and SF simultaneously was 0.86 (95% CI: 0.78-0.94), which was significantly higher than that for PCS and Mental Component Summary (MCS) (0.82, 0.73-0.91) ($p<0.05$). Conclusion : SF-36 is a predictor of frailty incidence in a Taiwanese metropolitan elderly population. Our study finding has important implication on screening of older persons for frailty incidence in community settings. Keywords : prospective study, SF-36, frailty incidence

PP25 C-226

QUALITY OF LIFE IN ALCOHOL RELATED BRAIN DAMAGED INDIVIDUALS: WHAT A GOOD-TEMPERED, SOCIALLY INTEGRATED AND HIGHLY EFFICIENT GROUP OF OLDER ADULTS ... OR MAYBE NOT?

Jean-Paul STEINMETZ¹, Christiane THEISEN¹, Carine FEDERSPIEL² (*1. Department of Research & Development, ZithaSenior, Luxembourg; 2. Department of Geriatric Rehabilitation, Department of Research & Development, ZithaKlinik, ZithaSenior, Luxembourg*)

Introduction : Long-term care individuals suffering from severe chronic alcohol abuse have been shown to experience widespread deficits in cognitive and affective functioning. Consequences of alcohol related brain damage seem however not to be limited to cognitive and affective performances during test situations, but have been found to influence the patient's perception of their performance level and personal health condition in everyday situations. The aim of the present research is to investigate the ability of detoxified chronic alcoholics to correctly perceive their own cognitive deficits and corresponding quality of life. Method : Our study group is composed of 12 older alcohol related brain damaged individuals (mean age 58.5, SD = 6.4) living in a specialized ward providing 24h care and support. Patient self-ratings are contrasted to expert ratings provided by two

health care professionals using two rating instruments: (1) the quality of life profile for chronologically ill patients (Laubach et al., 2001) and the Dysexecutive questionnaire (Wilson et al., 2000). It is hypothesized that alcohol related brain damaged (ARBD) individuals systematically overrate their own quality of life and level of everyday functioning. Results : Results of the present research support our hypotheses, suggesting that ARBD individuals are unable to correctly perceive and interpret their personal health and life situation. Conclusion : Crucially, these misperceptions may be at the origin of social conflicts, inadequate coping strategies (i.e., relapse), and may compromise adequate provision of care and support. Keywords : alcohol related brain damage, quality of life, self-perceptions vs. other-perceptions

PP25 C-227

QUALITY OF LIFE OF GROUP HOME RESIDENTS IN JAPAN

Miho MATSUI (School of Nursing, Nara Medical University, Japan)

Introduction : There are few empirical studies relating to quality of life (QOL) in group home residents in Japan although those facilities are extremely increasing and major care setting in Japan. The purpose of this study was to assess QOL and examine its associated factors in Japanese group home residents. Method : One hundred and nineteen residents of seven group homes participated, and the staff assessed the resident's QOL, level of dementia and caregiving, and Activity of Daily Living (ADL). QOL was assessed using The Alzheimer's Disease-Related Quality of Life (ADRQL) revised version. The ADRQL consists of 40 items that assess 5 domains; social interaction, awareness of self, feeling and mood, enjoyment of activities, response to surroundings. Higher scores indicate good QOL. Results : The mean age of the participants was 86.6 (SD 6.2), and 80% of them was female. The mean length of stay was 40 months (SD 26.1, Range 1 to 88). The ADRQL score showed that the mean of the total score was 66.5 (SD 17.1), social interaction for 59.9 (SD 29.0), awareness of self for 59.9 (SD 29.3), feeling and mood for 78.2 (SD 19.8), enjoyment of activities for 50.5 (SD 36.6), response to surroundings for 81.9 (SD 23.2). Age and gender were not related to ADQOL, on the other hand, level of dementia ($r=-.539$, $p<0.001$), level of caregiving ($r=-.581$, $p<0.001$), length of stay ($r=-.363$, $p=0.001$), and ADL ($r=.675$, $p<0.001$) were significantly associated to ADQOL. Conclusion : Group home resident's QOL were significantly associated with ADL. Keywords : QOL, Group home, ADL

PP25 C-228

A SURVEY OF ANAEMIA AND ITS ASSOCIATION WITH POST-OPERATIVE TRANSFUSION AND LENGTH OF STAY IN FRAIL OLDER PATIENTS UNDERGOING ELECTIVE ORTHOPAEDIC SURGERY

Mun Hoe POON¹, Jennifer SMITH¹, Rob MORRIS¹, Cherry CHANG², Tahir MASUD³, Adam Lee GORDON³ (1. Department of Healthcare for Older Persons, Nottingham University Hospitals NHS Trust, United Kingdom; 2. Department of Clinical Haematology, Nottingham University Hospitals NHS Trust, United Kingdom; 3. Division of Rehabilitation and Ageing, University of Nottingham, United Kingdom)

Introduction : Despite evidence that pre-operative anaemia is associated with post-operative complications and international guidelines which recommend normalisation of haemoglobin (Hb) prior to elective surgery, many hospitals in the United Kingdom lack robust mechanisms to identify and treat anaemia pre-operatively. We surveyed the prevalence of anaemia in a cohort of frail older patients

undergoing elective hip and knee replacement and investigated the association between pre-operative haemoglobin, post-operative transfusion rate and length of stay (LOS). Method : Data on type of operation, LOS and blood transfusion requirements were collected for all patients undergoing elective hip and knee replacement and seen at the Systematic Care for Older People in Elective Surgery (SCOPES) clinic between November 2011 and February 2012. Pre-operative haemoglobins were collected retrospectively from the hospital electronic blood results system. Results : 177 patients were studied. The average age was 76.7(SD 5.0). 106(59.9%) were female. 100(56.5%) and 77(43.5%) underwent total knee and hip replacements respectively. 29 (16.4%) patients were anaemic pre-operatively. 12(41%) patients with pre-operative anaemia required a post-operative transfusion, compared with 27(18%) who had normal pre-operative haemoglobin ($p<0.01$; Chi-square). The median (range; IQR) LOS was 6 days (3-56; 3.5-8.5) for the group as whole, 9 (4-56; 5-14) for those requiring transfusion and 6 (3-41; 3.5-8.5) for those not requiring transfusion ($p<0.01$; Median test). Conclusion : Anaemia was prevalent and was associated with a requirement for post-operative blood transfusion. Transfusion was associated with a longer LOS. We are developing a pathway to identify and treat frail older patients with pre-operative anaemia prior to elective hip and knee replacement. Keywords : Anaemia, Elective, Orthopaedic

PP25 C-229

CLINICAL AND ECONOMIC EFFICIENCY OF SIMULTANEOUS OPERATIONS FOR THE SECOND WORLD WAR VETERANS

Igor LESCHENKO, Igor ALEXANDROV, Valeriy SLIVKIN, Oleg YAKOVLEV (Samara Regional Clinical Hospital for War Veterans, First Research Institute of Rehabilitation of War Veterans of Medical Institute 'REAVIZ', Russia)

Introduction : The Surgery and Urology departments of our Research institute have performed 726 elective simultaneous operations since 1994 until 2011 of the Second World War veterans. This amounted to more than 14% of elderly patients requiring simultaneous operations. Method : Out of which 8,8 % are mild, 78,5% - moderate, 12,7% - severe. The results of simultaneous operations and similar staged operations differed insignificantly ($p>0,05$). Such achievement was realized due to advanced professional education of all medical staff of the departments and introduction of new techniques in examination and treatment: accurate definition of absolute and relative contraindications for simultaneous surgery, preoperative efficiency assessment, low-invasive operations, different types of non-endotracheal anesthesia. Results : In addition to a positive clinical effect, new technology of simultaneous operations reduces economic costs by 2,2 times vs staged surgery, and significantly improves quality of life of the above patients. Conclusion : In our research institute we realised high clinical and economic efficiency of simultaneous operations for senile patients. Keywords : simultaneous operations, senile patients, urological patients

COMPARISON OF PNEUMONIA IN THE ELDERLY WITH OR WITHOUT HYPERCAPNIA IN A SINGLE INTENSIVE CARE UNIT

Alice BREINING¹, Jacques BODDAERT², Christophe CRACCO³ (1. Geriatric, Pitie-Salpetriere Hospital, APHP, UPMC Paris 6, France; 2. Geriatric Department. Peri-Operative Unit., Pitie-Salpetriere Hospital, APHP, UPMC Paris 6, France; 3. Intensive Care Unit, Angouleme Hospital, France)

Introduction : Acute respiratory failure with hypercapnia > 45 mmHg in the elderly has been described as a predictive factor of death in emergency department. The aim of the study is to analyse the prognostic value of hypercapnia in elderly with pneumonia. **Method :** A retrospective study of prospectively collected data relative to elderly ≥ 75 years old admitted in a single Intensive Care Unit (ICU) for an acute severe bacterial pneumonia over a 28 month period was performed. Clinical and biological data and outcomes were compared in patients with and without hypercapnia > 45 mmHg. **Results :** 63 patients were included in this study: 27 patients with hypercapnia and 36 patients without hypercapnia. Mean age of patients was 81.9 ± 0.8 years old. Patients with hypercapnia had more often chronic obstructive pulmonary disease (59% vs 31%, $p=0.04$). Other comorbidities (chronic heart failure, chronic renal insufficiency, diabetes, cerebrovascular disease and cancer) were not found to be different between the 2 groups of patients. Advanced life support measures (use of invasive ventilation, renal replacement therapy and vasoactive drugs) and outcomes (ICU and hospital death and ICU and hospital length of stay) were not significantly different in the 2 groups except for patients with hypercapnia who had more non invasive ventilation (78% vs 50%, $p<0.05$). **Conclusion :** In our ICU, elderly admitted for acute respiratory failure due to pneumonia with hypercapnia have more often a COPD and required more frequently non invasive ventilation but didn't have a worse prognosis than those without hypercapnia. **Keywords :** Hypercapnia, Pneumonia, Elderly

PP25 C-231

ABNORMAL GLUCOSE TOLERANCE IS ASSOCIATED WITH LUNG DYSFUNCTION IN OLD SUBJECTS AROUND AGE 70 YEARS - SONIC STUDY

Ryosuke OGURO¹, Kei KAMIDE¹, Chikako NAKAMA¹, Tatsuo KAWAI¹, Hiroshi KUSUNOKI¹, Mitsuru OHISHI¹, Yukie MASUI², Kazunori IKEBE³, Yasuyuki GONDO⁴, Hiromi RAKUGI¹ (1. Geriatric Medicine and Nephrology, Osaka University Graduate School of Medicine, Japan; 2. Institute of Gerontology, Tokyo Metropolitan Geriatric Hospital, Japan; 3. Removable Prosthodontics, Osaka University Graduate School of Dentistry, Japan; 4. Clinical Thanatology and Geriatric Behavioral Science, Osaka University Graduate School of Human Sciences, Japan)

Introduction : Obstructive lung disease is one of a major cause of death in the old subjects. The number of this disease has been increasing in most of industrial countries. Lung function is known to be affected by multiple factors, especially such as age and smoking. To elucidate factors associated with the lung dysfunction, the analysis without the influence of age would be very important. In present study, we performed the analysis for old subjects around 70 and 80 years in SONIC study to reveal the factors associated with lung dysfunction. **Method :** We analyzed 388 subjects with age around 70 (70 ± 1) years and 482 subjects with age around 80 (80 ± 1) years in Japanese general population. We performed the spirometer, physical examination and collected blood samples. We assessed the factors associated with lung dysfunction. **Results :** Lung dysfunction was significantly associated with smoking status both in 70 and 80 elderly. In 70 years, lung dysfunction was significantly associated with diabetes. Forced expiratory volume in 1 second (FEV1) was significantly lower in diabetic than in non-diabetic subjects (74.6% vs. 79.7%; $P=0.015$). HbA1c was also significantly associated with % vital capacity (%VC) in linear regression analysis ($P=0.015$). On the other hand, these significant associations were not recognized in subjects with age around 80 years. **Conclusion :** Diabetes is one of associated factors with lung dysfunction in subjects with 70 years, but not with 80 years. We speculate this discrepancy will be due to multiple issues.

Keywords : diabetes lung dysfunction

MORTALITY AND RISK FACTORS FOR FATAL OUTCOMES IN ELDERLY CHINESE PATIENTS WITH BULLOUS PEMPHIGOID

Wing Man Christie LI¹, Hon Wai Felix CHAN², Chun Yin Johnny CHAN¹, Ka Hay James LUK² (1. Department of Medicine, Queen Mary Hospital, The University of Hong Kong, Hong Kong; 2. Department of Medicine, Fung Yiu King Hospital, Hong Kong)

Introduction : Bullous pemphigoid (BP) is the commonest autoimmune blistering disease and affecting the elderly (>65yo). High case-fatality rate was demonstrated in Caucasians. Local data on the mortality rate and associated risk factors are lacking. We aim to determine the 1-year and 3-year mortality rates of Chinese elderly patients with BP. An attempt was made to identify the risk factors associated with poor survivals. **Method :** Retrospective analysis on 80 Chinese patients with BP diagnosed in a regional hospital in Hong Kong between January 2009 and December 2010. **Results :** The 1-year and 3-year mortality rates were 32.9% and 52.3%. Mean age at diagnosis was 83.9 ± 9.7 years. A majority of patients (72.2%) lived in old-aged homes (OAH). In our study, 39.2% of patients were solely managed by the Community Geriatric Assessment Team (CGAT). Most patients had dependent active daily activities (ADL-D) and poor mobility status (bed-bound or chair-bound) (77.2%). Most patients (62%) had generalized blisters and 5.1% had mucosal involvement. 49 patients (61.3%) required systemic corticosteroid. Risk factors associated with lethal outcomes included OAH residency ($p=0.001$), pre-morbid bed-bound status ($p=0.02$), low albumin level ($p=0.002$), systemic corticosteroid therapy ($p=0.03$) and high prednisolone dose at three month ($p=0.03$). **Conclusion :** BP is an important geriatric disease associated with high mortality. Several risk factors may predict lethality of BP in elderly. Most BP patients are OAH residents and have poor pre-morbid condition. The CGAT service plays a pivot role in their long term management. Geriatricians should be aware of the predictive factors in treatment elderly patients with BP. **Keywords :** Bullous Pemphigoid, Mortality

PP25 C-233

ASSESSMENT OF SKIN MACERATION AS AN INDICATOR OF RISK OF INCONTINENCE-ASSOCIATED DERMATITIS

Yoshie ICHIKAWA¹, Hiromi SANADA², Chizuko KONYA³, Gojiro NAKAGAMP², Saldy YUSUF¹, Supriadi Junko MATSUO⁴, Takeo MINEMATSU², Yuko YAMAMOTO², Junko SUGAMA¹ (1. Department of Clinical Nursing, Institute of Medical, Pharmaceutical and Health Sciences, Kanazawa University, Japan; 2. Department of Gerontological Nursing/Wound Care Management, Graduate School of Medicine, The University of Tokyo, Japan; 3. Department of Adult Nursing, Kanazawa Medical University, Japan; 4. Faculty of nursing, Osaka Medical College, Japan)

Introduction : To confirm the predictive and content validity of skin maceration as a risk indicator of incontinence-associated dermatitis (IAD). **Method :** We performed a cohort study followed by a cross-sectional study of elderly female patients with fecal and/or urinary incontinence using diapers in Japan. We excluded patients with skin lesions on the buttocks. In the first study, we examined 47 patients for the presence or absence of skin maceration on the buttocks on entry and for IAD over the following six weeks. In the second study, we assessed some physiological and visual characteristics associated with skin maceration and compared all data between the maceration and non-maceration groups. **Results :** We found skin maceration in 36 of 47

patients on their baseline assessment; IAD occurred in 22/36 (61%) of these patients within six weeks. In comparison IAD occurred in 1/11 (9%) of patients without skin maceration within six weeks. Skin maceration accurately predicted development of IAD with a relative risk of 6.7 (95% confidence interval: 1.02-44.36). In the second study, all assessed physiological data were significantly different between the maceration and no-maceration groups. The sulcus cutis interval, erythema index and white index were also significantly different between groups. Receiver operating characteristic analysis to evaluate the discriminatory performance of physiological and visual characteristics for distinguishing skin maceration determined that the erythema index was the most effective of these tools. Conclusion : We have validated skin maceration as a risk indicator of IAD. These data may assist in prevention of IAD. Keywords : Elderly, Incontinence, Skin maceration

Geriatrics, Kremlin-Bicetre hospital APHP, France; 5. Geriatrics, Saint Antoine hospital APHP, UPMC Paris 6, France; 6. Geriatric department. Peri-Operative unit., Pitie-Salpetriere hospital APHP, UPMC Paris 6, France; 7. Geriatrics, Pitie-Salpetriere and Charles Foix hospital APHP and UPMC Paris 6, France; 8. Geriatrics, Tenon hospital APHP, UPMC Paris 6, France; 9. Emergency Department., Bichat hospital APHP, Universite Paris 7, France; 10. Emergency Department., Saint Antoine hospital APHP, UPMC Paris 6, France; 11. Emergency Department., Pitie-Salpetriere hospital APHP, UPMC Paris 6, France)

Introduction : acute heart failure (AHF) is a leading cause of hospitalization in elderly patients, but few studies analyzed the weight of precipitating factors especially in emergency medicine of the very old. The aim of our study was to analyze frequency and prognostic of precipitating factors in AHF. Method : retrospective study in Geriatrics (GD) and Emergency (ED) departments of 6 french teaching hospitals. All patients addressed from ED to GD during 2011 with a diagnosis of AHF at admission confirmed during hospitalization were enrolled. All medical data were obtained from ED and GD medical charts, including type of precipitating factor, length of stay, in-hospital mortality and 30-day readmission. Results : 236 patients were included (age 90±6 years, 73 % women) with multiple comorbidities (CIRS score 12±4, heart failure 72%, dementia 50 %). A precipitating factor was identified in 158 patients (67%), mainly represented by infections (69 %), arrhythmias (21%), anemia (13%), poor dietary or medication compliance (9%). From the 158 patients with precipitating factors found in GD, 52 were not diagnosed during ED stay (33%). We found no difference between patients where the precipitating factor was found in ED and GD or only in GD for in-hospital mortality (20 vs 10%, NS) and 30 days readmission (11 vs 12%, NS). Conclusion : Our preliminary results suggest that acute precipitating factors, mainly represented by infections, are frequent in AHF of elderly patients, but diagnosed in 2/3 of patients during emergency management. However, to diagnose or not these factors does not seem to be associated with a poor outcome. Keywords : heart failure, emergency medicine

PP25 C-235

BIOMARKERS FOR DIAGNOSIS OF BACTERIAL INFECTION IN ELDERLY PATIENTS

Anne FOREST¹, Lorene ZERAH¹, Patrick RAY², Marc VERNY¹, Jacques BODDAERT¹ (1. Geriatric department. Peri-Operative unit., Pitie-Salpetriere hospital. APHP. UPMC Paris 6., France; 2. Emergency Department., Tenon hospital. APHP. UPMC Paris 6., France)

Introduction : Usefulness of biomarkers such as procalcitonin (PCT) or C reactive protein (CRP) has been widely discussed in previous studies, but no convincing data has been reported in elderly patients. The aim of our study was to evaluate the diagnostic accuracy of PCT, using the reference TRACE method in the diagnosis of bacterial infections in elderly patients admitted in acute wards. Method : We conducted a 6 months retrospective study in patients aged 75 years and older. Main clinical and biological characteristics including PCT, CRP, leukocytes were obtained at admission. Final diagnosis of bacterial infection was made based on medical charts, microbiological and radiological investigations, by 3 experts unawares of PCT results. Results : One hundred and three patients were included (age 78 ±9 years, comorbidities 3 ± 2, ADL 4 ± 2, sex ratio f:m 3 :1) with a 9 % in-hospital mortality. According to experts, bacterial infection was noted in 40% of patients (pneumonia 76 %, soft tissues 12%, urinary 7%, gastrointestinal 7%). Bacterial infection was significantly associated with CRP (149 [85-211] vs. 26 [8-70] mg/L, p<0.001) and PCT (0.73 [0.22-1.51] vs. 0.09 [0.06-0.17] ng/mL, p<0.001). Using a 0.3 ng/ml cut-off for PCT accuracy in diagnosis of bacterial infection, sensitivity was 76 %, specificity 82 %, with a 74% positive predictive value and 80% negative predictive value (AUC 0.59), compared to 0.63 AUC for CRP. Conclusion : From our study, PCT does not appear to be useful to clinician for bacterial infection diagnosis. A risk stratification strategy requires further investigations. Keywords : procalcitonine, sepsis

PP25 C-236

PROCALCITONIN FOR DIAGNOSIS OF PERIOPERATIVE INFECTIONS IN ELDERLY PATIENTS WITH HIP FRACTURE. PRELIMINARY RESULTS

Anne FOREST¹, Lorene ZERAH¹, Judith COHEN-BITTAN¹, Marc VERNY¹, Bruno RIOU², Jacques BODDAERT¹ (1. Geriatric department. Peri-Operative unit., Pitie-Salpetriere hospital APHP and UPMC Paris 6, France; 2. Emergency Department, Pitie-Salpetriere hospital APHP and UPMC Paris 6, France)

Introduction : Surgery is associated with inflammation, and diagnosis of infection is particularly challenging. The aim of our study was to analyze value of procalcitonin (PCT) for diagnosis of bacterial infection in perioperative conditions. Method : Consecutive elderly patients admitted to our Geriatric Perioperative Unit for hip fracture management with PCT determination during 5 days post-surgery period. The highest value of PCT (PCTmax) was used for study. Diagnosis of infection was retrospectively confirmed by 3 experts unaware of PCT values, using medical charts, biological and radiological data. Clinical and biological data were reported, outcome included in-hospital mortality. Patients were compared according to diagnosis of infection, or PCT level. We present our preliminary results. Results : 203 patients were included (age 86±7 years, women 73%) with numerous comorbidities (median CIRS 8±4, dementia 38%) and dependency (IADL 8±5). Diagnosis of infection was noted in 48 patients (24%), mainly represented by pneumonia (50%) and urinary tract infections (27%). There was no difference for anemia, cardiovascular event, pressure ulcers, urinary retention between

infected and non infected patients, and Cockcroft creatinin clearance was comparable (respectively 49 ± 19 vs 57 ± 24 ml/min). In-hospital mortality was higher in infection group (10 vs 0%, $p=0.0031$). Patients with bacterial infection had higher level of PCTmax (median 0.33 vs 0.2, $p=0.0375$). Patients with levels of PCTmax ≥ 1 $\mu\text{g/L}$ had higher in-hospital mortality compared to others (14 vs 1%, $p=0.0042$). Conclusion : Our preliminary results suggest that perioperative infections and high level of procalcitonin are associated with a poor outcome in elderly patients with hip fracture. Keywords : hip fracture, biomarkers, procalcitonin

PP25 C-237

PRONOSTIC OF PERIOPERATIVE TROPONIN LEVEL IN ELDERLY PATIENTS WITH HIP FRACTURE. PRELIMINARY RESULTS

Helene VALLET¹, Anne FOREST¹, Judith COHEN-BITTAN¹, Alice BREINING¹, Marc VERNY¹, Bruno RIOU², Jacques BODDAERT¹ (1. Geriatric department. Peri-Operative unit., Pitie-Salpetriere hospital APHP. UPMC Paris 6., France; 2. Emergency Department., Pitie-Salpetriere hospital APHP. UPMC Paris 6., France)

Introduction : Cardiovascular diseases represent a frequent comorbidity in elderly patients, and could play a role in hip fracture prognosis. The aim of our study was to analyze the prognostic significance of troponin elevation in post-operative hip fracture surgery in elderly patients. Method : between November 2009 and April 2012, all patients admitted in our dedicated geriatrics post-operative unit (UPOG) after hip fracture surgery with a troponin determination were included. Data were prospectively collected, including comorbidities (CIRS scale) and troponin level. A troponin elevation was defined as a value > 0.15 $\mu\text{g/L}$ during hospital stay. Outcome included in-hospital post-operative events and mortality, and 6 months mortality and autonomy. We present our preliminary results. Results : 211 patients were included (age 86 ± 6 years, male 26%) with a 9 ± 4 CIRS and 8 ± 5 IADL scores, and 97% ability to walk. A history of coronary artery disease was noted in 17%, of heart failure in 18%. A troponin rise was reported in 15% of patients, with ACS diagnosis in 77%, and was associated with acute heart failure (39 vs 14%, $p=0.0034$), haemorrhagic complications (23 vs 7%, $p=0.0106$), ICU referral (13 vs 1%, $p=0.0047$). There was no difference for in-hospital and 6 months mortality (20 vs 15%, NS), but at 6 months, troponin elevation was associated with a lower ability to walk (76 vs 97%, $p=0.003$) and a lower rate of home return (63 vs 84%, 0.0231). Conclusion : Our preliminary results suggest that troponin elevation in hip fracture is not associated with mortality but is associated with a poor functional. Keywords : hip fracture, coronary artery disease

PP25 C-238

RECURRENT HYPOXEMIA AND DIZZINESS ASSOCIATED WITH A PATENT FORAMEN OVALE

Anne FOREST¹, Patrick RAY², Marc VERNY¹, Jacques BODDAERT¹ (1. Geriatric department. Peri-Operative unit., Pitie-Salpetriere hospital. APHP. UPMC Paris 6., France; 2. Emergency Department., Tenon hospital. APHP. UPMC Paris 6., France)

Introduction : Patent foramen ovale (PFO) is a persistent normal fetal communication between the right and left atria, occurring in 20-34% of the population, which majority will never present any complications. However, even in elderly patients, some factors can lead to the opening of a PFO. Method : Case report. Results : We report the case of an 82-year-old man admitted for pneumonia, with a history of left brain abscess 30 years ago, who developed recurrent transient episodes of hypoxemia related dizziness requiring

oxygenotherapy. Right to left shunt was confirmed by a transthoracic echocardiography. A decision of PFO closure was retained for following reasons, including functional limitation, history of recurrent similar episodes possibly implicated in recurrent falls and leading to frequent emergency visits. Moreover, history of brain abscess thirty years ago was probably related to his PFO. A percutaneous procedure of transcatheter device closure was successfully performed and clopidogrel was added to maintain aspirin/clopidogrel association for almost 3 months. Hypoxemia episodes regressed, and outcome was favourable symptom free two months later. Conclusion : In our case, two factors made the PFO symptomatic: an anatomical (association of the PFO with atrial septal aneurysm and mobile Eustachian Valve) and a functional factor (increase in pulmonary blood pressure by cough due to pneumoniae, defecation and rehabilitation). In case of severe unexplained hypoxemia, even in elderly patient, assumption of a right-left shunt through a reopening of PFO should be considered. Keywords : hypoxemia, dizziness, foramen ovale

PP25 C-239

TRANSFUSION IN ELDERLY PATIENTS WITH HIP FRACTURE: RETROSPECTIVE COMPARISON BETWEEN RESTRICTIVE AND LIBERAL REGIMEN. PRELIMINARY RESULTS

Anne FOREST¹, Judith COHEN-BITTAN¹, Alice BREINING¹, Marc VERNY¹, Bruno RIOU², Jacques BODDAERT¹ (1. Geriatric department. Peri-Operative unit., Pitie-Salpetriere hospital APHP and UPMC Paris 6, France; 2. Emergency Department., Pitie-Salpetriere hospital APHP and UPMC Paris 6, France)

Introduction : Hip fracture management frequently requires transfusion in elderly patients. In 2011, an international randomized study reported the safety of restrictive regimen compared to liberal. In our dedicated geriatric perioperative unit, according to these data, we changed our clinical transfusion practice. The aim of our study was to retrospectively analyze the safety of restrictive regimen in our patients. Method : Over a 3 years period, we compared transfusion practice and outcomes before (2009-2011, liberal group (LG)) and after (2012, restrictive group (RG)) modification of transfusion practice, according to international data published in December 2011. All patients admitted with a hip fracture were included. Transfusion performed during surgery was not considered since patients were admitted to our unit after surgery. Main outcomes were in-hospital mortality, acute coronary syndrome (ACS), heart failure and atrial fibrillation. We present our preliminary results. Results : 294 patients were included (age 86 ± 7 , preoperative haemoglobin 12 ± 1 g/dL). There was no difference between LG (n=212) and RG (n=82) for CIRS score (8.2 ± 3.8 vs 9.6 ± 3.9 , NS) or for cardiovascular comorbidities. A transfusion was performed in 74% in LG and 49% in RG. Considering outcomes, this reduction of transfusion between LG and RG was not associated with any difference for ACS (14 vs 18%, NS), heart failure (17 vs 10%, NS), atrial fibrillation (10 vs 7%, NS), and for in-hospital mortality (3 vs 6%, NS). Conclusion : Our preliminary results suggest that restrictive transfusion regimen is as safe as liberal transfusion regimen in elderly patients admitted with hip fracture in our dedicated unit. Keywords : hip fracture, orthogeriatrics, anemia, transfusion

PP25 C-240

UTILITY OF 123I-FP-CIT SPECT FOR DEMENTIA DIAGNOSES AND THERAPEUTIC STRATEGIES IN ELDERLY PATIENTS

Zina BARROU¹, Veronique FAUCOUNAU¹, Marie-Odile HABERT², Sandrine GREFFARD¹, Benedicte DIEUDONNE¹, Jacques BODDAERT¹, Marc VERNY¹ (1. Geriatric department. Peri-

Operative unit., Pitie-Salpetriere hospital APHP, UPMC Paris 6, France; 2. Nuclear medicine unit, Pitie-Salpetriere hospital APHP, UPMC Paris 6, France)

Introduction : Precise diagnosis of dementia is important but challenging, particularly in elderly patients, because multiple causes of cognitive impairment often coexist. Single photon emission computed tomography (SPECT) of the dopamine transporter (123I-FP-CIT) permits diagnosis of nigrostriatal denervation and helps for the diagnosis of dementia with Lewy bodies (DLB). We evaluated its influence on diagnosis and treatment strategies in an elderly population with mild dementia. **Method :** retrospective study of consecutive patients who had 123I-FP-CIT SPECT for suspected DLB. Clinical diagnoses were compared with imaging results. **Results:** 46 patients were included. Clinical diagnoses were probable DLB in 14, possible DLB in 21 and alternate diagnoses in 11. Rates of abnormal imaging in these groups were respectively 71%, 43% and 18%. Overall, diagnoses were revised in 37%. Four patients with probable DLB had normal imaging. The number of core criteria in these patients did not differ from the remainder (2.75 ± 0.5 vs. 2.1 ± 0.6), but hallucinations in 2 patients were not well formed and detailed as usual in DLB. Among 29 patients with parkinsonism, free of antipsychotics, rates of abnormal scans was 36% in patients with questionable parkinsonism, 57% in definite parkinsonism, and 67% in patients with no parkinsonism. Among 9 patients on Levodopa, 6 had normal scans and Levodopa was stopped. **Conclusion :** we show a significant impact of 123I-FP-CIT SPECT on diagnoses, even in cases of definite parkinsonism or probable DLB. In the latter, scarcity of hallucinations, especially if there are not well formed and detailed, should prompt 123I-FP-CIT SPECT. **Keywords :** Dementia, Lewy body, diagnosis

PP25 C-241 EVALUATION OF ADHERENCE TO THE ANTICOAGULATION GUIDELINES IN ATRIAL FIBRILLATION IN PATIENTS OVER 75 YEARS

Laurie Anne BERTHOLON¹, Dragos CIOCAN², Rachid MAHMOUDI³, Jean Luc NOVELLA¹, Moustapha DRAME², Pierre NAZEYROLLAS⁴ (1. Department of Internal Medicine and Clinical Gerontology, Reims Teaching Hospitals, France; 2. EA 3797 Faculty of Medicine, University of Reims Champagne-Ardenne, France; 3. Internal Medicine and Clinical Gerontology, CHU Reims, France; 4. Department of Cardiology, Reims Teaching Hospitals, France)

Introduction : The European Society of Cardiology (ESC) provided in 2010 antithrombotic guidelines for the management of patients with AF. The aim of this study was to evaluate clinicians' adherence to the 2010 ESC guidelines for the management of FA in patients over 75 years and to describe the characteristics of patients according to the anticoagulant treatment. **Method :** A monocentric retrospective study was conducted from March to July 2011 at Reims University Hospital, France and included all patients with AF over 75 years and hospitalised in the geriatrics (GD) and cardiology departments (CD). **Results :** A total of 152 patients were included with a mean age of 83 ± 5 . One hundred and seven patients had an anticoagulant treatment (75% in CD and 51% in GD, $p=0,007$); all had a CHA₂DS₂VASc score >2 . The bleeding risk was higher in patients hospitalised in GD (HASBLED score $3,3 \pm 0,7$ vs. $2,9 \pm 0,7$ in CD, $p=0,01$). Patients with a high bleeding and thromboembolic score (HASBLED >4 and CHA₂DS₂VASc ≥ 5) were all under anticoagulant treatment ($n=13$). Among patients with a higher thromboembolic risk than a bleeding risk ($n=36$), 58% received an anticoagulant treatment; while 70% of patients with a higher bleeding score than a thromboembolic risk score

($n=17$) were under treatment. Factors associated with the absence of anticoagulant treatment were: lack of autonomy, falls, age, dementia and malnutrition. **Conclusion :** Our study shows that, in elderly patients over 75 with AF, anticoagulant treatment is underused when compared to the ESC guidelines and may not be solely based on the data used in the CHADS₂VASC₂ and HASBLED scores. **Keywords :** atrial fibrillation, anticoagulation, elderly

PP25 C-242 STUDY OF MORBID PATTERN AMONG INMATES OF OLD AGE HOME

Drmahesh HEMADRI (Geriatrics, Global Hospital & Resaerch Centre, India)

Objectives : To study balance confidence amongst inmates of old age home. To study vitamin d3 level. To study morbid conditions of inmates of old age home. **Study Design :** Observational study. 35 inmates of an old age home were selected for the study to evaluate balance confidence, by using balance confidence scale. Each inmates were personally interviewed with the scale in which one negative answer was taken as lack of balance confidence in the individual. Vitamin D3 level were also estimated. &number of comorbid conditions were also noted. **Exclusion Criteria :** Bedridden inmates&inmates with history of dizziness. **Inclusion Criteria :** Literate inmates.inmates with walking aids inmates who are ambulatory more than 60 years. Inmates who could hear see&able to comprehend. **Results :** Out of 35 inmates which were studied, lack of balance confidence was predominantly seen amongst the inmates having age more than 70 years Irrespective of vitaminD levels&coexisting comorbid conditions 18 inmates had level of vitamin D3 $<30\text{ng/ml}$, 3 inmates showed levels between 30ng to 50ng/ml, 3inmates showed vitamin D3 level $<11\text{ng/ml}$. 31 inmates showed more than 2comrbid conditions. Both the factors of vitaminD3&balance confidence were found to be significant with Pvalue <0.05 . **Conclusion :** Lack of balance confidence &low vitamin D3 are commonly seen in elderly. As age advances lack of balance confidence is commonly seen. So interventions to correct Vitamin D3 levels&introducing balancing exercises are prerequisites for prevention of falls in the elderly Vitamin D3 levels did not correlate with body mass index. **Keywords :** balance confidence, vitaminD3levels, fallprevention

PP25 C-243 IMPACT OF A THERAPEUTIC EDUCATION PROGRAM FOR ALZHEIMER'S DISEASE PATIENTS AND CAREGIVER ON PATIENT'S QUALITY OF LIFE. THERAD STUDY DESIGN

Amelie PERRIN¹, Audrey ZUERAS¹, Pierre RUMEAU¹, Helene VILLARS¹, Fati NOURHASHEMI², Bruno VELLAS² (1. Geriatric Department, University Hospital, Toulouse, France; 2. Geriatric Department, University Hospital, INSERM Unity 558, University Paul Sabatier, Toulouse, France)

Introduction : THERAD is designed to determine whether a therapeutic education program for both Alzheimer's Disease (AD) patients in community dwelling and their primary caregivers improves patient's quality of life. Secondary endpoints are caregiver's burden (Zarit Burden Inventory) and patients' behavioural and psychological symptoms (NPI) and independence in personal and instrumental daily life activities (ADL and IADL). **Method :** It' a monocentric randomised controlled intervention trial. One hundred and seventy dyads 'patient-caregiver', patient suffering from mild to moderately severe AD (MMSE 11 to 26), in community dwelling with a primary caregiver, will be included during 18 months. The control group ($n=85$) will benefit from routine care. The intervention group ($n=85$)

will benefit in addition from two consultation for the dyad (M0: therapeutic education diagnosis, standard geriatric assessment and assessment of the judgement criteria, and M2: assessment of the response to the educational objectives and of the judgement criteria) and four weekly group sessions of therapeutic education (knowledge of the disease, pharmacological and non pharmacological treatments, risk situations, support services and care pathways) for caregivers only, between M0 and M2. Monitoring will consist of two consultations to 6 and 12 months including assessment of primary and secondary judgement criteria. Results : Intention to treat analysis using linear mixed model will be performed, adjusting for patients, caregiver characteristics and occurrence of life event that may interfere with patient's quality of life. Conclusion : THERAD's objective is to assess the impact of a therapeutic education program on AD patients' quality of life . First results will be available by 24 months. Keywords : therapeutic education, Alzheimer, caregiver

PP25 C-244

THE EFFECT OF ELASTIC BAND EXERCISE ON PHYSICAL ABILITY AND MUSCULAR TOPOGRAPHY IN ELDERLY WOMEN

Jung Won LEE¹, Chang-Hwan KIM² (1. Dept. of Physical & Rehabilitation Medicine, College of Medicine, InHa University, Korea 2. Dept. of Physical & Rehabilitation Medicine, InHa University, Korea)

Introduction : Using elastic band (EB) exercise are widely available, but the effect of exercise in the elderly are not well known. Using anaerobic exercise (AAE) and aerobic exercise (AE) with EB has been applied in old peoples, and we have analyzed the changes of body composition (BC), physical ability (PA), muscular topography (MT). Method : 23 women aged over 65 were divided into AE and AAE Groups (13 people in AAE), 12 weeks EB Exercise was carried out. BC (BWt, BMI, FFM, BFM, Fat%, WHR, and VAF) were measured by bioelectrical impedance. PA were measured by Leg extention power, sitting trunk flexion, Close-eyes foot-balance, Time up to go. And changes of MT was evaluated with Moire measurement equipment on the chest, abdomen, lumbar part, and all parts of the changes. All examination was compared before and after 12 weeks exercise session. Results : Changes in body composition after exercise of BW, BMI, BFM, Fat%, WHR, VAF in the AAE group was significantly lower than the AE group ($p < .001$), FFM was a significant increase Both groups ($p < .001$). Physical Ability factors Leg Extention Power, Sitting Trunk Flexion, Close-Eyes Foot-Balance, Time up to go was significantly increased in both groups ($p < .001$). MT factor the chest, abdomen, lumbar part, and all parts were significantly increased in both groups ($p < .001$). Conclusion : EB Exercise (Anaerobic and Aerobic Exercise) has effectively changes BC, PA, MT. Therefore, to increase the degradation rate of fat and to increase the tenacity of exercise, application of aerobic band exercise is considered to be effective. Keywords : exercise, aged women, topography

PP25 C-245

PREDICTORS OF QUALITY OF LIFE (QOL) IN LOW INCOME OLDER PEOPLE IN BRAZIL - EQ 5D TOOL

Marisa SANTOS¹, Fernanda BORGES², Marcelo GOULART³, Bernardo TURA⁴, Luiz Mauricio PLOTKOWSKI⁵, Jerson LAKS⁶ (1. Epidemiology, Centro de Estudo e Pesquisa do Envelhecimento, Brazil; 2. Nutrition, Centro de Estudo e Pesquisa do Envelhecimento, Brazil; 3. Epidemiologist, Instituto Nacional de Cardiologia, Brazil; 4. Doctor Ph.D. in statistics, Instituto Nacional de Cardiologia, Brazil; 5. Pulmonologist, Centro de Estudo e Pesquisa do

Envelhecimento, Brazil; 6. Psychiatry, Centro de Estudo e Pesquisa do Envelhecimento, Brazil)

Introduction : EQ-5D utilization is limited in low income and low educated older persons. The aim is to assess QoL in a low income older sample. Method : Elderly from primary care were evaluated (APRIL/NOVEMBER 2012). After training, professionals applied EQ-5D descriptive tool (Descript) and Visual Analogic Scale (VAS). We calculated EQ-5D using Brazilian valuation data . VAS assessed subjective QoL. Spearman test correlated VAS and Descript. Median, Interquartile interval, Wilcoxon test evaluated variables eligible to multivariable model ($p \leq 0.25$). Logistic regression model analyzed predictors of low EQ-5D. Results : Of 300 elderly: female (59%), mean age= 70 years (± 7); 42% lower educated, > 3 co-morbidities (76%). 82% from D/E class, 4.3% were excluded due to dementia. 5% showed mild cognitive impairment. VAS was poorly understood: 27/177 respondents reported VAS ≤ 10 . Most frequent comorbidities (18% depressed): Hypertension (88%), dyslipidemia (47%), diabetes (30%). 51.4% and 61.5% completed Descript and VAS, respectively. Most of those who did not complete the EQ-5D were depressed, with mild cognitive impairment, and of low income status. VAS and Descript linear correlated moderately ($\rho = 0.435$). Descript and VAS median: 0.82 (0.69 - 0.88) and 75 (50 - 100), respectively. Risk for EQ-5d < 0.07 ($p < 0.05$): Lawton (OR 3.06 1.38-4.75), >3 comorbidities (OR 4.05 2.42 - 5.68), depression (OR 3.40 1.69 - 5.11). Conclusion : Despite non response rate, EQ-5D may assess geriatric health programs. Comorbidity was the strongest poor QoL predictor. Keywords : older persons, quality of life, EQ-5D

PP25 C-246

EDUCATIONAL PLATFORM FOR THE NON-GERIATRIC HUMAN RESOURCES (FORHUM3)

Victoria ARANGO-LOPERA, Elizabeth CARO-LOPEZ, Luis GUTIERREZ-ROBLEDO (Education in Gerontology and Geriatrics, Instituto Nacional de Geriatria, Mexico)

Introduction : Almost 11 million of elderly subjects are now living in Mexico, and a lack of Geriatricians is one of the problems. In addition, the 70-year or older subjects are growing by 2,000 every day. Mexico has only 400 certificate geriatricians and only 40 acute care units (specialized in elderly). The aim of this study is to elaborate a collaborative strategy to train teams of high impact in long term care, acute care (emergency room), primary care and higher care levels (second and third levels); focused in maintaining functionality and those already who have developed dependency; with an on line technology. Method : The preelimirar results reported in this abstract correspond to a cross-sectional survey that was made to non-geriatric professionals that take care for elderly in long term facilities, of all the country. A questionnaire about needs of training was applied to all these professionals, and with the results, materials for an on line course was done. Results : 120 subjects were interviewed, with different disciplines. The topics that were recognized as the more important by these subjects were: depression, falls, palliative care, prevention, cognitive decline, physical activity and functionality. Educational materials were done and validated for the platform. Conclusion : Training for people who already care for elderly with evidence based contents and systematic methodology is essential for an optimal care of the elderly in all health care levels. Keywords : Education, Non-geriatric professional care, Health care

PP25 C-247

ELDERLY PATIENTS IN EMERGENCY DEPARTMENT WITH POSTURAL HYPOTENSION: WHO REQUIRES

ADMISSION?

Cheng Gek TAN¹, Norhafizah TAJUT DIN¹, Loretta NEO²
(1. Emergency Department, Tan Tock Seng Hospital, Singapore;
2. Emergency, Tan Tock Seng Hospital, Singapore)

Introduction : Postural hypotension (PH) is not uncommon in elderly patients presenting to the emergency department (ED). However, there is a paucity in the literature to aid us in the disposition of these patients. This study aims to identify variables that may help us predict the need for admission in ED elders found to have PH. Method : This was a subgroup analysis of a cross sectional study involving elderly ED patients presenting during office hours with fall, functional decline, giddiness, syncope, or gastroenteritis. We compared PH patients who were admitted vs. those discharged, looking at the following variables: age, gender, degree of drop, presence of reflex tachycardia, number of causes found, history of/ presenting with falls, recent history of giddiness/ syncope/ lower limb weakness, and the reproducibility of PH. Results : 78 of 382 patients (20.4%) had PH, of which 52 (66.7%) were admitted. Univariate analysis found the following to be significantly more common amongst admitted PH patients: median age (80 vs 76; $p=0.042$), increasing number of causes of PH ($p=0.029$), a history of giddiness in the preceding two weeks (81.5% vs 18.5%; $p=0.048$) and giddiness during postural blood pressure (PBP) check (84% vs 16%; $p=0.038$). Conclusion : When managing elderly ED patients with PH, it is important to ask recent symptoms of PH, as well as actively identify likely causes. Advanced age, more than one cause, a recent history of giddiness and experiencing giddiness during PBP check may be predictors for need for admission. Keywords : Geriatric Emergency Medicine, Postural hypotension, Hospital admission

PP25 C-248

PROFILE OF ELDERLY PATIENTS WITH POSTURAL HYPOTENSION IN EMERGENCY DEPARTMENT

Loretta Poh Choo NEO, Chen Chen GAN (Emergency Department, Tan Tock Seng Hospital, Singapore)

Introduction : To determine the prevalence, characteristics, and the likely causes of postural hypotension (PH) in elderly Emergency Department (ED) patients presenting with a fall, functional decline, giddiness, syncope and gastroenteritis. Method : This was a cross-sectional study. Patients aged 65-and-above presenting to the ED during office hours with any of the above five were recruited. Those acutely ill, pre-morbidly non-ambulant, or intolerant of postural blood pressure (PBP) taking were excluded. PBP was taken at 1 and 3 minutes. ED evaluation, management, disposition and likely causes of PH were analysed. Results : Of the 446 patients screened, 382 fit criteria. PH was found in 20.4%. Patients with PH were significantly older (78.9 vs 77.1, $p=0.044$), more likely to demonstrate postural giddiness during PBP taking (32.1% vs 18.8%, $p=0.013$), and more likely to report postural symptoms in the preceding two weeks (57.7% vs 14.8%, $p=0.000$). Majority (88.5%) of postural drop occurred in the 1st minute; 43.6% in the 3rd minute. 30.8% and 43.6% had one and two causes respectively; 25.6% had no obvious causes found in ED. Medication (48.7%) was the biggest suspect, followed by dehydration (34.6%). Admission rates were higher amongst PH patients (66.7% vs 54.3%, $p=0.055$). Conclusion : Postural hypotension is common. Advanced age, active postural giddiness and preceding postural symptoms all suggest its presence. Majority of PH causes may be elucidated in the ED. It is important to perform PBP in above patients because PH suggests these patients are more likely to require admission. Keywords : Geriatric Emergency Medicine, Postural hypotension

PP25 C-249

HEALTHCARE UTILISATION BY ED ELDERS - ED VISIT AS A GERIATRIC SCREENING OPPORTUNITY

Tse Ling TAN¹, Chik Loon FOO¹, Loretta NEO² (1. Emergency Department, Tan Tock Seng Hospital, Singapore; 2. Emergency, Tan Tock Seng Hospital, Singapore)

Introduction : A quarter of Emergency Department (ED) attendance comprises of patients 65-and-above. An ED visit may be an opportunity to provide geriatric screening. This is especially so if ED elders are found to be newcomers to the healthcare system and thus unlikely to have received geriatric screening before. Method : This was a retrospective study of 2000 consecutive ED elderly patients presenting in May 2011. Electronic medical records (EMR) were used to determine patients' healthcare utilisation. 'Newcomers' were defined as no ED visits or hospital admissions in the past year. 'On follow-up' was defined as having two or more visits with two or more prescriptions of similar medications from the Polyclinic or Hospital in the past year. Results : 2000 patients aged 65 and older were included in the study. Of these, 1036 (51.8%) were female. Median age of the patients was 76 years (range, 71-83). 900 (45.0%) of the study were newcomers, i.e. have not visited ED or been admitted in the past year. There were more patients on follow-up with hospital clinics compared to polyclinics (57.9% vs. 51.4%). 18.2% of all patients were not on follow-up with either polyclinics or hospital clinics. Conclusion : Almost half of ED elders are newcomers to the tertiary care system. One-fifth of patients are not even on follow-up at a public outpatient setting. These patients are unlikely to have received geriatric screening in the past year. We recommend that opportunistic screening be offered to these patients before they are discharged and potentially lost to system again. Keywords : Emergency Department, Health services consumption

PP25 C-250

PRELIMINARY VALIDITY OF THE COMPUTERIZED CANCELLATION TEST IN PATIENTS WITH STROKE

Ho-chuan HUANG¹, Tsui-Ying WANG² (1. Department of Information Management, National Kaohsiung University of Applied Sciences, Taiwan; 2. Department of Occupational Therapy, National Cheng Kung University, Taiwan)

Introduction : To introduce the function of the computer-assisted cancellation test (CACT) system and demonstrate how the system works for the visual attention and neglect problems in patients with stroke. Method : A total of 53 participants: 21 post-stroke patients (11 males, 10 females), and 32 normal subjects (13 males and 19 females) with no known neurological, psychological, visual, or motor problems, comparable with age and education were included in this study. Participants were given the computer-assisted cancellation test and behavior inattention test (BIT) to measure the attention performance. Results : The patient group and normal group showed significant differences in correct responses ($p < .005$) and completion time ($p < .001$) on both tests (structured and unstructured) of the CACT. In the three subtests of the BIT, only star cancellation test showed significant difference between the two groups. The symbol test of the CACT showed good concurrent validity and successfully discriminated normal and stroke patients. Conclusion : Computer-assisted assessment becomes a trend for the advantage of time-saving, less biased, more precise, more storage capacity and efficient processing. CACT was validated with good reliability and concurrent validity to measure the visual attention performance of the participants with stroke. Keywords : visual attention, computerized test, stroke

**PP25 C-251
PREDICTORS OF MORTALITY AND
INSTITUTIONALIZATION AFTER OPERATED GERIATRIC
HIP FRACTURE**

Chin Pang Ian CHAN, Y.L. E. CHENG, T.K. YIM, K.Y.E. SHA, C.Y. YUNG, M.F.E. LEUNG (Department of Medicine and Geriatrics, United Christian Hospital, Hong Kong)

Introduction : Optimal delivery of high-quality care of patients with fractured neck of femur was an achievable and rewarding goal of geriatric care. Method : We determined the predictors of mortality and institutionalization at 6 months and 1 year after operated geriatric hip fracture by retrospective multi-variate analysis of the central data bank in Hong Kong (Clinical Data and Reporting System). Results : The total number of operated hip fracture cases was 470. The mean age of the patients was 81.7 (SD 8.0) years. 346 patients (73.6%) were female. 144 (30.6%) patients had Charlson's comorbidity index more than 2. About 40% patients were classified as American Society of Anesthesiologists (ASA) Class III or IV. In-hospital mortality rate was 3.4% (n=16). Mortality rate was 12.3% (n=58) and 17.7% (n=83) at 6 month and 1 year post-fracture. Pre-fracture hip residency (institution) (p=0.029 HR 2.527; p=0.007 HR 2.791) and CCI (p=0.034 HR 1.196; p=0.028 HR 1.169) were risk factors of 6-month and 1-year mortality. Higher MMSE scores and serum albumin level predicted better survival rate (p=0.031 HR 0.915; p=0.002 HR 0.890) at 6-month post hip fracture. Age (p=0.001 OR 1.092) and dementia (p=0.003 OR 3.169) predicted 6-month post-fracture institutionalization. The pre-fracture availability of maid demonstrated protective effect on institutionalization after hip fracture (p=0.005 OR 0.145). At one year after hip fracture, age was the only identified risk factor of institutionalisation (p=0.015 OR 1.075). Conclusion : The recognition of predictors of outcome improves patient care and decreases institutionalization. Age in the community is an achievable goal of the elderly. Keywords : hip fracture, outcome, insitutionalization, mortality

**PP25 C-252
A SURVEY OF ORAL AND SWALLOWING FUNCTIONS
FOCUSING ON SILENT ASPIRATION AMONG DEMENTIA
ELDERLY CLIENTS**

Hirohiko HIRANO¹, Emiko SATO², Yutaka WATANABE³, Ayako EDAHIRO¹, Yuki OHARA⁴, Shiho MORISITA³, Yumi CHIBA¹, Haruka TOHARA⁵ (1. Research team for promoting independence of the elderly, Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Japan; 2. Department of Oral Medicine, Oral and Maxillofacial Surgery, Tokyo Dental College, Japan; 3. Oral Disease Research, National Institute for Longevity Sciences, Japan; 4. Graduate School, Section of Behavioral Dentistry, Tokyo Medical and Dental University, Japan; 5. Department of Dysphagia Rehabilitation, Nihon University School of Dentistry, Japan)

Introduction : This survey aimed to investigate oral and swallowing functions among dementia elderly to compare differences between dementia of the Alzheimer type (AD) and a blood vessel dementia (VaD). Method : Total 269 elderly clients hospitalized in chronic period hospitals, nursing homes and dementia group homes were observed or interviewed. Those were Mini Mental State Examination: MMSE, Clinical Dementia Rating: CDR, daily living situations (Barthel Index: BI, Vitality Index: VI) and nutrient state (Alb, Body Mass Index: BMI), and swallowing functions (revision water drinking test and cough test). Under the scores of the revision water drinking test (WT), 1, 2 and 3 are "positive", and 4 and 5 are "negative". Regarding the cough test (CT), the occurrence of cough reflex within

30 seconds can be judged as normal. Silent aspiration: SA can be screened using results of WT and CT. Results : Regarding WT, the worse a dementia level in AD and VaD was, the higher the positive rate was. And the rate of positive in VaD tended to be higher than that in AD. Regarding CT, the positive rate in AD was slightly higher than in VaD. Furthermore, worse score of SA depended on the level of dementia. Especially, the score of SA in the severe level of dementia was the worst significantly (p<.05). The relative risk of SA in AD against VaD was 3.8 times (OR=3.8, p<.01, CI=1.4-10.1). Conclusion : In these results, different characteristics of oral and swallowing functions and SA between AD and VaD were shown. Keywords : Dementia, Silent Aspiration, Cough test

**PP25 C-253
THE RELATIONSHIP BETWEEN BODY MASS INDEX AND
BONE MINERAL DENSITY IN OLDER PEOPLE**

Seyedreza HOSSEINI¹, Parvin SAJJADI², Sahar JAMALI², Hajjighorban NOREDDINI³, Reza GHADIMI⁴, Ali BIJANI⁴, Robert Graham CUMMING⁵ (1. Social Determinant of Health Research Center, Babol University of medical sciences, Iran; 2. Community Medicine, Babol University of Medical Sciences, Iran; 3. Radiology, Babol University of Medical Sciences, Iran; 4. Social Determinants of Health(SDH) Research Centre, Babol University of Medical Sciences, Iran; 5. Department of Epidemiology and Geriatric Medicine, University of Sydney, Australia)

Introduction : Obesity is a risk factor for cardiovascular diseases although it has been supposed that it has protective effect on bone loss. This study was done to determine the relationship between body mass index and bone mineral density in older people. Method : This cross-sectional study has been done on 1000 older people aged 60 and over in Amirkola city, northern part of Iran. Weight, height, waist circumference and hip circumference were measured. Waist to hip ratio (WHR) and body mass index (BMI) were calculated. Bone mineral density (BMD) has been measured by DEXA scan in lumbar spine and femoral neck and the result has been shown by T-Score. Then data analyzed by SPSS18 software. Results : In this study, 55.4% of the participants were men and 44.6% were women. The mean of bone mineral density in both areas was higher in men (p= 0.000). BMI had significant positive relationship with BMD (P=0.000). This relationship was strongest in femoral neck (p=0.000) in both men and women. Central obesity in men had a positive association with bone mineral density in both areas (p=0.000). Overall the strongest relationship of femoral neck BMD was with BMI (r=0.384, p=0.000) and in lumbar spine was with WHR (r=0.209, p=0.000). By controlling age, WHR and waist circumference; regression analyses showed that BMI is effective on femoral neck BMD but in lumbar spine the effect of BMI is covered with those factors. Conclusion : In this study, osteoporosis was reduced by increasing BMI in older people. Keywords : Bone Mineral Density, Body Mass Index, Elderly

**PP25 C-255
PAIN ASSESSMENT IN PEOPLE WITH COGNITIVE
IMPAIRMENT- A CHALLENGING TASK IN HOSPITALS**

Erika Gisela SIRSCH (Witten, German Center for Neurodegenerative Diseases (DZNE), Germany)

Introduction : A sufficient pain therapy for persons with dementia in hospital often fails because their pain is not even recognized. Pain self-assessment should be carried out systematically but because of a restricted ability of verbal expression persons with dementia often do not benefit from this at all or only to a limited extent. It is often unclear which patients are capable of giving self-report and which

require an external assessment. Method : Based on an integrative review was participants' observations and focus group interviews are conducted. Aim was to identify how the decision-making on pain assessment in patients with dementia was performed by nurses. Data were analyzed qualitatively. Results : Semi-structured observation protocols were carried out during early, late and night shifts. Three wards in two general hospitals were included (surgery / internal / special ward for people with dementia). The diagnosis of 'dementia' or specification of dementia has almost not been determined systematically. Even in the ward for people with dementia in half of the cases the diagnosis of dementia was unknown by the staff. The analysis of the hand-over communication revealed that nearly no communication took place about pain. (Facial Expressions (e.g. grimacing/groaning) of pain were often misdiagnosed. Focus group interviews had shown that key phenomena, which are known from the literature, often received no consideration during pain assessment. Conclusion : Key phenomena such as co-morbidity and surrogate reporting have to be taken into account. Advanced knowledge about pain and pain symptoms simplifies the pain assessment in persons with dementia; a pathway for nurses dealing with pain assessment is needed for patients with dementia. Keywords : Dementia, Painassessment, Hospital

PP25 R-001

FATAL ACCIDENTS DESCRIBED BY AGE, GENDER, AND PHYSICAL ENVIRONMENTS IN CALIFORNIA, 2010

Chae Man LEE, Elizabeth DUGAN (*Gerontology, University of Massachusetts Boston, USA*)

Introduction : Older drivers tend to be safe drivers, however when in a crash the risk for serious injury or death is elevated. The purpose of this study is to determine what individuals' characteristics (i.e., gender and age) and physical environments (i.e., road type) are related to fatal car accidents among older people in California (CA), 2010. Method : The Fatality Analysis Reporting System (FARS) dataset, administrated by National Highway Traffic Safety Administration (NHTSA), was used to analyze fatal accidents in CA, 2010. Fatal accidents involving older people age 65 and older was selected. Descriptive statistics were conducted to identify the frequency of fatal accidents. Results : There were 415 fatal accidents among older people and 531 older people involved those fatal accidents in CA, 2010. From those fatal accidents, there were 378 (71.2%) drivers and 153 (28.8%) non-drivers. Older male drivers (70.6%) involved much greater fatal accidents than older female drivers. Older drivers (65 to 74) were involved in a greater number of fatal accidents than other age groups (75 to 84; 85 +) (51.6%, 35.7%, and 12.7% respectively). About 60.6% of fatal accidents happened on major highways or state highways. Also, the majority (96%) of fatal accidents occurred at an intersection. Conclusion : Results showed that older male drivers are more likely than older women to be involved in fatal accidents and most fatal accidents occurred at intersections. Interestingly, fatal accidents appear to happen more on major highways than local streets in CA. Further research is needed. Keywords : Older Driver, Transportation

PP25 R-002

THE INFLUENCE FACTORS OF CONSUMER PURCHASING BEHAVIOR ON TELEHEALTH SYSTEM PRODUCTS

Hailun CHAO¹, Yu-Chih HUANG², Yi-Fan FU³, Ming-Lun HSIEH⁴ (*1. Department of Health Care Administration, Chung Hwa University of Medical Technology, Taiwan; 2. Department of Information Management, Tainan University of Technology, Taiwan; 3. Military Tainan Finance Office, Lieutenant Colonel Chief, Taiwan; 4. Department of Health Care Administration, Chia Nan University of*

Pharmacy & Science, Taiwan)

Introduction : In this study, the Anderson's behavioral model is introduced in three aspects, including predisposing factors, enabling factors, and demand factors to figure out how to effect the decisions of consumers' behaviors with the mediator variable, the purchase intention of intelligence caring watches. Method : Look for the possible development of telehealth systems in the future. The interviews were made in the Yongkang Veterans Hospital, Tainan University of Technology, and Chung Hwa University of Medical Technology by the way of purposive sampling. Results : The result of this study reveals that the influence of the factors such as ages, economic resources, emergency contacts, religion, and whether or not the health aids are used on the purchase intention of products of telehealth systems is partial significant. The influence of the age gap of purposing factors on the requirement levels of products of telehealth systems is more obvious. Besides, the family and social resources of the enabling factors are mostly the subjects themselves and their closest family members or children who are financially independent or under other commercial insurances. Conclusion : To conclude, the construction of telehealth systems should focus on the actual purchase intention of the elder consumers instead of the simple commercial thoughts, to lead up occupying the market without fully considering. This act will cause serious loss and damage the reputation of the whole industry. Keywords : Telehealth Systems, RFID, Health Service Utilizations, Consumer Behavior

AGE-FRIENDLY CITIES IN QUEBEC (CANADA): TRANSFERRING KNOWLEDGE INTO PRACTICE

Mario PARIS¹, Suzanne GARON², Marie BEAULIEU², Anne VEIL³, Andreean LALIBERTE² (*1. Gerontology, University of Sherbrooke, Canada; 2. Social Work, University of Sherbrooke, Canada; 3. Research Centre on Aging, University of Sherbrooke, Canada*)

Introduction : In Quebec, Age-Friendly Cities (AFC-QC) has started with seven initial projects in 2008 and there are now (end of 2012) 579 participating communities. The gap between what is known on AFC and what is done by communities has appeared to be a major issue for implementation success. Therefore, our aim is to explain the processes involved in transferring research knowledge into practice settings. Method : Based on a community building approach, the AFC-QC process is divided in 3 main phases: 1) social diagnostic of community resources and older people needs; 2) action plan based on a logic model; and 3) implementation through intersectorial collaborations. In each city, this process is led by a steering committee composed of older people and stakeholders from civic society, administration and political level. A program theory model has been developed and evaluation is based on a realistic approach (Pawson & Tilley, 1997). Results : An AFC practical guide has been developed through collaboration between academic researchers, policy stakeholders and a non-profit organisation. The purpose of the guide is to provide orientation to communities in their development and implementation of AFC. It presents a method for each phase of AFC-QC, with an emphasis on clear definition and practical description. Along with the guide, a website has been developed to provide additional practical tools and examples of best practice. Conclusion : In conclusion, we will highlight several issues regarding knowledge transfer and practical application of the AFC-QC guide such as fostering dynamic interactions between research and communities. Keywords : Age-Friendly, Knowledge Transfer, Best Practice

AN ENVIRONMENTAL AGEING STUDY FOR OLDER ADULTS LIVING ALONE TO FACILITATE AGEING IN PLACE

Song Iee HONG¹, Hye-Gyung YOON², Ruzica Bozovic STAMENOVIC³, Chang-Keun HAN⁴, Leng Leng THANG⁵, Gerald KOH⁶, Doina Andreea ILIES⁷, Amanda ZHENG¹, Michelle CHEAM⁸, Denise Zhen Yue CHEN⁹, Philip YAP¹⁰ (1. *Social Work, National University of Singapore, Singapore*; 2. *Dept. of Housing and Interior Design, Yonsei University, Korea*; 3. *Faculty of Architecture, University of Belgrade, Serbia*; 4. *Dept. of Social Welfare, Sungkyunkwan University, Korea*; 5. *Dept. of Japanese Studies, National University of Singapore, Singapore*; 6. *Saw Swee Hock School of Public Health, National University of Singapore, Singapore*; 7. *Dept. of Architecture, National University of Singapore, Singapore*; 8. *CPG Consultants Pte Ltd, Singapore*; 9. *Rehabilitation Services, Khoo Teck Puat Hospital, Singapore*; 10. *Dept. of Geriatric Medicine, Khoo Teck Puat Hospital, Singapore*)

Introduction : In light of the increasing number of older adults living alone in Singapore, we attempted a systematic investigation of bio-psycho-social-environmental needs of older adults living at Studio Apartments. Based on the Lawton's ecological model of ageing (1983), the multidisciplinary gerontological research team has examined personal competency and environmental press to understand older adults' environmental adaptation as a response to environmental press. **Method :** The study consisted of two phases: the first phase implemented 14 home visits at Studio Apartments [SA] specially designed for older adults in Singapore. The environmental hazards from the socio-spatial surroundings were assessed with a standardized tool combined with several home assessment instruments. The second stage has attempted to assess older adults' personal competence and perception of their residential surroundings through social surveys from 924 older residents at SAs. **Results :** The empirical findings from home visits identified socio-spatial hazards on insecurity, disorganized living, insufficient space, cluttering, inappropriate healing environment, and limited application of universal design for merely met function. The social survey found critical issues on utilization of assistive devices, home modification, and social services, self-care, social support and neighbourhood. **Conclusion :** Based on our findings, we suggest a glimpse of the development plan for SA and its implementation for older adults. Our findings are expected to increase a better understanding of these older adults' bio-psycho-social-environmental hazards and provide more practical implications and policy recommendations to promote 'aging-in-place' in the living alone context. **Keywords :** living alone, ageing-in-place, environmental hazards

PP25 R-005 CREATING A 'HEALING' ENVIRONMENT IN HEALTH CARE SETTINGS FOR OLDER PEOPLE

Annette HAYWOOD¹, Hazel MARSH², Mike NOLAN³, Stuart G. PARKER⁴ (1. *School of Health and Related Research, University of Sheffield, United Kingdom*; 2. *Research and Development, Barnsley Hospital NHS Foundation Trust, United Kingdom*; 3. *School of Midwifery and Nursing, University of Sheffield, United Kingdom*; 4. *School of Health and Related Research, University of Sheffield and Barnsley Hospital NHSFT, United Kingdom*)

Introduction : There are global concerns about the quality of hospital care received by older people. In understanding these, recent attention has focused on interactions between older people, families and staff, termed the relational environment. However, the built environment also significantly influences the care experience. **Method :** This poster

describes a study exploring aspects of the built environment seen to contribute to, or detract from, a healing environment from the perspectives of older people, family carers and staff working in differing care environments in the UK. In-depth interviews were undertaken with older people and their family carers and focus groups were held with multidisciplinary staff in 3 contrasting settings. **Results:** Data were analyzed using the principles of grounded theory in order to identify key themes and processes at play and analysis was informed by concepts emerging from a consideration of the literature on the nature of the healing environment. **Conclusion :** Here we consider both those aspects of the built environment that were perceived to be important to the care experience by the multiple groups of participants and the dynamic relationship between the built environment and the relational environment and the contribution that each makes to creating a healing environment. Building on the literature and our analysis we argue that a manifestly superior built environment may count for little if staff practices are poor and that conversely a less than ideal built environment can be compensated for when staff practices are sensitive. **Implications for creating a healing environment for frail older people are identified.** **Keywords :** healing environment; health; older people

PP25 R-006 CASE STUDY FOR DEVELOPMENT OF COMMUNITY CENTER IN THE DEPRIVED ARE SWARMED WITH OLDER PEOPLE

Jaeyeon KIM, Yeunsook LEE, Dongjoo LEE (*Housing and Interior Design, Yonsei University, Korea*)

Introduction : One of the huge characteristics of the deprived area is the fact that the elderly people swarmed to the area and are living in poor conditions without any support for them. Therefore it is essential to develop a community center which can support lives of the residents including the older people in that area. **Method :** First of all, literature study revealed that most elderly welfare facilities in Korea are the facilities for the aged people but current trend indicates that interchanges between generations are more desirable from international viewpoint. On the next step survey was made for the residents in the deprived urban area regarding their necessary facilities, the criteria of facilities from the aspects of public administration and the related facilities in the neighborhood. **Results :** The survey results indicated that this area was entering super aged society and their essential space was elderly welfare facility. However, elderly welfare facility was already built in the neighborhood and the elderly welfare facilities were fully established by the unit of city in terms of provincial administration. For this reason elderly welfare facility cannot be made additionally so that inter-generational community center that is shared by the diverse residents in the community was proposed presenting a desirable direction that satisfies all the merits of exclusive elderly welfare facilities and common elderly welfare facilities. **Conclusion :** With the result of this study, those characteristics will be utilized as an important reference for revision and compliment of the original plan through residents' participation. **Keywords :** community center, older people, deprived area

PP25 R-007 SUCCESS OF CASE MANAGEMENT FOR MEDICAL AID INITIATIVE IN KOREA

Jinjoo OH (*Department of Nursing, Dankook University, Korea*)

Introduction : Overuse of the free medical services has been a major factor for the rising cost in the Korea Medical Aid system. Most of Medical Aid beneficiaries are female, elderly, and low educated -the

most disadvantaged in Korean society-. This cross-sectional study was to determine the effects of case management of Korea Medical Aid. Method : Data from structured interview and claim data from medical institutions to the Korea National Health Insurance Corporation were used. Survey data were collected by questionnaire during September 2008. There were 647 responses out of 1069 (response rate 60.5%), but 260 were excluded from the analyses in this paper because they had received case management for less than 18 months. This left 269 individuals who had received case management services for 18 months continuously and 118 who had received no case management services in the same time period. Results : the satisfaction for the case management was very high. Although there was no difference in terms of health behaviour and QOL between the two groups, the overall ability to handle health problems was higher in the case management group ($P < 0.001$). As for healthcare use, the programme produced a significant reduction in hospital visiting days ($P = 0.034$), and while the mean increase in cost from 2007 to 2008 was 29.1% lower for individuals in the programme, the difference between the groups was not significant ($P = 0.851$). Conclusion : Case management in Korea is only in its beginning stage, and efforts for the development strategy should be exerted. Keywords : Case Management, Health Behaviour

PP25 R-008

POVERTY AND DEPRIVATION IN A DIVERSE OLDER POPULATION: TOWARDS NEW MEASUREMENT APPROACHES

Kieran WALSH¹, Thomas SCHARF¹, John CULLINAN², Caroline FINN¹ (1. Irish Centre for Social Gerontology, National University of Ireland Galway, Ireland; 2. Economics, National University of Ireland Galway, Ireland)

Introduction : In many international contexts, there has been a methodological and conceptual shift towards material deprivation indicators as a means of representing and measuring poverty. However, the framing of deprivation indicators has been shown to influence reported deprivation rates and, consequently, the numbers of older people identified as being in poverty. More importantly, questions persist surrounding the appropriateness of standard deprivation indicators to the lives of older people from different backgrounds. Without addressing these issues, our capacity for meaningful measurement of deprivation and poverty in later life is likely to be compromised, with the risk that inappropriate policy responses arise. Method : Drawing on data from a mixed-method study undertaken in Ireland, this paper explores new directions in understanding and measuring poverty in later life. In particular, we are interested in older people's perceptions of 'necessities of life' and how such perceptions influence assessments of deprivation. First, a secondary analysis of national data on living and income conditions ($n = 1831$) is presented, identifying deprivation trends and information gaps on poverty and ageing. Second, data on poverty, deprivation and necessities of life arising from interviews ($n = 21$) and focus group discussions ($n = 62$) with different groups of older people (e.g. nursing home residents; rural residents; urban deprived residents; those living with a disability; ethnic minorities), are described. Results : The findings are discussed with reference to the relative nature of poverty, the changing dynamics of necessities over the life course, and the appropriateness of current and alternative measurement approaches. Conclusion : The paper concludes with suggestions for both research and policy. Keywords : Deprivation; Measurement; Older People

PP25 R-009

HOW IS HOMECARE WORKERS' PREFERENCE IN PLACE FOR THEIR OWN DYING ASSOCIATED WITH THE

NUMBER OF EXPERIENCE AND CONFIDENCE LEVEL IN THEIR HOME END-OF-LIFE CARE?

Miho SUZUKI¹, Noriko YAMAMOTO-MITANI¹, Yuko OKAMOTO², Ayumi IGARASHI¹, Masakazu NISHIGAKI¹, Maiko WATANABE¹ (1. Graduate School of Medicine, The University of Tokyo, Japan; 2. Department of Gerontological Nursing, Tokyo Medical and Dental University, Japan)

Introduction : For homecare workers providing services for dying clients, one's own preference in death/dying may play a significant role in directing their practice. The purpose of this study was to examine the relationship between homecare workers' preference in place for their own dying and the number of experience and confidence level in their home end-of-life (EOL) care. Method : A cross-sectional correlational design was used. Participants were homecare nurses ($n = 308$, 31% of total subjects), home attendants ($n = 263$, 22%), and care managers ($n = 414$, 35%) working for homecare agencies that were randomly selected from the national database. Data were collected by a self-administered questionnaire. One's own preferred place of dying was asked by a multiple-choice question and recoded into three categories (home, palliative care unit, and others); the number of experience and confidence level were taken as ordinal variables with six and four levels, respectively. Bivariate analyses were performed to examine the association among three variables, by each group of professionals. Results : Preference for dying at home was associated with more EOL care experience ($p < .05$) and higher confidence level in EOL care ($p < .05$) among care managers only. There was a significant positive relationship between experience and confidence in all groups ($p < .001$). Conclusion : Intervening care managers so that they prefer home dying for themselves may improve their home EOL care practices. Further studies are needed to examine the causality between the preference and the numbers and confidence level in home EOL care. Keywords : Home care, End of life

PP25 R-010

ASSESSMENT OF FRAILTY AND PRESCRIBING CRITERIA IN OLDER PEOPLE: A SYSTEMATIC REVIEW

Arjun POUDEL¹, Lisa NISSEN¹, Ruth E HUBBARD², Charles MITCHELL³ (1. School of Pharmacy, Pharmacy Australia Center of Excellence, University of Queensland, Australia; 2. School of Medicine, The University of Queensland, Australia; 3. Centre for Safe and Effective Prescribing, University of Queensland, Australia)

Introduction : Rational prescribing in frail older people is complex and difficult. In this group, there is limited evidence on effectiveness of medication, drug pharmacokinetics and pharmacodynamics differ from younger people and multiple co-morbidities with higher risk of adverse drug events are more likely. Various criteria have been developed to measure irrational prescribing (IP) but their applicability to frail older population is uncertain. The primary aim of this systematic review was to identify studies describing the use of frailty measures for evaluating IP in those aged 65 and older. The secondary goal was to address the missing parameters in the prescribing tools to increase their utility for frail individuals. Method : A search was conducted in PubMed and EMBASE (1990- 2011). Original studies written in English that utilized frailty assessment and criteria to evaluate IP in frail individuals were included. Excluded are: studies of specific drugs or groups of drugs and of particular disease conditions. Results : Ten of 573 studies met the inclusion criteria. All papers measured certain parameters of frailty, such as performance based tests, measures of co-morbidity, etc. Six studies used the Beers criteria to explicitly identify inappropriateness while Medication Appropriateness Index (MAI); an implicit criteria was used by two

studies and combination of both in other two studies. Conclusion : Although some parameters of frailty measurement have been used, there appears a need of more user-friendly and detailed criteria for assessing frailty. Prescribing tools should address both medication and patient related factors such as life expectancy and functional status to minimize IP in frail individuals. Keywords : frailty, irrational prescribing, prescribing criteria

PP25 R-011

LOWER VITAL SIGN ASSESSMENT IN OLDER ADULTS WITH FALLS ADMITTED IN PUBLIC URGENT AND EMERGENCY SERVICES IN A BIG CITY IN BRAZIL

Iride Cristofoli CABERLON¹, Angelo Jose G. BOS² (1. School of Nurse, ULBRA, Brazil; 2. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil)

Introduction : Falls in the older adult represent a significant public health problem, facing the process of longevity of the Brazilian population. Vital signs are important parameters to determine the causes, clinical repercussion and prognostic of falls and their complications. Method : Aiming to investigate falls in older adults in Rio Grande do Sul, Brazil we reviewed 6556 charts of older adult patients presenting falls from four units of Public Urgency and Emergency in and around Porto Alegre, Brazil. Results : Among them, 4,664 (71%) were women and 1,892 (29%) were men. More than half of the visits (57%) were performed up to 6 hours after fall. The fall site was NOT reported in 83% of the charts. Only 30% of charts contained information on vital signs. Blood pressure was the most recorded vital sign (28% of charts). The least verified vital signs were pulse and body temperature. The degree of consciousness was mentioned only in 20.4% of the charts. Comorbidity was virtually not reported since history of Hypertension and Diabetes appeared in less than 10% of the revised charts. Conclusion : Thus, we observed structures using inappropriate emergency care routines for the older adult. Little heed seems to have been given to the older adult who felt in order to diagnose the possible causes and consequences of the fall. The biggest challenges for the better care for the older adult in Brazil is specialized health professional training and rational care practice for this fast razing population; particularly in the context of primary and secondary health care. Keywords : Public Health, Elderly Care, Health Care Assessment

PP25 R-012

HOW MARKED THE OLFACTION IMPAIRMENT IN PATIENTS WITH LEWY BODY DEMERNTIA IS ? PRELIMINARY RESULTS

Clovis FOGUEM, Gerard BRAND (CSGA, UMR 6265 CNRS - UMR 1324 INRA - University of Bourgogne - Dijon, France)

Introduction : The presence of olfactory deficits has been well established in both Alzheimer disease and Parkinson disease. As in Parkinson's disease central olfactory areas (i.e., olfactory bulb) appear to be among the first brain regions affected in LBD and furthermore, cognitive impairment present in DLB contributes to olfactory dysfunction. The purpose of this study is to evaluate the deficits in odour detection performance in Elderly with DLB and determine the clinical utility of odour detection tests in the antemortem diagnosis of DLB. Method : Five patients with diffuse LBD aged over 65 years old and five carefully matched with patients with PD and healthy controls were administered an odour detection test using three odours: Phenyl Ethylic Alcohol (PEA) [activating only olfactive (CNI) system] and N- butanol [activating both olfactive (CNI) and trigeminal (CNV) systems], and Pyridine [activating only trigeminal (CNV) system] for

odours thresholds. Results : Patients with diffuse LBD performed significantly worse than patients with PD and controls on the odours identification test. Conclusion : Odour detection deficits may be more prevalent and severe in people with LBD. Keywords : Olfactory dysfunction; Levy body dysfunction

PP25 R-013

OLFACTORY DYSFUNCTION IN ELDERLY WITH PARKINSON'S DISEASE: INTERACTIONS BETWEEN TRIGEMINAL (CV) AND OLFACTIVE (CI) SENSITIVITIES - PRELIMINARY RESULTS

Clovis FOGUEM¹, Anne DOE DE MAINDREVILLE², Jean Clement NWATCHOK³, Mylene KACK³, Gerard BRAND¹ (1. CSGA, UMR 6265 CNRS - UMR 1324 INRA - University of Bourgogne - Dijon, France; 2. Neurology Department, 'Maison Blanche' Hospital -CHU de Reims, France; 3. Department of Acute Geriatric, Auban Moet Hospital, France)

Introduction : Olfactory dysfunction is a prodromal and prevalent nonmotor symptom of Parkinson's disease (PD) and an appealing biomarker for PD because of the high prevalence (>90%) among PD patients and the relative ease of testing, as compared to other putative biomarkers (neuroimaging of the dopamine system...). Olfactory dysfunction of PD involves deficits in odour detection, discrimination and identification. The aim of this study is to evaluate the deficits in odour detection in Elderly with PD and suggests that trigeminal sensitivity dysfunction is less severe that olfactive sensitivity in elderly with PD and could contribute to the PD diagnosis accuracy. Method : Olfactory detection test using two odours: Phenyl Ethylic Alcohol (PEA) [activating only olfactive (CN I) system] and N- butanol (BUT) [activating both olfactive and trigeminal (CN V) systems] for odours threshold were performed on twenty five patients aged over 65 years old with PD and carefully matched healthy controls. Neuropsychologic evaluations were done as well as stage of PD estimations. Results : Patients with PD had impaired olfaction detection ability (mean PEA threshold: 16.7; mean BUT threshold: 13.04) compared with control subjects (mean PEA threshold: 18.28; mean BUT threshold: 14.2), independent of age and stage of PD. The PEA and BUT thresholds were correlated for patients with PD (p<0.02) and for controls (p<0.008). Conclusion : Our patients with PD have a moderate olfactory deficit than controls, but not yet statistically significant. The inclusion of patients continues. The olfactory detection test can be useful for diagnosing PD and for discriminating between PD and control subjects. Keywords : Olfactory dysfunction; Parkinson disease; Elderly

PP25 R-014

ANALYSIS ON THE SATISFACTION LEVEL ON SEOUL DEMENTIA MANAGEMENT PROJECT SERVICE

Mi Ra SUNG¹, Dong Young LEE², Jin Ha KIM³, Jae Young YANG³ (1. General, Ph.D, professor, Seoul Metropolitan Center for Dementia. Kyung-in women's college, Korea; 2. Director, Professor; Department of neuropsychiatry, Seoul Metropolitan Center For Dementia, Seoul National University Hospital, Korea; 3. Research Team, Seoul Metropolitan Center For Dementia, Korea)

Introduction : This study aimed to determine the satisfaction level of users who visited Seoul centers for dementia over the last three years from 2010 to 2012 and figure out the influential factors in order to provide fundamental data for improving the operational efficiency and the quality of service. Method : After conducting (1:1) individual interview with a well-structured tool that Seoul Metropolitan center for dementia had developed by itself, analyse the collected data by using

SPSS win 18.0 based on 11,716 people data in a database. Results : Regarding the level of satisfaction on services rated on a 5 point Likert scale, it is showed that the average level of satisfaction on all service areas in the center for dementia was 4.53 points, and the service with the highest level of satisfaction was the cognitive health program recording 4.60 points, followed by 4.54 points of dementia related counselling services, 4.53 points of caregiver support services including care training and 4.53 points of financial assistance for medical care and inspection expenses. The most satisfactory items were kindness of staffs rated at 4.48 points, expertise of staffs at 4.42 points, hygiene of the center at 4.42 points, appropriateness of time at 4.29 points, convenience of use at 4.10 points and location at 3.87 points. Conclusion : Considering the necessity for developing various education materials at customized services classified by dementia stages and the relatively lower level of satisfaction on location and convenience of use, it is required to improve the system and prepare appropriate measures. Keywords : Satisfaction, Seoul Dementia Management Project Service

PP25 R-015

CAREGIVER BURDEN IN DEMENTIA: ANALYSIS OF LARGE COMMUNITY DATA IN KOREA

Myonghwa PARK¹, Sun Kyung KIM¹, Mira SUNG², Dong Young LEE³ (1. College of Nursing, Chungnam National University, Korea; 2. Department of Nursing, Seoul Dementia Center Kyung-In Women's College, Korea; 3. Department of Neuropsychiatry, Seoul Dementia Center Seoul National University, Korea)

Introduction : This study describes caregiver burden according to patient and caregiver characteristics by using a large community dataset. There is little comprehensive information available in Korea about what are the main contributors to caregiver burden, since caregiver burden has been either only partially investigated or studies on this topic used only small sample. Method : The sample consisted of 10,399 dementia patients and 9,965 primary caregivers in 25 dementia centers in a metropolitan city. The database included sociodemographic and caregiving profile of the caregivers. Results : The findings indicated that cognitive impairment, behavior problems, and activities of daily living and instrumental activities of daily living dependency showed relatively high correlations with caregiver burden ($r = .48, .50, .44$ and $.52$, $p < .001$) than other variables. Caregiver burden scores differ significantly with disease progression and appearance of symptoms of dementia that patients with either low MMSE or higher CDR score imposed a higher caregiver burden. With regard to caregiving factors, co-residence, frequent contact, number of hours spent on caregiving and years of caregiving duration were identified as increasing the burden, while having a secondary caregiver and maintained economic activities reduced caregiver burden. Conclusion : The results suggest that the disease-specific factors are closely related to caregiver burden. It is therefore crucial to develop interventions that take these into account. * This work was supported by research grant of Seoul Dementia Center and Basic Science Research Program through the National Research Foundation of Korea (NRF) funded by the Ministry of Education, Science and Technology (No. 2010-0024922). Keywords : Dementia, Community data

COMPLIANCE WITH TRIAL REGISTRATION IN FIVE HIGH IMPACT GERIATRIC JOURNALS: A SURVEY OF PUBLISHED RCTS FROM 2008 TO 2011

Eva MANN¹, Gabriele MEYER² (1. General Practice and Institute of General Medicine, Family Medicine and Preventive Medicine, Paracelsus Medical University, Salzburg, Austria; 2. School of

Nursing Science, University of Witten/Herdecke, Germany)

Introduction : Since 2005 the International Committee of Medical Journal Editors postulates prospective trial registration as a precondition of publication to guarantee transparency of trial reporting. The aim of our study was to analyse compliance with trial registration of randomised controlled trials (RCTs) in a register approved by the WHO in five high impact geriatric journals. Method : We included all RCTs published from 2008 to 2011 in Age Aging, JAGS, AJPG, JAMDA, and Int Psychogeriatr, which reported on therapeutic or diagnostic interventions. One reviewer data extracted all RCTs and the second blinded reviewer a random selection of 30% using a piloted 13-item standardised data extraction sheet. Disagreement was solved by discussion. Results : A total of 192 RCTs were identified, $n=19$ did not meet the inclusion criteria, thus, $n=173$ were analysed. Agreement of reviewers on data extraction was excellent. A total of 55 RCTs (32%) were registered, but only 5 before patient enrolment. The most often registry used was Clinical Trial (35/55). 10 registered trials reported on all endpoints listed in the registry or the published study protocol, whereas the rest reported on selected outcomes only without referring to other or planned publications. Conclusion : Our study revealed that only one third of RCTs in geriatric journals was registered, the vast majority after patient enrolment. The publications suffered from selective outcome reporting. Our results confirm earlier analyses and should challenge editors and reviewers once more to consider investigators' compliance with trial registration in the process of decision making about paper's acceptance for publication in renowned geriatric journals. Keywords : Biomedical journals, trial registration, geriatric medicine

PP25 R-017

NURSES' KNOWLEDGE ON THE ELDERLY AND THE EDUCATION NEED DEGREE OF NURSING FOR THE ELDERLY

Kim Hyejung KIM¹, Lee Busep LEE¹, Lee Jeongeun LEE¹, Yun Hyunjeong YUN¹, Seo Jonghee SEO¹, Kim Jonghee KIM¹, Park Jeeun PARK¹, Lee Hwan LEE¹, Jung Hyunji JUNG¹, Choi Yong Hee CHOI¹, Lee Mikyoung LEE¹, Park Kyungmin PARK¹, Park Kyungsook PARK² (1. Graduate School of Chung-Ang University, Korea; 2. Red Cross College of Nursing, Chung-Ang University Professor, Korea)

Introduction : This study was to examine the relation of nurses' knowledge and the education need degree of nursing for elderly patient in hospitals. Method : The participants were 216 nurses from 5 an upper-scale grade general hospitals and general hospital in Seoul and the Capital area. Data were collected with self-administrated questionnaires and analysed by t-test, ANOVA, Pearson's correlation coefficient were used with SPSS/Win 18.0 version. Results : The mean of score for knowledge was average correct-answer ratio at 50.54%, and the average of 12.63 ± 2.73 and education need was the average of 124 point. There were significant difference in education needs according to marital status, final academic background, experience of residence with the elderly. The correlation between knowledge on elderly and geriatric nursing education needs was positively value. Conclusion : The finding of study indicate that the continuous practice education is necessary to improve the nurse's knowledge through developing practice education programs which were considered nurses' education need degree for the elderly. Keywords : nurse, the elderly, knowledge, education need degree on nursing

FACTORS RELATED OF EMPLOYMENT WILLINGNESS

AMONG STUDENTS IN GERONTOLOGY AND SERVICE RELATED DEPARTMENTS

Liang-Ju CHEN (*Department of Health Business Administration, Hungkuang University, Taiwan*)

Introduction : In 2006, the Ministry of Education in Taiwan encouraged universities and colleges to establish departments related to long-term care services in order to provide sufficient human resources to the senior-care industry. This study investigated the willingness of students to take care-industry jobs and the factors influencing their willingness. **Method :** The intended study participants are juniors and seniors in gerontology and social service related departments at colleges. 552 copies of questionnaires were distributed to the study participants. We conducted a structured questionnaires including demographic characteristics, family factors, educational factors, attitudes toward the care manpower, and perceptions of work value. We used SPSS 19.0 statistical software to perform factor analysis, descriptive analysis, and statistical analysis. **Results :** Our data showed that the willingness were substantially different from group to group, such as demographic characteristics, family factors, educational factors. Besides, students with higher score of cooperation and trust personality, positive attitudes toward the care manpower, higher support from parents, mother with lower education were higher willingness to take care-industry jobs. Students were concern the learning to match work, welfare system, stability of job, and promotion of being a care helper. **Conclusion :** The results will help colleges offer career planning assistance to students who intend to work in the care services industry. Further, colleges can cooperate with care facilities and introduce the students to the workplace and career opportunities. The study results will help policy makers to understand the factors influencing employment willingness in students and assist graduates in finding appropriate employment. **Keywords :** Employment Willingness, Attitudes towards the Elderly, Employment Recognition

AN APPLICATION OF OCCUPATIONAL THERAPY INTERVENTIONS FOR AN OLDER PATIENT WITH BURN AND STROKE

Mitsuru UCHIDA¹, Seiichi IWAYA¹, Hiromi NAKAMURA-THOMAS² (*1. Occupational Therapy, Eisei hospital, Japan; 2. Occupational Therapy, Saitama Prefectural University, Japan*)

Introduction : There are few studies that reported patients with complications of stroke and burn. This case report addresses an application of occupational therapy interventions for an 80 year old woman with complications of stroke and burn. **Method :** The patient took a hot bath, which temperature was 85 Celsius degrees, because of dementia. She suffered a grade 2 deep dermal burn on her buttocks, genital region and thighs, and thus, underwent a skin grafting operation. She had a cerebral hemorrhage in her left frontal lobe 5 days after the accident. Her burns had crusts and chronic bleeding with strong pain. She was paralyzed on her right side and had dysfunction in her left leg due to nerve Fibula paralysis. Her daily activities were restricted within her bed. She repeatedly complained about pessimistic thoughts because of the pain and immobile status. Occupational therapy practices were provided to alleviate pain, improve independent status in daily activities, reduce bed-ridden time and maintain psychological and cognitive stability. **Results :** She left the hospital 10 months later when our rehabilitation goals were achieved. Effective occupational therapy interventions for this patient were alleviation of common characteristics of burn and stroke, for instance, contracture, movement limitation and fear and to increase independent level in

daily activities. **Conclusion :** This care study proposes an application of occupational therapy interventions, which contributed to improvements in physical functions, physical environments and psycho-social aspects for an older patient with burn and stroke. **Keywords :** complications of stroke and burn, occupational therapy, an older woman

PP25 R-020

THE CONTENT ANALYSIS OF EDUCATIONAL GERONTOLOGY ACADEMIC THESIS IN TAIWAN

Shu-Hsin KUO (*Department of Adult and Continuing Education, National Chung Cheng University, Taiwan*)

Introduction : With the dramatic shift in the population as the baby boom generation ages. In 1993, the older population in Taiwan was seven percent, and the Council for Economic Planning and Development predicts that by 2025 one in five Taiwanese will be over the age of 65. The first elderly educational institution had been founded in 1978 and the practical of elder education works has been increased. In 2006, the Ministry of Education announcement a new White Paper entitled Toward to aged society: Policies on education for older people. These important events motivated the studies and practices of educational gerontology in Taiwan, so more and more master and doctoral program students have been paying attention on educational gerontology academic research. **Method :** A content analysis examine the incorporation of educational gerontology academic thesis on the National Library Taiwan Repository knowledge System since 2006 through 2012 and selected four key words, including “elder”, “senior”, “education” and “learning”. The total number consisted of 176 researches. **Results :** The findings were as follows: (1) Policy and demographic affect the trend of researches; (2) Most of researches were using quantitative methods and to get master's degrees; (3) These researches were seldom to concern the elder education for public; (4) Most of researches were focused on needs and motivations but lack of aging knowledge. **Conclusion :** Based on the result, there were some conclusions: (1) the government should encourage students to join gerontology education academic research; (2) students should use both quantitative and qualitative methods; (3) students should focus on public elderly issue; (4) follow up studies could concern the aging knowledge. **Keywords :** Elderly Education, Aging Education, Academic Research

STUDY ON THE CONSCIOUSNESS STRUCTURE OF THE PARTICIPANTS IN COMMUNITY COMPREHENSIVE HEALTH CARE SYSTEM BASED ON CONFUCIUS THOUGHT

Wenzhen SHI¹, Junichi YOKOYAMA², Masahiro NAGAI³, Masaru YAMAMOTO⁴ (*1. Graduate School of Business Administration and Computer Science, Aichi Institute of Technology, Japan; 2. Department of Civil Engineering and System Management, Nagoya Institute of Technology, Japan; 3. Graduate School of Information Science and Technology, Aichi Prefectural University, Japan; 4. Department of Management, Aichi Institute of Technology, Japan*)

Introduction : The concept of Community Comprehensive Health Care System (CCHCS) has recently been proposed in Japan. To help the people involved in CCHCS have a clear idea on how and what to do, it is necessary to provide a model of consciousness structure for all the participants. On the other hand, Confucius thought has been influencing the everyday life, actions, values of people in the Orient for 2,500 years. **Method :** In this paper, in order to explicit the model of consciousness structure, we applied Confucius Systems Approach

to CCHCS and deliberated the model that consists of four sides; 'Ren', 'Shu', 'Xue', and 'Le'. In addition, we demonstrated the model of consciousness structure by analyzing the citizen's survey carried out in Toyota-city. Results: The survey results showed that the model of consciousness structure based on Confucius thought is effective for CCHCS where people support each other. In particular, philosophy of 'Ren' meaning "personal social responsibility" is the most indispensable one in CCHCS. Conclusion: In the construction and management of the human-network in CCHCS, the collaboration and cooperation of participants is essential. In order to achieve that, there is a need for innovative consciousness of participants. The main conclusion we came to was that we proposed a model of consciousness structure based on Confucius thought for the innovative consciousness. Keywords: Confucius thought, CCHCS, consciousness structure

PP25 R-022
INTERVIEWS AS A RESEARCH METHOD AMONG PATIENTS WITH MEMORY DISORDERS

Jaana KOSKENNIEMI¹, Maija HUPLI², Minna STOLT², Riitta SUHONEN², Helena LEINO-KILPI² (1. Nursing Science, University of Finland, Finland; 2. Nursing Science, University of Turku, Finland)

Introduction: This study aims to improve the quality of research in the field of patients with memory disorders (PwMD) by analyzing experiences of interviewers. The data were collected in connection with a multi-national, EU-funded RightTimePlaceCare project (FP7-Health-F3-2010-242153). Method: Experiences of interviewers (N=15) of PwDs were asked with open ended questions about factors affected the realization of interviews and analysed with thematic content analysis. Results: There are many factors affecting to the realization of interviews with PwMDs, all of these having also a special ethical challenge. Factors related to PwMDs are: a) patients' attitudes to the study and to the interviewer, b) stage of memory disorder, and c) physical strength. Factors related to significant others (SO) of the PwMDs are SOs' a) attitude to the study and to the interviewer, b) relationship with the PwMD, c) intervening to PwMD's responses, d) hurry and e) physical condition. Factors related to organisation are: a) nurses' attitudes towards the research, b) their workload and c) lack of rooms for interview. Factors related to the researcher are: a) researcher's attitude to the study and to the interviewee b) preparation to the interview c) interview skills d) knowledge about memory disorders and e) ability to create a confidential reciprocal relation. Conclusion: Research, especially interviews, among PwMD, requires special skills of researchers. These skills need to be included into the basic education of researchers and in the orientation of new researchers in the project. By skillful interviews, it is possible to give voice to these vulnerable patients. Keywords: interview, memory disorder, patient

PP25 R-023
FACTORS AFFECTING CAREGIVERS' WILLINGNESS TO PARTICIPATE IN CAREGIVER BETTERMENT PROGRAMS

Chen-Fen CHEN (Department of Social Welfare, Chinese Culture University, Taiwan)

Introduction: Caregiver betterment programs, including education and training as well as support groups, are an important tool for improving the ability of caregivers; however, many caregivers do not participate. This study is based upon the conceptual framework of the Andersen model to examine the factors of caregivers' willingness to join betterment programs. Method: Data was collected from a survey of 922 caregivers of long-term care clients in Taiwan. The chi-square test and logistic regression model were applied for analysis. Results:

Female and younger caregivers were more likely to participate. Those with higher education levels were also more likely to attend. As previous studies have stated, the care load and care knowledge of caregivers are important factors of participation. Our research results also indicate that duration of caregiving is strongly correlated with participation: "new" caregivers prefer to attend education and training programs, while "older" caregivers prefer support groups. After controlling for predisposing and need factors, the enabling factor is the most important predictor of caregiver participation. In other words, it is necessary that all caregivers participating in betterment programs receive respite care alongside. Conclusion: To increase caregiver participation, respite care needs to be included in betterment programs. Keywords: Caregiver, Train program, respite care

PP25 R-024
FEELINGS REGARDING CARE AMONG PARTICIPANTS IN SUPPORT GROUPS FOR FAMILIES CARING FOR FAMILY MEMBERS WITH DEMENTIA - FOCUSING ON DISCUSSIONS DURING GROUP MEETINGS

Keiko MATSUMOTO¹, Jiang BO² (1. Nursing, Kawasaki University of Medical Welfare, Japan; 2. Social Work, Kawasaki University of Medical Welfare, Japan)

Introduction: We conducted a qualitative exploratory factor analysis focusing on participants at such meetings for the purpose of identifying their feelings regarding dementia and caring for family members with dementia. Method: The subjects were provided with an explanation of the purpose of the study and a written explanation of ethical considerations prior to holding the meetings. After acquiring the consent of all participants, the contents of the meetings were recorded over a predetermined time period to retain a written record of the proceedings. A qualitative exploratory factor analysis was then conducted based on the resulting data. Results: There were 31 participants including family members currently caring for family members with dementia. As a result of analysis, six categories were extracted consisting of 'learning about providing care is different from actual care', 'desire get along with spouse', 'conflict over placing in an institution', 'concerned about husband's well-being', 'feeling happiness is the same for everyone' and 'no choice but to make the best of the situation'. Conclusion: The feelings mentioned by participants related to actual difficulties encountered when providing care and conflict when having to place a spouse in an institution. In contrast, participants that had similar experiences expressed sympathy, and indicated that they had reached the feeling of having no choice but to make the best of the situation. In addition, participants currently caring for demented family members indicated feelings of their desire to get along with their spouse by taking advantage of what they had learned about dementia. Keywords: Participants, Support Groups, Family Members with Dementia

PP25 R-025
A STUDY ON THE PARTICIPATION OF A FOREIGN CARER IN FAMILY CARE FOR DISABLED ELDERERS

Yi-Wen CHIU (Social Welfare and Service Management Department, Tatung Institute of Commerce and Technology, Taiwan)

Introduction: This study is aimed at the understanding of foreign carers participating in family care for disabled elders. The purpose was to explore the practical caring work of foreign carers, the assistance and life change to family primary caregivers, and the condition and quality of family care. Method: This qualitative research study applied the face-to-face in-depth interview method to data collection, from a total of 17 primary family caregivers and 17 foreign carers. Results:

(1) The practical caring work of foreign carers included: (a) life attendance and medical care, (b) housework and cleaning, (c) recreation participation and company, and (d) miscellaneous work. (2) The assistance and life change to family primary caregivers was: (a) the reduced work and physical load, (b) the increased spare time, (c) life with regularity, and (d) the changed psychological burden. (3) The condition and quality of family care was maintained on the average. Conclusion : The caring ability and skill of foreign carers met standards; however, daily water and nutrients intake quantity for disabled elders was below the requirements. Certain nursing techniques needed further training and more practice. The researcher also made respective recommendations for family primary caregiver, medical and long-term care workers, social work practice, and social welfare policies. Keywords : Foreign carer, Disabled elders, Family care

PP25 R-026

USE THE BUNDLE CARE TO DECREASE THE AGED PATIENTS' URINARY TRACT INFECTION RATE: A STUDY IN NEUROSURGICAL DEPARTMENT OF CGMH, CHIAYI BRANCH

Yu Wen YEN¹, Yi-Cheng CHEN², Ya-May WANG³ (1. Neurosurgical Ward, Chang Gung Memorial Hospital, Taiwan; 2. Neurological Ward, Chang-Gung Memorial Hospital, Taiwan; 3. Ward, Chang-Gung Memorial Hospital, Taiwan)

Introduction : The aim was to explore predictors for urinary tract infection (UTI) in hospitalized aged patients and to set up strategies to reduce the incidence of UTI. Method : From April to July 2012, we evaluated data prospectively to compared the UTI rate before and after bundle care. 30 aged patients (age-65 years, sex was equal) with foley catheterization were included and the staffs followed the criteria of care bundle (perineum care daily, sterile technique, maintain a sterile closed drainage system, position bag below the waist, assess daily necessity of indwelling foley). The end point was to observe UTI rate after performance of care bundle. Results : From January 2011 to April 2012, 27 patients had UTI in neurosurgical department of our institution. 20 patients with UTI were aged patients (<65 years) and 80% were male and 20% were female. All patients with UTI had experience of catheterization over 10 days. 16 patients (60%) were ever transferred to intensive care unit. The infection control team and doctors joined clinical nursing staffs for this issue and then care bundle for another 30 aged patients with catheterization was induced since April 2012. The observation interval was 6 months. The infection rate was down to zero after the induction of bundle care 4 months later. Conclusion : The staffs can detect UTI and to think adequate timing of foley removal through care bundle. After induction of care bundle 6 months, in the latest 2 months, no more UTI happened in aged patients with foley catheterization in our neurosurgical ward. Keywords : Urinary Tract Infection, Aged, Bundle Care.

PP25 R-027

THE ROLE OF THE ENVIRONMENT IN ELDER ABUSE

Yuliya MYSYUK, Rudi WESTENDORP, Jolanda LINDENBERG (Leyden Academy on Vitality and Ageing, Leyden Academy on Vitality and Ageing, Netherlands)

Introduction : The increasing frequency of older people who have experienced abuse draws more attention to different behaviours expected from older people and the position of the elderly in society at large. Environmental factors can play an important role in elder abuse and the ways professionals and older people themselves perceive occurrences of abuse influence helping and help-seeking behaviour.

Understanding these perceptions is therefore vital to explain the circumstances around it. Method : Eight focus groups and more than 30 interviews with professionals that were conducted as part of a qualitative study on perspectives on elder abuse. The topics that were discussed were aimed at defining elder abuse and the necessary, subsequent actions that should be performed to prevent or intervene in the problem. We included different professional groups, experts, policy makers and the elderly themselves. We analyzed how they viewed elder abuse, and what factors influenced their attitudes, perceptions and expectations. Results : Our findings confirmed that environmental factors such as social arrangements and factors on the systemic level of health care appeared important in framing and understanding of elder abuse. These factors showed how elder abuse was framed as a social or a health problem. Conclusion : We argue that understanding the ways in which different people interpret abuse influence their views on prevention and intervention in elder abuse and are therefore vital for research, policy and practice in elder abuse. Keywords : elder abuse, perspectives, framing, environmental factors

PP25 R-028

EFFECTIVENESS OF MULTI-PURPOSE ACTIVITIES ON HAND FUNCTION OF THE ELDERLY

Hulya YUCEL (Physiotherapy and Rehabilitation, Bezmialem Vakif University, Faculty of Health Sciences, Turkey)

Introduction : Suitable hand activities chosen according to the demands and needs of the elderly aim to increase the skills of daily living. This study was planned with the aim of showing the effects of handicrafts on hand functions of the elderly who reside in the nursing home. Method : 34 subjects were included in the study. They were voluntary in activities and did not have any physically or mentally problems that might hinder the performance of the activities. Jebsen hand function test were used. Handicrafts such as ornament design, cloth-glass painting, knitting, lace, making book braces-vase base plates, arts, pastry, woodwork activities were performed two days a week for twelve weeks, with each section lasted forty five minutes. Paired student t test was used for hand function and Wilcoxon rank test for writing velocity for the comparison of before and after the activities. Results : The mean age was 74,5±7,59 years (60-85). Twenty (61,8%) of them were women. All participants were right handed and were not doing any leisure time activities. Jebsen hand function test score was 40,91±8,19 and writing time was 151,3±57,66 minutes before the activities. The scores were 40,33±10,46 and 145,15±55,56 after the activities (p>0.05). Conclusion : This study indicates the need of considering other factors besides activities in the elderly who reside in an institute. In this study, it was very difficult to maintain continuity of practice because of illnesses, hospital visits etc. These factors were potentially important for not achieving statistical significance. Keywords : elderly, activity, hand dexterity

PP25 R-029

GERONTOLOGY IN HUNGARY

Imre SEMSEI (Gerontology Science Coordination Center, Faculty of Health, University of Debrecen, Hungary)

Introduction : Hungary, among the other European nations, is a graying (aging) society characterized by all the symptoms and consequences of such societies. There are more and more aged people and even the ratio of elderly is constantly increasing. Because of the deformation of the structure of the society the ratio of active to inactive people has been decreasing. Besides, there are more and more ill old people not to mention that the ratio of women increasing between the elderly. Therefore we acquire more and more serious

problems and tensions in our societies regarding share of work, roles in the society moreover concerning pensions, health and social care as well. Conclusion : In order to solve these problems the European societies develop strategies and programs e.g. the White Book or in Hungary the National Strategy of Aging Matters. The European Year 2012 with the motto: "Active Ageing - Solidarity between Generations" would like to help in reaching an "age-friendly Europe" by the year of 2020. This presentation aims going to show all the programs, events, ect., which was carried out in Hungary during the EY 2012 in order to solve the problems originated from the aging of the Hungarian societies. The problems are pressing; nevertheless, we can hardly see "the light at the end of the tunnel". Keywords : aging societies, active aging, solidarity between generations

PP25 R-030

SOCIOECONOMIC STATUS, SOCIAL NETWORK, AND COGNITIVE FUNCTION AMONG MIDDLE-AGED AND OLDER ADULTS IN KOREA: A LIFE COURSE APPROACH

Moonhee SUNG, Hongsoo KIM (*Health Services Research & Gerontology Lab, Graduate School of Public Health, Seoul National University, Korea*)

Introduction : The purpose of this study was to investigate the associations between socioeconomic status, social networks, and cognitive function among adults in Korea using a life course approach. Method : Data from the Korean Longitudinal Study of Aging (KLoSA) were analyzed. The study sample includes 4,121 middle-aged (50-64 years) and 3,224 older adults (over 65). The dependent variable was cognitive function measured by MMSE-K. The key independent variables were family and social networks as well as educational attainment, primary lifetime occupation, and income, representing previously acquired socioeconomic inequalities. Multivariate regressions were performed, controlling for demographic- and health-related covariates. Results : Educational attainment and primary lifetime occupation were significantly associated with the current cognitive function of both middle-aged and older adults. People with blue-collar work as their primary lifetime job and people with no high school degree had lower cognitive function than their counterparts (compared to those with white-collar work and those with high school degrees). Income was positively associated with cognitive function among middle-aged adults only. With regard to social networks, the associations of current job status and social participation with cognitive function were dissimilar between middle aged and older adults. Family networks, measured by marital status and number of family members, were not associated with cognitive function. Conclusion : Socioeconomic inequalities acquired earlier in life and social networks in later life may affect cognitive functions in later life, suggesting the need of a lifecourse approach to research and policy to promote cognitive function for the entire population. Keywords : socioeconomic status, cognition, a life course approach

PP25 R-031

AN INTERVENTION APPLYING A PALLIATIVE CARE APPROACH IN RESIDENTIAL CARE - EFFECTS ON CARE PROVISION AND CARING CLIMATE

Ingela BECK¹, Ulf JAKOBSSON², Anna - Karin EDBERG¹ (*1. Department of Health and Society, Kristianstad University and the Swedish Institute for Health Sciences, Lund University, Sweden; 2. Center for Primary Health Care Research, Lund University, Sweden*)

Introduction : The palliative care approach aims to integrate psychosocial and existential aspects as well as relationship aspects in

the care and can be used in all care contexts. In residential care, nurse assistants (NAs) are the ones who are closest to the residents, but have limited prerequisites to work in accordance with the palliative care approach. We aimed to investigate the effects of an intervention applying a palliative care approach in residential care, on NAs' experience of care provision and caring climate. Method : In this quasi-experimental study we evaluated the intervention involving NAs (n=75) and their leaders (n=9), focusing on emotional, existential and relationship aspects within the palliative care approach, in comparison with controls (n=110). Data consisted of a questionnaire that the NAs answered at three time points. Results : In the intervention group, effects were seen concerning the NAs reports of the care provision in that they focused more on to ease for residents to narrate about their lives, and on communication with residents in what gives them meaning in life. In the intervention group also effects were seen, in that the NAs rated the residents' medical and nursing care needs being less met at the facility directly after the intervention. No effects were seen concerning the caring climate or the possibilities to provide a more person-centered care. Conclusion : The intervention seemingly facilitated for the NAs to focus on relationship aspects with the residents. However, in spite of the leaders' involvement, the intervention seemed not to be sufficient to change the organizational prerequisites for the staff to provide a more person-centered care. Keywords : palliative care approach, residential care facilities, Intervention

PP25 R-032

RESEARCH ON THE INFLUENCING FACTORS BETWEEN THE LEADERSHIP OF MANAGEMENT AND EMPLOYEES' LOYALTY IN THE LONG-TERM CARE FACILITY

Lin-Chiung CHEN¹, Meilan CHEN¹, Ying-Tsun HUNG² (*1. Institute of Health Industry Management, Ching Kuo Institute of Management and Health, Taiwan; 2. Department of Senior Citizen Service in Management, Ching Kuo Institute of Management and Health, Taiwan*)

Introduction : The population of the elderly is up to 7% in Taiwan since 1993. The Taiwanese society had been formally ageing. Currently, for senior citizen's population is continuously going up, and elders' lives have been paid more attention to. Besides, the change of society pattern will be the major factors for causing the growth of long term care service marketing. The loyalty of the employees significantly influences the service quality. The leader's management ability is especially important in the long-term care facility. Method : In the study, the quantitative studies analysis implement is interview. By recording seven employees' viewpoint toward their leader's management methods in the long-term care facility, the researcher analyzes the interview data. Results : The research's goal is to find out the must-be-solved problem between the leader's ability of management and employee's loyalty by the interview. Since the long-term care service will impact on the elderly's satisfactory of living in the facility, by research on employees feeling, the relationship between the leader and employees will be improved. Therefore, it also can promote service quality after integrating the improvement. Conclusion: The study analyses indicated that the promotion of the working efficiency of the employees is significantly related to the loyalty toward the leader of the facility. With NPO management skill improvement, the improved leadership will lead the long-term care home to a high satisfactory and home-like facility. Keywords : Leadership, Employees' loyalty, Long-term care facility

PP25 R-033

LONG-TERM CARE MINDSET: COMPONENTS OF

'KAIGONOKOKORO'

Minjeong CHO¹, Toshiyo TANIGUCHI¹, Kazuaki TANIKAWA², Kaori HARANO¹, Miki MATSUDA¹ (1. Department of Health and Welfare Science, Okayama Prefectural University, Japan; 2. Department of Social Welfare, Kansai University of Social Welfare, Japan)

Introduction : The concept of 'KAIGO' (long-term care) originated in Japan. However, little empirical research has been conducted on the value of this concept. Therefore, this study aimed to clarify the components that comprise 'KAIGONOKOKORO' (Long-term care mindset). **Method :** A self-administered questionnaire survey was conducted on 385 professional caregivers at 51 welfare facilities for the elderly in Japan. The questionnaire consisted of 66 items about 'KAIGONOKOKORO' based on previous research and items on basic individual attributes. Responses were given on a 4-point Likert scale. The response rate was 31.6%. **Results :** Collected questionnaire data were subjected to an exploratory factor analysis using the least squares method with promax rotation. After excluding factors with loadings less than 0.45, three factors (with eigenvalues >1) were extracted from the remaining 58 items. The factors were as follows: (1) Values of symbiosis with human beings, (2) Consciousness of oneself as a professional, and (3) Viewpoint of hope for the client. The reliability of these three factors ranged from moderate to excellent ($\alpha=0.81$ to $\alpha=0.88$). **Conclusion :** These findings represent the first conceptualization of 'KAIGONOKOKORO'. These findings suggest that 'KAIGONOKOKORO' consists of three components. Future investigations should comprehensively examine the various variables related to 'KAIGONOKOKORO'. **Keywords :** KAIGONOKOKORO, professional caregiver, factor analysis

PP25 R-034

ACTIVITIES PLANNING AND LIFE SATISFACTION FOR NURSING HOME RESIDENTS IN TAIWAN

Suchu WANG¹, Tsuann KUO² (1. Community Services Department, Sheng Te Hospital, Taiwan; 2. Medical Sociology and Social Work, Chung Shan Medical University, Taiwan)

Introduction : Taiwan has become one of the fastest aging countries in the world. In many nursing homes, the lack of planned activities often contributes to lower life satisfaction, more falls and injuries, higher depression, and a higher mortality rate. The purpose of this paper was to examine whether a series of activities were effective in increasing residents' wills to engage in social activities and life satisfaction. **Method :** 52 participants in a 74-bed nursing home in Taichung, Taiwan were the subjects of this research. The nursing home underwent an intensive planning process for activities. The participants were invited to join activities for at least one hour per day and the activities consisted of fitness exercises, horticultural activities, reminiscence groups, and music activities. The participants were asked to fill out one questionnaire before and after a two-month period of planned activities. The activities consisted of fitness exercises, horticultural activities, reminiscence groups, and music activities. **Results :** Results showed that participants were on average 77 years old with 31% having cardiovascular and cerebrovascular diseases as well as 57% having a medium-level dependency. After two months, 96% of the participants had a significant improvement on participating in activities, nearly 50% were chatting and about 25% starting walking. The overall satisfaction about the activities increased from 15% to 71%. **Conclusion :** Despite many older adults are dependent, careful planning of activities can significantly increase social interactions and quality of life in nursing homes. The process of effective planning on activities will be discussed in details. **Keywords :**

Nursing Home, Activities Planning, Taiwan

PP25 R-035

FACTORS ASSOCIATED WITH HOME CARE SERVICE UTILIZATION PATTERNS AMONG THE SEVERELY DISABLED ELDERLY: A COMPARISON BETWEEN LONG-TERM COMMUNITY DWELLERS AND NURSING HOME RESIDENTS

Takashi ISHIZUKI¹, Junko WAKE² (1. Social Welfare, Tohoku Fukushi University, Japan; 2. Social Welfare, Tokyo Metropolitan University, Japan)

Introduction : The purpose of this study is to examine the factors associated with service utilization patterns among the severely disabled elderly under the Public Long-term Care System, in Aichi, Japan. **Method :** Elderly people with severe disabilities living in their homes for three years or longer (n = 325) were compared with those who recently entered nursing homes (n = 102). The Andersen model was used, with multiple regression analysis. The pattern of "in-home service use" was used as a dependent variable. **Results :** For the long-term home living group, "number of medical treatments" (OR = 1.68, P < .05), and "degree of self-reliance in daily life" (OR = 1.43, P < .01) showed positive impacts. For the nursing home group, "caregiver's age" (OR = 6.13, P < .05), "number of chronic diseases" (OR = 1.76, P < .05), "number of medical treatments" (OR = 4.80, P < .01), and "caregiver's physical burden" (OR = 3.58, P < .05) showed positive impacts. In addition, "caregiver's mental burden" (OR = 0.25, P < .05) showed a negative impact. **Conclusion :** The medical care needs predict in-home service use in both groups. However, both groups showed different factors associated with in-home service use. The long-term home living group, with less self-reliance in daily life, would use in-home service. For the nursing home group, their uses of in-home services are based on the caregiver's higher age, physical burden and a lower mental burden. Based on these results, measures to support the severely disabled elderly in their community were discussed. **Keywords :** Service utilization pattern, Home care, Elderly

PP25 R-036

YEARLY INCOME, TURNOVER INTENTION AND WORK ENGAGEMENT AMONG JAPANESE EMPLOYEES AT LONG-TERM HEALTH CARE FACILITIES

Toshiyo TANIGUCHI¹, Etsuko FUKUOKA², Jiro TAKAKI³, Kumi HIROKAWA⁴, Min-Jeong CHO¹ (1. Department of Welfare System and Health Science, Okayama Prefectural University, Japan; 2. Nursing School, Niimi College, Japan; 3. Department of Public Health and Occupational Medicine, Mie University Graduate School of Medicine, Japan; 4. Department of Nursing, Baika Women's University, Japan)

Introduction : The work of professional caregivers in long-term care health facilities in Japan are many reasons why employees leave their jobs. The purpose of the present cross-sectional study was to investigate whether a difference in work engagement or turnover intentions exists between professional caregivers for the elderly and other employees. **Method :** A total of 881 employees at long-term care health facilities were surveyed using a self-administered questionnaire including the turnover intention scale, the Utrecht Work Engagement Scale (UEWS-9), and the Job Content Questionnaire as a measure of worksite social support. Data were analyzed using an ANCOVA. The study design and protocol were approved by the Research Ethics Committee of Okayama Prefectural University. **Results :** Turnover intention scores were significantly higher among caregivers than other employees (p<.05). Turnover intentions scores were significantly

higher among respondents with a low to moderate yearly income than those with a high yearly income ($p < .01$). Work-engagement scores were significantly higher among the other employees than caregivers ($p < .05$). Conclusion : Among respondents with a low income, working as a caregiver was associated with a higher turnover intention. Overall, 73.5% of respondents with a low income were caregivers. However, while a low income was found to increase turnover intention, the long-term care insurance system in Japan is unlikely to increase pay. Work engagement is related to the type of job, but is unrelated to yearly income. Negative feelings and low sense of fulfillment among caregivers may negatively affect the well-being of the professionals and quality of care they provide. Keywords : turnover intentions, professional caregivers for elder, yearly income

PP25 R-037

THE CHINESE FORMATION OF THE "CREDIT SYSTEM": DISPARITIES BETWEEN URBAN AND FARM VILLAGE

Zhao QIAN¹, Zhang TIANMIN², Hiroshi SUMII¹, Yang YANG², Mingjun WANG¹, Mai KONDO¹ (1. Health and Welfare Sciences, Prefectural University of Hiroshima, Japan; 2. Comprehensive Research Department, Hiroshima University, Japan)

Introduction : Since the reform, China has been achieving a remarkable economic development, but on the other hand a gap society among the people, especially between the urban area and the farm village, which became a serious problem to determine the Chinese society stability. The difference is not the only the income inequality, but the absurd difference between the urban area and farm village related to the Social Security Project. Therefore, in this study for a comprehensive establish of welfare, we analyzed the both sides of the Chinese society. Method : From the beginning of the 90's, Endowment Insurance, Medical Insurance, Unemployment Insurance, Minimum Life Insurance of the urban Security System have been fully incremented. On the other hand, in rural areas, there is a limit guarantee by the Chinese government. All the farmer's family have to take the burden of the old age person's pension. For this reason, the Social Security System for them are not yet equally established. Results : Referred as the 'Credit System', a 'unit' of organizations that carry out social activities of the government-managed and universities as well as the state-owned enterprises and local government. Employees who were hired not only pay a wage but the 'credit' such as Social Security and Medical Educational are provide as free of charge. Conclusion : In this way, the household registration system combine with the Credit System have been playing a role by immobilizing the enlargement disparity of the society. Keywords : Social security, Credit system, Aging

PP25 R-038

LONG-TERM CARE IN EUROPE THE CONTEXT OF POPULATION AGEING

Zofia SZWEDA-LEWANDOWSKA (Unit of Demography and Social Gerontology, University of Lodz, Poland)

Introduction : The amount of government spending on care for elderly persons as well as the forms and modes of support vary greatly across EU countries, depending on the ageing rate, economic situation, socio-economic development, history, ideology, values shared by the majority of the society, and the prevalent family model. With these factors in mind, Esping-Andersen classified particular countries into three welfare state regimes: liberal, conservative and social democratic. Method : The aim of the poster is to present the typology of long-term care systems in different welfare regimes in Europe. To achieve this aim the desk research and cluster analysis have been

conducted. Results : There are 5 major factors influencing the need to enlist the help of unrelated third parties in everyday life: age/stage of life cycle, cultural resources, family status, health status, economic status. Taking into consideration these factors European countries can be divided into 5 regimes. Conclusion : Each of these regimes implies a different approach to social services and a different degree of the state's involvement in providing assistance to senior citizens. At the same time, in the majority of countries systems of care for the elderly seem to have been developed without a clear agenda that would ensure coherence and efficiency. To make matters worse, in the absence of a systemic regulatory framework it is difficult to draw a line between services provided by the health care and social care systems. The lack of explicit eligibility criteria for the various forms of assistance results in inefficient and provisional solutions. Keywords : long-term care, welfare regimes

HYPODERMOCLYSIS AS AN ALTERNATIVE OF ARTIFICIAL REHYDRATION IN GERIATRICS WARDS

Stephen Shing-Fai WONG, Eva LO, Vivian YEUNG, Sim Heung YEUNG, Yu Pak CHAN, Shu Kin LI (Medicine, Hospital Authority, Hong Kong)

Introduction : There are problems in using intravenous (IV) fluid as rehydration therapy for older adults: they may have difficult venous access, potential serious complication like bloodstream infection, and physical discomfort. Hypodermoclysis (HDC, or subcutaneous hydration) could be an alternative method in providing artificial rehydration in eligible patients. Method : Patients in geriatrics convalescent wards who had mild to moderate dehydration or were at risk of developing dehydration were eligible for HDC. Patients who had severe hypovolemia, severe electrolytes imbalance, coagulopathy, generalized edema or severe emaciation were excluded. Results : Fifteen patients were recruited from October 2009 to March 2010. Their average age was 82.6. Sixty percent of patients had received HDC for more than 48 hours, and 53% did not develop adverse events. There was no significant difference in the mean of serum sodium, potassium and creatinine before and after administration of HDC. General condition was improved in 60% of patients while oral feeding was improved in 53%. Sixty percent of patients did not develop pain at the site of HDC, and 80% of patients accepted HDC as an alternative of artificial rehydration to IV fluid. Conclusion : Hypodermoclysis could be a safe and effective alternative of artificial rehydration in eligible older adults, and it could be used in settings like palliative care or long-term care facility. Keywords : hypodermoclysis, artificial rehydration

IMPROVING FOOD SECURITY AND HEALTHY AGING IN LOW-INCOME OLDER ADULTS: EXPERIENCES FROM GEORGIA, USA

Jung Sun LEE (Foods and Nutrition, University of Georgia, USA)

Introduction : Food insecurity, lack of food, is a hidden but persistent problem in older adults associated with deleterious effects on nutrition, health, and well-being. Older adults in Georgia are at increased risk of food insecurity due to heightened burden of poverty, chronic diseases, and disability; however, little is known about the status of food insecurity among them. Method : Since 2007, a series of research projects have been conducted to better understand the nature, extent, and prevention of food insecurity in older Georgians based on strong collaborations between university researchers and aging services providers in Georgia using innovative approaches. Results : The

Georgia Advanced Performance Outcomes Measures Project, longitudinal self-administered mail surveys conducted in low-income older Georgians, provided first-ever statewide food insecurity data that are comparable to the federal data, and unique needs and utilization patterns for nutrition assistance and healthcare services of food insecure older Georgians. The resulting findings were used to develop 1) procedures and infrastructure of the state and local client information system to monitor food insecurity and performance of aging and nutrition services in Georgia, and 2) programs and policies to enhance coordination, access, and participation of nutrition assistance programs for eligible older Georgians. Conclusion : Our experiences showed that understanding of the extent and nature of food insecurity as well as continued collaborative efforts among researchers, policy makers, and frontline administrators provide an essential basis to enhance the capacity of nutrition research, nutrition assistance, aging services, public health, and communities to promote food security and healthy aging in vulnerable ever-increasing older population. Keywords : Food insecurity, healthy aging, low-income older adults

MUSIC THERAPY FOR PATIENTS WITH DEMENTIA: SYSTEMATIC REVIEW AND META-ANALYSIS

Tomomi UEDA¹, Yoshimi SUZUKAMO¹, Mai SATO¹, Shin-Ichi IZUMI² (1. Department of Physical Medicine and Rehabilitation for the Physically Disabled, Graduate School of Medicine University of Tohoku, Japan; 2. Department of Physical Medicine and Rehabilitation for the Physically Disabled, Graduate School of Medicine, Graduate School of Biomedical Engineering University of Tohoku, Japan)

Introduction : Behavioral and psychological symptoms of dementia (BPSD) are common problems for patients and caregivers. Although music therapy is considered a non-pharmacological intervention for the management of BPSD, its effectiveness unclear. This study aimed to investigate the effects of music therapy on BPSD, cognitive function, and activities of daily living in patients with dementia. Method : A literature search was conducted in the following database: MEDLINE, CINAHL, PsychINFO, and Igaku Chuo Zasshi. We elected the studies, including randomized controlled trials, controlled clinical trials, cohort studies, and controlled trials, and conducted a meta-analysis. We performed random effects meta-analysis using standardized mean differences (SMD). In addition, we investigated the differences in effect size based on the type of interventions, the type of disease, and the intervention period. Results : Of 842 total studies found, 19 studies met inclusion criteria. The results showed that music therapy had moderate effects on anxiety [SMD, -0.64; 95% confidence interval (CI), -1.05 to -0.24; p=0.002] and small effects on behavioral problems (SMD, -0.44; 95% CI, -0.79 to -0.10; p=0.01). In studies of duration >3 months, music therapy had large effects on anxiety (SMD, -0.93; 95% CI, -1.72 to -0.13; p=0.02). Conclusion : The present systematic review and meta-analysis suggests that music therapy is effective for the management of BPSD. However, our results retained the potential of unknown bias because of the low methodological quality. Future trials should be designed with methodology, including study design and evaluation methods. Keywords : dementia, music therapy, meta-analysis

PP25 R-043

HELPING PEOPLE STAY HEALTHY IN COMMUNITY: A PROGRAM OF INTEGRATED CARE MODEL FOR COPD PATIENTS IN HONG KONG

Wai Yi TSANG, T.C. SIM, K.Y. SHA (*Medicine & Geriatrics, United*

Christian Hospital, Hong Kong)

Introduction : Chronic Obstructive Pulmonary Disease (COPD) was ranked second of hospitalization (14.6%) and inpatient bed-days (20.5%) among common respiratory diseases in Hong Kong. Program of Integrated Care Mode (ICM) for COPD was established since October 2011. It focuses on transitional care from hospital to community, symptoms early detection and prompt intervention to reduce the need for intensive hospital care. Review aims to evaluate the effectiveness of Integrated Care Mode on reducing these patients' avoidable healthcare utilization. Method : The ICM for COPD was established in October 2011 who were hospitalized & high risk score could be recruited. The model was run by multidisciplinary profession staff with Case Management training. The key components as follows: 1.High Risk Elderly Score established by Hospital Authority for elderly patient have systematic screening. 2.Case Management include Case Manager home visit, multidisciplinary assessment, risk factor reduction and exacerbation COPD care in community. 3. Empowerment with the knowledge and skills for self-care management of COPD patient. 4.Hotline for patient improves the health access and advices, triage for early follow up as appropriate. Results : There were 184 COPD patients recruited. Mean age was 80.9. They have case manager home visit 6 times after discharge in 2 months. It was significant showing that the number of A&E attendance was reduced by 33% (p<0.001), the average numbers of unplanned admission by 35.68% (p<0.001) and the length of stay by 44.66%. Conclusion : The COPD patients were significantly reduced A&E attendance & unplanned admission rate after they were under the care of Integrated Care Model. Keywords : Integrated Care Mode . COPD.

HOW CINDERELLA CARES PATIENTS WITH COPD IN COMMUNITY

Wai Yi TSANG, T.C. SIM, K.Y. SHA (*Medicine & Geriatrics, United Christian Hospital, Hong Kong*)

Introduction : Chronic obstructive pulmonary disease (COPD) was ranked second cause of hospitalization (14.6%) in 2010. In order to provide structured and proactive care for the COPD patients, a program of Integrated Care Mode (ICM) has been launch since 2011 in a Medicine & Geriatric unit of a district hospital. Method : The Integrated Care Model with approach of "CINDERELLA" has been launch with key components as follows: 'C'linical high risk elderly score established by Hospital Authority for elderly patient have systematic screening and early risk assessment. 'I'ndividualized care plan for COPD patients to recognize in early symptoms of exacerbation and non-pharmaceutical and pharmaceutical management. 'D'E'cision support with protocol & evidence-based for case manager to care COPD patients. 'R'e'cruit for home support service that engages with Non Government Organization provides timely home care support to COPD patient. 'E'nhanced sub-acute services with coordination of multi-disciplinary service across the acute, sub-acute and community setting. Hot'L'ine for COPD patient improves health access and advices, triage for early follow up as appropriate. 'A'lliance with other disciplines Multi-disciplinary approach could integrate and optimize care for COPD patients. Results: There were 184 COPD patients recruited. Mean age was 80.9. They have case manager home visit 6 times after discharge in 2 months. It was significant showing that the number of A&E attendance was reduced by 33% (p<0.001), the average numbers of unplanned admission by 35.68% (p<0.001) and the length of stay by 44.66%. Conclusion : The Integrated Care Mode with CINDERELLA approach to COPD patients were significantly reduced A&E attendance &

readmission rate. Keywords : Integrated Care Mode. CINDERELLA. COPD.

PP25 R-045

STUDY ON THE INFLUENCE OF THE APPROVAL MOTIVATION ON THE WORKAHOLISM OF SOCIAL WORKERS IN SENIOR WELFARE CENTERS IN KOREA: FOCUSING ON THE MEDIATED EFFECTS OF FAMILY COHESION AND ADAPTABILITY

Eunju LEE¹, Jungdon KWON² (1. Department of Public Policy, Director, Graduate School of Mokwon University, Seoul Dobong Senior Welfare Center, Korea; 2. School of Social Work, Mokwon University, Korea)

Introduction : The possibility that employees will become workaholics has been increased by the Korean culture that has cherished the value of labor and the higher average number of working hours per week than OECD countries. As the welfare services for the elderly have been expanded due to the aging of population, the social workers have experienced work-related stress and exposed to the risk that they will become workaholics. However, workaholism has hardly been discussed or studied by Korean Society until now. Therefore, the studies are needed to be conducted to determine the causes of workaholism of social workers and to prevent workaholism among them. Method : A quantitative research was conducted using a structured questionnaire for 451 social workers in senior welfare centers in Seoul. The data were analyzed with structural equation modeling. Results : The results of the study showed that two-fifth of the subjects has experienced workaholism, even though the overall level of workaholism of social workers was medium; 29.5% were mild workaholics; and 11.5% were severe workaholics. In results of testing research model, it was found that the family cohesion & adaptability have partially mediated between approval motivation and workaholism. Conclusion : It is meaningful that this is the first study that deals with the workaholism of Korean social workers by proving that the workaholism has reached the risky level. To prevent or ease the workaholism of social workers, personnel evaluation system of social welfare organization and family system as well as the stress management of each person need to be comprehensively improved simultaneously. Keywords : workaholism, social worker, approval motivation, family cohesion & adaptability

PP25 R-046

SHORTAGE OF HEALTH WORKFORCE IN GREATER TOKYO

Hiroo IDE, Katsuhiko TAKABAYASHI (Division of Healthcare Policy in Aging Society, Chiba University, Japan)

Introduction : It is expected that highly aged society will appear in urban areas throughout the world around the middle of this century. In Greater Tokyo, population aged over 60 years will reach thirteen million in 2035, which will be about 12% of the whole population in Japan. It is not hard to imagine that there will be a huge demand for healthcare services by these elderly people. Method : We examined geographical dynamics of physicians using micro data of physicians' career acquired from a government survey. Also, we conducted a survey among nurses to find out when they change or quit their job or retired nurses to reenter a job. Based on these analyses, we estimated the number of healthcare workers in the future. Results : Although the numbers of healthcare workers will increase in Greater Tokyo, those of per population there (except Tokyo metropolitan city) will be the lowest among all areas in Japan. Unless this circumstance changes, there will be a shortage of health workforce in the most populated

area. Conclusion : It seems difficult to provide sufficient healthcare services to these elderly people in Greater Tokyo. Policy makers or stakeholders there need to consider luring healthcare workers to the area in addition to preventing them from quitting a profession and training new workers. Using the results of the analyses, we will propose what policies Greater Tokyo should devise to avert or mitigate the problem. Keywords : workforce, urban area, healthcare services

PP25 R-047

COMMUNITY PARTICIPATION AND LIFE SATISFACTION IN OLD AGE:WHO GETS MOST FROM PARTICIPATING AT SENIOR CENTERS?

Pau-Ching LU (Graduate Institute of Social Work, Chengchi University, Taiwan)

Introduction : The effects of community participation on the subjective wellbeing of older adults have been well documented in the existent literature. However, the effects may vary with participation type. The aim of this study was to investigate the associations of senior center participation and life satisfaction. Two indicators of participation were analyzed: actual participation behavior and subjective perception of participation benefits. Method : This study collected data from an interview survey of senior center participants. We interviewed 400 older adults from 20 senior centers. Hierarchical regression analysis was applied to capture the effect of perceived benefits on life satisfaction. Results : 1.The benefit respondents perceived gaining from participation can be categorized into the following two dimensions: "socializing" and "self growth". 2.The regression analysis of perceive participation benefits showed that: women reported more benefits from participating at senior center than men did. In addition, respondents with higher education, more competencies in social skills, and greater involvement (measured by participation frequency and more types of activity) perceived greater benefits than their counterparts did. 3.Greater perceived participation benefits were positively related to life satisfaction; whereas greater involvement in participation, per se, is not significantly related to life satisfaction. Conclusion : These results support the importance of subjective assessment of their community participation experiences of older adults. The staff in senior centers should take such "participants' view" issue into consideration, when they design and Keywords : community participation, senior center, life satisfaction

PP25 R-048

EVALUATION SYSTEM ON LIVABLE COMMUNITY FOR ELDER PERSON IN URBAN CHINA

Shan LI (Public Management and Social Science College, Dalian Maritime University, China)

Introduction : he percentage of persons age 65 and over is about 14% in 2010 mainland China, while the ratio in urban area is much higher. Aging in place and the quality of life make community more and more important for elder person to evaluate their happiness and living conditions. What are the requirements for livable and sustainable community toward aging in China? In this research, the residential evaluation model was established mainly by means of subjective and objective methods. Method : We conducted a questionnaires survey on subjective satisfaction toward current community, with about 3200 valid elder person sampling in the urban area of Dalian city (a coastal city in east China with over 6.7 million residents), and also collected the objective index from 121 communities. Results : Community participation, convenience of mobility, spatial amenity, supply for elderly service, comfort of nature environment, fitness of building, supply of medical care service, and all the seven factors showed

statistic significance on evaluating livable community. Conclusion : The results highlight the main factors that urban elder residents most cared for their current dwelling place. To most of the urban elder people, social conditions on community participation, convenience of mobility, space amenity, supply of elder service, comfort environment, fitness of building, and supply of medical care service are the main factors affecting elders' subjective happiness toward current community. Keywords : livable community, age-friendly, urban China, evaluation system

PP25 R-049

POSSIBILITY OF TELECONSULTATION FOR DIABETES: ANALYSIS OF CONVENTIONAL DIABETES CONSULTATIONS

Farhad FATEHI¹, Len GRAY², Anthony RUSSELL³ (1. Centre for Online Health, The University of Queensland, Australia; 2. Centre for Research in Geriatric Medicine, The University of Queensland, Australia; 3. Diabetes and Endocrinology Department, Princess Alexandra Hospital, Australia)

Introduction : In response to growing demand for care with decreasing availability of personnel, telehealth strategies have potential for improving accessibility to health care services and lowering costs. This study evaluated the possibility of providing specialty consultation remotely for people with diabetes by analysing the conventional diabetes consultations to assess their suitability for substitution with a telehealth encounter. The suitability of this approach for older patients was assessed. Method : A questionnaire was distributed to all five endocrinologists at Princess Alexandra Hospital in Brisbane to explore the procedures, findings, and recommendations made for patients with diabetes. The opinion of endocrinologists also was surveyed on possibility of each patient to be consulted remotely. Results : A total of 50 consultation questionnaires were collected and analysed. Physical examination was not performed in 30% of consultations. The patient's current management plan was confirmed in 74% of the cases. The most frequent recommendations made for the patients were General Advice (88%) and Ordering lab tests (84%). In 86% of consultations, the clinicians believe that it would have been possible to provide that consultation remotely via telehealth. 19 (38%) patients were ≥ 60 y/o (range = 60~87). No significant difference was observed between recommendations made for this group and those of less than 60 years old. Conclusion : A significant proportion of in-person specialist consultations for people with diabetes can be substituted with remote consultation using telehealth solutions. No relationship was observed between the age of the patients and opinion of the endocrinologists on possibility of remote consultation using videoconferencing. Keywords: Telemedicine, Diabetes

PP25 R-050

DIGITAL TECHNOLOGY USE WITHIN AND BETWEEN UNITED STATES GOVERNMENT AGENCIES IN AGING

Marie A; BERNARD¹, Ralph PAXTON², Robert HORNYAK³ (1. National Institute on Aging, National Institutes of Health, USA; 2. Office of Research Development, Department of Veterans Affairs, USA; 3. Administration on Aging, Administration for Community Living, USA)

Introduction : United States federal agencies provide significant funding for research and services for the aged. Highlighted is digital and other technologies (DGT) at three of the leading federal agencies in aging - the National Institute on Aging (NIA), National Institutes of Health; Department of Veterans Affairs (VA); and Administration on Aging (AoA), Administration for Community Living. Method : Senior

staff surveyed ongoing research and service projects utilizing DGT. Identified projects were reviewed for their impact on older Americans Results : NIA DGT projects: Health and Retirement Study digital survey; Center for Research and Education on Aging and Technology Enhancement; Oregon Roybal Center Living Laboratory; real time cardiac monitoring for high risk patients ineligible for ICD; monitors - shoe insert for falls and gait mechanics, daily physical activity, self-selected gait speed with transmission capability to clinicians; national exercise campaign; clinical trials locator. VA - replaces and restores function to central nervous system injury and illness through electrical neural prostheses, robotics, and implantable devices; the creation of a single research database from hundreds of separate databases and millions of individual health records; Million Veteran campaign merging electronic medical records with genetic data; Home Telehealth allows distance care; My HealtheVet allows prescription refills, tracking labs, appointments. AoA - web-based system to assist older adults and persons with disabilities locate community organizations (eldercare locator), has an on-line presence and pre-assessments for services. Conclusion : Federal agencies support DGT projects that range from research (NIA and VA) to service (VA and AoA). Many of the programs may be replicable in other countries. Keywords : research, government, digital technology

PP25 R-051

ACCURACY OF MARGINAL FIT OF CROWN PREPPED BY PREP-GUIDE

Ui-Jung CHIN¹, Hee- Yong AHN², Oh-Dal KOWN³, Sang-Wan SHIN¹ (1. ICDR, Korea University, Korea; 2. Ahn Hee Yong Dental Clinic, Korea; 3. Dentapia Dental Clinic, Korea)

Introduction : CAD/CAM technology has been widely used in the fabrication of conventional dental prostheses including zirconia and metal crowns, and partial dentures. In this study, we evaluate KKOD's Digital Prep Guide which enables 3-D simulation of crown preparation prior to actual preparation. The desired amount of tooth reduction and gingival margin shape and form are decided and prepared virtually. A prep guide is fabricated using rapid prototyping and the tooth is prepped using this guide. Method : 1.Using KKOD's Digital Prep Guide the dimensional criteria for the tooth to be prepped is determined and set. The axial wall taper is set to 2 degrees. A model of the prepped tooth and the prep-guide is produced using rapid prototyping. 2.The guide is placed on the tooth to be prepped. Actual preparation of the tooth is carried out by a specially designed handpiece and the tooth is reduced 1mm in width 3.The crown margin is evaluated using a measuring microscope (100 x magnification) in buccal, lingual, mesial. Results : Results show that the largest marginal gap detected was 80 microns. A maximum fit average of 55 microns and a minimum fit average of 8 microns. The marginal gap was measured to be less than 30 microns mostly, which is less than the marginal discrepancy of zirconia crowns reported in current literature. Conclusion : Using Prep-Guide not only allows for the controlling of the amount of tooth reduction but also allows for various marginal formations, thereby it may offer minimally invasive prosthodontic therapy and prostheses to geriatric patients with systemic conditions. Keywords : CAD/CAM, Prep-Guide, Marginal accuracy, crown

PP25 R-052

A PROPOSAL FOR CALF CIRCUMFERENCE CUTOFF POINTS IN THE MINI NUTRITIONAL ASSESSMENT SHORT-FORM FOR ELDERLY JAPANESE

Kazue KUNO¹, Masako TSUJI², Seiji SAKEMOTO³ (1. Department of Health and Nutrition, Nishikyushu University, Japan; 2. Department of Health and Nutrition, University of Human Arts and Science,

Japan; 3. Department of Nutritional Science, Minami Kyusyu University, Japan)

Introduction : The Mini Nutritional Assessment Short-Form (MNA-SF) is used to screen for malnourished elderly individuals in the community. Measuring calf circumference (CC) can be easier than measuring height in elderly individuals, who may be stooped with aging. This study examined potential cutoff points for CC corresponding to cutoff points for body mass index (BMI) in the MNA-SF. **Method :** MNA-SF scores were measured for 602 individuals (age range, 19-96 years) living in southern Japan. **Results :** Estimated BMI for individuals ≥ 65 years (n=279) was calculated using the regression line between BMI and CC for individuals < 55 years old (n=190): $\log \text{BMI} = -0.5975 + 1.2553 * \log \text{CC}$. Significant positive correlations were found. Using this equation, CC cutoff points corresponding to BMI cutoff points in the MNA-SF were defined. CC 31.3 cm, 33.8 cm, and 36.3 cm corresponded to BMI 19, 21, and 23, respectively. Revised cutoff points for the Japanese population are: 0, < 31 cm; 1, > 31 to 34 cm; 2, > 34 to 36 cm; and 3, > 36 cm. In our 279 elderly participants, 13.2% were at risk of malnutrition, 1.0% were malnourished and 82.2% showed adequate nutrition. Mean MNA-SF score was 12.9 ± 1.4 . The same result was achieved using BMI cutoff points. **Conclusion :** We propose CC cutoff points for the MNA-SF to suit Japanese elderly populations. **Keywords :** elderly, mini nutritional assessment, Japanese

PP25 R-053

THE BURDEN OF HIP AND KNEE ARTHROPLASTY IN ELDERLY POPULATION IN KOREA

Seung-Mi YOO¹, Jeong-Hoon AHN², Eun-Jin JANG², Yun-Jung KIM², Yea-Ji JUNG² (1. School of Public Health, Seoul National University, Korea; 2. Office of Health Services Research, National Evidence-based Healthcare Collaborating Agency, Korea)

Introduction : Due to rapidly aging population, the rate of hip and knee arthroplasty is increasing in Korea. This study aims to estimate the surgical loads and economic burden of hip arthroplasty in Korean elderly population. **Method :** We analyzed the insurance claim data of National Health Insurance Corporation in Korea for 5 year period of 2007-2011. Elderly was defined as age group over 60 years old. Arthroplasty is divided further as primary total, primary elective, revision total and revision elective following by ICM description. Data analysis includes number of patients and surgery, length of hospital stay, total hospital visits and total cost. We also analyzed each criterion by gender. **Results :** Number of patients per 100,000 population increased from 192.1 to 223.0 (hip), 485.7 to 621.9 (knee) over 5-year period. The major part of surgery was the primary elective replacement in hip arthroplasty and primary total in knee. Length of hospital stay ranged between 342,466 and 414,519 days (hip), 771,097 and 1,078,913 days (knee). Total hospital visits ranged between 499,203 and 636,841 days (hip), 771,097 and 1,103,554 days (knee). Total cost related with hip arthroplasty increased from 901 billion won to 1239 billion won and 2420 billion won to 3698 billion won in knee arthroplasty. Women represented the majority of patients undergoing both types of arthroplasty. **Conclusion :** The change in socioeconomic burden of arthroplasty in Korea is remarkable. As the demand of arthroplasty is expected to increase continuously, it is necessary for policymakers to set the new healthcare plan reflecting this trend. **Keywords :** Arthroplasty, burden, cost

PP25 R-054

GRANDPARENTS CARING FOR ORPHAN GRANDCHILDREN IN THE ERA OF HIV AND AIDS IN

BOTSWANA

Sheila SHAIBU (School of Nursing, University of Botswana, Botswana)

Introduction : Background: Botswana has an HIV prevalence of 17.6 and an estimated 137805 orphans in a population of approximately two million people. Many of these orphans are cared for by their grandmothers, who struggle with caring for orphans suffering from a disease they know very little about. **Method :** Purpose: The purpose of the study was to identify the experiences of the grandparents who were taking care of orphan grandchildren in Botswana. **Design:** A descriptive qualitative design was used to interview 12 grandmothers aged 60 and above in a semi urban village in Botswana. **Content analysis** was used to analyze the data. **Results :** Findings: The ages of the grandmothers interviewed ranged from 60 to 80 years, whilst the number of orphans under their care ranged from one to nine. Most were illiterate. The themes that emerged included: it's doable if they are not sick, adherence issues, HIV related stigma, silence on communication of sexuality issues, and the paradox of adolescent pregnancies. Cultural beliefs prevented them from talking about sexuality and in some cases, accepting HIV as the cause of death. **Conclusion :** Conclusion: Grandmothers were challenged by HIV related illnesses of orphans, and their lack of knowledge of the diseases and cultural beliefs must be addressed to improve adherence and communication about HIV. HIV programs need to address older persons as some are sole caregivers of HIV positive orphans. **Keywords :** HIV and orphans, Grandparents, Botswana

PP25 R-055

RESEARCH PARTNERSHIPS: OWNERSHIP AND FUNDRAISING: THE IMPLICATIONS FOR NGOS IN DISSEMINATING INFORMATION

Susan HOWELL, Karen BOROCHOWITZ (Management, Dementia SA, South Africa)

Introduction : NGOs have a wealth of knowledge and can showcase this knowledge with the objective of sharing and learning through human rights based research combined with scientific input and methodologies. As Dementia SA is an organisation advocating for person centered care for those with dementia, their families and their communities, partnership for the scientific and medical research components is essential. This presentation will attempt to show good practise is research partnerships and the policy and procedures that ensue through what could otherwise be conceived as an unequal partnership. **Method :** The initial pilot project undertaken by Dementia SA and various tertiary institutions in South Africa will be a 'real case' methodology looking at the development of policy through collaborative research. The research will be based on a study and development of materials assessing dementia in a rural Xhosa community in the Eastern Cape, South Africa. **Results :** The results will be: 1. A sample of good practice policy highlighting the anticipated areas of difficulty and the methods used to overcome such challenges; 2. Real case samples showing why good practice policy is necessary; 3. How procedures support policy; 4. How a small NGO can partner large internationally recognised tertiary institutions to achieve scientific research and be equal partners. **Conclusion :** The conclusion will deal with the partnership aspect of research and collaboration and the real case outcomes as to the possibility of equal partnership among very different stakeholders. **Keywords :** Partnership Research Collaboration

PP25 S-001

CHILEAN NONAGENARIANS

Chung Bin YU¹, Luis VILLARROEL², Pedro Paulo MARIN³ (1. *Acute Geriatric Hospitalization Unit, Instituto Nacional de Geriatria, Chile*; 2. *Public Health, Department of Family Medicine, Faculty of Medicine, Pontificia Universidad Catolica de Chile, Chile*; 3. *Geriatrics and Gerontology, Internal Medicine Department, Faculty of Medicine, Pontificia Universidad Catolica de Chile., Chile*)

Introduction : The objective of this study is to compare the biomedical and social results obtained in a representative national sample of nonagenarians, data obtained from the Chilean National Health Survey, from the years 2003 and 2010. **Method :** Study the varied parameters of an expanded sample of nonagenarians. N(2003) = 26, N(2010) = 25. **Results :** The average weight (kgs), height (cm), IMC, and abdominal circumference (cm) was of 60, 147.2, 27.1, and 93.4 for the year 2003, and 53.4, 147.8, 24.1, and 85.1, for the year 2010. 2.8% of the nonagenarians in the year 2003 exercised once a week, while the rest did no exercise. In the year 2010, all were sedentary (p = 0.403). The total cholesterol (mg/dl), fasting blood sugar level (mg/dl), systolic and diastolic arterial pressure (mmHg) were 180.6 (7.3)*, 101.3 (7.4), 162.2 (11.9), and 90.2 (11.4), for the year 2003, and 200.4 (21.6), 93.7 (4.2), 152.9 (7.1), and 71.4 (2.2), for the year 2010. The results for the MMSE and Pfeffer were 7.7 (1.5), 23.1 (3.1), for the year 2003, and 13.2 (1.0), and 25.2 (3.7), for the year 2010. (Max score MMSE = 19, Pfeffer = 33) 8.5% of the nonagenarians received 8-12 years of education, in the ENS 2003. The rest had received less than 7 years of education. 21.7% studied in school for 8-12 years, and 3.8% had received 13+ years of schooling in the year 2010 (p = 0.303). **Conclusion :** There were no statistically significant differences in the studied parameters. **Keywords :** nonagenarians

PP25 S-002

RELATIONSHIP BETWEEN FRAILTY AND CO-MORBIDITY AND SOCIO-DEMOGRAPHIC CHARACTERISTICS IN COMMUNITY-DWELLING OLDER MEXICANS

Elva Dolores ARIAS MERINO¹, Neyda Ma. MENDOZA-RUVALCABA², Jazmin CUEVA-CONTRERAS¹, Martha Judith ARIAS-MERINO², Rosa Martha MEDA-LARA³, Genaro Gabriel ORTIZ⁴ (1. *Public Health, CUCS, University of Guadalajara, Mexico*; 2. *Health Science, CUTONALA, University of Guadalajara, Mexico*; 3. *Basic Psychology, CUCS, University of Guadalajara, Mexico*; 4. *Centro de Investigacion Biomedica de Occidente, Instituto Mexicano del Seguro Social, Mexico*)

Introduction : Frailty is a geriatric syndrome that places older adults at risk for adverse health outcomes such as functional impairments, falls, multiple medical co-morbidities, hospitalization, institutionalization, and death. Frailty has been mainly studied from physical and physiological aspects, although social and psychological domains of frailty have been recognized as critically important and also require research. The prevalence and correlates of frailty in Mexico are still unknown. **Objective:** To describe the correlation between frailty status and co-morbidity and socio-demographic characteristics in community-dwelling older Mexicans. **Method :** Design: Data were used from the Health, Wellbeing and Aging Study (SABE) in Jalisco and Colima, Mexico (FONCICYT/COECYTJAL). **Setting:** Jalisco and Colima States, Mexico. **Participants:** 2082 non-institutionalized Mexicans 749 (36%) men and 1332 (64%) women, of 60 years and older. Frailty was defined as: Unintentional weight loss (>3 kg in the last year), Weakness (Grip string), Slow walking (Mobility), Self-reported-exhaustion (Depressive symptoms), and Low physical activity level (Basic Activities of Daily Living). Information about socio-demographic factors, cognitive function, depressive symptoms, health conditions, functional and nutritional status, was obtained

through a comprehensive gerontological assessment. **Results :** A total of 309 (14.8%) persons with frailty were found. the factors of being female, low education, malnutrition, cognitive impairment, depression, IADL, hypertension, diabetes mellitus, heart, lung and cerebral vascular disease and arthritis are related. Falls, urinary and fecal incontinence are related as well. **Conclusion :** Our results of frailty are higher than in other studies, and we found a clear relationship between frailty and co-morbidity and socio-demographic characteristics. Longitudinal studies are needed to establish predictors. **Keywords :** frailty, cognitive function, SABE Project,

PP25 S-003

VULNERABILITY AND AGING: A PROSPECT IN THE CITY OF SAO PAULO - SABE STUDY

Flavia De Oliveira Motta MAIA¹, Yeda Aparecida De Oliveira DUARTE², Maria Lucia LEBRAO³ (1. *Hospital Universitario, Universidade de Sao Paulo, Brazil*; 2. *Escola de Enfermagem, Universidade de Sao Paulo, Brazil*; 3. *Faculdade de Saude Publica, Universidade de Sao Paulo, Brazil*)

Introduction : This research is part of a project called Health, Well-being and Aging ("SABE Study"). The aims was to identify and describe the living and health conditions of elderly physical and socially vulnerable in the city of Sao Paulo-Brasil and verify association with the outcomes: functional decline, frailty and death, six years later. **Method :** The sample was composed by the 2.143 elders interviewed in 2000 of which 1.115 were reevaluated in 2006. Rao-Scott tests weighted to account for sample design effects were used to evaluate associations of the variable origin with the independent variables considering the level of confidence of 95%. Multiple Regression with stepwise forward technique was used to analyse the outcomes. **Results :** The physical vulnerability was presented in 38,1% of the elders in 2000 and 52,7% in 2006. Most of the elders lived in a context of very low and low social vulnerability (71,9%). The physically vulnerable elders presented higher distribution in the medium, high and very high social vulnerability category (43,1% in 2000 and 60,1% in 2006). The physically vulnerable elderly has risk to become frail (2,61; p=0,000), to suffer functional decline for basic (2,48; p=0,001) and for instrumental (1,46; p=0,051) activities of daily living and has risk of social vulnerability(1,50; p=0,005). The socially vulnerable elderly has risk of death (1,58; p=0,024) and risk to become physically vulnerable (1,54; p=0,005). **Conclusion :** These findings suggest the importance of understanding the vulnerability in elderly, allowing the identification and prioritization of resources for the monitoring of those with higher possibility of adverse outcomes. **Keywords :** Aged. Vulnerability. Aging. Death.

PP25 S-004

PROTECTIVE FACTORS FOR SUCCESSFUL AGING OUTCOMES IN OLDER ADULTHOOD

Jae Won CHANG, Jun Sang LEE (Department of Social Welfare, Daegu University, Korea)

Introduction : The purpose of the present study was to identify psychosocial attributes that promote successful aging outcomes in later life and to examine the mechanism through which this process occurs. In general, it is hypothesized that there are two sources of resilience, personal factors and family/community support factors. This model was based on the notion that individuals who outcome the risks and challenges associated with aging and an increased number of life experiences may have important resources or protective attributes that promote more optimal outcomes in later life. **Method :** The study subjects were 650 elderly persons over 65 living in Daegu city, and the

survey was done in community centers and elderly social welfare centers. The actual measures used in this study were perceived stress, self-esteem, optimism, hardiness, social support, family environment, community support, life satisfaction, depression, and self-reported health. The data were analyzed by PASW 18.0 and AMOS 20.0, and P values less than 0.05 were significant. Results : Perception of stress did not have a direct effect on successful aging outcomes, whereas perceived stress exerted a negative effect on family/community support and family support. In contrast, family/community support and family support promoted successful aging outcomes in older adulthood. To further examine the intervening effect of family/community support and family support on successful aging outcomes, bootstrapping analysis was performed. Conclusion : The data showed that higher perception of stress significantly decreased the family/community support and family support and this had important implications for intervention strategies for successful aging outcomes in elderly individuals. Keywords : successful aging outcomes, resilience, protective factors

PP25 S-005

INTERGENERATIONAL TRANSMISSION OF SMOKING BEHAVIOR ACROSS THE LIFE COURSE

Joohong MIN¹, Tara GRUENEWALD², Merril SILVERSTEIN³
(1. Davis School of Gerontology, University of Southern California, Korea; 2. Davis School of Gerontology, University of Southern California, USA; 3. Maxwell School, Syracuse University, USA)

Introduction : Background: Previous research indicates consistent intergenerational transmission of smoking behavior. However, less research has been devoted to understanding the mechanisms through which smoking behavior is transmitted or not from parent to child and the persistence of this influence into adulthood. The current study capitalizes on the availability of dyadic reports of parent and child smoking behavior and attitudes to explore the role of behavioral modeling and socialization processes in the intergenerational transmission of smoking behavior. Parents' smoking behavior during the target child's childhood and parents' attitudes toward smoking were examined as predictors of the target child's smoking behavior in adulthood. Method : Data: Data came from the year 2000 wave of the Longitudinal Study of Generations (LSOG). Multinomial logistic regression in 531 parent-child dyads (parents mean age=72; child's mean age = 47) was used to examine parent's smoking behavior and parent's permissive attitude towards smoking as predictors of the odds of adult children's smoking behavior. Results : Results: The odds of adult children's regular smoking (OR = 2.837, $p < .05$) were greater in children of parents who were regular smokers. Parent's permissive attitude towards smoking also predicted greater odds (OR = 2.218, $p < .01$) of adult children's regular smoking. However, when we examined concurrently, only parent's attitude was a significant predictor of child's smoking in adulthood. Conclusion : Findings suggest that both parents' modeling and attitudes toward smoking may shape children's smoking behavior in adulthood, with a potentially greater influence of parental attitudes. Keywords : smoking , Transmission

PP25 S-006

EVIDENCE BASED PRACTICE: AROMATHERAPY AS PAIN RELIEF FOR OLDER ADULTS

Mimi TSE (School of Nursing, The Hong Kong Polytechnic University, Hong Kong)

Introduction : Objective: To review the effectiveness of aromatherapy in reducing pain. Method : Data Sources: The PubMed (2001 to January 2012), Ovid (2001 to January 2012) and CINAHL (2001 to

January 2012) databases were accessed to search for aromatherapy, nursing, complementary medicine and pain literature. Selection Criteria: studies related to the effect of odor and the perception of pain, and the use of aromatherapy as pain relief. Results : Main Results: There were 5 studies that fit the inclusion criteria. Laboratory-Based Studies: Participants in good health without any history of respiratory diseases were recruited. Pain was induced by hot water (46-48°C), contact thermode (36-47°C) or cold water and ice (3-4°C) until participants expressed pain. Pleasant and unpleasant odors were diffused by an odor generator. Pleasantness of the odor and pain were rated on a visual analog scale by each participant. Lower pain scores were reported after smelling pleasant odor in heat-induced pain. And higher pain scores were reported in both heat- and cold-induced after smelling unpleasant odor. Community-Based Studies: Community-dwelling older persons received massage with essential oils on their painful knee joints (30- to 35-minute for 6 times over a 3-week). Upon completion of the program, pain was reduced, with better physical functioning. Fibromyalgia patients received massage with essential oils to their painful body areas also reported lower pain scores and improved physical function after 12 weeks of intervention. Conclusion: Conclusions: Given the high prevalence of pain among older adults, the use of aromatherapy should be an appealing pain relief strategy. Keywords : aromatherapy, pain, elderly

PP25 S-007

COMMUNITY-DWELLING ASSESSMENT: THE OARS AS AN INTEGRATED MODEL FOR PLANNING CARE

Rogério Manuel Clemente RODRIGUES, Luis Manuel Jesus LOUREIRO, Silvia Manuela Dias Tavares SILVA, Zaida Aguiar Sa AZEREDO, Sandrina Sofia Silva CRESPO, Cristiana Filipa Ribeiro SILVA (UICISA-E, Escola Superior de Enfermagem de Coimbra, Portugal)

Introduction : The progressive aging of the population in contemporary societies leads to the necessary adjustment to the responses of health care services. The project "The Oldest Old: Coimbra aging study" (PTDC/CS-SOC/114895/2009) assess an elderly population enrolled in Health Centers of Coimbra-Portugal. The QAFMI/OARS (Questionario de Avaliacao Funcional Multidimensional para Idosos/Older Americans Resources and Services) is recognized as the first elderly multidimensional assessment instrument. Method : Objectives: Assess the use and need of health services and social support by the elderly, related with their functional status in five areas (physical health, mental health, activities of daily living, social and economic resources). Methodology: Quantitative methodology using the QAFMI/OARS. The sample consisted of individuals aged 75, or more, randomly selected, to achieve 10% of the population. Results : Preliminary results showed that there is a decline in population over the different age groups, most evident in males. In the areas of the physical health, activities of daily living and economic resources there are significant differences between age groups. In the area of mental health, there is a significant difference classification between gender, with a tendentiously lower scores in women. In the area of social resources, there is a significant difference classification between gender and age group. Conclusion : All the work developed with OARS lead us to consider this instrument very useful to define the functional status of the elders in specific evaluation areas and needs, becoming right to the planning of older care services. Keywords : assessment, community-dwelling, functional status

PP25 S-008

THE MUSICAL EFFECTS ON THE SPIRITUAL HEALTH IN

THE SOUTHERN TAIWAN ELDERLY

Su-Feng TSENG¹, Yong-Huei YANG², Pai-Lin LEE³, Chung-Chieh LEE⁴, Jia-Yi ZOU⁴, Cherng-En JIANG⁴, Yi-Hsin HO⁴ (1. Department of Senior Citizen Service Management, Chia-Nan University, Taiwan; 2. Department of Hospital and Health Care Administration, Chia-Nan University, Taiwan; 3. Department of Educational Psychology and Counseling, National Pintung University of Education, Taiwan; 4. Department of Senior Citizen Service and Management, Chia-Nan University, Taiwan)

Introduction : Although it is known that music can comfort people's mind, what we know so far about the effect of music on our spiritual level is limited. The purpose of the study focused on the elder's spiritual health, aiming at exploring the influence of music on the elder's lives and spiritual health. **Method :** The subjects of the study were people over 50 years old in southern Taiwan. Moreover, the qualitative interview was conducted as the instrument to collect data. The researcher used the scale to measure the participants' spiritual health, life meaning, and sense of self-esteem. Besides, the samples of the study. **Results :** The average age of the participants in this study was 65.2. Furthermore, 68.3 % of the participants were the females, and 37 % of the participants reached the educational level of high school degree. Besides, the participants averagely contact music 2 or 3 times a week (42.0%), and 30 minutes each time (39.0%). The research results stated that the more times people contact music, the higher spiritual health they would have. **Conclusion :** The research findings demonstrated that music can comfort and ease the elder's mind. Therefore, we should enhance the music activities in the elder's communities in order to improve their quality of lives. **Keywords :** music, spiritual health, aging

PP25 S-009

EXPECTATIONS FOR END OF LIFE: PERSPECTIVES OF OLDER ADULTS IN JAPAN

Sumie IKEZAKI¹, Shigeko IZUMI², Hiroko NAGAE³, Chihoko SAKURAI³, Mariko MASUJIMA⁴, Mariko TANIMOTO⁵ (1. Health Science, Graduate School of Nursing, Chiba University, Japan; 2. School of Nursing, Oregon Health & Science University, USA; 3. End of Life Care in Nursing, Graduate School of Nursing, Chiba University, Japan; 4. Adult Nursing, Graduate School of Nursing, Chiba University, Japan; 5. Gerontological Nursing, Graduate School of Nursing, Chiba University, Japan)

Introduction : The number of older adult population (>75 years old) is growing rapidly in Japan. Although some of them may stay relatively healthy, they are expected to face physical and/or cognitive function decline within next 10 years as they enter end-of-life phase of their lives. In order to prepare and support them to have quality end of life, it is critical to understand their values, needs, and expectations for their end of life. The purpose of this study was to describe older adults' and their family caregivers' perspectives about their end of life. **Method :** Nine older adults (mean age=88.8: male=5) who lived in nursing homes or homes and 5 family caregivers were interviewed. Although some older adult participants had communication difficulty due to hearing problems, they did not have cognitive impairment limiting the conversation with the interviewer. Qualitative content analysis was conducted. IRB approval was obtained from researchers' institution. **Results :** While both older adults and their families stated that they had lived long enough, none of them acknowledged the end of their life. None had clear or concrete advance care planning about their end-of-life care. Because they have been relatively healthy and did not have life-threatening illness experiences, they assumed that the older adult's life would continue as it is, and they could not imagine

how the decline towards death could happen. **Conclusion :** Further studies are necessary to explore their needs and care to assist the older adults to be prepared for their end of life. **Keywords :** frail older adults, end-of-life care, advance care planning

PP25 S-010

RELATIONSHIP BETWEEN SUBJECTIVE HEARING AND QOL IN INDEPENDENT ELDERLY

Tomoko KOBAYASHI¹, Norikazu KOBAYASHI² (1. Department of Speech, Language and Hearing Therapy Faculty of Health Sciences, Mejiro University, Japan; 2. Graduate School of Human Health Sciences, Tokyo Metropolitan University, Japan)

Introduction : Similar to the deterioration of physical functions, deterioration of hearing caused by aging can be a factor in reducing the quality of life (QOL) of the elderly. While audiometry is generally used for examining hearing state, we consider that self-consciousness of hearing by a subject, that is "subjective hearing," is also important in the relationship between hearing state and QOL, which is subjective to the subject. In the present study, we conducted audiometry for elderly living independently and investigated the state of subjective hearing in their ordinary lives, their health-related QOL, and interest in activities. **Method :** The subjects were 50 elderly living in Saitama Prefecture (31 men and 19 women; mean age, 69.4 ± 4.8 years) . We used standard pure tone audiometry (air conduction only) and questionnaires to study their subjective hearing, interests, and other parameters. **Results :** Average hearing level of the ears of the 50 subjects with better hearing was 3-35 dB. In addition, average total score of subjective hearing was 77.3. SF-36 showed results of 56.1 for vitality, and 49.7 for social role functioning, which are near the average levels for the Japanese. In the interests and concerns checklist, the average number of items a subject was interested in was 62.4. **Conclusion :** Since it was only subjective hearing and SF-36 that showed significant interactive correlation, subjective hearing rather than the audiometry-determined hearing level of the subjects in the present study appears to influence their QOL when we consider the relationship between their hearing and QOL. **Keywords :** independent elderly, subjective hearing, quality of life

PP25 S-011

THE EFFECTS OF THE FEEDING-SWALLOWING TRAINING PROGRAM OF CHOPPED UP FRENCH STYLE MEALS FOR JAPANESE ELDERLY SUFFERING FROM DYSPHAGIA

Yasuyo TANAKA¹, Mizue SUZUKI² (1. CEO of Nursing Home Kinoto, Nursing Home Kinoto, Japan; 2. Faculty of Nursing, Hamamatsu University School of Medicine, Japan)

Introduction : The purpose of this study is to clarify the effects of the Feeding- Swallowing Skills Training Program of chopped up French style meals. **Method :** Ten elderly patients with chronic dysphagia due to bulbar paralysis or pseudobulbar paralysis received the Feeding-Swallowing Skills Training Program of chopped up French style meals gradually for 16 weeks. **Results :** Evaluations were conducted every two weeks and at the end of the 16th week. According to results, an increased proportion of chopped food could induce better mastication, which could also help decreasing food boluses within the oral cavity were found. The average length of swallowing reflex response was shortened. The numbers of aspiration was decreased and the amount of food consumption was also increased. The average weight gain and BMI increased. Four out of six patients who had gastrostomy or esophagostomy tube were removed their tube. Two elderly patients started to eat solid food; however, they didn't develop aspiration

pneumonia. In the Barthel Index, scores were significantly improved. Conclusion : Based on the results described above, the chopped up French style meal can be used as a reasonable method to improve feeding and swallowing skills, since it can induce physiological activities such as improved masticatory function and salivary secretion, which can also help in forming and transferring a food bolus. These functions also help avoid aspiration. Ability to use limbs also improved during the recovery process of feeding behaviors. It is suggested that mastering the feeding behavior could also improve other functions as well. Keywords : chronic dysphagia, feeding-swallowing skills, Chopped up French style meals

PP25 S-012

THE RELATIONSHIP BETWEEN LIFE SATISFACTION AND LEVELS OF SOCIAL FUNCTIONING IN ELDERLY

Makbule SENYURT, Huriye GUN, Meral DEMIRALP (*School of Nursing, Gulhane Military Medical Academy, Turkey*)

Introduction : This descriptive study aims to determine the relationship between life satisfaction and levels of social functioning in elderly. Method : The sample of the study is consisted of 115 individuals who lives in a district of Aydin between January-March 2012 and who are volunteer to participate the study. The data were obtained from Sociodemographic Data Collection Form, Social Functioning Scale (SFS) and the Life Satisfaction Scale (LSS). Results : 57.4% of the participants were women and 52.2% of them were between the ages of 65-70. The mean LS total score of men were higher than women ($X=10.1 \pm 3.7$). There was a statistically significant relationship between total score of Life Satisfaction Scale and the subscales of Social Functioning. A statistically significant difference were found between age and interpersonal functioning, independence-competence, independence-performance subscales of SFS ($X_{\text{age}} = 11.584$, $p = 0.003$, $X_{\text{independence-competence}} = 14.988$, $p = 0.001$ and $X_{\text{independence-performance}} = 20.190$, $p = 0.00$ respectively). Unlike the male, life satisfaction scores were increased in females if leisure time activities were increased ($z=3.445$, $p=0.001$). There was a positive correlation between interpersonal functionality and life satisfaction score ($r=0.188$, $p=0.045$) in elderly. Interpersonal functioning and business-professional scores were lower in the individuals who were using the auxiliary devices (respectively $X_{\text{interpersonal}}=12.405$, $p=0.03$ and $X_{\text{business-professional}}=25.674$, $p=0.00$). The individuals who live alone were more socially withdrawn than the others ($X_{\text{alone}} = 41.289$, $p = 0.00$). Conclusion : Life satisfaction and social functioning in elderly were affected from each other in high levels. It is important to do further in-depth researches about this subject. Keywords : Elderly, Social function, Life satisfaction

PP25 S-013

PHYSICAL AND FUNCTIONAL PROFILE OF INSTITUTIONALIZED ELDERLY WOMEN FROM A BRAZILIAN NURSING HOME

Jhonatam BERNARDI¹, Indaiara FELISBINO¹, Eduardo L. WAMSER², Elisângela V. RODRIGUES², Leticia A. Alves DA SILVA³, Jessica Alves DE PAULA⁴, Darla SILVERIO⁴, Silvia VALDERRAMAS⁵, Maria Eliana Madalozzo SCHIEFERDECKER⁴, Anna Silveira GOMES⁶ (*1. Physiotherapy, Federal University of Parana, Brazil; 2. Physical Education, Federal University of Parana, Brazil; 3. Physiotherapy, Faculdade Dom Bosco, Brazil; 4. Nutrition, Federal University of Parana, Brazil; 5. Physiotherapy, Faculdade Dom Bosco e Faculdade Evangelica do Parana, Brazil; 6. Physiotherapy and Physical Education, Universidade Federal do Parana, Brazil*)

Introduction : It has been described that most institutionalized elderly

people have a low level of physical activity however it is not well known which physical and functional aspects are impaired. Aim: Evaluate the physical and functional profile of institutionalized elderly women from a Brazilian nursing home. Method : It was assessed the following variables from 7 elderly women: Age; Time living in the nursing home (TLNH); Cognitive status (MiniMental State Examination-MMSE); body mass (Kg); height (m); Body mass index (BMI); dominant calfcircumference (cm); Human Activity Profile (HAP); Lequesne's Algofunctional Questionnaire for Knee and hip; functional mobility (Timed "Up & Go"); Falls Efficacy Scale; International (FES-I) to evaluate the fear of falling; balance and risk of falls (Berg Balance Scale-BBS) and walking speed (WS-10m). Results: Elderly women ($n=7$, 71 ± 14 years old); TLNH 22 ± 21 years; MMSE 19 ± 5 ; height 1.51 ± 0.11 m; body mass 74 ± 27 Kg; BMI 32 ± 11 ; calfcircumference (35 ± 8 cm); HAP 47 ± 18 ; Knee's Lequesne 6 ± 6 ; Hip's Lequesne 3 ± 3 ; TUG 25 ± 27 s; FES-I 27 ± 10 ; BBS 42 ± 9 ; WS 0.73 ± 0.27 m/s. Conclusion : The mental status of the institutionalized elderly women was preserved; the BMI were overweight; physical level of activity was inactive and moderate functional level of impairment for knee and lower for hip. Therefore, instead they were not sarcopenic it was found low balance and functional mobility, risk for falls, and fear of falling. Keywords : Health of Institutionalized Elderly; Physical performance; Homes for the aged.

PP25 S-014

THE EXTENT OF DEMENTIA AMONG COMMUNITY BASED OLDER ADULTS

Nutthita PETCHPRAPAI (*Institute of Nursing, Suranaree University of Technology, Thailand*)

Introduction : Dementia is one of the most common diseases among older adults that lead them to depend on health care professions and caregivers. Early detection of brain abilities is a better to screen and plan for proper management. Method : This study was aimed to explore the extent of brain abilities among older adults who lived in community setting. The Mini Mental State Examination (MMSE) Thai version was used. Data were collected by face to face interview at the subjects' home. Results : Eighty-one older adults were interviewed, most were female (53.1%), not working (55.6%), underwent compulsory school (63%) and lived without their spouses (53.1%). Only 2.5% reported a family history of dementia, some reported a history of head injury (11.1%), smoking (30.8%) and drinking alcohol (7.3%). Data revealed that Mini Mental State Examination (MMSE) scores were 7-30, with the average of 21.09 (SD=5.67) and 17 were at risk of dementia. The average scores were significantly lower among the subjects who never attend school (mean = 16.55, SD=5.64). Proportion of Risk of dementia were higher among subjects who never attend school (5:15) compare to 8:44 among those who completed compulsory school. Conclusion : It is recommended that conducting dementia screening by using MMSE should be trained to elderly caregivers in order to monitor risk of dementia every few months. Keywords : dementia; MMSE

PP25 S-015

NATIONAL STUDY OF PERFORMANCE-BASED ASSESSMENTS AND PERSONAL CARE IN JAPANESE OLDER PEOPLE

Hiroyuki SHIMADA¹, Takao SUZUKI², Megumi SUZUKAWA³, Hyuma MAKIZAKO¹, Takehiko DOI¹, Daisuke YOSHIDA¹, Kota TSUTSUMIMOTO¹, Yuya ANAN¹, Kazuki UEMURA¹, Tadashi ITO¹, Sangyoon LEE⁴, Hyuntae PARK⁴ (*1. Section for Health Promotion, National Center for Geriatrics and Gerontology, Japan; 2. Research Institute, National Center for Geriatrics and Gerontology,*

Japan; 3. Faculty of Health Sciences, Department of Rehabilitation, Course of Physical Therapy, University of Human Arts and Science, Japan; 4. Section for Physical Functioning Activation, National Center for Geriatrics and Gerontology, Japan)

Introduction : Measures of physical performance may identify older persons with a preclinical stage of disability. However, which performance test and cut-point are the most useful to screen for risk of functional dependence in Japanese older people is not clear. The purpose of this study was to identify appropriate clinical tests for determining the demand for personal care in Japanese older people. **Method :** Ten thousand three hundred fifty-one individuals aged 65 years or older (6,791 with and 3,560 without personal care) participated the study. Physical performance tests included grip strength, chair stand test, walking speed at a comfortable pace, and timed up-and-go test. **Results :** Individuals who had received personal care showed significantly poorer performance than those without personal care on all physical performance tests. Gait speed had the greatest utility of the physical performance tests to determine the demand for personal care (AUC: men; 0.92, women; 0.94, sensitivity: men; 86, women; 90, specificity: men; 85, women; 85). After adjustments for age, sex, cognitive impairment, and other physical tests, all physical performance tests were individually associated with the demand for personal care. Slow gait speed (<1.0 m/s) was more strongly correlated with the demand for personal care than other performance measures (odds ratio 5.9, 95% CI 5.0 to 6.9). **Conclusion:** Clinical tests of physical performance were associated with the demand for personal care in older people. Preventive strategies to maintain physical independence may be needed in older adults who show gait speed slower than 1.0 m/s. Further research is necessary to confirm these preliminary results. **Keywords :** Physical test, Activities of daily living, Gait speed

PP25 S-016
CONTEMPORARY EPIDEMIOLOGY OF GOUT AND HYPERURICEMIA IN COMMUNITY ELDERLY IN BEIJING

Xiaolan LU (Department of Geriatrics, Beijing Institute of Geriatrics, Xuanwu Hospital of Capital Medical University, China)

Introduction : To evaluate the prevalence and risk factors of gout and hyperuricemia in an elderly community cohort in Beijing. **Method :** A total of 10,039 individuals aged 50 years or older participated in the study, based on the Beijing Longitudinal Study on Aging II (BLSA II) Cohort in 2009. All participants were asked for a Gout Assessment Questionnaire under the guidelines of the American College of Rheumatology (ACR). The prevalence of gout and hyperuricemia were evaluated. The potential risk factors for gout and hyperuricemia were analyzed by logistic regression. **Results :** In our BLSA II Cohort, the prevalence of gout and hyperuricemia were 2.8% and 18.1%, respectively. The traditional risk factors (age and body mass index, BMI) were significantly associated with the risk of both gout and hyperuricemia (age: OR 1.4, 95%CI 1.3 - 1.6 for hyperuricemia; OR 1.6, 95%CI 1.3 - 2.0 for gout; BMI: OR 1.6, 95%CI 1.4 - 1.9 for hyperuricemia; OR 2.1, 95%CI 1.5 - 2.8 for gout). The family history was strongly associated with an increased risk of gout (OR 6.4, 95%CI 3.5 - 11.6). In addition, the metabolic syndrome was also found to be a high risk factor for both hyperuricemia and gout (OR 2.1, 95%CI 1.9 - 2.4 for hyperuricemia; OR 2.5, 95%CI 2.0 - 3.3 for gout). **Conclusion :** Our study showed that the prevalence of both gout and hyperuricemia in Beijing remains substantial. The age, BMI, family history and metabolic syndrome were strong risk factors for gout and hyperuricemia in China. **Keywords :** gout, hyperuricemia, epidemiology

PP25 S-017
THE RELATION BETWEEN PERCEIVED QUALITY OF END OF LIFE CARE AND REFLECTIONS ON THE CARE EXPERIENCES AMONG NURSING HOME STAFF MEMBERS

Chiho SHIMADA¹, Fuki HORIUCHI², Ryo HIRAYAMA¹, Ryutaro TAKAHASHI¹ (1. Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan; 2. Department of Nursing, Saku University, Japan)

Introduction : Our aim in this study is to examine whether and how nursing home (NH) staff members' perceptions of the quality of their end of life (EOL) care might be related to their reflections on the care experiences. **Method :** Respondents were care workers (n=286) and nurses (n=96) in 11 NHs who engaged in EOL care. All respondents answered a self-administered questionnaire within one month after the residents died. Each respondent rated the quality of the care provided in their workplaces. Regarding reflections, respondents also answered (a) how much the residents' family members were seen as satisfied with EOL care provided in the NHs; (b) how much they considered the residents' preferences in providing EOL care (i.e., level of respectfulness); (c) perceived facial expression of the residents; and (d) their adherence to the individual care plan. **Results :** Reflected experiences that were significantly related to perceived quality of the EOL care involved perceived family satisfaction, facial expression of residents in the end of their lives, level of respectfulness, and adherence to the care plan. Such perceptions, however, did not differ significantly either by whether residents used tube feeding before death or by respondents' job title (nurse or care worker). **Conclusion :** The results suggest that NH staff members evaluate the quality of their EOL care in reflecting on their experiences. Further research is necessary to clarify whether these results can be generalized. **Keywords :** end of life care, nursing home, reflection

PP25 S-018
INITIATING ADVANCE CARE PLANNING WITH ELDERLY BY PHYSICIAN IN ASIAN CULTURE

Hui-Wen CHANG¹, Chia-Chen LU², Yi-Hown LAI¹, Yi-Jun CHEN¹ (1. Family Medicine, Changhua Christian Hospital Erhlin Branch, Taiwan; 2. Changhua Christian Hospital Erhlin Branch, Family Medicine, Taiwan)

Introduction : Advance care planning (ACP) is a process which involves the patient, in consultation with physician, families and important others. Unlike Western cultures, Asians ask their parents directly about end-of-life (EOL) care treatment preferences would be considered un-filial and disrespectful. The role of physician in initiating the conversation about EOL care with older adults is recommended. **Method :** A cross-sectional design was used from September 2010 through September 2011. Sampling was from outpatients of Family Medicine department at Changhua Christian Hospital a large teaching hospital in Taiwan. If the participant who was incompetent, cognitive impairment or unable to communicate was excluded. The questionnaire was designed to delineate participants' preferences, attitudes toward ACP, fear of death, preferences for information disclosure, things being worried after the death. **Results :** 54.2% of elder participants had willingness to prepare formal ACP. The results of the study indicate that: 1) aged patient's attitude toward refuse ACP preparing had much fear of death; 2) awareness of poor prognosis making elderly patient's attitude toward refuse life-sustaining treatment; 3) preferences for information disclosure by professional staff; 4) preference toward refusing life-sustaining treatments had less concern about how others will deal with his remains. **Conclusion :** From our survey, the elder want to discuss their

future care with physician. Some elderly were comfortable with such discussions but they preferred to leave such decisions to their families. For those who wanted to hold discussing and refused formal ACP preparing, wait for another appropriate timing and enough mental support should be arranged. Keywords : Advance care planning

PP25 S-019

DIFFERENT INVOLVEMENT SITUATIONS AT THE END OF LIFE IN LONG-TERM CARE

Jean Correll MUNN, Hyejin KIM (*College of Social Work, Florida State University, USA*)

Introduction : Although one fourth of the deaths of U.S. older adults occur in long-term care (LTC) settings, research regarding end of life in LTC is rare. In particular, examining the experiences of social workers, who are generally tasked with dealing with end of life issues, is needed. Using a comprehensive survey, we examined the involvement of social workers and administrators with residents and their families at the end of life in LTC. Method : We mailed the survey package (study information, survey instrument, and consent form) to 139 potential LTC participants (59 social workers and 80 administrators) in four U.S. states. The survey instrument addressed several areas of involvement (e.g., situations, initiation, barriers, training) and demographic information. Results : Respondents (n = 23[15 social workers; 8 administrators]) were largely white (87%) and female (65.2%). Almost all respondents (over 90%) reported they were involved with residents at the end of life in advocating for residents' care preferences, arranging meetings regarding end-of-life issues, assessing a residents' emotional well-being, providing emotional support to residents, referring residents to hospice, and attending funerals for dead residents. However, more than half of respondents reported that they were never involved in helping residents plan funerals, holding support groups, and discussing with residents about what to expect at the end of life. Conclusion : While limited by a small sample size, this study contributes to knowledge regarding current social work roles in end-of-life care in LTC communities to guide future research, especially various situations of both high and low involvement at the end of life. Keywords : involvement at the end of life, long-term care, social work involvement

PP25 S-020

FAMILY CAREGIVERS' EXPERIENCES WITH FRAIL OLDER ADULTS LIVING AND DYING IN NURSING HOMES

Katsumi NASU¹, Hiroki FUKAHORI², Megumi SHIMO³ (*1. Institute of Biomedical & Health Sciences, Hiroshima University, Japan; 2. Graduate School of Health Care Sciences, Tokyo Medical and Dental University, Japan; 3. Formerly Nursing Department, The Valley Private Hospital, Australia*)

Introduction : In Japan, the number of elderly people dying in nursing homes is increasing. Nurses and other health care professionals must support the caregiving family members of dying residents for providing quality end-of-life care. However, little is known about family caregivers coping with bereavement. This study aimed to explore family caregivers' experiences with frail older adults living and dying in nursing homes in Japan. Method : Two to 12 months after the death of elderly residents in two nursing homes, semi-structured interviews with caregiving family members were conducted. These interviews were audiotaped, transcribed, and qualitatively analyzed using the phenomenological approach. This study was approved by the Ethical Committee for Epidemiology of Hiroshima University. Results: The participants included 15 family caregivers of 11 elderly nursing home residents. Seven themes that characterized family

caregivers' experiences with frail older adults living and dying in nursing homes were identified: "Feeling of bonding with the resident," "looking for care that can be self-provided," "getting along with the staff and other residents," "decision-making regarding the resident's medical procedures," "selecting the place of death for the loved one," "staying with the dying resident," and "giving significance to the resident's death and care.". Conclusion : Caregiving by family members to frail older adults living and dying in nursing homes is a process by, which a feeling of bonding with the resident enhances caregivers' efforts in providing quality end-of-life to the loved one. In addition, the process includes caregivers' reflection of their caregiving experiences after the loved one's death. The caregivers gave significance to the resident's death and care through this process. Keywords : end-of-life care, nursing home, family caregiver

PP25 S-021

COMMUNITY END-OF-LIFE CARE AMONG CHINESE OLDER ADULTS LIVING IN NURSING HOMES

Leung-Wing CHU (*Department of Medicine, Queen Mary Hospital, The University of Hong Kong, Hong Kong*)

Introduction : Chinese older people living in nursing homes are commonly admitted to the hospital during their end-of-life period. This study investigated the proportion of nursing home residents who would accept end of life care in nursing homes rather than hospitals and the trade off that they are willing to make. Method : 1600 residents from nursing homes were recruited and interviewed face-to-face. Four hypothetical questions were asked to explore preferences for end-of-life care. Using a discrete choice approach, specific questions explored acceptable trade-offs between three attributes: availability of doctors on site, attitude of the care staff and additional cost of care per month. Results : Around 30% of respondents prefer end-of-life care in hospital, while 35% of respondents prefer the nursing home and 23% of them would consider it in a better nursing home. A good attitude of staff was the most important attribute of the care site. Older adults were willing to pay an extra cost of HK\$38 per month for more coverage of doctor's time and HK\$376 for a better attitude of staff in the nursing home. Older adults who were on Comprehensive Social Security Allowance Scheme valued the cost attribute more highly, as expected, validating the hypothesis that these residents would be less willing to pay an additional cost for end-of-life care. Conclusion : Our findings indicate that approximately one-third of the nursing home residents would accept end-of-life care provided in their nursing homes. The most important attribute was the attitude of care staff. Keywords : end-of-life care, nursing homes, preference

PP25 S-022

DEVELOPMENT OF EDUCATIONAL PROGRAMS FOR THE NURSING STAFF TO SUPPORT END-OF-LIFE CARE IN NURSING HOMES

Tayo NAGAHATA, Chitose MATSUDA, Kae YAMAUCHI, Kyoko EGUCHI, Kayo YAMAJI (*School of Nursing, Osaka Prefecture University, Japan*)

Introduction : A surge in end-of-life care in nursing homes is expected in Japan along with the super aging society, and it is urgent to ensure the care quality of such facilities. This study is intended to develop an education program through creating a list organizing end-of-life care practices in nursing homes. Method : We prepared a list of end-of-life care practices based on group and individual interviews with the nursing leaders of nursing homes, validated it with a mail survey, and created a 'Nursing Practice Review Sheet.' A training program using this sheet was developed and implemented and its efficacy and

adequacy was evaluated by a survey to 18 nursing staffs participating from 16 facilities. Each survey and training program was implemented under the permission of the Research Ethics Committee of our university. Results : The training program consisted of three workshops and related tasks. The tasks required participants to extract problems in end-of-life care using the Nursing Practice Review Sheet and tackle them with their colleagues. The participants exchanged information and provided peer support to complete the tasks within their group. Fourteen of the 16 participant facilities worked on the tasks. The questionnaire showed that all participants received useful information through the goal-oriented program and that 80% or more of them found the program was useful for their work. Conclusion : This program was practical because effective activities for each facility were identified through the tasks and also because useful communication was established among the facilities. Keywords : end-of-life care, nursing home, educational program

PP25 S-023

OCCUPATIONAL STRESS MANAGEMENT OF A VISIT NURSE PRACTICING AT-HOME END-OF-LIFE CARE

Tomoko MIZUMA¹, Masami KOBAYASHI², Akemi KARIYA³
(1. Faculty of Health Science, Prefectural University of Hiroshima, Japan; 2. Nursing Department, Kurashiki Municipal Hospital, Japan; 3. Faculty of Health Science, Prefectural University of Hiroshima, Japan)

Introduction : For visit nurses engaged in at-home end-of-life care, it was performed an interview investigation using the semiconstitutive questionnaire. Sense of accomplishment, sense of fulfilment and stress level in the temporary nursing at home was analyzed, resulting in stress reduction. Method : The qualitative contents were analyzed with supervisors and researchers, regarding the conceptualized and analysis performance using the stress coping theory. Results : By the intervention of the nurse the case treatment medical was solved, providing a sense of accomplishment and a sense of fulfilment for client and family. The nurse was able to improve the nursing technique and mental growth. On the other hand, in the terminal care the nurse found a dilemma and feeling of ineffectualness. The content of the stress between the doctor and nurse was hard gap operation. In particular way, there were not constructive hesitation of the decision, the client and a family and also the relationship of mutual trust cooperation with other types of job. Conclusion : We suggest four stress coping measurement: 1) knowledge and nursing skill development (Training and clinical practice); 2) Bond human relation; 3) Development medical knowledge and 4)Health insurance system reform (Grief care). Keywords : end-of-life care, visit nurses, stress

CAUSES OF POST STROKE FALLS ALONG THE CARE CONTINUUM: IMPLICATIONS FOR IMPROVING PATIENT SAFETY

Mona MADADY¹, Aleksandra ZECEVIC¹, Alan SALMONI¹, Bryan YOUNG², Eileen BRITT³
(1. Faculty of Health Sciences, Western University, Canada; 2. Department of Clinical Neurological Sciences, London Health Sciences Centre, Canada; 3. Stroke Rehabilitation Program, Parkwood Hospital, St. Joseph's Health Care, Canada)

Introduction : According to the World Health Organization 15 million people worldwide and almost a million North Americans suffer a stroke every year. While information about the incidence and risk factors of falling among stroke survivors is available, considerably less is known about the actual causes of falls and the circumstances surrounding these adverse events. The purpose of this project was to

identify systemic causes of falls in stroke survivors as they transition through continuum of care. Method : A total of 30 stroke survivors were followed for six months post stroke as they transitioned from acute care to rehabilitation hospital, and to home or long-term care facility. Their first fall at any stage of the care continuum was investigated using Systemic Falls Investigative Method (SFIM). Comprehensive data were collected through multiple interviews, document reviews, environmental scans, re-creation of events and was entered into the SFIM Database to produce falls reports. The guiding framework in data reduction and analysis was the Swiss Cheese Model of Accident Causation. Summary tables of contributing factors from all falls reports were organized using NVIVO and coded to identify dominant themes and patterns specific for falls of stroke survivors. Results : Results indicate that physical and behavioral characteristics of stroke survivors combine with broader supervisory, organizational and healthcare system influences as contributors to falls. Conclusion : When considering falls prevention programs in post-stroke rehabilitation and community re-integration, it is important to address not only stroke-specific health causes, but also challenge latent system-wide components that affect stroke survivor's safety. Keywords : stroke, falls, patient safety

FALLS SCREENING AND ASSESSMENT TOOLS USED IN ACUTE MENTAL HEALTH SETTINGS: AN ANALYSIS OF POLICES IN ENGLAND AND WALES

Venkat NARAYANAN¹, Angela DICKINSON², Charles SIMPSON², Caroline GRIFFITHS¹, Deborah HUMPHREY¹, Christina VICTOR³
(1. Older Adults, Oxford Health NHS Foundation Trust, United Kingdom; 2. Centre for Research in Primary and Community Care, University of Hertfordshire, United Kingdom; 3. School of Health Sciences and Social Care, Brunel University, United Kingdom)

Introduction : There is an urgent need to improve the care of older people at risk of or who experience falls in mental health settings. Falls are the most frequently reported patient safety incident. NICE Guidelines recommends the use of multidisciplinary fall risk assessment during individualised treatment and in prevention care plans for older people at risk of falls (NICE, 2004). This poster outlines work underway to explore the policy guidance issued by NHS Mental Health Trusts in England and Health Boards in Wales. Method: We requested fall policies and other relevant documentation from NHS mental health trusts in England (56) and healthcare boards in Wales (6). Policies are being subjected to a quantitative content analysis to explore guidance given to clinical staff and managers. Results : We obtained falls policies from 42 mental health trusts in England, and 2 from healthcare boards in Wales. 30 policies were publically available on the internet. 1 Trust told us they did not have a fall-prevention strategy. 1 was currently reviewing their policy. Analysis of fall risk assessment tools show variation in the number of risk-variables included. Few Trusts used validated tools such as STRATIFY, FRASE, MORSE, and MHOA, others used customised falls risk assessment tools. Conclusion : A wide variety of screening and assessment tools are in use, however, the most commonly used are those developed by individual Trusts, or which focus solely on the external environment, with no screening/assessment of individual patients. Use of invalidated tools raises questions of reliability and effectiveness. Keywords : Falls policy

CORRELATION AMONG TIME UP AND GO TEST (TUG), AGE AND BODY MASS INDEX IN ELDERLY SOUTH OF BRAZIL

Graziela Morgana Silva TAVARES¹, Maria Gabriela Valle GOTTLIEB², Vanusa MANFREDINI³, Fabiane Moreira FARIAS³, Jacqueline Da Costa Escobar PICCOLI³ (1. *Physical Therapy, Federal do Pampa University, Brazil*; 2. *Post - Graduate Biomedical Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil*; 3. *core studies and research in aging, Federal of Pampa University, Brazil*)

Introduction : Falling is a major cause of loss of autonomy and functional independence of older people, which directly affects the quality of life of these subjects. Furthermore, studies have suggested that older age and body mass index (BMI) are associated with loss of mobility in elderly. **Objective:** To verify if exists a correlation among the time of displacement in Time up and go test (TUG), age and BMI in the elderly. **Method :** Cross sectional study. We selected 125 elderly people [27 (21,6%) men and 98(78,4%) women]. They answered an evaluation form with identification data, anthropometric and thereupon the TUG test was performed. Data analysis was performed using descriptive statistics, correlation analysis and ANOVA Person. The level of significance was set at $p < 0.05$. **Results :** The mean age was 73.8 ± 6.7 years (minimum 60 years and maximum 88 years. Mean BMI was 28.5 ± 5.9 kg/m² and TUG was 11.8 ± 4.4 seconds. Was found a weak correlation between age and TUG ($r = 0.20$, $p = 0.02$) and BMI and TUG ($r = 0.27$, $p = 0.03$). ANOVA showed that there are significant differences between the mean TUG among older age groups of 60-69 years (10.5 ± 4.5 seconds) and 80-89 years (13.3 ± 3.5), $p = 0.038$. **Conclusion :** age and BMI are correlated with TUG test and that elderly over age 80 years has a longer shift the TUG test. **Keywords :** mobility, body mass index, tug test

PP25 S-027

ASSOCIATION AMONG SEX, MARITAL STATUS, FAT THICKNESS AND FUNCTIONAL DEPENDENCE OF THE ELDERLY IN SOUTHERN BRAZIL

Luciana VELHO¹, Graziela Morgana Silva TAVARES², Rodolfo Herberto SCHNEIDER³, Camila JACONDINO³, Cristiane ALVES¹, Gustavo Heiman SANDRI⁴, Rafael BAPTISTA⁴, Maria Gabriela Valle GOTTLIEB⁵ (1. *College of Biological Sciences, PUCRS, Brazil*; 2. *Physical Therapy, Federal do Pampa University, Brazil*; 3. *Graduate Program in Biomedical Gerontology, IGG - PUCRS, Brazil*; 4. *Faculty of Physical Education and Sport Science, PUCRS, Brazil*; 5. *Graduate Program in Biomedical Gerontology, IGG PUCRS, Brazil*)

Introduction : Increased fat mass in older adults is a finding inherent to the aging process. This increase may cause functional limitations resulting in loss of autonomy and independence, decreased strength and balance increasing the risk of falls and fractures in the elderly. **Objective:** To investigate the association between sociodemographic, functional dependency and fat thickness in the elderly. **Method :** Cross-sectional study with 75 older adults (14 men and 61 women), from the Department of Geriatrics, Hospital Sao Lucas, Brazil. They were randomized in two groups: dependent elderly ($n = 28$) and independent ($n = 47$). Variables investigated were: sociodemographic, activities of daily living (scale Kats), lower limb strength (Sitting-rising test) and fat thickness of triceps brachial, vastus lateralis and medial gastrocnemius muscles (ultrasound). **Results :** The average age of the elderly independent group was 74.04 ± 6.97 and $72.14 \pm$ dependent group was 6.84 ($p = 0.25$). An association between functional dependency and sex was observed ($p = 0.048$). It was also found an association between marital status and autonomy ($p = 0.011$), where 12 (42,9%) were elderly dependents widowed. Significant difference was observed between the average of the fat thickness of

the triceps brachial (dependent: 17.76 ± 7.18 and independent: 14.29 ± 5.30 , $p = 0.03$), vastus lateralis (dependent 17.67 ± 11.50 and 11.01 ± 5.183 independent, $p = 0.03$) and medial gastrocnemius muscles (dependent: 11.21 ± 5.528 and independent: 7.94 ± 2.770 , $p = 0.01$). No significant difference was found between groups with respect to the Sitting-rising test ($p = 0.908$). **Conclusion :** Sex, marital status and fat thickness are associated with loss of functional independence in the elderly. **Keywords :** Aging, autonomy, fat thickness,

PP25 S-028

THE ROLE OF TRUNK MUSCLE PERFORMANCE UNDERLING THE PHYSICAL FUNCTION IN OLDER PEOPLE: A STRUCTURAL EQUATION MODEL

Hikaru IHIRA¹, Atsushi MIZUMOTO¹, Keisuke YASUDA¹, Keitarou MAIKNO¹, Takeshi SASAKI¹, Mika KIMURA², Hyuma MAKIZAKO³, Taketo FURUNA¹ (1. *School of Health Science, Sapporo Medical University, Japan*; 2. *International Life Sciences Institute JAPAN, ILSI, Japan*; 3. *Department of Health and Medical Care, Center for Development of Advanced Medicine for Dementia, National Center for Geriatrics and Gerontology, Japan*)

Introduction : Deterioration of trunk muscle performance is associated with poor physical functions in patients with low back pain. However, the relationships between trunk muscle performance and physical function in community-dwelling older people have not been investigated. The purpose of this study was to determine the interrelationships between muscle strength, balance, gait and trunk muscle performance in older people using structural equation modeling. **Method :** We evaluated data on 106 community-dwelling older people (63 women and 43 men; age: 65 to 85 years; mean age: 75.4 years). We measured trunk muscle strength and pelvic walking test as trunk muscle performance. Trunk muscle strength was measured maximum torque of trunk flexion and extension by using Biodex. In pelvic walking test, we instructed to go forward as fast as possible during 10 seconds, rotating trunk at sitting position with cross arms. We measured the distance of between right lateral malleolus during 10 seconds. The other outcome measures were the physical functions, including performance in the knee extension power, grip power, one-leg standing test, functional reach test, 5m walk test and the timed up-and-go test. **Results :** In a structural equation model, performance in the trunk muscle contributed significantly to balance and gait function, low trunk muscle performance was significantly and directly associated with low balance and gait function in community-dwelling older people. **Conclusion :** The results suggest that trunk-specific strength exercise as well as general function training should be important exercise programs designed to maintain the physical function in community-dwelling Japanese older people. **Keywords :** trunk function, trunk strength, pelvic walking

PP25 S-029

EFFECTS OF A MULTIFACTORIAL FALL PREVENTION PROGRAM ON FALL INCIDENCE AND PHYSICAL FUNCTION IN COMMUNITY-DWELLING ELDERLY WITH RISK OF FALL

Hsuei-Chen LEE¹, Ku-Chou CHANG², Jau-Yih TSAUO³, Sang-I. LIN⁴, Yu-Ching HUANG², Jen-Wen HUNG⁵ (1. *Physical Therapy and Assistive Technology, National Yang-Ming University, Taiwan*; 2. *Division of Cerebrovascular Diseases, Department of Neurology, Kaohsiung Chang Gung Memorial Hospital, Taiwan*; 3. *School and Graduate Institute of Physical Therapy, National Taiwan University, Taiwan*; 4. *Physical Therapy, National Cheng Kung University, Taiwan*; 5. *Rehabilitation Medicine, Kaohsiung Chang Gung Memorial Hospital, Taiwan*)

Introduction : This study aimed to evaluate the effects of a multifactorial fall prevention program on fall incidence and physical function in community-dwelling elders identified with risk of fall. **Method :** This multi-center randomized controlled trial was conducted in Taipei, Tainan, and Kaohsiung of Taiwan from Jan. 2008 to June 2010. Eligible subjects were randomly allocated into intervention group (IG) and control group (CG) stratified by Physiological Profile Assessment (PPA) fall-risk level. IG received a 3-month multifactorial intervention program including 8-week exercise training, health education, home hazards evaluation/ modification, along with medication review and ophthalmology/other specialty consult. CG got health education brochures, referrals and recommendations without direct exercise intervention. Primary outcome was fall incidence within 1-year. Secondary outcomes were PPA battery (overall fall-risk index, vision, muscular strength, reaction time, balance and proprioception), timed up-and-go (TUG), Taiwanese-International Physical Activity Questionnaire, EuroQoL-5D, Geriatric Depression Scale (GDS), and Fall Efficacy Scale at 3 month after randomization. **Results :** There were 616 participants with 76±7 years, including low risk 25.6%, moderate risk 25.6% and marked risk 48.7%. The cumulative 1-year fall incidence was 25.2% in IG and 27.6% in CG (HR=0.90, 95% CI 0.66-1.23). IG improved more favorably than CG on overall PPA fall-risk index, reaction time, postural sway with eyes open, TUG, and GDS, especially for those with marked fall-risk. **Conclusion :** The multifaceted fall prevention program improved functional performance at 3-months for community-dwelling elders with risk of fall. Fall incidence might have been decreased simultaneously in both groups by heightened awareness engendered during assessments, education, referrals, and recommendations. **Keywords :** Accidental falls; Prevention; Elderly

VARIATION OF BALANCE AND DISPLACEMENT OF CENTRE OF MASS IN AGED PERSONS WITHOUT DEMENTIA AND WITH MILD AND MODERATE DEMENTIA
Isabela Oliveira AZEVEDO TRINDADE, Gustavo De Azevedo CARVALHO (*Physical Therapy, Universidade Catolica de Brasilia, Brazil*)

Introduction : This research compares the variation of balance and displacement of the centre of mass in groups of aged persons without dementia, with mild dementia and moderate dementia, and the relation with the risk of falls. **Method :** A transversal research was performed in 54 persons of both genders, aged 60-80 years old, divided into those three groups. Such persons were submitted to stabilometry, Performance-Oriented Assessment of Mobility (POMA) test and the Timed Up and Go Test (TUG). **Results :** The results show that relevant differences among the three groups were identified in relation to POMA, with the group that suffers from moderate dementia having the worst results. Relevant differences between the groups of mild dementia and moderate dementia, and the groups of persons without dementia and with moderate dementia, were observed in relation to TUG; however, this test presented no meaningful difference between the groups of persons without dementia and with mild dementia. Likewise, no relevant differences were identified among the three groups in stabilometry, but differences of the displacement course of the pressure centre in male patients were discovered. **Conclusion :** This research suggests that aged persons with dementia, particularly moderate dementia, present more balance constraints than aged persons without dementia, and thus are subject to increased risk of falls. In what concerns gait and mobility, aged persons with mild dementia may have similar results when compared to aged persons without dementia, but the evolution of the disease adversely affects

and deteriorates gait and mobility. **Keywords :** Elderly. Dementia. Balance.

PP25 S-031

LIVING WITH HOME-BASED SENSOR TECHNOLOGY: OLDER ADULTS' PERCEPTIONS

Jane CHUNG¹, Blaine REEDER¹, Amanda LAZAR², Hilaire J. THOMPSON¹, George DEMIRIS¹ (*1. Department of Biobehavioral Nursing and Health Systems, School of Nursing, University of Washington, Seattle, USA; 2. Division of Biomedical and Health Informatics, School of Medicine, University of Washington, Seattle, USA*)

Introduction : Home-based technologies are widely used to help older adults live independently by assisting them in coping with various health issues. However, there still remains a challenge in understanding and facilitating technology acceptance among older adults, which is critical for successful implementation of home-based technologies. We sought to explore older adults' attitudes toward and acceptability of home-based sensor technology during a 6-month deployment. **Method :** Eight participants (ages: 79-86) living in a retirement community were recruited. We installed a sensor system consisting of passive infrared sensors, an Internet gateway and a Web portal in every participant's apartment to assess mobility patterns. Face-to-face interviews were conducted at 3-month and 6-month time points to examine user perceptions related to the sensor technology. Here we report initial findings from the 3-month interviews analyzed using qualitative content analysis. **Results :** Most participants reported few privacy concerns related to obtrusiveness; some participants reported privacy concerns related to sensors in bathroom areas. Participants expressed a willingness to disclose the presence of the sensor technology to visitors and other residents. Older adults in the study did not have any aesthetic concerns regarding the in-home sensors; however, a few had misperceptions of how the technology works. Some participants perceived the sensors as useful as health risk increases. **Conclusion :** Older adults living with in-home sensors reported more positive than negative attitudes about its use. Although the generalizability of this study is limited because a convenience sample was used, this study provides insight into factors that can increase older adults' technology adoption. **Keywords :** Sensor Technology, Technology Acceptance, Obtrusiveness

A FALL DETECTOR IN SPECIAL CARE UNIT FOR ALZHEIMER'S PATIENTS

Aurelie LESAGE-LAPOSTOLLE, Nelly WAKSMANN, Cecile PONS-PEYNEAU, Olivier DRUNAT (*Service de Psycho-geriatrie, APHP HUPNVS - Bretonneau, France*)

Introduction : Inpatients of a psycho-geriatric department are exposed to a high risk of falling. The gerontechnology can help reducing this risk. The purpose of the study is to evaluate the experience of a video-surveillance system to detect falls and its integration into a Cognitive-Behavioral Unit (CBU). **Method :** We conducted a 4 months longitudinal observational study collecting all night falls occurring in the CBU whether identified by the video-surveillance system or by other fall reporting systems used in the hospital (risk management software and physician care book). In addition, we interviewed caregivers, patients and their families to assess their experience of the system, its acceptability and its integration into care. **Results :** 29 alerts have been triggered by the video system-surveillance, of which 76% were justified (actual falls or fall risk behaviors). Half of them led to a change in the management of patient care. The probability that an alert

is triggered in case of a fall is 58.3% and the events are not detected by the device in 1 case out of 5. The perceived usefulness (effectiveness and efficiency), the perceived ease of use, and thus the acceptability of the system by caregivers appear to be good. No patient or patient relative said he was embarrassed by the presence of cameras, and a large majority felt secured. Conclusion : The measured efficiency of the system is in line with the effectiveness as perceived by caregivers. This efficiency is good. A rigorous information and training improves the acceptability of this gerontechnology and its integration into care. Keywords : fall, gerontechnology

EFFECTS OF BODY MASS INDEX AND MUSCLE STRENGTH ON MOBILITY LIMITATION IN OLDER ADULTS: A ONE-YEAR FOLLOW-UP INVESTIGATION

Songee JUNG¹, Noriko YABUSHITA², Miji KIM³, Satoshi SEINO¹, Miyuki NEMOTO¹, Yosuke OSUKA¹, Yoshiro OKUBO¹, Kiyoji TANAKA² (1. Graduate School of Comprehensive Human Sciences, University of Tsukuba, Japan; 2. Faculty of Health & Sport Sciences, University of Tsukuba, Japan; 3. Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Japan)

Introduction : The aim of this study was to assess the effects of body mass index and muscle strength in older adults on mobility limitation. Method : This Longitudinal study included pooled data of 269 older Japanese women without mobility limitation (ML), 65 to 87 years of age (mean age 72.8 ± 5.3 years). Muscle strength was measured by hand-grip strength (HGS). Main outcome was ML assessed by self-reported data (ability to walk 400 m or climb one flight of stairs). Participants were categorized as overweight (BMI: ≥ 25 kg/m²) with high HGS ≥ 22.5 kg, overweight with low HGS < 22.4 kg, normal weight with high HGS (reference) and normal weight with low HGS. Multivariate logistic regression analysis was performed to determine the combined associations using age, exercise habit and medications as covariates. Results : During the follow-up period, 41 of 269 participants (15.2%) developed ML. In the overweight, only low HGS was associated with a significantly increased risk of ML (odds ratios 5.54, 95% confidence interval, 1.97 to 15.60). The overweight with low HGS showed a higher risk of mobility limitation to a greater extent than overweight with high HGS and normal weight with low HGS. Conclusion : The results suggest that BMI and muscle strength at one time point are more predictive of ML than 1-year changes and that low strength and high BMI are particularly powerful risk factors of ML. Keywords : Key words: mobility limitation, body mass index, muscle strength

Center for Gerontology and Social Science, Research Institute National Center for Geriatrics and Gerontology, Japan; 4. Department of Nursing and 2nd Department of Internal Medicine, Sapporo Medical University, Japan; 5. Public Health and 2nd Department of Internal Medicine, Sapporo Medical University, Japan; 6. Department of Public Health, School of Medicine, Fukushima

Medical University, Japan)

Introduction : To examine an influence of homebound during winter season on the old-old residents living in a snow full area, we designed a new cohort study named 'Population-based and Inspiring Potential Activity for Old-old Inhabitants (PIPAOI)'. The purpose of this study is to introduce the outline of this research project and to report some results of its first wave investigation. Method : Two hundred and seventy-two aged 75 years and over living in Bibai city of Hokkaido pref. were participated in this study. The participants received health-medical examinations included blood test (not report here), physical performance tests, cognitive status tests and social functions in November 2012 (and again will be received the same examinations in February 2013). After above examinations, remarkable parameters as for aging effect were analyzed by correlation analysis. An effect of homebound to some functions was also examined by one-way ANOVA. Results : Aging effect was observed in all functions measured except for total score of WHO-5, GDS, Social Support 6 and TMIG-IC in cognitive-social domain, and the number of falls in physical domain. With regard to homebound, main effects were observed in muscle strength, body sway, walking function, TMIG-IC and GDS. Conclusion : We completed the first wave of new cohort study and reported some results of it. The aging effect of all functions was observed among the old-old participants. A tendency toward low physical functions among homebound-participants was also confirmed. At the IAGG Congress, we will show the results including the second wave. Keywords : function, homebound, winter

AN EXPLORATORY STUDY OF CHARACTERISTIC OF PHYSICAL ACTIVITY BY CRITERIA OF GAIT STEPS IN DAY-CARE SERVICE USERS ON THE ELDERLY

Tomonori NOMURA¹, Toshiko FUTAKI² (1. Faculty of Medical Technology, Niigata University of Health and Welfare, Japan; 2. Human Health Sciences, Graduate School of Medicine, Kyoto University, Japan)

Introduction : The aim of this study was to clarify characteristic of physical activity in elderly day-care service users based on the number of gait steps. Method : The subjects were 30 frail elderly (10 in the high gait steps group and 20 in the low gait steps group) who regularly used a day-care service. An accelerometer was used to measure the amount of physical activity, and physical activity, as measured by the number of steps, was compared between the two groups. Results : The high gait steps group was observed to have lower physical activity and fewer steps on days that they were using the day-care service than on non-use days. The low gait steps group showed no significant difference in the amount of physical activity between day-care service use and non-use days; the number of steps on day-care service non-use days was related to fear of falling and the amount of physical activity. Conclusion : Fear of falling affected physical activity in the low gait steps group. These results suggest the need for interventions to change the number of gait steps. Keywords : Day-care service, Gait, Physical activity

Introduction : Falling in elderly people effect to decrease their quality of life (QOL). We investigate the relationship with Fall Risk Index (FRI) and Self-Rated Health (SRH) in community-dwelling elderly. **Method :** The study population consisted of 4107 people aged 65 and older (men=1575, women=2350, mean age 75.5±6.9) living in Urausu, Oodai, Tosa town at community-setting. They were screened by the self-reported questionnaire contained FRI-21, SRH, GDS, life styles, and medical conditions in 2006. The FRI-21 was validated by the Working Group for Fall Prevention in the Japanese Ministry of Health, Welfare and Labor to early detect of elderly at high risk of falling in 2005. It consists of 21 questionnaire-based items on a yes/no basis (0-21). SRH was rated on 100-mm visual analogue scale. Depression was assessed by the 15-item Geriatric Depression Scale (GDS-15: 0-15). **Results :** Response rates of the eligible population in each town were 79%, 90%, and 83%. Logistic regression model showed the factors associated with low SRH were scores of FRI-21, prior falls within a year, scores of GDS-15, usage of sleeping pill, osteoarthritis, stroke and cancer. Multiple logistic regression model showed the low SRH was significantly associated with FRI-21 in each town (Urausu: OR=3.00, 95%CI=1.96-4.58, Oodai: OR=3.24, 95%CI=2.50-4.21, Tosa: OR=2.56, 95%CI=1.86-3.52). **Conclusion :** The FRI-21 has significant correlation between SRH. We could use this index not only for the screening of fall risk, but also for perceiving SRH among community-dwelling elderly. **Keywords :** fall, self-rated health, community-dwelling elderly

PP25 S-037

OBJECTIVELY MEASURED PHYSICAL ACTIVITY IS ASSOCIATED WITH MULTIPLE FALLS IN OLDER ADULTS WITHOUT MUSCULOSKELETAL AMBULATION DISORDER SYMPTOM COMPLEX

Yosuke OSUKA¹, Yoshiro OKUBO¹, Noriko YABUSHITA¹, Mi-Ji KIM², Satoshi SEINO¹, Miyuki NEMOTO¹, Songee JUNG¹, Naoya OKI¹, Rafael FIGUEROA¹, Kiyoji TANAKA¹ (1. Graduate School of Comprehensive Human Sciences, University of Tsukuba, Japan; 2. The Research Team for Promotion Independence of the Elderly, Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Japan)

Introduction : While daily moderate- to vigorous-intensity physical activity (MVPA) such as brisk walking prevents falls, over-commitment to MVPA may increase prevalence of falls in older adults. This discrepancy may stem from musculoskeletal ambulation disorder symptom complex (MADS). The purpose of this study was to identify the association between objectively measured physical activity and multiple falls in older adults with or without MADS. **Method :** A cross-sectional analysis was conducted on data from 703 older Japanese adult (72.6 ± 6.0 years: 170 male, 533 female). MVPA was assessed by using a uniaxial accelerometer and divided into high-MVPA (≥ 150 min/week) and low-MVPA (< 150 min/week). MADS was defined as participants who could not perform one leg stance more than 15.0 sec. Chi-square test and logistic regression analysis was

performed to identify the association between MVPA and multiple falls with or without MADS. **Results :** Prevalence of multiple falls was significantly lower in high-MVPA (2.6%) than low-MVPA (8.5%) for the group of non-MADS (P < 0.05), but it was not significantly lower in high-MVPA (6.7%) than low-MVPA (16.6%) for the group of MADS (P = 0.27). Logistic regression analysis showed that MVPA was significantly associated with fewer falls (odds ratio (OR): 0.32, 95% confidence interval (CI): 0.12-0.85) for the group of non-MADS, but not significantly associated with fewer falls (OR: 0.42, 95%CI: 0.09-1.88) for the group of MADS after adjusted for age and sex. **Conclusion :** Moderate- to vigorous-intensity physical activity seems to have beneficial effect for prevention of multiple falls only in older adults who have stable-balance ability. **Keywords :** multiple falls, objectively measured physical activity, musculoskeletal ambulation disorder symptom

PP25 S-038

FALLS AND SOME PSYCHO-SOCIAL EFFECTS

Zaida Aguiar Sa AZEREDO, Beatriz Azeredo TOMAZ (UNIFAI, Portugal)

Introduction : About 30% of elderly people fall at least once a year and about 15% twice or more times per years . The consequences are common and some are very several, but while the physical consequences are easily identify, the psycho-social impact is less known and less reported by the elderly. **Method :** We studied 45 persons who attend a family doctor by several reasons , but they refer a fall in the last 3 months. We inquired them about their feelings in moment they fall and about the future impact For the interview we wrote some guidelines We analyzed the answers and we divided into categories. **Results :** The majority was elderly people (93,3%) and female (82,2%). The eldest had 90 years old Most of them fall on the street. The impact was divided into 4 categories: Physical, psychological, social and spiritual (decrease of self-empowerment. Fear was one of the main feelings (more frequent than physical pain). Others: shame, loneliness, insecurity. **Conclusion :** Sometimes the physical pain is not the most important event on falling. The shame to fall and how or when they can't stand up together with the feeling of loneliness can develop feelings of fear to the future. **Keywords :** falls, elderly, psycho-social effects

“AGING IN PLACE” HAS A POSITIVE EFFECT ON HOUSEBOUND STATUS IN WELL-FUNCTIONING ELDERLY

Akie KAWAMURA¹, Naoto KAMIDE¹, Yoshitaka SHIBA¹, Noriko YAMASHINA², Chihiro YAMAGATA¹ (1. School of Allied Health Sciences, Kitasato University, Japan; 2. Graduate School of Gerontology, J.F. Oberlin University, Japan)

Introduction : The housebound state is a risk factor for disability. The purpose of this study was to examine factors of housebound status in well-functioning elderly Japanese. **Method :** The subjects of this study were 226 elderly people aged 60 years and older who were living independently in public apartments in Kanagawa, Japan. The investigation was conducted using a self-reported questionnaire. The survey items included basic attributes (age, sex, habitation years, cohabitation status), frequency of going out, habitual exercise, depression, and social factors. Social factors were assessed using the Lubben Social Network Scale (LSNS-6) and a short version of the Multidimensional Scale of Perceived Social Support (MSPSS) (A higher score indicates a larger social network in LSNS-6, and richer social support in MSPSS.) Housebound was defined as leaving the

house once a week or less. Multiple logistic regression analysis was conducted by making into an independent variable items that had a dependent variable and showed a significant difference among the housebound. Results : We found that 29 of the elderly subjects were housebound, while 197 were non-housebound. There was a significant negative relationship between being housebound and years of habitation in the area, and negative tendency between social network and being housebound. Conclusion : Our findings show that, among well-functioning elderly, a short habitation history in the area and a small social networks of friends and family are risk factors for becoming housebound. For preventive care, it is important to both continue living in the area which one is accustomed to, and maintain a social network. Keywords : Housebound, Well-functioning elderly, Preventing care

PP25 S-040
IS WORK COMPLEXITY ASSOCIATED WITH PSYCHOLOGICAL DISTRESS AFTER RETIREMENT AGE?

Alexander DARIN MATSSON, Ingemar Pingo KAREHOLT (ARC, Karolinska Institutet, Sweden)

Introduction : Psychological distress is common among older persons. It is well established that working conditions have effects on people's health that persist after retirement. In this study we examine the effects of work complexity on typical symptoms of psychological distress in older persons after retirement. Method : Swedish nationally representative samples, interviewed in 1968, 1981, and 1991. Survivors aged 77+ where reinterviewed, those from the 1968 baseline in 1992, those from 1981 in 2002 and in 2004, and those from 1991 in 2011, resulting in a 20-24 years follow up time. These four follow-up surveys have been pooled (n= 2043). Ordered logistic regressions were used to analyze the association between work complexity and psychological distress. Work complexity was measured with three dimensions based on the typical tasks associated with the respondent's occupations, the level of complexity handling: (I) information, (II) people (intrapersonal relations) and (III) things (handling objects). Psychological distress was measured by three self-reported items: general fatigue, anxiety, and depression as well as by a summarized index of all three items. Results : Individuals with occupations characterized by higher work complexity tended to report less psychological distress during old age than individuals with occupations characterized by less work complexity. Information was the dimension of complexity that showed the strongest association with psychological distress, whereas the dimension Things wasn't at all associated with psychological distress during old age. Conclusion : There are pervasive long term psychological effects, remaining after retirement, of the complexity level of one's occupation. Keywords : work complexity, psychological distress

PP25 S-041
HEALTH PROMOTION THROUGH HOME VISIT FOR ELDERLY HYPERTENSION PATIENTS IN VILLAGE KEMULAN

Alidha Nur RAKHMANI¹, Muhammad MAULANA², Muhammad Irvan ARVANDI², Stanley Ariestia TANJAYA², Yustina Maria PUSPITASARI², Dedde Aditya RACHMAN², Sarah Binti MASRUKIN², Finna Yustita SARI² (1. Public Health, Brawijaya University, Indonesia; 2. Medical Faculty, Brawijaya University, Indonesia)

Introduction : One of the degenerative disease is hypertension at elderly. In a major factor in elderly. It is obvious that death from stroke and cardiovascular disease morbidity decreased with treatment of

hypertension. As hypertension is a risk factor for smoking, microalbuminuria, obesity, male age > 55 years, women > 65 years old, it does not work, a family history of hypertension, high cholesterol and diabetes.. Besides the provision of adequate health promotion is also very necessary for the elderly to be able to get adequate health care. Method : health promotion through home visits by dividing Kinanti books. At that elderly patients measured their blood pressure. Then do the follow-up of the three-day blood pressure outcomes and behaviors that are written in the book Kinanti. This was done for 1 week. Results: a decline from the previous one by 60% of respondents have hypertension category II after the intervention to 60% of respondents have hypertension category I and 26.4% in the pre-hypertension category. After follow-up obtained a significant increase of 6.66% to 20% of patients who have hypertension do not do risky behavior. However, 6.66% of respondents still do 3 or 4 hypertension risk behaviors. There has been a significant reduction in stress, from 66.6% or 10 respondents to 33.3% or 5 out of 15 respondents. Conclusion : health promotion can control blood pressure and hypertension risk behavior change for elderly patients. Keywords : hypertension, health promotion, home visit

PP25 S-042
HEALTHY EATING HABITS IN SOUTHERN BRAZILIAN ELDERLY PEOPLE

Maria Marina Serrao CABRAL¹, Claudine Lamanna SCHIRMER², Andressa LEWANDOWSKI², Angelo Jose G. BOS² (1. Nutrition, Federal University of Santa Maria, Brazil; 2. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil)

Introduction : The high prevalence of nutritional deviation in elderly people has been demonstrated. These results are due to the peculiar conditions in which older people live aggravated by socioeconomic conditions, the physiological changes of age and the progressive inability to perform their daily activities. In this context, the effects of poor nutrition, either excessive or deficit of nutrients, have significant representation. Additionally, little is known about elders living in developing countries as Brazil. Objectives: To investigate the elderly meals which usually hold throughout the day. Method : The research 'Older Adults' Profile in RS' involved 7315 elderly men and women, aged ≥60 years living in 59 different Brazilian Gauchos cities. They answered a questionnaire based on the WHO report "Global Age-Friendly Cities: A Guide" comprising multiple-choice questions as: 'What meals usually makes during a day?'. Results : We found that 94.5% (n=6,915) of older people eat for breakfast and only 5.5% (n=400) do not usually make this meal. On the other hand 17.4% (n = 660) of women and 15.6% (n=551) of men consume any food at midmorning (collation). With respect to lunch, 97.2% (n=7,108) of the elderly perform this meal. By midafternoon only 62.6% (n=4,576) of respondents perform the snack. Dinner is a meal held by 87.8% (n=3,100) of men and 85.8% (n=3,249) of women have supper (evening snack) is held by only 12.4% (n=906) seniors. Conclusion : It appears that most elderly performs four meals a day, as recommended where the number of daily meals is about 4 to 6. Keywords : Health promotion, Developing country, Nutrition

PP25 S-043
ASSOCIATION BETWEEN HIP WALKING PERFORMANCE AND PHYSICAL FITNESS IN COMMUNITY-DWELLING OLDER ADULTS

Atsushi MIZUMOTO¹, Hikaru IHIRA¹, Keisuke YASUDA¹, Keitaro MAKINO¹, Takeshi SASAKI¹, Mika KIMURA², Hyuma MAKIZAKO³, Taketo FURUNA¹ (1. School of Health Sciences,

Sapporo Medical University, Japan; 2. International Life Sciences Institute JAPAN, ILSI, Japan; 3. Department for Research and Development to Support Independent Life of Elderly, Center for Gerontology and Social Science, National Center for Geriatrics and Gerontology, Japan)

Introduction : The aim of this study was to measure hip walking distance for ten seconds and examine the relationship among hip walking distance, trunk muscle, balance and walking speed for older people. **Method :** The participants were 106 Japanese older adults (63 females) living in Sapporo, north city of Japan (mean age, 75.4 years). The term that will be used to describe the hip walking is defined as the movement: subjects in a posture of long sitting position with folding arms rotate a trunk with lifting an ischium and move the lower limbs forward as far as possible. The distance between right lateral malleoli was measured as for hip walking distance of ten seconds. Additionally, grip strength, knee extensor strength, trunk extensor and flexor strength, one leg stand, Functional Reach Test (FRT) and Timed Up and Go test (TUG) were measured. In order to explore the relationships between hip walking distance and other physical functions, partial correlation analysis was calculated using adjusted variable such as age, sex and body mass index. Furthermore, the stepwise linear regression analysis was conducted, in which dependent variable was hip walking distance. **Results :** It was indicated a significant correlation between hip walking distance and other physical functions (partial correlation coefficient $r=0.21-0.44$). As for regression analysis, 5m maximum walking speed, knee extensor strength and one leg stand were detected as significant factors with regard to hip walking distance. **Conclusion :** It was clarified that the hip walking would be a compound movement which reflects walking, muscle strength and balance. **Keywords :** hip walking, performance test, trunk function

PP25 S-044 DANCING WITH AGE

Lia MARQUES¹, Beatriz TOMAZ² (1. *Psychiatry, A Menina dos Meus Olhos Cultural Association, Portugal*; 2. *Psychology, A Menina dos Meus Olhos Cultural Association, Portugal*)

Introduction : In 2011 we work with a dance association monitoring dance classes of a group elderly. **Method :** Was intended to characterize the population of students in regular dance classes with regard to sociodemographic characteristics, cognitive impairment (dementia), mood disorders (Depressive syndromes), Self perception regarding their limitations and risk of falls. **Results :** In the initial evaluation we characterized 8 students, all females, with an average age of 74 years, a maximum 88 years and a minimum 60 years. Only 1 of the students scored positive in the test for cognitive impairment (MiniCOG). 2 scored positive in the Geriatric Depression Scale >5. To evaluate the self perception of limitations was applied to scale VES 13, and 5 students had scores greater than 3. As regards the risk of falls 2 students had fall risk accordingly to the Get up and Go test. Throughout the school year there was an irregularity in the frequency of classes. At the time of the final assessment were characterized only 5 students, all females, average age 77 years, maximum of 88 and minimum of 61 years. The results for cognitive impairment were similar to those found in the initial phase. Regarding the assessment of depressive syndromes none of the students had tested positive in the final evaluation. Regarding the vulnerability risk, 2 exceeded 13 in the test VES 3. The students at risk of falling at baseline abandoned classes throughout the school year. **Conclusion :** These data tend to indicate that dance classes may offer an improvement in depressive symptoms. **Keywords :** Dance, Ageing, Depression, self perception

PP25 S-045 DEMOGRAPHIC AND HEALTH CHARACTERISTICS AMONG NATIVE HAWAIIAN AND PACIFIC ISLANDER ELDERS

Bum Jung KIM¹, Kathryn BRAUN², Colette BROWNE¹, Lana Sue KA'OPUA¹, Noreen MOKUAU¹ (1. *School of Social Work, University of Hawai'i at Manoa, USA*; 2. *Department of Public Health, University of Hawai'i at Manoa, USA*)

Introduction : Although often aggregated together, Asian Americans (AA) and Pacific Islander populations in the US are considerably different. Generally, Native Hawaiians and Other Pacific Islanders (NHOPIs) have generally poorer socio-economic and health outcomes than most of the AA groups. In Hawaii, for example, life expectancy for Japanese, Chinese, and Korea residents is 9-13 years longer than for Native Hawaiian and Samoan residents. This study examines the health and mental health status of NHOPI elders in the US. **Method :** Using 2010 US Census Bureau data, the study investigated and compared socio-demographic characteristics of NHOPI elders, including population, age, gender, household income, disability status, comparing with that of the overall US population. In addition, Hawaii Health Survey data was used to explain health and mental status and relevant programs for NHOPI elders. **Results :** The study found that many NHOPI elders generally live in a poorer condition than do the general elderly and that they are economically vulnerable. Also, NHOPI elders suffer from higher rates of diabetes, dementia, as well as higher rates of demoralization, depression and low self-esteem. Vulnerability to physical and mental illnesses among NHOPI elders is associated with the highest rate of suicide in the AAPI elder population. **Conclusion :** Our findings call attention to the urgent need to develop programs that respond to NHOPI cultural beliefs, practices, and strengths, with a goal of increasing the appeal, accessibility, and timely use of health and social services. Further research is indicted to develop assessment measures and services that culturally tailor evidence-based and best practice interventions. **Keywords :** Native Hawaiian and Pacific Islander Elders, Health, Demography

PP25 S-046 EFFECTS OF SCIENCE-INQUIRY BASED INSTRUCTIONAL MODULE PROGRAM ON HUMAN HEALTH COGNITION FOR THE ELDERLY

Chwen-Chi WANG¹, Jin-Jong CHEN², Chao-Ti HSIUNG¹ (1. *Department of Science Education, National Taipei University of Education, Taiwan*; 2. *Department of Physical Therapy and Assistive Technology, National Yang-Ming University, Taiwan*)

Introduction : This study aimed to compare the effects of science-inquiry based instructional module program (SI) with traditional health education (HE) on human health cognition for the elderly. **Method :** Thirty-two community-dwelled apparent healthy elderly were recruited as volunteered subjects. All subjects were allocated into SI group (N=21, 73.0±6.0 y/o) and traditional HE group (N=11, 74.2±7.6 y/o). Body weight, height, and waist of both groups were measured to evaluate their body compositions. SI composed of lecture, demonstration, practice, and discussion was designed based on mastery learning theory for this special population. Density concept was introduced to illustrate the meaning of BMI and waist circumference. A six-item body composition related human health cognition (HHC) test was conducted before and after the intervention, and evaluated by one-way ANOVA with repeated measures. **Results :** After 90 minutes intervention, the SI group demonstrated significant improvements on total score of HHC test (3.43±.98 vs. 5.43±.98, P<.001), majorly on knowing (P<.001) and applying (P<.001). But, the

HE group kept their baseline HHC test total score level (3.45 ± 1.04 vs. 4.09 ± 1.30). Regarding acceptance to the SI program, 100% of SI subjects considered it as helpful ($n=8$) or very helpful ($n=13$). Conclusion : The results revealed that science-inquiry based instructional module program was a feasible and effective on human health cognition for community-dwelled apparent healthy elderly. Keywords : science-inquiry, health cognition, elderly

PP25 S-047

PSYCHOSOCIAL CORRELATES OF COLORECTAL CANCER SCREENING IN CHINESE OLDER ADULTS

Doris Y.P. LEUNG, Eliza M.L. WONG, Terry K.S. WONG, Carmen W.H. CHAN (*Nethersole School of Nursing, The Chinese University of Hong Kong, Hong Kong*)

Introduction : Colorectal cancer (CRC) is prevalent among older people. Screening for CRC presents a cost-effective secondary prevention and control strategy which results in a significant reduction in mortality. Psychosocial constructs are widely used to predict CRC screening and are targets for interventional studies as they are amenable to change. This study aims to explore psychosocial correlates of CRC screening in Chinese older people. Method : A convenience sample of 223 community-dwelling adults aged ≥ 60 was recruited in May-July in 2012 in Hong Kong. Volunteers were asked to complete a questionnaire which collected information on demographic variables, CRC-related psychosocial variables and whether had a CRC screening in the past 10 years. Logistic regression analysis with backward elimination was performed to identify factors associated with CRC screening. Results : Their mean age was 75.1 years old ($SD=7.5$), 80.0% were female, 59.4% were married, 24.4% had no education and 24.7% had CRC screening. Seven variables were found to be significantly associated with CRC screening in bivariate analyses and were included in the logistic regression model. Results of logistic regression revealed that participants with lower perceived psychological barriers ($OR=0.18$; $p<0.001$) and severity-fear ($OR=0.56$, $p=0.02$) were more likely to have CRC screening. Conclusion : Perceived barriers and severity seemed to be important correlates of CRC screening in Chinese older adults. However, similar to many studies in the Chinese populations, we also found perceived severity was negatively correlated with CRC screening. Further studies are needed to explore the reasons for the negative association between perceived severity and uptake of CRC screening. Keywords : Colorectal Cancer Screening; Psychosocial Correlates; Older Adults

PP25 S-048

COLORECTAL CANCER SCREENING BEHAVIOR AMONG OLDER KOREANS: DIRECTIONS TOWARD REDUCING CANCER HEALTH DISPARITY

Hee LEE, Mihwa LEE (*School of Social Work, University of Minnesota, Twin Cities, USA*)

Introduction : Screening for colorectal cancer is underutilized in Korea. This underutilization of cancer screening has led Koreans to have higher incidence and mortality rates of colorectal cancer. Although cultural attitudes and health beliefs have been considered to be critical factors impacting colorectal cancer screening behaviors, there is a dearth of empirical study on this topic in Korea. This study, therefore, examines sociocultural factors influencing colorectal cancer screening behaviors among older Koreans. Method : To explore the role of culture and health beliefs (the latter by means of the Health Belief Model) in colorectal cancer screening behaviors, a structured questionnaire was administered with 385 Korean older adults aged 50 and over residing in Seoul and Kwangju in Korea. Results : Results

showed that only 40% of the sample had undergone a fecal occult blood test within the past year, and a mere 33% of the respondents had received a sigmoidoscopy and/or a colonoscopy within the past five years. Logistic regression analyses revealed significant predictors that included not only constructs of the health belief model, but also cultural beliefs and attitudes about colorectal cancer screening. Conclusion : The findings reinforce a need for developing an intervention program that targets culture-specific barriers in order to increase colorectal cancer screening. Furthermore, a community education program aimed to increase older Koreans' knowledge and benefit of colorectal cancer screening should be implemented as a part of the intervention program. Keywords : Colorectal cancer, screening, culture

PP25 S-049

THE EFFECT OF ETHNIC MUSIC ON PSYCHOPHYSIOLOGICAL RESPONSES IN ELDERLY WITH DEPRESSED MOOD

Hui-Ling LAI¹, Yin-Ming LI², Chiung-Yu HUANG³ (*1. Department of Nursing, Tzu Chi University/Buddhist Tzu Chi General Hospital, Taiwan; 2. Department of Family Medicine/Department of Nursing, Buddhist Tzu Chi General Hospital/Tzu Chi University, Taiwan; 3. Department of Nursing, I-Shou University, Taiwan*)

Introduction : Since 2009, Taiwan has had the second most rapidly aging population in the world. This has naturally been accompanied by an increase in the number of elderly people with depressed mood. Music is considered an adjuvant therapy to heal patients. However, the efficacy of Taiwan ethnic music on psychophysiological responses has not been studied yet, which has resulted in uncertain clinical significance and limited its applications in clinical settings. Hence, we examined the effects of listening to their own classified ethnic music on psychophysiological parameters (heart rate variability, blood volume pulse, depression scores) in community residing elderly people. Method : This was a one-group repeated measures design for 32 subjects aged 55-76 years who participated in focus groups to classify Taiwan ethnic music classification into four quadrants according to the Thayer Model. Subjects were individually listening to the first quadrants music for 20 minutes in the research room. The music was pleasure, happy, and excited with music tempo between 100 and 130 beat/min. Subjects' heart rate variability and blood volume pulse were continuously measured by medical device for 20 minutes. Generalized estimating equation analyses were used to examine the differences within group. Results : Subjects' heart rate variability, blood volume pulse and depressive scores were significantly decreased after the subjects listening to the fourth quadrants ethnic music (all $p < 0.01$). Conclusion : Our results provide evidence for the beneficial effects of first quadrant Taiwan ethnic music on heart rate variability, blood volume pulse, and depressive scores of the community-residing elderly people. Keywords : music, psychophysiological parameters, Taiwanese elderly

PP25 S-050

THE EFFECTS OF PERCEIVED NEED AND ACTUAL MENTAL HEALTH STATUS ON MENTAL HEALTH SERVICE USE AMONG OLDER ADULTS IN THE US

Hyo Jung LEE, Elizabeth DUGAN (*Gerontology Department, McCormack Graduate School of Policy and Global Studies, University of Massachusetts Boston, USA*)

Introduction : The use of mental health services is related to how one perceives his/her mental health. Yet, self-perception is not always accurate and may lead to over or under-utilization of care. This study

examined the impact of discrepancies between self-perceived need and actual mental health status on mental health service use, focusing on depression and memory decline. Method : Data from the 2010 Health and Retirement Study were analyzed (n=9547). Subjects age 65 and older reported on their self-perceived mood and memory status. CESD and TICS measured current actual mood and memory status. Descriptive analysis and multinomial logistic regression were conducted. Results : We found that 12% and 30% of older adults in the US had inaccurate perceptions on their depression and memory status. Older adults who perceived that they were depressed are more likely to take medications for depression regardless of current depressive symptoms that they had (OR=3.075 and OR=4.831). Those who did not perceive depression but had current depressive symptoms were more likely to take medications for depression (OR=2.845), compared to those who did not perceive depression and had no current symptoms. Among those who took medications for memory decline (n=119), 14.7% perceived no memory decline and had no actual memory decline, while 20.6% perceived no memory decline but had actual memory decline. Also, 36.3% of those who took medications for memory decline perceived memory decline but did not have actual memory decline. Conclusion : Thus, providing evidence that discrepancies between perception and actual status contributes to both over and under-utilization of mental health care. Keywords : Depression, memory decline, mental health service use

PP25 S-051

ARE WORK CONDITIONS MORE THAN 20 YEARS EARLIER ASSOCIATED TO COMPLEX AND SEVERE HEALTH PROBLEMS AFTER RETIREMENT AGE?

Ingemar KAREHOLT, Alexander DARIN MATTSSON, Bettina MEINOW (Aging Research Center, Karolinska Institutet and Stockholm University, Sweden)

Introduction : Complex and severe health problems are increasingly common as age increases. Most people spend a large proportion of their life at work. Work conditions may therefore be associated with health at older ages. AIM: To study the association between complex and severe health problems and physical and psychological work conditions. Method : DATA: Swedish nationally representative samples, interviewed in 1968, 1981, and 1991. Survivors aged 77+ where reinterviewed, those from the 1968 baseline in 1992, those from 1981 in 2002, and those from 1991 in 2011, resulting in a 20-24 years follow up time. These three surveys have been pooled (n= 1598). ANALYSES: Binary and ordered logistic regressions. VARIABLES: Complex health problems were based on having severe problems in three domains: diseases/symptoms, mobility, and cognition/communication. Having severe problems in at least two domains was considered as complex health problems. We analyzed the number of domains with severe problems and each domain separately. Indexes of work conditions: 1) heavy work conditions e.g. heavy lifting and physically exhausting; 2) exposure to dust/gas; 3) psychological (flexibility, autonomy, psychological exhausting, monotonous work tasks); 4) number of days with night work. Results : Heavy work was associated with complex health problems, number of domains with severe problems, problems with cognition/communication, and diseases/symptoms. Exposure to dust/gas was associated to severe mobility problems. We found no associations for psychological work conditions and night work. Conclusion : There are long term effects of work conditions, e.g. having a physically heavy work, on health after retirement age. Keywords : Complex health problems,, Work conditions, Longitudinal

PP25 S-052

EFFECTS OF CIRCUIT TRAINING ON PHYSICAL PERFORMANCE AND BODY COMPOSITION FOR THE FRAIL ELDERLY

Jin-Jong CHEN¹, Tzu-Chiao LIAO¹, Ku-Chou CHANG², Hsuei-Chen LEE¹ (1. Department of Physical Therapy and Assistive Technology, National Yang-Ming University, Taiwan; 2. Division of Cerebrovascular Diseases, Department of Neurology, Chang Gung Memorial Hospital, Taiwan)

Introduction : This study aimed to compare the effects of a 12-wk “combined aerobic and resistance circuit exercise program” and a “chair-based exercise program” with “usual care” on physical performance and body composition for the frail elderly. Method : A mass frailty screening using the Fried frailty criteria was conducted to recruit subjects. Sixty-nine subjects were allocated into circuit training (CT) group (N=23, 77.0±8.8 y/o), chair-based (CB) exercise group (N=23, 81.1±9.8 y/o) and control group (CG) (N=23, 81.9±7.6 y/o). Physical performance and body composition were measured before and after the intervention, and evaluated by mixed-design two-way ANOVA with repeated measures. Results : After 12-wk intervention, the CT group demonstrated significant improvements on functional reach test (P=.016), grip strength (P<.001), knee extensor strength (P<.001); upper limb (P<.001) and lower limb endurance (P<.001), 6-minute walking distance (P<.001), as well as 5-m walking time (P=.008). The CB group kept their baseline physical performance level. In contrast, the CG group revealed significant decline on grip strength (P= .016), upper limb endurance (P=.029) and 6-min walking distance (P=.022). Regarding body compositions, the CT group kept their muscle mass while both CB and CG group demonstrated significant loss (P<.05). Conclusion : Our study demonstrated that there was a dose?response effect of exercise training, and CT program was feasible and effective for frail elderly of advanced age. Keywords : Circuit training, body composition, frail elderly

PP25 S-053

MEDICATION TAKING STRATEGY USE AMONG THE ELDERLY: IMPLICATIONS FOR MEDICATION ADMINISTRATION DEVICE DESIGN

Joan Julia BRANIN¹, Gloria JUAREZ² (1. Center for Health & Aging, University of La Verne, USA; 2. Nursing Research and Education, City of Hope, USA)

Introduction : Data from the WHO indicate that approximately 50% of all medications are being taken by the elderly, with 34% of the elderly taking three or more prescription daily. Nonadherence and errors in self-administration of medications are common and often lead to serious medical problems. The purpose of this research was to investigate the type of medication taking strategies used by older adults and its effect on medication administration device design. Method : One hundred-ninety seniors living independently in the community participated in the survey. Results : Participants were predominantly high school educated (58%) Caucasian (86%) women (78%) who were married (51%) and between 75-84 years of age (43%) living independently in the community. Older adults reported using more external memory strategies than internal memory strategies in their medication adherence behaviors. External strategies involve physical changes to the environment whereas internal strategies involve mental activities either to improve the quality of information encoding or improve the search for already encoded information. Use of a dated pillbox and other devices were the external memory strategy used most frequently (31%). Relating the taking of medication to one's routine was the internal memory strategy used most frequently (25%). There was a significant difference in preference for event-based

medication instructions (take with meals) over time-based medication instructions (take three times a day). Conclusion : These findings suggest that the type of strategy used by older adults in adhering to their medication regimen can impact the design of medication administration devices and be a major predictor of medication adherence. Keywords : medication adherence, medication administration devices

PP25 S-054

THE DEVELOPMENT AND OUTCOME OF AN ACTIVITY PROGRAM AT A NURSING HOME WITH THE MODE OF THE UNIT CARE IN TAIWAN

Ju-Huey WEN (*Department of Social Work, Chia Nan University of Pharmacy and Science / Department of Education, National University of Tainan, Taiwan*)

Introduction : Due to the development of and advances in medical technology and living conditions, the elderly population in Taiwan has already reach to 11.02% of the total population by 2012. A major cause of decline in the elderly is “activity reduction” or “lack of exercise taking” which has been ignored in their daily lives. This study presents the development and outcomes of an activity program which was conducted in a nursing home with the mode of the unit care in southern Taiwan. The space of care unit was utilized to provide small size activities to enhance the physical mobility and social interaction of elderly in their daily lives. Method : The activity program includes four unit activities: traditional childhood game, cooking, art crafting, and cheese unit activities. The one-group pre-test-post-test design was used and the tools of the Simple Intelligent Examination (MMSE), the Geriatric Depression Scale (GDS) index and the Instrumental Activities of Daily Living Scale (IADL) were conducted for evaluating the outcome of this program. Results : The major findings of this study showed that 80% (13 elderly) of the total participants’ scores in MMSE, GDS, and IADL were maintained the same level or made some progress within four months. Some elderly were not willing to attend activities because of the bad weather. Conclusion : A small-scale designed activity program in the care unit could promote elderly participation in activities that suit their physical and mental condition and also increase the interaction between the elderly and the nursing home staff. Keywords : nursing homes, elderly, activity

PP25 S-055

FACTORS ASSOCIATED WITH ANTIRETROVIRAL THERAPY NONADHERENCE IN OLDER ADULTS WITH HIV IN THE US

Katryna MCCOY¹, Louis GROTHAUS², Robert HARRISON², Sheryl CATZ², Christine MAHONEY² (*1. Health Sciences, Division of Nursing, Winston Salem State University, USA; 2. Center for Health Studies, Group Health Research Institute, USA*)

Introduction : By the year 2015, approximately 50% of US individuals infected with HIV will be over age 50. The advent of antiretroviral therapy (ART) has contributed to a significant decrease in deaths from HIV/AIDS in the US, yet Americans aged 50 years or older have continued to have higher mortality when compared to their younger counterparts. As more older adults confront the challenges associated with living with HIV/AIDS, an understanding of the complex psychosocial factors that impact adherence to ART regimens in this population becomes more urgent. The purpose of this study was to explore gender and racialized differences in psychosocial factors associated with antiretroviral therapy nonadherence and treatment adherence self-efficacy among HIV+ adults ages 50 years and older. Method : This descriptive study involved a secondary analysis of

baseline data collected from 426 African American (n=87 women and 168 men) and White American (n=30 women and 141 men) participants in the “PRIME” study, a telephone-based antiretroviral therapy adherence and quality of life intervention trial in older Americans living with HIV. Predictor variables included demographics factors, HIV-disease related factors, and psychosocial factors. Outcome variables included self-reported ART nonadherence and treatment adherence self-efficacy. Cross-sectional analyses of baseline data involved descriptive statistics, comparisons and analysis of covariance. Results : Neither ethnic nor gender differences contributed to the differences in ART nonadherence nor treatment self-efficacy across the different ethnic/gender groups. Conclusion : As the number of people ageing with HIV increases, factors that influence their ART nonadherence warrant further evaluation to encourage effective self-management of HIV. Keywords : antiretroviral therapy, adherence, older adults

PP25 S-056

IS CONTINUOUS-WALK-DISTANCE ASSOCIATED WITH TRUNK PERTURBATION DURING WALKING AND MOTOR FUNCTION IN COMMUNITY-DWELLING OLDER PEOPLE?

Keisuke YASUDA¹, Hikaru IHIRA¹, Atsushi MIZUMOTO¹, Keitarou MAKINO¹, Mika KIMURA², Hyuma MAKIZAKO³, Takeshi SASAKI⁴, Taketo FURUNA⁴ (*1. Graduate School of Health Sciences, Sapporo Medical University, Japan; 2. International Life Sciences Institute Japan, ILSI, Japan; 3. Department for Research and Development to Support Independent Life of Elderly, Center for Gerontology and Social Science, National Center for Geriatrics and Gerontology, Japan; 4. Department of Physical Therapy, School of Health Sciences, Sapporo Medical University, Japan*)

Introduction : The decline of the motor function and the increase of the trunk perturbation during walking may shorten older people’s continuous-walk-distance. The purpose of this study was to determine whether continuous-walk-distance was associated with trunk perturbation during walking and motor function among community-dwelling older people. Method : This study included men and women aged 65 and older, independent in activities of daily living and walking. Continuous-walk-distance without rest was evaluated by a self-reported questionnaire. After that, reported continuous-walk-distance was treated as dummy variables (0: 1km or more, 1: less than 1km). Root Mean Square (RMS) of trunk resultant acceleration during walking was calculated to provide an indicator of trunk perturbation. In addition, trunk flexion and extension strengths, knee extension strength, one-leg standing time, functional reach test (FRT) and timed up & go test were assessed. Results : Thirty seven persons were able to walk 1km or more and 16 persons were not able to walk 1km. Average RMS was 2.0±0.3G. With reference to multiple logistic regressions analysis (method of increasing and decreasing the variables) controlling for age, sex and body mass index, continuous-walk-distance was predicted by FRT (OR=0.84 [95%CI: 0.73-0.97]) and RMS (OR=12.70 [95%CI: 1.04-154.60]). Conclusion : Our result showed that older people who were not able to walk 1km or more had a decline of balance function and performed increased trunk perturbation during walking. Keywords : acceleration, continuous-walk-distance, motor function

PP25 S-057

THE ASSOCIATION BETWEEN GOING OUTDOORS DAILY AND PHYSICAL FUNCTIONS IN COMMUNITY-DWELLING OLDER ADULTS

Keitaro MAKINO¹, Hikaru IHIRA¹, Atsushi MIZUMOTO¹, Keisuke YASUDA¹, Taketo FURUNA² (*1. Graduate School of Health*

Sciences, Sapporo Medical University, Japan; 2. School of Health Sciences, Sapporo Medical University, Japan)

Introduction : It is reported that going outdoors daily is associated with maintaining the activities of daily living in community-dwelling older adults. The aim of this study was to determine the association between going outdoors daily and physical functions in community-dwelling older adults. **Method :** One hundred and two healthy older adults (35 men, 67 women, mean 74.3± 5.4 years) participated in this study. The going outdoors daily as main outcome was investigated the frequency of going outdoors per week. Grip power, knee extension power, abdominal muscle function, one-leg standing time, functional reach test, hip walking and 5m walking speed were also measured as physical functions. Pearson's correlation coefficients were used to assess relationships between going outdoors daily and each physical performance parameter. A stepwise multiple-regression analysis was also used to determine the relative contribution of going outdoors daily. **Results :** The mean frequency of going outdoors were 5.14 day per week. The stepwise multiple-regression analysis revealed that the going outdoors daily could be explained by the functional reach test and hip walking distance, this variable explained 20%. **Conclusion :** The results suggest that going outdoors daily is associated with dynamic balance and mobility function on the floor among community-dwelling older adults. **Keywords :** Going outdoors daily, Physical functions, Hip walking

PP25 S-058

RELIGIOUSNESS OF THE ELDERLY OF THE CITY OF PORTO ALEGRE

Laura Brenner MARIANO DA ROCHA, Nair Monica Ribacik NASCIMENTO, Patricia Chagas DURGANTE, Irenio GOMES, Yukio MORIGUCHI (*Geriatrics and Gerontology Institute, PUCRS, Brazil*)

Introduction : Religiousness and spirituality have been the subject of a growing interest among clinicians and researchers in the area of health. Hundreds of studies have been published investigating the relationship between religious involvement and physical and mental health. These studies indicate a positive association between religiousness and better health and quality of life. **Method :** This research was conducted with the elderly population of the city of Porto Alegre, aged over 60 years and 1078 individuals were included. An objective questionnaire was used containing general demographic, social, cultural and economic characteristics as well as health and daily living. **Results :** The sample consisted of 1078 elderly: 304 men (28.2%) and 774 women (71.8%). The mean age of the sample was 72 years, mostly Caucasian 879 (82.7%), widowed 417 (39.2%) and married 388 (36.5%). Most elderly received a monthly income of up to 3 minimum wages. More than half of the sample was born in the urban area 658 (61.9%). Most of the sample (72.3%) reported being Catholic and 62.9% practiced their religion. Almost half of the elderly (47.8%) reported not having changed in relation to religion over the years while 37.9% said they had become more religious and 12.5% less religious. When asked about some psychogeriatric issues we found higher positive responses in the group who does not practice its religion on questions relating to happiness and well being. **Conclusion :** Since religion has multiple connections to health, is very important to understand the distribution of religiosity in populations and its relation to health and quality of life. **Keywords :** religiousness, elderly, health

PP25 S-059

EFFECTS OF 3 SESSIONS OF PHYSICAL EDUCATIONAL CLASS COMBINED WITH 12 WEEKS HOME-BASED

EXERCISE PROGRAM ON IMPROVING PHYSICAL FITNESS IN MILD STROKE OUTPATIENTS

Long Pio CHIO¹, Ku Chou CHANG², Hsuei Chen LEE¹, Pei Jhen LEE³, Yu Ching HUANG², Jin Jong CHEN¹ (*1. Department of Physical Therapy and Assistive Technology, National Yang-Ming University, Taiwan, Taipei, Taiwan; 2. Division of Cerebrovascular Diseases, Department of Neurology, Kaohsiung Chang Gung Memorial Hospital, Taiwan, Taiwan; 3. Department of Rehabilitation Medicine, Kaohsiung Chang Gung Memorial Hospital, Taiwan*)

Introduction : This study aimed to investigate the effectiveness of the physical educational class for the mild stroke outpatients on improving the physical fitness on 12th week and 24th week. **Method :** This was a quasi-experimental study. Exercise group received 3 sessions of supervised physical educational class during the visit of the regular OPD consultation (1 session/month) with 12-week home-based exercise program. Each class included strengthening, cardiopulmonary fitness and balance training for 40 minutes. Control group received one exercise consultation session during the first visit. Outcome measures contain body composition, muscle strength, 6-minute walk test (6MWT), 10 meter walk time (10MWT), flexibility and Berg balance scale (BBS). Measurements were conducted at baseline, 12th week for both groups and 24th week for the exercise group. **Results :** One hundred and five stroke patients were recruited: 51 in exercise group and 54 in control group. There were 84 males and 21 females; 62.5±9.2 years. After 12 weeks, the exercise group demonstrated greater improvements than the control group on most outcomes including waist circumference (-1.4 vs. 0.2 cm, P=.004), 6MWT (-71.5 vs. -29.4 meter, P=.001), 10MWT (-1.73 vs. -0.28 sec, P=.001), upper limb strength index (lb/kg, -0.25 vs. -0.10, P=.001), lower limb strength index (lb/kg, -0.48 vs. -0.20, P=.002), and BBS (-1.59 vs. -0.04, P=.001). Exercise group maintained the fitness gain in 6MWT, 10MWT, lower limbs strength, and BBS at 3 months after the intervention. **Conclusion :** Physical educational class combined with home exercise program improved physical fitness for those mild stroke outpatients. These kinds of intervention also have the lasting effect on several outcomes. **Keywords :** stroke; physical fitness; outpatient

PP25 S-060

AN INTERPROFESSIONAL COLLABORATIVE NETWORK TO ADDRESS OLDER ADULT ORAL HEALTH

Sharon COMPTON¹, Minn YOON¹, Joanne CLOVIS², Sandra COBBAN¹ (*1. Dental Hygiene, University of Alberta, Canada; 2. Dental Hygiene, Dalhousie University, Canada*)

Introduction : Poor oral health significantly increases the risk for developing systemic diseases. Poor oral health is of growing concern considering the increasing number of older adults who are retaining their teeth longer, and who may be dependent for oral care such as those who reside in long-term care facilities. **Method :** A Canadian symposium hosting a collaborative network of various stakeholder groups involved in addressing older adult oral health (dental health researchers and practitioners; nurse researchers and practitioners; Speech Pathology; Occupational Therapy; geriatricians; frontline caregivers; policy makers; long-term care facilities; seniors advocates), facilitated the sharing of knowledge between researchers and knowledge users in the area of older adult oral health. **Results :** Using the Knowledge-to-Action framework, the presentation will specifically focus on the knowledge creation cycle and the tailoring of knowledge into areas of action produced by the various stakeholders. **Conclusion :** An interprofessional network collaborating on the development of strategies related to older adult oral health policy, practice and

research can provide a foundation to address disparities in this population. Keywords : oral health, interprofessional, knowledge translation

PP25 S-061
EFFECT OF ENVIRONMENTAL AND LIFESTYLE FACTORS ON HYPERTENSION IN AN AGING REGION IN JAPAN: SHIMANE COHRE STUDY

Tsuyoshi HAMANO¹, Yoshinari KIMURA², Miwako TAKEDA³, Masayuki YAMASAKI³, Minoru ISOMURA⁴, Toru NABIKA⁴, Kuninori SHIWAKU³ (1. Center for Community-based Health Research and Education (COHRE), Organization for the Promotion of Project Research, Shimane University, Japan; 2. Department of Geography, Graduate School of Literature and Human Sciences, Osaka City University, Japan; 3. Department of Environmental and Preventive Medicine, Shimane University School of Medicine, Japan; 4. Department of Functional Pathology, Shimane University School of Medicine, Japan)

Introduction : In recent years, there has been growing evidence of an association between residential remoteness and hypertension. However, no study has examined the effect of residential remoteness-lifestyle associations on hypertension. The aim of this study was to examine the effect of residential remoteness, measured by road network distance and elevation, and lifestyle (i.e. access to private car) on hypertension in an aging region in Japan. Method : This is a cross-sectional population-based study. We analyzed data from the Shimane COHRE study conducted from 2006 to 2009 in the rural mountainous regions of Japan. After excluding missing data, we conducted a logistic regression analysis of the data for 1,348 individuals. Results : In subjects without access to car use, the odds ratios for self-reported hypertension were significantly increased in those living in moderate (odds ratio (OR): 2.21, 95% confidence interval (CI): 1.19-4.08) and far (OR: 2.55, 95% CI: 1.00-6.51) road distances, whereas there were no significant associations in subjects with access to car use. There were no significant associations between elevation and hypertension for participants either with or without access to car transportation. Conclusion : Our findings show that the specific residential remoteness-hypertension associations differ by dairy transport, measured by access to private car, in an aging region in Japan. These results implicate that the more understanding are needed to consider the effect of residential environment in establishing health policy for coming aging society. Keywords : Residential environment, Geographic information systems, Hypertension

PP25 S-062
AN FACTOR ANALYSIS EFFECTED THE LIFE SATISFACTION AND SELF-ESTEEM FOR THE DISABLED ELDERLY POPULATION IN KOREA

Nan Hee YEE (Health Policy Division, Korea Institute for Health and Social Affairs, Korea)

Introduction : With growing the number of elderly population over the world, grows the concern about the elderly. So researchers have done analysis of the health behavior for the elderly population. Especially, the quality of life for the disabled aged is likely to effects the health behaviors. This research will identify the Satisfaction of Lives and Self-esteem for the Disabled Elderly Population in Korea. Method : Frequency, Chi-square, Multiple Logistic Regression Data: Korea Welfare Panel Study. Results : This research will analysis Factors effected the Life Satisfaction and Self-esteem for the Disabled Elderly Population in Korea. Conclusion : The conclusions of this study identify factors effected the life satisfaction and self-esteem for the

aged and propose programs development health behaviors for the elderly population. Keywords : The aged. Self-esteem, life satisfaction

PP25 S-063
DEPRESSION IN JAPANESE ELDERLY PEOPLE WITH LOW-INCOME WAS INFLUENCED FROM SOCIAL SUPPORT AND HABITUAL EXERCISE

Naoto KAMIDE¹, Noriko YAMASHINA², Akie KAWAMURA¹, Yoshitaka SHIBA¹ (1. School of Allied Health Sciences, Kitasato University, Japan; 2. Graduate School of Gerontology, J.F. Oberlin University, Japan)

Introduction : Elderly people with low income have a tendency to show depression. The aim of this study was to investigate physical, social and lifestyle factors which influence depression in Japanese elderly people with low income. Method : The participants in this study were people aged 60 years and older living independently in public apartments for low-income people in Kanagawa, Japan. Depression was assessed using the five-item version of the Geriatric Depression Scale (GDS-5), where a higher score indicates severe depression. Instrumental self-maintenance ability was investigated as physical factor using the subscale of the TMIG index of competence. Social network and social support were assessed as social factors by abbreviated Lubben Social Network Scale (LSNS-6) and a short version of Multidimensional Scale of Perceived Social Support (MSPSS), respectively (a higher score indicates a larger social network in LSNS-6, and a strong social support in MSPSS). Housebound status and habitual exercise were investigated as life-style factors. Age, sex and cohabitation status were also investigated. All investigations were performed by questionnaire. Results : 276 subjects (70.8±5.8 years old, men 40.2%) were included in this analysis. Significant negative relationships were found between GDS-5 and MSPSS, and habitual exercise from the results of multiple logistic regression analysis. Other factors were not significantly related to GDS-5. Conclusion : Our findings suggested that in elderly people with low-income, strong social support and regular exercise decrease the likelihood of depression. Our findings may provide useful information for prevention of depression in elderly people with low income. Keywords: Depression, Social support, habitual exercise

PP25 S-064
OCCUPATIONAL COMPETENCE AND QOL IN ELDERLY JAPANESE PEOPLE WHO LIVE AN INDEPENDENT LIFE

Norikazu KOBAYASHI¹, Takashi YAMADA², Hironori KAWAMATA³, Yu ISHIBASHI³, Atsuko TANIMURA¹, D. Yoshikazu ISHII¹ (1. Graduate School of Human Health Sciences, Tokyo Metropolitan University, Japan; 2. Graduate School of Rehabilitation Sciences, Mejiro University, Japan; 3. Faculty of Health Sciences, Tokyo Metropolitan University, Japan)

Introduction : The purpose of this study was to clarify the features of the occupational competence in elderly Japanese people living independent. Competence appears to begin with organizing one's life to meet basic responsibilities and personal standards and extends to meeting role obligations and then achieving a satisfying and interesting life (Kielhofner & Forsyth, 2001). Method : 205 healthy Japanese persons (aged 65 to 85 years) completed the Occupational Self Assessment Revised (OSA), the WHO-QOL26 and the SF-36. OSA is a two-part self-rating form, was assumed to be an index of the occupational competence. Section one includes a series of statements about occupational functioning (21 items), to which clients respond by labeling each in terms of how well they do it using a four-point scale. Rasch analysis was used to calculate the item difficulty of the each

item and the capability value(C-value) of the objected person. Results : The item difficulty was shown. Item with high difficulty included “Effectively using my abilities”, “Expressing myself to others” and “Accomplishing what I set out to do”. Conversely, item with low difficulty included “Managing my basic needs” and “Managing my finances”. The average score of the C-value in the participants was 62.4 with a standard deviation of 6.9. There was statistically significant correlation between any of the QOL & Health score and the C-value. Conclusion : This result suggests the occupational competence have relation to life satisfaction and health. Thus, we obtained an important perspective on preparing occupational therapy intervention programs aiming to promote the health of elderly people. Keywords : health promotion, aged person, Occupation Therapy

PP25 S-065

THE ROLE OF ELDERLY HEALTH PROGRAMME (POSYANDU LANSIA) TO ELDERLY HEALTH STATUS. OBSERVATIONAL STUDY IN SUB DISTRICT DIWEK JOMBANG JAWA TIMUR INDONESIA

Novira WIDAJANTI¹, Lilik DJUARI², Yudha HARYONO³, Erikavetri ERIKAVITRI³ (1. Subcommitee Geriatric of dr Soetomo Hospital, PERGEMI, PAPDI, Indonesia; 2. Community Medicine - Dept. of Public Health, Faculty of Medicine Airlangga University, IDI, Indonesia; 3. Subcommitee Geriatric of dr Soetomo Hospital, IDI, Indonesia)

Introduction : In Indonesia, elderly health programme (Posyandu Lansia) is the development of government policies through the health service for the elderly which operate through the program of the health center by involving the elders, families, community leaders and social organizations in its implementation. Level of development of Posyandu Lansia, divided into four groups from the lowest to highest level (pratama, madya, purnama, and mandiri). Health services in it including physical and mental health, with card records and monitoring to determine early disease or health problem facing threats. Method : To describe the elderly health status between Posyandu Lansia Mandiri (PLM) and Purnama (PLP) groups. This was an observational study, which conducted on 30 individuals aged 60 years above in each group. The data included age, gender, education, marital status, comorbidities, functional status by Barthel ADL, Cognitive status by MMSE, Mental status by GDS, Nutritional status by MNA. Results: In PLM 56.7% female, 70% in range of age 60-74 y.o, In PLP; 56.7% male, 63.3% in range of age 60-74 y.o. In PLM; the comorbidity 18/30 diabetes, B-ADL 20/30 were independent, Mild Cognitive Impairment were 24/30, risk of malnutrition was 6/30, and no depression. In PLP; the comorbidity were 20/30 hypertension, B-ADL 11/30 were independent, Mild Cognitive impairment were 28/30, the risk of malnutrition was 12/30, GDS showed 2/30 depression. Conclusion : The elderly health status in highest level of development of Posyandu lansia more better than in lower level. Posyandu Lansia could improve elderly health status. Keywords : Posyandu lansia, health status, elderly

PP25 S-066

OLDER GENERATION AS AN ECONOMIC AND SOCIAL RESOURCE OF NATIONAL CAPACITY

Olga MIKHAILOVA, Vladimir KHAVINSON, Lenar KOZLOV, Vera BASHARINA (Biogerontology, Saint Petersburg Institute of Bioregulation and Gerontology, Russia)

Introduction : According to UN experts demographic tendencies may produce considerable impact on economy, social sphere and safety of Russia. Every fifth Russian citizen is a pensioner. During recent 10

years the number of pensioners increased by 2 mln. and reached 31.8 mln. (22%). Life expectancy increased by 5 years during 2006-2011 and made 64,3 years for men and 76,1 years for women. Method : This disequilibrium should be considered during policy formulation. Extension of the pension age being the lowest in Europe is critical for Russia. It could be gradient retirement with decreased working time down to 6, 4 and 2 hours per day correspondingly. Education of all professionals and policy-makers in ageing is crucial. Results : Very instrumental in this respect seems to be the initiative of the Government of Saint Petersburg in collaboration with our Institute to have organized under the auspices of the Russian Health Ministry International Forum “Senior Generation” which provides a platform for experts from governments, research institutions, NGOs, business and civil society to exchange knowledge, experience and good practices at the regional, local and international levels. The Forum provides unique opportunities to highlight the achievements for the elder people in the fields of education, social support and health. It is a useful tool for promoting evidence-based research in various areas of ageing for its furtherance in the shape of policies. Conclusion : A lot has been done in Russia to meet the challenges of the ageing society, however, there is even more room for new efficient undertakings. Keywords : aging society, quality of life, social support and health

PP25 S-067

PREVENTIVE BEHAVIOR OF THE ELDERLY IN GERMANY

Peter ENSTE, Sebastian MERKEL, Josef HILBERT (Institute for Work and Technology, Westfaelische Hochschule, Germany)

Introduction : Successful prevention consists of different aspects, which is especially true for the elderly. Two crucial fields are regular physical activities and social interactions. However, up to now only a few studies address the preventive behavior of elderly people. As part of the European project 'Mobility Motivator' it is the goal of our study to close this knowledge gap. Method : We developed a questionnaire to measure the preventive behavior of the elderly. The questionnaire consists of three elements: a socio-economic part, a part measuring the subjective state of health using the SF-36 and a part to address the preventive behavior of the elderly. We used existing and established as well as newly developed scales. We will conduct a pretest to validate the questionnaire. The survey will include to a basic population of 2.000 participants, with an expected rate of return of approximately 15 percent. Results : The survey will provide a broad knowledge of the preventive behavior of the elderly. Using a cluster analysis we expect to identify different types, according to the different attitudes as well as the different needs. A major point of our interest lies in possible correlations between social inequalities and the preventive behavior. The final results will be available in April 2013. Conclusion : We will provide a tool helping to measure preventive behavior of elderly people and which can be used for further studies. Moreover we hope to close the scientific gap of research regarding the preventive behavior of the elderly. Keywords : Prevention, Mobility, subjective state of health

PP25 S-068

HOUSEWORK REDUCES ALL-CAUSE AND CANCER MORTALITY IN CHINESE MEN

Ruby YU, Jean WOO (Department of Medicine and Therapeutics, The Chinese University of Hong Kong, Hong Kong)

Introduction : The effects of non-leisure time physical activity on all-cause and cancer mortality are limited, particularly among the elderly. Method : We studied physical activity in relation to all-cause and cancer mortality in a cohort of 4,000 community-dwelling elderly aged

65 and older. Leisure time physical activity (sport/recreational activity and lawn work/yard care/gardening) and non-leisure time physical activity (housework, home repairs and caring for another person) were self-reported on the Physical Activity Scale for the Elderly. Subjects with heart diseases, stroke, cancer, or diabetes at baseline were excluded. Results : Among the 2,867 subjects with a mean age of 72 years at baseline, 452 died from all-cause and 185 died from cancer during the follow-up period (2001-2012). With the adjustment for age, education level and lifestyle factors, we found an inverse association between risk of all-cause mortality and heavy housework among men, with the adjusted hazard ratio (HR) of 0.72 (95%CI=0.57-0.92). Further adjustment for BMI, frailty index and leisure time activity did not change the result (HR=0.71, 95%CI=0.56-0.91). Among women, however, heavy housework was not associated with all-cause mortality. The risk of cancer mortality was significantly lower among men who participated in heavy housework (HR=0.52, 95%CI=0.35-0.78), whereas among women the risk was not significant. Men participated in light housework also were at lower risk of cancer mortality than were their counterparts, however, the association was not significant. Leisure time activity was not related to all-cause or cancer mortality in the elderly. Conclusion : Heavy housework was associated with reduced all-cause and cancer mortality in older men over a 9-year period. The underlying mechanism needs further study. Keywords : Non-leisure time physical activity, housework participation, elderly

PP25 S-069

LEISURE ACTIVITIES AS A MECHANISM LINKING SOCIOECONOMIC STATUS AND HEALTH: FINDINGS FROM THE JAPANESE STUDY OF AGING AND RETIREMENT

Ryo HIRAYAMA, Tatsuro ISHIZAKI (*Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : Better understanding of mechanisms linking socioeconomic status and health is necessary to resolve structural inequalities in later life. Guided by Hendricks and Hatch's (2006) framework on lifestyle, we examined longitudinally whether the link between these two might be mediated by older adults' level of involvement in health-promoting leisure activities. Method : We used two-wave panel data from 1,928 older adults age 65 and over in the Japanese Study of Aging and Retirement. Focusing on two types of leisure activities (physical and learning activities) and three indices of health status (self-rated health, depressive symptoms, and scores of physical functioning), we conducted path analysis and estimated models separately for each type of activities and for each health index. Results : The anticipated relations among socioeconomic status, leisure activities, and health were observed especially in the models on physical activities. Specifically, income level had a significant positive effect on time spent on physical activities, which then influenced health indices positively both within and across waves. Furthermore, there were significantly positive cross-lagged effects between time on physical activities and all health indices. For learning activities, similar results were obtained except in the model to predict depression. Conclusion : The results suggest that leisure activities function as a mechanism that links socioeconomic status and health in later life. On the one hand, more economic resources available increase older adults' involvement in leisure activities that can promote their health. On the other hand, better health status enables their further participation in such activities. Keywords : Leisure Activities, Socioeconomic Status, Two-Wave Panel Data

PP25 S-070

THE MOTIVES FOR FOOD CHOICE BY ELDERLY JAPANESE LIVING IN THE COMMUNITY: THE DIFFERENCE ACCORDING TO GENDER, AGE, AND LIVING ARRANGEMENTS

Sachiko KATO¹, Hisao OSADA² (*1. Department of Home Sciences and Welfare, Faculty of Home Sciences and Welfare, Kyoto Notre Dame University, Japan; 2. Graduate School of Gerontology, J. F. Oberlin University, Japan*)

Introduction : We should understand the perceived individual motives for food choices by the elderly when developing a health promotion programs. The purpose of the investigation was to measure the motives for food choices by elderly Japanese living in community. And we investigated the difference of the motives for food choice according to gender, age, and the living arrangements. Method : The participants were 244 Japanese elderly people with the higher-level functional capacity. They were 51 male and 193 female, 154 young-old (male; n=30, female; n=124) and 90 old-old (male; n=21, female; n=69), and 60 people living alone (male; n=3, female; n=57), and 184 people living with family (male; n=48, female; n=136). Data collection was conducted using a questionnaire survey method. FCQ-E (Food Choice Questionnaire for elderly; 9 motives, 27 items) was used to measure the motives. Two-way ANOVA without replication test of independence were used to examine. Results : 'Obviousness of quality', 'Weight control', 'Physical well-being', 'Nutrition balance', 'Familiarity', 'Managing relationships', and 'Economical efficiency' were more important in female than males. 'Familiarity' was more important in the people living with family than the people living alone. And 'Physical well-being' was interaction of gender and the living arrangements. 'Sensory/Mood', 'Physical well-being', 'Familiarity' and 'Managing relationships' were more important in the old-old than the young-old. Conclusion : The results of this study suggested that gender difference was large. It is necessary to also see relation with other factors. Keywords : FCQ-E, motives for food choice

PP25 S-071

READY TO ADAPT - SWEDISH OLDER PERSONS' PERCEPTIONS OF PSYCHOSOCIAL IMPACT OF EXISTING AND FUTURE MOBILE HEALTH RELATED ICT APPLICATIONS

Sarianne WIKLUND AXELSSON, Lars NYBERG, Annika NASLUND, Anita MELANDER-WIKMAN (*Health Sciences, Lulea University of Technology, Sweden*)

Introduction : The aim of this study was to describe how older people perceived the psychosocial impact of existing and future mobile health related ICT applications compared with the general ICT usage and the use of health information on the internet. Method : 650 persons, aged 55-105, were randomly selected from the Swedish population register for a survey. Two vignettes that illustrated the use of mobile health related ICT at present and in the future were presented and the psychosocial impact related to the two different vignettes was measured by the instrument PIADS. A total of 154 persons participated, (mean age: 71.9). Results : Mobile health related ICT applications was expected to have an overall positive psychosocial impact and there were significantly higher scores for the vignette that showed futuristic mobile applications. Adaptability was the highest ranked sub-score and advanced age was associated with low self-rated psychosocial impact in relation to both vignettes. Those with experience of general ICT usage and internet for health information scored a higher psychosocial impact. Conclusion : Older adults are from a psychosocial point of view ready to adapt mobile health related ICT and have to some extent already done so in Sweden. This

knowledge is encouraging for future deployment of the services, but a differentiated strategy seems to be of value in order to avoid that the services will be abandoned or rejected by important target groups.
Keywords : health related ICT, older persons, psychosocial impact

PP25 S-072

EXAMINATION OF AN EFFECTIVE AND EFFICIENT HEALTH PROGRAM TO IMPROVE THE NUTRITIONAL STATUS OF COMMUNITY-DWELLING ELDERLY

Shigeko KATAKURA¹, Miki SUGAWARA², Go INUZUKA³, Shouzoh UEKI³, Masako TSUJI⁴, Michiko SUZUKI¹ (1. Faculty of Comprehensive Human Sciences, Shoukei Gakuin University, Japan; 2. Tome Civic Life Part Healthy Promotion Section, Tome City Office, Japan; 3. Faculty of Medical Science & Welfare, Tohoku Bunka Gakuen University, Japan; 4. Faculty of Human Sciences, University of Human Arts and Sciences, Japan)

Introduction : To examine an effective and efficient health program to improve the nutritional status in the community-dwelling elderly. Method : Three kinds of health program [i.e., two intervention groups (high / low frequency) and control group] were conducted for elderly people over 65 living in three areas of Tome, Miyagi (areas A, B, and C). The effects of health programs were assessed based on the levels of serum albumin at the baseline and after intervention. Results : The levels of serum albumin were increased significantly in the high (area A, n=9, paired t-test, p=0.004) and low frequency (area B, n=24, p=0.021) intervention groups. The level of serum albumin in the control group was significantly decreased after intervention (area C, n=9, p=0.005). Interactions between the high or low frequency intervention group and control group were shown by ANOVA after adjustment for the age and sex, but no significant interaction was found between high and low frequency intervention groups. Conclusion : The effects of the health programs to improve the nutritional status were suggested in the high and low frequency intervention groups, and there were no significant difference in the levels of serum albumin between the two groups. From these results, the low frequency intervention of this study is proposed as an effective and efficient program. Furthermore, there is a need to examine the contents and frequency of interventions. Keywords : community-dwelling elderly, preventing undernutrition, serum albumin

RELATIONSHIP BETWEEN ANTHROPOMETRIC PARAMETERS, PERCENT BODY FAT AND PHYSICAL FITNESS PERFORMANCE IN OLD MALE LIVED IN RURAL COMMUNITY

Shoa-Yun YANG¹, Meng-Tzu HOU¹, Jin-Jong CHEN², Ian JEN³ (1. Department of Physical Therapy and Assisitive Technology, National Yang-Ming University, Taipei, Taiwan; 2. Department of Physical Therapy and Assisitive Technology, Exercise and Health Science Research Center, Taiwan. National Yang-Ming University, Taipei, Taiwan; 3. Institute of Public Health, Exercise and Health Science Research Center, Taiwan. National Yang-Ming University, Taipei, Taiwan)

Introduction : The purpose of this study was to disclose the relationship between anthropometric parameters and physical fitness performance in old male lived in rural community in Taiwan. Method : In 2010, 1033 men aged 65 and over lived in Tianliao Township, Southern Taiwan was selected in an epidemiological survey. A total of 414 subjects were enrolled, the respond rate was 60.8%. Structured questionnaires were inquired by face-to-face instructor for each subject. The anthropometric measurements, percent body fat (PBF,

Tanita TBF 410, Tokyo) and 5 physical fitness tests were also obtained accordingly. Results : There were 402 subjects completed the study, the average age was 74.5±6.0 (range=65-98) y/o. Using multiple linear regression models, the independent factors (β coefficient) for 5 different physical fitness tests were listed as followings: chair stand test= age(-0.299), height(-0.247) and socioeconomic status (SES) (1.085); chair sit-and-reach test = age (-0.4), height(-0.822), arm span (0.548) and waist (-0.247); open eyes stand=age(-0.738); 8-foot walking test=age (0.181), waist (0.077) and SES(-0.599); hand grip test (Grip-D, TKK 5401, Japan)=age(-418), height(-296), weight(0.477), arm span(0.287), waist(-0.272) and SES(1.068). Conclusion : The anthropometry, but not PBF, were dominantly associated with the physical fitness performance in old males live in rural community in Taiwan. Keywords : Old Male, Physical Fitness Performance, Anthropometric Parameters

PP25 S-074

EFFECTS OF THE DEVELOPMENT OF VOLUNTARY ACTIVITIES AIMED AT THE POPULARIZATION OF A LOW-INTENSITY EXERCISE PROGRAM BY ELDERLY VOLUNTEERS ON AN AREA

Shouzoh UEKI¹, Jinro TAKATO¹, Go INUZUKA¹, Naoko ARAYAMA¹, Hiroto YOSHIDA¹, Hiroshi HAGA² (1. Faculty of Medical Science & Welfare, Tohoku Bunka Gakuen University, Japan; 2. Graduate School of Gerontology, J. F. Oberlin University, Japan)

Introduction : The purpose of this study was to clarify the area-based effects of voluntary activities led by older volunteers, aimed at the popularization of a low-intensity exercise program, such as gymnastics, composed of muscle strengthening using one's own body weight and stretching exercise. Method : The subjects were 3,055 people over 65 years old living in three districts, in which the implementation rates of voluntary activities by volunteer leaders of the elderly were different. In order to understand the impact on the lifestyle and health of the subjects, in the baseline survey, we investigated the actual condition of eating habits, social participation, and rate of falls in the previous year using interview surveys. In addition, the grip strength, time needed to stand up from a long sitting position on the floor (SULF), and Up & Go time were measured. One and two years later, follow-up surveys were conducted. Results : In the intervention area, rates of being housebound and falls decreased significantly in the first year. There was a tendency toward an increased food diversity score in the area where voluntary activities were marked. In the intervention area, the grip strength was maintained, and Up & Go and SULF times were shortened. Conclusion : These results suggest that this approach required a willingness to promote voluntary activities. Keywords : voluntary activities, elderly volunteers, exercise for older adults

A STRUCTURAL ANALYSIS OF HEALTHY LIFE AMONG JAPANESE ELDERLY URBAN DWELLERS: THE EFFECTS OF SOCIO-ECONOMIC STATUS, LIFESTYLE AND SOCIAL HEALTH ON HEALTHY LIFE

Shuo WANG¹, Suwen YANG¹, Fanlei KONG¹, Naoko NAKAYAMA², Bin AI³, Tanji HOSHI¹ (1. Graduate School of Urban Environmental Science, Tokyo Metropolitan University, Japan; 2. Research center for development of nursing practice, St. Luke College of Nursing, Japan; 3. Department of Ethnology and Sociology, MinZu University of China, China)

Introduction : Population aging has been considered one of the most crucial social problems facing contemporary Japan. How to help

elderly people live a healthy life becomes an urgent issue. The purpose of this chronologic study was to clarify causal relationships between healthy life and its related factors among elderly urban dwellers of Japan. Method : The study was based on a self-reported questionnaire survey responded to by 8,162 elderly individuals in 2001, with response rate 80.2%. Moreover, two follow-up surveys were done in 2004 and 2007 respectively. Descriptive analysis by SPSS and structural equation modeling by Amos 17.0 were used to perform the analysis of data. Results : The structural equation modeling fitted the data well with IFI=0.931, RMSEA=0.020. The results showed 'healthy lifestyle' affected 'healthy life' directly. 'Social health' could not only have direct effects, but also could affect 'healthy life' through 'healthy lifestyle' indirectly as well. However, 'SES' had no direct effects on 'healthy life', just could affect it in an indirect way through 'lifestyle' and 'social health'. In the case of standardized total effects, 'lifestyle' and 'social health' exerted much greater effects on 'healthy life' than 'SES' did. Conclusion : A positive lifestyle and social health can turn into a better healthy life, exactly as it happens with high education level and income. Age plays a secondary role, because of its associations with lower levels of SES and social health. Social health is more important among older elderly than younger elderly. Comparing with female elderly, healthy lifestyle is more crucial for male elderly. Keywords : Lifestyle, Social health, Healthy life

IN THE EYE OF THE BEHOLDER: PSYCHO-EMOTIONAL ISSUES IN PERSON-CENTERED THERAPY WITH OLDER ADULTS

Sofia VON HUMBOLDT, Isabel LEAL (*Research Unit in Psychology and Health, R&D, ISPA-Instituto Universitario, Portugal*)

Introduction : Aims: This research aims to evaluate psycho-emotional challenges for older adults and the relevance of person-centered therapy (PCT) for older adults. Method : Methods: Forty senior adults, aged above 65 years (M = 71.7; SD = 4.6) were assessed with the the Self-Esteem Scale ('SES') and the Mini-Mental State Examination (MMSE). Socio-demographic data, including gender (57.5% women), marital status (37.5% married) and education (39.2% mandatory school) were also assessed. Bivariate associations were performed. Results : Results: Results yielded a set of five descriptive categories that captured the distinct ways older adults perceived psycho-emotional challenges and that reflected the individual's perceived importance of PCT: 'time perspective', 'the aging body', 'autonomy and control', 'cognitive endurance' and 'loss and reminiscing'. Regarding bivariate associations, results indicated that 'autonomy and control' was associated with the 'aging body' ($r=.552, p<.001$) and 'cognitive endurance' with 'time perspective' ($r=.425, p<.001$). This latter was also associated with 'loss and reminiscing' ($r=.616, p<.001$). Conclusion : Conclusions: This study highlights the importance of PCT for older adults facing psycho-emotional challenges in old age. Interventions with older adults may benefit from clearly understanding older adults' specific issues as an important component for promoting successful aging and reducing health disparities. Keywords : Congruence, person-centered therapy, psycho-emotional challenges

PP25 S-077
PREDICTORS FOR SENSE OF COHERENCE WITHIN A CROSS-NATIONAL SAMPLE OF OLDER ADULTS

Sofia VON HUMBOLDT, Isabel LEAL (*Research Unit in Psychology and Health, R&D, ISPA-Instituto Universitario, Portugal*)

Introduction : Aims: This research aims to explore a causal model of sense of coherence' predictors in a cross-cultural older population.

Method : Methods: Measures were completed using a variety of culturally appropriate methods, including mail-outs, self-administration and interviews. For the purposes of this study, the Sense of Coherence Scale, the Adjustment to Aging Scale, one measure of cognitive functioning - the Mini-Mental State Examination (MMSE) and demographics, were included. All variables prompted fewer than 1% missing values and complete data were available for 709 older adults (M = 82.4, SD = 6.45, (range 74-102)) from eight different nationalities. Structural equation modeling was used. Controlling for age, gender and country of origin, we assessed the level of sense of coherence of elderly people, and its predictors. Results : Results: Sense of coherence is predicted, not only by self-reported spirituality, but also by adjustment to aging, among other variables. Sense of coherence was significantly associated with age progression ($\beta = .426; p = .001$) and perception of health ($\beta = .381; p = .001$). All estimates were statistically significant ($p<.01$). Conclusion: Conclusions: Specifically in late adulthood, changes may affect older adults' worldview and thus their SOC. The older individual with a strong SOC has a greater ability to mobilize and exploit potential resources. In brief, this study stresses the predictors of sense of coherence in older age. Keywords : Predictors, structural equation modeling, sense of coherence, adjustment to aging.

PP25 S-078
THE POTENTIAL OF SPIRITUALITY TO OLDER ADULT'S ADJUSTMENT TO AGING: A QUALITATIVE STUDY WITH MULTIPLE CORRESPONDENCE ANALYSIS

Sofia VON HUMBOLDT, Isabel LEAL (*Research Unit in Psychology and Health, R&D, ISPA-Instituto Universitario, Portugal*)

Introduction : To analyze the indicators of adjustment to aging (AtA) and to investigate the latent constructs that can work as major determinants in spirituality for a cross-national older community-dwelling population. Method : Questionnaires were completed, assessing participants' background information. Interviews were performed, addressing one core area: indicators of AtA. Complete data were available for 154 older adults, aged between 75-103 years (M = 86.6, SD = 6.98) from two different nationalities. Data was subjected to content analysis. Representation of the associations and latent constructs were analyzed by a Multiple Correspondence Analysis (MCA). Results : The most prevalent response of the interviewed participants for indicators of AtA was 'spirituality' (43.2%) whereas 'financial stability' was the least referred indicator of AtA (10.3%). 'Spiritual activities' was the most reported response regarding 'spirituality' (20.0%). Spirituality for older adults was explained by a three-factor overall model: 'spiritual and existential meaning', 'limit-related awareness' and 'community embeddedness'. Conclusion : The findings presented in this paper emphasized the need to explore the potential of spirituality to AtA and the need for improving the spiritual dimension of health care for the older population. Keywords : Spirituality, Adjustment to Aging, Multiple Correspondence Analysis, Community-Dwelling Older Adults

PP25 S-079
OLDER ADULTS' SENSE OF COHERENCE: A LONGITUDINAL STUDY ON THE IMPACT OF PERSON-CENTERED THERAPY

Sofia VON HUMBOLDT, Isabel LEAL (*Research Unit in Psychology and Health, R&D, ISPA-Instituto Universitario, Portugal*)

Introduction : Older adults' sense of coherence (SOC) is often challenged by changes in later adulthood. Therefore, this study aims to explore if a brief eight-session individual person-centered therapy

(PCT) intervention on older adults can promote their SOC, as compared with a control group (waiting list). We posited that participants and randomized to PCT would report improvements in SOC from pre- to post-intervention compared to those in waiting list. Method : The Sense of Coherence Scale (SOCS) and demographics were assessed at the baseline (t1), post-treatment (t2) and at the 12-month follow-up (t3), in a group of 87 participants between 65-86 years (M=71.9 SD=4.77). Results : Results indicated that participants in PCT evidenced greater improvements as to their SOC (31.4%) than those in waiting list (2.3%). Both at the post-intervention, and at follow-up, participants who underwent PCT had a significantly higher SOC (M=4.76, SD=.524). In addition, results revealed no significant between group differences in any socio-demographic variable ($P>.05$) in t1, t2 and t3. Conclusion : Changes in SOC were positive and maintained, thus, findings suggest that PCT is favorable to enhancing SOC. In this context, PCT is also a personal resource to promote SOC. Moreover, since SOC is shown to be associated with health-related well-being among older populations, SOC development in old age should be focused. Keywords : Changes in SOC were positive and maintained, thus, findings suggest that PCT is favorable to enhance

PP25 S-080

USING DIFFERENT SCREENING TOOLS TO ASSESS NUTRITIONAL STATUS IN HOSPITALIZED ELDERLY PATIENTS

Su-E. KUO¹, Yuh-Jane KO² (1. Department of Nutritional Services, National Cheng Kung University Hospital, Dept. of Education, National University of Tainan, Taiwan; 2. Department of Nutritional Services, National Cheng Kung University Hospital, Taiwan)

Introduction : Malnutrition is one of the critical factors affect mortality, morbidity, infection, length of stay, and re-hospitalization, especially in elderly population. An effective screening tool is needed to early detect the risk of malnutrition, so that nutrition care plan could be implemented as soon as possible. Method : We used Nutritional risk screening (NRS-2002), Malnutrition universal screening tool (MUST), and Mini nutritional assessment-short form (MNA-SF) to assess the risk of malnutrition, blood samples were collected to check serum albumin level simultaneously. Results : After informed consent, 60 geriatric patients were enrolled, average aged 79.6 ± 7.7 years, BMI 22.5 ± 5.5 kg/m², both male and female gender were equal (n=30). The percentage of patients at moderate to high nutritional risk were 74%, 45%, and 84% based on NRS-2002, MUST, and MNA-SF separately; at low risk to normal status were 14%, 55% and 16%. Of patients, 38% showed normal serum albumin level (3.5-5.0 mg/dL), among these patients 28.6%, 23.9%, and 66.7% were screened as low risk or good nutritional status assesses by NRS-2002, MUST, and MNA-SF separately. For patients with low albumin level (≤ 3.0 mg/dL), of them 91%, 72.7%, and 63.6% were screened as moderate to high risk when assesses by NRS-2002, MUST, and MNA-SF separately. Conclusion : Malnutrition might be underestimated if MNA-SF was used as screening tool. We need to further analyze the relationship among these three nutritional screening tools, and include more subjects to find a most effective, time-sparing, and accurate tool for clinical applications. Keywords : malnutrition, NRS, MUST, MNA-SF, nutritional screen

PP25 S-081

THE RELATIONSHIP BETWEEN LIGHT-INTENSITY PHYSICAL ACTIVITY AND COGNITIVE FUNCTION IN A COMMUNITY-DWELLING ELDERLY POPULATION : AN 8-YEAR LONGITUDINAL STUDY

Sungchul LEE¹, Atsumu YUKI¹, Yukiko NISHITA¹, Chikako TANGE¹, Heungyoul KIM², Rumi KOZAKAI³, Fujiko ANDO⁴, Hiroshi SHIMOKATA¹ (1. Department for Development of Preventive Medicine, National Center for Geriatrics and Gerontology, Japan; 2. Department of Human Wellness, Tokaigaku University, Japan; 3. Department of Sport Education, Hokusho University, Japan; 4. Faculty of Health and Medical Sciences, Aichi Shukutoku University, Japan)

Introduction : The purpose of this study was to examine the relationship of light-intensity physical activity and sedentary time with cognitive decline independent of MVPA in a community-dwelling elderly population. Method : The subjects were 550 (289 men and 261 women) adults aged 60 years or older who completed the baseline (2000-2002) and eight years later (2008-2010) examinations of the National Institute for Longevity Sciences - Longitudinal Study of Aging in Japan. Data on sedentary, light-intensity physical activity, and MVPA time were collected using an interviewer-administered questionnaire at baseline. Cognitive function was measured using the MMSE at baseline and 8 years later. We examined the effect of light-intensity physical activity and sedentary time on cognitive decline (at least a 3-point decline on the MMSE) by multiple logistic regression controlled for age, sex, BMI, MMSE score at baseline, smoking status, self-rated health, CES-D, education, sleep duration, occupation, medical history (hypertension, myocardial infarction, hyperlipidemia, diabetes mellitus, stroke, rheumatoid arthritis) and MVPA. Results : Participants in the highest light-intensity physical activity quartile were less likely to show cognitive decline than those in the lowest quartile (OR = 0.39; 95% CI = 0.18 - 0.83). In contrast, those in the highest quartile of overall sedentary time were more likely to show cognitive decline than those in the lowest quartile. This tendency was also found among subjects without an occupation and lower education, regardless of multivariate control. Conclusion : A decrease in light-intensity physical activity and an increase in sedentary time are risk factors for cognitive decline in the elderly. Keywords : light-intensity physical activity, cognitive decline, longitudinal study

PP25 S-082

SELF-REGULATION IN THAI OLDER WOMEN WITH SELF-REPORTED KNEE OSTEOARTHRITIS: A PATH MODEL

Suparb AREE-UE¹, Inthira ROOPSAWANG² (1. School of Nursing, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Thailand; 2. Ramathibodi School of Nursing, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Thailand)

Introduction : The purpose of this study is to test a model of factors influencing coping behavior and health status among Thai older women with knee osteoarthritis, and to estimate the direct and indirect effects of illness representation, social support, and self-efficacy on coping behaviors and health status. Method : The 'Common Sense' Model (CSM) of illness representations has been developed as a proposed model for understanding the self-regulation processes in Thai older women with knee osteoarthritis. A total of 274 older adults with knee OA (mean \pm SD age = 63.56 ± 9.82 years, range 50-90 years) living in six communities in Bangkok and its vicinity was recruited. The data were collected through home and health care center visits using questionnaires including the Brief Illness Perception Questionnaire, the London Coping with Rheumatoid Arthritis Questionnaire, the Self-Efficacy Expectation Questionnaire, the MOS Social Support Survey, and Arthritis Impact Measurement Scale 2-Short Form. Data were analyzed using descriptive statistics, correlation techniques, and path analysis. Results : Illness representation was a better predictor of perceived health status than

were the other variables, while self-efficacy was a better predictor of coping behaviors. Illness representation and social support had a statically significant direct and indirect effect on perceived health status. Conclusion : The complex relationships among study variables should help to tailor future interventions more appropriately to break down the progression of the disease and to promote optimal health in Thai older women suffered from knee osteoarthritis. Keywords : knee osteoarthritis; Thai older women; the Common Sense' Model

PP25 S-083

ASSOCIATION BETWEEN HEALTH LITERACY AND HEALTH BEHAVIOR OR HEALTHY WEIGHT OF INDIVIDUALS AGED OVER 65 YEARS IN JAPAN

Tomoe NISHIZAWA, Junko SUGAMA, Seto IINO, Saki OKUBO, Yuki SAWADA, Chisato SUGIMOTO, Masumi DOUNO, Shoko YOKOYAMA, Aya AKAGAWA, Shiho OKAYAMA (*Department of Clinical Nursing, Institute of Medical, Pharmaceutical and Health Sciences, Kanazawa University, Japan*)

Introduction : Senior citizens currently obtain health information in various ways and incorporate this information into their lives. However, some do not have appropriate health behaviors because they misunderstand the information. Therefore, the purpose of this study was to investigate the association between health literacy (HL) and health behavior or healthy weight of individuals aged over 65 years in Japan. Method : This was a cross-sectional study in K city, Japan from August to September 2012. The subjects completed a questionnaire including demographic questions, an HL scale (5 items), and lifestyle questions regarding physical activity, sleeping, and diet (17 items). HL scale responses were solicited on a 5-point scale. The answers to the questions regarding lifestyle were "Yes" or "No." We measured the subjects' height and weight and calculated their body mass index (BMI). Subjects who answered 4 to 5 points for each item of the HL scale were the "High score group," and the remaining subjects were the "Low score group." The subjects with a BMI of 18.5 to 24.9 were the "Normal group," and the remaining subjects were the "Abnormal group." To investigate the association between HL and health behavior or BMI, χ^2 analysis was used for statistical analyses. Results : One hundred twenty-four of the 531 respondents were over 65 years of age. In terms of health behavior, dietary patterns were significantly associated with HL. In contrast, BMI was not associated with HL. Conclusion : These results suggest that acquiring HL effectively improves lifestyle in terms of diet. Keywords : health literacy, health behavior, healthy weight

PP25 S-084

ASSOCIATIONS OF SMOKING BEHAVIOUR WITH SOCIAL SUPPORT AND ACTIVITY IN RURAL ELDERLY JAPANESE MEN: A CROSS-SECTIONAL STUDY

Feng SUN¹, Toshimi YONEYAMA¹, Masamitsu KAMADA¹, Tsuyoshi HAMANO², Masayuki YAMASAKI¹, Kuninori SHIWAKU¹ (*1. Department of Environmental & Preventive Medicine, Shimane University School of Medicine, Japan; 2. Center for Community-based Health Research and Education (COHRE), Organization for the Promotion of Project Research, Shimane University, Japan*)

Introduction : Tobacco smoking is one of the risk factors for health-related diseases. In recent years, there is growing interest in the effect of social factors on smoking behaviour. The aim of this study was to clarify the association between smoking behaviour and social factors, defined by social support and social activity, in rural elderly Japanese men. Method : A total of 978 Japanese men aged over 65 years were

selected from the Shimane COHRE Study for a cross-sectional study. Multiple logistic regression analysis was performed to evaluate the association between social factors and smoking behaviour. Results : 94.7% of subjects reported having some social supports and 44.6% engaged in some kind of social activities. Social support (adjusted odds ratio: 95% confidence interval, 0.75: 0.41-1.38) was not associated with smoking, but social activity (0.69: 0.52-0.91) had a significant association with smoking behaviour. Among the subjects, 89.2% of them reported being satisfied or fairly satisfied with the current life. Life satisfaction (0.49: 0.31-0.78) was associated with smoking. Conclusion : Rural older men engaged in social activities were less likely to smoke. Social activity should be considered as a countermeasure in smoking prevention in the rural elderly population. Keywords : Smoking, Social support, Social activity

EFFECTS OF A DAO YIN YANG SHENG EXERCISE (DYYSE) ON PHYSICAL AND MENTAL HEALTH OF JAPANESE ELDERLY POPULATION

Toshio KOBAYASHI, Yubo CAO, Yukio URABE (*Graduate School of Biomedical and Health Sciences, Hiroshima University, Japan*)

Introduction : The Dao Yin Yang Sheng Exercise (DYYSE) as a traditional therapy belongs to Chinese Qi Gong. Its positive effects on healing chronic diseases have been verified in China. However, it is not clear how DYYSE affects the physical and mental functions of elderly populations. This study focused on Japanese elderly population as its study, conducted four weeks of DYYSE, and analyzed the effects on physical and mental functioning indices. Method : The subjects were 30 elderly Japanese (mean age: 64.7 years \pm 10.7 years). The evaluation indices for the study include Body Mass Index (BMI), blood pressure, pulse rate, the maximum one-step length, the time for single leg balance with closed eyes, CES-D scores as mental health, and SF-36 as quality of life (QOL) indices. The data were collected prior to the commencement of the exercise, and then measured again after four weeks of DYYSE. Results : During the four weeks of the DYYSE, there were 27 (90%) subjects who had a participation rate of above 80%. For these subjects, a significant reduction has been observed in their BMI, blood pressure, and pulse rate. In addition, the maximum one-step length and the time for single leg balance have significantly increased. Among the sub-scales of SF-36 indices, "Physical functioning", "Bodily pain", and "General health" have been significantly improved. Scores of CES-D has also been significantly improved. Conclusion : The practice of DYYSE was proved to be effective not only on the physical functions but also on mental health and QOL indices of the elderly Japanese. Keywords : Qi Gong, Quality of life, Physical and mental health

PP25 S-086

DEVELOPMENT OF PHYSICAL FITNESS EQUIPMENTS FOR ELDERLY IN NEIGHBOURHOOD PARKS

Cheng-Yu KUO¹, Tzu-Yao TAI¹, Chiang LIU², Hsueh-Wen CHOUW³, I-Yao FANG⁴ (*1. Department of Mechanical Engineering, Southern Taiwan University of Science and Technology, Taiwan; 2. Graduate Institute of Sports Equipment Technology, Taipei Physical Education College, Taiwan; 3. College of Management Institute of Physical Education, Health&Leisure Studies, National Cheng Kung University, Taiwan; 4. Department of Physical Education, National Taiwan Normal University, Taiwan*)

Introduction : Population aging is progressing rapidly in many industrialized countries and Taiwan is an exemplary one. The increasing aging population is the inevitable trend in the future. The

muscle weakening for elderly may cause in the recession in function, and also lead to inconvenience in daily life. Some simple actions could become more difficult due to the aging process. Method : How to make the elderly strengthen the key muscles by themselves and live independently is the key issue of successful aging. In this study, investigations are performed to census the new outdoor fitness facilities in metropolitan park of Tainan city. These facilities' numbers, types, and their prevalence are further identified. The topology, mechanism and movement are also analyzed to realize the health promotion for the elderly. Results : The results reveal that air walker ranks as top activity in terms of numbers in metropolitan parks of Tainan city (21.1%). Furthermore, 54% of parks in Tainan installed new outdoor fitness facilities. This indicates that these fitness facilities play a more and more important role for the elderly. However, according to the analysis from its mechanism and movement, these facilities can't enhance the health promotion due to no extra loading design. This study develops a upper and lower limb fitness facility equipped with rotary reciprocating cam and assisted by hydraulic resistance. Conclusion : It contains green design and can be involved into the park's surroundings. The muscle strengthening can be improved through this facility and hence provides a social activity and health promotion for aging in place. Keywords : Aging in place, Fitness facility, Active aging

PP25 S-087

META-ANALYSES OF HEALTH OUTCOMES FROM SUPERVISED EXERCISE INTERVENTIONS AMONG HEALTHY OLDER ADULTS

Vicki CONN, Jo-Ana CHASE, Lorraine PHILLIPS, Todd RUPPAR
(Health Sciences Center, University of Missouri, USA)

Introduction : These meta-analyses determined the magnitude of lipid, anthropometric, insulin sensitivity, and cardiovascular fitness (V02max) outcomes of supervised exercise among healthy older adults. Method : Comprehensive diverse search strategies located potential studies. Eligible intervention trials compared treatment and control subjects after supervised exercise with verified exercise dose. Data accuracy was verified through duplicate extraction. Standardized mean differences (d-indices) were calculated using random-effects models. Effect sizes were weighted by inverse of variance to give more influence to larger studies. Q and I2 statistics assessed heterogeneity. Results : Primary study sample mean ages ranged from 60 to 83 years. Six studies were comprised entirely of men and 30 included only women, the remaining studies included both genders. The typical exercise dose was 45-minute sessions thrice weekly over 12 weeks. The fitness effect size was 0.779 ($p < .001$; $k = 48$; k denotes comparisons). The effect size for insulin sensitivity was 0.478 ($p < .001$; $k = 6$). For anthropometric outcomes, the effect size was 0.112 ($p = .055$; $k = 45$). An effect size of 0.189 ($p = .148$; $k = 15$) was calculated for lipid outcomes. Significant heterogeneity (Q) was documented for lipid, anthropometric, and fitness outcomes. Conclusion : These meta-analyses quantified significant improvements in fitness, insulin sensitivity, and anthropometric outcomes from verified exercise among healthy older adults. Statistical power was limited for the smaller lipids effect size. Diversity in sample, intervention, and research procedures probably accounted for significant heterogeneity documented in this project. As more primary studies accumulate, future meta-analyses can use moderator analyses to determine if sample and intervention characteristics account for variations in health outcomes. Keywords : exercise meta-analysis

PP25 S-088

THE EFFECTS OF HYPERTENSION AND DIABETES IN THE

DIMENSIONS OF QUALITY OF LIFE OF ELDERLY PEOPLE

Victor CLAUDIO¹, Dina CARDOSO², Sofia VON HUMBOLDT¹, Isabel LEAL¹ (1. Department of Clinical Psychology and Health, ISPA-I.U. / UIPES, Portugal; 2. Department of Clinical Psychology and Health, ISPA-I.U., Portugal)

Introduction : Aging with quality has become increasingly relevant in a context in which life expectancy has increased. In addition to the efforts made in order to provide an increased life expectancy, several attempts are being explored so that the extra lifespan can be experienced with quality. This research aims at: 1) analyzing the variation of QoL dimensions of older adults with diabetes. 2) examining the variation of QoL dimensions of older adults and with hypertension. Method : 120 patients, between 74 and 97 years old constituted the convenience sample of this study. The instruments utilized were the following: Assessment Questionnaire for Health Gains (SF-6D), Socio-demographic Questionnaire and Mini-Mental State Examination (MMSE). Results : In both pathologies lower mean scores were verified in 'mental health' dimension ($M = 2.85$) in elderly with diabetes and ($M = 3.06$) in elderly with hypertension. Results also indicated significant differences in some of the QoL dimensions of elderly with both pathologies when compared with elderly with other diseases or with no diseases. However the correlation between the variable 'chronic disease' and QoL was not verified ($r = .589$; $p = .61$). Conclusion : This study highlighted that hypertension and diabetes affect dimensions of older adults' QoL. It is thus relevant to take into account these results for clinical practice and behavioral strategies for older populations. Keywords : Hypertension; Diabetes; Quality of life

PP25 S-089

ANALYZING THE EFFECTS OF RELIGION IN THE QUALITY OF LIFE OF AN INTERNATIONAL OLDER POPULATION

Victor CLAUDIO¹, Sofia VON HUMBOLDT¹, Catarina COSTA² (1. Department of Clinical Psychology and Health, ISPA-I.U./UIPES, Portugal; 2. Department of Clinical Psychology and Health, ISPA-I.U., Portugal)

Introduction : One of the motivations of human existence is linked to the search for meaning and value in life. In advanced age, elderly are affected by the end of life and death. These matters can be addressed through religion. Moreover, religion and spirituality are related to the physical and psychological well-being of elderly people. This study aims at assessing the association of religion to quality of life (QoL) and at analyzing the effects of religion on the six dimensions of quality of life: (i) Physical Functioning; (ii) Role Limitations; (iii) Social Functioning; (iv) Pain; (v) Mental Health and (vi) Vitality. Method : The sample comprised 118 people over 74 years, from eight different nationalities, with no psychiatric disorders. For the purposes of this study, the Assessment of Gains in Health Scale (SF-6D), one measure of cognitive functioning - the Mini-Mental State Examination (MMSE) and demographics, were included. Results : Findings indicated that taoist participants showed the highest score for social function score ($x = 6.0$), whilst protestants showed the highest score for role limitations ($x = 5.8$). There were no association between religion and QoL. Conclusion : Religion has proved to be a cross-cultural catalyst for personal investment, internal development and maturity. This study contributed to enlightening the relevance of religion to older adults' QoL. Recommendations for future research and behavioral approaches on older adults' QoL and clinical practice are also presented. Keywords : Health Promotion; Quality of Life; Religion.

PP25 S-090

DOES RELIGION REALLY MATTER? QUALITY OF LIFE AND RELIGION IN A CROSS-NATIONAL SAMPLE OF ELDERLY

Victor CLAUDIO¹, Sofia VON HUMBOLDT¹, Catarina COSTA²
(1. Department of Clinical Psychology and Health, ISPA-I.U./UIPES, Portugal; 2. Department of Clinical Psychology and Health, ISPA-I.U., Portugal)

Introduction : The aging process requires the individual's adaptation to resulting losses and changes. In old age, individuals might search for existential meaning, through religion. Moreover, there is a need to collect empirical data to understand the contribution of religion in the adaptation of elderly to aging. This study aims at examining the relevance of religion for the elderly and at analyzing how different religions may be relevant to the quality of life (QoL) of elderly people. **Method :** The sample comprised 118 participants over 74 years old, from eight different nationalities, including Portuguese, German, English and Romanian; with no psychiatric disorders. For the purposes of this study, the Assessment of Gains in Health Scale (SF-6D), one measure of cognitive functioning - the Mini-Mental State Examination (MMSE) and demographics, were included. **Results :** Findings indicated that QoL score was higher for taoist participants ($x = 5.3$), followed by protestants ($x = 4.9$), when compared to participants without religious beliefs ($x = 4.1$). German participants indicated a higher QdV score ($x = 5.3$) whilst Romanian showed the lowest QdV score ($x = 3.9$). There was no association found between QoL and religion or nationality. **Conclusion :** This study makes a valuable contribution for the incorporation of religion as an intervenient in QoL in old age, enlightening its contribution to healthy aging and behavioral strategies. Recommendations for future research on older adults' QoL and clinical practice are also presented. **Keywords :** Health Promotion, Quality of Life, Religion

PP25 S-091

DIABETES AND HYPERTENSION: ASSESSING THE EFFECTS OF PHYSICAL ILLNESSES ON THE QUALITY OF LIFE OF ELDERLY PEOPLE

Victor CLAUDIO¹, Dina CARDOSO², Sofia VON HUMBOLDT¹, Isabel LEAL¹
(1. Department of Clinical Psychology and Health, ISPA-I.U./UIPES, Portugal; 2. Department of Clinical Psychology and Health, ISPA-I.U., Portugal)

Introduction : There is a set of organic transformations in the aging process that contribute to the appearance of diseases characteristics of this stage of life, such as hypertension and diabetes. The adjustment to these pathologies can be facilitated, by understanding their effect on quality of life (QoL) of elderly people. **Objectives:** i) To analyze significant differences of QoL in elderly with diabetes when compared with elderly with other diseases or with no diseases; and ii) To analyze significant differences in elderly with hypertension when compared with elderly with other diseases or with no diseases. **Method :** The research focused on a sample of 120 patients, between 74 and 97 years. The instruments utilized were: Assessment Questionnaire for Health Gains (SF-6D), Socio-demographic Questionnaire and Mini-Mental State Examination (MMSE). **Results :** The results indicated that elderly with diabetes showed a significantly higher QoL score than the ones with other diseases ($M=1,11$; $p = .001$). Elderly with hypertension showed a level of QoL significantly lower to the ones with no diseases ($M=-0,919$; $p=.001$). **Conclusion :** We concluded that there is an association between these pathologies and the QoL and that this is pertinent for the understanding of health and well-being in older populations. **Keywords :** Diabetes; Hypertension; Quality of Life.

PP25 S-092

RELATIONS AND ASSOCIATED FACTORS AMONG SUPPLEMENT-TAKING HEALTH BEHAVIOR AND SELF-PERCEPTION OF AGING IN MIDDLE-AGED PEOPLE

Yoko NAGAYA¹, Nobuko AIDA², Shin-Ichi SUGIURA³, Hiroshi GOHMA³, Naoko KOBAYASHI⁴, Akemi OGATA⁵
(1. Department of Nursing, The National Hospital for Geriatric Medicine, National Center for Geriatrics and Gerontology, Japan; 2. Graduate School of Medicine (Health Sciences), Nagoya University, Japan; 3. Graduate School of Medicine, Nagoya University, Japan; 4. School of Nursing, Japanese Red Cross Toyota College of Nursing, Japan; 5. Department of Nursing, Association Medical Corporation MEISHOKAI, Total Support Clinic, Japan)

Introduction : We aimed to investigate requirements regarding nursing support for health-related supplement use by clarifying the relationship between supplement use and self-perception of aging and associated factors in middle-aged people. **Method :** A total of 392 of 963 recipients who aged ≥ 40 to < 65 years selected through stratified random sampling of the Basic Resident Register (collection rate, 40.8%) agreed to participate in and around Nagoya City, approved by Nagoya University Ethics Committee. **Results :** With regard to supplement use, 41.8% were currently taking supplements (Current Use), 25.0% had previously taken supplements (Previous Use) and 33.2% had never taken supplements (Never Used). The Current Use group took 2.5 ± 1.7 types of supplement daily for health maintenance ($p < .001$) and as an anti-aging measure ($p < .001$) despite feeling the financial burden ($p < .001$). There was higher self-perception of aging factor 'poor physical condition' among the Current and Previous Use groups (29.4 ± 5.8 and 29.5 ± 5.2 , respectively) than the Never Used group (27.9 ± 5.8) ($p = 0.038$). Female sex, valuing lifestyle health, and positive factors of self-perception of aging (leeway and maturity) were extracted as factors relating to current healthy lifestyle, while no experience using supplements and ineffectiveness of supplements (due to lack of use) were extracted as factors relating to unhealthy lifestyle in order to further investigate nursing support requirements. **Conclusion :** Based on the present findings, the following suggestions comprise nursing support requirements; 1) support based on assessment of health-related supplement use and background factors, 2) health education based on understanding of self-perception of aging, and 3) construction of a healthcare system based on multi-discipline cooperation were. **Keywords :** middle-aged, dietary supplement, health behavior, aging, self-perception

PP25 S-093

EFFECTS OF THREE-YEAR TELECARE-BASED EXERCISE PROGRAM FOR THE HEALTHY ELDERLY IN RURAL JAPAN

Yoshiharu YOKOKAWA¹, Minoru HONGO¹, Hiroaki URAYAMA², Ichiro KAI³
(1. School of Medicine, Shinshu University, Japan; 2. Surgery, Nakamura Hospital, Japan; 3. Emeritus Professor of Social Gerontology, University of Tokyo, Japan)

Introduction : Information communication technology-based telecare can be useful device to promote health condition of the elderly in rural community. Telecommunication video system enables to conduct exercise class by exchanging visual data between remote areas. The purpose of this study is to examine the effects of three-year telecare-based exercise program (TBE). **Method :** Twenty one female inhabitants aged 55 and over were randomly assigned to a TBE group (TBE, $n=11$) and a face to face resistance training group (FRT, $n=10$). Both groups trained once a week. The TBE group conducted slow resistance training without occlusion. The FRT group performed

resistance training with moderate vascular occlusion. And whole body vibration (WBV) twice weekly at a health center. Training by WBV was self-administered using a power plate (Power Plate International, Ltd.) at another center. All of programs were conducted for 33 months, using 6 sets of dynamic exercises. Each TBE and FRT exercise session included 1 sets of 10 repetitions of the movements. Various indicators such as bone mineral density (BMD) and strength were measured at pre- and post-intervention: BMD of femur, elbow extensor muscle strength, one-leg standing time, and 10 m walking time. Results : The mean age±SD were 64.8±4.5 (TBE) and 62.6±5.8 (FRT) years. Both groups improved significantly in their muscle strength and 10m walking performance after the intervention. The differences were observed on balance and walking distance between the two groups. Conclusion : TBE was suggested to be feasible and almost equally effective as FRT among the healthy elderly in remote areas. Keywords : telecare, exercise, BMD

PP25 S-094

THE EFFECTIVENESS OF ORAL HEALTH EDUCATIONAL PROGRAM IN COMMUNITY-DWELLING ELDERLY WITH XEROSTOMIA

Yuki OHARA¹, Naomi YOSHIDA², Yoko KONO³, Hirohiko HIRANO⁴, Hiroko IMURA⁵, Shiro MATAKI¹, Kumiko SUGIMOTO⁶
(1. Section of Behavioral Dentistry, Department of Comprehensive Patient Care, Graduate School of Medical, Tokyo Medical and Dental University, Japan; 2. Department of Dental Hygiene, Faculty of Health Care Science, Chiba Prefectural University of Health Sciences, Japan; 3. Section of Cognitive Neurobiology, Graduate School of Medical and Dental Sciences, Tokyo Medical and Dental University, Japan; 4. Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Institute of Gerontology, Japan; 5. Section of Orofacial Pain Management, Graduate School of Medical and Dental Sciences, Tokyo Medical and Dental University, Japan; 6. Basic Oral Health Science, School of Oral Health Care Sciences, Faculty of Dentistry, Tokyo Medical and Dental University, Japan)

Introduction : Few studies have reported about the effectiveness of oral health educational programs for the independent elderly by dental professionals. Thus, the purpose of this study was to evaluate the changes in oral health function by providing oral health education for the independent elderly. Method : The community-dwelling people aged over 65 years who had complaint about xerostomia were recruited for this education program. Forty-seven elderly were assigned into two groups, the intervention group (n = 26) and the control group (n = 21). The intervention group attended a 90-minute oral health education program every 2 weeks for 3 months. The program consisted of oral hygiene instruction, facial and tongue muscle exercise and salivary gland massages. The control group was provided only general information about oral health. The assessment of oral functions such as oral diadochokinesis of articulation, swallowing and taste was performed before and after 3 months with or without intervention. Results : Consequently, 38 subjects (21 from intervention group and 17 from control group) completed the study protocol. In the intervention group, unstimulated salivation and oral diadochokinesis were significantly improved after the program. The summed time of 3 times of repetitive saliva swallowing test was significantly shortened. The recognition thresholds for saltiness and bitterness were significantly lowered. On the other hand, no improvement was observed in the control group. Conclusion : The present result suggests that professional intervention of oral health education is effective for improvement of oral function among independent elderly. Keywords : oral health education, professional intervention, independent elderly

PP25 S-095

SELF-CARE IN ELDERLY PEOPLE WITH CANCER: A QUALITATIVE APPROACH

Carlos LARANJEIRA (Ph.D, Higher School of Health Sciences, Piaget College, Portugal)

Introduction : It is about a qualitative research of the case study type with the general objective of identifying the alterations in the way of living of elderly people with cancer in their home. Its specific objectives are learning how the elderly with cancer refer their life experiences in the home about the changes in life/ health habits and finding out how they perform the self-care therein. Method : For such purpose, home visits to fifteen Portuguese elderly with cancer were made when the semi-structured interview was utilized in order to collect the information. Results : The content analysis provided gathering four categories divided into themes. In the category "Experiencing the disease", two themes were noticed: "search for health care" and "facing the treatment". In the category "perception of the elderly about the disease", two themes stood out: "the subject feels him/herself different" and "the family history related to cancer". The category "the impact of the diagnosis" was related to the themes: psychological support and support from the religious belief. The category "alterations in the way of living" was related to the themes "changes in the daily life", "self-care with food"; "self-care with self-image" and "appreciation of health". Conclusion : Studies like this contribute for the construction of knowledge in the field of health education and, specially, in the case of elderly with cancer. The information about the aspects of health education can help the elderly and their families to manage their care and therefore avoid further hospital admittances and improve their quality of life. Keywords : elderly, cancer, health

PP25 S-096

AWARENESS OF THE IMPORTANCE OF ORAL HEALTH AMONG THE GENERAL PUBLIC: FINDINGS FROM A SURVEY IN JAPAN

Hiroshi UEDA¹, Mitsugu KANDA², Minoru YOSHIDA², Teruhisa TOYOKAWA³
(1. Graduate School of Human Sciences, Osaka University, Japan; 2. Information Management Committee, Hyogo Dental Association, Japan; 3. President's Office, Hyogo Dental Association, Japan)

Introduction : Oral health has been one of the most important issues in aging societies. In Japan, the Ministry of Health, Labour and Welfare has undertaken the 8020 campaign to increase the proportion of those who have 20 own present teeth at the age of 80. Method : We conducted a mail survey among the residents of Hyogo prefecture, Japan about their knowledge of and behavior towards oral health in June 2012. Results : The number of adult responders between ages 20 and 99 was 11,228 (2,433 men and 8,795 women). Among these, women knew more about the relationship between oral health and general health than men. The elderly generally showed a lower awareness of individual dental risk factors such as brushing, dietary practice, smoking, and alcohol consumption than younger age groups. Women in all age groups maintain higher awareness of the importance of dietary health for dental health than men, where lower understanding was observed with age. Older adults show a higher rate of having a personal dentist to visit regularly, especially for women. The rate of oral problems is highest among middle-aged persons and lower among the elderly. Approximately 20% of those who have an oral problem have not seen a dentist. Conclusion : It is concluded that the importance of oral health should be emphasized through an individual's life course to achieve general health in ageing societies.

To do so, oral health promotion to increase public awareness should be continuously highlighted. Keywords : oral health, health promotion, Elderly

PP25 S-097
THE EFFECT ON ATTITUDE OF SCALP AND HAIR CARE OF CLIMACTERIC SYMPTOMS IN MIDDLE AGED WOMEN
Eunjin IM, Chanhwi CHO, Jungtae HAN (*Dept. of Beauty Care, Youngdong University, Korea*)

Introduction : In recent, the stress factor is on the increase by the rise of women's social activities and achievement needs, which climacteric hair loss occurs when climacteric symptoms worsen as well as aging is promoted and premature ovarian failure grows. Method : It made a survey on middle aged women in their forties-sixties living in some areas of Seoul and Gyeonggi in Korea to examine. Results : All physical and psychological factors of climacteric symptoms were significantly and positively correlated with hair management, hair products and interests in hair. While hair conditions were significantly and negatively correlated with physical and psychological factors, which for women with severe climacteric symptoms, the current scalp or hair conditions were bad, and attitudes on scalp and hair management were high. Conclusion : Consequently, for middle aged women with severe climacteric symptoms, scalp or hair conditions were bad, while attitudes on scalp and hair care were high, which they are perceiving the importance of management for the health of scalp and hair, but they are treating scalp and hair as negative attitudes despite the symptom of hair loss. The role of scalp and hair specialists, who help prior prevention of women's hair loss by perceiving the necessity of scalp and hair management and improving the problems of it, is important for their health of scalp and hair by proper management. Keywords : Scalp and Hair Care, Climacteric symptoms, Middle Aged Women

PP25 S-098
GENDER DIFFERENCES IN SMOKING BEHAVIOR AMONG OLDER ADULTS IN TAIWAN: SMOKING TRAJECTORY PATTERNS AND CORRELATES

Dih-Ling LUH¹, Hui-Chuan HSU², Wen-Chiung CHANG³, Ling-Yen PAN⁴ (*1. School of Public Health, Chung-Shang Medical University, Taiwan; 2. Department of Health Care Administration, Asia University, Taiwan; 3. Institute of Health Policy and Management, National Taiwan University, Taiwan; 4. Bureau of Health Promotion, Department of Health, Taiwan*)

Introduction : Smoking behavior changes over time in old age, and smoking patterns differ by gender and age. However, the smoking trajectories of older adults are not often examined. The purpose of this study was to examine the smoking trajectories of older adults and their associated factors by gender. Method : Data were drawn from a nationally representative longitudinal study of a sample of Taiwanese adults aged 50 to 66 (n=2,097). The samples were followed from 1996 to 2007. Group-based trajectory analysis was used. Results : Three smoking trajectories were identified in men: non/rare smokers (42.6%), quitting smokers (16.5%), and chronic smokers (40.9%). The male quitting smokers were more likely to be lower educated than the male non/rare smokers. The male chronic smokers were more likely to be older, lower educated, and living in rural areas than the male non/rare smokers. Two smoking trajectories were identified for females: non/rare smokers (95.9%) and smokers (4.1%). Females of mainlander ethnic groups were more likely to be smokers. Conclusion: There are gender differences in the smoking trajectories and related factors of older adults. Tobacco control programs should be sensitive

to the gender of the target population. Keywords : smoking, group-based trajectories, gender difference

PP25 S-099
BURNOUT SYNDROME: DIFFERENT APPROACHES IN A LONG TERM CARE FACILITY (LTCF)

Ana Cristina AGUIAR¹, Tania Novinsk HABERKORN¹, Sabrina Marcondes TEIXEIRA², Gabriela SATO³, Miriam Ikeda RIBEIRO⁴ (*1. Psychology, Residencial Israelita Albert Einstein, Brazil; 2. Care Givers Supervision, Residencial Israelita Albert Einstein, Brazil; 3. Assistential Coordination, Residencial Israelita Albert Einstein, Brazil; 4. Institutional Manager, Residencial Israelita Albert Einstein, Brazil*)

Introduction : Burnout syndrome is a form of stress produced in professionals who keep constant and direct relationship with other people, being more evident in assistential occupations. Its consequences can be both somatic and psychical and might interfere with the quality of the relations. A LTCF it's known by the heterogeneity of the patients who live in the institutional care, by a variability of levels of functionality or diagnostics. The objective of this study is analyzing this phenomenon of stress on different aspects on the formal caregiver. Method : Data from the Maslach Burnout Inventory (MBI) of 58 formal caregivers were compared with the Neuropsychiatric Inventory (NPI) applied in 158 formal caregivers. These data were analyzed taking into account the degree of functionality of the residents: independent, semi-dependent and dependent. Results : The sub-items of the MBI showed no statistical difference when compared to the degree of functionality (emotional exhaustion, p=0.601; personal realization, p=0.525; depersonalization, p=0.374). Although NPI showed significant difference when analyzing the level of burnout among different degrees of functionality (p=0.001). Conclusion : The phenomenon of burnout is a reality for professionals who keep a constant and direct relationship with people who depend on some kind of care. In addition to the subjective aspects intrinsic of care, factors such as neuropsychiatric disorders might cause significant impact on these cares. The sensibilization of these professionals, besides the emotional aspects, should include educational strategies seeking a better understanding of neuropsychiatric disorders. Keywords : Long Term Care Facility, Burnout

PP25 S-100
PSYCHOMETRIC EVALUATION OF THE GERMAN VERSION OF THE CAREGIVER REACTION ASSESSMENT SCALE (G-CRA)

Astrid STEPHAN, Gabriele KRAUSE, Herbert MAYER, Anna RENOM-GUITERAS, Gabriele MEYER (*Faculty of Health/School of Nursing Science, Witten/Herdecke University, Germany*)

Introduction : Approximately 70% of care recipients in Germany receive nursing care at home, mostly from informal caregivers. Measurements assessing family caregivers' reaction on care giving are lacking. The CRA is a generic tool comprising 24 items in 5 subscales taking positive and negative aspects of caring into consideration. Psychometric properties' testing of the newly translated German version was nested into the 7th Framework European project RightTimePlaceCare. Method : Calculations are based on 234 interviews with caregivers of older persons with dementia in North Rhine-Westphalia, Germany (home care: n=116; nursing homes: n=118; time: 01/2011-01/2012). Exploratory factor analysis (EFA) was performed to derive independent subscales. To assess criterion validity, subscales were inter-correlated. Internal consistency was

computed for subscales using Cronbach's Alpha. Applicability was assessed by evaluation of interviewers' experiences (n=9). Results : EFA revealed 6 factors with eigenvalues >1 but screen-plot clearly supported 5 factors explaining 56.2 % of variance. Dimensions of the original instrument were confirmed. Subscales' inter-correlation was mainly weak to moderate (Spearman's rank correlation coefficients between $r = -0.097$ and $r = 0.304$) indicating different concepts. Only subscales "schedule" and "health" inter-correlated higher ($r = 0.496$; $p = 0.01$) which might indicate that both dimensions cannot be separated accurately enough. Internal consistency of subscales can be judged as sufficient/good (Cronbach's α between 0.671 and 0.78). In general, interviewers judged the G-CRA as well applicable. Conclusion : Sufficient psychometric properties were found indicating - conservatively interpreted - that the G-CRA might be an appropriate measurement on family caregivers' reactions in the German context. Further research is needed focusing on different target groups. Keywords : caregiver reaction assessment, psychometric evaluation

PP25 S-101

PERSONS WITH DEMENTIA BEING AT RISK FOR INSTITUTIONALISATION: ANALYSIS OF JUDGEMENTS BY PROFESSIONAL CAREGIVERS ACROSS EIGHT COUNTRIES

Astrid STEPHAN¹, Basema AFRAM² (1. Faculty of Health/School of Nursing Science, Witten/Herdecke University, Germany; 2. Department of Health Services Research (Faculty of Health, Medicine and Life Sciences), Maastricht University, School for Public Health and Primary Care (CAPHRI), Netherlands)

Introduction : Transition from home care to nursing home is a decisive moment in the trajectory of dementia care. Decision-making in this context is not well understood. We investigated why professional caregivers consider nursing home admission as necessary and whether their judgements differ across countries. The analysis is part of the EC 7th framework project RightTimePlaceCare with England, Estonia, Finland, France, Germany, Spain, Sweden and The Netherlands. Method : Professional caregivers of persons with dementia living at home were asked to openly report anticipated reasons for nursing home admission. Answers were translated into English and inductively categorized, after 20% were checked for reliability and validity. Results : Unstructured risk assessments of 1162 professional caregivers were eligible for analysis. The content analysis of anticipated reasons for admission revealed 25 main categories containing several subcategories. In the participating countries, the following 5 main categories were most often identified: caregiver burden (39%, n=453), caregiver inability to care (20%, n=235), neuropsychiatric symptoms (18%, n=204), overall deterioration (16%, n=185) and ADL dependency (11%, n=128). Professionals in Finland more frequently mentioned patient-related characteristics; caregiver burden was identified in only 26% of all Finnish cases. Risk assessment of Spanish professionals focused primarily on caregiver-related factors: burden was identified in 72% and caregiver inability to care in 15% of all Spanish cases. Conclusion : Professional risk assessment for institutionalisation considered caregiver and patient-related aspects, whereas caregiver-related aspects were predominantly mentioned. In this regard, our analysis revealed interesting variations between countries. Analysis of subcategories and comparison between formal and informal caregivers is ongoing. Keywords : Dementia, institutionalisation, risk assessment

PP25 S-102

INFLUENCE OF VISUALIZING HOME CARE BY USING DEMENTIA CARE MAPPING ON CARE PLAN FOR

ELDERLY PERSON WITH DEMENTIA

Atsushi USHIDA¹, Hisayuki SHIMOYAMA² (1. Graduate School of Medical Welfare, Aichi Shukutoku University, Japan; 2. Social Welfare Department, DOHO University, Japan)

Introduction : This study's purpose was to clarify visualizing home care service by using of Dementia Care Mapping (DCM) to improve a care plan for an elderly person with dementia. Method : The research was done from December 2010 to March 2011, using DCM (7th edition) which was made a small adjustment from original methods. Subjects of the investigation were three elderly persons with dementia who were living in their house, and home care givers. Results : Each investigation took 4 hours, 3 hours were devoted to the observation and 1 hour was devoted to the feedback based on the observation to home care givers. Each home care giver wanted to get advice concerned with dementia care. And they wondered their care ways were effective or not. When they got some advice, they were release from their stress. After that these result reported to each Care Manager who planed care service for the elderly people with dementia. The Care Managers said they got new information and notified new needs for an elderly person with dementia from these reports. They suggested visualizing by DCM should be done one time per three months. That was a chance of monitoring the care plan for elderly persons with dementia. Conclusion : As a result, visualizing by DCM is effective to improve a care plan for person with dementia. Further it releases home care givers from their stress. And visualizing by DCM makes a network relevant people. After those result, a person with dementia can live in their house continuously. Keywords : Visualizing, Dementia Care Mapping, Care Plan

A 10-YEAR (2000 TO 2009) HOME CARE STUDY IN SINGAPORE

Benedict John Chain Ching HO¹, Gerald Choon Huat KOH², Lydia SEONG³, Weng Yew THAM⁴, Thai Lian TAN⁵, Ming Ee YOUNG⁶ (1. Regional Health Systems & Primary Care Development, Agency for Integrated Care, Singapore; 2. Saw Swee Hock School of Public Health, National University of Singapore, Singapore; 3. Knowledge Management Division, Agency for Integrated Care, Singapore; 4. Home Care, Code 4 Pte Ltd, Singapore; 5. Clinical Services, Ren Ci Community Hospital, Singapore; 6. Community Care Development Division, Agency for Integrated Care, Singapore)

Introduction : Aim of study: To describe the home care patients in Singapore from 2000 to 2009. Description of home care patients in terms of their socio-demographic profile, mental and physical attributes, functional abilities and existing medical problems. Method : We reviewed the medical records of patients admitted to a home care provider in Singapore, over a 10-year period from 2000 to 2009. Results : Of the 582 patients who utilised the home care services provided by the provider, 37% were male and 63% were female, with about 75% were Chinese and living in HDB 5-room (33%) and 4-room (22%) flat. The acute public hospitals were the main source of patient referral for homecare services, accounting up to 73%. Patients utilising homecare usually have at multiple co-morbid conditions, with stroke (63%) and hypertension (62%) being the two more common medical conditions. Their length of stay as a homecare client averaged a year (355 days) with the death as the main reason for discharge (75%). Other trends on the co-morbid conditions, functional assessment, psychological assessment and social assessment of the 582 patients over the 10-year period would be further analysed so as to better determine the needs of the homecare patients and identifying area in medical and nursing care or social sector that can be ameliorated.

Conclusion : Conclusion: With an increasing emphasis to encourage ageing in the community and more attention diverted to building up the home care industry's capacity and capability, it is important to understand the profile of the patients who had been utilising home care. **Keywords :** home care

PP25 S-104

OUTCOMES STUDY FOR THE ENHANCED HOME AND COMMUNITY CARE SERVICE - THE MAIN HOME CARE SERVICE FOR MODERATE TO SEVERE IMPAIRED ELDERLY IN HONG KONG

Choi Ying TONG, Chi Shan KONG (*Integrated Elderly Care Service, Christian Family Service Centre, Hong Kong*)

Introduction : The Enhanced Home & Community Care Service (EHCCS) in Hong Kong has been a pilot home care service for moderate & severe impaired elderly since 2000. The multi-disciplinary service team consists of social workers, nurses, physiotherapists, occupational therapist & home care workers. The Team provides various home care service including basic to advanced nursing care, rehabilitative exercise, home modification, independent daily living functioning training, carer support and training, & basic home care, e.g. meal delivery, escort service, personal care, household cleaning, etc. This is the main home care service, in the Long Term Care Service System, for this target group in Hong Kong. There are in total 5600 placement of this service in Hong Kong. **Method :** Christian Family Service Centre has, now, a quota of 723 service placement serving the target elderly living in the community. A pre-and-post service evaluation study has been conducted, measuring 127 service users for the degree of improvement of the functioning. Three times of data collection was conducted, ie. baseline, first half year and 2nd half year after service intervention. Barthel Index (dependence of activity of daily living), EMS (mobility & functioning), MMSE (cognitive functions) were used as assessment tools. Improvement was found in comparison. **Results :** Positive improvement was found in EMS and MMSE with statistically significant ($p < .005$). The improvement rate in the first half year is higher than the second half year. **Conclusion :** The improvement resulted shows the positive effectiveness of the EHCC service. **Keywords :** home-care, long-term care, functioning

PP25 S-105

CAREGIVER'S PELVIC MOVEMENT DURING TRANSFER ASSISTANCE FROM BED TO WHEELCHAIR USING 3D MOTION ANALYSIS SYSTEM AND A TRIAXIAL ACCELEROMETER DEVICE

Douglas MORI¹, Yurimi MATSUMOTO², Mitsuhsa SHIOKAWA¹, Kenji KAWAMURA³, Hiroshi SUMII¹ (*1. Health and Welfare Sciences, Prefectural University of Hiroshima, Japan; 2. Health and Welfare Sciences, Niimi College, Japan; 3. Physical Therapy, Kibi International University, Japan*)

Introduction : Regarding on the increased number of elderly people with needs of assistance transferring movement submitted by the caregiver and the high mechanical load on the lumbar spine that these care activities are characterized. This study analyzed caregiver's pelvic movement by simulating transferring assistance from bed to wheelchair. **Method :** By simulating the task of the caregiver while transferring assistance, 6 divided phases were analyzed: Starting-up, Pulling-close, Standing-up, Turning, Sitting-down and Seating. To measure values of the movement course and acceleration data, a 3D Vicon Motion Analysis System were used compounding 12 infrared cameras and a Triaxial Accelerometer device. All the data were plotted on a graph for further analysis of the waveform and statistical analysis

was adopted. **Results :** The positioning of the pelvic axis were determined in all six phases by the coordinates x,y,z, as follows: X-axis: Starting-up (221.35±32.87); Pulling-close (257.55±43.63); Standing (295.54±34); Turning (231.24±19.82); Sitting-down (261.60±39.86) and Seating (314.90±18.42). Y-axis: Starting-up (-5.90±29.20), Pulling-close (-33.25±4.80), Standing (-29.43±7.87), Turning (-34.31±13.61), Sitting-down (-1.54±23.99) and Seating (61.75±24.43). Z-axis: Starting (921.80±30.81), Pulling-close (807.87±42.72), Standing (890.19±64.32), Turning (940.17±9.34), Sitting-down (916.22±17.92) and Seating (824.33±19.10). **Conclusion:** The caregiver's pelvic movement during the transfer assistance, composed by the 6 phases was analyzed showing a high load in this care activity, during the Standing phase, according to the index of acceleration created upon xyz coordinates. **Keywords :** Transfer assistance, 3D, Caregiver

PP25 S-106

IS HONESTY ALWAYS THE BEST POLICY? MEDICAL STUDENTS' VIEWS ABOUT LYING TO PEOPLE WITH DEMENTIA

Ellen TULLO¹, Tony Johnstone YOUNG² (*1. Institute for Ageing and Health, Newcastle University, United Kingdom; 2. Education, Communication and Language Sciences, Newcastle University, United Kingdom*)

Introduction : Communicating with people with dementia (PWD) in clinical settings is complex. Healthcare professionals are often faced with communicative dilemmas, for example whether it is ever acceptable to lie to PWD. Healthcare professionals' views about lying to PWD remain under-explored. **Method :** Using mixed-methods, first and third-year students at a medical school with sites in the UK and Malaysia were invited to complete a Likert-scale questionnaire about communicating with PWD (the CDQ). Participants were subsequently invited to participate in exploratory focus groups to further discuss their responses. Analysis here focussed on data relating to lying to PWD. Audio-recorded focus group data was transcribed and initial codes identified. Further coding cycles allowed the identification of themes relating to perceived acceptability of lying to PWD. **Results :** 284 first and 43 third-year students completed the CDQ. The modal response ($n = 143$) was to 'neither agree nor disagree' that it was acceptable to lie to PWD if the truth might be upsetting. A total of 19 students took part in 6 focus groups. Key themes relating to lying included: plurality of terminology used to describe dishonest communication; uncertainty about the application of ethical principles in practice; and awareness that acceptability of lying was highly dependent on individual circumstances. **Conclusion :** This mixed-methods study revealed that medical students are uncertain about the acceptability of lying to PWD, although some examples of acceptable lies were proposed. This uncertainty highlights the need to continue explore the ethical issues concerning lying to PWD, including the individual circumstances when lying to may be acceptable. **Keywords :** dementia, lying, medical student

PP25 S-107

CHANGES IN LONG-TERM INSTITUTIONAL CARE AND ROUND-THE-CLOCK CARE OF THE ELDERLY DURING TWENTY-FIVE YEARS IN HELSINKI

Heikki TAKKUNEN¹, Elina TAKKUNEN² (*1. Assurance Medicine Consultations, Freelance Helsinki, Finland; 2. General Practice, Freelance Helsinki, Finland*)

Introduction : In Helsinki, the capital of Finland with 600000 inhabitants, long-term institutional care of the aged has been prevalent.

Method : The aim was to study the changes of long-term institutional care and round-the-clock care using the public statistics of Helsinki and National Institute for Health and Welfare, Finland. **Results :** In 1985 there were daily on average 3540 people at old-age and nursing homes. In long-term hospitals on average 2094 beds were daily in use. On average 440 patients needing long-term care were daily waiting in acute wards. In 1985 circa 15% of Helsinki aged 75 years or over (N = approximately 4300) were in the long-term institutional care. Round-the-clock service housing was practically nonexistent. In comparison, in 2010 the average number of clients daily at old-age homes was 2851 persons, of them 2415 persons aged 75 years or over (6.1% of this age cohort). The average number of long-term patients daily in health centre hospitals was 480, of them 323 aged 75 years or over (0.8 of the cohort). In units of enhanced service housing (24h care) the average number of clients was 2902, of them 75 years or over 2511 persons (6.3%). At the end of 2010 the proportion of long-term institutional care in people aged 75 years and over was 5.1%. The total proportion of long-term round-the-clock care of this age group, either institutional or enhanced service housing, was 10.9%. **Conclusion :** In Helsinki during 25 years the proportion of the elderly needing long-term round-the-clock care decreased approaching the goals of the City. **Keywords :** Aged, Long-Term Care, Housing for the Elderly

PP25 S-108
EXPLORING NECESSARY SUPPORT FOR OLDER ADULTS AFTER THE DEATH OF THEIR FAMILY MEMBERS THEY CARED FOR

Hiroko KODAMA (*Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : My aims in this study are (a) to identify the challenges older adults face in the lives after the death of their family members they cared for and (b) to explore necessary support for these older adults. It is important to understand their support needs because it is found that family caregiving influences caregivers' health negatively even after the death of care recipients and that such influences are especially powerful for older caregivers. **Method :** I qualitatively analyzed interview data from 15 older adults age 60 and over who cared for one of their family members until her or his death. **Results :** Participants' view of their lives varied by whether they had a coresiding family member and whether and how much they accepted the death of their care recipients. Those without coresiding family members felt helpless, reporting little interest in socializing. Some participants made efforts to close their caregiving lives and move forward by writing down their experiences with their care recipients. Keeping connected with care service staff members also helped participants to adjust to their post-caregiving lives. **Conclusion :** Given the negative view of life among some participants, it is necessary to provide socioemotional support for family caregivers after the death of care recipients, not only during caregiving. **Keywords :** older caregiver, after the death of care recipients, socioemotional support

PP25 S-109
IMPACT OF ORGANIZATIONAL FACTORS ON BURNOUT AMONG CARE WORKERS IN JAPAN

Hisanori ISHIKAWA (*Social Work, Kwansei Gakuin University, Japan*)

Introduction : Due to the increase of the elderly in Japan, it has been necessary to improve the quality and quantity of care workers. This study aims to investigate the cause of care workers quitting through calling attention to the problem of burnout syndrome, and investigating the factors contributing to burnout syndrome. **Method :**

486 care workers in 15 facilities for the aged in Hyogo Prefecture were sent questionnaires by mail in February 2010, and 188 replied. The revised Japanese version of the Maslach Burnout Inventory (MBI), which consisted of 17 items, was used as a dependent variable. Organizational factors such as manager support, working conditions, mutual respect, and maintenance of goals were independent variables. Professional network^o item was also an independent variable. **Results :** The results of one-way ANOVA of burnout of care staff by socio-demographic variables showed that there was a significant difference of their experience and working status. As a result of multiple regression analysis, working conditions and mutual respect were significantly related to burnout with controlling other independent variables. **Conclusion :** The results indicate that burnout can be reduced through improvement of working conditions and by increasing mutual respect. Working conditions such as wages, working hours and holidays are important factors in running and managing care facilities for the aged. Therefore, adequate planning of care workers' salaries and duties are necessary to improve the workers' motivation. In addition, it is the care facilities' managers who should take a leading role in increasing mutual respect among care workers. **Keywords :** Care worker, Burnout, Organizational factor

PP25 S-110
THE NECESSITY OF DEVELOPMENTAL AND CONTINUOUS EVALUATIONS FOR LONG TERM DEMENTIA CARE

Hisayuki SHIMOYAMA¹, Atsushi USHIDA² (*1. Faculty of Social Welfare, DOHO University, Japan; 2. Graduate School of Medical Welfare, Aichi Shukutoku University, Japan*)

Introduction : The purpose of this study was to clarify the function of Dementia Care Mapping (DCM) as developmental and continuous evaluations for long term dementia care. **Method :** We were investigating one group home (GH) for people with dementia using DCM from 2008 to 2012. That GH had 9 residents and 7 staff members. In 2008, we did DCM 5 times. From 2009 to 2012, we did DCM 2 times every year. In total, we did 11 times DCM in this GH. **Results :** Before the 1st DCM, the GH had several problems, some residents showed B.P.S.D, and some staff wondered whether their care methods were effective or not. The 1st DCM clarified the GH's condition, after that the staff improved their care methods. Gradually, the GH's condition improved. However, the next year, we found the condition was worse than previous year's condition. There were 5 months between the 5th DCM and the 6th DCM. The GH's care standard was falling. At 7th DCM, the GH's condition was recovered. From 2011 to 2012, some residents' health conditions were deteriorating as aging. They were in the stage of terminal care. The staff had to get new care methods for these conditions. The DCM helped the staff cope with new needs. **Conclusion :** The word "Developmental" imagines improvement. The care for an elderly people is not always improving, however, that is not due to the lack of a staff's effort. As they age, elderly people might exhibit their worse conditions, continuous evaluations help care staff knows how to do. **Keywords :** Dementia Care Mapping, Continuous Evaluations, Group Home Care

PP25 S-111
THE RELATIONSHIP BETWEEN QUALITY OF LIFE AND DAILY ACTIVITIES OF DISABLED ELDERLY USING HOME CARE SERVICES

Hsiao-Mei CHEN¹, Ching-Min CHEN² (*1. Department of Nursing, and Doctoral Student, National Cheng Kung University, CC0003, Taiwan; 2. Department of Nursing, National Cheng Kung University,*

CC0003, Taiwan)

Introduction : As proportion of elders increased, the need for long-term care also increased. To enable aging in place for the elderly, the government has implemented home care services to utilize this community-based long term care service in meeting their needs. Home care service provides 'in home' elder care services which can help the disabled individuals with daily tasks such as bathing, cleaning the home and preparing meals in order to maintain their independence and stay at homes for as long as possible. As utilization of the services increasing, it is important to know the relationship between quality of life and daily activities of disabled elders who using home care services. **Method :** A cross-sectional, correlated design was used. A total of 255 disabled elders currently using home care services from the seven home care service centers in Taichung, Taiwan were recruited. The SPSS 17.0 was used for statistical analysis. **Results :** The mean scores of QoL are 45.41. Result of multiple regression analysis reveals a total of 39.2% of the variance in QoL by following predictors respectively. Income (over 15001 NTD monthly), not receiving public aid, fewer diseases, and better in IADLs are positively predicting QoL. Results of this study demonstrate the importance of home care service in helping disabled elders with ADL and IADL to enhance their QoL. **Conclusion :** The research results demonstrate the empirical evidence of the relationship between daily activities and quality of life among disable elders using home care services. A better follow-up and interventional study will be recommended for future research. **Keywords :** quality of life, home care services, activities of daily living

PP25 S-112

A COMPARATIVE STUDY OF MUSCULOSKELETAL DISCOMFORT AND PSYCHOSOCIAL BURDEN AMONG FOREIGN AND DOMESTIC NURSING ATTENDANTS IN TAIWAN

Pei-Chun LIN¹, Ku-Chou CHANG², Yu-Ching HUANG², Man-Chun CHOU³, Hsuei-Chen LEE⁴ (1. Department of Rehabilitation, Tri-Service General Hospital, Taipei Clinic Center, Taiwan; 2. Department of Neurology, Kaohsiung Chang Gung Memorial Hospital, Taiwan; 3. Department of Nursing, Kaohsiung Chang Gung Memorial Hospital, Taiwan; 4. Department of Physical Therapy and Assistive Technology, National Yang-Ming University, Taiwan)

Introduction : Nursing attendants (NA) are at risk of work-related musculoskeletal disorders (MSD) and psychosocial burden. This study investigated the prevalence and risk factors related to MSD and psychosocial burden for foreign NA (FNA) and domestic NA (DNA) in Taiwan. **Method :** This cross-sectional comparative study recruited family FNA and hospital affiliated DNA after informed consents. Variables were collected and compared between FNA and DNA including: 1) Demographics, 2) Physical fitness, 3) Knowledge of transfer skills (0-10, 10=excellent), 4) Frequencies of tasks and activities, 5) Nordic Musculoskeletal Questionnaire (NMQ), 6) Caregiver Strain Index (CSI 0-13, normal < 7), 7) Cervical and lumbar spine image, and 8) urine 17-hydroxycorticosteroid (17-OHCS). **Results :** The study enrolled 85 FNA and 65 DNA with mean age 31.4 and 51.4 years. MSD was prevalent in 70.6% FNA and 83.1% DNA, frequently on neck (40-52%), low back (37-48%), and shoulder (35-55%). FNA performed better than DNA in BMI, grip strength, and flexibility. Both groups had worse abdominal/back muscular endurance compared to age-matched norms. FNA showed higher work loading but inadequate knowledge of body mechanics. Among 39 FNA and 50 DNA undertaking X-ray examinations, C-spine abnormality was 35.9% vs. 82.0% while L-spine abnormality was

51.3% vs. 84.0%. C/ L spine lesions were positively correlated to MSD. CSI was 6.0 vs. 4.4 and abnormal 17-OHCS was found in 59.6% vs. 43.4% of FNA and DNA respectively. **Conclusion :** The prevalence of MSD in NA was high. Intervention on fitness training and education of transfer skills might ameliorate MSD risk for NAs. **Keywords :** Domestic nursing attendant, Foreign nursing attendant, Musculoskeletal disorder, Psychosocial burden, Risk factor

PP25 S-113

COST-EFFECTIVENESS OF A CHRONIC CARE MODEL FOR COMMUNITY-DWELLING FRAIL OLDER ADULTS: DESIGN OF THE ECONOMIC EVALUATION OF ACT (FRAIL OLDER ADULTS: CARE IN TRANSITION)

Karen VAN LEEUWEN¹, A.P.D. JANSEN², J.E. BOSMANS³, H.P.J. VAN HOUT², M.W. VAN TULDER³, H.E. VAN DER HORST², G. NIJPELS² (1. General Practice and Elderly Care Medicine, VU University Medical Centre / EMGO Institute for Health and Care Research, Netherlands; 2. General Practice and Elderly Care Medicine, EMGO+ Institute for Health and Care Research, VU University Medical Center, Netherlands; 3. Department of Health Sciences, EMGO+ Institute for Health and Care Research, VU University Amsterdam, Netherlands)

Introduction : Health care utilization in Western countries is increasingly driven by the needs of vulnerable older persons. New care models are needed to warrant the financial tenability of health care systems. We evaluate the cost-effectiveness and -utility of the Chronic Care Model for community-dwelling frail older adults compared to usual care. **Method :** Design: Prospective (2-year) economic evaluation from a societal perspective alongside a stepped wedge cluster RCT Study population: Dutch community-dwelling frail older adults (N = 1147) and their primary informal caregivers Intervention: Half-yearly geriatric assessments of care needs will be performed by practice nurses using the Resident Assessment Instrument (RAI), resulting in a tailored care plan. Complex situations are reviewed in a multidisciplinary meeting (including the patient's general practitioner). All professionals involved are directed by a central CCM team, which encourages coordination between care organizations. Measurements: Effect measures at 6, 12, 18 en 24 months include functional status (Katz Index) and quality of life (EQ-5D). Costs include health care utilization by both the older adults and their informal caregivers, and the costs of development and implementation of the CCM. Resource use is measured using cost diaries and will subsequently be valued using Dutch cost prices. Analysis: Bootstrapping will be used to analyses cost-effectiveness. Cost-effectiveness planes and cost-effectiveness acceptability curves will be estimated. **Results :** Results are expected in the second half of 2013. **Conclusion :** This study will show whether implementing the CCM for community-dwelling older adults is cost-effective compared to usual care. **Keywords :** Care models, Cost-effectiveness, Design

PP25 S-114

A NEW ATTEMPT TO ACHIEVE SEAMLESS MULTIDISCIPLINARY COOPERATION USING INFORMATION AND COMMUNICATION TECHNOLOGY IN AGGRESSIVE PROMOTION OF HOME MEDICAL CARE IN JAPAN

Katsuya IJIMA¹, Satoru YOSHIE¹, Mari KIMATA¹, Mikio IHORI¹, Takuma YAMAMOTO¹, Jun GOTO¹, Shinsuke FUJITA², Katsuhiko TAKABAYASHI³, Minoru KAMATA¹, Tetsuo TSUJI¹ (1. Institute of Gerontology, The University of Tokyo, Japan; 2. Dept. of Welfare and Medical Intelligence, Chiba University Hospital, Japan; 3. Division for Medical Informatics and Management, Chiba

University Hospital, Japan)

Introduction : Now Japan is advancing toward super-aged society, there is general consensus that the current healthcare delivery system will not be able to supply an adequate workforce for the ever-increasing chronic-care needs of growing Japanese elderly. Therefore, medical policy in Japan should be redefined. In concrete, it is necessary to reconsider the importance of patient-centered home medical care (HMC) comprehensively, but not the traditional hospital-centered care only. In particular, aggressive promotion of HMC is strongly demanded further, however, many problems are still piled up. Our aim is to achieve 'AGING IN PLACE' that the patients should receive hospitable care closely connected with their life in their hometown (region) throughout their lifetime. **Method :** Here, we promote patient-centered home medical care, which implements chronic and/or end-of-life care models, as a new model of a promising framework for primary care transformation in Kashiwa city, 400 thousand population city in the north-east part of Mega-Tokyo. The intents of our challenge are to provide coordinated and comprehensive care rooted in a strong collaborative relationship and to launch an original model with 'chief physician/vice-chief supportive physician system'. **Results :** This system strongly consists of the multidisciplinary team-based care system. In addition, the use of Information and Communication Technology (ICT) with mobile device has made possible smooth and seamless cooperation from it without time lag. **Conclusion :** Healthcare reform will require implementation of new models of care with utilizing ICT. We report new perspective based on the progression of our challenge in Kashiwa city on the concepts of the patient-centered HMC. **Keywords :** Comprehensive Home Medical Care, Multidisciplinary Cooperation, ICT

PP25 S-115

USER ATTRIBUTES THAT INFLUENCE THE DEGRADATION OF QOL OF THE ELDERLY LONG-TERM CARE INSURANCE USERS

Kazutaka MASUDA¹, Masakazu SHIRASAWA², Ryosuke HATA³, Satoru YOSHIE⁴, Hiroko SHIRAKI⁵, Keiko YAMADA⁶, Hiroko TAKASUNA⁷, Asako YONEZAWA⁸, Koji KISHIDA⁹, Yoshimasa TAKASE¹⁰, Katsuko TANNO¹¹ (1. Faculty of Human Sciences, Waseda University, Japan; 2. Graduate School of Gerontology, J.F. Oberlin University, Japan; 3. School of Social Welfare, Hokusei Gakuen University, Japan; 4. Institute of Gerontology, The University of Tokyo, Japan; 5. General Division, Fuji Care Corporation, Japan; 6. Division of Chief Care Managers, Maebashi-shi Comprehensive Community Support Center, Japan; 7. Division of Visiting Nurse, Minamiku Visiting Nurse Center, Japan; 8. Social Innovation Consulting Sector, NTT Data Institute of Management Consulting, Japan; 9. Department of Home Economics, Wayo Women's University, Japan; 10. Division of Visiting Doctors, Takase Clinic, Japan; 11. Department of Physical Therapy, Yamagata Prefectural University of Health Sciences, Japan)

Introduction : With the aim of identifying the characteristics of the service users whose QOL tends to degrade, the study investigated the changes of QOL for one year, observed by case managers, as well as the correlation between the changes and the user attributes. As a result, age, dementia and the after-effect of cerebrovascular disease (CVD) were identified as the QOL degrading factors. **Method :** A panel survey was conducted from 2010 in order to observe the changes of the QOL of the service users. A logistic regression analysis was then conducted to determine the correlation between the changes of QOL and the user attributes. **Results :** As a result of logistic regression analysis, it was shown that the degrading risks of eating and bathing

are approximately 2.5 times higher among the users of over 75 years old group, compared to the under 75 group. It was also shown that the degrading risks of toileting, communication, and motivation in life are more than 2 times higher among the users with dementia, compared to those without. The degrading risk of eating is 1.27 times and the communication 2.13 times higher among the users with after-effect of CVD. **Conclusion :** For high-risk users, it is necessary to conduct detailed assessments and coordinate and manage the service provision in order to prevent further degradation as much as possible. It is also necessary to ensure that care support professionals have knowledge of risk management in order to prevent accidents and illnesses caused by the degradation of QOL. **Keywords :** case management, QOL

PP25 S-116

A STUDY BASED ON THE THOROUGH DATA ANALYSIS OF THE ELDERLY REGARDING THE NUTRITION GUIDANCE OFFERED AT THE DAY CARE CENTER

Keiko ENDO (Section of Oral Health Care Science for Community, Tokyo Medical and Dental University, Japan)

Introduction : The Nursing Care Insurance system in Japan has been focusing mainly on the preventative care since 2005. However, its substantial target has been the underweight elderly with precise nutrition program. The objective of this research is to verify the necessity of a new nutrition guidance program for the overweight elderly who are receiving the day-care services. **Method :** The elderly at the Day Care Center have been divided into five groups for the data analysis: the underweight with their BMI below 18 and the overweight with their BMI over 25. The questionnaire survey was conducted for both groups concerning their daily diet and their feeling of contentment induced by the food in order to specify the correlation. **Results :** The data consist of age, gender, height, weight, need for nursing care, use of the nursing care insurance services, illnesses, single household or with a family, physical activities, and nutrition assessment. For the purpose of examining their mental wellbeing, several questions were asked such as their judgment of present physical status, their awareness of weakening ability, their daily diet, and their request for the better services at the Day Care Center. **Conclusion :** The data shows that there is a strong correlation between the overweight and the necessity for a further nursing care, in remedy for nutrition balance. Therefore, this research leads to a conclusion that a new approach for nutrition guidance should be adopted at the Day Care Center to support the quality of life of the overweight elderly now and in the future. **Keywords :** Obese elderly, nutritional care, Day Care Center

ACTUAL CONDITION OF FALL PREVENTION INVOLVING COLLABORATION FROM THE PERSPECTIVE OF THE ROOT CAUSES OF FALLS: FOCUS ON GERIATRIC HEALTH SERVICE FACILITIES

Keiko YAMAMOTO, Etsuko KAKIYAMA (Nursing, Kyushu University of Nursing and Social Welfare, Japan)

Introduction : Fall prevention at elderly care facilities requires the collaboration of facility staff as the risk of falls cannot be avoided by the elderly individuals themselves. In the present study, we therefore aimed to elucidate the actual awareness and collaboration of staff regarding fall prevention. **Method :** An anonymous self-report questionnaire survey was conducted on a total of 530 geriatric health service facilities. The inadequacy of such survey items as sharing of information among professions, assessment of users, care planning, and evaluation of plans is considered a root cause of falls. The present

study was approved by the ethics committee of the researchers' university. Results : Responses were obtained from a total of 127 facilities (response rate, 24.0%). Sharing of information, care planning, and evaluation of plans were implemented by 97% of facilities while assessment was implemented by 80% of facilities. At many facilities, the four items were implemented by multiple professions. However, investigation of the details of implementation such as methods and timing showed that 20% of staff had a common awareness. In addition, none of the facilities had a common awareness for all four items. Facilities at which staff had a common awareness tended to have fewer falls. Conclusion : Although staff implemented fall prevention, there was a lack of common awareness within facilities regarding the methods and timing of implementation. These findings suggest that improvement of the lack of common awareness may strengthen collaboration among staff and contribute to fall prevention. Keywords : Fall prevention, collaboration, residential care

PP25 S-118

EFFECTS OF USING AROMATHERAPY TO RELIEVE KNEE PAIN FOR THE ELDERS IN COMMUNITY: A RANDOMIZED CONTROLLED TRIAL

Cheng-Yuan LIN, Shu Nu CHANG-LEE (*Long-term Care, Asia University, Taiwan*)

Introduction : Osteoarthritis is a common cause of disability in elderly. Most patients with the condition will be managed in the community. This study was aim to investigate the effects of aromatherapy to relieve the knee pain for the elders in community. Method : This study was carried out in three communities. A single-blind, placebo-controlled randomized study was conducted to evaluate the effects of aromatherapy to relieve the knee pain for the elders in community. A total of 81 elders with knee pain were randomly allocated to 2 groups, 41 in experimental group and 40 in the control-placebo group. Outcome measures included the Western Ontario and McMaster universities (WOMAC) osteoarthritis index of pain, disability and joint stiffness in knee. Results : The scores in WOMAC were reduced significantly at 1 and 2 months ($p < 0.001$) in both groups. Nevertheless, in first month of intervention, the scores of pain, stiffness and motor disturbance in experimental group were reduced much more remarkably as compared with placebo group ($P < 0.01$, $P < 0.05$). Conclusion : Positive effects with both groups were observed. Moreover, the beneficial long-term effects on knee pain with aromatherapy appeared to be sustained. In conclusion, aromatherapy can significantly relieve the knee pain for the elders in community. Keywords : Osteoarthritis, aromatherapy, randomized controlled trial (RCT)

PP25 S-119

GRANDCHILDREN'S BEHAVIOR PROBLEMS AND CUSTODIAL STATUS PREDICT DEPRESSION AND BURDEN IN GRANDPARENTS

Loriena YANCURA (*Family and Consumer Sciences, University of Hawaii, USA*)

Introduction : Research literature provides conflicting information on how raising grandchildren influences mental health. These conflicting findings might be because there are variations in type and intensity of care. Some grandparents provide custodial care to grandchildren, without assistance from the children's biological parents; other grandparents provide only babysitting or part time care. The present study compares mental health outcomes between groups of grandparents based on type (custodial vs. part time) and intensity (presence or absence of grandchildren's behavioral problems) of care.

Method : Participants in this pilot study were 29 grandparents aged 51-84 years who completed structured interviews that included measures of CESD Depression, Burden, Self-Care, and Life Satisfaction. One-Way ANOVAs were used to compare outcome variables between three groups based on intensity of grandchild care: low (part time care, no grandchild problems), medium (either custodial care or grandchild with problems), and high (custodial care and grandchild problems). Results : All groups had significantly different scores on CESD depression, $F(2,26) = 5.42$, $p < .01$, and emotional burden, $F(2,26) = 14.147$, $p < .001$. Post hoc tests showed that high intensity grandparents had highest scores and low intensity grandparents had the lowest scores. Conclusion : These findings suggest that the impact of raising grandchildren on grandparents' health depends on the type and intensity of care. Grandparents providing custodial care to grandchildren with behavior problems may be most at risk for poor mental health outcomes. Keywords : grandparents, depression, burden

PP25 S-120

THE RELATIONSHIPS BETWEEN CAREGIVER BURDEN AND LEARNED RESOURCEFULNESS FOR THE SENIOR CAREGIVERS OF THE DISABLED OLDER ADULTS

Meng-Chun CHEN, Kuei-Min CHEN (*EE0003, CC0002, Taiwan*)

Introduction : According to the standard of ageing population introduced by the United Nations, Taiwan has developed as an aging society since 1993. Caregivers are under heavy burden levels for caring for the disabled older adults. Rosenbaum (1990) emphasized a set of skills for regulating internal events and using problem solving methods obtained from internal and external events combined with experience is known as learned resourcefulness. The purpose of this study was to explore caregiver burden and learned resourcefulness for the senior caregivers of the disabled older adults. Method : A cross-sectional correlation research design was used in this study. Using convenience sampling, 108 senior caregivers of the disabled older adults were recruited from a medical center and a regional teaching hospital, southern Taiwan. The data was collected using a structured questionnaire interview. Measures used in this study include SPMSQ, Barthel Index, the Caregiver Burden Scale and the Rosenbaum's Self Control Scale (SCS). Results : Results indicated that the two variables " caregiver's burden and learned resourcefulness " were negatively correlated ($r = -.70$; $p < .001$). Multiple regression analysis further showed that the predictors of caregiver burden included learned resourcefulness, economic status, and duration of care. These three predictors accounted for 57.2% of total caregiver burden variance. Conclusion : Results of this study revealed that the health professionals should understand the effect of the senior caregiver's burden and self-control skills. Results suggested that the healthcare professionals who use cognitive behavior coping strategies (learned resourcefulness) may help senior caregivers to cope with stressful events and decrease the caregiver's burden. Keywords : senior caregivers, caregiver's burden, learned resourcefulness

PREVALENCE OF PAIN AND THE RELATIONSHIP BETWEEN PAIN AND PHYSICAL/PSYCHIATRIC FUNCTIONS AMONG THE ELDERLY WITH DEMENTIA IN JAPANESE GERIATRIC FACILITIES

Mizue SUZUKI¹, Yukari TAKAI², Yoshie FURUTA³, Yumi MATSUI⁴, Ayami SATO³, Hajime OOSHIRO⁵, Noriko Mitani YAMAMOTO⁶, Masao KANAMORI⁷ (*1. Faculty of Nursing, Hamamatsu University School of Medicine, Japan; 2. Graduate School of Health Sciences, Gunma University, Japan; 3. Graduate School of Nursing, Hamamatsu University School of Medicine, Japan;*

4. Nursing Department, Totomi Hospital, Japan; 5. Administration, Totomi Hospital, Japan; 6. Graduate School of Medicine, the University of Tokyo, Japan; 7. Department of Health Sport, Seikei Spot College, Japan)

Introduction : Elderly patients with dementia who have communication impairments are often having difficulty to report the degree and locations of their pain appropriately. Therefore, it is highly possible that physical/psychiatric functions could be impaired by the pain. The purpose of this study is to clarify the pain among the elderly patients with dementia by using the Japanese version of the Abbey Pain Scale (APS-J) and to find its relationship between pain and physical/ psychiatric functions. **Method :** One hundred twenty nine elderly patients with dementia staying at the geriatric psychiatry hospitals and long-term care health facilities between August and October of 2012 were enrolled in this study. Primary nurses evaluated their patients' pain by using the APS-J. Clinical psychologists and occupational therapists evaluated these patients' cognitive functions and dementia symptoms by using the Mini-mental State Examination (MMSE), the Japanese version of the Gottfries-Brane-Steen Scale (GBS-J) and Behavioral symptoms in Alzheimer's disease (Behave-AD). **Results :** In the results, the subjects of 41(32%) suffered from pain. The relationship among the total score of APS-J and subscales of GBS-J such as motor functions, instinctual, emotional functions, and different symptoms of dementia were significantly correlated. Due to these findings, pain could induce certain Psychological Symptoms of Dementia (BPSD), degenerate of cognitive impairment and ADL among the elderly patients with dementia. **Conclusion :** It was suggested that nurses have to assess elderly patients with dementia to reduce pain even though they have communication impairments. **Keywords :** Dementia, Pain, physical/psychiatric functions

DIFFICULTIES EXPERIENCED BY STAFF AT WELFARE FACILITIES FOR THE ELDERLY REQUIRING LONG-TERM CARE WHEN CUTTING THE TOENAILS OF RESIDENTS WITH DEMENTIA AND RELATED STRATEGIES

Nobuko AIDA¹, Makomi TAKAKI², Naoko KOBAYASHI³, Yoko NAGAYA⁴, Akemi OGATA⁵, Hiroshi GOHMA⁶, Shin-Ichi SUGIURA⁶ (1. Graduate School of Medicine (Health Sciences), Nagoya University, Japan; 2. Department of Nursing, Nagoya University Hospital, Japan; 3. School of Nursing, Japanese Red Cross Toyota College of Nursing, Japan; 4. Department of Nursing, The National Hospital for Geriatric Medicine, National Center for Geriatrics and Gerontology, Japan; 5. Department of nursing, Association medical corporation MEISHOKAI, Total Support Clinic, Japan; 6. Graduate School of Medicine, Nagoya University, Japan)

Introduction : The present study clarified the difficulties experienced by 5 care workers and 3 nurses at a welfare facility for the elderly requiring long-term care when cutting the toenails of residents with dementia, and the details of related strategies. **Method :** The study was approved by the Nagoya University School of Medicine Life Ethics Committee School of Health Sciences, and was done by interview method. **Results :** Difficulties comprised 1) dealing with behavioral and psychological symptoms of dementia (BPSD) provoked by the characteristics of care activities; 2) dealing with unpredictable and dangerous situations; and 3) the dilemma of being unable to cut the toenails even if willing to due to factors such as being too busy and the limited discretionary power of care workers and nurses. High levels of awareness were observed regarding dealing with BPSD and risk management, and various strategies were employed. However, the dilemma between job role and limited discretionary power were not

proactively handled. **Conclusion :** The present findings suggest that a nationwide survey is required to investigate 1) the care provision environment affecting toenail care; 2) the relationship between care techniques and educational background regarding risk management; and 3) the effects of job role and limited discretionary power on the implementation of toenail care and the requirements of basic and postgraduate education regarding foot care in the elderly. **Keywords :** dementia, trimming and filing of nails, welfare facilities for the elderly requiring long-term care

THE BEST EVIDENCE FOR MINIMIZING RESISTANCE-TO-CARE (RCT) BEHAVIORS DURING ASSISTED PERSONAL CARE FOR OLDER ADULTS WITH DEMENTIA IN NURSING HOMES: A SYSTEMATIC REVIEW

Rie KONNO¹, Kiyoko MAKIMOTO², Hee Sun KANG³, Miyae YAMAKAWA² (1. Department of Nursing, Kansai University of International Studies, Osaka University, Japan; 2. Division of Health Sciences, Osaka University Graduate School of Medicine, Osaka University, Japan; 3. Red Cross College of Nursing, Chung-Ang University, Korea)

Introduction : The purpose of this study was to systematically review the literature regarding the effectiveness of non-pharmacological interventions for resistance-to-care (RCT) behaviors during assisted personal care for older adults with dementia in nursing homes. **Method:** A review was conducted by searching the relevant electronic databases with specified search terms for studies published between 1990 and 2012. The references listed in the selected publications were also searched for additional studies. Twenty articles were included for final analysis. **Results :** The majority of studies, firstly, employed a quasi-experimental design with a small sample, and secondly, were conducted only in one institutional setting. The participants' age ranged from 55 to 101 years and the majority were female. Participants in most studies had a moderate to severe level of dementia. Interventions such as music or individualized person-focused care were examined during mealtime, bathing, oral care, and morning care to manage RCT behaviors. Music was the most common intervention. Most studies measured only behavior of participants except four studies that measured emotion or interactional behavior of caregivers. Playing music and use of the person-focused approach was found to be effective for reducing RCT behaviors. **Conclusion :** This review identified playing music during mealtime and using the person-focused approach can minimize RCT behaviors of older adults with dementia. However, more high-quality research is necessary to confirm these findings. Evaluating the impact of intervention on the caregivers would be desirable since caregivers play a crucial role in managing resistant behaviors during personal care. **Keywords :** Dementia, Nursing home, Resistant Behavior

INFLUENCE OF DEMENTIA ON CHANGES OF CONDITION OF THE ELDERLY WHO REQUIRE EVERYDAY LIFE ASSISTANCE

Ryosuke HATA¹, Masakazu SHIRASAWA², Kazutaka MASUDA³, Satoru YOSHIE⁴, Hiroko SHIRAKI⁵, Keiko YAMADA⁶, Hiroko TAKASUNA⁷, Asako YONEZAWA⁸, Koji KISHIDA⁹, Yoshimasa TAKASE¹⁰, Katsuko TANNO¹¹ (1. School of Social Welfare, Hokusei Gakuen University, Japan; 2. Graduate School of Gerontology, J.F. Oberlin University, Japan; 3. Faculty of Human Sciences, Waseda University, Japan; 4. Institute of Gerontology, The University of Tokyo, Japan; 5. General Division, Fuji Care Corporation, Japan; 6. Division of Chief Care Managers, Maebashi-shi Comprehensive

Community Support Center, Japan; 7. Division of Visiting Nurse, Minamiku Visiting Nurse Center, Japan; 8. Social Innovation Consulting Sector, NTT Data Institute of Management Consulting, Japan; 9. Department of Home Economics, Wayo Women's University, Japan; 10. Division of Visiting Doctors, Takase Clinic, Japan; 11. Department of Physical Therapy, Yamagata Prefectural University of Health Sciences, Japan)

Introduction : With the aim of identifying the influence of dementia on the changes of conditions of the elderly requiring everyday life assistance and using the elderly long-term care insurance services, the study followed the changes of QOL assessment of the service users for one and half years, to investigate the correlation between the changes and dementia. Method : A panel survey was conducted. In the study, the changes in the QOL evaluations of the service clients were analyzed at three time points, at the start of the case management, 6 months and 18 months after receiving the service, during the 18 months of the investigation. In order to identify the influence of dementia on the changes of clients' QOL evaluation, two-way repeated measure ANOVAs were conducted with each of the nine QOL indexes as the dependent variables, the time as the independent variable and with/without dementia as the between-subject factor. Results : As a result of the analysis, time was shown to have a significant correlation with all QOL items, demonstrating that the case management service influences the QOL of the clients. Dementia showed significant correlation with the four QOL items, identifying the negative pattern of changes among the clients with dementia. Conclusion : The study demonstrated that the QOL of the elderly temporarily improves after starting to receive the case management service, but that it tends to deteriorate again. It is significant that the study showed the possibility that even the elderly with dementia could maintain the once-improved QOL with appropriate case management. Keywords : Case management, Dementia, Panel survey

IMPLEMENTING PRACTICE CHANGE IN RURAL AUSTRALIA: CREATING ENABLING ENVIRONMENTS

Sandra DAVIS¹, Alison CAMPBELL², Bernie MCCARTHY³
(1. Palliative and Supportive Services, Flinders University, Australia; 2. Palliative and Supportive Services, School of Medicine Flinders University, Australia; 3. Managing Director, McCarthy Psychology Services, Australia)

Introduction : Many rural communities in Australia are faced with significant challenges in providing quality dementia care, with ageing buildings designed for acute care, a workforce that is itself ageing, a severe shortage of skilled health care professionals generally and many barriers to up-skilling and educating staff. The Australian Government Department of Health and Ageing, Encouraging Best Practice in Aged Care Program funded two year study aimed at implementing existing evidence specific creating enabling environments to facilitate better practice in addressing behaviors of concern. Method : A hub and spoke model was used to support implementation in aged care homes across seven locations. The framework of change used targeted the dimensions of philosophy, management support, leadership, skilled staff and environment. Three education components underpinned the implementation process, with environmental modifications, policy review and Dementia Care Mapping informing practice change over an 18 month period. Using a pretest-posttest non-experimental design for the evaluation, outcome indicators included levels of psychotropic drug use, frequency of behaviors of concern/incident reporting, measures of individualized care, well-being, quality of life and family involvement. Results : The results of the evaluation revealed increases

in staff Individualized Care Inventory scores, needs-based problem solving embedded as standard practice, better quality family involvement, reductions in behaviors of concern, decreased use of psychotropic medications and increased resident well-being. Conclusion : Affordable, accessible education of a critical mass of staff, key staff to champion change and support other staff, strong management support and external expertise to support change processes can effect successful, sustainable outcomes that benefit staff and residents. Keywords : behaviors of concern, enabling environments, long term care

Research Laboratory, National Center for Geriatrics and Gerontology, Japan)

Introduction : The purpose of the present study was to assess state of needs of oral care and to investigate the factor to need oral hygiene management by dental hygienist for the dependent elderly. So we conducted actual condition survey about them for all the dependent elderly of specific region. From those results, we examined correlated factor for needs of oral care and oral hygiene management for the dependent elderly. Method : We intended for 425 dependent elderly who resident in A prefecture Y City old O-cho. They underwent examination of oral status, examination of cognitive function (Clinical Dementia Rating), certification of needed Long-Term Care, mode of nutrition intake, needs of oral care and oral hygiene management by dental hygienist. Results : The result about necessity of oral hygiene management found a significant association on all survey items. For the logistic-regression analysis, dementia strongly influenced the oral hygiene situation than age, degree of autonomy, certification of needed Long-Term Care, mode of nutrition intake, number of the teeth. Conclusion : In this investigation, the oral hygiene situation and severity of dementia found to be the important factors that oral hygiene management assistance by the dental hygienist was necessary. About the intervention time of the dental hygienist, we suggest necessity starting oral hygiene management by the time of mild or moderate on the basis of prognosis of the dementia. PROFILE AND TARGET OF MUSICAL CARE ACTIVITIES IN THE LONG-TERM CARE FACILITIES

Su-Feng TSENG, Pei-Lin KUO, Yi-Hsin HO, Cherng-En JIANG, Jia-Yi ZOU, Chung-Chieh LEE, Pai-Lin LEE (Department of Senior Citizen Service and Management, Chia-Nan University, Taiwan)

Introduction : The purpose of the study is to explore the influence of the music care activities at the long-term care facilities; moreover, it analyzed the difference in the various music activities among the

participants. Method : The subjects of this study were 1300 long-term care facilities in Taiwan. The research used the mail questionnaires to collect data. The total number of the returned questionnaires for all participants was 469, with a 36.1% effective return rate. In addition to the background information of the facilities, the contents of the questionnaire included the types of music activities performed at the facilities and the objects that the activities focused on. Results : The majority of the research samples were non-profit facilities (70%). Besides, the primary types of the music care activities at the facilities were singing activities (65.5%), and the others were music movement (42.4%), music appreciation (34%), and music care activities (33.3%). Furthermore, the participants mainly aimed at those who can take care of themselves but slightly disabled. Moreover, people who suffered from dementia mainly participated in the music activities of playing the percussion instruments (47.4%) and music movement (46.2%). Conclusion : Although the music care activities were performed in the long-term care facilities widely, the types of the activities were limited. Besides, the design of the activities for dementia people needed to be enhanced in order to improve the quality of the long-term care service. Keywords : musical care activities, long-term care facilities, patterns

PP25 S-128

MUSIC EFFECTS ON THE HOME CARE SERVICES

Su-Feng TSENG¹, Hsiu-Ling WANG², Chung-Chieh LEE¹, Pai-Lin LEE³ (1. Department of Senior Citizen Service and Management, Chia-Nan University, Taiwan; 2. Institute of Hospital and Health Care Administration, Chia-Nan University, Taiwan; 3. Department of Educational Psychology and Counseling, National Pintung University of Education, Taiwan)

Introduction : Replacing catheters for the bedridden disabled cases mostly brought about their nervous tension and discomfort, thereby affecting the home care service efficiency. Music therapy has gained emphasis due to the improvement of sedation in clinical effects, and thus been applied in the long-term care services. The research on music used in home care, however, is extremely scarce. This study is to explore to what extent the cases perceived positively from home care services in terms of music intervention, and to analyze the physiological characteristics and behavior of the cases in the service process. Method : This study adopted an experimental design to investigate 10 home-care disabled cases, employing classical music tune as a moderate factor. We separately measured and recorded vital signs before and after the music intervention served in treatments, using pair t test to compare and analyze the deviations of the outcomes. Results : The result showed no significant difference between before and after music intervention. Two cases were observed eyes open and head towards music in action; another one reduced times on being reset the gastric tube resulting from choking, and even had been snoring before the treatment ended. Conclusion : Although there was no significant improvement of care treatment incorporated with music listening on vital signs, the influence of music on disability cases existed in light of the reaction of the cases. Therefore, the impact of music listening on home nursing disable cases is worthy of exploring in further in-depth and long-term research. Keywords : Music, home care services, disability

A CASE STUDY OF TUBE FEEDING OF ELDERLY PEOPLE WITH COGNITIVE DIFFICULTIES

Takako MIZUOKA, Tsutomu FUJINAMI (Knowledge science, Japan Advanced Institute of Science and Technology, Japan)

Introduction : The progress of medical technology has extended life expectancy. Although the extension is welcome, it has also brought in some unwanted effects. In Japan, if it becomes difficult for an elderly person to eat, tube feeding is often proposed as a 'natural' medical treatment and used to prevent starvation. We will report a case study of a family who chose to feed their elderly parent with cognitive difficulties using a feeding tube. We will describe how the family members adopted tube feeding and how their lifestyle changed. Method : The decision-making process for adopting tube feeding was investigated with a series of semi-structured and informal interviews to the family caregivers. We investigated the everyday life of the elderly parent at home and at a care home. Results : The family invested a good deal of time and effort preparing meals for the 92-year-old mother, who disliked to eat. When heat stroke deteriorated the parent's condition suddenly, they were determined to adopt tube feeding. Two years later, the family reduced the stress and uneasiness due to her not eating. Her 70-year-old son seems to now enjoy interacting with his active and content mother and she now enjoys receiving visitors. Conclusion : Although cultural differences need to be examined, the elderly are not just a target to be cared for even when communication is difficult for them. They exist as an active and contributing member of the family. Tube feeding is effective in order that elderly people can enjoy living 'here and now' as a family's member. Keywords : tube feeding, elderly family members, case study,

PP25 S-130

THE OCCURRENCE AND COPING THE STRESS OF CARE STAFF OF NURSING HOME WITH NEW CARE SYSTEM

Takehiko TANABE (Faculty of Humanities, Hokusei Gakuen University, Japan)

Introduction : So far we examined to the psychological stress of environmental relocation effects to care staff of nursing home for the elderly residents with dementia being converted into group living unit at the preexisting loop corridor-type facility. After that we convinced group living unit care in the currently available facilities of the nursing home for the elderly in Japan was effective for residents. But for care giver, it is difficult to maintain the good care situation with a few person. So we research about the process throughout their interview and clear how to occur and cope with psychological stress. Method : We listened for psychological stress to 20 caregivers about 10 years at 2012. And we analyzed interview data by TEM (Trajectory Equifinality Model). Results : Most of them experienced stress after changing Public Nursing Care Insurance Law (2000,2005,2010). Because changing the law led to the change of system and care technique. We assume that makes care givers being stressful. Furthermore, they could cope with the stress by getting the knowledge about "The care method of group living unit". Conclusion : It is important to make clear procedure for changing in care system to group living unit and to make psychological supports to care staff with public and private situation when the troubles are occurred from new care system. It will lead to preventing psychological stress. Keywords : nursing home staff, group living unit, stress coping

PP25 S-131

RELATIONSHIP BETWEEN ATTAINMENT OF GOALS OF CARE IN FRAIL, OLDER PATIENTS AND CAREGIVER BURDEN

Wei-Chin WONG¹, Cindy Ying Ying YEO², Wendy Khar Gek NG³ (1. Geriatric Medicine, Tan Tock Seng Hospital, Singapore; 2. Continuing and Community Care, Tan Tock Seng Hospital, Singapore; 3. Nursing Service, Tan Tock Seng Hospital, Singapore)

Introduction : Frail, older patients often have multiple problems. Establishing the goals of care in these patients is essential to good medical care. The attainment of goals of care may also reduce the degree of burden perceived by their caregivers. The aim of this study was to determine the relationship between the attainment of goals of care in frail, older patients and caregiver burden. **Method :** Prospective, cohort study involving 51 patients and their caregivers seen at an outpatient clinic. The goals of care and attainment of goals for each patient was established using the goal attainment scaling method. Caregiver burden was assessed using the 12-item Zarit Burden Interview (ZBI) at the initial visit and at 6 weeks. **Results :** The mean age of the patients was 81.3 years. The mean number of goals identified per patient was 1.7. 98.0% of caregivers reported some degree of caregiver burden. The mean ZBI score at the initial visit was 16.5. 68.6% of patients attained the goals of care at the clinically expected level or better than expected level at 6 weeks. Caregivers for these patients reported significantly lower ZBI scores at 6 weeks compared to the initial visit (mean ZBI score: 16.5 at initial visit vs. 12.9 at 6 weeks, $p = 0.04$). There were no significant differences in the ZBI scores reported by caregivers of patients who did not attain the goals of care. **Conclusion :** The attainment of goals of care in this cohort of frail, older patients is associated with reduction in the degree of caregiver burden. **Keywords :** Caregiver burden

PP25 S-132
PHYSICAL HEALTH AMONG FAMILY CAREGIVERS IN JAPAN -BLOOD PRESSURE AND SERUM CHEMISTRY-

Yasuko SASAI¹, Noriko YAMAMOTO-MITANI², Hiroko SHIMADA-HORIKAWA³, Toshiko ICHIRIZUKA⁴, Ai FUJITA⁵, Takashi WADA⁶ (1. Department of Community Health Nursing, School of Nursing, The Jikei University, Japan; 2. Department of Adult Nursing, Graduate School of Medicine, The University of Tokyo, Japan; 3. Department of Nursing, The Jikei University Hospital, Japan; 4. Department of Central Clinical Laboratory, The Jikei University Hospital, Japan; 5. Department of Nursing, Kitasuma Home-Visit Nursing and Rehabilitation Center, Japan; 6. Shimbashi Medical Checkup Office, School of Medicine, The Jikei University, Japan)

Introduction : High burden has been reported among Japanese family caregivers even after the introduction of long-term care insurance. However, the actual impact of caregiver role on their physical health remains largely unknown. The purposes of this study are to evaluate the impact of care-giving on the physical health of family caregivers and to assess how health care professionals can promote caregivers' health. **Method :** We recruited 160 family caregivers (FCs) and 160 sex- and age-matched non-caregiver controls (Cs), and collected data of serum chemistry, blood pressure, and several self-rated health scores. This study was approved by the institutional review board of the researcher's organization. **Results :** The percentage of persons with hypertension among FCs (i.e., systolic blood pressure (SBP) > 140 mmHg, or diastolic blood pressure (DBP) > 90 mmHg, or under medical treatment) is significantly higher than that among Cs. Men's percentage of persons with hypertension were 70.2% in FCs vs. 40.4% in Cs ($p < 0.05$). Women's were 57.5% in FCs vs. 27.4% in Cs ($p < 0.001$). The percentage of persons with estimated glomerular filtration rate (eGFR) < 60 mL/min/1.73m² among female FCs is significantly higher than that among Cs. (44.2% in FCs VS.11.5% in Cs ($p < 0.001$)). **Conclusion :** We still need to continue our analysis to control major influencing factors, yet the results show the possibility of high health risk among FCs. Health care professionals need to teach family caregivers their risk of high blood pressure and renal dysfunction, and to make efforts for early detection of their health problems. **Keywords:**

family caregivers' health, care-giving

PP25 S-133
INTEGRATED DISCHARGED CHRONIC DISEASES ELDERLY CARE WITH ONE-STOPPED SERVICE IN COMMUNITY NURSING SERVICE: A PILOT PROGRAM

P.S. YAU, S.H. LEUNG, K.C. YEUNG (Community Nurse Service, Hospital Authority, Hong Kong)

Introduction : A collaboration pilot program was established for chronic diseases elderly with coordination and joint effect by a proactive multi-disciplinary team in United Christian Hospital (UCH) and home support service since 2008. The program aimed to facilitate early hospital discharge and promote the quality of care for the chronic diseases elderly through patient empowerment to supported self care, community-based care, and multidisciplinary care with interface between health and social care services. **Method :** Over 1,648 targeted discharge chronic diseases elderly were recruited in 4 community centers of UCH from 2008 to 2011. The experienced Community Nurses (CNs) as case managers were appointed for providing comprehensive nursing interventions, timely on-site complex needs identification and care review after discharge from hospital. Functional outcome and care progress were looked into for evaluation of outcome within three months cared by CNs. **Results :** Among 71% (n=1165) of recruited targeted cases were aged over 76 and over 69% were clinically referred from M&G Department. About 62% (n=1026) of them had received home support service in term of meal-on-wheel and personal care. There were 8% of recruited cases with more than 2 chronic diseases. Over 48% of elderly were kept physical stable and functional improved by using assessment tool Barthel Index 20 within 3 months after discharged from hospital. **Conclusion :** This pilot program equipped different professionals to provide timely community home care by strengthening the fragmentation of community services and using a case management approach which is helpful in maintaining their health status, prevent avoidable admission, to enhance the cross-sector collaboration. **Keywords :** Integrated Discharged elderly

PP25 S-134
GLOBALIZATION AND TRANSNATIONAL FAMILIES: EXPERIENCES OF ELDER CARE AMONG ASIAN H1B VISA FAMILIES IN THE UNITED STATES

Yeon-Shim LEE¹, Anoshua CHAUDHURI², Grace Jeanmee YOO³ (1. Social Work, San Francisco State University, USA; 2. Economics, San Francisco State University, USA; 3. Asian American Studies, San Francisco State University, USA)

Introduction : The purpose of this study is to explore the salient sociocultural and economic contexts that influence elder care arrangement and practices in transnational contexts among Korean, Chinese, and Indian H1B visa workers in the San Francisco Bay area in the U.S. **Method :** In-depth semi-structured interviews with 21 Asian H1B immigrants were conducted in 2010 and analyzed using qualitative analysis. **Results :** Results revealed that despite geographical distance and rapid sociocultural changes, Asian H1B migrant workers continue to perform transnational caregiving relations with their aging parents, maintaining important economic and emotional links. Sustaining family connections and participating in caregiving involve a multitude of emotional and practical tasks?regular return visits to the home country to care for their aging parents, remittances of money and gifts, supportive letters and phone calls, and engagement in decisions about matters of health and finance. Findings also demonstrated that caregiving is a culturally-laden construct and a

gender-specific issue in relation to the types of tasks performed. Female migrants as well as their female siblings in home country play a bigger role in providing emotional and physical care, whereas male migrants tend to be more involved in looking after business affairs, repairs, or maintenance issues. Conclusion : Cultural beliefs and values strongly influence the caregiving arrangements (e.g., use of a nursing home), transmitting these values across the generations. This study highlights the importance of kin work among geographically dispersed families. Findings have important implications for health insurance, immigration and workplace policies. Keywords : Elder care, transnational families, Asian migrant workers

PP25 S-135
USING TECHNOLOGY TO SUPPORT CAREGIVERS OF DEMENTIA OR ALZHEIMER'S PATIENTS

Youjeong KANG¹, Kyung Sook CHOI¹, Hyejin KIM¹ (1. Nursing, University of Pennsylvania, USA; 2. Nursing, Chung-Ang University, Korea)

Introduction : Due to a rapidly increasing aging population with a high prevalence of dementias such as Alzheimer's disease, supporting the financial and emotional burden of family caregivers is a growing challenge for healthcare providers in the United States. One innovative method of delivering support to family caregivers is through technology-based interventions. The purpose of this paper is to describe the types of technology-based interventions currently in use and to summarize and evaluate the published empirical evidence about the effectiveness of technology-based interventions designed to support family caregivers. Method : Pubmed, EMBASE, and CINAHL were searched for randomized controlled trials from January 2002 to January 2012 using the MeSH terms "technology" and "interventions" in conjunction with the keyword "dementia" or "Alzheimer's disease". Results : Fourteen studies met the selection criteria. The majority of studies used telecommunications technology interventions to deliver education and support program such as counseling. One study reported that a home-based intervention delivered via telephone reduced the cost of caregiving. A few studies used an internet-based program aimed at reducing the burden of family caregivers of persons with dementia. Overall results indicate that technology-based interventions are useful to effectively assist in managing distress among the groups of caregivers. Conclusion : Technology-based interventions have been shown to be effective to reduce the caregiver burden. Building on the science, future studies may consider incorporating mobile phone-based support network groups instead of impersonal automated telephone-mediated or computer-mediated system. Keywords : Technology, Caregiver, Dementia

PP25 S-136
ASSOCIATIONS BETWEEN PROFESSIONAL HELP-SEEKING ATTITUDES AND BEHAVIORS AMONG JAPANESE FAMILY CAREGIVERS OF FRAIL ELDERLY

Yuki YAJIMA¹, Junko SAKANO² (1. Department of Nursing, Niimi College, Japan; 2. Department of Health and Welfare, Okayama Prefectural University, Japan)

Introduction : Family caregivers face many difficulties when caring for an elderly relative. Seeking help from professionals (e.g. geriatric care manager) is an adaptive means to address these difficulties, but they often reluctant to do so. The purpose of the study was to investigate the characteristics of and attitudinal factors associated with professional help-seeking by Japanese family caregivers of the frail elderly relatives. Method : A cross-sectional survey was carried out from March to May, 2011. Self-administered questionnaires were sent

to a convenience sample of 300 family caregivers who cared for their frail elderly relatives at home in two northern areas of Okayama, Japan. The questionnaire included professional help-seeking, fear for seeking professional help, worry about caregiving, social support, in addition to socio-demographic characteristics and information about care situation. Consequently, 197 family caregivers returned the questionnaire (response rate: 65.6%). Descriptive statistics, one-way analysis of variance with multiple comparisons, and multiple regression analysis were used to describe and analyze data. Results : Seventy-one caregivers (38.1%) had not sought professional help for the last few months. In multiple regression analysis controlling for caregivers' gender, kinship, care situation, support network and level of worry about caregiving, frequency of professional help-seeking was significantly explained by fear of expressing emotion to professionals (std beta = -0.21, p<0.05) and self-help tendency (std beta=-0.21, p<0.05). Conclusion : Findings suggest that fear of expressing emotion and self-help tendency are avoidance factors of seeking professional help in Japanese family caregivers. Reduction of these psychological barriers may allow them to seek and use professional help when needed. Keywords : family caregivers, help-seeking, frail elderly

PP25 S-137
RELEASING OPPRESSED FEELINGS IN THE CAREGIVERS OF JAPANESE PARENTS WITH DEMENTIA: A PILOT INTERVENTION STUDY

Yumi HASHIZUME (Faculty of Medicine, University of Tsukuba, Japan)

Introduction : In 2011, approximately 5 million (16.7% of total elderly population) of Japanese elderly need long-term care. Governmental policy is to promote home-based care and gender equality to encourage family caregiving. However little progress in gender equality has been made and Japanese middle-aged working women caregivers (JMWWC) must balance career and family life with caregiving of their elderly parents or parents-in-law. Research demonstrates that JMWWC experience feelings of oppression for which there are no current services. This is particularly difficult because of the cultural norms for women's responsibilities of family task and the value of keeping harmony in the home. The purpose of this study was to test the short-term outcomes of an educational counseling education program for JMWWC that was developed to reduce this culturally sensitive distress. This study reports on the program's short-term impact. The program is called Releasing Oppressed Feelings in the Caregivers of Japanese Parents with Dementia. Method : The program involved four, 1-hour sessions delivered at 1 to 4 weeks intervals by a Masters prepared nurse. Eleven caregivers participated. Impact was evaluated within a single group design using standardized questionnaires with established reliability and validity. Results : Results showed significant improvement caregivers' coping behavior (p=0.039); depressed mood; and caregiver strain. Self-reported gains included positive appraisal of the amount of conversation and their sense of being valued by the spouse. Conclusion : Positive study outcomes reinforce the importance of a short-term intervention for JMWWC and argue the importance of additional tests with a larger study sample. Keywords : Working-women-caregiver, elderly parent, dementia

PP25 S-138
RELATIONSHIP BETWEEN FUNCTIONAL DEFICIT OF OLFACTORY AND FEEDING OF ELDERLY PEOPLE WITH DEMENTIA ESPECIALLY WITH CONCERNS TO ALZHEIMER'S DISEASE?

Yutaka WATANABE¹, Shiho MORISITA¹, Emiko SATO², Hirohiko

HIRANO³, Ayako EDAHIRO³, Yuki OHARA⁴, Haruka TOHARA⁵, Takao SUZUKI⁶ (1. Oral Diseases Research, National Center for Geriatrics and Gerontology, Japan; 2. Oral Medicine and Oral and Maxillofacial Surgery, Tokyo Dental College, Japan; 3. Research Laboratory, Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Japan; 4. Behavioral Dentistry, Tokyo Medical and Dental University, Japan; 5. Dysphagia Rehabilitation, Nihon University School of Dentistry, Japan; 6. Research Laboratory, National Center for Geriatrics and Gerontology, Japan)

Introduction : In the scene of meals of the dementia patient, the problematic behaviors with the independence of meals as difficulty leads to increase of care burden and aggravation of the nutrition condition. We think that decrease in olfactory and taste sensation is a factor influencing the food recognition greatly, and it influences maintenance of the independence of meals greatly. We investigate olfactory and taste sensation, and problematic behavior of meals of the dementia patient. Method : A total of 192 mild cognitive impairment patients with Alzheimer's dementia underwent examination of cognitive function and olfactory and taste sensation, evaluation of vital functions. In addition, they underwent evaluation about problematic behavior of meals of dementia. Results : The olfactory sensation began to deteriorate since dementia was mild. And it deteriorated as the dementia became severe. The taste sensation did not deteriorate at dementia was mild. And it deteriorated gently as the dementia became severe. The taste sensation did not deteriorate at dementia was mild. And it deteriorated gently as the dementia became severe. About the evaluation about eating-related behavioral and psychological symptoms of dementia, the olfactory sensation related to eight of ten items. Conclusion : The result of this study suggested that the devices such as the offer and the maintenance of meals environment in consideration for deterioration of olfactory sensation improvement eating-related behavioral and psychological symptoms of dementia since the early stage of Alzheimer's dementia. In addition, we speculated the possibility that those interpositions could reduce the care burden and malnutrition for dementia patients. Keywords : Dementia, Olfactory, behavior of meals

DAY-CARE STAFF MEMBERS' VIEWS ON CARE USERS AND THE RELATIONSHIP OF THOSE VIEWS TO THE CARE THEY PROVIDE

Mami TOYODA, Hong GAO, Shinichi SATO (Graduate School of Human Sciences, Osaka University, Japan)

Introduction : Because of the increasing number of elderly people, care services supplied by various medical facilities are now becoming more important. However, the turnover rates for nursing home staff tend to be high, and lack of manpower is a chronic problem for facilities that provide care for the elderly. For this problem to be resolved, the work environment of these facilities must improve. This study focused on examining day-care staff members' views on care users and the relationship of those views to the care that they provide. Method : Five staff members, working at the same day-care facility (aged 24-57 years), were interviewed regarding their views on care users and the care they provided in the facility. Results : After performing a content analysis, the interview content was classified into 3 categories - views from observation, views from presumption, and attitudes toward work - comprising 9 subcategories. The care that they provided was classified into 2 categories - care that reflected their views or care that did not - also with 9 subcategories. Additional analysis indicated that there were 2 types of staff views: views that were formed primarily by observation of care users and views that were formed by presuming

unknowable information about users. Conclusion : In conclusion, most staff members determined the care they provided by reflecting on the views they held, although they tended not to let all of these views influence their care. Keywords : staff's view on care users, relationship of views to the care, day-care staff

PP25 S-140

ETHICAL CLIMATE, PROFESSIONAL PRACTICE ENVIRONMENT AND INDIVIDUALISED CARE IN CARE SETTINGS FOR OLDER PEOPLE

Riitta SUHONEN¹, Jouko KATAJISTO², Minna STOLT¹ (1. Department of Nursing Science, University of Turku, Finland; 2. Department of Mathematics and Statistics, University of Turku, Finland)

Introduction : The quality of care provision is affected by organisational environments, such as the ethical climate and the professional practice environment. The association between professional practice environment and individualised nursing care has been pointed out. However, we know little about how ethical climate is associated with the level of individualised nursing care delivery. This study aimed to investigate the associations between the ethical climate, professional practice environment, and individualised nursing care in care settings for older people. Method : A cross-sectional explorative and correlational survey design was used. The study was conducted in care settings for older people (62 units) in the vicinity of a Finnish city using a total sample of nurses (N=1513 n=874, response rate 58%) who worked clinically with older people. Survey data were collected using the Hospital Ethical Climate Survey (HECS), Revised Professional Practice Environment (RPPE) scale and Individualised Care Scale (ICS-Nurse-B). Data were analysed using descriptive statistics, Pearson's correlation coefficients and multiple stepwise regression analyses. Results : Statistically significant associations were found between the study variables, ethical climate and individualised care (r=0.371) and between individualised care and the RPPE subscales Leadership and Autonomy (r=0.667), Control over Practice (r=0.359) and Cultural Sensitivity (r=0.354). Multiple stepwise regression showed associations between individualised care, the ethical climate and the internal work motivation, control over practice and leadership and autonomy. Conclusion : Association between individualised care provision, ethical climate and practice environment were found. To increase individualisation within care provision, efforts need to be directed towards organisational aspects requiring the support of nursing leaders. Keywords : nursing care, environment, older people care

PP25 S-141

OLDER PERSONS' EXPERIENCES OF THE ACTUALIZATION OF THEIR OWN FREE WILL IN NURSING HOME

Leena TUOMINEN, Riitta SUHONEN (Department of Nursing Science, University of Turku, Finland)

Introduction : Free will is regarded as patients' right. However, only a few studies have explored older people's experiences of the actualization of free will in nursing home settings. Method : The aim of this study was to describe the experience of the free will of older people and its actualization and promoters in nursing home environment. Data was collected using a purposive sample with open interviews among cognitively intact older people (n=15) with a mean age of 80 years in four nursing homes in Finland. Inclusion criteria were age over 65, over 3 months in long term care and able to take part in the interview. The data were analyzed using inductive

phenomenological approach. Results : Older people described their free will as an action consistent with one's own spirit, opportunity to determine one's personal matters and holding on to one's rights. Actualization was described as an experience of satisfaction to bedtime, dressing and social life with relatives, to one's own room and opportunity to regulate one's privacy. More common experiences were not being able to execute one's own free will, dissatisfaction to possibilities to impact to meals, washing, moving as well as meaningful action and company. The promoters of free will were attitudes of the elderly, health and physical functioning, trust in caring relationship, professional skills and ethical conduct of the nurse and willingness to help. Conclusion : The results can benefit both the ethics education and the development of care quality for older people. Keywords : older people, free will, nursing home

CURRENT SITUATION OF DISCHARGE INSTRUCTIONS FOR ELDERLY STROKE PATIENTS RECEIVING NURSING CARE-A REVIEW OF THE JAPANESE LITERATURE-

Zhang PINGPING¹, Otsuka MARIKO¹, Zensho MARIKO¹, Tsuji REIKO¹, Masaki HARUE², Kanagawa KATSUKO³ (1. Faculty of Health Sciences, Department of Nursing, Saitama Prefectural University, Japan; 2. Graduate School of Nursing, Chiba University, Japan; 3. Kobe City College of Nursing, Japan)

Introduction : The present study aimed to clarify the current situation of discharge instructions for elderly stroke patients and discuss nursing responsibilities through a review of the Japanese literature. Method : Relevant reports published from 2007 to 2012 were identified by searching the Ichushi-Web database (version 5) using "elderly", "stroke patients" and "discharge instructions" as key words. The search results were refined by selecting only reports that were [original articles] and [nursing articles]. The selected reports were analyzed. Results : A total of eighteen reports were identified and analyzed. 1) Characteristics of reports: During the 5-year period of interest, most reports were published in 2008. Fourteen authors worked in hospitals and four authors worked in a rehabilitation center, stroke center, city government, or university nursing school. The data collection methods used in the reports were case study, interview, and questionnaire investigation. 2) Main topics of reports: Nine reports focused on individualized interventions based on patient-centered nursing, such as teaching insulin self-injection for patients with dominant hand disorder or assessing the needs for living at home after discharge. Six reports focused on the effects of discharge support that resulted from the effective collaboration of interdisciplinary teams using critical path and other methods. Three reports focused on discharged and rehospitalized patients' satisfaction with discharge instructions received during hospitalization and improvements for future discharge instructions. Conclusion : These results demonstrate the importance of strengthening the systematization of discharge support in an aging society of Japan and the worldwide dissemination of accumulated knowledge regarding nursing responsibilities. Keywords : elderly stroke patients, discharge instruction, nursing care

COGNITIVE IMPAIRMENT AND DEMENTIA DIAGNOSIS AMONG INSTITUTIONAL CARE FACILITY RESIDENTS IN ONTARIO, CANADA

Emma BARTFAY¹, Wally J. BARTFAY¹, Kevin M. GOREY² (1. Faculty of Health Sciences, University of Ontario Institute of Technology, Canada; 2. School of Social Work, University of Windsor, Canada)

Introduction : To determine the prevalence of cognitive impairment and potentially undetected dementia among institutional care facility residents in Ontario, Canada, and to identify factors associated with undetection. Method : We utilized a population-based secondary data analysis approach, pertaining data from the Canadian Institute for Health Information's Continuing Care Reporting System from 2009-2011. Potentially undetected dementia was defined as having severely impaired cognitive function and requiring extensive assistance on activity of daily living (ADL) but no records of dementia diagnoses. Cognitive function was measured by a cognitive performance scale (CPS) - 0 (intact) to 6 (very severe impairment), and ADL by a hierarchy scale - 0 (independent) to 6 (total dependence). Results : Of the 242 957 residents who had no records of dementia diagnoses, 11.6% (n=28 078) had a CPS score \geq 4 (severe to very severe impairment) and ADL score \geq 3 (required extensive assistance to total dependence). Data from 11 614 demented residents with corresponding CPS and ADL scores were used for comparison. Residents without dementia diagnosis were younger (77 vs. 84, p<0.001), more likely to have never married (20% vs. 6%, p<0.001), and to have been admitted longer (4 vs. 2.8 years, p<0.001). The most significant factors for no diagnoses were never married (adjusted odds-ratio=2.1, p<0.001), admitted to hospital-based facilities (adjusted odds-ratio=1.58, p<0.001), presence of schizophrenia (adjusted odds-ratio=1.43, p<0.001), depression (adjusted odds-ratio=1.23, p<0.0001) and diabetes mellitus (adjusted odds-ratio=1.32, p<0.0001). Conclusion : Our findings suggest that a large number of residents who had poor cognitive function and inadequate ADL ability do not have dementia diagnoses. Keywords : undetected dementia, institutional care facilities, cognitive function

RELATION OF ELDER'S PERCEPTION, ATTITUDE, COPING BEHAVIOR REGARDING SEXUALITY ON SUBJECTIVE QUALITY OF LIFE

Young Mun CHO¹, Chang Hee KIM² (1. Department of Nursing, Young Dong University, Korea; 2. Department of Nursing, Konyang University, Korea)

Introduction : This study aimed to understand the aged sexuality by analyzing the relation between subjective quality of life and perception, attitude, coping behavior regarding sexuality in elders. Method : The participants were 109 elders, aged 65 or over, located in Y city. Data were collected from April to June, 2012 by self questionnaire survey. Data analysis was done by using SPSS WIN 14.0 program including one-way ANOVA, independent t-test, Pearson correlation coefficients, and stepwise multiple regression. Results : The predicting variables affecting to subjective quality of life is sexuality perception (B=0.45, p<.001), sexuality copingsexual behavior (B=0.20, p=0.014) and have 25.75% (R²=26.9) explanatory power for subjective quality of life in elders. Conclusion : To increase subjective quality of life for elderly, it is necessary for positive perception for aged sexuality and expression of positive sexuality coping behavior. Keywords : Aged, sexuality

PP25 S-145

THE EXPERIENCE OF TOKYO ADULT DAY CARE CENTERS AFTER THE TOHOKU EARTHQUAKE

Mio ITO, Kazunori KIKUCHI, Motonaga KOJIMA, Yukie MASUI, Shuichi OBUCHI (Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : On March 11, 2011, Japan experienced a catastrophic earthquake that devastated Pacific coast areas in the north-eastern

region. The disaster caused chaos to Tokyo as well, where traffic and communication systems were disrupted for several days. Our aim of this study is to describe how staff members of day care centers (DCCs) in Tokyo managed such a critical situation to continue to provide care for older adults. Method : We conducted a mail survey and collected staff members' experiences using a self-administered questionnaire. Of the original sample of 341 DCCs (15.1% of DCCs in Tokyo), we received and analyzed responses from 137 centers. Results : After the earthquake, not all staff members of 66 DCCs (48.2% of the 137 centers) could show up. In 38 DCCs (27.7%), staff members had difficulty providing regular services, such as sending pick-up bus and preparing lunch. They, however, made considerable efforts to continue to serve users. Despite a breakdown of telephone lines, staff members kept contact with older users (68 DCCs, 49.6%) and also with the family members of these users (72 DCCs, 52.6%). Further, in 27 DCCs (19.7%), special services (e.g., taking care of older adults in centers longer as usual) were offered during the chaotic times. It also was found that, using these experiences, staff members of 75 DCCs (54.7%) set a new guideline to provide care in a time of disaster. Conclusion : DCC staff members' experiences after the earthquake should be widely shared to help care providers prepare against disaster. Keywords : Adult Day Care center, Disaster, Experience

PP25 S-146

'VULNERABLE' OLDER ADULTS AND KITCHEN PRACTICES IN THE HOME

Wendy WILLS, Angela DICKINSON, Angela MEAH, Frances SHORT (Centre for Research in Primary and Community Care, University of Hertfordshire, United Kingdom)

Introduction : People aged 60 and above are considered to be at a higher risk of adverse consequences of foodborne illness than younger people. The UK Food Standards Agency (FSA) is working towards developing a better understanding of the factors which contribute to this increased vulnerability. This FSA funded study aims to contribute through an in-depth exploration of the domestic kitchen practices of 20 UK households. Method : The ethnographic case-study design includes households with people aged under 60, 60-79 and 80+ years. The researchers observed people in their kitchens, taking photographs and recording video footage as well as talking to participants and involving them in data collection (e.g. giving participants a diary and a disposable camera and some households generated their own video data). Results : Preliminary analysis of the data suggests that a number of areas of 'kitchen-life' can be examined in relation to the way that 'vulnerability' in older age is defined or understood in relation to food-related practices. For example, the cleaning of utensils and work surfaces are rarely performed as 'standalone' tasks; they are part of wider routines in the kitchen which may or may not be performed with the intention of making something 'microbiologically clean'. Methods of cleaning include using/not using detergent or other products and using cloths, sponges, scourers, kitchen paper or hands to remove food crumbs/other debris. Conclusion : The poster will describe the practices revealed by the research and their potential meaning for food safety policy and practice in relation to safeguarding older people's health. Keywords : Older people, kitchens, food safety

PP25 S-147

AGE-FRIENDLY COMMUNITIES IN CANADA: BUILDING CAPACITY THROUGH ONLINE NETWORKING AND KNOWLEDGE EXCHANGE ACTIVITIES

Anthony LOMBARDO¹, Verena MENEZES², Margaret DENTON³, Janice KEEFE⁴, Louise PLOUFFE¹ (1. Age-Friendly Communities Canada Collaboration, Canadian Association on Gerontology,

Canada; 2. Centre on Aging, University of Manitoba, Canada; 3. Department of Health, Aging & Society and Sociology, McMaster University, Canada; 4. Nova Scotia Centre on Aging, Mount Saint Vincent University, Canada)

Introduction : Over 800 communities in Canada have engaged in becoming more age-friendly, based on the WHO Age-Friendly Cities and the Canadian Age Friendly Rural and Remote Communities models. To support dissemination of research and practice knowledge, the Canadian Association on Gerontology (CAG) is using online initiatives to raise awareness of age-friendly communities stakeholders and their work in Canada and to network stakeholders. Method : To assess needs and next steps for age-friendly communities in Canada, the CAG in 2010 formed the Age-Friendly Communities Canada Collaboration, an initial working group of key stakeholders. In 2011, the CAG participated in a stakeholder consultation to discuss means of fostering knowledge development and exchange for age-friendly communities. Consultations revealed excitement about age-friendly communities and numerous priority areas, including interdisciplinary collaboration; centralized information sharing; and dialogue among all relevant stakeholders. Results : In response, the CAG first developed the "Age-Friendly Communities Canada Research and Stakeholder Inventory," an interactive, online repository to showcase Canadian stakeholders and their initiatives. Next, the CAG, in partnership with the Centre on Aging at University of Manitoba and others, is developing the "Age-Friendly Communities Canada Hub," an innovative online networking and knowledge exchange platform which uses various social media to mobilize knowledge and connect stakeholders. Conclusion : Online media offer opportunities for inclusive dialogue and rapid sharing and mobilization of information. These projects make use of collaborative and inclusive tools like social bookmarking, blogs, Twitter and Facebook to disseminate information and to broker relationships between all stakeholders, from research through community through practice. Keywords : age-friendly communities, knowledge mobilization, Canada

PP25 S-148

DIFFERENT COMMUNITY NEIGHBORHOOD ENVIRONMENTS FOR THE HEALTHY OLDER ADULTS IN INSTITUTIONALIZED HOUSES: ARE RESIDENTIAL AREAS OR CULTURAL AND EDUCATIONAL AREAS BETTER?

Blossom Yen-Ju LIN¹, Chin-Ping WANG¹, Yung Kai LIN², Cheng-Chieh LIN³ (1. Health Services Administration, China Medical University, Taiwan; 2. Division of Cardiovascular Surgery, Taichung Veterans General Hospital, Doctoral Student at Department of Business Administration, National Chung Hsing University, Taiwan; 3. Family Medicine & Geriatric Medicine, China Medical University & Hospital, Taiwan)

Introduction : To meet the potential growth of the older adult population in Taiwan, the government and private health care providers have invested and built institutionalized houses for healthy older adults. This study explores the living satisfaction of older adults living in institutionalized houses in different community types, and explores how they perceive their community environments. Method : A total of 212 residents from 2 institutionalized houses in 2 community areas (i.e., residential versus cultural and educational areas) were recruited for this study and interviewed using a developed structured questionnaire. Community neighborhood environment evaluations covered the dimensions of community design (six items), ambient conditions (seven items), place capability and transportation (five items), shopping and access to medical services (four items), and leisure and walkability (four items). In addition, overall living

satisfaction was measured. Results : The average age of the older adults was 83 years, living for approximately 45 months in the institutionalized houses. Multivariate analyses showed that the older adults of the institutionalized house in the cultural and educational area ranked 'community design' and 'place capability and transportation' as more satisfied than those in the residential area, although these were unrelated to overall living satisfaction. However, the community neighborhood ambient conditions, such as street cleanliness, landscape, fresh air, garbage collection, noise, and management of the community, were related to better living satisfaction for older adults. Conclusion : Different community neighborhood environments lead to different perceptions for healthy older adults in institutionalized houses. Community neighborhood ambient conditions play a key role in healthy older adult living satisfaction. Keywords : community characteristics; institution environment selection; ageing in places

PP25 S-149

GIS-BASED URBAN FORM ANALYSIS OF WALKABILITY AND NEIGHBORHOOD SATISFACTION FOR ACTIVE AGEING

Faysal Kabir SHUVO¹, Ma Shwee Zin NYUNT², Jia Yen ENG², Tze Pin NG² (1. *Architecture, National University of Singapore, Singapore*; 2. *Psychological Medicine, Clinical Research Fellow, Singapore*)

Introduction : The quality of the built environment is an important factor for active ageing. The walkability of the residential neighborhood greatly influences the level of physical mobility and social activity of elderly people. Walkability may be evaluated using objective assessment of the organization of urban form, including residential density, land-use mix and street connectivity/density using geographic information system (GIS) tools. In high density urban living environments, GIS tools provide information on neighborhood walkability that can help better decision making for urban planners and policymakers. Method : In this study, we investigated the association of GIS-measured characteristics of urban form (residential density, land-use mix and street density) with self-reported measure of neighborhood satisfaction among 400 elderly residents in two residential neighborhoods in Singapore. Modified version of Neighborhood Environment Walkability Scale (NEWS) is used for subjective assessment of built environment quality and ArcGIS10[®] of ESRI is used for GIS objective analysis. Results : Neighborhood satisfaction was positively correlated to land use mix, i.e. presence of dissimilar land uses ($r=0.132$, $p=0.008$) but negatively correlated to residential density ($r=-0.124$, $p=0.013$), and was not significantly correlated to street density. Conclusion : The results indicate that elderly people are more satisfied with their neighborhood when they are able to move about for varied purposes within the neighborhood. In urban high density residential neighborhoods, the availability of amenities and facilities is a positive factor, while over-crowding of residences is a negative factor for active aging. Keywords : GIS, walkability, neighborhood, urban form, active ageing

PP25 S-150

DEBRIS IN THE INNOVATIVE SPACE: THE STATE OF QUALITY IMPROVEMENT IN LONG-TERM CARE SETTINGS

Francis ETHERIDGE¹, Yves COUTURIER¹, Jean-Louis DENIS² (1. *Gerontology, Research Center on Aging - Universite de Sherbrooke, Canada*; 2. *Public Administration, Ecole Nationale D'administration Publique, Canada*)

Introduction : A majority of long-term care organizations has difficulty

reaching contemporary expectations regarding the quality of services they produce, but variability is observable in the field. Some organizations appear to have created virtuous cycles while other organizations appear to have created vicious ones. The objective of our study was to explain what differentiates these organizations based on how they initiate and plan change processes. Method : An embedded multiple case study was conducted employing an action research approach in collaboration with four long-term care organizations producing contrasted levels of care and service quality. Using multiple qualitative methods of data collection, we reconstructed the differentiated paths by which change intentions in each organization were translated into concrete change projects. Results : The processes by which long-term care organizations initiate and plan change is driven by their "obligation" to fulfil increasing regulatory requirements more than by a meticulous evaluation of their strengths and needs. This inclination leads to the simultaneous engagement of multiple innovative processes and to the fragmentation of the slim resources devoted to improvement processes. Consequently, the "innovative space" in long-term care organizations is filled by prescriptive programs, or, written otherwise, by "structural debris" which overwhelm change users and foster cynicism towards change. Conclusion : Change agents in long-term care organizations would benefit from establishing a sequence of change priorities specifically adapted to the strengths and needs of their organization. Adapting the regulatory environment to ensure more accurate quality insurance procedures and customized improvement imperatives may ensure more efficient quality improvement processes in long-term care organizations. Keywords : long-term care, innovation, change management

PP25 S-151

WHAT IS COMFORTABLE HOUSING FOR THE ELDERLY? : A SURVEY ANALYSIS OF THE EXPERIMENTAL HOUSE FOR THE ELDERLY IN JAPAN

Go SATO¹, Kei ADACHI², Hidetoshi SATO³, Chisato MASAFUMI⁴, Hiroyuki MURANAKA⁵, Katsuyuki SATO⁶ (1. *Graduate School of System Engineering, Wakayama Univ., Japan*; 2. *Environmental Systems, Faculty of System Engineering, Wakayama Univ., Japan*; 3. *Community-based Comprehensive Palliative Care, Saga Medical School Hospital, Saga Univ., Japan*; 4. *Graduate School of Lifelong Learning Studies, Hokusho Univ., Japan*; 5. *Chitose-town.net, General Incorporated Association, Japan*; 6. *Graduate School of Human Welfare Studies, Hokusho Univ., Japan*)

Introduction : This study is to propose a living environment corresponding to changes under various situations to help the elderly live. Method : We have conducted POE(Post-occupancy Evaluations) for 4 years from 2009 to 2012, and have evaluated design issues based on residential experience of the elderly couple. Results : The experimental house has been designed with special consideration for the elderly to be easy to use and caregivers to make it easier to support. The arrangement was to focus on communication around the living room. For example, kitchen and bedrooms were located the side of the living room. Points to keep in mind were as follows: 1) simple flow lines, 2) elimination of the steps, 3) space of wheelchair rotation (1m50cm), 4) sufficient door width (85cm) and corridor width (85cm). Results of this survey analysis, several problems on the design were found as follow: 1) toilet, wash basin, bathroom, bedroom, dressing room, 2) kitchen, living room, stairs, entrance, approach, 3) cooking facilities, air conditioning, hot water supply, 4) fire and security equipment. Conclusion : According to the elderly couple's residence experience, experimental house could respond to a decrease in their body conditions. As a future work, there are some difference between

how it is used and the original planning. Keywords : the elderly, experimental house, communication

PP25 S-152

OUTDOOR FITNESS FACILITIES IN THE PARK IN TAINAN CITY, TAIWAN

Hsueh-Wen CHOW¹, Guan-Lin WU¹, I-Yao FANG², Tzu-Yao TAI³, Chiang LIU⁴ (1. Graduate Institute of Physical Education, Health & Leisure Studies, National Cheng Kung University, Taiwan; 2. Department of Physical Education, National Taiwan Normal University, Taiwan; 3. Mechanical Engineering, Southern Taiwan University of Science and Technology, Taiwan; 4. Graduate Institute of Sports Equipment Technology, Taipei Physical Education College, Taiwan)

Introduction : Enhancing physical activity has become a high priority for promoting health. Parks, close to residence areas and easily accessible are the preferences of many older citizens for leisure-time physical activities. Recently, many parks installed outdoor fitness facilities; however, no census regarding the available equipment exists neither scientific investigation regarding the conditions of these equipment and seniors' perceptions exists. Method : Thus, this study investigates these facilities in Tainan, Taiwan from field observations and interviews. Results : Results from field observations revealed that 1) 74% labeled the equipment; 2) 58% posts benefits from using the equipment; 3) 47% state the appropriate age range for users; 4) 69% illustrate how to use the equipment, and 23% illustrate that with graphs, 5) the mean score for the appearance of the equipment is 4.2 on a five point scale (5 is best quality); 6) the mean score for condition of the equipment is 4.5 (5 is most well kept); 7) installation of most of the equipment was on the parks' grassy areas. Conclusion : The results provide a reference for developing policies for placement of facilities for promoting health among the aging population. The findings provide park and recreation departments in municipal governments a basis for evaluating and maintenance of fitness equipment. In addition, the results provide statistics for other studies considering related research projects. Keywords : outdoor fitness equipment, park, census

PP25 S-153

INCREASING THE CONVENIENCE OF MEASURING WEIGHT FOR ELDERLY OR DISABLE PEOPLE BY PROPOSING SYSTEM

Huang Ying CHI¹, Tu Shih TE² (1. Administration of Department Specialist, Changhua Christian Hospital Lukang Branch, Lukang, Taiwan, R.O.C., Taiwan; 2. Superintendent, Changhua Christian Hospital Lukang Branch, Lukang, Taiwan, R.O.C., Taiwan)

Introduction : With the increasing in the elderly population, the majority in hospitals patients are elderly people. Therefore, it will be really inconvenient for them to measure their weight if they need. Because they might need their families or hospital staff to help them stand on scales. Additionally, this situation will higher the risk of falling down as well. Method : By recording the weight of every kind of wheel chairs in hospitals, to make elderly people can weight without leaving wheel chairs. Results : By proposing system, it only costs one thousand dollars to make the cards that print the weight of chairs and stick the cards on the wheels chairs. This way will be easier for hospital staff or patients' families to measuring the weight of elderly by subtracting the weight of wheel chairs from the total weight showed on the scales. Conclusion : By proposing system, it solved the long time harassment of weighting elderly people. Now, hospitals can provide their patients and elderly a safety, comfortable, and convenient environment. Keywords : disable people, Proposing System

PP25 S-154

AGING IN PLACE AND REASONS FOR MOVING

Hyun Joo KWON¹, Julia O. BEAMISH², Eunju HWANG² (1. Art and Design, Purdue University, USA; 2. Apparel, Housing, and Resource Management, Virginia Tech, USA)

Introduction : People over 50 in the United States have indicated that they want to age-in-place in their current home, which is often a single-family home. Multifamily housing, the second most popular housing type in the U.S., provides convenience and location advantages that often are not considered by older adults. This study investigates older residents of multifamily housing and their desire to age-in-place, their reasons for considering moving, and their preferences for future housing. Method : This study design was mixed methods, using a self-administered questionnaire. An on-line survey was conducted during February, 2012. The target population was people age 65 and over living in multifamily housing in the U.S. (N=242). Results : Participants indicated that they desired to age-in-place. Chi-square analysis and ANOVA detected that participants who were older and homeowners were more likely to remain in their home as long as possible. Almost 45% of the total participants answered that they might consider moving and described their reasons for moving using an open-end question. Most frequently mentioned reasons were related to cost, aging, size or design of housing, closeness of relatives, and local services. Participants who would consider moving showed significantly higher preferences for multifamily housing and housing communities for all age groups, and lower preferences for any type of services in a housing community. Conclusion : Older adults in multifamily housing had strong intentions for aging-in-place; however, they were concerned about declines in financial and health status. If they were to move, they prefer to live independently in multifamily housing located in a non-age-restricted community. Keywords : aging-in-place, moving, multifamily housing

PP25 S-155

THE EFFECTS OF HAUSGEMEINSCHAFT (HOUSING COMMUNITY) AS INNOVATIVE APPROACH IN GERMAN NURSING HOME CARE ON THE DAILY LIFE OF RESIDENTS

Joachim WILBERS, Susanna RE (Headquarters, Project Care Ruhr, Germany)

Introduction : The Hausgemeinschaft (Housing Community - HG) was first described in Germany by Winter (1995). HGs are a special type of household consisting of a limited number of people needing care in a nursing home setting. The aim is "normalcy" in contrast to institutionalization. Method : The daily life of N=151 residents in 12 HGs compared to N=47 residents in a conventional nursing home setting is analyzed by questionnaires and interviews. Results : HG residents have a higher degree of autonomy; they are less dependent on a tight schedule of the nursing staff and they enjoy the possibility to choose what to eat and take part in preparing the meals. The HG also leads to more influence of relatives due to the family-like setting. It is shown that HGs lead to more activity of the residents, a better satisfaction of staff and relatives, and an improved image of the nursing facility. As a result the higher influence on the menu leads to less variation than the professional meal plans but to a higher degree of satisfaction. The influence of relatives fosters a better atmosphere but also tends to more conflict about daily life with the professional team than in traditional homes. Conclusion : Thus HGs are an innovative approach in nursing home. The aim of normalcy can be accomplished but more options in daily life need more communication and a different training of the nursing home staff. Keywords : nursing home

PP25 S-156

USE OF EVERYDAY TECHNOLOGY: A COMPARISON STUDY OF ELDERLY PEOPLE WITH DEMENTIA IN JAPAN AND SWEDEN

Kazue NODA¹, Toru NAGAO¹, Rumi TANEMURA¹, Lena BORELL²
(1. Graduate School of Health Sciences, Kobe University, Japan;
2. Department of Neurobiology, Care Sciences and Society Division of Occupational Therapy, Karolinska Institute, Sweden)

Introduction : We describe the use of everyday technology (ET) by elderly people with dementia in Japan and Sweden and how it impacts their daily lives in their home. **Method :** Our study group consisted of five elderly Japanese persons [age: 75-83, mini-mental state examination (MMSE) 4-23] and five elderly Swedish persons (age: 63-87, MMSE 13-27). They were living alone or were alone during the day. We interviewed them and the Everyday Technology Use Questionnaire (ETUQ) was completed. We observed them using the same ET appliances: stoves, a code-operated lock, a telephone and a microwave oven. **Results :** 1. Two Japanese persons used the gas stove, but no Swedish person used a gas/electric/IH-stove. 2. Swedish persons were unable to use the code-operated door phone and lock, but all Japanese persons were able to use the key-operated door lock. 3. All Japanese persons and three Swedish persons were able to use the telephone. 4. All Japanese persons were able to use the microwave, but no Swedish person was. **Conclusion :** Elderly people with dementia can use ETs that have been adapted with large touch pads, pre-set numbers, or dial-type timers. Manufacturers should adapt ETs so that they can be safely used by elderly people with dementia. Once they are able to use the ETs, elderly people with dementia can safely live alone at home. Occupational therapists should advise elderly people with dementia on which ETs are suitable for them. **Keywords :** Dementia, Everyday Technology, Safety

PP25 S-157

STIGMA: A BARRIER TO HELP-SEEKING AT THE RESIDENTIAL END OF THE CONTINUUM OF CARE

Maggie GIBSON (Veterans Care Program, St. Joseph's Health Care London, Canada)

Introduction : Stigma is the product of negative and unfavourable attitudes and the negative behaviours that result from those attitudes. Stigma is recognized as a major barrier to help-seeking. Self-stigma, stigma by association and public stigma may all compromise help-seeking behaviour by those who would benefit from residential care. There is a need to combat the stigma associated with the residential end of the long term care continuum in the interests of rational and supportive help-seeking and decision-making about care needs and options at different life stages. The goal of this project was to produce resources that could contribute to stigma reduction. **Method :** Several literatures were explored to develop a conceptual framework for understanding the associations among aging, health, help-seeking and stigma. Stigma reduction strategies (education and contact) were deployed. **Results :** A resource titled 'Understanding Long Term Care Homes as Communal Living Environments: A Discussion Guide for Staff' was developed. The Guide is aligned with the Alzheimer Society of Canada (ASC)'s culture change in long term care initiative and is available for download from the ASC website. A video was developed to highlight the communal living aspects of the target service and made available for viewing on the organization's website. **Conclusion :** Communal living has many benefits for people who need a significant level of care but stigma among other factors can compromise timely help-seeking at residential end of the continuum of care. Stigma reduction practices are relevant to confronting this barrier. **Keywords :**

stigma, long term care, communal living

PP25 S-158

PATTERNS IN THE PRESENTATIONAL SENSE OF WELL-BEING OF THE ELDERLY: THE IMAGERY INHERENT IN EVERYDAY HOME LIFE

Masao KOBAYASHI (Design, Nexus A.L., Japan)

Introduction : The purpose of this study is to extract the visual imagery presented by the elderly on expressing their sense of well-being in daily life, and to clarify the relation between that visual imagery, the attributes of the subjects, and their family relationships. **Method :** The subjects were 11 elderly men and women over seventy years old. The study was performed as follows 1) Subjects were asked to visualize the happiest scene in their everyday life. Once that image was established, the subjects were interviewed. 2) All interviews were recorded using an IC recorder. 3) The subject described a visual image in words. As the description progressed, it was checked for consistency in order to attain greater accuracy. 4) Comparisons were made between the subject's attributes, family relationships, and the subject's presentation of visual image. **Results :** 1) The images described as evoking the greatest sense of well-being most commonly took place in the living room or dining room, and focused on scenes of eating or talking with other family members. 2) A high rate of correlation was observed with scenes of child-raising and interaction with other family members. **Conclusion :** The presentation of a sense of well-being by the elderly appears to have a relationship to their experiences in raising their children. **Keywords :** Inherent sense of well-being, Visual imagery, Patterns in the presentational sense

HOW AGE-FRIENDLY IS THIS CITY? STRATEGIES FOR MEASURING AGE-FRIENDLINESS

Michelle DELLAMORA¹, Aleksandra ZECEVIC², Donna BAXTER³, Anita CRAMP² (1. Health & Rehabilitation Sciences, Western University, Canada; 2. Faculty of Health Sciences, Western University, Canada; 3. Recreation, Neighbourhood & Children's Services, City of London, Canada)

Introduction : The Age-Friendly Communities (AFC) initiative has gained momentum under the guidance of the World Health Organization as a global response to population aging. Communities around the world and Canada have developed age-friendly projects and strategies for the implementation and evaluation of their AFC programs. Currently, there is no universally accepted tool for measurement of the baseline age-friendliness of a community, so that meaningful comparisons can be made to assess future progress. The purpose of this study was to review assessment tools for measuring the age-friendliness of a community. The objective was to present the strengths and weaknesses of available questionnaires and surveys, and to determine the best tools for large-scale quantitative measurement of age-friendliness. **Method :** A comprehensive review of peer reviewed and gray literature was utilized to examine presently available age-friendly assessment tools. Communities across Canada were contacted and tools were gathered from personal communications. **Results :** There is a paucity of published research on this topic. Assessment surveys vary greatly in terms of topics covered, total number of questions and number of questions per eight AFC domains. Only three of 20 assessed surveys had reliability and validity information available. The Community Assessment Survey for Older Adults emerged as the best tool for measuring age-friendliness. **Conclusion :** A considerable number of assessment tools are available to assess various aspects of age-friendliness. Only the most comprehensive of

these tools can be recommended for effective baseline assessment of the age-friendly features of a community. Keywords : age friendly communities, assessment surveys

PP25 S-160

A COMPREHENSIVE APPROACH TO THE LIVING CONDITION OF RURAL ELDERLY FOR A SENIOR-FRIENDLY INDUSTRY

Mihee OH¹, Suna PARK² (1. *Social Welfare, Youngdong Univ, Korea*; 2. *Social Welfare Policy, Dankook Univ, Korea*)

Introduction : The purpose of this study is to suggest a way for letting them know of a real efficiency of developing welfare medical device through the investigation of the life condition of rural elders and the survey of the recognition of a senior-friendly industry. Method : 731 of the elders in the rural areas its population is around 50,000 turning super-aged society were surveyed and interviewed for this study. Results : For residence, most elders live in an undetached house without cohabitant and his or her caregiver is also the elder. They consider getting geriatric care alone or going to the nursing home if necessary. For economy, most answer that they have not prepared for their elder life. For health, it turns out that many of them have musculoskeletal disease and hypertension. Conclusion : According to the result of the study, the demand for a senior-friendly devices and welfare service is expected to increase; however, considering the low income level of the elder, it is necessary to develop the inexpensive for the elders. The devices for the elders such as health information system and oriental medical devices, interior or outdoor space moving system, in-and- out of the house - moving system and nurse-caring system are necessary to set up first. Moreover, from now on, it is necessary to enlarge the investigation of the demand of Older People in Rural Area to activate a senior friendly industry more. Keywords : Senior-friendly industry, rural elders, elderly Living status

PP25 S-161

HOUSING AND DEMOGRAPHIC CHARACTERISTICS OF ELDERLY HOUSEHOLDS IN THE SOUTHERN UNITED STATES

Sung-Jin LEE¹, Mira AHN², Kathleen R. PARROTT³ (1. *Department of Family and Consumer Sciences, North Carolina Agricultural and Technical State University, USA*; 2. *School of Family and Consumer Sciences, Texas State University - San Marcos, USA*; 3. *Department of Apparel, Housing, and Resource Management, Virginia Tech, USA*)

Introduction : With an increasing U.S. elderly population, important considerations are that a majority of older adults experience health problems and the 2009 recession influenced their financial and housing sustainability. Particularly, elderly households living in the Southern U.S. face more housing challenges due to relatively lower median incomes and a decrease in home equity. This study examines current housing and demographic characteristics of these challenged elderly households in the Southern U.S. Method : A secondary dataset, the biennial 2011 American Housing Survey (National and Metropolitan Data) of the U.S. Department of Housing and Urban Development and the U.S. Census Bureau, was employed. Detailed profiles of 8,411 elderly householders were presented, utilizing descriptive statistics. Results : Selected findings were: Almost 78% were homeowners, and 73% lived in single, detached housing. Average age was 75 years old, and majority lived in urban areas. Almost 60% were not married and 30% were minorities. Almost 75% reported family income as less than U.S. median income (\$50,502), but only 10% received government assistance. Almost 43% spent more

than 30% of income for housing, exceeding the national standard for affordability. Conclusion : This profile of elderly Southern U.S. households shows a high percentage of single homeowners with below median incomes who pay an excessive portion of their income for housing costs. Thus, the housing affordability issue for these aging households needs more attention. This analysis implies that housing affordability is a critical issue to consider in planning housing assistance programs and services for the target population.

WHAT KINDS OF FACTORS MAKE IT POSSIBLE THAT JAPANESE ELDERLY PEOPLE LIVING IN PUBLIC APARTMENTS KNOW THE LOCATION OF THE SHELTER IN DISASTERS?

Noriko YAMASHINA¹, Naoto KAMIDE², Akie KAWAMURA², Yoshitaka SHIBA², Hiroshi HAGA¹ (1. *Graduate School of Gerontology, J.F. Oberlin University, Japan*; 2. *School of Allied Health Sciences, Kitasato University, Japan*)

Introduction : Japan is a disaster-prone country such as earthquake; elderly people are the most vulnerable to disasters. It would be important for health care providers to know how elderly people obtain information about evacuation means. The aim of this study was to investigate what kinds of factors make it possible that Japanese elderly people living in public apartments know the location of the shelter in disasters. Method : 60 year and older people who were living independently in public apartments, which were provided for low-income people in Kanagawa, Japan, were participated in this study. Factors, which make it possible that Japanese elderly people living in public apartments know the locations of the shelter, were investigated from four aspects; (1) cohabitation status with family, (2) social networks and support with family, (3) social networks and support with neighbors or friends, (4) presence of access to information supplied by the administrative organ. Age, sex, residence year, instrumental self-maintenance ability and depression were also investigated. Results : 270 subjects (70.8±5.8 years old) were included in this analysis. From the results of multiple logistic regression analysis, we found that information about the location of the shelter in disasters was associated significantly with access to information from administrative organ and residence year. Other factors were not related to information significantly. Conclusion : Our study suggested that dissemination of information from the administrative organ and aid for people who have shorter residence year were important to get information about the location of the shelter in disasters among elderly people living in public apartments. Keywords : disaster prevention, information supplied by the administrative organ, residence year

THE IMPORTANT CHARACTERISTICS OF DAYCARE CENTER: FROM TAIWAN'S PROMOTE EXPERIENCE SINCE 2008

Potsung CHEN (Institute of Gerontology, National Cheng Kung University, Taiwan)

Introduction : Faced with the problem of an aging population, the Taiwanese government is actively promoting long-term care insurance for the elderly. Daycare centers play a crucial role in this approach, and this study focuses on the provision of appropriate care services and the enhancement of the social status of the elderly by daycare centers in Taiwan. Method : The objective of this paper was to conduct a participant observation experiment in 45 newly established daycare centers in Taiwan for a period of 5 years so as to examine how these

centers provide appropriate care services and promote the welfare of the elderly in the community. Results : Most of the daycare centers towards the following goals: (1) to help the elderly construct new social networks and obtain social support, (2) to encourage the elderly to help one other, (3) to encourage autonomy in the elderly, (4) to provide supportive and personal care, (5) to enhance the quality of life for the elderly, (6) to provide a variety of options and activities for the elderly, (7) to preserve the cultural heritage and build a sustainable community for the elderly, and (8) to create awareness of cultural issues in the community. Conclusion : In conclusion, daycare centers can play a critical role in improving the quality of life of the elderly, helping them earn respect and recognition from others, and enhancing their social status. Keywords : aging in place, elderly, daycare

PP25 S-164
SUITABILITY OF HANDRAIL HEIGHT FOR DISABLED OLDER PEOPLE

Shinya HISANO (*Graduate School of Health Sciences, Kyushu Nutrition Welfare University, Japan*)

Introduction : The purpose of this study was to evaluate a method for determining the suitability of handrail height for disabled older people with different body sizes, diseases, locomotion assistance aids, methods of use, and standing postures. Method : The subjects were 39 disabled older people (8 males, 31 females, mean age 86.9±6.7 years). We recorded the subjects on video tape while using a standard handrail in a nursing home. Video tapes were analyzed to determine the subjects' greater trochanter height and gait motion. The suitability of the handrail height was analyzed based on greater trochanter height, body size, disease, locomotion assistance aids, methods of use, and standing postures. Results : The subjects' mean greater trochanter height was 716 mm±57 mm. A handrail height 38-82 mm higher than subjects' greater trochanter height was most suitable. In subjects with bad posture, a handrail height 98-125 mm higher than their greater trochanter height was most suitable. Conclusion : The present results suggest that the suitability of handrail height varies among older people. The current method of determining the suitability of handrail height according to body size could be applied for disabled older people in nursing homes. Keywords : disabled older people, handrail height, body size

PP25 S-165
PROCEDURE OF ENVIRONMENTAL DESIGN IN THE CREATION OF A HOMELIKE ENVIRONMENT FOR THE ELDERLY WITH DEMENTIA

Tetsuya AKAGI¹, Kei ADACHI² (*1. Department of Architectural Design, School of Architecture, Kogakuin University, Japan; 2. Department of Environmental Systems, Faculty of Systems Engineering, Wakayama University, Japan*)

Introduction : The purpose of this study was to research and clarify the relationship between psychological and physical factors in the perception of the quality homelike, and to implement this understanding in the physical design of the activity spaces of a nursing home for the elderly with dementia. Method : Three main surveys, psychological, physical and observational, were conducted. The nature and degree of homelike in the activity spaces was analyzed by the semantic differential method. The number, kind and locations of the physical elements were recorded, and the person-environment transaction in the spaces was analyzed by measuring the verbal behaviors of all residents and staff. Results : The study demonstrated the procedure of environmental design in the creation of a homelike environment in three stages. First is the Overall factor, which creates

an environment by which a homelike atmosphere can be called to mind. Next, each Single factor that fits well with the Overall factor must be carefully examined. Finally, each Single factor must then be appropriately arranged to contribute to the Combined factor. Conclusion : Seven physical environment factors were shown to be the fundamental factors which uniformly exist in activity spaces. This was deeply reflected in this research in deciding the Overall factor in the procedure of the environmental design. This environmental design procedure is developed as a design tool so that it can be fully utilized in a wide range of care environments not only by specialists in planning and design but by on-site care staff. Keywords : environmental design, homelike, elderly with dementia

PP25 S-166
DISSOLVING THE EDGE: BUILDING CAPACITY THROUGH DIGITAL PHOTOGRAPHY

Theresa GARVIN (*Human Geography - EAS, Human Geography - University of Alberta, Canada*)

Introduction : In many societies, some older adults live 'on the edge.' They live on the edge politically through exclusion from decision-making. They can live on the edge socially through isolation and economically via reduced retirement incomes and lost social programs. They live on the edge physically by increasingly being found in low-density suburbs and rural areas. As a result of these, some older adults live on the edge emotionally as they struggle to cope with all of these as well as their own age-related capabilities. Method : This small-scale, community-based project sought to build capacity in a small group of seniors by conducting a participatory digital photography exercise on their physical environment. Using digital cameras and focus group discussions, the project built on existing interests and further developed digital photography skills of participants. The project included a set of four group interview discussions based on digital photographs taken by participants. Participants then reflected on what they had learned through the process and how they might build on their skills in the future. Results : Participants were enthusiastic about learning to use digital media and noted that it gave them increased status both within their extended families and their communities. Community service workers and support groups indicated that the photography skills were being passed on within their communities and that there was an impact beyond the length of the research project. Conclusion : Providing equipment and instruction for digital photography increased the capacity of older adults to speak for themselves and developed individual and group confidence. Keywords: capacity, digital photography, community

PP25 S-167
EXPLORING SOCIAL INEQUALITIES IN HOUSING TENURE AMONG OLDER ADULTS. FINDINGS FROM THE BELGIAN AGEING STUDIES

An-Sofie SMETCOREN¹, Nico DE WITTE², Tine BUFFEL¹, Tinie KARDOL¹ (*1. Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Belgium; 2. Faculty of Psychology and Educational Sciences, University College Ghent - Vrije Universiteit Brussel, Belgium*)

Introduction : The purpose of this study is to investigate whether housing tenure differs among older people in terms of socio-demographic variables, physical health, income and marital status. Housing tenure refers to the legal status under which someone lives: homeownership, private rented housing, social rented housing and others (e.g. living with children, beneficial interest). The study also explores the relationship between housing tenure and housing quality.

Method : Data are derived from the Belgian Ageing Studies among people aged 60 and over (N=48.889) living in 138 municipalities across Belgium. To answer the research questions, frequencies and bivariate analyses are performed. **Results :** The results indicate that homeowners have a higher income, a better physical health and are more likely to be married or widowed in comparison with older renters. Differences are also found between older people living in private rented housing and those who live in socially rented housing. Renters on the private market appear to be the most vulnerable category: they are more likely to have a lower income, a poorer physical health and they are more likely to be divorced or cohabitant than older people who live in social housing. Furthermore the results pointed out that older renters are more likely to be living in inadequate housing than older homeowners. **Conclusion :** The findings revealed the importance of recognizing the various multidimensional inequalities in housing tenure among older adults. This study could yield practical and policy recommendations, such as the need for more adapted and affordable housing for older renters. **Keywords :** Housing tenure, housing quality, equality

PP25 S-168

CURRENT STATUS AND SUBJECT OF LIFE SUPPORT PROVIDED IN THE NEWLY-ESTABLISHED SERVICE-ADDED ELDER PERSONS' HOUSING IN JAPAN

Tokiko INOUE, Mari KINUKAWA (*Research Dept., Institute of Elderly Housing Sciences, Japan*)

Introduction : The new housing is required to provide consultation and safety confirmation as service in principle. However, another life support services are not defined clearly, which life support provision depends on operators. This research focuses on the current status of life support to obtain subjects to develop this newly-established housing as one with quality from the elderly persons' vision who need to relocate from their homes. **Method :** Monthly surveys of the information provided by Ministry of Land, Infrastructure, Transport and Tourism were conducted to grasp overall status of the housing. Questionnaire survey to 500 operators was also performed. About 360 responds were collected and the results were categorized to show function of life support in comparison with the status of another assisted living residence in Japan. **Results :** The process of providing meals and care depends. Some provide as individual fee-based services categorized as "out of the long-term care insurance". Some seem to be insufficient and some overloaded. On the other hand, assisted-living residence provides 24-hour comprehensive care services under the insurance. However, it is categorized as "institution" where elders live in institutionalized life environment. The comparison indicates that further survey is necessary to define appropriate service volume and system to sustain elderly life in housing environment. **Conclusion :** Further research is underway to find how the life support should be to meet the individual needs of the elderly who relocates to the housing. The current status of life support in the housing is "various", which leads us to find various study cases for the study. **Keywords :** Service-added Elder Persons' Housing, Aging in Place, Life Support

PP25 S-169

LONG DISTANCE EVACUATION WAS WHOLESOME FOR REFUGEES OF THE 2011 TOHOKU EARTHQUAKE

Yasuko ABE, Norihiko IZUMIMOTO, Tomomi HAKAMADA, Kenji TOYOSHIMA, Marie YAMAUCHI, Eiji KANEKO, Kentaro SHIMOKADO (*Geriatrics and Vascular Medicine, Tokyo Medical and Dental University, Japan*)

Introduction : On March 11, 2011, the huge earthquake attacked

Tohoku district of Japan and caused large damage. Total number of the fatalities and the missing on the seventh day after the earthquake was over 20,000, whereas refugees over 386,000 were able to live at the shelters prepared by the government or autonomies. Mitsuke, one of the cities in Niigata prefecture, also offered shelters for the refugees who evacuated from Fukushima prefecture. We conducted health research of refugees and has prepared medical care for them. **Method :** On April 30 and November 26 in 2011, the medical checkups for refugees to investigate their health conditions were held at Mitsuke city hospital. We used a cross sectional survey design to collect data from the medical checkups reports. Participants were administered the blood test and questionnaire about mental health. **Results :** 333 refugees lived in Mitsuke city on April 30 and 150 refugees were on November 26. A total of 53 participants underwent the first medical checkup, 18(34%) of whom were over 65 years old. A total of 125 participants underwent the second medical checkup, 13(10.4%) of whom were over 65 years old. No one suffered from severe depression and nutrition disorder. **Conclusion :** Refugees transferred about 300km from Fukushima prefecture to Mitsuke city. This distance was distinctly longer than that of refugees who moved within Fukushima prefecture. But refugees in Mitsuke city were in good health. We conclude that long distance evacuation of refugees from terrible disasters area is one of the effective provisions for the health of refugees. **Keywords :** refugee, earthquake, health checkup

PP25 S-170

AN OPINION SURVEY AMONG HEALTHCARE PROFESSIONALS, TO ASSESS "AGE-FRIENDLINESS" OF THE CITY OF ATHENS, IN ORDER TO PROMOTE "ACTIVE AGEING" IN THE OLDER ATHENIANS

Christos PLIAKOS (*Centre for Sustainable Development, University of Central Lancashire-Greek Institute of Gerontology and Urban Sociology on Ageing, United Kingdom*)

Introduction : There is an international debate and collaboration in establishing sustainable social policies and developing a new research agenda, including policy makers, researchers, practitioners and older people, to ensure healthy livable cities for promoting "Active Ageing". The World Health Organization has prioritized the design of 'Age-friendly cities', publishing objective criteria and standards for the removal of barriers and difficulties occurring in the urban environment to enforce active participation of older people, while providing them adequate support and protection. The survey aims to explore current attributes of the city of Athens concerning "Age-friendliness", as perceived by healthcare professionals with an active interest in working with older people and study the perspective of creating an 'Age-friendly city' for all citizens, promoting "Active Ageing" in the older Athenians. **Method :** Quantitative survey targeted a convenience sample of 514 healthcare professionals, using semi-structured questionnaires heavily based on the WHO-Guidelines-Checklist form. **Results :** Found current status of the city poor and troubled, against the WHO guidelines in six out of eight domains of urban life, as perceived by the healthcare professionals, recording the feedback of the unmet criteria (65% of responses holds a negative perception, 23% a positive one and 12% is neutral). Found different perceptions concerning "Age-friendliness" among healthcare professionals, depending on the kind of profession. **Conclusion :** The paper based on the survey's findings, in light of the relative literature, attempts to make some recommendations to the local policy makers to act towards an urban regeneration plan creating an 'Age-friendly' city of Athens. **Keywords :** Age-friendly cities, PATH project, Active Ageing

PP25 S-171

PHYSICAL ACTIVITY AND MENTAL HEALTH OF POLISH OLDER ADULTS

Alina ZUREK¹, Grazyna DABROWSKA², Grzegorz ZUREK³
(1. Dept. of Psychology, University of Wrocław, Poland; 2. Dept of Physiotherapy, University School of Physical Education, Poland; 3. Dept. of Biostructure, University School of Physical Education, Poland)

Introduction : Physical activity (PA) performed by the elderly can result in improvement of the physical health and comfort; it can also influence the mental functioning providing benefits in the emotional and intellectual sphere. The aim of the research was to analyze psychological variables ? of anxiety and of subjectively understood mental health in a group of older adults who were very active and in a group of those, who were moderately active or almost inactive. **Method :** The participants of the research were 101 older adults who were meeting together in a University of Third Age. They were divided into two groups: displaying high level and low level of PA. The GHQ-28 was used together with the STAI. GHQ-28 allows to describe the mental health globally as well as in the four areas: somatic symptoms, anxiety, insomnia, functioning disorders, symptoms of depression; STAI is used to diagnose anxiety as a state and anxiety as a personality trait. **Results :** Statistically significant differences within the scope of anxiety as a trait were observed in the respective groups of the highly physically active and of those showing low levels of PA, while the intensity of anxiety experienced is low in both groups. The GHQ-28 results mark the mental health of the persons examined in the global sense and in every of the areas distinguished in GHQ-28. **Conclusion :** Mental health of Polish older adults is satisfactory. The intensification of anxiety may be a significant subjective psychological indicator of undertaking PA by the elderly in order to reduce tension. **Keywords :** physical activity, mental health, older adults

PP25 S-172

THE QUALITY OF LIFE OF THE SENIOR ADULT PARTICIPATING IN SENIOR EMPLOYMENT PROJECT

Keunyun RYU¹, Kyuryang HAN² (1. Dept. of Social Welfare, Korea National Univ. of Transportation, Korea; 2. Department of Social Welfare, Korea National University of Transportation, Korea)

Introduction : The purpose of this study was to investigate the effect of the life quality of seniors participating in the Senior Employment Project, and the intermediation effect of the psychosocial factors. The total of 511 seniors was recruited from the institutions participating in the Senior Employment Project in Chungchungbuk-do. The survey was chosen as a primary study method, and the data was gathered through self-reporting questionnaire and interview. **Method :** The direct and indirect effect and the factors that influence on the life quality of seniors were analyzed with SPSS 11.0 Statistical program, and frequency analysis and __ analysis on the personal characteristics and the actual conditions of the Senior Employment Project were carried out. **Results :** The survey results showed that life satisfaction of seniors influenced by working in the Senior Employment Project was 14.4%, and the variables that explain the outcome of participation were 53.6% and directly and indirectly turned out to affect the results of the project. **Conclusion :** The following senior welfare policies are proposed based on the result of this study: First, since the Senior Employment Project is the critical factor that influences the life quality of seniors, it is necessary to create a variety of jobs to improve the quality of senior life. Second, it is necessary to create jobs requiring professional abilities considering the motivation and the level of satisfaction of the seniors. Third, Educational programs that strengthen the psychosocial competence of the seniors should be planned to

improve the life quality of seniors who joins the Senior Employment Project. **Keywords :** The life quality of seniors, The Senior Employment Project, The senior welfare policies

PP25 S-173

EFFECTS OF AGE AND PHYSICAL ACTIVITY LEVEL ON NEUROELECTRIC INDICES OF RESPONSE INHIBITION

Geoffroy BOUCARD¹, Cedric A. BOUQUET², Abdelrhani BENRAISS³, Michel AUDIFFREN³ (1. Sport Sciences, University of Poitiers / CNRS, France; 2. Psychology, University of Poitiers / UMR CNRS 7295, France; 3. Sport Sciences, University of Poitiers / UMR CNRS 7295, France)

Introduction : Physical activity (PA) is a moderator of age-related cognitive decline, particularly in tasks involving response inhibition. In a Go/NoGo task, two event-related potentials (ERPs) allow to assess the efficiency of inhibitory processes: (1) The NoGo-N2 that would be produced by the right inferior frontal cortex (rIFC), a cortical area involved in premotor inhibition processes; (2) The NoGo-P3, focused over the medial frontal areas and that would be related to motor inhibition processes. The aim of this study is to determine the effects of PA level on the different inhibition-related ERPs in aging. **Method :** Twenty-four young and 24 older adults were classified as physically active or sedentary, based on measures of past (PA questionnaire) and present (accelerometer) PA. Reaction Time (RT) and ERPs amplitudes were the main dependent variables. **Results :** Concerning RT, young participants (415 ms) were faster than older participants, and active older participants (574 ms) were faster than the sedentary older participants (664 ms). Concerning ERPs, the NoGo-N2 was larger in active older participants (-2.5 μ V) than in sedentary older participants (-1 μ V), only at the right inferior frontal area, while there was no effect of PA level in young participants. The NoGo-P3 was smaller at FCz in older participants (4.3 μ V), compared to young participants (8.8 μ V), but this effect was not modulated by PA level. **Conclusion :** These results suggest a positive effect of PA level on premotor inhibition in aging people. This is consistent with other neuroimaging studies showing that physically-trained older adults exhibit volumetric and functional improvements in the rIFC. **Keywords :** Lifestyle, Electroencephalography, Reaction time

PP25 S-174

AN INTERVENTION STUDY ON PHYSICAL ACTIVITY AND COGNITIVE FUNCTIONING IN PEOPLE WITH PARKINSON'S DISEASE

Maud ROUILLARD¹, Michel AUDIFFREN², Cedric T. ALBINET³, Gaetan GARRAUX³, Fabienne COLLETTE⁴ (1. Sport Sciences, University of Liege, Belgium; 2. Sport Sciences, University of Poitiers / UMR CNRS 7295, France; 3. Neurology, University of Liege / Cyclotron research center, Belgium; 4. Neuropsychology, University of Liege / Cyclotron research center, Belgium)

Introduction : At this time, very few intervention studies were interested to assess the effects of physical activity on cognitive functioning in people with Parkinson's disease (PD) and most of their results were inconclusive. The principal aim of the present study was to re-examine the causal relationship between physical activity and cognitive efficiency in people with PD. **Method :** Twenty-seven volunteers with PD participated to this study (Mean age = 65.33 years; Mean Hoehn-and-Yahr score = 1.59). Twelve participants were involved in a 12-week physical activity (PA) program including 90-min sessions of aerobic or resistance exercises twice a week, while fifteen controls did not change their sedentary habits. All participants performed a series of neuropsychological tests before and after the 12-

week period, which assessed global cognitive performance (MMSE and Mattis), psychomotor speed (letter comparison task), attention (SDMT), memory (Rey word list recall), executive functions (WCST, running span letter, random number generation, orthographic and verbal fluency, Stroop task) and visuospatial functions (JOLO). Results : Significant interactions between Group (PA program vs. control) and Time (before vs. after training program) were observed for global cognitive performance, executive (orthographic fluency and Stroop) and visuospatial functions. The performances of the control group decreased from pre- to post-test while those of the group involved in the PA program remained stable. Conclusion : These results suggest that regular PA could slow down the cognitive impairments induced by PD. Future studies will be needed to confirm these results and to determine if PA could be a new and effective therapeutic approach to PD. Keywords : Chronic exercise, Executive functions, Compensatory mechanisms

PP25 S-175

PREDICTORS FOR SUBJECTIVE WELL-BEING OF CROSS-NATIONAL OLDER ADULTS

Sofia VON HUMBOLDT, Isabel LEAL (*Research Unit in Psychology and Health, R&D, ISPA-Instituto Universitario, Portugal*)

Introduction : Aims: This research aims to explore a causal model of subjective well-being predictors in a cross-cultural older population. Method : Methods: Measures were completed using a variety of culturally appropriate methods, including mail-outs, self-administration and interviews. For the purposes of this study, the Positive and Negative Affect Schedule (PANAS), the Satisfaction with Life Scale (SwLS), the Adjustment to Aging Scale (ATAS) one measure of cognitive functioning - the Mini-Mental State Examination (MMSE) and demographics, were included. All variables had fewer than 1% missing values and complete data were available for 709 older adults (M = 82.4, SD = 6.45, (range 74-102)) from eight different nationalities. Structural equation modeling was used. Controlling for age, gender and country of origin, we assessed the level of subjective well-being of elderly people, and its predictors. Results : Results: Subjective well-being is predicted, not only by age progression, but also by adjustment to aging, among other variables. Age was significantly associated with cognitive impairment ($\beta = .387$; $p = .003$) and perception of health ($\beta = -.172$; $p = .004$). All estimates were statistically significant ($p < .01$). Conclusion : Conclusions: Subjective well-being appears to be a catalyst to attitudinal markers of maturity and internal development, across cultures. This study highlights the predictors of subjective well-being in older age, warranting further study across cultures among frailer populations over time. Recommendations for future research on older adults' well-being measures and clinical practice are also presented. Keywords : Predictors, structural equation modeling, older adults, subjective well-being, adjustment

PP25 S-176

DOES HOSPITAL-BASED VOLUNTEERING FACILITATE ACTIVE AGING?

Erin SHEPPARD, Halina Gajlewicz KUSZ, Anne DOHRENWEND (*Medical Education, McLaren Flint Health Care/Michigan State University, USA*)

Introduction : Previous research supports a positive relationship between volunteering and health. (1,2,3). Our study sought to establish the benefits of volunteering in a hospital-based program, on the elderly population's health and process of active aging, as defined by the World Health Organization and as measured by mental health, and

physical and social functioning. Method : In May 2011, we mailed an anonymous survey to 294 volunteers at McLaren Health Care. The RAND 36-Item Health Survey TM (Version 1.0) was used as the quality of life measure. Demographic questions, including gender and age, were added. Responses were collected for 8 weeks. We used Quality Metrics' Health Outcomes Scoring Software 4.0 to evaluate volunteers' scores. Our group scores on physical functioning (PF), mental health (MH), and social functioning (SF) were compared to the general population and same age and gender norms. Results : We had 133 participants return completed surveys, resulting in 45% response rate. Majority were female, ages 75-84. Our volunteers' mean scores compared to the general US population norms were: PF 67.45 (84.2), MH 81.76 (74.7), SF 82.86 (83.3), respectively. Conclusion : While across all domains of quality of life our volunteers are not statistically significantly different compared to the general population norms, they did score higher compared to same age and gender norms. This suggests that volunteering in a hospital-based program promotes active aging and health in elderly people. Keywords : Active Aging and Voluntary Work

PP25 S-177

RECOGNITION OF HAPPINESS FROM DYNAMIC VISUAL CUES IS NOT PRESERVED IN DEMENTIA

Despina MORAITOU¹, Georgia PAPANTONIOU², Pantelis GINOS¹, Theofilos GKINOPOULOS³, Daphni KOTSELIDOU¹, Magdalini NIGRITINO¹ (*1. School of Psychology, Aristotle University of Thessaloniki, Greece; 2. Department of Early Childhood Education, University of Ioannina, Greece; 3 School of Psychology, Panteion University, Greece*)

Introduction : Difficulties in recognizing emotional signals might have serious implications for social interactions. Neurodegenerative diseases affecting neural networks involved in emotional displays processing may thus be connected with a disproportionate impairment in social life. The few dementia studies that have investigated emotion perception indicate that perception of happiness is relatively spared compared with other emotions. However, it has been argued that such findings may be due to ceiling effects in identifying happiness that is usually presented as a very intense emotion in static stimuli tests. The purpose of the present study was to examine the ability to decode happiness from dynamic emotional displays in mild to moderate dementia. Method : Thirty older adults diagnosed as mild to moderately demented, and 30 gender-matched healthy controls were administered a measure of emotion evaluation. The groups did not differ significantly in age and educational level. The emotion evaluation test used in the study was designed to examine a person's ability to visually identify basic emotions and discriminate these from neutral expressions, when they are expressed as dynamic, subtle, day-to-day expressions. Results : Patients with dementia were significantly impaired in happiness decoding and systematically tended to confuse happiness with positive surprise, compared to healthy older adults who had an almost excellent performance. Conclusion : Happiness recognition is not preserved even in mild dementia. Given that the same ability is well-preserved in healthy ageing, happiness decoding might be used as a marker of early cognitive decline. Keywords : emotion decoding, mild dementia, naturalistic emotional displays

PP25 S-178

"COMING TO TERMS WITH AGING" AS AN ADAPTATION PROCESS FOR AGING

Etuko KAKIYAMA, Keiko YAMAMOTO (*Nursing, Kyushu University of Nursing and Social Welfare, Japan*)

Introduction : Aging is an irreversible and universal process, and few studies have clarified the process by which elderly individuals adapt to aging. In the present study, we analyzed the ways in which elderly individuals adapt to age-related changes based on data obtained from interviews. **Method :** Semi-structured interviews were conducted with a total of 12 elderly individuals living independently at home. The present study was approved by the ethics committee of the researchers' university. **Results :** Subjects included eight women and four men with a mean age of 82.5 years. Because subjects had maintained lifestyles conducive to the prevention of lifestyle-related diseases from an early age, they did not have a conscious awareness of adaptation to aging. Subjects dealt with age-related changes following manifestation of subjective symptoms, and they were aware that similar changes occurred in friends of the same age, thereby making a with the feeling of "resignation". **Conclusion :** While subjects were aware of aging, they accepted it as a natural course of life and engaged in the same types of coping behavior as their contemporaries rather than actively adapting to changes, and thereby made a "Coming to terms with aging". Nevertheless, the possibility of delays in detection of age-related diseases was suggested. **Keywords :** Coming to terms aging, adaptation, aging

PP25 S-179

FACTORS RELATED TO PERCEIVED ENACTMENT OF AUTONOMY AMONG OLDER ADULTS IN JAPAN

Miho MATSUI (*School of Nursing, Nara Medical University, Japan*)

Introduction : The principle of promoting personal autonomy underpins many of the guidelines for improving the quality of care in a range of settings. Despite the assertion by many older people themselves that autonomy and independence are important to a good quality of life, little is known about perceived enactment of autonomy in Japanese older adults. The aim of this study was to examine related factors to autonomy among both healthy and frail older adults in Japan. **Method :** A cross-sectional design was adopted using a questionnaire consisted of demographics and measurement regarding autonomy. Three hundred and sixty-nine older adults consisting of 220 for senior center and 149 for long-term care users participated in this study. PEA Short version contains 13 positively and negatively worded statements. There are 3 subscales: Voluntariness (4 items), Individuality (5 items) and Self-Direction (4 items). **Results :** The sample had a mean age of 76.9 years, and half of the subjects (51%) were male due to stratified sampling. Living arrangements were that 42% couple, 31% alone, and 18% three generations. Self-reported health status showed 31% good, 37% fair, and 30% bad. PEA scores were observed that 7 of 13 items were significantly different between two groups. In addition, Senior center users indicated significantly higher score Voluntariness although total score of PEA in both groups were similar. Factors related to autonomy were health stats and social support in both groups. **Conclusion :** These results suggest that health stats and social support are important factors to maintain autonomy among older adults. **Keywords :** autonomy, social support, Japan

WHAT MAKES PEOPLE ANXIOUS ABOUT LIFE AFTER THE AGE OF 65? EVIDENCE FROM INTERNATIONAL SURVEY RESEARCH IN JAPAN, THE UNITED STATES, CHINA, AND INDIA

Yoshihiko KADOYA (*Institute of Social and Economic Research, Osaka University, Japan*)

Introduction : Due to the aging population, many governments with limited budgets are required to focus available resources on the direct

causes of people's anxieties about aging. **Method :** This study investigates what makes people anxious about their old age. It analyzes micro data concerning individuals aged 40 or above in the countries with different social contexts: Japan, the United States, China, and India. The data used for this research are from the international household data in these countries. **Results :** This study uncovered three major causes of people's anxieties about life after the age of 65. First, the speed of population aging does not always make people anxious. Second, high financial status effectively lessens people's levels of anxiety in Japan and the United States. Third, living with a child does not necessarily lessen people's concern about life after 65. **Conclusion :** The research revealed several facts concerning people's anxieties about aging issues in an aging era. However, further research is required to identify the causes of the anxieties and to provide insights into the social issues those anxieties create or represent. **Keywords :** future concern, social security

PP25 S-181

ETHNIC IDENTITY AND ISSUES OF AUTHENTICITY: THE MIDLIFE PERSPECTIVES OF SECOND-GENERATION KOREAN-AMERICANS

Linda Sujin PARK, Clifton BARBER (*Human Development and Family Studies, University of Wisconsin-Madison, USA*)

Introduction : This study focuses on ethnic identity from the perspective of middle adulthood for second-generation Korean-Americans. Of particular interest is the issue of authenticity, wherein individuals grapple with being viewed both as a "racial foreigner" in one cultural context and as a "cultural foreigner" in another. **Method :** In semi-structured interviews using the life course perspective, 16 middle-aged second-generation Korean-American participants shared retrospective thoughts and experiences about being racial foreigners in predominantly white communities and being cultural foreigners within their co-ethnic community. **Results :** The experience of being a cultural foreigner was highlighted as more distressing than being a racial foreigner. Issues of authenticity arose from an unawareness of the competing perspectives between the U.S and Korea for the social construction of race. This difference in perspectives generated some misunderstanding in the definition of being a Korean. Additionally, Koreans' rooted sense of ethnic nationalism (deeply connected to culture and language) created strong in-group and out-group boundaries. These boundaries go beyond separating Koreans from non-Koreans but extend to the way first and 1.5 generations treat the second-generation Korean-Americans through "othering" and exclusion. Many participants recounted incidents of exclusion during college stemming from the strong "in-group" solidarity of the 1.5 generation Koreans. **Conclusion :** Participants' lack of fluency in the Korean language impeded their inclusion into the Korean community then. Although participants continued to lament their lack of heritage language skills, especially in regards to issues of authenticity as a cultural foreigner, at midlife they developed a sense of appreciation for their Korean heritage which was formerly absent. **Keywords :** midlife, ethnic identity, cultural foreigner, life course

PP25 S-182

THE CAUSAL ASSOCIATION BETWEEN GENERATIVE CONCERN AND GENERATIVE ACT IN OLD AGE

Megumi TABUCHI¹, Takeshi NAKAGAWA², Yasuyuki GONDO²
(1. *Psychological Science, Kwansei Gakuin University, Japan*;
2. *Psychological Science, Osaka University, Japan*)

Introduction : The purpose of this study was to reveal the causal association between generative concern and generative act in old age.

Generativity, suggested by E. H. Erikson (1950; 1963) as a developmental task in middle-age, is the concern of contributing to the well-being of others, especially younger generations. According to the “anatomy of generativity” (McAdams & Aubin, 1998), the generative concern has an impact on generative act, and the person of high level generative concern acts positively for contributing to the well-being of young generations. On the other hand, some studies reported that necessary inter-generational relationships, such as child and grandchild rearing, influenced on the development of generative concern, and actions came before concerns. Method : We conducted longitudinal survey, and 400 older adults aged 62-87 years responded to the questionnaire at 2 time points that were 12 months apart. Generative concern was assessed with a Japanese version of the Loyola Generativity Short Scale. Generative acts were measured by the generative acts checklist. Results : Cross-lagged effects model conducted by simultaneous analysis of several groups showed that the both impacts, from generative concern to generative acts and from acts to concern, were significant in men. On the other hand, only the impact from acts to concern was significant in female. Conclusion : These results showed the gender difference in the relationship between activities and psychological development in middle and old age. Keywords : generativity, generative act, generative concern

PP25 S-183

DEVELOPMENTAL CHANGES IN PERCEPTIONS AND THE SENSE OF RESPECT FOR THE ELDERLY AMONG ADOLESCENTS

Tomoya TAKAHASHI (*Environment and Information Science, Yokohama National University, Japan*)

Introduction : Changes in the sense of respect for the elderly and perceptions of the elderly among adolescents were investigated. Method : Participants were early adolescents in junior high school (N = 190, 88 boys and 102 girls) and late adolescents attending universities (N = 202, 126 men and 76 women) in City A that responded to the questionnaire. Considerations regarding the protection of their privacy were explained to the participants and they were handed a document detailing these. The study utilized the “Sense of Respect towards the Elderly among Adolescents Scale” (Takahashi, 2012) and “Perceptions towards the Elderly Scale” (Cheng et al., 2000) as well as face sheets to create the questionnaire. Results : Results indicated that the sense of respect for the elderly increased during adolescent maturation, but perceptions towards the elderly become more negative. These results supported a previous claim by Nakano (1996) suggesting, “Positive perceptions towards the elderly during youth become negative during maturation.” Our results also supported Chen’s (2007) finding that “There is a disparity between attitudes towards filial piety and following through with filial piety”. Conclusion : We predicted that a factor mediating between the positive effect of maturation and the sense of respect towards the elderly might be the acquisition of social awareness. Moreover, the negative effect of maturation on the perceptions towards the elderly might be caused by the realization of the large burden that the younger generations must carry to support the growing elderly population in Japanese society. Keywords : Perceptions of the Elderly, Sense of Respect for the Elderly, Adolescence

PP25 S-184

TRAJECTORIES OF DEPRESSIVE SYMPTOMS IN LATER LIFE: A MULTIPLE-INDICATOR MULTILEVEL GROWTH MODEL

Yu-Jing GAO (*Department of Psychology, Fu Jen Catholic University, Taiwan*)

Introduction : Research has focused on the dynamic nature of depressive symptoms in later life. Little research has treated depressive symptoms as a latent variable from multiple indicators. This article examines depressive symptoms over a 19-year period (from 1989 to 2007) in a sample of 3,957 Taiwanese elders using a multiple-indicator multilevel growth model (MIML) which incorporating measurement models into the growth curve of the latent variable. Inter-individual differences on perceived health status, autonomy, and age attitude were also considered into the growth model. Method : Data taken from the Survey of Health and Living Status of the Elderly in Taiwan (TLISA) were used in analysis. Depression was measured by the 10-item version of CESD. Perceived health status and age attitude was measured by a single item 'What do you think about your health status?' and 'Do you think it is a bad thing about getting older?' respectively. Autonomy was measured by the Instrumental Activities of Daily Living (IADL). Results : The depressive symptoms were not correlated with age at initial stage but increased with age. Initial perceived poor health status, less autonomy, and negative age attitude had a positive effect on latent baseline depression ($\beta = .536$, $\beta = .486$, and $\beta = .176$, $p < .01$, respectively). Initial less autonomy enhanced the increase trend of depression across time ($\beta = .175$, $p < .001$). Conclusion: The results show that perceived health status and autonomy play an important role for both intercept and slope growth factors of depression. Age is an important predictor only for the slope growth of depressive symptoms. These results are consistent with previous research. Keywords : Depressive symptoms, Latent growth modeling, Temporal measurement invariance

THE ACCESS LIFE COURSE RESEARCH INFRASTRUCTURE - A NORWEGIAN BASED INFRASTRUCTURE FACILITATING ACCESS TO HIGH QUALITY LIFE COURSE DATA

Kristine KOLØEN¹, Marijke VEENSTRA¹, Morten BLEKESAUNE¹, Thomas HANSEN¹, Katharina HERLOFSON¹, Lars DOMMERMUTH², Trude LAPPEGARD² (*1. NOVA, Norwegian Social Research, Norway; 2. SSB, Statistics Norway, Norway*)

Introduction : Improving knowledge for meeting tomorrow's sociopolitical challenges requires high quality longitudinal data that are easily available to researchers. The ACCESS Life Course Research Infrastructure establishes a research platform for interdisciplinary, cross-national research analysing life course patterns, in particular within the fields of ageing and demography. ACCESS provides data from two large-scale surveys: The Norwegian panel study on life course, ageing and generation (NorLAG) and The Life Course, Generation and Gender study (LOGG). Method : The first wave of NorLAG was conducted in 2002-03. The sample was drawn from the non-institutionalised population aged 40-79 years in 30 municipalities and townships in Norway. In the second wave of data collection (2007-08), NorLAG was merged with the United Nations-initiated Generations and Gender Survey (GGS) and also includes a nationally representative sample of persons aged 18-79 years. Response rates are 67 % (N=5,559) for the first wave of NorLAG and 61 % (N=14,892) for the second wave of data collection. In wave 2, 71.6 % (N=3,774) of the respondents from wave 1 were retained. Data sources include survey and annual updates from the public registers. Results : Easy-to-use data on the following main topics are available: work and retirement, family and intergenerational relations, mental health and quality of life, health and care, fertility histories and partnership dynamics. ACCESS provides easy-to-use data files and facilitates access by providing cleaned and tested data, detailed documentation of datasets and variables, and ready to use scales and measures.

Conclusion : The infrastructure has generated an increase in new users of the data. Keywords : survey data, infrastructure, life course

PP25 S-186

THE INFLUENCE OF PERSONALITY TRAITS ON PAIN IN OLDER ADULTS: FINDING FROM THE SNAC-B STUDY

Lena W. SANDIN WRANKER¹, Mikael RENNEMARK², Johan BERGLUND³, Solve ELMSTAHL⁴ (1. Department of Health Sciences, Division of Geriatr, Lund University, Lund, Sweden; 2. School of Education, Psychology and Sport Science, Linnaeus University, Sweden; 3. School of Health and Sciences, Blekinge Institute of Technology, Sweden; 4. Department of Health Sciences, Division of Geriatric Medicine, Lund University, Sweden)

Introduction : The experience of pain may vary depending on personality traits and individual characteristics. The aim of this study was to investigate possible associations between pain and the personality dimensions, (the big five), and to explore if it is equally gender expressed among older adults. The possible covariates age, insomnia, cash margin, and education will be controlled for. Method : The Swedish National Study on Aging and Care (Blekinge) sample includes 1402 individuals aged 60-96 years out of whom 769 (55%) reported pain. This sample of elderly people is being followed over time. Information on personality traits were obtained by using the personality SGC1 questionnaire; a Swedish (60 questions) version of Costa & McCrae's FFM questionnaire. . Multivariate logistic (forward) regression analyses were conducted to provide odds ratios (Ors). All analyses were carried out using the SPSS program, version 17.0. Results : Among women insomnia gave the highest odds for experiencing pain (OR 2.18), $p < 0.001$, followed by neuroticism (OR 1.05), $p < 0.001$, and belonging to the younger part of the older adult cohort (OR 1.02), $p < 0.035$. In men, only insomnia yielded high odds ratio for pain (OR 2.02), $p < 0.003$. Conclusion : Insomnia was the most influential factor for both genders but neuroticism contributes in the experience of pain among older adult women. This study adds, a suggestion that older adults with pain may share particular personality characteristics, but also that there are gender differences. Thus, to better understand older individuals who suffer from pain, personality traits should be taken into account. Keywords : Personality, pain, older

PP25 S-187

THE INCREASING IMPACT OF GEROTRASCENDENCE ON MENTAL HEALTH WELL-BEING ASSOCIATED WITH A REDUCTION IN SOCIAL RESOURCES OF OLD AGE

Yukie MASUI¹, Yasuyuki GONDO², Takeshi NAKAGAWA², Madoka OGAWA¹, Yoshiko ISHIOKA², Yukiko TATSUHIRA², Marina KOZONO², Megumi TABUCHI³, Hiroki INAGAKI⁴, Kazunori IKEBE⁵, Kei KAMIDE⁶, Yasumichi ARAI⁷, Tatsuro ISHIZAKI¹, Ryutaro TAKAHASHI⁸ (1. Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan; 2. Graduate School of Human Sciences, Osaka University, Japan; 3. Department of Psychological Science, Kwansai Gakuin University, Japan; 4. Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Institute of Gerontology, Japan; 5. Graduate School of Dentistry, Osaka University, Japan; 6. Graduate School of Medicine, Osaka University, Japan; 7. School of Medicine, Keio University, Japan; 8. Research on Social and Human Sciences, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : The purpose of this study is to examine the impact of gerotranscendence on mental health well-being of older adults who have few social resources. Method : A questionnaire survey was administered to 1,973 community-dwelling Japanese older adults

(Mean age=74.9 years; SD=5.0) to assess gerotranscendence and mental health well-being using the Japanese Gerotranscendence Scale Revised (JGS-R) and the WHO-5 Well-being Index, respectively. Principal component analysis was performed to assess the social resource score, which was combined with the size of social network, the frequency of interactions, and the social support scale. We utilized the multiple population analysis of structural equation modeling, while controlling for age, sex, and IADL, and ascertained the impact of the eight subordinate factors of gerotranscendence on mental health well-being with a comparison of higher- and lower-scoring groups on social resource. Results : The results revealed that "Awareness of 'arigatasa' and 'okage'", "Releasing from social self", and "Let it go" of the subordinate factors of the JGS-R significantly influenced mental health well-being in the both higher- and lower-scoring groups on social resource. Furthermore, the standard partial regression coefficient of 'Awareness of 'arigatasa' and 'okage' to mental health well-being was significantly larger ($p < 0.05$) for those with lower scores ($\beta = .26$) on social resource than for those with higher scores ($\beta = .16$). Conclusion : These findings were consistent with the hypothesis of Erikson & Erikson (1997) that psychological adaptation is promoted by the development towards gerotranscendence when various resources such as physical abilities and social resources decrease in the late old age. Keywords: gerotranscendence, psychological well-being, social relationship

PP25 S-188

USING PATH ANALYSIS TO EXAMINE THE EFFECT OF PHYSICAL ACTIVITY, DEPRESSION, SOCIAL SUPPORT, ON SPIRITUAL WELLNESS AMONG INSTITUTIONALIZED OLDER PEOPLE

Chiang-Fang CHU¹, Yi-Heng CHEN², Yu-Han WANG² (1. School of Nursing, China Medical University, Taiwan; 2. School of Nursing, Mackay Medical College, Taiwan)

Introduction : Spirituality is considered as a critical component of institutional care for elders, under the higher risk of life-threatening events, chronic illness or disability. Literature investigating the interrelationships between spiritual wellness and associated variables is extremely limited, and causality among these variables have not been fully tested in this group. The study was to investigate the causal relationships between spiritual wellness and relevant variables including physical function, depression and social support in institutionalized older people. Method : This is a cross-sectional study, and a total of 176 eligible older people in central Taiwan were recruited. The structured questionnaires including Barthel index, Geriatric Depression Scale (GDS), Interpersonal Support Evaluation List (ISEL), and Spiritual Well-Being Scale (SWBS) were used to measure the major concepts. Results : The results of bivariate correlation analysis showed that moderate relationships existing between spirituality and each other variables, as the authors predicted. Further, we investigated the causal relationships by path analysis and found that although both social support and depression had direct impacts on existential well-being, physical function influenced existential well-being through social support or depression among institutionalized older adults. Moreover, depression was found as a mediator between social support and existential well-being. The results indicated that physical function could influence social support and then indirectly increased spirituality through depression. Conclusion : The study evidenced that physical function, depression and social support all had influence on threaten older adults' spiritual wellness. Thus, a more comprehensive biopsychosocial treatment strategy is recommended to integrate into the future care plan for institutional residents. Keywords : path analysis, spiritual wellness, older people

PP25 S-189

THE REQUIREMENTS FOR SUCCESSFUL AGEING

Audrey GUY (*Business, Law and Governance, University of Canberra, Australia*)

Introduction : In all stages of life people need to have a purpose which provides a definition of who they are in society. Prior to retirement this need is filled by employment which provides necessary status in people's lives. Employment may also provide social contacts, another human need. Older people and the community in which they live need to be aware of this and both groups should actively seek to fill these gaps for retirees. Method : Employees who enjoy their work have no desire to retire but for others retirement creates a new gap in their lives. This needs to be filled by a substantial interest, or purpose, which gives meaning to life and can also provide social contacts. Isolation and physical impairment are no longer barriers in a digital world in which people are just a keystroke away from involvement. Results : Encouraging successful ageing through any community involvement, paid or unpaid, benefits the person through better health, particularly mental health, and benefits the nation through increased social and financial participation. Older people no longer have the fear of failing and can branch out into previously untried fields, such as setting up a new business or entering a new occupation, possibly with government assistance. Conclusion : We should regard the later stage of life as one of enjoyment, achievement and self-fulfilment, not as a time of being merely a burden on the community, lacking self-respect. It is a stage in life when we should be free to follow our dreams. Keywords : Status, purpose, ageing

PP25 S-190

USING TECHNOLOGY TO IMPROVE HEALTHY AGEING: DEVELOPING A RESEARCH AGENDA

Ilan KWON, Paul FREDDOLINO (*Social Work, Michigan State University, USA*)

Introduction : Ageing populations mean increased health care costs. Information and Communication Technologies (ICTs) are often seen as solutions to this growing need, but how to obtain the most potential benefits from ICT-based programs is unclear. Method : Findings from Korean and U.S. literature raise important questions for program development and research. These findings suggest the broad outlines of a research agenda that builds on progress in digital inclusion in many countries. Results : Several Korean surveys report elders with computer use or training are more confident getting health information via Internet, and expanding their social network and social participation. In the U.S., several empirical studies using quasi-experimental designs indicate that older adults with little prior computer experience can and will learn to use ICTs, and also feel more comfortable with technology. Even though training can facilitate elders to reach some level of e-inclusion, desired outcomes in specific areas of interest to families, caregivers, and the government (such as health and social support/social networks) generally do not reach hypothesized levels. Conclusion : The proposal for discussion is that we need to develop and implement a research agenda that assesses the healthy ageing potential for ICT training targeted toward specific, high-value content areas like health and social support. Such training must go beyond how to use computers, the Internet, Skype, etc. Training must be targeted, include active participation and homework, and incorporate some rewards/motivators. We will briefly present one model being implemented and evaluated, and we hope to discuss others' ideas for a research agenda. Keywords : Information and Communication Technologies (ICTs), healthy aging

PP25 S-191

SELF-REPORTED ADJUSTMENT TO AGING AND SUBJECTIVE AGE: A QUALITATIVE STUDY WITH ANGOLAN AND PORTUGUESE COMMUNITY-DWELLING OLDER ADULTS

Sofia VON HUMBOLDT, Isabel LEAL (*Research Unit in Psychology and Health, R&D, ISPA-Instituto Universitario, Portugal*)

Introduction : Individual differences concerning the aging experience influence the ways the aging self adapts to challenges that are related to late adulthood in various cultural settings. Purpose: This study aims at examining the indicators of adjustment to aging (AtA) and subjective age (SA) reported by older adults and at investigating the latent constructs that can work as major determinants in AtA and SA in an older Portuguese and Angolan community-dwelling population. Method : Questionnaires were completed, using a variety of appropriate methods, including demographics and interviews. Complete data were available for 102 older adults aged between 75-99 years (M = 80.5, SD = 5.76). Data was subjected to content analysis. The correlational structure and latent constructs of indicators of AtA and SA were analyzed by a Multiple Correspondence Analysis (MCA). Results : 'Social support' was the most reported indicator of AtA (25.4%) and 'in harmony' (22.3%) was indicated as the most frequent SA response. Adjustment and age was explained by a three-factor overall model: 'integrated', 'congruent' and 'concerned' for Angolan participants whereas 'fulfilled', 'reconciliated' and 'driven' was indicated as a best-fit model for Portuguese elderly. Conclusion : The findings presented in this paper emphasized the deepening of the concept of AtA in this population and its association with SA, in an overall model. Keywords : Adjustment to Aging; Multiple Correspondence Analysis; Community-Dwelling Older Adults

PP25 S-192

ASSOCIATIONS OF SUCCESSFUL AGING AWARENESS WITH RETIREMENT PREPARATION: A STUDY OF WORKERS IN A MEDICAL CENTER

Yi-Ling CHOU¹, Hui-Chuan HSU², Shu-Nu Lee CHANG², Haung-Yu YANG³, Yi-Hui SUNG⁴ (*1. Chung Shan Medical University Hospital, Chung Shan Medical University, Department of Nursing, School of Nursing, Taiwan; 2. Asia University, Department of Healthcare Administration, Taiwan; 3. Yuanpei University, Department of Healthcare Management, Taiwan; 4. Chung Shan Medical University Hospital, Department of Nursing, Taiwan*)

Introduction : The purpose of this study was to explore the elements of their awareness in successful aging and retirement preparation, and the relationship between successful aging awareness and retirement preparation among the workers in a medical center before retirement. Method : The questionnaire was designed according to literature review and the results of a pilot qualitative interview. The samples were from the employees in a medical center who were 45 years old or more. In total 174 persons were included in the analysis, with response rate of 69.6%. Factor analysis and multiple regression models were used for analysis. Results : (1) Six factors were extracted from the items of successful aging awareness : learning and social life, economy and health expense, environment and society welfare, family relationships, health, and positive thinking (with variance explained 68.4%). (2) Seven factors were extracted from retirement preparation items: learning and social life, environment and social welfare, family relationships, economic security, psychological and physical health, social relationships, spirituality and religion (with variance explained 69.3%). (3) In general, the higher awareness of successful aging in learning and social life, environment and social welfare, economy and

health expense, and health, the more retirement preparation behaviors were found. Conclusion : Stronger successful aging awareness predict better retirement preparation. The successful aging components are suggested to be added in the education for the pre-retirement population. The sample size and the scope of medical institutions as well as the longitudinal design are suggested in the future studies. Keywords : successful aging^o retirement preparation

PP25 S-193

COMPLEXITY OF WORK AND LATE-LIFE COGNITIVE FUNCTION

Yoshiko ISHIOKA¹, Yasuyuki GONDO¹, Madoka OGAWA², Yukie MASUI², Takeshi NAKAGAWA¹, Yukiko TATSUHIRA¹, Kazunori IKEBE³, Kei KAMIDE⁴, Yasumichi ARAI⁵, Ryutaro TAKAHASHI² (1. Human Sciences, Osaka University, Japan; 2. Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan; 3. Graduate School of Dentistry, Osaka University, Japan; 4. Graduate School of Medicine, Osaka University, Japan; 5. School of Medicine, Keio University, Japan)

Introduction : Previous studies demonstrated the association of occupational complexity with cognition in the elderly. To measure complexity, most of studies used the score based on the Dictionary of Occupational Titles. It is a very useful tool because each occupational title has own complexity score. However, occupational complexity might be diverse even in the same occupation, because it depends on how much people devote cognitive effort to their work. This study examined the association between complexity of work measured by our own score and late-life memory and reasoning performance. Method : We conducted venue surveys with 1000 community-dwelling people aged from 69 to 71 years, who were chosen from resident registry of four districts in Tokyo and Hyogo prefectures. Evaluation of complexity of work with data, people, and things was developed based on the Japanese job complexity score that enables to rate more precise work complexity score. Results : Multiple regression analyses revealed that after controlling for sex, school records, and educational achievement, more complex work with people was associated with higher memory performance and more complex work with data was associated with higher reasoning performance. Moreover, in relation to reasoning performance, an interaction effect was found between complexity of work with data and sex: in men, high complexity of work with data was associated with high reasoning performance. Conclusion : These findings suggest that high complexity of work is associated with the maintenance of cognitive function in later life. Future research using longitudinal data is required to investigate whether complexity of work predicts cognitive decline. Keywords : cognitive function, individual differences, life environment

PP25 S-194

DOSE THE POSITIVITY EFFECT IN UNINTENTIONAL PROCESS RETRIEVAL?

Daisuke UENO¹, Yasuyuki GONDO¹, Shinichi SATO¹, Kouhei MASUMOTO² (1. Graduate School of Human Sciences, Osaka University, Japan; 2. Graduate School of Human Development and Environment, Kobe University, Japan)

Introduction : Socioemotional selectivity theory cites the positivity effect to explain higher memory performance for positive than negative materials in aging. Previous research suggests that older adults intentionally retrieved more positive than negative materials compared with younger adults, but it is unknown whether the positivity effect occurs unintentionally. To test whether the positivity effect is shown unintentionally, this study examined age differences in

the effect of emotional valence on explicit and implicit memory. Method : In experiment 1, 48 younger adults (mean age 22 years) and 48 older adults (mean age 70 years) encoded neutral words to which emotional valence was added by subsequent presentation of positive, negative, or neutral pictures. After the encoding phase, participants completed a free recall task (explicit memory). In experiment 2, 27 younger adults (mean age 20 years) and 30 older adults (mean age 69 years) completed a word completion task (implicit memory) after an encoding phase with the same procedure as experiment 1. As a covariate, positive and negative mood were measured before the encoding and retrieving phases in both experiments. Results : Explicit memory in the negative condition was highest in younger adults, but revealed a positivity effect in older adults. Implicit memory in the positive and negative conditions was higher than in the neutral condition in both age groups. Conclusion : This study revealed that the positivity effect is shown in explicit memory. This study suggests that the positivity effect does not occur unintentional process, supporting the socioemotional selectivity theory. Keywords : positivity effect, emotional memory, socioemotional selectivity theory

PP25 S-195

VALIDITY OF FEAR OF CRIME SCALE TO ASSESS THE ELDERLY IN TAIWAN

Chih-Ping LI (Health Industry Management, Kainan University, Taiwan)

Introduction : This research explores issues associated with an increasingly fear of crime among elderly people. Previous studies investigate whether elderly people have a significantly higher fear of crime using the fear of crime scale by crime type. However, with the emergence of new crime types targeted at elderly people in Taiwan, such as fraud, harassing phone and contamination, it is necessary to develop fear of crime indicators according to the experiences of elderly people in Taiwan. Method : EFA and CFA were performed with a sample of 176 elderly people aged 65 years or older from a community of Taiwan and established reasonable fit for 19-item fear of crime scale. Confirmatory factor analyses were conducted by using the LISREL program with maximum likelihood estimation of covariance matrices. Results : The EFA was performed on the 19 items located on the elderly. The result revealed a clear pattern of item loading across the two factors named 'concrete fear' and 'formless fear'. The CFA was performed on the total sample (N=176). Although Chi-square and RMSEA were somewhat below expectation; however, the CFI of 0.9, the IFI of 0.9, and the SRMR of 0.091 were demonstrated good fit between the data and the proposed measurement. Conclusion : The fear of crime scale is a relatively brief 19-item instrument that can be administered for a focused assessment of the elderly. It would be useful to extend the research by exploring the relationship between fear of crime and quality of life or investigating the gender difference in elderly people's perceptions of the link between fear of crime and quality of life. Keywords : elderly people, fear of crime

PP25 S-196

A CASE STUDY OF THE NURSE EXPERIENCE IN CARING DEMENTIA

Chinghua LIU¹, Chih-Ping LI² (1. Department of Nursing, Cardinal Tien Junior College of Healthcare And Management, Taiwan; 2. Department of Health Industry Management, Kainan University, Taiwan)

Introduction : In this study, the experiences of the researcher in establishing a care program for the elder with dementia and the

contribution of the researcher in reducing the anxiety of the elderly with dementia were described. The location of collected data was elderly daycare center. Method : The period of data collection was from 18 October to 14 December 2012. The studying case was firstly denoted as an elderly female with dementia and serious anxiety based on the record of her patient record, oral description of her family members, and nursing works. Then the subject was evaluated by person centered approach for understanding her favor of choice in daily life. The results showed that the subject liked to do housework, scrimp her household, and fold clothes. Results : The program for reducing her anxiety was designed for her to fold clothes with other member in care home. The ability of communicating with others was improved, but repetition, anxiety and eye uncomfortable were eliminated. Conclusion : We suggest that a consideration of subject's need is essential to understanding of how respond to the impact of dementia, then provide the various types of 'work' that is required. Keywords : dementia, case study, person centered approach

PP25 S-197

GENERATIVITY OF ELDERLY PEOPLE IN WESTERN MEXICO

Jazmin CUEVA-CONTRERAS¹, Elva Dolores ARIAS MERINO¹, Neyda Ma. MENDOZA-RUVALCABA², Martha Judith ARIAS-MERINO³, Martha Elena VAZQUEZ-ARIAS³ (1. *Public Health, CUCS, University of Guadalajara, Mexico*; 2. *Health Science, CUTONALA, University of Guadalajara, Mexico*; 3. *Maestria en Gestion y Politicas de la Educacion Superior, CUCEA, University of Guadalajara, Mexico*)

Introduction : Generativity is composed of seven psychosocial characteristics: cultural demands, inner desire, and concern of next generation, commitment, belief in the species, the action and storytelling, and the expression of generative behavior which focus on individual and social objective of providing future generations. A high level of generativity has positive influence in elderly people. Method : This study was developed from Self-perception of Aging Study in the CASOENAC project, FONCICYT-94670 (EU-CONACYT). A cross-cultural study in western Mexico, with a sample of 1564 people aged between 60 and 108. The battery of self-perception of aging included a scale of generativity. Analysis was performed on SPSS program. Results : Mean age was 70.78±8.4, 51.7% female, 54.3% reported being married, 59.9%, only the 7.0 obtained an upper level degree, and 31.4% have elementary school. In average more people lives in the same household (3.2). The concern about generativity was associated with age (p=.019) social exclusion (p=.025) and educational level (p=.037), the doubts about generativity showed an associated with self-perfection of aging (p=.012), burden of society (p=.012), the identification with the age group (p=.007) and dissociation with age group (p=.000). Conclusion : In Mexico there were more doubts about generativity, which means that people are unsure of their contributions for the betterment of the community and whether they have passed on their knowledge and skills so that others will remember for a long time. Keywords : Generativity, Self-perception,

RISK FACTORS OF GERIATRIC DEPRESSION IN TAIWAN: A TEN-YEAR LONGITUDINAL STUDY

Hui-Wen LIN¹, Miao-Yu LIAO², Chi-Hua YEN³, Meng-Chih LEE¹ (1. *Department of Family Medicine, Taichung Hospital Department of Health; Insititute of Medicine of Chung Shan Medical University, Taiwan*; 2. *Department of Geriatrics, Taichung Hospital Department of Health; Insititute of Medicine of Chung Shan Medical University, Taiwan*; 3. *Department of Family Medicine, Chung Shan Medical*

University Hospital, Taiwan)

Introduction : Depression, one of the most common mental disorders among the geriatric population, is often used as an index of psychological health. This study aimed to identify the risk factors of depression among the elderly in Taiwan. Method : The data were drawn from the "Survey of Health and Living Status of the Elderly in Taiwan", a nationally longitudinal study launched in 1989. We recruited the community-dwelling respondents without depressive symptoms or disorders since 1993, and followed them over a ten-year period. Of the eligible 1,540 respondents, 535 and 142 individuals did not complete the follow-up in 2003 due to death and uncompleted interview, respectively. Depressive symptoms were assessed by the ten-item Center for Epidemiologic Studies Depression Scale (CES-D). Independent variables, including age, sex, education, marital status, living arrangement, poverty level, chronic diseases, physical functions, leisure activities, and mental support systems, were gathered at baseline in 1993. Multivariate logistic regression analysis was used to evaluate. Results : The 863 respondents completed the ten-year follow-up, and there were 304 individuals having the depressive symptoms, accounting for 35.2%. Our results revealed disability and being female were independent predictors for geriatric depression in Taiwan, and the OR was 8.74 (95% CI = 1.04~73.57) and 1.80 (95% CI = 1.28~2.51), respectively. Conclusion : The prevalence of depression among the elderly was very high in Taiwan according to our research. Furthermore, female gender and disability were the independent association factors for geriatric depression. Functional maintenance and health promotion to prevent further disability is the major issue dealing with the geriatric depression. Keywords : geriatric depression, disability

PP25 S-199

THE PREVALENCE OF DEPRESSION SYMPTOMS AND INFLUENCING FACTORS AMONG COMMUNITY DWELLING OLDER ADULTS IN KOREA

Jaesoon YOO¹, Hyun Sook KIM², Hyon-Jin YON³ (1. *Department of Nursing, Chungbuk National University, Korea*; 2. *Department of Social Welfare, Korea National University of Transportation, Korea*; 3. *Mental Health, Chungwon-gun Mental Health Center, Korea*)

Introduction : The aim of this study was to determine the prevalence of depression symptoms and influencing factors among community dwelling older adults in Korea. Method : Home-dwelling older adults living in three cities in one province of Korea (size: 833 from 3 different sample groups) were recruited as a model sample group of this study. A cross-sectional survey was conducted using face-to-face private interviews. The structured questionnaire that includes questions on descriptive characteristics and the Korean version of Geriatric Depression Scale-short form (GDS-SF) were administered to each older adult. A simple descriptive statistical method and multivariate regression were used to analyze 774 meaningful data screened out of all collected responses. Results : The prevalence of depression symptoms among the older adults in sample groups was 49.6%. The multivariate regression analysis revealed that influencing factors of the depression symptom were the level of life satisfaction, health status, experiences of stressful life events, ADL dependency, social support, and presence of chronic disease. The clients of customized home visiting health care service by public health center showed higher prevalence of depression symptoms than those of Kyong-Ro-Dang (community house for senior citizens) or the senior welfare center. Conclusion : This study shows that there are high levels of prevalence of depression symptoms in older adults. Especially, the clients of customized visiting healthcare service of public health center are high

risk group. Keywords : depression, Home-dwelling older adult

PP25 S-200

ALCOHOL CONSUMPTION AND COGNITIVE IMPAIRMENT AMONG KOREAN OLDER ADULTS: DOES GENDER MATTER?

Jiyoung LYU, Seungah Hannah LEE (*Gerontology Institute and Department, University of Massachusetts Boston, USA*)

Introduction : The purpose of this study was to examine the relationship between alcohol consumption and cognitive impairment among individuals aged 65 and older in South Korea. **Method :** The study sample was drawn from a nationally representative data set, the Korean Longitudinal Study of Ageing (KLoSA) wave 1. The final sample was subdivided into female and male groups, which consisted of 2,250 and 1,535 subjects, respectively. Cognitive impairment was measured based on the Korean version of the Mini-Mental State Exam (K-MMSE). The drinking status variable consisted of four categories (never drinker, past drinker, moderate drinker, and heavy drinker). **Results :** Adjusted for confounding variables, a multivariate analysis showed that compared to moderate drinkers past drinkers were more likely to be cognitively impaired for women, while never drinkers and heavy drinkers were more likely to be cognitively impaired for men. **Conclusion :** These findings suggest that there may be a curvilinear association between drinking patterns and cognitive function in later life, such that a moderate level of alcohol consumption may be associated with reduced risk of cognitive impairment. **Keywords :** alcohol, cognition, korean older adults

PP25 S-201

THE APPLICATION OF MMSE IN PREDICTION OF COGNITIVE DETERIORATION

Jui Hung LIN (*Psychiatry department, Taichung Veterans General Hospital, Chia-Yi Branch, Taiwan*)

Introduction : Cognitive deterioration is common observed phenomenon. Many factors are supposed to be related to this situation. This study focused on demographic information and medical condition to determine what factors could be the predictor for cognitive deterioration in the elderly. **Method :** Two hundred and twenty four elderly in the veteran nursing home were included in a 2-year follow-up study from 2010 to 2011. Demographic information including education and medical records were reviewed. Mini-mental status examination (MMSE) was performed for cognitive evaluation at the same time. Descriptive statistics, and liner regression was performed for further analysis. **Results :** The average age in this study population is 83.63 years old. (SD=7.04). The elderly with higher education level (Above junior high school, n=60, 26.8%) had higher MMSE score (21.83 versus 18.87, p<0.01). The average decline of the MMSE score is 0.78 (SD=3.47) after 1-year follow-up survey. The age, education, baseline MMSE, systemic disease (Hypertension, stroke, diabetes, COPD, dementia) were under considered, the linear regression indicated that only baseline MMSE and dementia could predict further decline in cognitive function. (R=0.288, p<0.01). **Conclusion :** The MMSE scores could be the predictor for cognitive deterioration. The worse of MMSE score is, the poor cognitive function found in follow up. To sum up, it is important for physician to take the MMSE score as regular tools in cognitive screening. **Keywords :** Cognition, MMSE,

THE RELATIONSHIP BETWEEN MENTAL DISTRESS AND INDIVIDUAL-LEVEL COGNITIVE SOCIAL CAPITAL AMONG COMMUNITY-DWELLING ELDERLY ADULTS

Koji FUJITA, Yoshihiro KANEKO, Yutaka MOTOHASHI (*Department of Public Health, Akita University Graduate School of Medicine, Japan*)

Introduction : This study examines the relationship between mental distress and individual-level cognitive social capital among community-dwelling elderly adults. **Method :** We conducted a population-based cohort study, using self-administered questionnaires, in a rural community in Akita, Japan (population aging rate: 34.8%). The baseline survey was conducted for all residents aged 30 and over in July 2010, and the follow-up survey was conducted in August 2012. Responses to the follow-up survey were obtained from 1,018 of the 1,808 respondents of the baseline survey who were aged 65-89 years at baseline (follow-up response rate: 56.3%). Mental distress was assessed using the 6-item Kessler Psychological Distress Scale (K6). Scores on K6 ranged from 0 to 24, and scores of 9 and over signified psychological distress. Cognitive social capital (CSC) was assessed using the 5-item Social Capital Scale (Motohashi and Kaneko), and scores falling in the 1st quartile on this scale indicated low CSC. Logistic regression analysis was used to examine effect of low CSC on mental distress, adjusting for potential confounders. **Results :** Of the 866 subjects without mental distress at baseline, 65 (7.5%) had mental distress at follow up. Multiple logistic regression analysis adjusted for age and sex revealed that the adjusted odds ratio of low CSC vs. high CSC for mental distress was 4.71 (95% CI: 2.30-9.62). **Conclusion :** Low individual-level cognitive social capital is a risk factor for mental distress among community-dwelling elderly adults. **Keywords :** mental distress, cognitive social capital

PP25 S-203

THE EMOTIONS AND VARIABILITY OF THE CARDIORHYTHM: SOME ASPECTS OF NEURO-PSYCHOLOGY OF TEMPERAMENT

Nataliia PROKOPENKO (*Social Gerontology, State Institute of Gerontology of the Ukrainian Academy of Medical Sciences, Ukraine*)

Introduction : We studied peculiarities of the autonomic reactions related to emotional experiences in persons with different characteristics of their individuality. **Method :** During emotional tests, cardiointervalographic indices of the subjects were examined. The following properties of the individuality were taken into account: extraversion/introversion (temperament parameter), externality/internality (characteristic of the locus of psychological self-control), extrapunitivity/ intropunitivity (characterological feature manifested in frustration situations). **Results :** Sympathico-parasympathic influences were more powerful than central influences in regulation of the cardiorhythm in tested subjects with clearly "externally directed" reactions to emotiogenic factors (extraverts, externals, and persons with an extrapunitive type of reaction). Vice versa, shifts of the autonomic balance toward activation of the sympathoadrenal link, relatively low efficacy of baroreflex regulation, and strain of regulatory systems of the organism were observed at a high level of introversion in examined persons. Physiological adaptation to the action of the various stressors, including the emotional ones, is realized mostly by the system cerebral cortex - hypothalamus - hypophysis - adrenal cortex. In turn, the release of adrenalin by adrenal glands activates the reticular formation and, via this structure, the hypothalamus and cerebral limbic system. **Conclusion :** Thus, it can be supposed that extraverts are characterized by higher thresholds of the emotional sensitivity, which correspond to a higher threshold of activation of the reticular formation and more intense inhibitory cortical influences upon subcortical formations. This is why extraverts manifest weaker, in general, activation of the

regulatory mechanisms of the cardiovascular system after the influence of extero- and interoceptive stimuli, while in introverts such activation is more intense. Keywords : temperament, emotions, variability of the cardiorythm, limbico-reticular system

PP25 S-204

THE RELATIONSHIP BETWEEN PHYSICAL FUNCTION AND WELL-BEING FOR THE ELDERLY

Sheng-Te LIN¹, Ming-Hung CHEN¹, Ming-Yueh CHOU¹, Chih-Kuang LIANG² (1. Department of Recreation Sport and Health Promotion, National Pingtung University of Science and Technology, Taiwan; 2. Geriatric Medicine Center, Kaohsiung Veterans General Hospital, Taiwan)

Introduction : The purpose of this research was to investigate the relationships between physical functional and well-being of the elders. Method : A total of 323 elderly people who were over 65 years old and lived in Veterans Home were chosen as the research subjects in this study. All of the respondents had to take the functional fitness test designed for elderly people. Then completed the psychological well-being questionnaire, which included three parts: 1) active participation; 2) unstable relationships; and 3) past roles. Results : The test item of right hand grip, 2-min step, chair sit-and-reach, single standing stance-eyes open, 3m up-and-go and 6m walk, the older the respondents, the worse their test results. The test results of the left hand grip, 30-s chair stand and back scratch test were relatively worse when the respondents were more than 90 years old. The overall sense of psychological well-being showed a significant positive correlation with the left hand grip, right hand grip, chair sit-and-reach, single standing stance-eyes open, 30-s chair stand and number of 2-min step. And a significant negative correlation with the seconds of 6m walk. Conclusion : The physical function of the respondents in this study is generally low. Nonetheless, the research results show that the better the physical function and the higher the life satisfaction, the higher the participation and the higher the overall sense of psychological well-being. Keywords : elderly, physical function, well-being

PP25 S-205

QUANTITATIVE ANALYSIS ON LITERATURES ABOUT COGNITIVE AGING STUDY IN CHINA IN THE LAST 30 YEARS

Shiyong XIA (Beijing Normal University, China)

Introduction : Objective To describe the cognitive aging study in China in the last 30 years. Method : Quantitative analysis in 244 articles was used via indexes like percentage, frequency, etc. Results : ①One third of the papers focused on memory, which was the main concern of cognitive aging research; ②The cognitive aging mechanisms had gradually become focus area in the last decade; ③Cooperative research had become the trend; ④More than 90% subjects came from city, whereas little from rural areas. Conclusion : It is necessary to develop more collaborative researches between institutions and regions, To resolve problems with society aging, more researches on cognitive aging mechanisms and interventions should be developed. Keywords : cognitive aging; quantitative analysis

PP25 S-206

PREDICTING MODELS OF THE DEPRESSION AND LIFE SATISFACTION AMONG THE MIDDLE AGED AND YOUNG OLD IN KOREA

So Jin LIM¹, Seongyeon AUH², Sun Ah PAIK¹, Jeeun KIM¹, Bo Ryeom SEO¹, Yoon Ji LEE¹, Ji Hae LEE¹, Kwangdeok BYEON¹ (1. Dept. of Family Studies, Chung-Ang University, Korea;

2. Dept. of Family Welfare, Chung-Ang University, Korea)

Introduction : The purposes of this study were to examine the predicting variables of depression and life satisfaction among the middle aged and young old in Korea. Method : To accomplish the goals, the survey data drawn from a randomly selected 649 convenient sample during the period of January and February, 2011, were analyzed with SPSS attempting the correlations and hierarchical multiple regression on the depression (study1) and the life satisfaction (study2). Results : Results from Study1. The education was the robust predicting variable of the depression as the model proceeded. With the education and assets, in the final stage where we examined the influences from the environmental contexts, housing satisfaction, satisfaction on the retirement provisions, and satisfactions on the neighborhoods were the significant predictors of individual's depression. Results from Study2. In the predicting model of life satisfaction, education and homeownership were the significant predictors at the first stage, and at the second stage, education, age and satisfaction on the retirement provisions were significant variables whereas the effect from homeownership was faded away. At the final stage, education, satisfaction on the retirement provisions, satisfaction on the housing, and the satisfaction on the neighborhood were the significant predictors. Conclusion : Based on the results from this study, some policy implications were discussed to enrich the lives among the middle aged and young olds in Korea. Keywords : life satisfaction, depression, middle aged and young old

PP25 S-207

ADJUSTMENT TO AGING, AGE REPRESENTATION AND SUBJECTIVE AGE: ANALYSING LATENT CONSTRUCTS FOR OLDER ADULTS

Sofia VON HUMBOLDT, Isabel LEAL (Research Unit in Psychology and Health, R&D, ISPA-Instituto Universitario, Portugal)

Introduction : Aims: To investigate latent constructs that can act as major determinants in the adjustment to aging (AtA), age representation (AR) and subjective age (SA), and to explore relations between these constructs in an older adults cross-cultural population. Method : Methods: Measures were completed using a variety of culturally appropriate methods, including demographics and interviews. Complete information on 33 older adults aged between 74-101 years (M=86.2; SD = 5.4) from eight different nationalities, was available. The data was subjected to content analysis. Representation of the associations and latent constructs were analyzed by a Multiple Correspondence Analysis (MCA). Standardized instruments measured regular cognitive abilities. Results : Results: Findings showed a model for each pre-category. SA was explained by a two-factor model: 'age-cautious' and 'young-at-heart'. A three-dimension model formed by 'maximizers', 'optimizers' and 'essentialists' was indicated as a best-fit solution for AtA, and AR was best explained in a three-dimension model by 'past-oriented', 'present-oriented' and 'future-oriented'. AtA is shown to bear associations with individuals' SA and AR in a model composed by 'enjoyers', 'engaged', 'regardful' and 'conciliated'. Conclusion : Conclusions: AtA is related to SA and AR in older adults. Enhancing AtA on shared perceptions of SA and AR might be an important target to improve older adults' interventions' outcomes in aging well. Keywords : Key Words: Adjustment to Aging, age representation, older adults, subjective age, latent constructs.

PP25 S-208

TRAJECTORIES OF WELL-BEING AMONG OLDER ADULTS IN TAIWAN

Yu-Jing GAO (Department of Psychology, Fu Jen Catholic University,

Taiwan)

Introduction : Emotional support is considered to be an important factor to successful aging. A large body of research has documented significant association between social support and well-being among elderly (Merz & Consedine, 2009). But less studies explored this issue adopting a developmental perspective. Hence, the contribution of emotional support to the developmental trajectory of well-being in Taiwanese elderly from 1999 to 2007 was examined. **Method :** Data were taken from the "Survey of Health and Living Status of the Elderly in Taiwan". Well-being was constituted by the absence of negative affect, the presence of positive affect and life satisfaction. Emotional support was measured by four items such as the degree to which family/relatives/friends care about you and so on. The data analysis was conducted using Mplus 5.0. **Results :** The results indicated a good model fit for the growth model (CFI=.94 and TLI=.92; RMSEA=.03 and SRMR=.08). In an initial stage, a negative relationship between age and well-being was found ($\beta = -.14, p < .01$). With time passing, the level of well-being at the baseline was correlated with the slope of well-being negatively ($\beta = -.42, p < .05$). And the result demonstrated that emotional support contributed to elders' well-being at each wave ($\beta = .51, p < .001$; $\beta = .47, p < .001$; $\beta = .42, p < .001$, respectively). **Conclusion :** With a decreasing trend of elders' well-being in Taiwan, the trajectory of well-being of Taiwanese older adults were confirmed to be promoted by their emotional support. This result is similar to previous findings (Reinhardt, Boerner, & Horowitz, 2006). As a supportive evidence of SST (Carstensen, Fung, & Charls, 2003), old people regulate their social goals to gain emotional support and enhance their well-being. **Keywords :** Trajectory analysis, Well-being, Taiwan

PP25 S-209

AN INNOVATIVE PRACTICE OF NON-FORMAL LEARNING FOR ELDER ADULTS

Lingjie FANG, Dan TANG (*The School of Sociology & Population Studies, Renmin University of China, China*)

Introduction : This was a study involving older adult learners who participated in Non-formal learning through their university courses and research practice. This research was to evaluate the Elder Learning Research Project 2011-2012 which was an innovative program to encourage elder adults to learn how to do academic research in the Elder Academy at Lingnan University in HK. **Method :** This study utilized a qualitative approach to find out the effects of the Elder Learning Research Project. Several sessions of focus group discussions were organized to serve as a primary component of the study. Depth-interviews and literature research were used as supplementary methods of this research. **Results :** The Elder Learning Research Project was an effective model for elder adults to gain academic research knowledge and other learning skills. It promoted the happiness of participants through team cooperation, boosted the sense of worth of the elders, enhanced the willingness of life-long learning, and facilitated the social participation of the elder learners. **Conclusion :** The elder participants' successful completion of their research indicated that the elder adults truly had potential to develop their cognitive capacities. They showed that they were capable of achieving high levels of intellectual complexity and acquiring advanced ways of knowing if they were provided the opportunities. This research shows that elder adults can still be productive citizens in our communities. **Keywords :** elder learning, nonformal-learning, elder academy

PP25 S-210

UNDERGRADUATE TEACHING IN GERIATRIC MEDICINE USING COMPUTER AIDED LEARNING IMPROVES STUDENT PERFORMANCE IN EXAMINATIONS

Laura DAUNT¹, Patience UMEONUSULU¹, John GLADMAN¹, Adrian BLUNDELL¹, Simon CONROY², Adam GORDON¹ (*1. Health Care of the Older Person, Nottingham University Hospitals NHS Trust, Queen's Medical Centre, Derby Road, Nottingham NG7 2UH, United Kingdom; 2. Health Care of the Older Person, Clinical Sciences Building, Leicester Royal Infirmary, Leicester, LE1 5WW, United Kingdom*)

Introduction : Computer Aided Learning (CAL) is increasingly used to deliver teaching, but no studies have evaluated its impact on learning within geriatric medicine. At the Universities of Nottingham and Leicester, we have developed and implemented CAL packages on falls and continence, and evaluated the effect on student performance. **Method :** Traditional ward based and didactic teaching was replaced by CAL packages; either as a compulsory exercise prior to an interactive session (Nottingham); or as a link to supplement learning (Leicester). Examination scores were compared for cohorts of medical students receiving traditional learning and those receiving blended learning (CAL package combined with traditional teaching methods). Control questions were included to provide data on cohort differences. **Results :** In both Nottingham and Leicester, scores were significantly better in the blended learning group ($p < .01$), and a smaller number of students achieved low scores. There was a trend towards some of the improvement being a cohort effect, but this did not achieve significance (Nottingham $p = 0.051$, Leicester $p = 0.752$ respectively). Feedback from students about the CAL packages was positive, although uptake rates where CAL was non-compulsory were less than fifty percent. **Conclusion :** At both university sites, blended learning was associated with a significant improvement in student exam performance, regardless of the setting or the methods adopted, and without increasing teaching time. In addition, CAL was well received by students. Our findings support the use of CAL in teaching geriatric medicine and this method has been adopted for teaching other topics in the undergraduate curriculum. **Keywords :** Computer, Learning, Education

PP25 S-211

MULTIDISCIPLINARY GERONTOLOGY EDUCATION OUTCOMES: A SYSTEMATIC REVIEW

Barbara B. COCHRANE¹, Nancy R. HOOYMAN² (*1. School of Nursing, University of Washington, USA; 2. School of Social Work, University of Washington, USA*)

Introduction : Goals for education in aging include increasing knowledge and competencies; improving attitudes; and attracting students into aging-related fields. Research evidence documenting these student outcomes is needed to guide the development of higher education offerings that address demographic trends in aging. The University of Washington Elder-Friendly Futures Initiative, guided by faculty from Nursing, Social Work and Pharmacy, includes innovative strategies for enhancing university systems and educational programs that prepare students for an aging society. A systematic review of gerontology education research was undertaken to inform these strategies by identifying curricular components associated with improved student outcomes. **Method :** Full issues of gerontology education journals were reviewed and key bibliographic databases searched using the terms gerontology, geriatrics, aging, and older adults concatenated with education, curriculum, and training. Abstracts from these sources were evaluated to identify research articles in the past ten years on higher education programs and curricular offerings

with gerontology or geriatrics content that documented student outcomes. Information was compiled into an evidence table outlining the following study components: offering type, student characteristics, study design, and outcomes. Results : Although over 100 articles met review criteria, most involved limited program evaluations of knowledge and attitude change. Long-term outcomes and educational impact on aging-related career choice and retention were rarely measured. Additionally, few multidisciplinary or interprofessional educational offerings were evaluated. Conclusion : There is limited outcomes-based evidence to guide or sustain gerontology educational offerings. Given current aging trends and fiscal pressures in higher education, such evidence is urgently needed to support effective gerontology curricula. Keywords : Higher Education, Education Outcomes, Systematic Review

PP25 S-212

MOBILIZING THE LBGTT SENIORS GROUP TO PROVIDE DIVERSITY TRAINING TO THE COMMUNITY

Deana JOHNSON¹, Chris RABIDEAU² (1. West Region, Ontario Network for the Prevention of Elder Abuse, Canada; 2. Artistic Director, Windsor Pride, Canada)

Introduction : This paper will explore the strategies used to bring education and understanding to the community related to the struggles and experiences of LBGTT seniors. Through the sharing of this information it is expected that the general public and, for example, health service agencies will receive diversity training in a powerful and creative way. The 50+ Proud committee produced a book of personal stories, 'Out and Aging', that gives a glimpse at the history of LBGTT lives, aging in the community. Using excerpts from the book, diversity training was provided to social service and health agencies. Of special concern was that older members might go 'back into the closet' if they felt unwanted and un-included in life in the Long-Term Care Facility. To further the discussion and education, a one-act play ('Our Stories, Our Hope: A Living Library') was developed, produced and performed at a community theatre. This Social Justice play was used as a tool to affect social understanding and change. This was an opportunity to reveal even more of the history, in a non-threatening, visceral manner. The Play itself and the making of the Play were videotaped in a documentary that emphasizes the importance of not only the end product but the process used in its development. These strategies were part of a total community effort to enhance inclusivity. Method : Community education including the production of a book, diversity training, the production of a play and development of a documentary. Results : Products developed. Conclusion : Diversity training was enhanced. Keywords : LBGTT seniors education

PP25 S-213

ELDERCARE TRAINING IN THE CHURCH

Elaine Chi-Ling PANG (Research and Development, Educational Services Exchange with China, Inc. (ESEC), USA)

Introduction : Religious organizations are increasingly recognized as valuable resources for care and services to the growing elderly population. In many parts of the world, Christian churches are collaborating with government and private eldercare programs. Training of caregivers has become an important part of this effort. This study investigates training programs among the churches in China and in the United States. Method : This study is based on development and implementation of eldercare training programs in China and in the United States during the last 15 years, and research in the literature. Eldercare training programs included curriculum development, workshops, conferences, symposia and retreats conducted through

exchanged programs between church leaders in China and the United States. Results : This investigation shows that, in China, when the government began to encourage religious organizations to provide social services, the churches took the initiative to provide eldercare by adapting traditional family care to organized care. Training of caregivers followed. From basic eldercare training in the beginning, to-day's eldercare training has advanced to including the latest technologies and senior housing management. The churches in the United States appeared to follow a reversed trend. Senior citizens historically received government support and care provided by private and non-profit agencies, with little church involvement; but the approaching "age wave" and economic instability recently propel the churches to participate in integrated public eldercare programs. Conclusion : Within the boundaries of organized religion, the pedagogical input from leaders in the fields of aging can create programs that benefit elders in communities around the world. Keywords : Eldercare , Training, Churches, China, United States

THE FEASIBILITY OF INTRODUCING 'AGE-FRIENDLY PRIMARY HEALTH CARE CENTRES TOOLKIT' IN JAPANESE PRIMARY HEALTH CARE SETTING

Hiroto YAMANASHI¹, Morito KISE², Machiko INOUE³, Yoko SUNAGA⁴, Hiroshi TAIRA⁴, Akira TAKAYANAGI⁵, Miwako TAKAMURA⁶, Koya ARIYOSHI⁷ (1. Clinical Medicine, Tropical Medicine, Department of Clinical Medicine, Institute of Tropical Medicine, Nagasaki University, Japan; 2. Family Medicine, Kuji Clinic, Japanese Health and Welfare Co-operative Federation, Japan; 3. Epidemiology, Teikyo University, Japan; 4. Family Medicine, Torimachi Clinic, Japanese Health and Welfare Co-operative Federation, Japan; 5. Family Medicine, Maebashi Kyoritsu Clinic, Japanese Health and Welfare Co-operative Federation, Japan; 6. Primary Care Clinic, Japanese Health and Welfare Co-operative Federation, Japan; 7. Clinical Medicine, Tropical medicine, Department of Clinical Medicine, Institute of Tropical Medicine, Nagasaki university, Japan)

Introduction : The World Health Organization (WHO) assumes Primary Health Care (PHC) plays the important role to promote health of elderly people in all over the world, and that Primary Centres and should adapt to what elderly people need. WHO had issued an "Age-Friendly Primary Health Care Toolkit" (Toolkit) in 2008, to assist PHC in preparing for the rapid ageing of the population, in order to promote "active ageing". Although Japanese society is highly aged, the quality of the elderly care provided is considered variable. The Japanese Health and Welfare Co-Operative Federation (JHWCF) has launched a project to implement and disseminate Toolkit in Japanese PHC setting. Method : JHWCF translated and published the Japanese version of Toolkit. We made a committee, and the implementation method of Toolkit was selected to be workshop (WS) style. We also prepared the manual to make each participants conduct WS easier. From 2009 to 2012, 62 clinics participated this program. During implementing WS, clinic leaders were required to submit a process evaluation sheet after each WS. We provide the periodic annual conference. Results : Total 38 PHC clinics (out of 62) in 2012 completed the program. The feedback from clinic leaders suggested that the program provided the opportunities to discuss issues of elderly care with multidisciplinary staff and to raise awareness of improvement of quality among participants. However, the achievement degree varied a great deal in each clinic. Conclusion : Implementing Toolkit has feasibility in Japanese PHC clinics under the support of the introduction manual, and a follow-up system. Keywords : Active ageing, Age-Friendly Primary Health Care Centres

Toolkit, Comprehensive Geriatric Assessment

PP25 S-215

EFFECT OF ILLITERACY LEVEL ON LANGUAGE TASKS IN KOREAN ILLITERATE ELDERLY

Jungwan KIM¹, Jihye YOON², Hyanghee KIM³ (1. Department of Speech and Language Pathology, College of Rehabilitation Sciences, Daegu University, Korea; 2. Department of Speech Pathology and Audiology, College of Natural Sciences, Hallym University, Korea; 3. Graduate Program in Speech and Language, Department and Research Institute of Rehabilitation Medicine, Yonsei University College of Medicine, Korea)

Introduction : In Korea, illiteracy rates in elderly are high. Neuropsychological assessment of elderly with literacy problems is a difficult task that requires both to know the effects of literacy on language competence, and to use specific and standardized tools in this population. Thus, we studied the effects of illiteracy level on language tasks. **Method :** We compared the performance of language tasks of healthy elderly who were pure illiterate (n=34, mean age=78.91), with those who were functional illiteracy (n=24, mean age=77.71), and semi-literacy (n=83, mean age=77.2). Tasks included the Mini-Mental Status Examination (MMSE), the animal naming test (30 sec), brief-Boston naming test (15 item), verb naming test (12 item), ASHA-FACS(functional communication), sentence comprehension (12 item, 1/4 choice) and the attention task.(each 3 level: sustained, selective, and divided attention, 3 point scale). **Results :** In the between-group analyses, the scores of the MMSE, the animal naming test, and brief-Boston naming test could distinguish the functional illiteracy and semi-literacy from pure illiterate. In the multiple regression analyses, we found that illiteracy level was a better predictor of language ability than was years of education. **Conclusion :** These findings suggest that the impact of illiteracy level on language tasks performance is an important aspect of cognitive-communication evaluations for elders. Thus, the analysis of illiteracy can significantly increase the understanding about brain organization of cognition under normal and abnormal conditions. **Keywords :** illiteracy, language ability, elderly

PP25 S-216

A LONGITUDINAL STUDY OF LIFE SATISFACTION AMONG ELDERLY FARMERS IN TAIWAN: LIFESTYLE AND ACTIVITY PARTICIPATION

Ju-Ping LIN, Chia-Wen YU (Human Development and Family Studies, National Taiwan Normal University, Taiwan)

Introduction : Although there is abundant research on life satisfaction among older people, few studies specifically focused on life satisfaction among elders retired from agriculture. This population faces multiple difficulties related to living and aging in rural area (limited access to services and practitioners). However, these difficulties may be counter-balanced by advantages related to healthier lifestyle and richer social support. This study is aimed at exploring the lifestyles and activities participation of retired farmers, as well as at examining the effect of some influential factors and their relationships with life satisfaction. **Method :** In partnership with nine farmers' organizations, this study included 306 participants (aged 65 and over), were recruited from the "Farm Retirement Scheme" (Council of Agriculture, Executive Yuan, 2009). The study started in 2009, with two follow-up visits over 3 years. Data were gathered by means of an interview that included activities participation and life satisfaction (by applying the Life Satisfaction Index A, LSIA). **Results :** The freedom after retirement gave farmer opportunity to create a new lifestyle. For the retired farmer, the purpose of agricultural activities in life was

changed from the economic activities of the past into leisure activities. Family involvement predicts a high life satisfaction. Moreover, participation in educational activities relates positively and significantly to life satisfaction. **Conclusion :** The results of this study support the activity theory, and enhance understanding of the role of activity participation in achieving a high level of life satisfaction among retired farmers. **Keywords :** life satisfaction, elderly farmer, activity participation

PP25 S-217

FACTORS INFLUENCING NURSING STUDENTS' IMAGE OF AND COMMUNICATION WITH DEMENTED ELDERLY PERSONS

Nobuko AIDA¹, Mika MIURA², Hiroshi GOHMA³, Shin-Ichi SUGIURA³, Yoko NAGAYA⁴, Naoko KOBAYASHI⁵, Akemi OGATA⁶ (1. Graduate School of Medicine (Health Sciences), Nagoya University, Japan; 2. Department of Nursing, Seirei Hamamatsu General Hospital, Seirei Social Welfare Community, Japan; 3. Graduate School of Medicine, Nagoya University, Japan; 4. Department of Nursing, The National Hospital for Geriatric Medicine, National Center for Geriatrics and Gerontology, Japan; 5. School of Nursing, Japanese Red Cross Toyota College of Nursing, Japan; 6. Department of Nursing, Association Medical Corporation MEISHOKAI, Total Support Clinic, Japan)

Introduction : We administered an anonymous, self-report questionnaire to a total of 120 first- and fourth-year nursing students (response rate, 73%) in order to elucidate factors influencing their image of demented elderly persons as well as their communication with them and thereby obtain suggestions for approaches to education regarding basic nursing for elderly with dementia at our university. **Method :** The method was used an anonymous, self-report questionnaire, and the study was approved by the Nagoya University School of Medicine Life Ethics Committee School of Health Sciences. **Results :** Compared to first-year students, fourth-year students had a significantly greater knowledge of the general facts of aging (FAQ), but also had a significantly stronger image of demented elderly persons as having "loss of independence" and "psychiatric disorders". No significant differences between grades were observed for characteristics of communication settings involving demented elderly persons. Approximately 10% and 50% of students in both grades engaged in "questioning/cross-examination/inquiry" in settings simulating elderly residents' lifestyle, and "explanation/persuasion/encouragement" in settings simulating medical settings, respectively. The explanation/persuasion group and questioning/cross-examination group in regard to communication settings involving demented elderly persons had a large variation in their image of demented elderly persons, and students with a weak image were thought to lack not only knowledge of dementia, but also opportunities to interact with elderly individuals. **Conclusion :** Based on the above, we discussed the necessity of practical training in lifestyle and medical settings using elderly patients with dementia as subjects, as well as the importance of specialized nursing role models for demented elderly persons. **Keywords :** dementia, nursing student, image, communication

PP25 S-218

LEARNING OUTCOMES IN THE EDUCATION OF NURSING FOR OLDER PEOPLE - A SCOPING REVIEW

Sanna KOSKINEN, Leena SALMINEN, Helena LEINO-KILPI (Department of Nursing Science, University of Turku, Finland)

Introduction : The education of nursing for older people and its research are expected to meet for their part the increasing service

demands in a high-quality manner. Learning outcomes are realized when nursing students move on to the labour market. Today, older people nursing is not the highest priority among students for a career. In this study, we analysed published empirical studies about the education of nursing for older people and especially learning outcomes to find out the main research areas. Method : Scoping literature review was conducted. Three electronic databases (MEDLINE, CINAHL, ERIC) were searched. The retrieval process was systematically conducted by two researchers applying inclusion and exclusion criteria. Finally, 56 articles were included in the analyses. Results : Learning outcomes is one of the main research areas in the education of nursing for older people. In these studies, students' attitudinal views and knowledge were dominant topics. For attitudinal views, studies were concerned with students' perceptions, feelings, views and attitudes towards older people and ageing. Studies about students' knowledge covered topics like common geriatric conditions, gerontology and ageing. Students' clinical skills were less studied. For clinical skills, topics like students' ability to communicate and reminisce with older people and their cultural skills were studied. Conclusion : Knowledge about the learning outcomes seems to be limited. Required knowing for providing nursing care for older people might be under-recognized, when it also becomes difficult to define what learning outcomes to study. There is a risk that this leads students not to find older people nursing as a diverse speciality. Keywords : education, nursing students, older people

PP25 S-219

ERROR PATTERN ANALYSIS IN VERBAL FLUENCY TASK IN THE NORMAL ELDERLY WITH DIFFERENT EDUCATION LEVELS

Hyang Hee KIM¹, Seon Ha LEE² (1. Graduate Program in Speech and Language Pathology, Department of Rehabilitation Medicine, Yonsei University College of Medicine, Korea; 2. Graduate Program in Speech and Language Pathology, Yonsei University, Korea)

Introduction : Error patterns (i.e., intrusion, perseveration) in semantic fluency task have been found to be sensitive to cognitive status. The purpose of this study was to investigate the influence of educational levels on the error patterns of the animal naming task for old adults. Method : The sample included 71 old adults, ranging from 65 to 87 years (M = 74.9 ; SD = 5.9) and they were stratified into four educational groups (group 1: 0 year; group 2: 6-8 years; group 3: 9-11 years; and group 4: more than 12 years). All subjects scored within the normal range (M = 26.4 ; SD = 2.2) on the MMSE. The total number of errors was counted and error patterns were divided by intrusion and perseveration. Results : Results showed that the number of total errors during the entire 30 s was significantly different between group 1 and group 4 (p= .029). Perseveration errors were more observed than intrusion errors. In addition, perseveration errors were more observed in group 1 and group 2 than in group 3 and group 4. Conclusion : Groups 1 and 2 are low-educated groups compared with groups 3 and 4. Low-educated groups have less stable semantic network systems and lower working-memory capacities than high-educated group. Thus, Groups 1 and 2 make more perseveration errors and seem to have difficulty in controlling the suppression of previously recalled items. Keywords : verbal fluency task, error pattern, perseveration error

PP25 S-220

THE EFFECT OF MULTIFACTORIAL INTERVENTION PROGRAMS (MUFIPS) ON HEALTH BEHAVIOR AND SYMPTOMS CONTROL AMONG COMMUNITY-DWELLING OVERWEIGHT OLDER ADULTS WITH KNEE

OSTEOARTHRITIS

Yuwadee SARABOON¹, Suparb AREE-UE², Suchinda Jarupat MARUO² (1. Ramathibodi School of Nursing, Faculty of Graduate Studies, Mahidol University, Thailand; 2. Ramathibodi School of Nursing, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Thailand)

Introduction : The purpose of this study is to examine the effect of Multifactorial Intervention Programs (MUFIPs) on osteoarthritis knowledge, illness representation, and health outcomes in terms of health behavior, knee pain, physical ability, joint range of motion, and body weight in overweight older Thais with knee osteoarthritis. Method : Eighty older Thais with knee osteoarthritis living in communities (mean age of 67.41 ± 6.70 years), whose body mass index between 23 and 29.9 kg/m², were randomly equally assigned into two groups. The intervention group received MUFIPs including health education, weight reduction / control program, quadriceps exercise training class-based sessions followed by home-based exercise program, and home visit program. In relation to the control group, participants received a telephone health counseling if they had any health problem. The changes in osteoarthritis knowledge, illness representation, and health outcomes were assessed at baseline and 8-week follow-ups. Data were analyzed by using descriptive and independent t-test analyses. Results : Findings revealed that the participants in the intervention group had significant improvement in osteoarthritis knowledge, illness representation, health behavior, physical ability, joint range of motion and reduction in knee pain and body weight after enrollment compared with their initial status. Additionally, there was a statistically significant difference in study variables, except body weight, when compared between the intervention and control groups. Conclusion : The MUFIPs shed in light in the improvements in health outcomes in overweight older Thais with knee osteoarthritis, which break down the progression of the disease among these persons. Keywords : Multifactorial Intervention Programs; overweight older Thais; knee osteoarthritis

PP25 S-221

LEADERSHIP AND PERSON-CENTEREDNESS - IMPORTANT FACTORS OF JOB STRAIN AND STRESS OF CONSCIENCE AMONG NURSE ASSISTANTS' WORKING IN RESIDENTIAL CARE

Anneli ORRUNG WALLIN¹, Ulf JAKOBSSON², Anna-Karin EDBERG³ (1. Department of Health Sciences, Lund University, Sweden; 2. Center for Primary Health Care research, Faculty of Medicine, Lund University, Sweden; 3. Department of Health and Society, Kristianstad University, Sweden)

Introduction : It is important to investigate the job strain and stress of conscience (SC) of NAs not only for the sake of nurse assistants (NAs), but also due to the impact on the quality of care they provide. Thus, the aim of this study was to investigate job strain, SC and associated variables among NAs working in residential care. Method : NAs (n=225) completed questionnaires, including job strain, SC and potentially associated variables. The variables were compared concerning high and low job strain and SC and were explored with multiple linear regression analyses. Results : Organisational and environmental support, personalised care provision and, a positive caring climate were associated with low job strain and SC as well as NAs receiving a supportive leadership. In addition, having compulsory schooling in comparison with upper secondary schooling was associated with low job strain and SC. Factors related to health complaints and work-related information were associated with high job strain and SC. Conclusion : Exploring and adopting a broader

perspective of factors which are connected to strenuous aspects of NAs' work situation in residential care are important for the provision and management of nursing-care. In order to ensure the wellbeing of NAs and in turn the quality of care, both the NAs and their leaders need to be addressed simultaneously. Person-centeredness concerns the actual care-provision and the care climate which need to be implemented into the care system/care philosophy. This highlights the importance of the leaders' role as crucial when implementing or sustaining person-centred care in residential care for older people. Keywords : job strain, stress of conscience, residential care

PP25 S-222

RELATIONSHIP BETWEEN WORKING MOTIVATIONS AND THE MECHANISM OF SUBJECTIVE WELL-BEING OF JAPANESE ELDERLY PEOPLE

Hiroto MUROHASHI¹, Ikuko SUGAWARA², Naomi YATOMI¹, Kouji SHIBASAKI¹, Katsuya IJIMA¹, Nobuhiro MAEDA¹, Yoshihiko SATO¹, Hiroko AKIYAMA¹, Jun GOTO¹, Yuichi HIROSE¹, Mikihiro OIDA¹, Tetsuo TSUJI¹, Minoru KAMATA¹ (1. Institute of Gerontology, The University of Tokyo, Japan; 2. Institute of Social Science, The University of Tokyo, Japan)

Introduction : Working in the neighborhood is drawing attention as a method to encourage elderly people's social participation. It is also expected to promote physical and mental health in older age. In this study, we examined the elderly people's motivations for working, the mechanism of older people's subjective well-being, and their association to obtain basic knowledge to facilitate elderly working. Method : The researchers conducted an attitude survey on Japanese older people aged 60 or over who participated in seminars about elderly working. With respect to motivations for working, older persons rated the importance of eight motivations in 5-point scale. With respect to subjective well-being, elderly people gave scores to their satisfactions with nine aspects of life from 0 to 100. Results : Elderly people's motivations for working were revealed to be grouped into three different categories; accomplishment and compliment, contribution to others, and healthy and social life. Subjective well-being for whole life was verified to be affected by satisfactions with one's mood, relationship with family, relationship with friends and economic condition. In addition, some of the effects on whole life satisfaction were confirmed to vary with the levels of motivations for working. Conclusion : It was confirmed that the older people's motivations for working and the mechanism of subjective health have much in common with those of general adult, but they are not perfectly-equal. If one considers the moderator effect of working motivations for the mechanism of subjective health, elderly working can enhance participants' quality of life more efficiently. Keywords : elderly working, working motivation, subjective well-being

PP25 S-223

CONSTRUCTING A JAPANESE VERSION OF NVQ: SELECTION PROCESS AND VALIDITY TEST OF SKILL ASSESSMENT ITEMS FOR CARE STAFF

Takako TSUTSUI¹, Sadanori HIGASHINO², Masaaki OTAGA³, Alexis COTTENCIN¹, Sumie TSUTSUI³ (1. Department of Health and Social Services, National Institute of Public Health, Japan; 2. School of Management and Information, University of Shizuoka, Japan; 3. Department of Social Rehabilitation, Research Institute, National Rehabilitation Center for People with Disabilities, Japan)

Introduction : In 2008, the total number of care staff in Japan reached 1,280,000 persons. However, considering the on going ageing of the society, this number is expected to double by 2025, leading to a

quantitative issue for securing human resources. Moreover, Japan also faces a qualitative issue, as practice skill assessment is considered insufficient in the current system of care staff certification. For this reason, the government aimed to implement a Japanese version of NVQ (National Vocational Qualification). To do so, it was necessary to identify the basic nursing skills of care staff. This research explains the research process that led to this selection of care staff skills and tests the validity of the selected assessment items. Method : A survey was conducted over 843 care staff divided in 140 locations all over Japan and providing residential or home-care services to test 227 candidate items, grouped in 4 subscales, assessing care staff skill. The survey took into consideration the characteristics and experience of each care staff and certified statistically the validity and reliability of the items. Results : Skill possessed by more than 90% of care staff, and skill with a correlation coefficient over 0.8 were identified and regrouped based on clinical knowledge to finally represent 148 items grouped in 3 subscales. Conclusion : Results from this research were used to identify the skills that care staff should possess and to construct a certification system based on these skills. It should provide crucial information to support the currently under-developed on-the-job training system of Japan. Keywords : care staff skill assessment, Japanese version of NVQ (National Vocational Qualification), validity

PP25 S-224

ELDERLY EMPLOYMENT IN AN AGING SOCIETY: PRODUCTIVE AGING AND INSTITUTIONALIZED AGEISM

Mihwa LEE (School of Social Work, University of Minnesota, USA)

Introduction : The rapidly changing demographics of older adults have expanded the concept of productive aging in social welfare policies in Korea. Although elderly employment centers play a major role in serving the government policies to increase the elderly social participation, very little research has been done on this topic. Method : This study examines the role of elderly employment centers as mediators in elderly job market. Specifically, the study looks at the ways in which elderly employment centers increase elderly employment and how effective these strategies are. To explore this role of elderly employment centers, an in-depth case study was conducted in Seoul, Korea. Results : Findings show that the employment center focused on assisting the elderly to understand the reality of elderly job market and encouraging the elderly to accept low-paid, low-skilled, and temporary jobs. Given that both age and appearance were more important than ability and skills in elderly employment, the employment center emphasized that elderly job seekers look young and neat. Elderly people who started working eventually quit after two-three months due to low pay and health problems. Conclusion : The Korean government made efforts to boost the senior citizen workforce, injecting them into the labor market. However, these efforts reinforced certain types of jobs for the elderly rather than satisfying the senior citizen's desire to participate and achieve success in the workforce. Findings suggest that the government needs to apply continual effort to improve the elderly employment environment, considering elderly socioeconomic status, education level, and health conditions without discriminatory and prejudicial attitudes. Keywords : Productive aging, Elderly employment, Institutionalized ageism

PP25 S-225

ACCEPTANCE INDONESIAN NURSES TO JAPAN

Nur HANIFAH (Innovation Management and Environmental Sciences, Yokohama National University, Japan)

Introduction : In 2008, EPA (Economic Partnership Agreement)

between Indonesia and Japan was conducted for Indonesian nurses to work in Japan. Due to number of nurses decreasing by having problem of aging society, Japan needs more nurses. Meanwhile, Indonesia has plenty nurses that look for a chance to work in Japan. In this sense, both nations have common interest. However, the system has number of controversies. Method : This study focused on nurses visiting Japan through EPA program to reveal various problems and the impact upon Indonesia in EPA system. The interviews had been conducted to 9 nurses. Results : In this research, some problems were revealed. In general, the cause of the problem is the ignorance of the system for the needs of people actually working at site. Next problem is that the study period for nursing students to prepare themselves to pass nurse examination is short. If they miss the chance, they cannot work as nurse in Japan and have to go back to Indonesia. Besides, no support is provided by the Government for the exam. Therefore, majority of the student nurses feel more burdens. As the result, passing ratio of the exam is dropping as well as the number of nurse candidates from Indonesia. Conclusion : Seeing the problem, there are many improvements need to make in both nations. Working environment must be prepared in the dispatching nation and the receiving nation. Only when it is accomplished, the system will be worthy of its real meaning and value. Keywords : EPA, nurses, Indonesia

PP25 S-226

INFLUENCE OF UNEMPLOYMENT DURATION ON SOCIAL NETWORK IN JAPANESE ELDERLY

Naomi YATOMI¹, Ikuko SUGAWARA², Hiroto MUROHASHI¹, Kouji SHIBASAKI¹, Kastuya IJIMA¹, Hiroko AKIYAMA¹
(1. Institute of Gerontology, The University of Tokyo, Japan;
2. Institute of Social Science, The University of Tokyo, Japan)

Introduction : According to a survey conducted by the Japanese government, 43.6 percent of Japanese elderly are working, and 89.6 percent of them wish to continue to work as long as possible. Japanese people tend to live work-centric lives and at the expense of the leisure activities and social interactions. This study aims to examine the effects of duration of unemployment on social network in Japanese elderly who want to get job. Method : Subjects were 68 participants of employment seminar for senior citizen that was sponsored by the University of Tokyo. Fifty five participants complete a questionnaire which includes various items from health, and psycho-social domain as well as items related to employment. The average age of the subjects was 68.2 years (SD=5.8yrs). Subjects were comprised of 35 male (63.6percent) and 20 female (36.4). The average age of the unemployment duration was 6.4 years (SD=4.8yrs). Partial correlation analysis between log-transformed unemployment years and social network by controlling age and sex were conducted. Results : The result shows that the longer unemployment duration related with the more free time ($r=.343$; $P<.012$), the less leisure activities ($-.436$; $p<.001$), the less frequency of talking with friends and acquaintances who live in places other than the neighborhood ($-.315$; $P<.022$), and the less frequency of using home telephone ($-.316$; $P<.021$). Conclusion : The results suggested that the unemployment in Japanese elderly may reduce the social interaction with others and leisure activities. Perhaps this would be a reflection of the Japanese work-centric culture. Keywords : Unemployment, social network, leisure activity

PP25 S-227

CORRELATION BETWEEN HEARING LOSS AND HEARING HANDICAP IN INSTITUTIONALIZED OLDER PEOPLE

Stefani RIBEIRO¹, Cristina SOLDERA², Angelo Jose G. BOS¹, Isabela MENEGOTTO² (1. Institute of Geriatrics and Gerontology,

Pontifical Catholic University of Rio Grande do Sul, Brazil;
2. Audiology, UFCSPA, Brazil)

Introduction : Few studies have addressed the possible relationship between hearing loss and hearing handicap in institutionalized older people. Method : We assessed hearing handicap using "The Hearing Handicap Inventory for the Elderly ? HHIE" questionnaire and the hearing thresholds were measured in a group of institutionalized elderly. The sample consisted of people resident of a long-term institution for the elderly who had results from the HHIE questionnaire and an audiometric evaluation. Results : The study included 41 individuals, of which 30 were females, aged between 63 and 92 years old. All participants presented some degree of hearing loss being the most with mild degree. Only 34% of the participants has a hearing handicap resulting in a weak positive correlation and statistically not significant with hearing loss. Conclusion : The prevalence of hearing loss was high in the sample studied, but less than half of study participants presents auditory handicap. We hypothesize that nursing home residents with mild hearing loss perceive more intensely their hearing handicap than those with more severe loss. Nursing home residents with severe hearing loss would restrict their daily life activities and social participation, not perceiving the hearing handicap. Keywords : Homes for the aged, Social participation, Presbycusis

PARTICIPATION FOR SUCCESSFUL AGEING

Audrey GUY (*Business, Government and Law, University of Canberra, Australia*)

Introduction : In every stage of our lives, including the later stage, we need to have a purpose, a reason for living. This purpose provides us with our status in society. This presentation will look at different options for participation for older people. It can include physical involvement in the local community and also communication with people who have similar interests through correspondence or, with the modern method of communication, the internet, which enables us to age better through the digital world. Method : Older people need to be aware of the need to keep fit, both physically and mentally. Exercise of the body is easy to identify but mental fitness is more difficult. The old idea that we lose brain cells as we age is being challenged by modern research which suggests that if we provide stimulation to our brains we can develop new connectors between the cells, possibly challenging dementia. Social participation, including volunteering, can provide the social contacts we need as humans and the challenge to our brains required for mental fitness. This presentation will address the conditions needed to adequately fulfil this, including the amount of time required to be devoted to such participation to benefit from it. Results : Promotion of this concept of involvement will help to reduce, perhaps eliminate, the current downsides of ageing such as depression, loneliness and the feeling of older people that they have no role in society. Conclusion : Older people need to be encouraged to actively participate in society to enable successful ageing. Keywords : Ageing, Participation

PP25 S-229

THE IMPACT OF SOCIAL CAPITAL ON DEPRESSION AMONG OLDER CHINESE AND KOREAN IMMIGRANTS: SIMILARITIES AND DIFFERENCES

Bum Jung KIM¹, Erica AUH², Lesley Maradik HARRIS³, Wesley LUM⁴, Erica SOLWAY⁵ (1. School of Social Work, University of Hawaii at Manoa, USA; 2. Graduate School of Social Welfare, Ewha Womans University, Korea; 3. Department of Social Welfare, University of California at Los Angeles, USA; 4. Executive Office on

Aging, State of Hawaii, USA; 5. Health and Aging Policy Fellows Program, Health and Aging Policy Fellows Program, USA)

Introduction : This study aimed to examine the relationship between social capital and depression among older Chinese and Korean immigrants in the U.S. **Method :** A cross-sectional study of 172 older Chinese and 205 older Korean immigrants (aged 65 years and older) was conducted in Los Angeles County. Independent variables included age, gender, marital status, income, and social capital (social norms, trust, partnership with the community, information sharing and political participation). Depression was the dependent variable. Multiple regression analyses were employed separately for the Chinese and Korean groups. **Results :** For older Chinese immigrants, partnership in community ($\beta = -.16$, $p < .05$) and political participation ($\beta = -.20$, $p < .05$) were significantly associated with depression. Among older Korean immigrants, social norms ($\beta = -.12$, $p < .01$), partnership in community ($\beta = -.36$, $p < .01$), and information sharing ($\beta = -.14$, $p < .05$) were significantly associated with depression. Also, being younger ($\beta = .21$, $p < .01$), being female ($\beta = -.34$, $p < .01$), and having higher income ($\beta = -.34$, $p < .01$) were associated with lower levels of depression. **Conclusion :** Implications for this study include a better understanding of how the social capital of older Asian individuals contributes to depression. Social workers or social service agencies must consider examining older adults' existing social capital in searching for ways to improve mental health of older Chinese and Korean immigrants. **Keywords :** Social Capital, Depression, Older Chinese/Korean Immigrants

PP25 S-230

INTEREST-BASED PARTICIPATION IN ACTIVITIES AND PHYSICAL TEST RESULTS OF OLDER JAPANESE INDIVIDUALS

Hiroimi NAKAMURA-THOMAS¹, Makoto KYOUGOKU²
(1. Occupational Therapy, Saitama Prefectural University, Japan;
2. Occupational Therapy, KIBI International University Graduate School of Health Sciences, Japan)

Introduction : Active engagement of occupational therapists in physically focused examination and programs is gaining importance, because one of the target domains in the recently established government policy is physical functions. Identifying the relationship between interest responses and physical functions seem to be important for occupational therapists who have traditionally used interest responses to support clients' engagement in activities. This study examined physical functions in two groups divided on the basis of interest-based participation in the activities. **Method :** The research protocol was reviewed and approved in the first author's organization. Participants were 673 healthy older Japanese individuals. Physical functions were assessed using the handgrip strength, one-leg stance, timed-up-and-go and 10-meter walking-speed tests. The 25 activities in the Japanese Interest Checklist for the Elderly were used for data collection. The frequencies of respondents were separately calculated for men and women for each activity. Data for each physical test were separately compared for men and women between the interest-based participated group and no participated group in relation to each activity. **Results :** All 25 activities were associated with significant differences in physical test results among women, whereas 6 activities (sewing, personal care, visiting acquaintances, enjoying literary activities, watching TV/movies and gate-ball) were not associated with any significant differences in physical test results in men. **Conclusion :** This study identified that activity numbers associated with significant differences in physical test results were different between men and women, emphasizing the importance of maintaining physical

functions to sustain interest-based participation for old women. **Keywords :** activity and participation, community-dwelling older people, Japanese Interest Checklist for the Elderly

PP25 S-231

A NEW ERA FOR COMMUNITY VOLUNTEER SERVICE (CVS) : COLLABORATION BETWEEN HOSPITALS COMMUNITY PARTNERS FOR DISCHARGED FRAIL ELDERLY PATIENTS

Hon Wai Felix CHAN (*Medicine & Geriatrics, TWGHs Fung Yiu King Hospital, Hong Kong*)

Introduction : Over 300 volunteers from 13 non-government organizations (NGOs) were trained to provide regular home visits and phone contacts to discharged frail elderly patients. Working alongside with health care professionals to provide good neighbor and psychosocial support. **Method :** Patients with a computer generated "Hospital Admission Risk Reduction Program for the Elderly" (HARRPE) score of >0.17 were recruited. Volunteers, matched according to their place of residence, provided basic health check reminded elders on drug compliance and medical follow-up. When social problems were encountered, volunteers could consult the social workers of their respective NGOs. Protocol-driven telephone triage nursing service was available to deal with ad hoc medical problems, and for booking of early appointments in the outpatient clinics. Hospital services utilization pre & post 90 days after receiving the service were compared by paired t-test. **Results :** From April 2008 to Dec 2011, 1993 patients were recruited. Their mean age was 80.2 years old ($SD=7.4$), 74.7% of the elders were previously not engaged in community social services. CVS resulted in significant decrease in the number of A&E attendance -52.5% , number of A&E admission -58.5% , and length of stay -55.2% respectively. In the user satisfaction survey, 98% of the discharged elderly & volunteers indicated "satisfied" or above satisfaction level to the project. **Conclusion :** With the collaborative effort of HK West Cluster hospitals and local NGOs, an effective and caring community network was built to promote aging in place. **Keywords :** Community Volunteer Services

PP25 S-232

GOVERNMENT SERVICES TO PROMOTE COMMUNITY SERVICE ACTIVITIES BY ELDERLY CITIZENS

Kyeongah LEE, Takashi KOIKE, Yoshiko FUJIWARA, Takatoshi ANDO (*Innovation Management and Environmental Sciences, Graduate School of Environment and Information Sciences, Yokohama National University, Japan*)

Introduction : Recently, community service activities by elderly citizens have become a focus of attention. The government expects the elderly to tackle the issue of aging population by providing a helping hand in social welfare services within the community. **Method :** A survey was conducted in the 18 districts of Yokohama to understand the current state of government support services to promote community service activities by the elderly. Interviews were conducted with workers at the "Center for Support of Lifelong Learning and Civic Activities" in the 18 districts, which were used to promote "consultations", "information transfer" and "provision of facilities". Interview questions focused primarily on the objectives of the administrative system that was controlled externally from the center and the functional workings of the consulting service that was under the control of the center. **Results :** Results of the interviews indicated two main findings. First, the workers at the center acknowledged the need for collaboration with public facilities. However, the administrative system did not have a structured plan to

foster this type of collaboration. Second, different measures depending on each situation were taken in the 18 districts in order to balance the various needs of middle-aged and elderly citizens with their desire to participate in community service activities. Conclusion : Government services to promote community service activities by the elderly are still developing. Therefore, there is a need for further research to examine the future directions of government services. Keywords : social participation of elderly citizens, government support services

PP25 S-233

ACTIVE AGEING IN A SCANDINAVIAN CONTEXT: PATTERNS OF VOLUNTEERING AMONG GROUPS OF OLDER PEOPLE IN SWEDEN

Magnus JEGERMALM¹, Eva Jeppsson GRASSMAN² (1. Institute of Gerontology, Jonkoping University, Sweden; 2. Institute for the Study of Ageing and Later Life (NISAL), Linkoping University, Sweden)

Introduction : The current gerontological debate on active ageing often implicitly targets the third age. This presentation, however, analyses the role not only of 'old' (60-74) but also 'old-old' (75+) people as 'active citizens' in Sweden, carrying out unpaid work in the form of volunteering in voluntary organizations. Method : The discussion is based on results from a national survey that was conducted 2005 and 2009. Results : The results indicate that almost half in the age group 60-74 but also a third in the age group 75-84 were engaged as volunteers. Both groups were substantially engaged, with many hours of involvement. These volunteers, also the oldest age group, had extensive informal social connections, in line with other age groups of volunteers. Many membership-based social organizations in Scandinavia have a "we for us"-character. They often have members among the oldest age groups who are providers as well as recipients of unpaid care of a reciprocal nature in these organizations. Conclusion : It appears relevant to use the framework of active ageing also for 'old-old' people in the population. Old-old people are not just consumers of services but rather to a high degree also contributors to society as well as being an important force in creating social capital, in a welfare state that is characterized with comprehensive welfare arrangements financed by the public sector. Keywords : active ageing, volunteering, welfare state

PP25 S-234

EFFECTS OF VOLUNTARY MOTIVATION OF THE ELDERLY ON THE DEVELOPMENT OF SELF-EFFICACY AND PSYCHOLOGICAL WELLBEING

Mi Jung KWAK¹, Se Na YOON² (1. Doctoral Student, Kyunggi University Graduate School, Korea; 2. Master Degree Student, Shungshin Women's University Graduate School, Korea)

Introduction : The purpose of this study is to understand what effects the elderly volunteer's motivations work has on their self-efficacy and psychological wellbeing. Most researches strength of volunteer activities without considering their motives. So the characteristics of this study is to empirically verify the effects of voluntary motivations which influences the senior self-efficacy and psychological wellbeing. Method : This study surveyed three hundred and forty senior citizens who are over sixty years old and use the welfare center of Jecheon City, it used 310 copies of survey questionnaires. After collecting the questionnaires, it verified the reliability and used statistical techniques and a regression analysis by applying quantitative research methods. Results : First, the effects of motives for volunteer activities of the elderly on their sense of self-efficacy may vary depending on their sexes. Male senior citizens show higher inner motives with principles for activities while the analysis of female seniors' motives reveals that

their motives for self-development and the advice of others also affect their sense of self-efficacy. Secondly, senior citizens' motives affect all of the sub-factors of their psychological well-being. In terms of different sexes, male seniors' motives more affect their psychological well-being, and female seniors' motives for self-development, and their motives with external factors and for leisure more affect their psychological-wellbeing. Conclusion : Volunteer activities during an old age are an important factor of experiencing a successful old age. Volunteer activities of senior citizens have positive effects of improving their self-efficacy and psychological wellbeing. And the volunteer activity of elderly had better consider the gender deeply. Keywords : Motivation to participate in volunteer work, self efficacy, psychological wellbeing

PP25 S-235

PRODUCTIVE AGEING IN RURAL AUSTRALIA

Sandra DAVIS¹, Natalie CROTHERS² (1. Palliative and Supportive Services, Flinders University, Australia; 2. Rural Health, LaTrobe University, Australia)

Introduction : Being involved in community life is good for individuals and good for society. However, we know very little about the participation of and contribution by people aged 50 and over in rural communities. This research aimed to develop a better understanding of productive ageing in different types of communities in rural Victoria, Australia. Method : An anonymous self-complete postal questionnaire was distributed to a sample of 20,000 households in twenty rural communities using the Australia Post Unaddressed Select Service. Measures of social and civic engagement, familiarity with community, trust, reciprocity, group membership, leadership and social demographic information were included. Householders 50 years of age and older were invited to complete the survey. Results : 4003 surveys were returned, of which 3925 were included for analysis. Although civic involvement is low, the majority of older people living in rural communities continue to be involved in a range of social and community group activities even in very old age, despite barriers. Feelings of obligation were not the reason for higher levels of community group involvement and group civic involvement found in declining communities. Enjoyment, wanting to give something back to the community and to learn how to do new things were the most common reasons for being involved. High levels of generalised and personalised trust were evident, particularly in declining communities. Group membership is common, and reciprocity an integral part of community life. Conclusion : Older people in rural Australia maintain strong community connections and well-functioning social capital. They play a vital role in community sustainability. Keywords : rural, productive ageing, community sustainability

PP25 S-236

VOLUNTEER ACTIVITY AND FUNCTIONAL CAPACITY AMONG COMMUNITY-DWELLING OLDER ADULTS IN JAPAN: A 3-YEAR LONGITUDINAL STUDY

Sangyoon LEE¹, Tami SAITO², Hyuntae PARK¹, Hiroyuki SHIMADA³, Ichiro KAI⁴ (1. Section for Physical Functioning Activation, National Center for Geriatrics and Gerontology, Japan; 2. Section for Social Welfare and Community Care, National Center for Geriatrics and Gerontology, Japan; 3. Section for Health Promotion, National Center for Geriatrics and Gerontology, Japan; 4. Emeritus Professor of Social Gerontology, University of Tokyo, Japan)

Introduction : Previous studies have demonstrated that volunteer activity in productive activities has a beneficial effect on physical

health for older adults. However, the volunteering commitment's longitudinal effect on functional capacity remains unclear. The purpose of this study was to determine the role of volunteer activity on functional capacity using data from Japanese older adults. Method : Subjects were 382 independently living older adults aged 65 to 74 years, who live in a suburban area of Tokyo and took part in this longitudinal study from 2001 to 2004. Volunteer activity was composed of 10 categories based on the Law to Promote Specified Nonprofit Activities of Japan and functional capacity was measured by the Tokyo Metropolitan Institute of Gerontology (TMIG)-index of competence. Parameter estimates using the GLM univariate procedure by SPSS were conducted to predict independent association between volunteering time and functional capacity after 3 years, controlling for job characteristics, education, economic status, age, gender, health condition at baseline and other productive activities, such as housework, caregiving, hobby or continuing education activities. Results : The main findings demonstrate that older adults who participate in their volunteer activities and who engage in more hours of volunteering are associated with a higher functional capacity, especially more than 52 hours per year, than non-volunteers. In addition, volunteering hours was curvilinearly associated with functional capacity. Conclusion : Further research utilizing 3-wave over a longitudinal and representative sample will be needed to identify the relationship between volunteering time and health condition. Keywords : volunteering, volunteering commitment, longitudinal study

PP25 S-237

MUNICIPALITIES, NEIGHBORHOODS AND VOLUNTEERING: A MULTILEVEL ANALYSIS

Sarah DURY, Liesbeth DE DONDER, Dominique VERTE
(*Educational Sciences, Vrije Universiteit Brussel, Belgium*)

Introduction : This contribution explores the relationship between features of the municipality, neighborhood and participation in volunteering. Relatively strong evidence of the influence of place on older people's physical and mental health exists. However, the question how municipalities and neighborhoods promote or hinder volunteer participation remains under-explored. Method : The data for the present research are derived from the Belgian Ageing Studies, a project which uses structured questionnaires to collect information about various aspects of quality of life among older adults at the municipality level. Using data from Belgian older people (N=67,144), a multilevel multinomial logistic regression model is applied, with personal characteristics, neighborhood features and municipality-level measures to predict volunteer participation. Results : At the individual level, results reveal that the more people are involved in the neighborhood, the more likely they are to volunteer. At the municipality level, the extent and quality of facilities increases volunteer participation, while higher aggregated rates of older residents decrease volunteer participation. Conclusion : The discussion highlights the potential of the local environment as promoters or barriers for volunteering. Keywords : Neighborhood volunteering multilevel

PP25 S-238

THE CORRELATION RESEARCH ON ACTIVITIES OF DAILY LIVING, PARTICIPATING IN LEISURE ACTIVITIES AND SOCIAL EVENTS FOR THE OLDER PEOPLE IN TAIWAN

Ching Show LIN, Shou Wen CHENG (*Department of Gerontechnology and Service Management, Nan-kai University of Technology, Taiwan*)

Introduction : Taiwan has already an aging society in 1993, the population of older people aged 65 and over has 2.5 million people and accounted for 10.6 percent of the total population. Participating in leisure activities and social events to enhance the quality of life in their spare time after retirement. The purpose of this study is to explore the current status of activities of daily living, leisure activities and social events participation of the older people and to analyze the correlation among activities of daily living, leisure activities and social events participation. Method : The study used the long-term follow-up survey data of the Health and Living conditions of older adults conducted by the National Health Agency, Department of Health in 2007. The total subjects are 2700 elderly people aged 65 and above. Results : The results showed that the older the people are, the worse the activities of daily living, instrumental activities of daily living and basic activities of daily living get and the number of participation in leisure activities and social events also are less. The participation in leisure activities and social events and their three activities of daily living were positively correlated. The better the activities of daily living are, the more participation in leisure activities and social events are. Conclusion : The older people should enjoy their retirement time by participating in health promotion activities and live an independent life to enhance the quality of life. Keywords : Physical activity, Leisure activities, Social participation

LIVING LONGER- LIVING BETTER: THOUGHTS ON LIVING WELL IN LATER LIFE

Terence Anthony SEEDSMAN (*School of Sport and Exercise Science, Victoria University, Australia*)

Introduction : This paper represents an attempt to examine a set of core elements considered essential for positioning human life, particularly during later life, within the framework of a personal journey in which 'living well' is the outcome of a complex mix of a) personal responsibility b) societal responsibility c) respect for human rights and d) the extent to which support exists for the promotion of age-friendly environments . Older people do not live in a vacuum and while the influence of socio-economic factors play a role in influencing the sense of 'living well' the older person is by nature a self determining entity who can choose to live with enthusiasm and anticipation despite experiences involving loss, illness and suffering. For some older people, personal ageing is more than a time of despair but rather a time to engage new ventures and accomplishments. Living well in old age is characterized by a person who is linked productively to other lives. It is recognized, however, that society has a moral mandate to consider and act upon the understanding that 'living well' in older age requires new thinking about ways of enhancing opportunities for social and civic participation of older people. Addressing barriers in the built environment as well as advocacy for a human rights approach is deemed essential for understanding the true essence of 'living well' in later life. Method : Oral presentation by Emeritus professor Terence Seedsman/ not part of symposium/ individual presentation/ presentation using power point. Results : Not applicable. Conclusion : Not applicable. Keywords : not applicable

FACTORS ASSOCIATED WITH USE OF COPING STRATEGIES OPTIMIZING SOCIAL PARTICIPATION IN OLDER ADULTS

Veronique PROVENCHER¹, Johanne DESROSIERS², Louise DEMERS³ (*1. Geriatric Unit, Research Centre, Centre hospitalier affilié universitaire de Québec, Canada; 2. School of Rehabilitation, Université de Sherbrooke, Research Center on Aging, Canada;*

3. School of Rehabilitation, Universite de Montreal, Research Center-
Institut universitaire de geriatrie de Montreal, Canada)

Introduction : Older adults often use behavioral coping strategies to optimize their social participation (daily activities and social roles). However, the types of strategies used and factors associated with their use have hardly been explored. This study aimed to 1) determine the behavioral coping strategies (housework, mobility, communication, purchasing consumer goods, reading, personal care, taking medication) that are most strongly correlated with optimal social participation and 2) identify the personal and environmental factors associated with the use of these coping strategies. Method : The sample was comprised of 201 community-dwelling older adults (≥ 75 years) living independently. Coping strategies and social participation were respectively measured using the Inventory of Coping Strategies Used by the Elderly and the Assessment of Life Habits (LIFE-H) questionnaires. Information about personal and environmental factors was also collected during the interview. Results : Linear regression analysis showed a strong relationship between the use of mobility-related coping strategies and optimal social participation (R_{change}: 0.282; F=.309; p<.001). Personal factors (older age, female, low self-perceived level of activity, heart disease, osteoporosis) and environmental factors (availability of technical aids) were significantly associated with increased use of these strategies (adjusted R_c: 0.309; F=16.35, p<.001). Conclusion : Our results support the importance of including mobility-related coping strategies in programs designed to promote older adults' social participation. The knowledge generated by this study also helps to pinpoint which personal and environmental factors to consider in order to optimize implementation of these strategies. Keywords : coping strategies, activities of daily living, social roles, aged 75+

PP25 S-241

THE EFFECT OF INTERGENERATIONAL PROGRAM "REPRINTS" ON THE DEPRESSIVE MOOD THROUGH THE DEVELOPMENT OF SENSE OF COHERENCE: 3-YEAR EXPERIENCE AND LONG-TERM EFFECTS

Yoh MURAYAMA, Masashi YASUNAGA, Rumi TAKEUCHI, Hiromi OHBA, Kumiko NONAKA, Mariko NISHI, Yoshinori FUJIWARA, Shoji SHINKAI (*Research Teams for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : In an aging society, it can increase the risk of social isolation and the loneliness among older people. Given these circumstances, this study, therefore, focuses on an intergenerational program's effects on older people's mental health. This study examines the long-term effect of an intergenerational program with Senior Volunteer Picture Book Readers "REPRINTS" on senior volunteers' depressive mood through the development of sense of coherence (SOC). Method : 56 volunteers and 86 controls, all aged 60+ years and over living in three area participated in a baseline health check-up in June 2005. After completion of 3-month training seminars, volunteers visited public elementary schools and kindergartens in groups of 6-10 persons for 33 months. They were assessed by annual follow-up health check-ups in March, 2006-2008. SOC was measured 4 times over 12-month interval by the 13 item of Index (SOC-13). Depressive mood was measured 1 time of 33 months by the 5 item of Index (GDS-15). Results : Repeated analysis of covariance revealed that intergenerational exchanges have positive effects on senior volunteer's meaningfulness (ME) (P<.05). Furthermore, the longitudinal trend of ME and the effect on GDS was analyzed by using a latent curve model (LGM). LGM fits the data well

($\chi^2(10) = 16.40$, $p = 0.09$; RMSEA = 0.08; CFI = 0.68). The results showed that initial ME wasn't associated with the subsequent ME increase. Intervention was significantly associated with a larger degree of ME increase. ICEPT and SLOPE were positive effect on. Conclusion : In order to promote old people's mental health, it is helpful to participate in the intergenerational program. Keywords : Intergenerational program, Sense of coherence, Depressive mood

SOCIAL ACTIVITY OF JAPANESE ELDERLY IS ASSOCIATED WITH PAID WORK ACTIVITY AND FAVORABLE PHYSICAL FUNCTIONING-RELATED QOL

Yoshitaka SHIBA¹, Saori ANZAI², Hiroshi HAGA³ (*1. School of Allied Health Sciences Department of Rehabilitation, Kitasato University, Japan; 2. Graduate school of Gerontology, J.F. Oberlin University, Japan; 3. Institute for Aging and Development, J.F. Oberlin University, Japan*)

Introduction : To identify factors affecting social activity of elderly people living in a rural area of Japan. Method : Of 381 elderly (≥ 75 years old) living in T village of Gunma Prefecture who participated in a session to discuss health examination results and responded to a questionnaire, 326 elderly (follow-up rate: 85.6%) who could be followed up 1 year later participated in this study. Interview and self-administered mail surveys were conducted in both the baseline and follow-up surveys. Survey items included age, gender, resident status, social activity, being house-bound, exercise habits, pain, working status, self-rated health, higher level functional capacity (instrumental activities of daily living, intellectual activity, social role), and health-related QOL (physical functioning, role physical, bodily pain, general health, vitality, social functioning, role emotional, mental health). To examine factors affecting variations in social activity, a multiple regression analysis was performed using one-year variations in social activity as a dependent variable. Results : The mean social activity score significantly decreased from 2.3 ± 1.95 at the baseline to 2.0 ± 1.88 at the follow-up ($p < 0.01$). One-year variations in social activity were significantly correlated with paid work activity including paid volunteer ($\beta = 0.164$) and role physical ($\beta = 0.189$). The adjusted R² of the model was 0.217. Conclusion : We identified factors affecting one-year variations in the social activity of 229 elderly subjects living in a rural area of Japan. The findings indicated that participation in paid work activity and maintaining a favorable physical functioning-related QOL are associated with engagement in social activity the following year in elderly residents. Keywords: Social activity, paid work activity, Japanese elderly

THE INFLUENCE OF MUSIC ON ACTIVE AGING IN JAPANESE COMMUNITY RESIDENTS: THE FOCUS ON LISTENING MUSIC AND MUSICAL ATTITUDE

Yuko TAKENAKA, Kaoru HOUNOKI, Shuichi OKADA, Makoto CHOGAHARA, Norihiko KONDO, Kouhei MASUMOTO (*Graduate School of Human Development, Kobe University, Japan*)

Introduction : The purpose of this study was to examine the relationship between musical activity/attitude and active aging level among adult population in Japan. Special attention has been paid to the differences of the relationship according to personal attributes including age. Method : The survey data were used 801 respondents from community-dwelling adults aged 20 and older. For the measurement of active aging level, three items; life satisfaction, self-assessment of health, and age consciousness, were used. Regarding the scale for musical activity/attitude, seven items were used respectively.

Results : A series of regression analyses indicated that the item of musical activity “listening to music while driving a car”, had impact on active aging levels. Also, the item of music attitude “I think age does not matter to enjoy music” had impact on active aging levels. Conclusion : It was cleared that listening to music while doing something is useful to active aging. It is considered that such musical activities can be enjoyed regardless age, so can make attitude “Age does not matter to enjoy music” and have an impact on active aging as well. Keywords : active aging, musical activity, musical attitude

PP25 S-244

GENDER DIFFERENCES IN THE DETERMINANTS OF VOLUNTEERING AMONG THOSE 65+ WHO ARE OUT OF THE LABOR FORCE

Barbara MCINTOSH¹, Nicholas DANIGELIS² (1. School of Business Administration, University of Vermont, USA; 2. Sociology Department, University of Vermont, USA)

Introduction : Human, social, and cultural capital resources are recognized as important determinants of volunteering (Wilson and Musick, 1997; Tang 2006), but does their relevance differ by gender among those 65+ who are out of the labor force? This paper examines how these resources differentially predict the likelihood of volunteering for older men and women. Method : “Yesterday” diary data from the combined 2003-2011 American Time Use Surveys (ATUS) were examined using odds ratios, logistic regression, and difference of slopes T-tests to identify significant gender differences in volunteering among those 65+ who are out of the labor force (male N = 5,602; female N = 10,164). Volunteering yesterday was dichotomized (yes/no); age beyond 65 was measured by three dummy variables; being female, being white, living with a partner, and participation in religious activity were all dichotomized (yes/no); and three dummy variables for education and two for household income were used. Results : Overall, volunteering was positively associated with being female and highly educated, having higher income, and participating in religious activities. Based on separate analyses by gender, however, unstandardized slopes T-test comparisons showed: Age and income were significantly more important for men, while education was significantly more important for women. Being white increased volunteering likelihood for women but not being white increased it for men, and the race difference was significant. Conclusion : These results are discussed in the context of human capital’s association with volunteering (McNamara & Gonzales, 2011; Choi, Burr, Mutchler & Caro, 2007) and gender roles in relationship to volunteering (Taniguchi, 2006; Chambre, 1984; Choi, 2003). Keywords : Volunteering, 65+, Gender

CHALLENGES AND OPPORTUNITIES FOR U-HEALTH AND SOCIAL SERVICES: COMPARING GERMANY AND KOREA

Peter ENSTE¹, Yeung Ja YANG² (1. Institute for Work and Technology, Westfaelische Hochschule, Germany; 2. Division of Social Welfare, Kyungnam University, Korea)

Introduction : Due to the demographic change, products and services that promote the preservation of the independence of older people in their own homes will become more important during the next few years, both in Germany and in Korea. In many cases products from the area of Ambient Assisted Living (AAL) are not well accepted, especially with the target group of older people: Typical obstacles and barriers are the lack of technical experience, exorbitant prices and lack of information about the needs of the target group on the side of the provider. Furthermore, the use of technology cannot substitute social

contacts, thus social services and technical innovations need to be implemented complementary. AAL offers good prospects and opportunities to develop marketable products in combination to develop services that help to improve the quality of life of older people. Method : Based on a literature research in both countries we identified strengths and weaknesses of implementing AAL. These findings were discussed at three workshops in Germany and Korea with experts in the field of AAL and social welfare. Results : In summary three main barriers can be identified: Aims of technical providers and social services are difficult to reconcile. Some products do not meet the real needs of older people. Another problem is the gap between the income of the elderly and the pricing of AAL products. Conclusion : In both countries AAL offers opportunities to improve the quality of life of older people if AAL is not intended to replace but rather to support social services. Keywords : AAL, Social services, U-Health

PP25 S-246

A CONCEPT FOR A SOCIALLY RESPONSIBLE SILVER ECONOMY IN GERMANY AND KOREA

Peter ENSTE¹, Yeung Ja YANG² (1. Institute for Work and Technology, Westfaelische Hochschule, Germany; 2. Division of Social Welfare, Kyungnam University, Korea)

Introduction : Germany has a tradition of over 10-years experience in the field of silver economy. A driving force is the comparably good income situation of elderly people because self-payment serves as a distinguishing characteristic of silver economy. But this situation will change in the coming years and there is a risk of age poverty for a part of the elderly population. To raise quality of life of all parts of the elderly this requires a further development of the concept of silver economy with a focus on social welfare. In Korea silver economy is still in its beginning. This proposal will describe a common way for both countries. Method : In-depth research of scientific reference literature, Comparing of the social welfare systems, Evaluation of income and expenditure data of elderly people. Results : It is necessary to find alternative ways of financing products and services for the elderly. The care insurance provides good opportunities to support products and services which raise quality of life and help elderly people to stay in their own home as long as possible. But until now there are no sustainable business models in both countries. Because a shrinking private income will lead to a disproportionate reduction of private health expenditure there must be a focus on the development of alternative forms of prevention and health promotion. Conclusion : Because of similar population developments and social welfare systems it is helpful for both countries to develop a common concept of socially responsible silver economy to prevent age poverty and social inequality. Keywords : Silver Economy, Social policies, Social Welfare

PP25 S-247

GENDER DIFFERENCES IN DRIVING CESSATION: ARE SUCCESSIVE COHORTS LESS LIKELY TO SHOW GENDER EFFECTS?

Melissa O'CONNOR¹, Michelle ACKERMAN², Jerri EDWARDS³, Christy HALEY³ (1. Department of Human Development and Family Science, North Dakota State University, USA; 2. Department of Psychology, University of Alabama at Birmingham, USA; 3. School of Aging Studies, University of South Florida, USA)

Introduction : Past cross-sectional and longitudinal studies have indicated that females are more likely to cease driving than males, although findings have been mixed. These gender differences may be

moderated by cohort effects, such that earlier birth cohorts may exhibit larger gender disparities than later cohorts. To investigate this possibility, data from the Maryland Older Drivers Project were used. Method : Participants (N=1,248) were drivers at baseline, and their driving status was assessed annually over 10 years. The sample was 47% female, with an age range of 55-92 (M=69.54). Participants were divided into 3 cohorts by birth year: <1920 (cohort 1), 1920-1929 (cohort 2), and ≥1930 (cohort 3). The proportions of males and females did not differ significantly between each cohort ($p<0.05$), and there were no significant baseline age differences between the males and females within each cohort ($p<0.05$). A total of 143 participants stopped driving. Cox proportional hazard models were used to examine the risk of driving cessation as a function of gender (reference group=females), cohort, and baseline age, as well as two-way and three-way interactions between predictors. Results : Main effects for gender (HR=0.85) and age (HR=1.11) were significant at $p<0.05$, as well as gender*cohort and age*gender interactions. When age was held constant at the sample mean, female gender was a significant risk factor for driving cessation in Cohort 1 (HR=0.05, $p<0.05$), but not in Cohorts 2 or 3. Conclusion : These findings support the idea that gender differences in driving cessation diminish in later cohorts of older adults, where females may have more driving experience. Keywords : driving cessation, gender differences, cohort effects

PP25 S-248

HOW TO COMPARE THE PERFORMANCE OF THREE EUROPEAN LONG TERM CARE SYSTEMS BY USING THE BALANCED SCORECARD FRAMEWORK

Samir HENNI¹, Bruno FANTINO², Christophe GERMAIN³, Olivier BEAUCHET² (1. Geriatry, Hospital Center Francis Robert and Aime Jallot, France; 2. Geriatry, Hospital University Center of Angers, France; 3. Vice Dean - Academic Director, Audencia school of management, France)

Introduction : The economic context is characterized by a decline in revenues of the state and an increase in deficits and debt. Even if this context has an impact on healthcare systems, it is not sufficient to limit the thinking to the economic dimension to evaluate healthcare systems performance. In fact, the only measure of the efficiency of financial indicators, leads to a management by the mirror. It is therefore necessary to adopt a more balanced and forward-looking. A tool for performance evaluation, called Balanced ScoreCard (BSC) seems appropriate mainly because it measures criteria for recognition and anticipation. Thus, the aim of our study was to compare systems of care for elderly in France, Germany and the UK using the BSC approach. Method : We aggregated values of each country for the four dimensions of BSC (financial, customer/user/patient, internal process and organizational learning). We select the best value among the three studied countries and we calculated the percentage difference between the value of each country and the reference value of each indicator. Results : We found that French system of care for elderly people is quite efficient compared to the resources allocated and results recorded. Furthermore, France system approaches evenly the four dimensions of BSC compared to the other countries. Limitations: the multidimensional nature of our comparison (three countries compared according four dimensions). Conclusion : The research shows that the theory and the concept of the BSC, initially designed for industries in the private sector may be applied in the context of healthcare systems to compare healthcare performance across organizations, sectors and countries. Keywords : European long term care, BSC Balanced Scorecard, efficiency health system

PP25 S-249

PARENTAL CARE AND FINANCIAL STATUS AMONG WOMEN

Yeonjung LEE, Fengyan TANG (School of Social Work, University of Pittsburgh, USA)

Introduction : This study examines the relationship between eldercare and financial status by investigating whether women's poor financial status is both a result and a cause of assuming a caregiver role for elderly parents. A vicious circle may exist between caregiving and financial well-being. Method : Data for women aged 51 or older with at least one living parent or parent-in-law were drawn from the Health and Retirement Survey 2006, 2008, and 2010 (N= 2,093). A cross-lagged panel design was applied with structural equation modeling to examine whether a reciprocal relationship existed between eldercare and financial status among women. Results : Female caregivers at earlier observation points were more likely than non-caregivers to be in poor financial status at later observation points. Women providing care to elderly parents in 2006 and 2008 had significantly lower household income than non-caregivers by .29 and .45 standard deviation in 2008 and 2010, respectively. On the other hand, women in poor financial status at earlier observations were more likely than women in better financial status to assume caregiving at later observation points. For one standard deviation increase in household income at earlier observations, the odds of assuming care for elderly parents at later observations decreased by 23% and 12%, respectively. Conclusion : This study suggests that there exists a vicious circle of eldercare and poor financial status among women. What appears particularly important is to watch for female caregivers' financial status when eldercare is assumed, and to reduce care burden when women's financial status becomes worse. Keywords : eldercare, financial status

PP25 S-250

THE MACROECONOMIC EFFECTS OF AGING IN IRAN

Kazem YAVARI¹, Mehdi BASAKHA², Hosein SADEGHI², Alireza NASERI² (1. Economics, Tarbiat Modares University, Iran; 2. Health Economics, Tarbiat Modares University, Iran)

Introduction : The recently emerged symptoms of population aging have raised serious concerns in some developed countries. A recent report by the United Nation indicates that aging in developing countries is even more serious and is more rapidly growing than in other countries. The report states that developing countries will confront the negative consequences of this phenomenon in a few decades. Method : The main purpose of the present study is to specify the economic aspects of the Iran's aging population. To this end, dynamic general equilibrium is used to calibrate the suitable Overlapping Generation Model for Iran's economy. Within this structure, not only can we explain the effects of demographic changes, but also we can forecast the variables path to a new steady state. Results : Simulation results show that Iranian population aging (increase in longevity and decrease in fertility) changes a wide range of economic variables, particularly the variables under investigation in this study. Population aging increases savings and capital accumulation. This in turn, decreases the interest and unemployment rates. In addition, an increase in elderly population influences the public spending for health and pension. Conclusion : The results of the study suggest that due to increased capital to labor ratio in Iran, the interest rates will decline, and this leads to capital flight. It is likely that the government expenditures will increase in the social dimensions, especially in health and pension. Therefore, the government should attempt to find funding sources for these two segments of the budget. Keywords : Aging, life cycle, General

Equilibrium

DEVELOPING AN OLDER ADULT VOLUNTEER PROGRAM IN A NEW YORK CHINESE COMMUNITY

Ada C. MUI¹, Huajuan CHEN², Juanjuan SUN³ (1. *Social Work, Columbia University, USA*; 2. *Social Work, Washington University, USA*; 3. *Institute of Gerontology, Renmin University of China, China*)

Introduction : This study reports the results of a pilot volunteer project for older Chinese-American immigrants, and documents the benefits of volunteering perceived by the participants. Using a social marketing approach, the older volunteer program was designed as a social model for greater acceptability among participants, with the goal of promoting better health among older Chinese immigrants in New York City. **Method :** The Phone Angel Program was developed using a quasi-experimental design. Systematic assessment of individual level outcomes between older volunteers and caregivers were conducted. We assessed the Phone Angel volunteers before the training and after their 6 months of service to determine the impact of the Phone Angel Program on older volunteers' physical, psychological, and social well-being. In the Program, 18 older Chinese immigrants were recruited to serve as volunteers, and were trained to provide friendly calls as a support service to informal caregivers of ill relatives in the Chinese community. A control group of 31 participants was used as a comparison. **Results :** Results show that volunteers reported a greater sense of well-being and satisfaction in life. Specifically, 100% of the volunteers in the program felt much empowered because of training and volunteering, 61% reported health benefits to themselves and more than 90% reported that the skills they learned improved their communication with their families. **Conclusion :** The findings suggest that utilizing a volunteer program model is an effective health promotion intervention for older Chinese immigrants. The results also confirm that low-income, low-educated volunteers are capable to meet the critical needs of their communities. **Keywords :** Older Chinese volunteers

PP25 S-252

A STUDY ON THE TREND OF CONSUMPTION EXPENDITURE INEQUALITY BETWEEN ELDERLY AND NON-ELDERLY HOUSEHOLDS

Hye In OH (*Korean Women's Development Institute (KWDI)/Seoul National University, Korea*)

Introduction : The purpose of this study is to analyse inequalities in expenditure between elderly and non-elderly household and to see internally contributing factors in such discrepancies. **Method :** To quantify inequalities in goods and services, each item in expenditure basket is studied using Gini decomposition method and national census in trends in households data acquired by National Statistics Office are used. **Results :** In non-elderly households, inequalities in expenditures in essential goods has been decreased with increase of inequalities in discretionary goods. In elderly households, opposite phenomenon occurred. Discretionary goods, including education, transportation, and other goods and services have lowered itself in the inequality scale. Rather, the essential goods, including housing, water and heating, and healthcare, increased its contribution to the inequality. After the financial crisis of 2008, discretionary goods have lessened in weight and in same time Gini coefficient has increased. Thus, it can be deduced that elderly households with low expenditures have forfeited their small 'discretionary goods' spendings to stabilize their homes. **Conclusion :** First, review is required in areas where expenditures have risen dramatically in recent years. This includes

housing, water and heating, and healthcare. Second, further evaluation is required in meeting with elderly household's needs in discretionary goods that was forfeited earlier to meet the ends. Third, it needs to be recognized that individual elderly household with different needs are not lumped together into one single group. As they have different needs and goals, the social support provided to such households needs to be individualized to each and every households. **Keywords :** elderly, inequalities in expenditure, Gini decomposition, discretionary goods, essential goods

PP25 S-253

EXPECTATIONS OF INDIVIDUALITY OF HEALTHCARE SERVICES WITHIN OLDER PERSONS LIVING AT HOME

Riitta SUHONEN, Paivi HAAPALAINEN, Minna STOLT (*Department of Nursing Science, University of Turku, Finland*)

Introduction : The increasing number of older persons pose challenges to care and service arrangements globally. Recognising the individuality of each person is a requirement for tailoring care and enabling better patient outcomes. Older persons' evaluations have been used in the development of healthcare services but their expectations have rarely been studied. The aim of this study was to explore the expectations of individuality in healthcare services within older persons living at home and to explore what it means for older persons to be cared for as an individual person. **Method :** This study employed a qualitative descriptive study design. Data were collected using open interviews amongst eleven older persons (over 70 years of old) living independently at home and were recruited from four senior clubs for pensioners. Data were analyzed using inductive content analysis. **Results :** Older persons' expectations of individuality were described in terms of attending of professionalism, cooperation between patient and nursing staff and as the rights of individuals. They expected accountability, knowledgeable and skilled professionals, quick access to care, the necessary assistance and guidance, and the possibility of being cared for in one place. Individuality as a right of the individual was seen as a person's activity and freedom. These are reflected in the person's own abilities and desires to participate and as an opportunity for independent decision-making. Individuality in care meant that the person's situation will be taken into account in care provided. **Conclusion :** The results can help in developing care and healthcare services to be patient-centered for older people. **Keywords :** expectations, individuality, older people

CUSTODIAL GRANDPARENTS: ADDRESSING UNPLANNED UNCERTAINTY IN LATER LIFE

Lynn MCDONALD¹, Raza MIRZA², Rebecca BLISS³, Michelle MAJEED⁴ (1. *Factor-Inwentash Faculty of Social Work, University of Toronto, Canada*; 2. *Faculty of Medicine, Institute for the Life Course and Aging, University of Toronto, Canada*; 3. *Faculty of Medicine, Factor-Inwentash Faculty of Social Work, Institute for the Life Course and Aging, University of Toronto, Canada*; 4. *Geography, Institute for the Life Course and Aging, University of Toronto, Canada*)

Introduction : Over the last decade the number of custodial grandparents has dramatically increased. For many custodial grandparents this new caregiving role is a result of their child's substance misuse, divorce or separation, mental and physical health issues, teen pregnancy, or through their death. The custodial grandparenting role often comes at a time that disrupts the intended life course and this subsequently has long lasting implications on retirement plans and financial situations. The purpose of this study is to explore and develop an understanding of the experiences of

custodial grandparents and their ongoing needs. Method : This study employed a qualitative research design and conducted in-depth interviews with participants (n=25). From these interviews, observations were made to address the variability within the participants' needs related to financial literacy. The coding scheme was based on issues and themes as they emerged from the data. Results : Our results indicate that custodial grandparents experienced high levels of financial stress due to the uncertain and unplanned nature of the circumstances that led them to be in custody of their grandchildren. Results also showed that participants felt that they were out of touch with current child rearing theories and guidelines and in need of support when navigating through the complexities of legal, tax and child protection systems. Conclusion : Our findings identify the diverse socioeconomic status of custodial grandparents and highlight the systematic policy gaps that currently exist. Keywords : Custodial Grandparents, Finances, Canada

CUSTODIAL GRANDPARENTS: ADDRESSING ECONOMIC UNCERTAINTY IN LATER LIFE

Lynn MCDONALD¹, Raza MIRZA², Rebecca BLISS³, Michelle MAJEED⁴ (1. *Factor-Inwentash Faculty of Social Work, University of Toronto, Canada*; 2. *Faculty of Medicine, Institute for the Life Course and Aging, University of Toronto, Canada*; 3. *Faculty of Medicine, Factor-Inwentash Faculty of Social Work, Institute for the Life Course and Aging, University of Toronto, Canada*; 4. *Geography, Institute for the Life Course and Aging, University of Toronto, Canada*)

Introduction : Over the last decade the number of custodial grandparents has dramatically increased. For many custodial grandparents this new caregiving role is a result of their child's substance misuse, divorce or separation, mental and physical health issues, teen pregnancy, or through their death. The custodial grandparenting role often comes at a time that disrupts the intended life course and this subsequently has long lasting implications on retirement plans and financial situations. The purpose of this study is to explore and develop an understanding of the financial literacy of custodial grandparents and their needs in relation to the aforementioned. Method : This study employed a qualitative research design and conducted in-depth interviews with participants (n=25). From these interviews, observations were made to address the variability within the participants' needs related to financial literacy. The coding scheme was based on issues and themes as they emerged from the data. Results : Our results indicate that custodial grandparents experience high levels of financial stress due to the uncertain and unplanned nature of the circumstances that led them to be in the custody of their grandchildren. Participants also identify several areas for which they require further support and information including navigating the legal and financial systems, more tailored financial resources, and greater support in understanding their custody agreements as well as government benefits and taxation. Conclusion : Our findings emphasize varying levels of financial literacy among custodial grandparents and the policy gaps that exist in the current system. ADJUSTMENT TO AGING AND SUBJECTIVE AGE THROUGH THE EYES OF ROMANIAN AND PORTUGUESE OLDER ADULTS: A COMPARATIVE MULTIPLE CORRESPONDENCE ANALYSIS

Sofia VON HUMBOLDT, Isabel LEAL (*Research Unit in Psychology and Health, R&D, ISPA-Instituto Universitario, Portugal*)

Introduction : Purpose: To analyze the manifestations of adjustment to aging (AtA) and subjective age (SA) identified by older adults and to investigate the latent constructs that can work as major manifestations in AtA and SA in an older Portuguese and Romanian population. Method : Methods: Measures were completed, using a variety of culturally appropriate methods, including demographics and interviews. Complete data were available for 64 older adults aged between 72-99 years (M=80.1; SD = 5.8). Data was subjected to content analysis. Representation of the associations and latent constructs were analyzed by a Multiple Correspondence Analysis (MCA). Results : Results: The most prevalent response of the interviewed participants for AtA was 'Accomplishment, personal fulfillment, and future projects' (24.1%). 'With apprehension' (33.3%) was identified as the most frequent SA response. Findings showed a model for each nationality. AtA and SA for Portuguese elderly were explained by a three-factor model: 'conciliated', 'young-at-heart' and 'involved'. A three-dimension model formed by 'satisfied', 'attentive' and 'concerned' was indicated as a best-fit solution for Romanian elderly. Conclusion : Conclusions: AtA and SA are strongly explained by increased likelihood of specific constructs in its definition. AtA was differently related to SA in older adults in both samples. THE COMPREHENSIVE FRAILTY ASSESSMENT INSTRUMENT

Nico DE WITTE¹, Liesbeth DE DONDER², Robbert GOBBENS³, Jos SCHOLS⁴, Dominique VERTE⁵, Tine BUFFEL² (1. *Faculty of Education, Health and Social Work, University College Ghent/ Vrije Universiteit Brussel, Belgium*; 2. *Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Belgium*; 3. *University of Applied Sciences, Rotterdam University of Applied Sciences, Rotterdam, Netherlands*; 4. *Department of General Practice and Department of Health Services Research Caphri - School for Public, Maastricht University, Netherlands*; 5. *Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Belgium*)

Introduction : This contribution evaluates the psychometric properties of the Comprehensive Frailty Assessment Instrument (CFAI), a new self-report instrument including physical, psychological, social and environmental indicators. Population ageing forces governments to shift their policy towards ageing in place. Consequently, early detection of frail older persons is appropriate in order to avoid adverse outcomes. Several instruments to detect frailty exist. However, most instruments have a biomedical basis and none of them uses environmental indicators. Method : Scale validation study on data provided by the Belgian Ageing Studies, a cross-sectional survey conducted in 142 municipalities in the Dutch speaking part of Belgium. 33 629 community dwelling respondents aged 60 and over were included in this study. Exploratory factor analysis was performed on the subscales of the CFAI. Second-order confirmatory factor analysis was applied on the subscales and the whole scale. Step by step deletion of indicators was used in order to improve the overall model fit. Finally, internal consistency and explained variance of the CFAI and the subscales were assessed. Results : The analysis revealed a Cronbach's α of .812, explaining 63.6% of the variance and moderately large to large factor loadings and good model fit indices: RMSEA= .032, CFI= .974 en TLI= .970. Emotional aspects contributed more to frailty (.80) than psychological (.69) and physical aspects (.36) and environmental aspects also contributed to frailty. (.32). Conclusion : The CFAI is found to be valid and reliable, providing evidence for the multidimensionality of frailty and can be

easily used to detect community dwelling frail older people.
Keywords: frailty, elderly, community

ATTRACTING STUDENTS INTO THE FIELDS OF GERONTOLOGY AND GERIATRICS

Judith A. SUGAR (*Community Health Sciences, University of Nevada, Reno, USA*)

Introduction : The world's rapidly aging population is one of the most important challenges of the 21st century, and no nation exemplifies this challenge more than Korea, whose 65+ population is expected to rise from 10.5 percent to 38 percent by 2050. Method : In no country is there a workforce prepared to meet the interests and needs of its aging citizenry. One arena where this is especially evident is healthcare. In 2008, the National Academy of Sciences released a report on the preparedness of the American healthcare workforce for its burgeoning older population, concluding that "geriatric care has not attracted health care professionals in sufficient numbers in the United States." Rather than increasing, the number of practitioners and providers actually appears to be decreasing. Results : Our gerontology and geriatric communities have not been successful at recruiting adequate numbers of students into their fields. Conclusion : Clearly, a new multifaceted strategy is needed. Many organizations have called for increases in remuneration for their professionals. This approach has some merit, but will not by itself solve the problem. Negative stereotypes about aging, along with little or no contact with older adults, predispose young people to be disinterested in working with or for elders. Exceptions exist of course, but are wholly inadequate to make up for the incipient workforce shortages we face. Approaches to overcome the lack of interest in gerontology and geriatrics depend on addressing the deterrents, and we can begin in our own classrooms. Examples of what works, and what does not, will be discussed. Keywords : workforce, educators, students

PP25 S-259

REGIONAL CAPACITY OF HEALTHCARE RESOURCES AND NURSING HOME PLACEMENT: 10 YEARS OF THE PUBLIC LONG-TERM CARE INSURANCE PROGRAM IN JAPAN

Miharu NAKANISHI (*Research Department, Institute for Health Economics and Policy, Japan*)

Introduction : Japan introduced a national long-term care insurance (LTCI) program for the elderly in 2000 to help persons with aging in place. The present study performed a longitudinal small area analysis on the association between regional capacity of healthcare resources and LTCI nursing home placements in Japan. Method : Published annual data on regional capacity of hospital beds and clinics, use of LTCI home care, community-based care, and residential care services of 346 health regions were obtained from national statistics during a 10-years period from 2001 to 2010. A multilevel linear regression analysis was employed using a linear mixed model with a variance component structure and restricted maximum likelihood. The model included health region as a random effect to account for within-health region correlation. Results : The annual number of nursing home placements per 1000 elderly population was significantly greater among health regions that had a greater elderly population rate, a higher annual per capita expenditure on LTCI home and community-based care services, a larger number of annual residents of geriatric intermediate care facilities per 1000 elderly population, a smaller number of clinics per 100,000 population, and a greater number of hospital beds per 1000 population. The number of nursing home

placements was significantly increased over time. Conclusion : Our results suggest regional capacity of healthcare resources may cause supplier-induced needs for LTCI nursing home placements. Keywords: Japan, Nursing home placement, Small area variation

ASSESSING THE FUNCTIONS OF LOCAL GOVERNMENTS IN JAPAN'S NEWLY ESTABLISHED COMMUNITY-BASED INTEGRATED CARE SYSTEM: SURVEY INSTRUMENT DEVELOPMENT

Takako TSUTSUI¹, Sadanori HIGASHINO², Masaaki OTAGA³, Naoko MURAMATSU⁴ (*1. Department of Health and Social Services, National Institute of Public Health, Japan; 2. School of Management and Information, University of Shizuoka, Japan; 3. Department of Social Rehabilitation, Research Institute, National Rehabilitation Center for People with Disabilities, Japan; 4. Division of Community Health Sciences, School of Public Health, University of Illinois, USA*)

Introduction : Japan introduced the Community-Based Integrated Care System as part of the 2012 revisions of the Long Term Care Insurance (LTCI) System. Municipalities (LTCI insurers) are expected to play increasingly important roles for integrating medical and long-term care at the community level, but empirical research on their functions is scant. The goal of this study was to develop a survey instrument to assess municipalities' functions as LTCI insurers. Method : A mail survey was conducted to assess their functions as defined by the LTCI law, using 25 questions developed by experts. Of the 1,731 municipalities, 645 participated. Results : Exploratory and confirmatory factor analysis indicated that LTCI insurers' functions consist of four factors: 'Evaluating and supporting community-based integrated care centers', 'Assessing, guiding and auditing the LTCI activities', 'Supporting LTCI service providers and care managers', and 'Mid- and long-term needs assessment and planning'. We successfully developed a scale that involves 12 items grouped into 4 sub-scales. Results demonstrated the validity and internal consistency of the scale (GFI=0.966, AGFI=0.951, RMSEA=0.040; Cronbach's alpha above 0.7). Municipalities with larger populations and lower percentage of older populations had higher levels of functioning as LTCI insurers. Conclusion : This scale will allow local governments (municipalities) to assess their strengths and weaknesses as LTCI insurers and improve their functions and facilitate the development of an effective Community-Based Integrated Care System in Japan. Keywords : Long-term care insurance system, Community-based integrated care system, Functions of Insurers

PP25 S-261

FACTOR OF THE DIFFICULTIES BY ASSESSMENT INVESTIGATORS INVOLVED WITH ELDERLY DEMENTIA PEOPLE FOR LONG-TERM CARE INSURANCE IN JAPAN

Yoko YAMAZAKI¹, Yukimichi IMAI² (*1. Doctoral Program Graduate School of Social Welfare, Japan College of Social Work Graduate School, Japan; 2. Wako Hospital, Japan*)

Introduction : This study investigates the difficulties faced by long-term care needs assessment investigators of elderly dementia people who live with family members and those who live alone. The study also examines the kinds of skills that an investigator must possess. Method : As a preliminary study, we carried out a group discussion about "problems at the time of certification survey" with 43 care needs assessment investigators. Create an item based on the results, I conducted a questionnaire survey. Analysis, I have analyzed exploratory factor to capture the characteristics of the degree of the difficulties. Results : From a written questionnaire survey based on the

qualitative investigation, effective replies were obtained from 152 care needs assessment investigators. Factor analysis showed the following results. For elderly dementia people who live with family members, four factors were found: the burden of relationships, understanding of the investigation and lack of needs, investigator skills, and pride/privacy. For elderly dementia people who live alone, four factors were found: lack of information about living conditions, understanding of the investigation and lack of needs, investigator skills, and a shortage of basic information. Moreover, the analysis points to characteristic factors and common factors. Conclusion : As a conclusion of this study, the following were determined as desirable skills for long-term care needs assessment investigators: "information gathering that considers each relation," "cooperation with other professionals," and "knowledge for dementia people, and its practical use". Training methods to impart such skills to investigators must now be considered. Keywords : Investigator for long-term care need, People with dementia, Difficulty,

PP25 S-262

THE RELATION OF SOCIOECONOMIC STATUS AND GASTRIC CANCER SCREENING IN KOREAN ADULT POPULATION

Hyunsuk OH , Jung-Ae RHEE (*Department of Preventive Medicine, Chonnam National University Medical School, Korea*)

Introduction : Socioeconomic status plays an important role in health care and disease prevention. This study aimed to examine the association between socioeconomic status measured by educational levels and household income and cancer screening participation. Method : 21,220 community dwelling adults to aged 40 to 69 within a defined geographic area participated in community health survey in 2010. The survey was conducted by trained investigators who visit the subjects' households directly through developed questionnaire. Logistic regression analysis were used to determine a relationship between self-reported participation in gastric cancer screening and socioeconomic variables (education, house income). Results : The gastric cancer screening rates were 52.1% in aged 40 to 49 years, 63.7% in aged 50 to 59 years, and 67.3% in aged 60 to 69 years. In multivariate analysis, Higher educational and income levels were associated with higher screening rate of gastric cancer (for high school vs elementary school: odds ratio [OR], 1.41; 95 % confidence interval [CI], 1.26-1.58, for highest income quartile vs lowest income quartile: OR, 1.68; 95% CI, 1.45-1.94). The gradient between Income and screening rate was more pronounced in the aged 40 to 49 years population than in the other population. Conclusion : This study demonstrated that lower socioeconomic status is associated with decreased participation in gastric cancer screening. Our findings suggest that the screening program should be focused on low income and less educated population, especially in the younger adults to reduce health disparities. Keywords : Socioeconomic status, education, household income

PP25 S-263

THE IMPACT OF HEALTH CARE EXPENDITURES ON ECONOMIC STATUS AND HEALTH IN LATER LIFE

Jinhyun KIM, Jina HAN (*School of Social Work and Administrative Studies, Marywood University, USA*)

Introduction : Health care expenditures have been a significant financial burden, especially for the elderly poor. Older adults living in poverty spend a higher percentage of their income on health care expenses and are more likely to have poor overall health compared to their higher socioeconomic counterparts. This study aims to identify

longitudinal relationships between health care expenditures, economic status, and health among older population. Method : The panel data (2008 to 2009) from the Medical Expenditure Panel Survey (MEPS) was used to identify causal pathways between health care expenditures, economic status, and health. Among a total of 18,287 samples, those who are 65 years old and over (N=1,773) were selected. Latent growth curve modeling (LGM) was used to analyze health changes related to health care expenditures and economic status. Results : Health care expenditures significantly decreased the economic status of older adults. The economic status was significantly related to the initial health status, but it did not predict changes in health. Interestingly, health care expenditures had a greater negative impact on the economic status of elderly poor compared to their nonpoor counterparts. Finally, older adults whose economic status changed from middle- to low- income were more likely to suffer financial hardships due to health care expenditures. Conclusion : Health care expenditures might cause financial hardships, especially for the elderly poor, which in turn negatively affect their overall health. Financial support for out-of-pocket health care cost will be needed to reduce health disparities among older population. Keywords: health care expenditures, poverty, health

PP25 S-264

THE RELATIONSHIPS BETWEEN SMOKING AND PERSONAL & REGIONAL INCOME OF SILVER POPULATION IN KOREA

Junh-Ae RHEE (*Department of Preventive Medicine, Chonnam National University Medical School, Korea*)

Introduction : This study aimed to evaluate the impact of personal and regional incomes on smoking for adults after individual's various factors related with smoking are modified. Method : The total subjects over 60 were 68,803 and, 2,355 people without the information for smoking and income among them were excluded. 66,448 (male 28,056, female 38392) people were in the final-analysis. Multilevel logistic regression analysis was used to investigate the personal and regional incomes and smoking rates. Results : In male elder citizens, when adjust individual variables such as age, alcohol, and marital status, the highest individual income group shows low rates than the lowest individual income group in both city and rural areas. And when individual variable and personal incomes were revised, in case of male elderly, only in urban areas, the smoking rate of highest income area shows low value compared to the lowest income region. For elderly women, when individual variables such as age, alcohol, and marital status, only urban areas shows that the highest individual income area has low smoking rates than the lowest. On the other hand, when individual variables and personal incomes were corrected, only in rural areas, women shows higher smoking rate in the highest regional income areas than the lowest regions. The interaction of personal income and regional income has no significant meaning in both cases of male and female. Conclusion : This study shows that regional characteristics can have contextual impact on health behaviors in the individual level. Keywords : smoking, personal income, regional income

PP25 S-265

OLD GAY MEN: PATHWAYS TO FAMILY INTEGRITY

Liliana SOUSA, Filipa MARQUES (*Health Sciences, University of Aveiro, Portugal*)

Introduction : Current old gay men constitute a unique group as they represent individuals among the first cohorts to start living "out gay" lives. The family integrity approach offers an important framework for

the study of old persons and their families from a normative and developmental perspective. Therefore, this exploratory study examines old gay men specificities in the construction of family integrity (versus disconnection). Method : The sample comprises 11 participants (60 to 88 years old). Data were collected through a semi-structured interview that explores the construction of family integrity. Interviews were submitted to content analysis. Results : Main findings suggest three specificities in old gay men construction of family integrity: i) influence of homosexuality throughout life; ii) building a family of choice; iii) building a legacy associated to homosexuality. Conclusion: Results have implications to better understand old gay men family relationships. Keywords : old gay men; homosexuality; development; ageing; identity; family.

PP25 S-266
THE EFFECT OF MIDDLE AND ELDERLY WOMAN'S SKIN CARE ON HAPPINESS

Joung-Sook KIM (*Dept. of Beauty Care, Youngdong University, Korea*)

Introduction : The purpose of this study was to demonstrate effect of skin care for middle and elderly women in their sense of happiness, so that it could help respond proactively to ever-increasing demands of middle and elderly women for beauty care and also develop possible ways of silver industry. Method : In order to meet these goals, this study surveyed total 584 middle and elderly women who had ever been treated with skin care services. Results : First, the effect of middle and elderly women's skin care on the self-efficacy, self-esteem, and happiness showed that the skin care has a significant positive effect on the self-efficacy, self-esteem, and happiness. Second, the effect of middle and elderly women's self-efficacy and self-esteem on the happiness showed that the self-efficacy and self-esteem have a significant positive effect on the happiness. Third, an analysis of a mediating role of self-esteem in the relation between middle and elderly women's skin care and the happiness showed that an independent variable, skin care and a parameter self-esteem all have a significant effect in the three-stage, and a regression coefficient of parameter is sharply bigger than that of independent variable, which the self-esteem plays a mediating role. Conclusion : As a result, this study could demonstrate and conclude that middle and elderly women tend to feel confidence in their own choice and action owing to better sense of satisfaction with skin care, and confidence leads to improvement in their sense of self-efficacy and self-esteem, and better sense of happiness as well. Keywords : Middle and elderly women, Skin care, Happiness, Self-efficacy, Self-esteem

PP25 S-267
A STUDY ON USE BEHAVIOR AND SELECTION FACTOR OF SKIN CARE CENTER IN AGING WOMEN

Myungwoo KIM (*Dept. of Beauty Care, Youngdong Univ, Korea*)

Introduction : The purpose of this study was to be conducive to skin care of women in the aging period, and further to offer basic data necessary for operating skin care center, by examining the actual condition of skin care, the use behavior of skin care center, and the selection factor of skin care center in the aging women. Method : It made a survey on total 120 middle and elderly women living in some areas of Seoul in Korea to examine. Results : The following facts were clarified. Women in the aging period had high interest in skin care and did put the most emphasis on the facial region given the skin care. They used skin care center the most because of anxiety about aging and had high intention of using skin care center continuously. Also, women in the aging period preferred dermatologist's special clinic

more than general skin care center given the skin care, and recognized that the lack of professionalism is a problem, which needs to be improved most imminently. Conclusion : Given seeing these results, women in the aging period have a high desire for service of skin care center. middle and elderly women tend to feel confidence in their own choice and action owing to better sense of satisfaction with skin care. They used skin care center the most because of anxiety about aging and had high intention of using skin care center continuously. confidence leads to improvement in their sense of self-efficacy and self-esteem, and better sense of happiness as well. Keywords : Aging women, Skin care, Behavior of skin care

PP25 S-268
PRESENT SITUATION AND MEASURES FOR THE ELDERLY HAVING DIFFICULTY SHOPPING IN JAPAN

Hiroaki FUJII, Taizo ITO, Toshimi NAKATSUKASA (*Faculty of Wellbeing Science, Fukuyama Heisei University, Japan*)

Introduction : The purpose of this study is to clarify the present situation and measures for an increasing number of elderly people who have difficulty shopping in recent years in Japan. We can refine the elderly having difficulty shopping (hereinafter referred to as "EHDS") as the elderly who cannot buy daily necessities because there are no stores in their neighborhood. The livelihood of local residents in Japan has been ensured by such social resources as commercial facility, hospitals and public facility in good condition. For decades, however, Japanese commercial environment has changed greatly. The number of small stores and shopping streets which used to be many in Japanese local areas has decreased greatly because of the emergence of large suburban shopping malls or the successors problems in small stores. As a result many elderly people have come to have difficulty getting food and daily necessities. Method : 813 day service centers for elderly in Hiroshima prefecture were surveyed. We conducted a questionnaire survey to them. Results : 366 centers answered. 292 (79.8%) centers knew that there were "EHDS" among their users. 89(24.9%) centers conducted a support program for "EHDS". They worried about conducted such support programs. That is because public nursing care insurance system recognizes only the functional training as the program which allows "EHDS" to go out of the centers. Conclusion : We think effective measures should be taken for the support program for "EHDS" in every field including day service centers for the elderly. Keywords : the elderly, shopping, day service

PP25 S-269
CRISIS MAPPING OF SENIOR SERVICES AND SOCIAL MEDIA USE IN RESPONSE TO HURRICANE DISASTER

Wen DOMBROWSKI¹, Pete GIENCKE², Jimmy SHEN³, Leah M. VAUGHAN⁴ (*1. Health I.T., Social Media, and Aging Consultant, Resonate Health LLC, USA; 2. GIS Data Engineer, Crisis Response Team, Google.org, USA; 3. Data Analyst, Independent, USA; 4. Public Health Researcher, Director, The Health Policy Group, USA*)

Introduction : Hurricane Sandy disproportionately affected older adults. After the storm, there was chaos about how volunteers and professionals could help. Method : In response to this, various social media sites were used to receive and send updates about disaster relief. Additionally, a geriatrics physician technologist volunteer used social media to contact GoogleMaps, recruit technology volunteers, and partner with local senior centers to create a Senior Services Map of disaster-specific volunteer and donation needs of older adults, as well as create map of ongoing social and medical services for seniors(the help many older adults needed after the storm were meals, care

management, and services that senior organizations usually provide). Data for the map came from several sources: 510 locations in New York City from reformatting public directories, 101 locations from social media and crowdsourced submissions, and 108 locations from spreadsheets by a Long Island hospital that later partnered in this project. Results : Awareness of the Senior Services Map was spread by co-locating it with the highly publicized Google Gas Station Map and announcing it via email and social media. Community feedback was positive about the usefulness of geographically visualized local senior services. Regions beyond hurricane-affected areas requested similar maps as an ongoing resource and to prepare for future emergencies. Conclusion : Technology has enormous potential to help aging adults and their caregivers. Valuable I.T. tools can be created when stakeholders from different disciplines and organizations work together with aging experts. Furthermore, open data and crowdsourcing can enable large scale projects to be completed more quickly. Keywords : GIS mapping, interprofessional practice, information technology

PP25 S-270

ROLE OF SOCIAL WORKERS IN ELDERLY CARE FACILITIES -SELF-DETERMINATION AND COORDINATION BETWEEN MULTIPLE OCCUPATIONS-

Fujiwara YOSHIKO (*Jerontology, Yokohama National University, Japan*)

Introduction : The principle of respect for self-determination has been a central theme in the domain in social welfare work. However, various contradictions and problems to the principle have been pointed out and further research must be conducted to reorganize and understand the essence of the principle. There are people that can be self-determined and those that cannot (e.g. elderly people who have diminished decision-making abilities due to cognitive impairment). Therefore, it has been pointed out that providing support to develop self-determination has its limitations and restrictions. An empirical analysis was conducted on the role of social workers in collaboration with other types of workers when providing support for self-determination. Method : A semi-structured interview was conducted with five social workers that were providing support for the elderly with diminished decision-making abilities due to cognitive impairments. The continuous comparative analysis method was employed for the qualitative and inductive analysis interview contents. Characteristics of the coordination between social workers in the process of providing support for self-determination was collected and displayed as a figure. Results : This study identified five characteristics of coordination in elderly care facilities when providing support for self-determination: “listen (listen, inquire, empathize),” “connect,” “move forward,” “develop (spend time),” and “look (look, observe, assess, take care)”. Conclusion : The characteristics that were identified were reciprocally correlated. Social workers were better able to provide care that respected the intentions of the elderly, when they collaborated with different types of workers while making use of information from different work environments. Keywords : support for self-determination, role of social workers, coordination between multiple occupations

PP25 S-271

OLDER PEOPLE'S ATTITUDES TOWARDS SOCIAL WELFARE IN TAIWAN: DOES INTERGENERATIONAL SOLIDARITY MATTER?

Ju-Ping LIN, Chiu-Hua HUANG (*Human Development and Family Studies, National Taiwan Normal University, Taiwan*)

Introduction : In Taiwan, the increasing old-age dependency ratio puts states under rising financial pressure. Simultaneously, families with fewer children are faced with higher financial and caring responsibilities for their old-aged members. Do children and the elderly compete for restricted resources in families (and state)? It is important to notice that demographic trends can also influence intergenerational solidarity both privately in the family and publicly in society. Method : This study explored whether the experience of intergenerational solidarity within the family has an impact on older people's attitudes towards age related social welfare policy. Data were taken from the Taiwan Social Change Survey in 2011. Latent class analysis was used to develop types of older people's policy preferences. Results : Four types were found for older people's social welfare policy preferences: (a) Welfare state: government has responsibility for child and elderly care, (b) Government-oriented elderly care: elderly care was government's responsibility, (c) Cooperative: both family and government have responsibility to take care elderly, (d) Family centered: both child and elderly care were family's responsibility. Older people who have a stronger sense of family values, with higher levels of intergenerational exchange with adult children, are more likely to become the “family centered” type. Elderly's income is shown to have a pronounced effect, in that when elderly with lower income, the policy preferences are prone to be the “welfare state” type. Conclusion : The social welfare policy preferences of older people can be influenced by intergenerational relations with adult children and is not only subject to egocentric considerations. Keywords : Attitudes towards Social Welfare, Intergenerational Relations, Elderly

PP25 S-272

ASSOCIATIONS BETWEEN ORAL MUCOSAL IMMUNOCOMPETENCE OF INDEPENDENT AND FRAIL ELDERLY PERSONS AND SCREENING FOR PREVENTION OF NEEDED LONG-TERM CARE

Kimiko HIROTSU¹, Masayuki OKUDA² (*1. Faculty of Nursing and Human Nutrition, Yamaguchi Prefectural University, Japan; 2. Department of Environmental Medicine, Yamaguchi University Graduate School, Japan*)

Introduction : The relationships between secretory immunoglobulin A (SIgA) in the saliva of local elderly persons and the screening items for prevention of needed long-term care were studied. Method : The subjects were 25 independent females(primary prevention group) and 18 frail females(secondary prevention group), 65 years old or older, living in k town in Yamaguchi prefecture. The survey consisted of implementation of the care prevention medical examination basic checklist and investigation of subjects' life styles as well as measurement of anthropometry, care prevention physical performance tests and oral mucosa immunity (SIgA in saliva). Results : The secondary prevention group had high values in age (p=0.02). The primary prevention group indicated higher values of right grip strength (p=0.02) in physical performance tests. The secondary prevention group showed slower TUG values (p=0.04). The primary prevention group indicated faster rates of saliva secretion (p=0.04) and SIgA secretion (p=0.02). The secondary prevention group revealed more problems with the life-style questionnaire regarding questions such as “problems with one's meals” (p=0.04), “necessity in improving one's meals” (p=0.04), “difficulty in salivation” (p=0.03) and “living alone” (p=0.02). Conclusion : The secondary prevention group with decreased physical strength indicated slower rates of saliva and SIgA secretion. Saliva which moistens oral mucosa plays an important role in the maintenance of health of oral tissues, and people with oral disorders such as dysmasesis, dysphagia, lower denture retentive forces and dysgeusia increase as their amounts of saliva decreases.

This study suggests that prevention of “oral dryness” will result in the maintenance of oral mucosal immunocompetence. Keywords : Independento elderly person, Frail elderly person, SlgA

PP25 S-273

CURRENT STATUS AND CHALLENGES OF NURSING HOMES THAT EMPLOYED EPA LONG-TERM CARE WORKER CANDIDATES: FINDINGS FROM 57 NATIONWIDE INTERVIEW STUDIES

Noriko TSUKADA (*Graduate School of Business, Nihon University, Japan*)

Introduction : It has been four years since Japan officially opened its long-term care (LTC) labor market for foreign workers in August 2008, based on an Economic Partnership Agreement (EPA) with the Republic of Indonesia. The purpose of this study is to find out how senior personnel of the nursing homes, which employed EPA candidates would perceive their experience and what they would suggest to improve the current EPA scheme. Method : The structured-interview data, obtained from senior personnel of the 57 nursing homes between August 2010 and January February 2011, were qualitatively analyzed. Results : All respondents cited that EPA candidates work very hard with smiles and sincere attitude towards residents. Contrary to their original expectations, cultural differences were not a huge barrier. The respondents, however, found that EPA candidates had poor skills in writing the Japanese language. The respondents' biggest concern was the national qualification exam for a certified care worker where EPA candidates have once chance to take it. Most frequently cited suggestion was “to give them a second chance to take the exam”. Conclusion : Knowing that an Indonesian candidates' pass rate (37.9%) for the national exam in January, 2012 was lower than the Japanese counterparts (63.7%), it is suggested that the EPA scheme be modified to either accept candidates who already have minimal Japanese language skills at the time of their entry to Japan or by creating another visa status to allow migrants to work without a national qualification if they meet certain levels of Japanese language proficiencies. Keywords : Economic Partnership Agreement , Long-term care workers, Foreign workers

PP25 S-274

FEASIBILITY OF WORKING AS A PREVENTIVE CARE PROGRAM : THE CASE OF SHRC

Tomoaki ISHIBASHI¹, Mayumi HARIGANE², Masato OKA³, Hisao OSADA⁴, Yasunori KOMATSU⁵ (*1. Research Division, The Dia Foundation for Research on Ageing Societies, Japan; 2. Research and Consulting, Seed Planning, Inc., Japan; 3. International College of Arts and Sciences, Yokohama City University, Japan; 4. Graduate School of Gerontology, J. F. Oberlin University, Japan; 5. Managing Director, The Dia Foundation for Research on Ageing Societies, Japan*)

Introduction : Japan's Silver Human Resource Centers (SHRC) program provides temporary and short-time jobs for persons aged 60 or older.°°This study examined the feasibility that working at SHRC could be a preventive care program. Method : The subjects were 1,981 members at the age of 65 and over belonging to the SHRC of A City in Tokyo. They were divided into Risk (n=469) and No Risk (n=1,512) groups by the national government screening test for preventive care. One year later, we made a survey on monthly incomes, job contents and withdrawal from the SHRC over the year. Results : The proportion of working was 78.3% with the Risk Group and 82.7% with the No Risk Group (P=0.05). However, when their monthly income and the ratio of withdrawal (2.2%) were compared with the No Risk Group, it

was not statistically significant. The job contents for Risk Group were mostly cleaning up public parks and inspection of locking-up in case of men and sweeping in the facilities and packing in case of women. Conclusion : The reasons why the frail elderly were able to continue work could be explained by the following factors. First, the nature of jobs was easy, light and of low-risk. Second, those jobs were group work consisted of two to five persons, which may allow them to cope with problems collectively. The significantly low rate of withdrawal suggests that the work program at SHRC can be evaluated as a kind of preventive care program. Keywords : prevention, working

PP25 S-275

ACCEPTABILITY OF NASOGASTRIC FEEDING AMONG CAREGIVERS OF GERIATRIC IN-PATIENTS IN A MALAYSIAN

Nordiana NORDIN, Mau Pin TAN (*Geriatric Unit, Medical Department, University Malaya Medical Centre, Malaysia*)

Introduction : Dysphagia is a common condition among geriatric inpatients. Nasogastric feeding is often prescribed for such patients, which could lead to increased care-giver burden. We conducted a study to determine the acceptability of nasogastric tube feeding among caregivers of geriatric in-patients in Malaysia. Method : Face-to-face interviews were conducted with immediate caregivers of geriatric patients with and without NG feeding in our acute geriatric ward using an interviewer-administered questionnaire. Statistical analysis was performed with SPSS and Chi-squared test. Results : 70 care-givers were interviewed, 59(84%) were spouses or children. 57(81 %) carers felt they would have NG feeding in the future. 44(63%) of them felt ng feeding was an acceptable method of feeding during the terminal phase of life, while 19(27%) disagreed with NG feeding during the end-of-life. Reasons for disagreeing were, “it will not make a difference” (11/19(58%)) and “doctors should not interfere with the dying process” (5/11(26%)). There was a significant difference in acceptance of NG feeding with level of education [3/5(60%) no formal education, 4/9(44%) primary education, 23/28(82%) secondary education and 27/28(96%) tertiary education; p=0.003]. The acceptance of NG feeding during end-of-life care did not differ with education level or ethnic group. Conclusion : Majority of caregivers agreed with the use of NG feeding at the end-of-life. The acceptability of NG feeding differs with educational level. Future work needs to be conducted to evaluate the reasons behind the popularity of NG feeding in our setting and the benefits or harm related to NG feeding in our patient group. Keywords : Nasogastric/ perception

PP25 S-276

ASSOCIATION BETWEEN WISDOM AND CAREGIVER WELL-BEING: A NEW HORIZON?

Patrick NG¹, Vivian W.Q. LOU² (*1. University of Hong Kong, Hong Kong; 2. Social Work and Social Administration, University of Hong Kong, Hong Kong*)

Introduction : This cross-sectional study examined the relations between stress and coping predictors and psychological well-being among dementia family caregivers. Caregiving burden has a direct negative impact as stipulated in the infamous stress and coping model. Whether the caregivers would develop depressive symptoms depend on the amount of stress they have encountered, such as the severity of care recipients, level of caring demand, the availability of coping resources, and the ability of the carers to adjust. Although literature suggests caregiving afford benefits, these components have not been conceptualized as wisdom. The construct has never been incorporated into the model to entail caregiver resilience. Method : A cohort of 108

dementia family caregivers in Hong Kong completed questionnaires and interviews. Predictors for well-being included caregiving parameters, social support, coping strategies and wisdom. Results : Similar to previous empirical findings: caring people with dementia of more behavioural problems was related to more caregiving burden ($p<0.01$), and the caregivers were more depressed ($p<0.05$). Better perception of social support helps to reduce caregivers burden ($p<0.05$). Regression analyses indicated that after controlling for the effects of relevant caregiving demographic parameters, caregiver stress and coping resources, higher level of wisdom predicting better well-being ($\beta=-0.20$; $t=-2.15$; $p<0.05$). Wisdom was also associated with more use of problem-based coping strategy ($p<0.01$). Conclusion : Findings support interventions that aim to enhance the psychological well-being of dementia caregivers should concentrate on improving their wisdom, so that greater exposure to caregiving stress does not translate into greater distress. The moderating effect of wisdom to caregiver stress is yet to be investigated. Keywords : Dementia, caregivers, wisdom

PP25 S-277

DOES THE EFFECT OF CAREGIVING DEPEND ON THE NATURE OF THE RELATIONSHIP BETWEEN THE CAREGIVER AND CARE RECIPIENT? THE MODERATING EFFECT OF RACE

Eun Ha NAMKUNG¹, Jan GREENBERG¹, Jieun SONG², Marsha M. MAILICK¹ (1. *Social Work, University of Wisconsin - Madison, USA*; 2. *Waisman Center, University of Wisconsin - Madison, USA*)

Introduction : Relatively little known is whether the effects of caregiving differ depending on the nature of the role relationship between the caregiver and care recipient. This study examined: (1) whether caregiving has a differential effect on caregiver well-being depending on the caregiver's relationship with care recipients (i.e., spouse, parent, adult child or sibling), and (2) whether the effect of caregiving on well-being is moderated by the race of the caregiver. Method : Using data from the Midlife in the United States (MIDUS), this study analyzed 79 spouses, 67 parents, 272 adult children and 41 siblings who self-identified as caregivers, as well as 4,810 non-caregivers as a comparison group. Standard measures of physical and mental health were administered. The data were analyzed using multiple regression. Results : Caregiving had its greatest toll on parents caring for a child with disabilities. Compared to the non-caregiver group, these parents reported poorer mental and physical health, higher levels of depression, lower levels of life-satisfaction and less control over their lives. Non-white parent caregivers reported poorer mental health than their white counterparts caring for a child with disabilities. Spouse caregivers reported higher levels of depression and lower levels of life-satisfaction and less control over their lives, while sibling caregivers showed higher levels of depression and lower levels of life- and self-satisfaction. Adult child caregivers for their parents only differed from the non-caregivers with respect to higher levels of depression. Conclusion : Given the heterogeneity among family caregivers, this study gives implications for researchers and service providers to consider their differing needs. Keywords : family caregiving, race, mental health, physical health, parent caregiver

PP25 S-278

WHO RECEIVES INFORMAL AND FORMAL CARE IN ICELAND ?

Sigurveig H. SIGURDARDOTTIR¹, Ingemar KAREHOLT² (1. *Faculty of Social Work, University of Iceland, Iceland*; 2. *Institute of Gerontology, School of Health Sciences, Jonkoping University,*

Sweden)

Introduction : Even if older people in the Nordic countries living in their homes usually have good access to formal help, the family plays an important role. The aim of this study is to analyze the patterns of informal and formal IADL and PADL care of older people living at home in Iceland and to describe how help and care varies depending on the degree of limitations, the gender of the recipient and whether she/he is cohabitating or not. Method : A random nationally representative telephone survey (ICEOLD) among persons 65+ living in their homes in Iceland is used. N = 782, 441 woman and 341 men. The response rate was 66%. The participants were asked about their living standards and the help they received from formal and informal care givers. Results : The results show that cohabiting men are much likelier to receive informal IADL help and much less likely to receive formal help than men not cohabiting. The majority of the respondents with IADL or PADL limitations received either informal or formal help but not both, indicating substitution rather than complementation. More persons receive informal care than formal care, which shows the importance of the family. When the IADL limitations increase, the informal care increases for men but not for women. This indicates that the informal care steps in among men with increasing limitations. Conclusion : Informal care is an important factor in the total provision of care for older people. The results indicate that cohabitation is important for receiving informal care, especially for men. Keywords : informal care, formal care, cohabitation

FACTORS AND STRUCTURES OF HEALTH-RELATED QUALITY OF LIFE OF TURKISH AND POLISH MIGRANTS AND GERMANS -UNDER THE CONSIDERATION OF GENDER AND AGE

Johanna Maria BUCHCIK¹, Joachim WESTENHOEFER¹, Colin R. MARTIN² (1. *Health Sciences, Hamburg University of Applied Sciences, Germany*; 2. *Mental Health, School of Health, Nursing and Midwifery, University of the West of Scotland, United Kingdom*)

Introduction : The number of elderly migrants in Hamburg (Germany) will increase significantly in the coming years. Turkey and Poland represent the largest countries of origin (Statistics Office for Hamburg and Schleswig Holstein, 2010). The aim of the PhD-thesis is to examine and to analyze (comparatively) the factors and structures of the multidimensional and subjective (perceived) HRQOL of a total of 300 Turkish, Polish and German women men aged over 60 and living in Hamburg. Method : To satisfy the multidimensionality and the subjectivity of HRQOL a comprehensive questionnaire is being used. It includes questions dealing with their (perceived) health status, medical service from GP, HRQOL (SF-36), sport and physical activity, consumption of alcohol/tobacco, nutrition, self-efficacy, experience of discrimination in Germany, social networking/contacts, leisure activities and religion. Additionally, the socio-demographic and socio-economic data is being collected. The surveys are being conducted in selected districts in Hamburg in the appropriate mother tongue. These districts were chosen due to the high proportion of people with migration backgrounds living there (see Statistics Office for Hamburg and Schleswig Holstein, 2010) and allows a district-based comparison between the three target-groups. Results : The results will be analyzed using the statistics program SPSS 19. Possible group differences will be seen using t-test and ANOVA. Factor structures of HRQOL will be analyzed using Factor Analysis as well as structured linear models (using AMOS). Conclusion : Along with the demographic change, the importance of health promotion and prevention and health-related quality of life (HRQOL) are becoming

more and more important in research on older migrants Keywords : health-related quality of life, migration, age

MODEL OF SUPPORT FOR FAMILY CARERS AT HIGH WOMEN'S EMPLOYMENT RATE IN SLOVENIA

Ksenija RAMOVŠ, Joze RAMOVŠ (*Social Gerontology, Anton Trstenjak Institute for Gerontology and Intergenerational Relations, Slovenia*)

Introduction : Slovenia has among the EU countries two important features regarding political and technical assistance for elderly care at home: the population is one of the oldest, women's employment rate is among the highest. In the national survey of needs, abilities and attitudes of the population 50 + research was included also the care of the elderly, carried out by family members. Mostly it is provided by daughters (47.5%), majority of them full-time employed and having family, being under extreme pressure. The care of the sick and weakened they provide, having no training and rarely with public assistance, because Slovenia has very low proportion of home care in EU. Method : Based on their needs, National Institute of gerontology has developed an effective model for family carers' training and their self-organizing in local communities. Training consists of eight two-hour learning sessions once a week. It is going on in groups, attending by about 15 family carers, with an active method of social learning from own experience and expertise, a separate manual is provided. Results : Topics: communication with the old person - especially when socially unpleasant, dementia, care for carer's own health and fitness, the techniques and care (the local home care nurse and physiotherapist), and psychosocial situation management, when older person cannot be cared at home, death and mourning. Conclusion : During the course a group becomes closely linked. At the end of training is suggested to continue with the meetings once a month in the 'local relatives club' working on the principle of self-help group. Keywords : family carers, support

PP25 S-281

CURRENT STATE AND ISSUES REGARDING FAMILY SUPPORT PROVIDED BY NURSING HOME STAFF: COMPARISON OF SUPPORT CONTENT AMONG CARE-RELATED OCCUPATIONS

Masako OKAYASU-KIMURA¹, Mari KATAOKA², Masako HAYASHI², Mariko NISHIKAWA³, Kazumi TAWARA¹ (*1. Department of Nursing, The University of Shimane, Japan; 2. Department of Nursing, Kochi University, Japan; 3. Department of Nursing, Hiroshima International University, Japan*)

Introduction : It has been revealed that the emotional ties with the family affects the health of the elderly. Therefore, In cases where an elderly person has to be admitted to a nursing home due to physical and/or mental disability, cooperation between the nursing home and the family is an important issue that is directly linked to quality of life of the elderly patient. Method : To elucidate the current state and issues regarding family support provided by nursing home nurses, care workers and counselors. A 27-item questionnaire survey regarding family support was conducted on 1500 randomly selected staff at nursing homes across Japan. Results : A total of 199 valid responses were obtained (13.2%), including 54 nurses, 62 care workers, 77 lifestyle counselors and 6 blanks. Factor analysis of the 27 items identified 6 factors as family support. Comparison of scores for each factor among the three occupations revealed higher scores for counselors than care workers for factors 1 'constructing and adjusting interpersonal relationships' and 4 'role execution as a guardian'.

Conclusion : Despite superficial differences in support for families provided by different occupations, there were no marked differences in the details of support content. Welfare-related tasks appear to be undifferentiated. In order to achieve cooperation among different occupations, clear specification of expertise and task allocation are required. This study was supported by a grant Unvers Foundation. Keywords : nursing home, care-related occupations, family support

SOCIAL SUPPORT AND LIVING ARRANGEMENT OF THE ELDERLY IN TAIWAN

Miao Yu LIAO¹, Hui-Wen LIN², Chun-Chung LIAO³, Meng-Chih LEE⁴ (*1. Geriatric Department, Taichung Hospital and Institute of Medicine, Chung Shan Medical University, Taiwan; 2. Department of Family Medicine, Taichung Hospital and Institute of Medicine of Chung Shan Medical University, Taiwan; 3. Family Medicine Department, Taichung Armed Forces General Hospital and Institute of Medicine of Chung Shan Medical University, Taiwan; 4. Superintendent, Taichung Hospital and Institute of Medicine of Chung Shan Medical University, Taiwan*)

Introduction : The research on the advantages and disadvantages of different living arrangements of the elderly has not been available for many countries, we try to check the relationship of social support and living arrangement of the elderly in Taiwan. Method : Study population was from the source of Health and living status in Taiwan. Panel Study Of Longitudinal Design. Random samples from the year 1996 ,2003 and 2007, We use SAS 9.2 , Descriptive statistics Chi-square, test and Anova. Results : There are 1304 Male and 1267 Female. Emotional support will affect living arrangement. (OR:1.14 , P£0.001) ; especially those Live alone and live with spouse . Instrument support , age, disease numbers also will affect live alone and live with spouse . Conclusion : Social support has significant relationship with living arrangement, the trend of living arrangement for the elderly in Taiwan is changing now. The higher the social support, the more rate living with family. Keywords : social support . Living arrangement

PP25 S-283

THE CAREGIVING EXPERIENCES OF THE CAREGIVERS OF INDIVIDUALS WITH DEMENTIA

Tsui-Ying WANG¹, Ho-Chuan HUANG², Shih-Han HUANG¹ (*1. Department of Occupational Therapy, National Cheng Kung University, Taiwan; 2. Department of Information Management, National Kaohsiung University of Applied Sciences, Taiwan*)

Introduction : The purpose of this qualitative research is to investigate the daily experience for the family caregivers who took care of the individuals with dementia. Method : Six female caregivers who lived in south Taiwan were interviewed in person with questions regarding how the typical routines were like and how were their lives like when they managed the caring for their relatives living with dementia. Interviews were tape-recorded and transcribed verbatim for data analysis. Results : Using grounded theory method, there were six main themes emerged in this study. They are 'change of daily life structure', 'family or social support as a motivator', 'behavior and psychological symptoms as stressors', 'psychological and physical distress', 'aspiration for taking a break', and 'self-efficacy in managing the care duty'. The results showed that as the disease progressed, the caregiver experienced more restriction in their own lives, and the family support and social support from professional guidance and services would ease the stress. Otherwise, the sustained caring experience would have adverse effect for the health of the caregivers. Conclusion : This

research extends the knowledge in understanding the adaptation processes and factors related to caring for elderly with dementia. The findings also provide readers to recognize the care for the caregivers' needs to improve their health. Keywords : care-giver, dementia, experience

PERCEPTION OF ALZHEIMER'S DISEASE IN THE FRENCH POPULATION

Alice BREINING¹, Benoit LAVALLART², Stephanie PIN³, Christophe LEON³, Sophie MOULIAS⁴, Pierre ARWIDSON⁵, Francois BECK⁶, Claudine BERR⁷, Marc VERNY¹ (1. *Geriatrics, Pitie Salpetriere Hospital APHP - UPMC Paris 6, France*; 2. *Health, Ministry for Health, France*; 3. *Research, National Institute for Prevention and Health Education, France*; 4. *Geriatrics, Ambroise Pare Hospital APHP, France*; 5. *Director of research, National Institute for Prevention and Health Education, France*; 6. *Head director, National Institute for Prevention and Health Education, France*; 7. *INSERM U1061, La Colombiere Hospital INSERM, France*)

Introduction : To improve care taking of patients with Alzheimer's disease (AD), the French government decided to launch an action plan. The aim of this study was to investigate the perception, knowledge, opinions and beliefs about AD in the French population. Method : A telephone survey was performed in 2008. The respondents answered a questionnaire in which they were presented with a series of attitudinal statements about health in general and AD. Results : A total of 2013 persons, representative of the French population, were investigated. Main results are summarized as followed: (1) Respondents think that AD can be devastating for a family (93%). This calamity feeling is prevailing in elderly persons >75 years old and in people who know an AD patient. (2) General population does have a quite good knowledge about AD, but still lacks of knowledge on beginning stages: 95% of responders considered that difficulties to manage administrative papers are suggestive of early AD as difficulties to find their way back home. (3) An overwhelming majority of the population (91%) would like to know the diagnosis if they had AD. (4) Thirty eight per cent of the population know or have known at least one patient within their circle of acquaintances. People do think that the care of AD's patient can be better but they trust in the French government to improve it. Conclusion : Representation of AD is changing in a positive way and, even though AD is perceived as a real plague, people are confident that solutions will be found in the future. Keywords : Alzheimer's disease, perception, French population

PP25 S-285

PRESENT SITUATION OF TERMINAL CARE IN JAPAN: FINDINGS FROM A SURVEY ON HOME-VISITING NURSING SERVICES AND SPECIAL NURSING HOMES FOR THE ELDERLY

Harumi ARAKI¹, Takae IMAGAWA¹, Mariko NIKURA², Yasuko SUMITANI¹ (1. *Department of Nursing, Toyama College of Welfare Science, Japan*; 2. *Gerontological Nursing, Graduate School of Medicine and Pharmaceutical Sciences for Research, University of Toyama, Japan*)

Introduction : The place at which terminal care is provided has become important, with Japan's aging society. The home and special nursing homes for the elderly (henceforth facilities) have been recommended instead of hospitals as terminal care centers. This study identifies problems with terminal care by examining the present situation of home-visiting nursing services (henceforth services) and

facilities. Method : Anonymous questionnaire surveys were completed by users of services and facilities and their caregivers in prefecture A. The survey on services was conducted biennially, and the response rates were 69.5%, 64.7%, 69.5%, and 66.8% in 2005, 2007, 2009, and 2011, respectively. The survey on facilities was conducted in 2012 (46 facilities; response rate 68.7%). The results were simply totaled. The study was approved by the ethics committees of the organization the authors are affiliated to. Results : Mean age and sex distribution of user samples did not drastically change across surveys. The average age of caregivers was 65 years; 80% were the users' children and spouses. Among both the users and caregivers, 55% wished for terminal care to be provided at home (55%), 31% were not sure, and 1% desired to use a facility. Many patients in facilities died at night. Facilities had an average of 4.9 full-time nurses; nurses worked at night in one facility. Approximately 40% of the patients died in hospital. Conclusion : Elderly patients should be supported in expressing their desires regarding terminal care. A system must be established to encourage elderly patients to use facilities for terminal care. Keywords : terminal care, home-visiting nursing service, nursing home

BEING PERCEIVED AS A "VISITOR" IN THE NURSING STAFF'S WORKING ARENA-THE INVOLVEMENT OF RELATIVES IN DAILY CARING ACTIVITIES IN NURSING HOMES IN SWEDEN

Jessica HOLMGREN¹, Azita EMAMI², Lars E ERIKSSON¹, Henrik ERIKSSON³ (1. *Dept. of Neurobiology, Care Sciences and Society, Karolinska Institutet, Sweden*; 2. *College of Nursing, Seattle University, USA*; 3. *The Red Cross University College, Sweden*)

Introduction : It is both complex and difficult for relatives when a family member moves into a nursing home and many relatives are not prepared for the realities these new situations entail. Little attention has been paid to scrutinising the involvement of relatives in patient care, particularly in relation to the structures and routines of nursing homes or to the staff's reasoning concerning their involvement. The aim was to describe, from a gender perspective, how nursing staff's routines and reasoning act to condition the involvement of relatives in nursing homes. Method : Focused ethnographic fieldwork was conducted in three different nursing homes in Sweden. Results : The nursing staff assign a certain code of conduct to all relatives they perceived as "visitors" in their working arena. This code of conduct was related to the routines and subcultures existing among the nursing staff and stemmed from a division of labour; the underlying concept of "visitor" predetermined the potential for relatives' involvement. This involvement is explicitly related to the general gendered characteristics that exist in the nursing staff's perception of the relatives. Conclusion : It is essential to develop mechanisms that provide opportunities for nursing staff in elderly care to reflect upon the gendered power structures that exist in the nursing home culture. These issues have to be further explored to gain a deeper understanding regarding relatives and their involvement in nursing homes in order to facilitate the transition from informal caregiver to "visitor". Keywords : Nursing home staff, relatives, gender perspective

RESEARCH ON SUCCESSFUL AGING

Jiang BO (Department of Social Work, Kawasaki University of Medical Welfare, Japan)

Introduction : Introduction: This research aimed at clarifying the meaning of Successful Aging for the elderly people who reside in

urban areas of central China. Method : Method: The aim, method and ethical implications of the research were explained and participants signed consent forms. Thereafter, semi-structured interviews were conducted based on questions resulting from an in-depth literature review. The resulting data was analyzed using exploratory analysis to reveal qualitative factors. Results : Results: The following 6 components of successful aging were identified: the meaning of aging included conceptions of 'national stability', 'physical well-being', 'contentment', 'family ties', 'secure longevity', and 'productivity in society'. Most participants were satisfied with their present life to a certain extent and this was explained through a narrative of putting energy into keeping yourself healthy in old age. Moreover, other prevalent narratives were able to contribute to the state and prizing one's family relations. Conclusion : Conclusions: This study supports the findings of Rika et al, that elderly people who reside in urban areas of China were relatively satisfied with the present state, were anxious about health, attached importance to family relations and put their trust in social security provided by the state. Keywords : secure longevity °family ties °elderly people in China.

DILEMMA OF MOVING HOUSING FOR THE ELDERLY LIVING IN A HOUSING COMPLEX IN JAPAN: CARE PREFERENCES AND CARE CAPITAL OVER THEIR LIFE COURSE

Mai YAMAGUCHI¹, Mie MORIKAWA², Rie YAMANOI³, Akiko SAITO⁴, Shizuko NAGATA⁵, Harumi SASATANI⁶ (1. Department of Social Work, Japan Lutheran College, Japan; 2. Department of Social Services, National Institute of Public Health, Japan; 3. Department of Humanities, Meisei University, Japan; 4. Research Fellow, The Japan Society for The Promotion of Science, Japan; 5. Sapporo International Junior College, Sapporo International College, Japan; 6. Department of Education, Hokkaido University of Education, Japan)

Introduction : To promote comprehensive community care, housing and caring for the elderly is an emerging agenda especially after the 2012 Revision of the Long-term Care Insurance (LTCI) program in Japan. The objective of this study is to examine dilemma of moving housing for the elderly living in a housing complex, by analyzing their care preferences of combination pattern of formal and informal care. Method : The subjects were 429 elderly living at Housing complex B in City A in Tokyo. Home-visit structured interviews were completed for 196 elderly (response rate: 46.0%). We measure their preference for formal and/or informal care at the timing of widowhood, preferences of informal carers, and their preferences of living place at the timing when they need care (open-ended question). Results : 1) As for the preference for formal and/or informal care (IADL care), 36.7% of respondents preferred only formal care, while 52.1% preferred both formal and informal care and 11.2% preferred only informal care. 2) As for the preference for informal carers, daughters°°(48.2%)°°and sons (25.9%) were more preferred than daughters-in-law (3.5%). 3) Multivariate analysis of their preferences indicated that the availability of support from their children was significantly correlated to preference of formal care. Conclusion : Our findings suggest that there is a wide variety of care preferences depending on their care capital (care resources) over their life course and that most of them are facing dilemma of moving housing in spite of their preferences to live at the housing complex as long as possible. Keywords : care preferences, elderly, housing

CHARACTERISTICS OF ELDER-TO-ELDER CARE

Mariko NIIKURA¹, Rina TANAKA², Sayumi YOSHIOKA², Harumi

ARAKI³, Yasuko SUMITANI³ (1. Gerontological Nursing, University of Toyama, Japan; 2. Nursing, Kanazawa University Hospital, Japan; 3. Gerontological Nursing, Toyama College of Welfare Science, Japan)

Introduction : The rapid aging of Japan's population and associated increase in the elderly population have resulted in a corresponding increase in the number of elderly individuals requiring nursing care. The present study aimed to clarify the characteristics of elder-to-elder care(elderly nursing care provided by another elderly person) and investigate issues regarding continuing with home care. Method : In September 2011, an anonymous questionnaire survey was conducted on 1,099 family caregivers of patients using 31 home care agencies that consented to participate among the 37 home care agencies in X Prefecture. Of the 734 responses obtained (collection rate, 66.8%), those from 582 family caregivers over 40 years old caring for patients over 65 years old were analyzed. The study was approved by the ethics review board of the authors' affiliated institution. Results : Mean patient age was 82.9(SD 8.5) years while mean family caregiver age was 67.2(SD10.1) years [40-64 years, n=261 (44.8%); 65-74 years, n=164 (28.2%); over 75 years, n=157 (27.0%)]. The over 75 years group compared to the 40-64 years group had significantly higher mean scores for sense of caregiving burden, significantly more kinds of home care burden, significantly lower numbers of social activities and hobbies and a significantly higher proportion of individuals requesting health management for themselves from the visiting nurses. Conclusion : The present findings indicate the importance of increasing the use of nursing care services in order to alleviate the caregiving burden and of supporting the health management of family caregivers particularly in cases of elder-to-elder care by family caregivers over 75 years old. Keywords : elder-to-elder care, family caregivre, care burden, home care

A COMPARTIVE STUDY OF GENGDER ROLD IDENTITY BETWEEN KOREAN ELDERLY MAN AND WOMAN

Myungae Kim KIM¹, Sung Hee KOH², Eun-A. PARK³ (1. College of Nursing, Keimyung University, Korea; 2. Department of Nursing, Chonbuk National University, Korea; 3. Department of Nursing, Pukyong National University, Korea)

Introduction : The perception on gender role identity is subjective and varies across individual experiences and values of a social culture. Korean elderly adults are the generations who internalize the patriarchy and the distinctive perception between genders. The purpose of this study is to seek a desirable direction of an elderly care by comparing and culturally considering the difference in the gender role identity between Korean male and female elderly adults. Method : Q-methodology, a technique for extracting subjective opinions, was used. The Q sample has two categories: representing masculinity and femininity. Each category has 20 statements, resulting in 40 adjectives. P samples are 40 elderly men and 40 elderly women. Results : There are four factors in older male about the perception of gender role identity; 'caring-affectionate type' 'assertive-confident type,' and 'sensitive-affectionate type.' There are three factors in older female; 'powerful-confident' 'caring-affectionate' 'affectionate - leading' and 'sensitive-affectionate.' Both elderly men and elderly women are turned out to have two types in common: "Caring-affectionate type" who is generous, putting effort into understanding and sympathizing with others, and "sensitive-affectionate type" who is romantic, loving beautiful things, and who is compassionate having a sensitive character and comforting others. Conclusion : There is a deep perception of a traditional patriarchy, masculinity and femininity in

Korean elderly men and women. And they have specific characteristics in common in terms of gender role identity. Social-psychological adaptations of aging, and understanding family role performances between married couples will be promoted by understanding their features and differences in their types of gender role identity. Keywords : gender role identity

THE PERSPECTIVE DIVERSITY ON THE AGED BY UNIVERSITY STUDENTS IN DIFFERENT GENERATIONS

Shu Tzu CHENG¹, Yoko HOSOE², Ching-Sung LEE³ (1. *Family Studies and Child Development, Shih Chien University, Taiwan*; 2. *Living and Health Science Education, Joetsu University of Education, Japan*; 3. *Restaurant, Hotel and Institutional Management, Fu Jen Catholic University, Taiwan*)

Introduction : Demographic variables of university students have been examined for their influence on perspectives held about older people. The purpose of this study is to compare and analyze the perspective diversity on the aged by university students in different generations. Method : The studies were conducted both in 1997 and 2011 respectively, employing self-administered questionnaires based on a semantic differential scale. The samples consisted of 240 male students and 438 female ones from 14 universities in 1997; and 218 male and 271 female students from 9 universities in 2011 in Taiwan. Results : 1. There was a significant difference in perspective on the aged by university students in different generations. Comparatively, most students of young generation had an affirmative view, negative perspective only on items of °Πhard°π,°Πconservative°π,°Πsubjective°π,°Πstubborn°π,°Πemotional°πand°Πslow°π. 2. A factor analysis identified three semantic spheres. They were: °ΠActive°π,°ΠSocial°πand°ΠCoordination°π. °ΠSocial°π ranked the highest, °ΠCoordination°πthe second and °ΠActive°πthe third. It demonstrated clearly that university students held a negative view on °ΠActive°πof the aged. 3. There was no significant difference of perspective on the aged as to the variable of °Πexperience of living with grandparents°π. Conclusion : Comparatively, the perspective on the aged of young generation university students held an affirmative evaluation. Keywords : Perspective diversity on the aged, generation, experience of living with grandparents

PP25 S-292

NEEDS FOR TERMINAL CARE OF PERSONS WHO IDEALIZE 'DYING WITHOUT TROUBLING OTHERS' -A SURVEY IN A RURAL COMMUNITY IN JAPAN -

Tomoko ITO¹, Maki KATO¹, Ryosuke MOROOKA², Reiko AGAWA³, Hiroshi ASAMI³ (1. *School of Nursing, Shimane Prefectural University, Japan*; 2. *Faculty of Education, Shimane University, Japan*; 3. *School of Nursing, Ishikawa Prefectural Nursing University, Japan*)

Introduction : In the Japanese society, many people have collective conception on life and death, and idealize 'dying without troubling others'. The aim of the present study is to clarify their needs for terminal care. Method : A survey was conducted using self-reported questionnaire by post-mail for 800 persons from forties to seventies in a rural community in Japan. Results : Over 70% of the participants in every generation idealize 'dying without troubling others.' There were significant differences in 'residence with the spouse', concern about death with dignity' and 'need for continuation of medical treatments' between groups of those who idealize 'dying without troubling others' and those who don't. However, there were no significant differences in 'place for terminal medical treatment' between the two groups.

Comparison between these two groups about the conditions of 'realization of death at home' indicated significant differences in 'support of visitor nurses' and 'own will'. It was suggested that those who idealize dying without troubling others did not want to disturb their spouse, did not want the life prolonging treatment, and hoped for death with dignity. While these persons didn't want to trouble others, they thought that they could receive medical care at home by 'their own will' and 'support of visitor nurses'. Conclusion : Needs for terminal care of the persons who idealize 'dying without troubling others' were 'respect for their own will' and 'fullness of the social resources. Keywords : Conception on life and death, Dying without troubling others, Terminal care

PP25 S-293

MARITAL RELATIONSHIP AND CARING ATTITUDES OF AGED SPOUSAL CAREGIVERS

Yuko HARASAWA¹, Kiyomi YAMADA² (1. *School of Nursing and Health, Aichi Prefectural University, Japan*; 2. *School of Nursing, Nagoya City University, Japan*)

Introduction : This study aimed to describe the emotional aspect of aged Japanese spousal caregivers in terms of their marital relationship and to examine the effect of marital relationship on caring attitudes. Method : At first, data were collected by semi-structured interview, and were analyzed qualitatively and inductively. The participants were 16 spousal caregivers, aged over 65 years old. The findings indicated that marital relationship had 20 items of emotional aspects and 10 items of caring attitudes. Next, survey data from 205 spousal caregivers and 306 non-spousal caregivers, aged over 65 years old, were used. By using Exploratory factor analysis, the above 20 items were summarized into 13 items including 3 subordinate concepts. The 13 items were named Marital Relationship Balance Index (MRBI) and 3 subordinate concepts were named "mutual support", "one-way support" and "self-helping". MRBI ensured internal consistency as Cronbach's $\alpha = .902$. Results : Factors Related to MRBI were "mental health condition" and "prevalence of the disease". Multi-Regression Analysis explained following two things; spousal caregivers whose MRBI had high scored on "one-way support" tend to be high self-sacrificial, self-trapping or positive caring attitudes. Spousal caregivers whose MRBI had high scored on "mutual support" tend to depend on their fail spouse and think their fail. Conclusion : Marital Relationship of aged spousal caregivers were different from non-caring Aged couples. Caring Attitudes of Aged Japanese Spousal Caregivers were tend to be high self-sacrificial, self-trapping or positive caring attitudes. Keywords : Marital Relationship, Caregiver, elderly person

PP25 S-294

INTERGENERATIONAL LIVING ARRANGEMENTS AND PSYCHOLOGICAL WELL-BEING AMONG OLDER ADULTS IN SOUTH KOREA: COMPARISON BETWEEN THE YOUNG-OLD AND THE OLD-OLD

Bo Rin KIM¹, Lydia LI², Jersey LIANG¹ (1. *Health Management and Policy, University of Michigan, USA*; 2. *School of Social Work, University of Michigan, USA*)

Introduction : This study investigates the effects of intergenerational living arrangements on changes in life satisfaction and depression among Korean older adults, and how the effects differ between young-olds (age 60-69) and old-olds (age 70+). Method : Data were from the 2006 and 2008 waves of the Korean Longitudinal Study of Ageing (KLoSA) on individuals over the age of 60 years (N=4,476). Intergenerational living arrangements were classified into four categories: living away from children, living near children, living with

unmarried children, and living with married children. We conducted multivariate linear and logistic regressions to estimate the effects of intergenerational living arrangements at Wave 1 on life satisfaction and depression at Wave 2, controlling for Wave 1 scores of the dependent variables, health status, and socio-demographic characteristics. Results : We found cohort differences in the association between living arrangements and changes in psychological well-being. Among old-old adults, those living with married children, relative to all other arrangements, had improvement in life satisfaction and depression. Among young-old adults, however, living near children was associated with increase of life satisfaction compared to living with unmarried children, and living near children and living away from children were associated with decreased depressive symptoms. Conclusion : As living with children has been traditionally considered an ideal living arrangement for older parents in South Korea, it has been believed that this living arrangement is the most beneficial for psychological well-being of older parents. However, our results suggest that the effects of living arrangements on psychological well-being vary depending on age cohort and children's marital status. Keywords : intergenerational living arrangements, psychological well-being, age cohort differences

PROMOTING INTERGENERATIONAL RELATIONS IN FAMILIES AND IN COMMUNITY: A PROPOSED THEORY

Vera ROOS, Erica DE LANGE (*African Unit for Transdisciplinary Health Research, North-West University, South Africa*)

Introduction : Researchers' attempts to focus attention on the importance of relationships to explain intergenerational relations as well as to promote intergenerational solidarity, provide little insight to explain the relational nature of intergenerational relationships. The aims of this presentation are to describe intergenerational interactions and to propose a relational theory to explain and promote intergenerational relations in families and communities. Method : The systems theory as well as the interactional approach suggested by Beukes, Roos and Vorster (2012) will be applied to 5 case studies. Data in the case studies were obtained by applying the Mmogo-method® (Roos, 2008; 2012) as well as the Intergenerational Reflecting Group Technique (Roos, 2011) and analysed by using visual- as well as thematic analysis. Results : The older generation (people 60 years and older) define their relationships with the previous generation (including their ancestors) and with the younger generation (people 18 years and older) as complementary relationships. The relational definition is challenged by the younger generation who move towards more control in the relationship. A symmetrical struggle between the older and the younger generation emerges. Conclusion : The preferred style of interaction between the two generations that restrain effective intergenerational relationships will be discussed and illustrated with examples from the case studies. Recommendations for appropriate intergenerational interventions will be made as well as suggestions for the development of a relational theory. Keywords : intergenerational relations, families, community

PP25 S-296

INTERGENERATIONAL EXCHANGE AMONG THE OLDEST OLD IN SWEDEN

Marie ERNSTHBRAVELL¹, Magnus JEGERMALM¹, Stephen H. ZARIT², Eleonor FRANSSON³ (*1. Institute of Gerontology, Jonkoping University, School of Health Sciences, Sweden; 2. Department of Human Development and Family Studies, Penn State University, USA; 3. Department of Natural Science and Biomedicine, Jonkoping University, School of Health Sciences, Sweden*)

Introduction : Despite the comprehensive Swedish welfare system, civic participation among elderly is extensive. However, studies on the oldest old mainly analyse them as recipients, not as helpgivers. Aim: This study examines intergenerational exchanges of different types of support in a sample of the oldest old. Method : Data are from the OCTO2-study, a population-based sample of 171 women and 156 men, 75-90 years old. Using the Intergenerational Support Scale (ISS), participants rated how often they received and gave different kinds of support to family. Those who estimated a frequency of receiving and/or giving support more than once a month were considered as receivers and/or givers of support. Descriptive statistics and logistic regression analyses were performed. Results : Twenty percent of the sample received and 19% gave emotional support, 8% did both; 37% received and 32% gave practical support, 15% did both; <1% received and 16% gave financial support, <1% did both. Most exchanges were between the respondents and their children. Respondents received significantly more practical support from their sons and significantly more emotional support from their daughters. Respondents mainly gave, rather than received; financial support, significantly more to grandchildren, and emotional support, mostly to daughters and grandchildren. The regressions showed that younger age was associated with giving practical support and older age with receiving practical support. Lower quality of life was associated with receiving more practical and emotional support. Conclusion : The oldest old are an overlooked resource in society that likely are an important force in the creation of social capital. Keywords : Oldest-old, intergenerational, exchange

PP25 S-297

THE VARIATION AMONG REGIONAL DIFFERENCES IN THE INSTRUMENTAL ACTIVITIES OF DAILY LIVING

Seungwon JEONG¹, Katsunori KONDO², Kayo SUZUKI¹, Chiyoe MURATA¹, Tami SAITO¹, Takao SUZUKI¹ (*1. Center for Gerontology and Social Science, National Center for Geriatrics and Gerontology, Japan; 2. Center for Well-being and Society, Nihon Fukushi University, Japan*)

Introduction : We studied the regional differences and the variables associated with the occurrence of dementia as regards the defined limitation of instrumental activities of daily living (IADL). Method : We analyzed the data obtained from Japan Gerontological Evaluation Study (JAGES) conducted between August 2010 and May 2011 for 65,171 people who were not eligible for nursing care in 27 municipalities. In logistic regression models, the dependent variable was a dichotomized score on a scale of IADL. Maximal scores (5 points) were contrasted with all scores below (0-4 points) the maximum. After a much more thorough deliberation on the available data, the researchers had pointed out that the major independent variable was the municipality of residence. Other things considered were individual socio-economic variables, psychosocial variables, and indicators of social environment. Results : The percentage of lower IADL scores among the old-old (over 75 yrs old) varied more than double. For example, 20.6% of men in one municipality had lower IADL scores, while the comparable percentage in a different municipality was 46.4%. The same pattern was also seen among the young-old (65-74 yrs old). Indicators of the social environment were significantly associated with having low IADL scores, after adjustment for individual socio-economic variables, psychosocial variables, indicators of social activities, and regional variables, social network, and social capital. Municipalities with more people with high IADL scores also had better environments. Conclusion : Preventing dementia may require not only individual-level interventions but also a comprehensive approach that encompasses regional environments.

Keywords : IADL, regional environments, JAGES

PP25 S-298

RELATIONSHIP BETWEEN PROVIDING SOCIAL SUPPORT AND LONELINESS AMONG THE MIDDLE AGED AND THE ELDERLY

Aya TOYOSHIMA, Shinichi SATO (*Graduate School of Human Sciences, Osaka University, Japan*)

Introduction : It is thought that loneliness is not synonymous with an objective isolated state and is a psychological factor to become the background of the consequent isolated death of the elderly person. Social support is a factor to loneliness. Lack of social support does not directly contribute to loneliness, but social support can alleviate loneliness. A recent study on social support showed that the act of providing support had the same beneficial effect as that of receiving support. However, few studies on loneliness focus on the provision of social support on the part of the person experiencing loneliness. Hence, the present study investigated how receiving and providing support could reduce loneliness the elderly, and whether reciprocal altruism could adequately explain the above relationships. Method : In Study 1, questionnaires were administered to 326 people aged 50 years and above. We measured loneliness by using the UCLA Loneliness Scale Version 3, mental health, and social support. In Study 2, we intervened people aged 65 and above. Results : The results of Study 1 indicate relationship between loneliness on the one hand and receiving and providing emotional support on the other, even if we assumed inter correlations between receiving and providing emotional support. We plan to report the results of Study 2 in detail in a subsequent paper. Conclusion : These results indicate that the providing social support has an independent effect in reducing loneliness the elderly, apart from the effect mediated by reciprocal altruistic behavior, but also independent effect among the elderly. Keywords : Social support, UCLA Loneliness Scale version 3, Mental health

PP25 S-299

DOES SOCIAL CAPITAL ENHANCE HEALTH RELATED ACTIVITY IN JAPAN?

Daisuke WATANABE (*Center for Asian and Pacific Studies, Seikei University, Japan*)

Introduction : The purpose of this study was to examine the association between individual-level social capital and health related activities (HRA). Method : Data were collected in a cross-sectional survey in 50 municipalities, Japan, in 2012. A systematic sampling approach was used to randomly select 3,000 residents (40-79 years old). A total 1,466 questionnaires were returned (response rate: 49.6%). 870 complete cases were only used for analyzing. HRA were assessed by 10 items about health maintenance and improvement. Individual-level social capital were assessed by 3 items inquiring about general trust of others in society (cognitive social capital), social participations in 4 different groups, which further distinguished between bonding and bridging social capital (bonding and bridging social capital), and position generator and 3 social support networks (network dimension of bridging social capital). Multiple linear regressions was used to determine the relationship between HRA as outcome variables, individual-level social capital as explanatory variables, and other variables (i.e. sex, age, years of education, equivalent household income, marriage, and work) as control variables. Results : Among total participants, average of number of HRA was 5.90 ± 2.38 . Higher general trust and emotional support network were associated with a significantly positive coefficient of HRA. Position generator and bridging social capital of social

participation to local community group have interaction effects between sex and the variables on HRA. Conclusion : Cognitive social capital and emotional support network have positive effect on HRA. Effect of bridging social capital on HRA varied according to sex. However, bonding social capital was not associated with HRA. Keywords : social capital, health related activity (HRA), social participation

SOCIAL NETWORKS AND WELL-BEING AMONG OLDER JAPANESE: AGE AND GENDER VARIATIONS

Erika KOBAYASHI¹, Taro FUKAYA¹, Yoko SUGIHARA², Hiroko AKIYAMA³, Jersey LIANG⁴ (*1. Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan; 2. Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan; 3. Institute of Gerontology, University of Tokyo, Japan; 4. School of Public Health, University of Michigan, USA*)

Introduction : This research examines the relative importance of four types of social networks (i.e., spouse, contact with children, contact with friends and neighbors, and social participation/volunteer activities) on psychological well-being (WB), and how these linkages vary across age and gender. Method : Data came from a national sample of older adults in Japan (N=3,482) in 1999. WB was measured by life satisfaction and depressive symptoms. Structural equation models were used to evaluate the effects of social networks on each WB in conjunction with those of employment, financial status, and health conditions. In addition, similarities and differences between young-old (63-74 years old) and old-old (75+ years old) men and women were assessed. Results : The association between being married and both WB was stronger among the young-old than the old-old, whereas the effect of contacts with children was greater among the old-old. Among the young-old, the effects of being married and social participation on life satisfaction were greater for male than female, but contacts with friends and neighbors were more important for female than male. Conclusion : The effects of social networks on WB vary across age and gender. Further research is needed to ascertain whether age differences result from aging and/or cohort variations. Keywords : life satisfaction, informal network, social participation

PP25 S-301

AGEING IN FEAR: THE CHALLENGE OF SECURITY IN LATER LIFE

Gary PRITCHARD, Katie BRITAIN (*Institute of Health and Society, Newcastle University, United Kingdom*)

Introduction : Many older people are incredibly worried about being a victim of crime and this paper offers a sociologically grounded critique of currently available crime prevention technology designed specifically for this age group. In particular, we question their effectiveness both at reducing crime and fear of it, which we regard as a greater social ill than crime itself. We further suggest that these devices often work to harm the wellbeing of older individuals by being overly invasive and exacerbating a sense of social isolation. Method : Extensive literature review, interviews (n=10) and focus groups (n=5). Results : Taking into account the sources of older people's fear of crime, we propose a research agenda that develops solutions that are less responsive-driven and instead work to improve information flows, foster social capital and encourage community engagement. Conclusion : Technology alone cannot be the answer to the problem of older people's fear of crime. On occasions, the very opposite can be true. Rather than responding directly to the fear as it is propagated by the media and consumer security technologies, we have argued that it

is better to tackle the causes of this fear and through this understanding have tentatively put forward three challenges for HCI and design research. These suggestions do not directly tackle crime and instead work to alleviate other social harms; like media disproportionality, low levels of social interaction and ageist assumptions. In tackling these issues, we reason that overall fear of crime and the associated social ills that accompany it. Keywords : Crime; Fear; Technology

PP25 S-302

THE COMMUNITY RELATIONSHIPS BEYOND HOUSEHOLDS BASED ON TEA PRODUCTION IN MOUNTAIN VILLAGES IN CENTRAL JAPAN

Hiroko SATO (*School of Human Science and Environment, University of Hyogo, Japan*)

Introduction : Many of Japanese villages in mountainous areas are facing depopulation, aging of the local farmers and lack of successors. Method : Three panel studies were conducted in 1982, 1993 and 2005 to clarify the change in the family structure of mountain villages. Also, a case study in 2012 was carried out on 22 females aged 65 or older in two of the villages previously studied. Results : In the 1982 survey, 72.3% of the households were extended families-either three-generation or four-generation households-, and husband and wife only households made up only a mere 2.4%. In contrast, however, in 2005 three-generation households made up less than 50% of the total, and the rate of husband-wife only households rapidly increased to 18.2%. The villages have the production of the best green tea in Japan. The elder farmers of these villages produce green tea with the “same goal to produce green tea of best quality”. They also share “the awareness of the competition of tea quality” and “the spirit of the best tea producers”. Conclusion : The villages have the function of “giving aids on farm work” and there is a tea making factory that is operated by the qualified farmers. When an elderly grows tea alone because his/her partner is too ill or old to work, the farmer does not have to provide workforce to the tea making factory. This system plays an important role in supporting the households lacking “sufficient workforce”. However, this system cannot fully function without sufficient number of successors. Keywords : community relationships, mountain village, Japane

PP25 S-303

THE POTENTIAL AND ISSUES WITH PREVENTING ISOLATION AMONG ELDERLY PEOPLE IN URBAN AREAS USING ICT: EXPLORATORY ANALYSIS OF INTERVIEW DATA THROUGH TEXT MINING

Hikomichi ARAI¹, Takako SODEI², Shino SAWAOKA³, Yasuko MORI⁴, Akio SUZUKI⁵ (*1. Dept. of Sciology, Komazawa University, Japan; 2. Dept. of Life Sciences, Ochanomizu University, Japan; 3. Dept. of Research, The Dia Foundation for Research on Ageing Societies, Japan; 4. Graduate School of Humanities and Sciences, Ochanomizu University, Japan; 5. Dept. of Research, Japan Association for Age-free Society, Japan*)

Introduction : A major issue facing Japanese society is the increasing number of elderly people living alone in urban areas. Elderly people who live alone are at the risk of losing their purpose in life, feeling insecurity in life, and dying alone. In recent years, ICT has drawn attention as a tool for elderly people to actively build and maintain social relationships. Given that it facilitates the obtainment, transmission, and sharing of information, ICT has the potential to empower elderly people and to strengthen community ties. This research, then, aims to shed light on the potential for preventing isolation among elderly people in urban areas using ICT and the issues

that this might entail. Method : This study consisted of “participatory action research.” The ICT terminal used in this study consisted of a touch panel-type PC equipped with “VoViT,” a communication support system aimed for elderly people. The verbatim records were obtained from in-depth interviews and group interviews that were subjected to exploratory analysis by using the text mining method. Results : The research results made it possible to visualize the potential for preventing isolation among elderly people in urban areas using ICT and the issues that this might entail. Conclusion : By using ICT, it has the potential to create protective networks through liberal ties and to strengthen protective networks through supporters. In addition, the future use of this might entail the following issues: (1) having to deal with the diverse characteristics of users and (2) having to provide training to supporters. Keywords : ICT, preventing isolation, text mining

THE RISK OF SUICIDAL IDEATION IN ELDERLY WHO USE 24H SUICIDE PREVENTION HOTLINE IN TAIWAN

Jui-Yun TSAI¹, Meng-Tzu HOU² (*1 Department of Medical Sociology and Social Work, Kaohsiung Medical University / Department of social services, Shin Kong Wu Ho-Su Memorial Hospital, Taiwan; 2 Exercise and Health Scicence Research Center, Nation Yang-Ming University, Taiwan*)

Introduction : The rapid growth rate of elderly population, on the surface appears to be a symbol of social progress, and it's to be proud of the achievements. But it also reflects the urgency and necessary for elderly issues, especially that highest suicide rates among elderly in almost every country now. However, everyone will grow old, but not every elderly in the risk. This research will focus on the risk of suicidal ideation in elderly. Method : The study used secondary data analysis from Taiwan. In 2011, we choose age over 60 as the subjects who used 24h prevention hotline and recorded that included base-line characteristics: gender, marital status, education level, mental health status, substance abuse, medical treatment way, violence situations, source of income etc., and the main problem they complained: marital, family, physical ailments, debt, economic difficulties, living alone, question of retirement etc., then took down the information whether they had suicidal ideation. Results : There were 495 subjects (male: 211, female: 284) and 68 had suicidal ideation. Using multiple logistic regression models, then control the demographic variables, the independent factors for suicidal ideation were listed as follows: education level: senior high(OR: 0.170, 95% CI: 0.031-0.550), living state: live with others(OR: 0.190, 95% CI: 0.067-0.539), mental condition: normal(OR: 0.249, 95% CI: 0.087-0.711), economic difficult (OR: 6.305, 95% CI: 1.127-35.273). Conclusion : Our findings point toward the elderly who has suicidal ideation, the main problem of risk factor was economic problem. We hope the finding can remind the government that resources should be focused on the most vulnerable groups, and not only to build social networks, offer social support of the elderly, more necessary is to construct the social welfare, to give the basic quality of life for the elderly. Sustained efforts by many sectors of society are often necessary to gain political assistance to tackle the economic problem. Keywords : Suicidal ideation, Suicide Prevention Hotline, Economic problem

PP25 S-305

THE INFLUENCE OF WORKER IDENTITY ON LIFE SATISFACTION: THE MODERATING EFFECT OF WORKER CENTRALITY

Jun NAKAHARA (*Graduate School of Human Sciences, Osaka*)

University, Japan)

Introduction : A previous study found support for the following hypothesis, guided by the activity theory (AT) of aging and symbolic interaction theory (SIT): The activities of elderly people at Japan's Silver Human Resource Centers had a positive impact on their life satisfaction, by developing positive worker identity and high self-esteem. However, this model did not examine the potentially moderating effect of worker centrality. Thus, we propose a model for examining the moderating effect of worker centrality on the relationships between worker identity and self-esteem or life satisfaction. **Method :** For this purpose, a survey was administered to 279 elderly people from the Silver Human Resource Center of I city. To test our hypothesis, we estimated two regression models for self-esteem and life satisfaction, using the interaction effect between worker centrality and worker identity as an independent variable. **Results :** Although we found that worker identity had a significant positive association with self-esteem, there was no effect of the interaction between worker centrality and worker identity on self-esteem. However, this interaction was significantly related to life satisfaction. **Conclusion :** These results suggested that life satisfaction is positively affected by worker identity when elderly people have a self-concept centering on their role as a worker. On the other hand, their self-esteem can be influenced regardless of whether they have high worker centrality. **Keywords :** worker identity, worker centrality, life satisfaction

PP25 S-306

THE RELATIONSHIP BETWEEN SOCIAL CAPITAL AND RESIDENCY LENGTHS OF ELDERLY PEOPLE INHABITING ISLANDS

Kaori KINOSHITA, Sachiko KOJO (*Nursing, Niimi College, Japan*)

Introduction : The objective of this research is to reveal the relationship between social capital and residency length of elderly people inhabiting islands. **Method :** The population of Town B in Island A in western Japan is 2,327 people in which aged people account for 39.8%. A questionnaire was conducted targeting 751 inhabitants over the age of 65 about their attributes, residency lengths and six points regarding social capital. **Results :** Of the 423 respondents, the average age was 75.9, 42.1% was males and 85.3% had maintained their residency over 31 years. Those who had been living in the town for less than 30 years showed significantly less affection and general trust ($p=0.010, 0.001$). Also, those who had maintained their residency in the island for their entire life showed significantly more affection toward the region compared with people who had either lived outside the island or moved in following their marriage ($p=0.002$). There was no significant difference in structural social capital, including the depth and number of social relationships. **Conclusion :** The research revealed that living in islands with high percentage of aged population for a long time increases elderly people's cognitive social capital. **Keywords :** Social Capital, Residency Lengths, Inhabiting Islands

PP25 S-307

ELDERLY IN JAPAN; IMPACT OF DOG WALKING, COMMUNICATION AND COMMUNITY ACTIVITIES

Kazumi KIKUCHI (*Dept. of Occupational Therapy, Faculty of Medical Health and Science, Teikyo Heisei University, Japan*)

Introduction : Recently, elderly Japanese seem isolated within the community. Pet ownership leads to interaction with others. Therefore, we wanted to compare the differences between community interaction

when people are "dog walking" and "not dog walking". **Method :** By using an internet survey in March 2012, we targeted a specific group of retired dog owners, and gathered information using a questionnaire. We focused on demographics as well as friendships in dog related activities. We also inquired about their reaction to various other people while "dog walking" and "not dog walking". **Results :** 380 mostly male dog owners throughout Japan answered all questions. Around 80% of them walked their dog daily in the community. Using SPSS Statistics for Survey 17.0, we found categorical differences ($p<0.05^*$, $p<0.01^{**}$) between "dog walking" and "not dog walking". "Dog walking" created the opportunity for dog owners to interact with others**, even strangers**. When dog owners were not walking their dogs, they avoided interaction with people*, even acquaintances*. **Conclusion :** Dog walking is persuading owners to be more extroverted, and participate in relationships with others. Through dog walking, people have a better chance to get to know someone in the community compared with non-dog walking activities. It is suggested that activities related to "dog walking" provide more social opportunities and longer lasting relationships for the elderly in the community. For Japanese, especially the elderly, the social structure is somewhat introverted, so dog walking activities overcome these obstacles and act as an effective communication tool. **Keywords :** community, activity, Dog Walking

PP25 S-308

PSYCHOLOGICAL, HEALTH AND SOCIAL PREDICTORS OF SOCIAL AND EMOTIONAL LONELINESS IN OLDER PEOPLE

Lena DAHLBERG¹, Kevin J. MCKEE² (*1. School of Health and Social Studies, Dalarna University, & Aging Research Center, Karolinska Institutet/Stockholm University, Sweden; 2. School of Health and Social Studies, Dalarna University, Sweden*)

Introduction : Loneliness in old age has been shown to have negative outcomes such as mortality, physical and mental health problems, and reduced activity levels. To reduce loneliness in older people, factors associated with loneliness and open to intervention must be identified. **Method :** Older people (aged 65+, N=1255) from the United Kingdom received a questionnaire-based interview (response rate: 66.0%). The questionnaire covered items on demographic, psychological, health and social characteristics. It also contained the de Jong-Gierveld Loneliness Scale (de Jong-Gierveld & Kamphuis, 1985), measuring Emotional and Social Loneliness. **Results :** Eight percent of the respondents were found to be severely or very severely lonely, while another 38% were moderately lonely. Being female, widowed, low well-being, low self-esteem, high activity restriction, and high concern about personal finances were significant predictors of Emotional Loneliness ($F(17, 976)=25.59, R^2=.31, p<.001$). Being female, widowed, low well-being, low self-esteem, high concern about personal finances, low contact with family, low contact with friends, low engagement, and low perceived community integration were significant predictors of Social Loneliness ($F(17, 982)=19.63, R^2=.25, p<.001$). **Conclusion :** This study provides empirical evidence for conceptual separation of emotional and social loneliness. Consequently, different targets for intervention are required in order to reduce emotional and social loneliness respectively, although psychological intervention has the potential to reduce both. **Keywords :** Loneliness

RESEARCH REGARDING THE USE OF ELDERLY MONITORING SENSORS AS A SUPPORT TOOL FOR THOSE LIVING ALONE: ATTEMPT TO DEVELOP A MONTHLY

REPORT SERVICE FOR THE COMMUNITY CARE CENTRES

Masami HASEBE¹, Kumiko NONAKA¹, Takashi KOIKE¹, Tarou FUKAYA¹, Reiko WATANABE², Shouzoh UEKI³, Hiroto YOSHIDA³, Naoko ARAYAMA³, Shuichiro WATANABE⁴, Tomoko KAMEI², Masumi MATSUMOTO⁵, Chiaki TANAKA⁶, Takayuki HOSOI⁷, Yoshinori FUJIWARA¹ (1. Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan; 2. St. Luke's College of Nursing, Japan; 3. Faculty of Medical Science & Welfare, Tohoku Bunka Gakuen University, Japan; 4. Graduate School of Gerontology, J. F. Oberlin University, Japan; 5. Department of Architecture and Building Engineering, Tokyo Metropolitan University, Japan; 6. Division of Integrated Sciences, J. F. Oberlin University, Japan; 7. Department of Clinical Research and Gerontology, National Center for Geriatrics and Gerontology, Japan)

Introduction : The number of elderly living alone in Japan has been rising dramatically in recent years. Additionally, elderly isolation has become an increasingly important social issue. The monitoring sensor is one variety of 'Smart home' (monitoring system using information communication technology) and does not require active correspondence to the elderly. We developed a monthly report on the monitoring sensor. The monthly reports, which form the basis for the analysis in this paper, are reports compiled of data gathered on a monthly basis regarding the elderly's activity. These reports can be sent to community care centres or the elderly's family. The aim of the reports, through analysis of activity levels and lifestyle rhythms, allows for early detection of diminished mental or physical function or illness, and the provision of necessary support. Method : The contents of the monthly reports are analysed. Also included are interviews with community care centre staff in relation to the current status and conditions of the monthly reports. Results : Interviews with staff showed that information about approximate sleeping and waking times and when the elderly left the house was useful. Also, monthly reports, in some cases it was possible to infer the cause of illness. Conclusion : The monthly reports, if linked with daily support, are a useful tool for elderly support. In the future, revision of the format and content is important to make it easier for community care centres to practically apply the information. Keywords : monitoring sensor, elderly living alone, monthly report service

SOCIAL SUPPORT AND INTENTION TO CONTINUE TO LIVE IN THE COMMUNITY: A STUDY IN THE DEPOPULATED AREA IN JAPAN

Masami NAKATA¹, Tomoo NAKATA² (1. Graduate School of Human-Environment Studies, Kyusyu University, Japan; 2. Department of Social Policy, Hokusei Gakuen University, Japan)

Introduction : The aim of this study is to examine the relationship between social support and their intention to continue to live their community among Japanese elderly people living in the depopulated areas. Method : This study employed the data collected in 2012 in A Town in Hokkaido prefecture, Japan. Respondent were men and women who was living alone and aged 65-years-old and older (N=51). The dependent variable was whether respondent want to continue to live the community they are living at the survey was conducted. And social support, age, gender and their education level were used as independent variables. Respondents were asked six items concerning social support for/from others. In this study, the authors tried to reveal the effect of amount of social support, and the offering and receiving targets of social support. Results : The results using multinomial logit models are as follow; 1) bringing up the concerns foster the intention

to continue to live, on the other side, looking after in bad condition, asking advise, and asking around the house decrease that. 2) Person who listens to the other residents' concern does not want to live further. 3) Delivering and receiving social support from friends reduce the wishes to continue to live the community. Conclusion : More data from different respondent in this town will be collected next year and impact of characteristic of community would be examined in the future. Keywords : Social Support , The Depopulated Area

RURAL ISOLATION AND BEFRIENDING ACTIVITIES IN A RURAL MOUNTAINOUS AREA OF JAPAN

Masashige SAITO¹, Kinya FUJITA², Takayuki HIRANO¹ (1. Social Welfare, Nihon Fukushi University, Japan; 2. Social Services Policy Evaluation Center, Nihon Fukushi University, Japan)

Introduction : To evaluate the process and outcomes of home visiting and befriending activities among the aged living in a rural mountainous area, we performed dyad data analysis and ecological analysis of Hidaka Village, Kochi Prefecture, Japan. Method : Information on 355 and 513 dyadic relationships in 2011 and 2012, respectively, was obtained from the data management system developed by Nihon Fukushi University. We gathered additional information using a mail survey in 2009 and 2012 about all older people who lived alone (n=167) and from some participants who befriended these older people (n=109). Results : Major findings included: 1) visiting and befriending activities were expanded in this area and the number of participants who befriended older people who lived alone increased from 1.96 in 2011 to 2.58 in 2012; 2) dyad data revealed that friendships were not limited to same-gender pairs (p=.416), and there was no significant correlation with age (r=.029); and 3) in the neighborhood where many people participated in these befriending activities, the proportion of older people whose frequency of intimate contact was less than once a week was low, and the number of extremely isolated older people was also low. Conclusion : The results seem to indicate that neighborhood home visiting and befriending activities were performed without regard to gender or age for aged persons. Our results suggest that promotion of befriending activities within the neighborhood contributes to the reduction of socially isolated older people. Keywords : social isolation, befriending activity, dyad data

PP25 S-312

COMPARISON OF ANTONOVSKY'S SOC SCALE AND BALTES'S SOC SCALE

Ryoko OKAMI¹, Mariko NIIKURA², Tomiko TAKEUCHI² (1. Nursing Department, The University of Tokyo Hospital, Japan; 2. Gerontological Nursing, Graduate School of Medicine and Pharmaceutical Sciences for Research, University of Toyama, Japan)

Introduction : Antonovsky originally proposed that sense of coherence (Antonovsky's SOC) referred to an ability to cope with stress and maintain mental health. However, Baltes proposed a model of adaptive development, the model of selection, optimization, and compensation (Baltes's SOC). Once the differences between these scales are clarified, both scales can be used to evaluate the adaptation of the elderly. Method : Elderly people over the age of 60 who were members of clubs for the elderly in X prefecture, Japan, were sent a self-administered anonymous questionnaire between May and August 2011. Among the 575 responses received (response rate, 57.5%), 477 complete responses were subjected to analysis. The protocol of this study was approved by the ethics committee of Toyama University. Results : No correlation was observed between Baltes's SOC scale

total scores and Antonovsky's SOC scale total scores. However, a weak correlation ($r = 0.372$) was observed between Baltes's SOC scale total scores and Antonovsky's SOC subscale scores of "meaningfulness". Both scales were found to be related to physical health, exercise, balanced nutrition, participation in social events, and participation in hobbies. In addition, Antonovsky's SOC scale was associated with smoking and drinking. Conclusion : Antonovsky's SOC scale was more closely related to health behaviors than Baltes's SOC scale. On the other hand, the power to live positively and participate in hobbies and social activities could be measured accurately by both scales. Although these two scales differ to a certain extent, they are both effective in helping to maintain mental health in the elderly. Keywords : SOC, scale, elderly

PP25 S-313

SOCIAL SUPPORT PROVIDED BY FAMILY: CASE STUDY OF THE ELDERLY WHO HAVE A BAD RELATIONSHIP WITH THEIR FAMILY

Sachiko TAKASE (*Japan Society for the Promotion of Science, Japan*)

Introduction : The purpose of this paper is to examine provided support by family for the elderly who have a bad relationship with their family. Method : Case study was selected as a qualitative research method. Twenty-two cases of the elderly living alone in Tokyo were explored from 2008 to 2009. All of them were clients of comprehensive community support centers. Data was collected by document analysis for case records taken by social workers and interviews with social workers and the clients. Results : Among 22 cases, 14 cases had some kind of trouble with their family. In seven cases the elderly clients had a good family relationship but felt lonely, because their family seldom contacted the clients. In another seven cases, the elderly clients had a bad relationship with their family. Analyzing the 7 cases in detail, the clients were provided more than a little support by their family despite a bad family relationship. Most of the support was instrumental support. Conclusion : It is said that the elderly prefer formal support in instrumental support and informal support in emotional support. In case of the elderly in a bad family relationship, however, it seems that instrumental support is easier to provide than emotional support. This fact represents the specialty of family relationship. When a relationship breaks down, other informal support resources, such as friends and neighborhood, never provide emotional support as well as instrumental support. Family provide support even though the relationship become worse. Keywords : social support, a bad family relationship, case study

THE INFLUENCE OF SOCIAL SUPPORT ON THE RELATIONSHIP BETWEEN PERSONALITY AND DEPRESSION IN ELDER HEMODIALYSIS PATIENTS

Shu-Chuan Jennifer YEH¹, Kuo-Hsu YUAN², Ying-Ying LO³, Shih-Hua Sarah CHEN⁴ (*1. Department of Business Management & Institute of Health Care Management, National Sun Yat-sen University, Taiwan; 2. Department of Business Management, National Sun Yat-sen University, Taiwan; 3. Department of Healthcare Administration, I-Shou University, Taiwan; 4. College of LAS, University of Illinois at Urbana-Champaign, USA*)

Introduction : Under enormous restrictions and changes from end-of-stage diseases and aging, elder patients are prone to feel depressed. The purpose of this study was to examine the possible effects of social support on the relationship between personality and depression for elderly patients with hemodialysis. Method : A total of 811

hemodialysis patients at the age of 60 and older were interviewed. Big Five Inventory, Social Provision Scale, and Beck Depression Inventory were measured. We used BDI scores ≥ 9 as a cutoff level to classify the participants into depressed and non-depressed groups. Descriptive analyses and hierarchical multiple regression were performed. Results : Comparing with non-depressed group ($n=314$), the patients in the depressed group ($n=497$) perceived less social support and were less extraverted, agreeable, conscientious, open to experience, and more neurotic. When social support is high, the severity of depressive symptoms would be mitigated among high neurotic patients ($\beta = -.122, p = .007$). We further found that social support could mediate the association between agreeableness and conscientiousness and depression after controlling for demographic and health-related variables. The indirect paths of agreeableness and conscientiousness did exert significant effects (Sobel $t = -5.829, p < .001$; Sobel $t = -5.590, p < .001$, respectively). Conclusion : Social support was a moderator to buffer the relationship between neurosis and depression, while it played a mediating effect when patients high in agreeableness or high in conscientiousness. Health care providers should understand patients' personality traits and focus on strategies that can improve how patients perceive social support. Keywords : personality, depression, social support

PP25 S-315

SOCIAL SUPPORT, COPING BEHAVIORS, AND HEALTH STATUS IN OLDER PERSONS WITH KNEE OSTEOARTHRITIS

Somma VANAVANANT¹, Suparb AREE-UE² (*1. Ramathibodi School of Nursing, Faculty of Medicine Ramathibodi, Mahidol University, Thailand; 2. Ramathibodi School of Nursing, Mahidol University, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Thailand*)

Introduction : The aims of this descriptive study were to describe social support, coping behaviors, and health status among older Thais with knee osteoarthritis and to examine the relationship between social support, coping behaviors, and health status among those persons. Method : Participants were recruited from catchment areas of Ramathibodi Hospital, Bangkok, Thailand. The sample consisted of 112 persons with the mean age of 60.63 (SD = 9.18 years). The data were collected by using questionnaires. Statistical analysis was performed using descriptive statistics and Pearson's product moment correlation coefficient. Results : Findings revealed that the highest mean score of social support was positive social interaction subscale followed by affectionate support. Regarding coping behaviors, participants rated the highest mean score on the rest subscale followed by the active and information seeking subscale, but the lowest mean score was found in avoidant subscale. The participants perceived moderate level of health status. In relation to an association among study variables, social support had a positive relationship to social dimension of perceived health status ($r = .35; p < .01$), and to coping behaviors ($r = .41; p < .01$). A positive relationship was also found between coping behaviors and perceived health status ($r = .21; p < .05$). Conclusion : We demonstrate a positive correlation between social support and coping behaviors and between coping behaviors and perceived health status. The intervention aims at promoting coping behavior appropriately and encouraging social support by means of support group may increase health status in persons with knee osteoarthritis. Keywords : social support; coping behaviors; knee osteoarthritis

PP25 S-316

THE INFLUENCE OF TECHNOLOGICAL PROGRESS ON

ELDER'S DAILY LIFE

Sonia Amps FUENTES¹, Maria Ligia PAGENOTTO², Flaminia LUDOVICI², Elisabeth F. MERCADANTE², Ceneide Oliveira CERVENY¹ (1. *Clinical Psychology, Pontificia Universidade Catolica de Sao Paulo, Brazil*; 2. *Gerontology, Pontificia Universidade Catolica de Sao Paulo, Brazil*)

Introduction : The last decade was marked by a boom in Information and Communication Technologies (ICT), exposing the elder community (60 years +) to new technologies. However, the elderly are commonly depicted as technophobic. This characterization of the elderly might be related to the fact that the elderly are the age group with the lowest ratio of computer and Internet usage, also to preconception or a stereotype. To empower elderly people's usage of ICT we need to look at their patterns of ICT usage, and perceived benefits. Method : This study, explores the influence that technological progress can have on elders. More specifically it investigates whether 1) the use of computers and the recent interactive portable apparatus contribute to the physical wellbeing of the elderly, 2) the incorporation of these devices to their daily life reduces their feelings deprivation and/or belonging, and 3) ICT is just another stress factor in their life. To address this we conducted semi-open interviews with 10 elders in Sao Paulo, Brazil and asked: 1) "What is the influence (negative or positive) of ICT in your daily life? Results : 70% of the respondents indicated that CTI positively influences their lives, by facilitating their daily activities, especially those related to the field of written and oral communication. Negative influences of CTI were also highlighted, 20% of elders indicated that the use of CTI makes them feel incapacitated and intimidated, and 10% neutral. Conclusion : In general elders, recognize some of the issues they have using CTI and are curious about their potential advantages. Keywords : technological progress, impact , elder's daily life

PP25 S-317

EXPLORING OLDER PEOPLE'S SUPPORT NETWORKS: OPPORTUNITIES FOR HEALTH CARE

Suzanne BYERS (*Palliative and Supportive Services, Flinders University, Australia*)

Introduction : The positive effect of strong social networks on older people's health, especially their psychological health, has been much evinced and discussed. However, while extensive research has focused on exploring the relationships between people most at risk of poorer health and reduced mortality by the 'type' of networks they belong to, efforts in using a network typology to provide the most appropriate services and tailor interventions across a diverse older population has been more limited. Method : A comprehensive search of the literature was undertaken focusing on studies that were specific to or included aspects of support networks or network typology in older people. The literature search utilised (i) electronic databases including AgeLine, Cambridge Journals Online, ProQuest Central, Expanded Academic ASAP (Gale), SAGE Journals Online, Journals@Ovid, Oxford University Press Journals, Infomit Search and Google Scholar (ii) broad handsearch back forty years to catch seminal papers and published works. Results : Compelling outcomes for both clients and service providers exist when network typing has been applied in a practice setting. The benefits to the gerontological practitioner are highlighted. Conclusion : Network typology shows significant potential for health service planning and service provision. The extent to which this can be utilised in differing populations has yet to be explored. This analysis of the research literature offers key avenues for research to examine the utility of a network typology in Australian rural populations. This literature analysis is the first component of my

current research. Keywords : Older people, Network Typology, Support networks

PP25 S-318

PREVENTING SOCIAL ISOLATION OF THE ELDERLY BY USING ICT

Takako SODEI¹, Yasuko MORI², Hiromichi ARAI³, Shino SAWAOKA⁴, Akio SUZUKI⁵ (1. *Dept. of Life Sciences, Ochanomizu University, Japan*; 2. *Graduate School of Humanities and Sciences, Ochanomizu University, Japan*; 3. *Dept. of Sociology, Komazawa University, Japan*; 4. *Dept. of Research, the Dia Foundation for Research on Ageing Societies, Japan*; 5. *Dept. of Research, Japan Association for Age-free Society, Japan*)

Introduction : Recently more and more older people are living alone and often isolated. sometimes they are found dead after several weeks or months without being noticed by their neighbors. ICT can be used to prevent social isolation of the elderly. Method : A simple ICT machine which is specially designed for those who have difficulty in using a mouse and keyboard was provided to each house of 9 monitors (5males and 4females in their 60s~80s) in Tokyo and they were asked to try email and skype for three months. Five technical supporters helped to solve technical problems and two communication supporters encouraged the elderly not to drop out. In order to find out the effects and problems of this social experimnt, all of them were interviewed several times. Results : 1. ICT contacts easily changed to face-to-face contact especially among females. 2. Based on our findings, we have developed a hypothetical model to prevent social isolation of the elderly by using ICT which can be applicable to other communities. 3. Technical supporters as well as communication supporters are quite important for the elderly to keep using ICT. We started a program to train supporters who acquire both abilities. Conclusion : ICT seems to be quite promising to expand and strengthen the social network of the elderly living alone who have few friends in their community and also the frail elderly who have difficulty in going out. Keywords : social isolation, social network, ICT

PP25 S-319

SUPPORT ACTIVITIES FOR THE ELDERLY BY RESIDENTS IN AGED HOUSING COMPLEXES

Takashi KOIKE¹, Toshiki NISHIMORI², Kyoko HORI³, Yoshiko FUJIWARA², Kyeongah LEE², Takatoshi ANDO³ (1. *Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan*; 2. *Graduate School of Enviroment and Information Sciences, Yokohama National University, Japan*; 3. *College of Education and Human Sciences, Yokohama National University, Japan*)

Introduction : During the period of rapid economic growth in Japan (1950s -1970s), many workers from the countryside moved to urban areas. Due to this, there was a lack of residential homes for such workers. In order to tackle this issue, many housing complexes were built. Today, after 40 to 60 years many of their residents have become elderly. In many of these housing complexes, the proportion of elderly residents is higher than the national average, reflective of the future of Japanese society. Recently, many residents in housing complexes have started to actively support elderly residents. Method : In this study interviews were conducted with residents that are providing support for the elderly in nine housing complexes. We asked them about the circumstances and motives for their activities. The housing complexes in which the interviews were conducted, all had an aging population rate of over 30%. Results : The interviews revealed that in many cases,

members of resident councils that were already active in community service were motivated to help the elderly as a result of external encouragement, or from strong feeling for the hardships that the elderly encounter, which may result in solitary deaths. Conclusion : There are many lessons that we can learn from studying how elderly support activities started and how they have developed in housing complexes with aging populations. Results indicated that to promote elderly support activities in residents, the government would need to provide support and appeal for a community-based support system. Keywords : Aged Housing Complex, Support Activity

PREDICTORS OF LONELINESS AMONG ELDERLY MEN AND WOMEN IN JAPAN: RESULTS FROM THE JAPANESE LONGITUDINAL STUDY ON HEALTH IN AN AGED SOCIETY (J-LOHAS)

Tami SAITO-KOKUSHO¹, Tomoko WAKUI², Ichiro KAI³
(1. Department of Social Science, National Center for Geriatrics and Gerontology, Japan; 2. Population, Family and Reproductive Health, Johns Hopkins Bloomberg School of Public Health, USA; 3. Emeritus Professor, The University of Tokyo, Japan)

Introduction : This study aimed to clarify the effects of social relationships, health, and other factors on loneliness in the elderly in Japan by using longitudinal data, examining how these effects differ between elderly men and women. Method : Data were obtained from a two-year self-administered follow-up survey completed by 2,571 people 65 years old or above living in a prefecture located in northern central Japan. Loneliness was assessed with the AOK (Ando, Osada, and Kodama) Loneliness Scale. Social-relationship factors assessed were marital status, cohabitation, social network, social support, participation in social activities, and perceived trust in one's neighbors. Health, socioeconomic variables, age, etc., were also investigated. Generalized linear modeling was conducted to examine the effects of these variables on loneliness scores at the follow-up survey, adjusting for scores at the initial survey. All analyses were conducted for men and women separately. Results : The results showed that AOK scores increased significantly for both men and women during the follow-up period, which indicated that loneliness increased in the two years. In men, loneliness was significantly associated with not living with one's children, no contact with friends, and low perceived trust in neighbors. In women, loneliness was significantly associated with poor economic status, no contact with friends, no instrumental support, and no participation in social activities. Conclusion : The results suggest that the predictors of loneliness should be examined considering the differences in social relationships between men and women. Keywords : loneliness, Japanese elderly people, longitudinal study

PP25 S-321

THE TRAJECTORY OF DISENGAGEMENT AMONG JAPANESE ELDERLY PEOPLE: USING GROUP-BASED TRAJECTORY MODELS

Tomoo NAKATA (Department of Social Policy, Hokusei Gakuin University, Japan)

Introduction : The aim of this study is to examine the differences in the disengagement trajectories and its factors among elderly Japanese people. The word 'disengagement' is used to mean withdrawing from society like 'disengagement theory'. Though every people in their later life are said to disengage, actual figure of the disengagement and its factor have not known yet. In this study, it will be revealed applying latent class growth models using panel data. Method : This study

employed the National Survey of the Japanese Elderly, from wave I (1987) to wave IV (1996) , which was conducted by Michigan University and Tokyo Metropolitan Institute of Gerontology. A number of friends, which is operational definition of the disengagement, was used as a dependent variables and age was independent variables. Education and gender were used as time-stable covariates and occupational and marital status and self-rated health were used as time-dependent covariates. Results : The results of this analysis are as follow; 1) Dividing into four groups was adequate. 2) Those groups showed quite different trajectories. The first group showed almost no friend consistently, the second one decreased step by step, the third one increased with age in dribs, and the fourth one showed a trajectory with sharp decrease. 3) the second group was consisted of female and the second and fourth group were consisted of the highly educated. Conclusion : This results clear up that the processes separate interpopulationally, but the characteristics of the respondents except occupational status do not demonstrate the type of the process. Keywords : Disengagement, Group-Based Trajectory Models

PP25 S-322

CONTACTS WITH OTHERS AND ELDERLY'S HAPPINESS

Yoshiaki TAKAHASHI (JICA Research Institute, Japan International Cooperation Agency, Japan)

Introduction : Human relationship makes us happy. On the other hand, elders now live separately from younger generation in modern society. Younger generation is busy for their own life. Therefore, face-to-face contact is much more difficult for elders. According to a happiness study in Japan, they felt lonely and unhappy more than other age groups. In this circumstance, indirect contact through email and other means may be more important as means of contact. However, in terms of happiness level, does indirect contacts through email and other means make difference from face-to-face contacts? Method : The Quality of Life Survey conducted by the Economic and Social Research Institute of Japan in 2012 included the questions about frequency of direct and indirect contact with spouses, children, brothers and sisters, other relatives and friends. By using its micro-data, the author analyzed if indirect contact makes a difference. Results : As a result, more frequent indirect contact with children and friends, much happier. However, indirect contact with brother and sister and other relatives was not statistically correlated with happiness. This result implies that indirect contact only with children and friends may complement direct contact. Conclusion : Technology and mechanism to promote indirect contact with children and friends easily may make elderly happier. Keywords : contact, happiness, elders

PP25 S-323

CHANGE OF COMMUNITY PEOPLE GATHERING IN TWO YEARS IN A MARGINAL COMMUNITY

Yuichi WATANABE (Social Welfare, Musashino University, Japan)

Introduction : A marginal community is defined as a community in which over 50% of the population are over 65 years old and face difficulty maintaining adequate function of the residents' daily lives. A marginal community lacks the human resources necessary to maintain a healthy standard of living, and people gathering in the community play an important role in maintaining that mutual support. The circumstances surrounding this situation vary year by year. This research aims to reveal changes over time in the gathering of people between 2009 and 2011 in a marginal community. Method : Cross sectional research was conducted repeatedly in 2009 and 2011 through

a questionnaire. The questionnaire was administered to people over 20 years old in a marginal community through visiting all the houses in that community. The data analyzed with a chi-square test focused on the change of community dwellers between 2009 and 2011. Results : "Participating in a tea party with neighbors" for all subjects decreased significantly. Participation in a "Senior citizens' club" in subjects over 65 and "Disaster prevention practice" in all subjects also declined. Conclusion : Although opportunities to gather in the community are needed to maintain mutual support in marginal community, a weakening trend was observed which may lead to a loss of connections among community dwellers. Approaches aiming to reconnect long-standing connections and develop new ones are needed. Keywords : community people gathering, a marginal community

PP25 S-324

THE INFLUENCE OF SOCIAL NETWORKS AND SUPPORTS ON HEALTH: DIFFERENTIAL PATHWAYS FOR OLDER KOREAN AMERICANS AND NON-HISPANIC CAUCASIANS

Haesang JEON, James LUBBEN (*School of Social Work, Boston College, USA*)

Introduction : The purpose of this study is to examine the pathways for different formations of social networks (kin vs. non-kin) and social supports (emotional vs. instrumental), which affect health status (perceived general health & depression symptoms) among older Korean Americans. More specifically, this study explores whether these processes differ by race/ethnicity. Method : Data comes from the Korean-American Elderly: Social Support and Long Term Care Survey. The study includes community-dwelling 221 older Korean Americans and 201 non-Hispanic Caucasians, 65 years and older from Southern California. Path analysis (Structural Equation Modeling) is used for the analysis. Results : Influence of social networks and social supports on health varies depending on group's race/ethnicity. For instance, non-kin network plays a significant role on perceived general health among Korean Americans, while kin-network appears to be a significant predictor for non-Hispanic Caucasians. Emotional support is only a significant predictor for depression symptoms among Korean Americans. Conclusion : This study highlights that the influence of social integration on health varies based on a person's race/ethnicity. Future research should take into account these inherent differences, especially when developing interventions to promote an individual's health. Keywords : cross-cultural study, social network, social support

PP25 S-325

UNDERSTANDING THE RELATIONSHIP OF TYPE D PERSONALITY AND PERCEIVED SOCIAL SUPPORT TO BLOOD PRESSURE, LIPEMIA IN ELDERLY PATIENTS WITH DIABETES

Yixin HU¹, Li FAN¹, Ping MENG¹, Shuangshuang DU², Yanjun LIU³ (*1. Health Care Department, PLA General Hospital, China; 2. Health Care Department, PLA 306 Hospital, China; 3. Endocrine Department, PLA 306 Hospital, China*)

Introduction : We examined the psychometric properties of the Danish version of the Type D Scale (DS14) and the impact of Type D and perceived social support on blood pressure, lipemia in elderly patients with diabetes. Method : Diabetes patients (n=178, age 58.95±13.16 years) completed the DS14 and PSSS Questionnaire. The blood pressure, blood components, blood lipids and glucose was measured. Results : 1. 24.0% of 42/178 patients have Type D personality. Type D personality was present higher women than that in men (29.17% vs 20.39%, P<0.05). Women got higher NA score as

compared with men (r=0.162, p<0.05). Both of SI score and NA score were negatively correlated with age (r=-0.155, p<0.05; r=-0.230, p<0.01). 2. Compared with those with none type D personality, Patients with type D personality have a lower level of systolic pressure blood pressure (123.68±18.43mmHg vs 129.30±15.58mmHg, p<0.05), higher level of total cholesterol (5.14±1.89 vs 4.67±1.04, p<0.05), higher level of C-reactive protein (6.23±2.74 vs 1.83±2.50, p<0.05). 3. NA score was found positively correlated with high blood pressure in diabetes patients (r=0.190, p<0.05). 4. Covariance analysis showed that neither Type D personality nor perceived social support independently influence the systolic pressure. But their synergistic reaction significantly affect the level of systolic pressure (F=2.049, p<0.05). Conclusion : Type D personality and perceived social support were related to blood pressure and lipemia changes in patients with diabetes, which suggests both behavioral and biological vulnerability for development of cardiovascular disorders and diabetes. Keywords : type D personality; diabetes

PP26 S-326

THE PREVALENCE AND CHARACTERISTICS OF SOCIAL ISOLATION

Mariko NISHI, Taro FUKAYA, Takashi KOIKE, Hiroyuki SUZUKI, Kumiko NONAKA, Hiroshi MURAYAMA, Erika KOBAYASHI, Shouji SHINKAI, Yoshinori FUJIWARA (*Reserch Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : Purpose of this study was to determine the prevalence and characteristics of social isolation among community-dwelling elderly (over 65) who live alone and who live with others. Method : A survey was conducted in Wako-city, Saitama-prefecture in 2012. Data were obtained from 8,304 elderly (response rate 74.3%). Frequencies of contacts with other people (non-resident children, relatives, friends, and neighbors) were used to define the state of social isolation; contact less than 2-3 times a month defined as "isolated" and contact more than once a week defined as "non-isolated". Results : The major findings were as follows. 1) The prevalence of "isolated" were 23.0% in elderly living alone and 30.0% in elderly living with others, and was higher in men than in women with either household composition. 2) Within elderly living with others, the prevalence of "isolated" increased as 5-year age-group raised. On the contrary, prevalence reduced as 5-year age-group raised within elderly living alone. 3) Compared with "non-isolated" group, "isolated" group tend to have low/poor state in many aspects (such as one's estate, mental health status, evaluation toward one's neighborhood) for both household composition. 4) Some exceptions were seen. For example, the result of physical health status and anxiety about future differed between household composition: low/poor state in "isolated" group in those living with others, and differences not salient between isolated-state in those living alone. Conclusion : The prevalence and characteristics of socially isolated elderly were not completely consistent between household composition. These findings would be useful when considering an efficient way of supporting isolated elderly. Keywords : social isolation, prevalence, characteristics, community-dwelling elderly, health

PP25 S-327

LONELINESS AND DEPRESSION AMONG THE ELDERLY IN FELDA: MEDIATING EFFECTS OF SOCIAL SUPPORT

Wan Mohd Azam WAN MOHD YUNUS¹, Normah CHE DIN¹, Mahadir AHMAD¹, Shazli Ezzat GHAZALI¹, Norhayati IBRAHIM¹, Zaini SAID¹, Ahmad Rohi GHAZALI², Suzana SHAHAR³, Rosdinom RAZALI⁴, Maniam THAMBU⁴ (*1. Health Psychology Programme,*

Faculty of Health Sciences, Universiti Kebangsaan Malaysia, Malaysia; 2. Biomedical Science Programme, Faculty of Health Sciences, Universiti Kebangsaan Malaysia, Malaysia; 3. Dietetic and Nutrition Programme, Faculty of Health Sciences, Universiti Kebangsaan Malaysia, Malaysia; 4. Department of Psychiatry, Faculty of Medicine, Universiti Kebangsaan Malaysia, Malaysia)

Introduction : Loneliness has long been known to have strong association with depression. The relationship between loneliness and depression, however, has been associated with other risk factors including social support. To what extent social support plays a role in the association between loneliness and depression was not known. Method : Cross-sectional study examined the mediating effects of social support among 161 community-based elderly in FELDA settlement of a rural area in Sungai Tinggi, Malaysia. Subjects were investigated with De Jong Gierveld Loneliness Scale, Geriatric Depression Scale (GDS) and Medical Outcome Survey (MOS) Social Support Survey. Data were analysed using Pearson correlation, and linear and hierarchical regression. Results : Results indicated that social support partially mediated the relationship between loneliness and depression. Conclusion : This suggests that social support affects the linear association between loneliness and depression in the elderly in FELDA. Keywords : loneliness, depression, social support

PP25 S-328

DEFINING AND MEASURING ELDER ABUSE IN CANADA: TOWARD A NATIONAL PREVALENCE STUDY

Lynn MCDONALD¹, Anthony LOMBARDO², Marie BEAULIEU³, Simon BIGGS⁴, Gloria GUTMAN⁵, Sandra HIRST⁶, Ariela LOWENSTEIN⁷, Cynthia THOMAS⁸ (1. Factor-Inwentash Faculty of Social Work, University of Toronto; National Initiative for the Care of the Elderly, Canada; 2. National Survey on the Mistreatment of Older Adults in Canada, National Initiative for the Care of the Elderly, Canada; 3. Ecole de Travail Social, Faculte des Lettres et Sciences Humaines, Universite de Sherbrooke, Canada; 4. School of Social and Political Sciences, Faculty of Arts, University of Melbourne, Australia; 5. Gerontology Research Centre, Simon Fraser University, Canada; 6. Faculty of Nursing, University of Calgary, Canada; 7. Center for Research & Study of Aging, University of Haifa, Israel; 8. Westat, USA)

Introduction : More recent estimates of the prevalence of elder abuse in Canada are needed, and the National Initiative for the Care of the Elderly (NICE) has been working towards a prevalence study for the country. NICE began with a project to provide definitions of mistreatment and to develop and validate a measurement instrument. Method : The initial project included a literature review of prevalence studies and theoretical frameworks; development of definitions; and development and validation of an instrument to measure elder abuse. To test the instrument, telephone interviews were conducted with 267 older adults living in communities across Canada. Responses were subject to a "known groups" validation process. An evaluative coding process was used to investigate cases where participants indicated they experienced abuse but did not feel abused. Results : The validation process showed a statistically significant difference in the number of items that were answered positively by "known abused" and "known not abused" groups, suggesting that 20 of the most important abuse items distinguished between the two groups. The percentage of respondents experiencing abuse differed from respondents' reports of feeling abused, indicating that current research may be over- or under-estimating prevalence rates in certain abuse categories. Conclusion : NICE will soon launch a new national prevalence study based on this preparatory work. The study will survey a representative sample of

5,000 adults, aged 55 years and older, living in private dwellings in Canada on numerous forms of abuse and neglect. Evaluative coding will again be used to provide more sensitive prevalence rates. Keywords : elder abuse and neglect / mistreatment, Canada, prevalence

PP25 S-329

THE FEMINIZATION OF ELDERLY ABUSE AND THE POLICE STATIONS

Guíta Grin DEBERT, Amanda Marques OLIVEIRA (IFCH - Institute of philosophy and humanities, UNICAMP - University of Campinas, Brazil)

Introduction : Elder abuse is a violation of human rights, and Brazil has been engaged in ensuring the rights of older people. Method : Building on the dilemmas involved in Brazilian initiatives to address abuse, the article analyzes the way in which the elderly are treated at the police stations and at the special precincts for elderly protection. Results : The text highlights the disconnection between the images police officers constructed on old age and those over 60 years of age that comes to the police asking for their help. The main argument is that this disconnection leads to an invisibilization of elderly neglect and exploitation; to a feminization of old age; and to the consideration that crimes are the result of a moral deficit in family relationship. Conclusion : The dynamic aspect of the functioning of the police stations turns it into instances focused on the judicialization of family relations. Instead of being a subject of rights, the elderly becomes the object of family violence. Keywords : old age, elder abuse, special police stations.

PP25 S-330

COMPARISON OF REPORTED CASES OF ELDER ABUSE IN SOUTH KOREA AND JAPAN

Kenji KURODA¹, Tsuzuru MIZUGAMI², Yunjeong JANG³, Koeun KIM⁴ (1. Faculty of Health and Well-being, Kansai University, Japan; 2. Faculty of Rehabilitation, Kobegakuin University, Japan; 3. Division of Social Welfare, Gyeongnam University, Korea; 4. Woman and Family Policy Research Center, Gyeongnam Development Institute, Korea)

Introduction : Starting in South Korea with the amendment of the Welfare Law for the Aged in 2004, and in Japan with the introduction of the Elder Abuse Prevention Act in 2006, a legislative response to the issue of elder abuse has been introduced. The present study aimed to identify the distinctive features and examine the background to elder abuse in the two countries. Method : Statistical data on reported cases of elder abuse in South Korea and Japan were compared. The data used were, for South Korea, a report on elder abuse (Health and Welfare Department, 2006-2011); and, for Japan, the results of a survey of the status of response to the Elder Abuse Prevention Law (Ministry of Health, Labour and Welfare, 2006-2010). Results : In the two countries the number of cases judged as elder abuses was 5.7 for every 10,000 of the elderly population in South Korea and 5.8 in Japan (2010). Physical abuse and mental abuse were frequent, and in both countries the victim was female in 70% of cases where the perpetrator of the abuse was the victim's son accounted for 48% of the total in South Korea and 43% in Japan. Conclusion : A likely background factor is that the marriage rate in both countries has declined so that the number of sons looking after their mothers has increased. Also, the increase in unemployment and casual forms of employment has created a challenging environment. An effective strategy to deal with this scenario of abuse needs to be considered. Keywords : elder abuse, reported cases, comparison of Korea and Japan

PP25 S-331

HOW TO PREVENT THE ELDER ABUSE IN THE GROUP LIVING FOR PEOPLE WITH DEMENTIA

Nozomi MATSUMOTO (*Social and behavioral sciences, Japan college of social work, Japan*)

Introduction : In Japan, the group-living for people with dementia are pointed out the risk about occurrence and latency of elder abuse. However, there is only a little literature about the abuse, and it does not have enough evidence. Purpose of this study is to identify factor structure of preventive measure, and consider about those effects to prevent the abuse from prior studies. **Method :** First, questionnaire survey of caregiver's recognition to find the factor structure of preventive measure of the abuse, were distributed among 1,000 caregivers, and the number of valid responses was 421. Second, used factor analysis, and identified factors. Third, compared with factors which have been pointed out the needs or effect of prevent the abuse in prior studies. **Results :** The results of factor analysis, 4 factors were identified. These factors were seen in the prior studies, and some of these studies^o have pointed out the effect of reducing risk of abuse. Also, these factors were similar to measures which have been indicated as decreasing risk of stress, burnout or staff's turnover. **Conclusion :** We find the four factors to prevent the abuse by experimental study, and we showed the evidence of past studies by clarifying the similarity of the factors which were pointed out in past literature. We need more studies to disclose the relationship between each risk and prevention factors, and its effect. **Keywords :** elder-abuse, group-living, dementia

PP25 S-332

RECOGNIZING AND ASSESSING ABUSE IN THE ELDERLY BY HOSPITAL OUTPATIENT NURSE

Reiko TSUJI (*Faculty of Health Sciences, Department of Nursing, Saitama Prefectural University, Japan*)

Introduction : The purpose of this research was to identify how the outpatient nurses in a Japanese hospital recognized and assessed signs of abuse in the elderly. **Method :** The data were collected in August 2011 through interviews with outpatient nurses at a hospital consisting of >200 floors. The interviews were based on the observations of situations, signs, symptoms of elderly and formulation of solutions for those identified as abused. I analyzed the findings both qualitatively and inductively. **Results :** All 5 participants were female, with an average of 16.4 years of nursing experience. When outpatient nurses observed elderly people, they used all their senses to detect any "atmosphere different from normal". Information was gathered from elderly individuals and risk assessment was performed. Low-risk abuse in the elderly were well coped. With regard to high-risk individuals, the following three points were elucidated. : 1. The nurse assigned only one person to the diagnosis and treatment department doesn't have the person with it can consult at once. Therefore, the nurse was embarrassed with the correspondence of high-risk abuse in the elderly. 2. It is difficult for the nurses to correspond with outpatients to obtain their cooperation and details about their occupations. 3. The outpatient nurse cannot consult with other organizations operating outside the hospital. **Conclusion :** Outpatient nurses could recognize the signs of elderly abuse and were able to perform risk assessments. Further research on this issue and correspondence with outpatients are necessary for evaluating the severity of risk of elderly abuse. **Keywords :** Elder Abuse , Outpatient Nursing, function of nursing personnel

PP25 S-333

COMPARISON OF PROGRAMS FOR PREVENTING ELDER ABUSE IN SOUTH KOREA AND JAPAN

Tsuzuru MIZUGAMI¹, Yunjeong JANG², Koeun KIM³, Kenji KURODA⁴ (*1. Faculty of Rehabilitation, Kobegakuin University, Japan; 2. Division of Social Welfare, Gyeongnam University, Korea; 3. Woman and Family Policy Research Center, Gyeongnam Development Institute, Korea; 4. Faculty of Health and Well-being, Kansai University, Japan*)

Introduction : Elder abuse as reported in South Korea and Japan shows a similar pattern with, for example, many cases of elder abuse are caused by the elder's son. Both countries belong to the east Asian cultural sphere and have similar problems such as population aging, increasing difference in income levels, and a rising percentage of unmarried people. The purpose of this study is to examine useful programs in Japan and South Korea by comparing programs for preventing elder abuse. **Method :** We reviewed the programs for preventing elder abuse provided by the following laws. (1) Welfare Law for the Aged (South Korea and Japan), (2) Long-Term Care Insurance Law (South Korea and Japan), (3) Elder Abuse Prevention Law (Japan)/Law on Special Cases Concerning the Punishment, etc., of Crimes of Domestic Violence (South Korea). **Results :** Three main differences between the two countries were found in the programs. (1) The role of the central government is clearer in South Korea. In that it has established the Korean Elder Protection Agency. (2) In South Korea, provinces bear responsibility for elder abuse, whereas in Japan, municipalities do. (3) In South Korea, special agencies react to elder abuse, whereas in Japan, comprehensive support centers do. **Conclusion :** These results suggest the necessity for establishing a central agency in Japan similar to the Korean Elder Protection Agency and enhancing municipalities' functions in the comprehensive support of the elderly, including functions relating to elder abuse in South Korea. MEXT/JSPS KAKENHI GRANT Number 24730495. **Keywords :** Elder abuse, Korea and Japan, program

PP25 S-334

SEEKING EUTHANASIA

Ai Diem LE (*School of Social Sciences and Psychology, Victoria University, Australia*)

Introduction : The prolonged ethical debate of legalising euthanasia, while representing the moral dilemmas inherent to end of life decisions, continues to limit pro-death options for the terminal and chronically ill. Euthanasia is not an encouraged motion nor is it an acceptable disposition for most of the jurisdictions around the world. Medical bioethics contained within the Hippocratic oath remains hesitant; while legal ethics representing the consensus view is constrained by the underlying Christian values that form the basis of the Western judiciary system. Conservative laws fail to address the advocacy for human rights, consequentially denying the people's autonomy by diminishing their civil rights. In Australia, inconsistent and fickle legislation has forced despaired sick individuals to resort to alternative arrangements for a peaceful death. **Method :** Through Literature Review and Media Reporting this presentation wishes to address the ethical, social and political concerns of those who have independently procured euthanasia. **Results :** This retaliative suicidal movement only reflects the inadequacies of the Australian health care system. End-of-life decisions are ineffectual unless respected and fulfilled. Therefore, without the governmental support the local health care system fails to deliver critical end-of-life decisions. Compelled to retain autonomy over their lives, these people pursue their own deaths. **Conclusion :** This social phenomenon is an alarming call for a deeper investigatory discourse on issues concerning gerontological mental

health. Lawful or not, people are not waiting for the law to reform. The issue here is that while the government hesitates to legalise euthanasia, people are taking suicide into their own hands. Keywords : Euthanasia, Ageing Mental Health, Civil Rights

RELIABILITY AND VALIDITY OF THE KNOWLEDGE AND ATTITUDE SCALE OF ADVANCE DIRECTIVE (AD) FOR JAPANESE

Hamayoshi MIHO, Kono AYUMI (*Nursing, Osaka City University Graduate School of Nursing, Japan*)

Introduction : The present study aimed to examine the reliability and validity of the AD Knowledge Test and the AD Attitude Survey measure which were developed by Catherine, P (2000), were translated into Japanese. Method : Subjects were 102 elderly members of community elderly association in A city, Japan. Questionnaires included the AD Knowledge Test and an AD Attitude Survey. The statistical analyses were conducted by I-T correlation analysis and examined the internal consistency by Cronbach's alpha. The correlation items of AD creation intention by preceding study and related the scale were checked using a t-test. Results : As a result of the I-T correlation check, AD Knowledge Test and AD attitude survey were delete 2 items of 0.3 or less items. And that of Cronbach alpha of AD Knowledge Test was $r = .67$, and that of AD Attitude Survey was $r = .83$. The correlation with the AD creation intention that 'suffering serious disease and operations or not 'were survivors had high scores in AD Knowledge Test, $r = .02$, and 'never heard about AD who answered was 'No' had a high score in AD Attitude Survey of $r = .01$. and 'suffering serious disease and operations or not 'were survivors had high scores in Attitude Survey of $r = .01$. Conclusion : These results suggested that the reliability of AD Attitude Survey has been examined. However, Cronbach's alpha of the AD Knowledge Test was less than 0.8. Further investigation with another large numbers of subjects should be conducted to confirm this scale. Keywords : Advance directive elderly

PP25 S-336

SELF-REPORTED VIOLENCE IN LOW INCOME AND LOW EDUCATED ELDERLY IN RIO DE JANEIRO, BRAZIL

Adriana SANTOS¹, Juliana ROSAS¹, Fernanda BORGES², Marisa SANTOS³, Luiz Mauricio PLOTKOWSKI³, Jerson LAKS³ (*1. Social Service, Centro de Estudo e Pesquisa do Envelhecimento, Brazil; 2. Nutrition, Centro de Estudo e Pesquisa do Envelhecimento, Brazil; 3. Medicine, Centro de Estudo e Pesquisa do Envelhecimento, Brazil*)

Introduction : There are scarce data on violence against the elderly in Brazil. This cross-sectional study aims to delineate the profile of an outpatient low income and low educated elderly sample who suffer abuse. Method : We screened 300 elderly people referred by a primary care center from April to December 2012. They were assessed with a multidimensional structured questionnaire. Typology was characterized according to WHO classification (2002). They were mainly female (59%), mean age = 70 years (± 7); 42% lower educated, 82% from D/E economic class. Results : In our study 14% of this group of 300 elders didn't have any kind of social or family support. From the 9% (n=27) who reported some kind of violence, 37% are married, (88%) female abused against (18%) compose by male old people. About the social profile of this sample who suffers any kind of violence, we had (85%) assets for social security. Most abusers (90%) were the partners, followed by their sons/daughters. Verbal violence occurred more frequently (52%) followed by physical violence (33%), split by psychology abuse (11%); sexual (7%) and financial abuse

(7%). Use of alcohol and drugs were present in 22% of families. Conclusion : Domestic violence shows the same typology as described in other countries. Relatives were the main aggressors and verbal violence the most common type of violence. Keywords : Violence, Elderly, Low income

ROLE OF CIVIL SOCIETIES TO PROTECT THE RIGHTS OF OLDER PERSONS

Dola GUPTA¹, Indrani CHAKRAVARTY², Samar Kumar CHAKRAVARTY³, Jayanta Kumar ROY⁴ (*1. Electronics and Gerontology, Narula Institute of Technology, India; 2. Gerontology, CMIG, India; 3. Electronics and gerontology, CMIG, Calcutta Metropolitan Institute of Gerontology, India; 4. Electronics and Instrumentation, Narula Institute of Technology, India*)

Introduction : Asia is the fastest ageing region in the world. Presently half of the world's older people live in Asia, and in the coming fifty years two-thirds of the world's older population will be residing here. Asia has experienced various development processes, political and economic upheavals, disparities amongst various segments in the society that have had a multidimensional impact upon ageing in the region. Method : This paper deals with the role of civil to promote the awareness towards the protection of rights of the older persons . The study is made in the contemporary Indian society by the researchers in the Calcutta Metropolitan Institute of Gerontology (CMIG) in Kolkata metropolis of India. Respondents are selected by standard sampling technique. Results : In the present socioeconomic format, it is not possible to protect the rights of the older persons as appreciated in UN principle such as dignity, fairness, respect, equality, autonomy and all. Surely the rights for the elderly as said in the various international charters is a huge task and action plan to be aggregated through coherent activities in steps world over by all stake holders of the society. Conclusion : In course of this study some key areas are identified for creating awareness of rights as well as capacity building. Keywords : Ageing, Rights, UN principals, Civil Society, Dignity, Fairness, Equality, Autonomy

PHYSICAL HEALTH, SELF-PERCEPTION OF AGING, AND DEPRESSIVE SYMPTOMS AMONG OLDER PEOPLE: SELF-PERCEPTION OF AGING AS A MEDIATOR AND AGE SCHEMA AS A MODERATOR

Jina HAN, Jinhyun KIM (*School of Social Work and Administrative Studies, Marywood University, USA*)

Introduction : This research is intended to examine how ageism might be related to interdependent processes between physical health and depressive symptoms over time. The first goal is to examine the extent to which self-perception of aging mediates the relationship between prior physical health and later depressive symptoms. The second is to explore whether the cognitive schema of old age (age stereotypes) affect these processes in particular by enhancing the influence of physical health on older peoples' self-perception of aging. Method : Data from the Health and Retirement Study (2004-2010) were used for analyses. Structural equation models were employed to analyze the effects of age stereotypes on interdependent processes between physical health and depressive symptoms. Results : The mediating effect of self-perception of aging in the relationship between prior physical health and later depressive symptoms was significant. Although the moderating effect of age schema was not statistically supported, older individuals who had age schema were likely to report negative self-perception of aging four years later when their physical health status had worsened, while physical health was not significantly

related to self-perception of aging among older individuals without age schema. Conclusion : Self-perception of aging is another mechanism that explains the effects of physical health on depressive symptoms among older people, and older individuals might have more negative self-perception of aging when they have age schema and worsening physical health. Keywords : Self-Perception of Aging, Age Schema, Health

HOW DO THEY SEE THE ELDER? THE ELDER IMAGE ANALYSIS IN THE MEDIA

Ming Chih HSU, Ya Hui LEE (*Department of Adult and Continuing Education, National Chung Cheng University, Taiwan*)

Introduction : Media greatly affect the social education. All kinds of images presented by the mass media in the daily lives affect the surrounding people, things, the views and feelings of the matter in a subtle. Thus, the media has played an important role in cognition and decision-making and can be regarded as an effective tool to promote health aging image. Method : This study adopts the qualitative content analysis to investigate the newspaper report 2006-2011 to provide for the elderly related topics. Results : The preliminary study could be summarized as follow: (1) the proportion of news coverage for the elder has increased over the years; (2) the proportion of positive reports on the elder has increased year by year and leads to successful aging image; (3) news coverage for the elderly category tend to be varied; (4) elderly commercial possibilities has been increased over the years. Conclusion : This study can provide a reference for designing educational programs for the elder.

Keywords : elder image , media

PRESENTATION OF THE ELDERLY WITH DEMENTIA AND THEIR PROBLEMS IN THE NHK TV PROGRAMS IN THE FIRST HALF OF 1980S

Akiko TAJIMA¹, Takashi IGUCHI² (*1. Faculty of Rehabilitation, Seirei Christopher University, Japan; 2. Faculty of Human Life and Environment, Nara Womans University, Japan*)

Introduction : The elderly with dementia appeared in the rehabilitation and political TV discourses in the latter half of 1980s in Japan. This study aimed to elucidate what kinds of NHK TV programs had been broadcast, how the elderly with dementia had been presented, and what problems had been raised until the first half of 1980s. Method : Subjects: Of the TV programs on the elderly with dementia constructed until 1985, three programs that were considered to be suitable for the aims of this study based on the title were watched and texts changed from sounds were subjected to analysis. Results : In the first program, the elderly nursing home that was dedicated for the first time in Japan exclusively for the elderly with dementia was recorded with their speech and activities in 1981. In the second one, experts commented on the images of the first one and a challenge of "how to provide nursing care" was raised. In the third one, an effort with music therapy was introduced as the method that focused on the brain mechanism. Conclusion : Discussion and Summary: These movements of mass media drew attention of the people and accelerated the discourses about the policy and rehabilitation in the latter half of 1980s. Keywords : problems in the NHK TV programs, Presentation of the elderly with dementia

HOW HAVE PEOPLE WITH DEMENTIA BEEN REPRESENTED IN TV DOCUMENTARY PROGRAMMES IN

JAPAN?

Takashi IGUCHI¹, Akiko TAJIMA² (*1. Faculty of Human Life and Environment, Nara Womens University, Japan; 2. School of Rehabilitation Sciences, Seirei Christopher University, Japan*)

Introduction : In Japan, a new image of people with dementia (PWD) has been promoted through policies and narratives of caregivers from the late 1990s to the twenty-first century. Especially since the Alzheimer's Disease International (ADI) conference in Kyoto in 2004, the trend has been for Japanese PWD to speak about their thought and will in public. This presentation will focus on the era before that trend. I explore patterns of how PWD and their thought and will were described in NHK TV documentary programmes produced between 1982 and 2003 by analyzing and comparing some of these programmes. Method : By searching through the database and watching many TV programmes at the NHK Archives Center, I chose some distinctive programmes. I analysed each selected programme, focusing on how it describes thought and will of PWD in institutional care settings. Results : Two patterns of describing thought and will of PDW emerged. The first pattern is that their thought and will descriptions relate to problematic behaviours for caregivers. Caregivers need to understand this pattern to treat these problematic behaviours. The second pattern is that PWD's thought and will are important in and of themselves, and therefore sometimes conflict with caregivers' convenience. Conclusion : Finding two patterns indicates the possibility of potential conflict in person-centered care, and necessitates investigation of how the thought and will of PWD are described in TV programmes after 2004. Keywords : mass media, image

PP25 S-342

IMAGE OF THE ELDERLY HELD BY UNIVERSITY STUDENTS -A CROSS-CULTURAL STUDY IN JAPAN, SOUTH KOREA AND TAIWAN-

Yoko HOSOE¹, Ju-hyun KIM², Shu-Tzu CHENG³, Ching-Sung LEE⁴ (*1. Department of Living and Health Sciences Education, Joetsu University of Education, Japan; 2. The Institute for Social Development and Policy Research, Seoul National University, Korea; 3. Department of Family Studies and Child Development, Shih Chien University, Taiwan; 4. Department of Restaurant, Hotel, and Institutional Management, Fu-Jen Catholic University, Taiwan*)

Introduction : The purpose of this study was to compare and analyze the image of the elderly held by university students in Japan, South Korea and Taiwan. Despite sharing traditions based in Confucianism, the three countries have quite different social norms and cultural values concerning the elderly. And although three have enjoyed a rapid growth of economy, Japan being a super-aged society and others aging societies also merits comparison. Method : The study was conducted in Japan in 2009, South Korea in 2011 and Taiwan in 2011 employing self-administered questionnaires based on a semantic differential scale using 50 adjective pairs. The sample consisted of 320 university students in Japan, 384 students in South Korea and 489 in Taiwan. Results : The outcome was as follows: (1) A factor analysis identified four semantic spheres in Japan, five in South Korea, and three in Taiwan. "Capable" and "Cooperative" were common to both countries, Japan and South Korea. "Active" and "Social" were distinctive to Japan and Taiwan; "Noble and intelligent," "Happy," and "Intimate" to South Korea. (2) In the "Active" sphere, students in Japan had a more positive image than those in South Korea. In "Cooperative," students in both countries had a positive image. (3) "Concern for the elderly or the problems of the elderly," "Experience in activity with the elderly," and "Satisfaction for the family" were

important factors in shaping the respondents' image. Conclusion : The study suggested that in post-industrial societies, personal factors such as experience with and concern for the elderly became stronger determiners of the resulting image. Keywords : Semantic differential scale, Factor analysis, Semantic spheres

PP25 S-343

A COMPARATIVE STUDY BASED ON YEARS OF NURSING EXPERIENCE AND TYPES OF BEHAVIORAL AND PSYCHOLOGICAL SYMPTOMS OF DEMENTIA (BPSD) THAT NURSES FIND DIFFICULT TO CARE

Hiroshi YOSHIMURA¹, Mizue SUZUKI², Tomomi TAKAGI³
(1. Department of Nurse, Seirei Mikatahara General Hospital, Japan; 2. Faculty of Nursing, Hamamatsu University School of Medicine, Japan; 3. Department of Nursing, Seirei Mikatahara General Hospital, Japan)

Introduction : Nurses in acute care hospitals are facing difficulties in caring Behavioral and Psychological Symptoms of Dementia (BPSD). The purpose of this study is to clarify the various types of BPSD that nurses feel difficult and burdensome to care, and nurse's perceptions of this issue based on their years of nursing experience. Method : The questionnaire survey has been conducted between October and December in 2012 which target floor nurses at the hospital. The questionnaire included the following contents: years of nursing experience, severity of BPSD that nurses find difficult to care, nursing care for the elderly patients with BPSD. Results : The questionnaires were given to four hundred thirty-four ward nurses. Thirty percent (130 subjects) of the questionnaires were returned. In terms of BPSD, 90% of nurses found some risk behaviors difficult to care, such as "waking up during midnight". The following symptoms were perceived as being difficult to care, most significantly among nurses with less than three years of experience: "not showing interest in things", and so on. The following nursing care methods were reported to be difficult to provide, particularly among nurses with less than three years of experience; "assigning nurses to patients with whom they are familiar with" so the patient can experience more comfort. Conclusion : It was suggested that educational specialized training for the elderly patients with dementia and effective systems to provide good nursing care without physical restraints are required for nurses with less than three years of experience. Keywords : Acute hospital, Patients with dementia, Nurses, Difficulties

PP25 S-344

A COMPARATIVE STUDY OF FACTORS RELATED TO COGNITIVE FUNCTIONING IN LATER LIFE: FINDINGS FROM THE HEALTH AND RETIREMENT STUDY & KOREAN LONGITUDINAL STUDY OF AGEING

Jiyoung LYU, Chae Man LEE, Elizabeth DUGAN (Gerontology, UMass Boston, USA)

Introduction : Cognitive functioning in later life has been a growing concern worldwide. Many studies have sought to identify risk factors for cognitive problems, but little research has sought to make cross-national comparisons. The purpose of this study was to compare the factors related to cognitive functioning in later life in a U.S. and Korean sample. Method : The study sample was comprised of subjects from the Health and Retirement Study (HRS) and the Korean Longitudinal Study of Ageing (KLoSA). Separate multivariate regression models were employed to examine the impacts of socio-demographic factors, health factors, and health behaviors on cognitive functioning among individuals aged 65 and over. Results : Multivariate regression analysis showed that age, gender, IADL

impairment, and poor eyesight were negatively associated with cognitive functioning, while higher education, higher income, better self-rated health, and regular exercise were positively associated with cognitive functioning in both countries. However, net worth and depression were significantly associated with cognition only in U.S., while poor hearing was a significant factor only in Korea. In addition, gender-specific models suggested several socio-economic and health factors had significantly different effects by gender in both countries. Conclusion : Cross-national comparative research identified similar risk factors, suggesting robust associations. Unique factors related to cognitive functioning in U.S. and Korean older adults highlight the important role of cultural influences on outcomes. Keywords : cognition, cross-cultural comparison, U.S., Korea

PP25 S-345

BRIDGING THE DIGITAL GAP? INTERNET DIFFUSION AMONG OLDER PEOPLE IN GERMANY 2002 TO 2012

Michael DOH, Hans-Werner WAHL (Department of Psychological Ageing Research, Institute of Psychology, Heidelberg University, Germany)

Introduction : Internet is a key media of the mediatisation with more than 50 million users in Germany. Diffusion research replicates a tremendous development in the last decade, but also strong inequalities of diffusion by social-structural factors e.g. age, education, gender, income and region (Doh, 2009). These results are confirmed by theories such as diffusion process (Rogers, 2005), generation and social differences (Docampo Rama et al., 2001). But little is known about the dynamics of the predictors of the internet diffusion. With this presentation we will analyse over a period from 2002 to 2012: 1) The development of internet adoption by age and cohort groups. 2) The process of a digital gap by social-structural factors. 3) The dynamics of social-structural factors in the age group 60plus. Method : Data was drawn from the (N)Onliner-Atlas, the greatest national internet study, comprising 11 annual surveys (2002-2012, N=413.655 totally, aged 14-99). Logistic regression models were computed to examine the impact of socio-structural, age and cohort factors on internet diffusion. Results : Between 2002 and 2012 the internet diffusion increased especially in the age groups of 50-59 years and 60-69 years. Further analyses suggest a substantial effect of cohort, dominating the age effect. The 'Digital-Divide-Index' demonstrates a decline, however cohort is still a dominating factor of inequality. In addition within older persons the socio-structural factors "level of income" and "level of education" are unaltered strong predictors of internet adoption. Conclusion : The digital gap between young and old are getting closer, but not between older persons. Keywords : internet diffusion Germany

PP25 S-346

PHYSICAL, EMOTIONAL HEALTH LEVEL & RELATED FACTORS OF EMPLOYEES IN NURSING HOMES FOR ELDERLY

Bo-Sung KIM¹, Jung A. KIM² (1. Graduate School of Information in Clinical Nursing, Hanyang University, Seoul SeoBu Senior Care Center, Korea; 2. Division of Nursing, Hanyang University, Korea)

Introduction : Elderly care center employees provide physically-dependent elderly people with daily life activity services. They experience various physical and emotional symptoms and stress due to the hard work. This study aimed to identify the physical, and emotional health of elderly care center employees and to examine the relation between these variables. Method : This was a descriptive correlational study. A total of 121 employees were recruited from 8 elderly care centers in Seoul and a self-reported questionnaire survey

was performed from November 1st to November 14th 2011. Collected data were analyzed using SPSS WIN 19.0. Results : More than half of the elderly care center employees were care worker (56.2%), followed by nurse (19.8%). The contract/temporary employees were 47.9%. For the quality of elderly care, 52.1% reported that their service was 'excellent', and 41.3% reported 'poor'. Overall physical health score of the subjects was 64.95±16.20 and overall emotional health score was 18.22±3.22. Physical health of subjects significantly differed by types of working. Particularly, 12-hour shift employees had significantly poorer health. Emotional health significantly differed by how they recognize the quality of the care they provide, and the lower the quality of care they provide, the emotional burden was heavier. There was a significant positive correlation between physical and emotional ($r = -.172, p = .030$). Conclusion : To improve the quality of care that the employees recognize, education focused on practical care service should be provided, and to provide advanced care technique, continuous communication and educational exchange between workers of different elderly care centers. Keywords : Elderly care center employee, Physical health, Emotional health

PP25 S-347

A STUDY OF CENTENARIANS IN PUERTO RICO FROM A SOCIOLOGICAL PERSPECTIVE

Julita ORTIZ-MARIN, Angeles J. ALMENAS-VELASCO (*Puerto Rico, Sociedad de Gerontologia de Puerto Rico, Puerto Rico*)

Introduction : The study points out the life style, kind of social relationships and demographic profile of the centenarians living now in Puerto Rico and compares to the findings of the characteristics of other centenarians studied in the world. It includes data in regard to diet, health practices, relationships networks and their quality and their personal views to explain their longevity. Method : After screening the subjects with a Mini Mental, those were selected who could answer questions to be recorded by the researcher. This was followed by an interview with open end questions that allowed the subjects to clarify or add. Results : Most of the subjects were raised in a rural environment with close family ties. Their diet was rich in vegetables and fruit with some meat. They had large families and worked in a variety of jobs. Although some live alone most live with another member of their close parental family. Their interactions are frequent with children and siblings seeing other family members at family gatherings such as baptisms, weddings and funerals. Close family members are expected to take care of them when in financial need, illness and hospital stays although other institutions may substitute them. There exists trust in their doctor and expectancy of friendliness from the brethren in the church. Their outlook on life has been positive, Most have a cheerful dispositions. Conclusion : Centenarians in Puerto Rico resemble other centenarians studied in other parts of the world in regard to overall habits of diet and health. They yearn for close emotional relationships. Keywords : Centenarians, Puerto Rico, Relationship

PP25 S-348

NEVER TOO LATE TO LEARN: ELDERLY WOMEN'S CLUB Svetlana ASLANYAN (*Elderly Women's League, Center for the Development of Civil Society, Armenia*)

Introduction : In the introduction I intend to make a short overview on the situation of elderly women in soviet and post-soviet Armenia based on the research, which reveals the incredibly vulnerable situation in which elderly women found them appeared after downfall of Soviet Union, it also revealed totally social exclusion of target group. Method : Methodology: I will present the project its goal, objectives and results and refer to case studies. The long term goal of the project is: to

protect elderly rights, to promote their participation in public life, to improve their social status, to find their own place in changed social and economical environment, to increase public awareness on elderly issues, to change the attitude of the society to older person. The objectives are: to help elderly women to stay active persons, to increase their active participation in the social/civic life, to help them learn healthy and constructive ways to spend their leisure time, to assist them to share their life and professional experience with younger generation. Results : Elderly women club will be established and operate. Conclusion : Conclusion: Today in our country the older generations are in danger of being left out of the society. It is necessary to evaluate elderly women's role in society and to facilitate and encourage their participation in public life. In this regards establishment of club where women could meet, exchange views, discuss an interesting topic pertaining to issues of concern such as health or social relations topics and share the knowledge and experience they have accumulated. Keywords : elderly, exclusion, participation

PP25 S-349

IMPACT OF SPIRITUALITY ON LIFE COURSE OF AN INDIVIDUAL: AN EXPERIENCE FROM INDIA

Gaurav AGGARWAL (*Public Health Consultant, International Academy for Public Health Management, India*)

Introduction : Rajyoga being observed by brahma kumaris at world spiritual university is a unique spiritual education which facilitates the individual to realize true potential of uplifting ones self identity or awareness. It also helps in experiencing the true and deeper qualities which manifests and vibrates in a natural. Method : Elderly population ($n=200$) from across the country was taken as study subjects. A prior verbal consent was taken from them. Amongst this elderly population 100 were recruited into one group consisting of those who practices raj yoga and other group of 100 consisted of population who doesn't follow raj yoga. A convenient sampling method was used. A pretested questionnaire was used. Results : Total of 200 subjects were taken into consideration out of which 100 were Raj Yogis and 100 were those who were not practicing spirituality in any form. The subjects who were recruited in this study belongs to age group of 60 to 95. Mean age of the subjects was 68 with SD 6.5, variance of 42.3 and range of 35. These three perspectives have been measured in two dimensions of gerotranscendence: 1. Cosmic Gerotranscendence, which is connected with changes in perception of time, space, life, and death; and 2. Ego gerotranscendence, which is connected. Conclusion : Tornstam defined gerotranscendence as 'a shift in the meta-perspective from material and rational vision to a more cosmic and transcendent one, normally followed by increased life satisfaction. According to Tornstam (1999) many elderly people look at their body with disgust, regarding it an indication of overall decline. Keywords : Spirituality, Transcendence

KNOWLEDGE AND ATTITUDE TOWARD INFORMED CONSENT FOR SUSTAINING TREATMENT INTERRUPTION AMONG CLINICAL NURSES

Sun Ok OH¹, Boon Han KIM², Min Su KIM³ (*1. Graduate School of Information in Clinical Nursing, Hanyang University, Seoul Veterans Hospital, Korea; 2. Division of Nursing, Hanyang University, Korea; 3. Graduated School of Information in Clinical Nursing, Hanyang University, Korea*)

Introduction : The purpose of this study was to identify the knowledge and attitude toward sustaining treatment interruption (STI) among

clinical nurses. Method : Study subjects were 294 clinical nurses in a general hospital in Gyeonggi-do, Korea. A self-reported questionnaire survey was carried out from Apr. 26th to May 5th in 2010. Three instruments were used in collection data: 1) Scale of Knowledge of STI, 2) Scale of Attitude toward informed consent for STI of their own and their family member, 3) selected demographic data. Collected data were analyzed on SPSS/WIN 17.0. Results : The knowledge of STI scored 54.75 out of 100.00. For attitude toward informed consent for STI of their own, 95.9% subject agreed with administering a painkiller for pain control, 82.7% agreed with supplying nutrition using an intravenous injection. Only 6.1% agreed with doing CPR. For attitude toward informed consent for STI of their family member, 95.2% agreed with administering a painkiller for pain control, 91.5% agreed with supplying nutrition using an intravenous injection, and 18.7% agreed with doing a CPR. Conclusion : The findings of this study showed that clinical nurses could have a harder time making a decision on the informed consent for STI of their family member than their own. This may result from their past experience in clinical nursing practice, and it is possible that they would not come to a decision easily if their family need to decide on the STI. Keywords : Resuscitation Orders, Informed Consent, Decision Making

PP25 S-351

LIFE OF THE ELDERLY LOW-INCOME WOMEN WHO LIVE ALONE

Soon Won KANG¹, Boon Han KIM², Joon Ah CHO³ (1. Graduated School of Information in Clinical Nursing, Hanyang University, Seoul Medical Center, Korea; 2. Division of Nursing, Hanyang University, Korea; 3. Graduated School of Information in Clinical Nursing, Hanyang University, Korea)

Introduction : According to the data from Statistics Korea in 2010, the elderly population, aged 65 or older, comprised 11.3% and the ratio has been steadily increasing. Especially, the acceleration of increase of elderly woman who live alone has been proved to be a kind of social problems by previous studies. Those women are suffered from limitation of physiological function, poverty and loneliness. The purpose of this study was to figure out what was the life of the elderly low-income women who live alone, then to explore a nursing intervention to help the elderly women. Method : This study is a qualitative study using phenomenological approach to explore the life of the elderly low-income women who live alone. Six participants were recruited and data collected from March to May 2012, and the meetings were done through a total of 11 deep interviews. Results : In this study, the life of the elderly low-income women who live alone were classified into 7 categories as follows; 'ambivalence toward families', 'relatedness with others', 'physical pain', 'life dedicated to religion', 'anxiety about death', 'economic poverty', and 'role loss'. Conclusion : The findings of this study showed that the life of the elderly low-income women who live alone had negative emotions like guilt, remorse, solitude, grudge, and loneliness due to living difficulty, inherited poverty and severance of the relation with sons and daughters, and at the same time they firmly led a life with positive emotions like expectation of a new life with meeting their daughters. Keywords : Aged, Qualitative research, Life change event

TRADITIONAL MEDICINE THERAPY A PARADIGM SHIFT IN PROMOTION OF GERONTOLOGICAL SEXUAL MEDICINE IN SUB-SAHARAN AFRICAN COUNTRIES

King ODOR¹, Ngozi IWUJI², Rose OPARA³ (1. Health Promotion, University of Ibadan/Navitas Australia, Nigeria; 2. Sexual and Reproductive Health, Sure Health Organization, Nigeria; 3. Aged

Care, Gertrude Abbot Nursing Home, Australia)

Introduction : Traditional Medicine (TM) has responded to healthcare-delivery needs of Africans for decades. However TM means different-things-to-different people. Equally, TM as sexual remedy has received limited attention. Therefore, this study examined TM as paradigm shift in promotion of sexual medicine in sub-Saharan Africa. Method : The study adopted quantitative/qualitative data collection methods, and was descriptive and cross-sectional in design comprising 800 respondents. The FGDs and questionnaires data were analysed thematically and statistically respectively. Results : A total of 20.5% of participants under herbal addiction used TM to prevent infection during sex. Few (3.0%) used herbs and concoction (6.3%) to increase sexual performance. Moreover, (1.5%) suggested that herbal concoction could improve sexual health. Most (60.3%) postulated visiting traditional healers herbal use (10.3%) and drug-taken (17.3%) would provide prevention/treatment against STDs. FGD participants unanimously believed in TM efficacy than contraceptive-use. Hence Magun could prevent diseases while Ale enhances ejaculation and sperm-production Aseje boost sexual-performance. Most African people used traditional herbs to enhance sexual performance. Conclusion : There is need to support clinical investigation of TM especially the claims in relation to sexual health improvement. Keywords : sexual performance, health, traditional herbs

PP25 S-353

DOES DEMENTIA ADD TO HOSPITAL RESOURCE UTILIZATION COMPARED TO ELDERLY PATIENTS WITHOUT DEMENTIA?

Jun TANG¹, Marissa TRESTER¹, Rachel NG², Leslie WILSON³ (1. Clinical Pharmacy, University of California, USA; 2. Internal Medicine, San Francisco Medical Center, USA; 3. Clinical Pharmacy and Medicine, University of California, USA)

Introduction : Dementia patients are at risk for more hospital utilization than those without dementia . We explore associations of time to first and second hospitalization, death and last health care service and compared length of hospital stay(LOS) between dementia and nondementia groups. Method : We used administrative claims from 2000-2008 from an integrated managed-care system. Patients with any dementia diagnosis claim were selected. From the remainder a matched patient group without dementia were selected. Analysis was bivariate and multivariate Cox proportional hazards models and mixed linear regression models controlling for demographics and socioeconomic characteristics and Charlson co-morbidities. Results : There were 108,622 patients; 61,770 with dementia. The dementia group was older(80.42 vs 74.44, p<0.0001), had longer LOS(8.08 vs 6.95, p<0.0001) and more hospitalizations(1.57 vs 1.43, p<0.0001) than non-dementia patients. Kaplan-Meier curves showed dementia patients had a significantly shorter time to hospitalizations and longer time to last healthcare service. Dementia patients had a 49.5%(p<.0001) higher risk to first hospitalization. Increasing age by 1 year increased relative risk (RR) of hospitalizations by 3%. Female gender decreased hospitalization RR by 10%. CHF, Behavioral problems, COPD, hypertension and diabetes increase hospitalization RR by 107.2%, 88.1%, 44.2%, 39.1%, and 25.6% respectively. Mixed models showed dementia patients had 0.9846 days longer LOS than non-dementia patients. Conclusion : Presence of dementia adds to healthcare utilization even when compared to a matched elderly non-dementia group. Disease management focus should include dementia patients with selected co-morbidities. Keywords : Dementia, healthcare utilization, hospitalization

PP25 S-354

XEROSTOMIA, MOOD STATES AND ORAL HEALTH RELATED QUALITY OF LIFE AMONG THE ELDERLY OUTPATIENTS

Young Mi GO¹, Jung A. KIM² (1. The Graduate School of Information in Clinical Nursing, Hanyang University, Asan Medical Center, Korea; 2. Division of Nursing, Hanyang University, Korea)

Introduction : Xerostomia in the elderly is a physical problem in the aging process, which occurs in approximately 30% of people aged 65 or older. It causes psychological discomfort such as depression, and moreover negatively affects the quality of life. This study aimed to identify the xerostomia, mood states and oral health-related quality of life(OHQoL) of elderly outpatients and the relationship among the variables. **Method :** This is a descriptive correlational study which included 189 outpatients aged 65 or older in a tertiary hospital located in Seoul, Korea, from September 1st to the 28th, 2012. A self-reported questionnaire including three instruments (Xerostomia evaluation tool, Korean-version Profile of Mood states-Brief (K-POMS-B), Oral Health Impact Profile-14 (OHIP-14)) were used to collect data. Collected data were analyzed on SPSS WIN 18.0. **Results :** Mean score of Xerostomia was 18.15±15.66, total mood disturbance(TMD) was 29.08±24.97, and OHQoL was 17.19±14.95. Among 6 subscales of K-POMS-B, 'tension' showed the highest mean score (7.27±5.27) and 'vigor' showed the lowest one (3.93±3.63). For OHQoL subscales, the mean score of 'oral disability' was highest (3.06±2.80) and 'psychological discomfort' was lowest (2.12±2.19). There was a positive correlation between xerostomia and mood states, especially tension, depression, anger, fatigue and confusion. Xerostomia had a positive correlation with the oral health-related quality of life. **Conclusion :** In this study, elderly patients' xerostomia was found to be associated with mood states and OHQoL. It would be important for nurse to understand the xerostomia of elderly and essential to explore a nursing intervention for reducing Xerostomia of elderly patient. **Keywords :** Xerostomia, Affect, Elderly

PP25 S-355

EFFECT OF A SENIOR SIMULATION EXPERIENCE ON NEW NURSES' ATTITUDE AND NURSING PRACTICE TOWARD THE ELDERLY

Jae Myoung YANG¹, Jung A. KIM² (1. Graduat School of Information in Clinical Nursing, Hanyang University, The Catholic University of Korea Uijeongbu St. Mary's Hospital, Korea; 2. Division of Nursing, Hanyang University, Korea)

Introduction : A positive attitude of the new nurses with less than 1-year clinical experience and who start caring for elderly patients is a very important factor that can affect the quality of nursing services for the elderly in the future. This study aimed to verify the effect of senior simulation experience (SSE) on new nurses' attitude toward care for the elderly (ACE) and nursing practice for the elderly (ANPE). **Method :** The subjects of this study were the 50 nurses (25 experimental group(Exp) and 25 control group(Con) by random assign) in a university hospital. SSE procedure was to do activities only subject of Exp for daily living for 45 minutes wearing aging simulation suit. Survey was conducted two times to ask the nurses' ACE and ANPE from February 1st to 29th, 2012. Tow instruments, Aging Semantic Differential Scale and Empathy and Attitude toward Caring for the Elderly, were used to collect data. The collected data were analyzed using SPSS/WIN 14.0. **Results :** Before SSE, there were no significant differences in AEC (t=1.161, p=.252) and ANPE (t=1.682, p=.099) between Exp and Con. After SSE, AEC (t=-3.978, p<.001) and ANPE (t=-3.788, p<.001) of Exp were significantly

higher than two variables of Con. **Conclusion :** The findings of this study suggest that SSE is useful and meaningful method for enhancing AEC and ANPE of new nurse and various healthcare professionals who support elderly. It is desirable to be highly applied in the nursing education field or nursing student and continuing education system of nurse practitioner. **Keywords :** Aged, Nursing care, Attitude of health personnel

PP25 S-356

PERCEPTIONS ON AGEING AND RETIREMENT

Cynthia Grace VALDEZ (Research and Development, Quirino State University, Philippines)

Introduction : This research was conducted to find out the various thoughts on aging and retirement, preparation and the prospective activities that the government employees of selected agencies in Quirino Province, Philippines would like to do when they retire. **Method :** Descriptive method of research was done. Data collected through the use of instruments like questionnaire were analyzed through frequency counts, percentages and chi-square test. **Results :** The mean age of future retirees is 56.30 years old, females and married, but only few have graduate degrees. Respondents have started thinking about retirement already but have not prepared for it yet since their finances at present is intended for the education of their children. Their concepts about retirement are: being able to enjoy life, time to do the things they like and having time to pursue their hobbies. Preferred activities after retirement are: establish a business and take care of themselves; work for pay after retirement from their current job. Among the disliked aspects of retirement are: missing the camaraderie of their co-workers and having health problems. Significant relationship between the respondents' nature of work and their willingness to engage in paid work after retirement exists. Marital status of the respondents and their educational attainment has a significant relationship with the most disliked aspect of retirement. **Conclusion :** With these findings, the researcher recommends that future retirees must prepare for retirement to avoid the crisis associated with it. Pre-retirement planning is very important. **Keywords :** Retirement, Aging, Pre-Retirement Planning

PP25 S-357

ASSOCIATION BETWEEN MUSCULOSKELETAL PAIN AND PHYSICAL FITNESS IN COMMUNITY-DWELLING ELDERLY

Saori ANZAI¹, Hiroshi HAGA¹, Haruhiko HONDA², Shouzoh UEKI³ (1. Graduate School of Gerontology, J.F. Oberlin University, Japan; 2. Center for General Education, Tohoku Institute of Technology, Japan; 3. Faculty of Medical Science & Welfare, Tohoku Bunka Gakuen University, Japan)

Introduction : Purpose: To investigate whether musculoskeletal pain correlates to physical fitness according to site of pain in a community elderly dwelling in Japan. **Method :** Participants: 228 men and 950 women, 65 years and over, who are living in the community took part in this survey. Measurements: age, sex, economic, education, history of hospitalization in past years, pain (shoulder, knee, low-back), self-rated health, depression, Instrumental Activities of Daily Living(IADL), Motor Fitness Scale(MFS), time needed to Stand Up from a Long Sitting position on the floor (SULS). **Analysis:** To examine association between musculoskeletal pain and physical fitness, multiple linear regression analysis of which the dependent variable physical fitness (MFS, SULF) was used. And, Factors associated dependent variable at 5% significant level in univariable analysis entered into multiple linear regression analysis as independent

variables. In that regards musculoskeletal pain were categorized as “knee pain”, “low-back pain”, “shoulder pain”, “knee and low-back pain” and “shoulder, knee and low-back pain”, by site of pain. Results : MFS was significantly related to “knee pain (beta=-.129)”, “low-back pain (beta=-.157)”, “knee and low-back pain (beta=-.200)”, and “shoulder, knee and low-back pain (beta=-.062)”. SULF was significantly associated with “knee and low-back pain (beta=.133)”. Conclusion : It was suggested that the presence of shoulder pain does not affect physical fitness in community-dwelling elderly in Japan. Then it was also suggested that the presence of knee pain, low-back pain, and in particular duplicative pain of knee and low-back pain had an impact on physical fitness. Keywords : pain, physical fitness

PP25 S-358
IMPROVING SEXUALITY IN PERU TO HAVE AN ACTIVE AGING

Jaime LAMA VALDIVIA (*Geriatrics and Gerontology, Universidad Nacional Federico Villarreal, Peru*)

Introduction : Latin America and the Caribbean is a region consisting of 41 countries where 570 million people live. The aging of our population is progressive. In Peru, 9 % of the population is over 60 years old. Sexual health is considered as part of universal human rights. There are few studies about sexuality of latin american elders.

Method : Review of current medical and social literature in this region with emphasis in data of Peru. Results : Sexual behavior in this age depends on many factors, including health state, the availability of a partner, personality, social and cultural factors, education level, prior practices and satisfaction with life. At this age, most people find sex pleasurable, although many do not have privacy to practice it, because they are institutionalized or living with relatives. Most of them have not received information about sex. In our country, aging is accompanied in many cases by poverty, lack of job opportunities and social security, isolation and discrimination at the level of society and within families, with negative effects on sexual life. Conclusion : A new policy of public health and educational projects are necessary to enable the elderly to know the characteristics of human development and thus enjoy their sexuality as a strategy to achieving active aging. Keywords : Active Ageing Sexuality Elders

PP25 S-359
WHAT IS THE REALITY OF ACTIVE AGING PROGRAMS IN PANAMA REPUBLIC?

Cecilia Donderis LOUISON (*Geriatric Medicine, Panama University, Panama*)

Introduction : Latin America and the Caribbean is a region consisting of 41 countries where 570 million people live. The aging of our population is progressive. In Peru, 9 % of the population is over 60 years old. Sexual health is considered as part of universal human rights. There are few studies about sexuality of latin american elders.

Method : Review of current medical and social literature in this region with emphasis in data of Peru. Results : Sexual behavior in this age depends on many factors, including health state, the availability of a partner, personality, social and cultural factors, education level, prior practices and satisfaction with life. At this age, most people find sex pleasurable, although many do not have privacy to practice it, because they are institutionalized or living with relatives. Most of them have not received information about sex. In our country, aging is accompanied in many cases by poverty, lack of job opportunities and social security, isolation and discrimination at the level of society and within families, with negative effects on sexual life. THE RELATED FACTORS OF SUICIDE ATTEMPT AMONG KOREAN ELDERLY

Hyunkyung LEE (*Dept. of Mental Health Research, Seoul National Hospital, Korea*)

Introduction : This study was conducted to investigate the related factors of suicide attempt among Korean elderly. For this purpose, this study was conducted to examine the relation of health, mental health, and socioeconomic status on suicide attempt among Korean elderly.

Method : This study was analyzed using raw data of the Korea National Health & Nutrition Examination Survey conducted in 2009. Collected data were analyzed by frequency, X2 test, and logistic regression. Results : First, sex, age, income, education level, marital status, economic status, drinking, smoking, stress, and depress were significantly associated with suicide attempt. Second, stress, depress, age, and education level have an impact on suicide attempt. Conclusion : The findings have reinforced the need for developing a mental health disease prevention program in Korea elderly with a more practical focus on suicide and mental health status. Keywords : elderly, mental health, suicide

PP25 S-361
ANALYZING ENERGY USE OF THE ELDERLY HOUSEHOLDS ASSOCIATED WITH HOME LIVING PATTERNS

Myoung Won OH, Mi Jeong KIM (*Department of Housing and Interior Design, Kyung Hee University, Korea*)

Introduction : With the shift to an ageing society, the number of the elderly households has been increased, thus fundamental studies on the elderly households are much needed for understanding and supporting them appropriately. The elderly’s cognitive and physical capabilities are getting reduced, accordingly their physiological conditions and sensory functions are getting weaken. Method : Given these situations, more pleasant and appropriate residential environments for the elderly are needed however many elderly have not got such residential environment due to insufficient information and economic conditions. Thus, it is essential to provide the elderly with a guideline for using the household energy effectively because the energy use is one of the critical factors affecting the residential environment. Results : The elderly’s households can be divided into several groups according to economical, physical and social levels, accordingly, home living patterns of each group might show different characteristics from those of other groups. Further, the range of the pleasant residential environments would be different according to the home living patterns. Thus, we expect that home living patterns might affect the energy use in the elderly households because the energy consumption in households would be changed according to the living factors of the inhabitants in their homes. Conclusion : This research classifies home living patterns in elderly households and investigates their energy use in households in each home living pattern group. This empirical research could be a basis for the guideline of the energy use in elderly households. Keywords : Energy use, Healthy home living

PP25 S-362
EXPLORING INFORMATION APPLIANCES, INTELLIGENT HOUSEHOLD OBJECTS AND AUGMENTED FURNITURE SUPPORTING THE ELDERLY’S HEALTHY LIVING

Mi Jeong KIM, Myung Eun CHO, Myoung Won OH (Department of Housing and Interior Design, Kyung Hee University, Korea)

Introduction : In the era of information technology, homes we live in have been transformed into computing environments to support daily living of the inhabitants. The potential of the smart home technologies could further be emphasized for enabling the elderly's autonomous living in their own residence. The elderly's cognitive and physical abilities are declined, thus more systematic assistances are needed through the technology mediated supports. **Method :** This research focuses on information appliances, intelligent household objects and augmented furniture, which provide supports to the elderly's quality of home living. For example, the elderly's memory loss could be tempered by a reminding display creating a context for remembering. Further, we can add new communication capabilities to household notice board or layering interactive functions onto existing appliances for supporting the elderly's healthy living. This research aims to explore the potential of technological infrastructure of the domestic settings for the health smart home. **Results :** There has been a large quantity of research efforts and inventions in health smart home for elderly. It is necessary to have a comprehensive and thorough review of the recent significant works in this area. Further, to identify promising research areas and future direction for the development of the health smart homes, we explore new types of interaction, new areas of application and new forms of devices being capable of implanting such intelligences into our home settings. **Conclusion :** The computational residential environment could be aware of contexts of themselves and its inhabitants thus provide more appropriate services which satisfy the elderly's needs and desires. **Keywords :** smart home, healthy home living

PP25 S-363

RESIDENTIAL ENVIRONMENTS, HEALTH AND SATISFACTION THAT CONCERN THE ELDERLY

Myung Eun CHO, Mi Jeong KIM (Department of Housing and Interior Design, Kyung Hee University, Korea)

Introduction : As the period in which people live as being aged over 65 has increased, much research on the elderly have been carried out in various areas from multiple perspectives. However, most of research in the architecture domain has focused on housing settings for the elderly that are pleasant and safe environments to support the declined capabilities of the elderly in the process of aging. There is a lack of research dealing with the elderly's psychological aspects other than physical factors. Further, age is often used as the major determinant being the causal variable of health, behavior and competence. **Method :** However, there is a growing emphasis on the idea that environmental factors account for variation in the way people are getting older. This research aims to identify the effect of such psychological characteristics as well as environmental factors on the elderly's satisfaction of their own housings. **Results :** It is noted that environmental factors such as socio-recreational aids, community accessibility, and social climate could influence personal factors such as health, memory and depression etc. among the elderly's living in residential settings. Further, socio-demographic factors such educational and income levels are also associated with the elderly's health. **Conclusion :** Based on the initial study, this research developed a customized questionnaire and conducted an empirical study using it. The result is being analyzed using SPSS and will be presented to clarify the influencing variables for the elderly's satisfaction of their living in their residence. **Keywords :** satisfaction, psychological factor

PP25 S-364

PREVALENCE AND ASSOCIATED FACTORS OF FUNCTIONAL DISABILITY IN A RURAL ELDERLY CHINESE COHORT

Ming YANG, Li LUO, Birong DONG (Department of Geriatrics, West China Hospital of Sichuan University, China)

Introduction : The prevalence of functional disability increases with advancing age. However, it is under-diagnosed and under-treated in China. The prevalence of functional disability in the elderly is unclear in rural China. **Method :** We conducted a cross-sectional, epidemiological study, including people older than 60 years. The study population was obtained from the total of cases aged 60 years and older registered in a census in Suining, China (n = 2,689), taking a randomized sample of 550 participants. From September 2011 to January 2012, a questionnaire was performed with face-to-face interviews, including the following variables: sociodemographic variables, clinical factors, functional disability (assessed using Barthel and Lawton indices), cognition (assessed using Mini Mental States Examination) and depression (assessed using Geriatric Depression Scale). **Results :** 550 older persons (76.3 years of age, 43.7% male) were included in the study. The prevalence of disability in activities of daily life (ADL) was 10.9%, and in instrumental activities of daily life (IADL) of 23.7%. Logistic regression analysis indicated that age (OR=2.07), female sex (OR=1.11), number of chronic diseases (OR=3.42), previous history of stroke (OR=3.88), previous history of fracture (OR=2.78), and cognition impairment (OR=2.64) were associated with ADL disability. In addition, age (OR=1.87), number of diseases (OR=1.38), previous history of stroke (OR=2.45), depression (OR=1.35) and cognition impairment (OR=2.83) were the correlators to IADL disability. **Conclusion :** ADL and IADL disability are common in rural elderly Chinese. These data showed key risk factors for functional disability in this population. More attention should be paid to this special population. **Keywords :** functional disability, elderly

PP25 S-365

CLINICAL NURSES' AGING ANXIETY AND ATTITUDE TOWARD THE ELDERLY

Mikyung JEON¹, Jung A KIM² (1. Graduat School of Information in Clinical Nursing, Hanyang University, Seoul Medical Center, Korea; 2. Division of Nursing, Hanyang University, Korea)

Introduction : This descriptive correlational study aimed to identify the clinical nurses to orrelation U (AA) and attitude towards the elderly (AE) and to examine the relationship between two variables. **Method :** Study subjects were 170 nurses working at S hospital in Seoul. Data was collected from October 17, 2012 to October 23, 2012 by using structured survey. Anxiety about Aging Scale (AAS) and Aging Semantic Differential Scale (ASDS) were used to collect data. Collected data were analyzed on SPSS/WIN 18.0. **Results :** The mean score of AA was 59.93ean s. In sub-categories, mean score of 'fear of loss' was highest (15.78st (o)). The mean score of AE was 84.19e mean, positive questions were 2 questions (wise, reliable) and negative questions were 7 (conservative, sick, dependant, inactive, unproductive, unattractive, grouchy). There was positive correlation between AA and AE. **Conclusion :** The findings of this study showed that the higher AA was, the more negative AE. It is essential to develop an educational program for reducing AA which is originated from distorted comprehension of aging, and to provide quality nursing to the elderly with positive attitude. The education and geriatric nursing practice reinforcement regarding aging and geriatric nursing is required since role of nurse for the elderly patients is expanding at the aging society. **Keywords :** Aged, Aging Anxiety, Attitude toward

elderly

DETERMINANT FACTORS OF AGING DISABILITY IN JAKARTA INDONESIA

Charles SURJADI¹, Regina Satya WIRAHARDJA² (1. *Public Health and Preventive Medicine, Atmajaya University Faculty of Medicine Jakarta, Indonesia*; 2. *Public Health and Preventive Medicine, Atmajaya Catholic University Faculty of Medicine, Indonesia*)

Introduction : As part of effort to maintain healthy and active aging in Jakarta we analyzed the determinant factors of aging disability at Jakarta. Method : A total of 1671 older persons were selected at random as respondents. The respondents were asked of their age character, sex, number of household members, socio-economic status, and disability status using questionnaire of disability (WHO ICF, 2003). Univariate analysis and bivariate analysis using chi square test with $P < 0.05$ was performed to know factors significantly related to disability among aging. Multivariate analysis using logistic regression was performed to the variables significantly related in the bivariate analysis to look for ultimate model to explain determinant factors of disability among aging. Results : Multivariate analysis with logistic regression gave the result that elder person with disease related to paralyze and injury OR 2.1 (1.04-4.38), had mental health problems OR 6.4 (2.7-15.1) ($p = 0.000$), with low socio-economic 6.8 (2.1-22.2) and did not do regular physical activities daily OR = 5.1 (1.2 - 20.4), were more likely disabled. Conclusion : The result indicated the important of some diseases prevention program, physical, activities regularly, attention to socio-economic status, single or lonely elder person to prevent disability among elder persons. And effort to facilitate activities to have healthy aging community in Jakarta. Keywords : disability aging

INTER-GENERATIONAL COMMUNICATION BREAKDOWN: AGE-RELATED DIFFERENCES IN PROCESSING OF EMOTIONS IN SPEECH

Boaz M. BEN-DAVID¹, Namita MULTANI², Vered SHAKOOF³, Pascal H.H M. VAN LIESHOUT⁴ (1. *Psychology, Speech-Language Pathology, Interdisciplinary Center (IDC) Herzliya University of Toronto, Israel*; 2. *Graduate Department of Rehabilitation Studies, University of Toronto, Canada*; 3. *Psychology, Interdisciplinary Center (IDC) Herzliya, Israel*; 4. *Speech-Language Pathology, University of Toronto, Canada*)

Introduction : The identification of emotions in spoken language is an important part of social interaction. When the sentence "I hate you so much!" is spoken in a happy tone, would this be interpreted as angry or happy? This demonstrates the complex interaction between lexical content and prosody (tone of voice) in spoken language. When interpreting emotions, one may rely either on the lexical content, the prosody or both. Previous studies suggest that young adults may focus on the prosody of the spoken utterance, but would older adults react in the same fashion? Method : Stimuli: 50 recorded sentences made up of 10 lexical sentences in each of the following five semantic categories: Anger, Fear, Happiness, Sadness and neutral. These were recorded in 5 different prosodies (Anger, Fear, Happiness, Sadness and neutral), such that each lexical category was represented twice in each of the tested prosodies, generating a 5X5 matrix. Method: 24 younger adults and 24 older adults were asked to rate the emotions presented in these sentences in different experimental blocks. Results : While for young adults, the prosody is the main source for rating emotions in speech, older adults rely on a more equal combination of lexical content and

prosody. For example, younger adults rated a lexically-angry sentence spoken in a happy prosody as exclusively happy, whereas older adults rated it as equally happy and angry. Conclusion : Older adults may utilize different strategies in communication than younger adults. Our results suggest the need to adapt spoken communication with older adults to generate a senior-friendly environment. Keywords : Speech, communication, language

IMPACT OF FACTOR ANALYSIS TO INVESTIGATE THE LONG-TERM CARE INSTITUTIONS

Hailun CHAO¹, Su-Feng TSENG², Ming-Lun HSIEH³, Chien-Hung LIN⁴ (1. *Department of Health Care Administration, Chung Hwa University of Medical Technology, Taiwan*; 2. *Department of Senior Citizen Service Management, Chia Nan University of Pharmacy & Science, Taiwan*; 3. *Department of Health Care Administration, Chia Nan University of Pharmacy & Science, Taiwan*; 4. *Diagnostic Radiology, Chi Mei medical center, Taiwan*)

Introduction : Taiwan Country household registration the elderly population about total of 2.45 million 7,648, total population 10.63%, aging index of 65.05%, show increased. With the increase of the elderly population, the need of long-term care elderly will also extend. According to the Taiwan-Fujian area Ministry of the Interior 2005 years the elderly status of the investigation, elderly considered ideal living, there more than 60% of the 65-year-old elderly people want live together with their children, not currently living with children 43% of the elderly, one hope of living together with their children; but lower level of education were more likely to want live with their children. Method : This study surveyed total 421 people, questionnaire survey use that SPSS statistical analysis: Age distribution of 136 (32.3%) aged 41 to 50 years for the highest. Results: Quality of professional services capabilities will affect the facility selection, professional service capabilities and service quality, the attitude all the significant differences. Conclusion : Care for agencies should strengthen transparency quality information, people need understand quality care for through proper channels, and select the appropriate care facility according to their needs, employer should construct a comprehensive model of care to meet the future demand for care for elderly. Keywords : Quality of service, Long-term care facilities, Satisfaction

ANALYSIS ON THE INFLUENCE FACTORS OF THE DESIRED LIVING ARRANGEMENTS FOR THE ELDERLY

Duan YUSHAN (*Institute of Gerontology, Renmin university of China in Beijing, China*)

Introduction : As the development of ageing, the number of old people will rise rapidly throughout China. The type of household in which the elderly desire to live will influence the choice of the care for the elderly and well-being in their later life. This article makes a study of the desired living arrangements of the elderly in China based on the survey of National Population and Health Survey for the Elderly conducted in 2008. Method : Descriptive Statistic. Comparing the state of the actual living arrangements and the desired living arrangements for the elderly; conducting univariate analysis of the desired living arrangements for the elderly; Multiple Logistic Regressions. Independent variables is the desired living arrangements of the elderly which include three options: living alone (or only living with spouse), living with child or children and living in nursing home. Results : There exists a correlation between actual living arrangements and desired living arrangements. The model results suggests that age, sex,

marriage, education level, self-report health and source of income have significant impacts on the desired living arrangements. Conclusion : The desired living arrangements of part of the elderly did not quite fit in with their actual living arrangements. Compared with actual living arrangements, more elderly are like to living alone or living in nursing home. Compared with living with child or children, the elderly who are lower aged, male, hanzu, married, more healthy, self-sufficient and living alone (or only living with spouse) are more likely to desired to live alone (or only living with spouse); the elderly who are married, living alone or living in nursing home, less healthy are more likely to desired living in nursing home. Keywords : the Elderly, Actual Living Arrangements, Desired Living Arrangements

A SURVEY ON DEMENTIA CARE LEADERS TRENDS WHO COMPLETED THE TRAINING PROGRAM IN TOKYO DEMENTIA RESEARCH AND TRAINING CENTER

Koichi NAKAMURA (*Training Department, Tokyo Dementia Research and Training Center, Japan*)

Introduction : Tokyo Dementia Care Research and Training Center has been carried out training program for dementia care leaders that was appointed by the Ministry of Health, Labor, and Welfare since 2001. They have become a trainer of the training program for dementia care that was carried out in each prefecture. The aim of this study is to clarify the trends of dementia care leaders in training program carried out in each prefecture. Method : Targets of this survey were 526 people who completed the training program in Tokyo Dementia Care Research and Training Center. This research was carried out by mail questionnaire. Major Questions were the reason why they could fill the role, or could not fill the role as a trainer of training program in 2011. Results : The return rates of this survey was 348 people (65.90%). 281 people (80.7%) of respondents answered that they have filled the role as a trainer of training program in each prefecture. 37 people (10.6%) answered that they have not participated as a trainer of training program, and as the reason, The duties of their corporation are busy is the largest in number of answer. Conclusion : The result of this survey demonstrated that most dementia care leaders filled the role in the training programs in each prefecture as a trainer. Keywords : dementia care leaders

THE EFFECT OF COCHINCHINA MOMORDICA SEED EXTRACT ON GASTRIC ACID SECRETION AND MORPHOLOGIC CHANGE IN AGED RAT STOMACH

Hyun Jin JO¹, Nayoung KIM¹, Ryoung Hee NAM¹, Hyun CHANG¹, Joo-Hyon KIM², Ji Hyun PARK³, Jung Mook KANG³, Dong Ho LEE¹, Hyun Chae JUNG³ (*1. Department of Internal Medicine, Seoul National University Bundang Hospital, Korea; 2. Life Science R&D Center, SK Chemicals, Korea; 3. Department of Internal Medicine and Liver Research Institute, Seoul National University College of Medicine, Korea*)

Introduction : Cochinchina Momordica Seed Extract (SK-MS10) has a gastric protective effect. We aimed to assess the effect of SK-MS10 on gastric acid secretion with morphologic changes in the aged rat. Method : Acid secretions were evaluated in the male F344 rats of four different ages (6-, 31-, 74-wk and 2-yr). The 31-wk-old rats were divided to 3 groups and continuously administered chow containing

vehicle, SK-MS10 and lansoprazole, respectively. At the age of 74 weeks and 2 years, basal and stimulated acid was measured and the expression of mRNA and protein of H⁺-K⁺-ATPase were determined. The area of connective tissue of lamina propria was measured. Results: Basal and stimulated gastric acid significantly decreased and connective tissue of lamina propria increased with age. mRNA and protein of H⁺-K⁺-ATPase significantly decreased with age. However, 74-wk-old rats in the SK-MS10 group had higher stimulated gastric acid secretion than those in the vehicle and lansoprazole groups. In 2-yr-old rats of SK-MS10 group there was no increase of connective tissue. Conclusion : As SK-MS10 kept the capacity of acid secretion as well as connective tissue area to comparable to young rats, it might valuable to perform further research regarding mechanism of SK-MS10 as an anti-aging agent in the stomach. Keywords : Gastric acid, Cochinchina Momordica seed, aging

PP26 B-002

LIFE SPAN MODULATION BY ALT1, ALANINE-METABOLIZING ENZYME, IN SACCHAROMYCES CEREVISIAE

Sung-Lim YU¹, Mi-Sun KANG², Ho-Yeol KIM², Choco Michael GOROSPE³, Sung-Keun LEE³ (*1. Inha Research Institute for Medical Sciences, Inha University, Korea; 2. Department of Pharmacology, Inha University, Korea; 3. Department of Molecular Biomedicine, Inha University, Korea*)

Introduction : Importance of alterations in metabolic pathways has been implicated as important factors affecting life span. However, the determination of specific pathways and enzymes involved in life span remain largely unexplored. Meanwhile, caloric restriction (CR) has been known to extend life span of many species. In yeast, CR extends both replicative life span and chronological life span. Method : Using metabolomics and genetic approaches, we identified metabolites affecting CR-induced chronological life span in yeast, *Saccharomyces cerevisiae*. Results : Among 23 metabolites with altered profile by CR, we found that alanine level is inversely correlated with yeast chronological life span. Later analysis using deletion mutant of ALT1, the gene encoding the major alanine transaminase, revealed that life span modulation by ALT1 is TOR1-independent. Further studies showed that *alt1Δ* completely suppresses cytochrome C oxidase subunit 2 expression. Conclusion : This study shows the importance of small molecule metabolism and relevance of metabolomics combined with genetic approach in the mechanistic studies in life span. Keywords : yeast, metabolites, ALT1

PP26 B-003

KOREAN MISTLETOE (VISCUM ALBUM COLORATUM) EXTRACT EXTENDS THE LIFESPAN OF INVERTEBRATES

Shin-Hae LEE, Kyung-Jin MIN (*Department of Biological Sciences, Inha University, Korea*)

Introduction : Dietary restriction (DR), a reduction of food intake without malnutrition, is one of the best reliable interventions for retarding of the aging process. Several pharmacological interventions such as resveratrol, rapamycin, and metformin and several plant extracts such as blueberry and aloe vera have been also investigated for the DR mimetic pharmacological intervention. However, the underlying mechanisms and species-specificity of these extracts are not tested so far. Method : *Viscum album coloratum* (Korean mistletoe; KM) is a semi-parasitic plant growing on various trees, which has been shown to possess a variety of biological functions such as immunomodulating, apoptosis-inducing, and anti-tumor activity. However, there is no information about how the mistletoe extract

affects the length of life of the host. In this study, in order to examine the effect of mistletoe extract on the longevity of the host, we investigated whether Korean mistletoe extract (KME) is able to extend the lifespan in experimental models, *Caenorhabditis elegans* and *Drosophila melanogaster*. Results : When animals were given the diet containing KME, mean survival time of both worms and flies showed significantly higher than that of the control. In addition, KME supplement led to the increase of the resistance to heat shock stress and cold shock stress. Furthermore, KME supplement did not show the additive lifespan extension effect by dietary restriction and increased the expression of sir2. Conclusion : These results suggest that KME extends the lifespan of invertebrates as a putative DR mimetics. Keywords : Korean mistletoe extract, Lifespan, Invertebrates

PP26 B-004

GENOTYPE DETERMINES THE CLINICAL FEATURE IN CADASIL

Sanghee KIM¹, Bong-Hee JEON², Na-Ri KANG², Jae-Sung RYU², Moon-Doo KIM², Young-Suk KWAK², Chang-In LEE², Joon-Hyuk PARK² (1. Department of Psychiatry, Jeju National University, Korea; 2. Department of Psychiatry, Jeju National University Hospital, Korea)

Introduction : Cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASIL) is an inherited small vessels disease of the brain caused by mutations in the Notch3 gene and the subtype is classified by genotype. CADASIL is characterized by recurrent stroke, transient ischemic accident, migraine, cognitive impairment, and mood disturbances. It is suggested that the clinical feature is associated with the genotype of CADASIL. In this study, we aimed to investigate whether a relationship exists between the genotype and the clinical feature. Method : 53 patients with CADASIL (34 men, 64.2%) were included in the study and the subtype is confirmed by blood gene test and skin biopsy test. Neuropsychiatric symptoms were evaluated using M.I.N.I.. Cognitive function was assessed by MMSE-KC, and quality of life by SF-36. Results : 38 subjects (71.7%) were R544C heterotype (Group A), 13 subjects (24.5%) were gene negative and biopsy positive type (Group B), 2 subjects (3.8%) were R578C heterotype. The common neuropsychiatric symptoms were different by genotype. While stroke (31.6%) and headache (26.3%) was common in Group A, brain hemorrhage (23.1%) and seizure (15.4%) was common in Group B. Group A had a significantly higher frequency of depressive disorder compared to Group B (94.12% vs 5.88%). The mean MMSE-KC score of Group A was higher than that of Group B (23.37±5.41 vs 22.15±3.24), which didn't reach a Conclusion : The results show that stroke, headache and depressive disorder is more common in Group A and brain hemorrhage, seizure and cognitive impairment is more common in Group B. This results indicate that the clinical feature is associated with the genotype of CADASIL. Keywords : CADASIL, neuropsychiatric symptom, depressive disorder, cognitive impairment

PP26 B-005

EFFECTS OF ENDOCRINE DISRUPTORS ON AGING IN RATS

Tadashi SHINKAI, Koji FUKUI (Bioscience and Engineering, Shibaura Institute of Technology, Japan)

Introduction : Tetrachlorodibenzodioxin (TCDD) and bisphenol A (BPA) represent a family of ubiquitous environmental pollutants and are well known as environmental endocrine disruptors and they change

multiple endocrine systems in the living body. Moreover, it has been reported that exposure to the chemicals causes oxidative stress in a variety of animal models and there is a suggestive consideration that they may have influence on aging. Method : In order to investigate the lifespan associated with the endocrine disruptors, we gave a single subcutaneous injection of TCDD (100ng/kg body weight) and BPA (100ug/kg body weight) to pregnant Wistar rats on gestational day 19 and studied effects of a relatively low dose of the chemicals on mortality, body weight and morphological changes in male and female offspring. Results : The mean lifespan of the non-treated animals were 27.1±4.7 months in male and 30.8±5.2 months in female. The lifespan and the body weight decreased in TCDD treated rats. Furthermore, exposure of low dose of TCDD increased apoptotic cells in the rat brains. These results indicate that TCDD which was transferred into the offspring through the placenta and the mammary gland caused the lifespan-shortening. On the other hand the changes of lifespan were not recognized between BPA treated rats and controls. But hypothyroidism was observed in BPA treated animals. It indicates that BPA was also transferred from the mother into the offspring. Conclusion : Our finding suggests that the endocrine disruptors were transferred from the mother into offspring and that may induce modulation of homeostatic functions and cause a change in aging. Keywords : endocrine disruptor, homeostasis, aging

PP26 B-006

A RARE CASE OF MENINGOCOCCAL SEPTICEMIA Y IN THE ELDERLY IN FRANCE

Abrar-Ahmad ZULFIQAR, Tommy COURTEL, Moustapha DRAME, Jean-Luc NOVELLA (Department of Internal Medicine and Geriatric, CHU Reims, France)

Introduction : *Neisseria meningitidis* is a leading cause of bacterial meningitis world-wide. Serogroup Y has historically been uncommon in France. We report a rare case of meningococcal septicemia serogroup Y in a patient aged 91 years. Method : A patient, female, 91 years, followed for pulmonary embolism and cerebral ischemic stroke, was admitted for hyperthermia. Neurological examination didn't find a stiff neck, without purpuric skin. The rest of the clinical exams found no infectious call points. A biological inflammatory syndrome was found. Chest X-ray and bacteriological examination of urine were normal. Aerobic blood cultures isolated the strain serogroup Y *Neisseria meningitidis*, while the study of the spinal fluid were sterile. We noted a complete absence of hypocomplementemia. Meningococcal septicemia by serogroup Y was diagnosed, leading to an effective antibiotic and chemoprophylaxis for contacts. We noted a clinical and biological improvement. Mandatory declaration was made. Results : *Neisseria meningitidis* serogroups B and C have been responsible for the majority of invasive meningococcal disease in France. Invasive infections caused by other capsular groups like Y are infrequent and sporadic in France. Recently an increase of serogroup Y has been noted in France. Septicemia forms are very common for serogroup Y. Invasive forms related to serogroup Y are very often associated with complement deficiency and functional or anatomic asplenia, unlike in the elderly. Serogroup Y are often isolated in the elderly. These strains are phenotypically and genotypically heterogeneous. Serogroup Y strains are predominantly clonal complex ST-23, but with several phenotypes and several combinations of VR1, VR2 and Fet-a. Conclusion : The peculiarity of this case is that frequency of infectious caused by serogroup Y is low in France and also in the elderly. Keywords : *Neisseria meningitidis*; Serogroup Y; Elderly

A RETROSPECTIVE STUDY ON TREATMENT OUTCOMES OF SINGLE IMPLANTS IN THE MOST POSTERIOR AREA IN ELDERLY PATIENTS

Byung-Ock KIM (*Periodontics, Chosun University Dental Hospital, Korea*)

Introduction : Aim of study is to evaluate the long-term outcomes of single implants in the most posterior area in elderly patients. **Method :** From June 2001 through December 2012, 457 patients were treated at the Department of periodontology, Chosun University Dental Hospital, Gwang-ju, Korea were identified. A retrospective study design was adopted. Patients gender and age, follow-up duration, distribution of the implants according to the location, inserted implants according to implant system, the inserted implants by diameter and length, cumulate survival rates for total implants, mean marginal bone loss were evaluated. **Results :** 457 patients (289 male and 168 female) were eligible for the present study. 457 implants were inserted in the most posterior area. The diameter and length of the most implants appeared from 5 to 6 mm diameter and 11 to 12 mm length. During the follow-up, 2 implants in 2 patients were failed. A cumulative survival rate was 99.56%. **Conclusion :** The single implant in the most posterior area of jaw in elderly patients is a successful treatment modality and has a positive prognosis as well. **Keywords :** single implant, posterior area, elderly patients

AQUATIC PHYSIOTHERAPY IN ELDERLY DEPENDENTS

Debora Melo SIGNORETTI¹, Melina Grossi VENDITTI², Vivian SOUZA³, Gabriela SATO³, Valeria Aparecida Lopes CRISCIMANI⁴, Luciana ALVES⁵, Flavia Renata TOPICIO⁶, Miriam Ikeda RIBEIRO⁷ (*1. Physicaltherapy, Residencial Albert Einstein, Brazil; 2. Physiotherapy, Residencial Israelita Albert Einstein, Brazil; 3. Coordination, Residencial Israelita Albert Einstein, Brazil; 4. Senior Nurse, Residencial Israelita Albert Einstein, Brazil; 5. Nurse, Residencial Israelita Albert Einstein, Brazil; 6. Geriatric, Residencial Israelita Albert Einstein, Brazil; 7. Manager, Residencial Israelita Albert Einstein, Brazil*)

Introduction : The objective of this pilot was to assess the real benefits of including resident dependents, with cognitive impairment in the aquatic physiotherapy of Residencial Israelita Albert Einstein, in order to provide assistance to the Immobilization Syndrome effects. **Method:** This study was developed in a CCRC with 2 female residents, octogenarian, dependents and diagnosed with dementia. It was necessary the involvement of a multidisciplinary team: social assistant, nurse (1 nurse and 1 technician), 2 caretakers, nutritionists, physiotherapists and geriatrician. The aquatic physiotherapy session included 30 minute length exercises for the upper and lower limbs, assisted gait and global passive stretching, and only two sessions for each person per week. **Results :** The elderly female were less responsive to oral commands, with functional impairment and maximum assistance for transferences and mobility, which hindered the physiotherapy assistance in the ground. During the aquatic physiotherapy, the elderly female present themselves more alert, responding to simple command, ambulating with moderate assistance and orally and in their facial expressions showing their sensations to the water and the physiotherapist touch. After the therapy, the caretakers and nurse technicians reported better disposition to hygiene, transference and mobilization of the elderly female. **Conclusion :** The aquatic physiotherapy has benefitted elderly female dependents on motor abilities and with cognitive alterations, enabling the sensorial and functional stimulation, preventing deformities, deleterious immobilization effects, benefitting the patient's neurological,

psychological status and wellness. **Keywords :** elderly, immobilization effects, Aquatic Physiotherapy

PP26 B-009

ANALYSIS OF FUNCTIONAL PERFORMANCE, HANDGRIP STRENGTH AND BALANCE IN ELDERLY ASSISTED BY A CCRC

Debora Melo SIGNORETTI¹, Gabriela SATO², Miriam Ikeda RIBEIRO³, Lilian Tiemi SONODA⁴, Ana Carla Mota CARVALHO⁵, Nivia PIRES⁵, Fatima Cristina Martorano GOBBI² (*1. Senior Physical Therapy, Residencial Israelita Albert Einstein, Brazil; 2. Coordinator, Residencial Israelita Albert Einstein, Brazil; 3. Manager, Residencial Israelita Albert Einstein, Brazil; 4. Physical Therapist, Residencial Israelita Albert Einstein, Brazil*)

Introduction : The objective assess the elderly profile based on motor performance and analyze the assistance approach and physiotherapy assessment in a CCRC. **Method :** Through SPPB tools, the study provided, with international recommendation for risk assessment of functional loss in elderly, where grades lower than 9 show higher probability of falls, hospitalization, functional decline and death; the HG, handgrip evaluation test, related to the risk of falls and functional loss when lower than 17kgf among elderly and the TUG, evaluating the performance in the execution of daily tasks. **Results :** After two year attendance and functionality score, we have observed that elderly independents have shown improvement in SSPB and TUG motor performance, and have maintained the HD measure. The semi-dependents and the dependents have maintained the functional status being unable to perform SPPB and TUG, but have improved the HD score. **Conclusion :** According to deleterious effects of frailty spiral, this study is proposing to establish risk profiles for biological frailty, assess the efficiency of tools based on functionality. It is suggested that intervention by means of physical exercises, individual or group physiotherapy have improved the performance of elderly independent group and in the semi and dependent groups the functional status was maintained, without worsening the functional decline or by variables of Frailty Syndrome. **Keywords :** elderly, long term care, motor performance

PP26 B-010

PROPOSAL FOR A MODEL OF PHYSIOTHERAPY ATTENDANCE TO THE ELDERLY DEPENDENT IN CCRC (COMMUNITY CARE RETIREMENT COMMUNITY)

Debora Oliveira Melo SIGNORETTI¹, Camila SOUZA², Caroline Santos CARUZO³, Melina Grossi VENDITTI³, Gabriela SATO⁴, Miriam Ikeda RIBEIRO⁵ (*1. Senior Physical Therapist, Residencial Israelita Albert Einstein, Brazil; 2. Physical Therapist, Residencial Israelita Albert Einstein, Brazil; 3. Physical Therapist, Residencial Israelita Albert Einstein, Brazil; 4. Coordinator, Residencial Israelita Albert Einstein, Brazil; 5. Manager, Residencial Israelita Albert Einstein, Brazil*)

Introduction : The objective apply a new model of physiotherapy attendance and multidisciplinary assistance to the elderly dependent (cognitive and/or motor) in a CCRC, aiming the quality in the assistance and prevention of deleterious effects of Geriatric Syndromes, Immobilization Syndrome among others. **Method :** Developed in Residencial Israelita Albert Einstein, through the medical routing for the practices held by physiotherapist with respiratory, geriatric, aquatic rehabilitation expertise and in palliative care aiming the comfort, humanization, rehabilitation and maintenance of the functional capacity. The elderly were assessed by an interdisciplinary team and individually evaluated, in order to

determine the assistance and the physiotherapy action plan in group and/or individually, in which the gerontic can be benefitted. Results : After two months of intervention, it was observed the scheduling adequacy and the absence of delay, concomitantly the productivity of the physiotherapists have increased, enabling an improvement in efficiency of the interdisciplinary demands. One hundred thirty six attendances of motor and respiratory physiotherapy were held in the month of September and 16 sessions of aquatic rehabilitation, compared to 76 attendance in the month of August, which denotes the need for a specific physiotherapist for this profile of age. Conclusion : The value of the physiotherapy assistance for elderly dependents has diminished the index of hospitalization, respiratory and urinary infections and, furthermore, the improvement in mobilization and handling of the elderly, with humanization and individualization in the intervention level. Keywords : Elderly, Physiotherapy, Humanization

PP26 B-011

THE EFFECTS OF MOXIBUSTION THERAPY ON CHRONIC BACK PAIN AND DISABILITY OF DAILY LIVING ACTIVITIES IN ELDERLY MEN

Hye Sook RYU¹, Kyung Sook PARK² (1. Major in Gerontological Nursing, Red Cross College of Nursing Chung-Ang University Graduate School, Korea; 2. Major in Gerontological Nursing, Prof. Red Cross College of nursing, Chung-Ang University, Korea)

Introduction : This study was attempted in order to verify the effects of moxibustion therapy on elderly men's pain and disability of daily living activities. Method : A research design is quasi-experiment with pre-post design in nonequivalent control group. As for data collection and experimental treatment, it randomly sampled totally 50 people with 24 people for the experimental group and 24 people for the control group who appeal for chronic back pain and disability of daily living activities among elderly men aged over 60 who visited 4 senior centers where are located in Namyangju city from October 25, 2012 to November 20, 2012. Experimental treatment was carried out moxibustion therapy totally 12 times by 3 times for 4 weeks in the experimental group. As for a research tool, the measurement of pain level was used VAS in Cline, Herman, Shaw, Morton(1992). A measurement tool for disability of daily living activities was used Oswestry's Disability Index. Results : 1) Hypothesis 1 : The hypothesis was supported as saying that "pain level in the experimental group with execution of moxibustion therapy will reduce more than the control group without execution"(F=40.971, p=0.000). 2) Hypothesis 2: The hypothesis was supported as saying that "disability level of daily living activities in the experimental group with execution of moxibustion therapy will reduce more than the control group without execution"(F=104.881, p=0.000). Conclusion : This study examined a change in pain relief level and in disability level of daily living activities following 4 weeks targeting elderly patients who appeal for chronic back pain. Keywords : back pain, moxibustion therapy, elderly men's pain

PP26 B-012

EFFECT OF CHRONIC INCLINE WALKING ON TRUNK MUSCLE CROSS SECTIONAL AREA IN FEMALE SENIORS

Hyo Jeong KIM (Aging Research Center, Korea National Sport University, Korea)

Introduction : The present study was performed to investigate the effect of chronic incline walking on trunk muscle cross sectional area (CSA) in female seniors. Method : Healthy thirty females aged 62-68 years old were recruited from the general community and divided into three groups, control(n=10), level walking(n=10), and incline

walking(n=10) group, as their regular exercise pattern. A visual analogue scale (VAS) and a medical history questionnaire were used as a survey of health status. Magnetic resonance images of psoas, multifidus and elector spinae muscle was obtained between the fourth (L4) and fifth (L5) lumbar. Results : We hypothesized that the demand of mechanical change with incline walking would produce greater resistant-like stimulation than level walking. The psoas major CSA of incline walking group was 9.0% higher than control and 4.9% higher than level walking group with a 5.1% difference between control and level walking group(p<.01). In the CSA of multifidus, a 11.5% and 11.9% difference was observed in incline and level walking group, respectively. The CSA of elector spinae was not significantly different among groups. The total trunk muscle CSA was significantly correlated with age(-3.33, p<.01), weight(0.29, p<.05), exercise frequency(0.32, p<.05), and exercise experience(0.33, p<.01). Conclusion : These results suggest that the chronic incline walking positively effect on the CSA of trunk muscle in senior women. Keywords : aging, walking, muscle cross sectional area

PP26 B-013

SPECIFIC ANTI-AGING INTERVENTION CAN PREVENT AND ABROGATE NON-PATHOLOGICAL SARCOPENIA

Alexander KHALYAVKIN¹, Viacheslav KRUTKO² (1. Kinetics of Biological Processes, Inst of Biochem Physics, RAS & Inst for Systems Analysis, RAS, Russia; 2. Systems Analysis and Information Technologies in Medicine and Ecology, Institute for Systems Analysis of RAS, Russia)

Introduction : The major reason which leads to age-related immobility is non-pathologic sarcopenia during natural aging process. Recent findings indicate that normal sarcopenia strongly depends on parameters of intercellular milieu, which is frequently disturbed due to dysregulation problems of senescent individual. For this reason general anti-aging intervention in addition to adequate mobility and exercise must be useful for prevention and cure non-pathological weakness and immobilization. And the main objective of our research is to confirm via consideration of up-to-date findings the high plasticity of aging process as well as to reveal a possibility of its deceleration and even reversibility. Method : For this reason we used the critical analysis of the array of published findings and our interpretation of these findings in order to unite at the one conception many separate and various data obtained from the molecular level up to the level of population. Results : A heterochronic parabiosis reveals that senescence is an actively controllable process. Accumulated facts are compatible with the hypothesis that living conditions exist which are conducive to a significant deceleration of the human aging due to more adequate and stable functioning of control systems of organism. Moreover the newest findings indicate that in adequate internal milieu even senescent stem cells, mitochondria, lens, mature neurons etc. can fully restore lost status quo. Conclusion : As vast majority cases of age-depended weakness and immobility are connected with a general age-related functional deterioration the realizable prevention of its or its reversibility could be very useful in prophylaxis and cure of these distressing and money-losing events. Keywords : Sarcopenia, Aging deceleration , Aging reversibility

RESVERATROL DOES NOT PROTECT AGAINST PARACETAMOL-INDUCED CELL DEATH IN MOUSE PRIMARY HEPATOCYTES

Alice E. KANE¹, Aniko HUIZER-PAJKOS², Victoria C. COGGER³, David G. LE COUTEUR³, Sarah N. HILMER⁴ (1. Clinical Pharmacology and Ageing, Kolling Institute of Medical Research,

University of Sydney and Royal North Shore Hospital, Australia; 2. Clinical Pharmacology and Ageing, Kolling Institute of Medical Research and Royal North Shore Hospital, Australia; 3. Centre for Education and Research on Ageing and ANZAC Research Institute, Concord Hospital, Australia; 4. Clinical Pharmacology and Ageing, Royal North Shore Hospital, Kolling Institute of Medical Research and University of Sydney, Australia)

Introduction : Paracetamol is a commonly used analgesic and antipyretic. Excessive doses can cause hepatotoxicity, which is treated with N-Acetyl Cysteine (NAC). While toxicity is commonest in younger people, most paracetamol associated deaths occur in older people. Calorie restriction protects from paracetamol-induced hepatotoxicity. Resveratrol, a calorie restriction mimetic, reduces paracetamol hepatotoxicity in animal studies and may have a therapeutic role, especially in old age. We investigated the effects of resveratrol on paracetamol-induced hepatotoxicity in vitro. Method : Primary hepatocytes were isolated from young male C57BL/6 mice by collagenase perfusion. Hepatocytes were treated with serum free medium (control), paracetamol (20mM), ethanol (0.5%), NAC (25mM), resveratrol (1-100µM in 0.5% ethanol) or a combination of treatments. Hepatocyte survival was measured using the MTT assay 24 hours after treatment. Results : Cell viability with ethanol (0.5%) and NAC (25mM) treatments did not differ from control. Compared to controls, 20mM paracetamol resulted in 50.4±22.4% cell survival (p<0.05), and concurrent treatment with 25mM NAC maintained cell viability at control levels (p<0.05). Preliminary results suggest cell viabilities with 1-25µM resveratrol do not differ from control, but there is trend towards a reduction in viability with 50-100µM resveratrol treatment (p>0.05). Concurrent treatment with 20mM paracetamol and any resveratrol dose (1-100µM) did not increase hepatocyte viability. Conclusion : The lack of protection from 1-100µM resveratrol against paracetamol induced toxicity in primary mouse hepatocytes implies that resveratrol may not act directly on hepatocytes in vivo. The trend towards dose related toxicity observed with resveratrol is consistent with resveratrol hormesis. Current studies are investigating mechanisms for these findings. Keywords : Resveratrol, Paracetamol, Hepatocytes

PP26 B-015
EFFECT OF ACANTHOPANAX SESSILIFLORUS ON STRESS RESPONSE AND AGING IN C. ELEGANS
Chul-Kyu KIM, Sang-Kyu PARK (Medical Biotechnology, Soonchunhyang University, Korea)

Introduction : Acanthopanax sessiliflorus has been used as traditional medicine in many diseases. Recent studies also reports anti-oxidant and anti-aging activity of Acanthopanax species. Method : In this study, we examined the anti-oxidant activity of the extracts from Acanthopanax sessiliflorus leaves using *C. elegans* as a model system. Then the effect of Acanthopanax sessiliflorus on lifespan of *C. elegans* was determined. In order to identify possible underlying mechanisms of anti-aging effect of Acanthopanax sessiliflorus, we examined thermotolerance and fertility of worms. Results : Resistance to oxidative stress was significantly increased by Acanthopanax sessiliflorus extracts. Since increased resistance to oxidative stress is commonly positively correlated with lifespan extension, we determined the effect of Acanthopanax sessiliflorus on lifespan of *C. elegans*. Both mean and maximum lifespan were markedly increased by Acanthopanax sessiliflorus extracts. In addition, the treatment of Acanthopanax sessiliflorus enhanced the survival of worms under heat stress. However, the reduced fertility or delayed reproduction period frequently accompanied with increased lifespan were not observed in

Acanthopanax sessiliflorus? treated animals. Conclusion : These findings suggest that Acanthopanax sessiliflorus leaves can confer longevity phenotype without reduced fertility, possibly through their anti-oxidant activity. Keywords : Acanthopanax sessiliflorus, *Caenorhabditis elegans*, aging

PP26 B-016
SCREENING FOR THE MYOGENESIS-PROMOTING COMPOUNDS IN PRIMARY MYOBLAST DIFFERENTIATION USING DRUG REPOSITIONING
Hye Yeong SUNG, Jong Sung HA, Sung Sup PARK, Ki Sun KWON (Aging Research Center, Korea Research Institute of Bioscience and Biotechnology, Korea)

Introduction : Sarcopenia is characterized by decreases of skeletal muscle mass and function in an aged over sixty although various physiological changes are occurred in aging. An activation of satellite cells to induce myogenesis in muscle fibers is a growing treatment as a sarcopenia therapy. For enhancing myogenesis in primary myoblast using Drug Repositioning, the application of known drugs and compounds to new indications, we have a plan to screen FDA (USA)-approved drugs achieved from ChEMBL at Korea Research Institute of Chemical Technology (KRRICT). Through a screening, 10 drugs were selected after the increase of MHC, which was assessed in a concentration range from 0.001 µM to 2.0 µM. Finally we collected 5 drugs under the consideration of papers and patents already reported on them, side effects in long-term taking, and hormonal property. We investigated the phosphorylation of Akt, and AMPK, and expression level of p21, which are known to be involved in muscle cell differentiation. We have a plan for technology transfer after medicinal effects are determined using animal model. Method : We used In-Cell ELISA as a screening system, which could measure expression of Myosin heavy chain. Results : 5 drugs were selected for myogenesis-promoting compounds using drug repositioning. Conclusion : Known drugs can be used for sarcopenia treatments. Keywords : Screening, drug repositioning, myogenesis

PP26 B-017
MECHANISM OF METFORMIN: INHIBITION OF DNA DAMAGE AND PROLIFERATIVE
Hyun-Jin NA, Joung-Sun PARK, Mi-Ae YOO (Department of Molecular Biology, College of Natural Science, Pusan National University, Korea)

Introduction : Age-related changes in stem cells could have a profound impact on tissue aging and the development of age-related diseases such as cancer. However, the effects of metformin, a recently recognized anti-cancer drug, on stem cell aging remain largely unknown. In the present study, an experiment was set up to investigate the underlying mechanism of metformin's beneficial effects on age-related changes in intestinal stem cells (ISCs) derived from *Drosophila* midgut. Method : Using *Drosophila* midgut for studying stem cell aging, we determined the expression of γH2AX and 8-oxo-dG as a DNA damage marker, PHH3 as a proliferation marker using immunocytochemistry, and we studied the function of AKT in ISCs and EBs using the UAS-Gal4 system. Results : Results showed that metformin reduced age- and oxidative stress-related accumulation of DNA damage marked by *Drosophila* γH2AX foci and 8-oxo-dG in ISCs and progenitor cells. Metformin also inhibited age and oxidative stress-related ISC hyperproliferation as well as intestinal hyperplasia. Our study further revealed that the inhibitory effects of metformin on DNA damage accumulation may be due to the down-regulation of age-related and oxidative stress-induced AKT activity. Conclusion : These

data indicate that metformin has beneficial effects on age-related changes in ISCs derived from *Drosophila* midgut. Further, our results suggest a possible impact of DNA damage on stem cell genomic instability, which leads to the development of age-related diseases. Additionally, our study suggests that *Drosophila* midgut stem cells can be a suitable model system for studying stem cell biology and stem cell aging. Keywords : *Drosophila* intestinal stem cells, metformin, DNA damage

ENRICHMENT AND CHARACTERIZATION OF HUMAN DERMAL STEM/PROGENITOR CELLS BY INTRACELLULAR GRANULARITY

Joong Hyun SHIM, Tae Ryong LEE, Dong Wook SHIN (*Bioscience Research Institute, Amorepacific Corporation R&D Center, Korea*)

Introduction : Adult stem cells from the dermis would be an attractive cell source for therapeutic purposes as well as studying the process of skin aging. Several studies have reported that human dermal stem/progenitor cells (hDSPCs) with multipotent properties exist within the dermis of adult human skin. However, these cells have not been well characterized, because methods for their isolation have not yet been optimized. Method : We found that collagen type IV-sorted hDSPCs had higher intracellular granularity than collagen type IV-sorted non-hDSPCs by flow cytometry. Therefore, we isolated the cells with high intracellular granularity (high side scatter) from normal human dermal fibroblasts (NHDFs). We evaluated stemness properties of hDSPCs by Q-PCR, etc. Results : In the present study, we isolated SSChigh (high side scatter)-hDSPCs from normal human dermal fibroblasts (NHDFs) using a structural characteristic, intracellular granularity, as a sorting parameter. The SSChigh-hDSPCs had high proliferation properties and expressed high levels of Sox2 and S100B, similar to previously identified mouse Sox2+ hair follicle dermal stem cells. The SSChigh-hDSPCs could differentiate into not only mesodermal cell types, e.g., adipocytes, chondrocytes, and osteoblasts, but also neuroectodermal cell types, such as neuronal cells. In addition, the SSChigh-hDSPCs exhibited no significant differences in the expression of nestin, vimentin, slug, twist1, versican, etc. Conclusion : These cells are different from the previously identified multipotent fibroblasts and SKPs. We show that SSChigh-hDSPCs exhibit high proliferation and differentiation potentials and can be isolated by using characteristic of their high intracellular granularity. These cells may maintain the stemness properties necessary for recovering homeostasis in aged human skin. Keywords : Skin, Stem Cells, Age

ORALLY-APPLIED CATECHIN INCREASES HEME LEVELS IN RAT BLOOD MITOCHONDRIA

Marni E. CUENO, Muneaki TAMURA, Kenichi IMAI, Kuniyasu OCHIAI (*Department of Microbiology, Nihon University School of Dentistry, Japan*)

Introduction : Catechins are polyphenols that induce anti-inflammatory and antioxidant activities in vitro and are found to have beneficial effects on the cardiovascular system and lower both plasma cholesterol and triglyceride levels in vivo. The mitochondrion is the site of heme biosynthesis and is primarily involved in several aging-related activities. Interestingly, catechin effects on mitochondrial heme biosynthesis have never been elucidated. Method : Throughout this study we made use of young (10-wk old) and old (40-wk old) male rats. One set was orally-applied with gel-encapsulated catechin everyday for 30 days while the other set was used as control. After the

30-day catechin application, blood was obtained from the heart and blood mitochondria were isolated for further analyses. Heme amounts were measured to determine catechin effects. Similarly, hydrogen peroxide (H₂O₂), superoxide dismutase (SOD) and catalase (CAT) levels were subsequently measured to establish mitochondrial reactive oxygen species (ROS) homeostasis. Results : We found that catechin increased mitochondrial heme amounts in all rats. Heme has been correlated to increase H₂O₂ levels, however, in both young and old rats, mitochondrial H₂O₂ levels were decreased. This would suggest that catechin-induced heme increase is not correlated to mitochondrial oxidative stress. We checked mitochondrial SOD and CAT levels in all rat samples and found no significant difference in SOD activity while CAT were significantly increased insinuating that catechin-induced heme increase is associated to antioxidant activity. Conclusion : Our results show that orally-applied catechin increases mitochondrial heme levels which we speculate is associated with antioxidant activity, particularly CAT. Keywords : catechin, heme, mitochondria

NOVEL PPAR α/γ γ DUAL AGONIST, MHY 966 MODULATES UVB-INDUCED SKIN INFLAMMATION THROUGH INHIBITING NF-KB ACTIVITY

Min Hi PARK¹, Dae Hyun KIM¹, Ki Wunga CHUNG¹, Daeui PARK¹, Hyoung Oh JEONG¹, Chan Hum PARK¹, Ha Ram BAE¹, Hye Jin AN¹, Eun Ji JANG¹, Ji Yung PARK², Hyen Jung LEE², Hyoung Ryong MOON², Hae Younga CHUNG¹ (*1. Molecular Inflammation Research Center for Aging intervention (MRCA), College of Pharmacy, Pusan National University, Korea; 2. Laboratory of Medicinal Chemistry, College of Pharmacy, Pusan National University, Korea*)

Introduction : Ultraviolet B (UVB) irradiation-induced lipid peroxidation induced inflammatory responses and leading to skin wrinkle formation and epidermal thickening. Peroxisome proliferator-activated receptor (PPAR) α/γ dual agonists have the potential to be used as preventive agent for anti-wrinkle agents through inhibiting inflammatory response and lipid peroxidation. Method : This study evaluated the function of 2-bromo-4-(5-chloro-benzo[d]thiazol-2-yl) phenol (MHY 966), a novel synthetic PPAR α/γ dual agonist, as a dual agonist for PPAR α/γ , and investigated its anti-inflammation and anti-lipid peroxidation. In this present study, we determined function of MHY 966 as a PPAR α/γ dual agonist by reporter gene assay. Additionally, 8-week-old melanin-possessing hairless mice (HRM2) were exposed to a dose of 150mJ/cm² UVB every other day and MHY 966 was simultaneously treated with every day to investigate anti-wrinkle formation and elucidate its molecular mechanisms. Results : MHY 966 stimulated the transcriptional activities of PPAR α and γ . In HRM2 mice, we observed that the mice exposed to only UVB significantly increased pro-inflammatory mediators such as NF- κ B, iNOS, COX-2 and lipid peroxidation, while the MHY 966 treatment down-regulated them through activating PPAR α and γ . Conclusion : We demonstrated that MHY 966 exhibits beneficial effects on inflammatory responses and lipid peroxidation by simultaneous activation of both PPAR α and γ . Our major finding of this study is MHY 966 would be a potential agent against wrinkle formation associated with chronic UVB exposure leading to photoaging. Keywords : PPAR dual agonist , Skin aging, Inflammation

ELECTROLYZED-REDUCED WATER EXTENDS LIFESPAN VIA INSULIN/IGF-1-LIKE SIGNAL IN C. ELEGANS

Seul-Ki PARK, Sang-Kyu PARK (*Medical Biotechnology, Soonchunhyang University, Korea*)

Introduction : Electrolyzed-reduced water (ERW) scavenges reactive oxygen species and is a powerful anti-oxidant. A positive correlation between oxidative stress and aging has been proved in many model organisms. In *C. elegans*, many long-lived mutants showed reduced fertility as a trade off against longevity phenotype. **Method :** We aimed to study the effect of ERW on oxidative stress, fertility, and lifespan of *C. elegans*. We also investigated the genetic pathway involved in the effect of ERW on resistance to oxidative stress and lifespan. We compared lifespan and fertility of worms in media prepared with distilled water and ERW. **Results :** ERW significantly extended lifespan and increased the number of progeny produced. Then, the effect of ERW on resistance to oxidative stress and lifespan of long-lived mutants was determined. ERW increased resistance to oxidative stress and lifespan of eat-2, a genetic model of dietary restriction, but had no effect on those of age-1, which is involved in insulin/insulin-like growth factor (IGF)-1-like signal. In addition, knockdown of daf-16, the downstream mediator of insulin/IGF-1-like signal, completely prevented the effect of ERW on lifespan. **Conclusion :** These findings suggest that ERW can extend lifespan without accompanying reduced fertility and modulate resistance to oxidative stress and lifespan via insulin/IGF-1-like signal in *C. elegans*. **Keywords :** electrolyzed-reduced water, *C. elegans*, aging

AGE-DEPENDENT CHANGE OF CAVEOLIN-1 EXPRESSION IN THE SKIN:A MARKER FOR SKIN AGING

Seung-Chul LEE, Jee-Young CHOI, Da-In CHOI (*Department of Dermatology, Chonnam National University Medical School, Korea*)

Introduction : There are a variety of biomarkers for chronological aging in the body, and caveolin was suggestive to be implicated in the aging process in the skin. This study was aimed to evaluate the modulation of caveolin-1 (Cav-1) in relation with collagen levels in the skin. Age-dependent change in the expression levels of Cav-1 and collagens I and III (COL I/III) were compared between the young and aged skin of mouse and human *in vivo*, and between the young and senescent human dermal fibroblasts (HDFs) *in vitro*. **Method :** 1.Experimental samples from mouse and human * Mouse and Human- Young aged group, Old aged group 2.Protein and total RNA extracts from mouse skin and human skin 3.Semi-quantitative RT-PCR 4.Immunohistochemistry for Cav-1 5.Confocal microscopy for Cav-1 **Results :** In RT-PCR and Western blot analysis, mRNA and protein levels of Cav-1 were up-regulated, but those of COL I/III were down-regulated, from the aged skin of human and mouse, and also in the senescent HDFs. Immunohistochemical staining revealed that Cav-1 was up-regulated both in the epidermis and dermis of the aged human skin. Immunocytochemical staining showed that Cav-1-positive signals were markedly increased in the cytoplasm of senescent HDFs. The reciprocal negative correlation between Cav-1 and COL I/III was confirmed from our results that COL I/III were markedly up-regulated in Cav-1 siRNA transfected HDFs or Cav-1(-/-) knock-out mice. Collectively, Cav-1 is up-regulated in relation with decreased COL I/III expression in the aged skin. **Conclusion :** Our results suggest us that Cav-1 can be a novel biomarker for skin aging. **Keywords :** Caveolin-1, Collagen, Skin aging

EFFECTS OF AROMA INHALATION METHOD ON NURSING STUDENTS' ANXIETY, STRESS AND SERUM CORTISOL LEVELS

Ye-Jung KO¹, Myung-Soon JUNG², Kyung-Sook PARK³ (*1. Nursing Department, Kimcheon Science College, Korea; 2. Professor, College of Nursing, Kyungdong University, Korea; 3. Professor, Red Cross*

College of Nursing, Chung-Ang University, Korea)

Introduction : Nursing college students experience more stress when compared with students of other majors. The reasons of that is being strictly to learn variety of majors of the curriculum within a short period of time and combination of the clinical practice. These anxiety and stress has to resolved in a proper way , otherwise it will be negatively affected to the nursing professionalism and holistic nursing care as well as nursing students, their own health and well being. Therefore nursing students required that the manage of anxiety of test and stress intervention. **Method :** The survey used pre-survey, 5-day experimental treatment (2012.11.17-21) and posterior survey for 65 cases - 31 aromatic inhalation cases and 34 control cases. Pre-survey measured general demographic characteristics and tested anxiety, stress and serum cortisol levels of all cases. The experimental cases were treated with aromatic inhalation using aroma oil (mixed Maychang, lavender, rosewood essence - ratio of 3:5:2), whereas the control cases were treated with common hand massage. Posterior survey tested the differences between the cases. **Results :** The experimental cases treated with aromatic inhalation scored significantly lower in the anxiety test than the control cases($t=2.330$ $p=0.023$). They also scored significantly lower in physical stress($t=-2.910$ $p=0.005$) and psychological stress($t=-3.285$ $p=0.002$) than the control cases. However, there were no differences found in serum cortisol levels($t=0.228$ $p=0.820$). **Conclusion :** Aromatic inhalation, by using maychang, lavender and rosewood essential oils, contributes significantly in reducing anxiety and stress amongst nursing students, and can therefore be an effective intervention to relieve those levels. **Keywords :** Aromatherapy, Nursing Student, anxiety, stress, serum cortisol

AMP-ACTIVATED PROTEIN KINASE-DEPENDENT NUCLEAR LOCALIZATION OF GLYCERALDEHYDE 3-PHOSPHATE DEHYDROGENASE IN SENESCENT HUMAN DIPLOID FIBROBLASTS AND AGED RAT SKIN CELLS

Eui-Ju YEO, Hyun Jin KWON, Yun Taek LEE, Myung Yeon LEE, Meong-Sook JEONG, Jae Hong KIM (*Department of Biochemistry, Gachon University School of Medicine, Korea*)

Introduction : Besides its role in glycolysis, glyceraldehyde-3-phosphate dehydrogenase (GAPDH) is involved in several biological functions, including DNA repair and apoptosis. Its diverse activities depend on its intracellular localization. It was previously reported that the nuclear translocation of GAPDH might be regulated by the phosphoinositide 3-kinase signaling pathway acting mainly as a nuclear export signal and the AMP-activated protein kinase (AMPK) signaling pathway acting as a nuclear import signal in human diploid fibroblasts (HDFs). **Method :** Because senescent HDFs showed an increased activity of AMPK, we explored the nuclear translocation of GAPDH by confocal laser scanning microscopy of immunostained senescent HDFs. Age-dependent nuclear localization of GAPDH was confirmed by immunohistochemical analysis of skin cells from aged rats. **Results :** More than 80% of senescent cells showed nuclear GAPDH in 10% FBS and its nuclear accumulation increased to over 90% by serum depletion for 5 days. This nuclear accumulation of GAPDH was not reversed by the re-addition of platelet-derived growth factor but lysophosphatidic acid increased its nuclear export by about 40% in the serum-depleted senescent cells. 5-Aminoimidazole-4-carboxamide-1- β -D-ribofuranoside (AICAR), an activator of AMP-activated protein kinase (AMPK), also increased nuclear accumulation of GAPDH in senescent cells cultured in 10% FBS. AMPK inhibition by Compound C partially prevented both basal and AICAR-induced

nuclear translocation of GAPDH. AMPK depletion by siRNA treatment partially prevented the nuclear accumulation in senescent HDFs. Conclusion : Our data suggest that the nuclear accumulation of GAPDH might be partly due to the enhanced AMPK activity in senescent HDFs. Keywords : glyceraldehyde-3-phosphate dehydrogenase; nuclear localization; AMP-activated protein kinase

PP26 B-025

TRF2 REGULATION BY SUMOYLATION AND UBIQUITINATION

Joonyoung HER (*Molecular cancer Lab, WCU-Yonsei Univ., Korea*)

Introduction : Eukaryotic chromosome end is composed of DNA and proteins, called telomere and forms T loop to protect chromosome ends. TRF2 is a major component of shelterin complex and function to prevent loss of genetic materials and shelter chromosome end to avoid DNA damage machinery. Without TRF2, DNA damage signal occurs and cells go to apoptosis. To avoid it, TRF2 mostly binds to telomere and is very stable. So we think that there should be complex mechanism to degrade. Method : Shelterin complex proteins are regulated by several post translational modifications. Among these modification, SUMOylation is one of essential modifications in ALT cells. It is known that TRF1 and TRF2 are sumoylated by MMS21 and their SUMOylation is required for APB formation in ALT cells but it is not clear what the function of TRF1 and TRF2 SUMOylation is in telomerase positive cancer cells. Results : Here, we found that PIAS1 is another SUMO E3 ligase for TRF2 and SUMOylated TRF2 is regulated by proteosomal degradation. Conclusion : SUMO-specific E3 ubiquitin ligase, RNF4, is also involved in SUMOylated TRF2 degradation and control the levels of SUMOylated TRF2. Keywords : TRF2, SUMOylation, Ubiquitination

HJURP REGULATES CELLULAR SENESCENCE IN HUMAN FIBROBLASTS AND ENDOTHELIAL CELLS VIA A P53-DEPENDENT PATHWAY

Jung Hee CHO¹, Jong-Ik HEO², Jae-Ryong KIM³ (*1. Aging-associated Vascular Disease Research Center, Department of Biochemistry and Molecular Biology, College of Medicine, Yeungnam University, Korea; 2. Department of Pharmacy, College of Medicine, Seoul National University, Korea; 3. Dept. of Biochemistry and Molecular Biology, College of Medicine, Yeungnam University, Korea*)

Introduction : Holliday junction recognition protein (HJURP), a CENP-A histone chaperone, mediates centromere-specific assembly of CENP-A nucleosome, contributing to high fidelity chromosome segregation during cell division. However, the role of HJURP in cellular senescence of human primary cells remains unclear. Method : We investigated the effects of HJURP on cellular senescence by measuring senescence-associated beta-galactosidase activity, cell proliferation, and the level of p53 protein. Results : We found the expression levels of HJURP decreased in human dermal fibroblasts and umbilical vein endothelial cells in replicative or premature senescence. Ectopic expression of HJURP in senescent cells partially overcame cell senescence. Conversely, down-regulation of HJURP in young cells led to premature senescence. p53 knockdown, but not p16 knockdown, abolished senescence phenotypes caused by HJURP reduction. Conclusion : These data suggest that HJURP plays an important role in the regulation of cellular senescence through a p53-dependent pathway and might contribute to tissue/organismal aging and protection of cellular transformation. Keywords : Holliday junction recognition protein (HJURP), Cellular senescence, p53, Human primary cells

PP26 B-027

DOWN-REGULATION OF POLO-LIKE KINASE 1 INDUCES CELLULAR SENESCENCE IN HUMAN PRIMARY CELLS THROUGH A P53-DEPENDENT PATHWAY

Jung Hee CHO¹, Hee-Jin KIM¹, Jae-Ryong KIM² (*1. Aging-associated Vascular Disease Research Center, Department of Biochemistry and Molecular Biology, College of Medicine, Yeungnam University, Korea; 2. Dept. of Biochemistry and Molecular Biology, College of Medicine, Yeungnam University, Korea*)

Introduction : Polo-like kinase 1 (PLK1) plays a key role in various stages of mitosis from entry into M phase to exit from mitosis. However, its role in cellular senescence remains to be determined. Method : Therefore, the effects of PLK1 on cellular senescence in human primary cells were investigated. Results : We found that expression of PLK1 decreased in human dermal fibroblasts (HDFs) and human umbilical vein endothelial cells (HUVECs) under replicative senescence as well as premature senescence in response to adriamycin treatment. PLK1 knockdown with PLK1 siRNAs induced premature senescence characterized by large and flattened cell morphology, decreased cell proliferation, increased senescence-associated beta-galactosidase (SA-beta-gal) activity, and higher protein expression of p53. In contrast, up-regulation of PLK1 in old cells partially reversed senescence phenotypes, including increases in cell proliferation, incorporation of bromodeoxyuridine and population doublings, and a decrease in SA-beta-gal activity. Cellular senescence by PLK1 inhibition was observed in p16 knockdown cells but not in p53 knockdown cells. Our data suggest that PLK1 might play important roles in the regulation of cellular. Conclusion : senescence of human primary cells via a p53-dependent pathway and also contribute to tissue/organismal aging and protection of cellular transformation. Keywords : Polo-like kinase 1, Cellular senescence, p53, human primary cells

SUPPRESSION OF THE MMR ACTIVITY CONTRIBUTED TO THE SENESCENCE-ASSOCIATED MUTAGENESIS

Sang Pil YOON¹, In Youb CHANG², Ho Jin YOU³ (*1. Department of Anatomy, School of Medicine, Jeju National University, Korea; 2. Department of Anatomy, College of Medicine, Chosun University, Korea; 3. Department of Pharmacology, College of Medicine, Chosun University, Korea*)

Introduction : DNA damage and mutations in the genome increase with age. To determine the potential mechanisms of senescence-dependent increases in genomic instability, we analyzed DNA mismatch repair (MMR) efficiency in young and senescent human colonic fibroblast and human embryonic lung fibroblast. Method : MMR activity was estimated by Western blot analysis, immunohistochemistry, semiquantitative reverse transcription-PCR analysis, and E2F transcriptional activity. Results : It was found that MMR activity is significantly reduced in senescent cells. Western blot and immunohistochemistry analysis revealed that hMSH2 and MSH6 protein (MutS alpha complex), which is a known key component in the MMR pathway, is markedly down-regulated in senescent cells. Moreover, the addition of purified MutS alpha to extracts from senescent cells led to the restoration of MMR activity. Semiquantitative reverse transcription-PCR analysis exhibited that MSH2 mRNA level is reduced in senescent cells. In addition, a decrease in E2F transcriptional activity in senescent cells was found to be crucial for MSH2 suppression. E2F1 small interfering RNA expression reduced hMSH2 expression and MMR activity in young human primary fibroblast cells. Importantly, expression of E2F1 in

quiescent cells restored the MSH2 expression as well as MMR activity, whereas E2F1-infected senescent cells exhibited no restoration of MSH2 expression and MMR activity. Conclusion : These results indicate that the suppression of E2F1 transcriptional activity in senescent cells lead to stable repression of MSH2, followed by a induction of MutS alpha dysfunction, which results in a reduced cellular MMR capacity in senescent cells. Keywords : MSH2, MutS alpha, Senescence

MILD MITOCHONDRIAL UNCOUPLING PREVENTS PREMATURE SENESCENCE IN HUMAN DERMAL FIBROBLASTS

Si Young CHO, Dae-Bang SEO, Wan Gi KIM, Sang Jun LEE (*Health Science Research Institute, R&D Center, Amorepacific Corporation, Korea*)

Introduction : Mild mitochondrial uncoupling is considered to prolong life span of organism by reducing the production of reactive oxygen species (ROS) and preventing oxidant damage. However, little is known about the effect of mitochondrial uncoupling on cellular senescence and aging of human. Method : Human dermal fibroblasts (HDFs) were pretreated with or without 60 nM carbonyl cyanide (p-trifluoromethoxy)-phenylhydrazone (FCCP) for 30 min and exposed to 200 μ M H₂O₂ for 2 h at day 0. The cells were continuously subcultivated for 12 days. The effects of FCCP on the cellular senescence and collagen homeostasis were investigated. Results : Cells grown in media supplemented FCCP showed delayed senescence compared to untreated senescent HDFs. Treatment of senescent HDFs with FCCP alleviated an increase in the levels of MMP1 mRNA and protein and a decrease in secreted type I procollagen protein levels. Furthermore, we found that the inhibitory effects of FCCP on senescence-associated MMP-1 expression involved preventing activation of JNK pathways. Conclusion : Our data suggest that a mild mitochondrial uncoupling could prevent development of ROS-induced premature senescence by attenuating the alteration in redox-state and suppressing JNK-mediated MMP-1 expression, which may offer a strategy for improving the collagen loss of chronologically aged human skin. Keywords : Mild Mitochondrial Uncoupling, Human Dermal Fibroblasts, Senescence

PP26 B-030

ROLE OF ARC, APOPTOSIS REPRESSOR WITH CASPASE RECRUITMENT DOMAIN, IN STRESS-INDUCED PREMATURE SENESCENCE (SIPS) OF HUMAN DIPLOID FIBROBLASTS

Yun-Yeong LEE¹, Richard N KITSIS², In Kyoung LIM¹ (*1. Department of Biochemistry and Molecular Biology, Ajou University School of Medicine, Korea; 2. Department of Medicine, Albert Einstein College of Medicine, USA*)

Introduction : It has been known that characteristics of cellular senescence include loss of cell division ability with short telomeres, changes of cell morphology e.g. enlarged and flattened with cytoskeleton protein rearrangement, activity of beta-galactosidase at pH 6.0 and lower, formation of senescence associated heterochromatin foci. Apoptosis repressor with caspase recruitment domain (ARC) has been known as a highly potent and multifunctional inhibitor of apoptosis that is physiologically expressed mainly in the post-mitotic cells such as cardiomyocytes, skeletal muscle and neuronal cells. ARC is upregulated in various forms of malignant tumors, and impairs apoptotic responsiveness to a wide range of stresses and insults, including extrinsic apoptosis initiation by death receptor ligands,

dysregulation of cellular Ca²⁺ homeostasis and ER stress, oxidative stress and hypoxia. ARC is subject to both transcriptional and post-translational regulation and exhibits its function through a multitude of molecular interactions with upstream transducers of apoptosis signals. Method : ARC expression was measured by realtime PCR and immunoblot. Knockdown of ARC by lentiviral infection or siRNA transfection was carried out according to previously established method. Apoptosis phenotype was determined by PI staining, counted survival cells, cell cycle (sub G1) by FACS analysis, apoptotic index and molecular marker proteins. Results : ARC expression was upregulated in the replicatively senescent HDF and stress induced prematurely senescent HDF cells, compared with young cells. By employing lentiviral infection containing shARC or transfection of siRNA analyses, show the cell death by apoptosis during senescence. Conclusion : ARC is required for the maintenance of cell survival and of pre-mature senescence in HDF cells. Keywords : Senescence, ARC, HDF cells, cell death

IMMUNOLOGICAL AND VIROLOGICAL RESPONSE OF ELDERLY HIV PATIENTS TO ANTIRETROVIRAL THERAPY

Elizabeth Gar Mit CHONG¹, Philip J.H. POI², Adeeba KAMARUZAMAN³ (*1. Geriatrics, Ministry of Health, Malaysia; 2. Geriatrics, University Malaya Medical Centre, Malaysia; 3. Infectious Diseases, University Malaya Medical Centre, Malaysia*)

Introduction : The introduction of the antiretroviral therapy (ART) has led to improved survival and an increase in aged-HIV infected individuals. The UNAIDS figures has shown that about 15% of the HIV population are now more than 50 years old. This rising trend is of concern because both diagnosing and treatment of HIV in the elderly is complicated by their multiple co-morbid illnesses and late presentation that is associated with poorer outcome. Method : This study was conducted at the Infectious Diseases Clinic, University Malaya Medical Centre. Subjects included into the study were individuals above 50 years old, diagnosed with HIV from 1996-2010 and the young control group were individuals aged 25-40 years old. The individuals in the young control group were selected by matching their CD4 count at presentation, treatment regimen and number of treatment years with the elderly subjects. Results : 206 patients were recruited for the study: 103 subjects in each group. The individuals in the elderly group presented more frequently with opportunistic infections while more of the young control group were asymptomatic and detected by screening. The individuals in the elderly group also had more co-morbid illnesses. Poorer immunological response was found for the individuals in the elderly group presenting with a lower CD4 count (less than 200cells/mm³) after commencing ART. There were no differences in virological suppression between both the groups. Conclusion : The study showed that elderly and young HIV individuals have different demographic differences and poorer immunological response if they present with a CD4 count of less than 200cells/mm³. Keywords : HIV, elderly

PP26 B-032

POSITIVE EFFECT OF NICOTINAMIDE ON CD8+ T CELL SURVIVAL DURING ACTIVATION

Hojin CHOI (*Department of Life Science, University of Seoul, Korea*)

Introduction : Upon TCR stimulation during antigen encounter, T cells are activated and differentiated to secrete cytokines for pathogen clearance. They undergo repetitive clonal expansion which is accompanied with telomere shortening. This in turn sets a limitation to

cells for the capacity for proliferation, and eventually leads to immune senescence. For this reason, modulation of T cell activation can be an important strategy for improving immune function in the elderly. Previously, it was shown that nicotinamide (NAM) improve mitochondrial quality and extended replicative life span of normal human fibroblasts. Method : Primary CD8+T cells were isolated from healthy donors and activated with CD3/CD28[?]conjugated beads in the absence or presence of nicotinamide. The effect on CD8+ T activation and differentiation, and mitochondria and ROS status was examined by flow cytometry and Western blot analyses. Results : Nicotinamide treatment accelerated the expansion of activated CD8+ T cells, and this took place by attenuating the activation-induced cell death (AICD). In the nicotinamide-treated cells, the increase of mitochondria content during activation was suppressed. Moreover, the increase of mitochondrial ROS production was severely compromised without a change in the differentiation potential of effector cells. In addition, the treatment of NAM attenuated the activation-induced increase of cytosolic Ca²⁺. The decrease of intracellular ROS and Ca²⁺ accumulation, both of which are believed to play important role in AICD, possibly protected the activated cells from AICD. Conclusion : The potentiation of CD8+ T cell proliferation during activation by NAM treatment may be beneficial to the elderly who suffer from immune senescence. Keywords : CD8+ T cell, AICD, nicotinamide

A NEW MUCOSAL VACCINE ADJUVANT CONSISTING OF RECOMBINANT PSPA FUSED TO A FLAGELLIN ACTIVATES TLR5 AND PROTECTS AGAINST STREPTOCOCCUS PNEUMONIAE INFECTION IN AGED MICE

Jae Sung LIM¹, Chung Truong NGUYEN², Kim Cuc Thi NGUYEN¹, Kyu Suk KIM¹, Shee Eun LEE³, Joon Haeng RHEE⁴, Ik Soon JANG⁵, Kyung A. CHO¹ (1. Department of Biochemistry, Chonnam National University Medical School, Korea; 2. Clinical Vaccine R&D Center, Chonnam National University Hwasun Hospital, Korea; 3. Dental Science Research Institute, School of Dentistry, Chonnam National University, Korea; 4. Department of Microbiology, Chonnam National University Medical School, Korea; 5. Division of Life Science, Korea Basic Science Institute, Korea)

Introduction : The age-associated decline of immune responses leads to a high susceptibility to viral or bacterial infections and a failure of vaccine efficacy in the elderly. The impact of aging on the innate immune system has recently been implicated in the decline of immune responses, but the mechanisms underlying age-related deficits are unclear. Results : In this study, we observed the significant production of Toll-like receptor 5 (TLR5)-induced proinflammatory cytokines, through *Vibrio vulnificus* flagellin stimulation in macrophages from aged mice. This response was similar to the response in young mice, although the macrophages from the aged mice showed both decreased phagocytic functions and lower TLR-dependent cytokine production compared with the macrophages from the young mice. To demonstrate the TLR5-dependent enhancement of immune responses in aged mice, we designed a vaccine platform with FlaB as a mucosal adjuvant for the pneumococcal surface protein A (PspA) against *Streptococcus pneumoniae* infection in young and aged mice. Compared with PspA alone, intranasal administration of the FlaB-PspA fusion protein induced significantly higher levels of PspA-specific IgG and IgA responses in the sera and mucosal secretions in both the young and aged mice. Aged mice that were immunized with FlaB-PspA showed a high protective efficacy against a lethal challenge with live *S. pneumoniae* compared with the mice immunized with PspA alone. Conclusion : These results suggest that TLR5 signaling plays a key

role in age-associated innate immune responses and that FlaB-PspA stimulation of TLR5 may be a new strategy for a mucosal vaccine adjuvant against pneumococcal infection in the elderly. Keywords : TLR5, flagellin, vaccine adjuvants

ASSOCIATION OF INFLAMMATORY MARKERS WITH SOCIOECONOMIC STATUS IN OLDER ADULTS: DOES RACE/ETHNICITY MATTER?

Ji Hyun CHO¹, Jennifer WEUVE², Lisa L. BARNES³, Denis A. EVANS², Carlos F. MENDES DE LEON⁴ (1. Epidemiologic Science, University of Michigan, Ann Arbor, USA; 2. Rush Institute for Healthy Aging, Department of Internal Medicine, Rush University Medical Center, USA; 3. Rush Alzheimer's Disease Center, Department of Neurological Sciences and Department of Behavioral Sc, Rush University Medical Center, USA; 4. Department of Epidemiology, School of Public Health, University of Michigan, USA)

Introduction : Inflammatory processes are one of downstream biological pathways by which socioeconomic status (SES) affects disease risk. Studies have demonstrated that chronic health conditions are associated with elevated inflammatory marker levels. SES differences may persist or widen with age, leading to greater chronic disease risk in those of lower SES. Given the SES differences among subpopulations of different racial backgrounds, it is important to examine how SES is associated with inflammation within specific racial groups. Method : A cross sectional analysis was conducted for a sample from the Chicago Healthy Aging Project (CHAP) separately for black and non-black population (n=3618, aged 65 or older). The participants' CRP and IL-6 levels were measured and assayed. Their SES as well as behavioral variables and medication status were obtained. Results : The pattern of the association between inflammation and SES varied across different racial groups. Among blacks, lower-SES groups had higher CRP and IL-6 compared to the highest-SES group, although the inverse gradient was not perfectly linear. The association between CRP and income demonstrates only a marginally significant inverse gradient between low- and middle-income groups. Among whites, there was a significant inverse gradient of association between income and IL-6, but not between education and both CRP and IL-6. Compared to the highest-income group, low-income whites were more likely to have higher CRP. Conclusion : Distinct SES gradient of inflammatory marker levels in blacks and whites suggest that well-targeted interventions are necessary to solve both racial and SES disparities altogether. Keywords : inflammation, socioeconomic status, older adults

PP26 B-035

CAVEOLIN-1 DEPENDENT TLR5 SIGNALING IN IMMUNOSENESCENCE

Kyu Suk KIM¹, Jae Sung LIM¹, Kyung A. CHO² (1. Department of Biochemistry, Chonnam National University Hwasun Hospital, Korea; 2. Department of Biochemistry, Research Institute of Medical Sciences, Chonnam National University Hwasun Hospital, Chonnam National University Medical School, Korea)

Introduction : Aging is associated with a progressive decline in immune function (immunosenescence) resulting in increased susceptibility to viral and bacterial infections and decreased response to vaccines. Previously we found that flagellin-dependent toll-like receptor (TLR) 5 activation is sufficient to enhancing of immune systems and successfully protect against *Streptococcus pneumoniae* infection in old mice. Method : From this study, we found that the expression of TLR5 was well maintained in macrophages from old

mice (>24 months), like that of macrophages from young mice (8 weeks). Results : In this study, we provide new molecular mechanism of caveolin-1 dependent maintenance of TLR5 expression and signaling in immunosenescence. Caveolin-1 is known to as a regulator of signaling molecules and increased with various aging process. In macrophages from old mice, caveolin-1 was also increased and directly interacted with TLR5. Interestingly, TLR5 expression was sensitively affected by caveolin-1 expression status and its signaling was mediated by the interacting with caveolin-1 in macrophages from the old mice. Furthermore we found that caveolin-1 formed triple complex with TLR5 and Myd88, an adaptor protein of TLR5, and this complex was increased by stimulation of flagellin. Conclusion : These results suggest that caveolin-1 might be an important mediator for TLR5-dependent immune responses in immunosenescence. Keywords: Immunosenescence, TLR5, Caveolin-1

PP26 B-036

AGE-ASSOCIATED ALTERATION IN THE FREQUENCY OF REGULATORY T CELL IN HUMANS

Ji-Min KIM¹, Jaeseon LEE², Joo-Yeon JHUN², Jennifer LEE², Ho-Youn KIM³ (1. Division of Rheumatology, Department of Internal Medicine, Keimyung University Dongsan Medical Center, Korea; 2. Rheumatism Research Center, The Catholic University of Korea, Korea; 3. Division of Rheumatology, Department of Internal Medicine, Konkuk University, Korea)

Introduction : Aging is associated with alterations in the immune system which might contribute to increased risk of infection and malignancy in the elderly. Regulatory T (Treg) cells have a critical role in the regulation of autoimmunity, antitumor immunity, and anti-infectious responses. Here we investigated the effect of aging on the frequency of Treg cells and subpopulation of Treg in humans. We also analyzed cell cycle-related genes for their expression in human Tregs with aging. Method : Peripheral blood mononuclear cells (PBMCs) were prepared from peripheral blood of healthy elderly (age ≥ 65) and young subjects (age ≤ 30) on Ficoll-Hypaque gradients. Cells were stained with anti-CD4, anti-CD25, anti-CD45RO and anti-FOXP3 antibodies. Stained cells were analyzed by flow cytometry. Cell apoptosis was analyzed by annexin V staining. Real-time reverse transcription polymerase chain reaction was used to determine the expression of cell cycle-related genes on Treg cells which were sorted by immunomagnetic technique. Results : We demonstrated that healthy elderly individuals had increased frequency of Treg cells (CD4+CD25+Foxp3+ T cells) compared to healthy young individuals. Remarkable increase of memory proportion (CD4+CD25+Foxp3+CD45RO+ T cells) and decrease of naive proportion (CD4+CD25+Foxp3+CD45RO- T cells) were also observed in the population of Treg cells of elderly people. Memory Treg cells as well as total Treg cells of the elderly had more resistance to apoptosis than those of the young. Altered cell cycle-related gene expression was observed in human Treg cells between the aged and the young. Conclusion : Our observations suggest that aging affects the (sub)population of Treg cells in humans. Keywords : aging, T cell

SHARED EPITOPE AND RADIOLOGIC PROGRESSION ARE LESS PROMINENT IN ELDERLY ONSET RA THAN YOUNG ONSET RA

Jennifer LEE¹, Eun-Ji KIM¹, Ji Hyeon JU¹, Hee-Baeg CHOI², Tai-Gyu KIM², Ho-Youn KIM³ (1. Rheumatism Research Center, The Catholic University of Korea, Korea; 2. Department of Microbiology, St. Mary's Hospital, The Catholic University of Korea College of Medicine, Korea; 3. Division of Rheumatology, Department of Internal

Medicine, Konkuk University, Korea)

Introduction : To determine the influence of HLA-DRB1 and HLA-DQB1 genes on the disease susceptibility and the disease severity in elderly-onset rheumatoid arthritis (EORA) compared with young onset rheumatoid arthritis (YORA) in Korean patients. Method : Genetic analysis of HLA-DRB1 and HLA-DQB1 alleles was performed in three groups. Group 1 included 63 patients who were diagnosed with RA after the age of 60 (elderly onset RA (EORA)). Group 2 consisted of 109 patients who were diagnosed with RA before the age of 60 (young onset RA (YORA)). Group 3 involved 133 normal controls. The shared epitope-coding alleles included the members of the HLA-DRB1*04 allele group (*0401, *0404, *0405, *0408, *0410), HLA-DRB1*01 allele group (*0101, *0102), HLA-DRB1*1001 and HLA-DRB1*1402. The disease severity was assessed by the modified total sharp score (mTSS). Results : The shared epitope-coding alleles were more frequently observed in the RA patients than in the normal controls. The shared epitopes-coding alleles were less frequently found in EORA group than YORA group (31/63 (49.2%) in group 1, 72/109(66.1%) in group 2, 45/133(33.8%) group 3, $P=0.02$). Although the mTSS of the group 1 was higher than group 2 at symptom onset, the overall mean mTSS of the group 1 was lower than that of group 2 (26.8 vs. 57.5, $P<0.05$). HLA-DQ*04 showed the higher frequency in the patients group than in normal controls ($P<0.001$). And HLA-DQ*04 was less commonly found in the patients with EORA than YORA ($p<0.05$). Conclusion : The presence of shared epitope and radiologic progression are less prominent in EORA patients than YORA patients. Keywords : elderly onset rheumatoid arthritis

PP26 B-038

ABOUT A REALITY OF EXTREME AGES THAT ESSENTIALLY EXCEED A CANONICAL BOUNDARY OF HUNDRED YEARS

Alexander KHALYAVKIN (Kinetics of Biological Processes, Inst of Biochem Physics, RAS & Inst for Systems Analysis, RAS, Russia)

Introduction : The regularities of statistics of mortality allow indirectly estimate a possibility to live up to extremely high ages. Method : The Gompertz law connects the force of mortality $M(t)$ in some cohort with its current age t via formula $M(t)=M^*exp[at]$. Parameter 'M' is a characteristic force of mortality. Kinetic parameter 'a' characterizes the rate of aging. Let extreme age (T_e) is the age when $M(t)=1/year$. Then the life expectancy at t must be approximately one year. Therefore, $T_e(a,M)=(1/a)*ln(1/M)$. It is underestimated evaluation for T_e because $M(t)$ grows more slowly at advanced ages than exponent of the Gompertz law. The second regularity of mortality statistics connects characteristic force of mortality 'M' of some cohort with its kinetic parameter 'a' (rate of aging) via formula $lnM=lnB-a*T$. Parameter 'B' is a characteristic force of mortality when $a=0$ (agelessness) and parameter 'T' is a characteristic species-specific age. Then the relationship between of extreme age and the rate of aging parameter 'a' is $T_e(a)=T+(1/a)*ln(1/B)$. Results : We know that for human beings $B\sim 0.05$ per year and $T\sim 70$ years. As $ln(1/0.05)=3$ so the rough formula for extreme age evaluation is $T_e(a)\sim 70+(3/a)$. As parameter 'a' is around 0.1/year and more for contemporary developed countries so underestimated extreme age for these countries must be around 100 years. We know that for underdeveloped and developing populations (especially for previous centuries) parameter 'a' was around 0.03-0.06/year. It means that the appropriate extreme age should be approximately 120-170 years. Conclusion : Thereby the empirical laws of mortality are compatible with a rare but real opportunity of super-longevity. Keywords : Super-Longevity , Rate of Aging , Regularities of Mortality

PP26 B-039

JOB STRESS AND MORTALITY IN OLDER AGE

Beata TOBIASZ-ADAMCZYK, Piotr BRZYSKI, Marzena FLOREK, Monika BRZYSKA (Chair of Epidemiology and Preventive Medicine, Jagiellonian University Medical College, Poland)

Introduction : The relation between job stress, morbidity and mortality has been the longstanding focus of research interest over the last four decades. This presentation aims to assess the relation between the determinants of psychosocial work environment, as expressed in terms of JDC or ERI models, and all-cause mortality in older individuals. Method : The baseline study was conducted in a simple random sample of a cohort of 65-year-old community-dwelling citizens of Krakow, Poland. All of the 727 participants (410 women, 317 men) were interviewed in their households in the period between 2001 and 2003, using a structured questionnaire on the history of the respondents' occupational activity, including indexes measuring particular dimensions of psychosocial work environment based on Karasek's Job Demand-Control model and Siegrist's Effort/Reward Imbalance model, as well as health-related quality of life and demographic data. Mortality was ascertained by monitoring City Vital Records for 7 years. Analyses were conducted separately for men and women, with multivariate Cox proportional hazard model. Results : During the 7 year follow-up period 59 participants (8,1%) died, including 21 women (5,1%) and 38 men (12%) ($p < 0,05$). Multivariate Cox proportional hazard model showed that significantly higher risk of death was observed only in men with low physical demands and low control, compared to those with low physical demands and high control ($\text{Exp}(B) = 4,65$, $95\% \text{CI} = (1,64; 13,2)$). Conclusion : Observed differences in mortality patterns are similar to the patterns of relationships observed in health-related quality of life (HRQoL) level at the beginning of old age. Keywords : psychosocial working conditions, mortality, older age

PP26 B-040

AMINE NEUROTRANSMITTERS REGULATE LIFE-SPAN IN C. ELEGANS

Haruka HOSHIKAWA, Masaharu UNO, Hiroyuki YOSHIMURA, Sakiko HONJOH, Eisuke NISHIDA (Department of Cell and Developmental Biology, Graduate School of Biostudies, Kyoto University, Japan)

Introduction : Dietary restriction increases life-span in many species from yeasts to mammals; however, the underlying mechanisms remain unclear. In *C. elegans*, four biogenic amines, serotonin (5-HT), dopamine (DA), octopamine (OA), and tyramine (TA) function as neurotransmitters and are emitted depending on food availability. 5-HT and DA are involved in behaviors under fed conditions, while OA and TA are involved in behaviors under fasted conditions. We previously developed an intermittent fasting (IF) regimen (an every 2 days fasting) that extends life-span by more than 60% in *C. elegans*, and thus thought that these amine neurotransmitters might be involved in IF-induced longevity. Method : We measured life-span of the mutants of neurotransmitter-synthesizing enzymes. We tested the effect of neurotransmitters on life-span under ad libitum (AL) feeding conditions. We examined effects of OA treatment on nuclear accumulation of DAF-16, the key transcription factor for longevity. Results : IF-induced life-span extension was suppressed in several of the mutants in neurotransmitter-synthesizing enzymes, and the suppressions for the most part resulted from the mutation-induced life-span extension under AL conditions, suggesting that some of neurotransmitters should mimic IF effects. OA treatment extended life-span of wild type worms under AL conditions and induced nuclear

accumulation of DAF-16. Conclusion : These results suggest that OA treatment can mimic the effects of fasting on DAF-16 nuclear localization and longevity. We are examining the molecular mechanisms of OA-induced longevity in more detail. Keywords : longevity, neurotransmitter, C. elegans

PP26 B-041

MOLECULAR MECHANISMS UNDERLYING FASTING-INDUCED LONGEVITY IN C. ELEGANS

Saya KISHIMOTO, Masaharu UNO, Yumi KANEKO, Saori NISHIOKA, Eisuke NISHIDA (Department of Cell and Developmental Biology, Graduate School of Biostudies, Kyoto University, Japan)

Introduction : As organisms are constantly exposed to many environmental stresses, dealing with stresses is an intrinsic protective mechanism to adapt themselves to the environment. Through exposure to milder stresses, animals increase stress resistance and viability, and thereby live longer. In *Caenorhabditis elegans*, it has been reported that exposure of adult worms to mild stresses can extend life-span. We investigated whether exposure to stresses only during larval stages could have the longevity effect. Method : We first exposed larva to several kinds of stresses at various doses (e.g., oxidative stress, osmotic stress, and fasting), and then measured the adult life-span in unstressed conditions. Results : Our life-span measurements showed that exposure to 1 mM arsenite (oxidative stress), 100 mM NaCl (osmotic stress) during larval stages, or 1 day fasting at L4 stage extended adult life-span of wild-type worms. Fasting was the most effective in extending the life-span. Interestingly, the offspring of the fasted worms was also long-lived. Conclusion : These results suggest that exposure to various stresses during larval stages can extend life-span. Fasting has the marked longevity effect. We are now examining the mechanisms underlying the stress-induced longevity in more detail, and will investigate the mechanisms of transgenerational inheritance of the fasting-induced longevity. Keywords : longevity, stress response, C. elegans

INHIBITION OF ERK5 PROTECTS PULMONARY FIBROSIS VIA DOWNREGULATION OF TGF- β 1-SMAD SIGNALING

Suji KIM¹, Jae Hyang LIM², Chang-hoon WOO¹ (1. Department of Pharmacology, Yeungnam University College of Medicine, Korea; 2. Department of Microbiology, Ewha Womans University School of Medicine, Korea)

Introduction : Idiopathic pulmonary fibrosis (IPF) is a progressive and chronic lung disease. Although IPF cause remains unknown, the interstitium of the lungs becomes thick and stiff which eventually cause symptom of breathlessness. It has been established that transforming growth factor- β 1 (TGF- β 1)/Smad signaling pathway plays an important role in lung fibrosis. Method : Herein, we identified whether ERK5 regulates TGF- β 1-induced fibrogenic gene expression in both in vitro and in vivo system. Pharmacological inhibitor of MEK5/ERK5, BIX02189 and depletion of ERK5 with siRNA inhibited TGF- β 1-induced ECM molecules in lung epithelial cells and fibroblasts. Results : Inhibition of ERK5 also blocked TGF- β 1 signal to smad3 transcriptional activity and PAI-1 promoter activity. TGF- β 1-induced Smad3 phosphorylation and nuclear translocation was not regulated by ERK5 signaling. Notably, ERK5 is involved in Smad2 phosphorylation at linker region and Smad3 acetylation. In bleomycin-induced lung fibrosis, we found that BIX02189 treatment improved survival rate and inhibited lung fibrosis of mice after bleomycin. Conclusion : Our results demonstrate ERK5 plays a major role in

TGF- β 1-induced Smad3 acetylation, PAI-1 transcription, and ECM molecules. Taken together, these data suggest that ERK5 may become a potential therapeutic target for treatment of lung fibrosis. Keywords : lung fibrosis, ERK5, smad

4-HYDROXYNONENAL ACTIVATION OF SRC TYROSINE KINASE FOR UP-REGULATION OF P38/AP-1 SIGNALING AND COX-2 GENE EXPRESSION IN ENDOTHELIAL CELLS

Eunji JANG¹, Hyoung Oh JEONG¹, Dae Ui PARK¹, Dae Hyun KIM¹, Byung Pal YU², Hae Young CHUNG¹ (1. Molecular Inflammation Research Center for Aging Intervention (MRCA), Department of Pharmacy, Pusan National University, Korea; 2. Department of Physiology, The University of Texas Health Science Center at San Antonio, USA)

Introduction : 4-hydroxynonenal(4-HNE), a major end product of lipid peroxidation, is highly reactive and involved in the alterations of various cellular activities, including inflammatory signaling. However, to date, the mechanistic role of 4-HNE in progression of inflammatory signaling related to protein tyrosine kinases in endothelial cells has not been elucidated. In the present study, we investigated the interaction 4-HNE with non-receptor tyrosine kinases(NRTKs), Src, for its involvement in the molecular modulation of inflammatory signaling pathway. Method : We utilized YPEN-1 cell system. LC MS/MS and docking simulation methods were used. The role of 4-HNE-activated Src in inflammatory signaling pathway was further confirmed by the use of Src inhibitor, Dasatinib and Src siRNA. Results : Results show that 4-HNE through adduct formation activates phosphorylation of Tyr418 of Src, the active form of Src, as detected by immunoprecipitated Src. In addition, LC MS/MS and docking simulation data revealed the adduction site was Cys248 residue of Src. It was found that only p38 MAPK was directly regulated by Src, when the phosphorylation form of mitogen-activated protein kinases (MAPKs) that are key elements in the pathway involved in the transduction of signals from activated Src were immunoblotted. Our further study also showed that HNE-enhanced activation of AP-1 and the expression of one of the AP-1 target gene, COX-2, were modulated by Src. Conclusion : These results showed that 4-HNE adduct formation activated Src, leading to the stimulation of downstream signal, p38/AP-1 and COX-2 in endothelial cells. Keywords : 4-Hydroxynonenal, c-Src, p38, AP-1, COX-2, endothelial cell

PEPTIDYLARGININE DEIMINASE 2-MEDIATED PROTEIN CITRULLINATION IN PRION DISEASE

Hee-Jun KIM¹, Byungki JANG¹, Jae-Kwang JIN¹, Yong-Chul JEON¹, Akihito ISHIGAMI², Naoki MARUYAMA², Richard I. CARP³, Yong-Sun KIM¹, Eun-Kyoung CHOI¹ (1. Ilsong Institute of Life Science, Hallym University, Korea; 2. Molecular Regulation of Aging, Tokyo Metropolitan Institute of Gerontology, Japan; 3. Department of Virology, New York State Institute for Basic Research in Developmental Disabilities, USA)

Introduction : The post-translational citrullination (deimination) process is mediated by peptidylarginine deiminases (PADs), which convert peptidylarginine into peptidylcitrulline in the presence of high calcium concentrations. Over the past decade, PADs and protein citrullination have been commonly implicated as abnormal pathological features in neurodegeneration and inflammatory responses associated with diseases such as multiple sclerosis, Alzheimer's disease and rheumatoid arthritis. Based on this evidence, we investigated the roles of PADs and citrullination in the

pathogenesis of prion diseases. Method : Here we used cultured cells expressing PAD2 and the brains of scrapie-infected mice and of patients with sporadic Creutzfeldt-Jakob disease or Alzheimer's disease. To determine the role of PAD2-mediated citrullination in the pathogenesis of prion diseases, we performed RT-PCR, Western blot analysis, 2-DE and proteome analysis, immunohistochemical staining and immunogold labeling. Results : We demonstrated that the up-regulation of PAD2, mainly found in reactive astrocytes of infected brains, leads to excessive citrullination, which is correlated with disease progression. Furthermore, we found that various cytoskeletal and energy metabolism-associated proteins are particularly vulnerable to citrullination. Our recent in vivo and in vitro studies elicited altered functions of enolase as the result of citrullination; these altered functions included reduced enzyme activity, increased protease sensitivity and enhanced plasminogen-binding affinity. Conclusion : These findings suggest that PAD2 and citrullinated proteins may play a key role in the brain pathology of prion diseases. By extension, we believe that abnormal increases in protein citrullination may be strong evidence of neurodegeneration.[This work was supported by the National Research Foundation of Korea Grant funded by the Korean Government (NRF-2011-619-E0001)]. Keywords : Peptidylarginine deiminase 2, citrullination, prion disease, neurodegeneration

DEVELOPMENT OF A NOVEL PPAR α/γ DUAL AGONIST, MHY2013

Hye Jin AN¹, Min Hi Park PARK¹, Ha Ram BAE¹, Kyoung Mi MOON¹, Yu Ri JUNG¹, Dae Hyun KIM¹, Ki Wung CHUNG¹, Chan Hum PARK¹, Yeon Ja CHOI¹, Hyung Oh JEONG¹, Hye Jin LEE², Ji Young PARK², Hye Rim KIM², Hyung Ryong MOON², Byung Pal YU¹, Hae Young CHUNG¹ (1. Molecular Inflammation Research Center for Aging Intervention (MRCA), Department of Pharmacy, Pusan National University, Korea; 2. Laboratory of Medicinal Chemistry, College of Pharmacy, Pusan National University, Korea)

Introduction : The findings of the important role of peroxisome proliferator-activated receptors (PPARs) as modulators of lipid and glucose homeostasis have raised attention to the development of PPAR α/γ dual agonists for the treatment of type 2 diabetes and simultaneously prevent dyslipidemia. However, PPAR α/γ dual agonists such as muraglitazar have some side effects including weight gain, cardiovascular risks and potential carcinogenicity during preclinical or clinical trials. Therefore, we report the characterization of a novel PPAR α/γ dual agonist, MHY2013 capable of inducing activity of PPAR through various in vitro approaches. Method : We screened various synthetic compounds for PPAR α/γ agonists by Luciferase assay in human Embryonic Kidney Cells. One of the most active compounds, MHY2013 was selected and performed docking simulation. The cell viability assay was carried out using 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide in rat prostate endothelial cells. To determine whether MHY2013 induce PPAR α/γ transcriptional activity in YPEN-1 cells, we performed various in vitro approaches such as chromatin immunoprecipitation assay, PPRE luciferase assay, immunofluorescence and Western blot analysis. Results : MHY2013 was non-cytotoxic to YPEN-1 cell. Binding affinity of MHY2013 was higher than fenofibrate and rosiglitazone, known as PPAR α and γ agonist, respectively. In addition, MHY2013 induced interaction of PPAR α/γ and peroxisome proliferator response elements. Therefore, MHY2013 increased transcriptional activities of PPAR α/γ . Conclusion : Taken together, the newly synthesized MHY2013 has a powerful agonistic effect on PPAR α/γ in comparison with fenofibrate and rosiglitazone known as PPAR α and γ agonist, respectively. This study suggests that MHY2013 could be an useful

PPAR α/γ dual agonist. Keywords : PPARs, PPAR α/γ dual agonist

PP26 B-046
IMMUNOHISTOCHEMICAL LOCALIZATION OF SIRT6 PROTEIN IN NORMAL ADULT RAT BRAIN WITHOUT CALORIE RESTRICTION

Dong Hoon SHIN¹, Il Young JANG², Chang Seok OH¹, Eunju LEE²
(1. Dept of Anatomy, Seoul National University College of Medicine, Korea; 2. Dept of Internal Medicine, Asan Medical Center, University of Ulsan College of Medicine, Korea)

Introduction : Sirtuins are known to be a family of enzymes highly conserved in evolution, mediating longevity by modulating calorie restriction pathways. Although there are seven members of sirtuin family protein (SIRT1-7) in mammals, SIRT6 immunoreactivities (IRs) was rarely reported until now. In this study on the adult normal rat brain without calorie restriction, we tried to observe SIRT-6 IRs in each brain area. Method : The Brains of adult Sprague-Dawley rats were used in this study. The SIRT6 primary antibody was treated on the brain sections. Fluorescence conjugated secondary antibody was also subjected to it. To see the types of the cells showing SIRT6 immunoreactivities, specific antibodies for neuron, astrocyte, microglia and oligodendrocyte were used. The sections were observed with fluorescence microscope. Results : In this study on the adult normal rat brain without calorie restriction, we observed SIRT6 IRs in neurons of hippocampus, astrocytes in most of brain areas. However, in case of microglia and oligodendrocytes, SIRT6 IRs were very weakly expressed or did not show any positive signs. SIRT6 IRs were mainly localized in the cytoplasm, but not in the nuclei. Conclusion : We can summarize the distribution of specific SIRT6 IRs in different regions of normal adult rat brain. Although SIRT6 is known to be a nuclear protein, in this study, most of immunoreactivities were localized in cytoplasm, but very little in nucleus. In adult rat brain without calorie restriction, SIRT6 protein seems not to be actively functioning in nuclear processes, even if it is expressed in some specific types of neural cells. Keywords : SIRT6, calorie restriction, brain, rat

PP26 B-047
CAVEOLIN-1 MEDIATES SALMONELLA INVASION VIA THE REGULATION OF SOPE-DEPENDENT RAC1 ACTIVATION AND ACTIN REORGANIZATION

Jae Sung LIM¹, Kyu Suk KIM¹, Hyon E CHOY², Kyung A. CHO¹
(1. Department of Biochemistry, Chonnam National University Medical School, Korea; 2. Department of Microbiology, Chonnam National University Medical School, Korea)

Introduction : Caveolar endocytosis has an important function in the cellular uptake of some bacterial toxins, viruses, and circulating proteins. However, the molecular machinery involved in caveolae-dependent bacterial endocytosis is poorly defined. Previously, we reported that both M cells, the antigen-sampling site in Peyer's patches (PPs), and senescent host cells showed a high sensitivity to Salmonella infection, which was dependent on caveolin-1 expression. Results : In the present study, we provide a new molecular mechanism for the caveolin-1-dependent entry of Salmonella into host cells through the direct regulation of actin reorganization. Unlike other known pathogens, the caveolae did not form Salmonella-containing vesicles (SCVs) or endosomes in the host cells but quickly moved to the apical plasma membrane with actin condensation during early invasion. Interestingly, SopE, an injected bacterial protein, and Rac1, regulated actin reorganization through their interaction, were co-localized with and directly interacted with caveolin-1 in caveolae during early

invasion. After the complete internalization of Salmonella, the SopE level decreased in both the caveolae and host cytoplasm, and Rac1 activity was also decreased. Down-regulation of the caveolin-1 by siRNA treatment lead to reduce of Salmonella invasion compare to control siRNA treated cells. Conclusion : These results suggest a new model in which caveolin-1 might be involved in Salmonella entry via its interaction with SopE and Rac1, leading to enhanced membrane ruffles for phagocytosis into host cells. Furthermore, these results explain why specific host cells, such as M cells and senescent cells, which express high levels of caveolin-1, show high sensitivity to Salmonella infection. Keywords : Caveolin-1, SopE, Actin

PP26 B-048
TRANSCRIPTIONAL AUTOREGULATION OF FOXO3A
Jeong-Min LEE, Min-Ju KIM, Jeong-Hyeon KIM, Jee-In HEO, Seong-Hoon PARK, Hong-Jun KANG, Sung-Chan KIM, Jaebong KIM, Jae-Bong PARK, Jae-Yong LEE (Hallym University, Medical School, Department of Biochemistry, Korea)

Introduction : FOXO3a is down-regulated during cellular aging and up-regulated by treatment of hydrogen peroxide even though their molecular mechanism remains still unknown. In order to investigate how FOXO3a is up-regulated by treatment of hydrogen peroxide, we tested mRNA and protein levels of FOXO3a. Method : Promoter activities of serial deletion and point mutants (of FOXO3a promoter) were measured. CHIP assay in FOXO3a promoter were carried out. Results : Both mRNA and protein levels of FOXO3a were increased by H₂O₂ treatment in concentration-dependent manner, indicating that FOXO3a is mainly regulated at transcriptional level. The promoter assay using a reporter construct containing FOXO3a promoter and luciferase gene showed same up-regulation by H₂O₂ treatment. Promoter assay with serial deletions of FOXO3a promoter showed that FOXO3a binding sites of FOXO3a promoter are important, indicating that FOXO3a is transcriptionally autoregulated through FOXO3a binding site in its own promoter. Only FOXO3a overexpression increased FOXO3a promoter activity while overexpression of FOXO1 or FOXO4 could not activate, indicating that FOXO binding sites of FOXO3a promoter interact specifically only with FOXO3a. Serial deletion mutant of promoter and point mutant of FOXO binding sites showed the decrease of promoter activity. CHIP (chromatin-immuno precipitation) assay in FOXO binding sites also confirmed that FOXO3a is a its own transcriptional target gene of FOXO3a. Conclusion : Overall, the results suggest that FOXO3a is transcriptionally up-regulated through FOXO binding site in its own promoter by H₂O₂ treatment. Keywords : FOXO3a, transcriptional autoregulation

PP26 B-049
APE1, XRCC4, AND XPC ARE TRANSCRIPTIONAL TARGET GENES OF FOXO TO MEDIATE DNA DAMAGE-DEPENDANT-ACTIVATION OF DNA REPAIR

Jeong-Hyeon KIM, Jee-In HEO, Seong-Hoon PARK, Hong-Jun KANG, Seung-Min LEE, Jeong-Min LEE, Jae-Bong PARK, Jaebong KIM, Sung-Chan KIM, Jae-Yong LEE (Hallym University, Medical School, Department of Biochemistry, Korea)

Introduction : DNA damage is known to activate DNA repair and also reported to increase FOXO3a, implying that FOXO3a is related with DNA repair. Since the detailed function of FOXO3a in DNA damage and DNA repair has not been elucidated yet, the role of FOXO3a in DNA damage-mediated activation of DNA repair HEF (human embryonic fibroblast) was examined. Method : Promoter activity of APE1, XRCC4, XPC were measured for deletion and point mutants

BER, NER, and NHEJ were measured. Results : When HEF cells were treated with doxorubicin, a DNA intercalating agent the protein level of FOXO3a was increased. APE1 level and BER activity were also increased. Promoter activity of APE1 was increased by increased FOXO3a. Deletion and point mutants in FOXO3a binding sites of APE1 promoter showed decrease of promoter activity. CHIP (Chromatin Immunoprecipitation) assay showed that APE1 binding to FOXO3a binding sites of APE1 promoter was increased in doxorubicin treated-HEF cells, indicating that APE1 is a transcriptional target gene of FOXO3a. Deacetylation and dephosphorylation mutants of FOXO3a (activation of FOXO3a) resulted in up-regulation of APE1 and activation of BER as expected. Additional data also showed that XRCC4, a factor of non-homologous end-joining (NHEJ) and XPC, a component of nucleotide excision repair (NER) are transcriptional target genes of FOXO3a to mediate the increase of NHEJ and NER activities in doxorubicin-treated HEF cells. Conclusion : Our result showed that DNA damage increased the protein level of FOXO3a and thereby up-regulated its target genes, APE1, XRCC4, and XPC to activate BER, NHEJ and NER activities. Keywords : FOXO3a, APE1, XRCC4, XPC, DNA damage, DNA repair

MDM20, AN AUXILIARY SUBUNIT OF THE N-TERMINAL ACETYLTRANSFERASE COMPLEX NATB, INVOLVES IN POLYQ AGGREGATE CLEARANCE

Kunihiko YASUDA, Kyoji OHYAMA, Nozomu MORI (*Anatomy and Neurobiology, Nagasaki University School of Medicine, Japan*)

Introduction : Neurodegenerative disorders, like Alzheimer disease, Parkinson disease or Huntington disease, accumulate the protein aggregates in brain and finally induced neuronal death. In this presentation, we report the novel regulation system for protein aggregates clearance. Mdm20 is an auxiliary subunit of the NatB complex, which includes Nat5, the catalytic subunit for protein N-terminal acetylation. The NatB complex catalyzes N-acetylation during de novo protein synthesis initiation; however, recent evidence from yeast suggests that NatB also affects post-translational modification of tropomyosin, which is involved in intracellular sorting of aggregated proteins. We hypothesized that an acetylation complex such as NatB may contribute to protein clearance and/or proteostasis in metazoan and/or mammalian cells. Method : We examined whether the NatB complex or its components affect polyQ aggregation, autophagy induction and regulation of PI3K-Akt-mTOR signaling in rat primary cultured hippocampal neurons and HEK293 cells using over-expression and siRNA methods. Results : The number of polyQ aggregates increased in Mdm20 over-expressing (OE) cells, but not in Nat5-OE cells. Conversely, in Mdm20 knockdown (KD) cells, but not in Nat5-KD cells, polyQ aggregation was significantly reduced. Furthermore, in Mdm20-KD cells, a punctate appearance of LC3 was evident, suggesting the induction of autophagy. Consistent with this notion, phosphorylation of Akt, most notably at S473, was greatly reduced in Mdm20-KD cells. Conclusion : Mdm20, the so-called auxiliary subunit of the translation-coupled protein N-acetylation complex, contributes to protein clearance and/or aggregate formation by affecting the phosphorylation level of Akt independently from the function of Nat5. Keywords : poly-glutamine acetylation autophagy

PP26 B-051

THE EFFECT OF A NOVEL COMPOUND, (Z)-5-(2,4-DIHYDROXYBENZYLIDENE) THIAZOLIDINE-2,4-DIONE (MHY498), ON NITRIC OXIDE-INDUCED MELANOGENESIS

Kyoung Mi MOON¹, So Hee KIM¹, So Ra KIM¹, Hye Jin AN¹, Hye Jin LEE², Yu Ri JUNG¹, Ki Wung CHUNG¹, Yeonja CHOI¹, Youngwoo WOO², Hee Won LEE², Hyung Ryong MOON², Hae Young CHUNG¹ (*1. Molecular Inflammation Research Centre for Aging Intervention (MRCA), College of Pharmacy, Pusan National University, Korea; 2. Laboratory of Medicinal Chemistry, College of Pharmacy, Pusan National University, Korea*)

Introduction : Nitric oxide (NO) and the NO/PKG signaling pathway play a crucial role in ultraviolet (UV)-induced melanogenesis, which is related to the induction of the expression of tyrosinase. In an attempt to find a novel anti-melanogenic agent, we synthesized a new compound, (Z)-5-(2,4-Dihydroxybenzylidene) thiazolidine-2,4-dione (MHY498). The purpose of this study was to investigate the effect of MHY498 on NO and the NO-mediated signaling pathway using in vitro model of melanogenesis. Method : MHY498 inhibited Sodium Nitroprusside (SNP, an NO donor)-induced NO generation, dose-dependently in B16F10 melanoma cells. MHY498 suppressed the tyrosinase activity and melanin synthesis, which induced by SNP in B16F10 melanoma cells. To investigate the affected signaling pathway, guanosine cyclic 3',5'-monophosphate (cGMP) activity were measured by cGMP EIA Kit and Western blot analyses were conducted to determine the effect on the gene expression of tyrosinase and microphthalmia-associated transcription factor (MITF). Results : The activity of cGMP increased by SNP and reduced dose-dependently by MHY498. MHY498 suppressed the expression of tyrosinase and MITF, which were stimulated by SNP. From this study, we confirmed that the enhancement of tyrosinase gene expression through the cGMP pathway is a primary mechanism for NO-induced melanogenesis and the NO-induced pathway by MITF enhances melanogenesis. Conclusion : The newly synthesized tyrosinase inhibitor, MHY498 had an scavenging activity of NO and inhibitory activity of the NO-mediated signaling pathway, which lead to down-regulation of tyrosinase expression in melanogenesis. MHY498 could be a promising anti-melanogenic agent targeting the NO-induced cGMP signaling pathway. Keywords : (Z)-5-(2,4-Dihydroxybenzylidene)thiazolidine-2,4-dione, melanogenesis, nitric oxide

A NOVEL TELOMERASE COMPONENT COEXISTS WITH TELOMERASE AND REGULATES TELOMERASE ACTIVITY

Prabhat KHADKA, Ji Hoon LEE, Sun Ah JEONG, In Kwon CHUNG (*Department of Systems Biology and Department of Integrated Omics for Biomedical Science, Yonsei University, Korea*)

Introduction : It has shown that the conventional DNA metabolism machineries directly or indirectly regulate telomerase activity and telomere, still it is not clearly known how DNA replication proteins regulate telomerase. Method : 1. Cell culture 2. Confocal analysis. Results : Here, we report the role of borealin which binds with hTERT and regulates telomerase activity. Borealin plays important role in DNA replication, chromosome alignment, and spindle assembly checkpoint. Here, we show that borealin coexists with telomerase in vivo via telomeric DNA in telomerase positive cells and telomerase-immortalized human somatic cells but not in human ALT cells. In this study, we demonstrate that hTERT interacts with borealin both in vitro and in vivo. Here, we show that the association of borealin with hTERT is independent of RNA but requires DNA and also we show that N-terminal of hTERT binds to borealin. Furthermore, we show that borealin depletion by RNAi reduces the telomerase activity inducing the cell growth arrest in MCF7 cells. Conclusion : Borealin has until now been described as a component of chromosomal

passenger, mainly involved in DNA replication, here, we confirmed that borealin can bind to telomeric end. This is, to our knowledge, the first evidence that Borealin coexist with active telomerase and regulates telomerase activity, revealing a not yet recognized link of this CPC protein to telomere. Keywords : Telomere, Telomerase

PP26 B-053

STEROIDOGENIC ACUTE REGULATORY PROTEIN-RELATED LIPID TRANSFER (START) DOMAIN-CONTAINING 6 IN THE TESTIS AND BRAIN OF AGING RAT
Sang Pil YOON (*Department of Anatomy, School of Medicine, Jeju National University, Korea*)

Introduction : START domain-containing proteins share homologous domain containing a 200- to 210-amino acid and implicate in intracellular lipid transport. START domain -ontaining 6 (StarD6) originally reported to play a role during male germ cell maturation, but we have reported the changes of StarD6 in developing normal and hypothyroid rats. Therefore, we investigated the changes of StarD6 in aging rat testis and brain. Method : Characteristics of chronological aging were compared in testis and brain, respectively. Quantitative and qualitative analysis of StarD6 were done at 6, 12, and 24-month-old male Sprague-Dawley rat testis, with serum testosterone levels at 6 and 24-month-old rats. As there were no significant changes until 24-month-old, the same characteristics of StarD6 were compared at 6 and 28-month-old male rats brain, further subdivided as cerebrum, cerebellum, and hippocampus. Results : Serum testosterone levels decreased as aging and total protein levels of StarD6 in testis decreased. While the immunolocalization of StarD6 in the spermatocyte decreased, cytoplasmic localization unexpectedly appeared in aged testis. Compared with young rats, aged rats showed decrease in StarD6 in the cerebrum and cerebellum without changes in immunolocalization of principal cells. But, aged rats showed increase in StarD6 in the hippocampus with changes in immunolocalization from stratum pyramidale to stratum radiatum and strata lacunosum-moleculare. Conclusion : Taken together, StarD6 decreases in accordance with aging except hippocampus. These results suggest that StarD6 might have a role for neurosteroidogenesis in the hippocampus. Keywords : Aging, Hippocampus, StarD6

IMPAIRED AUTOPHAGIC FLUX AND ELONGATED MITOCHONDRIA IN GLUCOSE-STARVED CELLS
Seonbeom SONG, Eun Seong HWANG (*Department of Life Science, University of Seoul, Korea*)

Introduction : Autophagy is a well conserved biological process designed to clear abnormal proteins and organelles such as mitochondria. In addition to this vital role, autophagy is considered to function in replenishing substrates which are required for ATP production and biosynthesis of cellular components in response to nutrient deprivation. When autophagy is activated, autophagosome formation and its removal through fusion with lysosome are accelerated. Method : In glucose-starved cells, it is conceivable that autophagy is activated while mitochondrial respiration rises to meet the demand for ATP supply in the absence of resource for glycolysis. We investigated whether autophagy is executed effectively and how mitochondria survive during glucose starvation. Results : As has been shown in other studies, in cells undergoing glucose starvation, autophagosomal content increased substantially. However, even though autophagy was activated in these cells, mitochondrial content also increased. And, mitochondria formed filamentous networks. The level of p62 increased, indicating that autophagic flux was impaired.

Treatment of CCCP, an uncoupler which causes mitochondrial depolarization, activates mitophagy, resulting in a decrease of mitochondrial content and alleviation in blockage of autophagic flux. Conclusion : Taken together, in prolonged glucose starvation, mitophagy is attenuated due to the lengthening of mitochondria and the impairment of autophagolysis. Keywords : mitochondria autophagy

PP26 B-055

NAM-INDUCED MITOPHAGY : AN EVENT INDEPENDENT OF PINK1/PARKIN PATHWAY
So-young JANG, Eun Seong HWANG (*Department of Life Science, University of Seoul, Korea*)

Introduction : Nicotinamide (NAM), which is a vitamin B3 derivative, is converted to NAD⁺ through NAD⁺-salvage pathway. In previous studies, we reported that NAM alters cellular redox state ([NAD⁺]/[NADH] ratio) and activates mitochondrial degradation through SIRT1-dependent mitophagy. Upon NAM-treatment mitochondria were fragmented, produced less ROS and had high membrane potential. We hypothesized that NAM causes selective elimination of defective mitochondria, which has been proposed to be mediated by PINK1/Parkin-dependent. PINK1 and Parkin have been shown to on damaged mitochondria and degradation by activating autophagosome formation on them. We hypothesized that PINK1/Parkin pathway also plays a role in mitochondrial targeting in the NAM-induced mitophagy. Method : We determined whether PINK1/Parkin pathway is involved in NAM-induced mitophagy activation by using HeLa cells which does not express Parkin. Results: Neither Parkin over-expression nor knock-down affect NAM-induced mitophagy in HeLa and fibroblast, respectively. However SirT1 knock-down abolished NAM-induced mitophagy. And treatment of SirT1 activator induced mitophagy accompanied with mitochondrial fragmentation without increase of mitochondrial membrane potential. Conclusion : NAM induced mitophagy is PINK1/Parkin pathway independent event. Maybe, mitochondria content gets lowered and their quality gets enhance through the activation of SIRT1-mediated basal level autophagy. Keywords : Nicotinamide Mitophagy

PP26 B-056

IMPORTIN α/β AND RAN ARE INVOLVED IN NUCLEAR TRANSLOCATION OF hTERT
Sun Ah JEONG¹, Ji Hoon LEE², Prabhat KHADKA², In Kwon CHUNG² (*1. Department of Integrated OMICS for Biomedical Science, WCU program, Yonsei University, Korea; 2. Department of Systembiology, Department of Integrated OMICS for Biomedical Science, WCU program, Yonsei University, Korea*)

Introduction : The maintenance of eukaryotic telomeres requires telomerase, which is minimally comprised of a telomerase reverse transcriptase (TERT) and an associated RNA component (TERC). Telomerase activity is tightly regulated by its nucleocytoplasmic transport as well as expression of hTERT at both the transcriptional and posttranslational levels. Previously, it was reported that hTERT requires a bipartite nuclear localization signal (NLS) for import to the nucleus. However, the molecular mechanism of nuclear translocation of hTERT between subcellular compartments remained unclear. Method : Telomeric repeat amplification protocol (TRAP), GST pulldown, Immunoprecipitation and Immunoblot, Immunofluorescence Microscopy, RNA interference, In vivo Ubiquitination Assay. Results : Here, we show that hTERT translocates into nucleus via importin α/β dependent pathway, with hTERT NLS which physically associates with multiple importin

alpha(α)s and beta(β) in vitro and in vivo. Depletion of endogenous multiple subfamilies of importin alpha inhibits nuclear translocation of hTERT and thereby decreases telomerase activity via ubiquitination of hTERT in vivo. We further show that importin alpha depletion results in dissociation between hTERT and dyskerin, a main core factor of active telomerase holoenzyme, and consequent loss of telomerase activity in nucleus. Conclusion : Therefore, given that the nuclear translocation of hTERT is mediated by the multiple importin α/β import pathway, it will lead to understand the dynamic regulation of hTERT protein related to the subcellular localization and telomerase activity. Keywords : hTERT, importin, Ran

PP26 B-057

SUMO1 INCREASES AUTOPHAGIC ACTIVATION IN ALZHEIMER'S DISEASE

Sun-Jung CHO, Sang-Moon YUN, Chulman JO, Sang Ick PARK, Young Ho KOH (*Division of Brain Diseases, Korea National Institute of Health, Korea*)

Introduction : In Alzheimer's disease (AD), massive accumulation of autophagic vacuoles (AVs) is observed in the brain. The accumulation of AVs in affected neurons is responsible for amyloid-beta ($A\beta$) production. Previously, we reported that small ubiquitin-related modifier protein 1 (SUMO1) increases $A\beta$ levels. In the present study, we investigated whether SUMO1 is associated with AV formation in AD. Method : Human neuroglioma H4 cells were cultured in DMEM supplemented with 10% fetal bovine serum. H4 cells stably expressing wild-type human APP with Myc tag (HAMg), SUMO1 with EGFP tag (HGS1) were established by G418 selection. For primary cortical neuronal cultures, dissociated cells from cortexes of embryonic rat brains were plated in 12 well dishes coated with poly-D-lysine and maintained in neurobasal medium supplemented with B27. The following primary antibodies were used : α -SUMO1, α -Myc, α -GFP, α -LC3, α -Beclin1, and α -Tubulin. Results : We found that the formation of autophagic vacuoles (AVs) was increased in the brains of APP transgenic mice (APPswXPS1del9). We also found that SUMO1 protein levels were increased in APP Tg mouse. Consistent with our in vivo observation, treatment of primary neuron and H4 cells with $A\beta$ increased SUMO1 protein levels and AVs. Furthermore, overexpression of SUMO1 induced the formation of LC3-II-positive AVs in rat cortical neurons and neuroglioma H4 cells. Conclusion : Our results implicate that SUMO1 might link β -amyloidogenic pathways through autophagy, which is abnormally activated in AD. SUMO1-induced autophagic activation is a key mechanism for understanding the AV-mediated pathogenesis of AD. Keywords : SUMO1, Autophagy, Alzheimer's disease (AD)

PP26 B-058

ROLES OF SENESCENT DERMAL FIBROBLASTS IN CHRONOLOGICAL SKIN AGING

Sunmi KIM, Si Young CHO, Dae Bang SEO, Sang Jun LEE (*Health Science Research Institute, AMOREPACIFIC Corporation R&D Center, Korea*)

Introduction : Senescent cells accumulate with aging in various tissues including skin. Senescent dermal fibroblasts secrete high levels of inflammatory cytokines and matrix metalloproteinases, which have negative influence on structural integrity of skin. We hypothesized that senescent fibroblasts could accelerate chronological aging of skin through the factors they secrete by collapsing structural integrity of dermis. Method : Replicative senescence of primary human dermal fibroblasts was induced by serial passaging and confirmed by senescence-associated- β -galactosidase staining and the expression

levels of cell cycle inhibitors. To investigate effects of senescent fibroblasts on presenescent cells, early passage fibroblasts were treated with conditioned media from senescent cells and the expression levels of skin aging-related factors were analyzed. Furthermore, to examine how these alterations could affect dermal structures, we analyzed changes in contraction of three-dimensional collagen lattice. Results : Expression levels of inflammatory cytokines and matrix metalloproteinases were significantly elevated in replicative senescent dermal fibroblasts. Upon treatment with conditioned media from the senescent fibroblasts, the expression levels of inflammatory cytokines and MMP-1 was increased also in the presenescent dermal fibroblasts. As previously reported, three-dimensional collagen lattices with senescent fibroblasts were contracted greater than those with presenescent fibroblasts when secreted MMP-1 was activated in the collagen lattices. And the contraction of collagen lattice was enhanced not only by senescent cells but also by presenescent cells treated with senescent cell-conditioned media. Conclusion : These results indicate that senescent fibroblasts have active roles on chronological skin aging. Senescent fibroblasts make surrounding presenescent cells to weaken structural integrity of skin dermis and therefore accelerate skin aging. Keywords : Cellular senescence, Skin aging

PP26 B-059

PEROXIREDOXIN V SELECTIVELY REGULATES IL-6 PRODUCTION BY MODULATING JAK2-STAT5 PATHWAY

Hoon-In CHOI¹, Kyoung-Jin CHUNG², Hee-Young YANG¹, Poo-Reun KIM³, Min-Suk KOOK³, Tae-Hoon LEE¹ (*1. Department of Biochemistry, School of Dentistry, Chonnam National University, Korea; 2. Division of Vascular inflammation, Department of Medicine, Technical University of Dresden, Germany; 3. Department of Oral & maxillofacial surgery, School of Dentistry, Chonnam National University, Korea*)

Introduction : Mammalian peroxiredoxin V (PrdxV) is a multifunctional protein that protects cells from DNA damage and inhibits stress-induced apoptosis. Since PrdxV was discovered, it is consistently reported in inflammation field. For example, mRNA levels of PrdxV are increased in rat lung during acute inflammation induced by lipopolysaccharide (LPS). However, the role of PrdxV in the modulation of lipopolysaccharide (LPS)-mediated host cell signaling has not been well elucidated. Method : To characterize the functional role of PrdxV in LPS-mediated immune response, the stable RAW264.7 cell lines encoding wild type (WT) or catalytic cysteine mutant (C48S) of PrdxV were established. The level of pro-inflammatory cytokines in those cells was checked by ELISA and real time PCR analysis. And also, to understand the regulation mechanism of PrdxV, protein-protein interaction between PrdxV and Jak2-Stat5 signal molecules was studied by using co-immunoprecipitation. Results : We found that PrdxV selectively regulates the production of interleukin 6 (IL-6), but not other cytokines. We also found that overexpression of PrdxV may inhibits phosphorylation of signal transducer and activator of transcription 5 (Stat5), which is result in IL-6 reduction, through the inhibition of Jak2 phosphorylation by Jak2-PrdxV interaction. Interestingly, this function of PrdxV was dependent on its catalytic cysteine at 48 residues. In addition, PrdxV is also effective to inhibit the Jak2 phosphorylation, although SOCS1 (Suppressor of cytokine signaling 1) clearly inhibits the Jak2 phosphorylation. Conclusion : Our results indicate that PrdxV is partially involved in regulation of IL-6 production through modulation of Jak2-Stat5 pathway. Keywords : Lipopolysaccharide, Peroxiredoxin V, Inflammation

PP26 B-060

A STUDY ON THE ASSESSMENT OF NUTRITIONAL STATUS OF ELDERLY WOMEN RESIDING IN OLD-AGE HOMES OF KOLKATA, INDIA

Bidisha MAITY¹, Debnath CHAUDHURI², Minati SEN¹
(1. Department of Home Science, University of Calcutta, India;
2. Department of Biochemistry and Nutrition, All India Institute of Hygiene and Public Health (West Bengal University of Health Sciences), India)

Introduction : Malnutrition is often a neglected problem among the elderly persons. Objective of the present study was to assess the nutritional status of elderly women of 60 years and above residing in old age homes in and around Kolkata. **Method :** The study was conducted among 67 inmates of the old age homes in and around Kolkata, India after obtaining consent from them. Mini Nutritional Assessment (MNA) tool was used for the assessment of nutritional status. Anthropometric measurements such as Height, Weight, Mid-arm-circumference (MAC) and Calf Circumference (CC) as well as bio-chemical estimation such as blood Hb, serum cholesterol and albumin levels were also carried out. **Results :** Based on the MNA score the women were classified as malnourished (N= 9, 13.43%, MNA score < 17), at risk of malnutrition (N= 36, 53.73%, MNA score = 17- 23.5) and well-nourished (N= 22, 32.83%, MNA score > 23.5). Significant associations were observed between MNA and Weight (p< 0.0001), BMI (p< 0.0001), MAC (p< 0.0001), CC (p< 0.0001). No significant association between MNA and Bio-chemical parameters was found. **Conclusion :** Nutritional assessment by MNA revealed that majority of the study population were either malnourished or at risk of malnutrition and MNA score was significantly associated with all the anthropometric parameter tested. **Keywords :** Elderly women, old age home, nutritional assessment

RENO-PROTECTIVE EFFECTS OF 7-O-GALLOYL-D-SEDOHEPTULOSE, PHENOLIC COMPOUND FROM CORNI FRUCTUS, ON DIABETES-INDUCED ALTERATIONS SUCH AS OXIDATIVE STRESS, INFLAMMATION, AND APOPTOSIS IN TYPE 2 DB/DB MICE

Chan Hum PARK, Hae Young CHUNG (*Molecular Inflammation Research Center for Aging Intervention, Department of Pharmacy, Pusan National University, Korea*)

Introduction : This study was carried out to verify the preventive effects of 7-O-galloyl-D-sedoheptulose (GS), a phenolic compound isolated from Corni Fructus, underlying diabetic renal damage in type 2 diabetes. **Method :** GS (20 or 100mg/kg body weight/day, p.o.) was administered every day for 6 weeks to db/db mice, and its effects were compared with those of the vehicle in db/db and m/m mice. **Results :** In the serum and kidney, biochemical factors and protein expressions associated with nicotinamide adenine dinucleotide phosphate (NADPH) oxidase, inflammation, and apoptosis were examined. As a result, GS administration to type 2 diabetic mice lowered serum and renal oxidative stress through the reduction of reactive oxygen species, lipid peroxidation, and increase in the ratio of glutathione and its oxidised form. These results were derived, at least in part, from attenuating the expression of NADPH oxidase subunit proteins, Nox-4 and p22phox. Moreover, in the GS-treated group, nuclear factor-kappa B-related pro-inflammatory factors (such as cyclooxygenase-2 and inducible nitric oxide synthase) and pro-apoptotic protein expressions (such as Bax and cytochrome c) were alleviated in the kidney. **Conclusion :** The present study demonstrated that the administration of GS isolated from Corni Fructus had a protective effect against renal oxidative stress under type 2 diabetes through regulations of protein

expressions related to oxidative stress, inflammation, and apoptosis. **Keywords :** 7-O-galloyl-D-sedoheptulose, diabetes, inflammation

PP26 B-062

METABOLIC REGULATION BY A NOVEL AGE-DEPENDENT MITOCHONDRIA-ENCODED PEPTIDE

Changhan David LEE, Pinchas COHEN (*Gerontology, University of Southern California, USA*)

Introduction : The mitochondrion is heavily implicated in metabolism and the aging process as well as in age-related diseases, but the mechanistic details of these phenomena are still largely unclear. The recent discovery of Humanin, a small mitochondrial-derived peptide (MDP) encoded within the mitochondrial 16S rRNA, with potent in vivo activities against diabetes and Alzheimer's disease positions the mitochondria as an important regulator of cellular and organismal protection. We discovered another MDP encoded within the mitochondrial 12S rRNA with potent metabolic roles; MOTS3 (Mitochondrial ORF within the Twelve S rRNA). **Method :** MOTS3 expression and function was assessed in rho-0 and HEK293 cells using the Seahorse analyzer, metabolomics, microarray, and immunoblots. 10-week-old CD-1 mice were fed a high-fat diet (60%) and treated with MOTS3 (0.5 mg/kg/day; I.P. daily for 8 weeks). **Results :** MOTS3-specific antibodies confirmed the mitochondrial-derived origin of MOTS3 and indicated reduction of levels in old animals in the circulation and mitochondrial rich organs such as testes. In vitro, MOTS3 increases glucose uptake (>7-fold) and fatty acid oxidation, decreases mitochondrial respiration, and activates AMPK and autophagy. The AMPK activation was due to a 25-fold increase in MOTS3-induced endogenous AICAR levels. Microarray analysis paralleled increased lipid and glucose use and decreased mitochondrial respiration. MOTS3 treatment dramatically curbed weight gain in mice fed a high-fat diet (without changing food intake), reduced blood sugar levels, and activated AMPK in muscles, without evidence of toxicity. **Conclusion :** MOTS3 is a novel and potent age-dependent metabolic regulator that resembles the actions of metformin and has promise in metabolic diseases of aging. **Keywords :** mitochondrial-derived peptides, AICAR, AMPK

PP26 B-063

VITAMIN B12 STATUS WITH AGING AND RELATIONS WITH CLINICAL HEALTH AND NUTRITIONAL PARAMETERS IN KOREANS

Chung Shil KWAK, Ji Hyun CHO (*Institute on Aging, Seoul National University, Korea*)

Introduction : Vitamin B12 deficiency is not rare but under-recognized disorder in older people. The purpose of this study was to examine vitamin B12 status with aging and its correlations with other clinical parameters. **Method :** It was examined blood test, grip strength, walking speed and mini-nutritional assessment(MNA) in 933 volunteers (337 men and 596 women) aged 50 years and over living in Korean rural area. **Results :** The average serum vitamin B12 concentration was significantly decreased with aging, specially after 70 years old, both in men(p<0.05) and women (p<0.01). Serum vitamin B12 concentration showed a significant positive correlation with grip strength(r2=0.1377) and negative correlation with MCV(r2=-0.138), MCH(r2=-0.1594) and serum homocystein concentration(r2=-0.2050) in men, while a significant positive correlation with serum folate(r2=0.1208) and IGF-1 concentrations (r2=0.1250) and negative correlation with serum homocystein concentration(r2=-0.1840) in women. The prevalence of low serum vitamin B12(<340 ng/mL) was 5.04%(n=17) in men and 4.53% (n=27) in women, all of those were

aged 65 years or older. In this old population, low serum vitamin B12 group showed significantly higher prevalence of low serum folate (<3 ng/mL), high serum ALP (>129 U/L) and hypertension in men when compared to normal group, while significantly higher prevalence of serum folate, high serum homocystein (>17 μmol/L), low hematocrit (<36%) and low serum 25-(OH) vitamin D3 (<10 ng/mL) in women. Conclusion : Serum vitamin B12 concentration decreased with aging in Koreans. It would be rather checked low folate and vitamin D3 status, high serum homocystein, low muscle strength, anemia and malnutrition to older people with low serum vitamin B12 concentration. Keywords : vitamin B12 status, aging, clinical parameter

PP26 B-064

METABOLIC SYNDROME AND INFLAMMATORY CYTOKINES IN THE PREDICTION OF ALL-CAUSE MORTALITY AMONG OLDEST OLD INSTITUTIONALIZED CHINESE MEN IN TAIWAN

Chu-Sheng LIN (*Family Medicine Department, Taichung Veterans General Hospital, Taiwan*)

Introduction : The metabolic syndrome is associated with increased cardiovascular morbidity and mortality. The hot topic are inflammatory cytokines of metabolic syndrome . But the data among metabolic syndrome, inflammatory cytokines, cardiovascular mortality and all cause mortality in elderly people are rarely reported. Method : A longitudinal study during 2002 ~ 2012 was performed in a Veterans Care Home, Taiwan. Three groups were analysis, one is alive in veterans care home, another is lost follow up, the other is mortality. The presence of metabolic syndrome was defined according to the AHA/NHLBI criteria with a modification of waist circumference for Asians. Tumor necrosis factor- α (TNF- α) was determined. Serial comparisons were done by Chi square test. Results : A total of 354 residents were enrolled (mean age: 79.07±3.96 years, 100% males) During 10 years of longitudinal follow-up, 130 residents are dead (mean age: 79.46 ±3.78 years), 127 residents (mean age: 78.01±3.51 years) are alive and stay in the same veterans care home, 97 residents (mean age: 79.94 ±4.47 years) are lost from veterans home. The prevalence of metabolic syndrome is 26.9 %. During the follow-up period, all cause mortality did not correlate with metabolic syndrome (p=0.942). However, TNF- α (P<0.001 , HR:1.04) and systolic blood pressure (P=0.002, HR:1.02) were independent risk factors for all-cause mortality. Conclusion : Metabolic syndrome can not predict the all-cause mortality among oldest old institutionalized Chinese men in Taiwan. However, TNF- α and systolic blood pressure are the independent risk factors for all cause mortality among residents of oldest old institutionalized Chinese men in Taiwan. Keywords : Metabolic syndrome, Inflammatory Cytokines, All-Cause Mortality

PP26 B-065

SCD5 IS ASSOCIATED WITH THE DEVELOPMENT OF HCC IN KOREAN POPULATION

Ha Seung SHIN¹, Gyeong Im YU², Dong Hoon SHIN², Su Kang KIM¹, Joo-ho CHUNG¹ (*1. Kohwang Medical Research Institute, School of Medicine, Kyung Hee University, Korea; 2. Department of Preventive Medicine, School of Medicine, Keimyung University, Korea*)

Introduction : Hepatocellular carcinoma (HCC) is the first cause of death among people especially in their 60s in Korea. This study was conducted to examine SCD5 gene expression in HCC tissue and the relationship between 3'-UTR of single nucleotide polymorphisms (SNPs) in SCD5 gene and HCC. Method : SCD5 expression was examined using northern blot. The exonic SNPs (rs3733230,

rs1065403, and rs6840; 3'-untranslated region, 3'-UTR) were genotyped by direct sequencing. Results : In HCC tissue, SCD5 gene expression was strongly observed. One hundred sixty two male HCC patients and 173 male control subjects were recruited. Two SNPs (rs6840 and rs3733230) among three SNPs (rs6840, rs1065403, and rs3733230) in genotype frequencies showed a connection with HCC (P=0.02, P=0.014, under the recessive model, respectively). However, the allele frequency of rs3733230, rs6840, and rs1065403 did not show any connection between HCC and controls. According to the clinical characteristic data of HCC, the genotype frequency of rs3733230, rs6840, and rs1065403 were related considerably with α -fetoprotein (AFP) levels (rs6840: P=0.0019 in the co-dominant 1 model, P=0.043 in the dominant model; rs1065403: P=0.004 in the co-dominant 1 model, P=0.007 in the dominant model; rs3733230: P=0.022 in the co-dominant model). The A allele frequency of rs1065403 was lower in high AFP (>200 ng/ml) group (26.1%) than that in low AFP (\leq 200 ng/ml) group (38.0%). Conclusion : In conclusion, SCD5 gene expression in HCC and SNPs in 3'-UTR of SCD5 are related with HCC. The study also shows that SCD5 may be associated with AFP levels in clinical characteristics. Keywords : stearyl-CoA desaturase 5, hepatocellular carcinoma, single nucleotide polymorphism

EFFECT OF SHORT-TERM GAMMA TOCOPHEROL SUPPLEMENTATION ON DIABETIC NEPHROPATHY

Hanna SHIN, Yunsook LIM (*Department of Food and Nutrition, Kyung Hee University, Korea*)

Introduction : Diabetic nephropathy (DN) is the major life-threatening complication of diabetes in the elderly. Diabetes-induced renal damage is associated with inflammation and fibrosis. Gamma tocopherol (GT) has shown anti-inflammatory effect by regulation of proinflammatory eicosanoids, proinflammatory cytokines in inflammation-mediated injury. This study has been conducted to investigate the role of gamma-tocopherol supplementation in acute DN state. Method : Diabetes were induced by injection of alloxan monohydrate (150mg/kg, i.p) dissolved in 0.9% NaCl solution in ICR mice (5.5-week-old, male). Mice with fasting blood glucose (FBG) levels were higher than \geq 250mg/dl were considered as diabetic. Mice were divided randomly into 4 groups: non-diabetic controls (CON), diabetic-controls (DMC), and diabetes treated with alpha-tocopherol (AT) and gamma-tocopherol (GT). Treatment groups were orally administered 35mg/kg of AT or GT diluted in tocopherol stripped corn-oil. General indices (body weights, food intake and FBG) were measured once a week. After 2 weeks treatment, functional indicators of kidney damage (blood urea nitrogen and plasma creatinine), lipid peroxidation and lipid profiles were measured. Morphology changes and inflammatory, oxidative stress and pre-fibrosis markers were also determined. Results: GT significantly decreased FBG levels as much as shown in AT treated diabetic mice. Lipid peroxidation level of GT group was significantly lower than that of DM group. GT group regulated protein levels of inflammation (CRP, MCP-1 and pI κ B), pre-fibrosis (PKC, PKC- β II and TGF- β I) and improved oxidative stress markers (Nrf2, HO-1 and GPx). Conclusion : Short-term GT supplementation might protect diabetic kidney damages through regulation of hyperglycemia-induced oxidative stress, inflammation and fibrosis in DN. Keywords : α , γ -tocopherol, Diabetic nephropathy, Inflammation

KNOCKDOWN OF CPSF-2/CLEAVAGE AND POLYADENYLATION SPECIFICITY FACTOR 2 INCREASES LIFESPAN IN C. ELEGANS

Heehwa SON¹, Dongyeop LEE¹, Dae-Eun JEONG¹, Seung-Jae LEE²

(1. Division of Molecular and Life Science, Pohang University of Science and Technology, Korea; 2. Division of Molecular and Life Science, School of Interdisciplinary Bioscience and Bioengineering, World Class University Information Technology Convergence Engineering, Pohang University of Science and Technology, Korea)

Introduction : Abnormal glucose regulation is associated with several age-related diseases including type 2 diabetes, and their causal relationship has been extensively studied. However, research on how glucose influences aging itself has just begun. Several recent reports demonstrated that glucose-enriched diet shortens the lifespan of the roundworm *C. elegans* through poorly understood mechanisms. **Method :** By performing a genome-wide RNAi screen using a glucose-inducible fluorescence reporter, we identified many novel genes that affected the metabolism and the lifespan of *C. elegans*. **Results :** We present our finding regarding the role of *cpsf-2*, a cleavage and polyadenylation specificity factor that regulates 3' end cleavage during RNA processing, in the lifespan regulation of *C. elegans*. We initially found that *cpsf-2* RNAi decreased the glucose-inducible fluorescence reporter. Furthermore, we showed that knockdown of *cpsf-2* significantly increased the lifespan of *C. elegans*. **Conclusion :** These data indicate that reduction of *cpsf-2* may promote long lifespan by reducing metabolism-related genes that play a role in increasing the glucose level. Currently, we are determining which aging-regulatory genes interact with *cpsf-2* to influence lifespan and/or glucose metabolism. We believe our research will help elucidate novel mechanisms by which glucose influences lifespan. **Keywords :** *cpsf-2*, *C. elegans*, glucose metabolism

EVODIAMINE IMPROVES INSULIN RESISTANCE BY INHIBITING MTOR-S6K SIGNALING IN ADIPOCYTES AND PREVENTS AGE-RELATED OBESITY IN MICE

Hitoshi YAMASHITA¹, Ting WANG², Tatsuya KUSUDO¹, Tamaki TAKEUCHI¹, Yongxue LI¹, Shanlou QIAO¹, Nozomu MORI³ (1. Biomedical Sciences, College of Life and Health Sciences, Chubu University, Japan; 2. Internal Medicine, Iwate Medical University, Japan; 3. Anatomy and Neurobiology, Nagasaki University School of Medicine, Japan)

Introduction : Regulation of body fat is critical for preventing progression of metabolic syndrome and extending lifespan. Evodiamine reduces obesity and insulin resistance in mice given a high-fat diet; however, the mechanism underlying the effect of evodiamine on insulin resistance and whether evodiamine has beneficial effects for longevity are unknown. **Method :** We performed in vitro experiments using adipocyte culture and in vivo experiments with dietary supplementation of evodiamine in mice. **Results :** In 3T3-L1 adipocyte cultures, evodiamine inhibited insulin-stimulated phosphorylation of mammalian target of rapamycin (mTOR) and activation of ribosomal S6 protein kinase (S6K), leading to downregulation of insulin receptor substrate 1 (IRS1) serine phosphorylation, an indicator of insulin resistance. Beginning at 12 months of age, dietary supplementation of evodiamine at a low dose (1 mg per kg diet) effectively prevented body weight gain and improved glucose tolerance in C57BL/6J mice; whereas increased lifespan did not occur, in which long-term feeding of evodiamine at a high dose (10 mg per kg diet) caused excessive reduction in body weight in aged animals. Down-regulation of mTOR signaling pathway was detected in the white adipose tissue (WAT) of aged mice fed evodiamine diet, suggesting an improvement effect of evodiamine for insulin resistance in vivo. This effect was confirmed in db/db mice injected daily with evodiamine (3 mg per kg body weight) for one week. **Conclusion :** Our

data suggest that evodiamine induces beneficial effects for healthy lifespan by improving age-related obesity and insulin resistance by inhibiting mTOR-S6K signaling in adipocytes in mice. **Keywords :** adipocyte, insulin resistance, evodiamine

ECKLONIA CAVA EXTRACT REGULATES FAT METABOLISMS IN HIGH FAT DIET-INDUCED OBESE MICE

HyeYoon EO, Yunsook LIM (Department of Food and Nutrition, Kyung Hee University, Korea)

Introduction : Obesity is considered to be a 'metaflammatory' condition characterized by both metabolic and inflammatory deteriorations. In addition, the increasing population of obese elderly group has become an critical public health problem. Ecklonia cava, a brown algae containing rich amount of dieckol, shows strong antioxidant activity. However, anti-obesity effect of *E. cava* has not been examined yet. We investigated anti-obesity effect of *E. cava* extract (ECE) by regulation of fat metabolism in obese mice. **Method :** Mice were fed with a control diet (CON) or a high fat diet (HF) for 9 weeks. After obesity was induced, the mice were administered ECE at low dose (100 mg/kg/day, LG) and high dose (500 mg/kg/day, HG) by oral gavage for 12 weeks. **Results :** In comparison with the HFD-fed mice, mice fed with ECE attenuated body weight gain and adipose tissue weight (mesenteric and retroperitoneal). Regardless of dosage, ECE significantly reduced both plasma levels of triglyceride and total cholesterol. Moreover, ECE improved hepatic steatosis in HF groups. Moreover, ECE treatment selectively attenuates liver protein levels of both lipogenic and lipolytic markers in HF groups. **Conclusion :** Collectively, ECE supplement may have potential anti-obesity effects via regulation of fat metabolism in HF diet induced obesity. **Keywords:** Obesity, Ecklonia cava, Lipid metabolism

EFFECT OF LONG-TERM ENDURANCE TRAINING ON ANGIOGENIC FACTORS IN DB/DB MICE

Hyo Jeong KIM, Hyo Seong YEO (Aging Research Center, Korea National Sport University, Korea)

Introduction : It is well known that type 2DM is closely related to ischemic vascular disease and wound healing defect. Dysfunction of the vascular endothelium is regarded as an important factor in the pathogenesis of diabetic angiopathy. In diabetic skeletal muscle, impaired angiogenesis and reduced VEGF expression have been observed, whereas in healthy muscle, exercise is known to have opposite effects. We hypothesized that long-term endurance training enhances angiogenesis in skeletal muscle of db/db Mice. **Method :** Twenty one db/db mice (8 wk) were randomly assigned into Pre-CON (n=7), Post-CON (n=7, 12 wk), ET (n=7, endurance training) groups. The animals in ET group ran on the rodent treadmill for 1 hour at the level of 12m/min (60% VO₂max) for 12 weeks (5d/w). Change of capillarity was determined by periodic acid Schiff (PAS) staining and VEGF165, and HIF-1 α protein expressions were analyzed by western blotting. **Results :** VEGF165 (30%, p=.003) and Total VEGF (30%, p=.037) protein expressions in heart muscle was significantly increased in ET group compared to control groups. Capillarity was significantly increased in SOL muscle of ET group (39%, p=.000) compared to control groups. **Conclusion :** These results demonstrate the positive effect of long-term endurance training on the angiogenic capacity in the heart muscle and Type I muscle of db/db mice. **Keywords :** diabetes, endurance exercise, angiogenesis

EFFECT OF ACUTE LONG-ENDURANCE EXERCISE ON LIPID METABOLIC ENZYMES IN OLD RATS

Hyo Seong YEO¹, Hoo Kyoung BYUN², Su Zu EO³, Hyo Jeong KIM⁴
(1. Aging Research Center, Korea National Sport University, Korea;
2. Exercise Physiology, Korea National Sport University, Korea;
3. Korea Sport Science Institute, Korea National Sport University,
Korea; 4. Aging research center, Korea national sport University,
Korea)

Introduction : It has been suggested that aging is related to crucial metabolic disorders. Lipoprotein lipase (LPL) and hormone-sensitive lipase (HSL) are rate-limiting factors for the metabolism of fatty acids. The present study was undertaken to simultaneously determine the activities of LPL and HSL in red/white skeletal muscle and subcutaneous/visceral adipose tissue with an acute endurance exercise from aged rats. **Method :** 78-week-old female rats (n=16) were randomly divided into control and exercise groups. All animals in the exercise group performed a 3-hr swimming (30min x 6 bouts with 5min rest). LPL and HSL protein expression were measured before and after exercise by western blot analysis. **Results :** The serum metabolic profile related to metabolism decreased by 52.7% (p=.001) for glucose, 65.1% (p=.001) for insulin and 88.4% (p=.001) for total glycogen content with the exercise. The HSL and LPL protein expressions were decreased by 33% and 39% in gastrocnemius red muscle (p<.05) without changing in white muscle. On the other hand, HSL and LPL protein expressions were increased by 54% and 76%, respectively, in subcutaneous fat (p<.05) without changing in visceral fat. **Conclusion :** These results suggest the possibility of metabolic disorder in aged visceral fat. **Keywords :** aging, swimming, LPL

EVALUATION OF NUTRIENTS TO PREVENT SO IN THE ELDERLY BY KNHANES 2010

Jae-Kyung NO¹, Chorong OH¹, Sunkug JHO² (1. Department of Nutrition and Health Care, Kyungung University, Korea;
2. Rehabilitation Medicine/Clinical Aging Research Institute, Busan Medical Center, Korea)

Introduction : Age related body composition change, a progressive loss of muscle mass and increase of fat mass such as sarcopenic obesity in the elderly are often under-recognized. As a major problem SO in aged society, early detection and treatment is important and urgent as well as prevention of it. **Method :** We analyzed 1433 subjects (658 men, 775 women) aged 60 yr and older who participated in the four parts of a questionnaire by KNHANES 2010. This study investigated the relation body composition, glucose tolerance indices, inflammation marker, and other biochemical status according to Nonsarcopenic Nonobesity (NSNO), Nonsarcopenic Obese (NSO), Sarcopenic Nonobese (SNO), and Sarcopenic Obese (SO). Further more, as epigenetic modulators, the major nutrient factors such as protein, vitamin D, calcium, unsaturated fatty acid, and antioxidants nutrition were evaluated by food frequency questionnaire (FFQ), and nutrient intake with 24-hour recall. **Results :** The values of HOMA-IR representing insulin resistance were significantly higher in SO group (3.2±1.4 for men, 3.4±2.1 for women), the level of WBC(6.8±2.0 for men, 6.2±1.7 for women) were also higher but the levels of serum 25(OH)D(20.4±6.2 for men, 16.6±6.3 for women) were lower in SO group. Evaluation of nutrients was protein intake (72.3±34.7 for men, 50.6±23.4 for women), calcium (540.7±332.3 for men, 422.6±300 for women), vitamin C(104.0±83.4 for men, 89.4±83.2 for women). **Conclusion :** Body composition changes with aging were strongly associated with inflammation which was controlled by major nutrients intake such as protein, calcium, vitamin D, unsaturated fatty acid, and

antioxidants. Therefore, adequate nutrients are needed for the elderly.

LIVER-SPECIFIC INDUCIBLE NITRIC-OXIDE SYNTHASE EXPRESSION IS SUFFICIENT TO CAUSE HEPATIC INSULIN RESISTANCE AND MILD HYPERGLYCEMIA IN MICE

Shohei SHINOZAKI¹, Cheol Soo CHOI², Nobuyuki SHIMIZU³, Marina YAMADA³, Minhye KIM³, Ting ZHANG⁴, H. Henry DONG⁴, Young-bum KIM⁵, Masao KANEKI³ (1. Geriatrics and Vascular Medicine, Tokyo Medical and Dental University, Japan; 2. Internal Medicine, Gil Medical Center and Lee Gil Ya Cancer and Diabetes Institute, Korea; 3. Anesthesia, Critical Care and Pain Medicine, Massachusetts General Hospital, Harvard Medical School, USA; 4. Division of Immunogenetics, Rangos Research Center, Children's Hospital of Pittsburgh, University of Pittsburgh Medical Center, USA; 5. Division of Endocrinology, Diabetes and Metabolism, Beth Israel Deaconess Medical Center and Harvard Medical School, USA)

Introduction : Inducible nitric-oxide synthase (iNOS), a major mediator of inflammation, plays an important role in obesity-induced insulin resistance. Inhibition of iNOS by gene disruption or pharmacological inhibitors reverses or ameliorates obesity-induced insulin resistance in skeletal muscle and liver in mice. It is unknown, however, whether increased expression of iNOS is sufficient to cause insulin resistance in vivo. **Method :** We generated liver-specific iNOS transgenic (L-iNOS-Tg) mice. And we performed in vivo and in vitro studies, to address the mechanism of insulin resistance. **Results :** L-iNOS-Tg mice exhibited mild hyperglycemia, hyperinsulinemia, insulin resistance, and impaired insulin-induced suppression of hepatic glucose output, as compared with wild type (WT) littermates. Insulin-stimulated phosphorylation of insulin receptor substrate-1 (IRS-1) and -2, and Akt was significantly attenuated in liver, but not in skeletal muscle, of L-iNOS-Tg mice relative to WT mice without changes in insulin receptor phosphorylation. Moreover, liver-specific iNOS expression abrogated insulin-stimulated phosphorylation of glycogen synthase kinase-3 β (GSK-3 β), forkhead box O1 (FoxO1), and mTOR (mammalian target of rapamycin), endogenous substrates of Akt, along with increased S-nitrosylation of Akt relative to WT mice. However, the expression of insulin receptor, IRS-1, IRS-2, Akt, GSK-3 β , FoxO1 was not altered by iNOS transgene. Hyperglycemia was associated with elevated glycogen phosphorylase activity and decreased glycogen synthase activity in the liver of L-iNOS-Tg mice. **Conclusion :** These results clearly indicate that selective expression of iNOS in liver causes hepatic insulin resistance along with deranged insulin signaling, leading to hyperglycemia and hyperinsulinemia. Our data highlight a critical role for iNOS in the development of hepatic insulin resistance and hyperglycemia. **Keywords :** S-nitrosylation

INTERMITTENT HIGH GLUCOSE ENHANCES PROLIFERATION OF VASCULAR SMOOTH MUSCLE CELLS (VSMCS) THROUGH MITOGEN ACTIVATED PROTEIN KINASE (MAPK) PATHWAY

Sung Hoon YU¹, Hyung Joon YOO², Dong Hyun KANG³
(1. Department of Internal Medicine, Hallym Medical Center Hallym University, Korea; 2. Division of Endocrinology & Geriatrics, Department of Internal Medicine & Geriatrics School of Medicine Hallym University, Korea; 3. Vascular Research Lab. Division of Endocrinology & Geriatrics, Hallym Medical Center Hallym University, Korea)

Introduction : Objective: To investigate the effects of exposure to

intermittent hyperglycemia on proliferation of obese diabetic rat aortic VSMCs in vitro. Method : VSMCs were incubated for 72 hours with four groups; (1) constant normal glucose medium (4.8 mmol/L); (2) constant high glucose medium (24.5 mmol/L); (3) alternating normal & high glucose media every 12 hours; (4) osmotic control of mannose. The proliferation of VSMCs were analyzed by 3-[4,5-dimethylthiazol-2-yl]-diphenyltetrazolium bromide (MTT assay. And molecular mechanism (including p44/42 MAPK, MEK, Akt and apoptosis pathway) were analyzed. Results : We found enhanced proliferation of VSMCs incubated with constant and intermittent high glucose medium by MTT assay ($p < 0.05$). However, proliferation of VSMCs was more pronounced in intermittent high glucose than in constant high glucose. In western blot analysis, treatment with constant high glucose increase phospho-p44/42 MAPK (ERK1/2) and phospho MEK1/2 expression compared with treatment of normal glucose. And these effects were further enhanced with intermittent high glucose. Akt and phospho-Akt were not affected with hyperglycemia. In apoptotic pathway, Bcl-x1, phospho-Bad and caspase-3 were not affected with hyperglycemia for 72 hours. Conclusion : Intermittent hyperglycemia enhanced proliferation of VSMCs of OLETF rats through MAPK pathway. Keywords : intermittent hyperglycemia, VSMCs, MAPK pathway

THE EFFECTS OF ISOCALORIC HIGH FAT DIET AND ENDURANCE EXERCISE ON MITOCHONDRIA BIOGENESIS, ENDURANCE CAPACITY AND INSULIN RESISTANCE IN MALE WISTER RAT

Suryun JUNG¹, Jayoung BYEON¹, Youngsik JU¹, Seoungcho JANG¹, Juhyeon JEONG¹, Nayoung AHN¹, Jusik PARK², Hongsu KIM³, Kijin KIM¹ (1. Department of Sport, Keimyung University, Korea; 2. Department of Sport, Gyeongju University, Korea; 3. Practical Physical Education, Keimyung College, Korea)

Introduction : A decline in mitochondrial biogenesis of skeletal muscle is a common finding in aging. In previous study, raising serum FFA in rat by feeding them a high-fat diet results in an increase in muscle mitochondria. Although obesity is well recognized as the most important health problem related to the genesis of insulin resistance, but fat is still controversial. In this report, we tested the hypothesis that moderate-intensity exercise training with isocaloric high fat diet could increase mitochondria biogenesis and endurance exercise capacity. Method : The rats were randomly separated into 4 groups: A, Isocaloric high fat diet group (50% of calories from fat), B. Chow group, C. Isocaloric high fat diet with endurance exercise (treadmill running, slop 8%, 23 m/min, 120 min/day, 5 days per week), D. Chow group with endurance exercise. Both Isocaloric high fat diet group and chow group were given an equal caloric composition with 3.2kcal/g. equal amount of food were checked every day and given to both groups. Results : 4 weeks of high fat diet did not show any changes in body weight and % body fat. Further the level of glucose and insulin in blood, and insulin-stimulated glucose transport rate in skeletal muscle was not affected by isocaloric high fat diet. After 4 weeks of isocaloric high fat diet with aerobic exercise treatment, mitochondria biogenesis markers and endurance exercise capacity were significantly increased. Conclusion : Therefore isocaloric high fat diet with moderate intensity aerobic exercise is an effective way to induce mitochondrial biogenesis and endurance exercise capacity. Keywords : isocaloric high fat diet , endurance exercise, mitochondria biogenesis,

PP26 B-076

N-3 FATTY ACIDS SUPPLEMENTATION OF OVARIECTOMIZED RATS INCREASE NEUROGENESIS AND RESCUES LEARNING MEMORY PERFORMANCE

Jian-Rong LIN, Hui-Min SU (Physiology, National Taiwan University College of Medicine, Taiwan)

Introduction : Postmenopausal women with estrogen replacement therapy have higher plasma docosahexaenoic acid (DHA, 22:6n-3) levels, delay cognitive decline and reduce Alzheimer's disease risk than those without hormone replacement therapy. However, estrogen therapy increases the risk of breast cancer. It is important to find an alternative way to ameliorate the declined cognition in postmenopausal women. DHA is the major n-3 polyunsaturated fatty acids in the neuronal membrane. Estrogen has similar effects to n-3 fatty acids on hippocampal function. The aim of this study is to examine whether n-3 fatty acid enriched fish oil supplementation would prevent the decline of learning and memory in estrogen deprived rats. Method : Six months old female rats were ovariectomized (OVX) or sham operation and then fed n-3 fatty acid-deficient diet with or without fish oil supplementation for six months. Results : We found that OVX rats showed significantly poorer learning memory compared with the sham operated rats, and fish oil supplementation rescued the declined memory performance. In addition, neurogenesis was increased in OVX rats with fish oil supplementation. Decreasing size of dentate gyrus in OVX rats was ameliorated by fish oil supplementation. CA1 neuronal cell sizes and the number of cholinergic neurons were not significant difference in OVX or sham rats with or without fish oil supplementation. Conclusion : It was concluded that fish oil supplementation improves the learning memory and increase hippocampal neurogenesis in OVX rats. These results suggest that n-3 fatty acids supplementation may have the benefit on delay learning memory decline in estrogen deprivation such as in postmenopausal women. Keywords : estrogen, DHA, neurogenesis

PP26 B-077

COMPLIANCE, TOLERANCE AND ACCEPTABILITY OF A SPECIALLY FORMULATED NUTRITIONAL FORMULA IN THE OLDER ADULTS

Chi-Hua YEN¹, Hsiao-Ling CHEN², Eduardo SCHIFFRIN³, Lorena CHEUNG⁴ (1. Department of Family and Community Medicine, and School of Medicine, Chung Shan Medical University, Taiwan; 2. Department of Nutrition, Chung Shan Medical University, Taiwan; 3. Clinical Development, Nestle Research Center, Switzerland; 4. Nestle HealthCare Nutrition, Nestle Health Science, Asia, Oceania, Africa Region, Singapore)

Introduction : Ageing is a dynamic process with physiological and psychological consequences. Supplementation of properly designed nutritional formula can support the nutritional status of the older adults and thereby can help modulate the detrimental effects related with the ageing process. The primary objective of the trial was to evaluate the compliance, tolerance and acceptability of a specially formulated complete nutrition formula containing a high quality whey protein blend, added pre- and probiotics and enhanced vitamin E level to meet the specific nutrient needs of the older adults. Method : This study was an open-label single center study conducted in a teaching hospital in Taiwan. 30 elderly subjects (9 males and 21 females) with a mean age of 76.3 ± 7.9 years were enrolled in the study. The subjects were instructed to consume 2 daily servings of Nutren® Optimum (Nestle Health Science, Switzerland) for 6 weeks. They were assessed on compliance, tolerance, acceptability, immunity status, inflammation status, nutritional status, and stool characteristics. Results : Twenty-four (80%) of the 30 subjects completed the study. Most of the subjects complied with the recommended dosage and considered the product well-tolerated and acceptable. Pre-albumin level (26.6 ± 6.3 mg/dl vs. 29.6 ± 9.0 mg/dl, $P = 0.0114$), weight (50.0 ± 7.9 kg vs.

51.0±7.8 kg, P=0.0001) and Mini Nutrition Assessment (MNA®) score (9.6 ±1.3 vs. 11.3± 1.4, P<0.0001) were increased significantly from baseline to 6 weeks. Conclusion : Nutren® Optimum was generally well-tolerated, and the compliance and acceptability were good. The oral supplementation of the formula has promoted a significant improvement in the nutritional status of the older adults. Keywords : Oral Nutritional Supplement, Mini Nutrition Assessment

THE RELATION BETWEEN METABOLIC CONDITIONS ON PERIODONTAL DISEASE PREVALENCE AMONG ELDERLY KOREANS IN A RURAL AREA

Youn-Hee CHOI¹, Kyeong-Soo LEE², Hee-Kyung LEE³ (1. Preventing Dentistry, Kyungpook National University, Korea; 2. Preventive Medicine and Public Health, Yeungnam University, Korea; 3. Dentistry, Yeungnam University, Korea)

Introduction : The aim of this study was to investigate the relationship between the duration and extent of diabetes and metabolic syndrome component prevalence, and of periodontal disease among rural Korean elderly individuals over 60 years old. Method : : The study population consisted of 399 participants who received regular health examinations at Seongju-gun Public Health Center from 2000 to 2007. Diabetes mellitus and metabolic syndrome components (hypertension, obesity and hypercholesterolemia) were evaluated from clinical records and periodontal health by Community Periodontal Index. Results : Participants with longer duration of diabetes mellitus, hypertension and obesity were more likely to have periodontal disease. Individuals with a greater number of these systemic conditions were more likely to have periodontal disease. Conclusion : Older rural Koreans with diabetes and metabolic syndrome components have unmet periodontal treatment needs. Medical and dental professionals need to coordinate systemic and oral care for this group. Keywords : elderly, metabolic syndrome, Community Periodontal Index

OXIDATIVE STRESS IN ALZHEIMER'S DISEASE AND MCI

Dina ZEKRY¹, Francois R. HERRMANN², Karl-Heinz KRAUSE³ (1. Geriatrics, Geneva University, Switzerland; 2. Geriatrics Department, Geneva University Hospitals, Switzerland; 3. Genetic and Laboratory Medicine, Geneva University, Switzerland)

Introduction : Multiple pathophysiological processes are implicated in Alzheimer's disease (AD) as well as in the conversion from mild cognitive impairment (MCI) to AD. Among them, there is increasing evidence for a role of inflammation and oxidative stress. Oxidative stress is related to an imbalance between the production of reactive oxygen species (ROS) and the cellular antioxidant defense mechanisms. Oxidative damage occurs early in the pathogenesis of AD and precedes severe pronounced neuropathologic alterations. It therefore represents a potential area for therapeutic intervention designed to avoid and/or to delay the onset and to slow the progression to AD. Method : Identifying markers in peripheral blood related to oxidative stress that are correlated with the early detection of preclinical AD and with the progression from MCI to AD represents a major challenge. The NADPH-oxidase (NOX) enzymes family represents a notable source of reactive oxygen species (ROS). Results : We will present results from a prospective study analyzing genetic predisposition toward increased oxidative stress through i) analysis of polymorphisms of different NOX isoforms and subunits (Single Nucleotide Polymorphism Chromatin Immuno-precipitation; direct sequencing of hypervariable subunits); and ii) measurement of NOX-dependent oxidative stress in individuals lymphoblastoid cell lines

generated through immortalization of B cells by Epstein-Barr Virus. Conclusion : This approach might provide an innovative and robust biomarker risk profile allowing to detect preclinical AD, the risk of progression from MCI towards dementia and the possible discovery of potential treatment targets like blocking the undesirable actions of NOX enzymes. Keywords : oxidative stress, dementia, MCI conversion

PP26 B-080

NEUROPROTECTIVE EFFECTS OF PLANT EXTRACTS AGAINST THE OXIDATIVE STRESS INDUCED BY ROTENONE

A-Rang IM, Young-Hwa KIM, Seong Wook CHAE, Hye Won LEE, Mi-Young LEE (KM-Based Herbal Drug Research Group, Korea Institute of Oriental Medicine, Korea)

Introduction : The results of many studies implicate oxidative stress in mediating cell death in these disorders. Rotenone, an inhibitor of mitochondrial complex I, has been widely regarded as a neurotoxin and oxidative stress because it induces a Parkinson's disease-like syndrome. In this study, we examined the neuroprotective effects of plant extracts in rotenone-treated PC12 cells. Method : Our experiments contains with cell viability, cellular ATP levels, mitochondrial membrane depolarization, caspase 3/7 activity, the ratio of Bax:Bcl-2 expression levels, mitochondrial superoxide level, and intracellular calcium (Ca²⁺) concentration. PC12 cells were cultured in RPMI 1640 with 10% fetal bovine serum in a humidified atmosphere of 95% air and 5% CO₂ at 37 °C. Results : Pretreatment with plant extracts significantly increased cell viability and ATP levels; they also attenuated caspase activation, mitochondrial membrane depolarization, and mitochondrial superoxide production. Moreover, confocal microscopy showed that the mitochondrial staining pattern was restored from that of extracts treated cells and that the increase in intracellular Ca²⁺ level was blunted by treatment with the extracts. Conclusion : Our results suggest that plant extracts may have the possible beneficial effects in Parkinson's disease by attenuating rotenone induced toxicity. Identification of the active chemical moiety may serve as a starting point for developing neuroprotective therapeutics to treat neurodegenerative disease. Keywords : oxidative stress; neuroprotective effects; rotenone; PC12 cells; mitochondrial dysfunction

THE EFFECTS OF REGULAR EXERCISE PROGRAMS ON OLDER ADULTS BOTH MULTIPLE DIMENSIONS OF WELLNESS AND SATISFACTION WITH LIFE SCALE

Changsu LEE¹, Youn-Soo JUNG², Hyunkook KIM³ (1. Fisher Institute of Wellness and Gerontology, Ball State University, USA; 2. Department of Gerokinesiology & Sports Industry, Daegu Hanny University, Korea; 3. Gerokinesiology & Sports Industry, Daegu Hanny University, Korea)

Introduction : This study investigated the effect of 16 weeks' regular exercise programs on older adults both multiple dimensions of wellness and satisfaction of life scale. Method : As research subjects, 132 older adults over 65 years were selected. The participants were divided into two groups (Non Exercise vs Regular Exercise) and, observed the changing of 5 dimensions of Wellness, and satisfaction with life scale. Researchers could see how many participants' wellness and satisfaction levels had gone up or down between exercises using pairs of before and after 16 week's regular exercise program. Results : The researchers found that Regular Exercise group significantly increased 5 dimensions of wellness and satisfaction with life scale

before initiating regular exercise programs ($p < .001$). Moreover, Non Exercise group was significantly increased both wellness dimensions and satisfaction with life scales after regular exercise programs. However, Regular Exercise group was no significant differences in wellness dimensions and satisfaction with life scales after regular exercise programs. Conclusion : Consequently, Regular exercise programs such as nordic walking, theraband exercise, yoga were good programs for the beginners of older adults. If participants were an experienced "senior" regular exercise training, they probably won't need this beginner programs. The researchers suggest that we make further study on the possible guidelines to provide more specific and detail exercise programs for seniors who do not satisfied with basic exercise programs. Keywords : Key words: Regular exercise programs, older adults, Wellness dimension, Satisfaction with life scale

PP26 B-082

MOLECULAR AND GENOMIC APPROACH FOR UNDERSTANDING THE GENE-ENVIRONMENT INTERACTION BETWEEN NRF2 DEFICIENCY AND CARCINOGENIC NICKEL-INDUCED DNA DAMAGE

Hye Lim KIM, Seung Hun KANG, Young Rok SEO (*Department of Life Science, Institute of Environmental Medicine for Green Chemistry, Dongguk University, Korea*)

Introduction : Nickel is a toxic and carcinogenic metal which induces a redox imbalance followed by oxidative stress. Nuclear factor erythroid-2 related factor 2 (Nrf2) is a redox factor that regulates oxidation/reduction status and consequently mediates cytoprotective responses against exposure to environmental toxicants. Method : In this study, we evaluated the protective roles of the Nrf2 gene under oxidative stress and DNA damage induced by 20uM nickel at sub-lethal doses in terms of gene-environment interactions. Additionally, we attempted to identify potential nickel and Nrf2-responsive targets and the relevant pathway via microarray, qRT-PCR, and pathway analysis. Results : Under nickel exposure conditions, we detected significantly higher amounts of DNA damage via a comet assay, in addition to increased intracellular ROS generation in Nrf2 lacking cells, as compared to Nrf2 wild-type cells. Additionally, gene expression data were analyzed via microarray assays for the selection of Nrf2-responsive genes under nickel treatment. In particular, altered expressions of 10 genes (CAV1, FOSL2, MICA, PIM2, RUNX1, SLC7A6, APLP1, CLSPN, PCAF, PRAME) were confirmed via qRT-PCR. These genes functioned principally in a variety of biological processes, including oxidative stress response, necrosis, DNA repair, and cell survival. Conclusion : Therefore, these findings indicate that Nrf2 is an important factor that performs a protective role in the suppression of oxidative stress-induced DNA damage by environmental nickel exposure. Furthermore, we describe the potential biomarkers regarded as molecular targets for Nrf2-related cellular protection against nickel exposure. Keywords : Nickel, Nuclear factor erythroid-2 related factor 2 (Nrf2), Toxicogenomics

REACTIVE OXYGEN SPECIES DERIVED FROM DUOX1 MEDIATE KERATINOCYTE DIFFERENTIATION

Hyun CHOI, Tae Ryong LEE, Dong Wook SHIN (*Bioscience Research Institute, AMOREPACIFIC Corporation R&D Center, Korea*)

Introduction : Keratinocytes undergo continuous process of differentiation to maintain skin permeability barrier. Recent studies have demonstrated that the production of reactive oxygen species

(ROS) itself plays a indispensable role in the process of differentiation in various tissues. However, it is unclear the effect of ROS on the differentiation of keratinocytes. Method : Knockdown experiments with Duox1 siRNA were performed in NHKs, and analyzed with Q-RT-PCR and Western blots, etc. Results : Here we show that dual oxidase 1 (DUOX1) is the major ROS-producing source in normal human keratinocyte (NHK) stimulated with ionomycin. Lack of DUOX1 significantly reduces filaggrin gene transcription, implicating the direct role of DUOX1 in the differentiation of the epidermal permeability barrier in the normal human skin. In cultured NHK, treatment of extracellular calcium increases the extracellular level of reactive oxygen species (ROS) and up-regulates the gene transcription of DUOX1 as well as various differentiation markers. Deficiency of DUOX1 in NHK during the process of differentiation decreased gene expression of keratin1 (KRT1), keratin 10 (KRT10), filaggrin, etc. Conclusion : These studies suggest that DUOX1-producing ROS play a significant role on differentiation of human skin through the changes in the expression of proteins essential in normal epidermal differentiation. Keywords : ROS, keratinocyte, skin barrier

PP26 B-084

WHICH DURATION OF SWIMMING EXERCISE IS MOST EFFECTIVE ON COGNITIVE FUNCTION IN FOCAL CEREBRAL INFARCTION RAT?

Jung-Kook KIM, Min-Keun SONG, Jong-Hoo LEE, Jeong-Hyun BYUN, Hyun-Sik YUN, Jae-Young HAN, In-Sung CHOI, Sam-Gyu LEE (*Department of Physical & Rehabilitation Medicine, Research Institute of Medical Sciences, Chonnam National University Medical School & Hospital, Korea*)

Introduction : Regular aerobic exercise has been known to improve cognitive function. There is little basis on the effects of swimming exercise on cognitive function and proper exercise duration for cognitive improvement in cerebral infarction. We aimed to investigate the proper swimming exercise duration for maximal cognitive improvement in focal cerebral infarction rats. Method : Forty male Sprague-Dawley rats, weighing 300±50 g, aged 10 weeks were subjected to photothrombotic cerebral infarction. Four rats died after the operation. All rats were randomly divided into 4 groups: non-exercise group (group A, n=9); short-duration swimming exercise group (group B, n=9); moderate-duration swimming exercise group (group C, n=9); long-duration swimming exercise group (group D, n=9). Swimming exercises were performed at 1st day after cerebral infarction, 5 times a week, for 4 weeks according to the groups. Cognitive function was evaluated using Morris water maze test. Immunohistochemistry and western blotting for BDNF (brain derived neurotrophic factor) and VEGF (vascular endothelial growth factor) in the hippocampus were conducted after 4 weeks. Results : After 4 weeks of swimming exercise, escape latency was shorter in group C than A, C or D. More damaged neuronal cells were found in group A than group B, C and D in CA3 lesion of hippocampus. Group C showed the most significant immunoreactivity of BDNF and VEGF. Expression of BDNF and VEGF proteins was higher in group C than group A, B and D. Conclusion : Moderate-duration regular swimming exercise was the most effective exercise protocol for cognitive improvement in focal cerebral infarction rats. Keywords : Exercise, Cognition, Stroke

LONG-TERM VITAMIN E DEFICIENCY INDUCES AXONAL DEGENERATION IN MOUSE HIPPOCAMPAL NEURONS

Koji FUKUI¹, Hirokatsu TAKATSU², Tadashi SHINKAI¹, Shiro URANO³ (*1. Department of Bioscience and Engineering, Shibaura*

Institute of Technology, Japan; 2. Malaysia Japan Higher Education Program, Kolej Kemahiran Tinggi MARA Beranang, Malaysia; 3. Life Support Technology Research Center, Shibaura Institute of Technology, Japan)

Introduction : Vitamin E is a common natural lipophilic vitamin. One of pivotal function of vitamin E is as an antioxidant. Recently, several lines of evidence demonstrate that vitamin E deficiency induces cognitive dysfunction. However, the detail mechanisms of this phenomenon have not yet understood. In these cases, it is difficult to recover cognitive function, because the neurons have been already severely damaged or died. Previously, we found axonal degenerations before induction of cell death in hydrogen peroxide-treated cultured neurons. In this study, we assessed axonal condition in the hippocampal region of vitamin E deficient mice. **Method :** A wild type C57BL/6 mouse strain was used. Vitamin E-deficient mice were fed a vitamin E-deficient diet from 4 week to 3 or 6 month of age. Paraffin block samples of each brain region were made for slices and stained using silver stain. Another, all samples were homogenized and used Western blotting assay. **Results :** Short-term of vitamin E deficient mice did not change axonal morphology in hippocampal CA1 region. However, long-term vitamin E deficient mice remarkably induced axonal degeneration in hippocampal CA1 region. Furthermore, the appearance of microtubule-associated protein (MAP) light chain 3, a major index of autophagy, was lower in long-term vitamin E deficient mice than in short-term ones. **Conclusion :** Long-term vitamin E-deficiency induced autophagy dysfunction. It is well known that vitamin E deficiency accelerates to oxidative damage in central nervous systems. These results indicate that oxidative stress-induced axonal injury is induced in living tissues, but not cultured cells. **Keywords :** Vitamin E deficiency, oxidative stress, axonal injury

PP26 B-086
IN VITRO TOXICITY OF STABLY-NANOSIZED TITANIUM DIOXIDE USING POLYMERIC DISPERSANT IN HUMAN KERATINOCYTE CELLS

Yeo Jin KIM, Young Rok SEO (Department of Life Science, Institute of Environmental Medicine for Green Chemistry, Dongguk University, Korea)

Introduction : Titanium dioxide is one of the most frequently used engineered nanomaterials because it can serve two distinct functions: absorbing and scattering ultraviolet(UV) radiation and/or semiconductor photocatalysis activated by UV radiation. It is unclear whether nTiO₂ have any potential toxicological impact on the dermal system. A few studies have shown that nTiO₂ could penetrate the skin. Although the primary size of commercial nTiO₂ that are used experimentally is generally less than 50 nm, in solution, nTiO₂ tend to agglomerate or precipitate with size > 100 nm. Thus, obtaining a uniform solution of nTiO₂ is a key step in investigating the actual cytotoxicity and molecular pathogenesis of nTiO₂. **Method :** In this study, a stable, homogenous, and weakly aggregated nTiO₂ suspension was obtained by using surfactant-like dispersant, called sodium polyacrylate(PAA). This was used to assess the cytotoxicity and genotoxicity of these nTiO₂ in immortalized human epidermal keratinocytes(HaCaT). **Results :** Approximately 70 % cell viability was remained upon 24 h exposure of 5 ppm nTiO₂/PAA by methyl tetrazolium(MTT)-based cytotoxicity assay. The oxidative stress was induced by nTiO₂, as dose-dependent manner, with respect to the levels of reactive oxygen species(ROS) via ROS reactive probe DCF. DNA damage in terms of DNA adducts and relative intensity of foci was increased toward 24 h exposure of nTiO₂/PAA in dose-related manner, evaluated by comet assay and gamma-H2AX

immunostaining, respectively. **Conclusion :** This implies that nTiO₂ suspension containing a dispersing stabilizer PAA exhibited actual genotoxic potential in HaCaT cells via generation of ROS. Mechanisms driving the genotoxicity and phototoxicity will be of interest for further study. **Keywords :** Titanium dioxide nanoparticle, Sodium polyacrylate (PAA)

SEX DIFFERENCES IN REPRODUCTIVE STEROID METABOLISM FROM GONAECTOMIZED MALE AND FEMALE RATS

Hyun-Hwa SON¹, Ju-Yeon MOON¹, Kwang Joon KIM², Kyong Min KIM², Hye Jin CHUNG³, Yura JANG⁴, Minkyung KO⁴, Hesson CHUNG⁴, Sung-Kil LIM², Bong Chul CHUNG¹, Man-Ho CHOI¹ (1. Future Convergence Research Division, KIST, Korea; 2. Department of Internal Medicine, Yonsei University School of Medicine, Korea; 3. College of Pharmacy, Gyeongsang National University, Korea; 4. Center for Neuro-Medicine, KIST, Korea)

Introduction : Inconsistent steroid actions may occur during reproductive physiology and reveal sex differences. Comparative steroid signatures between ovariectomized (OVX) and orchietomized (ORX) rats were therefore evaluated. **Method :** Quantitative steroid profiling was investigated from 4-week-old female and male Sprague Dawley rats (4 shame controls and 6 models for each sex). The gonadectomy was carried out 3 weeks later, and all rats were sacrificed 13 weeks after the surgery. Urine samples were collected at 4, 6, 7, 12, 16 and 20 weeks, and plasma, tissues (adrenal gland, subcutaneous/visceral fats) and femur were obtained after the sacrifice. **Results :** The plasma level of cholesterol and its fatty acid esters were increased in the models, while their levels from both fat tissues were decreased. However, the accumulation of cholesterol was tended to increase in female models. For urinary sex steroids, testosterone was significantly decreased in the male models (P < 0.01) and its level in female models was increased compared to the corresponding controls. A prohormone, androstenedione, was also remarkably decreased in the male models (P < 0.01), while 17β-estradiol was significantly decreased in the female models (P < 0.01). In adrenal, a major stress hormone, corticosterone, was significantly decreased in both models, but its 5α-reductive metabolite, dihydrocorticosterone, was increased in the models. **Conclusion :** Differentiated steroid metabolism was observed between OVX and ORX rats and the results could be correlated with femoral geometry. **Keywords :** sex difference, steroid, reproductive endocrinology

PP26 B-088
THE EFFECTS OF BALANCE TAPPING THERAPY ON LOWER BACK PAIN AND MUSCLE FLEXIBILITY OF THE MIDDLE-AGED WOMEN WITH LOWE BACK PAIN

Si Yeon PARK¹, Su Youn PARK¹, Sang Hee KIM¹, Jung A.H. KIM¹, Jun Sik KIM¹, Yu Rim SHIN¹, Hye Rin YONG¹, Su Mi JUNG¹, Nu Ri JO¹, Kyung Sook PARK² (1. Red Cross College of Nursing, Chung-Ang University, The Master's Course, Korea; 2. Red Cross College of Nursing, Chung-Ang University, Professor, Korea)

Introduction : This study is aimed at investigating the effect of the Balance Taping Therapy on the low back pain and muscle flexibility in middle-aged women who suffer from backaches. **Method :** This study is a quasi-experimental research using non-equivalent control group pre-post test design, and it is directed at a total of 62 middle-aged women (experimental group:32,control group:30) in their 40 to 60s with backaches who use a singing class af cultural center located in D-gu, Seoul from November 10 to November 30, 2012. As for research

methods, the degree of low back pain and muscle flexibility were measured in 30 minutes after the pre and post tests, and data were analyzed using the SPSS 20.0 statistical program. Results : The low back pain score of the group to which the Balance Taping is applied decreased from 5.14 to 3.48, and its degree of muscle flexibility was significantly reduced from -5.16 to 1.92Cm in statistics, compared to non-applied group. As its result, it was found that the Balance Taping is an effective nursing intervention to reduce the low back pain and increase the muscle flexibility. Conclusion : Though this study, it is expected that the use of the Balance Taping Therapy will help reduce low back pain in subjects with backaches and increase their muscle flexibility. However, in order to generalize the effect of the Balance Taping Therapy, it is proposed to conduct repeated studies by expanding the sample size, and examine the effect duration time and effect size through repeated measurements on the dependent variables. Keywords : balance tapping therapy, lower back pain, muscle flexibility

BISPHENOL-A EXPOSURE MAY BE NOT ASSOCIATED WITH METABOLIC CHANGES OF STEROIDS IN PRECOCIOUS PUBERTAL GIRLS

Su Hyeon LEE¹, Se Mi KANG¹, Jeongae LEE¹, Mi Jung PARK², Sin Hye KIM², Won-Yong LEE³, Jongki HONG⁴, Man-Ho CHOI¹, Bong Chul CHUNG¹ (1. Future Convergence Research Division, KIST, Korea; 2. Department of Pediatrics, Sanggye Paik Hospital, Korea; 3. Department of Chemistry, Yonsei University, Korea; 4. Department of Basic Pharmaceutical Science, Kyung Hee University, Korea)

Introduction : Estrogens and androgens play key roles in pubertal onset and sexual maturation. Due to the estrogenic and anti-androgenic properties of bisphenol-A (BPA) in reproductive endocrinology, we evaluated the association between BPA exposure and metabolic changes of steroids from precocious pubertal (PP) girls. Method : Gas chromatography-mass spectrometry (GC-MS) based steroid signatures were conducted with urine samples obtained from patients with both 41 peripheral-PP and 43 central-PP to against 33 age-matched healthy girls. In addition, the association between urinary levels of steroids and BPA (< 5 and > 10 µg/g creatinine) in both PPs and controls was investigated. Results : The level of estrone was increased in central-PP (P < 0.01) compared to peripheral-PP, and epitestosterone, 16α-OH-DHEA, 17β-estradiol and estril were significantly increased in only central-PP (P < 0.005). The results could be explained that the level of testosterone activated by luteinizing hormone is decreased in peripheral-PP when many sex steroids are up-regulated in both PP groups. In addition, altered steroid concentrations were introduced to associate with urinary BPA levels, 3 gonadal steroids, testosterone (P < 0.009), 17β-estradiol (P < 0.09) and pregnenolone (P < 0.01), were significantly up-regulated in the high BPA exposure groups of all subjects. Conclusion : The results suggest that BPA exposure may induce the metabolic changes in reproductive steroidogenesis, but it may be not associated with the development of precocious puberty in girls. Keywords : steroid hormone, bisphenol-A, precocious puberty

PP26 B-090

ACCELERATED AGEING IN RHEUMATOID ARTHRITIS PATIENTS: EFFECT OF SERUM ON WOUND HEALING IN HUMAN STEM CELLS IN VITRO

Henriette JOERGENSEN¹, Dino DEMIROVIC¹, Torkell J. ELLINGSEN², Suresh I.S. RATTAN¹ (1. Molecular Biology and Genetics, Aarhus University, Denmark; 2. Department of Rheumatology, Aarhus University Hospital, Denmark)

Introduction : Rheumatoid arthritis (RA) is a chronic inflammatory disease characterized by a large proportion of patients also showing co-morbidity with several age-related diseases such as diabetes, cardiovascular diseases, and fibrosis. Together with a much higher increase in mortality rate of RA-patients, RA is being considered as an accelerated ageing syndrome. The aim of this project is to determine the biological status of blood-derived serum from RA-patients as compared to the serum from normal healthy subjects of equivalent age. Method : The parameters to be studied are the cell migration and proliferation of human cells in vitro in a so-called wound healing assay, using telomerase-immortalized mesenchymal stem cells (hTERT-MSC). Confluent monolayers of hTERT-MSC are mechanically "wounded" creating a fixed size scratch and then allowed to "heal" in the presence of culture medium containing 4% serum from RA-patients or healthy subjects for 3 days. Results : Our hypothesis is that serum from RA-patients is significantly less effective in supporting wound healing as compared with age-matched controls. We have previously shown that there is an inverse correlation between the number of focal adhesion points (FAP) and the rate and extent of cellular migration during cellular ageing of human skin fibroblasts. Our current focus is to examine the effect of serum from RA-patients on the newly formed FAP on hTERT-MSC. Conclusion : These studies will establish cellular and molecular parameters for the biological age status of RA-patients, and also provide novel criteria for determining the efficacy of therapeutic interventions against RA. Keywords : Rheumatoid arthritis, Accelerated ageing

PP26 B-091

ANTI-INFLAMMATORY EFFECTS OF GENISTEIN VIA SUPPRESSION OF TOLL-LIKE RECEPTOR 4-MEDIATED SIGNALING PATHWAY IN BV2 MICROGLIA

Jin-Woo JEONG¹, Cheol Min KIM², Gi-Young KIM³, Hye Jin HWANG⁴, Byung Woo KIM⁵, Yung Hyun CHOI⁶ (1. Department of Biochemistry, Dongeui University College of Oriental Medicine, Korea; 2. Department of Biochemistry, Busan National University College of Medicine, Korea; 3. Laboratory of Immunobiology, Department of Marine Life Sciences, Jeju National University, Korea; 4. Department of Food and Nutrition, Dong-Eui University, Korea; 5. Department of Life Science and Biotechnology, Dong-Eui University, Korea; 6. Department of Biochemistry College of Oriental Medicine, Anti-Aging Research Center & BBI-RIC, Dongeui University, Korea)

Introduction : Genistein, a principal soy isoflavone, has received considerable attention as a protein kinase inhibitor. However the anti-inflammatory effect of genistein is unclear in microglial cells, in this study, we performed whether genistein attenuates the expression of pro-inflammatory mediators and cytokines in lipopolysaccharide (LPS)-stimulated BV2 microglial cells. Method : As inflammatory parameters, the production of nitric oxide (NO), prostaglandin E2 (PGE2), interleukin (IL)-1β and tumor necrosis factor (TNF)-α were evaluated. We also examined the genistein's effect on the activity of nuclear factor-kappaB (NF-κB) and toll like receptor (TLR) signaling pathways. Results : At non-toxic concentrations, genistein attenuated the production of NO and PGE2, by inhibiting inducible NO synthase (iNOS) and cyclooxygenase-2 (COX-2) expression. Furthermore, release and expression of inflammatory cytokines, including IL-1β and TNF-α, were inhibited by genistein. Genistein also suppressed NF-κB translocation by blockade of IκB-α (IκB-α) degradation and inhibited the levels of TLR4 and myeloid differentiation primary-response protein 88 (Myd-88), an adaptor protein of TLR4-mediated signaling, in LPS-stimulated BV2 cells. By using a specific TLR4 signaling inhibitor, CLI-095, as well as TLR4 specific small

interfering RNA, we have shown that BV2 cell activation by LPS is completely dependent on the TLR4 activation pathway. Conclusion : Therefore, our data indicate that genistein attenuates the inflammatory responses by inhibiting the binding of LPS to TLR-4 on microglial cells. Keywords : Genistein, anti-inflammation, TLR4

PP26 B-092

TUMOR SUPPRESSOR GENE, TIS21/BTG2/PC3, INHIBITS DOXORUBICIN-INDUCED PREMATURE SENESCENCE THROUGH ROS-ACTIN ASSOCIATED PROTEIN CASCADE

Jung-A CHOI, In Kyoung LIM (Department of Biochemistry & Molecular Biology, Ajou University School of Medicine, Korea)

Introduction : Cellular senescence is a crucial anticancer mechanism that prevents cell growth at risk for neoplastic transformation. Recently, however, drug-induced senescence has been considered as a factor promoting cancer progression. Results : In this study, we observed that overexpression of TIS21 reduced senescence phenotypes induced by doxorubicin treatment to Huh-7 human hepatoma cells, and resulted in the increased cell death via inhibition of NADPH oxidase (Nox)-generated ROS level in the cells. Noticeably, treatment of Huh7 cells with doxorubicin (100 ng/ml) induced senescence phenotypes along with alterations of F-actin and vimentin rearrangements. Nox-derived ROS changed intracellular distribution and localization of cytoskeletal proteins. These patterns changed by doxorubicin treatment could be blocked by overexpression of TIS21 gene as well as the antioxidant, N-acetylcysteine, treatment. Conclusion : Taken together, the data suggest that overexpression of TIS21 inhibits doxorubicin-induced premature senescence phenotypes via ROS-actin-associated protein cascades. Present study suggests TIS21/BTG2/Pc3 gene as a potential determinant of cellular fate from senescence to cell death after exposed to chemotherapeutic agents. Keywords : senescence, NADPH oxidase, actin, TIS21/BTG2/Pc3

PP26 B-093

A POSSIBLE INVOLVEMENT OF APURINIC/APYRIMIDINIC ENDONUCLEASE ON APOPTOSIS IN AGED RAT KIDNEY

In Youb CHANG¹, Sang Pil YOON² (1. Department of Anatomy, College of Medicine, Chosun University, Korea; 2. Department of Anatomy, School of Medicine, Jeju National University, Korea)

Introduction : We have reported a possible involvement of apurinic/apyrimidinic endonuclease (APE), one of DNA repair pathway, in animal models of hydronephrosis, acute tubular necrosis, and diabetic nephropathy, and found that there is a close connection between APE and p53-dependent apoptosis. Therefore, we investigated the changes of APE in aging rat kidney since aging is the consequence of increased susceptibility to apoptosis and impaired repair. Method : Characteristics of chronological aging were compared between 6- and 24-month-old male Sprague-Dawley rats. Serum blood urea nitrogen (BUN) and creatinine were measured for renal function. Western blot assay was compared for p53, caspase 3, gamma-H2AX, and APE. Immunohistochemical staining of 8-hydroxy-2'-deoxyguanosine (8-OHdG) and APE were performed. Cellular senescence was checked by beta-galactosidase staining. Results : Compared with young rats, aged rats showed significant increase in BUN and creatinine levels. All the checked proteins were significantly increased with aging: 1) increased p53 and caspase 3 may activate the apoptotic pathway, 2) increased gamma-H2AX might mean augmented DNA damage, and 3) increased APE might have dual role in anti-apoptosis and in DNA repair pathway. But, beta-galactosidase staining turned to positive in proximal tubule cells of aged kidney, in which APE decreased its immunolocalization. Conclusion : Taken

together, APE increases in accordance with p53 and caspase 3 despite compromised renal functions in aged rats. These results suggest that APE in aged rats might have a role on p53-dependent apoptosis rather than DNA repair activities in aged renal proximal tubules. Keywords : APE, Apoptosis, Renal proximal tubule

PP26 B-094

OVEREXPRESSION OF MALIC ENZYME IN THE FAT BODY EXTENDS DROSOPHILA LIFESPAN

Young-Eun LEE, Gye-Hyeong KIM, Yeogil JANG, Young-Nam LEE, Donggi PAIK, Joong-Jean PARK (Department of Physiology, College of Medicine, Korea University, Korea)

Introduction : Malic enzyme, linked to tricarboxylic acid cycle, converts malate to pyruvate and produces CO₂ and NADPH. Recently function of malic enzyme that regulates lipid metabolism has been recognized. Pyruvate produced by malic enzyme is transported to mitochondria and changed to acetyl-CoA, the fuel of the TCA cycle. Then the acetyl-CoA is converted to citrate, which is transported to the cytoplasm for lipid biosynthesis. Thus, malic enzyme provides a component not only for the TCA cycle, but for the fatty acid synthesis. In *Drosophila*, Men (CG10120) is homologous to human cytosolic NADP+-dependent Men (ME1, EC 1.1.1.40) and is highly expressed in fat body during larval period. Method : Recently we reported Men overexpression extended fly lifespan. In the present studies, we investigated how Men overexpression made such lifespan extension. Transgenic flies expressing specifically Men transgene were generated and crossed with fat body-specific gene-switch Gal4 driver flies. The lifespan of these flies was measured with feeding RU486, the inducer of GS in various conditions. Results : Men overexpression in the fat body during the larval period was sufficient to extend adult lifespan. In addition, such a condition reduced the body weight, the levels of triglyceride and expression of several genes related lipogenesis, such as acetyl-CoA carboxylase, fatty acid synthase, and carbohydrate-responsive element-binding protein. Moreover, levels of reactive oxygen species and hsp22, mitochondrial oxidative damage protector, were increased in larvae overexpressing Men in the fat body. Conclusion : Together, our results suggest that lifespan extension by developmental overexpression of Men is related to fatty acid metabolism and ROS production. Keywords : *Drosophila*, Malic enzyme, lifespan extension

EFFECTS OF JUGLANIN, LOLIOLIDE, AND QUERCETIN-3-O-BETA-D-GLUCURONIDE ON CELLULAR SENESCENCE

Hyo Hyun YANG¹, Jong-Keun SON², Jae-Ryong KIM³ (1. Aging-associated Vascular Disease Research Center, Department of Biochemistry and Molecular Biology, College of Medicine, Yeungnam University, Korea; 2. College of Pharmacy, Yeungnam University, Korea; 3. Dept. of Biochemistry and Molecular Biology, College of Medicine, Yeungnam University, Korea)

Introduction : Cell senescence, induced by the DNA damage response or inflammatory stress, contributes to age-associated vascular disease. Method : We investigated the effects of juglanin, loliolide, quercetin-3-O-beta-D-glucuronide on cellular senescence by measuring senescence-associated beta-galactosidase activity, reactive oxygen species, and p53 protein level. Results : Juglanin and loliolide reduced senescence phenotypes induced by adriamycin as well as cell replication in human dermal fibroblasts and quercetin-3-O-beta-D-glucuronide in human umbilical vein endothelial cells. Conclusion : These results suggest that juglanin, loliolide, and quercetin-3-O-beta-D-glucuronide might be useful for aging intervention based on cellular

senescence. Keywords : Juglanin, Loliolide, Quercetin-3-O-beta-D-glucuronide, aging intervention

CHOICE OF TACTICS IN ENDOVASCULAR TREATMENT OF GENERALIZED ATHEROSCLEROSIS BY ELDERLY PATIENTS

Ekaterina SEDOVA¹, Nadegda ALEXEEVA², Kirill KOZLOV², Vladimir KHAVINSON² (1. Cardiology, St-Petersburh Instituit of Bioregulation and Herontology, Russia; 2. Cardiology, Institut of Bioregulation and Gerontology, Russia)

Introduction : Endovascular intervention on the coronary, brachiocephalic, renal arteries and arteries of the lower limbs in elderly patients are minimally invasive and less traumatic in comparison with open surgery. They do not require a long hospital stay, psychologically more comfortable, representing surgery without being cut. In the absence of general anesthesia in endovascular treatment has reduced possibility of post-operative complications, especially in the elderly, who very frequently have comorbidities. Method : The main advantage of endovascular diagnostic procedures are the accuracy and opportunity of simultaneous endovascular treatment at the same procedure. Simultaneous angiography of renal, carotid and low extremities arteries has several advantages as? more precise information about lesions in different vessels and the opportunities for the treatments strategy. In aged patients with multivessel heart disease who have to undergo CABG should be done simultaneously angiography of renal, mammaia and brachiocephalic arteries. Results : According to current guidelines significant lesions of renal or carotid arteries should be treated before the heart surgery because of postoperative stroke and renal insufficiency prophylaxis. Conclusion : The Simulaltaneous (multivessel) approach in angiography and endovascular treatment reduces mortality and improves the quality of life in aged patients. Keywords : generalized atherosclerosis

AN E-HEALTH APPROACH HEALTH EDUCATION TO PROMOTE EXERCISE FOR CORONARY HEART DISEASE ADULTS

Eliza Mi-Ling WONG, Doris Y.P. LEUNG, Sek Ying CHAIR, Janet Wing Hung SIT (The Nethersole School of Nursing, The Chinese University of Hong Kong, Hong Kong)

Introduction : Coronary heart disease (CHD) is the leading cause of death worldwide. Health education that feature regular physical exercise as a secondary preventive measure are rarely incorporated in routinely prescribed practice of care despite persistent international evidence of the importance of regular exercise. The overall aim of the study is to test the effectiveness of an e-health educational intervention for CHD patients. Method : CHD patients were recruited in a follow up clinic. Usual care included a written pamphlet and brief verbal information regarding the CHD. Patients in the intervention group received an additional health education via an e-health link. E-health link content covered the general knowledge of CHD and walking exercise promotion. Data were collected at baseline and 3 months after recruitment. Measures included total exercise per week, demographic and clinical data. Results : 70 patients completed the study with 48 (69%) male. The mean age was 61.7 years old (SD= 8.19). There was no significance at baseline data. The increase in total exercise time per week in the intervention group was significantly greater than the control group (intervention: 36.4±41.8, control: 8.6±152.7; P=.003) and the estimated effect size of the e-health intervention was 0.29. Positive effects such as increases in the adherence rate, self efficacy

for exercise as well as a positive perception of the usefulness of the e-health link were found in the intervention group. Conclusion : The e-health approach health education is effective in increasing total exercise per week leading to higher exercise adherence rate for patients with CHD. Keywords : Coronary heart disease, e-health, health promotion

ANALYSIS OF THE RELATIONSHIP BETWEEN ARTERIAL STIFFNESS AND AGE IN THE ELDERLY USING THE SPRING CONSTANT METHOD

Ching-Chuan WEI¹, Shu-Wen HUANG², Pi-Shan H SU³, Miao-Yu LIAO⁴ (1. Department of Information and Communication Engineering, Chaoyang University of Technology, Taiwan; 2. Department of Information Management, Chaoyang University of Technology and Taichung Hospital, Taiwan; 3. Department of Family Medicine, Taichung Hospital, Taiwan; 4. Department of Geriatric Medicine, Taichung Hospital, Taiwan)

Introduction : This study aims to investigate the relationship between the arterial stiffness and age in the elderly. Method : We used the spring constant method, which is newly proposed and well validated, to evaluate the arterial stiffness. Based on the blood pressure wave equation, the vibration of arterial well is modeled by the spring oscillation, and then the spring constant used to assess the arterial stiffness is calculated by the radial pulse. The experimental group comprised 56 participants (27 men and 29 women, average age of 66.6 ± 9.6) ranging between 60 and 80 years old. All were subjected to the measurements of pulse at radial artery, and the spring constant was calculated based on them. Results : Statistical analysis of the experimental group indicated a significant negative correlation between the spring constant and age (P < .001; r = - 0.51). The finding implied that the spring constant decreased when the age increased. In other words, the aging of arterial stiffness is more obvious when the person grows older, especially in geriatrics. Conclusion : The spring constant method can be easily calculated. These showed the simplicity in clinical measurement and application. Therefore, the results demonstrated the feasibility of using the spring constant method to monitor the abnormal status of arterial stiffness of the elderly to avoid the cardiovascular diseases. Keywords : spring constant, arterial stiffness, age, radial pulse

PP26 C-004

COMPARISON OF CLINICAL CHARACTERISTICS AND OUTCOMES OF DIABETIC VERSUS NON-DIABETIC ELDERLY PATIENTS WITH PAINLESS MYOCARDIAL INFARCTION

Jaе Yeong CHO¹, Jong Chun PARK², Kye Hun KIM², Hyun Ju YOON² (1. Cardiology, Department of Cardiology, Chonnam National University Hospital, Korea; 2. Cardiology, Chonnam National University Hospital, Korea)

Introduction : Some portion of patients with diabetes mellitus often experience painless myocardial ischemia. However, there are others who are non-diabetic and have painless myocardial infarction. In addition, there are few data available on the prognosis of elderly patients with painless myocardial infarction (PMI). We aimed to investigate whether there is difference of outcomes between diabetic and non-diabetic elderly patients with painless myocardial infarction. Method : Between November 2005 and July 2011, 33,939 consecutive AMI patients were enrolled in Nation Wide Myocardial Infarction Registry (65.3±12.9 years, 25,693 men). We extracted 1,463 elderly patients with painless myocardial infarction. They were divided into

two groups according to presence of diabetes mellitus. (DM Group: n=452, non-DM group: n=999). Primary endpoint was composite of major adverse cardiac events. Results : In-hospital death tended to be more frequent in non-DM group (25.8% vs. 30.4%, p=0.075). One-year outcome tend to be worse in DM group (19.2% vs. 15.6%, p=0.225). Kaplan-Meier analysis showed no difference in 1-year MACE-free survival between groups. Independent predictors of in-hospital death were High Killip class, No PCI and Diabetes mellitus. Independent predictors of 1-Year MACE was Left ventricular ejection fraction (OR 1.862, 95% CI 1.079-3.212, p=0.025). Conclusion : Diabetes did not have critical impact on outcomes after PMI in elderly patients. LV dysfunction was independent predictor of 1-year adverse outcome in elderly patient with PMI. Since LVEF was better in PMI than painful one, low LVEF should be consider as highest risk in risk stratification in this category of patients. Keywords : Elderly, myocardial infarction, diabetes

PP26 C-005

LIMITED MEDICATION KNOWLEDGE PREDICT POOR ADHERENCE TO SELF-CARE IN THE ELDERLY WITH HEART FAILURE BEYOND COGNITIVE IMPAIRMENT

Eun Kyeung SONG¹, Youn-Jung SON² (1. Department of Nursing, College of Medicine, University of Ulsan, Korea; 2. Department of Nursing, College of Medicine, Soonchunhyang University, Korea)

Introduction : Cognitive impairment may be associated with poor adherence to self-care in patients with heart failure (HF). Patient education for medication knowledge is encouraged to improve adherence to self-care, particularly in elderly people with HF. However, the relationships among cognitive impairment, medication knowledge, and adherence to self-care have been unexplored. The purpose of this study was to determine the relationships among these 3 variables. Method : A total of 107 patients with HF over 65 years old completed the Mini-Mental Status Examination (MMSE) by face-to-face interview to assess cognitive impairment. Patients completed the European Heart Failure Self-care Behavior (EHScB-9) to measure adherence to self-care and split by the median score; poor vs. good adherence. Medication Knowledge was used to assess how well patients knew the names, purposes, recommended doses, frequencies, and side effects; lower scores mean more limited medication knowledge. Hierarchical logistic regression was used to determine the relationships among cognitive impairment, medication knowledge, and adherence to self-care. Results : Twenty-nine patients (27%) had normal cognitive function \geq the cut-point of 24 in total MMSE score. The average score of total Medication Knowledge was 13.1(\pm 2.9) with the range of 5 to 22. More limited medication knowledge was independently associated with poor adherence to self-care (OR=1.20, 95% CI=1.01-1.41) in hierarchical logistic regression after controlling for age, gender, NYHA class, educational level, etiology, duration of HF, ejection fraction, total comorbidity score, use of beta blockers, and cognitive impairment. Conclusion : Although most elderly people with HF had cognitive impairment, medication knowledge plays an important role in adherence to self-care. Keywords : cognitive impairment, heart failure, medication knowledge, self-care

PP26 C-006

MICRONUTRIENT DEFICIENCY INDEPENDENTLY PREDICTS HEALTH OUTCOMES IN ELDERLY PEOPLE WITH HEART FAILURE

Eun Kyeung SONG¹, Choung RYOU² (1. Department of Nursing, College of Medicine, University of Ulsan, Korea; 2. Dept of Nursing, Severance Cardiovascular Hosp, Yonsei Univ Health System, Korea)

Introduction : The elderly people are known to be higher risk for micronutrient deficiency. Micronutrient deficiency may be considered as poor adherence to nutritional self-care of patients with heart failure (HF), resulting in adverse health outcome. However, there has been limited research that micronutrient deficiency affects health outcomes. The aim of this study was to determine whether micronutrient deficiency independently predicts adverse health outcomes. Method : A total of 113 consecutive outpatients with HF over 65 years old completed a 3-day food diary to measure intake of 15 micronutrients. The Computer Aided Nutrition Analysis Program for Professionals was used to analyze the food diaries and determine dietary micronutrient deficiencies. Patients completed the Minnesota Living with HF Questionnaire to assess health-related quality of life (HRQoL); higher score means worse HRQoL. Patients were followed for 1 year to determine cardiac-related hospitalization or cardiac death. Hierarchical multiple linear regressions and Cox proportional hazard regressions were used to determine whether micronutrient deficiencies predicted health outcomes. Results : Fifty-one percent of patients had at least 3 micronutrient deficiencies (range 0-14). Calcium, Magnesium, and Vitamin D were the most common micronutrient deficiencies. Micronutrient deficiency was independently associated with worse HRQoL (β =0.187, p=0.025) in hierarchical multiple linear regression. Thirty-nine patients were hospitalized or died during follow-up due to cardiac problems. Number of micronutrient deficiencies independently predicted cardiac event-free survival (hazard ratio=1.14, 95% CI=1.02-1.28). Conclusion : These findings show that elderly people with HF are vulnerable to nutritional self-care. Micronutrient deficiency is an independent predictor of adverse health outcomes in elderly people with HF. Keywords : heart failure, micronutrient deficiency, health outcomes

PP26 C-007

EFFECT OF NIGELLA SATIVA SEED EXTRACT FOR HYPERTENSION IN ELDERLY: A RANDOMIZED CONTROLLED TRIAL

Aulia RIZKA, Siti SETIATI, Aida LYDIA (Internal Medicine, Faculty of Medicine University of Indonesia, Indonesia)

Introduction : The use of herbal agents by elderly is increasing. Since Nigella Sativa (NS) seed extract shows diuretic activity, inhibits sympathetic nerve system overactivity and increases the production of Nitric Oxide, it is potentially used as adjuvant antihypertension for elderly. Aim of the study is to determine the effect of Nigella sativa seed extract on blood pressure of the elderly. Method : A randomized, double-blind controlled trial was conducted in elderly subjects with hypertension in outpatient clinics of Cipto Mangunkusumo National Hospital Jakarta Indonesia on June-September 2011. Intervention group was given 300 mg Nigella sativa seed extract twice daily for 28 days and another group was given placebo. Blood pressure were measured on day 1 and 29. Intention to treat analysis using unpaired t-test to compare blood pressure after intervention between the two groups was performed. Results : Of 85 patients, 76 subjects were fulfilling study criteria and randomized into 2 groups, containing 38 subjects in each group. Both groups were comparable in all important prognostic factors including SBP before intervention which was 159,4 (15,3) mmHg in NS group and 160 (16,2) mmHg in placebo group and also DBP before intervention which was 78,7 (10,9) mmHg in NS group and 79,2(12,8) mmHg in placebo group. SBP of NS group was decreasing to 146,67 (22,4) mmHg and to 143,48 (19,9) mmHg in placebo group (p=0,63). DBP in NS group was decreasing to 75,18 (9,69) mmHg and to 74,2 (10,87) mmHg in placebo group (p=0,59). Conclusion : Nigella sativa does not reduce blood pressure in the elderly. Keywords : Nigella sativa, hypertension, elderly

PP26 C-008

RELATIONSHIP OF TOOTH LOSS AND IMPLANT RELATED TO THE EFFECTS OF PERIODONTAL TREATMENT AMONG PERIODONTAL DISEASE PATIENTS WITH HYPERTENSION

Jae-Mok LEE (*Dept. of Periodontology, School of Dentistry, Korea*)

Introduction : Hypertension is very common disease in Korea. Moreover, prevalence of hypertension is increasing (Min et al. 2010). Hypertension is associated with inflammation (Boos et al. 2005). Elevated inflammatory markers, such as C-reactive protein(CRP), interleukin-6(IL-6) and tumor necrosis factor-(TNF-) were associated with increased risk of developing hypertension(Sesso et al. 2003) and were significantly related to elevated blood pressures. Periodontal disease is characterized by a chronic infection and inflammation in the periodontal tissue leading to the destruction of the bone surrounding the teeth and, ultimately, to tooth loss(Page et al. 1997). An association between periodontitis and cardiovascular disease has been reported in a number of studies. This study was conducted to analyze the effect of hypertension on tooth mortality, implant treatment and prosthetic status among patients with and without hypertension. **Method :** Number of tooth loss and implant treatment at first visit and tooth loss during active treatment was assessed in hypertension group(n=267) and control group(n=291) with moderate to severe periodontal disease. The data was compared using SPSS program. **Results :** The number of tooth loss at first visit was significantly different in two groups(OR:2 .05). Although it is not significantly different, implant treatment history was higher in hypertension group than control group. Hypertension is associated with progressive periodontal disease. Moreover, implant treatment for restoration is considerable restoration treatment option in hypertensive patients. **Conclusion :** In conclusion, a significant association was observed between the extent of tooth loss and hypertension. Therefore, prevention and control of hypertension, supportive periodontal therapy and oral hygiene education should be recommended. **Keywords :** tooth loss and implant therapy in hypertension patients

PP26 C-009

SALT APPETITE IN HYPERTENSIVE AND NORMOTENSIVE OLDER INDIVIDUALS

Patricia Teixeira Meirelles VILLELA¹, Nereida Kilza Da Costa LIMA¹, Paula Teixeira, Meirelles VILLELA², Eduardo Borges OLIVEIRA¹, Julio Cesar MORIGUTI¹, Eduardo FERRIOLI¹, Jose Maria Thiago BONARDI¹, Rodrigo Fenner BERTANI¹ (*1. Clinical Medicine, FMRP-USP, Brazil; 2. Odontology, FORP-USP, Brazil*)

Introduction : Most populations consume more salt than recommended by WHO and high salt intake is an important determinant of hypertension and cardiovascular risk. This study was conducted to evaluate habitual salt consumption and salt preference among hypertensive and normotensive older individuals. **Method :** We studied 28 treated hypertensive (H) and 16 normotensive older individuals (N), mean age of 73.5±7.0 years. French bread with three different concentrations of added salt (421.2, 648.0 and 874.8 mg sodium/100g) were presented to volunteers. Volunteers were instructed to answer a questionnaire, evaluating each sample using hedonic scale of flavor, and in the end of the test they were asked about the preference among samples. 24-hour urinary sodium was collected twice, and blood pressure and body mass index (BMI) were measured in the same day of sensory analysis. Data were analyzed by Fisher's exact test and by unpaired Student "t" test. **Results :** Mean 24-h urinary sodium was greater in H group (H:177±66 mEq, N:141±44 mEq, p = 0.036). Systolic blood pressure showed a tendency to be higher in

hypertensive ones (p=0.08). There was no difference between BMI of both groups. Sixty-eight percent of hypertensive and only 31% of normotensive volunteers preferred the bread sample with higher salt concentration (p=0.06). **Conclusion :** Hypertensive older individuals consume more salt and have higher salt appetite than normotensive ones. **Keywords :** salt appetite, elderly, hypertension

ANTIHYPERTENSIVE AGENTS PRESCRIBING FOR THE ELDERLY HYPERTENSION AT ANHUI PROVINCIAL HOSPITAL IN CHINA - A CROSS-SECTIONAL STUDY

Shilian HU¹, Lei WU², Yin CHEN³, Xiang FANG⁴, Song JIN⁵, Gan SHEN⁶ (*1. Anhui Evidence Based-Medicine Center, Gerontology Institute of Anhui Province, Anhui Provincial Hospital, China; 2. Department of Neurology, Anhui Provincial Hospital, China; 3. Anhui Evidence-based Medicine Center, Anhui Provincial Hospital, China; 4. Department of Gerontology, Anhui Provincial Hospital, China; 5. Department of Cardiology, Anhui Provincial Hospital, China; 6. Gerontology Institute of Anhui Province, Anhui Provincial Hospital, China*)

Introduction : Hypertension is continuously increasing in the elderly population in China. The objective of present study was to assess the prescribing pattern of antihypertensive treatment in the aged hypertensive inpatients at a tertiary public hospital in the central region of China in accordance with the recommendations of current international guidelines. **Method :** A retrospective cross-sectional study was performed from 1 January to 31 December, 2011. Patients (≥60 years old) who have been diagnosed with hypertension based on the JNC-7 guidelines and those who were currently treated with antihypertensive drugs were included. Data were extracted from Health Information System. **Results :** A total of 1584 aged hypertensive inpatients were included with 1209 males vs. 555 female. Among 539 (34.03%) patients receiving monotherapy, Calcium Channel Blockers (CCBs) were the most frequently prescribed drugs (66.73%). Combination therapies were offered to over 60% while the two-drug regimen was preferred for 44.82%. Angiotensin-Converting Enzyme Inhibitors (ACEI)/Angiotensin Receptor Blocker (ARBs) and Beta-blockers (BBs) being the most frequent drug combination (33.89%), followed by the combination of ACEI/ARB with either CCBs(22.78%) or Diuretics(20.22%). The combination of Diuretics (D) and CCBs plus ACEI/Angiotensin Receptor Blocker (ARBs) accounted for only 13.6% of total triple-drug combination(18.62%). **Conclusion :** The patterns appear to be partly in accordance with the recommendations of international guidelines. There was a tendency to use CCBs in the aged hypertensive patients in monotherapy, whereas BBs and ACEI/ARBs were the most prescribed in the combination therapy. The utilization of D was an area that needs to be addressed in the combination therapy. **Keywords :** elderly hypertension, prescription, China

PP26 C-011

EFFECT OF BLOOD PRESSURE LEVEL ON COGNITIVE FUNCTION AND DAILY LIFE ABILITY IN THE VERY ELDERLY HYPERTENSIVE PATIENTS

Juan DUAN (*Geriatrics, The Second Xiangya Hospital, China*)

Introduction : Study of the cognitive function and the ability of daily life status in the very elderly hypertensive patients and the effect of blood pressure levels on cognitive function and ability of daily life. Provide the evidence for clinical intervention measures. **Method :** We randomly assigned 120 patients who were 80 years of age or older. The object is divided into three groups according to the blood pressure

level. To evaluate the daily living ability and cognitive function of research object by ADL and MMSE. Use χ^2 test and logistic regression analysis to evaluate the independent risk factors for cognitive function and daily life. Results : There was no significant difference among 3 groups in ADL \pm 0.05%. Group B had significantly higher MMSE score than group A, $P < 0.05$, and there was no statistical significance between group A \pm 0.05%. Age, PP, TCD and history of cerebrovascular disease are independent risk factors for cognitive function \pm 0.05%. Age, diabetes mellitus and ABI are independent risk factors for daily life ability \pm 0.05%. Conclusion: 1 The level of blood pressure is related to cognitive function in the very elderly hypertensive patients. Pulse pressure, age, history of cerebrovascular disease, cerebral blood flow and 24 hour urinary albumin is the independent risk factors of cognitive function. We should control the level of blood pressure in order to maintain and improve the cognitive function in the very elderly hypertensive patients. 2 The level of blood pressure do not affect the ability of daily life directly. Age, diabetes, ABI are independent risk factors of ADL. Keywords : Very elderly hypertensive patients; Activity of daily living; Cognitive function

PP26 C-012

AGING-RELATED DECLINE OF ELASTICITY OF BLOOD VESSEL IS THE MAIN FACTOR OF VASCULAR SENESCENCE

Xiaojuan BAI, Huimeng QI, Hongyu ZHOU, Bing WU (Departments of Gerontology and Geriatrics, The First affiliated Hospital of China Medical University, China)

Introduction : To explore the ankle brachial index (ABI) and brachial-ankle pulse wave velocity (baPWV) in the same group of healthy people in longitudinal section. To investigate the elasticity of blood vessel decreasing rate with aging. Method : Based on the healthy people cohort in 2008 in Shenyang, the healthy people were divided into ≤ 44 years old, 45-54 years old, 55-64 years old, 65-74 years old and ≥ 74 years old groups according 2008 age. We conduct 310 self-control analysis after 3 years later. They finished biochemistry, carotid ultrasonograph, limb blood pressure detected by arteriosclerosis detector (systolic blood pressure, diastolic blood pressure, pulse pressure), baPWV, ABI and so on. Results : There are significant differences between serum total cholesterol, lower-density lipoprotein, systolic blood pressure, diastolic blood pressure, pulse pressure, ABI, baPWV, ABI changed value and baPWV changed value in different groups in 310 healthy people ($P < 0.05$). There are positive correlation between serum lower-density lipoprotein, serum uric acid, systolic blood pressure, diastolic blood pressure, pulse pressure, ABI, baPWV, baPWV changed value and age ($P < 0.05$). There is negative correlation between ABI changed value and age. There are significant differences of high-density lipoprotein, lower-density lipoprotein, serum uric acid, fasting plasma glucose, systolic blood pressure, diastolic blood pressure, pulse pressure, ABI, baPWV in the twice examination ($P < 0.01$) after self-control analysis. Conclusion : There are association between age and ABI and baPWV. Elasticity of blood vessel decreased induced by aging is the main factor of vascular senescence. Keywords : aging; ankle brachial index; brachial-ankle pulse wave velocity

PP26 C-013

LACK OF INDEPENDENT RELATIONSHIP BETWEEN NORMAL AGING-RELATED KIDNEY AND CARDIAC DIASTOLIC FUNCTION DECLINES IN A HEALTHY CHINESE POPULATION

Lulu HAN¹, Xiaojuan BAI¹, Hongli LIN², Xuefeng SUN³, Xiangmei CHEN³ (1. Departments of Gerontology and Geriatrics, The First affiliated Hospital of China Medical University, China; 2. Department of kidney, Dalian Medical University, China; 3. Department of kidney, General Hospital of Chinese PLA, China)

Introduction : Age-related changes in kidney structure and function have been well documented. This study aimed to assess the relationship between declines of normal aging-related kidney function and cardiac diastolic function in a healthy Chinese population. Method: 852 healthy adults aged 30-98 years were enrolled and divided into four groups according to quartiles of estimated glomerular filtration rate (eGFR) and cystatin C (CYSC). Cardiac diastolic function was measured by ratio of peak velocity of early filling to peak velocity of atrial filling (E/A), which was derived by B-mode echocardiography. Lower E/A was defined as measures under the 25th percentile of sample distribution (0.784). Results : Both eGFR and CYSC were significantly correlated with age (eGFR: $r = -0.102$, $P < 0.01$; CYSC: $r = 0.544$, $P < 0.01$). Age was significantly associated with E/A ($r = -0.381$, $P < 0.01$). Binary logistic regression analysis revealed that second, third and fourth quartile groups of CYSC were associated with lower E/A in an unadjusted model with odds ratios of 2.49 (1.403-4.419), 4.177 (2.368-7.37), and 7.614 (4.387-13.217), respectively. However, this association was lost after full adjustment. eGFR was only associated with lower E/A in group IV (fourth quartile; 2.058, 95% CI: 1.3-3.258) in an unadjusted model, and this association was lost after age adjustment. Conclusion : We conclude that aging is a major factor contributing to declines in kidney and cardiac diastolic function in a healthy population but there is no independent relationship between normal aging-related kidney and cardiac diastolic function declines. Keywords : cystatin C, glomerular filtration rate, cardiac diastolic function

MICROSCOPIC POLYANGIITIS : A CASE REPORT IN A TUNISIAN MAN OF SIXTY

S. EL AOUD¹, S. MARZOUK¹, Radhouane GOUIAA², M. ABBES¹, F. FRIKHA¹, M. JALLOULI³, Y. CHERIF¹, M. SNOUSSI¹, Z. BAHLLOUL¹ (1. Internal Medicine, Hedi Chaker Hospital, Tunisia; 2. Polyclinique CNSS - Sfax, Tunisian Association of Gerontology, Tunisia; 3. Internal Medicine, Hedi Chaker ospital, Tunisia)

Introduction : Microscopic polyangiitis (MPA) was first recognized as a separate disease entity in 1948 in a subgroup of polyarteritis nodosa (PAN) patients. It usually occurs in patients older than 50 years. Method : Results : Case report : A 69-year-old man developed hemorragic stroke after two episodes of transient dysarthria and left hemiplegia, a typical manifestation of capsular warning syndrome. Electromyography has shown mononeuritis multiplex in both upper and lower extremities. However, he has others systemic manifestations, such as inflammatory polyarthralgia involving small and large joints and hemoptysis. The renal analysis showed a microscopic haematuria ($H = 20000$ elements/mm³), a proteinuria (1.68 g/24h) and decreasing of renal function (creat = 190 μ mol/l). The titer of anti-myeloperoxidase anti-neutrophilic cytoplasmic antibodies (p-ANCA) was elevated. Renal specimens show focal segmental necrotizing glomerulonephritis without any immune deposition. Bronchoalveolar lavage confirmed alveolar hemorrhage. The patient was diagnosed with MPA. he received corticosteroid therapy and cyclophosphamide at the dose of 1 g as monthly intravenous pulses. Conclusion : Discussion: MPA is a necrotizing vasculitis involving the small vessels without granulomatous inflammation. The usual clinical presentation is significant renal disease. Neurological manifestations

are at the most peripheral, found in only 14-36% of the cases. However central nervous system complications are rarely reported especially cerebral thrombosis MPA commonly affects patients with advanced age. Early identification and treatment of this disease is important to improve the prognosis and prevent mortality. Keywords : Microscopic polyangiitis Elderly

ANTIPHOSPHOLIPID SYNDROME IN THE ELDERLY: FIVE CASE REPORTS

Yosra CHERIF, Moez JALLOULI, Sameh MARZOUK, Radhouane GOUIAA, Makram FRIGUI, Mouna SNOUSSI, Zouhir BAHLOUL (Internal Medicine, University Hospital, Sfax-Tunisia, Tunisia)

Introduction : The antiphospholipid syndrome (APS) is characterized by the occurrence of venous or arterial thrombosis or miscarriage, associated with a laboratory evidence of antiphospholipid antibodies (aPL). The first vascular event usually occurs in young adults and rarely in people over 65 year-old. Method : We gathered five among 67 patients considered to have APS based on the Sapporo classification criteria, whose the age of onset was over 65 years. Results : Five patients, 3 men and 2 women, were diagnosed with APS. The mean age at diagnosis was 78 years (70-84). 3 patients have deep venous thrombosis of the lower limb, one has venous thrombosis of the upper limb and brachiocephalic vein and one has central retinal vein occlusion associated with a cerebral ischemic stroke. Significant amounts of antibodies to α_2 -glycoprotein I were found twice in 2 patients. The anticardiolipin antibodies were positive twice in 3 of them. No deficiency in natural coagulation inhibitors was found. All patients were treated with heparin and long-term anti-vitamin K and thrombosis were cleared in all cases. Two of them were presented with bleeding complications: Hematuria and hematoma in one patient and rectal bleeding in another case. One of them developed one year after a colon cancer. Conclusion : APS is scarce in elderly and there clearly are no differences in the spectrum of clinical findings compared to younger. An intensive search for cancer is prompted in these patients. Treatment for these patients should be given carefully, since age has been demonstrated to be a risk factor for severe bleeding episodes. Keywords : Antiphospholipid, thrombosis, elderly

PP26 C-016

A METHOD TO ESTIMATE THE CONFIDENCE INTERVAL AROUND A MULTIVARIABLE RISK SCORE PREDICTION

Wonsuk YOO¹, Brian A. FERENCZ², Issa ALESH³ (1. Dept. of Community Health and Preventive Medicine, Morehouse School of Medicine, USA; 2. Translational Research and Clinical Epidemiology, Centre for Evidence Based Medicine, Wayne State School of Medicine, University of Oxford, USA; 3. Division of Cardiovascular Medicine, Wayne State University School of Medicine, USA)

Introduction : Multivariable risk scores predict an individual patient's risk of disease based on that person's unique combination of risk factor values (e.g. Framingham Risk Score). However, the risk scores produce only a point estimate of risk for each person, with no estimate of the precision of that risk estimate. Method : Using NHANES individual patient level data, we calculate the Framingham Risk Score (FRS) and Reynolds Risk Score (RRS) for all patient in the NHANES data set with 95% CI, and compare the predicted FRS and RRS for each person to determine if the point estimates are similar and if one of the scores has consistently smaller IQR. Results : We resampled 10000 variables of age, sbp, cholesterol, HDL, and hsCRP from normal distributions. The average of 1000 point estimates are far greater than 0.204 and empirical 95% confidence interval for risk prediction is so

large (0.03-0.99). Conclusion : The results suggest that the current risk prediction models (Reynolds, Framingham, and QRISK) are so imprecise that they do not provide any meaningful information, assigning patient's to risk categories (low, intermediate, and high) based on their risk scores is too imprecise and therefore should NOT be used to make treatment decisions. Keywords : Framingham risk score, Reynold risk prediction model, empirical confidence interval

PP26 C-017

OXIDATIVE STATUS IN ELDERLY PATIENTS WITH DIABETES MELLITUS AND FALLS INCIDENCE

Andrei ILNITSKI¹, Kiryl PRASHCHAYEU², Natalja POZDNIJAKOVA² (1. Clinical Gerontology, Belarusian Association of Gerontology and Geriatrics, Belarus; 2. Clinical Gerontology, Non-commercial Organization, Researching Medical Centre 'Gerontology', Russia)

Introduction : The research purpose is to examine the contents of sulfhydryl (SH) groups and malon dialdehyde in elderly patients with diabetes mellitus and falls incidence. Method : The 1st group includes 52 elderly persons (men - 23, women - 29), from 60 to 74 years old, with the group average age of 64.2+2.2 years. The 2nd group includes 37 middle-aged persons (men - 16, women? 21), from 40 to 49 years old, with the group average age of 46.1+3.0 years. Results : The middle-aged and elderly patients had the following SH group level: in the group with falls incidence, DM in combination with AH ? 318.3+4.7 and 285.1+3.7 μ mol/L; with dyscirculatory encephalopathy? 319.1+4.5 and 287.2+3.3 μ mol/L; with diabetic arthropathy? 318.9+3.9 and 288.1+3.1 μ mol/L; with CHD ? 318.5+3.5 and 287.2+3.1 μ mol/L; with anxiety-depressive syndrome ? 319.1+3.1 and 288.4+3.2 μ mol/L; with diabetic retinopathy ? 318.7+3.4 and 289.1+3.1 μ mol/L; which is significantly higher than in those with metabolic syndrome ? 301.5+2.3 and 215.2+2.1 μ mol/L, diabetic polyneuropathy ? 302.8 +2.2 and 214.9 +2.2 μ mol/L, dyscirculatory encephalopathy with cerebral infarction consequences ? 302.4+2.1 and 215.1+2.3 μ mol/L, $p < 0.05$. The following MDA levels were found in middle-aged and elderly patients statistically negative situation for elderly too ($p < 0.05$). Conclusion : The study of oxidative status for diabetes mellitus, its complications and related clinical conditions has revealed that elderly patients with diabetes mellitus and falls incidence are characterized by significantly more expressive changes of oxidative homeostasis to pro-oxidant side in comparison with middle-aged patients. Keywords : diabetes mellitus

PP26 C-018

THE EFFECTS OF MEAL CALORIE VARIATION ON METABOLIC SYNDROME, HYPERTENSION, DIABETES MELLITUS

Bumjo OH¹, Min Sun PARK² (1. Department of Family Medicine, SMG-SNU Boramae Medical Center, Korea; 2. Department of Family Medicine, Seoul National University Hospital, Korea)

Introduction : There are few studies about association between meal calorie variation and metabolic syndrome, hypertension, diabetes mellitus in healthy populations. This study was done to assess the association of meal calorie variation and metabolic syndrome, hypertension, diabetes mellitus. Method : A total of 4,512 subjects were selected. The diagnosis of metabolic syndrome was made according to the criteria of NCEP-ATP III established in 2001 with Asia-Pacific waist circumference. We defined meal calorie variation as the standard deviation of four meal's calorie (breakfast, lunch, dinner, snacks). To examine the association between the metabolic syndrome components and meal calorie variation, we used the method of

multiple linear regression analysis. To examine the association between the metabolic syndrome, hypertension, diabetes mellitus and meal calorie variation, we used the method of multiple logistic regression analysis. Results : The prevalence of the metabolic syndrome, hypertension, and diabetes mellitus in our subjects was 30.6%, 26.5%, 8.7%. Increased meal calorie variation was not associated with the components of metabolic syndrome. The only significant finding was that HDL-cholesterol was associated negatively with increased meal calorie variation in men. ($\beta=-4.73$, P value=0.003) Unfortunately, meal calorie variation was not associated with the prevalence of metabolic syndrome, hypertension, diabetes mellitus. Conclusion : After statistical adjustment for age, body mass index, smoking, total calorie intake, physical activity, regular exercise, total alcohol intake, total carbohydrate, fat, protein intake, monthly income, the meal calorie variation was not associated with the metabolic syndrome, hypertension, diabetes mellitus. Keywords : metabolic syndrome, meal calorie variation, diabetes mellitus

PP26 C-019

THE ASSOCIATION OF SERUM VITAMIN D LEVEL AND METABOLIC SYNDROME IN ELDERLY KOREAN WOMEN

Chang-Hae PARK (Department of Family Medicine, Eulji University Hospital, Department of Preventive medicine, Chungbuk National University, Korea)

Introduction : Vitamin D status, as indicated by 25-hydroxyvitamin D (25-(OH)D), is inversely associated with glucose homeostasis, lipid profiles, and blood pressure. Evidence on the association of vitamin D with metabolic syndrome (MS), however, is very limited in elderly women. Therefore, we investigated the association between them in this study. Method : This study was a cross sectional study including 198 elderly Korean women who visited a health promotion center in a university hospital from January 2010 to May 2011. MS was defined according to the AHA/NHLBI criteria and the Korean Society for the Study of Obesity. MS and its individual components were assessed as well as serum 25-(OH)D levels with multiple logistic regression analysis. Results : The overall prevalence of the MS in participants of this study was 55(27.2%). After multiple adjustments, compared with the highest quantile serum 25-(OH)D level group (18.5-45.4 ng/mL), the odds ratio for MS in the lowest level group (4.3-8.0 ng/mL) was 2.72 (95% CI=1.06-6.95), in the lower level group (8.1-12.5 ng/mL) was 1.70 (95% CI=0.65-4.46), and in the intermediate level group (12.6-18.4 ng/mL) was 1.62 (95% CI=0.60-4.35). Among the components of metabolic syndrome, the odds ratios for abdominal obesity, impaired fasting glucose, elevated blood pressure, low HDL cholesterol level, and high triglyceride level in the lowest serum 25-(OH)D level group were 2.70(0.78-9.34), 1.48(0.61-3.60), 1.49(0.57-3.92), 2.15(0.89-5.22), and 2.44(0.98-6.07), respectively. Conclusion : We found that a low serum 25-(OH)D level is significantly associated with the presence of MS in elderly Korean women. Keywords : Vitamin D, metabolic syndrome, abdominal obesity

PP26 C-020

THE EFFECT OF HIGH-DOSE VITAMIN D SUPPLEMENTATION ON GLYCEMIC CONTROL AND ARTERIAL STIFFNESS

Hyung Joon YOO¹, Ok Hyun RYU², Sung Hoon YU³, Sung Hwa Lee LEE⁴ (1. Dept. of Internal Medicine & Geriatrics, Hallym Univ. School of Medicine, Kangnam Sacred Heart Hospital, Korea; 2. Department of Internal Medicine, School of Medicine Hallym University, Korea; 3. Department of Internal Medicine, Hallym Univ. Kangnam Sacred Heart Hospital, Korea; 4. Internal Medicine, Hallym Medical Center, Korea)

Introduction : Vitamin D deficiency is very common in Korea. Recent epidemiologic studies showed the striking inverse relationship among vitamin D level, cardiovascular disease, and insulin resistance/glucose intolerance. But there are few interventional studies that evaluate the causal relationship among vitamin D, glycemic control, and vascular function. We investigated the role of high-dose vitamin D. Method : We enrolled type 2 diabetic patients who took antidiabetic agents or managed diabetes by lifestyle modification. We excluded patients who took vitamin D or calcium. We also excluded chronic kidney disease patients (in men: $Cr>1.5$ mg/dL, in women: $Cr>1.4$ mg/dL) and heavy alcoholics. We randomized participants into 2 groups: intervention group (Vitamin D 2000IU/day+Calcium 200mg/day) or placebo group (Calcium 200mg/day). We compared HbA1c, brachial-ankle pulse wave velocity (baPWV) for the study period. Results : We randomized 81 participants into placebo (n=41) and intervention (n=40) group. There was no difference in glycemic control (HbA1c 7.54±0.50% vs 7.50±0.49% in placebo and intervention group, respectively), diabetes duration, oral antidiabetic agents, body mass index, and baPWV between groups. 62 participants completed the 24-week study. In the end of study, HbA1c was 7.49±0.62% in placebo group and 7.63±0.69% in intervention group ($P=0.417$). There was no difference in adjusted means of baPWV (Rt baPWV 1498±46cm/sec vs 1549±42cm/sec, Lt baPWV 1478±49 vs 1542±44cm/sec) after controlling for age, sex, diabetes duration, and pulse pressure. Conclusion : Daily 2000 IU vitamin D supplementation in short-term period may be ineffective in lowering blood glucose and ameliorating peripheral arterial stiffness. Keywords : high-dose vitamin D supplementation, glycemic control, arterial stiffness

PP26 C-021

ERYTHROCYTES AS TARGET CELLS IN CASE OF DIABETES MELLITUS IN ELDERLY

Kiryl PRASHCHAYEU¹, Andrei ILNITSKI², Tatiana PAVLOVA³, Natalja POZDNIJAKOVA¹ (1. Clinical Gerontology, Non-commercial Organization 'Researching Medical Centre 'Gerontology', Russia; 2. Clinical Gerontology, Belarusian Association of Gerontology and Geriatrics, Belarus; 3. Pathology, Belgorod State University, Russia)

Introduction : The research purpose is to provide morphofunctional characteristics of red blood cells in case of diabetes mellitus in elderly. Method : 67 patients from 28 to 77 years old. Light microscopy, scanning electron microscopy, scanning probe microscopy. Results : In case of DM type 1, not more than 10-15% of unchanged discocytes were detected. 20% discocytes had multiple excrescences, mulberry-shaped cells were also found among such discocytes. There were discocytes with crest ridges, spherical discocytes, including spherical red blood cells with excrescences. About 5% of red blood cells had the shape of deflated balls and were burned-out. All that indicated both erythron disfunction and progressing cell destruction in blood channels. In addition, both microcytes (5.49 μ m) and macrocytes (8.36 μ m) were observed, which was indicative of poikilocytosis. In average, cells (6.5±0.5 μ m) were smaller than those of the standard size (7.5). Red blood cells of the patients with DM type 2 were mostly in the form of discocytes. Poikilocytosis appeared in a lesser degree than in the previous group and was indicated mostly by macrocytes (8.72 μ m). Average size of cells was 7.0±0.5 μ m, which is still somewhat lesser than the standard size. In this group we observed significant membrane flexibility during the contact of cells with each other, which exceeded the rates in the control group. The situation in elderly were more catastrophically than in younger and middle-age patients. Conclusion : Erythrocytes can be deemed to be target cells in case of diabetes mellitus. The data obtained about morphofunctional changes should be taken into account. Keywords : erythrocytes, diabetes mellitus

PP26 C-022

HIDDEN OBESITY AND RISK OF LIFE-STYLE RELATED DISEASE IN THE ELDERLY JAPANESE

Hiroshi SHIMOKATA¹, Fujiko ANDO², Masafumi KUZUYA³
(1. Department for Development of Preventive Medicine, National Center for Geriatrics and Gerontology, Japan; 2. Department of Sports and Health Sciences, Aichi Shukutoku University, Japan; 3. Department of Geriatrics, Nagoya University, Japan)

Introduction : Obesity is relatively rare but prevalence of life-style related disease is not low in Japanese elderly population. Hidden obesity with low BMI and high body fat percentage may be a risk of life-style related disease. The purpose of this study is to clarify the risk of life-style related disease by hidden obesity in the elderly. Method : Subjects were 57,244 men (age at the first visit 46.0±9.8 years, age range 17 to 92 years) and 34,884 women (44.8±10.1 years, 18 to 89 years) who had a comprehensive medical checkup between year 2000 and 2011. Obesity was defined as BMI≥25. Hidden obesity was defined as BMI<25 and percent body fat≥20% in men and ≥30% in women. Risks of diabetes, hypertension, and dyslipidemia by hidden obesity were estimated in the elderly subjects and compared with those in young and middle-aged subjects using generalized estimation equation (GEE). Results : Odds ratios of diabetes, hypertension, and dyslipidemia were estimated in the hidden obese elderly born before 1930's compared with those in the non-obese elderly. Odds ratios of diabetes were 1.21 (95%CI: 1.08-1.36) in men and 0.92 (0.68-1.34) in women. Odds ratios of hypertension were 1.30 (1.14-1.48) and 1.40 (1.12-1.75), and odds ratios of dyslipidemia were 1.87 (1.66-2.09) and 1.78 (1.48-2.14), respectively. These odds ratios in the elderly were smaller than those in young and middle-aged population born after 1940's, but were significant except diabetes in the elderly women. Conclusion : Hidden obesity was a risk factor of life-style related disease in the elderly Japanese. Keywords : hidden obesity, life-style related disease, longitudinal study

PP26 C-023

WEIGHT-LOSS INDUCED CHANGES IN RMR: ASSOCIATION WITH LEPTIN AND ADIPONECTIN LEVELS

Mathieu MALTAIS, Martin BROCHU, Isabelle DIONNE (Faculty of Physical Education and Sports, University of Sherbrooke, Canada)

Introduction : Weight loss induced by caloric restriction and resistance training may affect resting metabolic rate (RMR) in obese postmenopausal women in two different ways, with some studies showing an increase in RMR and some showing a decrease in RMR. These differences could be explained by different adipokine response. Adiponectin and leptin seem to have a role on energy metabolism, hunger and/or glucose homeostasis. Method : 28 obese postmenopausal women were separated into two different groups and pooled by baseline fat mass, depending on RMR response. Subjects who increased RMR after resistance training and weight loss intervention and subjects who decreased RMR after intervention. Fat mass was measured by DXA, RMR by indirect calorimetry and leptin/adiponectin by radioimmunoassay procedures. Results : Leptin values were significantly different between groups (p<0,05), but not adiponectin. As such, leptin increased in the RMR+ group and decreased in the RMR- group. Fat mass significantly decreased in the RMR- group only (p<0,05). Pearson correlation analysis indicated a significant and positive relationship between RMR and leptin (r=0,56, p<0,01) as well as with fat mass (0,6 p<0,001). Linear regression analysis indicated that leptin is a significant predictor of RMR. Conclusion : Surprisingly, the results of this study shows that an increase in RMR is explained by the increase in leptin levels, rather

than changes in fat mass and muscle mass, which was non-significant. Also, when losing fat mass, leptin levels seem to decrease and this is related to a decrease in RMR values, which could explain the yo-yo effect subjects encounter when weight loss is present. Keywords : Weight loss and resistance training, Resting metabolic rate, Leptin

PP26 C-024

LIFESTYLE MODIFICATION REALLY WORKS FOR DIABETES CONTROL

Yin-Ming LI (Family Medicine, Buddhist Tzu Chi General Hospital, Tzu Chi University, Taiwan)

Introduction : Lifestyle modification really works for diabetes control. Method : Here we presented a case of weight reduction with excellent diabetes control. Results : A dentist, a victim of breast cancer aged 55, who had underwent surgery for breast cancer and chemotherapy at 49 years old. Diabetes was accidentally diagnosed at regular follow up, fasting serum blood sugar 300 mg/dl and HbA1c 11.3%. She was obese, body weight 71.5 kg and body height 154 cm. She visited a general practice clinic and oral medical medication (Glipizide 5 mg once daily) was given for sugar control. After a consultation of lifestyle modification, she determined to change her lifestyle. She quit her favorite coke and candy and adopts a healthy lifestyle- small meals and 30 minutes walking three times daily. Her body weight was decreased by 1.5 kilogram weekly. She also actively monitors her blood sugar and body weight at home. After one month she started to control her diabetes with "Glucophage" 500 mg twice a day instead of Glipizide. Six months later, her body weight was 53 kg and good blood sugar control- fasting sugar 100 mg/dl and HbA1c 5.3%. One year later her fasting sugar was 89 mg/dl, HbA1c 5.4%, low density cholesterol 79 mg/dl, decreased from 119 mg/dl. Conclusion : This case once again proves that weight reduction really works at diabetes control. Patient's active role is crucial at chronic disease management. Family physicians should make effort in encouraging patients' self lifestyle modification. Keywords : obesity, weight reduction, diabetes

PP26 C-025

THE RELATIONSHIP BETWEEN URIC ACID AND METABOLIC SYNDROME IN THE ELDER TAIWANESE

Sung Lin HU¹, Min Chun CHAO¹, Ming May LAI¹, Chia Ing LI¹, Chiu Shong LIU², Cheng Chieh LIN³, Wen Yuan LIN³ (1. Department of Family Medicine, China Medical University and China Medical University Hospital, Medical Research, China Medical University Hospital, Taiwan; 2. Department of Family Medicine, China Medical University and China Medical University Hospital, School of Medicine, Taiwan; 3. Department of Family Medicine, China Medical University and China Medical University Hospital, School of Medicine, Graduate Institute of Clinical Medical Science, Taiwan)

Introduction : Elevated serum uric acid level increased the risk of metabolic syndrome (MetS) in general population. This relationship between uric acid and metabolic syndrome, however, is not clear in the elderly. We aim to investigate the association between uric acid and metabolic syndrome prevalence in the elder Taiwanese. Method : All individuals aged 65 and over were recruited in Taiwan. A total of 1093 subjects, out of 1774 registered residents, were contacted by face-to-face interview. The response rate was 61.6 %. However, only 588 subjects with serum uric acid level and completed questionnaires were kept for final analyses. Hyperuricemia was defined as more than 7.5 gm/dL in men and 6.5 gm/dL in women. Multiple logistic regression analysis was used to estimate the association between MetS and hyperuricemia. Results : There were 187 subjects corresponding to the definition of MetS. After adjustment for age, sex, social habit

(cigarette smoking, alcohol consumption, betel nut chewing and exercise), and chronic kidney disease, the ORs (95% CI) of having MetS among subjects with hyperuricemia were 1.93(1.33-2.79), compared with subjects with normouricemia. We also found that the prevalence of the individual components (elevated BP, hypercholesterolemia, hypertriglyceridemia) of MetS were higher in subjects with hyperuricemia than in subjects with normouricemia after adjustment for potential confounders. Conclusion : Elevated serum uric acid level was associated with the prevalence of MetS and its components in the elderly Taiwanese. Keywords : hyperuricemia, metabolic syndrome, uric acid

PP26 C-026

ASSOCIATION OF METABOLIC SYNDROME WITH SMOKING, ALCOHOL CONSUMPTION, TEA CONSUMPTION AND EXERCISE AMONG CHINESE NONAGENARIANS/CENTENARIANS

Li LUO, Qiukui HAO, Birong DONG (Department of Geriatrics, West China Hospital, S.C.U, China)

Introduction : Metabolic syndrome (MetS) which includes obesity, hypertension, dyslipidemia and insulin resistance has been shown to cause many adverse events among the old people. There is no study to observe the association of metabolic syndrome with habits of smoking, alcohol consumption, tea consumption and exercise among very old people. In this study, we aimed to examine the relationship between metabolic syndrome and these habits among the oldest-old people using a cohort of Chinese aged 90-108 years. Method : A cross-sectional study based on The Project of Longevity and Aging in Dujiangyan which is a population-based study of 870 people aged 90 years and more. Venous blood samples were collected after an overnight fast in order to measure the biochemistry indicators. Results: Among the 662 participants for this analysis, the mean age was 93.5±3.3 years (range 90-108 years) .The total prevalence rate of Metabolic Syndrome was 9.8%.There were significant differences between the participants with and without Mets among the habits of smoking, tea consumption(former and current) and current habit of exercise.(p<0.05).After adjustment for age, gender and cognitive function, there was no statistic significant odds ratio for Mets among all these habits. Conclusion : For Chinese Nonagenarians/ Centenarians, among these habits (current and former) of smoking, alcohol consumption, tea consumption and exercise, there seems no significant association of Mets. Keywords: metabolic syndrome, Nonagenarians/Centenarians, exercise

PP26 C-027

RELATION BETWEEN THE NUMBER OF MEDICATION AND THYROID HORMONES IN THE ELDERLY

Silvana Oliveira E. SILVA¹, Mariana AROEIRA-NEVES¹, I. Thien CHAN², Andressa SIMOES², Helder R. De GIVIGI², Julia ALMEIDA², Leticia B.B. De M. TEXEIRA¹, Michele Lopes FAGUNDES¹, Patricia F.S. TEIXEIRA¹, Mario VAISMAN¹, Carlos Montes PAIXAO JR³ (1. Endocrinologia, Universidade Federal do Rio de Janeiro, Brazil; 2. Faculdade de Medicina, Universidade Federal do Rio de Janeiro, Brazil; 3. Clinica Medica -Geriatrics, Universidade Federal do Rio de Janeiro, Brazil)

Introduction : The number of medication and thyroid diseases are both prevalent in the elderly population and the number of drugs that disturb the metabolism of thyroid is crescent. Is our goal to observe if the use of many medications is associate with subclinical hypothyroidism (SH) (defined by normal T4 free and high TSH) and which classes of medication are more related to it. Method : We

interviewed 270 geriatric outpatients > 65 years old at the Hospital Universitario Clementino Fraga Filho that do not use levothyroxine replacement or have hyperthyroidism or used contrast in the last 6 months. They were submitted to a questionnaire, dosage of the thyroid hormones (TH) and chart review. Those patients or their caregiver signed a consent form earlier approved by the Ethics Committee of the hospital. Results : There is significant association SH with the number of medications used (p=0,017) on the group with <85 years old (mean age 77,46 years old). No significant association was found when the total sample and >85 years old were analyzed. The medications classes studied (lipid-lowering drugs, antidepressants, cholinesterase inhibitors and memantine, other psychotropic drugs, hypoglycemic and antihypertensive drugs) were not associated with SH. Conclusion : The amount of medication classes may influence TH levels, but none of the classes studied were related to it. Other classes might be implicated or the association of these drugs may disrupts the metabolism of the TH. Maybe the results of the older patient group could not be associated by the sample size. Keywords : elderly, polypharmacy, hypothyroidism

PP26 C-028

THE INQUIRY ABOUT THE AGE-ASSOCIATED CHANGES OF THYROID FUNCTION AND AGING---ANALYSIS OF 1540 COHORT PERSONS

Yongxing MA, Pei-Fang LU, Ri-Ping HAN (Department of Aging, Antiaging and Cognitive Function, Shanghai Institute of Gerontology and Geriatrics, Affiliated Huadong Hospital, Shanghai Medical College, Fudan University, China)

Introduction : To observe the basal value aging changes of thyroid function (T.F.) and sub clinical decrease of thyroid function in the adults and elderly. Including aged ≥85 yrs. old in 1540 persons. Method : To study the basal values of T3, T4, FT3, FT4 and TSH with BM in the elderly and the relationship between TSH and T3, T4, FT3 and FT4. Of every five years groups in randomised cohort sample with 1540 persons (45-90 years. M 1367, F 173) of healthy care objects in HuaDong Hospital. The mean value of TSH revealed TSH of 0.8609-4.03039 mIU/L in 1231 patients (Group A), TSH of ≥4.3039 mIU/L in 174 patients (Group B) and TSH of < 0.8609 mIU/L in 99 patients (Group C). Results : He mean value (M±SD) of combined statistical results of M+F in various age groups in 1540 cohort persons. 2. The mean value (M±SD) of M+F combined statistical results in ≥70yrs. group: Conclusion : 1.There was significant decreasing of the mean value of T3 and T4 on the whole with aging. No significant aging decreasing of FT4 and FT3 as a whole except aged over 85 years were found. 2. Level of TSH was significantly increased on the whole with aging but decreased in aged > 90 years. Keywords : Thyroid function; Aging changes; Aging changes of thyroid function

PP26 C-029

HIGHER RATES OF TRANSIENT HOARSENESS AND HYPOCALCAEMIA AMONG ELDERLY PATIENTS UNDERGOING TOTAL THYROIDECTOMY

Ioannis Emmanouil PETRAKIS, Konstantinos LASITHIOTAKIS, Alexandros ANDREOU, Maria VENIANAKI, George CHALKIADAKIS (General Surgery, University Hospital of Heraklion Crete, Greece)

Introduction : Multinodular goiter and thyroid cancer become more prevalent with increasing age. Herein, we assess the prevalence of thyroid cancer and long term outcomes of patients older than 65 years undergoing total thyroidectomy for endemic multinodular goiter. Method : We retrospectively assessed all consecutive patients

undergoing total thy-roidectomy for multinodular goiter between January 1990 and October 2008. Demographics, clinical presentation, pathological characteristics and long term postop-erative outcomes were collected from the prospectively maintained electronic data-base of the department and all thyroid cancer patients underwent telephone interview with the use of structured form. Results : Among 1.161 patients included in the study, there were 183(15.7%) patients older than 65years. Elderly patients presented with larger goiter but the prevalence of thyroid cancer was not significantly different than younger patients (21.4% vs. 23.1%, P=0.97). Transient postoperative hypocalcaemia was significantly more com-mon in the elderly (34.9% vs. 23.7%, P=0.002). There was a trend towards higher rates of transient postoperative hoarseness in the older age group (39.5% vs. 24.6%, P=0.06). Within a median follow-up time of 78.5 months similar rates of disease re-currence (90.7% vs. 93.2%, P=0.558) and mortality (2.3% vs. 0.9%, P=0.137) were noted between patients older and younger than 65 years. Conclusion : In this hospital based sample, the prevalence thyroid cancer after total thyroidectomy for multinodular goiter is similar between patients older and younger than 65 years old. However, older patients experience higher rates of transient post-operative hoarseness and hypocalcaemia. Keywords : total thyroidectomy, multinodular goiter, thyroid cancer, elderly,

PP26 C-030

THE RELATIONSHIP BETWEEN DIABETES AND COLORECTAL ADENOMA IN THE ELDERLY

Hsinen HUANG, Yi-Ching YANG, Jin-Shang WU, Ru-Hsueh WANG, Feng-Hwa LU, Chih-Jen CHANG (*Department of Family Medicine, National Cheng Kung University Hospital, Taiwan*)

Introduction : Diabetes is considered as a risk factor for colorectal cancer. In the previous studies, the association between diabetes and colorectal adenoma is inconsistent. However, there is no study on the relationship between diabetes and colorectal adenoma in the elderly. The aim of this study was to investigate the association between diabetes and colorectal adenoma in the Taiwanese elderly population. Method : A total of 1277 participants consisted of 758 men and 519 women with ages more than 60 years were included after excluding a past history of diabetes, colorectal cancer, inflammatory bowel disease, familial adenomatous polyposis and colectomy. Diabetes was defined by 2011 American Diabetes Association diagnostic criteria. Subjects were classified into three groups: non-adenoma, non-advanced and advanced adenoma. Results : There was significant difference in the prevalence of diabetes among groups. In addition, the following variables were different among groups: triglyceride, gender, and the prevalence of hypertension. In the multinomial logistic regression analyses, diabetes was related to advanced adenoma. In addition, male gender and hypertension were also associated with advanced adenoma. Conclusion : Diabetes had a higher risk in advanced colorectal adenoma in the elderly. We recommended early detection for diabetes to recognize the risk of colorectal adenoma in clinical practice. Keywords : colorectal adenoma diabetes

PP26 C-031

THE ROLE OF ABDOMINAL RADIOGRAPHY IN DIAGNOSIS AND MANAGEMENT OF CONSTIPATION IN OLDER ADULTS

Hyun Suk LEE (*Geriatrics, Fremantle hospital, Australia*)

Introduction : Constipation is a common problem in older adults. History can be unreliable and often with atypical presentation. This audit reviewed the role of abdominal radiography in diagnosis and management of constipation in Aged Care patients in both in- and out-patient settings. Method : Radiology database was used to identify

patients in Aged Care clinics, medical ward and restorative unit who had plain abdominal X-ray (AXR) ordered from 1st of January 2011 until 31st of October 2011. Their radiology and medical records were reviewed retrospectively and relevant information was retrieved. Results : Thirty seven out of the fifty patients had evidence of faecal loading on AXR. These patients were commenced on bowel regimen or had the regimen intensified. Fourteen out of thirty-seven patients (38%) had improvement in bowel symptoms following the bowel regimen. In thirteen patients, where AXR showed no faecal loading, no bowel regimen was commenced or intensified and in few patients bowel regimen was reduced or ceased. Eleven patients who had faecal loading on initial AXR underwent repeat AXR to assess response to constipation management and seven of these patients had shown either resolution or less faecal loading. The most common indications for AXR in this study were for assessing for constipation and faecal incontinence. The most common medications that may precipitate constipation found in this audit were antipsychotics and antidepressants. Conclusion : Abdominal X-ray is useful in diagnosis of constipation when they presented with bowel or lower urinary tract symptoms or delirium. The finding from the AXR guides the subsequent patient clinical management. Keywords : Constipation, abdominal radiography, older adults

PP26 C-032

CLINICAL AND PATHOLOGIC FEATURES OF ELDERLY GASTRIC CANCER: NO POORER PROGNOSIS AND SURGICAL TOLERANCE

Joo Hyun LIM¹, Dong Ho LEE², Cheol Min SHIN², Na Yung KIM², Hyun Chae JUNG¹, In Sung SONG² (*1. Department of Internal Medicine, Seoul National University Hospital, Korea; 2. Department of Internal Medicine, Seoul National University Bundang Hospital, Korea*)

Introduction : Gastric cancer is one of the most common cancers, having great incidence in the elderly. However, little is known about elderly gastric cancer. This study was designed to evaluate the specific features of elderly gastric cancer. Method : We reviewed medical records of 1107 patients who had undergone radical gastrectomy for gastric cancer between June 2005 and December 2009. They were divided into non-elderly group (<65, n=676) and elderly group (≥65, n=431). Between both groups, these were compared: symptoms, comorbidities, tumor marker levels, stages, H. pylori status, locations, Lauren type, differentiation, complications, microsatellite instability, p53 over expression. Results : More elderly patients showed elevated tumor markers (CEA: 4.9% vs. 8.7%, p = 0.041, CA19-9: 6.1% vs. 13.2%, p = 0.001) and advanced diseases (42.5% vs. 49.4%, p = 0.023) There were no significant differences in N stage (62.4% vs. 58.2%, p = 0.164) or H. pylori status (63.6% vs. 57.5%, p = 0.153) between the groups. More elderly patients had Lauren intestinal type (40.7% vs. 58.2%, p < 0.001). Complication rate did not differ between the groups (6.1% vs. 8.1%, p = 0.187). Microsatellite instability (p < 0.001) and p53 over expression (p < 0.001) were more frequent among the elderly. Conclusion : Elderly gastric cancer was related to pathologic features known for favorable prognosis except p53 over expression, despite the more advanced stage. Surgery in the elderly was as tolerable as in young patients. We recommend looking favorably upon surgery for elderly patients with operable gastric cancers. Keywords : elderly, gastric cancer, feature

PP26 C-033

PATTERNS OF THE UPPER GASTROINTESTINAL TRACT PATHOLOGIES OF SENILE PATIENTS ACCORDING TO X-RAY DIAGNOSTICS

Natalia POLYARUSH, Tatiana STOVOLKOVA, Tamara ZHELNOVA, Oleg YAKOVLEV (*Samara Regional Clinical Hospital for War Veterans, First Research Institute of Rehabilitation of War Veterans of Medical Institute 'REAVIZ', Russia*)

Introduction : In Samara regional clinical hospital of war veterans we performed 168 x-ray examinations of patients with disease patterns of alimentary system. The patients of ages from 60 to 86 (95 females, 73 males). **Method :** We used combine method of traditional and double contrast using BarVIPs medicine and gas-producing mix in the condition of multiposition and multiple view examination. **Results :** We revealed 54 patients with pathology of the upper gastrointestinal tract: Zencer diverticula - 1, midesophageal diverticula - 3, gastroesophageal hernia and reflux esophagitis - 41, gastritis - 35, duodenitis - 26, gastric diverticula - 2, gastric ulcer - 3, gastric polyp - 3, leiomyoma - 1, gastric cancer - 1, duodenum diverticulum - 3, duodenum cancer - 1. The results of our diagnostic findings indicate some specific features of the upper gastrointestinal tract pathology of senile patients. **Conclusion :** We revealed combinations of several diseases in 28 examinations. We found out all types of axial gastroesophageal hernia: cardiac, cardiofundic, subtotal, total. We revealed rare localization diverticula: cardia. In gastric ulceration we diagnosed multiple ulcers, penetrate ulcer and ulceration with the signs of malignancy. Duodenum diverticula differed by large size and multiple locations. Notably malignant tumors are more often localized in the upper gaster, which were diagnosed on the developed stage of cancer with long period of erased clinical picture or asymptomatic disease course. **Keywords :** upper gastrointestinal tract, x-ray diagnostics, esophagus and stomach

PP26 C-034

EXPERIENCE OF AN ELDERLY GASTROINTESTINAL BLEEDING PATIENT ASSOCIATED WITH DEGENERATIVE ARTHRITIS

Shih-Ping WU¹, Ya-Chuan HSU² (*1. Nursing, Chi Mei Medical Center and Chang Jung Christian University, Taiwan; 2. Department of Nursing, Chang Jung Christian University, Taiwan*)

Introduction : This article describes the caring experience of a 79 year-old male with degenerative arthritis who is taking analgesics cause gastrointestinal bleeding and admitted to geriatric care units. **Method :** Clinical observation, family meeting, physical examination and telephone visit were used guided by the holistic assessment to identify nursing problems from 2 MAY 2011 to 14 MAY 2011. **Results :** During hospitalization, the major nursing problems were chronic pain and impaired skin integrity. **Conclusion :** During the nursing process, the author established a good relationship with patient and offered elderly specialist nursing intervention to relieve physical discomfort from degenerative arthritis and mental stress induced from the uncertain prognosis of disease. We also enhance the patient's understanding of degenerative arthritis, increase patient's confidence for self-care through family's support, to promote the quality of patient's life and decrease the recurrence of gastrointestinal bleeding. We hope this experience of nursing care could provide a reference for geriatrics nursing practice. **Keywords :** Gastrointestinal bleeding, degenerative arthritis, elderly

PP26 C-035

CLINICAL RETROSPECTIVE STUDY OF IMPLANTS IN GERIATRIC PATIENTS OLDER THAN 70 YEARS

Hyo-Jung LEE¹, Jung-Tae LEE¹, Eun-Gyung LEE¹, Young-Kyun KIM², Pil-Young YUN², Myung-Jin KIM³ (*1. Department of Periodontology, Section of Dentistry, Seoul National University*

Bundang Hospital., Korea; 2. Department of Oral and Maxillofacial Surgery, Section of Dentistry, Seoul National University Bundang Hospital., Korea; 3. Department of Periodontology, Section of Dentistry, In-Jae Baek hospital Busan, Korea)

Introduction : The objectives of this study were to analyze the presence of systemic diseases, the associated complications, and other problems occurring following loading of an implanted prosthesis and to evaluate the amount of bone resorption occurring at the apex of alveolar bone. Therefore, this study analyzed these effects on dental implants in elderly patients or those with systemic diseases. **Method :** In total, 35 patients over the age of 70 who had been operated on at Seoul National University Bundang Hospital between June 2003 and December 2006 were included. According to the types of additional surgical procedures, implant site, implant prosthesis, and systemic diseases, statistical comparisons were made of peri-implant bone resorption at last follow-up. **Results :** Following the completion of prosthodontic treatment, after a mean period of 32.7 months, the mean peri-implant bone resorption was 0.27 mm and the peri-implant bone resorption was not significantly related to the type of upper prosthesis ($p = 0.389$), the surgical procedures accompanying placement ($p = 0.439$), or the presence/absence of systemic disease ($p = 0.893$). **Conclusion :** According to this analysis, implant therapy in geriatric patients should not be considered particularly high risk. **Keywords :** Geriatric patients, Implant

PP26 C-036

REHABILITATION APPROACH ON DYSPHAGIA OCCURRED POSTOPERATIVELY OF LARYNGECTOMY AT OVER 10 YEARS HAVE PASSED - A CASE REPORT-

Naomichi MURATA¹, Eiko OKAMOTO², Kyoko ARIOKA¹, Noriko KANDA³, Yumi FUJIWARA², Naoki KOBAYASHI² (*1. Center for Special Needs Dentistry, Okayama University Hospital, Japan; 2. Dentistry, Mannari Hospital, Japan; 3. Dentistry, Goshikidai Hospital, Japan*)

Introduction : Laryngoectomy for laryngeal cancer is considered resulting less dysfunction of cricopharyngeal opening. Although there is a report of occurrence of dysphagia due to insufficient sensory stimuli input to the pharyngeal portion at early postoperative stage, we have successful result with balloon dilatation method for the case of a dysphagia shown at over 10 years from the operation. **Method :** 83 years old male patient who had laryngoectomy in 1997, visit us complaining the transport disorder of foods to pharynx and rhinorrhea. Poor oral hygiene and decreasing of saliva secretion were observed. With VE exam, there is given as dysphagia due to dull swallowing reflex, pharyngeal constriction and dysfunction of cricopharyngeal opening. Training of using balloon assured at the second VF exam was periodically repeated on bedside and for oral hygiene care was followed. **Results :** Dysfunction of cricopharyngeal opening was improved by 3 months later. As food transport disorder and rhinorrhea were disappeared 6 months later. Therefore, balloon training was temporarily ended. At 7 months later, no specific problems were observed by routine exam, so decided to complete entire dysphagia training, and keep continued the oral hygiene care. Improvement of oral hygiene condition, redness of gingiva, and swollen gum were observed. **Conclusion :** In previous reports, the causal factor of dysfunction of cricopharyngeal opening is explained due to dysfunction of sensory stimulation, however, this case presented the swallowing dysfunction at over the 10 years from the operation. Therefore, we suspected one of the causal factors is due to the dysfunction of cricopharyngeal opening. **Keywords :** Dysphagia rehabilitation, Laryngoectomy, Oral Health Care

PP26 C-037

SALIVA OF OLDEST OLD CORRELATE TO THE ORAL AND GENERAL HEALTH CONDITIONS; TOKYO OLDEST OLD SURVEY ON TOTAL HEALTH (TOOTH)

Toshimitsu IINUMA¹, Yusuke FUKUI¹, Motoko FUKUMOTO¹, Kensuke NISHIO¹, Jun LEE¹, Kentaro URATA¹, Yasumichi ARAI², Michiyo TAKAYAMA², Yukiko ABE², Takashi IWASE³, Nobuhito GIONHAKU¹, Kazuo KOMIYAMA³, Nobuyoshi HIROSE² (1. Department of Complete Denture Prosthodontics, Nihon University School of Dentistry, Japan; 2. Division of Geriatric Medicine, Department of Internal Medicine, Keio University School of Medicine, Japan; 3. Department of Pathology, Nihon University School of Dentistry, Japan)

Introduction : As the oldest old population has been rapidly increased in worldwide, considerable concern has arisen about the social and economic burden of diseases and disability in aged group. We continue studying the Tokyo Oldest Old survey on Total Health (TOOTH). In this study, we focused on the saliva secretion in aged 85 years or older. Saliva secretion and composition reflects the body health conditions. Measurement of salivary IgA is useful for the non-invasive assessment of secretory immunity. A Cortisol in the saliva is an indicator of stress. Method : The subjects participated 542 oldest old (236 men, 306 women; range, 85 - 102 years) in this study. Total saliva was collected and measured the amount from all subjects by non-invasive procedure. Secretory IgA and cortisol in the saliva were assessed by the ELSA assay. In addition, oral health, the physical performance and degree of independence also were evaluated by dentists and geriatricians. Results : The amount of saliva was clearly correlated with sIgA, cortisol, number of remaining teeth, and maximum bite force. Saliva was also correlated to physical performance levels among the oldest old living in Tokyo, including the grip and the time up & go test. Conclusion : In conclusion, the saliva amount and sIgA and cortisol were indicator for the oral health as well as a physical performance of the oldest old. Our results incorporated non-invasive measurements of total health conditions, demonstrated the feasibility of a new comprehensive study. The data may help develop new models of health promotion. Keywords : oldest old , saliva

PP26 C-038

EFFECTS OF THE AUDITORY VERBAL CUES ON DRINK SWALLOWING: A STUDY BASED ON PSYCHOMETRIC ANALYSIS AND SURFACE-ELECTROMYOGRAPHY

Aya NAKAMURA¹, Satoshi IMAIZUMI² (1. Graduate School of Comprehensive Scientific Research, Prefectural University of Hiroshima, Japan; 2. Department of Communication Science and Disorders, Faculty of Health and Welfare, Prefectural University of Hiroshima, Japan)

Introduction : For dysphagia rehabilitation, pureed or minced food, which is served to individuals with dysphagia to prevent aspiration, is not easily recognized based on appearance. This difficulty in recognition may have a negative influence on flavor perception and swallowing, resulting in decreased appetite. The aim of this study was to investigate possible effects of auditory verbal cues on drink swallowing. Method : Subjects were two groups, younger participants and older participants. Apple juice, aojiru (grass) juice, and water were ingested with or without auditory verbal cues. Flavor perception and ease of swallowing were measured using a visual analog scale, and swallow physiology by cervical auscultation and surface electromyography. Results : The auditory verbal cues had significant effects on flavor and ease of swallowing as well as on swallow

physiology. The taste score significantly increased when the participant's anticipation was primed by accurate auditory verbal cues, while the ease of swallowing score significantly decreased when the anticipation was contradicted. There was no significant effect of auditory verbal cues on distaste score. Regardless of age, the maximum suprahyoid muscle activity significantly decreased when a beverage was ingested without auditory verbal cues. The interval between the onset of swallowing sounds and the peak timing point of the infrahyoid muscle activity significantly shortened when the anticipation induced by the cue was contradicted in the elderly participant group. Conclusion : These results suggest that auditory verbal cues can improve the perceived flavor of beverages and swallow physiology. These phenomena can be utilized for dysphagia rehabilitation. Keywords : auditory verbal cues, swallowing, surface electromyography

Geriatric Medicine Center and Department of Family Medicine, Kaohsiung Veterans General Hospital, Aging and Health Research Center and Institute of Public Health, Yang Ming University, Taiwan; 4. Department of Psychiatry, Kaohsiung Veterans General Hospital, Taiwan; 5. Department of Orthopedics, Kaohsiung Veterans General Hospital, Taiwan; 6. Geriatric Medicine Center and Division of Neurology, Kaohsiung Veterans General Hospital, Taiwan; 7. Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Aging and Health Research, Centre, Institute of Health Welfare and Policy, National Yang Ming University, Taiwan)

Introduction : Delirium is closely related to poorer outcomes among older patients in many clinical conditions especially for orthopedic surgery. The purpose of this study was to evaluate the association of pre-operative and peri-operative factors for occurrence of delirium after surgery. Method : This prospective study was conducted from January to December of 2011. All patients admitted to a tertiary medical centre for orthopedic surgery in Southern Taiwan were invited for study. Demographic characteristics and functional status were evaluated by trained nurses. Pre- and peri-operative conditions, including route for admissions, pain, time to surgery, blood loss, anesthesia type, the surgical procedures, ASA score, pre-operative laboratory data and vital signs were also collected. The diagnosis of delirium was made according to the criteria of DSM IV. Results : Overall, among 232 enrolled patients (mean age:74.7 ± 7.8 years, 46.6% males), 25.9% receiving vertebral surgery, 31.0% receiving hip surgery, and 43.1% receiving knee surgery. Overall, the prevalence of delirium was 9.1%, and older age, male, lower body mass index, hearing impairment, higher Charlson's Comorbidity Index, poorer nutrition, poorer cognition, poorer functional status and the longer waiting time to surgery after admissions were all significant factors for delirium occurrence. However, logistic regression showed that only age (O.R.=1.093, 95% C.I.=1.005~1.188, p=0.038), male (O.R.=6.134, 95% C.I.=1.489~25.271, p=0.012) and MMSE score (O.R.=0.804, 95% C.I.=0.730~0.884, p<0.001) were significantly risk factors for post-operative delirium. Conclusion : The overall prevalence for

elderly patients receiving orthopedic surgery developing post-operative delirium was 9.1%, and older age, male, and lower MMSE score were independent risk factors. Keywords : Delirium, Orthopedic Surgery

PP26 C-040
COGNITIVE FUNCTION, DEPRESSION AND AGGRESSIVE BEHAVIOR IN ELDERLY MEN WITH DEMENTIA AT ELDERLY NURSING HOMES

Dae Soon KWON, Bo Kyoung KIM (*Graduate School Student, Red Cross College of Nursing, Chung-Ang University, Korea*)

Introduction : This study is a descriptive survey research in order to inquire into cognitive function, depression, and aggressive behavior level of elderly men with dementia who entered the elderly nursing homes, to grasp difference in depression and aggressive behavior according to cognitive level, and to survey correlation between variables. Method : The period of data collection was from October 1, 2012 to November 1. Research subjects were measured the dementia elderly men's cognitive function, depression, and aggressive behavior. Totally 180 copies were used in this study. Data collection was made through SPSS Windows 18.0 statistical program. Results : (1) The elderly men with dementia at elderly nursing homes were indicated to have lots of serious cognitive function (under 10 points) as for cognitive function, to have depression of exceeding the reference score (8 points) in depression tool, and to have high aggressive behavior, too. (2) Depression was indicated to have no difference according to cognitive function level in elderly men with dementia at elderly nursing homes. The aggressive behavior according to cognitive function level was indicated to have difference. 3) The depression in elderly men with dementia at elderly nursing homes showed correlation with aggressive behavior. This was shown to be higher in aggressive behavior in the higher depression. Conclusion : The above results show that there is a need of nursing intervention for reducing cognitive function, depression, and aggressive behavior in elderly men with dementia at nursing homes by grasping influential factors of causing cognitive function, depression, and aggressive behavior. Keywords : dementia, cognitive behavior, depression, aggressive behavior

PP26 C-041
EXPLORING HEARING AND VISION IMPAIRMENT AMONG COMMUNITY DWELLING ELDERLY IN MALAYSIA

Farizah MOHD HAIRI¹, Zainudin MOHD ALI², Rohaya RAMLI², Suriyati ABDUL AZIZ², Noran Naqiah HAIRI¹, Choo WAN YUEN¹, Sajaratulnisa OTHMAN³ (*1. Department of Social and Preventive Medicine, University of Malaya, Malaysia; 2. Negeri Sembilan State Health Department, Ministry of Health Malaysia, Malaysia; 3. Department of Primary Care Medicine, University of Malaya, Malaysia*)

Introduction : The Malaysian National Morbidity and Health Survey II in 1996 reported that the prevalence of hearing and vision impairment among our elderly was 40% and 21% respectively. These sensory deficiencies affect speech communication, independence and overall well-being of the elderly. Our aim was to explore the pattern of hearing and vision impairment among community dwelling elderly in Malaysia. Method : This was a cross-sectional study conducted from August to October 2012 among 1234 community dwelling elderly in Negeri Sembilan, Malaysia via face-to-face interview, which comprised questions on demographic variables, screening on hearing and vision impairment. Data were analysed with univariate and

multivariate methods. Results : The mean age was 71.9 years (standard deviation=7.3 years); 68.3% were female, almost 90% only obtained primary education or had no formal education; 50% were married and 47% were widowed. The prevalence of hearing impairment was 30%. Among the hearing-impaired only 4.6% use hearing aids. On the other hand, the prevalence of vision impairment was higher at 71%; 60% reported far-sighted, 46.1% short-sighted and 18.1% had cataract problem. However, only 52.8% wore spectacles. Conclusion : The pattern of hearing and vision problems explored but left untreated highlights the need for medical alertness in identifying these problems early to incorporate appropriate management and treatment among the needy elderly. It is also important to empower the elderly to be aware of their problems and informing them of possible solutions. Keywords: deafness, visual impairment, older persons

PP26 C-042
PREVENTING FALLS AMONG OLDER PEOPLE WITH MENTAL HEALTH PROBLEMS: A SYSTEMATIC REVIEW

Frances BUNN¹, Charles SIMPSON¹, Angela DICKINSON¹, Venkat NARAYANAN², Christina VICTOR³, Deborah HUMPHREY², Caroline GRIFFITHS² (*1. Centre for Research in Primary and Community Care, University of Hertfordshire, United Kingdom; 2. Older Adults, Oxford Health NHS Foundation Trust, United Kingdom; 3. School of Health Sciences and Social Care, Brunel University, United Kingdom*)

Introduction : Falls are a leading cause of mortality and morbidity in older people and these risks are exacerbated by mental health conditions such as depression and dementia. Previous reviews have focused on people with dementia and cognitive impairment, but not those being cared for with other mental health conditions or in mental health settings. To evaluate the effectiveness of fall prevention interventions for older people with mental health conditions. Method : We conducted a systematic review of fall prevention interventions for people aged 65 and over in both inpatient and community health settings providing care for patients with mental health conditions. We searched a range of electronic databases and undertook lateral searches to identify both controlled and uncontrolled studies. Studies were assessed for risk of bias on six domains. Due to heterogeneity results were not pooled but are reported narratively. Results : Fifteen studies met our inclusion criteria. Interventions that include multifactorial, multi-disciplinary interventions and those involving increasing staff awareness appear to reduce the risk of falls but the evidence is mixed and quality of the studies varied. Only 2 studies, both undertaken in the US, were undertaken in mental health settings. We found no data relating to process outcomes or patient views. Conclusion : The review provides evidence that fall prevention interventions can be effective in preventing falls in older people with mental health problems. There is a dearth of falls research undertaken in mental health settings or which focus specifically on patients with mental health problems. Keywords : Falls, Mental health

PP26 C-043
SEASONAL DIFFERENCES ON FALLS AND FRACTURES IN BRAZILIAN OLDER ADULTS

Angelo Jose G BOS¹, Iride Cristofoli CABERLON² (*1. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil; 2. School of Nurse, ULBRA, Brazil*)

Introduction : Falls and fractures in the older adult represent a significant public health problem, facing the process of longevity in Brazil. The influence of environmental factors, such as climate, on falls risk is related to the functional state and mobility of older adult. Thus,

the present study aimed to investigate seasonal differences on falls and fractures in the older adult in Rio Grande do Sul, Brazil. Method : Data were collected from the 6556 charts of older adult patients presenting falls from four units of Public Urgency and Emergency. Results : Among them, 4,664(71%) were women and 1,892(29%) were men, with 26.8% of cases occurring in winter followed by autumn with 24.5% ($p < 0.05$). Thirty-one percent of falls had fractures confirmed by radiology (women 32%, men 28%, $p < 0.0001$). The season with the highest number of fractures was winter, where fractures were observed in 34% of falls ($p = 0.0002$), with spring (28% of falls) the lowest. Age, sex, and winter were the significant risk factors for falls. Conclusion : We conclude that falls in winter are more frequent and more severe. Female gender and older age are more vulnerable to falls and fractures. This survey results point to the need for further epidemiological and clinical studies that can clarify issues related to other approaches to risk factors for falls and fractures. These approaches include behavioral factors, extrinsic and intrinsic multifactorial interventions; particularly in the context of primary and secondary care by the Brazilian Unique Health System. Keywords : Public Health, Falls, Season

PP26 C-044

FALL AND COGNITIVE CONDITION IN ELDERLY OLD PERSONS

Dongqing ZHAO, Yanling ZHANG (*West China Hospital Sichuan University, Geriatrics, China*)

Introduction : The world population survey data show the older people (>60 years old) is 10.80% of the total in the world's population in 2009, while it will be 21.95% in 2050. Fall is one of the most important causes of bad health and disability. Fall related damage such as fracture and cerebral trauma will increase mortality in the old. Method : In 2005, we performed a cross-sectional study in Dujiangyan, Sichuan province. Results : We include 743 very old persons (89-108 years old, the median 93) in our study (238 men). Our questionnaire includes demographics, living conditions, social contact, cognitive function, subjective well-being, personalities and characteristics, physical condition, chronic diseases, activities of daily living (ADL), medicine, physical activity, and leisure-time activity. The primary outcome was the times of fall in one year. According to their education background, we divided them into two groups, educated and non-educated (90.31%)(never go to school). We have dealt with the data by software SPSS 17.0 and analyze of it by Logistic Regression. In these person 53.4% had fell in one year and 73.04% were found fell twice or more. we found that fall was related with cognitive function($p = 0.059$ correlation coefficient 1.403 95%CI 0.987-1.994), subjective well-being($p = 0.034$ correlation coefficient 0.954 95%CI 0.914-0.996), personalities and characteristics($p = 0.019$ correlation coefficient 1.135 95%CI 1.049-1.700) and ADL($p = 0.057$ correlation coefficient 0.979 95%CI 0.958-1.001). Conclusion : In the group without education, we found that the people with disturbance of consciousness would be easier to fall in their daily life. While in the group with education, more persons are needed to gain positive results. Keywords : fall, very old, cognitive function

PP26 C-045

FALL RISK IN OLDER ADULTS WITH COGNITIVE IMPAIRMENT

Hyun Suk LEE (*Geriatrics, Fremantle hospital, Australia*)

Introduction : Fall risk is twofold higher in older adults with cognitive impairment (CI). Most trials in fall prevention study excluded older people with cognitive impairment or dementia. Fall risk factors in

older people with cognitive impairment may be different to older adults without cognitive impairment. There is no known effective fall prevention strategy in older adults with cognitive impairment. This prospective study assessed the effect of multidisciplinary intervention targeting fall risk factors in older adults in community. Method : Older people residing in community presented to balance and mobility clinic for fall prevention. Cognitive assessment was conducted and older people were categorised as normal cognition, mild cognitive impairment and dementia. Fall risk factors were analysed in each groups to identify different characteristics. Multidisciplinary intervention targeting fall risk factors were offered to all patients. Timed up and go test (TUG), Modified falls efficacy scale (MFES), Berg balance scale (BBS) and history of falls were reviewed at baseline and after completion of the intervention. Results : About 40 percent of patients had cognitive impairment or dementia. 88 percent of patients had falls in the past. Fall risk factor profile was similar among older people with normal cognition, CI and dementia. Mean TUG was slower and BBS was lower in older adults with cognitive impairment at baseline. BBS and TUG improved and fall rate declined after the intervention in older people with cognitive impairment. Conclusion : Multidisciplinary intervention was effective in older adults with CI. Cognitive assessment needs to be incorporated into routine fall risk assessment. Early implementation of fall prevention strategy in older people with CI reduced falls rate. Keywords : fall risk factor, multidisciplinary intervention, cognitive impairment, older adults

PP26 C-046

EFFECT OF ALFACALCIDOL ON FUNCTIONAL MOBILITY IN INDONESIAN ELDERLY WOMEN: RANDOMIZED CONTROLLED TRIAL

Jane Estherina Fransiska SINAGA (*Internal Medicine, School of Medicine, University of Indonesia, Indonesia*)

Introduction : Previous studies reported the D-analog alfacalcidol, increases muscle power and balance and lead to a highly significant decreases in the number of fallers and falls in Caucasian elderly community-dwelling population. Method : A randomized, double-blind controlled trial was conducted in elderly women subjects geriatric clinic of Cipto Mangunkusumo National Hospital Jakarta Indonesia on April-September 2012. Intervention group was given 0,5 mcg alfacalcidol and 500 mg calcium daily for 90 days and another group was given placebo and 500 mg calcium. Balance test, Timed-up and Go Test (TUG) was measured at the beginning and after 3 months. Per protocol analysis to functional mobility after intervention between the two groups was performed. Results : 95 subjects were fulfilling study criteria and randomized into 2 groups, containing 47 subjects in alfacalcidol group and 48 subjects in placebo group. Both groups were comparable in all important prognostic factors including age, BMI, nutritional status, muscle strength. After three months the mean time in alfacalcidol group used for the TUG was decrease significantly by 2,49 s ($p < 0.0001$). There were significant improvement of the median time for TUG in the group that received alfacalcidol compared to placebo (9,01 vs.10,07 $p = 0.028$). Conclusion : Treatment with 0.5 mg alfacalcidol with calcium effectively improved functional mobility in Indonesian elderly women. Keywords : alfacalcidol, functional mobility, Indonesian elderly women

PP26 C-047

EFFECTS ON FALLS OF A ONE-YEAR HOME-BASED CASE MANAGEMENT INTERVENTION IN FRAIL OLDER PEOPLE

Ulrika OLSSON MOLLER, Jimmie KRISTENSSON, Patrik MIDLOV, Charlotte EKDAHL, Ulf JAKOBSSON (*Department of*

Health Sciences, Lund University, Sweden)

Introduction : Today frail older people to a higher extent receive healthcare at home and the number of falls increase with age and frailty level. The objective of this study was to investigate the effects of a one-year home-based case management intervention in frail older people (aged 65+ years) on self-reported falls, injurious falls and falls resulting in medical care. **Method :** A sample of people aged 65 + years with disability and repeated health care contacts were randomly assigned to an intervention group (n=80, mean age 81.4 years (SD 5.9), 65% women) or control group (n=73, mean age 81.6 years (SD 6.8), 68.5% women). The intervention group received monthly home-visits for 12 months by a nurse and physiotherapist with a multifactorial preventive approach including assessment, information giving, an individual physical exercise programme, home hazard evaluation/ modification and referrals. The control group received usual care. Data on falls were collected through personal interviews at 3, 6, 9, and 12 months. **Results :** In the intervention group 96 falls occurred during the 12-month follow-up period compared with 85 falls in the control group (p=0.900). Of those falls 40 and 38 falls in the intervention and control groups, respectively, were injurious (p=0.669) and 19 falls in the intervention group resulted in medical care compared with 15 falls in the control group (p=0.151). **Conclusion :** This home-based case management intervention was not able to prevent falls, fall injuries or falls resulting in medical care in frail older people. Further home-based studies to frail older people to prevent falls needs to be conducted. **Keywords :** falls, frail, case management

PP26 C-048

FALL PREVENTION AND MANAGEMENT IN KOREAN LONG TERM CARE SETTINGS: A GAP IN EVIDENCE BASED PRACTICE

Myonghwa PARK¹, Mi-Hwa PARK² (1. College of Nursing, Chungnam National University, Korea; 2. Department of Nursing, Sejojeong College, Korea)

Introduction : This study was to explore gap between actual practice and evidence-based fall prevention and management for the older adults in long term care settings to establish baseline data for evidence-based fall protocol development and dissemination. **Methods:** The subjects were 600 nursing staff members from 32 long term care hospitals in Korea. Self-administered questionnaires were used to collect the data and the results of the study were analyzed with descriptive statistics, t-test, ANOVA and Pearson correlation. **Method:** The subjects were 600 nursing staff members from 32 long term care hospitals in Korea. Self-administered questionnaires were used to collect the data and the results of the study were analyzed with descriptive statistics, t-test, ANOVA and Pearson correlation. **Results :** There were statistically significant differences between fall prevention management practice in real clinical settings and evidence based practice. Nursing staff members' knowledge and attitudes toward fall prevention and management contributed to the gap in evidence based practice. There were also statistically significant differences in evidence based fall management practice according to the nursing staff members' career and experiences of fall education. **Conclusion :** To ensure best care for fall management, the factors contributing to these gaps need to be analyzed to identify the barriers. In addition, the evidence-based fall prevention and management protocol suitable for long term care settings needs to be developed and disseminated. * This work was supported by research grant of Basic Science Research Program through the National Research Foundation of Korea (NRF) funded by the Ministry of Education, Science and Technology (No. 2010-0024922). **Keywords :** Fall

PP26 C-049

STEPPING OUT INTO ACTIVE LIFE -A COMMUNITY-BASED FALL PREVENTION PROGRAM FOR THE ELDERLY

Noor Hafizah ISMAIL¹, Ian Yi Onn LEONG¹, Mei Lin TEOH¹, Joseph Antonio MOLINA² (1. Department Of Continuing and Community Care, Tan Tock Seng Hospital, Singapore; 2. Health Services and Outcomes Research, National Health Care Group, Singapore)

Introduction : Falls is an important cause of mortality and morbidity amongst elderly living in the community. Multi-intervention Fall prevention program in the community that targets risk factors has been shown to reduce falls in elderly. This research described the outcomes of a fall prevention program conducted in the community dwelling elderly. **Method :** 745 elderly were enrolled into a multi-factorial fall prevention program which consist of medical assessment to screen for fall risk factors, twice weekly exercise, home safety assessment and education. The participants were follow up for 1 year period and the following outcomes were measured: Time up and Go, Berg Balance Score, Step test , Chair rise and 6 minute walk, Quality of life as measured by EQ5D and Fear of Falling. Falls and admissions were also collected throughout the 1 year period. **Results :** The mean age of the participants was 73 ± 8 years , 28.3% were males. At the time of analysis 296 participants had completed 1 year follow up. There was significant improvement in Berg Balance scores, six minute walk , step test and Chair rise between baseline and 1 year. The EQ5D and the falls efficacy show significant improvement in the first 3 months of follow up and then plateaued. There was a 10% reduction in the proportion of fallers (Odds ratio 2.43 95% CI 1.39,4.24). **Conclusion :** Community fall prevention program for the elderly does improve physical performance, quality of life, fear of falling and risk of falling. **Keywords :** falls, community, elderly

PP26 C-050

GERIATRIC GIANTS AND THEIR CONSEQUENCES ? CRUCIAL PROBLEM AMONG THE ELDERLY IN-PATIENTS IN ACUTE GERIATRIC WARD

Pavel WEBER¹, Hana MELUZINOVA², Hana Matejovska KUBESOVA¹, Vlasta POLCAROVA¹, Kamila GREPLOVA¹, Katarina BIELAKOVA¹, Dana WEBEROVA¹, Petronela AMBROSOVA¹ (1. Department of Internal Medicine, Geriatrics and Practical Medicine, Faculty Hospital and Masaryk University Brno, Czech; 2. Department of Internal Medicine, Geriatrics and Practical Medicine, Faculty Hospital and Masaryk University, Czech)

Introduction : With increasing age the degree of dependency and occurrence of geriatric syndromes grow substantially. The retrospective study of data was aimed at conducting an analysis and comparison of geriatric syndromes among age different groups. **Method :** Between 1995 and 2011 years we had altogether 12,210 elderly patients of an average age 80.5±7.0 y. (range 65-103 y.) hospitalized at the Department of Geriatrics. We divided the patient set into three different age subgroups (65-74 y.; 75-84 y. and ≥ 85 y.; e.g. 21.4%; 47.9% and 30.7% of all hospitalized patients) and compared the results among them. **Results :** All the subgroups showed statistically significant increase of the geriatric syndromes, such as falls, immobility, incontinence and cognitive impairment and dementia with increasing age (p<0.001). Their occurrence in the above mentioned age different sets was according to single geriatric syndromes and sex (female and male): falls 22%, 27.8%, 39.9% and 20.5%, 27%, 36.1%; immobility 26.4%, 29.3%, 42.5% and 30.3%, 30.1% and 39.2%; incontinence 38.4%, 50.6%, 69.5% and 38.2%, 47.4%, 61.8%; dementia and cognitive impairment 13.4%, 23.4%,

38.1% and 15.8%, 24.3%, 33.2% respectively. Age cut-off for geriatric syndromes occurrence based on ROC analysis is for female sex 83.5-84.5 y. and for male sex 78.5-82.5 y. We documented also higher occurrence of loneliness, higher need of after-care and dependency in the ADL with growing age and female gender. Conclusion : The increasing occurrence of geriatric giants with age and female gender has crucial importance and could have serious consequences not only for individuals and families but also for demands on and costs of health and social care. Keywords : geriatric giants - increasing age - decreasing self-sufficiency - growing dependency - frailty

PP26 C-051

PREDICTORS OF FALLS AND RECURRENT FALLS AMONG OLDER ADULTS WITH CANCER: THE HEALTH AND RETIREMENT STUDY

Tuo Yu CHEN (*School of Aging Studies, University of South Florida, USA*)

Introduction : Older adults with cancer are at a greater risk for falling than the general population due to side effects of cancer treatment, pain, and general deconditioning. Although previous research has found that poor balance, gait, vision, and vestibular function and difficulties in activities of daily living (ADL) and instrumental activities of daily living (IADL) predict falls, no study to date has examined these factors concomitantly. Furthermore, there is limited research on recurrent falls in this vulnerable population. Method : Thus, this study aimed to investigate the known predictors of falls and identify predictors of recurrent falls among seniors with cancer across time using the data from the Health and Retirement Study. On average, participants (N = 1505) were 75 years old, white (88%), and female (53%). The Spearman correlation and multivariate logistic analyses were used to analyze the data. Results : The results indicated that greater difficulties in performing ADL (OR = 2.06, p = .001) and faster walking speeds (OR = .82, p = .026) at baseline significantly predicted falls whereas more comorbidities (OR = 1.82, p = .034) at baseline was a significant predictor of recurrent falls at follow-up. Having greater comorbidities (OR = 1.49, p = .033) at baseline was also a predictor of fall-related injury. Conclusion : These findings have implications for the course of cancer treatment. Education regarding ADLs and walking patterns as well as the treatment of comorbidities should be provided concurrently with cancer treatment to prevent future falls in this population. Keywords : cancer, falls, recurrent falls

PP26 C-052

DETERMINANTS OF FALLS AND/OR FEAR OF FALLS IN COMMUNITY DWELLING ELDERLY

Gulistan BAHAT¹, Ilker BAY¹, Timur Selcuk AKPINAR¹, Asli TUFAN¹, Cihan KILIC¹, Akin BASKENT¹, Sevilyay NADIR¹, Ozlem SOYLUK², Nilgun ERTEN¹, Mehmet Akif KARAN¹ (*1. Department of Internal Medicine, Division of Geriatrics, Istanbul University Istanbul Medical School, Turkey; 2. Department of Internal Medicine, Bakirkoy Education and Research Hospital, Turkey*)

Introduction : Falls are the major cause of fractures in all ages. However, the majority of osteoporotic fractures occur in the elderly. If we can prevent falls, we can also prevent the majority of the osteoporotic fractures. In this study, we aimed to study the determinants of falls and/or fear to falls in community dwelling elderly. Method : The community dwelling elderly ≥ 60 years of age admitted to our geriatrics outpatient clinics were included into study. Age, gender, timed up and go (TUG) test, 4 meters usual gait speed, chronic disease number, chronic drug number, geriatric syndrome number, activities of daily living (ADL) scores, presence of depression,

dementia, urinary incontinence, fecal incontinence, visual impairment, polypharmacy, undernutrition, dynapenia, sarcopenia according to muscle mass, sarcopenia according to EWGSOP definition, chronic pain, serum 25(OH)vitamin D, TSH levels were studied for their possible effect on falls and/or fall fear. Results : 95 elderly were included into the study. 27.4% were males, 72.6% were females. Mean age was 73.6 \pm 5.9. 32.6% had at least 1 fall in the previous year and 43% had fear to falls. Only determinants of falls and/or falls fear were older age, higher number of geriatric syndromes, dependency in ADL, higher TUG period and lower 4 m usual gait speed (p<0.05). Conclusion : Older elderly with higher number of geriatric syndromes, with at least 1 dependency in ADL are more likely to fall or have fall of fearing. In physical examination, TUG test and 4 meters usual gait speed may help to predict elderly at risk of falls. We suggest that assessment of geriatric syndromes, functional status, TUG and usual gait speed should be an integral part of evaluation for osteoporotic fractures. Keywords : Falls, fear of falling, assessment

QUANTIFYING THE EFFECT OF FRAILTY ON GENTAMICIN PHARMACOKINETICS IN OLDER INPATIENTS: A POPULATION MODELING APPROACH

Claire JOHNSTON¹, Sarah N. HILMER¹, Andrew J. MCLACHLAN², Slade T. MATTHEWS³, Peter R. CARROLL³, Carl M.J. KIRKPATRICK⁴ (*1. Department of Clinical Pharmacology and Aged Care, University of Sydney/Royal North Shore Hospital, Australia; 2. Faculty of Pharmacy/Centre for Education and Research on Ageing (CERA), University of Sydney/Concord RG Hospital, Australia; 3. Sydney Medical School, University of Sydney, Australia; 4. Centre for Medicine Use and Safety, Monash University, Australia*)

Introduction : Frailty is a multifactorial biological syndrome characterized by a cumulative dysregulation of physiological processes and is associated with changes in pharmacokinetics. The aim of this study was to determine and quantify the impact of frailty on the clearance of gentamicin and perform dosing simulations to propose appropriate dose recommendations for older people. Method : Gentamicin concentration-time data were pooled from 2 prospective observational studies of older hospitalized patients; one on prophylactic gentamicin and one on therapeutic gentamicin for the empiric treatment of sepsis. Data were modeled using NONMEM. Results : Gentamicin pharmacokinetics were investigated in 38 older patients (30 prophylactic and 8 therapeutic) with a total of 89 gentamicin concentration observations. A one compartment linear pharmacokinetic model best described the data, which included between subject variability on both clearance and volume of distribution parameters. The addition of frailty to the model reduced the random variability after renal function (based on estimated creatinine clearance using lean body weight) and lean body weight were included. Frail patients had a 14% lower gentamicin clearance compared to non-frail. Simulations showed that gentamicin dosing based on total body weight, renal function and frailty at 7 mg/kg gave the highest percentage of patients achieving target gentamicin exposure, with 2.9% of patients reaching potentially toxic levels. Without the adjustment for frailty, 5.8% of patients had a higher risk of toxicity. Conclusion : This study has shown that frailty may independently predict reduced clearance of gentamicin in older patients. Adjustment for frailty when calculating dose may reduce the number of patients experiencing gentamicin toxicity. Keywords : Frailty

PP26 C-054

BODY COMPOSITION AND ITS RELATIONSHIP WITH FRAILTY PHENOTYPE OF BRAZILIAN ELDERLY: A SUB-

PROJECT OF "FIBRA"

Fernanda Pinheiro Amador Dos Santos PESSANHA¹, Eduardo FERRIOLLI¹, Jose Ailton De Oliveira CARNEIRO¹, Andre Filipe Junqueira DOS SANTOS¹, Juliana Lemos De Souza MARCHESI¹, Karina PFRIMER¹, Rutineia De Fatima MICHELETTO¹, Nereida Kilza Da Costa LIMA¹, Julio Cesar MORIGUTI¹, Eduardo FERRIOLLI² (1. Medical Clinic, University of Sao Paulo-USP/RP, Brazil; 2. Medical Clinic, University of Sao Paulo-Ribeirao Preto, Brazil)

Introduction : Although weight loss is a component of the frailty cycle, this syndrome may be related either to an underweight or an obesity setting. **OBJECTIVE:** To investigate the possible association of body composition assessed by Body Mass Index (BMI) with profiles of frailty in elderly Brazilians. **Method :** Cross-sectional study in subjects aged ≥ 65 years, participants of the 'Survey of Frailty in Elderly Brazilians ? FIBRA', chosen by probabilistic sampling in 14 Brazilian cities in five demographic regions. The elderly were classified as frail and pre-frail according to the phenotype proposed by Fried et al. and BMI was calculated using weight / height². The classification proposed by WHO was adopted to define nutritional state. The association between frailty and BMI was assessed using multinomial logistic regression. **Results :** The study included 5006 elderly, mostly women (65.9%), with low income (56.3%) and low education (50.1%). Mean age was 73.1 (6.1) years. The prevalence of frailty was 11.6%. 22.1% and 27.6% of the frail subjects were underweight and obese, respectively. Subjects with BMI <18.5 and BMI ≥ 35 kg/m² were, respectively, 1.74 (1.40- 2.15) and 1.59 (1.16 ? 2.17) times more likely to be frail when compared to the ones with normal weight (18.5 to 24.99 kg/m²) (p <0.01). BMI range between 25.00 and 29.99 was a protective factor for frailty, with odds ratio 0.57 (0.46-0.70) (p <0.01). **Conclusion :** Both malnutrition and moderate obesity seem to be related with frailty in Brazilian elderly, while overweight plays a protective role. **Keywords :** Frailty, Body Composition, Elderly

PP26 C-055

A SARCOPENIC DEMENTIA CASE: SUCCESSFUL TREATMENT WITH NUTRITION SUPPORT AND RESISTANCE TRAINING

Ergun BOZOGLU, Mehmet Ilkin NAHARCI, Umut SAFER, Ilker TASCI, Huseyin DORUK (Geriatrics, Gulhane School of Medicine, Turkey)

Introduction : The prevalence of sarcopenia observed in population aged 80 years or older is 11.50%. Sarcopenia is a syndrome characterized by a progressive and generalized loss of skeletal muscle mass, strength and performance with a risk of adverse outcomes, such as physical disability, poor quality of life and death. **Method :** Eighty-eight years old dementia patient admitted out geriatric department with complain of dental problem. She could not eat properly as she has no teeth and this caused the increase of depressive symptoms. Her history consists of dementia, hypertension, chronic kidney disease and hypothyroidism. **Results :** Our geriatric assessment showed that patient had low body mass index, skeletal muscle mass, hand grip strength and 15-ft (4.572 m) course gait speed. We ordered Ensure Plus® nutrition shakes 3 packs/day and Abound® therapeutic nutrition drinks 2 packs/day and also resistance training program. After 6 months, patient body mass index (first visit vs. 6th month visit; 25.9 vs. 27.6), and skeletal muscle mass (6.45 kg/m² vs. 6.58 kg/m²) improved, also decreased depressive symptoms. But no change in hand grip strength and 15-ft (4.572 m) course gait speed. **Conclusion :** Ensure Plus® and Abound® combination treatment with resistance training seem to be good alternative for treatment of sarcopenia. Also this regime could

improve depressive symptoms related to this condition. **Keywords :** sarcopenia, dementia, nutrition

PP26 C-056

ASSOCIATION BETWEEN MUSCLE MASS INDEX AND METABOLIC SYNDROME IN THE ELDERLY

Cristiane Alves BORGES¹, Graziela Morgana Silva TAVARES², Vera Elizabeth CLOSS³, Isadora De Souza RODRIGUES⁴, Carla Helena Augustin SCHWANKE⁵, Silvana JUNGES⁶, Maria Gabriela Valle GOTTLIEB⁵ (1. Biology Department, Pontifical Catholic University of Rio Grande do Sul, Brazil; 2. Physical Therapy, Federal do Pampa University, Brazil; 3. Program in Biomedical Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil; 4. Pharmacy, IGG-PUCRS, Brazil; 5. Graduate Program in Biomedical Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil; 6. Graduate Program in Biomedical Gerontology, IGG PUCRS, Brazil)

Introduction : The metabolic syndrome (MS) as well as to changes in body composition are very prevalent in the elderly. The objective of the present study was to verify the association among muscle mass (MM), muscle mass index (MMI) and MS in elderly. **Method :** Cross-sectional study. We selected 75 elderly people (14 men and 61 women) of the Ambulatory Geriatric Service of the Hospital of Sao Lucas, Brazil. They were randomized into two groups: group 1=elderly with MS (40), group 2=elderly without MS (34). The variables evaluated were: age, sex, MM, MMI. The instruments used were the following: for the diagnosis of MS was used the (NCEP-ATPIII), for the measurement of MM and MMI we used the following formulas: $MM = \text{height}^2 \times (0.00744 \times \text{arm circumference}^2 + 0.00088 \times \text{thigh circumference}^2 + 0.00441 \times \text{calf circumference}^2) + 2.4 \times \text{sex} + 0.048 \times \text{age} + \text{race} + 78$ and $MMI = (\text{kg}) / \text{height}(\text{m})^2$. We performed a correction for subtraction of subcutaneous fat using the formula $Cm = \text{Climb} - \pi S$. **Results :** The average age of the groups was: MS=73.53 \pm 6.734; without MS group =73.23 \pm 7.273, p=0.085. There was no significant difference in the average MM of the groups investigated (MS:MM=23.60 \pm 4.98 and without MS: MM= 21.96 \pm 4.52, p =0.14). However, there was a significant statistic difference between the groups with respect to the MMI (MS:MMI=10.04 \pm 2.09, without MS:MMI= 9.08 \pm 1.62, p=0.03). **Conclusion :** MS is associated with the MMI in this sample, where it was observed that elderly people with MS have a slightly higher average of the MMI than elderly without MS. However more research is needed to elucidate the effect of MS on skeletal muscle. **Keywords :** Muscle mass index, Metabolic syndrome, elderly

PP26 C-057

RELATIONSHIPS AMONG APPENDICULAR SKELETAL MUSCLE INDEX, LIPID PROFILE, AND HBA1C IN COMMUNITY-DWELLING ELDERLY WOMEN

Hyoun-Joong KONG¹, Eunjin HWANG¹, Jeongeun KIM², Suk Wha KIM³, Jeeyoung HONG¹ (1. Biomedical Research Institute, Seoul National University Hospital, Korea; 2. College of Nursing, Seoul National University, Korea; 3. Department of Plastic Surgery, Seoul National University Hospital, Korea)

Introduction : With the population aging in Korea, interests for sarcopenia and the related diseases are in old age getting higher. This study focused on association among appendicular skeletal muscle index (ASMI), which is the diagnosis index of sarcopenia, HbA1c, which is the management index of diabetes mellitus, and blood lipid profile for community-dwelling elderly women to provide basic knowledge for preventing diseases related to sarcopenia. **Method :** The subjects in this study were 53 low-income elderly women in the K district of Seoul whose average age was 74.11 \pm 7.10 years. After

appendicular skeletal muscle mass (ASMM) was obtained through analyzing body composition by using dual-energy X-ray absorptiometry (DEXA), appendicular skeletal muscle index (ASMI) was calculated (ASMM/Weight¹⁰⁰) for those. And total cholesterol (TC), high-density lipoprotein (HDL), Triglyceride (TG), and HbA1c were examined through blood test. Pearson's correlation analysis between ASMI and HbA1c was done by using SPSS-PC (version 18.0). The level of statistical significance was set for $\alpha = .05$. Results : As a result of research, ASMI showed significant correlation with HDL ($r = .454, p = .001$) and HbA1c ($r = -.337, p = .014$), but failed to show significant correlation with TC ($r = -.007, p = .961$) and TG ($r = -.197, p = .158$). Conclusion : The ASMI in community-dwelling elderly women was indicated to have relationship with HDL, which is useful for their health, and with HbA1c, which is serves as a marker for average blood glucose levels. Hence, a steady increase of muscle volume through exercise and diet is judged to be likely conducive to preventing cardiovascular disease and diabetes. Keywords : Community-Dwelling Elderly, Appendicular Skeletal Muscle Index, HbA1c

PP26 C-058

ALFACALCIDOL CAN IMPROVES MUSCLE STRENGTH IN ELDERLY INDONESIAN WOMEN WHO HAVE LOW HANDGRIP STRENGTH : A RANDOMIZED CONTROLLED TRIAL

In ANUGRAHINI, Siti SETIATI (*Internal Medicine, Faculty of Medicine, University of Indonesia, Indonesia*)

Introduction : The age-related increase in falls is strongly associated with a decline in muscle strength by the mechanism of sarcopenia. Muscle mass decreases 1.2% annually after age 50 and muscle strength declines by 3%. Promising treatment of sarcopenia with analog vitamin D (alfacalcidol) that have muscular effect remains challenging. A double-blinded randomized controlled trial was conducted in order to determine the effect of alfacalcidol on the upper-body muscle strength in Indonesian elderly women in age group of 60 or more who have low handgrip strength. Method : A total 122 elderly women were enrolled to this study. There were 95 subjects fulfilled the eligible criteria. These subjects were randomized into two groups, one group of 47 subjects received alfacalcidol 0.5 mcg/day and the other group received placebo. Each subject was given calcium 500 mg/day. It was determined subjects with handgrip strength equal to or less than 22 kg and measured using handheld dynamometer. Results : After 12 weeks of intervention, 88 subjects had the second muscle strength measurement (7 dropped out). By Mann Whitney analysis, there were significant improvement of muscle strength in the group that received alfacalcidol compared to placebo in handgrip strength (15.50 kg vs. 13.75 kg; $p = 0.003$). Conclusion : Daily doses of 0.5 mcg alfacalcidol significantly improve muscle strength in elderly Indonesian women who have low handgrip strength compared to placebo. Keywords : Alfacalcidol, Muscle strength

PP26 C-059

GERIATRIC SYNDROM INQUIRY IN SENIOR CITIZENS HOSPITALIZED FOR OTHER REASONS IN BASIC ACCOMMODATIONS OF A HIGHLY SPECIALIZED HOSPITAL IN SANTIAGO CHILE

Juana SILVA¹, Carolina PEREZ², Pablo FLORES², Anakena IBACETA³, Sergio CASTRO⁴ (*1. Director, Institute National of Geriatrics, Chile; 2. Research and Teaching Department (DIDE), National Institute of Geriatrics, Chile; 3. Mathematics Department, Universidad Iberoamericana, Chile; 4. Day Hospital, National Institute of Geriatrics, Chile*)

Introduction : Geriatric Syndrom (G.S.) is a clinic condition that can interfere in the evolution of an illness requiring hospitalization. In Chile, the National Institute of Geriatrics has instituted a model of geriatric care with geriatric specialists doing the Integral Geriatric Evaluation (I.G.E) OBJECTIVES: To detect G.S. in Senior Citizens (S.C.) hospitalized for other reasons in basic beds in a highly specialized hospital after doing the I.G.E. Method : By applying existing I.G.E methodology to a group of 605 hospitalized 80 year old and above S.C., showing the most obvious G.S. The information was analyzed on SPSS. Results : Main diagnostics: 24% fractures, 22% cerebral stroke, 13% digestive disorders, 70% showed more than three pathologies. According to Barthel, 57% showed dependency, 86% severe handicapped of ABVD, 15% cognitive deterioration, 54% risk of bed sore. The most frequent G.S. were: sensory disorders 63%, malnutrition 13%. The media stay was 14 days, 80% was released, 12% died. Conclusion : The geriatric specialist and his team is key to detect G.S. and indentified S.C. with fragile clinic profile, group that spend more time in the hospital, uses resources and have greater mortality rate. Discharging patients from a geriatric point of view is of great importance if we consider that 80% are sent home without being checked by a specialist, which can result in a prompt return to the hospital. Our current guidelines for admitting patients into hospitals are not setup for the geriatric specialist to refer patients to specific care nonetheless suggestions are made in medical profiles. Keywords : Geriatric Syndromes

SYSTOLIC BLOOD PRESSURE IS NEGATIVELY ASSOCIATED WITH WALKING SPEED IN KOREAN AGING PEOPLE

Ki Young SON, Belong CHO, Dong Wook SHIN (*Department of Family Medicine, Health Promotion Center, Seoul National University Hospital, Korea*)

Introduction : Arterial blood pressure (BP) is a marker of aging cardiopulmonary system and is related to decrease in physiologic reserve via tissue perfusion alteration. Hypothesis of this study was increase of blood pressure was associated with decrease of physical performance in old aged people. This study aimed to investigate the relationship between BP and walk speed in Korean aging people. Method : The systolic blood pressure (SBP), diastolic blood pressure (DBP) and 4 meter-walking speed were measured on random sample nested in the KLoSA panel, a national representative sample of aging people in Korea. We performed linear regression to evaluate the association between walking speed and blood pressure adjusted for age, sex, leg length. Results : Five hundred and eighteen subjects were included in analysis. Approximately 43% (222/518) of the subjects were male and 65% (338/518) were 60 years or older. Mean SBP/DBP was $131.34 \pm 19.63/82.85 \pm 11.18$ mmHg and mean elapsed time for 4 meter walk was 4.48 ± 1.82 sec. 10 mmHg increase of SBP was significantly associated with 0.075 sec increase of elapsed time for 4 meter walk (95% CI 0.003 ? 0.148 sec). However DBP ($\beta = -0.024$, 95% CI -0.150 ? 0.101) or Mean BP ($\beta = 0.063$, 95% CI -0.036 ? 0.163) did not show significant association. Conclusion : SBP was negatively associated with walking speed in Korean aging people. However DBP or Mean BP did not show this association. Keywords : Blood pressure, Walk speed

PP26 C-061

THE EFFECTS OF A HIGH ENERGY DENSE, SMALL VOLUME ORAL NUTRITIONAL SUPPLEMENT ON COMPLIANCE IN THE DAILY CLINICAL PRACTICE OF A GERIATRIC WARD

Karien LOMBARD¹, Mirjam KUHN², Carlette ROUWS², Dieneke VAN ASSELT¹ (1. Department of Geriatric Medicine, Medical Center, Netherlands; 2. Nutricia Advanced Medical Nutrition, Danone Research-Centre for Specialised Nutrition, Netherlands)

Introduction : Compliance is key for optimizing the clinical effectiveness of oral nutritional supplements (ONS). High energy-dense ONS (≥ 2 kcal/ml) have been shown to improve compliance in clinical trial settings (Hubbard Clin Nutr 2012). Data on compliance in daily clinical practice are largely lacking. The aim of the present observational study was to evaluate the effect of a high energy dense, small volume ONS on compliance in daily clinical practice. **Method :** Undernourished (or at risk of under nutrition) geriatric inpatients received two servings of either a high energy dense, small volume ONS (125ml, 2.4 kcal/ml: Nutridrink Compact Energy, Nutricia) or a standard ONS (200ml, 1.5 kcal/ml: Nutridrink) as part of their daily routine care. Compliance (kcal/day and % of prescribed volume) was assessed via weighing dispensed and returned bottles. Data were analysed via Mixed Model for Repeated Measures. **Results :** Forty-seven patients received the high energy dense, small volume ONS and 61 patients received standard ONS during a period of respectively 10 (2 - 28) and 9 (1 - 25) days ($p=0.074$). Compliance was significantly higher with the energy dense, small volume ONS compared to standard ONS (378 ± 14.0 kcal/day vs. 337 ± 13.6 kcal/day, $p = 0.039$, $63.0 \pm 2.34\%$ vs. $56.2 \pm 2.26\%$, $p = 0.039$). Moreover, a trend ($p=0.078$) was observed towards an increasing difference in compliance over time. **Conclusion :** This study showed that compliance with a high energy dense, small volume ONS is significantly higher than with a standard ONS in daily clinical practice at a geriatric ward. **Keywords :** Frailty, oral nutritional supplements, compliance

PP26 C-062

LOWER LEG MUSCLE MASS IS ASSOCIATED WITH AUGMENTATION INDEX BUT NOT WITH BRACHIAL BLOOD PRESSURE IN AN ELDERLY POPULATION

Seung Won LEE¹, Won Joon LEE², Wungrak CHOI³, Yoosik YOUM⁴, Yeong-Ran PARK⁵, Sang Hui CHU⁶, Hyeon Chang KIM² (1. Department of Public Health, Yonsei University College of Medicine, Korea; 2. Department of Preventive Medicine, Yonsei University College of Medicine, Korea; 3. Severance Hospital, Yonsei University Health System, Korea; 4. Department of Sociology, Yonsei University College of Social Sciences, Korea; 5. Division of Silver Industry, Kangnam University, Korea; 6. Department of Clinical Nursing Science, Yonsei University College of Nursing, Korea)

Introduction : Augmentation index (AI), a measure of systemic arterial stiffness, was associated with cardiovascular risk. The aim of this study was to investigate the association between leg muscle mass and the AI and brachial blood pressure in an elderly Korean population. **Method :** This study used data from Korean Social Life, Health and Aging Project (KSHAP) in 2011. A total of 814 people agreed to participate in the KSHAP. Among them, 180 men and 247 women aged 52-95 years completed questionnaire survey, health examinations and AI measurement. Leg muscle mass was measured with bioelectrical impedance method. AI was measured by radial pulse waveform analysis. Brachial blood pressure and anthropometric data were obtained from the participants. The association between leg muscle mass and AI was investigated by multiple linear regression analysis. **Results :** Mean (standard deviation) age was 71.7 (6.9) in men and 70.9 (7.2) in women. In male participants, leg muscle mass was inversely associated with AI when adjusted for age ($\beta = -2.641$, $p = 0.001$), and even after additional adjustment for body mass index,

brachial systolic blood pressure, total cholesterol, HDL cholesterol, fasting glucose, fasting insulin, TUG, smoking and alcohol consumption ($\beta = -1.632$, $p = 0.035$). In women, leg muscle mass was associated with AI when adjusted for age ($\beta = -1.540$, $p = 0.033$) but the association disappeared when fully adjusted ($\beta = -1.017$, $p = 0.198$). However, leg muscle mass was not associated with brachial blood pressure. **Conclusion :** In an elderly Korean population, lower leg muscle mass was independently associated with arterial stiffness but not with brachial blood pressure. **Keywords :** arterial stiffness, augmentation index, muscle mass

MUSCULAR DECLINE AND COGNITIVE STATUS: A PILOT STUDY IN ROMANIAN ELDERLY PATIENTS

Sorina Maria AURELIAN¹, Minerva GHINESCU², Andreea ZAMFIRESCU³, Justin AURELIAN⁴, Alexandru A. CAPISIZU⁵, Iulian COVLESCU⁶, Mihai Viorel ZAMFIR⁷, Dan Mircea CHETA⁸ (1. Clinic of Geriatric and Gerontology Hospital Sf. Luca, University Titu Maiorescu, Romania; 2. Family Medicine, University Titu Maiorescu Faculty of Medicine, Romania; 3. Clinic of Geriatric and Gerontology Hospital Sf. Luca, Romanian Association of Young Geriatricians, Romania; 4. Social Medicine, University of Medicine and Pharmacy 'Carol Davila', Romania; 5. Neurology, University of Pharmacy and Medicine 'Carol Davila', Romania; 6. Artificial Brain Study, Vrije Universiteit Amsterdam, Netherlands; 7. Geriatric, Romanian Association of Young Geriatricians, Romania; 8. Diabetology and Nutrition, University of Medicine and Pharmacy 'Carol Davila', Romania)

Introduction : On our knowledge the incidence of frailty and muscular decline is not known in the Romanian elderly population. Sarcopenia is a risk of adverse outcomes such as physical disability, poor quality of life and death. **Objective:** We examine the association between muscular decline, physical performance and cognitive impairment in a specific population (elderly). **Method :** This is a cross-sectional pilot study on 70 randomised patients hospitalized in January-August 2012 at Saint Luke Hospital. We measure the handgrip for muscular force with a MSD dynamometer using Southampton protocol; physical performance was assessed using the short physical performance battery (4-m walk, balance, and chair stands), which yields a summary performance score ranging from 0 to 12 (high) and cognitive status (attention, memory and verbal fluency) with MMSE and Clock Test. The inclusion criteria was age >65 years. Exclusion criteria were diagnosis of dementia, MCI, Parkinson disease, hypo- and hyperthyroidism or neoplasm diagnosed in the prior 10 years. **Results :** We have a heterogeneous group men and women (60% vs. 40%). After adjustment for sex, age and BMI, we used a bivariate analysis with Pearson correlation coefficient. We observed that MCI is correlated with low physical performance ($p < 0.01$) but we didn't obtain any significant correlation between handgrip strength and MCI. We see also a high prevalence of MCI (30%). **Conclusion :** A screening of physical performance and MCI is necessary in development of the Romanian public health for the elderly and to prevent frailty and dependence on this target population. **Keywords:** elderly, sarcopenia, cognitive decline.

ENGLISH VERSION OF THE NEWLY-DEVELOPED CGA INITIATIVE 'DR. SUPERMAN' FOR ELDERLY OUTPATIENTS

Toshihiko IWAMOTO (Geriatric Medicine, Tokyo Medical University, Japan)

Introduction : Comprehensive geriatric assessment (CGA) is a keystone for improving and maintaining the quality of life (QOL) of elderly patients. However, CGA consists of a variety of assessments in physical, psychosocial and functional abilities, and in environmental resources and problems. Therefore, CGA with multiple components and time-consuming consultation can lead to difficulty in providing primary care. Recently, we have developed a concise screening test for CGA named, "Dr. SUPERMAN". **Method :** We used this to examine 110 outpatients with various chronic diseases. The name "Dr. SUPERMAN" is a mnemonic and an acronym: "Dr", representing physical examination; "S", sensation; "U", understanding of speech (communication); "PER", pharmacy and key person; "M", 3 M's indicating the geriatric syndrome of disturbances of mentality, mobility and micturition; "A", ADL; and "N", nutrition. Several questionnaires for each item were adopted using the appropriate gold standards and statistics described elsewhere. **Results :** It required 5-15 minutes to complete the test in 110 outpatients (83.5±5.6 y, 43 men). The representative geriatric problems revealed in each item were as follows: cognitive decline (55%), depressive status (38%), gait & balance disturbance (79%), swallowing difficulty (19%), urination disturbance (52%), any disruption in ADL (51%), and nutritional problems (23%). **Conclusion :** "Dr. SUPERMAN" showed a convenient screening test for CGA, with the systematic items kept in mind by mnemonics. "Dr. SUPERMAN" is also easy to perform in primary care, and is completed within approximately 10 minutes. **Keywords :** Comprehensive Geriatric Assessment, screening, geriatric syndrome

RELATIONSHIP BETWEEN DYSPHAGIA AND NUTRITIONAL STATUS IN FRAIL OLDER PEOPLE: IMPLICATIONS FOR SARCOPENIC DYSPHAGIA

Yoshitoshi KURODA (Department of Rehabilitation, St. Francis Hospital, Japan)

Introduction : Dysphagia and malnutrition are frequently observed in older people admitted to hospital. However, the relationship between dysphagia and nutritional status has not been sufficiently investigated. **Method :** We retrospectively investigated 63 patients with dysphagia admitted to our hospital in 2012. The subjects consisted of 29 men and 34 women with a mean age of 85.7 years (range 70-100 years). Functional assessment included a graded water swallowing test (GWST), a food intake level scale (FILS), and a physical activity scale. Nutritional assessment included serum albumin, mid-upper arm circumference (MUAC), and calf circumference (CC). **Results :** GWST was significantly correlated with MUAC ($r = 0.40$) and CC ($r = 0.49$) but not with serum albumin ($r = 0.21$). FILS was significantly correlated with MUAC ($r = 0.35$) and CC ($r = 0.35$) but not with serum albumin ($r = 0.22$). Physical activity was significantly correlated with MUAC ($r = 0.26$) but not with CC ($r = 0.22$) or serum albumin ($r = 0.16$). **Conclusion :** Dysphagia in the subjects was related to the MUAC and CC but not with serum albumin, indicating that the relationship between dysphagia and nutritional status was not straightforward. The most likely explanation for these results is that the general reduction in lean body mass, including the swallowing muscles, was responsible for the association between the anthropometric and the swallowing measures, suggesting the presence of sarcopenic dysphagia. **Keywords :** dysphagia, nutrition, sarcopenia

PP26 C-066

LOW PULMONARY FUNCTION IS ASSOCIATED WITH SARCOPENIA IN KOREAN ELDERLY

Young-Sang KIM¹, Kwang-Min KIM², Moon Jong KIM¹ (1. Dept. of

Family Medicine, CHA Bundang Medical Center, CHA university, Korea; 2. Dept. of Family Medicine, Ajou University Medical Center, Korea)

Introduction : Sarcopenia is an important factor of functional impairment related to aging. It is not well known whether decrease in pulmonary function is related to age-related muscle mass decline. **Method :** Representative Korean elderly men (594) and women (738) were included in this study from the Fourth Korean National Health and Nutritional Examination Surveys. Body composition was measured with dual-energy X-ray absorptiometry in each body part. Sarcopenia was defined by weight-adjusted method and by Newman's residual method. The results of pulmonary function tests consist of forced vital capacity (FVC), forced expiratory volume in 1s (FEV1), and their ratio. **Results :** Mean age was 71 in both men and women. Height and weight adjusted appendicular skeletal muscle mass (ASM) was positively correlated with pulmonary function. According to simple comparison by t-test, sarcopenic men had lower FVC, FEV1, and FEV1/FVC, while sarcopenic women did not. After adjusting age, smoking, history of pulmonary disease, exercise, and body fat proportion, sarcopenic women had lower FEV1/FVC; sarcopenic men had lower FEV1 and FEV1/FVC. **Conclusion :** Sarcopenic elderly had lower pulmonary function in both men and women. Further research is needed to clarify whether age-related muscle mass loss precedes pulmonary function decline. **Keywords :** sarcopenia, pulmonary function, elderly

PP26 C-067

IMPACT OF MODERATE COGNITIVE IMPAIRMENT ON PHYSICAL CHARACTERISTICS IN ACTIVE SENIORS

Charlotte H. PION¹, Sebastien BARBAT-ARTIGAS¹, Marc BELANGER², Mylene AUBERTIN-LEHEUDRE² (1. Department of Biology, University of Quebec at Montreal, Canada; 2. Department of Kinanthropology, University of Quebec at Montreal, Canada)

Introduction : Cognitive impairment can often result in health problems among elderly. Physical activity (PA) appears to be an effective intervention to slow this phenomenon. The objective of this study is to examine functional differences between active seniors with or without moderate cognitive impairment (MCI). **Method :** 288 active elderly men and women were divided into 2 groups according to their score on the Montreal Cognitive Assessment (MoCA): MCI (MOCA <26; n=102) and Non-MCI (MOCA ≥27; n=186) groups. Body composition (fat free mass and fat mass by DEXA; muscle strength by handgrip and leg extension), functional capacities (SPPB), cognitive characteristics (MoCA, Stroop and TMT) and their PA levels were compared between the 2 groups. $P < 0.05$ were significant (SPSS 17.0). **Results :** The 2 groups were significantly different at the cognitive level scores except for the Stroop A and B1 Stroop and orientation's the MoCA orientation scores. No difference was observed between groups for age, BMI or gender. No difference in physical and functional characteristics, PA duration and the number of steps (>180min/wk, ≥7500 steps/day) was observed between the 2 groups. **Conclusion :** Regardless of cognitive status in elderly, a moderately active lifestyle seems to preserve a favorable body composition and functional independence. **Keywords :** successful aging, cognitive impairment, functional capacity

FRAIL ELDERLY AND HEALTH SELF PERCEPTION: RESULTS FROM A LOW INCOME AND LOW EDUCATED ELDERLY IN RIO DE JANEIRO, BRAZIL

Janiciene SOUZA¹, Fayanne SCHAUSTZ¹, Roberta BARROS²,

Annibal TRUZZI¹, Fernanda BORGES³, Luiz Mauricio PLOTKOWSKI², Marisa SANTOS² (1. Nursing, Centro de Estudo e Pesquisa do Envelhecimento, Brazil; 2. Medicine, Centro de Estudo e Pesquisa do Envelhecimento, Brazil; 3. Nutrition, Centro de Estudo e Pesquisa do Envelhecimento, Brazil)

Introduction : Poor health self-perception (HPS) has been related with higher morbidity, mortality and functional decline in the elderly. There is conflicting evidence linking poor HSP and advanced age. This cross-sectional study aims at investigating the association between age and HSP. Method : We included 300 elderly people from a primary care center from April to December 2012. The majority of the sample were female (59%), with a mean age of 70 years (SD=7.0), 42% had lower education, 82% belonged to D/E socioeconomic class. Frail elderly (SOF index) comprised 32.6% (n=90) of the sample. The individuals were categorized into three age groups: 60 to 69 (group 0), 70-80 (group 1) and above 80 years-old (group 2). Results : 276 people answered the question about HPS. Most of the participants reported their health as regular (44.9%), good (39.5%), and poor (15.6%). Frail elders showed a poorer HSP (p < 0.01). Conclusion : There is a strong association between frailty and poor HSP in the elderly. Keywords : Frailty, Health self perception

PP26 C-069

SARCOPENIA AND FRAILTY IN JAPANESE ELDER PATIENTS WITH OBSTRUCTIVE SLEEP APNEA SYNDROME (OSAS) UNDERGOING CONTINUOUS POSITIVE AIRWAY PRESSURE (CPAP) THERAPY

Jun TAKEDA¹, Kazuyoshi SENDA², Shosuke SATAKE³, Masataka SHIBASAKI¹, Mitsunori NISHIKAWA¹, Haruhiko TOKUDA⁴, Hisayuki MIURA², Hidetoshi ENDO³, Kenji TOBA⁵ (1. Department of Pulmonary Medicine, National Center for Geriatrics and Gerontology, Japan; 2. Division of Home Care Promotion, National Center for Geriatrics and Gerontology, Japan; 3. Department of Geriatric Medicine, National Center for Geriatrics and Gerontology, Japan; 4. Department of Clinical Laboratory, National Center for Geriatrics and Gerontology, Japan; 5. Director of the Hospital, National Center for Geriatrics and Gerontology, Japan)

Introduction : OSAS is prevalent among obese adults. However, information about body composition in Japanese elder patients with OSAS is scarce. We investigated sarcopenia and frailty in elder OSAS patients using body composition analysis with dual-energy X-ray absorptiometry (DEXA). Method : Clinically stable 53 patients with OSAS undergoing CPAP (age: 73.4 +/- 4.9 years; male: 42; Apnea-hypopnea index: 43.4 +/- 15.4; BMI: 24.7 +/- 3.0 kg/m²; Epworth Sleepiness Scale: 8.9/24 +/- 5.7) were underwent a comprehensive geriatric assessment. Results : While 15 patients were diagnosed with sarcopenia by Baumgartner Criteria, 6 sarcopenic patients were diagnosed by the European Working Group on Sarcopenia in Older People Criteria. Mean appendicular skeletal muscle mass index (ASMI) was 7.32 +/- 0.87 kg/m². Mean Body fat mass was 25.9 +/- 8.1%. With DEXA, 28 were diagnosed as obesity including 5 patients with sarcopenic-obesity and 7 patients with BMI <25. With Fried frailty criteria, 9 were classified as frail and 23 as pre-frail. Four sarcopenic-obesity patients were pre-frail and one is frail. ASMI is associated with frailty and QOL. Frailty is associated with QOL and not with parameters in sleep study. Conclusion : Among the elder OSAS patients with more than acceptable CPAP adherence, sarcopenia was observed in 28% by Baumgartner Criteria and obesity in 53% with DEXA. Frail elder OSAS patients were 17% and pre-frail were 43%. Frailty progresses with decrease in muscle. Elder sarcopenic OSAS patients need early detection with body composition

analysis and efficacious nutritional support combined with exercise added on conventional CPAP therapy. Keywords : Obstructive Sleep Apnea Syndrome, Sarcopenia, Frailty

EFFECTS OF AROMA THERAPY ON WRIST ACTIVITY DURING DAY AND NIGHT FOR PATIENTS WITH DEMENTIA

Taiki KOMATSU (School of Health Science, Department of Physical T, Tokyo University of Technology, Japan)

Introduction : Currently, the number of patients with dementia in Japan is about 2 million. In 2030, it is estimated to be approximately 3.5 million. Recently, aroma therapy has received great interest for reducing Behavioral and psychological symptoms in dementia (BPSD). Method : Subjects were 1 patient with dementia of Lewy bodies (DLB) and 3 patients with Alzheimer's disease of dementia (DAT). Two types of essential oils which were developed jointly by Kinki university and @aroma Co., Ltd.(Tokyo, Japan) were used. One is based on tea tree which is expected to have an awakening effect, the other one is based on lavender which is expected to have a sedation effect. Results : Physical activity and total duration of awake during the daytime were significantly increased during the third, fourth, and fifth weeks compared to the first week for all subjects. Total duration of sleep time during night was increased during the third, fourth weeks for all subjects. Conclusion : Our results indicate that aroma therapy might be useful to reduce sleep problems for patients with dementia of DLB and DAT. Keywords : Aroma Sleep disorder Dementia

PP26 C-071

CHARACTERISTIC OF PHYSICAL FUNCTIONS AND HEALTH-RELATED INDEXES IN COMMUNITY-DWELLING OLDER AGED ABOVE 75 YEARS WITH HISTORY OF CANCER

Hikaru IHIRA¹, Atsushi MIZUMOTO¹, Keisuke YASUDA¹, Keitarou MAIKNO¹, Yoko MIYABE¹, Hirofumi OHNISHI², Sigeyuki SAITO¹, Tomomi AKANUMA³, Seiji YASUMURA⁴, Takao SUZUKI⁵, Taketo FURUNA¹ (1. School of Health Science, Sapporo Medical University, Japan; 2. Department of Public Health, School of Medicine, Sapporo Medical University, Japan; 3. Bibai City Office, Japan; 4. Department of Public Health, School of Medicine, Fukushima Medical University, Japan; 5. National Institute of Longevity Science, National Center for Geriatrics and Gerontology, Japan)

Introduction : We sought to examine whether physical functions and health-related indexes in community-dwelling older aged above 75 years with history of cancer different from that without diagnosed cancer. Method : This was a cross-sectional analysis of 272 community-dwelling older adults (160 women and 112 men; age: 75 to 95 years; mean age: 80.0 years), participated in the first wave of the 'Population-based and Inspiring Potential Activity for Old-old Inhabitants (PIPAOI)' We measured physical functions such as grip power, knee extension power, standing balance, 5m walking time, pelvic walking time and timed up-and-go test. The health-related indexes were also evaluated by a self-report questionnaire. Participants were asked to physician, nurse and physical therapist by interview whether it be diagnosed as cancer until now. Results : Twenty-seven older adults (9.9 % of the whole; mean age 80.4 years) have been diagnosed as cancer in the past. There was a significant deterioration in 5m walking time, pelvic walking time, exercise habit, frequency of outdoor, self-confidence for exercise and self-confidence for activity among participants with history of cancer (P<0.05). In addition, it was shown that older with history of cancer were more fall history and

have a good appetite than non-history of cancer ($P < 0.05$). Conclusion : It is confirmed characteristic of physical functions and health-related indexes in older with history of cancer. The results suggest that it is important to maintain the physical function in community-dwelling Japanese older aged above 75 years with history of cancer. Keywords : walking speed, appetite, fall history

PP26 C-072

PATIENT'S COGNITION TOWARD THE DISCLOSURE OF CANCER DIAGNOSIS

In Hee CHUN¹, Kyungsook PARK² (1. Graduate School of Nursing, Chung-Ang University, Korea; 2. Redcross College of Nursing, Chung-Ang University, Korea)

Introduction : The purpose of this study was to examine the actual condition and the general cognition toward the disclosure of diagnosis among cancer patients. Method : A survey using a structured questionnaire was conducted with 200 cancer patient from October 18, 2011 to November 19. The data was analyzed with SPSS(version 18.0) for frequency analysis and χ^2 test. Results : 88.2% of cancer patients were agreed to the disclosure of cancer diagnosis. Cancer patients had preferences for a doctor to notify the disclosure of their cancer diagnosis (90.8%) and immediate notification of the cancer diagnosis (89.7%). The sequences of disclosing cancer diagnosis were following; the patient and the care-giver notified at the same time (47.2%), the patient notified first (32.3%) and the care-giver notified first (20.5%). Cognition toward disclosure of cancer diagnosis was statistically significant only with age ($p = .003$). Conclusion : These result suggested that cancer patient wanted to notify their cancer diagnosis by doctor, as soon as cancer diagnosis confirmed, before notifying to their family, and to know accurate cancer related information. Therefore, principals and guidelines in disclosing cancer diagnosis are essential to increase the quality of cancer patient care. Keywords : Cancer Diagnosis, Disclosure, Cognition

PP26 C-073

ELDERLY PATIENTS FOLLOWING FRACTURED NECK OF FEMUR SURGERY HAVE INADEQUATE PAIN CONTROL: PRELIMINARY RESULTS FROM A RANDOMIZED-CONTROLLED TRIAL

Ashley Clifford HARDING¹, Ashley Clifford HARDING² (1. Rehabilitation and Aged Care, Gosford Hospital, New South Wales Health, Australia; 2. Rehab and Aged Care Division, Gosford Hospital, Australia)

Introduction : The aim of this research was to review the adequacy of pain management in elderly patients following surgical repair of a fractured neck of femur taking part in the REVITAHIP study. Adequate pain management reduces length of stay, promotes recovery and mobility. Method : We analysed of 200 patients involved in the REVITAHIP, who presented to a major teaching hospital with a hip fracture requiring surgical intervention between January 2011 and December 2012. Evaluation of pain was attended within a five-day period using the Wong-Baker faces, or 0-10 visual analogue (numeric) scale (VAS). Results : Of 200 patients, 175 met the inclusion criteria of the study and were assessed for current pain levels post operatively. A mean age of 81.2 ± 9.1 years was established and of the group assessed, 19% carried a diagnosis of mild dementia. In this group, consent was gained from the next of kin. 66% of patients come from a home environment with the remaining 33% from hostels or nursing homes. 18% had a VAS > 5 , 33% had a score of 1 or zero. However almost half (49%) complained of pain between 2 and 4. It was also found that patients with dementia used less analgesia compared with

those patients that had a mini-mental of $> 25/30$. Conclusion : Post-operative pain management for patients with hip fracture are not adequate. This has implications for both nurses and medical staff as adequate analgesia can decrease anxiety and promote mobility, and has the potential to reduce post-operative complications (e.g. delirium) in elderly patients. Keywords : Analgesia Fractured Femur

PP26 C-074

COMPARISON OF HIP FRACTURE MORTALITY BEFORE AND AFTER INTRODUCING AN ORTHOGERIATRICS UNIT AT HELEN JOSEPH HOSPITAL, JOHANNESBURG

India BUTLER¹, Lindy SINCLAIR¹, Brent TIPPING¹, Andrew BOULLE² (1. Division of Geriatrics, Department of Medicine, University of Witwatersrand, South Africa; 2. School of Public Health and Family Medicine, University of Cape Town, South Africa)

Introduction : Hip fractures in elderly patients have a high in-hospital mortality. A comprehensive geriatric intervention has been shown to reduce the mortality rate. There is little evidence of the role of comprehensive geriatric intervention in management of acute hip fractures in Africa. Geriatric services only became available in state hospitals in Gauteng province, South Africa in early 2012. Our objectives were to assess the outcomes in older patients with hip fractures before and after the introduction of an Acute Orthogeriatrics Unit at Helen Joseph Hospital, a state facility for indigent patients in Johannesburg, South Africa. Method : Chart review for one year before and then 9 months after commencement of the geriatric intervention. The risk ratio was calculated comparing surgery and mortality pre and post the intervention, and was estimated for mortality adjusted for admission characteristics in a binomial regression model. Results : A total of 110 patients were reviewed, 50 (45%) received the geriatric intervention. Intervention patients were older (median 83 vs 78 years, $p = 0.11$) but were otherwise comparable to the pre-intervention group. The intervention patients were more likely to undergo surgery (86% vs 50%, RR 1.5, 95% CI 1.2-1.9, $p < 0.00$) and less likely to die (12% vs 22%, RR 0.5, 95% CI 0.2-1.3) especially if female (5% vs 22%, OR 0.19, 95% CI 0.3-1, $p = 0.05$). Conclusion : Geriatric intervention reduced in-hospital mortality and resulted in a higher proportion of patients receiving surgery. While the small number of patients studied requires caution in interpreting the results, the findings are suggestive of the effectiveness and feasibility of such an intervention even where resources are relatively scarce. Keywords : hip fracture mortality africa

PP26 C-075

PREDICTING OUTCOME AFTER HIP FRACTURE: USING FRAILITY INDEX TO INTEGRATE COMPREHENSIVE GERIATRIC ASSESSMENT RESULTS

Manju KRISHNAN¹, Ruth E HUBBARD², Eamonn EELES³, Antony JOHANSEN⁴ (1. Cardiff Trauma Unit, University Hospital of Wales, Cardiff, United Kingdom; 2. Centre for Research in Geriatric Medicine, University of Queensland, Australia; 3. Dept. Medicine and Geriatrics, Prince Charles Hospital, Australia; 4. Cardiff Trauma Unit, University Hospital of Wales, United Kingdom)

Introduction : Hip fracture is expensive in terms of mortality, hospital length of stay (LOS) and consequences for independence. Poor outcome reflects the frailty of the patients who typically sustain this injury, but the impact of different comorbidities and impairments is complex to understand. We consider this in a prospective cohort study designed to examine how patients' Frailty Index (FI) predicts outcome. Method : We assessed sequential patients admitted with low trauma hip fracture, excluding only those unfit for surgery. National Hip

Fracture Database data was supplemented with a 51 point FI derived from Comprehensive Geriatric Assessment (CGA) findings. Results : We describe 178 patients; mean age 81 years, 73.5% female. Mean FI was 0.34 (SD=0.16), and logistic regression identified AMT score and FI as the strongest predictors of poor outcome. When patients were stratified by FI, 56(31.5%) were in low frailty group (FI≤0.25), 58(32.5%) in intermediate (FI>0.25-0.4), and 64(36%) in high FI group (FI>0.4). All patients in low FI group returned to their original residence, 80% by 30 days (mean 21.6 days) with no inpatient deaths. Mean LOS for intermediate group was 36.3 days compared with 67.8 days in the high FI group (p <0.01). 30-day mortality was 3.4% for the intermediate group, compared with 17.2% for the high FI group (p<0.001). Conclusion : Individual CGA findings proved disappointing as outcome predictors, while the FI proved effective in integrating assessment results to make useful predictions of LOS, of the likelihood of successful return home, and of mortality in the first 30 days. Keywords : Frailty Index, Hip Fracture, Length of stay

PP26 C-076

COMPARISON OF THE EPIDEMIOLOGIC AND CLINICAL CHARACTERISTICS OF THE ACUTE OSTEOPOROTIC COMPRESSION FRACTURE BETWEEN ELDERLY MALE AND FEMALE

Sung Han OH (*Neurosurgical Department, Bundang Jaesaeng General Hospital, Korea*)

Introduction : To compare the epidemiologic and clinical characteristics of elderly male patients with female patients who underwent percutaneous vertebroplasty or kyphoplasty for acute osteoporotic compression fractures. Method : Retrospectively, we analyzed total 233 patients (male 33, female 200) according to the epidemiology, bone mineral density(BMD), body mass index(BMI) and fracture segments using Fisher's exact test and T-test as a statistical analysis. Results : The secondary osteoporosis was more frequently found in the elderly male patients compared with the female patients (p=0.025). Particularly, alcohol abuse and/or smoking were more possible independent factors causing secondary osteoporosis in male patients compared with female patients (p=0.001). More than 65% of all patients had some degree of trauma history and fall was a major event in both groups. Mostly their body weights were within normal range in both groups. In male patients, T-score (standardized normal score) of BMD was much lower in the lumbar bodies than femur neck (p=0.000). Above 75% of the fracture segments were in the thoracolumbar junction in both groups. There were no differences in the involvement of multiple segments and old fractures between two groups. The compression rate was not significantly higher in the male group than female group. Conclusion : It is essential for the healthy elderly life to find and correct the risk factors of fall. To drink in moderation and quit smoking are correctable habits for the secondary osteoporosis. Keywords : Compression fracture , Osteoporosis

PP26 C-077

OSTEOPOROSIS AND TREATMENT WITH PARENTERAL IV ZOLENDRONATE IN A COMMUNITY HOSPITAL IN SINGAPORE

Diana CHAN¹, David YONG² (*1. Medical Services, Ang Mo Kio-Thye Hua Kwan Hospital, Singapore; 2. Medical Services, Changi General Hospital, Singapore*)

Introduction : The incidence of osteoporosis and fractures is set to rise in a rapidly ageing population where it is projected that 20% will be aged 65 years and above in 2030 in Singapore. Ang Mo Kio-Thye hua kwan hospital(AMKH) admits mostly elderly patients 30% of which

are for fractures requiring rehabilitation. We wanted to find out among high risk patients for osteoporosis how many would go for the BMD. We also wanted to find out what would be the uptake of treatment amongst those diagnosed to have osteoporosis. We also wanted to see if there were any side effects of oral versus IV treatment. Method : All patients aged 50 years and above admitted for past or present history of fragility fractures and those with clinical risk factors were considered for BMD. Those who qualified for treatment were given a choice of treatment-oral bisphosphonates(Fosamax)or IV Aclasta. Patients were assessed from Sept 2011-July 2012. Results : 118(73%) of inpatients opted to have BMD. 53% were found to have osteoporosis. 40(88%) of these patients opted for ACLASTA. 5 patients developed fever which resolved over 48 hours. There were no side effects seen in those on oral Fosamax. Conclusion : BMD is a good and validated tool for diagnosis of osteoporosis Aclasta may be safely given with a high percentage of acceptance in the community hospital setting. Keywords : BMD, osteoporosis, zolendronate

PP26 C-078

ASSOCIATION OF FONG AND THSD7A GENES WITH THE PREVALENCE OF VERTEBRAL FRACTURE IN 2427 CONSECUTIVE AUTOPSY CASES

Heying ZHOU (*Tokyo Metropolitan Geriatric Hospital, Japan*)

Introduction : We previously reported a couple of osteoporosis-susceptible genes, formiminotransferase N-terminal sub-domain containing gene (FONG) and thrombospondin, type 1, domain containing 7A (THSD7A), in which we identified common SNPs, rs7605378 (FONG) and rs12673692 (THSD7A); the former was associated with a predisposition to osteoporosis and the latter with bone mineral density. To further elucidate the importance of these polymorphisms in the pathogenesis of osteoporosis, we examined their association with the incidence of vertebral fracture. Method : DNA extracted from the renal cortex of 2427 consecutive Japanese autopsies (1331 men, mean 79 years, and 1096 women, mean 82 years) were included in the study. The presence or absence of femoral fracture during each subject's lifetime was determined by thorough examination of the clinical records as well as autopsy reports. Results : After adjustments for sex and age at autopsy, logistic regression analysis revealed that homozygotes for the risk allele of rs7605378 (A-allele) or that of rs12673629 (A-allele) possess an increased risk of vertebral fracture. The subjects simultaneously homozygous for the both risk alleles of rs7605378 (AA genotype) and rs12673629 (AA genotype) showed significantly higher risk of vertebral fracture (OR 2.401, 95% CI 1.305 to 4.416, P = 0.0048) as compared with those who bear at least one non-risk allele of both rs7605378 (AC/CC genotypes) and rs12673629 (AG/GG genotypes). Conclusion : Japanese subjects homozygous for the risk alleles of rs7605378 and rs12673629 may have higher risk of vertebral fracture. Keywords : osteoporosis; vertebral fracture

PP26 C-079

EFFECTIVENESS OF A SINGLE LOADING DOSE OF VITAMIN D IN ELDERLY PATIENTS FOLLOWING HIP FRACTURE SURGERY: BASELINE CHARACTERISTICS FROM THE REVITAHIP STUDY

Jenson C. MAK¹, Ashley HARDING¹, Rebecca MASON², Ian CAMERON³ (*1. Department of Geriatric Medicine, Gosford Hospital, Australia; 2. Department of Physiotherapy, Bosch Institute University of Sydney, Australia; 3. Rehabilitation Studies Unit, University of Sydney, Australia*)

Introduction : Hypovitaminosis D is particularly common among older

people with a proximal femoral (hip) fracture and has been linked with poorer lower extremity functioning, falls, and fractures. There is evidence that disability severity and fall rates may be reduced by adequate vitamin D replacement. However, the ideal regimen for vitamin D administration to have these benefits in older people who have been in the hospital has not been established. The REVITAHIP study aims to determine whether the administration of a loading dose of Vitamin D (with daily supplementation) improves walking speed, morbidity and mortality of elderly people (aged over 65 years) following surgery for a hip fracture. Method : A double-blind placebo-controlled trial was conducted across three catchment areas, providing analysis of over 250 patients who received either a placebo, or an active dose of 250000IU of vitamin D (within 7 days of surgery), followed by daily calcium (1000mg) and vitamin D (800IU) daily for six months in both groups. Results : We will present the baseline characteristics of the study population in terms of medical, functional, psychological and social domains. Conclusion : Reference: 1) Mak JCS, Mason RC, Klein L, Cameron ID, Improving Mobility and Reducing Disability in Older People Through Early High-Dose Vitamin D Replacement Following Hip Fracture: A Protocol for a Randomized Controlled Trial and Economic Evaluation. *Geriatric Orthopaedic Surgery & Rehabilitation*. May 2011;2:94-99, doi: 10.1177/2151458511406723. Keywords : hip fracture, vitamin D, randomized controlled trial

PP26 C-080

THE IMPACTS OF DIETARY HABIT AND CARDIOVASCULAR RISK FACTORS ON BONE MINERAL DENSITY IN KOREAN MIDDLE-AGED WOMEN

Hye Jin LEE, Kyung-Hea LEE (*Dept. of Food and Nutrition, Changwon National University, Korea*)

Introduction : The aim of this study was to research the relationship between bone mineral density (BMD) and cardiovascular risk factors in Korean middle-aged women. Method : This study consisted of 117 women aged 45-60 years who visited a Changwon Hanheart hospital for medical examination from July to September, 2012. The subjects were divided into the following three groups by lumbar t-score. Normal group (t-score > -1), Osteopenia group (-2.4 ≤ t-score ≤ -1), Osteoporosis group (t-score < -2.5). All data were analysed using the SPSS statistics version 20.0 program. Results : In the Normal group, Weight (p < 0.001), Waist circumference (p < 0.05) and Body mass index (p < 0.01) were significantly higher than other groups. However, other variables did not show a significant difference between the three groups. In the correlation analysis result between bone mineral density and cardiovascular risk factor, bone mineral density was a significant negative association with Age (r = 0.240, p < 0.01) and a significant positive association with Weight (r = 0.396, p < 0.01), Waist circumference (r = 0.276, p < 0.01) and Body mass index (r = 0.352, p < 0.01). However there is no significant association with Fasting glucose and serum lipids. In the correlation analysis result between BMD and health associated factors, BMD was a positive significance with Activation level (r = 0.192, p < 0.05) and a negative significance with Anxiety/Depression (r = -0.192, p < 0.05). However, there is no significant association with Dietary habit, one of most important hypothesis in this study. Conclusion : In conclusion, increased BMD was a significant association with increased BMI and Waist circumference, and no significance with other clinical indicators. We think the more detailed studies on the impact of dietary habit and Cardiovascular Risk Factors in BMD changes are needed in order to secure the health of Korean middle-age women. Keywords : Bone Mineral Density, Dietary Habit, Cardiovascular Risk Factors

PP26 C-081

ASSOCIATION BETWEEN HELICOBACTER PYLORI INFECTION AND RISK OF OSTEOPOROSIS IN ELDERLY TAIWANESE FEMALES WITH UPPER GASTROINTESTINAL DISEASES

Malcolm KOO¹, Shih-Chun LIN², Kun-Wei TSAI² (*1. Department of Medical Research, Buddhist Dalin Tzu Chi General Hospital, Taiwan; 2. Department of Geriatrics, Buddhist Dalin Tzu Chi General Hospital, Taiwan*)

Introduction : Helicobacter pylori (H. pylori) infection could lead to chronic local and systemic immune response. The resulting increase in pro-inflammatory cytokines could affect the bone resorption and might increase the risk of osteoporosis. This study aimed to investigate the possible association between H. pylori infection and risk of osteoporosis in elderly female patients with upper gastrointestinal diseases. Method : A retrospective computerized patient record review study was conducted in a regional teaching hospital in southern Taiwan. Elderly (age 65 and over) female subjects diagnosed with diseases of esophagus, gastric or duodenal ulcer during January 1, 2008 to December 31, 2010 were identified. The association between H. pylori infection and osteoporosis was evaluated using logistic regression analysis. Results : A total of 365 patients (mean age 77.3, SD 7.6 years) were included in the analysis and 77 (21.1%) had H. pylori infection and 70 (19.2%) had been diagnosed with osteoporosis. Results from logistic regression analysis revealed that osteoporosis was significantly associated with H. pylori infection (OR = 2.00, 95% CI = 1.12-3.59). The association did not vary after adjusting for age, body mass index, alcohol consumption, or the use of proton pump inhibitor. Conclusion : Identifying at-risk populations is important for both prevention and treatment of osteoporosis. In this retrospective patient medical record analysis of elderly Taiwanese female patients with upper gastrointestinal diseases, osteoporosis was found to be associated with H. pylori infection. Further studies using prospective design with information on potential confounding factors is needed to confirm the association. Keywords : Helicobacter pylori, osteoporosis, elderly

PP26 C-082

SARCOPENIA IS SIGNIFICANTLY ASSOCIATED WITH BONE MINERAL DENSITY IN KOREAN ELDERLY MEN

Yong Jun CHOI¹, Kwang-Min KIM², Yunhwan LEE³, Yoon-Sok CHUNG¹ (*1. Department of Endocrinology and Metabolism, Ajou University School of Medicine, Korea; 2. Department of Family Medicine, Ajou University School of Medicine, Korea; 3. Department of Preventive Medicine and Public Health, Ajou University School of Medicine, Korea*)

Introduction : This study was conducted to investigate the relationships among muscle mass, muscle strength, physical performance and bone mineral density (BMD) in Korean elderly men. Method : 161 elderly males aged ≥ 50 years were enrolled from Ajou University Health Promotion Center. Grip strength, gait speed, weight, and height were measured. BMD and appendicular skeletal muscle mass (ASM) were also measured using dual energy X-ray absorptiometry (DXA). We used the height-adjusted ASM (ASM/height²) for muscle mass and the cutoff values of sarcopenia as 6.58 kg/m² according to the result from our previous study. Results : The prevalence of sarcopenia and osteopenia in this study was 23% and 48%, respectively. Among sarcopenic subjects, 67.5% were osteopenic. Osteopenic subjects were more sarcopenic compared to normal subjects (32.5% vs 14.5%, P = 0.007). ASM/height² was significantly associated with BMD of spine, total hip, and femur neck

(spine: $r=0.268$, $P=0.001$; total hip: $r=0.357$, $P<0.001$; femur neck: $r=0.287$, $P<0.001$). Gait speed was associated with BMD of total hip and femur neck (total hip: $r=0.164$, $P=0.039$; femur neck: $r=0.169$, $P=0.033$). Grip strength was associated with only femur neck BMD ($r=0.181$, $P=0.047$). BMD of spine and hip were significantly associated with ASM/height² after adjustment for age. Femur neck BMD was also associated with ASM/height² even after adjustments for age and weight. Gait speed showed independent associations with BMD of total hip and femur neck even after adjustments for age, weight and height. Conclusion : BMD is significantly associated with measures of frailty in Korean elderly men. Keywords : Sarcopenia , Osteopenia, Frailty

PP26 C-083

FACTORS ASSOCIATED WITH TREATMENT OF OSTEOPOROSIS IN POSTMENOPAUSAL WOMEN

Young-Jee JEON¹, Ji-Wan KIM², Chung-Reen KIM³ (1. Family Medicine, Inje University Haeundae-Paik Hospital, Korea; 2. Orthopaedic Surgery, Inje University Haeundae-Paik Hospital, Korea; 3. Rehabilitation Medicine, Dong-Eui Medical Center, Korea)

Introduction : Many studies have reported risk factors related to osteoporosis or osteoporotic fractures, but few have assessed factors related to osteoporosis treatment in Korea. Here, we investigated the treatment rate of osteopenia and osteoporosis after diagnosis and determined factors related to osteoporosis treatment in Korea. Method: This retrospective analysis included postmenopausal women who had visited the health promotion center and been diagnosed with osteoporosis (19.5% of 375) or osteopenia (45.9% of 375). Telephone surveys were performed 1 y after diagnosis. Participants were stratified according to whether they had received osteoporosis treatment (lifestyle modification such as exercise and calcium/vitamin D supplementation for osteopenia and medical treatment such as bisphosphonate and hormone therapy for osteoporosis). We employed logistic regression to determine factors associated with treatment using clinical risk factors as covariates in a FRAX model. Results : Receipt of preventative treatment against osteoporotic fracture was reported by 108 of 172 (62.8%) women with osteopenia and 20 of 73 (27.4%) with osteoporosis. Only consultation with an osteoporosis clinic was significantly related to receiving osteoporotic treatment for osteopenia (odds ratio (OR), 5.01; 95% confidence interval (CI), 2.01-12.00) and osteoporosis (odds ratio (OR), 4.91; 95% confidence interval (CI), 1.16-20.75). In the osteopenic group, age, smoking, parental fracture history, previous fracture history, and secondary osteoporosis affected osteoporosis clinic consultation. No variables affected osteoporosis clinic consultation in the osteoporotic group. Conclusion : Recommending consultation at an osteoporosis clinic after health check-up for both osteopenia and osteoporosis patients is important for the prevention and treatment of osteoporosis. Keywords : Bone density, osteoporosis, drug therapy, postmenopause, risk factors

PP26 C-084

INCIDENCE OF SECOND HIP FRACTURE AND COMPLIANT USE OF BISPHOSPHONATE

Young-Kyun LEE¹, Yong-Chan HA², Kyung-Hoi KOO¹ (1. Department of Orthopaedic Surgery, Seoul National University Bundang Hospital, Korea; 2. Department of Orthopaedic Surgery, Chung-Ang University College of Medicine, Korea)

Introduction : Bisphosphonate has been used to prevent osteoporotic fracture, and is recommended for secondary prevention after hip fracture. However, little is known regarding secondary prevention after first hip fracture. Our purpose was to determine the incidence of

second hip fracture and to evaluate whether compliant use of bisphosphonate can reduce the risk of second hip fracture. Method : Eight hundred twenty six patients who sustained the first hip fracture from May 2003 to October 2011 were retrospectively evaluated. The incidence of second hip fracture was compared between compliant users of bisphosphonate and non-users. Results : Seventy-one (8.6%) patients suffered a second hip fracture at mean 30.0 months (SD 24.6, range 1 to 90 months) after the initial hip fracture. The cumulative incidence of second hip fracture was 5.1% (42/826) at 2 year and 8.6% (71/826) at 8 years. The incidence of second hip fracture was 4.2% (12/283) in compliant users and 10.9% (59/543) in non-users ($p = 0.001$) (Figure 1). Conclusion : Compliant use of bisphosphonate is effective in prevention of second hip fractures. Keywords : second hip fracture, bisphosphonate, compliance

PP26 C-085

KNOWLEDGE ON OSTEOPOROSIS IN GUARDIANS OF HIP FRACTURE PATIENTS

Young-Kyun LEE¹, Yong-Chan HA², Kyung-Hoi KOO¹ (1. Department of Orthopaedic Surgery, Seoul National University Bundang Hospital, Korea; 2. Department of Orthopaedic Surgery, Chung-Ang University College of Medicine, Korea)

Introduction : Treatment gap between the treatment guideline and real clinical practice of osteoporosis has been worldwide found. Although insufficient knowledge of guardians on osteoporosis might be one important obstacle to diagnose and treat osteoporotic patients, there was no study on the knowledge of guardians. We evaluated the guardians' knowledge on osteoporosis compared with the knowledge of orthopedic doctors, using a self-administered questionnaire, modified Facts on Osteoporosis Quiz (FOOQ). Method : In March and April 2012, the knowledge of osteoporosis was measured in 40 guardians of hip fracture patients and 40 orthopedic surgeons using a modified FOOQ. Results : In terms of treatment and prevention of osteoporosis, the modified FOOQ score of the guardians have inadequate knowledge and understanding about the osteoporosis, compared with orthopedic doctors. ($p<0.001$). Conclusion : The level of guardians' knowledge on osteoporosis should be considered and improved to achieve satisfactory osteoporosis treatment in hip fracture patients. Keywords : Osteoporosis , Knowledge , Hip Fracture

PREVALENCE OF DYSPHAGIA AND ASPIRATION RISK IN KOREAN ELDERLY POPULATION: RESULTS FROM THE KOREAN LONGITUDINAL STUDY ON HEALTH AND AGING (KLOSHA)

Eun Joo YANG, Mi Hyun KIM, Jae-Young LIM, Nam-Jong PAIK (Rehabilitation Medicine, Seoul National University Bundang Hospital, Korea)

Introduction : Oropharyngeal dysphagia is a very frequent condition among older people. The clinical screening methods should be used to identify older people with oropharyngeal dysphagia and to identify those patients who are at risk of aspiration. We investigate the prevalence of dysphagia with the standardized swallowing assessment (SSA) and the ability of a SSA to reliably exclude the risk of aspiration among older people. Method : This study was conducted as a part of the Korean Longitudinal Study on Health and Aging (KLoSHA) that was designed as a population-based, prospective cohort-study in a population aged >65 years living in a satellite city of Seoul in Korea. We recruited 195 men and 220 women and assessed with the SSA for the evaluation of swallowing function and the 3-ounce water swallow test for determining aspiration status. Results :

One hundred out of 412 assessable patients (24.2%) had their swallow problem by SSA. SSA by one occupational therapist gave a sensitivity of 46.5%, a specificity of 80.8%, positive predictive value (PPV) of 33.7% and a negative predictive value (NPV) of 87.8% for risk of aspiration evaluated by 3-ounce water swallow test. Multiple logistic regression revealed the optimum element of the SSA was a voice quality after adjusting age, sex and comorbidity status. Conclusion : Dysphagia is a common problem that lowers quality of life for the elderly. The Standardized Swallowing Assessment met the criteria for a screening tool among older people. Keywords : Dysphagia, Screening, elderly

PP26 C-087

KNEE EXTENSOR STRENGTH AS PROGNOSTIC FACTOR FOR MORTALITY IN KOREAN OLDER CANCER SURVIVORS

Eun Joo YANG¹, Jee Hyun KIM², Nam-Jong PAIK¹, Jae-Young LIM¹
(1. Department of Rehabilitation, Seoul National University Bundang Hospital, Korea; 2. Department of Internal Medicine, Seoul National University Bundang Hospital, Korea)

Introduction : To examine the associations between muscular strength, markers of overall and central adiposity, and mortality in community-dwelling older cancer survivors in Korea. Method : This study was conducted as a part of the Korean Longitudinal Study on Health and Aging (KLoSHA) that was designed as a population-based, prospective cohort-study in a population aged >65 years living in a satellite city of Seoul in Korea over a 5 year period. Korean men and women 65 years and older with a history of cancer (n = 74) were enrolled. Isokinetic muscle strength of the knee extensors, as determined by peak torque per body weight (newton meter per kilogram) was measured. Adiposity was assessed by body mass index (BMI), percent body fat, and waist circumference. Results : Of the 74 enrolled patients, the survivors (n=62) differed by 56.9 (Standard Deviation (SD) 8.9) from the reference values for those that died (n=12). The effect of the prognostic factors was analyzed via Cox models. Patients with higher baseline knee extensor strength had not higher overall survival significantly (hazard ratio [HR]=0.74, p=0.600). The associations of BMI, percent body fat, or waist circumference with cancer mortality did not persist after further adjusting for muscular strength (all P > or = 0.1). Conclusion : The knee extensor strength was not a prognostic factor for mortality in the sample studied. However, the cancer survivors had significantly higher strength initially than those who died. Keywords : Cancer survivor, mortality, muscle strength

PP26 C-088

UNSUPERVISED VIRTUAL REALITY-BASED EXERCISE PROGRAM IMPROVES HIP MUSCLES STRENGTH AND BALANCE CONTROL IN THE ELDERLY

Jungjin KIM, Jaebum SON, Minyoung LEE, Bumchul YOON
(Department of Health Science / Physical Therapy, College of Health Science, Korea University, Korea)

Introduction : Virtual reality (VR) is an emerging technology that provides a sense of reality through visual and auditory feedback. We aimed to explore the effectiveness of VR exercise in terms of supervision and feedback in older adults. Method : Ambulatory older adults (n=32) from a local community participated in this study. The VR group (n=18; mean, SD; 68.28, 3.74y; 4 men) completed the VR-based exercise program, whereas the remaining subjects in the control group (n=14; mean, SD; 66.21, 3.87y, 1 man) were asked to continue their daily routine for 8 weeks. Hip muscles strength was measured

using a multimodal dynamometer, and ground reaction force using the backward stepping test and the results of the crossover stepping test were recorded using a force platform. Results : The VR group showed significant improvement in hip muscles strength of the extensors, flexors, adductors, and abductors after 8 weeks (all P<= .001). However, no significant improvement was observed in the control group. The VR group had significantly greater ground reaction force on the backward stepping test (with eyes opened and closed) (all P<.005) and the crossover stepping test (with eyes opened and closed) (all P<= .001) compared with those at baseline. However, no significant improvement was observed in the control group. Conclusion : The VR-based exercise program includes the role of supervisor and feedback, which is important for older adults. Therefore, a VR-based exercise program may be a useful tool to improve decreased physical function in older adults as a home-based exercise. Keywords : Virtual reality; Frail elderly; Rehabilitation

QUALITY OF LIFE IN ELDERLY HYPERTENSIVE PATIENTS: EFFECT OF EXERCISE TRAINING

Jose Maria Thiago BONARDI, Leandra Goncalves LIMA, Rodrigo Fenner BERTANI, Giulliard Oliveira CAMPOS, Paulo PADOVAN, Julio Cesar MORIGUTI, Eduardo FERRIOLLI, Nereida Kilza Costa LIMA (Medical Clinic, Faculty of Medicine Ribeirao Preto, Brazil)

Introduction : Instruments to assess quality of life (QOL) have been created to evaluate the impact of interventions on health, including Short Form of Quality of Life Questionnaire for Arterial Hypertension (MINICHAL) that emerges as the more specific instrument used in hypertension. Studies show a strong correlation between exercise and life satisfaction. Objective: To evaluate the effect of aerobic training and aerobic and resistance training in the quality of life of hypertensive older individuals. Method : Forty-four subjects were randomized into three groups: aerobic (A), aerobic and resistance (AR) and control (C). The volunteers were previously undergone cardiac evaluation and they were interviewed with the MINICHAL questionnaire. After 10 weeks of protocol, they were interviewed with the same questionnaire. The MINICHAL is divided into two areas: mental state (MS) and somatic manifestations (SM), and the higher the score, the worse QOL. Statistic analysis: Student's paired 't' test and Fisher's exact test. Results : Mean age was 68.5 ± 5.1 years. Comparing mean values for MS and SM before and after training we observed 6.5/2.3 vs 3.5/1.2 (p=0.0001) and 3.8/2.0 vs 2.1/1.8 (p=0.001) for A; 4.9/2.1 vs 3.1/1.9 (p=0.0001) and 2.5/2.7 vs 1.1/1.9 (p=0.005) for AR. The total score pre and post training for the A and AR were, respectively, 10.4/4.0 vs 5.6/3.4 (p=0.0001) and 7.5/3.5 vs 4.3/2.5 (p=0.0001). Control group had higher scores in MS and in total questionnaire after 10 weeks. Conclusion : We observed a significant improvement in quality of life in individuals who underwent A and AR during ten weeks of training. Supported by FAPESP and CNPq. Keywords : Quality of Life, Exercise Training, Elderly

PP26 C-090

BLOOD PRESSURE AT REST, AFTER ATTEMPTS TO OBTAIN THE MAXIMUM LOAD AND AFTER THE ONE REPETITION MAXIMUM ASSESSMENT IN OCTOGENARIANS IN THREE RESISTANCE EXERCISES

Rodrigo Fenner BERTANI, Jose Maria Thiago BONARDI, Giulliard De Oliveira CAMPOS, Paulo Roberto PADOVAN, Julio Cesar MORIGUTI, Eduardo FERRIOLLI, Nereida Kilza Da Costa LIMA (Clinica Medica Geriatrica, FMRP-USP, Brazil)

Introduction : The increasing number of older individuals requires a

special attention in order to provide adequate levels of physical health. Therefore, resistance exercises are increasingly encouraged. The one repetition (1 RM) assessment is the gold standard for prescribing resistance exercises, but it is speculated that this may raise the blood pressure (BP). We observed the BP at rest (we included only volunteers with BP lower than 160/100 mmHg), immediately after each attempt to obtain the maximum load, and after the assessment in three resistance exercises. Method : Twenty-one individuals (seven men) with a mean age of 83.1/2.9 years were evaluated. It was used a BP automatic monitor OMRON model HET-742INT to obtain measurements. The 1RM assessment was performed within five attempts in the exercises Chest Press, Leg Press and Back Row. Immediately after each trial was measured BP. After the test were performed four BP measurements. Statistic analysis: One way ANOVA to compare different times. Results : The resting BP was 132/68 mmHg. After attempts on the exercise Chest Press, BP was 141/66 mmHg; after the completion of the Leg Press, BP was 144/69 mmHg; after Back Row, it was obtained an average of 142/68 mmHg; and after the three exercises, BP was 136/71 mmHg. Conclusion : There was no significant elevation of resting BP to the time immediately after the attempts, and after the assessment (Chest Press: $p=0.7$; Leg press: $p=0.35$; Back Row: $p=0.58$). These findings showed that there was low risk of high BP in the 1RM assessment in these octogenarians. Keywords : 1RM, elderly, resistance training

PP26 C-091

EFFECT OF SIX WEEKS CIRCUIT HYDRAULIC RESISTANCE TRAINING ON OSTEOPOROTIC ELDERLY IN NEW TAIPEI CITY: A PRELIMINARY INVESTIGATION

Tsung-Ching LIN¹, Tzyy-Yuang SHIANG², Ming-Fang HSU³, Shu-Fen CHIU¹, Hsiu-Ling CHOU⁴ (1. Department of Physical Medicine and Rehabilitation, Far Eastern Memorial Hospital, Taiwan; 2. Graduate Institute of Exercise Science, National Taiwan Normal University, Taiwan; 3. Department of Healthcare Administration, Asia University, Taiwan; 4. Department of Nursing, Taipei Veterans General Hospital, Taiwan)

Introduction : Osteoporosis is a common health problem in elderly population. Kyphotic posture and decreased fitness are also often being found. Previous studies suggested that increased physical activity might be beneficial for the elderly. Hydraulic resistance circuit training is an effective, safety exercise for the elderly and we want to realize the training effect on osteoporotic elderly. Method : Ten participants (3 male and 7 female, Age: 77.89±7.72 year-old) were recruited from the rehabilitation clinics. They participate in a 18-hour (1hour/time, 3 times/week for 6weeks) exercise program with seven hydraulic resistance training equipment: chest press, leg abduction, arm curls, deltoid press, leg press, back press, and knee extension. Between each resistance training session, there was a stepping for subject to do aerobic stepping. The outcome measurements including: body composition and senior fitness tests. After six-week intervention, the serial evaluation was performed and using paired t-test to compare the difference and significant level was 0.05. Results : During the assessment after 6week training, the back muscle strength had a significant improvement ($t=2.521$, $p=0.036$), and the circumference of waist and hip were both decreased (decreased 2.71cm and 0.96cm respectively). After six weeks intervention, the physical fitness performance in back strength and body composition both had a significant improvement. Conclusion : If this safe and effective circuit hydraulic resistance training method can be promoted to community or more place, osteoporotic elderly were expected to gain more health physical fitness performance and independent. The cost of health care on osteoporosis may be decreased. Keywords : Exercise; Osteoporosis;

Fitness

PP26 C-092

RELATIONSHIP BETWEEN MUSCLE STRENGTH AND ACQUISITION OF NONWEIGHT-BEARING GAIT WITH AXILLARY CRUTCHES IN ELDERLY ORTHOPEDIC PATIENTS

Yoshitsugu OMORI¹, Shotaro SASAKI¹, Masuo SASA¹, Setsu IJIMA² (1. Dept. of Rehabilitation Medicine, St.Marianna University School of Medicine Yokohama City Seibu Hospital, Japan; 2. Graduate School of Comprehensive Human Sciences, University of Tsukuba, Japan)

Introduction : Nonweight-bearing gait (NWB) with axillary crutches is important method to ambulate in orthopedic patients. Although the functions of the upper extremities are important in supporting the body weight, little is known about the relationship between upper extremity muscle strength and NWB ability. The purpose of this study was to investigate the relationship between muscle strength and acquisition of NWB with axillary crutches in elderly orthopedic patients. Method : The subjects were eleven inpatients with musculoskeletal disorder of the one lower limb (mean age; 68.7±6.7 years). Isometric knee extension strength, grip strength and the safety of NWB ability with axillary crutches were evaluated. The safety of NWB ability was evaluated while the subjects were walking on 200m distance when a week after the beginning of physical therapy. The subjects were classified into two groups according to their NWB ability: those who were able to walk safely (Group1) and those who were unable to walk safely (Group2) when a week after the beginning of physical therapy. For analytic purpose, knee extension strength and grip strength/body mass ratio was calculated. Age, height, body mass index (BMI), knee extension strength and grip strength were analyzed. Results : The median of the grip strength in the Group1 (n=6) was 0.67±0.15 and Group2 (n=5) was 0.38±0.11 kgf/kg, respectively, showing significant difference ($p=0.01$). No differences were observed between groups for age, height, BMI, knee extension strength. Conclusion : There was a significant difference of grip strength by NWB ability with axillary crutches. Therefore, the grip strength is an important factor for determining the acquisition of NWB with axillary crutches. Keywords : axillary crutches, muscle strength, nonweight-bearing gait

PP26 C-093

SYSTEMATIC REVIEW OF TELEMEDICINE AND MOBILE HEALTH TECHNOLOGY FOR CHRONIC NON CANCER PAIN

Barrie RAIK¹, Xuefeng NI², Wei WANG¹, Usman RAZA¹, M. Cary REID¹ (1. Medicine/Geriatrics, Weill Cornell Medical College, USA; 2. VIP Health, Peking Union Medical College Hospital, China)

Introduction : Chronic pain is a major geriatric health problem usually treated with medication and non-pharmacologic modalities. Telemedicine involves using technology to communicate over space and time with providers and patients. Examples of uses: to teach pain management strategies through web-portals, using monitoring symptoms with mobile devices or using computer based systems for giving feedback. However, studies evaluating telemedicine for pain management remain inadequately defined. Method : A database search for articles with keywords: mobile health technology, telemedicine, hand held devices, chronic pain, adults, elderly was conducted. Citation abstracts were reviewed by two investigators. Eligibility criteria: English-language publication, evaluate mobile health technologies, adults with non-malignant pain. Exclusion criteria: review articles, online surveys, online discussion forums only. Studies

meeting criteria were abstracted and analyzed for 4 outcomes: feasibility, efficacy, patient acceptance, and health care utilization. Results : Identified 1317 articles, 35 of which met the inclusion criteria. 49% focused on internet training, the others on smartphone applications or videoconferencing. 66% were randomized trials. Mean sample size was 124 (6-593), average study duration 6 months (5 days-18 months), and mean subject age 47 (18-86). Most studied chronic musculoskeletal pain. 85% reported that telemedicine was effective in pain management or could effectively monitor symptoms. Patient satisfaction and pain relief were found in over half the studies. Conclusion : Studies of telemedicine in chronic pain are of fair quality and rarely include sufficient geriatric patients. Larger scale studies with well defined outcome measures are needed to confirm that these telemedicine techniques succeed in helping patients with chronic pain and their care providers. Keywords : Chronic pain, telemedicine, review, mobile technology

PP26 C-094

ASSOCIATION BETWEEN RELATIVE MUSCLE MASS AND FALL EFFICACY IN COMMUNITY-DWELLING ELDERLY

Hyoun-Joong KONG¹, Eunjin HWANG¹, Jeongeun KIM², Suk Wha KIM³, Jeeyoung HONG¹ (1. Biomedical Research Institute, Seoul National University Hospital, Korea; 2. College of Nursing, Seoul National University, Korea; 3. Department of Plastic Surgery, Seoul National University Hospital, Korea)

Introduction : Falls are common in frail older adults and often result in injuries and hospitalization. It is well known that the fall is affected by muscle weakness, gait disturbance, balance abnormality and so on. This study focused on associations among appendicular skeletal muscle index (ASMI), balance ability and fall efficacy in community-dwelling elderly to provide basic knowledge for preventing diseases related to falling. Method : Subjects were 94 low-income elders (30 males and 64 females) in the K district of Seoul whose average age was 74.11±7.10 years. After appendicular skeletal muscle mass (ASMM) was obtained through analyzing body composition by using dual-energy X-ray absorptiometry (DEXA), appendicular skeletal muscle index (ASMI) was calculated (ASMM/Weight₁₀₀) for those. Dynamic balance was measured using a foot and gait analyzer (Gateview AFA-50, alFOOTs, Seoul, Korea). For fall efficacy measures, the Korean Falls Efficacy Scales (FES-K) was used and the activity fall efficacy and the daily life falls efficacy were calculated. Pearson's correlation analysis between ASMI, balance and fall efficacy was done using SPSS-PC (version 18.0). The level of statistical significance was set for $\alpha=0.05$. Results : As a result of research, ASMI showed significant correlation with the activity fall efficacy ($r=0.302$, $p=0.003$) and the daily life falls efficacy ($r=0.362$, $p=0.000$), but failed to show significant correlation with sway velocity ($r=0.094$, $p=0.369$) and stability score ($r=-0.047$, $p=0.653$) related with balance. Conclusion : For community-dwelling elders, relative muscle mass was indicated to have association with fall efficacy. Hence, various researches for increase of muscle volume through exercise and diet are needed. Keywords : Community-Dwelling Elderly, Fall Efficacy, Appendicular Skeletal Muscle Index

PP26 C-095

CHARACTERISTICS OF SARCOPENIC PATIENTS IN GERIATRIC OUTPATIENTS CLINIC IN INDONESIA

Lazuardhi DWIPA, Muhamad APANDI (Internal Medicine, Hasan Sadikin General Teaching Hospital, Padjadjaran University, Indonesia)

Introduction : The epidemiologic nature of sarcopenia has been studied

in various countries and the prevalence of sarcopenia was found to be fairly substantial in both men and women, with the prevalence increasing rapidly with aging. But there has been no epidemiologic study concerning sarcopenia and its characteristics in Indonesia. Method : This is an epidemiological study which aims to describe the characteristics of geriatric patients with sarcopenia in outpatients of geriatric clinic in Hasan Sadikin General Teaching Hospital in Bandung, Indonesia that were taken between August to November 2012. Results : A total of 74 patients were evaluated consisted of 29 male (39%) and 45 female patients (60%) with an average age of 71.9 (± 6.15) years old. Sarcopenia was found in 26 patients (35%) with mostly women (76%). Nine patients (34.6%) were considered as Sarcopenic Obesity and 6 sarcopenic patients (23%) with low BMI. Most of sarcopenic patients had relatively good Activity Daily Life (ADL), relatively normal cognitive function and no depression but with mild sleeping problem. Based on dietary recall most of them were below appropriate daily intake with low intake of calcium and protein and had sedentary lifestyle. Among the sarcopenic patients osteoarthritis was the most common problem (57.7%). Conclusion : The incidence of sarcopenia is quite high and it should receive special attention, especially in the future to conduct an epidemiological study with a larger scale so that it can better describe the magnitude of the problem nationwide. Studies to develop intervention measures need to be done to address this problem. Keywords : Sarcopenia, Skeletal Muscle Index, Muscle strength, Sarcopenic Obesity, BMI

PP26 C-096

EFFECT OF TPN (TOTAL PARENTERAL NUTRITION) ENFORCEMENT ON THE LENGTH OF HOSPITAL STAY IN GERIATRIC ATHEROSCLEROTIC ARTERIAL DISEASE WITH ABOVE OR BELOW KNEE AMPUTATION

Young Woo CHUNG¹, Won Chae JANG², Sang Young CHUNG³, Soo Jin Na CHOP³, Kwang Ik JUNG⁴ (1. Orthopedic surgery, Jangsung Hyewon Hospital, Korea; 2. Cardiovascular Surgery, Jangsung Haewon Hospital, Korea; 3. Vascular Surgery, Chonnam National University Hospital, Korea; 4. Department Rehabilitation, Gwangju Veterans Hospital, Korea)

Introduction : Malnutrition increase the incidence of wound infection and complications, extend the length of hospital stay, and increase mortality. The geriatric patients with atherosclerotic arterial disease, may require amputation the knee joint. We tried to find out what correlation there is in the length of hospital stay after amputation and enforcement period in patients who underwent TPN in patients suffering from debilitating disease. Method : From January 2004 to December 2012, we analyzed retrospective review in geriatric atherosclerotic arterial disease with knee amputations in Chonnam National University Hospital. Pearson correlation using the Spearman two tail Test was performed. Results : Patient aged 65 to 74 years were 17, 75 to 84 years were 16 patients and four patients were over the age of 85. 20 patients amputated above the knee, 17 patients amputated below the knee. 8 patients didn't use TPN, 7 patients used TPN under 7 days, 11 patients used TPN from 7 days to 14 days, 2 patients 14 days~21 days, over 22 days were 3 patients. Positive correlation about hospital stay and applied period of TPN was maintained even in the presence of the of the disease corrected with age and associated disease but not affected by occurrence of complications. Conclusion : TPN (total parenteral nutrition) is needed in geriatric atherosclerotic arterial disease with above or below knee amputation, there is positive correlation between TPN applied period and hospitalization period after amputation, so we were able to verify that shortening the length of hospital stay by TPN enforcement therapy. Keywords : TPN (total parenteral nutrition), geriatric atherosclerosis, knee amputation

PP26 C-097

USEFULNESS OF SPAIR IMAGE, FRACTURE LINE AND THE ADJACENT DISCS CHANGE ON MAGNETIC RESONANCE IMAGE IN THE ACUTE OSTEOPOROTIC COMPRESSION FRACTURE

Sung Han OH (*Neurosurgical Department, Bundang Jaesaeng General Hospital, Korea*)

Introduction : Osteoporotic compression fracture is an increasing issue in this community. Although the T1-weighted and T2-weighted signal intensity including morphological changes have high specificity and sensitivity for the acute osteoporotic compression fractures, we added T2- Spectral Adiabatic Inversion Recovery (SPAIR) sequence for more clear delineation of this abnormality. Besides, we have branched out to evaluate the fracture line, “fluid sign” and adjacent discs change on magnetic resonance image. Method : Retrospectively, this study was conducted on 85 patients (120 fracture segments) who had been diagnosed with acute osteoporotic compression fracture. They all had been underwent MRI including T1WI, T2WI and T2-SPAIR image. Results : In this study, the incidence of high signal intensity on T2-SPAIR image was very high (0.9917). The “fluid sign” was seen in 56.7% on the SPAIR image. The fracture lines were more observed on the T2WI than T1WI (P=0.0062). The adjacent discs change on T2WI and T2-SPAIR image were higher than T1WI (P<0.001). Conclusion : T2-SPAIR image is very useful and gives additional information to detect the acute osteoporotic compression fractures. The “fluid sign” is another suggestive finding of the acute osteoporotic compression fractures when considered other studies 9,14). T2WI is more useful to find the fracture line. We thought T2WI is helpful to detect the location of fracture. Abnormal signal intensity on the adjacent discs may provide additional information for the acute osteoporotic compression fractures. We are studying to compare this result with infective and malignant fractures about fluid sign and adjacent discs changes on MRI. Keywords : Adjacent discs, Osteoporotic compression fracture , T2-SPAIR

GENE EXPRESSION PROFILE IN AGED MUSCLE ATROPHY MODEL

Ipppei YAMATO¹, Masaichi YAMAMURA¹, Takaaki KINOUE², Tomoichi OHKUBO³, Kayo YASUDA³, Masayuki TANAKA³, Hideki HAYASHI³, Michio TSUDA¹ (*1. Basic Medicine, Tokai University School of Medicine, Japan; 2. Basic Clinical Science and Public Health, Tokai University School of Medicine, Japan; 3. Education and Research Support Center, Tokai University School of Medicine, Japan*)

Introduction : Sarcopenia, muscle weight and strength decrease accompanying aging, affects quality of life of old people. Additionally, ailment, such as stroke or injuries, accelerates muscle atrophy, so it has been an important social issue in ageing society to prevent not only sarcopenia but muscle atrophy derived from diseases. In this study, we experimented on old rat model to simulate sarcopenia, and analyzed the gene expression profile in the model utilizing immobilization. Method : Male Fisher rats, young rats aged 20 weeks and older rats aged 80 weeks, were used in this study. 10days before the experiment day, right hind-limbs of all rats were immobilized in a plaster cast (left contra-lateral hind-limbs were analyzed as controls). On the experiment day, all rats were anesthetized and muscles (extensor digitorum longus muscle: EDL, and Soleus muscle: SM) were removed and weighed. Muscles were prepared by documented method and were analyzed for gene expression pattern difference on DNA arrays (Agilent Technology Inc.). Results : 10days immobilization resulted in

significant decrease of muscles weight in right (immobilized) muscles. This was more pronounced in SM than in EDL. This was also observed in DNA array analysis. Conclusion : The results were of great interest to find further solution of prevention of disuse and sarcopenia in the elderly. Keywords : sarcopenia, disuse atrophy, immobilization, gene expression

PP26 C-099

INFLUENCE OF WHITE MATTER HYPERINTENSITIES ON PRESENT AND FUTURE COGNITION: 3-YEAR FOLLOW-UP STUDY OF WHITE MATTER HYPERINTENSITIES IN COMMUNITY-DWELLING ELDERLY KOREANS

Chang In LEE¹, Joon Hyuk PARK¹, Ki Woong KIM² (*1. Department of Psychiatry, Jeju National University Hospital, Korea; 2. Department of Psychiatry, Seoul National University Bundang Hospital, Korea*)

Introduction : The purposes of this study were to investigate influence of white matter hyperintensities (WMH) volume on neurocognitive function in the baseline and the 3-year follow-up study. Method : 228 subjects were recruited among community-dwelling elderly Koreans in baseline study. Diagnostic assessment using Mini International Neuropsychiatric Inventory (MINI), neurocognitive test using CERAD-K Neuropsychological Assessment Battery, and brain magnetic resonance imaging (MRI) were conducted. WMH was rated by the modified Fazekas scale and the volume of WMH was also calculated by an automated quantification method. Subjects were classified as having WMH(+) if they had a score of 2 or more on either deep white matter hyperintensities or subcortical gray matter ratings. Results : 122 subjects participated in the baseline study (response rate: 53.5%) and 54 subjects were followed up in the 3-year follow-up study (follow-up rate: 53.5%). The frequency of WMH(+) was 38.5% and the mean volume of WMH was 11.3±11.3 mL in baseline study. For 3 years, the change of WMH volume was 2.4±3.2 mL. Log WMH volume (OR=5.78, 95 CI=1.04-31.72) in the baseline study was associated with poor performances on Boston naming test (p=0.015, ANOVA) and Korean version of Mini-Mental State Examination (MMSE-KC) (p=0.048, ANOVA) in the baseline study, and on Boston naming test (p=0.037, ANOVA) in the 3-year follow-up study. Conclusion : WMH is a crucial predictor for future present and future cognitive dysfunctions in parallel with the concept of subcortical dementia. Keywords : white matter hyperintensities, cognition

PP26 C-100

COMORBIDITY AND SOCIOECONOMIC RISK FACTORS FOR COGNITIVE DISORDERS IN LATER LIFE

Gabriel Ioan PRADA¹, Ioana ALEXA², Raluca NACU¹, Eliza TAPELEA¹, Speranta PRADA¹, Bogdan PALTINEANU¹, Irina IGNAT¹, Ioana FITA¹ (*1. Clinical Department, 'Ana Aslan' National Institute of Gerontology and Geriatrics, Romania; 2. Clinical Department of Geriatrics, 'Gr. T. Popa' University of Medicine and Pharmacy, Romania*)

Introduction : We evaluated influence of comorbidity and socioeconomic factors upon cognitive disorders in older people. Method : 1163 older patients consecutively admitted to our clinics between 2008 and 2012 were investigated. Gender distribution: 68% women, 32% men; age range 65 to 95, mean age 80 years. The sample was divided into three age groups: young-old (65-74 years), old-old (75-84 years) and very old (85-95 years). Parameters followed up: gender, age, level of education, place of residence (urban/rural), household income, marital status, comorbidity, cognitive function at admission. Three tests were used for screening cognitive disorders:

Mini Mental Status Examination (MMSE), Clock Drawing Test and Five Words Test. Results : We considered two cognitive disorders: mild cognitive impairment (MCI) and dementia. Higher risk of MCI in men than women: Odds Ratio 1.47. Adjusting for age and education Odds Ratio was higher 1.67, adjusting for marital status Odds Ratio was 1.71 in favor of men. Adjusting for disease burden we obtained 1.54 in favor of men. Higher risk of dementia for women, Odds Ratio 1.61. Adjusting for age and education Odds Ratio increased to 2.2 in favor of women; adjusting for marital status value decreased to 1.3. Adjusting for comorbidity, risk of developing dementia in women as compared to men was 1.9. Odds of having dementia was higher in rural as compared to urban patients 1.3. Conclusion : Risk of MCI was higher in men, with low education and without spouse. Risk of dementia was higher in women, with lower education and higher comorbidity and from rural area. Keywords : cognitive disorders, socioeconomic factors, comorbidity

PP26 C-101

THE ASSOCIATION OF ALCOHOL CONSUMPTION WITH VERBAL AND VISUOSPATIAL MEMORY IN OLDER ADULTS

Haewon BYEON¹, Yunhwan LEE², Soon Young LEE³, Kang Soo LEE⁴, So Young MOON⁵, Hyanghee KIM⁶, Chang Hyung HONG⁷, Sang Joon SON⁸, Seong Hye CHOI⁹ (1. Dept. of Speech-Language Pathology & Audiology, Nambu University, Korea; 2. Department of Preventive Medicine and Public Health; Institute on Aging, Ajou University School of Medicine, Korea; 3. Department of Preventive Medicine and Public Health, Ajou University School of Medicine, Korea; 4. Department of Psychiatry, CHA Kangnam Medical Center; CHA University School of Medicine, Korea; 5. Department of Neurology; Institute on Aging, Ajou University School of Medicine, Korea; 6. Graduate Program in Speech-Language Pathology; Department of Rehabilitation Medicine, Yonsei University College of Medicine, Korea; 7. Department of Psychiatry; Institute on Aging, Ajou University School of Medicine, Korea; 8. Department of Psychiatry, Myongji Hospital, Kwandong University College of Medicine, Korea; 9. Department of Neurology, Inha University School of Medicine, Korea)

Introduction : The purpose of this study was to examine the association of alcohol consumption with verbal memory and visuospatial memory in older Koreans. Method : The subjects were 1,572 aged persons (489 male, 1,083 female) of aged 60 to 90 years who participated in the Clinical Research Center for Dementia of South Korea, who completed the neuropsychological assessment and health survey between May 2008 and April 2012. Alcohol consumption was classified as abstainer, mild to moderate drinker (1-7 drinks/week), and heavy drinker (≥ 8 drinks/week). Measurements for verbal memory included immediate recalls, delayed recall, and recognition from the Seoul Verbal Learning Test, while visuospatial memory included the Rey Complex Figure Test. Memory impairment was defined as less than 16 percentile (-1 standard deviation) on the delayed recall performance for each memory. Hierarchical logistic regression analysis was used to examine the association of drinking status and memory impairment. Results : Adjusting for covariates (age, sex, education years, family history of dementia, depression, baseline Mini-Mental State Examination score, smoking, exercise, high density lipoprotein cholesterol, hypertension, diabetes mellitus and stroke), moderate drinking was independently associated with a lower likelihood of verbal memory impairment (OR=0.65, 95% CI: 0.48-0.88). No significant association, however, was observed between alcohol consumption and visuospatial memory impairment. Conclusion : These findings may suggest the possibility that light to

moderate alcohol consumption in the elderly would reduce the risk of verbal memory impairment. A longitudinal study is warranted to empirically investigate the causal relationship between drinking habit and memory impairment in the elderly. Keywords : alcohol consumption, verbal memory, visuospatial memory

PP26 C-102

IMPROVEMENT OF WORKING MEMORY BY BI-FRONTAL TRANSCRANIAL DC STIMULATION IN HEALTHY OLDER ADULTS

Sang-Hee LEE, Gi-wook KIM, Kang-Won KIM, Yun-Gyu SONG, Sung-Hee PARK, Jeong-Hwan SEO, Myoung-Hwan KO (Department of Physical Medicine and Rehabilitation, Research Institute of Clinical Medicine of Chonbuk National University - Biomedical Research Institute of Chonbuk National University Hospital, Korea)

Introduction : Noninvasive transcranial direct current stimulation (tDCS) can modulate the cortical excitability and has been applied for improvement of brain functions. We investigated the effects of dual bi-frontal tDCS in healthy older adults aged more than 65 years by means of verbal and visual working memory tasks. Method : Forty-two healthy older adults (14 males, 28 females, and 65~78 years old) were enrolled in this study. They were randomly divided into three groups; bi-frontal, left unilateral frontal, and sham. Subjects underwent anodal tDCS over bilateral prefrontal cortex (F3, F4 in 10-20 EEG system) or anodal tDCS over left prefrontal cortex (F3), or sham. DC was delivered for 30 minute at 2 mA with 25 cm²saline-soaked sponge electrodes. Cathode electrode was applied on left arm. Before and after tDCS, subjects were performed 2-back verbal working memory and visuospatial memory tasks. The improvement rate of the accuracy and the reaction time were analyzed. Results : After bilateral prefrontal stimulation, accuracy of the verbal WM increased (pre-stimulation: 51.5 \pm 11.9, post-stimulation: 60.4 \pm 11.1, P=0.003), whereas after unilateral prefrontal stimulation, accuracy of the verbal WM increased (pre-stimulation: 50.2 \pm 10.8, post-stimulation: 57.0 \pm 10.8, P=0.002) and after sham tDCS it remained unchanged (pre-stimulation: 49.2 \pm 9.1, post-stimulation: 45.4 \pm 8.9, P=0.08). The response time was not significantly improved in the three conditions. In visuospatial WM tasks, accuracy and response time were not significantly improved in bilateral, unilateral, sham stimulation conditions. Conclusion : We suggest that tDC-induced changes in prefrontal excitability have beneficial effects to improve the age-related cognitive impairment in healthy elderly population. Keywords : Working Memory, Bi-frontal Transcranial DC Stimulation, Healthy Older Adults

THE TREATMENT OF AGE- ASSOCIATED MEMORY IMPAIRMENT IN 168 CASES AND DEMENTIA IN 136 CASES WITH THE REINHARDT AND SEA CUCUMBER PART IAAMI

Yongxing MA, Chuanfu WANG, Yue-Di GU (Department of Aging, Antiaging and Cognitive Function, Shanghai Institute of Gerontology and Geriatrics, Affiliated Huadong Hospital, Shanghai Medical College, Fudan University, China)

Introduction : To observe the efficacy of Reinhardt and Sea Cucumber Capsule (R.S.C.£Sea animal products) in treatment of Age-Associated Memory Impairment(AAMI). Method : Double blind trial were performed in 168 cases of AAMI in the aged and preaged with MQ£90(WMS).The dosage of R. S.C. and placebo were all 4 capsules(0.28g£Øcap)tid for 3 months. The effect were evaluated with MQ(WMS). Results : The mean value of MQ (WMS) before and after treatment were 81.35 \pm 7.51 and 90.64 \pm 8.98(P£0.001) in 83 cases

treated with R.S.C. and 84.34±6.80 and 88.60±7.40 (P<0.001) in 85 cases in placebo group respectively. significant difference of mean value of MQ increment between R.S.C. 9.30±6.46 and placebo 4.31±5.29 (t=5.49, P<0.01) were observed. The total effective rate of the R.S.C. and placebo were 62.65% and 23.53% respectively (P<0.001). No significant side effects were observed. Conclusion: R.S.C. is rather effective and safe to improve memory and cognitive function in the elderly. Key words: Reinhardt and Sea Cucumber Capsule (R.S.C.). Keywords: Age-Associated Memory Impairment (AAMI) Aged

AGING CHANGES OF MEMORY AND COGNITIVE FUNCTION IN 3234 COHORT 65-98 YEARS SUBJECTS

Yongxing MA, Yue ZHU, Qingwei RUAN, Pei-Fang LU, Zhanshun WANG (Department of Aging, Antiaging and Cognitive Function, Shanghai Institute of Gerontology and Geriatrics, Affiliated Huadong Hospital, Shanghai Medical College, Fudan University, China)

Introduction: To study the "Physiological" and "total" aging changes of memory (MQ) and cognitive function (MMSE) in the presaged young old (65-74 years old) and old-old (75-98 years old) in 3234 cohort persons in the aged. Method: To survey the MQ(WMS) and MMSE in 3234 cohort object of various age groups (2666≥65 years old; 1741≥75), and divided the whole objects as normal cognitive function (MQ≥100, MMSE 28-30; 867 persons), AAMI (MQ<100, MMSE 28-30; 860 persons); MCI (MQ<100, MMSE 24-27; 782); dementia (MQ<100, MMSE≤23; 157). To observe the "physiological" (NCF 867+AAMI 860=1727) and "total" population (NCF 867+AAMI 860+MCI 782=2509) memory (WMS) and cognitive (MMSE) aging changes excluding dementia. Results: WMS in "physiological" group: mean performance score of various aged groups ranged 83.54±15.05~82.12±13.74, MQ 99.01±13.05~98.05±12.64. WMS in "whole" group: mean performance score of various aged groups is lower than that in "physiological" group by 7.5. MMSE: All the median of various aged group is 29, higher than that of "whole" group 28. We defined the abnormal cutting point of various aged group as the "MMSE total score -1.5SD" in the group in order to distinct the MCI (MMSE 24-27) from normal cognitive function with MMSE 28-30. The results of this calculation in various aged groups indicated that the cutting points of MMSE in distinction from NCF is ≤27. The significant aging decline changes in memory and cognitive function was observed. The WMS value in "physiological" group may be consider as the normal reference value in various age group of the old-old and longevous. It is suggested that the WMS criterion for AAMI may be defined as performance < 83.5. MQ < 100. MMSE total score ≤ 27 may be considered as the abnormal value in distinction from NCF, and MMSE ≤ 23 as cutting point for dementia. Keywords: MMSE, memory function, cognitive function

AVAILABLE TREATMENT IN DEMENTIA: OUR EXPERIENCE IN USING COMBINED THERAPY WITH CHOLINESTERASE INHIBITORS AND MEMANTINE

Andreea ZAMFIRESCU¹, Ana CAPISIZU², Sorina Maria AURELIAN³, Ioana OMER⁴, Ana Maria STROIE⁵, Aurel ROMILA⁶ (1. Clinic of Geriatrics, Hospital for Chronic Diseases 'Sf. Luca', Bucharest, Romania, Romania; 2. Clinic of Geriatrics, University of Medicine and Pharmacy 'Carol Davila', Romania; 3. Geriatrics and Gerontology, University 'Titu Maiorescu', Romania; 4. Psychology, 'Sf. Luca' Chronic Diseases Hospital, Romania; 5. Geriatrics, Hopitalier Bretagne Atlantique, France; 6. Psychiatry,

University of Medicine and Pharmacy 'Carol Davila', Romania)

Introduction: Dementia is one of the most important health challenges facing aging populations worldwide. Lately failure of new generation drugs in phase 3 clinical trials, reveal us the need to optimize the use of existing treatment: cholinesterase inhibitors (ACEI) and memantine. Our aim was to identify the characteristics of patients and disease (stage and type of dementia) that might be associated with a better response to existing therapy. Method: A randomized prospective study was conducted including 203 participants diagnosed with Alzheimer's disease (AD), vascular (VaD) or mixed dementia, divided in 4 groups: treated with ACEI (48), memantine (20), combined therapy with cholinesterase inhibitors and memantine (67) and no specific medication (68). Cognitive evaluation included baseline: MMSE, Clock Drawing Test, GDS (Global Deterioration Test, Reisberg), R-ACER (Romanian version of Adenbrooke's Cognitive Evaluation Revised), ADL/IADL (Activities of Daily Living / instrumental ADL), NPI (neuropsychiatric inventory). Follow up for 18 months consisted in re-evaluations at each 3 months. Results: The group that received combined therapy with cholinesterase inhibitors and memantine (33% of participants) consisted mainly in patients with moderate to severe dementia and had better mean evolution for cognitive tests (MMSE, R-ACER) than both single therapy groups, whereas compared to the placebo group it had a statistical power (p<0.001). Significant changes were also obtained in ADL and in reducing agitation in the groups with single memantine or combined therapy. Conclusion: In patients with moderate to severe AD receiving combined treatment with a cholinesterase inhibitors and memantine, we found better outcomes on cognition, behavior and activities of daily livings. Keywords: dementia, cholinesterase inhibitors, memantine.

COGNITIVE EFFECTIVENESS OF THE COMBINATION OF MEMANTINE PLUS VITAMIN D IN PATIENTS WITH ALZHEIMER DISEASE

Cedric ANNWEILER¹, Francois R HERRMANN², Bruno FANTINO¹, Bernard BRUGG³, Olivier BEAUCHET¹ (1. Neuroscience and Geriatrics, Angers University Hospital, France; 2. Geriatrics, Geneva University Hospitals, Switzerland; 3. UMR 7102 NPA, UPMC Universite Paris 6, France)

Introduction: Cognitive decline in Alzheimer disease (AD) is temporarily delayed by memantine, thereby highlighting only partial neuroprotection. Our objective was to determine whether the use of memantine combined with vitamin D, a steroid hormone showing neuroprotective properties, could be more effective than the use of memantine alone or vitamin D alone on cognitive performance in older patients with AD. Method: Forty-three Caucasian outpatients (mean, 84.7±6.3 years; 34.9% male) free of anti-dementia drugs and vitamin D supplements, with a de novo diagnosis of AD, were prescribed either memantine alone (n=18), vitamin D alone (n=17), or memantine plus vitamin D (n=8) for 6 months on average. Cognitive change was assessed using MMSE. Age, gender, baseline MMSE score and duration of treatment were used as covariables. Results: Groups were comparable at baseline. The increase in MMSE score of +4.0±3.7 points amongst participants using memantine+vitamin D was higher than amongst participants using memantine alone (0.0±1.8 points, P=0.011) or vitamin D alone (-0.6±3.1 points, P=0.009). Using memantine+vitamin D was associated with an improvement of MMSE score when compared to the participants using memantine alone (adjusted=-3.89, P=0.009) or those using vitamin D alone (adjusted=-4.77, P=0.002). The mixed regression showed a

significant interaction of visit*memantine plus vitamin D treatment (P=0.001) compared to the use of vitamin D only or memantine only. Conclusion : The combination of memantine plus vitamin D in AD patients was associated with a statistically and clinically relevant gain in cognition after 6 months of treatment, underlining synergic beneficial effects of the combination of memantine plus vitamin D. Keywords : Alzheimer's disease; treatment; memantine; vitamin D; neuroendocrinology; older adults

PP26 C-107

DERIVATION AND VALIDATION OF A SHORT FORM OF THE MINI-MENTAL STATE EXAMINATION (SMMSE) FOR THE SCREENING OF DEMENTIA IN OLDER ADULTS WITH A MEMORY COMPLAINT

Cedric ANNWEILER¹, Gladys HAUBOIS², Laure DE DECKER³, Cyrille LAUNAY², Gilles ALLALI⁴, Olivier BEAUCHET¹
(1. Neuroscience and Geriatrics, Angers University Hospital, France; 2. Geriatrics, Angers University Hospital, France; 3. Geriatrics, Nantes University Hospital, France; 4. Neurology, Geneva University Hospitals, Switzerland)

Introduction : Early detection of dementia is recommended in older adults but is faced in clinical practice with the length and complexity of current neuropsychological tools. Our aim was to validate a Short form of the Mini-Mental State Examination (SMMSE) as a screening test for dementia in older ambulatory individuals followed in a memory clinic for a memory complaint. Method : A total of 202 cognitively healthy individuals, 100 with Mild Cognitive Impairment and 304 with dementia visiting a memory clinic for a memory complaint were prospectively included in this cross-sectional study. They were randomized into derivation (n=303) and validation (n=303) groups. The SMMSE score was built from 6 memory items of MMSE, with a score ranging from 0 to 6 (i.e., best performance). Results : The ROC curve showed an AUC of 0.98 for the derivation group and 0.97 for the validation group without differences between curves (P=0.254). The cut-off between sensitivity and specificity of SMMSE score for clinically diagnosed dementia was ≤4. SMMSE performance for the diagnosis of dementia was high in derivation and validation groups, respectively sensitivity at 93.1% and 93.8 %, specificity at 93.8% and 90.5%, PPV at 94.3% and 90.1%, NPV at 92.5% and 94.0%, likelihood ratio of positive test at 14.9 and 9.8, and of negative test at 0.07 and 0.07. Conclusion : SMMSE was a good screening test for dementia in older individuals followed in memory clinic for a memory complaint. The next step should be the confirmation of its discriminative value in older primary care patients. Keywords : Short form of MMSE; memory complaint; screening; dementia; derivation/validation; older adults

XYLOCOSIDE G REDUCES AMYLOID-β INDUCED NEUROTOXICITY THROUGH INHIBITING NF-κB SIGNALING PATHWAY

Dehua CHUI¹, Yan YU², Pengfei TO³, Liying PIAO⁴
(1. Neuroscience Research Institute & Department of Neurology, Third Hospital, Peking University, China; 2. Neuroscience Research Institute & Department of Neurobiology, Health Science Center, Peking University, China; 3. The State Key Laboratory of Natural and Biomimetic Drugs, Health Science Center, Peking University, China; 4. Neurobiology & neurology & Neuroscience research Institute, Health Science Center, Peking University, China)

Introduction : Amyloid-_β (A_β) peptide, which can invoke a cascade of inflammatory responses, is considered to play a causal role in the

development and progress of Alzheimer's disease (AD). Xylocoside G (XG) is an active compound isolated from a traditional Chinese medicinal plant, *Itoa orientalis*. Method : We have previously reported that XG has neuroprotective effects, of which the mechanism is yet unknown. In this study, we investigated the possible mechanisms underlying neuroprotection of XG against A_β-induced toxicity in SH-SY5Y cells and primary neurons. Pretreatment with XG significantly attenuated the cell viability reduction induced by A_β exposure in a dose dependent manner which was testified by 3-[4, 5-Dimethylthiazol-2-yl]-2, 5-diphenyltetrazolium bromide (MTT) and Lactate dehydrogenase (LDH) release assay. In addition, pretreatment with XG countered the effect of A_β on Bax and Bcl-2 expression and repressed A_β-induced caspase-3 activation, suggesting that the neuroprotective effect of XG is associated with apoptosis regulation. Results : Neuroinflammation has been implicated in A_β-induced neuronal death. XG significantly attenuated A_β-stimulated release of inflammatory factors such as tumor necrosis factor-_α (TNF-_α), interleukin-1_β (IL-1_β) and prostaglandin E₂ (PGE₂). It also downregulated the expression of cyclooxygenase-2 (COX-2) in SH-SY5Y cells. Further molecular mechanism studies demonstrated that XG inhibited A_β-induced NF-_κB p65 translocation, which was probably the result of inhibition of JNK phosphorylation but not ERK or p38 MAPK pathway by XG. Conclusion : This is the first study to demonstrate that XG protects SH-SY5Y cells against A_β-induced inflammation and apoptosis through down-regulating NF-_κB signaling pathways. Keywords : Xylocoside G (XG); Amyloid-_β (A_β); NF-_κB

MAGNESIUM MODULATES AMYLOID-BETA PRECURSOR PROTEIN TRAFFICKING AND PROCESSING

Dehua CHUI¹, Jia YU², Liying PIAO³, Guosong LIU⁴
(1. Neuroscience Research Institute, Department of Neurology, Peking University Third Hospital, Health Science Center, Peking University, China; 2. Neuroscience Research Institute, Department of Neurobiology, Health Science Center, Peking University, China; 3. Neurobiology, Neurology and Neuroscience Research Institute, Health Science Center, Peking University, China; 4. Tsinghua-Peking Center for Life Sciences, School of Medicine, Tsinghua University, Beijing, China)

Introduction : Alzheimer's disease (AD), the most common form of dementia, is characterized by the presence of excessive deposits of aggregated amyloid-_β (A_β), which is derived from the amyloid-_β precursor protein (A_βPP) following processing by α - and γ -secretase. Metal elements are implicated in the pathophysiology of AD. Magnesium affects many biochemical mechanisms vital for neuronal properties and synaptic plasticity, and magnesium levels were reported decreased in various tissues including brain of AD patients. However, the exact role of magnesium in the neurodegenerative process of AD remains elusive. Method : In this study, we investigated the effects of physiological (0.8 mM, as normal control), low (0-0.4 mM), and high (1.2-4.0 mM) concentration of extracellular magnesium ([Mg²⁺]_o) on APP processing and A_β secretion. Results : We show the effects of varying [Mg²⁺]_o on APP processing is time- and dose-dependent. After 24 hr treatment, high [Mg²⁺]_o increased C-terminal fragment- α (CTF) level and soluble α -secretase cleaved APP (sAPP- α) release via enhancing retention of APP on plasma membrane. In contrast, low [Mg²⁺]_o enhanced CTF- β accumulation and A β secretion, and reduced cell surface APP level. Varying [Mg²⁺]_o did not alter protein contents of full length APP (flAPP). However, decreased total intracellular magnesium level by magnesium deprivation over 24 hr impaired cell viability. Normal APP processing could be restored when magnesium was adjusted back to physiological

concentration. Conclusion : These data demonstrate that APP processing can be modulated by magnesium and at high [Mg²⁺]_o, APP processing favors alpha-secretase cleavage pathway. Our findings suggest that supplementation of magnesium has a therapeutic potential for preventing AD. Keywords : Alzheimer's disease (AD); magnesium; amyloid-beta precursor protein (APP)

VITAMIN D DEFICIENCY AND COGNITIVE FUNCTION

Christophe GRAF¹, Cecile ROSSI¹, Sandra GIANNELLI¹, Francois R. HERRMANN², Dina ZEKRY¹ (1. Geriatrics, Geneva University, Switzerland; 2. Geriatrics Department, Geneva University Hospitals, Switzerland)

Introduction : The understanding of the role of vitamin D in maintaining good health has considerably increased in the recent years. There is a growing evidence that vitamin D has not only a beneficial effect to prevent osteoporosis and the risk of falls in the elderly, but also may reduce incidence of cancers, infections, autoimmune, cardiovascular and neurologic diseases. In addition, there is ample biological evidence to suggest an important role for vitamin D in brain development and function. However, the observational studies conducted in humans are still inconclusive, given the different assessment to diagnose cognitive impairment that have been used, most of them were cross-sectional, and did not take into account confounding factors. Method : The aim of this prospective study is to examine the association between 25-hydroxyvitamin D (25(OH)D) levels and cognitive performance in Alzheimer's disease, vascular and mixed dementia (Alzheimer's disease plus vascular). A comprehensive standardized neuropsychological battery was carried out by the same neuropsychologist at least one week after inclusion, with formal clinical criteria used to determine the etiology and severity of clinical dementia 15. Cerebral imaging was also carried out. Results : Data come from a previous study with a yearly follow-up concerning 431 patients randomly selected (mean age: 85 years; 74% female), and discharged from the acute geriatric unit of Geneva University Hospitals. The prospective design allows to examine the predictive value of 25(OH)D on mild cognitive impairment conversion to dementia. Conclusion : The clinical implication of this study could lead to important new possibilities for treatment and prevention. Keywords : vitamin D, dementia, MCI

PP26 C-111

PROSPECTIVE SURVEILLANCE DATA OF HUMAN PRION DISEASE IN CHUGOKU AND SHIKOKU REGION IN JAPAN

Kota SATO, Yoshio IKEDA, Koji ABE (Neurology, Okayama University Graduate School of Medicine, Dentistry and Pharmaceutical Sciences, Japan)

Introduction : Genetic prion diseases in Japan were reported to have a characteristic distribution of phenotypes, which was quite different from that of Western countries. Especially in Chugoku and Shikoku region in west Japan, there is a great frequency of genetic prion disease with PRNP mutations at codon of V180I (71.4% of all genetic prion diseases in these regions). Our aim is to compare the clinical features of the genetic prion disease with V180I mutation and sporadic prion disease in these regions based on the Japanese prion surveillance data. Method : From April 1999 to February 2011, 134 patients with sporadic prion diseases and 28 patients with genetic prion diseases were registered in these regions. All sporadic prion diseases and genetic prion disease with V180I mutation were analyzed for their clinical features, including onset age, resident area, frequencies of symptoms, 14-3-3 protein, PSWC of EEG, and abnormal hyper

intensity of MRI. Results : The frequency of V180I mutation in these regions was 71.4%, and it is significantly larger than that of Japan. Patients with V180I mutations were significantly higher age of onset (78±7 y.o.) than sporadic prion disease (p<0.01, 69±11 y.o.), and had tendencies of low frequency of myoclonus (55% vs 80%), elevation of 14-3-3 protein in CSF (60% vs 82%), and PSWC of EEG (0% vs 70%), and high frequency of HIA in DWI (100% vs 73%). Conclusion: The profiles of genetic prion diseases in Chugoku and Shikoku regions were different from the rest region in Japan. Especially patients with V180I mutation dominated in genetic prion disease. Keywords: Creutzfeldt-Jakob disease, Genetic prion diseases

TELEPHONE CONSULTATIONS IN A DEMENTIA DIAGNOSIS AND TREATMENT UNIT

Maria Isabel FORT, Begona BODEGAS, Francisco Javier AFONSO, Milagrosa BLANCA, Anna FERRE, Anna MAS, Lourdes ISPIERTO (Dementia Unit, Badalona Serveis Assistencials, Spain)

Introduction : The Dementia Unit, Badalona Serveis Assistencials is a reference unit for the diagnosis and treatment of dementia in patients of all ages. The aim of this study was to determine the characteristics of telephone consultation and its utility in the assessment and resolution of clinical problems without attendance at the unit. Method : We recorded all calls answered by a nurse specializing in dementia for one year. The number of calls, the reason, the caller, the age, the patient's diagnosis and the intervention carried out were collected. Patients aged >80 years and <80 years were compared. Data analysis was performed with SPSS Win15.0. Results : There were 576 calls from 347 patients with a mean age of 81.2 years (range 42-99), of whom 210(63.5%) were female. 368(63.9%) calls were made by patients' children and 83(14.4%) by a partner. 162(28.1%) had Alzheimer disease, 118(20.5%) mild cognitive impairment and 107(18.6%) vascular dementia. 178(30.9%) calls were due to psychiatric symptoms or behavioural disorders, 150(26.0%) for other clinical problems and 154(26.7%) for information and advice. The intervention included pharmacological treatment in 215(37.3%) cases and counselling and information in 125(21.7%). In patients aged >80 years, there were a higher proportion of females, calls from patients' children, Alzheimer disease, clinical problems and a greater need for treatment adjustment. Conclusion : Psychiatric symptoms and behavioural disorders were the most common cause of telephone consultations, which are of utility in providing advice and resolving clinical problems. There were differences in the reason for calling and the intervention made according to age. Keywords : Telephone. Dementia. Ageing

PP26 C-113

PREVALENCE OF VASCULAR RISK FACTORS IN HISPANICS WITH FAMILIAL ALZHEIMER'S DISEASE

Martin MEDRANO¹, Juanly RODRIGUEZ¹, Massiel PAULINO¹, Bienvenido VERAS² (1. School of Medicine, Pontificia Universidad Catolica Madre y Maestra, Dominican Rep; 2. Bioestadística, Hospital Universitario Jose Ma Cabral y Baez, Dominican Rep)

Introduction : APOE-4 is the principal genetic risk factor for those with Alzheimer's Disease (AD), both familial as well as sporadic, which occurs at life's end. Cardio and vascular diseases appear to be associated with an increased risk of AD. To determine the proportion of patients with AD who also have some type of vascular risk factor, such as Arterial Hypertension (AHT), Hypercholesterolemia, Diabetes mellitus type 2 (DM2), and an addiction to tobacco, we used the data base from the Familial Study of Genetic Influence on Alzheimer's

(EFIGA in Spanish), a population-based familial genetic study. Method : Hispanic families from the Dominican Republic and Puerto Rico in which two or more living members have AD were studied. The protocol included: clinical history, medical and neurological examinations, risk-factors interview, neuropsychological test, and APOE genotype test. A Diagnostic Consensus was conducted using NINCDS-ADRDA Alzheimer's criteria. The chi-squared statistical test was used to analyze the data. Results : 1,253 participants were evaluated; 411 (32.8%), were males and 842 (67.2%) females. AHT appeared in 703 of the participants (1%), the odds ratio (OR) was 1.28 (P: 0.6); addiction to tobacco appeared in 251 (20.0%), OR 0.20 (P: 0.3); DM2 appeared in 199 (16%), OR 0.19 (p: 0.2), and Hypercholesterolemia in 75 (6%), OR 0.06 (P: 0.1). Conclusion : In the EFIGA, participants with AHT were found associated with AD, but without statistical significance. Keywords : Alzheimer's Vascular risk

PP26 C-114

EFFECTS OF COSMETIC THERAPY ON SLEEP/WAKE PATTERNS, COGNITIVE FUNCTION, AND PHYSICAL FUNCTION OF FRAIL ELDERLY WOMEN WITH DEMENTIA

Masae TSUTSUMI¹, Toshio KOBAYASHI², Hiroshi NOGAKI¹, Sumie TOMEHATA¹ (1. Graduate School of Medicine, Yamaguchi University, Japan; 2. Graduate School of Biomedical & Health Sciences, Hiroshima University, Japan)

Introduction : Frail elderly women with dementia sometimes lose interest in their appearance. This tendency may cause the reduction of their self-esteem and sociability, and make their life rhythm worse and decrease mental/physical well-being. In this study, we examined effects of cosmetic therapy on sleep/wake patterns, cognitive function, and physical function of frail elderly women with dementia. Method : We investigated four elderly women (aged 73-87 years) who stayed in a long-term care facility located in a prefecture in western Japan. After the agreement to participate in the study was obtained, their sleep/wake patterns were recorded in a sleep log for 10 days by nurses and care workers. For the following 10 days, cosmetic therapy was implemented every day, and sleep/wake patterns were also recorded. We compared their cognitive and physical function examined before and after the implementation. Results : There were no significant changes in sleep/wake parameters such as total sleeping hours, nighttime awakening hours, and daytime awakening hours. However, in the intervention period, their wake-up time tended to be stabilized. Cognitive function was improved in three subjects (from 9 to 14 and from 6 to 10 in HDS-R, from 29 to 33 in NM scale), and physical function was improved in one subject (from 40 to 65 in Barthel Index). These effects were obviously seen in the subjects who showed positive attitude to the cosmetic therapy. Conclusion : These findings indicated that there were some positive effects of cosmetic therapy on life rhythm and mental/physical well-being of frail elderly women with dementia. Keywords : cosmetic therapy, dementia

NUTRITIONAL STATUS BY SEVERITY OF DEMENTIA IN KOREAN LONG-TERM CARE FACILITIES

Myonghwa PARK, Sungjin KIM (College of Nursing, Chungnam National University, Korea)

Introduction : The purpose of this study was to evaluate nutritional status by severity of dementia in Korean long-term care facilities. Method : The secondary data analysis was conducted. Subjects were 3,469 elderly with dementia aged 60 years and older who completed Nationwide Survey on Dementia Care in Korea (NaSDeCK). The

demographical and disease related characteristics and nutritional status of participants were analyzed using ANOVA, χ^2 tests and multiple regression analysis. Results : The severity of dementia was categorized into four different levels according to MMSE-DS score. Severe, moderate, mild and very mild dementia were identified in 1,784 (51.4%), 838 (24.2%), 492 (14.2%), 355(10.2%) of the participants respectively. Using MNA classification, 238 (6.9%) participants of this study fulfilled the criteria of being well-nourished, 1,898 (54.7%) were at risk of malnutrition and 1,333(38.4%) were classified as malnourished. The patients with severe dementia scored significantly lower in both total score and subtotal scores of MNA than patients with moderate, mild and very mild dementia. Number of disability, health related quality of life, difficulty in chewing, illness severity, extremity paralysis, and hand grip strength were associated with the nutritional status of patients with dementia. Conclusion : Given the negative impact of nutritional status on mortality and morbidity of elderly with dementia, emphasis should be placed on the importance of effective nutritional intervention for the long-term care facilities in Korea. * This work was supported by Basic Science Research Program through the National Research Foundation of Korea (NRF) funded by the Ministry of Education, Science and Technology (No. 2010-0024922). AN OBSERVATIONAL STUDY IN NURSING HOME RESIDENTS WITH ALZHEIMER'S DISEASE TREATED WITH ORAL OR TRANSDERMAL MONOTHERAPY TO EVALUATE COMPLIANCE, TREATMENT OUTCOME AND CAREGIVER SATISFACTION

Pierre JOUANNY¹, Mathieu CECCALDI², Olivier GUERRIN³, Alain BREDIN⁴, Jean-Jacques PERE⁵, Isabelle BOURDEIX⁶ (1. Service de Medecine Geriatrique, CHU d'Amiens - Hopital sud, France; 2. Service de Neurologie et Neuropsychologie, CHU Timone, France; 3. Departement Geriatrie Aigue et Therapeutique, CHU de Nice, Hopital de Cimiez, France; 4. Cabinet de neurologie, Private neurologist, France; 5. Clinical Research, Novartis Pharma S.A., France; 6. Biometry, Novartis Pharma S.A., France)

Introduction : Both patients and caregivers contribute to compliance challenges in AD. Alternative formulations of drug, such as transdermal patches, could be a way to optimize treatment compliance. The objective of the study was to compare treatment compliance, caregiver satisfaction and treatment outcome according to the route of drug administration: oral form (OF) vs transdermal form (TDF). Method : Observational, 24 weeks, multicenter, study in nursing home residents with AD treated with OF or TDF monotherapy. Patients initiating therapy for the first time or who failed to benefit from a previous oral form were eligible. Outcomes measures (week 24) were treatment compliance and caregiver satisfaction based on a caregiver questionnaire, changes in MMSE, Clinical Global Impression (CGI), neuropsychiatric symptoms (NPI) and psychotropic drug use. Results : 83 residents on OF and 80 residents on TDF were analyzed. Scores of the caregiver questionnaire were respectively 8.4/10 and 9.5/10 for compliance (p=0.001) and 7.0/10 and 7.5/10 (p =0.1) for satisfaction. Decrease of psychotropic drug use was significantly better in the TDF group (p = 0.04). There was relevant but not significant numerical difference in favor of the TDF for NPI, especially in the switching population (p =0.07), and for decrease of MMSE scores (OF: -1.2 ; TDF: -0.2; p= 0.09). The percentage of patients stabilized or improved at CGI score was respectively 65.4% and 73.1%. Conclusion : Treatment compliance is a challenge in AD. The rivastigmine patch may prove an effective approach to optimize treatment compliance in AD patients, offering the possibility of greater and more sustained

clinical benefits. Keywords : dementia caregiver compliance

DIFFERENCE BETWEEN NURSE AND PROFESSIONAL CAREGIVER IN DEMENTIA CARE AT GERIATRIC HEALTH SERVICE FACILITIES

Sachiko HARA¹, Sakae MIKANE², Saki HASEGAWA¹ (1. Faculty of Medicine, Shimane University, Japan; 2. Faculty of Health and Welfare Science, Okayama Prefectural University, Japan)

Introduction : The geriatric health service facilities in Japan are accommodations for elderly citizens who require rehabilitation with the purpose of shifting to home care. At the facilities, 95% of the residents suffer the dementia, and the nurses and professional caregivers cooperate with each other to cope with the demands of the residents. The purpose of this study was to clarify the difference between the nurses and caregivers in dementia care at the facilities. Method : Questionnaires were distributed to the nurses and caregivers at the facilities, and 380 valid responses were obtained. The dementia care guideline developed by Hara et al. (six fields and 29 items) was used, and the nurses and caregivers were requested to rate each item with five grades to measure the frequency of practicing the dementia care. For each job type (nurse: 1 or caregiver: 0), the model to exercise influence on the six factors (or six fields of the dementia care guideline: "creating an environment where residents can feel safe and at home" etc.) was established, and its goodness was analyzed with the covariance structure analysis. Results : The goodness of the model resulted in CFI = 0.872 and RMSEA = 0.066 and was judged to stay at the generally acceptable level. Only the path coefficient from the job type to "consistent and coordinated care including cooperation with residents' families" satisfied the statistically significant level. Conclusion : The study indicated that the nurses are executing more "consistent and coordinated care including cooperation with residents' families" than the caregivers at the facilities. Keywords : geriatric health service facility, dementia care

PP26 C-118

PREDICTING MODEL OF QUALITY OF LIFE IN INSTITUTIONALIZED ELDERLY WITH DEMENTIA

Sung Ja KIM¹, Kyung Sook PARK² (1. Director, Seoul Seniors Tower (Seoul Tower), Korea; 2. Red Cross College of Nursing, Chung-Ang University, Korea)

Introduction : This study was conducted to construct and to examine the hypothetical model that explains causal relationship between various variables that affect the quality of life in elders with dementia. Method : Variables associated with quality of life in elders with dementia were depression, social support, physical function and major concepts associated with behavioral and psychological symptoms of dementia. Data analysis was conducted to examine the hypothesis and hypothetical model adaptability, using AMOS 7.0. Hypothetical model was constructed based on the results from references and previous studies. Hypothetical examination was conducted based on model adaptability which was analyzed by covariant component analysis, and modified model was presented with additional route, in order to improve the model adaptability. Results : The present study revealed that the most directly significant variable related was depression. Of all 6 hypothesis presented, all 6 routes that were selected by researchers were supportive, and structural model associated with the quality of life in elders with dementia were shown to correspond well with the causal model between measuring instruments from collected data. Conclusion : In conclusion, present study demonstrated that the quality of life in elders with dementia could be explained by

hypothetical examination, and furthermore, this model could be most effective in understanding the quality of life in elders with dementia. Also, it would be very meaningful to utilize the basic framework of the general idea of quality of life in elders with dementia, as a strategy for improving the quality of life in elders with dementia. Keywords : dementia, quality of life, predicting model

Introduction : Aim Describe antipsychotic medications delivered to an AD population in South East of France in 2010, from the French General Health Care (GHC) insurance Data Base. Method : In 2008, was created the cohort PACA-Alz that enrolled all subjects affiliated to the GHC insurance Provence-Alpes-Cote d'Azur and Corsica (i.e. 75% of the total population of the area), with an AD diagnosis and/or at least one delivery of Acetylcholinesterase Inhibitors or Memantine. Antipsychotic consumption was exhaustively registered in the data base as there is no under-the-counter delivery for psychotropic drugs in France. Each delivery was considered to be given for one month. Chronic consumption was defined by three or more consecutive deliveries. Results : 34696 patients were included, 73.1% were women; 68.8% of the patients were aged 80 y.o. and over. Twenty-six-per-cent of the population received at least one antipsychotic medication (n=9040); 69.2% were aged 80 y.o. and over; 61.3% had chronic consumption (i.e.16% of the total study population). Risperidone was the most common antipsychotic prescribed (43%). Antipsychotic consumers (P1) were prescribed significantly more other psychotropic drugs than non antipsychotic consumers (P2) (p<0.001); respectively for antidepressant (P1: 54.4% vs P2:43.4%), benzodiazepines (P1: 66.3% vs P2: 37.9%), hypnotics (P1: 37.5% vs P2:20.3%). Most of the time, these psychotropic medications were chronically delivered. Conclusion : Antipsychotic medications are useful for psychiatric symptoms that frequently occurred in AD patients. But these medications are often associated to other psychotropic drugs and chronically delivered. More appropriate use is necessary to avoid adverse side effects. Keywords : Antipsychotic-consumption-Alzheimer disease

NON-PHARMACOLOGICAL MANAGEMENT OF WANDERING IN PERSONS WITH DEMENTIA: LITERATURE REVIEW

Yaelim LEE (School of Nursing, University of Pennsylvania, USA)

Introduction : Wandering is a common behavior observed in persons with dementia (PWD). It is accompanied by significant risks to the patient if not well managed, including falls, injuries, elopement, and

even death. It also aggravates the caregiver burden and becomes a concern for patient facilities. Further, wandering is commonly treated with off-label use of various medications, which may not be effective and may cause serious adverse effects. This paper reviews the recent understanding and possible non-pharmacological management of wandering behavior, along with the limitations of recent studies. Method : Electronic data collection included studies from February, 2007 to October, 2012 from the following databases: PubMed and Scopus. Twenty-nine articles from PubMed and nineteen articles from Scopus were found using the search terms including “dementia,” “alzheimer disease,” “wandering,” and “management.” Studies that were published in English and contained information related to the purpose of this paper were selected. Results : A review of the literature published in last five years shows many attempts to explain wandering behavior, including its prevalence, etiology, triggering factors, clinical presentation, and management. Some non-pharmacological management techniques described in the literature include: eliminating possible causes, generating a safe wandering environment, encouraging exercise and activity, supporting care providers, and preparing elopement protocols. However, even though there are many studies addressing possible interventions for wandering behavior, few examine their actual effectiveness. Conclusion : Wandering in older PWD is multifactorial and calls for an interdisciplinary approach. Non-pharmacological management of wandering behaviors should be considered while acknowledging the limited effects and possible risks of pharmacological management. Keywords : dementia, wandering , non-pharmacological management

COMMUNITY REHABILITATION: A PILOT STUDY ON GROUP PHYSICAL EXERCISES FOR OLDER ADULTS WITH COGNITIVE IMPAIRMENT

Yi LIN¹, Yi-Ling LIN², Tsai-Chun CHEN¹, Ai-Chen CHUNG³, Pi-Huei TSAI⁴, Hsiao-Yun HU¹, Hui-Ting SHIH¹, Kai-Lin HUNG¹, Tzu-Hsuan CHEN¹, Yi-Ling LI², Ming-Hsia HU¹ (1. Department of physical therapy, National Taiwan University, Taiwan; 2. Department of physical therapy, National Taipei University of Nursing and Health Sciences, Taiwan; 3. Department of physical therapy, Jinwen Rehabilitation Clinic, Taiwan; 4. Department of Social Welfare, Taipei Nangang Seniors Service Center, Taiwan)

Introduction : Exercise for older adults with declining cognition prevents physical function deterioration. This study attempted to assess the effectiveness of a group exercise program for cognitive impairment older adults in a day care center. Method : Fourteen community-dwelling older adults were recruited from a day care center in Taipei. All participants met the inclusion criteria of (1) diagnosis of cognitive impairment, (2) able to walk without physical assistance, and (3) without condition that prevented them from participating in physical exercises. Physical therapist held the program 1 session each week, 40-minute per session for eight weeks. Outcome measures included handgrip strength, Saint Louis University Mental Status Examination (SLUMS), timed up and go (TUG), 6 minutes walking test (6MWT), and Barthel Index were collected before and after the intervention. Results : Average age of the 14 participants was 74.38 years, and the average score of SLUMS was 10.9. Four participants were dropout due to inconvenient transportation. The intention to treat analysis was used to analyze the missing data. There were no significant changes on SLUMS, handgrip strength, TUG, 6MWT, and Barthel Index after eight-week intervention. Four participants improved their walking distance during 6MWT beyond the minimal clinical important change score, ie., 33.5 m (Ries et al., 2009). Conclusion : This study suggests that the group exercise

training is feasible and effectiveness for the community-dwelling older adults with cognitive impairment to maintain physical function, cognition and the function of daily living. Larger scale or a higher dosage of group exercise is suggested for future study. Keywords : cognitive impairment, group exercise, older adults

PP26 C-122

COMPARISON OF 'SERIAL 7S SUBTRACTION' AND "SAM-CHUN-RI-GANG-SAN" BACKWARD

Youngdae KIM , Chang Won WON (Department of Family Medicine, Kyung-hee University Hospital, Korea)

Introduction : There are two variations in the attention subitem of the Mini-Mental State Exam; 'serial 7's subtraction and "Sam-chun-ri-gang-san"backward. When scored on a scale of one to five, they can be used interchangeably, which inevitably brings a considerable difference in the results. Thus, we compared the scores of the 'serial 7's subtraction' and "Sam-chun-ri-gang-san"backward, and analyzed the influence of sociodemographic factors on the differences. Method : We administered the K-MMSE including the two type of attention item ; serial 7's and "sam-chun-ri-gang-san"backward to the 239 community- dwelling elderly people aged 65 or older in the K University Hospital and four Seoul senior centers . we analyzed the differ from June 2012 to July 2012. Results : The score for "sam-chun-ri-gang-san"backward(2.5±2.1) was lower than that of the serial 7's(3.4±1.7) by a mean point of 0.9±1.9. The score of "sam-chun-ri-gang-san"backward was zero in 31.4% of the subjects while only 9.6% scored zero on the serial 7's. The ratio of the same scores between two tasks was 36.0%. Education is primary source of variance on difference score, followed by number of family. There was no significant effect of age, gender when score of difference was analyzed by multiple regression. Conclusion : In study, subjects tended to outperform the serial 7's in general. Upon administering "sam-chun-ri-gang-san"backward instead of serial 7's due to the preference of the patient, we should take into account that the score of "sam-chun-ri-gang-san"backward was mean 0.9 point lower than serial 7's to ensure appropriate interpretation of MMSE score. Keywords : MMSE, serial 7's subtraction, sam-chun-ri-gang-san backward

A UNIQUE YOUNGEST PATIENT WITH A SPORADIC CJD IN JAPAN

Yumiko NAKANO¹, Yuko KOZAI¹, Yoshio OMOTE¹, Motonori TAKAMIYA¹, Yoshio IKEDA¹, Koji ABE¹, Masako TABATA², Sato KATSUYA³ (1. Neurology, Okayama University Graduate School of Medicine, Dentistry and Pharmaceutical Sciences, Japan; 2. Neurology, Himeji Central Hospital, Japan; 3. Neurology, Nagasaki University Graduate School of Medicine, Dentistry and Pharmaceutical Sciences, Japan)

Introduction : Creutzfeldt-Jakob disease (CJD) is a degenerative neurological disorder that is usually found in elderly people, and is invariably fatal. Method : A woman developed anorexia at her age of 22. At age 23 she developed a progressive cognitive impairment. 3 months later she developed a walking disturbance, dysarthria and dysphagia. At that time only ribbon-like hyperintensities in MRI-DWI in cerebral cortex was observed. At 24 months after the onset, she admitted to our hospital. Results : On admission, she was lethargic and disoriented. She presented with symptoms such as dysarthria, dysphagia, and bradykinesia. She also presented pyramidal signs, cerebellar ataxia, and she couldn't stand up alone. In laboratory tests, there was no-specific finding and no known mutation in the prion protein gene. EEG showed diffuse slow waves without periodic sharp

wave complexes. MRI revealed exaggerated hyperintensities in cerebral cortex, and CSF examination turned to be 14-3-3 protein elevation. RT-QUIC, indicating an increase of pathological prion protein, revealed positive finding. Thus, clinical, MRI and CSF findings finally led us to diagnosis as prion disease. Conclusion : The age 22 was the youngest onset of sporadic prion disease in Japan, and the present case showed a unique clinical characteristics. Keywords : prion youngest onset

PP26 C-124

“BEHAVIORAL AND PSYCHOLOGICAL SYMPTOMS OF DEMENTIA” RATHER THAN COGNITIVE FUNCTION IN PATIENTS WITH DEMENTIA INCREASES CAREGIVER BURDEN

Hirofumi SAKURAI, Haruo HANYU, Mayu ARAKI, Toshihiko IWAMOTO (*Geriatric Medicine, Tokyo Medical University, Japan*)

Introduction : We hold classes for caregivers on how to understand and manage patients with dementia. The aim of the present study was to assess various factors associated with the burden caregivers bear in coping with patients with dementia. Method : Thirty-three participants from our classes for caregivers were enrolled in this study. They provided written informed consent to participate in this study. Caregivers completed all questionnaires on care, namely, Neuropsychiatric Inventory Questionnaire (NPI-Q), EuroQoL-5 Dimensions (EQ-5D), and the Japanese version of the Zarit Burden Interview (J-ZBI). The patients underwent the Mini Mental State Examination (MMSE) and evaluation of ADL according to the report of Imai et al. Results : 1.The mean MMSE score for patients, and NPI-Q score, EQ-5D score, and J-ZBI score for caregivers were 18.8±5.2, 5.6±4.9, 0.700±0.167, and 27.3±17.8, respectively. 2.The NPI-Q score was significantly correlated with the J-ZBI score (R=0.51, p<0.01). 3.The EQ-5D score was significantly correlated with the J-ZBI score (R=0.44, p<0.05). 4.The number of caregivers was significantly correlated with the J-ZBI score (p<0.05). 5.Age, relationship, cohabitation, and contact time with the caregiver were not significantly correlated with the J-ZBI score. 6.The evaluation scores of the MMSE and ADL of the patients were not significantly correlated with the J-ZBI score. Conclusion : The strong correlations of the BPSD, QOL score, and the number of caregivers with the J-ZBI scores suggest the importance of providing support to patients with BPSD who are receiving medical care for dementia and their caregivers. Keywords : BPSD, Caregiver burden, Dementia

DECREASED QUALITY OF LIFE IN SUBSYNDROMAL DEPRESSION

Jae Sung RYU, Moon Doo KIM, Young Sook KWAK, Chang In LEE, Sang Hee KIM, Bong Hee JEON, Na Ri KANG, Joon Hyuk PARK (*Department of Psychiatry and Institute of Medical Science, Jeju National University School of Medicine, Korea*)

Introduction : Depression with fewer symptoms than required for a DSM-IV diagnosis of Major Depressive Disorder (MDD) has consistently been found to be associated with functional impairment. In this study, we aim to estimate the quality of life in elderly patients with Subsyndromal Depression (SSD) compared with Non-depressive elderly (NDE). Method : The Korean version of Mini International Neuropsychiatric Interview were conducted on 194 of outpatients with chief complaint of depression and 108 of normal control group. SSD is defined as having five or more current depressive symptoms with core depressive symptoms (depressive mood or loss of interest or pleasure) during most of the day and nearly every day over at least two weeks.

All patients were estimated with GDS (Revised Korean version of the Geriatric Depression Scale), HDS (The Korean Version of Revised form of Hasegawa Dementia Scale), MMSE-KC (Mini-Mental State Examination in the Korean version of CERAD assessment packet), SMCQ (Subjective Memory Complain Questionnaire) and SF-36 (The Korean Version of Short-Form 36-Item Health Survey). Results : There were statistical difference between SSD group and NDE group in the scores of SF-36 including PCS (physical component summary) and MCS (mental component summary) (t-test, p<0.001). The scores of PCS in the SSD group were lower than those in NDE group with adjustment of age, gender, and education (F=9.274, p=0.003, ANCOVA) and It was the same as the scores of MCS (F=53.166, p<0.001, ANCOVA). Conclusion : SSD, as well as MDD, lowered quality of life including physical and mental aspects compared with NDE. Keywords : Subsyndromal depression, Quality of life, Elderly

COGNITIVE IMPAIRMENT IN SUBSYNDROMAL DEPRESSION

Ji Eon KANG¹, Moon Doo KIM², Young Sook KWAK², Chang In LEE², Sang Hee KIM², Bong Hee JEON², Jae Sung RYU², Joon Hyuk PARK² (*1. Department of Psychiatry, Yeonkang Hospital, Korea; 2. Department of Psychiatry and Institute of Medical Science, Jeju National University School of Medicine, Korea*)

Introduction : Depression with fewer symptoms than required for a DSM-IV diagnosis of Major Depressive Disorder (MDD) has consistently been found to be associated with functional impairment. In this study, we aim to estimate the cognitive impairment in elderly patients with Subsyndromal Depression (SSD) compared with Non-depressive elderly (NDE). Method : The Korean version of Mini International Neuropsychiatric Interview were conducted on 194 of outpatients with chief complaint of depression and 108 of normal control group. SSD is defined as having five or more current depressive symptoms with core depressive symptoms (depressive mood or loss of interest or pleasure) during most of the day and nearly every day over at least two weeks. All patients were estimated with GDS (Revised Korean version of the Geriatric Depression Scale), HDS (The Korean Version of Revised form of Hasegawa Dementia Scale), MMSE-KC (Mini-Mental State Examination in the Korean version of CERAD assessment packet), SMCQ (Subjective Memory Complain Questionnaire) and SF-36 (The Korean Version of Short-Form 36-Item Health Survey). Results : There was a significant difference between the SSD group and the NDE group in the performance of MMSE-KC (F=9.3, p<0.001, ANOVA). The scores of MMSE-KC in the SSD group were lower than those in NDE group with adjustment of age, gender, and education (F=4.270, p=0.04, ANCOVA). When cognitive impairment was defined as Z-score of MMSE-KC less than -1.5, Odds ratio of cognitive impairment was 1.86 in SSD (p=0.036), 7.57 in MDD (P<0.001) compared with reference of NDE (Logistic regression analysis). Conclusion : SSD, as well as MDD, lowered cognitive impairment compared with NDE. Keywords : Subsyndromal depression, Cognitive function, Elderly

WHITE MATTER HYPERINTENSITIES IS AN INDEPENDENT PREDICTOR OF FUTURE DEPRESSION: 3-YEAR RESULTS FROM EPIDEMIOLOGICAL STUDY OF VASCULAR DEPRESSION IN COMMUNITY-DWELLING ELDERLY KOREANS

Joon Hyuk PARK¹, Chang In LEE¹, Ki Woong KIM² (*1. Department of Psychiatry, Jeju National University Hospital, Korea; 2. Department of Psychiatry, Seoul National University Bundang*)

Hospital, Korea)

Introduction : The purposes of this study were to estimate the prevalence rates of subtypes of late life depression (LLD including (vascular depression and non-vascular depression) in the baseline study, to examine the natural course of LLD and to investigate influence of white matter hyperintensities (WMH) volume on depression in the 3-year follow-up study. **Method :** WMH was rated by the modified Fazekas scale and the volume of WMH was also calculated by an automated quantification method. Patients were classified as having vascular depression if they suffered from any type of depressive disorders and had a score of 2 or more on either deep white matter hyperintensities or subcortical gray matter ratings. **Results :** The prevalence rates of vascular MDD and vascular nMDD were 2.39% (53.6% of MDD) and 4.24% (34.0% of nMDD), respectively, in the baseline study. The relative proportion of vascular depressive disorders to non-vascular depressive disorders increased with aging. Among non-depressive group in the baseline study, subjects with WMH(+) had 13.5 times (OR=13.5, 95% CI=1.10-165.97) risk of developing depressive disorder in the 3-year follow-up study, as compared to those without WMH(+). Log WMH volume (OR=5.78, 95 CI=1.04-31.72) in the baseline study was an independent predictor for depressive disorder in the 3-year follow-up. **Conclusion :** Late life depression is very common and its course is chronic and pleomorphic in community. WMH is a crucial predictor for future depressive disorder, which supports the previous vascular depression hypothesis. Vascular depression is a useful construct for clinical characteristics and impact of late life depression. **Keywords :** vascular depression, white matter hyperintensities

PP26 C-128

PREVALENCE OF MAJOR MENTAL DISORDERS AMONG KOREAN ELDERLY IN A NATIONWIDE COMMUNITY SURVEY

Su Jeong SEONG, Jee Eun PARK, Maeng Je CHO (*Department of Psychiatry and Behavioral Science, Seoul National University Hospital, Korea*)

Introduction : We investigated the prevalence of the DSM-IV major mental disorders among the Korean elderly dwelling in community. **Method :** Nationwide face-to-face household interviews were conducted in 2011. The sampling of the subjects was carried out across 12 catchment areas using a multistage, cluster sampling design. Korean version of the Composite International Diagnostic Interview(K-CIDI) was applied to evaluate mental illness of each subject. **Results :** Among the population aged from 60 to 74(n=928), more than one fifth(22.1%) experienced at least one mental disorder in their lifetime and 13.7% experienced the episode in the past year. Lifetime prevalence rates were 7.3% for alcohol use disorder, 5.4% for nicotine use disorder, 7.6% for anxiety disorder, 7.3% for mood disorder. Men were more likely to have alcohol use disorder, nicotine use disorder and less likely to have mood disorder, anxiety disorder. Those who did not attend any college had a greater risk for alcohol use disorder. Compared to the younger population aged from 18 to 59, elderly had lower 12 month prevalence rates of alcohol use disorder(1.7% to 4.8%), nicotine use disorder(2.8% to 4.2%), anxiety disorder(5.9% to 6.9%). On the contrary, mood disorder was more prevalent in elderly(3.9% to 3.5%), especially in women. **Conclusion :** Major mental disorders were quite common, although the prevalence is lower in elderly than in younger population. The results argue that more concern in clinical practice and mental health policy is needed for mentally ill elderly, especially for those with mood disorders. **Keywords :** Prevalence, Mental disorders, Elderly

PP26 C-129

COMPARISON OF OBESITY /PSYCHOLOGICAL DISORDERS COMORBID BETWEEN MIDDLE AGED AND OLD WOMEN

Soodeh RAZEGHI JAHROMI¹, Maryam ABOLHASANI², Maryam BIDADIAN², Leila KOUTI³ (*1. Geriatric group, Sina Hospital, Tehran University of Medical Sciences, Iran; 2. Obesity Group, Endocrine and Metabolic Research Center, Sina Hospital, Tehran University of Medical Sciences, Iran; 3. school of pharmacy, Ahvaz Jundishapur University of Medical Sciences, Iran*)

Introduction : Epidemiologic data proposed a relationship between obesity and depression in older adults. Findings have suggested a stronger relationship in aged women than men. We conducted this study to evaluate the association between obesity and mood disorders, as well as a range of eating disorders in old women. **Method :** From a total of 1477 clients referred to an outpatient university hospital overweight and obesity clinic in Tehran, Iran, between Jan 2008 and Jan 2012, 212 obese persons (97 persons 60+ and 115 persons 40-59 years of age) were enrolled. Data of demographics, comorbidities, anthropometrics, physical activity level, and diet, as well as, mood and eating disorders were collected. Mood and eating disorders were assessed using diagnostic structural interview based on DSM-IV-TR (Diagnostic Statistical Manual of Mental Disorder- fourth edition-Text version). BMI more than or equal to 30 was considered as obesity. **Results :** The prevalence of dysthymia was significantly lower in older women compared to younger (4.2% vs. 13%, P.value= 0.039). Comparable but not significant results were observed for major depression disorder (13.5% in older individuals vs. 17.7%), Bulimia Nervosa (0% vs. 1.8%), and eating disorders not otherwise specified (2.1% vs. 8%). **Conclusion :** Our findings suggest that obese older women were less suffers from Comorbid dysthymia/obesity compared to younger. **Keywords :** dysthymia, obesity, older adult

PP26 C-130

ASSOCIATIONS BETWEEN CLINICAL AND FUNCTIONAL MEASURES WITH SELF-RESTRICTED DRIVING PRACTICES IN OLDER ADULTS WITH PARKINSON'S DISEASE

Alexander Michael CRIZZLE¹, Anita M. MYERS², Quincy J. ALMEIDA³, Eric ROY⁴ (*1. School of Rehabilitation Science, McMaster University, Canada; 2. School of Public Health and Health Systems, University of Waterloo, Canada; 3. Sun Life Financial Movement Disorders Research and Rehabilitation Centre, Wilfrid Laurier University, Canada; 4. Department of Kinesiology, University of Waterloo, Canada*)

Introduction : The extent to which various symptoms associated with Parkinson's disease (PD) affect driving practices is presently unknown. The primary aim was to determine whether a clinical battery of tests (clinical and functional) were associated with driving practices (exposure and patterns) in a sample of PD drivers compared to age and gender matched controls. **Method :** We installed electronic devices in the vehicles of 27 drivers with PD (mean age 71.6±6.6; Unified Parkinson's Disease Rating Scale (UPDRS) motor score 30.1±8.6); and 20 controls (mean age 70.6±7.9) to monitor their driving over 2 weeks. Participants also completed scales on sleepiness, depression, quality of life, as well as vision (contrast sensitivity), cognition (MoCA) and a brake test. **Results :** The PD group had significantly slower brake response times (p<.05), poorer MoCA and quality of life scores (p<.01), and greater depression (p<.05). Scores on depression, sleepiness, and quality of life were not associated with any driving variables. Slower reaction time, however, was significantly related to

night driving: fewer trips ($r=-.46$; $p<.05$), distance ($r=-.54$, $p<.01$) and duration ($r=-.58$, $p<.01$). Although not significant, MoCA scores were negatively associated with night driving: trips ($r=-.28$), distance ($r=-.25$) and duration ($r=-.24$), as were UPDRS motor scores with night distance ($r=-.21$) and duration ($r=-.16$). Conclusion : These findings suggest that some PD drivers with worse disease severity (based on UPDRS motor scores) may recognize declines in performance (reaction time, cognition and contrast sensitivity) and restrict their driving practices, beginning with night driving. Future studies with larger samples are needed to replicate and extend these preliminary findings. Keywords : Driving behavior, Parkinson's disease, clinical tests

PP26 C-131

VALIDATION OF THE KOREAN VERSION OF THE 8-ITEM MORISKY MEDICATION ADHERENCE SCALE IN PATIENTS WITH PARKINSON'S DISEASE

Jee-Eun CHUNG¹, Ka Eun YOO¹, Ju Yeun LEE², Han-Joon KIM³, Byung Koo LEE¹ (1. College of Pharmacy, Ewha Womans University, Korea; 2. College of Pharmacy, Hanyang University, Korea; 3. Department of Neurology and Movement Disorder Center, College of Medicine, Seoul National University, Korea)

Introduction : This study aimed to validate a Korean translation of the structured 8-item Morisky Medication Adherence Scale(MMAS-8) and examine the psychometric properties of the Korean version of the MMAS-8 among patients with Parkinson's disease. Method : A standard 'forward-backward' procedure was used to translate MMAS into Korean language. An observational cross sectional study was conducted in the movement disorder center of Seoul national university hospital. Internal consistency was assessed using Cronbach's α and the test-retest reliability at 2 week interval using the intraclass correlation coefficient(ICC). Validity was confirmed using a self-reported simple question and Medication Possession Ratio(MPR) to antiparkinson medication. To find MPR, we obtained the prescribing data for 18 months from electronic medical record. Low adherence was defined as MPR <0.8 . Results : From August to October 2012, a total of 104 patients were included: mean age $68.4(\pm 7.6)$ years, 45% men. The mean score of MMAS-8 was $6.22(\pm 1.72)$ and 34.6%, 30.2%, 34.6% of patients had low, medium, high adherence. Internal consistency reliability was moderate($\alpha=0.68$) whereas the test-retest reliability of the Korean MMAS-8 was excellent(ICC=0.95, $p<0.0001$). Regarding validity, the MMAS-8 categories had significant relationship with self-reported question($\chi^2=75.5$, $p<0.0001$). Our analysis showed that a positive correlation between MMAS-8 and MPR scores($r=0.33$, $p=0.001$) and a significant relationship between MMAS-8 and MPR categories($\chi^2=8.09$, $p=0.016$) were found. Conclusion : This study demonstrates that the Korean MMAS-8 scale is a reliable, valid instrument for assessing medication adherence in Parkinson's disease. Keywords : Medication adherence, Morisky medication adherence scale, Parkinson's disease

PP26 C-132

NUTRITIONAL STATUS ASSESSMENT FOR STROKE SURVIVORS

Eun Kyoung KANG¹, Hyun Jung JEON², Jin A. PARK², Su Jin CHOI², Gi Ho JO³ (1. Rehabilitation Medicine, Seoul Bukbu Hospital, Kangwon National University Hospital, Korea; 2. Clinical Nutrition Team, Seoul Bukbu Hospital, Korea; 3. Rehabilitation Medicine, Seoul Bukbu Hospital, Korea)

Introduction : Dysphagia and subsequent malnutrition develop

frequently in stroke patients. We aimed to assess the nutritional status in stroke patients who were just admitted to a rehabilitation center. Method : From October 2011 to October 2012, 127 stroke patients (63 male, age 68.0 ± 10.5 years) were enrolled at a single rehabilitation center. Nutritional status was graded and assessed with regard to the patient's subjective appetite (using a 3 point scale), weight loss (<5 , >5 kg), gastrointestinal problem (absence, presence), diet type (enteral tube feeding, dysphagia diet, regular diet), albumin level (<2.9 , $2.9-3.3$, >3.3 mg/dL), and total cholesterol level (<130 , $130-160$, >160 mg/dL). Total score was classified as Patient 1 (P1, high risk for malnutrition state), P2 (moderate) or P3 (low). And their dysphagia were classified as Diet 1 (D1, tube feeding), D2 (modified diet) or D3 (regular diet). Results : Six-teen patients (12.6%) were classified as P1, 38 patients (29.9%) as P2 and 73 patients (57.5%) as P3. Twenty-nine patients (22.8%) were classified as D1, 27 patients (21.3%) as D2 and 71 patients (55.9%) as D3. Eleven patients (8.7%) were classified into both P1 and D1. Correlation between dysphagia and nutritional status was significant (Spearman's $\rho = -0.505$, $P=0.001$). Conclusion : Nutritional status and dysphagia should be assessed earlier in patients with stroke at admission to rehabilitation center because they may influence on rehabilitation outcome. Keywords : stroke, nutrition

MAGNETIC RESONANCE ANGIOGRAPHY IN PATIENTS WITH MOYAMOYA SYNDROME ASSOCIATED WITH ATHEROSCLEROTIC OCCLUSION OF THE MIDDLE CEREBRAL ARTERY

Kwang Deog JO, Wooyoung JANG, Moon Kyu LEE (Department of Neurology, Gangneung Asan Hospital, University of Ulsan College of Medicine, Korea)

Introduction : Magnetic resonance imaging and angiography (MRA) has been used to diagnose and follow-up for moyamoya disease. However, MRA studies of the moyamoya syndrome associated atherosclerosis have not been investigated. We aimed to evaluate 3-T MRA in patients with moyamoya syndrome associated with atherosclerotic occlusion of the middle cerebral artery (MCA). Method: We analyzed 15 consecutive patients (7 males and 8 females) who had unilateral ($n=14$) or bilateral ($n=1$) steno-occlusive lesions in the MCA with basal moyamoya vessels demonstrated by digital subtraction cerebral angiography. Patients ranged in age from 35 to 85 years (mean age, 54.3 years). All patients underwent 3-T three-dimensional time-of-flight MRA. The steno-occlusive severity of the MCA was evaluated according to modified Houkin's grading system (MRA score) and the visibility of moyamoya vessels (moyamoya vessel score) was graded according to a 4-point scale. Results : The steno-occlusive lesions were found in the proximal (87.5%) or mid-portion (12.5%) of the MCA. MRA scores confined to the MCA were grade 3 (invisible) in 9 patients (56.3%) and grade 2 (discontinuity of M1 signal) in 7 patients (43.8%). The moyamoya vessel scores were grade 2 in 3 patients (18.8%), grade 1 in 12 patients (75%), and grade 0 in one patients (6.3%). Conclusion : The MRA findings in patients with atherosclerotic moyamoya syndrome showed the lesions most frequently affect the proximal portion of the MCA with severe degree of steno-occlusion and poorly visible basal moyamoya vessels. Keywords : Moyamoya syndrome, Middle cerebral artery, Atherosclerosis

PP26 C-134

THE EFFICACY OF REPETITIVE BILATERAL ARM TRAINING WITH RHYTHMIC AUDITORY CUEING FOR PATIENTS WITH STROKE

Seong Won KIM¹, Tae Hyun KIM² (1. Yonsei PMR Clinic, Korea;

2. Saint Paul's School, USA)

Introduction : To evaluate the effect of repetitive bilateral arm training with rhythmic auditory cueing (BATRAC) on functional motor performances of the hemiplegic upper limb. **Method :** Twenty four subjects with stroke (12 males, 12 females) were enrolled and classified into two groups, experimental and control group. The control group received conventional rehabilitation therapy while the experimental group received additional BATRAC. The motor function of patient's upper extremity was assessed by Fugl-Meyer Motor Function Assessment (FMA), Manual Function Test (MFT), and Functional Independence Measure (FIM) before the treatment, at 4 weeks and at 6 weeks after beginning of the treatment. **Results :** There were no differences in FMA between two groups before the treatment and the continual improvements in the function at 4 weeks and at 6 weeks after beginning of the treatment ($p \leq 0.05$). Furthermore, the experimental group revealed higher performances in FMA than control group ($p \leq 0.05$). However, there were no differences in FIM and MFT before the treatment and in the improvements of function after the treatment between two groups ($p \leq 0.05$). **Conclusion :** BATRAC improves motor performance of the paretic upper extremity and will be useful as an additional tool of improving motor function in patients with stroke. **Keywords :** stroke, hemiplegic, BATRAC

GROWTH HORMONE DEFICIENCY IN ELDERLY PATIENTS WITH ISCHEMIC STROKE

Myung Jun SHIN¹, Jae Hyeok CHANG¹, Yong Beom SHIN¹, Sunkug JHO², Sungnyun KIM² (1. Department of Rehabilitation Medicine, Pusan National University School of Medicine, Korea; 2. Rehabilitation/Clinical Aging Research Institute, Busan Medical Center, Korea)

Introduction : Pituitary dysfunction is a known complication of traumatic brain injury and subarachnoidal hemorrhage. However there are few data about pituitary dysfunction as a complication of ischemic stroke. **Method :** This study was designed as a retrospective observational study. The subjects were clinically hemiplegic individuals with a subacute ischemic stroke under 6 months in rehabilitation units in Pusan National University Hospital. We excluded the patients with decompressive cranioplasty and previous endocrine diseases such as hypopituitarism. Finally, Ten females over 65 years (mean age; 74.83 ± 6.40 years, Group A) and 11 postmenopausal females (mean age; 56.67 ± 4.93 years, Group B) were enrolled. We measured pituitary hormones, stroke severity and functional ability. **Results :** In group A over 65 years old, five patients (50%) presented with some degree of pituitary dysfunction with decreased IGF-1, which of less than 175 mcg/L is a good clinical marker for growth hormone deficiency. Abnormal IGF-1 levels were found in 5 patients (45%) of group B. Functional abilities such as MMSE and mRS(modified Rankin scale) was not different between group A and B. **Conclusion :** These results showed no significant prevalence of pituitary dysfunction in elderly patients with ischemic stroke. However, we suggest that patients who suffer from ischemic stroke should undergo pituitary testing, when considering the high prevalence of growth hormone deficiency of this study. **Keywords :** stroke, growth hormone, elderly patients

PP26 C-136

SALIVARY INTERLEUKIN (IL)-6 IN ELDERLY PEOPLE WITH STOMATITIS APHTOUS AND GINGIVITIS ASSOCIATED TO THE OCCURRENCE OF COGNITIVE IMPAIRMENT

Dewi PRIANDINI¹, Tri Budi RAHARDJO², Eef HOGERVORST³, Gus Permana SUBITA⁴, Irawati ISMAIL⁵ (1. Oral Medicine, Faculty Dentistry Trisakti University, Indonesia; 2. Centre For ageing studies, Universitas Indonesia, Indonesia; 3. School of Sports and Health Sciences, Loughborough University, United Kingdom; 4. Oral Medicine, Faculty of Dentistry Universitas Indonesia, Indonesia; 5. Psychiatry, Faculty Medicine Universitas Indonesia, Indonesia)

Introduction : Oral health is often poor in many elderly and has been associated with many health conditions, possibly due to infection. The aging process in itself also increases the vulnerability of elderly people to infections and is also associated with increased levels of interleukin (IL)-6. Stomatitis Aphthous and Gingivitis are a well-known oral infection which seems to be mediated principally by the immune system and by bacteria contain several components that can enhance the pro inflammatory cytokines, including (IL)-6. However, the relation between stomatitis aphtous and gingivitis with cognitive impairment in the elderly is not well understood. **Method :** In 133 respondents sample of those over 60 years old was collected in rural Borobudur in Central Java Indonesia. Each subject underwent detailed oral and dental examination, with a focus on oral infections in accordance with the Axell method, Medical examination and medical history was assessed by using standardized questions from the Cambridge Mental Disorder of the Elderly Examination (CAMDEX). salivary IL-6 was determined by use of enzyme-linked immunosorbent assay (ELISA). Statistical analysis was performed by use of descriptive statistics. **Results :** Significant differences in salivary IL-6 for stomatitis aphtous were found ($P < 0.05$) as well as respondents with gingivitis. Gingivitis was significantly associated to the occurrence of cognitive impairment ($p < 0.05$). **Conclusion :** We might conclude that elevated salivary IL-6 levels for stomatitis aphtous and gingivitis which showed higher levels but only Gingivitis related to cognitive impairments. However this was not maintained in regression analyses. **Keywords :** Salivary Interleukin (IL)-6, Stomatitis Aphthous, Gingivitis, Cognitive impairment

CLINICAL FEATURES OF THE ELDERLY PATIENTS CONSIDERED BY THE CHIEF COMPLAINTS

Jong Lull YOON¹, Ji Sang PARK² (1. Dept. of Family Medicine and Geriatrics, Hallym University College of Medicine, The Korean Geriatrics Society, Korea; 2. Dept. of Family Medicine, Hangang Sacred Heart Hospital, Hallym University, Korea)

Introduction : With the rapidly increasing older population, there are more rapidly increasing elderly patients who need medical services. By the physiologic senescence, clinical features of older patients are quite different from younger ones. This study purposed to make basic characteristic data of geriatric in-patients from analyses of chief complaints resulted in admission. **Method :** The subjects were inpatients in the department of family medicine of one general hospital from March 2009 to July 2011. They were divided in two group by age 65, and their medical records were reviewed. **Results :** The number of subjects were 82 patients over 65 years old in total of 106 inpatients. The number of female patients were 4.5 times more than male. The older patients had 3.7 underlying disease in average. The most common disease was hypertension, and others were diabetes, dyslipidemia, osteoporosis, depression as in order. The average count of drug taken by them were 7.1. The drugs included antihypertensive drugs, hypoglycemic agents, antilipidemic agents, H2 blockers, and antiplatelet agents. The most common chief complaints induced to admission were general weakness(23.1%), poor oral intake(10.9%), fever(7.3%), dizziness(6%). The common diagnoses at discharge were

pneumoniae(9.7%), gastritis & gastric ulcers(8.5%), urinary tract infections(7.3%). Conclusion : Many elderly patients had multiple pathologies and have taking many drugs. We can find out that their chief complaints were quite non-specific which could not be matched appropriate with final diagnoses. This results suggest that physicians should be well-knowlegeable with clinical features of older patient for proper diagnosis and management. Keywords : older patients, chief complaint, diagnosis

PP26 C-138

ASSOCIATIONS BETWEEN GERIATRIC SYNDROMES AND RISKS OF MORTALITY IN ELDERLY: RESULTS OF A NATIONAL LONGITUDINAL STUDY IN TAIWAN

Chi Chang HUANG¹, Chia Ming CHANG¹, Jenq Daw LEE², Deng Chi YANG¹ (1. Department of Internal Medicine, National Cheng Kung University Hospital, Taiwan; 2. Department of Finance, Shih Chien University, Taiwan)

Introduction : This study was designed to evaluate the associations between clustered geriatric conditions and risks of mortality in the elderly in Taiwan. Method : Data were collected from the Taiwan Longitudinal Study in Aging (TLSA) in 2003. Basic characteristics, including age, sex, education, marital status, institutional care, residence, comorbidities, geriatric conditions and information of mortality were analyzed. Geriatric conditions were asked or assessed: 1) recurrent falls within a year 2) functional limitation (dependency in either one of six ADLs); 3) low body mass index (BMI) (< 18.5 kg/m²); 4) cognitive impairment (SPMSQ score ≤ 7); 5) depressive mood (10-item CES-D scale ≥ 10). Results : A total of 2744 subjects aged ≥ 65 years were included in the analysis, 634 of them were died. Univariate analysis of each item which showed p<0.05 was further analyzed by different models. After multi-variate analysis, subjects aged ≥ 85 years were highest associated with mortality (OR:5.42 95%CI= 3.53-8.33). Other characteristics, such as male, illiterate, still smoking, malignancy, low BMI, impairment of ADL were also significantly associated with elder mortality. Regular adequate drinking among elderly seemed to have protective effect (OR:0.55 95%CI= 0.33-0.90). Combined effects of geriatric syndromes also predicted high risk of mortality (N=1, OR: 1.42, 95%CI=1.08-1.86; N=2 OR:1.95, 95%CI=1.33-2.86; N=3, OR:3.51,95%CI=1.90-6.50; N=4, OR:3.95,95%CI=0.83-18.78). The accumulative predict effects were more obvious among elderly aged between 65~85 year. Conclusion : Geriatric syndrome information is important to understanding the risks of mortality for elderly. When taking care of the elderly, the geriatric conditions and its accumulative effects must be assessed. Keywords : geriatric syndromes, mortality. Taiwan

PP26 C-139

GAIT SPEED AND COGNITIVE IMPAIRMENT IN COMMUNITY-DWELLING OLDER PEOPLE

Eun Sook HAN¹, Yunhwan LEE², Jinhee KIM² (1. Department of Preventive Medicine and Public Health, Ajou University School of Medicine, Institute on Aging, Ajou University Medical Center, Seoul National University Bundang Hospital, Korea; 2. Department of Preventive Medicine and Public Health, Ajou University School of Medicine, Institute on Aging, Ajou University Medical Center, Korea)

Introduction : Gait speed is known to be a strong predictor of incident walking disability and emerging studies indicate cognitive function is associated physical functioning in older adults. The aim of this study was to examine the relationship between gait speed and cognitive impairment in community-dwelling elderly people. Method : Data were from the baseline survey of the Living Profiles of Older People in

2008, with 10,226 participants aged 65 years and older living in the community in South Korea. Cognitive impairment was assessed with the Korean Version of the Mini-Mental State Examination (MMSE-KC). Gait speed was measured in a 2.5 m walk. Covariates included sex, ages, educational status, disability in activities of daily living (ADL), instrumental ADL, comorbid diseases, smoking, and alcohol drinking. Logistic regression analysis was used to examine the association between gait speed and cognitive impairment, adjusting for all covariates. Results : Among the participants, the prevalence of gait impairment was 37.8% and cognitive impairment was 25.9%. The mean age of the participants was 73.2 (±6.0) years. In gait impaired group, MMSE-KC score was 21.1 (±5.6), lower than the 23.8 (±4.0) among those who were not impaired. Cognitive impairment was significantly associated with gait impairment (odds ration [OR] = 1.36, 95% confidence interval [CI]: 1.22-1.51), even after controlling for all covariates. Among the MMSE-KC dimensions, immediate recall, delayed recall, and naming were significant correlated with cognitive impairment. Conclusion : Cognitive impairment was associated with gait impairment in community -dwelling older adults. This study suggests that gait speed may be an indicator of cognition in elderly. Keywords : gait speed, cognitive impairment

PP26 C-140

ASSOCIATION BETWEEN HDL-CHOLESTEROL LEVEL AND PHYSICAL PERFORMANCE IN AN ELDERLY KOREAN POPULATION: THE KOREAN URBAN AND RURAL ELDERLY STUDY

Hansol CHOI¹, Hyeon Chang KIM², Yumie RHEE³, Yoosik YOUM⁴, Chang Oh KIM³ (1. Department of Public Health, Yonsei University College of Medicine, Korea; 2. Department of Preventive Medicine, Yonsei University College of Medicine, Korea; 3. Department of Internal Medicine, Yonsei University College of Medicine, Korea; 4. Department of Sociology, Yonsei University, Korea)

Introduction : There is a growing body of research showing that high-density lipoprotein (HDL) cholesterol has been considered as a reliable marker of frailty and poor prognosis in an elderly population. The aim of this study was to evaluate the association of HDL-cholesterol level and physical performance in an elderly Korean population. Method : This study used data from the Korean Urban and Rural Elderly (KURE) study. In 2012, a total of 927 people (65 years or older) agreed to participate in KURE study. HDL-cholesterol levels were measured from overnight fasting blood samples. Physical performance was assessed by 3-m timed up & go (TUG) and 5-times chair rise test (CRT). After excluding people missing CRT (n=35) value, cross-sectional analyses were conducted for 892 participants (294 men and 598 women). Results : In men, HDL-cholesterol level was significantly associated with TUG (r=-0.121, p=0.038) but not with CRT (r=-0.013, p=0.826) in an age-adjusted model. But the association was not significant after additional adjustment for body mass index, total cholesterol, diabetes mellitus and blood pressure. In women, HDL-cholesterol level was significantly associated with CRT (r=-0.104, p=0.016) but not with TUG when fully adjustment. Conclusion : Our findings suggest that high level of HDL-cholesterol is associated with better physical performance in an elderly Korean population. Keywords : HDL-cholesterol, physical performance, cohort study

PP26 C-141

PREVALENCE AND PATTERNS OF MULTIMORBIDITY IN ONTARIO'S AGING HOME CARE POPULATION

Joshua J. ARMSTRONG¹, Mu ZHU², John HIRDES¹, Paul STOLEE¹ (1. School of Public Health and Health Systems, University of

Waterloo, Canada; 2. Department of Statistics and Actuarial Sciences, University of Waterloo, Canada)

Introduction : Driven by rapidly growing populations of older adults, there is a mounting interest in the study of multimorbidity. Multimorbidity is the coexistence of multiple chronic diseases and it is associated with aging, negative health outcomes, and increased service health care utilization. The prevalence of multimorbidity in older adults has been reported to range between 55 to 98% yet little research has focused directly on developing our understanding of the common chronic disease patterns that develop. With electronic health databases growing rapidly through the everyday use of information systems, investigations into frequent patterns of chronic diseases can be conducted through the application of novel data mining techniques. Association rule mining (ARM) can be applied to health information from older home care clients to discover the most common patterns of chronic diseases in Ontario's home health care system. **Method :** ARM was performed using the arules package in R on clinical assessment data from long-stay (>60 days) home care clients over the age of 65 in Ontario, Canada. Data was collected using the mandated RAI-HC data system (N=298 262; year range = 2005-2010). **Results :** The prevalence of multimorbidity for those over the age of 65 was 78%. The ARM analysis resulted in identifying the top 20 2-way combinations of chronic diseases and the top 5 3-way combinations for Alzheimer's disease, dementia not AD, and hypertension. **Conclusion :** Our findings illustrate that multimorbidity is prevalent in the home care population and that common patterns of chronic diseases can be identified through the application of innovative data mining techniques. **Keywords :** multimorbidity, home care, data mining

PP26 C-142

A CLINICAL EVALUATION OF THE CLINICAL UTILITY OF GENETIC RISK SCORES

Wonsuk YOO¹, Brian A. FERRENCE² (1. Dept. of Community Health and Preventive Medicine, Morehouse School of Medicine, USA; 2. Translational Research and Clinical Epidemiology and Centre for Evidence Based Medicine, Wayne State School of Medicine, University of Oxford, USA)

Introduction : Substantial uncertainty exists as to whether combining multiple disease-associated single nucleotide polymorphisms (SNPs) into a genotype risk score (GRS) can improve the ability to predict the risk of disease in a clinically relevant way. **Method :** We calculated the ability of a simple count GRS to predict the risk of a dichotomous outcome using a variety of clinical risk prediction metrics, under both a log additive (multiplicative) and linear additive model of combined effects. We then compared the results of these simulations with the observed results of published GRS measured within multiple epidemiologic cohorts. **Results :** If the combined effect of each disease-associated SNP included in a GRS is log additive (multiplicative on the risk scale), then a count GRS score should be useful for risk prediction with as few as 10-20 SNPs. Adding additional SNPs to the GRS under this model dramatically improves risk prediction. By contrast, if the combined effect of each SNP included in a GRS is linearly additive on the risk scale, a simple count GRS is unlikely to provide clinically useful risk prediction. Adding additional SNPs to the GRS under this model does not improve risk prediction. The combined effect of SNPs included in several published GRS measured in several well-phenotyped epidemiologic cohort studies appears to be more consistent with a linearly additive effect. **Conclusion :** A simple count GRS is unlikely to be clinically useful for predicting the risk of a dichotomous outcome. Adding additional SNPs to a count GRS is not likely to substantially improve its predictive

power. **Keywords :** SNPs, genotype risk score, risk prediction

PP26 C-143

COFFEE CONSUMPTION AND MORTALITY: A META-ANALYSIS OF PROSPECTIVE COHORT STUDIES

Youjin JE¹, Youngyo KIM¹, Edward GIOVANNUCCI² (1. Department of Food and Nutrition, Kyung Hee University, Korea; 2. Departments of Nutrition and Epidemiology, Harvard School of Public Health, USA)

Introduction : Recent meta-analyses of prospective studies showed reduced risks of type 2 diabetes, cardiovascular diseases and some types of cancer among coffee drinkers. Long-term coffee consumption may prolong people's lifespan by preventing the incidence and/or progression of chronic diseases, but no comprehensive review and meta-analysis of coffee consumption and total mortality has been conducted. **Method :** To provide a quantitative assessment of this association, we conducted a meta-analysis of prospective cohort studies published up to December 2012 through a search of MEDLINE and EMBASE databases and the reference lists of the retrieved articles. Information on participant characteristics, measurement of coffee consumption and outcomes, adjustment for potential confounders and estimates of associations was extracted. **Results :** We identified sixteen cohort studies of coffee consumption and total mortality, including 944,384 participants, and calculated pooled relative risks (RRs) with 95% confidence intervals (CIs) using a random-effects model. The pooled RR of total mortality was 0.85 (95% CI, 0.80-0.90; p <0.001) for the highest (≥6 cups per day), 0.87 (95% CI, 0.81-0.93; p < 0.001) for the second highest (≥3-5 cups per day), and 0.92 (95% CI, 0.88-0.97; p =0.001) for the third highest (1-2 cups per day) category of coffee consumption compared with the lowest coffee consumption category (0 or less than 1 cup per day). The inverse associations did not differ substantially by gender, adjustment factors, and follow-up times. No evidence of publication bias was found (Begg's p-values > 0.10). **Conclusion :** Our findings suggest that regular coffee consumption is associated with a reduced risk of total mortality. **Keywords :** coffee, mortality, death, cohort studies, meta-analysis

PP26 C-144

A SYSTEMATIC REVIEW OF THE EXERCISE IN DEMENTED SENIORS

Chu-Lin CHANG, Kuei-Min CHEN (College of Nursing, Kaohsiung Medical University, Taiwan)

Introduction : Exercise intervention has been utilized widely in older adults. It can prevent the occurrence of chronic illness disease, improve the mental and physical health, and maintain the life quality. In recent years, exercise program intervention for demented senior has been studied by some researche. Because of the increasing incidence of dementia, a systematic review of exercise intervention in older adults with dementia is warranted. **Method :** Using a systematic review, we searched for articles published between 2007 and 2012 in the database of MELINE, PubMed, CINAHL, ProQuest, Cochrane Library and CEPS with the keywords: 'exercise', 'physical activity' and 'dementia'. An initial 102 articles were initially retrieved. After filtering based on inclusion criteria and excluding duplicates, we found 7 articles with contained either randomized clinical trials or controlled clinical trials for further analysis and synthesis. **Results :** In all 7 articles, exercise program intervention can prevent the decline of cognitive function, improve the physical health, and reduce the mood disorder in demented seniors. **Conclusion :** The result of review helpful for medical staff to learn the exercise intervention and the

operational information for demented seniors in clinical practice. It can also provide information for future study and prospect of exercise intervention in demented seniors. Keywords : exercise, physical activity, dementia

PP26 C-145

BALANCE AND MOBILITY AFTER PHYSICAL-EXERCISES IN DIZZY OLDER ADULTS

Hsiao-Yun HU¹, Ming-Hsia HU¹, Li-Chou CHEN¹, Ai-Wen HUANG², Heui-Fen LIN³, Shiun-Jeng LIN⁴, Shu-Fang HSIAO³, Yi-Ho YOUNG⁵
(1. School of Physical Therapy, National Taiwan University, Taiwan; 2. Graduate Institute of Early Intervention, Chang Gung University, Taiwan; 3. Physical Therapy Department, National Taiwan University Hospital, Taiwan; 4. Physical Therapy Department, Endeavor Rehabilitation Clinic, Taiwan; 5. Department of Otolaryngology, National Taiwan University Hospital, Taiwan)

Introduction : The etiologies of many old patients with dizziness are unclear and are attributed to presbyastasis. The study aims to investigate the effect of physical exercises designed by physical therapist in improving balance and functional mobility in dizzy older adults. Method : Patients diagnosed with presbyastasis and received more than 6 months of medication treatment without satisfactory alleviation of symptoms were referred from the Department of Otolaryngology in National Taiwan University Hospital. A total 34 patients were included and randomly assigned to the training or the control group. Each subject received 12 1-hour sessions of individualized vestibular exercises training including vestibular habituation exercises, multisomatosensory balance and reconditioning exercises. General physical fitness exercise principles were provided to the control group. All patients were tested during pretest, posttest and at 1 month follow up test for their static and dynamic balance, one-leg stance test, timed up and go test (TUGT), cadence and gait speed during the TUGT, and motion sensitivity score. Results : The training group showed significant improvement in anterior-posterior weight shifting amplitude, decreased motion sensitivity score, reduced time to reach peripheral targets and reduced time to finish TUGT. In training group, 1/3 of participants reported successful weaning from medication and 1/3 reduced the medication dosage. Conclusion : Twelve hours of exercises improved the dynamic balance and functional mobility in dizzy older adults diagnosed with presbyastasis. Physical therapy exercise programs for dizzy older adults may supplement medication for reducing dizzy symptoms and improving balance and mobility. Keywords : dizzy, older adult, balance exercise

PP26 C-146

EFFECTIVENESS OF EXERCISE INTERVENTION PROGRAM FOR DEPRESSION AMONG ELDERLY: A COMPREHENSIVE REVIEW

Moon Ki CHOI, Ju Hee LEE (Department of Nursing Science, College of Nursing, Yonsei University, Korea)

Introduction : Depression is an important issue because of its high prevalence among elderly as well as impact on quality of life. Previous studies reported that various exercise intervention programs improved older adults' mental health. However, there is a lack of examined evidence to support the effectiveness of it for depression in older adults. The purpose of this study is to examine the effectiveness of the interventions for decreasing depression of older adults by synthesizing individual studies. Method : A comprehensive review was conducted from 2006 to 2012 using electronic search via the PubMed, MEDLINE, and CINAHL database. Following keywords were used for this search: depression, exercise, and elderly. The inclusion criteria

for inclusion were 1) a randomized controlled trials studies providing exercise intervention, 2) elderly with over 60 years old, and 3) English or Korean language. Results : A total of 10 randomized controlled trials were included for this study. Most of the trials were conducted by health care professionals such as medical doctor(6), registered nurse(2) and physiotherapist(1), and only one trial was conducted by a psychological counselor. Of the 10 trials, 5 trials included elements of endurance, strength, stretching and balance. In 2 trials the exercise intervention was classified as Yoga. Others included Qigong, folk dance and resistance exercise, respectively. Only 4 trials showed statistically significant effect in improving depression among elderly, while 6 trials did not. Conclusion : The effect of exercise on depression in elderly could not be confirmed, so our findings strongly suggest that studies of exercise intervention for elderly are in need. Keywords : depression, exercise, elderly

PP26 C-147

THE EFFECT OF DUAL-TASK TRAINING ON GAIT IN ELDERLY WOMEN

Sun-Shil SHIN¹, Duk-Hyun AN² (1. Department of Physical Therapy, Graduate School of Public Health, Inje University, Korea; 2. Department of Physical Therapy, College of Biomedical Science and Engineering, Inje University, Korea)

Introduction : Many activities of daily living require maintaining balance during the concurrent performance of two or more tasks. Older people who perform poorly based on dual-tasks are at increased risk for falls. The purpose of the study was to investigate the effect of dual-task to balance program on gait in elderly Korean women, as well as to suggest a more effective balance exercise method. Method : For this study, twenty elderly Korean women who walked independently were recruited from community dwelling. The dual-task balance training group (experimental group, n=10) stood on the Aero-step, and incorporated ball bouncing, catching, and throwing, while simple training group (control group, n=10) merely stood on the Aero-step. Participants received 45 minute training sessions, 2 times a week for 6 weeks. Gait variables (velocity, cadence, step length, stride length) were recorded with a GAITRite walkway at self-paced speed walking. Results : Velocity, cadence, step length, and stride length of the dual task balance training group were significantly improved more than that of the control group (p < .05). All selected gait variables of the dual task group were significantly improved after training (p < .05). Conclusion : We compared the effects of dual-task and simple-task conditions on gait in elderly women. The results of this study showed that the dual-task balance training group improved walking ability more than that of the simple balance training group. Further studies should investigate dual-task balance training with kinematic and kinetic data, and muscle activation based on various pressure value of Aero-step. Keywords : Dual Task, Balance, Elderly

PP26 C-148

FACTORS RELATED TO DROPOUT FROM A VOLUNTARY EXERCISE GROUP ARE DIFFERENT AMONG COMMUNITY-DWELLING ELDERLY OF DIFFERENT AGE GROUPS

Takuya UEDA¹, Yoshitaka SHIBA², Shuichiro WATANABE¹
(1. Graduate School of gerontology, J.F.Oberlin University, Japan; 2. School of Allied Health Sciences, Kitasato University, Japan)

Introduction : Continuation of exercise is important among elderly individuals. Few studies have investigated factors related to dropout from a voluntary exercise group (the group). We aimed to examine differences in factors related to dropout from the group after 3 years

among community-dwelling elderly of different age groups. Method : The subjects were 67 community-dwelling elderly (age, 71.4 ± 5.3 years) who belonged to the group and participated in the baseline survey. We conducted an interview survey and physical function measurement at baseline. Three years later, we investigated whether the subjects were a part of the group. We classified subjects into the 60- to 69-year group and the >70-year group. We used multiple logistic regression for analyzing variables. Results : Three years later, 48 people (71.6%) continued to participate in the group. In the 60- to 69-year group, no factor was related to dropout. However, in the >70-year group, we extracted factors related to dropout: one leg standing time (OLS; odds:0.96, 95%CI:0.92-0.99) and Fall Efficacy Scale International score (odds:1.07, 95%CI:1.00-1.16). We also found 6 reasons related to dropout: pain (n=5), illness (n=3), other exercise (n=3), death (n=3), injury (n=2), loss of interest (n=1), and unknown (n=2). Conclusion : Factors related to dropout from the group were different between the 60- to 69-year group and the >70-year group. We found that OLS and fall efficacy were related to dropout from the group. These findings suggest that to prevent pain and illness, it is important to continue to participate in the group. Keywords : community-dwelling elderly, dropout, exercise

ASSOCIATION OF PRE-TREATMENT FUNCTIONAL STATUS [MEASURED BY INSTRUMENTAL ACTIVITIES OF DAILY LIVING (IADL)] AND RECEIPT OF NABPACLITAXEL \leq 2 MONTHS IN PATIENTS WITH METASTATIC BREAST CANCER (MBC)

Anthony CHOI¹, Suzette BLANCHARD², George SOMLO¹, Joanne MORTIMER¹, Thehang LUU¹, Timothy SYNOLD¹, Vani KATHERIA¹, Arnold ROTTER³, Carol WONG³, Rupal RAMANI¹, Kurt HANSEN¹, Arti HURRIA¹ (1. Medical Oncology and Therapeutics Research, City of Hope Comprehensive Cancer Center, USA; 2. Information Sciences, City of Hope Comprehensive Cancer Center, USA; 3. Radiology, City of Hope Comprehensive Cancer Center, USA)

Introduction : IADLs are activities required to maintain independence in the community, such as shopping and preparing meals. nab-paclitaxel is a common treatment for MBC. The goal of this analysis was to evaluate the association between pre-treatment IADL score and discontinuation of nab-paclitaxel at \leq 2 months from treatment initiation. Method : Thirty-nine evaluable patients (mean age 60; range 30-81) with MBC received 1st or 2nd line chemotherapy with nabpaclitaxel 100mg/m² weekly for 3 of 4 weeks. IADL score [range 0 - 14 (higher score, more independent)] was measured pre-treatment and at 2 months. Recursive partitioning implemented with the R package tree was used to assess if pre-treatment IADL score was predictive of time on study \leq 2 months, and was extended to include patient age. Results : IADL score was available for all evaluable participants; 31% (12/39) received \leq 2 months of treatment [reasons for discontinuation: progression (83%), toxicity (17%)]. Only 16% (4/25) with an IADL score >12.5 discontinued treatment at \leq 2 months compared to 57% (8/14) with an IADL score <12.5 . In patients with an IADL scores <12.5 , 100% (6/6) age < 63 discontinued treatment at \leq 2 months vs 25% (2/8) age >63 . There was little longitudinal change in IADL (from >12.5 to <12.5) from pre-treatment to 2 months: 17% in participants who came off study at \leq 2 months vs 8% in those who continued >2 months. Conclusion : There is an association between pre-treatment IADL score and receipt of \leq 2 months of nab-paclitaxel treatment that is worthy of further study. Keywords : Functional status, Metastatic breast cancer

PP26 C-150

THE ROLE OF PREOPERATIVE INCENTIVE INSPIROMETRY IN ELDERLY PATIENTS

J. LEE¹, S. SHIN¹, H. LEE¹, J. KIM¹, J. HAN², H. SHINN², R. UMID³,

D. ERKINJON³, (1. Surgery of Inha University College Of Medicine, Korea; 2. Anesthesiology of Inha University College Of Medicine, Korea; 3. Surgery of Inha University College Of Medicine, Uzbekistan)

Introduction : The effect of preoperative incentive inspirometry (IS) for protection of pulmonary complications in elderly patients who had abdominal surgery is still controversial. Our objective was to ascertain the role of preoperative IS in elderly patients. Method : We selected 417 adult patients older than 65 years who were hospitalized from March, 2010 to June, 2012 for any type of abdominal surgery procedures. The X-rays on POD 3, fever for two days of post operation, duration of hospitalization, whether ICU care was received or not, and mortality rate of 177 patients with preoperative IS were compared with other 240 patients who IS was not used for. Results : The rates of fever, atelectasis and both in preoperative IS group are 20.34%, 38.42%, 9.60%; they were significantly greater than the rates of the group with no IS.(9.17%, 17.08%, 1.67%) But there are no significant differences in ICU care, mortality and hospitalization period between the two groups.(2.82% vs 1.67%, 1.69% vs 1.25, 15.11days vs 14.30days). Conclusion : It can be thought that the preoperative IS has no effect on pulmonary complications because there were lower rates of fever, atelectasis and both in the group without IS. However, it can be the result of selection bias from retrospective study. Moreover, we can assume that the use of IS can decrease pulmonary complications during hospitalization and help overcoming the early complications for there was no significant differences in ICU care, mortality, hospitalization period between the two groups. We recommend the prospective study to ascertain the role of IS. Keywords : incentive inspirometry, pulmonary complication, elderly patients

ANEMIA IS ASSOCIATED WITH MORTALITY AND PHYSICAL FUNCTION IN COMMUNITY-DWELLING KOREAN ELDERLY : 5-YEAR LONGITUDINAL PROSPECTIVE STUDY

Seung Yeol LEE¹, Soo-Mee BANG², Ki Woong KIM³, Nam-Jong PAIK⁴, Jae-Young LIM⁴ (1. Department of Rehabilitation Medicine, Seoul National University Bundang Hospital, Korea; 2. Department of Internal Medicine, Seoul National University Bundang Hospital, Seoul National University College of Medicine, Korea; 3. Department of Neuropsychiatry, Seoul National University Bundang Hospital, Seoul National University College of Medicine, Korea; 4. Department of Rehabilitation Medicine, Seoul National University Bundang Hospital, Seoul National University College of Medicine, Korea)

Introduction : The purpose of this study is to recognize the associations of anemia with mortality and poorer physical function at 5-year follow-up period in Korean elders. Method : We used the baseline and 5-year longitudinal follow up data from a populationbased cohort study focused on older Koreans, the Korean Longitudinal Study on Health and Aging (KLoSHA). A total 638 persons aged 65 years older who were completed the 5-year follow up assessment were included. Primary outcome was determined using short physical performance battery (SPPB) score and mortality. Poor outcome group (PG) included elders who were expired during the follow up or whose SPPB score were below 10 at follow-up period. Good outcome group (GG) were those with a good physical performance (SPPB score \geq 10) score at follow-up period. Anemia was defined according to World Health Organization criteria as a hemoglobin concentration below 12 g/dL in women and below 13 g/dL in men. Results : The prevalence of anemia was 7.0% in GG and 17.6% in PG. Hemoglobin levels, skeletal

muscle mass, muscle strength, physical activity score, depressive symptoms (GDS-K), cognitive function (MMSE-K), pain related dysfunction (WOMAC-K) and comorbidity (CCI) at baseline data were significantly different between two groups. In the multivariate logistic regression analysis, age of 75 or more, presence of anemia and cognitive dysfunction (OR [CI] 3.16 [1.80-5.57], 2.74 [1.19-6.30], and 0.88 [0.81-0.96], respectively) at baseline were significant factors affected on poor outcome. Conclusion : We found anemia and cognitive dysfunction were associated with poor outcome; mortality and poorer physical function in community-dwelling Korean elders. Keywords : Anemia, Mortality, Longitudinal Study

CRITERIA TO DETERMINE APPROPRIATENESS OF HOSPITAL ADMISSIONS AMONG RESIDENTS OF LONG-TERM CARE FACILITIES: A SYSTEMATIC REVIEW

Anna RENOM GUITERAS¹, Lisbeth UHRENFELDT², Gabriele MEYER¹, Eva MANN³ (1. School of Nursing Science, Faculty of Health, Witten/Herdecke University, Germany; 2. Horsens Hospital Research Unit, Department of Public Health, University of Aarhus, Denmark; 3. Institute of General Practice, Family Medicine and Preventive Medicine, Paracelsus Medical University, Austria)

Introduction : Residents of long-term care facilities have a high risk of hospital admission. Estimates of the frequency of inappropriate admissions vary throughout studies. This report aims to review the criteria used to assess appropriateness of hospital admissions among this population. Method : Systematic review of the studies published in PubMed and CINAHL® between January 2000 and October 2011, covering seven languages. Quantitative studies using any criteria for assessing appropriateness of hospital admission of long-term care residents were included. Data were extracted by two pairs of independent researchers. Results : Twenty-six articles were included; six dealt with admission to emergency departments, seven with admission to hospital wards, five with both, and eight did not provide this information. The proportion of admissions considered as inappropriate ranged from 2% to 77%. Throughout the studies, 15 different criteria were used; all were based on expert opinion; six criteria had been developed considering published literature or interpretation of patient data additionally. Criteria covered several aspects: medical diagnoses (n=11), acute symptoms (n=8), resident's characteristics (n=6), resident's or family's wishes (n=5), existence of a care plan (n=2), availability of resources (n=9). Six criteria assessed only one aspect and two criteria assessed all the aspects; five judged appropriateness based on a balance of aspects. Conclusion : Most criteria are not comprehensive and do not take individual aspects into account. Some are comprehensive but their generalisability is unknown. Further research is needed in order to develop evidence-based, comprehensive and generalisable criteria for assessing appropriateness of hospital admission among residents of long-term care facilities. Keywords : residential facilities, patient transfer, hospitalization

SURVIVAL ANALYSIS: HANDGRIP STRENGTH AND CANCER STAGING IN THE ELDERLY CANCER PATIENTS

Shu-Yuan LIU, Chia-Hui CHEN (Nursing, National Taiwan University, College of Medicine, Taiwan)

Introduction : Cancer has been the first leading cause of death for the past 30 years in Taiwan. Survival is one of the most concerned issues for patients and their families. Literature has suggested that handgrip strength might be an important prognostic factor for mortality,

especially in the elderly, but clinical data are limited. Method : The purpose of this study was to examine the predictive power of handgrip strength in the elderly cancer population. As part of a trial study evaluating the effect of a nursing intervention on postsurgical functional decline, 95 elderly cancer patients (>65 years) who were diagnosed with gastric and pancreatic cancer and scheduled for an abdominal surgery were enrolled from August 2007 to April 2009. Their handgrip strengths were taken prospectively at three time points: admission (preoperative baseline), discharge, and three-month after discharge. Whether handgrip strength is a prognostic factor for survival were analyzed using Cox Regression with cancer staging served as a covariate. Results : The results shown that for every 1 kg increase in preoperative handgrip strength, the all-cause mortality decreased approximately 5% (95% confidence interval 0.90 to 0.99; P<.05). Conclusion : The findings suggested that while cancer staging remains to be the strongest prognostic factor, the preoperative handgrip strength is an independent prognostic factor for all-cause survival in the elderly cancer patients with diagnoses of gastric and pancreatic cancer. If verified, handgrip strength measure will be a simple, yet effective parameter that is clinically accessible to predict survival so treatment decisions can be well-informed and justified. Keywords : Elderly, cancer, handgrip, cancer staging, prognostic factor for survival

DEVELOPMENT OF SPECIAL SYSTEM AND SOFTWARE FOR STRUCTURED FUNCTIONAL ASSESSMENTS IN LONG-TERM CARE IN THE CZECH REPUBLIC

Martina JEDLINSKA¹, Iva HOLMEROVA¹, Hana VANKOVA¹, Eva JAROLIMOVA¹, Dana HRADCOVA¹, Zoltan SZABO², Radim KRUPICKA², Kristyna SOUKALOVA³ (1. Faculty of Humanities, Charles University, Czech; 2. Faculty of Biomedical Engineering, Czech Technical University in Prague, Czech; 3. Faculty of Health Studies, University of Pardubice, Czech)

Introduction : The issue of Long-Term Care is a major health and economic problem, in the context of demographic trends and the changing morbidity pattern, mainly due to longer life survival of chronically ill and people with severe disability. The Czech Republic is among the countries which miss nationwide data about long-term care, e.g. some relevant data such as dependence in activities of daily living, frailty and their risk factors. These data are necessary for quality long-term care, its planning and delivery. Method : The project NT/13705 aims to create a battery of tests for the functional evaluation in Long-Term Care and the creation of software for data mining, which allows easier user-accessible data acquisition and analysis. The project's goal is to effectively overcome barriers with usage of a simple electronic system for data collection, typically resulting from the Czech environment of providing long-term care (lack of quality computer technology, low computer-literacy of workers in direct care) for creation of starter conditions for a quality data gathering in this area. Results will be linked with the system of quality control and evaluated at national level. Results : The methods of the project and the experience of the first two years of the project 2012; 13th will be presented in the paper. Conclusion : The project has crucial importance for the coordination of long-term care in the Czech Republic as well as improvement of the quality care at individual workplaces. The financial support of the IGA grant of the Czech Ministry of Health No NT 13705 is acknowledged. Keywords : Long-Term Care, data mining

PP26 C-155

PROFILES OF GERIATRIC PATIENTS IN A COMMUNITY

HOSPITAL: A PILOT PROJECT OF AN INDIVIDUALIZED CASE MANAGEMENT SYSTEM AMONG 80 YEAR OLDS AND OLDER

Carine FEDERSPIEL¹, Jean-Paul STEINMETZ² (1. Geriatric Rehabilitation Unit, Department of Research and Development, ZithaKlinik, ZithaSenior, Luxembourg; 2. Department of Research and Development, ZithaSenior, Luxembourg)

Introduction : According to Eurostat, the proportion of the population aged 80 years and more increased by approximately 37% over the last decade. This increase of the most elderly is associated to amplifications of geriatric syndromes leading to hospitalizations. Research demonstrates that up to two thirds of the patients aged 80 to 90 years face functional decline during hospitalizations, entailing a dependency in activities of daily living, increasing morbidity and mortality. As recently stressed by the I.A.G.G/A.M.P.A. Task Force, hospital organizations should enable the easy identification of old adults vulnerable for functional decline. After identification, the geriatric patient should be guided through a coherent pathway of care to minimize negative outcomes. **Method :** The present research communicates preliminary findings from a pilot project about a community hospital attempting to apply a patient-centered pathway of care. More precisely, the research project aims to profile the characteristics of frail adults aged 80 years and more and their vulnerabilities by using a very short screener that sets off a process of in-depth geriatric assessment using a broader newly constructed geriatric screening instrument. The Zitha Geriatric Screening is composed of medical, physical, cognitive, functional, and social parameters, enabling the multidisciplinary team to construct a detailed profile of the individual patient. **Results :** Patient profiles are then used to propose individualized patient-centered pathways of care. **Conclusion :** The present research communication will demonstrate the characteristics of approximately 200 hospitalized adults aged 80 years and more and will discuss actions undertaken by geriatricians to support maintenance of the functional status among elderly patients. **Keywords :** geriatric screening, case management, geriatric profile

PP26 C-156

DISTAL ARM AND LEG CIRCUMFERENCES CORRELATED WITH SKELETAL MUSCLE MASS IN OLDER ADULTS

Kuei-Yu CHIEN¹, Lee-Hwa CHEN², Jou-Min TUNG², Yu-Ti TIEN¹, Shu-Chen CHEN³, Li-Fang HU⁴ (1. Graduate Institute of Sports Science, National Taiwan Sport University, Taiwan; 2. Department of Athletic Training and Health, National Taiwan Sport University, Taiwan; 3. Department of Recreation Sport Management, Yu-Da University, Taiwan; 4. Dept. of Nursing, Taichung Veterans General Hospital Chiayi Branch, Taiwan)

Introduction : Accurate and practical estimation of skeletal muscle mass is important for clinical practice and community health promotion. Appendicular skeletal muscle mass (ASM) is a majority portion SMM. Therefore, upper arm and thigh as estimations of muscle mass are frequently reported. However, the correlation between forearm and leg circumferences and ASM are unclear. The purpose of this study was to investigate the correlation among ASM, appendicular circumferences, body mass index (BMI), arm muscle circumference (AMC) and AMA (Arm muscle area). **Method :** A total of 102 community-dwellers (mean age 74.3±0.58 yrs ;) volunteered for the study. Fifty-four participants are from 65 to 75 years old and 48 participant are older than 76. Appendicular skeletal muscle mass was measured by dual energy X-ray absorptiometry (DXA). Anthropometric measurements (height; weight; forearm; middle arm; thigh and calf circumference) were also determined. **Results :** Middle

arm, thigh circumferences, BMI, AMC and AMA moderately correlated with ASM in the age of 65-75 participants (.409-.518, p<.001), except for age older than 76 participants (-.266-.241, p>.05). Forearm and calf circumferences highly correlated with ASM and WSM (forearm .605-.737; calf .573-.749, p<.001) in all of elderly. **Conclusion :** These results suggest that forearm and calf circumferences measurements would be added into clinical or community screening procedures, especial for the elderly older than 75 years old. **Keywords :** Appendicular, Elderly, Nutrition assessment

PP26 C-157

RELIABILITY OF ONLINE GERIATRIC DIAGNOSTIC AND PROGNOSTIC DECISIONS

Leonard C. GRAY¹, Melinda MARTIN-KHAN¹, Helen EDWARDS², Steven COUNSELL³, Richard WOOTTON⁴, Peteris DARZINS⁵ (1. Centre for Research in Geriatric Medicine, The University of Queensland, Australia; 2. School of Nursing, Queensland University of Technology, Australia; 3. School of Medicine, Indiana University, USA; 4. Centre for Integrated Care and Telemedicine, University Hospital of North Norway, Norway; 5. Geriatric Medicine and Continuing Care, Monash University, Australia)

Introduction : The relative shortage of geriatricians, particularly in rural communities, suggests a need to use geriatrician time more efficiently, and to find methods to enable their expertise to be provided at a distance. We developed a method to achieve this using a combination of structured assessment based on the interRAI Acute Care system, applied by a trained nurse assessor at the distant site, and reviewed on a web-based clinical decision support system by geriatricians at a distant site. This study tested the reliability of online decision making using this system. **Method :** Prospective cohort study in which patients referred in 3 acute hospitals received paired assessments by 2 geriatricians. Pairs were randomly allocated to be conducted 'online' or 'live'. Thus patients received either 2 sequential live assessments (LL) or a live and online assessment (LO). This enabled the inter-rater reliability (IRR) of live decisions to be compared with the IRR of live - online pairings. **Results :** 175 patients were recruited, with 87 receiving live-live paired assessments and 88 receiving paired live-online assessments. Agreement expressed % agreement did not differ significantly for any of the following clinical judgements: Presence of delirium (LL 63%, LO 62%); dementia (100%,100%); depression (67%, 61%); requires long term residential care (87%, 90%); probable discharge destination from hospitals (40%, 37%); and likely location in 3 months (62%, 54%). **Conclusion :** These results indicate that key decisions made by geriatricians, including some difficult prognostic decisions which are associated with considerable inaccuracy when performed live, are equally as reliable when made online as in person. **Keywords :** assessment; telehealth; geriatrician

A TRIAL ON INTERVENTIONS BY THE LIAISON PSYCHIATRY TEAM IN A JAPANESE ACUTE CARE HOSPITAL _SUPPORTING ELDERLY PATIENTS' RETURN HOME_

Minori TOKUI¹, Makoto TAKAYOSE², Eiki KONISHI³, Akira TAKAHARA¹, Daisuke ITO¹, Mineo ARAKI¹ (1. Nursing, Himeji St. Mary's Hospital, Japan; 2. Liaison Psychiatry Team, Himeji St. Mary's Hospital, Japan; 3. Rehabilitation, Himeji St. Mary's Hospital, Japan; 4. Psychiatry, Kikukawa Araki Psycho-somatic Medicine Clinic, Japan)

Introduction : Psychiatric conditions such as dementia, delirium, and

depression are frequently a problem during hospitalization in elderly patients. Taking these medical circumstances into account, the Ministry of Health, Labor and Welfare decided to include a payment system for Liaison Psychiatry Team activities in acute care hospitals from 2012 to promote early discharge. We established a Liaison Psychiatry Team at our hospital and would like to report the operational status of their interventions. Method : The team comprised 6 members (a psychiatric physician, clinical psychotherapist, certified nurse specializing in gerontological nursing, certified nurse in dementia care, and an occupational therapist). The clinical psychotherapist makes a daily ward round and collects patient information. Team conferences are held every week to map out patients' care/treatment plans. The data were collected from July to September, 2012. Results : Forty-six patients [18 males, 28 females; average age, 75.24 years (82.6% ≥65)] received consultations (internal medical ward, 30; surgical ward, 9; orthopedic surgery, 5; ENT, 1; urology, 1). The most frequent reasons for consultation were insomnia, anxiety, and delirium, and the most frequent interventions were pharmacotherapy, occupational therapy, and psychotherapy. Outcomes: 22 discharged home, 9 still under hospitalization, 9 discharged to long-term-care hospitals or nursing homes, and 6 died. Conclusion : Most consultations involved enquiring about patients' psychological or behavioral disorders such as insomnia, anxiety, and delirium. Nearly half of patients were discharged 'Home', which indicates the success of the interventions. Keywords : Liaison Psychiatry Team, elderly patients, discharge

PP26 C-159

WHEN THE GOLDEN YEARS ARE BLUE: CHANGES IN DEPRESSIVE SYMPTOMS OVER TIME AMONG OLDER ADULTS NEWLY ADMITTED TO LONG TERM CARE FACILITIES IN ONTARIO, CANADA

Eva NEUFELD¹, Shannon FREEMAN¹, Karlijn JOLING², John P. HIRDES¹ (1. School of Public Health and Health Systems, University of Waterloo, Canada; 2. Department of General Practice and Elderly Care Medicine, VU University Medical Centre and EMGO Institute for Health and Care Research, Netherlands)

Introduction : The identification of depression among residents in long-term care facilities is an important concern. This study investigated prevalence of depressive symptoms and diagnoses among older adults newly admitted to long term care facilities (LTCFs) in Ontario, Canada. The degree of change in depressive symptoms at 3 month follow-up assessment was also examined, including predictors of the development of depression over time. Method : Using assessments (N=63,095) from the Minimum Data Set 2.0 (MDS 2.0) collected as a regular part of clinical care, changes in depressive symptoms and predictors of depression following admission to institutional care were examined. The MDS 2.0 captures information on all residents who enter a LTCF and is mandated for use in all LTCFs in Ontario, Canada. Results : Depressive symptoms were present in 54.3 cases per 100 residents at initial assessment, increasing to 60.8 cases per 100 residents by follow-up. Although depressive symptoms worsened, approximately 30% of residents showed moderate to significant improvement following LTCF admission. Changes in depressive symptoms are discussed in relation to clinical characteristics including functional, cognitive, psychosocial, and demographic variables. Results are discussed in the context of the MDS 2.0 and interRAI Mood CAP as a resource for LTCF care staff. Conclusion : Integrated approaches using information from the interRAI Mood CAP will assist LTCF staff in recognizing depressive symptoms and treat residents at-risk; make informed decisions in addressing depression at the person-level, and thereby improve the

quality of care and quality of life of LTCF residents. Keywords : interRAI, Minimum Data Set, assessment

FACTORS AFFECTING LIFE SATISFACTION AMONG THE PATIENTS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE

Haejung LEE¹, Yeonjung LIM¹, Sungmin KIM¹, Jong Joon AHN², Ki Uk KIM³, Doo Soo JEON⁴, Yunseong KIM⁴, Hye-Kyung PARK³ (1. College of Nursing, Pusan National University, Korea; 2. Department of Internal Medicine, Ulsan University Hospital, Korea; 3. Department of Internal Medicine, Pusan National University Hospital, Korea; 4. Department of Internal Medicine, Pusan National University Yangsan Hospital, Korea)

Introduction : This study was conducted to identify the factors related life satisfaction in patients with chronic obstructive pulmonary disease (COPD). Method : Male patients with COPD (N=235) were recruited from 5 hospitals in Korea between March and November 2010. Descriptive statistics, Pearson correlation, and stepwise multiple regression were used. General and disease-related characteristics, health status, and depression were included in the regression model as predictors. Results : The mean age was 67.13±7.92 years, duration since diagnosed with COPD was 7.06±9.57 years, forced expiratory volume in 1 second (FEV1) % predicted was 61.39±23.07 %, and 6 minute walk distance (6MWD) was 348.01±84.42 meters. The mean score of life satisfaction was 20.32±6.71 (range: 5.0~35.0), perceived health status was 67.49±19.08 (range: 10.1~95.8), and depression was 14.13±8.73 (range: 0~57.0). Stepwise multiple regression analysis indicated that 24.2% of the variance in life satisfaction was explained by depression (β=.350), age (β=.251), total household income (β=.202), FEV1 % predicted (β=.156), and educational level (β=.140). Depression was the most important predictor of life satisfaction (β=.350). Patients with less depression, older age, higher total household income, better pulmonary function, and lower educational level reported higher life satisfaction. Conclusion : Findings from this study provide a comprehensive understanding of life satisfaction and related factors in patients with COPD in Korea. Researchers and healthcare professionals need to be aware of the presence of depression and its possible adverse effects on patients' future life satisfaction. Further study with a larger sample and long-term design is necessary. Keywords : chronic obstructive pulmonary disease, life satisfaction, depression

ETHICAL ISSUES RELATED TO PERCUTANEOUS ENDOSCOPIC GASTROSTOMY AND TUBE FEEDING OF ELDERLY PEOPLE IN JAPAN- APPROACHES OF THE JAPAN ACADEMY OF GERONTOLOGICAL NURSING -

Harue MASAKI¹, Satoshi IDE², Mari KATAOKA³, Mayuko TSUJIMURA¹, Pingping ZHANG⁴, Kieko IIDA⁵ (1. Graduate School of Nursing, Chiba University, Japan; 2. Gerontological Nursing, Open University of Japan, Japan; 3. Nursing Course of Kochi Medical School, Kochi University, Japan; 4. Department of Nursing, Faculty of Health Sciences, Saitama Prefectural University, Japan; 5. Florence Nightingale School of Nursing & Midwifery, King's College London, United Kingdom)

Introduction : The International Exchange Committee of the Japan Academy of Gerontological Nursing (JAGN) continuously held international exchange meetings with the objective of learning from the practices in various countries to clarify the ethical issues related to Percutaneous Endoscopic Gastrostomy (PEG) and tube feeding for the

elderly. Method : In the JAGN annual meetings in 2011 and 2012, we invited nursing specialists from Japan, Korea, China and Sweden, and exchanged opinions with the participants about the ethical issues related to PEG and tube feeding in the elderly. We analyzed the exchanged opinions and the response papers from the participants by the Qualitative Synthesis Method (KJ Method). Results : The participants understood the differences among countries and cultures, and obtained deeper understandings of the present situations and issues in their own as well as other countries. It became clear that making decisions regarding PEG or tube feeding which can satisfy patients and their families is difficult in the current medical and long-term care settings in Japan. The participants confirmed that the philosophy, systems and policies in each country affect the decision-making, and recognized the necessity for civic education and recognition changes of the patients, families and healthcare workers in order to make a breakthrough. The roles of the JAGN are also highly expected. Conclusion : We shall continue to discuss this theme, and to consider the role of the geriatric nursing practice in the decision-making process suitable for the Japanese culture as well as the JAGN's concrete approaches for the future improvement in this field. Keywords : elderly, nursing, end-of-life care

PP26 C-162

THE INFLUENCE OF EMOTIONAL LABOR AND SOCIAL SUPPORT ON BURNOUT OF CLINICAL NURSES

Hyeon Jeong LIM¹, Seo-In HA¹, Min-Seo KIM¹, Min-Yi PARK¹, Hyo-Jung BAN¹, Na-Rai LEE¹, Yoon-Mi LEE¹, Eun-Sook LEE¹, Hye-Young LEE¹, Ji-Won JUN¹, Yeon-Jung CHO¹, In-Suk CHOI¹, Kyung-Sook PARK² (1. Department of Nursing, Graduate School, Chung-Ang University, Korea; 2. Professor, Red Cross College of Nursing, Chung-Ang University, Korea)

Introduction : This study is designed to know the influence of emotional labor and social support on burnout of clinical nurses. Method : A random sample of 200 nurses working in five general hospitals with more than 500 beds in Seoul. The survey with questionnaires was in process during the period from Nov. 5 to Nov. 23, 2012. It used measuring tools of Maslach Burnout Inventory(MBI), emotional labor, and social support. The collected data were analyzed by frequency, percentage, mean and standard deviation, t-test, ANOVA, Duncan's test, and Pearson's correlation. Results : Mean scores for each category were 3.08 for emotional labor, 3.27 for supervisor's support, 3.59 for colleague's support, and 3.24 for burnout. There was statistically significant difference between emotional labor and demographic characteristics, in age, gender, working unit, position, and clinical experience($p < .05$); there was statistically significant difference between social support and demographic characteristics, in gender and education level($p < .05$); there was statistically significant difference between burnout and demographic characteristics, in working unit and position($p < .05$). In other words, emotional labor was positively correlated with burnout and social support was negatively correlated with burnout. Conclusion: It is confirmed that emotional labor and social support are the factors influencing the burnout of clinical nurses. Among the factors, the correlation between the nurses' burnout and emotional labor appeared to be the strongest. Following the prior, the list continued in order with the factors of social support. Therefore it is necessary to establish support system through several programs at the organizational level to reduce nurses' emotional labor and improve the awareness of social support. Keywords : Burnout, Emotional labor, Social support

KNOWLEDGE AND CARE BURDEN FOR THE PATIENTS

WITH DEMENTIA IN ACUTE HOSPITAL NURSES

Jeong-Sook KIM¹, Jeung-Im KIM², Sook-Hee LEE³ (1. Department of Nursing, Soon Chun Hyang University Hospital, Korea; 2. School of Nursing, Soon Chun Hyang University, Korea; 3. Department of Nursing, Seoyeong University, Korea)

Introduction : This study was to aimed to explore nurses' knowledge and care burden for problematic behavior and symptoms of the demented in acute hospitals. Method : The subject was consisted of 191 people working at two acute hospitals in Seoul and Kyungi. We used the questionnaire of knowledge for demented elderly patients and the measurement of care burden on problematic behavior and symptoms. Data collection was done by self administered questionnaires after getting an informed consent. The differences of care burden were analyzed with t-test and ANOVA. Results : The mean age of the subjects was 30.0(± 6.1) years. The mean score of knowledge on the demented was 16.7(± 1.71), and the subjects had the lowest score about knowledge on dementia disease among knowledge of treatment, nursing, and disease. Correct answer rate was highest in the item of "It is a good way for demented elderly to keep lay down and keep alone" while the lowest score in "Demented elderly can't anything by themselves because of their low thinking and cognitive level" The mean score of the care burden to problematic behavior and symptoms was 2.26(± 0.50), and it was significantly different by age($t=2.67, p < .05$), career($t=3.54, p < .05$), continuous education related dementia ($t=2.67, p < .05$), experiences of care the demented ($t=2.71, p < .05$). Conclusion : From the above results, we suggest that it needs to be provided more specific education on the demented and problematic behaviors and symptoms into continuous education for nurse in acute hospitals. Keywords : Care burden, Problematic behavior & symptoms, Demented

PP26 C-164

THE EFFECTS OF VISUAL STIMULATION AND SWALLOWING PROMOTING EXERCISE BEFORE MEAL FOR STROKE ELDERLY IN A LONG TERM CARE FACILITY

Mi Soon HAN, Hwasoon KIM (Department of Nursing, Inha University, Korea)

Introduction : Many stroke patients had swallowing problems after stroke attack. Swallowing difficulty can cause severe aspiration pneumonia. The purpose of this study was to investigate the effect of providing visual stimulation and swallowing promoting exercise before meal among stroke elderly who had swallowing difficulty. Method : The subjects for this nonequivalent control pre-post test design were 72 stroke elderly. Inclusion criteria were subjects who were 1) less than 19 Gugging Swallowing Screen(GUSS) score; 2)having solid and chopped or half solid food; 3) older than 65 years. Thirty-six subjects were assigned experimental group and control group using convenient sampling method respectively. The intervention was provided for 13 to 15 minutes in every lunch and dinner time during 4 weeks. The outcome variables were GUSS score, body weight, total caloric intake for 3 days, self-efficacy for swallowing, coughing episodes during meal times. Results : Female elderly were 51(72.9%) and 74.3 percents of subjects had only one diagnosis. The experimental group had less time to finish their meal and more ratio of patients had solid chopped food than the control group. These difference were statistically significant. Mean GUSS score for the experimental group in pretest was significantly lower than the score of the control group. In ANCOVA analysis using GUSS score as a covariate, the only significant variable was self-efficacy for swallowing. Conclusion : The visual stimulation and swallowing

promoting exercise could make the improvement of self-efficacy for swallowing even if it had no effect in decreasing coughing episode due to aspiration of food during meal time. Keywords : elderly, swallowing difficulty, stroke

PP26 C-165

NURSING STAFF MEMBERS' KNOWLEDGE AND ATTITUDE ABOUT EVIDENCE-BASED RESTRAINTS PRACTICE FOR OLDER ADULTS IN KOREA

Myonghwa PARK¹, Mi-Hwa PARK² (1. College of Nursing, Chungnam National University, Korea; 2. Department of Nursing, Seojeong College, Korea)

Introduction : This study was to explore nursing staff members' knowledge and attitude toward evidence-based restraints practice for older adults to establish baseline data of evidence-based restraints protocol development and dissemination. Method : The subjects were 500 nurses and nurse aides from 22 long term care hospitals in Korea. Self-administered questionnaires were used to collect the data and the results of the study were analyzed with descriptive statistics, t-test, ANOVA and Pearson correlation. Results : There were statistically significant differences between nurses and nurse aides in knowledge and attitude toward restraints use. Nurse aides showed more positive attitudes toward restraint use and lower knowledge of restraints use compared to nurses' knowledge and attitude. There were also statistically significant differences in knowledge and attitudes according to the career and experience of restraint education. There is a high agreement among nursing staff that a standardized evidence based restraints protocol is needed to facilitate right use of restraints in long term care settings. Conclusion : The nursing staff members' knowledge and attitudes toward evidence based restraints use for the older adults showed gaps between evidence and actual practice. To ensure safe restraints use, the factors contributing to these gaps need to be analyzed to identify the barriers. In addition, the evidence-based restraints use protocol suitable for long term care settings needs to be developed and disseminated. * This work was supported by research grant of Basic Science Research Program through the National Research Foundation of Korea (NRF) funded by the Ministry of Education, Science and Technology (No. 2010-0024922). Keywords : Evidence based, Aged, Restraints

PP26 C-166

EFFECTS OF A SWALLOWING REHABILITATION PROGRAM ON NUTRITION AND QUALITY OF LIFE IN LONG-TERM CARE RESIDENTS

Su-Min LEE, Ju-Young HA (College of Nursing, Pusan National University, Korea)

Introduction : The purpose of this study was to examine the effect of a swallowing rehabilitation program on nutrition and quality of life in long-term care residents. Method : The research design was non-equivalent control group non-synchronized design. The subjects of this study consisted of 85 elderly patients hospitalized in Nursing facilities between August 23, 2012 and October 25, 2012. The 85 research subjects were assigned to experimental (42 patients) and control (43 patients) groups. The rehabilitation program was provided to the experimental group 5 days a week for 8 weeks. The effects were evaluated by measuring MAMC (Mid-upper Arm Muscle Circumference), TLC (Total lymphocytes counts), albumin, TC (Total cholesterol) and SWAL-QOL. The collected data were analyzed with descriptive statistics, x²-test and independent t-test using SPSS WIN 18.0 program. Results : The participants aged 65 to 71 years (Mean: 68.09). In nutrition, the degree of MAMC of the experimental group

was significantly increased than that of the control group after providing the rehabilitation program (t=2.360, p=.021). The score of SWAL-QOL of the experimental group were significantly increased than that of the control group after rehabilitation program, especially Burden (t=3.344, p=.002), Frequency (t=2.677, p=.011), Fear (t=2.442, p=.019), Mental Health (t=2.471, p=.018), Sleep (t=2.077, p=.044). Conclusion : Based on this results described above, the swallowing rehabilitation program should be helpful to promote the swallowing function and nutrition condition for elderly in long-term care facilities. Keywords : Swallowing, Nutritional Status, Quality of life

NON-COMMUNICABLE DISEASES IN AGEING: A MULTI-DIMENSIONAL PREVENTIVE AND CURATIVE APPROACH FROM URBAN AND SEMI-URBAN INDIA

Shuchin BAJAJ (Internal Medicine, Cygnus Medicare, India)

Introduction : Ageing is on rise in India. Currently, there are over 100 million people living above the age of 60 years in India. A figure which is likely to touch the 300 million-mark by 2050. With significant medical advances, the life expectancy has grown but the quality of life has remained of great concern, especially due to the high prevalence of non-communicable diseases (NCDs) in elderly. Method: Cygnus Medicare is a network of hospitals and outreach healthcare professionals dedicated to providing highest quality healthcare at affordable prices to communities. The network runs 7 hospitals in Delhi and Haryana states of India, in areas where there is a lack of services. Ageing is on top of the agenda for the group. Outreach component in the context of NCDs concentrates on life-style education mainly aimed at nutrition and hygiene promotion. Cygnus is also actively engaged in research, policy advocacy and public health training with NGOs and academia. Results : The work reaches an elderly population of over 30,000 people of the region. The services include specialty geriatrics clinics, indoor wards specifically designed for elderly patients, therapeutic and surgical services and a comprehensive outreach programme on education, cure and counseling. Battling with the NCDs is in the core of Cygnus' work on older people's health. Special focus is laid on high prevalence diseases including diabetes, cardio-vascular conditions, cancer and musculo-skeletal disorders. Conclusion : Multi-dimensional approach of Cygnus has been effective and will continue making an important contribution on older people's health in a rapidly ageing India. Keywords : Healthcare, Hospitals, Geriatric

COMPREHENSIVE GERIATRIC ASSESSMENT HAS A ROLE IN UK CARE HOMES

Adam L. GORDON¹, Isabella J. ROBBINS², Jane DYAS³, Lucy BRADSHAW², Matthew FRANKLIN², Pip A LOGAN², John R.F. GLADMAN² (1. Health Care of Older People, Nottingham University Hospitals NHS Trust, United Kingdom; 2. Division of Rehabilitation and Ageing, University of Nottingham, United Kingdom; 3. Faculty of Medicine and Health Sciences, University of Nottingham, United Kingdom)

Introduction : Comprehensive Geriatric Assessment (CGA) improves individual and service level outcomes in a number of healthcare settings. The UK care home population has not been described in such a way that would justify widespread implementation of CGA. We set out to describe this group and how they receive healthcare in detail. Method : We conducted a programme of research comprising: a 6 month longitudinal cohort study of 227 residents of 11 UK care homes, collecting comprehensive health and functional status data; and

a grounded theory-style interview study with 31 care home and healthcare professionals considering how they respond to care home residents' medical problems. Results : Residents had a median Barthel index of 9(2.5-15.5), MMSE of 13(4-22) and number of medications of 8(5.5-10.5) The mean number of diagnoses per resident was 6.2(4). 30% were malnourished, 66% had evidence of behavioural disturbance. Residents had unpredictable illness trajectories. General Practitioners (GPs) reported difficulty finding the time to meet these needs. There was a dissonance in health care knowledge between care home staff and GPs indicating imperfect partnership working. GPs and care home staff identified similar goals and challenges in caring for care home residents but neither group seemed to recognise this commonality. Conclusion : The cohort described was dependent, cognitively impaired, had prevalent malnutrition, and was subject to polypharmacy, multimorbidity and behavioural disturbance. Existing models of care were delivered by staff with an inadequate knowledge-base and flawed models of partnership and communication. CGA represents the most evidence-based response to the identified care needs and deficiencies. Keywords : Comprehensive Geriatric Assessment (CGA), Care Homes

PP26 C-169

THE NATIONAL AUDIT OF INTERMEDIATE CARE (NAIC) FOR ENGLAND, WALES AND NORTHERN IRELAND

John GLADMAN¹, John YOUNG², Duncan FORSYTH³, Claire HOLDITCH⁴ (1. *Division of Rehabilitation and Ageing, University of Nottingham, United Kingdom*; 2. *BIHR, Bradford Teaching Hospitals NHS Foundation Trust, United Kingdom*; 3. *Elderly Care, Addenbrooke's Hospital, Cambridge University Hospitals NHS FT, United Kingdom*; 4. *NHS Benchmarking Network, NHS Benchmarking Network, United Kingdom*)

Introduction : Intermediate Care services in the National Health Services in the UK were expanded between 2000-2010, but no national quality assurance processes have occurred. The aim of NAIC was to survey intermediate care provision in 2011-12, benchmarking for organisation, provision and outcome. Method : All commissioners and providers of intermediate care in the UK were invited to participate, using a subscription model of funding. Participants provided data on quality standards for commissioners, quality standards for providers, and data on 10 consecutive patients. Results : 327 services (167 bed-based and 160 home-based) participated, giving data on 3150 patients. Provision varied markedly throughout the country. The investment averaged 1.9 million per 100,000 population (58% bed based and 42% on home based). The average cost per bed day was 136 in residential care homes and 252 in community hospitals. The mean number of admissions to bed based services was 259 per 100,000 population and there were 725 home based users per 100,000. Average lengths of stay were 27-30 days for bed based and 24-29 days for home based provision. Patients with lengths of stay over 90 days accounted for 9% of bed based days and 21% of home based days. 72% of bed based and 82% of home based service users maintained their level of independence (measured as their type of care setting) following intermediate care. Conclusion : More research is required to examine the reasons for the variations between parts of the country, and to estimate the most cost-effective models of provision. Keywords : intermediate care, audit

PP26 C-170

TELECARE WITH REMOTE ALARM AS PSYCHOSOCIAL SUPPORT FOR SENIORS; EXPERIENCE IN MEXICO

Sara TORRES-CASTRO¹, Liliana GIRALDO RODRIGUEZ¹, Maria De Lourdes AVILA ALVA² (1. *Investigacion Social, Instituto*

Nacional de Geriatria, Mexico; 2. *Direccion de Investigacion, Instituto Nacional de Geriatria, Mexico*)

Introduction : Telecare is a home care service that operates through a telephone system and a base center equipped with trained personnel for immediate attention to psychological, medical or social needs, and is a practical resource. These services help improve the quality of life and to decrease the incidence of depression, as it allows older adults remained in their home environment. Objective. Determine the impact of Telecare with remote alarm on the quality of life and incidence of depression in older adults in Mexico. Method : 454 older adults enrolled in June 2010 in the pilot Telecare with remote alarm of the Mexican Social Security Institute (IMSS) were given a questionnaire which included demographic data and measurement scales for quality of life and health status (EuroQoL) and depression (Yesavage), validated in Mexico. Results : Of the 378 elderly respondents, before the intervention, 50% of the participants rated their health with a value between 76 and 100 (best imaginable state of health), and 61.4% of the same population perceived their health at that level after the intervention. Before entering the program, 50.4% of the adult population had some degree of depression, and after participating, this percentage decreased to 44.6%. Conclusion : El analisis arroja resultados satisfactorios en terminos de la percepcion de la calidad de vida y de la salud mental en las personas adultas mayores participantes en un modelo publico de teleasistencia y telealarma en Mexico. Keywords : Telecare, remote alarm, psychosocial support

PP26 C-171

VACCINE COVERAGE IS RELATED TO LOWER RESPIRATORY MORTALITY

Angelo Jose G. BOS¹, Andrea Ribeiro MIRANDOLA¹, Sheila Ferreira FERNANDES² (1. *Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil*; 2. *School of Medicine, Pontifical Catholic University of Rio Grande do Sul, Brazil*)

Introduction : Respiratory infections are a group of diseases commonly related to the elderly, whereas the influenza virus is a major etiological agent. Vaccination of these individuals is considered by the World Health Organization as the most effective strategy to reduce morbidity and mortality from the disease. Brazil has sought in recent years, as a goal to vaccinate 80% of the target population. Method : This study aimed to relate the coverage of influenza and the mortality rate from respiratory diseases in the elderly. Methodology: This was a cross-sectional secondary data analysis. Data on vaccination coverage in 2010 of the 496 municipalities in the elderly Gauchos were obtained on the website of the National Immunization Program and mortality in the Mortality Information System. Results : The results showed that 49% of municipalities reached the target of 80% of seniors vaccinated, with vaccination coverage in municipalities below the target number of deaths was 5.2 per 1,000 elderly, this average significantly higher than in municipalities with coverage equal to or greater than 80%. Conclusion : We conclude that the target proposed by the Brazilian Ministry of Health to vaccinate 80% or more of the elderly is effective in reducing mortality from respiratory diseases. Keywords : vaccine coverage, primary prevention, mortality

PP26 C-172

ASSOCIATION OF DEPENDENCE IN ACTIVITIES OF DAILY LIVING AND INSTRUMENTAL ACTIVITIES OF DAILY LIVING WITH WORRY ABOUT FALL AMONG KOREAN ELDERLY

Beom-Young CHO (*Department of Occupational Science and*

Technology, College of Health Sciences, University of Wisconsin-Milwaukee, USA)

Introduction : Performing daily activities independently is important to maintain good health. However, many elders do not perform daily activities independently. The aim of the present study is to assess factors associated with dependence in daily activities then, to provide an evidence for improving independent performing of daily activities among elderly. **Method :** A cross-sectional study was conducted in 7556 participants (3365 males, 4191 females) aged 47 - 99 years (mean 62.5) selected from South Korea, as part of the Korean Longitudinal Study of Ageing (KLoSA) in 2008. Worry about falling was measured by questionnaires and dependence in daily activities was assessed by using 10 Activities of Daily Living (ADL) and 7 Instrumental-ADL (IADL) items. Prevalence of dependence in ADL&IADL based upon each variable was examined by Chi-square test. Multivariate logistic regressions were used to find association between dependence in ADL&IADL and worry about falling, adjusting for socio-demographic variables. **Results :** Older groups tended to have higher dependence in ADL&IADL than younger groups; furthermore, this tendency was prevalent in women. Worry about falling was strongly associated with dependence in ADL&IADL; a little bit of worry about falling showed Odds Ratio of 1.7 (95% Confidence Intervals, 1.3-2.3) in men and 5.2 (2.9-9.5) in women, and worry about falling a lot showed 2.3 (1.6-3.3) in men and 11.2 (6.0-20.8) in women, adjusting for covariates. **Conclusion :** Elders worried about falling performed ADL&IADL more dependently. Professionals in the gerontology & geriatrics should consider not only physical intervention, but also various factors among elderly to promote their independent performing of ADL&IADL. **Keywords :** Elderly, Dependence, Fall

PP26 C-173
COMPARISON OF ESTIMATED GLOMERULAR FILTRATION RATE (EGFR) USING THE MDRD STUDY EQUATION AND THE CKD-EPI STUDY EQUATION

Kyounghe KIM¹, Meae KIM² (1. Science Course, 3rd Grade, Hankuk Academy of Foreign Studies, Korea; 2. Laboratory Medicine, Gunpo G Sam Hospital, Korea)

Introduction : Glomerular Filtration Rate (GFR) is the predictor of renal dysfunction. Serum creatinine is of limited value, and creatinine based MDRD study equation is used to estimate GFR for the patients with renal disease. Korea National Healthcare Program adapted eGFR by MDRD Study equation to estimate renal function in healthy individuals. Recently CKD-EPI equation better performed in normal GFR ranges is proposed. We compared eGFR by MDRD Study Equation and CKD-EPI Study Equation to estimate CKD in Korean healthy population. **Method :** A retrospective study was performed using 612 Korean individuals whose eGFR had been calculated by MDRD and CKD-EPI study equation. The CKD-EPI equations are different following the creatinine value (0.7mg/dL for the women and 0.9 mg/dL for the men). One major difference between the two equations is the 'age factor', (age)-0.203 in the MDRD equation whereas (0.993)age in the CKD-EPI equation. The chronic kidney disease (CKD) is defined as eGFR under 60 mL/min/1.73 β_{\geq} . **Results :** The CKD-EPI Study Equation confers less underestimation of GFR than MDRD Study Equation in subjects under 60 years. Using the CKD-EPI equations, the prevalence of CKD is higher than the MDRD study equation in subjects over 70 years old. There is strong agreement between eGFR classification by MDRD equation and CKD-EPI equation. Serum creatinine concentration equivalent to 60 mL/min/1.73 β_{\geq} using average body weight and height in each age

group were lower when subjects were older, female and using CKD-EPI equation. **Conclusion :** CKD-EPI Study Equation is probably better than the MDRD Study Equation to screen CKD in healthy old population. **Keywords :** eGFR, MDRD equation, CKD-EPI equation

PP26 C-174
MODIFYING EFFECTS OF RESTING HEART RATE ON THE ASSOCIATION OF BINGE DRINKING AND MORTALITY FROM ALL-CAUSE AND CARDIOVASCULAR DISEASES IN OLDER KOREAN MEN: THE KANGWHA COHORT STUDY

Mikyung RYU¹, Bayasgalan GOMBOJAV², Sang-Wook YI³, Chung Mo NAM⁴, Heechoul OHRR⁴, Yunhwan LEE⁵ (1. Aju University School of Medicine, Department of Preventive Medicine and Public Health, Institute on Aging, Korea; 2. Institute for Health Promotion, Graduate School of Public Health, Yonsei University, Korea; 3. Department of Preventive Medicine and Public Health, College of Medicine, Kwandong University, Korea; 4. Department of Preventive Medicine and Public Health, College of Medicine, Yonsei University, Korea; 5. Department of Preventive Medicine and Public Health, Aju University School of Medicine, Institute on Aging, Korea)

Introduction : The combined effect of binge drinking and resting heart rate on mortality has rarely been assessed. This study assessed the association of binge drinking with cardiovascular and all-cause mortality, and evaluated the potential modifying effect of resting heart rate on this association in Korean men. **Method :** A total of 2,600 men (55 or older as of 1985), were followed for cardiovascular and all-cause mortality for 20.8 years until 2005. We estimated hazard ratios (HRs) for cardiovascular and total mortality by binge drinking and resting heart rate using the Cox proportional hazard model after controlling for confounding factors. **Results :** A total of 1,990 (76.5%) deaths occurred in the 20.8 years of follow-up. Heavy binge drinkers (≥ 12 drinks on one occasion) with elevated resting heart rate (≥ 80 bpm) had higher HR of 2.35 [95% confidence interval (CI)=1.53-3.59] for death from cardiovascular disease and 1.47 (95% CI=0.94-2.30) for total mortality compared to the reference group (non-drinking and resting heart rate 61-79 bpm). The HRs of dying from cardiovascular disease linearly increased from 1.43 to 1.55, 1.69 and 2.26 among individuals with resting heart rate greater than 80 bpm within the four alcohol consumption categories (non-drinking, non-binge, moderate binge, and heavy binge, respectively). **Conclusion :** Our findings suggest that heavy binge drinkers with increased resting heart rate are at higher risk for cardiovascular and all-cause mortality in older Korean men. **Keywords :** drinking; cardiovascular disease; mortality; resting heart rate

PP26 C-175
THE RELEVANCE BETWEEN SLEEPING HOURS AND HYPERTENSION, DIABETES, OBESITY OF ELDERLY IN KOREA

Sun A. KIM, Jung-Ae RHEE (Department of Preventive Medicine, Chonnam National University Medical School, Korea)

Introduction : The aim of this study was to identify the affects of sleeping hours on hypertension, diabetes, and obesity targeting adults male and female over 60 in South Korea. **Method :** This research utilized the materials for community health survey conducted in 2008 and 2009. The subject households were selected by probability proportional systematic sampling. It targeted adults over 60 year-old, 139,035 people and finalized the number, 110,472 people (male 49,140, female 61,332) excluding every missing values. **Results :** The prevalence rate of hypertension in adults over 60 were 34.8% in male, 43.1% in female and the prevalence rate of diabetes are 13.5% in male,

13.9% in female. The prevalence of obesity were male 19.7%, female 23.1%. Based on the group with 7 hours of sleep, the risk of hypertension with modified variables such as age, smoking, alcohol, marital status, family income, education level, and career was significantly high in the female group with less than 6 hours (OR=1.09, 95% CI: 1.05, 1.14). The risks of diabetes were significantly high in both gender groups with more than 8 hours (men: OR=1.13, 95% CI: 1.05, 1.21, women: OR=1.15, 95% CI: 1.08, 1.23). The risk of obesity was significantly high in the female group with more than 8 hours (OR=1.05, 95% CI: 1.00, 1.11). Conclusion : This research shows the fact that sleeping hours can have impacts on chronic diseases. Keywords : sleeping, hypertension, diabetes

PP26 C-176

EXPLORING THE RELATIONSHIP BETWEEN PHYSICAL FITNESS AND BONE MINERAL DENSITY IN OSTEOPOROTIC ELDERLY

Tsung-Ching LIN¹, Ming-Fang HSU², Shu-Fen CHIU¹, I-Po LIN³, Hsiu-Ling CHOU⁴ (1. Department of Physical Medicine and Rehabilitation, Far Eastern Memorial Hospital, Taiwan; 2. Department of Healthcare Administration, Asia University, Taiwan; 3. Department of Healthcare Administration, Oriental Institute of Technology, Taiwan; 4. Department of Nursing, Taipei Veterans General hospital, Taiwan)

Introduction : Osteoporosis is one of the major public health problems in elderly. The aim of the present study was to investigate the correlation between physical fitness and bone mineral density (BMD) in elderly with osteoporosis. Method : Elderly aged over 40 years old were recruited in this cross-sectional study. Measurements included (1) self-administered questionnaire for collecting their demographic characteristics and medical history; (2) fat mass and muscle ratio analysis by using Body composition analyzer; (3) physical fitness evaluation (grip strength and 30-Second Chair Stand); (4) BMD measurement at lumbar spine and femoral neck by using dual energy X-ray absorptiometry (DXA). Results : A total of 104 subjects (mean age of 65.47 ±12.13 years old) were selected and predominantly in female (78.8%). The percentage of osteoporosis in lumbar spine and femoral neck was about 14.4% and 8.7%, and 47.1% and 36.5% for osteopenia. The degree of osteoporosis was significantly differed by age (F=5.310, p=0.006), body composition (F=5.653, p=0.005). Further, Pearson correlation analysis revealed there was negative correlation between age and BMD (r=-0.255, p=0.009), whereas positive correlations among Free fat mass, grip strength, 30-Second Chair Stand, and BMD in femoral neck (r=0.433, p=0.000, r=0.366, p=0.000, r=0.325, p=0.001). Conclusion : According to the findings in this study, increasing muscle mass and training muscular strength of limbs should be emphasized to strength BMD. It can help to prevent the risk of osteoporosis to get a better quality of life for elderly and thus reduce the burden of health care. Keywords : Osteoporosis; Bone mineral density (BMD); Physical fitness

PP26 C-177

ADDRESSING HIV IN THE ELDERLY POPULATIONS IN INDIA: THE FORGOTTEN ASPECT OF THE EPIDEMIC

Prakash TYAGI (Adin, GRAVIS, India)

Introduction : HIV and its implications on elderly populations are hardly discussed in the academic, policy and program arena in India and globally. Older age is not a safety net that protects people from getting HIV and that people are living with HIV for decades. It was also clear that the many issues surrounding HIV among older adults will only increase as our country faces the continuing greying of our

nation's HIV epidemic. The threat of HIV for older people is as serious as it is for younger age groups. Method : GRAVIS in partnership with Help Age International is running a comprehensive age-friendly healthcare programme in India, which covers several health aspects including HIV and AIDS. People of above 50 years of age are provided education and counseling on HIV transmission and preventive aspects through outreach sessions. Specialized training materials have been developed keeping cultural aspects in view. A cadre of community-based trainers has been developed. Those living with HIV are encouraged to access government provided Anti Retro-Viral Therapy. Special focus is given on older women's educations, which are more unaware and vulnerable. Results : The programme has so far successfully trained over 9,000 older people in the area. The awareness on HIV has increased among elderly and there is an increased tendency of older people getting tested. ART centers are also giving special attention to older people coming for treatment. Conclusion : HIV and AIDS are a serious medial and public health challenge for elderly people too, and need adequate attention in community based health programmes. Keywords : ageing, HIV, community health

PP26 C-178

CARE NEEDS ASSESSMENT IN ELDERLY INDIVIDUALS LIVING IN LONG TERM UNIT BASED ON CANE QUESTIONNAIRE

Katarzyna WIECZOROWSKA-TOBIS¹, Dorota TALARSKA², Sylwia KROPINSKA³, Agnieszka DYMEK-SKOCZYNSKA³, Sławomir TOBIS⁴, Mirosława CYLKOWSKA-NOWAK⁴, Justyna MAZUREK⁵, Joanna RYMASZEWSKA⁶ (1. Department of Geriatric Medicine and Gerontology, University of Medical Sciences, Poland; 2. Department of Preventive Medicine, Laboratory of Social Nursing, University of Medical Sciences, Poland; 3. Department of Geriatric Medicine and Gerontology, University of Medical Sciences, Poland; 4. Department of Education, University of Medical Sciences, Poland; 5. University Hospital, Wrocław Medical University, Poland; 6. Department of Psychiatry, Wrocław Medical University, Poland)

Introduction : CANE questionnaire is a tool used in assessment of care needs in elderly individuals. It covers 24 areas targeting both the met needs (MN - problems receiving suitable intervention) and the unmet needs (UN). The aim of the study was to compare the needs rated separately by the elderly living in long term care unit and by the nursing staff. Method : The study involved 50 individuals, aged 75 years and more (mean age: 81.6±6.3 years; 37 females) receiving at least 15 points in MMSE. Results : The average number of needs identified by the staff was 11.6±2.8 (MN: 10.2±2.3; UN: 1.4±1.2). The most common UN were reported in areas of "Psychological distress" and "Company" (n=16 for each) and "Daytime activities" (n=14). The number of needs identified by the elderly was only 9.4±3.4, p<0.001. It was due to lower number of MN (7.1±2.5; p<0.001) while the number of UN was higher (2.3±1.7; p<0.001). They reported more commonly UN in areas of: "Food", "Information (related to health status)" and "Company". The lowest percentage of agreement (identical report for needs from the perspective of elderly person and the staff) was found in areas of "Eyesight/hearing" (26%), "Food" (36%), and "Company" (40%). The average percentage of agreement which includes all 24 areas was high and equaled 73.6%. Conclusion : Our study demonstrates good quality of care in analyzed subjects. An outline of the area of disagreement in the rating of needs (between the elderly individuals and the staff) allows to focus on them. Keywords : CANE, care need, unmet needs

IT'S NOT ALL DOWNHILL FROM HERE: EXAMINING DECLINE IN COGNITION UPON ENTRY TO LONG TERM CARE FACILITIES IN ONTARIO, CANADA

Shannon FREEMAN¹, Lina SPIRGIENE², Melinda MARTIN-KHAN³, John P. HIRDES¹ (1. School of Public Health and Health Systems, University of Waterloo, Canada; 2. Faculty of Nursing, Lithuanian University of Health Sciences, Lithuania; 3. Centre for Research in Geriatric Medicine, University of Queensland, Australia)

Introduction : Declining cognitive function has a significant impact on an individual's perception of their quality of life. In long term care facilities (LTCFs), there may be specific causes driving cognitive decline. This study examined factors which drive cognitive decline among residents newly admitted to a LTCF and identified factors amenable to intervention. Method : Secondary data analysis was performed using the interRAI Minimum Data Set (MDS 2.0) at admission and 6 months (N=109,067). The MDS 2.0. gathers comprehensive information as part of regular clinical care and is mandated for all LTCFs in Ontario. Decline in cognition and predictors of this decline following admission to institutional care were examined. Results : Data from 148,037 residents (aged 82.6 ± 9.9 years) was available for analysis however, 38,970 were excluded based on specific criteria. Analysis was stratified for residents with a diagnosis of dementia at admission (N=55,344). 16% of residents (N=17,445) exhibited decline in cognitive functioning at follow-up. Regression analyses of clinical characteristics (functional, cognitive, psychosocial, and demographic) illustrate factors affecting cognition in LTC. Analyses highlight links between use of physical restraints (chair, trunk, and limb) and importance of social interactions and decline of cognitive functioning. Conclusion : Use of physical restraints is closely linked to a decline in cognitive function. Cognitive decline was less pronounced among residents involved in social interactions on a regular basis, either formal activities or ad hoc. This held true for residents with a dementia diagnosis and without. Strong social networks and greater participation in social activities are associated with lower risks of cognitive decline. Keywords : geriatric assessment, interRAI, Minimum Data Set

PP26 C-180

REGULAR PHYSICAL ACTIVITY AND PREVENTION OF LONG-TERM CARE INSURANCE REQUIREMENT CERTIFICATION IN COMMUNITY-DWELLING JAPANESE ELDERLY WITH COGNITIVE IMPAIRMENT: A PROSPECTIVE COHORT STUDY

Shu NISHIGUCHI, Minoru YAMADA, Takuya SONODA, Tomoki AOYAMA (Department of Physical Therapy, Human Health Sciences, Graduate School of Medicine, Kyoto University, Japan)

Introduction : Cognitive impairment is one of the main factors that necessitates long-term care insurance (LTCI) in Japan. Recent researches have shown that physical activity is associated with improvement of cognitive impairment. The aim of the current prospective cohort study was to examine whether the regular physical activity can reduce new LTCI requirement certification in community-dwelling Japanese elderly with cognitive impairment. Method : We analyzed the cohort data from a prospective study entitled the Japan Multi-center Aging Cohort for Care prevention (J-MACC). We followed the cases of 1086 older adults with cognitive impairment defined by the Cognitive Performance Scale in a city for 18 months. We collected information concerning their regular physical activity through a questionnaire. The outcome measure was new LTCI requirement certification during 18 months. Cox proportional hazards model was used to estimate the hazard ratio (HR) and 95% confidence

interval (CI) for the impact of regular physical activity on the time of the new LTCI requirement certification in a multivariate analysis, adjusted for demographic variables and impaired lifestyle conditions. Results : During the 18 month follow-up period, older adults with cognitive impairment who had regular physical activity had a significantly lower risk for LTCI requirement than those who did not have regular physical activity in a multivariate analysis (adjusted hazard ratio: 2.52, 95%CI: 1.09-5.83, p < 0.05). Conclusion : Our results indicate that regular physical activity is an important factor for preventing the new LTCI requirement certification in older adults with cognitive impairment. Keywords : Physical activity, Cognitive impairment, LTCI requirement

PP26 C-181

NASOGASTRIC FEEDING IN HOSPITALIZED OLDER PATIENTS

Nordiana NORDIN, Mau Pin TAN (Geriatric Unit, Medical Department, University Malaya Medical Centre, Malaysia)

Introduction : Nasogastric feeding is often prescribed in patients with dysphagia. However, tube fed patients are devoid of the protective effect of oral clearance. Naso-gastric (NG) feeding is also associated with complications. This study was performed to determine the characteristics and complications associated with nasogastric feeding in older patients. Method : Data on demographics and ng-feeding use was collected prospectively for consecutive patients aged ≥ 65 years admitted to the acute geriatric ward at the University of Malaya Medical Centre over the period of 6 months. Patients were monitored for complications throughout their hospital stay. Results : 96 subjects, median age =80 years were recruited into the study, 44 of whom had NG tube inserted during their hospitalization, while the remaining had pre-existing NG feeding. The main indications for NG feeding were reduced conscious level (55%) and cerebrovascular events (28%). 67% of the patients reported at least 1 complication. Complications reported included gastroparesis (29%), aspiration pneumonia (26%) and constipation (27.1%). There were a total of 36 (37.5 %) deaths in this group of patient. Individuals with gastroparesis were more likely to develop aspiration pneumonia (15/28 (53.5%) vs 10/68 (14%), p<0.001). Conclusion : Complication and mortality rates are high among patients receiving NG feeding on our acute geriatric ward. It is important that carers receive adequate training about gastroparesis and feeding techniques to reduce the complications of aspiration. Further studies should now be performed to determine appropriate indications and to improve the management of NG feeding in order to reduce complications. Keywords : Nasogastric feeding

DETERMINANTS OF NUTRITIONAL STATUS OF COMMUNITY DWELLING OLDER PERSONS IN A PERI-URBAN AREA OF SOUTH AFRICA

Indhren NAIDOO¹, Karen CHARLTON², Tonya ESTERHUIZEN³, Bilkish CASSIM¹ (1. Department of Geriatrics, College of Health Sciences, University of KwaZulu-Natal, South Africa; 2. School of Health Sciences, Faculty of Health and Behavioural Sciences, University of Wollongong, Australia; 3. College of Health Sciences, University of KwaZulu-Natal, South Africa)

Introduction : The increased risk of malnutrition in older subjects is multifactorial. We studied the nutritional status and the determinants thereof of in community dwelling adults, aged 60 years and over, residing in a peri-urban area in South Africa. Method : In a questionnaire based survey of 984 randomly selected subjects, the demographic, socio-economic, medical and nutritional status (Mini

Nutritional Assessment-short form (MNA-SF) was recorded. Descriptive statistics, Pearson Chi-Square, Kruskal Wallis tests and logistic regression were applied. Results : The mean age of the subjects was 68.8 ± 7.4 years and the female to male ratio was 3.4:1. Five hundred and three subjects (51.1%) were classified as having a normal nutritional status, 427 (43.4%) as being at risk for malnutrition and 54 (5.5%) malnourished. There was a significant association between nutritional status and BMI ($p = 0.00$). Male gender ($p = 0.008$), lower income ($p = 0.003$), poor oral health ($p = 0.000$), depression ($p < 0.001$), pain ($p = 0.014$) and not walking to the shops ($p = 0.00$) were associated with an abnormal nutritional status. After logistic regression analysis gender, poor oral health and not walking to the shops remained significantly associated with an abnormal nutritional status. Surprisingly subjects who reported food insecurity were less likely to be at risk or being malnourished compared to those who did not ($p = 0.00$) in independent and logistic regression analysis. Conclusion : The high prevalence of the risk of malnutrition in older Africans supports the inclusion of nutritional assessment and interventions in the primary health care programme. Keywords : nutrition, South Africa, MNA-SF

PP26 C-183

HEALTH AND NUTRITIONAL STATUS AMONG THE OLDEST OLDS IN SARDINIA: EVIDENCE FOR GEOGRAPHIC DIFFERENCES

Gianni PES¹, Francesco TOLU², Michel POULAIN³ (1. Dept. Clinical and Experimental Medicine, University of Sassari, Italy; 2. Diabetes Unit, Azienda Ospedaliero-Universitaria di Sassari, Italy; 3. IACCHOS, Universite Catholique de Louvain, Belgium)

Introduction : Health status among the oldest-olds is very heterogeneous and major sources of variation are lifestyle and environmental factors. In the Mediterranean island of Sardinia, the distribution of long-lived people follows two distinct modalities: (i) an aggregated pattern in a mountain area (Longevity Blue Zone, LBZ), indicating the presence of shared determinants in the population; (ii) a more spatially dispersed pattern suggesting a variety of heterogeneous determinants acting at individual level. Our objective was to examine potential differences in health and nutritional status in groups of oldest-olds representative of the two areas. Method : In 244 Sardinian subjects aged 90 years or older (122 living inside and 122 outside the LBZ) we investigated several indicators of health and nutritional status such as self-reported health score (SRHS), MMSE, comorbidity indices, BADL/IADL disability score, weight change, anthropometry and vitamin status. Results : Compared to non-LBZ, LBZ subjects displayed 12% higher SRHS, 26% higher MMSE, 23% lower comorbidity, 20% lower mean IADL, 39% lower weight loss in the past 5 years, 5% higher average calf circumference, higher levels of vitamin B12, C, and D. Conclusion : The oldest-olds living in the Sardinian LBZ show a better nutritional status and more favourable health profile than age peers living outside this area. Traditional lifestyle of the LBZ population has remained very stable over the years, and nutrition transition was relatively delayed. This likely caused the accumulation of various positive behavioral and nutrition factors which have reduced the incidence of age-associated diseases and facilitated the emergence of a “longlived phenotype” at population level. Keywords : nutritional status, oldest olds, Sardinia

PP26 C-184

ASSOCIATION BETWEEN SERUM 25- OH VITAMIN D LEVEL AND THE QUALITY OF LIFE AMONG KOREAN OLDER ADULTS ? BASED ON KOREA NUTRITION AND HEALTH EXAMINATION SURVEY 2007-2010

Hyehyung SHIN¹, Kitae MOON² (1. Research Institute of Insurance, Samsung Life Insurance, Korea; 2. Insurance Medical Center, Samsung Life Insurance, Korea)

Introduction : Studies showed that vitamin D may be involved with quality of life and mood among the elderly. The purpose of this study is to investigate the association between serum 25-OH vitamin D and quality of life among Korean elderly. Method : This study utilized the data of the Korea National Health and Nutrition Examination Survey (KNHANES) 2007-2010. Subjects older than 65 years of age were only included in this analyses. Serum 25-OH vitamin D below 20ng/ml was considered as vitamin D deficiency. In addition to EQ-5D, one or more suicidal thoughts within the past year, perceived stress level and sleeping hours were assessed. Survey procedures in SAS 9.2 were used in all analyses. Results : The average serum 25-OH vitamin D was $19.6(\pm 0.2)$ ng/ml, and 54% of the elderly were vitamin D deficiency. 29.1(± 1.0)% of the elderly, who are vitamin D deficiency, had suicidal thoughts within the past year, whereas 25.1(± 1.3)% for those who are not ($p < 0.05$). For perceive stress, 25.5(± 1.0)% of those who are vitamin D deficiency expressed perceived stress while 21.4(± 1.2)% for those who are not ($p < 0.001$) reported perceived stress. The average score of EQ5D was significantly lower among the elderly with vitamin D deficiency (0.82 ± 0.004) compared to those who are not (0.85 ± 0.005 , $p < 0.001$). Conclusion : The results showed the clear association between vitamin D and the quality of life among the Korean elderly. Further studies are needed to investigate the mechanism of vitamin D for the psychological well-being for the elderly living in Korea. Keywords : vitamin D, Quality of Life

PP26 C-185

RELATIONSHIP BETWEEN PLASMA CAROTENOID LEVELS AND PHYSICAL PERFORMANCE AMONG JAPANESE ELDERLY

Kyoko SAITO¹, Yuki KISHIMOTO², Hisashi KAWAI³, Hirohiko HIRANO¹, Hunkyung KIM¹, Miji KIM¹, Yoshinori FUJIWARA⁴, Motonaga KOJIMA³, Kazushige IHARA⁵, Hideyo YOSHIDA¹, Shuichi OBUCHI³, Naoki MARUYAMA², Ishigami AKIHITO² (1. Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Institute of Gerontology, Japan; 2. Molecular Regulation of Aging, Tokyo Metropolitan Institute of Gerontology, Japan; 3. Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan; 4. Promoting participation and contribution to society, Tokyo Metropolitan Institute of Gerontology, Japan; 5. Department of Public Health, Toho university School of Medicine, Japan)

Introduction : Physical performance is one of the most important indicators of health status in elderly people and is also closely related to the quality of life. Recent studies suggested a beneficial relationship between plasma carotene levels and physical performance in elderly people. The purpose of this study was to examine the relationship between plasma carotene levels and physical performance among Japanese community-dwelling elderly men and women. Method : A cross-sectional study was conducted involving elderly residing in an urban area in Tokyo, Japan, in October 2011. We examined anthropometric measurements, physical performance measures such as hand grip strength, knee extension strength, usual and maximal walking speeds timed up & go, one leg standing time, lifestyles. Plasma carotene levels including lutein, zeaxanthin, beta carotene, alfa carotene and lycopene were also assessed. A total number of 242 subjects were analyzed. Results : The mean age (\pm standard deviation) of participants was 73.9 ± 5.0 years in this study. The geometric mean

(geometric standard deviation) of plasma beta carotene concentration was 0.50 (1.90) μ M. In age adjusted analysis showed that plasma beta carotene was significantly correlated with one leg standing with eyes open ($r=0.25$, $p<0.0001$) and time up & go ($r=-0.19$, $p=0.0036$). Conclusion : The results of this study suggest that plasma carotene levels may be related to physical performance in community-dwelling elderly men and women, specifically in balance ability. Keywords : Plasma carotene, physical performance, elderly Japanese

PP26 C-186

ASSOCIATION BETWEEN NUTRITIONAL STATUS AND FEEDING CONDITION ON JAPANESE ELDERLY RECEIVING HOME CARE: A CROSS-SECTIONAL STUDY

Rika OHTSUKA¹, Kyoko SAITO², Hideki OHTA³, Kayoko MAEDA⁴, Masafumi KUZUYA⁵, Hisayuki MIURA¹ (1. Department of Home Care Coordinators, National Center for Geriatrics and Gerontology, Japan; 2. Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Institute of Gerontology, Japan; 3. ASMSS Health Corporation, Japan; 4. Department of Food Science and Nutrition, Mukogawa Woman's University, Japan; 5. Department of Community Healthcare & Geriatrics, Nagoya University Graduate School of Medicine, Japan)

Introduction : Nutritional status is the most important indicators of health status in home care elderly people and is also closely related to the quality of life. The purpose of this study is to examine the association between nutritional status and feeding condition on Japanese elderly receiving home care. Method : This is a cross-sectional study on receiving home care the Japanese elderly, in October 2012. The eligible subjects were over 65 years old people using the home care services. We examined nutritional status, feeding condition, and lifestyle assessments. This survey was conducted by 46 teams which included home care clinics, home-visit nursing stations, pharmacies, and dental clinics, worked in collaboration. The initial number of subjects were 2120, and 1141 people ultimately participated in this study. Results : The mean age (\pm standard deviation) of participants was 82.5 ± 9.5 years, and 60.0 % of them was female. The mean of BMI was 20.9 ± 4.1 (N=888). Prevalence of low BMI group (<18.5) was 29.6 %. Concerning feeding condition the low BMI was 27.7% of oral feeding group (n=804), 46.2% of percutaneous endoscopic gastrostomy (n=93), 75.5% of intravenous hyperalimentation (n=4). Conclusion : The result above implied that there was association between nutritional status and feeding condition, and more detailed analysis will be shown at the session. Based on these findings, we will discuss and discussion on nutritional status of the Japanese elderly receiving home care. Keywords : nutritional status, feeding condition, home care

PP26 C-187

EFFECT OF NUTRITIONAL STATUS AT ADMISSION ON THE PHYSICAL FUNCTION AT DISCHARGE

Shin SATOU¹, Shohei OHGI² (1. Rehabilitation, Enshu Hospital, Japan; 2. Graduate School of Rehabilitation Sciences, Seirei Christopher University, Japan)

Introduction : The patients in malnutrition, muscle mass would reduce due to the muscle fibers cannot be synthesized, would fall into sarcopenia and eventually fall into physical function decline. This study aimed to reveal the relationship between changes of nutritional status and physical function during hospitalization. Method : Out the Enshu hospital inpatient databases at 2011 year (n=304), we extracted the data (n=164) which is measured at the time of C-reactive protein (CRP) and serum albumin levels on admission and motor scores of

Functional Independence Measure (m-FIM) on admission and discharge. From which, we analyzed the people (n=71) except those CRP levels greater than 0.3mg/dl in order to eliminate the influence of inflammation. We examined the relationship between serum albumin level and the m-FIM of the difference between at admission and discharge (m-FIM). We also examined by age groups and disease classification similarly. Statistical analysis was used the Pearson Product-Moment Correlation Coefficient, and significance level was less than 5%. Results : Significant positive correlation was observed between the serum albumin level and m-FIM ($r=0.295$). Higher age group and patients group with disuse syndrome showed significantly higher correlation than other age and disease classification groups ($r=0.632$, $r=0.729$, respectively). Conclusion : This study describes the patients with malnutrition had poor physical functional recovery at the time of discharge from the hospital, which is higher relevance in the older age and disuse syndrome group. It suggests that a nutritional intervention might be benefit in improving their physical function. Keywords : Malnutrition, Functional Prognosis, Rehabilitation

PP26 C-188

WAIST CIRCUMFERENCE AS AN INDICATOR OF HEALTH IN ELDERLY LIVING IN RIO DE JANEIRO, BRAZIL

Fernanda BORGES¹, Marisa SANTOS², Luiz Mauricio PLOTKOWSKI², Jerson LAKS² (1. Nutrition, Centro de Estudo e Pesquisa do Envelhecimento, Brazil; 2. Medicine, Centro de Estudo e Pesquisa do Envelhecimento, Brazil)

Introduction : Waist circumference (WC) had good relationship with Body Mass Index (BMI) and can be used as a predictor of risk for diseases in the elderly. This study aimed to investigate other factors related to WC in older people. Method : We screened 300 elderly people referred by a Primary Care Center from April to December 2012. WC was measured by trained professional at the midpoint between the last rib and the iliac crest and BMI calculated using weight in kilograms divided by height in meters squared. Direct questions assessed physical activity, comorbidities, education and health self perception. Pearson's correlation was used to calculate the differences in WC inadequate group. Results : The sample were mainly female (59%), mean age= 70 years (± 7); 42% lower educated, 82% from D/E economic class and 78% with at least 3 co-morbidities. Hypertension (88%), dyslipidemia (47%), diabetes (30%), and depression (18%) were the most frequent comorbidities. WC showed 78% inadequate subjects (≥ 94 cm for men and ≥ 80 cm for women) and 25.2% practiced regular physical activity. 48.6% of subjects considered their current health poor/very poor, 6.7% regular and 44.7% good/very good. There was a significant correlation between inadequate WC and low education ($p<0.01$), sedentariness ($p<0.01$), and more than three morbidities ($p=0.04$), whereas BMI did not correlated with any of these variables. Conclusion : Wc seems to be a better indicator than BMI in the elderly. Keywords : Waist circumference, elderly people, Body Mass Index

PP26 C-189

A SURVEY OF WILLINGNESS TO ACCEPT CHEMOTHERAPY AMONG ELDERLY MALAYSIAN PATIENTS

Rizah Mazzuin RAZALI¹, Ping Chong BEE² (1. Geriatrics, Hospital Kuala Lumpur, Malaysia; 2. Hematology, University of Malaya Medical Centre, Malaysia)

Introduction : Elderly patients with cancer are less likely offered optimal treatment due to concerns over their physical, mental frailty with multiple co-morbidities deteriorating organ reserve rendering

them less tolerance to chemotherapy as well as perceptions that costly treatment is a waste of socio-economy resources. Traditionally, elderly cancer patients are perceived as not willing to undertake chemotherapy. Method : Cross-sectional study recruiting patients above 60 years old from various clinics in UMMC from November 2008 - March 2009. They were interviewed with questionnaire, comprised of a scenario of side effects of strong and mild chemotherapy and to express their willingness to undertake chemotherapy. Exclusion criteria were dementia and patients who have received chemotherapy within a year prior to interview. Results : 75 patients recruited. 47% had previous cancer, 38.7% Chinese, 29.3% Indian, 26.7% Malay. 83% and 73% of patients willing to accept strong and mild chemotherapy respectively. Patients who had cancer were more willing to accept strong and mild chemotherapy compared to non-cancer group (88.6% vs 62.5%, $p=0.005$, 94% vs 80%, $p=0.068$). Chinese patients without history of cancer were not willing to receive strong ($p=0.001$) and mild ($p=0.010$) chemotherapy respectively. Conclusion : Elderly patients were willing to have chemotherapy if they were allowed to express their own wish. They should not be denied from the involvement of decision making. Treatment for cancer should not be compromised as a result of vulnerable socio-economic status. Delivering accurate information and support from cancer survivors may alleviate their fear of chemotherapy. Effective collaboration between oncologist and geriatrician is paramount. Keywords : Chemotherapy, elderly

PP26 C-190

CARE NEEDS OF SYMPTOM MANAGEMENT FOR PATIENTS WITH CANCER IN END-OF-LIFE CARE AT HOME - COMPARATIVE STUDY BETWEEN KOREA AND JAPAN -

Setsu SHIMANOUCHI¹, Shunyue CHENG¹, Junko MINAI¹, Soon Lea KIM², Jong-Eun LEE³ (1. School of Nursing, Hiroshima Bunka Gakuen University, Japan; 2. School of Nursing, International University of Health and Welfare, Japan; 3. College of Nursing, Catholic University of Korea, Korea)

Introduction : The aim of this study was to identify care needs of symptom management for patients with cancer by different stages (beginning, stable and near-death) during end-of-life care at home in Korea and Japan. Method : We analyzed data collected from a retrospective cohort study conducted in 2007 in Korea and Japan. Visiting nurses completed a questionnaire regarding symptom management for their patients. Criteria for inclusion of patients included patients aged 40 and over, received terminal home care, and died at home in 2006. Results : A total of 239 cancers (119 from Japan and 120 from Korea) data were available for statistical analyses. The need for pain management was significantly higher in Korea (52.5% - 87.5%) than in Japan (34.5% - 60.5%) in all three stages. The needs for management of dyspnea, digestive symptoms, dysphagia, fluid imbalance/nutritional state and fatigue were significantly higher in Korea than in Japan in both beginning and stable stages, but not near-death stage. While the needs for management of fever and infection were significantly higher in Japan than in Korea. The highest care need was fluid balance/nutritional state in both countries (Japan: 74.8%; Korea: 85.8%) followed by fatigue (Japan: 72.3%; Korea: 80.8%). Conclusion : The findings of this study showed that pain and physical symptom management were not satisfactory both in Korea and Japan. To improve QOL in terminal cancer patients, more active management of physical symptoms is needed. Keywords : end-of-life, care needs, cancer

PP26 C-191

USING BEERS CRITERIA ON HOSPITALIZED MEDICAL PATIENTS; WHAT DIFFERENCE DOES IT MAKE

Ada OKOLI, Muhammad MATIN, Clifford LISK, Ahmad NOORI (Medicine, Barnet Hospital, United Kingdom)

Introduction : Previous studies have shown that older patients take an average of 9 medications daily with an increase in the risk of adverse drug reactions. This may lead to a prescribing cascade ultimately increasing the numbers of medications patients take and also account for up to 10-17% of hospital admissions. In recent times the American Geriatric Society Beers criteria has been developed to assist Health Care Professionals in improving medication safety in older adults. Method : A review of patient clinical records for 83 hospitalized inpatients at a UK district general hospital was carried out in July 2012 looking at serious medication interactions and the effects of Beers criteria. Results : The majority of patients were above 60 years old (65) with the majority in their eighties (25). They were predominantly female (49). Patient had a median of 3 co-morbidities (range 0-6) and were on an average of 6 medications daily. There were 116 serious medication interactions occurring in 52/83 patients. These interactions mainly involved carbamazepine (15) and tricyclic antidepressants (14) with antipsychotics, antifungals, antibiotics and opiate analgesics accounting for the remainder. Using Beers criteria reduced serious medication interactions by a third. Conclusion : Significant medication interactions are common and mostly involve medications that health care professionals are familiar with. There is a necessity to teach our trainees about tools like Beers criteria which can complement our clinical decision making in older adults and help reduce serious medication interactions resulting from prescribing. Keywords : interactions, Beers, polypharmacy

PP26 C-192

POLYPHARMACY AMONG OLDER PEOPLE IN VARIOUS LONG-TERM CARE SETTINGS IN KOREA

Ahreum YOO, Hongsoo KIM, Young-Il JUNG, Moonhee SUNG, Jiyeon KIM (Division of Health Care Management and Policy, Seoul National University School of Public Health, Korea)

Introduction : Polypharmacy could have serious negative impacts on the health of frail older people. The study aimed to explore the prevalence of polypharmacy among older people with long-term care needs, who reside in three different care settings--long-term care hospital, nursing home, and home with home care services. Method : This was a cross-sectional study of 706 older adults in 7 long-term care hospitals ($n=270$), 10 nursing homes ($n=241$), and home with home care services from one of 11 home care organizations ($n=195$) in Korea. Medication data were collected along with interRAI-long-term care facility (interRAI-LTCF) and interRAI-home care (interRAI-HC) assessment system in 2011. The number of medication drugs was counted and polypharmacy status was grouped as non-polypharmacy (0-8 drugs) and polypharmacy (9 or more drugs). Descriptive statistics and ANOVA were used for the data analyses. Results : The average numbers of medication taken by older people were $8.71(\pm 3.99)$ in long-term care hospitals, $6.20(\pm 3.15)$ in nursing homes, and $5.97(\pm 3.79)$ in home care services ($p<.001$). The overall prevalence of polypharmacy across the three settings was 31%. The highest prevalence of polypharmacy was among residents in long-term care hospitals, which was up to 44.8%, followed by nursing home residents (21%), and people receiving home care (23.6, $p<.001$). Conclusion : Polypharmacy is common among older people with long-term care needs in Korea regardless of settings. Further studies are needed to explore resident and facility factors related to polypharmacy. Keywords : Polypharmacy, Older People, Long-term Care

PP26 C-193

IATROGENY IN HOSPITALISED ELDERLY PATIENTS

Ioana Dana ALEXA¹, Gabriel Ioan PRADA², Ovidiu ALEXA³, Adina Carmen ILIE¹ (1. Department of Geriatrics, Faculty of Medicine, University of Medicine and Pharmacy 'Gr.T.Popa', Romania; 2. Faculty of Medicine, University of Medicine and Pharmacy 'Carol Davila', Ana Aslan - National Institute of Gerontology and Geriatrics, Romania; 3. Department of Trauma, Faculty of Medicine, 'Gr. T. Popa' University of Medicine and Pharmacy, Romania)

Introduction : Iatrogeny refers to any unwanted event induced by an intervention belonging to health system either ambulatory or during hospitalization ... by any person involved in medical gestures: physicians, nurses, persons performing kinesitherapy or physiotherapy, psychotherapists and even the patient himself (by lack of proper surveillance). Modern approach of iatrogeny tends to enlarge the semantics of the term: iatrogeny should include any unwanted effect induced by any diagnostic, therapeutic or prophylactic gesture performed in the health system. **Method :** In this prospective study we included patients over 65 years hospitalized in our clinic for serious side effects due to ambulatory medical treatment. They underwent physical examination, geriatric assessment, biochemical tests and other specific investigations. **Results :** Data obtained from a 12 month period has been analyzed. The most affected age group was 70-80 years. The highest rates iatrogeny included: oral anticoagulant overdose, orthostatic hypotension (due to antihypertensive treatment, diuretic treatment, alpha-blockers), acute exacerbation of chronic kidney disease, thyroid disorders, arrhythmias. **Conclusion :** Elderly patients need careful monitoring and a refined personal therapeutical approach due to co-morbidities and frequent functional deficits, which may need multiple pharmaceutical approach with possible medical interferences. When prescribing, one must take into account the patient as a whole, including his or her life expectancy, cognitive status, family support and quality of life within a social and economical environment. **Keywords :** iatrogeny, elderly

PP26 C-194

A STUDY OF STOPP/START IN GERIATRIC INPATIENTS IN SINGAPORE

Mei Qi WAN (Pharmacy, National University Hospital, Singapore)

Introduction : Polypharmacy is common in the elderly due to multiple co-morbidities. The Screening Tool of Older People's Prescription (STOPP) and Screening Tool to Alert doctors to Right Treatment (START) can guide appropriate prescribing. The aim is to estimate the prevalence of potentially inappropriate medications (PIMs) and prescribing omissions (POs) in geriatric inpatients in an acute care, tertiary hospital in Singapore. Another objective is to survey pharmacists' awareness of STOPP/START. **Method :** Data was collected in 150 consecutive admissions of elderly patients (average age 79 years) from July to October 2011 in an internal medicine ward. PIMs and POs were identified using STOPP/START. 67 pharmacists from National University Hospital (NUH) and National Healthcare Group (NHG) were surveyed to gauge their awareness of these tools. **Results :** Results: 53% had at least one PIM and 67% had at least one PO. 73% of pharmacists were unaware of STOPP/START. Top 3 PIMs were: proton pump inhibitors for peptic ulcer disease at full therapeutic dosage for more than 8 weeks (n=29, 21.2%), beta-blockers in those with diabetes mellitus and frequent hypoglycaemia (n=20, 14.6%), long term neuroleptics as long term hypnotics (more than 1 month) (n=14, 10.2%). Top 3 prescribing omissions for START were: metformin in Type 2 Diabetes mellitus (n=37, 20%), statins in documented vascular disease (n=28, 16%) and statins in diabetes

mellitus with elevated cholesterol levels (n=19, 11%). **Conclusion :** STOPP/START are useful to detect PIMs or POs in elderly inpatients in Singapore; however, more awareness is needed amongst pharmacists. A prospective study incorporating these medication review tools. **Keywords :** STOPP/START criteria, Inappropriate prescription, Prescribing omission

PP26 C-195

PREVALENCE OF POLYPHARMACY IN PATIENTS 65 YEARS AND ABOVE WITH CARDIOVASCULAR RISK FACTORS

Qi Chang Tricia CHANG, Keith TSOU (Family Medicine, National Healthcare Group Polyclinics, Singapore)

Introduction : Polypharmacy is commonly seen in the primary care setting and is most evident in two populations: the elderly and the psychiatric patients. The geriatric population aged 65 years and above is more worrying due to the different pharmacokinetics and pharmacodynamics with a higher likelihood of chronic diseases leading to long-term pharmacotherapy. Risks associated with polypharmacy include non-compliance, adverse drug reactions, interactions and medication errors. **Method :** We conducted a cross-sectional study of patients aged 65 and above with 5 common cardiovascular risk factors in our population. Electronic prescriptive data were collected from our database analysing the number of drugs prescribed to each patient presenting to our polyclinic in Singapore over a 2 week period in 2012. Patients were selected based on having one or more of the following diagnoses: Hypertension, Ischemic heart disease, Type 2 Diabetes Mellitus, Hyperlipidemia and Stroke. The cohort comprised of 979 elderly subjects who presented for either chronic or acute conditions. Polypharmacy status was defined as a three stage variable. Non-polypharmacy was defined as the concurrent use of five or fewer drugs. Usage of six to nine drugs was classified as polypharmacy and usage of ten or more drugs was excessive polypharmacy. **Results :** A total of 363 elderly patients in the cohort (37.0%) were exposed to polypharmacy during the study period. The prevalence of excessive polypharmacy was 8.6%. **Conclusion :** Polypharmacy is common in the elderly. Further research with regards to patient characteristics, classes of medications and disease profile in those with polypharmacy would be beneficial to highlight patients at risk. **Keywords :** polypharmacy, elderly

PP26 C-196

POLYPHARMACY AMONG OLDER INPATIENTS IN AUSTRALIA

Ruth Eleanor HUBBARD¹, Nancye M PEEL¹, Ian A. SCOTT², Jennifer H. MARTIN³, Peter I PILLANS³, Leonard C. GRAY¹ (1. Centre for Research in Geriatric Medicine, The University of Queensland, Australia; 2. Department of Internal Medicine, Princess Alexandra Hospital and School of Medicine, The University of Queensland, Australia; 3. Department of Clinical Pharmacology, Princess Alexandra Hospital and School of Medicine, The University of Queensland, Australia)

Introduction : Hospitalisation presents an opportunity for physicians to rationalise medication prescribing for older people, weighing up the potential benefits and risks of pharmacotherapy. Here, we aimed to investigate medication changes for older inpatients and explore the associations with excessive polypharmacy. **Method :** This prospective cohort study included 1220 patients (mean 81.3y ± SD 6.8) admitted to general medical units of 11 acute care hospitals in Australia. The interRAI Acute Care assessment tool was used to collect data on each patient's functional status. **Results :** Patients were prescribed a mean of

8.42 (SD 3.9) regular medications on admission, 8.15 (3.9) on discharge. There were significant reductions in heparin (41.6% vs 11.1%) and antibiotics (45.8% vs 32.7%) but no changes in the prevalence of potentially inappropriate medications such as statins (38.5% vs 38.6%), opioid analgesics (14% vs 14.1%), antipsychotics (5.1% vs 5.6%) and benzodiazepines (10.4% vs 11.4%). Excessive polypharmacy (≥ 10 drugs) was observed in 426 (35.1%) inpatients at admission, 403 (33%) on discharge. Compared with non-polypharmacy (< 5 drugs), excessive polypharmacy on admission was associated with pain (OR 1.56; 95% CI 1.10-2.21), breathlessness (OR 4.27; 2.96-6.16) and pre-morbid dependence in instrumental activities of daily living (OR 2.02; 1.19-3.44), but inversely associated with cognitive impairment (OR severe vs no impairment 0.24; 0.13-0.45). Conclusion : Excessive polypharmacy is common among older people in Australia with no significant reductions in many chronic treatments during the inpatient episode. Patients with functional dependence are at particular risk and may be a target group for more individualised prescribing. Keywords : polypharmacy; inpatients; oldest old

PP26 C-197
PREDICTORS OF HEALTH-RELATED QUALITY OF LIFE (HRQOL) IN THE ELDER PATIENTS WITH OSTEOARTHRITIS USING EQ-5D

In Young YOO (Department of Nursing, Jeonju University, Korea)

Introduction : The purpose of this study was to identify the predictors of health-related quality of life (HRQoL) in the elder patients with osteoarthritis using EuroQol-5 Dimension (EQ-5D). Method : Data were extracted from the 5th Korea National Health and Nutrition Examination Survey (KNHANES) 2011. Subjects were 386 patients with osteoarthritis aged 65 years and over. Data was analyzed by using SPSS/Win 18.0. Results : The mean HRQoL using EQ-5D index of participants was .75 (± 0.22). HRQoL were significantly different according to age, education level, income, employment status, knee pain, knee stiffness, hip joint pain, low back pain, activity limitation, asthma, stress, depression and suicidal ideation. HRQoL was correlated with knee pain, hip joint pain, number of chronic disease, perceived health status and age. The factors affecting the HRQoL were perceived health status, activity limitation, knee stiffness, suicidal ideation, low back pain, asthma, income, hip joint pain, stress and employment status. These factors accounted for 46.0% of HRQoL. Conclusion : The findings suggest that the health care program for the elder patients with osteoarthritis should be carefully designed and tailored by socioeconomic variables, physical and emotional health status to improve HRQoL. Keywords : EQ-5D, Quality of life, Osteoarthritis

PP26 C-198
HEALTH-RELATED QUALITY OF LIFE IN ELDERLY PATIENTS WITH PARKINSON'S DISEASE

Ju Hee LEE¹, Moon Ki CHOI¹, Young Ho SOHN², Jin Yong HONG²
(1. Department of Clinical Nursing Science, College of Nursing, Yonsei University, Korea; 2. Department of Neurology, College of Medicine, Yonsei University, Korea)

Introduction : Health-related quality of life (HRQOL) has emerged as an important issue to elderly patients with chronic disease. With population aging, the number of the Parkinson's disease patients is predicted to grow, but we have limited knowledge of their HRQOL. This study was designed to test structural equation modeling of HRQOL of Parkinson's disease patients to provide development of interventions and strategies to improve their quality of life. Method : The participants in the study were patients who visited the neurology

outpatient department of a tertiary hospital in Seoul from July 16, 2012 to January 16, 2013. Demographic characteristics, disease related characteristics, quality of sleep, pain, depression, functional factors, and HRQOL were investigated via a structured questionnaire and measurement of physical function. The collected data were analyzed using PASW Statistics 18.0 and AMOS 7.0 program. Results : The final analysis included 217 patients. This hypothetical model verified disease related factors, depression, and pain as direct factors significantly influencing quality of life for Parkinson's disease patients (GFI=.93 and CFI=.96). Indirect factors including age, quality of sleep were also important factors in predicting quality of life. These variables explained 76.1% of variance in this model. Conclusion : Depression, pain as well as disease related features have the major impact on HRQOL in elderly Parkinson's disease. Therefore, comprehensive interventions are necessary to improve the quality of life of Parkinson's disease patients. Keywords : Parkinson's disease, health related quality of life

ASSOCIATION BETWEEN THE SATISFACTION FOR COMMUNICATION AND HEALTH-RELATED QUALITY OF LIFE IN COMMUNITY-RESIDING JAPANESE ELDERLY

Shuichi HARA¹, Hiroko MIURA², Kiyoko YAMASAKI³, Ken OSAKA⁴
(1. School of Health Science, Kyushu University of Health and Welfare, Japan; 2. Community Healthcare, National Institute of Public Health, Japan; 3. School of Social Welfare, Kyushu University of Health and Welfare, Japan; 4. Graduate School of Dentistry, Tohoku University, Japan)

Introduction : Decline of oral function may affect one's ability to communicate and may also decrease opportunities for verbal exchanges or deteriorate quality of life (QOL). We investigated oral function and health-related QOL (HRQOL) using a questionnaire to explore the factors related to improving the satisfaction for communication among community-residing elderly individuals. Method : Five hundred and seventy-eight subjects over 65 years (mean age 76.3 \pm 6.7 years) living in the north area of Miyazaki Prefecture, Japan were investigated. SF8 Health Survey (SF-8) was used to measure HRQOL. Satisfaction for communication was evaluated by five scale items (very satisfactory - very unsatisfactory). Dentition and denture condition, mastication, dysphagia risk, and General Oral Health Assessment Index (GOHAI) were assessed to clarify the factors associated with satisfaction for communication. Results : All scores on the SF-8 domains in subjects with low satisfaction for communication (unsatisfactory or very unsatisfactory) were significantly less than those in subjects with high satisfaction for communication (very satisfactory or satisfactory: $p < 0.001$). Furthermore, poorer mastication, worse denture condition, higher dysphagia risk, or a lower score on the GOHAI was significantly related to lower satisfaction for communication respectively ($p < 0.01$). Conclusion : These findings suggest that satisfactory oral conditions contribute to the ability for and satisfaction of communication; thus improving HRQOL among Japanese elderly individuals. Therefore, oral health programs for the elderly may play an important role in improving their communication status and HRQOL. Keywords : communication, health-related QOL (HRQOL), oral function

PP26 C-200
MULTIPLE TRAJECTORIES OF MULTIMORBIDITY AND IMPACTS ON SUCCESSFUL AGING AMONG THE TAIWANESE ELDERLY

Hui-Chuan HSU (Department of Health Care Administration, Asia University, Taiwan)

Introduction : Elderly usually have multiple chronic diseases at the same time which causes large medical expenditure and impacts on successful aging. However, the multimorbidity patterns are hardly examined across a long period of time. The purpose of this study was to examine the joint trajectories of chronic multimorbidity among the Taiwanese elderly as well as to examine the related factors across 14 years. **Method :** The data was from “The Taiwanese Longitudinal Survey on Aging (TLISA)”, year 1993 to 2007. Those who participated at least 3 waves or more were included in the analysis, in total 2,584 persons (57,012 observations). The chronic diseases included cardiovascular diseases (CVD), chronic non-specific lung disease (CNSLD), arthritis, cancer, gastrointestinal disease (GI), and kidney disease. The multiple group-based trajectories analysis approach was applied to identify the joint trajectory groups; the multinomial logistic regression was used to examine relationships of baseline factors to trajectory groups; the multiple regression and logistic regression were used to examine relationships of multimorbidity trajectories and successful aging indicators. **Results :** Four trajectory groups of multimorbidity were identified: Low risk (55.51%), CVD only risk (15.55%), GI & CNSLD risk (20.20%), and multiple risk (8.74%). Factors related to multimorbidity included age, education, physical functioning, depressive symptoms, regular exercise, and doing health examination. The multimorbidity trajectories were related to later physical functioning, depressive symptoms, social support, and life satisfaction. **Conclusion :** Multiple trajectories of multimorbidity show the patterns of health burden among the elderly over time. Dynamic changes of related factors to multimorbidity need to be further explored. **Keywords :** multiple group-based trajectories, multimorbidity, cormorbidity, chronic disease, successful aging

SARCOIDOSIS IN THE ELDERLY PATIENTS

H. HARIZ¹, S. MARZOUK¹, Radhouane GOUIAA², R. BEN SALAH¹, N. SAIDI¹, F. FRIKHA¹, M. SNOUSSI¹, M. JALLOULI¹, M. FRIGUI¹, Z. BAHLOUL¹ (1. Internal Medicine, Hedi Chaker Hospital, Tunisia; 2. Polyclinique CNSS - Sfax, Tunisian Association of Gerontology, Tunisia)

Introduction : Sarcoidosis is a multisystem granulomatous disease that generally affects young subjects. In elderly patients, the clinical features and the course of the disease can be different making the diagnosis challenging in some cases. **Method :** We retrospectively analyzed eight cases of sarcoidosis in elderly patients (≥65 years of age) treated in our department. Clinical and therapeutic characteristics were compared between the elderly and the younger patients. **Results :** From a series of 51 patients, eight patients (15, 7%) with sarcoidosis diagnosed after age 65 years. A female preponderance (75%) was noted. The intrathoracic involvement was frequent (75%). Dyspnea and cough were noted in the half of cases. Extrapulmonary signs involved ocular (3 cases), articular (2 cases) and hepatic (2 cases) manifestations. Cutaneous manifestations were significantly less frequent in elderly (p= 0,017). Hypercalcemia was noted in only one patient. Accessory salivary gland and lymphadenopathy biopsies were important contributing factors to diagnosis (respectively: 60% and 100% were positive). Oral corticosteroid therapy was required in 50% of cases but was less prescribed in young patients (p = 0, 05). **Conclusion :** Sarcoidosis is relatively rare in older persons. Female preponderance, as in our series, is widely reported. Pulmonary functional signs are the prominent symptoms. Alteration of general health is not rare. Diagnosis is sometimes not easy and should include accessory salivary gland or lymphadenopathy biopsy. Therapy involves corticosteroids. **Conclusion:** Sarcoidosis is not a condition exclusively of the young. It should be considered in the differential

diagnosis of elderly patients presenting with pulmonary or multisystem disease. **Keywords :** Sarcoidosis Elderly

A CASE OF TYPE 2 DIABETES MELLITUS DIAGNOSED THROUGH DETECTION OF PHARYNGOLARYNGEAL MYCOSIS

Shintaro IDE¹, Kazuki KOBAYASHI¹, Kho ISHIKAWA¹, Hidetaka YOKOH¹, Kaori TACHIBANA¹, Seichiro HIGUCHI¹, Naoko KIKKAWA², Ken-ichi SAKURAI¹, Minoru TAKEMOTO¹, Yoshitaka OKAMOTO², Koutaro YOKOTE¹ (1. Department of Medicine, Division of Metabolism and Endocrinology, Chiba University Hospital, Japan; 2. Department of Otorhinolaryngology/Head and Neck Surgery, Chiba University Hospital, Japan)

Introduction : A 65-year-old man visited the otolaryngology unit at our hospital with complaints of pharyngeal discomfort and difficulty in drinking. He was diagnosed as having impaired glucose tolerance on health checkup at the age of 50, but had not undergone further examination or treatment. Endoscopic examination revealed laryngeal edema with white patches, which led to a diagnosis of pharyngolaryngeal mycosis. **Method :** The patient was immediately hospitalized and treated with antifungal agents to avoid upper airway obstruction by acute progression of laryngeal edema. Blood test on admission showed marked hyperglycemia as 329 mg/dl of fasting plasma glucose and 12.7% of HbA1c, and therefore the patient was transferred to the diabetic unit for glycemic control. **Results :** Administration of insulin was initiated, and the pharyngolaryngeal mycosis resolved by day 12, with improvement of hyperglycemia. At the same time, a right renal tumor of 56?68 mm in size was detected and suspected as malignant on abdominal CT, therefore the patient was scheduled for surgery. **Conclusion :** It has been reported that pharyngolaryngeal mycosis is rare in Japan and mostly occurs in association with impaired local or systemic immunity. Several examinations for evaluating immune status showed almost normal results (ex. total and differential white blood cell count, T lymphocyte subset and serum concentration of immunoglobulins), nevertheless this patients would be thought to have some immunocompromised conditions caused by the untreated diabetes and malignant tumor. **Keywords :** Pharyngolaryngeal mycosis, Diabetes mellitus, Immunocompromised conditions

VISUAL AND MORPHOLOGICAL EVALUATION OF PERISTOMAL SKIN UNDER THE CERAMIDE-CONTAINING ADHESIVE

Hiroe KOYANAGI¹, Shinji IIZAKA², Sanae SASAKI¹, Mayumi ASADA², Gojiro NAKAGAMI², Takafumi KADONO³, Eiji SUNAMI⁴, Hiromi SANADA² (1. Dept. of Nurs, Univ. of Tokyo Hospital, Japan; 2. Dept. of Gerontol. Nurs./Wound. Care. Manage, Univ. of Tokyo, Japan; 3. Dept of Dermatology, Faculty of Medicine, Univ. of Tokyo, Japan; 4. Dept of Dermatology, Surgical Oncology & Vascular Surgery, Univ. of Tokyo, Japan)

Introduction : Peristomal skin may face the risk of eroded corneocytes, increased transepidermal water loss (TEWL) and various skin disorders because of the repeated attachment and detachment of the adhesives. Ceramide is a key molecule to maintain skin hydration at stratum corneum and barrier function. The objectives were to assess the morphological features of peristomal skin under the adhesives and to evaluate the effect of ceramide-containing adhesive in terms of the recovery fromof damaged peristomal skin. **Method :** We recruited older patients who aged 70yrs and visited the outpatient clinic for

stoma at the University of Tokyo hospital using the adhesives made by a manufacture. A ceramide-containing adhesive was applied instead of the usual adhesive. A patient was evaluated at most twice; baseline and at least 28 days later or the day when a patient consumed 10 adhesives. A trained nurse evaluated TEWL (VapoMeter®) and microscopic features (CharmView®) at six parts; the upper, lower, medial and lateral sites around stoma under adhesive, skin outside adhesive and an opposite site. Microscopic images were digitally analyzed to evaluate morphological feature of sulcus cutis. The protocol was approved by the Ethical Committee of the University of Tokyo (#2257). Results : At baseline, chronic skin changes characterized as a partial hypopigmentation, pigmentation, skin thinning and planarization of skin sulcus cutis were observed. After the application of a ceramide-containing adhesive, skin barrier function was recovered with decreased TEWL and normalized morphological condition. Conclusion : A ceramide-containing adhesive may be helpful to recover skin barrier function and improve chronic skin damages of peristomal skin. Keywords : Peristomal skin, Ceramide, Visual and morphological evaluation

PREVALENCE AND MANAGEMENT OF PRESSURE ULCERS IN A NEUROREHABILITATION WARD.

Maria Panagiota PANOURGIA, Cinzia TEROLLA, Francesca MAMOLI, Caterina PISTARINI (*Neurorehabilitation, Salvatore Maugeri Foundation, Italy*)

Introduction : Pressure ulcers (PU) are localized areas of tissue damage, caused by forces of pressure and friction, which constitute a common and serious health care problem having high costs in both economical and quality of life terms. Method : At admission patients were evaluated by registered nurses educated on risk assessment for developing PU and their nutritional states were screened and assessed by nutritionist. In case of PU presence registered nurse classified the PU, photographed the sore and started specific treatment according to the NPUA-EPUAP guide-lines. Results : 83 patients out of 176 admitted during 2011 were above 65 y.o. (median age=77, men=52, women=31). At admission 20 patients (24%) presented at least one PU and one patient (1.2%) presented one PU during the hospitalization period. According to the NPUAP-EPUAP classification 5 PU (23.8%) were presented at stage I, 7 PU (33.33%) at stage II, 4 PU (19.04%) at stage III and 5 PU (23.8%) at stage IV. After specific treatment for PU, according to the NPUA-EPUAP guide-lines, 19 patients (90.48%) out of 21 reached the complete healing of the ulcers while 2 patients deceased for causes not related to the PU presence. Conclusion : These results demonstrate the importance of the evaluation of the patients risk assessment on developing PU and of the presence of PU at admission, in order to activate immediately prevention measures and specific treatment. Thus, we observed a reduction of clinical complications due to PU and a substantial improvement of patients life quality. Keywords : pressure ulcers management

PROFILE OF REFRACTIVE ERRORS IN A SAMPLE OF OLDER POPULATION IN KUALA LUMPUR

Norhani MOHIDIN¹, Woei Kang THAM² (*1. Optometry & Vision Sciences, Faculty of Health Sciences, Universiti Kebangsaan Malaysia (National University of Malaysia), Malaysia; 2. School of Optometry, Twintech University College of Technology, Bandar Sri Damansara, Malaysia*)

Introduction : To study profiles of refractive errors in a sample of older population in a private practice in Kuala Lumpur. Method : This is a

retrospective study. Patients' files seen in a busy optical practice was reviewed and data on refractive errors extracted. The inclusion criteria was healthy subjects aged 40-80 years examined for refractive conditions in 2011. Data extracted include emmetropia, myopia, high myopia, hyperopia, astigmatism and its axis. Myopia was defined as SE < -0.50D, high myopia as SE < -5.00D, astigmatism as cylinder < -0.50DC, hyperopia as SE > 0.50D, and anisometropia as SE difference > 1.00 D. Results : Altogether 555 data of older adults was extracted. Only the right eye was analyzed since there was no significant difference between the right and left eye. Profile of refractive errors found was as follows: myopia -35.5%, high myopia -7.2%, hyperopia -24.9%, astigmatism -58.9% and anisometropia -8.3%. Astigmatism was found to be prevalent among emmetropic (32.4%), myopic (46.8%) and hyperopic (20.8%) subjects respectively. Hyperopic shift was seen as age increased. The proportion of subjects found with against-the-rule-astigmatism was higher in myopes, emmetropes and hyperopes than with-the-rule-astigmatism. There was no significant difference in refractive status according to gender. However, subjects with Chinese and Indian ethnicity showed higher prevalence of myopia and hyperopia respectively (p<0.001). Conclusion : The distribution for myopia was found to be 35.5% in the study population and the incidence is higher among the Chinese compared to the Indians and Malays. Keywords : Prevalence, Refractive error, Malaysian older population.

PATTERN VISUAL EVOKED POTENTIALS (PVEP) IN MILD COGNITIVE IMPAIRMENTS (MCI) - A PILOT STUDY

Norhani MOHIDIN¹, Chean Ling LAU¹, Suzana SHAHAR² (*1. Optometry & Vision Sciences, Faculty of Health Sciences, Universiti Kebangsaan Malaysia (National University of Malaysia), Malaysia; 2. Dietetics, Faculty of Health Sciences, Universiti Kebangsaan Malaysia (National University of Malaysia), Malaysia*)

Introduction : The effect of pattern visual evoked potential (pVEP) on mild cognitive impairment (MCI) is unknown, although it has been reported in patients with severe dementia such as Alzheimer. The purpose of this study is to find whether these effects are reflected in patients diagnosed with MCI. Method : Subjects aged 60 years and older diagnosed with MCI by clinical psychologists were invited to take part in the study. VEP recording was done in accordance with ISCEV recommendations using Roland Consult Electrophysiological instrument. Two measurements were taken and data on amplitude and implicit times of P100 were averaged. A group of controls were also recruited and subjected to the same procedure for comparison. The project was approved by the ethical committee of UKM and followed the tenets of Declaration of Helsinki. Results : The results for P100 amplitude and implicit time for MCI subjects and controls were 9.859 ± 4.207 (μ v), 109.737 ± 7.759 (ms), 9.030 ± 3.557 (μ v) and 105.736 ± 3.522 (ms) respectively. The results showed no significant difference in amplitude and implicit time of subjects diagnosed with MCI as compared to controls. Subjects included in this study were diagnosed between 1-3 years prior to VEP measurement. However the severity of MCI was not taken into consideration during analysis. It is possible that these contributed to the outcome of the study. Conclusion : Our pilot study results do not show any significant differences in amplitude and implicit times of pVEP in MCI subjects as compared to controls. Keywords : pattern VEP, MCI

PP26 C-207

IMPLEMENTATION OF A PROGRAM OF FALLS PREVENTION IN GERIATRIC POPULATION IN LA RIBERA COUNTY (ALZIRA, VALENCIA, SPAIN): PRELIMINARY

RESULTS

Pilar PEREZ-ROS¹, Francisco MARTINEZ-ARNAU², Rosana ALBERT-BLASCO³, Francisco J. TARAZONA-SANTABALBINA³ (1. *Facultad de Enfermería., Universidad Católica San Vicente Martir., Spain*; 2. *Departament de Fisioteràpia., Facultat de Fisioteràpia Valencia. Universitat de Valencia., Spain*; 3. *Geriatric Medicine, Hospital Universitario de la Ribera., Spain*)

Introduction : Prevalence of falls is high in geriatric population, constituting a social and sanitary problem. The aim of our study was to apply a program of falls prevention in the community based on active aging and evaluating its results. Method : 106 subjects of a sample of 730 were analyzed. They had completed twelve months of study follow-up. Sample was shared in three groups: 1.- This group received instructions on falls prevention and healthy exercises to improve physical function and balance at beginning of the study. 2.- This group received same theoretical information adding a quarterly session of recollection. 3.- This group received same theoretical information adding a monthly theoretical and practical reinforcement. Variables studied included anthropometric, nutritional, clinical, functional, cognitive and of quality of life values. Results : Average age was 75,1 (SD 4,7) years. Women percentage was 61,3 %. Active group presented a significant reduction of weight percentage (1,84% (IC 95% 0,96-2,72), $p < 0,05$) and body mass index (1,99 % (IC 95% 0,99-2,98), $p < 0,048$) and a major physical activity ($p < 0,03$). We observed an increased muscular force measured by dynamometer, a decreased fat mass measured with impedancemetry and a functional improvement measured up to Barthel's scale in intervention group. These trends were not statistically significant. Conclusion : A program of falls prevention applied in the community can influence positively an increase in physical activity and a reduction of weight. Analysis of complete sample will help to confirm some of these observed trends. Keywords : Falls prevention geriatric syndrome

UPDATE OF THE HIP FRACTURE CLINICAL PRACTICE GUIDELINE IN THE HOSPITAL UNIVERSITARIO DE LA RIBERA (ALZIRA, VALENCIA, SPAIN)

Josefina CUBES¹, Encarna MINANA¹, Raquel VILLAMAR¹, Elena BURDEOS², Francisco Jose TARAZONA-SANTABALBINA³, Antonio CALATAYUD⁴, Jose MINGUEZ⁵, Santiago BONONAD⁶, Edelmira MORENO⁷, Juan Antonio AVELLANA³, David CUESTA², Susana SIVERA¹ (1. *Anesthesia Department, Hospital Universitario de la Ribera, Spain*; 2. *Medical Assistential Quality Department, Hospital Universitario de la Ribera, Spain*; 3. *Geriatric Medicine, Hospital Universitario de la Ribera, Spain*; 4. *Orthopaedic Department, Hospital Universitario de la Ribera, Spain*; 5. *Medical Emergencies Department, Hospital Universitario de la Ribera, Spain*; 6. *Haematology Department, Hospital Universitario de la Ribera, Spain*; 7. *Rehabilitation Department, Hospital Universitario de la Ribera, Spain*)

Introduction : Hospital Universitario de la Ribera implemented a hip fracture clinical practice guidelines (CPG) in the year 2001. Method : 11 years later this CPG has been updated according medicine based evidence (MBE). An important point in approach strategy is interdisciplinary team action based in precociousness. Results : In this way, CPG incorporates to emergencies service. In emergencies room priority is based in clinical attention before 30 minute since patient arrives, pain control with an EVA scale ≤ 3 , fluid therapy, according kidney function and blood and X-ray tests. In Orthopaedic room patients will be received ferric carboxymaltose (500 mg) intravenous in only dose. Geriatric Comprehensive Assessment will be done before

8 hours since hospital admission. Assessment includes function scales, Nottingham hip fracture score and acute confusional state prevention tasks. In addition femoral nerve block will be considered to pain control and an anticoagulant drugs protocol has been established to avoid surgical delays beyond 36 hours. In this way, changes in anesthetic methods will be considered in order to an early surgery. Our updated CPG avoids permanent vesical catheter and establishes hemoglobin value of 9 g/dl as a limit to blood transfusion. It is essential to complete 100 % items of surgical check-list before starting surgical procedures. Surgical technique will be chosen according fracture type and MBE. Rehabilitation team will examine patient in first 24 hours after surgery. Conclusion : At hospital discharge calcium and vitamin D supplements, enteral nutritional supplements and antiresorptive or bone formation drugs will be considered. Keywords : hip fracture guidelines

PP26 C-209

VITAMIN D3 DEFICIT AS EVOLUTION RISK FACTOR IN GERIATRIC PATIENTS WITH HIP FRACTURE

Francisco Jose TARAZONA-SANTABALBINA¹, Rosa Ana PEREZ-GINER², Francisco Borja MARUENDA², Angel BELENGUER¹, Eduardo ROVIRA³ (1. *Geriatric Medicine, Hospital Universitario de la Ribera, Spain*; 2. *Orthopaedic Department, Hospital Universitario de la Ribera, Spain*; 3. *Internal Medicine Department, Hospital Universitario de la Ribera, Spain*)

Introduction : Vitamin D3 deficit is highly prevalent in geriatric population. This deficit associates increase risk of hip fracture. Objective: To study possible relationship between calcidiol blood levels and functional changes and mortality. Method : Prospective cohort of geriatric patients with hip fracture admitted at Hospital Universitario de la Ribera between years 2010 and 2012. 161 patients of age ≥ 70 years of a total sample of 332 who completed a follow-up period of 12 months. We studied functional and cognitive variables, nutritional parameters, blood values of calcidiol, parathormone (PTH), hospital readmissions and mortality for a 12 months of follow-up period were collected. Results : 121 women (74,7 %). Age 84,0 (SD 6,31) years, mean of length of stay 8,05 (SD 2,76) days. Mean presurgical length of stay 1,84 (SD 1,34) days. Calcidiol 13,8 (SD 9,5) ng/ml. 157 (96,95) with calcidiol levels in rank of insufficiency. PTH 84,6 (SD 46,9) pg/ml. 101 (62,3 %) patients with PTH levels higher than normal. Mortality during hospital admission 6 (3,7%), at month after admission 9 (6%), at 6 months 27 (18,2%), at 12 months 33 (22,4%). There is a significant statistical Spearman's correlation between difference Barthel's score and calcidiol blood levels, $p < 0,03$. A multiple regression was calculated to 12 months accumulated mortality. We found a significant statistical relationship between masculine gender and previous fracture history and mortality, $R^2 = 0,567$, $P < 0,016$. Conclusion : We have not found a statistically significant relationship between calcidiol levels and mortality or functional deterioration. We believe possible to find a relationship when we had completed global sample study. Keywords : hip fracture calcidiol deficiency

PP26 C-210

DO NOT RESUSCITATE ORDERS AND AGING: IS THERE AN IMPACT OF COMORBIDITIES ON THE DECISION-MAKING PROCESS?

De Decker LAURE¹, Annweiller CEDRIC², Berrut GILLES³, Beauchet OLIVIER² (1. *Geriatric, University Nantes, France*; 2. *Geriatric, University Angers, France*; 3. *Geriatric, Hospital Nantes, France*)

Introduction : The “Do Not Resuscitate” orders (DNR) are defined as advance medical directives to withhold cardiopulmonary resuscitation during cardiac arrest. Comorbidities may influence the DNR decision-making process. Our objective was to perform a systematic review and meta-analysis of published data examining the relationship between DNR orders and comorbidities in older patients. **Method :** A systematic Medline and Cochrane literature search limited to human studies published in English and French was conducted on August 2012, with no date limits, using the following terms: “resuscitation orders” OR “do-not-resuscitate” combined with “aged, 80 and over” combined with “comorbidities” OR ‘chronic diseases’. **Results :** Of the 65 selected studies, 22 met the selection criteria for inclusion in the qualitative analysis. DNR orders were positively associated with comorbidities in 21 studies (95%). The meta-analysis included 7 studies with a total of 27,707 participants and 5065 DNR orders. It confirmed that comorbidities were positively associated with DNR orders (summary OR = 1.25 [95% CI: 1.19-1.33]). The relationship between DNR orders and comorbidities differed according to the nature of comorbidities; the summary OR for DNR orders was 1.15 (95% CI: 1.07-1.23) for cognitive impairment, OR=2.58 (95% CI: 2.08-3.20) for cancer, OR=1.07 (95% CI: 0.92-1.24) for heart diseases (i.e., coronary heart disease or congestive heart failure), and OR=1.97 (95% CI: 1.61-2.40) for stroke. **Conclusion :** This systematic review and meta-analysis showed that DNR orders are positively associated with comorbidities, particularly with cognitive impairment, cancer and stroke. **Keywords :** Do not resuscitate orders; comorbidities

PP26 C-211

EARLY DEATH IN OLDER PATIENTS WITH CANCER

Rabia BOULAHSSASS¹, Sebastien GONFRIER¹, Francine AUBEN¹, Veronique MARI², Isabelle BEREDER¹, Anne Laure COUDERC¹, Jerome BARRIERE², Eric FRANCOIS², Olivier GUERIN¹ (1. Gerontology, CHU de Nice, France; 2. Oncology, Centre Antoine Lacassagne, France)

Introduction : The purpose of this study is to analyse early death in older patients with cancer during 100 days after a geriatric comprehensive assessment. **Method :** This study is a prospective et descriptive work. A geriatric comprehensive have been done before the treatment decision. Geriatric data (MMSE, MNA, BMI, ADL, IADL, CIRSg, Gait speed, QLQC30, Charlson, G8 and Balducci classification) are collected and also characteristic of the cancer and social and demographic data. During 100 days of follow up, the rate of death, treatment made et geriatric interventions are collected. **Results :** One third of the patients (n=104) have died during the follow up of 100 days. Mean age of the patients are 81 years old. Patients with lower gait speed (p=0,04), metastatic cancers (p=0,03), poor nutritional status (p=0,01), lower screening score test (G8) (p=0,01), PS>2 (p=0,01) and higher state score on Balducci's classification had significantly more risk to die. **Conclusion :** This study confirms the importance of the geriatric comprehensive assessment in oncogeriatric patients to predict risk factors of worse outcomes. Further analyses (logistic regression and Interventional geriatric factors) will be done in this study. **Keywords :** oncogeriatric, survey, early death

PP26 C-212

TREATMENT DECISIONS FOR ELDERLY CANCER PATIENTS

Boulahssass RABIA¹, Veronique MARI², Francine AUBEN¹, Sebastien GONFRIER¹, Jean Michel TURPIN¹, Guillaume SACCO¹, Patrice BROCKER¹, Eric FRANCOIS², Olivier GUERIN¹ (1. Gerontology, CHU de Nice, France; 2. Oncology, Centre Antoine Lacassagne, France)

Introduction : Purpose of the study was to analyse the treatment decision made by older patients with cancers and their caregivers. **Method :** After a Comprehensive Geriatric Assessment (CGA) , 109 patients and their caregiver were asked about their decision on oncologic treatment .Treatment could be chemotherapy, radiotherapy, surgery , others therapies or palliative care. Different aspects which could influence decision were collected: characteristics of the cancer (metastasis or not), cognitive status, knowledge of the diagnosis and data on CGA. **Results :** One hundred and one patients and 109 caregivers were enrolled .Mean age was 81 [SD] years old. Only 11% patients (n=12) refused the treatment and 14% of the caregivers (n=15). Five percent of patients could not make a decision because « it's difficult » and ask their doctors to make it. Fifteen percent could not make a decision because of their cognitive status. Six percent of the patients could not make decision because they don't know the diagnosis. Sixty three percent of them accepted to be treated. **Conclusion :** Most of patients who could made a decision have the same reflex ion than younger patients. Cognitive status needs to be checked before making the decision. A little part of them don't know the diagnosis because of their family .Ethical reflex ion is necessary because the right to know is also important in elderly patients. Further analyses are need to compare if there is differences between the treatments and including the data of the CGA. **Keywords :** ethics, treatment decision making, oncogeriatric

PP26 C-213

EFFECT OF ANEMIA ON FATIGUE AND QUALITY OF LIFE OF PATIENTS OVER 75 YEARS

Claire VANHAECKE COLLARD¹, Coralie BARBE², Jean Luc NOVELLA¹, Francois BLANCHARD¹, Dragos CIOCAN², Delphine LEBRUN¹, Rachid MAHMOUDI¹ (1. Geriatrie Aigue et Medecine Interne, CHU Reims, France; 2. Unite d'aide Methodologique, CHU Reims, France)

Introduction : Anemia is more prevalent with ageing and constitutes a risk of decompensation of frailty, which is a consequence of the multiple comorbidities frequent in the elderly. Aims of this study was to evaluate impact of anemia on fatigue and quality of life (QoL) among elderly over 75, based on the hemoglobin level, and to identify the etiologies of anemia, the treatment prescribed and the clinical and functional impact of the treatment. **Method :** A prospective and observational cohort study was conducted in the acute geriatric unit of the Hospital of Reims and included patients over 75. Socio-demographic and geriatric characteristics, hemoglobin level, assessment of fatigue and QoL (FACT-An and SF-36) were collected at admission and on discharge. Etiology and treatment of anemia were collected from medical records. **Results :** A total of 66 patients were included and 36 of them presented anemia (54,5 %). Mean hemoglobin level was 104,6 g/L. Fatigue and QoL were impacted by anemia with a reduction in FACT-An (p=0,0296), FACT-F (p=0,0356) and “anemia score” of FACT-An (p=0,0369) scores. Main etiologies of anemia were chronic kidney disease, inflammation and nutritional deficiencies. A treatment of anemia was prescribed to 15 patients (42,8%). **Conclusion :** Our study shows that there is a functional impact of anemia in the elderly. Medical management of anemia in this population can't be a transposition of the one applied to the general population and must be adapted to the specificities of the elderly in terms of tolerance to anemia. **Keywords :** anemia, fatigue, quality of live

PP26 C-214

INTEREST OF AB40 ASSAY AND AB42/AB40 RATIO IN THE DIAGNOSIS OF ALZHEIMER'S DISEASE

Rachid MAHMOUDI¹, Isabella MORRONE¹, Jean Baptiste OUDART², Claire VANHAECKE COLLARD¹, Laurent RAMONT³, Camille TALBOT³, Moustapha DRAME³, Jean Luc NOVELLA¹ (1. Internal Medicine and Clinical Gerontology, CHU Reims, France; 2. Biology, CHU Reims, France; 3. Geriatric, CHU Reims, France)

Introduction : Combined assay of A β 42 and tau-protein (total/phosphorylated) in cerebrospinal fluid (CSF) showed a high potential in the diagnosis of Alzheimer's Disease (AD) justifying their introduction in the new diagnosis criteria. However this assay led sometimes to discordant results indiscriminate (isolated variation of A β 42 or P-tau). The A β 42/A β 40 ratio reflects the relative variation of A β 42 in relation to the amyloid burden overall. This ratio is less than 0.05 in AD. Aim of this study was to evaluate interest of the A β 42/A β 40 ratio in patients whose biomarkers profile was discordant. **Method :** A monocentric prospective study was conducted over a period of 24 months. Were included all patients who received CSF biomarkers assay. **Results :** 119 patients were included of which 56 presented discordant profile. After integration of the A β 42/A β 40 ratio, 26 patients had normal profile (A β 42/A β 40 >0.05 and P-Tau<60), 2 had isolated tauopathy profile (A β 42/A β 40 > 0.05 and P-Tau> 60), 13 AD (A β 42/A β 40 < 0.05 and P-Tau>60), 15 isolated Amyloidopathy profile (A β 42/A β 40 < 0.05 and P-Tau<60). The A β 42/A β 40 ratio allows amelioration of diagnosis performance of 22% (63% versus 85% integrating the ratio). **Conclusion :** This study shows interest of A β 40 assay and A β 42/A β 40 ratio in diagnosis of AD. The recourse to this ratio can be very useful to our clinical practice. **Keywords :** Alzheimer's disease, A β 42/A β 40 ratio, CSF Biomarkers

PP26 C-215 THE CLINICAL CHARACTERISTICS OF PNEUMONIA AND URINARY TRACT INFECTION IN A COMMUNITY-BASED GERIATRIC HOSPITAL

Jong-Hoo LEE¹, Young-Jin KIM¹, In-Gyu KIM², Sung-Man ROWE², Hyun-Sik YUN¹, Jae-Young HAN¹, In-Sung CHOI¹, Sam-Gyu LEE¹ (1. Department of Physical & Rehabilitation Medicine, Research Institute of Medical Sciences, Chonnam National University Medical School & Hospital, Korea; 2. Department of Physical & Rehabilitation Medicine, Chonnam National University Hwasun Geriatric Hospital, Korea)

Introduction : Infection such as pneumonia and urinary tract infection (UTI) is one of common problems in patients of geriatric hospital. We aimed to investigate the clinical characteristics of pneumonia and UTI in a community-based geriatric hospital. **Method :** One hundred and seventy three inpatients (age 62.52±15.31 years; 61 men, 112 women; stroke 116, brain tumor 5, spinal cord injury 17, others 30) participated in NeuroRehabilitation program. We retrospectively reviewed the medical records of inpatients. Pneumonia was diagnosed by clinical symptoms, laboratory findings and simple radiologic findings. UTI was diagnosed by clinical symptoms, blood examination and urine analysis. **Results :** Four patients (4 men) out of 173 patients developed geriatric hospital acquired pneumonia. Tracheostomy was observed in 1 patient. Previous feeding route was tube feeding in all 4 patients. They were successfully treated with intravenous (IV) injection of antibiotics (2 ceftriaxone, levofloxacillin, tazobactam). Five (1 man, 4 women) patients out of 173 patients developed UTI. Voiding methods were voluntary voiding in 1 patient, continuous catheterization in 4 patients. They were successfully treated with empirical IV antibiotics treatment (4 levofloxacillin, 1 ceftriaxone). **Conclusion :** The incidence of pneumonia or UTI was not higher than expected. It may be attributed to the adoption of well-structured rehabilitative management system. The understanding of the clinical characteristics of pneumonia and

UTI in geriatric hospital would be helpful for therapeutic optimization. **Keywords :** Elderly, Pneumonia, Urinary tract infection

PP26 C-216 COMPARISON OF HOSPITAL-BASED CARDIAC REHABILITATION AND HOME-BASED CARDIAC REHABILITATION IN THE ELDERLY

Sam-Gyu LEE, Min-Keun SONG, Hyo-Jeong SEON, Young-Cheol YUN, Jun-Beom LEE, Hyun-Sik YUN, Jae-Young HAN, In-Sung CHOI (Department of Physical & Rehabilitation Medicine, Research Institute of Medical Sciences, Chonnam National University Medical School & Hospital, Korea)

Introduction : Home-based cardiac rehabilitation (CR) and hospital-based CR seem to be equally effective in improving clinical and health related quality of life outcomes in CR patients. The elderly has received less attention in CR field. We aimed to compare the effects of hospital-based CR and home-based CR in the elderly. **Method :** Twenty patients over 65 years old, who were referred for CR after percutaneous coronary intervention (PCI), were enrolled. All patients conducted exercise tolerance test (ETT) in 2 weeks after PCI by modified Bruce protocol. After ETT, each patient took an exercise prescription according to the result of ETT. Thirteen patients (6 men, 7 women; 7 ST-elevation myocardial infarction (STEMI), 6 non-ST elevation myocardial infarction (NSTEMI); age 71.6±4.9 years; ejection fraction (EF) 57.8±10.4 %; body mass index (BMI) 23.6±2.5 kg/m²) participated in the hospital-based CR and 7 patients (3 men, 4 women; 2 STEMI, 5 NSTEMI; age 71.8±2.9 years; EF 61.1±10.0 %; BMI 23.6±3.7 kg/m²) did the home-based CR. We evaluated the cardiac function by recording maximal metabolic equivalent of task (MET), VO₂max and peak heart rate (PHR). PHR was recorded at 100% of VO₂max during ETT. Follow-up ETT was conducted after 4 weeks. **Results :** There were significant differences of VO₂max and maximal METs in hospital-based CR group before and after CR (p=0.001, 0.013). After CR, there was significant difference of maximal METs between hospital-based CR group and home-based CR group (p=0.028). **Conclusion :** Hospital-based CR showed more improvement of cardiac function than home-based CR at short-term follow-up. **Keywords :** Exercise, Function, Ischemic heart disease

PP26 C-217 THE CLINICAL SIGNIFICANCE OF QUANTITATIVE SENSORY TEST IN STROKE

Yu-Ri CHOI, Hyo-Jeong SEON, Jun-Beom LEE, Hyun-Sik YUN, Jae-Young HAN, In-Sung CHOI, Sam-Gyu LEE (Department of Physical & Rehabilitation Medicine, Research Institute of Medical Sciences, Chonnam National University Medical School & Hospital, Korea)

Introduction : Sensory impairment is one of common symptoms in stroke patients. Quantitative sensory test (QST) has been developed to complement traditional neurological bedside examination in the analysis of sensory impairment. Pain and temperature sensations are conveyed via spinothalamic pathway, however, it is not easy to evaluate spinothalamic pathway objectively in stroke patients. We aimed to investigate the clinical significance of QST in stroke patients. **Method :** Eleven stroke patients (8 men, 3 women; age 59.82±12.19 years; ischemic 7, hemorrhagic 4) who can cooperate in the sensory evaluation were recruited. Conventional sensory exam including light touch, sharp & dull, proprioception and stereognosis was performed on 45.64±22.95 days. Both median nerve SSEPs were obtained on 39.18±21.88 days. QST with CASE IV (WR Medical Electronics,

Stillwater, MN) was performed on 42.09±21.86 days. We tested vibratory perception threshold (VPT), cold perception thresholds (CPT) and warm perception threshold (WPT) in both hands. Results : In the affected hand, VPT was 17.73±2.69 JND, CPT was 18.18±7.63 JND, WPT was 16.82±3.66 JND. Light touch sensation and proprioception were not associated with SSEP, respectively (p=0.424, 0.545). Sharp & dull sensation was associated with CPT (p=0.006). But, sharp & dull sensation was not associated with WPT (p=0.727). Light touch sensation was abnormal in 8 patients, SSEP was abnormal in 6 patients, however, VPT was elevated in all patients. Conclusion : CPT would be helpful for the objective evaluation of spinothalamic pathway in stroke patients. Further study including large stroke patients group with post-stroke central pain will be needed. Keywords: Stroke, Sensory function, Evaluation

PP26 C-218

OUTCOMES IN COMPLEX PATIENTS WITH DELIRIUM AND SUBSYNDROMAL DELIRIUM ONE YEAR AFTER HOSPITAL DISCHARGE

Nicolas MARTINEZ-VELILLA¹, Koldo CAMBRA², Berta IBANEZ³, Cristina ALONSO BOUZON⁴, Javier ALONSO-RENEO⁵, Alvaro CASAS-HERRERO⁵ (1. Geriatric Department, Complejo Hospitalario de Navarra, Spain; 2. Centro de Investigacion Biomedica, Fundacion Miguel Servet, Spain; 3. Centro Investigacion Biomedica, Fundacion Miguel Servet, Spain; 4. Servicio de Geriatria, Hospital Universitario de Getafe, Spain; 5. Servicio de Geriatria, Complejo Hospitalario de Navarra, Spain)

Introduction : There is growing evidence about the prognostic significance of SSD among elderly but to date, there are very few published studies of SSD in elderly medical patients and the goal of our study was to corroborate the 1-year outcomes. Method : Prospective multicentre study of 85 patients admitted in the acute geriatric wards of three tertiary hospitals in Spain. Our SSD clinical diagnostic criteria used were based on Marcantonio's, who defines them as non-full presence of CAM definitive delirium criteria rather as the presence of at least one of their criteria. To assess the relationship of delirium and SSD with different variables we used the Chi square test or Fisher test, the trend test in proportions, and T-test or Mann Whitney test. In multivariate models, linear or logistic, we have tried as covariates all variables with at least marginal significance in the bivariate analysis. Results : At 1-year follow-up thirty four (40%) of patients died (51% of patients with delirium, 39% with SSD and 47% without delirium). In the bivariate analysis the risk of death doesn't appear to be associated with any of the variables except CIRS-G (Cumulative Illness Rating Scale-Geriatric). Adjusting for CIRS-G and the initial Barthel, the diagnosis of subsyndromal delirium did not appear significantly associated with Barthel index variation at 12 months. Conclusion : Findings from this study confirm the high prevalence of delirium and SSD but fail to prove the gradient in outcomes at one year along the delirium spectrum that the baseline study suggested. We suggest several explanations. Keywords : delirium, subsyndromal delirium, prognosis

PP26 C-219

COST EFFECTIVENESS OF MEDICAL HOME VISITS IN BED BOUND HOME BOUND OLDER ADULTS IN A COMMUNITY SETTING

Rahul PADMANABHAN (Geriatric Services, G Kuppuswamy Naidu Memorial Hospital, Coimbatore, India)

Introduction : Aim of the study was to study the cost effectiveness of providing geriatric home care services to older adults in the

community through a mobile geriatric team. Method : Data was collected from 25 patients who were registered with the geriatric services department of a tertiary care hospital for routine home visits. Cost effectiveness was calculated by comparing the actual cost incurred to the patient and the estimated cost that would have incurred if the patient was brought to the hospital. Secondly, effectiveness of each home visit in preventing future hospital admission, re-admission and further complication were analyzed. Results : We found that through properly designed home care service program, we are able to cut down the overall health expenditure of the patient by 43 %. The sample included patients that were followed from the hospital to home through transitional care model (TCM) (3) and patients who registered from the community for the program (22). 45 % of patients studied improved well with routine health evaluations at home. We were able to cut down hospital admission by 40 %, hospital re-admission by 70 %. Infection was found to be the major contributor to declining health status (75%) needing in-patient care. Conclusion : Geriatric home visit is a cost effective method to cut down medical expenditure in older adults. Proper designing of the protocol and logistics is key to cost effectiveness from the hospital perspective. Early detection and management of anticipated complication reduces patient expenditure. TCM was an effective method of reducing re-admission and complications. Keywords : Geriatric Home visits, Transitional care model, Cost effectiveness

PP26 C-220

EARLY DISCHARGE AND ADMISSION AVOIDANCE STRATEGIES FOR OLDER PATIENTS WITH FUNCTIONAL DECLINE DUE TO ACUTE ILLNESS: COMPARING TWO INTERMEDIATE CARE UNITS

Miquel Angel MAS¹, Sebastia SANTA EUGENIA¹, Antoni SICRAS², Joan CUNILL¹ (1. Department of Geriatric Medicine and Palliative Care, Badalona Serveis Assistencials, Spain; 2. Planning and Resources Management, Badalona Serveis Assistencials, Spain)

Introduction : Alternatives to conventional care for older patients are needed. Intermediate Care (IC) resources seem effective both at home and at specialized hospital units. Method : A pilot descriptive study analyzed functional gain (measured by Barthel Index), length of stay (LOS; days) and discharge destination (%) of older medical (M) and orthogeriatric (O) patients with functional decline after acute illness. We compared two units: recently developed IC hospital-at-home (IC home) versus IC hospitalization (main inclusion criteria except home support; IC home if career and acceptance). We separately analyzed Early Discharge (ESD) and Admission Avoidance (AA) strategies. Results : 637 patients. Main results were (IC home/IC hospitalization): ESD M (N 47/126; functional gain 23.6/23.1, p 0.92; LOS 34/57, p<0.01; destination home 62/77, p<0.01); AA M (N 54/33; functional gain 25.8/15.8, p 0.06; LOS 53/58, p 0.43; destination home 76/73, p 0.02); ESD O (N 66/265; functional gain 27.0/29.2, p 0.45; LOS 43/60, p <0.01; destination home 89/89, p 0.91); AA O (N 20/26; functional gain 23.8/31.0, p 0.24; LOS 48/60, p 0.16; destination home 85/88, p 0.21). Conclusion : Both units had good results on ESD and AA processes. For ESD strategy LOS was significantly shorter in home unit. Some medical patients couldn't stay at home at the end of intervention due to severe acute events. Keywords : Intermediate Care, Admission Avoidance, Early Discharge, Rehabilitation

PP26 C-221

MEASUREMENTS OF FUNCTIONAL CAPACITY AMONG A VERY OLD SAMPLE OF INSTITUTIONALIZED PARTICIPANTS

Alvaro CASAS HERRERO¹, Eduardo CADORE², Frabricio

ZAMBON², Nora MILLOR³, Teresa MARCELLAN⁴, Mikel IZQUIERDO⁵ (1. Geriatrics, Complejo Hospitalario de Navarra. Universidad Publica de Navarra, Spain; 2. Pyhiotherapy, Universidad Publica de Navarra, Spain; 3. Mathematics, Universidad publicca de Navarra, Spain; 4. Geriatrics, Residencia Casa misericordia, Spain; 5. Pyhiotherapy, Univerisdad Publica Navarra, Spain)

Introduction : Limited information is available about measurements of functional capacity in the oldest old institutionalized elders. It remains controversial if cognitive decline could be part of the frail phenotype. Method : 35 participants were divided according to frailty paradigm (Fried criteria) into frail (n=12), robust (n=12) and frail and mild cognitive decline (MCI) (n=9) using Petersen criteria. Gait velocity 5 m test (GVT) and Time up and go (TUG), both with dual task paradigm, balance (semitandem) and strength (hand grip, knee extension, hip strength) were examined. Results : Significant differences between groups were observed in all tests related to the gait ability. Robust group reached higher TUG performance compared to that observed in frail (P<0.01) and MCI+frail group (P<0.01), whereas similar results were observed using dual task paradigm. Moreover, the nofrail group had significant greater performance in the usual GVT than the frail (P<0.001) and MCI+frail group (P<0.001), as well as greater performance with arithmetic and verbal dual task compared with frail (P<0.01) and DCL+frail group (P<0.001) Robust showed significant greater semitandem test performance compared with that observed in the frail (P<0.001) and DCL+frail group (P<0.05). Nofrail elderls showed greater hand grip, knee extension and hip flexor strength values compared with the frail (P<0.01) and MCI+frail group (P<0.01). Conclusion : Measurements of functional capacity in the robust oldest group were significant higher than that observe in frail or frail+ MCI group whereas no statistical differences were found between frail and MCI+frail group.. These results suggest that MCI could be included in the frailty continuum. Keywords : Functional capacity, frailty, mild cognitive impairment

PP26 C-222

THE RESULTS OF RENAL BIOPSY IN THE OLDER PATIENTS WITH RENAL DISEASE

Mi Young KIM¹, Dong Won PARK¹, Hang-Il, GOH², Koo Ho SEOK² (1. Internal Medicine, Seoul Paik Hospital, Korea; 2. Internal Medicine, Nephrology, Seoul Paik Hospital, Korea)

Introduction : The older patient with renal disease have been being taken conservative treatment without renal biopsy because of old age. But recently with the development of medicine and the number of older people in general population, it is time for need of analyzing the clinical manifestation and renal pathology about the older patient in Korea. Method : From Jun 1979 to Aug 2012, we searched and analyzed the medical record about the older patient (> 65 yrs) who had renal biopsy in Seoul Paik hospital. Results : The number who had renal biopsy was 54, the mean age was 70 ± 5, the number of male gender was 26 (45.6%), female gender was 27 (47.4%). Initially, the level of serum creatinine was 2.44 ± 2.04 mg/dL, and estimated glomerular filtration rate was 40.52 ± 2.71 ml/min/1.73m² and the stage of CKD by MDRD equation was 3 ± 1. With the result of pathology including repetition, the percentage of primary glomerulonephritis was 47.4% and that of secondary glomerulonephritis was 28.1%. In order of frequency, the percentage of membranous nephropathy was 16.92%, that of the interstitial nephritis was 13.85% and that of the FSGS was 7.69%. Secondary glomerulonephritis included diabetic nephropathy, lupus nephritis and vasculitis. Conclusion : In this study, the percentage of primary

glomerulonephritis was higher and the percentage of membranous nephropathy was the most. After the treatment renal function and proteinuria showed improvement, so we suggested that the older patient with renal disease should have renal biopsy actively for appropriate treatment. Keywords : renal biopsy, older patient, renal disease

A SYSTEMATIC REVIEW ON ESSENTIAL FACTORS AND EFFICIENT MANAGEMENT METHODS FOR COMPREHENSIVE GERIATRIC ASSESSMENT

Naoki TOMITA¹, Takae EBIHARA¹, Takashi OHRUI², Kaori UNE¹, Miho TSUTSUI¹, Youich KOSAKA¹, Shoji OKINAGA¹, Katsutoshi FURUKAWA¹, Hiroyuki ARAI¹ (1. Department of Geriatrics and Gerontology, Institute of Development, Aging and Cancer, Tohoku University, Japan; 2. Division of Geriatric Pharmacotherapy, Institute of Development, Aging and Cancer, Tohoku University, Japan)

Introduction : Trials have reported on several types of comprehensive geriatric assessments (CGA). The factors to be evaluated and management of these evaluations in the whole assessment are varying among these studies. However, not much is available on the comparison of these variations. As medical and care resources are limited, we need to develop not only effective, but also efficient system of geriatric assessments. In the present study, we reviewed the variation of CGA described in previous studies systematically to confirm the efficient method of evaluation. Method : Searches of PubMed were conducted for articles written in English, and published between January 1960 and December 25, 2012. The search terms were geriatric assessment, geriatric evaluation combined with comprehensive assessment, geriatric syndrome. Results : One thousand five hundred fifty-four citations were identified in the original literature search. Conclusion : In order to achieve more efficient assessment, seamless integration of structured geriatric problem detection through hospital-based (inpatient, outpatient) and community-based assessment are required. Our review indicated the potential usefulness of digital device for the comprehensive assessment. It was also suggested that the assessment should be discussed together with effective care planning. Keywords : Comprehensive geriatric assessment

PP26 C-224

RELATIONSHIP BETWEEN VITAMIN D, CENTRAL BLOOD PRESSURE AND AUGMENTATION INDEX IN ELDERLY

Mehmet Emin KUYUMCU, Yusuf YESIL, Burcu Balam YAVUZ, Meltem HALIL, Mustafa CANKURTARAN, Servet ARIOGUL (Department of Geriatric Medicine, IAGG 2013, Turkey)

Introduction : A growing body of evidence suggests a possible association between vitamin D deficiency and many cardiovascular disorders. Enough study was no found in geriatric population. Studies have suggested that central blood pressure measurement is more sensitive method than peripheral blood pressure measurement(1). Simultaneously measured Augmentation Index (AI) is the proportion of central pulse pressure (CBP) due to the late systolic peak caused by the reflected wave and serves as a measure of central arterial stiffness (2). The purpose of this study is evaluating the relationship between vitamin D levels, central blood pressure and augmentation index in geriatric population. Method : A total of 202 elderly patients were included. The patients with cardiac disease, advanced dementia and take vitamin D supplementation were excluded from the study. Non-invasive CBP and AI measured with tonometric system HEM-9000A. Results : Patients were evaluated in two groups according to vitamin D

level (cut-off=20 ng/ml). The mean age was similar. Mini-Mental State Examination and calcium levels were significantly higher in high vitamin D group. PTH levels and triglycerides were significantly lower in high vitamin D group. AI and CBP of groups were similar. Conclusion : In this study, there was no association between vitamin D levels, CBP and AI in elderly patients. The relationship between vitamin D levels, cognitive impairment and cardio-metabolic risk factors is attractive, because vitamin D may be an alternative for prevention and treatment of this diseases. Keywords : vitamin d, cbp, mmse

PP26 C-225

THE EFFECT OF BRAIN TRAINING PROGRAM ON COGNITIVE ABILITY IN ELDERLY

Tae-Yu KIM¹, Yun-Suk JUNG², Dong-Won KIM³, Tae-Young OH⁴
(1. Department of Neurology, Busan Willis Hospital, Korea; 2. Department of Social Welfare, Busan Willis Hospital, Korea; 3. Department of Instruction Section, Haeundae High School, Korea; 4. Dept.Physical Therapy, Silla University, Korea)

Introduction : The purpose of this study was to investigate effect of brain training on cognitive ability in elderly. Method : This study was performed in Willis hospital located B city during 2012 Oct. 12 ~ Dec. 12. Participants were 8 outpatient who were 2 male and 6 female(mean age 77.12). Brain training was performed 50 minute of once time per 1 week for 2 months using by brain training program self-developed. Brain training program has a program using by standardized workbooks, picture, music, sound and painting and shape fill, array scene, reminiscence therapy. We used CSOA(Cognition Scale for Older Adults) in order to evaluate cognitive ability of elderly. Data were analyzed paired test, ANOVA using by SPSS ver. 18. Results : The results of this study were as follow : the mean value between pre and post of brain training program were increased in every subdomain of CSOA. There was significantly difference between pre and post of brain training program in raw scores and scaled scores of reported drawing(p<.05). A highest score of COSA was occupation function score and lowest score was management intelligence area in pre brain training(p<.05). Attention function score was highest and management intelligence score was lowest in post training. Variation between pre and post of brain training showed significantly increasing in attention function, and showed significantly decreasing in occupational function(p<.05). Conclusion : We could confirm that brain training program for improving cognitive ability positive effect on CSOA. We suggested brain training program with physical activity because reported drawing was improved in this study. Keywords : Brain training program, cognition ability, elderly

PP26 C-226

AGE EFFECT ON QUALITY OF LIFE AMONG LOW INCOME AND LOW EDUCATED ELDERLY USING THE EQ-5D IN RIO DE JANEIRO, BRAZIL

Roberta BARROS¹, Janiciene SOUZA², Fayanne SCHAUSTZ², Fernanda BORGES³, Marisa SANTOS⁴, Jerson LAKS⁴, Luiz Mauricio PLOTKOWSKI⁴
(1. Geriatrics, Centro de Estudo e Pesquisa do Envelhecimento, Brazil; 2. Nursing, Centro de Estudo e Pesquisa do Envelhecimento, Brazil; 3. Nutrition, Centro de Estudo e Pesquisa do Envelhecimento, Brazil; 4. Medicine, Centro de Estudo e Pesquisa do Envelhecimento, Brazil)

Introduction : There are scarce data on the impact of aging on quality of life (QoL). EuroQol-5 D is not well studied in the elderly. This cross-sectional study aims to investigate the association between QoL and aging. Method : We screened 300 elderly people referred by a

primary care center from April to December 2012. EuroQol is available for 139 persons. Results : The patients were mainly female (59%), mean age= 70 years (± 7); 42% lower educated, 82% from D/E economic class. The results revealed a mean EQ-5D of 0.78. The mean QoL for each age group (G0=60-69; G1=70-79, G2 >80) was 0.77, 0.78, and 0.76 (p>0.05), respectively. We observed good QoL (EQ-5D>0.7) in 71.2% of the individuals. The proportion (%) of reported problems for each dimension was: mobility (G0=37.3, G1= 35.7, G2 = 50, total =38.8), self care (G0=11.9, G1=5.4, G2 =20.8, total =10.8), usual activities (G0= 18.6, G1=25, G2 =29.2, total =23), pain/discomfort (G0= 71.2, G1=60.7, G2 =66.7, total =66.2), anxiety/depression (G0= 45.8, G1=51.8, G2 =41.7, total =47.5). 2/3 of respondents reported pain/discomfort. Conclusion : Pain/discomfort was the most affected domain. An adjusted analysis is needed to study the effect of age higher than 80 years on QoL. Albeit this was a low income and low educated sample QoL was good. Keywords : Aging, Quality of life , EQ-5D

PP26 C-227

LONG-TERM FUNCTIONAL OUTCOME OF ACUTE FIRST-EVER STROKE PATIENTS

Hyo-Jeong SEON, Min-Keun SONG, Jeong-Hyun BYUN, Jung-Kook KIM, Hyun-Sik YUN, Jae-Young HAN, In-Sung CHOI, Sam-Gyu LEE
(Department of Physical & Rehabilitation Medicine, Research Institute of Medical Sciences, Chonnam National University Medical School & Hospital, Korea)

Introduction : We aimed to analyze the long-term functional outcome of acute first-ever stroke patients in Korea to provide useful information for the development of systematic rehabilitation care for stroke patients. Method : One hundred and thirty chronic stroke patients were recruited. All patients were acute first-ever stroke patients admitted to our NeuroRehabilitation center from 2008 to 2009. After 2 years or more from the onset of stroke, chronic stroke patients underwent neurological assessments for the functional outcome using Korean Modified Barthel Index (K-MBI), Lawton Instrumental Activities of Daily Living (IADL), Korean Mini-Mental Status Examination (K-MMSE), Fugl-Meyer Assessment (FMA) and Functional Ambulatory Category (FAC). General characteristics of subjects such as age, sex, educational background, residential area and income were collected and reviewed. Results : The duration of stroke was 2.83 \pm 0.61 years. Mean age was 63.7 years and the ratio of male to female was 1.23:1. K-MBI, Lawton IADL, K-MMSE, FMA and FAC were 96.2 \pm 85.3, 9.3 \pm 6.5, 24.5 \pm 5.3, 57.9 \pm 17.7 and 4.2 \pm 1.4, respectively. For the gender, K-NIHSS and Lawton IADL was higher in female than male, and K-MMSE was higher in male than female. K-MBI, Lawton IADL, K-MMSE, and FMA did not show any correlation with age. For a residential district, K-MMSE was higher in urban area than rural area (p=0.03) whereas Lawton IADL was higher in rural area than urban area (p=0.028). Conclusion : A large number of chronic stroke survivors showed impairments in many specific functional domains. Our results may afford further insights on the functional characteristics of Korean stroke survivors. Keywords : Stroke, Function, Outcome

PP26 C-228

LONG-TERM QUALITY OF LIFE OF ACUTE FIRST-EVER STROKE PATIENTS

Hyo-Jeong SEON, Min-Keun SONG, Jong-Hoo LEE, Jung-Kook KIM, Hyun-Sik YUN, Jae-Young HAN, In-Sung CHOI, Sam-Gyu LEE
(Department of Physical & Rehabilitation Medicine, Research Institute of Medical Sciences, Chonnam National University Medical School & Hospital, Korea)

Introduction : We aimed to analyze the long-term quality of life (QoL) of acute first-ever stroke patients in Korea. **Method :** One hundred and thirty chronic stroke patients were recruited. All patients were acute first-ever stroke patients admitted to our NeuroRehabilitation center from 2008 to 2009. After 2 years or more from the onset of stroke, chronic stroke patients underwent neurological assessments for the functional outcome including Korean Modified Barthel Index (K-MBI), Lawton Instrumental Activities of Daily Living (IADL), Korean Mini-Mental Status Examination (K-MMSE), Fugl-Meyer Assessment (FMA) and Functional Ambulatory Category (FAC). They completed structured self-administered questionnaires, and a face-to-face interview for QoL, psychosocial stress, and depression using Euro Quality of Life (EQ)-5D, Psychosocial Well-being Index-short form (PWI-SF), and Geriatric Depression Scale-short form (GDS-SF). General characteristics of subjects such as age, sex, educational background, residential area and income were collected and reviewed. **Results :** The duration of stroke was 2.83 ± 0.61 years. Age was 65.4 ± 12.2 years and the ratio of male to female was 1.75:1. EQ-5D showed negative correlation with age and functional status. Each PWI-SF and GDS-SF showed negative correlation with age and functional status. Chronic stroke patients with lower educational background showed higher psychosocial stress and lower QoL compared with higher educational background. For the gender, GDS-SF was higher in female than male. **Conclusion :** Long-term QoL, psychosocial stress and depression of chronic stroke patients was associated with functional status. It is necessary to apply the proper clinical rehabilitation practice to improve the function for the promotion of QoL in stroke survivors. **Keywords :** Stroke, Quality of life, Function

PP26 C-229

PHYSICAL AND PSYCHOSOCIAL BURDEN OF CAREGIVERS OF CHRONIC STROKE PATIENTS

Hyo-Jeong SEON, Min-Keun SONG, Yu-Ri CHOI, Jung-Kook KIM, Hyun-Sik YUN, Jae-Young HAN, In-Sung CHOI, Sam-Gyu LEE (*Department of Physical & Rehabilitation Medicine, Research Institute of Medical Sciences, Chonnam National University Medical School & Hospital, Korea*)

Introduction : Stroke lays a significant burden on caregivers. We aimed to analyze the physical and psychosocial burden of caregivers of chronic stroke patients. **Method :** One hundred and thirty chronic stroke patients and their caregivers (n=77) were recruited. All patients were acute first-ever stroke patients admitted to our NeuroRehabilitation center from 2008 to 2009. After 2 years or more from the onset of stroke, chronic stroke patients underwent neurological assessments for the functional outcome using Korean Modified Barthel Index (K-MBI), Lawton Instrumental Activities of Daily Living (IADL), Korean Mini-Mental Status Examination (K-MMSE) and Fugl-Meyer Assessment (FMA). Caregivers completed structured self-administered questionnaires for caregiver burden, psychosocial stress and quality of life using Caregiver Burden Inventory (CBI), Psychosocial Well-being Index-short form (PWI-SF) and Euro Quality of Life (EQ)-5D. **Results :** Mean stroke duration of patients was 2.83 ± 0.61 years. Age of caregivers was 59.6 ± 14.2 years and the ratio of male to female was 0.4:1. 71.4% and 28.6% of caregivers were the partner and the lineal family members, respectively. 89.9% of caregivers were living together with patients. CBI was significantly correlated with age of caregivers and functional status of patients, respectively. PWI-SF demonstrated positive correlation with age of caregivers and was higher in female than male caregivers. There was no significant correlation between EQ-5D of caregivers and functional status of patients. **Conclusion :** The functional status of chronic stroke patients was a factor associated with

the burden and psychosocial stress of caregivers. Additional support and anticipatory guidance for the caregivers of stroke survivors is needed. **Keywords :** Stroke, Caregiver, Quality of Life

PP26 C-230

SLEEP QUALITY OF CAREGIVERS OF INPATIENTS IN A COMMUNITY-BASED GERIATRIC HOSPITAL

Jeong-Hyun BYUN¹, Min-Keun SONG¹, In-Gyu KIM², Sung-Man ROWE², Hyung-Sik YUN¹, Jae-Young HAN¹, In-Sung CHOI¹, Sam-Gyu LEE¹ (*1. Department of Physical & Rehabilitation Medicine, Research Institute of Medical Sciences, Chonnam National University Medical School & Hospital, Korea; 2. Department of Physical & Rehabilitation Medicine, Chonnam National University Hwasun Geriatric Hospital, Korea*)

Introduction : Sleep disturbance negatively impacts quality of life (QoL) of patients and their caregivers. Little is known about sleep quality of caregivers. We aimed to evaluate the association of sleep quality of caregivers with functional status of inpatients in a community-based geriatric hospital. **Method :** Thirty-four caregivers of inpatients in a community-based geriatric hospital were enrolled. Caregivers completed structured self-administered questionnaires, and a face-to-face interview for demographics, health condition and quality of sleep using MOS (Medical Outcomes Study) 36-Item Health Survey (SF-36), Pittsburg Sleep Quality Index (PSQI). Functional status and cognitive function of patients were checked by reviewing medical records. Correlation analysis was used to analyze the associations between and within variables. **Results :** Fourteen caregivers were the partner or the lineal family members. Twenty caregivers were paid caregiver. Duration of disease of patients was 11.3 ± 19.8 months. Mean age of caregivers was 52.8 ± 10.1 years and the ratio of male to female was 0.26:1. 64.7% of caregivers were living together with patients. For the subjective health condition, 50.0% answered good and 5.9% answered bad. Social function in SF-36 was correlated with age of caregivers ($p=0.046$, $r=0.350$). PSQI was 27.4 ± 7.18 points. PSQI showed negative correlation with age of caregivers ($p=0.009$, $r=-0.450$). There were no significant correlations between PSQI and functional level of patients ($p>0.05$) and between SF-36 and functional level of patients ($p>0.05$). **Conclusion :** Our results showed the characteristics of health and sleep quality in caregivers of geriatric hospital patients. Additional support and anticipatory guidance for the caregivers will be needed. **Keywords :** Caregiver, Sleep, Quality of life

ESTHETIC AND COMFORT ANTERIOR TEETH ORTHODONTIC TREATMENT WITH 2D LINGUAL APPLIANCE IN A GERIATRIC PATIENT: A CASE REPORT

Hye-Young KWON, Yoon-Goo KANG (*Department of Orthodontics, Kyung-Hee University, Korea*)

Introduction : Today, the demand for esthetics in the elderly patients has increased and the need for orthodontic treatment is expected to continue to increase. However, geriatric patients preference to the invisible orthodontic appliance is much higher than the younger patients and their tolerance to the orthodontic appliance is much lower than the younger patients. 2D lingual appliance® is simple and lingually bonded appliance that minimizes appliance inconvenience but maximizes invisibility which makes the appliance suitable for geriatric patients. **Method :** This case report present a 73 year old female patient visited department of orthodontics with chief complaints of upper and lower anterior teeth spacing and malaligning. **Results :** 2D lingual brackets were bonded on the lingual side of upper and lower six anterior teeth. Aligning and leveling was done with

sectional archwires and the space was closed with elastics. Treatment duration was total 9 months. Panoramic radiographs and clinical examination revealed no harmful effect of orthodontic treatment on the periodontal and dental health. Conclusion : The patient was satisfied with the result of treatment also satisfied with the esthetic and comfortable procedure of the treatment. 2D lingual appliance is suggested appliance for esthetic orthodontic treatment anterior teeth in geriatric patients. Keywords : orthodontic treatment, lingual orthodontic appliance, esthetic orthodontic treatment

VERY COMMON DEPRESSIVE DISORDER, COGNITIVE IMPAIRMENT, AND DECREASED QUALITY OF LIFE IN CADASIL PATIENTS

Bong-Hee JEON¹, Jung Seok LEE², Na-Ri KANG¹, Jae-Sung RYU¹, Sang-Hee KIM¹, Moon-Doo KIM¹, Young-Sook KWAK¹, Chang-In LEE¹, Joon-Hyuk PARK¹ (1. Department of Psychiatry, Jeju National University Hospital, Korea; 2. Department of Neurology, Jeju National University Hospital, Korea)

Introduction : Cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASIL) is a single-gene disorder of the cerebral small blood vessels caused by mutations in the Notch3 gene. The main clinical manifestations are recurrent stroke, transient ischemic accident, migraine, psychiatric symptoms, and progressive cognitive impairment. Although recognized as a cardinal feature of the disease, psychiatric disturbances have rarely been the object of focused studies. Method : 53 patients with CADASIL (34 men, 64.2%) were assessed by psychiatrists using the Mini-International Neuropsychiatric Interview (M.I.N.I.), MMSE-KC and Medical Outcome Study Short Form 36(SF-36). Current mood disorder symptoms were assessed using the Hamilton Rating Scale for Depression (HRSD), the Center for Epidemiologic Studies Depression Scale (CES-D), and the Geriatric depression scale (GDS-K). Results : Mean age of participants was 61.65±11.41 years old and most of them had R544C heterotype(71.7%) in genotyping. Among the first presenting symptoms and signs of subjects with CADASIL, the most frequent one was stroke(35.8%), and the next one was migraine(22.6%). 28.3% of them was complaining of subjective cognitive and 17.0% was suffering from mood disturbance(17.0%). Mean score of MMSE-KC was 23.04±4.86 and Z score of MMSE-KC was -1.91±2.23. Frequency of major depressive disorder was 15.1% among the subjects with CADASIL. In aspects of quality of life, Physical component summary score of SF-36 was 44.69±9.92, Mental component summary score of SF-36 was 48.23±7.75. Conclusion : Depressive disorder was common among patients of CADASIL and they also showed cognitive dysfunction and poor quality of life, compared to general populations. Keywords : Cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASIL), Neuropsychiatric symptoms, Depression, Quality of life

PP26 C-233

ELECTROCRADIOGRAPHIC FINDINGS AMONG OLDER INDIVIDUALS WITH RECURRENT FALLS

Saedon Nor IZZATI (Internal Medical, University Malaya Medical Center, Malaysia)

Introduction : The population of Malaysia is ageing rapidly, posing a major challenge to our healthcare system. Falls are common medical problems in the older adult, which often lead to serious consequences. Cardiovascular conditions have been known to be associated with falls. We therefore determine the feasibility of conducting a

multidisciplinary falls assessment in our hospital, and to evaluate electrocardiographic (ECG) changes among older fallers seen at our hospital. Method : Older adults aged >65 years old with 2 or more falls or one injurious fall in the past year , were recruited from the primary care clinic, geriatric clinic and accident and emergency department at the University of Malaya Medical Centre. All patients were evaluated with a multifactorial falls assessment including 12-lead ECG, postural blood pressure, visual assessment, gait and balance assessment, psychological tests and fracture risk calculation. Results : Thirty eight patients were recruited our study. 11 (29%) abnormalities in their ECG. Prolonged PR interval as the commonest abnormality found. 7/11 (64%) had changes consistent with bifascicular block. 2/11 (18%) had sinus bradycardia. Conclusion : This pilot study has confirmed that multidisciplinary falls assessments can be conducted in our setting. Almost 30% of older fallers evaluated in our pilot study had abnormalities in their ECGs. 12-lead ECG should therefore always be performed in older people presenting with recurrent or injurious falls. Further studies should be performed to evaluate the relevance of abnormalities in ECGs in older fallers and to define the best strategies to further evaluate this abnormal finding. Keywords : electrocardiography , elderly fallers, risk

PP26 C-234

THE EXPERIENCE OF DEPRESSION IN LOW-INCOME ELDERLY WOMEN

Jeung-Im KIM¹, Haeng-Mi SON² (1. School of Nursing, Soon Chun Hyang University, Korea; 2. Department of Nursing, University of Ulsan, Korea)

Introduction : There were so many reports about the depression of elderly. The prevalence of probable depression in Korean elders increased with age and was highest in the group aged 80 years and over, at 35.4%. There is relatively consistent evidence that being female, having low income, no education, past MDD, dementia and history of cerebrovascular attack increased the risk of depression. However the essentials of depression were rarely found and low-income elderly women didn't have been interested by researchers. So it needs to be explored in low-income elderly women with depression. Purpose: This research was accomplished to explore and describe the essentials of depression in low-income elderly women. Method : Subjects were introduced by Registered Nurses in the Elderly Welfare Centers. We got the informed consent to interview. They were diagnosed as depressed. We did depth-interview 16 elderly women for one to two hours. We recorded the interview and copied the scripts as they said [verbatim]. We analyzed by Colazzi (1978) phenomenological methods. Results : We found some subjects. Depressed elderly women have lived without any hope. The essentials of depression were as continuum of worthless and painful life. There were categories like 'continuous hardness', 'children's shadowed problem', 'unhappy marriage life', 'painful life', 'worthless', 'loss of willing', 'strong loneliness', 'difficulty in sleeping' and 'dependent to religion'. Also most of them have lived to depend on seeing TV. TV is likes as their friends. Conclusion : We conclude the essential characteristics of low-income elderly women is the continuum of worthless and painful life. Keywords : depression, elderly women, qualitative research

PP26 C-235

ASSOCIATION OF PHYSICAL PERFORMANCE TESTS WITH BODY COMPOSITION

Pedro ARROYO-ACEVEDO¹, Mario PEREZ-ZEPEDA¹, Luis GUTIERREZ-ROBLEDO¹, Victoria ARANGO-LOPERA² (1. Clinical and Epidemiological Research, Instituto Nacional de Geriatria,

Mexico; 2. Education, Instituto Nacional de Geriatria, Mexico)

Introduction : Sarcopenia has been defined in the last years adding physical performance tests to body composition measurement. There are a number of factors that impact individually gait speed, grip strength and muscle mass. Aim of this study is to explore associations between these three elements and body composition. **Method :** Subjects belong to the Coyoacan cohort. Here we report baseline assessment. These subjects have measurements of gait speed, grip strength and calf circumference, along with anthropometry. Gait speed was measured by timing 4 meter track and then dividing it to obtain m/s; grip strength with dynamometry, reporting results in kilograms; anthropometry included calf circumference (reported in centimeters), knee height and weight. Body mass index was estimated with knee height and weight (kg/m²), stratified by WHO criteria. **Results :** A total number of 345 subjects were assessed. 184 women and 161 men, with a mean age of 78.5 years. Frequency of BMI, 3.19% underweight, 24.64% normal, 48.99% overweight, 23.19% obese. The mean values of calf circumference 33.02 (3.96), grip strength 15.42 (4.59) and gait speed .608 (.247). The main significant differences were found in those obese subjects, with lower gait speed. Also underweight subjects were lower in all the measurements. **Conclusion :** Obesity is higher than reported in other population; an effect that could account for the lower values observed in grip strength, gait speed and calf circumference in comparison with other populations. Further work is needed to assess the impact of body composition in different ethnical settings on physical performance, because of clinical implications of elderly assessment. **Keywords :** Sarcopenia, physical performance, body composition

PP26 C-236

PREVALENCE OF OSTEOPOROSIS AND IT'S ASSOCIATION WITH SERUM VITAMIN D LEVEL IN OLDER PEOPLE IN AMIRKOLA, NORTHEN OF IRAN

Zahra PORHASHEM¹, Mohammadali BAINI², Hajjighorban NOOREDDINI³, Ali BIJANI⁴, Seyed Reza HOSSEINI⁵, Robert Graham CUMMING⁶ (1. Medical School, Babol University of Medical Sciences, Iran; 2. Department of Internal Medicine, Babol University of Medical Sciences, Iran; 3. Radiology, Babol University of Medical Sciences, Iran; 4. Social Determinants of Health (SDH) Research Centre, Babol University of Medical Sciences, Iran; 5. Department of Community Medicine, Babol University of Medical Sciences, Iran; 6. Department of Epidemiology and Geriatric Medicine, University of Sydney, Australia)

Introduction : Ageing of population worldwide will be responsible for a major increase of the incidence of osteoporosis in elderly. For the individual, osteoporotic fractures result in great disability as well as loss of quality of life and also represent an enormous burden for healthcare systems. This study was conducted to determine the prevalence of osteoporosis and it's association with serum vitamin D level in elderly people in Amirkola. **Method :** In this cross-sectional study, 1202 participants aged 60 years old and over in Amirkola were assessed. Using a standard questionnaire, individual characteristics and densitometry (with DXA) results were collected and data were analyzed with SPSS18, t test and ANOVA. **Results :** The mean bone mineral density (BMD) in femoral area was 0.89±0.15 in men and 0.79±0.14 in women (p=0.000). The mean spinal BMD was 0.93±0.18 and 0.78±0.16 in men and women respectively (p=0.000). The prevalence of osteoporosis was 34.5% while 45.3% of them had osteopenia. The prevalence of osteoporosis in women (57.4%) was significantly higher than men (16.1%). Of the total subject, 38.20% had vitamin D less than 20 ng/ml and 68.1% had vitamin D below 30

ng/ml. There was no significant relationship between mean vitamin D in patients with osteoporosis (36.1±32.6), osteopenia (32.9±28.8) and people with normal BMD (32.3± 35.5) (p=0.308). **Conclusion :** Our findings revealed higher prevalence of osteoporosis in elderly people especially in women compared to other studies in Iran, and also showed high prevalence rate of vitamin D deficiency. **Keywords :** Osteoporosis, vitamin D, bone density, elderly

PP26 C-237

HOME HOSPITAL FOR LONG TERM MECHANICALLY VENTILATED PATIENTS

Jeremy M JACOBS, Jochanan STESSMAN (Home Hospital Unit, Institute of Geriatric Medicine, Clalit Health Services, Israel)

Introduction : The number of long-term ventilated patients is rising. With technological advances, home ventilation is becoming an increasingly common choice. We describe the experience of the last 7 years of home-ventilation within the Jerusalem Home Hospital Unit.

Method : The Jerusalem Home Hospital Unit treats over 300 home-bound medically complicated patients at home, as an alternative to a spectrum of in-patient care. Over 20,000 patients have been treated at home since its establishment in 1991. Home ventilated patients receive home visits by physician, pulmonologist, medical specialists, nurses, respiratory technicians, physiotherapist, occupational therapists, dieticians and social workers, as well as 24 hour on-call medical and technical backup. Descriptive data was gathered from medical records, and compared to long-term ventilated patients receiving in-patient care. **Results :** From 2005 -2012 the average number of home ventilated patients rose from 34 to 52 simultaneously, compared to a decline from 94 to 76 in-patients. Average age of adult home patients was 61 years, and 21% were under age 16 years. Reasons for ventilation were: neuromuscular degenerative (38%), chronic lung/post CVA/post resuscitation (23%), ALS (12%), post trauma (6%), pediatric illnesses (21%). Average duration of home ventilation was 60.9 months. Annual mortality at home ranged from 8-22% versus 35-46% for in-patients. The monthly cost of home ventilation versus in-patient care was 1:3. The number of referrals or admission to hospital was negligible among home ventilated patients. **Conclusion :** Home hospital is a cost effective and safe alternative to long term in-patient care for long term ventilated patients. **Keywords :** Home-Hospital, Chronic ventilation

A LONG-TERM CARE COMMUNITY MODEL TO SUPPORT PEOPLE WITH DEMENTIA: THE NAKA-SORACHI LOCAL NETWORK

Seiju KOBAYASHI¹, Masaru TATENO², Kumiko UTSUMI³, Toshikazu SAITO¹ (1. Neuropsychiatry, Sapporo Medical University, Japan; 2. Neuropsychiatry, Sapporo Medical University, Sapporo Hana Developmental Psychiatry Clinic, Japan; 3. Psychiatry, Sunagawa City Medical Center, Japan)

Introduction : Due to Japan's high life expectancy and low fertility rates, there have been a growing number of elderly individuals in Japan. The Naka-sorachi region is located in the center of Hokkaido with an aging rate of close to 30%. **Method :** Sunagawa City Medical Center (SCMC) is one of the primary hospitals in the region. SCMC opened a memory clinic (MC) which plays an important role as the central core of the local network built to support aged people in its catchment area. **Results :** The members of the MC are psychiatrists, a neurologist, a neurosurgeon, a clinical psychologist and radiological technicians who work together to provide accurate diagnosis and adequate medical treatments. The MC also offers emergency

interventions such as hospitalization to support clinic physicians. The network provides not only medical interventions but various educational opportunities to train staff members working in the region. It also educates people about the early detection of dementia through mass media, seminars and lecture meetings. Doctors and caseworkers regularly visit facilities such as day-care and group homes, and special elderly nursing homes. This allows direct monitoring of each facility and exchange of opinions between staff and community. The most vital function of the network is that it allows for collaboration between dementia patients and their families, general hospital and primary physicians, as well as medical specialists, caseworkers, and other staff members. Conclusion : We strongly believe that the network developed in Naka-sorachi could be an effective model for other regions in the long term-care of the elderly. Keywords : Dementia, care, network

PP26 R-001

USE OF THE MINI-NUTRITIONAL ASSESSMENT IN THE GREAT EAST JAPAN EARTHQUAKE DISASTER

Kanami TAMURA (*KATO Clinic, 43-1 Taira Aza Nityoume Iwaki-city Fukushima Prefecture, Japan*)

Introduction : An earthquake of magnitude 9.0 with a maximum seismic intensity of 7.0 struck the entire region of East Japan on March 11, 2011. And the Pacific coast of East Japan was hit by a massive tsunami. As a result, approximately 410,000 victims and evacuees had to take refuge in about 2000 shelters. Plus, the distribution of evacuation supplies was extremely delayed because of the TEPCO Fukushima Daiichi nuclear accident, leading to difficulties in the shelters. Method : We used MNA. Results : Temporary shortages of food and water continued in the shelters. Furthermore, when the food supplies arrived, there were major concerns regarding nutritional balance, such as excess energy and salt; these harsh conditions continued to affect the elderly, children, and patients with chronic diseases, such as diabetes and high blood pressure, for a long time. Conclusion : Most elderly people in the earthquake-stricken region took refuge in the shelters; therefore, there were many problems such as nutritional bias and the incidence of pressure ulcers. The physical and emotional stress were immense in the shelters. Also there were no weighing scales in the shelters, the evacuees could not measure their body weight. In this environment, MNA was a very useful assessment tool for the elderly because no complicated special devices were required; it was helpful as a tool for better communication among the evacuees. Under special circumstances, the role played by this assessment tool and its added value as a communication with for the elderly is extremely high. Keywords : Mini-Nutritional Assessment (MNA)

PP26 R-002

THE DAMAGES CAUSED BY THE GREAT EAST JAPAN EARTHQUAKE ON COMMUNITY GENERAL SUPPORT CENTERS, SUBSEQUENT SUPPORT FOR THE LOCAL ELDERLY VICTIMS AND THE FUTURE ISSUES

Masakazu SHIRASAWA¹, Naoto OKADA² (*1. Graduate School of Gerontology, J.F. Oberlin University, Japan; 2. School of Social Welfare, Hokusei Gakuen University, Japan*)

Introduction : The Great East Japan Earthquake on 11 March 2011 brought immense damage to the affected area, not just by the earthquake, but also by the subsequent tsunami and the damage to a nuclear power station. Japan stands on seismic faults and it is accepted that an earthquake of this magnitude can happen any time. Method : The aim of this survey is to strengthen the preparedness for such an

event by investigating the damages inflicted by the earthquake on Community General Support Centers (CGSC), which manages elderly care and support in the communities, the aftermath reality of the CGSCs and the future issues. The questionnaire survey was conducted between December 2011 and January 2012 to the managers of all CGSCs in Miyagi and Iwate prefectures. The recovery rate of the survey was 50%. Results : The survey identified that there are significant differences between CGSCs in the coastal areas and those in the mountain areas in terms of the dates when they started and finished safety checks of the client elderly and the level of difficulty of conducting such checks, while there was no difference in terms of the daily preparedness measures. Conclusion : It leads to the conclusion that the CGSCs had addressed and implemented the check procedures, but those in the coastal areas affected by tsunami found themselves in difficult situations with the consequent delay of starting and finishing the safety check. The study also found out that the everyday level risk management was not sufficient and the future issues to be addressed. Keywords : the Great East Japan Earthquake, Community General Support Center, safety check

PP26 R-003

A PICTURE AND PROBLEMS OF THE CONFIRMATION OF CLIENTS' SAFETY BY CARE MANAGERS FOLLOWING THE TSUNAMI DISASTER

Naoto OKADA¹, Masakazu SHIRASAWA² (*1. School of Social Welfare, Hokusei Gakuen University, Japan; 2. Graduate School of Gerontology, J.F. Oberlin University, Japan*)

Introduction : This study was conducted to clarify care management in disaster situations based on the activities of care managers in coastal areas that were hit by the tsunami following the Great East Japan Earthquake on March 11, 2011. Method : Questionnaires were sent to all care management organizations in Iwate and Miyagi prefectures, and an effective response rate of 47.1% (N=466) was obtained. Results: Results showed that by 6 days after the tsunami, 63.2% of care managers had successfully completed confirmation of clients' safety. However, notable differences in confirmation of safety existed between coastal areas that were hit by the tsunami and inland areas hit only by the earthquake and strong aftershocks. In the coastal areas, care managers' offices were not available due to tsunami damage (p<.000), personal information was lost (p<.000), and computers were damaged and unusable (p<.000). Therefore, personal information required to confirm clients' safety was not available in these areas (p<.001). Also, safety confirmation activities were significantly delayed (p<.000) and the work was extremely difficult (p<.000). Cooperation with medical services was difficult in coastal areas immediately after the disaster (p<.000), as was coordination with service providers to alter care plans (p<.000). As mentioned above, the area directly affected by the tsunami faced many more serious obstacles in terms of confirmation of clients' safety and support compared with inland areas that were affected only by strong earthquakes. Conclusion : It leads to the conclusion that everyday level risk management is important for care managers in the coastal areas in Japan. Keywords : the Great East Japan Earthquake, confirmation of clients' safety, care manager

PP26 R-004

THE VULNERABILITIES AND COPING STRATEGIES OF OLDER PEOPLE IN EAST JAPAN POST-EARTHQUAKE

Nahoko OKAMOTO¹, Chieko GRAINER², Godfred PAUL³, Marcus SKINNER⁴, Ayaka SOBU⁵, Shihoko FUJIMURA⁵, Hidenori HASHI⁶, Yoshiko TSUKADA⁷, Hiroshi HIGASHIURA¹ (*1. International Nursing & Disaster Nursing, Japanese Red Cross College of Nursing,*

Japan; 2. Geriatric Nursing, Japanese Red Cross College of Nursing, Japan; 3. Regional Office, Help Age International, Thailand; 4. Policy Advisor, Help Age International, United Kingdom; 5. Community Nursing, Iwate Prefecture University, Japan; 6. Clinical Nursing, Red Cross Akita College of Nursing, Japan; 7. International Humanity Research Institute, Japanese Red Cross Society, Japan)

Introduction : Japan has the world's highest proportion of older people. On March 11 2011, the M9 earthquake and resulting tsunami struck the eastern pacific coast of Japan. The affected regions of Miyagi ,Iwate and Fukushima Prefectures had very high population of older people. About 63% of East-Japan earthquake-related deaths were among persons 60 years of age or older. Older persons could not run away and clear direction of where to go. Health services which was a particular concern for those requiring continuous treatment for chronic disease. The challenges for displaced people are numerous, in temporary houses during harsh winters, dealing with the loss of items of sentimental value, managing the impact of isolation from family and community support. The objective is to gain a detailed understanding of the disaster on older people a year on, the vulnerabilities and challenges they faced and continue to face as a result of their displacement or their continued residency in affected areas where support and services are reduced. Method : Research Design; Survey using semi-structured interviews. Target Group: Older People over 65 years old in two prefecture affected. Results : Participants Olders 14; Male 2, Female 12, Under 80 years old 12, 80 years over , Older live alone 5, With wife/husband 5 , With son/daughter 4. They faced the weakness; limited Continuous treatment for chronic disease, Long evacuate days , Limited transportation, Less life activities, Less communication, Less friendship and Gender differences. Conclusion : Older people face common challenges between male and female, but they have gender differences. Consideration of Gender culture and each evacuate situation. Keywords : Disaster

PP26 R-005
PUBLIC HEALTH PROGRAMS AND POLICIES TO PREVENT ELDER ABUSE

Maryam HAZRATI (Gerontology, Shiraz University of Medical Sciences, Iran)

Introduction : Elder abuse is a complex and multi-dimensional issue. It has a significant negative effect on Victim's quality of life, and their well being is harshly threatened in the progressive form of abuse. Effective prevention program can reduce the occurrence, or prevent the consequence of elder abuse, and promote the well being and quality of life of elderly people who makes a vulnerable group of society. Method : The majority of researches in field of elder abuse focuses on the prevalence, incidence, and the numbers , but what not yet clear are the effective strategies and policies for controlling, and preventing this global problem. A variety of interventions programs are suggested which may have potentiality to prevent elder abuse, but in most cases there is a limited in practical experience. This review of articles is run to find the effective policies and programs for combating elder abuse in institutional setting, and domestic. Results : Different strategies are recommended for preventing of elder abuse such as daily prompt in the media, Public health contribution for prevention of elder abuse , Prevention Programs for elder abuse(Screening, Mandatory Reporting, Adult Protective Services, Professional's education and training , Potential Victim's Education, Legal and Victim Advocacy Services, Caregiver Support intercessions, and Public Health policies for prevention of elder abuse. Conclusion : Indeed advocating the older people, and preventing of elder abuse in the current epidemic of

elder mistreatment and neglect, is essential. Health care system, Justice System, and Financial system are responsible for preventing and managing elder abuse in communities. Moreover the existing preventative programs such as mandatory reporting, screening, and Adult Protective Services have little verified helpfulness for elder abuse, and need to careful evaluation of both positive and negative outcomes. Keywords : public health policies, prevention, Elder abuse

PP26 R-006
A STUDY ON PLANNING COMMUNITY GARDEN THROUGH ABILITY ENHANCEMENT OF IDLE LOCAL SENIOR HUMAN RESOURCES

Jaeyeon KIM, Yeunsook LEE, Yunsoo KIM (Housing and Interior Design, Yonsei University, Korea)

Introduction : Increasing the portion of elderly people who are disadvantaged among the residents and most of the aged people are surplus human resources living in socially and physically deprived environment. Therefore, it is necessary to find out any means to utilize these aged idle human resources living in bad environment by linking them with their physical environment in their community. Method : This study method was implemented through total eight workshops as a means of studying by local participation. ① Gathered idle senior residents in the community who have interest in growing plants, ② Through first workshop programs, we provided them with basic knowledge about growing plants, ③ Through second workshop process, we collected the idle senior residents' opinions, and ④ the final plan for community garden was set up through the consensus of idle senior residents' opinions. Results : As a result of this study by reinforcing the ability of the idle senior human resources at the target area through consecutive workshop process, they came to put great value upon improving their physical environment and their efforts resulted in forming a spontaneous working group being inspired by their community spirit. Conclusion : Through this study, if idle human resources, physical resources and educational contents are properly utilized in combination, it was proved that the physical environment of deprived urban area can be regenerated. Particularly, it is very meaningful that this study has verified the possibility of growth in consensus not by leaving the urban deprived area alone or supporting them one-sidedly but by helping them mutually. Keywords : Community Garden, Senior Human Resources, deprived area

COMMUNITY RESTAURANT IN AN AREA PROVIDING A HUB TO PREVENT ISOLATION OF ELDERS

Sakae HORIO¹, Shigeki HARADA², Shigenori NISHIWAKI³, Yukio NISHIMOTO⁴, Youichi KAWAMURA⁴ (1. Yogou, Social Welfare Corporation Seizanrikai, Japan; 2. Tokiwa, Social Welfare Corporation Seizanrikai, Japan; 3. Oyamado, Social Welfare Corporation Seizanrikai, Japan; 4. Seizanrikai, Social Welfare Corporation Seizanrikai, Japan)

Introduction : In recent years in Japan, solitary death and social isolation have been a social issue and its prevention has become a real problem. Method : with the rapid increase of older people living alone or in households consisting of elderly couples. Therefore, based on our research study, our nursing home has established a "Preventing isolation center", based on the three functions of "Securing Food", "Comprehensive Counseling" and "A Place for Interaction", for the older people living either alone or in households consisting of an elderly couple, by renting a space in the shopping center of a housing complex, which was built 40 ~ 50 years ago and with a rapidly aging

population, in March 2012. Results : It has been about one year since its opening. Its purpose is to prevent isolation and to enable the early discovery of a person in isolation. It has taken the aspect of a community restaurant, and the specialists, such as dieticians, social workers, and public health nurses, are working together and have been successful in preventing isolation by the early discovery of the basic needs of the elderly people living in the area. Conclusion : For the future, attempting to develop new living support service programs by consulting/cooperating with the relevant organizations in the area, we are just starting to set up "Life Support Mie". Keywords : Community Restaurant

PP26 R-009

A PLAN FOR BUILDING COMMUNITY-BASED ON THE BACKGROUND AND THE RISK FACTORS FOR "PREVENTING ISOLATION OF ELDERS"

Shigeki HARADA¹, Sakae HORIO², Shigenori NISHIWAKI³, Yukio NISHIMOTO⁴, Youichi KAWAMURA⁵ (1. Tokiwa, Social Welfare Corporation Seizanrikai, Japan; 2. Yogou, Social Welfare Corporation Seizanrikai, Japan; 3. Yamada, Social Welfare Corporation Seizanrikai, Japan; 4. Seizanrikai, Social Welfare Corporation Seizanrikai, Japan; 5. Aeizanrikai, Social Welfare Corporation Seizanrikai, Japan)

Introduction : With the rapid aging of the population and a declining birth rate, and an increasing number of seniors living alone, isolation of elders has become evident in Japan. Method : It is difficult for only the nursing-care insurance service to deal with these cases. Therefore, in June, 2008, our nursing home organized a group of researchers from various fields and conducted a questionnaire study of 2000 persons including older people who live alone and households with only elderly persons in Y area where there has been a rapid aging of the population. Also, we conducted a case study analysis of 25 cases collected by the care managers focusing on "Isolation". Results : Results of the study indicated paucity of neighborly relations and societal resources, in addition to the composition of the household, one's physical condition, and one's financial situation, as the background factors of "Isolation". The risk factors of isolation were food, such as the preparation of meals and getting foodstuffs, neighborly interaction, health maintenance, preventive care, and emergency response. Moreover, the involvement of care managers only provided nursing care insurance services, and it became obvious that the actual problem, which resulted from the difficulty in dealing with isolation because of the lack of societal resources, was left unresolved. Conclusion : In light of the outcome of the study, we have established and are operating "Preventing Isolation Centers" with three functions, which are "Securing Food", "Comprehensive Counseling", and "Place for Interaction", in two places in the Y area in March, 2012. Keywords : Preventing Isolation of Elders, A plan for building community-based

EXPENDITURE OF HOME HEALTH CARE UTILIZATION AMONG THE ELDERLY 65 AND OLDER IN TAIWAN

Chin Lung CHEN¹, Shu Hui LIN², Jeny Uan CHIOU³ (1. Department of Healthcare Administration, Asia University, Taiwan; 2. Nursing Department, Department of Healthcare Admini, Chung Shan Medical University Hospital, Asia University, Taiwan; 3. Health Policy and Management, Chung Shan Medical University, Taiwan)

Introduction : The rapid growth of the elder population brings up high prevalence rate of chronic diseases and functional disabilities, which consumes a great deal of medical and long-term care

resources. Method: This study explored the expenditure of home health care utilization among the elderly 65 and older in Taiwan from the 2122 samples who received home health care during 2008. The 2005 Longitudinal Health Insurance Database (LHID) from National Health Insurance Research Database (NHIRD) is used to do the analyses. Results : The results of this study has shown that women, having two or more chronic diseases, insured within the North district, Charlson Comorbidity Index (CCI) scored 1, and those grouped in resource utilizing group (RUG) level 2 are more likely to receive home health care. Those who stay at home have utilized more home health care than those who stay in the institution. The nasogastric tube care, Foley care, and large intravenous fluid injection are the top three special nursing care interventions both for those who stay at home and in the institutions. For medical care utilization, those who stay at home utilized more outpatient services, while those who stay in the institution utilized more admission services. Conclusion : we recommend that the health policy should design more home care visits for the newly enrolled and that there should be more respite care for the care-givers for more support. Keywords : National Health Insurance Research Database(NHIRD), home health care , medical care utilization

PP26 R-011

COMMUNITY BASED CARE FOR THE ELDERLY IN SHANGHAI: A CASE STUDY

Ginny Q. ZHAN (Psychology, Kennesaw State University, USA)

Introduction : The fast growing Chinese economy and changing views have brought many changes to people's lives, particularly family structure. For example, young people leave to pursue their dreams elsewhere, or move into their own apartments after marriage, establishing nuclear families. As a result, the number of elderly people living alone has skyrocketed. One estimate puts it as high as 40% of all the elderly population nationwide. In Shanghai, the biggest metropolis in China, approximately 30% of the elderly populace is considered empty-nesters who live alone and have no family nearby. Method : Published reports detailing community based elderly care programs in Shanghai were reviewed and content analyzed. These reports describe various programs of elderly care in Shanghai, some successful and some not. In this poster we will focus on two large districts: Yangpu and Putuo. Results : Our examination and analyses suggest that overall, an effective community based program would need to encompass the following elements: 1) financial commitment by the local government at the district level; 2) needs assessments before designing and implementing any programs; 3) dedicated volunteers from the same neighborhoods; 4) buddy system between the volunteer and the elderly; 5) aid concentrating in six specific areas of care; and 6) regular empirical assessments. Conclusion : It seems that community based elderly care can be an effective approach in a big city like Shanghai, if implemented properly. The programs provide various types of physical help as well as companionship to the elderly residents in the neighborhood who live alone. Keywords : China, community, elderly

A STRUCTURAL EQUATION MODEL OF NURSE'S TURNOVER INTENTION

Kyungsook PARK, Minsook SEO (Red Cross College of Nursing, Chung-Ang University, Korea)

Introduction : This study, the covariance structure for multiple group comparisons according to gender and to verify the validity of the model and the goodness of fit between the actual data and build a

hypothetical model based on a review of the literature in order to identify the factors affecting the Turnover Intention of Nurses. Those variables were nursing organization culture, empowerment, gender stereotype, mentoring, job stress and organizational commitment. Method : Nurses from general hospitals responded to a questionnaire. Between September 1 and October 25, 2012, among 375 copies of the distributed questionnaire 288 copies without any missing items were used for analysis. As an analysis tool, the SPSS/WIN 20.0 and AMOS/WIN 20.0 program was employed. Results : The nurse's turnover intention of the dependent variable of this study were influenced by organizational commitment, conservative culture, job stress and innovative culture. The male nurse's turnover intention of the dependent variable of this study were influenced by organizational commitment, conservative culture, job stress and innovative culture. The female nurse's turnover intention of the dependent variable of this study were influenced by conservative culture and innovative culture. Conclusion : The study findings demonstrate that gender stereotype, conservative culture, empowerment, innovative culture, job stress and organizational commitment had a significant influence upon nurse's turnover intention statistically. Based on the findings, the innovative scheme of human resources management could be recommended as a great way to manage nurses. Keywords : turnover, gender analysis

HOW WE HANDLE MISSING DATA IN GERIATRIC COHORT STUDIES

Geva GEVA¹, Danit SHAHAR², Sigal TEPPER¹, Tamara HARRIS³, Drora FRASER¹, Geert MOLENBERGHS⁴, Friger MICHAEL¹ (1. Public Health, Ben Gurion University, Israel; 2. Public Health, Ben Gurion University at the Negev, Israel; 3. Geriatric Epidemiology, Laboratory of Epidemiology, Demography, and Biometry, Israel; 4. Biostatistics and statistical Bioinformatics Centre, Leuven Katholieke University, Belgium)

Introduction : Longitudinal cohort studies focused on older persons are prone to selection bias due to the increased attrition as follow-up continues. This is an important issue requires analytical attention. Objective: to explore which missing data methodology has entered current practice and to illustrate the potential impact of ignoring the issue. Method : A Sample of 103 articles was drawn from six key geriatric cohort studies: Health ABC, InCHIANTI, LASA, BLSA, EPESE and KLoSHA. The selected publications were classified according to missing data methodologies and summary statistics were used. Results : 77% of the articles described the selected analysis data set, yet only 28% used a statistical method capable of handling all available observations per case. Missing data dedicated methods were rare, (< 10%) these few studies conducted single or multiple imputations with respect to baseline variables. None of the studies reported the use of advanced methods such as Inverse Probability Weighting or Selection Models. Studies with longer follow-up period more often employed longitudinal analysis methodologies to handle missing data. Conclusion : Despite the recognition that missing data is a major problem in studies of older persons, few published studies account for missing using limited methodologies. Keywords : missing data, geriatric cohort studies, methodologies review , longitudinal analysis

PP26 R-014

IMPACT OF SELF-RATED HEALTH ON MEDICAL AND CARE COSTS IN OLDER JAPANESE

Hiroto YOSHIDA¹, Yoshinori FUJIWARA², Mariko NISHI², Taro (FUKAYA², Shoji SHINKAI² (1. Faculty of Medical Science & Welfare, Tohoku Bunka Gakuen University, Japan. 2. Research Team

for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : This study examined the impact of self-rated health (SRH), which was categorized as very good, good, fair, and poor, on medical and long-term care expenditures in Japanese older adults. Method : A total of 916 subjects aged ≥ 70 years responded to the baseline survey conducted in 2001 in Kusatsu, Gunma, Japan. Sixty-six percent of the respondents at baseline (n=609) used medical or care service at least one time both in 2002 and 2004. They were followed through the end of February, 2004. The impact of SRH on medical and long-term care expenditures was examined by fitting multiple regression models. The dependent variable was the logarithmic transformed 2004 annual medical and long-term care expenditures per month. The independent variable was the baseline SRH. Control variables included the 2002 baseline annual medical and long-term care expenditures per month, gender, age, history of stroke, heart disease, hypertension, diabetes, and so on. Results : Fair or poor SRH at baseline was significantly associated with future medical and long-term care expenditures. We estimated that the decline of very good or good SRH to fair or poor would increase mean medical and long-term care expenditures per capita per month by approximately 22.7%. Conclusion : Prior studies have shown associations between fair or poor SRH and adverse health outcomes in Japanese older adults. This study found that fair or poor SRH was not only a significant predictor for adverse health outcomes in Japanese older adults, but it had a strong impact on the future medical and long-term care expenditures. Keywords : self-rated health medical and long-term care expenditures

PP26 R-015

DIFFERENCES AMONG PROFESSIONALS IN RESPONDING TO THE COMPLEX NEEDS OF THE COMMUNITY-DWELLING ELDERLY IN JAPAN

Junko WAKE (Social Welfare, Tokyo Metropolitan University, Japan)

Introduction : Community care support centers have been founded since the 2005 amendment of the Public Long-term Care Insurance law in Japan. They provide preventive care management as well as various support measures to frail elderly people in the community. Three kinds of professionals are placed in each center: a chief care manager (CM), a social worker (SW), and a public nurse (NS). The professionals are expected to carry out their own duties, while collaborating where elderly clients have the complex needs. Method : The study analyzes differences and similarities in the roles and functions of the three professionals in responding to the complex needs of the elderly. A nationwide mailing survey directed at 700 randomly selected centers was conducted in 2012. Response rates were 34% (CM), 35% (SW), and 34% (NS), respectively. Results : The results indicate that: (1) the three professionals have different roles and functions, as expected; (2) SWs are younger and have less experience, but have a heavier load of complex cases; (3) SWs regard elder abuse as the most difficult component, and; (4) SWs recognize the need for stronger collaboration with related institutions and professionals in the community, including with the local government. Conclusion : The results highlight the need to support younger social workers by providing necessary skills and training, as well as appropriate supervision. Keywords : Collaboration Complex needs Long-term care insurance Japan

PP26 R-016

VISUALIZATION OF HOSPITAL DEMAND CHANGE IN SUPER AGING SOCIETY IN JAPAN

Shunsuke DOI¹, Katsuhiko TAKABAYASHI² (1. Division of

Healthcare Policy of Aging Society, Chiba University Hospital, Japan.
2. Department of Medical Informatics and Management, Chiba University Hospital, Japan)

Introduction : Recent medical advances and hygiene improvement gave Japanese people the longest life span in the world. As the result, however, Japanese elderly population has been growing very rapidly, at the highest rate in world history. This similar phenomenon will occur in other western countries though the speed is not so fast, and in the eastern Asia such as Korea and China will have the same phenomena, while it will occur more than 10 years later than Japan. Especially Chiba prefecture, east part of the great Tokyo Metropolitan area this change is more drastic. To prepare for these circumstances we have to estimate elder population change and their demands in healthcare more precisely in this area. **Method :** We defined the patients' access area of each hospital by geographical information system (GIS) and demonstrated the area that demand exceeds. We simulated the number of inpatients and their hospital accommodation in Chiba prefecture from 2015 to 2035. The number of estimated hospital inpatients is calculated by using national census and expected population in every 500 meter square mesh and visualize this change on the map yearly. By changing the variables, we can estimate several simulation results. **Results :** Hospitals can afford to accept the patients in most area until 2015, while in 2030, 9,000 patients cannot be admitted to the hospitals in Chiba prefecture. **Conclusion :** In this study, we estimated the area that demands exceeds by using GIS especially in northwest part of Chiba Prefecture. **Keywords :** Geographic Information System, Access Area, Expecting Demand of Medicine

PP26 R-017

LONG-TERM FINANCIAL SECURITY AMONG OLDER LOW-INCOME ASIAN IMMIGRANTS IN THE UNITED STATES

Yunju NAM¹, Eun Jeong LEE², Jin HUANG³ (1. Social Work, University at Buffalo, USA. 2. National Asian Pacific Center on Aging, National Asian Pacific Center on Aging, USA. 3. Social Work, Saint Louis University, USA)

Introduction : Asset ownership, financial knowledge, and information on social programs are important in planning for post-retirement finance. This study examines older Asian immigrants' retirement readiness by investigating their assets, financial knowledge, and understanding of social programs and benefits. **Method :** This study uses survey data from low-income Asian immigrants in employment support programs in Los Angeles, Orange County, and New York City (N=160). The data were collected through group surveys conducted at mandatory meetings of program participants. The survey offered the questionnaire in three languages: Chinese, English, and Korean. This study uses regressions on three types of outcome measures: asset ownership and savings, knowledge on social program eligibility and benefits, and confidence in post-retirement economic conditions. **Results :** Asset ownership rates are very low: 21% own a home and 36% have financial assets (e.g. savings accounts). The percent of regular savers is 18%. About a quarter reported that they are comfortable with four basic financial activities (opening a bank account, depositing and withdrawing money, and applying for a credit card). More than half (52%) do not give any correct answers to 4 basic financial knowledge questions, while roughly a quarter give no correct answers to 5 questions on Social Security and Medicare. Only a minority of respondents report confidence in meeting post-retirement consumption needs (26% in meeting basic consumption needs; 17% in covering medical expenses). **Conclusion :** Results indicate that older

Asian immigrants' long-term financial security is precarious, calling for policy intervention to enhance their financial capacities. **Keywords:** financial security, Asians

PP26 R-019

PRIMARY FACTORS FOR IMPROVEMENT OF COGNITIVE TASK PERFORMANCE IN DOHSA-HOU FOR THE ELDERLY

Masaki ADACHI¹, Koji NAKANO² (1. Clinical Psychology, Graduate School of Human Relations Tokaigakuin University, Japan. 2. Department of Psychology, Social Welfare Corporation Ryuseikai clinic, Japan)

Introduction : This study investigates the improvement of cognitive performance reported as a result of Dohsa-hou (A Japanese Psycho Rehabilitation Method) for the elderly, taking into consideration changes in posture control abilities and situational anxiety. Additionally, it investigates the primary factors responsible for these improvements. **Method :** Using the Mini Mental State Examination and Berg Balance Scale, the study divided elderly participants who cleared the cognitive impairment cutoff point and had moderately unstable upright balance into two tests groups: an experimental group (N = 9) that attempted to improve upright balance by performing dohsa-hou, and a control group (N = 9) to establish the drop-off period for the effect of performing the given activities. Body sway and situational anxiety during task processing of Stroop test questions (black and white or color) were measured before and after the dohsa-hou activities and drop-off period. Also, the task processing time of Stroop test was measured. **Results :** Repeated-measure mixed-design two-way ANOVA and subsequent simple main effect tests showed that only the experimental (Dohsa-hou) group improved in body sway, had a shorter Stroop Color Test processing time ($F=35.87, p<.001$) and lower situational anxiety ($F=20.00, p<.001$). **Conclusion :** From this study, it has been identified that: 1) information-processing capacities spared for posture control are affected by distribution of processing resources towards solving other cognitive tasks, and 2) the effect of the release of attention from threat-related information due to a decrease in attentional bias, which accompanied the decrease in situational anxiety, are primary factors in improving cognitive task performance. **Keywords :** Dohsa-hou for the elderly, posture control abilities, cognitive task performance

PP26 R-020

OUTCOMES EVALUATION SYSTEMS FOR DEMENTIA CARE -OUTCOME CHANGE AFTER ONE YEAR-

Ayami SATO¹, Yoko UCHIDA¹, Kenichi INOUE², Rie HURUGOURI², Michiyo KOBAYASHI², Rieko NAGAI², Kyoko INOUE², Masami AOKI², Michiko HIROTA², Yuriko YAJIMA², Noriko NAKAJIMA² (1. Graduate School of Health Sciences, Gunma University, Japan; 2. JANPENPON, Non Profit Organization, Japan)

Introduction : The purpose of this study was to identify changes in outcomes of elderly clients with dementia after one-year use of multi-functional home care and day care services in small-scale facilities. **Method :** We used the Outcomes and Assessment Scale for Dementia Care (OASDC) for outcome evaluation. Of 56 clients with dementia who used services in small-scale facilities and measured OASDC at two time points (August and October, 2010), 43 clients, whose OASDC data were available at one year (October, 2011), were the subjects of this study. **Results :** Higher deterioration rates at one year were observed in Eating, Fulfillment of One's Role, Smile, Grooming and Caregiver's Stress and Fatigue, while higher maintenance rates were found in Bathing, Preventing Accidents, Rest/Sleep, Caregiver's Stress and Fatigue, and Maintaining Appearance. **Conclusion :** Although

elderly clients in small-scale facilities received care to improve and maintain their physical conditions and functions in daily life, several measures including eating and fulfillment of one's role could be deteriorated. Development and implementation of the action plan are needed to improve and maintain their physical conditions and functions in daily life. Keywords : Outcomes and Assessment Scale for Dementia Care, small-scale facilities, outcome change

PP26 R-021

COMPRESSION OR EXPANSION OF MORBIDITY? RURAL-URBAN DIFFERENCES IN DISABILITY AMONG THE ELDERLY IN TAIWAN BETWEEN 1989 AND 2007

Chen-Fen CHEN¹, Charlotte WANG², Pau-Ching LU³ (1. Department of Social Welfare, Chinese Culture University, Taiwan; 2. Institute of Epidemiology and Preventive Medicine, National Taiwan University, Taiwan; 3. Graduate Institute of Social Work, National Chengchi University, Taiwan)

Introduction : The objectives of this research are to explore residential disparities between disabled older persons aged 60 years and over in rural and urban areas in Taiwan, as well as to test the theories of compression or expansion of morbidity on the basis of this data. Method : The data was sourced from a national survey of 3,893 aging people above 60 years of age in Taiwan. Data was collected in 1989, 1993, 1996, 1999, 2003 and 2007. A linear mixed model was applied for trend analysis. Results : Not controlling for the independent variables, the long-term care needs for the rural participants was greater than those of the subjects in urban areas. After controlling for socioeconomic status and reported health indicators, and considering the implementation of National Health Insurance (NHI) from 1995, the disparity became greater over time: the rural elderly were more vulnerable to disability than their counterparts. Furthermore, the disparity in long-term care needs between the elderly in different areas will continue to grow as the lifespan of the elderly steadily increases. Conclusion : This study supports the "compression of morbidity" hypothesis for urban areas, but "expansion of morbidity" in rural areas. The results also suggest that Taiwan's public policymakers should be required to better understand that the elderly in different areas face various barriers in acute care and long-term care service utilization. For instance, what is needed is that NHI be revised to better balance the differences due to residential disparity and to design community-based long-term care programs. Keywords : Rural-Urban, Disability

THE COMMONWEALTH OF VIRGINIA'S RESPONSE TO ALCOHOL MISUSE IN LATER LIFE

Nancy BROSSOIE¹, Constance L. COOGLE² (1. Center for Gerontology, Virginia Tech, USA; 2. Virginia Center on Aging, Virginia Commonwealth University Medical Center, USA)

Introduction : The impact of alcohol and medication misuse on public health is arguably extensive. With a rapidly growing population of older adults who grew up in an era of increased illicit drug and alcohol use, there are reasons to believe that their continued alcohol use may have deleterious effects on their health. In a proactive response, the Department of Alcoholic Beverage Control (Virginia, United States) established the Alcohol and Aging Awareness Group (AAAG) to focus on the special risks of alcohol misuse among older adults and become the leader in Virginia to provide education, training and resources on the use of alcohol and medications as adults age. Since 2007, AAAG members from government, private, and non-profit organizations have collaborated to identify strategies to meet the informational and service needs of healthcare providers, community

service professionals, and consumers across Virginia. Method : In this presentation we describe actions taken to build organizational capacity within the AAAG using the World Bank's result management framework to train, educate, and raise awareness among community professionals and consumers of problems associated with alcohol use in late life. Results : Areas addressed include enhancing and sustaining membership, creating regional groups for improved outreach, training leaders within the organization, building upon evidence-based practices in the development of programs, using multimedia to raise consumer awareness, offering publically accessible referral and resource lists, and developing training curricula to reach community providers outside of the traditional healthcare professions. Conclusion: Success, challenges, and next steps to achieving goals are identified for each activity. Keywords : alcohol misuse, capacity building, community response

PP26 R-023

ASSOCIATIONS BETWEEN SARCOPENIA AND MORPHOMETRIC/PHYSICAL/FUNCTIONAL PARAMETERS IN COMMUNITY-DWELLING OLDER PEOPLE

Nariaki SHIRAIISHI¹, Yusuke SUZUKI², Kiwako OKADA³, Jun HASEGAWA⁴, Hiroyuki UMEGAKI¹, Maki AOYAMA², Masafumi KUZUYA² (1. Rehabilitation, Nihon Fukushi University, Japan; 2. Community Healthcare & Geriatrics, Nagoya University Graduate School of Medicine, Japan; 3. Nutritional Sciences, Nagoya University of Arts and Sciences, Japan; 4. Geriatrics, Nagoya University Hospital, Japan)

Introduction : To investigate the associations of sarcopenia(SP) with physical/functional characteristics in community-dwelling older adults. Method : Two hundred sixty seven independent community-dwelling older adults aged 65 or older (84 males , 183 females, mean age±SD: 75.5±6.0) were divided into SP (n=45) and non-SP (n=222) according to a modified EWGOP criteria and morphometric/physical/functional characteristics between the two groups were compared. Results : Significant differences of all morphometric and physical parameters except time to keep standing with a single leg were observed between SP and non-SP subjects. Regarding functional parameters, being able to use staircases, get up from the chair, walk for more than 15min without a break, BMI < 18.5, overt swallowing difficulties, subjective sense of fatigue and total score of MNA-SF were found to be significantly related to SP by univariate analysis. A logistic regression analysis revealed that upper arm and calf circumference, feeling fatigued, being able to get up from the chair remained as significant variables to predict the existence of SP. Conclusion : With respect to appropriate prescription of rehabilitation program for the prevention of SP in old age, the present study suggested particular importance of exercise requiring both balance function and muscle strength/range of motion of lower extremities. Also those who are prone to feeling fatigued may have increased risk of SP according to the present study. Keywords : sarcopenia, community-dwelling older adult

PP26 R-024

VALIDITY OF THE CAMBRIDGE NEUROLOGICAL INVENTORY AMONG OLDER JAPANESE INDIVIDUALS

Shingo SHIRATORI¹, Nobuo HOSHIYAMA¹, Hiromi NAKAMURA-THOMAS², Motohiko HARA² (1. Rehabilitation, DAINI HOKUSO Hospital, Japan; 2. Health, Medicine and Welfare, Saitama Prefectural University, Japan)

Introduction : Neurological Soft Signs (NSS) are undetectable neurological deviations under classical examinations. The Cambridge Neurological Inventory (CNI) has the ability to assess NSS and it is

used to assess patients with schizophrenia and cognitive impairments. No study with CNI has been currently reported in Japan, thus this study examined the compatible validity of CNI to discuss clinical applicability. Method : The research protocol was reviewed and approved in the first author's organization. The original CNI with 29 items was translated into Japanese after obtaining permission from the founder. Semantic compatibility of the Japanese version was reviewed by a neurologist and an occupational therapist with more than 20 years experience as well as being examined through 10 healthy Japanese older participants (6 men and 4 women) to see whether they were able to follow instructions. Performances among older participants were individually observed and they were interviewed to clarify what was difficult to understand. Results : Some sentences were revised based on feedback from the 2 professionals. All older participants easily performed 23 items out of 29; however there were 6 items which older participants had difficulties to perform because of complexity of instructions; 2 items (Glabellar tap and Stereognosis) for all participants, Lower limb strength for 8 participants, Arm drift for 5 participants, Finger agnosia for 3 participants and Wink with other eye open for a participant. Conclusion : It was suggested that CNI had a potential applicability in older Japanese individuals to assess NSS when the Japanese version was revised based on results in this study. Keywords : Neurological Soft Signs, Cambridge Neurological Inventory, older individuals

PP26 R-025

EFFECTIVE ACTION PLAN SYSTEMS FOR IMPROVING OUTCOMES IN OLDER PERSONS WITH DEMENTIA

Yoko UCHIDA¹, Kenichi INOUE², Ayami SATO¹, Rie HURUGOURI³, Michiyo KOBAYASHI², Rieko NAGAI², Kyoko INOUE², Masami AOKI², Michiko HIROTA², Yuriko YAJIMA², Noriko NAKAJIMA², Manami KAMIYAMA¹ (1. Graduate School of Health Sciences, Gunma University, Japan; 2. JANKENPON, Non Profit Organization, Japan)

Introduction : The objective of this study was to introduce the Outcome and Assessment Scale for Dementia Care and Action Plan Systems (OASDC) for quality improvement, and to identify action plans for improving outcomes in persons with dementia in small scale facilities with quality improvement activities. Method : The subjects were 56 older persons with dementia who used either of the following facility services of "A" organization: 3 group homes, one small multi-functional home care, or one day care service, and agreed to participate in the survey. Investigators planned and implemented action plans for quality improvement with facility staff. We assessed client outcomes using OASDC before and after implementing the plan. Results : After implementing the action plan for 3 months, 25 persons improved, 9 persons both improved and deteriorated, 14 persons only deteriorated, and 8 persons had no change in outcome measures. Conclusion : The most improved outcome was caregiver's stress followed by playing one's role, hobby, smiling, mental health, behavioral disorder, and grooming. The most effective plan was care to help people playing one's role, and having hobby followed by improvement of communication, toileting care, rehabilitation, family care, going out, and maintaining good health condition. Keywords : dementia, outcome, evaluation

PP26 R-026

WHAT ARE RISK FACTORS FOR AGE-RELATED HEARING IMPAIRMENT IN OLDER ADULTS?

Yoonmee JOO, Oi Saeng HONG, Margaret WALLHAGEN (School of Nursing, University of California, San Francisco, USA)

Introduction : Age-related hearing impairment (ARHI) can be delayed, if we identify risk factors of hearing loss and provide early intervention. Purpose: To determine risk factors interacting with age in ARHI among older adults Method : The PubMed database was searched using the term "age-related hearing impairment." Multiple combinations of terms were searched with the MeSH database using "hearing loss, aged" or "presbycusis" and "risk factors." Then, limits were applied to the literature search: 1) written in English, 2) human subjects, 3) individuals over the age of 18 years as the target population, and 4) clinical trials, randomized controlled trial and meta-analysis as a type of article for research articles. Review articles were excluded. Results : The identified key themes are: genetic factors (genes, race, and gender), environmental factors (noise, chemicals), individual health factors (cardiovascular diseases, diabetes, and obesity, ototoxic medications) and lifestyle factors (smoking, alcohol, diet). The findings lead that environmental, individual health, and lifestyle risk factors can accumulate over a lifetime and contribute to the hearing loss experienced by older people. In addition, genetic factors and the aging process itself are associated with degeneration in hearing ability. However, attempts to correlate specific risk factors to ARHI have resulted in conflicting results. Conclusion : Although some of the risk factors for hearing loss cannot be changed, many risk factors are modifiable and are possible targets for prevention of ARHI. Identifying the genetic, environmental, individual health, and lifestyle risk factors for ARHI and improving appropriate interventions will be a worthy goal for further research. Keywords : Age-related hearing loss, risk factors

PP26 R-027

SOCIOECONOMIC PROFILE AND TRAINING BACKGROUND OF CAREGIVERS OF NURSING HOME IN NORTHEASTERN BRAZIL

Andrea Mendes ARAUJO¹, Marcia Virginia Di Lorenzo FLORENCIO¹, Maria Betanea De Sousa SANTOS¹, Temistocles Bezerra DE SOUSA NETO², Angelo Jose G. BOS³ (1. Escola Tecnica de Saude, Universidade Federal da Paraiba, Brazil; 2. Psicologia, CEFOR-PB, Brazil; 3. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil)

Introduction : The growing demand for nursing homes incorporates a new scenario of assistance to this population, especially when there is limited functionality and increased complexity of care, requiring a specialized caregiver, who provides comprehensive care for him. This study aimed to describe the socioeconomic profile and training of caregivers of nursing home elderly working in a state in northeastern Brazil. Method : We applied a questionnaire about socioeconomic data and training of elderly caregivers. Results : Seventy caregivers were interviewed, 65% female, 71.4% aged between 30 and 49 years, 48.6% had completed high school. The monthly income was 87.1% prevalent than the minimum wage, 90% had over than 44 hours of work weekly, 71.4% had no technical training and 70% did not undergo a training course after admission to the institution. The difficulties reported were lack of human resources (51.4%), workload (45.7%) and poor pay (42.9%). There were complaints of health impairment (31.4%), with predominance of back pain (27.1%). It was found statistically significant associations between technical training and other variables such as: education ($p < 0.001$), income ($p = 0.013$), weekly workload ($p = 0.002$) and training course after admission to the institution ($p < 0.001$). Conclusion : These research findings point to the need to formulate new public policies directed to training of elderly caregivers of nursing homes, according to the context in which they live, also the organization of this job class, who can foster recognition and better conditions for the performance of activities of formal care. PROMPTED VOIDING (PV) IN MANAGING URINARY INCONTINENCE (UI) IN RESIDENTIAL CARE: CAN IT BE SUSTAINED

Claudia Ky LAI (*School of Nursing, The Hong Kong Polytechnic University, China*)

Introduction : PV has been found to be an effective non-invasive measure in managing UI but there is no reported study examining its efficacy in Hong Kong. Method : This was a quasi-experimental study examining the effect of PV in promoting continence for nursing home residents with UI. Forty-eight recruited residents were randomized into the intervention and control groups. All nursing home staffs were trained to ensure that they could correctly deliver the intervention, which was carried out during daytime once every two hours for 12 hours. Physical checks for wetness and measurement of voided volume were performed at an two-hourly interval from 7am to 7pm at the baseline and at 3- and 6-months post-intervention. Each period of data collection lasted three days. The outcome measures include the (i) incontinence rate, (ii) number of self-initiated toileting, (iii) number of continent voids, and (iv) the number of wet episodes. Results : The median numbers of wet episodes and self-initiated voids at 6 months post-intervention were 3.5 and 0.7 per day for the intervention group and 4.5 and 0.2 for the control group, respectively. Also the day time incontinence rate was 60.9% in the intervention group and 76.6% for the control group. There were significant differences in the number of wet episodes/day ($p = .043$) and in the day time incontinence rate ($p=.009$) between the two groups. Conclusion : PV has been shown to have some effects in its use in Chinese communities but its effect of PV was not found to be as effective as compared to Western populations. Keywords : Prompted Voiding, Urinary Incontinence, Behavioral Intervention, Residential Care

CAN ALZHEIMER'S PATIENTS' QUALITY OF LIFE BE IMPROVED BY INTER-GENERATIONAL MAINTENANCE? A STUDY OF THE RELATIONSHIP BETWEEN CHILDREN AND THE ELDERLY WITH DEMENTIA

Kazumi WATANABE¹, Katsuyoshi TAKAHASHI¹, Yukari SEKI², Sayuri KOBAYASHI², Ryoko ROKKAKU², Akira HONMA³ (*1. Dementia Care Laboratory, Japan; 2. Tokyo University of Technology, Japan; 3. Dementia Care Research and Training Tokyo Center, Japan*)

Introduction : In Japan over the recent years, interaction between children and senior citizens has been decreasing. It is particularly low with respect to the elderly with dementia. This paper reports the results of a four-month intervention of continuous, daily interaction between children from a nursery and the dementia-suffering elderly at an adjacent facility, finding that it can help maintain or improve the quality of life of Alzheimer's Disease (AD) sufferers, as measured along the Affect Balance Rating scale (ABRS). Method : (1) Conduct lifestyle interviews with the AD sufferers, the children, the families, and the managers of the nursery school and the day care center care. (2) With the intervention group, conduct activities with children one hour each morning. (3) Use ABRS to assess and compare the mood before and after the four-month intervention. Results : There was no significant difference between the pre-intervention and post-intervention ABRS findings for either the control or intervention group. However, subjects in the intervention group showed amazement with the words of the children and relayed them joyfully to the care

staff. On the days when the children could not visit, the subjects would say sadly, "Today, the children are not coming, right?". Conclusion : Even within the short, four-month period, the AD elderly were increasingly interested in the children and with their active involvement with the children, suggesting the possibility that this two-year intervention study could improve the quality of life of the intervention group. Keywords : quality of life

THE RELATIONSHIP BETWEEN FALLS AND PSYCHOLOGICAL WELL-BEING IN SOUTHERN BRAZILIAN ELDERLY

Patricia MORSCH¹, Dena SHENK¹, Julie MCLAUGHLIN², Angelo Jose G. BOS³ (*1. Gerontology, University of North Carolina at Charlotte, USA; 2. Gerontology, Queens University, USA; 3. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil*)

Introduction : One in three older adults fall each year in Brazil. Falling is associated with increased hospital and nursing home admissions and disability rates. Therefore, falls can have devastating outcomes for older adults, their families and health care systems. Research has identified many risk factors for falls, including physical and environmental hazards. However, less research has addressed the relationship between psychosocial factors and falls. Objective: to verify the relationship between psychological well-being and falls in community dwelling older adults. Method : Using a secondary dataset from the study 'Older Adults' Profile in RS' conducted between the years 2010 and 2011 by the State Government in partnership with the Institute of Gerontology and Geriatrics of PUCRS and the School of Public Health of the RS, we tested the relationship between psychological well-being and falls in community dwelling older adults. The data were used to test whether the independent variables representing demographics and psychological well-being (age, gender, race, educational attainment, monthly household income, if respondents reduced activities due to emotional problems, frequency with which respondents feel calm and relaxed and presence of depression or anxiety) are associated with the dependent variable of falls. Analysis was conducted using bivariate cross tabulation and noting of chi-square values. Results : Psychological wellbeing has a relationship with falls and the relationship varies in different groups. Conclusion : These research findings are important to increase the existing knowledge about falls and provide important information for professionals working in fall prevention. Keywords : Falls, Community based research

PP26 R-031

UTILIZATION PATTERNS OF COMMUNITY HEALTHCARE SERVICES OF SENIOR NURSING HOME RESIDENTS IN TAIWAN

Shinn-Jang HWANG¹, Chia-Hui LIN², Hsiao-Ting CHANG³, I-Hsuan HWANG⁴, Mei-Man HO⁵ (*1. Department of Family Medicine, Taipei Veterans General Hospital and National Yang-Ming University School of Medicine, Taiwan; 2. Department of Family Medicine, Taipei Veterans General Hospital, Taiwan; 3. Department of Family Medicine, Provincial Taipei Hospital, Taiwan; 4. Department of Health Care Management, National Taipei University of and Nursing and Health Sciences, Taiwan; 5. Home Care Institute, Taipei Veterans General Hospital, Taiwan*)

Introduction : Population ageing with its associated health care problems and financial burden is becoming an important issue in Taiwan. As people ageing progress, disability will increase and thus

making community long-term care more demanded. Method : This study examined the utilization patterns of community healthcare visits and services of senior nursing home residents in Taiwan by analyzing the Taiwanese National Health Insurance Database. Results : There were 4,335 nursing home residents aged 65 years (44.7% male and 55.3% female) receiving a total 25,441 community healthcare visits with an average of 5.0 visits per subject during 2004. Subjects aged 75-84 years received more community healthcare visits (48.5%) than subjects aged 85 years (26.1%) and subjects aged 65-74 years (25.4%). Women received more community healthcare services and visits than men in all age groups. Cerebrovascular disease was the most frequent diagnosis (51.2%) of residents, and the majority of community healthcare services were provided by the community home nursing care institutions (81.7%). The most common provided nursing services were resource utilization group-2 (general nursing service and one skilled nursing service). As for skilled nursing services, nasogastric tube replacement (56.4%), urinary indwelling catheter replacement (30.5%), and tracheostomy tube (13%) replacements were the leading skilled nursing services provided for elder residents in nursing home. The tube replacement accounted for 97.7% of all skilled nursing services. Conclusion : There were age and gender differences in the community healthcare services utilization among senior nursing home residents in Taiwan. The high percentage of tube replacement among community healthcare services in nursing home residents deserves more attention. Keywords : Community healthcare services; Nursing home residents; Tube replacement

EXPENDITURE OF HOME HEALTH CARE UTILIZATION AMONG DIABETES PATIENTS WHO AGED 65 AND OLDER - A THREE-YEAR FOLLOW UP STUDY IN TAIWAN

Shu Hui LIN¹, Jengyuan CHIOU² (1. Nursing department, Department of Healthcare Admini, Chung Shan Medical University Hospital, Asia University, Taiwan; 2. Health Policy and Management, Chung Shan Medical University, Taiwan)

Introduction : With the changes of population structure and the diet and lifestyle in Taiwan, diabetes has become a chronic disease with many complications, which also has a high incidence, high prevalence, and high economic burden nationwide. After the implementation of National Health Insurance (NHI), most patients discharged from the hospital with multiple long term diseases need persistent health home care. Method : The 2005 Longitudinal Health Insurance Database (LHID) from National Health Insurance Research Database (NHIRD) is used to explore the expenditure of home health care utilization among the elderly 65 and older diabetes patients in Taiwan. After deleting missing data, there are 273 diabetes patients who received home health care during 2005. Their utilizations of home health care and medical care are analyzed by a three-year follow-up. Results : Our study concludes that there are 273 people who have diabetes and receiving home health care. Most of them are women, insured within the North district of NHI, scored 2 in Charlson Comorbidity Index (CCI), grouped in resource utilizing group (RUG) level 2. The results of regression models show that, when holding the other variables constant, those with catastrophic illness utilizing more home health care services had a greater number of outpatient- total services points, and had shown significantly higher in the consecutive three years. Conclusion : Policy makers need to design more comprehensive programs and integrate discharge preparations and diabetic caring network to provide continuous care for diabetes with diabetes. Keywords : Home Health Care, National Health Insurance Research Database (NHIRD), Diabetes

PP26 R-033

PERCEIVED LIFE SATISFACTION OF THE KOREAN ELDERLY - A QUALITATIVE STUDY

Minsun SUNG¹, Mihye CHOP² (1. Emeritus Professor, Dept. of Social Welfare, The Catholic University of Korea, Korea; 2. Lecturer, Dept. of Social Welfare, The Catholic University of Korea, Korea)

Introduction : As South Korea is fast becoming an aged society, the quality of life for the elderly is deteriorating dramatically. It is estimated that about half of people age 65 and over are likely to be the victims of poverty, and the suicide rate among elderly Koreans steadily increased. The main reasons they choose suicide are illness, economic status, and loneliness. The aims of this study are: (1) to find out how the elderly subjectively perceive their current life situations, whether they are satisfied or not with their later life, and (2) to figure out what factors could contribute to their life satisfaction. Method : The method of the study is a qualitative study based on the Grounded Theory. Primary data are autobiographies of 15 elders which were collected by graduate students in one of the authors' classes in Spring and Fall 2012. Each student was assigned to select a participant who was able, and willing to talk his or her life story. Student wrote autobiography on behalf of the elderly who later approved it. Results : Through analysis, it is tentatively assumed that the most participants reach a settled inner state of consciousness like peace or equanimity in their later life, no matter what difficulties they faced in the past and present, by accepting their realities and by putting down many unfilled wishes, while trying to increase their own internal strengths and utilizing outside supports. Conclusion : Interpretation and implication of these results need to be discussed further in detail. Keywords : autobiography, life satisfaction, peace or equanimity

PP26 R-034

THE EFFECTS OF BABY BOOMERS' RETIREMENT PREPARATION AND LEISURE ACTIVITIES WITH SPOUSE ON LIFE SATISFACTION

Meehye KIM, Soonhyeon NAM (Graduate School of Social Welfare, Ewha Womans University, Korea)

Introduction : As the baby boomer generation joins the elderly population, it is estimated that the elderly population will reach 10 million by 2030. In this study, we investigate the effects of baby boomers' lifestyle, retirement preparation and leisure activities on their lifestyle satisfaction, thereby helping them to prepare a plentiful and active ageing. Method : The study was conducted from Oct 3 2011 to Nov 30 2011 on 1,021 baby boomers living in 15 large cities across the country. A proportional quota based sample was drawing utilizing residential listings from Korea's 2010 Population Census. Results : The results are as follows from using path analysis and SEM on the AMOS 18.0 statistics program. First, baby boomers' lifestyle revolving around work and leisure affected their degree of life satisfaction and they preferred work-lifestyle to leisure-lifestyle. Second, baby boomers' awareness of retirement preparation, retirement planning, and leisure activities with their spouses affected their degree of life satisfaction, and those with stronger awareness of retirement preparation were receiving more related retirement preparation education. Third, those who enjoy freetime with their spouse and a lifestyle centered around leisure not only affected the baby boomers' leisure satisfaction level, but also life satisfaction level. Conclusion : As a result, this study is suggested the importance of lifestyle, retirement preparation and leisure activities as an elderly in enjoying life after retirement by baby boomers who many will live up to 100. Keywords : Babyboomer generation, retirement preparation, leisure activities for old aging, active aging, life satisfaction, lifestyle, leisure

activities with spouse

THE EFFECT OF LEADERSHIP STYLE AND JOB SATISFACTION ON AFFECTIVE COMMITMENT

Chiu-Fen LAI¹, Meilan CHEN¹, Ying-Tsun HUNG² (1. *Institute of Health Industry Management, Ching Kuo Institute of Management and Health, Taiwan*; 2. *the Department of Senior Citizen Service in Management, Ching Kuo Institute of Management and Health, Taiwan*)

Introduction : It is an important issue for each organization to keep good employees and their own commitment. Every organization has their own distinctive culture which can influence employees' behaviors. The aim of the study is to investigate the moderating role of organizational culture and personality in the relationship among leadership, organizational commitment and job satisfaction. The study also explores the mediating role of job satisfaction in the relationship of leadership with organizational commitment. **Method :** The study use the quantitative studies analysis. By interviewing and recording seven employees' viewpoint toward their leader's management methods in the long-term care facility, the researcher analyzes the interview. **Results :** The aim of the study is to explore the impact of leadership style and job satisfaction, and affective commitment in the long-term care facility. **Conclusion :** The results of this study include: (1) Innovative culture has positive moderating effort in the relationship between transformational leadership, affective commitment, and so does Supportive culture. Supportive culture moderates the relationships of transactional leadership with affective commitment. (2) The moderating effects of conscientiousness personality influence in relationship between transformational leadership and job satisfaction significantly. (3) Job satisfaction mediates the relationship between transformational leadership and organizational commitment, as well as between transactional leadership and organizational commitment. The supervisors' leadership can influence affective commitment directly and influence affective commitment through job satisfaction indirectly. **Keywords :** Leadership Style, Job Satisfaction, Long-term care facility

HOW TO MANAGE DEHYDRATION/ELECTROLYTE IMBALANCE OF RESIDENTS IN NURSING HOME - BUILDING PRACTICAL ALGORITHM

Eun Young KIM, Su Jung LEE, Sung Ok CHANG (*College of Nursing, Korea University, Korea*)

Introduction : The elderly in nursing homes easy to get dehydrated and turn up electrolyte imbalance than the elderly in community, due to not to intake fluids sufficiently. Dehydration/electrolyte imbalance to the elderly should be recognized as a serious public health problem associated with increased morbidity and mortality. This study was conducted to identify type of emergency situation due to dehydration/electrolyte imbalance in nursing home and to develop nursing practice algorithm for emergency nursing management related to resident's dehydration/electrolyte imbalance in nursing home. **Method :** Nursing literatures review was done, 20 experienced nurses in 6 nursing home were interviewed and analyzed. We checked work flow and the preliminary algorithm were developed and this was evaluated by the expert group and modified. **Results :** In total, 80 literature were searched, that is, articles published in 12 kinds of academic nursing journals, 19 kinds of guidelines and 49 kinds of textbooks on nursing and medicine related to resident's dehydration/electrolyte imbalance in nursing home. The major

diseases that cause dehydration/electrolyte imbalance was stroke with dysphasia, dementia, gastrointestinal problems, end-stage cancer/bedridden state. Preliminary algorithm is consisted of assessment, intervention, evaluation part that includes 47 items. Finally, 42 items were constructed to the modified algorithm after the expert group was evaluated. **Conclusion :** The algorithms developed in this study will not only improve the quality of nursing care but also provide evidence for effective health care. This research was supported by Basic Science Research Program through the National Research Foundation of Korea(NRF) funded by the Ministry of Education, Science and Technology(2010-0009022). **Keywords :** Hemodynamic Homeostasis Management, Nursing home, Practical algorithm

PP26 R-037

DEVELOPMENT OF APPROPRIATE CASE MANAGEMENT MODEL IN LONG-TERM CARE SERVICES FOR THE ELDERLY

Ji Young HWANG, Mee Hye KIM, Soonhyeon NAM (*Graduate School of Social Welfare, Ewha Womans University, Korea*)

Introduction : Adoption of case management and establishment of system is required to continuously improve long-term care service insurance for the elderly, enhance effect and efficiency of long-term care services for the elderly and promote the welfare of the elderly and families. We explained problems that can be fixed and solved through initial contact, inspection, planning, intervention, review and evaluation by adopting case management from the problems arising from the implementation of long-term care services for the elderly. **Method :** In this research we discussed the goals, function, role, case management personnel education and their professional level and source of revenue by forming three models: long-term care services for the elderly, National Health Insurance Corporation, and health center & resident lifestyle support center combination. Central to the models were the main topic of case management, with case management range set all over the communities based on previous studies. **Results :** Models provided in the research results will not limit case management to only subjects of long-term care services for the elderly. Rather, integrated services will be provided to the regional community at large, leading to resolution of dead zone related to diverse services provided by communities, various use of resources by those communities and long-term care services for the elderly and provision of policy effect and efficiency. **Conclusion :** This research is suggested that it may contribute the continuous improvement of long-term care services insurance for the elderly by emphasizing the need for case management and developing appropriate case management models in long-term care services for the elderly. **Keywords :** long-term care service insurance for the elderly, long-term care services, case management

PP26 R-038

THE STUDY OF THE OPTION OF THE ELDERLY ON LONG-TERM CARE MODES AND INFLUENCING FACTORS

Liu NINA (*School of Sociology and Population Studies, Renmin University of China, China*)

Introduction : With the arrival of aging and advanced-aging in China, the amount of disabled senior citizen is obviously rising. Long-term care will be the key point of social care service for old people in the future. However, there were less studies on long-term care modes of the elderly. **Method :** I make regression analysis in elements that influence long-term care model of disabled old people. **Results :** The group that is taken care of in the institutions mainly is urban long-term care with good financial conditions, high-disabled level and poor inter-

generational relations in the south. Conclusion : Home long-term care is still main modes of senior citizens on long-term care, so it's very important for intervention of community service. The group that is taken care of in the institutions mainly is urban long-term care with good financial conditions, high-disabled level and poor inter-generational relations in the south. The institutional care may have to orient more clearly and play complementary roles. In addition, financial support of children and the amount of children can't hinder old people to choose institutional long-term care. Keywords : long-term care; old people needing long-term care; long-term care model

PP26 R-039

DEVELOPMENT OF PROTOCOL FOR EMERGENCY NURSING MANAGEMENT OF AIRWAY OBSTRUCTION BY FOREIGN BODY IN NURSING HOME

Su Jung LEE, Mi So KIM, Sung Ok CHANG (*College of Nursing, Korea University, Korea*)

Introduction : The purpose of this study was to draw a protocol on the emergency nursing management about airway obstruction by foreign body in nursing home. Method : The protocol was developed based on a literature review and experts' knowledge. Nursing management categories were developed from interviews with practice nurses, grouped in to five areas about the condition of residents. Reflecting the experiences of clinical nursing practice and literature review, a protocol were developed, as were algorithms displaying the flow of nursing process. We selected health experts who had prior experience related to gerontological nursing on emergency. Panels were consisted of emergency physician(1), family medicine(1), neurologist(1), nursing professor(6) and specialist nurses of nursing home (6). They assessed the protocol content validity and priority on management independently. Based on the content validation, the protocol for the emergency nursing care of airway obstruction by foreign body was modified and finalized. Results : Of the 38 items constituted, 33 items were determined to be appropriate. The protocol of airway obstruction by foreign body comprised 33 items for assessment domain(16), intervention domain(12), evaluation domain(5). The hierarchical assessment priorities of protocol are listed in 'judgement about looking appearance', 'physical assessment', 'Check the resident's history', 'Check the resident's behavioural habits'. Conclusion : The protocol developed in this study can be used for the elderly care and for training nursing students and novice nursing home nurses. This research was supported by Basic Science Research Program through the National Research Foundation of Korea(NRF) funded by the Ministry of Education, Science and Technology(2010-0009022). Keywords : nursing home, emergency, airway obstruction

PP26 R-040

ANALYSIS OF SPACE ORGANIZATION AND SCALE OF JAPAN'S GROUP HOME

Taeil KIM (*Faculty of Architecture, Jeju National University, Korea*)

Introduction : The population with dementia is consistently increasing. However, there is no specific facility standards though a variety of welfare facilities has been proposed according to an amendment. The purpose of the study is to prepare facilities for the aged with dementia and set facility standards of group home in order to improve the environment of facilities. Method : As Japan and Korea have similarity in living space, it is considered useful to make practical application from Japan's case in setting standard of architectural space for the aged. We collected 130 group home data in total. We figured out architectural features by analyzing and arranging data in detail. Results: First, location type of facilities could be sectionalized suburb

type and general residence type in town. Especially the latter has higher percentage which means many facilities are located near downtown. Second, small-scale(9 people) and middle-scale(18 people) of facilities capacity are the most, which make homelike atmosphere. Third, the typical feature of group home, unit is mostly composed of one unit or two units. 90% of researched case shows this. Fourth, each II type and L type accounts for 37.3% and 30%. Conclusion : Construction plan should reflect features as mentioned above. Research plan for the aged with dementia in Korea has just started. Many things in architecture can be applied from the empirical research through analyzing Japan's facilities. But complete design should contain actual Korean cultural background. Far more research about facilities atmosphere that is proper to Korea's sentiment and so on is required. Keywords : Japan, group home, unit

PP26 R-041

REPORTING ADVERSE EVENTS AT GERIATRIC FACILITIES: CATEGORIZATION BY TYPE OF INCIDENT AND FUNCTION OF REPORTING PERSONNEL

Tali SHMUELI¹, Ronit HAR NOY¹, Merav BEN NATAN², Joshua BEN-ISRAEL³ (*1. Nursing, Shoham Geriatric Center, Israel; 2. Nursing School, Israel; 3. Shoham Geriatric Center, Israel*)

Introduction : Adverse events and patient care-related incidents are a challenging universal problem, among elder residents of geriatric facilities. The aim of this study was to examine which types of adverse events are characteristic of the geriatric center studied and which of the nursing staff reported such incidents. Method : Data were retrieved from the computerized incident management system at a large geriatric center in central Israel, and all adverse events reported over the past three years were examined. Results : The study findings indicate that the most common type of adverse event was falls. Older nurses with greater seniority in the facility show a higher tendency to report adverse events. In addition, registered nurses were found to report more often than practical nurses. Conclusion : This study highlights the important role that nurses can play in reporting and reducing adverse events. The role of the nurse is becoming increasingly complex, especially in geriatric facilities, which serve people with complex mental and physical states who are more susceptible to adverse events to begin with. Keywords : Adverse events, geriatric facilities, nurses

PP26 R-042

UNINSURANCE AMONG PRERETIREMENT ASIAN AMERICANS: IDENTIFYING THE ROLE OF SOCIAL AND CULTURAL CONTRIBUTORS

So-Young PARK¹, Duy NGUYEN¹, Sunha CHOF (*1. Silver School of Social Work, New York University, USA; 2. College of Social Work, University of Tennessee, USA*)

Introduction : Despite nearly universal insurance coverage for older Americans over 65, the pre-retirement age cohort is susceptible to gaps in coverage. Related to the Patient Protection and Affordable Care Act (ACA), this study investigates heterogeneity in insurance status within pre-retirement Asian immigrants by examining the interacting effects of Asian ethnicity and employment type, a major factor that determines an individual's insurance status in the U.S. Method : Data from the 2009 California Health Interview Survey on 1,024 Asians between 50 and 64 were analyzed. Asian immigrants from Chinese, Vietnamese, Filipino and Korean backgrounds were included in the study. Results : The findings indicate significant moderating effects between employment type and Asian ethnicity. However, regardless of employment type, the highest rate of uninsurance was among Koreans.

Conclusion : To effectively reach the ACA's goal of reducing the uninsured, targeted interventions specific to Asian subgroups are essential. Keywords : Immigrants, insurance, capital

PP26 R-043

A REVIEW OF THE USE OF POPULATION PHARMACOKINETIC ANALYSIS IN OLDER ADULTS: AN IMPORTANT TOOL FOR DOSE OPTIMIZATION

Claire JOHNSTON¹, Carl Mj KIRKPATRICK², Andrew J. MCLACHLAN³, Sarah N. HILMER⁴ (1. Department of Clinical Pharmacology, University of Sydney/Royal North Shore Hospital, Australia; 2. Centre for Medicine Use and Safety, Monash University, Australia; 3. Faculty of Pharmacy/Centre for Education and Research on Ageing (CERA), University of Sydney/Concord RG Hospital, Australia; 4. Department of Clinical Pharmacology and Aged Care, University of Sydney/Royal North Shore Hospital, Australia)

Introduction : Older people are major users of medicines and often require dose adjustment due to age- and disease- related physiologic changes, inter-current disease and polypharmacy. Understanding and characterizing variability is key to optimal dose selection in older and older frail people. In population pharmacokinetic (PopPK) analyses the population of people is studied to determine average values and while still gaining an understanding of the causes of variability. The aim of this review was to investigate the utilization of PopPK studies in people over 65 years of age. Method : A MEDLINE and PubMed search identified 245 papers using the search term "population pharmacokinetics". Restrictions were set on papers describing research in: age > 65 years; in English; published 2005-2011; in humans; and full-text was available. Two papers were excluded because they were reviews, 75 because the maximum age of participants was <65 years and 3 due to not using population pharmacokinetic modeling. Results : The median(range) number of older people in the studies was 101(5-3355). Amongst the 16 studies that primarily focused on older adults, antimicrobials (7/16) were the most commonest drug class, most studies used sparse blood sampling methods and participants were generally acutely unwell. Some studies were translated into dosing guidelines specific for older people, although these were generally at a local level. No studies were identified which utilised PopPK to determine the impact of frailty on pharmacokinetics. Conclusion : The use of PopPK in older people is still limited despite a significant gap in knowledge on optimal dosing for older people, particularly the frail. Keywords : Population modelling, Review, New technology

PP26 R-044

DRUG USE REVIEW AMONG ELDERLY PATIENTS UNDERGOING LAPAROSCOPIC CHOLECYSTECTOMY THROUGH PREOPERATIVE COMPREHENSIVE GERIATRIC ASSESSMENT

Haerin PARK¹, Soh Mee PARK¹, Dam Kyoung LEE¹, Yewon SUH², Eunsook LEE², Kwangil KIM³, Byungkoo LEE¹ (1. College of Pharmacy, Ewha Womans University, Korea; 2. Department of Pharmacy, Seoul National University Bundang Hospital, Korea; 3. Geriatric Center, Seoul National University Bundang Hospital, Korea)

Introduction : A greater number of elderly patients undergo surgical operations, and their preoperative medication needs to be managed with careful attention. The role of pharmacist in Preoperative Comprehensive Geriatric Assessment(Preop-CGA) is to complete a full medication list, identify medications that require discontinuation and provide information to the geriatrician and patients. Method : Among patients who visited Geriatric Center for PreOp-CGA from

September 2011 to August 2012, 94 who had undergone laparoscopic cholecystectomy (LC) after the assessment was involved in this study. 79 elderly patients who had undergone LC without receiving PreOp-CGA were selected as the control group. All data were collected from the Electronic Medical Record(EMR). Results : The average number of medications taken by the study group was 6.0. 64(68.8%) were taking more than 4 medications (polypharmacy). 68.8% were taking at least one medication that requires discontinuation in the preoperative period. 57.0% and 82.8% were taking at least one medication that can cause delirium and that are known to increase risk of falls, respectively. Average age was significantly higher in the study group. Postoperative bleeding event was significantly lower in the patients in the study group(p=0.028). There was one patient who had postoperative delirium in each group, and one patient in the control group fell in the postoperative period. Conclusion : More than 50% of the patients were taking medications that may require discontinuation regarding bleeding, delirium or falls. Postoperative bleeding event was significantly lower in those who had their medication reviewed. Pharmacists' intervention in the preoperative period of elderly surgical patients is needed. Keywords : Preoperative Comprehensive Geriatric Assessment, Drug Use Review

PP26 R-045

A SUGGESTION FOR OPTIMAL CONTROL OF TUBERCULOSIS IN THE ELDERLY

Haesook SEO¹, Chongkyung KIM¹, Jaerak HONG¹, Jeongeun SEO¹, Youngsoo CHO¹, Ohwoo KWON², Hansun KIM³ (1. TB Department, Seoul Metropolitan Government Seobuk Hospital, Korea; 2. Cardiothoracic Surgery, Seoul Metropolitan Government Seobuk Hospital, Korea; 3. General Surgery, Seoul Metropolitan Government Seobuk Hospital, Korea)

Introduction : This poster's objectives are to implement TB control successfully through the early detection of TB and the effective management of TB by identifying the characteristics of the target elderly TB patients and organizations and control measures providing TB services for them. Method : The study design is consisted of literature review, the baseline survey, interview and focus group workshop for organizations and elderly TB patients to build mapping and directories of organizations, and establish the TB patient pathway. The baseline survey was conducted by questionnaire to the representative staff of each of the organizations and to elderly patients. The interviews were proceeded with multiple themes. The research also held focus group workshops for discussion barriers to managing TB patients. Results : The organizations and elderly TB patients were 13 and 41, respectively. The mapping of TB organizations and their directories provided systemic ways to address the distribution of organizations, link with the patients and medical institutions effectively, and enhance patients' accessibility to medical institutions. In addition, focus group workshops pointed to the main barriers of TB control and resolution of them. Conclusion : Main barriers of TB control in this research were lack of publicity activities and education, insufficient education and problems related to care giving. In advance, efforts for resolving these barriers will significantly improve TB management and eventually, lead to achieving the optimized TB Patient Pathway. Keywords : Tuberculosis control, The elderly, TB Patient Pathway

PP26 R-046

THE EFFECTS OF COVERAGE ON ATYPICAL ANTIPSYCHOTIC UTILIZATION AMONG MEDICARE PART D BENEFICIARIES WITH SCHIZOPHRENIC AND BIPOLAR DISORDERS IN WASHINGTON STATE, USA

Indira PINTAK (School of Social Welfare, University of California Berkeley, USA)

Introduction : Medicare Part D is an insurance program in the USA for qualified people who are either disabled or over 65 years old or suffer from End Stage Renal Disease. It provides coverage for outpatient prescription drugs. Unlike traditional Medicare program (Parts A and B) in which the federal government runs the program, benefits are uniform, and payments are based on fee-for-service plans, Part D is intended to spur competitive drug pricing and plan designs that would curb escalating drug costs, and at the same time improve quality of care and treatment adherence. Coverage includes a minimum drug formulary requirement, co-sharing of financial risks with the government, and a standard Part D benefit or an actuarially equivalent plan that may offer more benefits than the standard or stand-alone prescription drug plan (PDP). Standard components of such plans have annual deductibles, coverage up to a government pre-determined level, a gap in coverage when beneficiaries must bear 100 percent out-of-pocket costs, and a period of catastrophic coverage. On the beneficiaries' side it is not yet clear whether the program has benefited specific groups on particular prescription drugs. Additionally it is also unclear whether beneficiaries are making cost-effective decisions in choosing their drug coverage plans. The study examines the choices in coverage plans made by beneficiaries with schizophrenic and bipolar disorders and also takes a closer look at the patterns of select antipsychotic utilization. Federal claims data is used for analyses. **Method :** Cross-sectional analyses of claims data. **Results :** To be announced. **Conclusion :** To be announced. **Keywords :** American prescription drug insurance, Medicare Part D

PP26 R-047

INTRODUCTION OF FISH AND GOAL MANAGEMENT PORTFOLIOS TO BOOST THE MORALE OF DEMENTIA CARE PROFESSIONALS

Katsuyoshi TAKAHASHI¹, Kazumi WATANABE¹, Yukari SEKI², Sayuri KOBAYASHI³, Ryoko ROKKAKU³, Akira HONMA⁴ (1. Dementia Care Laboratory, Japan; 2. Tokyo University of Technology, Japan; 3. University of Technology, Japan; 4. Dementia Care Research and Training Tokyo Center, Japan)

Introduction : The purpose of dementia care is to support suffers live safely and normally. To accomplish this, it is most important for the patient to appreciate their need to continue to learn. This report exams the progress of eleven staff members of Day Center A, which introduced portfolios (a goals management system) and FISH (a customer correspondence manual) in 2010. **Method :** (1) Day Care Center A staff attended a seminar on portfolios-FISH in April 2010. After using brainstorming and the KJ method, the subjects came to a common understanding of goals for the next operational year. (2) Focusing on the annual goals, individual staff members envisioned their roles and acted to realize them.(3) Each staff fills in their vision, goals, process, etc. in a personal file. (4) The files are kept to allow all staff free access. (5) Using FISH's "gratitude" code of conduct, "Thank you." Seals were used among staff used. (6) Every three months, administrators conducted interviews with the staff in order to check progress towards their visions. (7) The portfolios were collated and each staff member presented their own. (8) The staff was surveyed. **Results :** The staff, after closely listening to each other's different visions, learned to reorient themselves and to use time more effectively. They realized the difficulty of maintaining their portfolios despite their busy workdays. However, through the creation and presentation of the portfolios, the staff improved their empathy with their dementia patients and confirmed both their learning and personal

development. Moreover, utilizing FISH helped them create a work environment of interpersonal awareness and appreciation. **Conclusion :** They expressed the desire to continue this work approach, in order to manage their future goals. **Keywords :** education

THE SERVICE MODEL OF AGED CARE UNIT IN A COMMUNITY HOSPITAL FOR THE CARE OF THE ELDERLY IN HONG KONG

Kwun Man LO¹, Lai Wan TONG¹, Siu Yin CHAN², Lai Fong IP¹, Kit Hoi CHAN³, Yuk Lun CHENG³ (1. Department of Medicine, Alice Ho Miu Ling Nethersole Hospital, Hong Kong; 2. Community outreach services team, Alice Ho Miu Ling Nethersole Hospital, Hong Kong; 3. Department of Medicine & ICU, Alice Ho Miu Ling Nethersole Hospital, Hong Kong)

Introduction : An Aged Care Unit (ACU) was established in a community hospital in Hong Kong. It aims at providing an elder-friendly environment for elders who are admitted to the hospital. A clinical care pathway based on the care needs of elders is adopted. ACU provides an environment for the community outreach services team (COST) to have early participation in formulating the discharge plan. **Method :** A 24-bed Aged Care Unit was specially designed and incorporated into a medical ward which was renovated in an elder-friendly environment. This included the installation of ceiling hoist with walking brace, flooring with embedded padding materials and adding the handrails in the corridors. A clinical care pathway was designed to target on the patients' needs. A comprehensive geriatric collaborative round with early participation of COST led by a geriatrician serves to provide early intervention and formulate the discharge plan. **Results :** The average length of stay (ALOS) of the designated medical ward incorporating the ACU was decreased by 8.7% from 4.6 days in 2010 to 4.2 days in 2011. The emergency admission rate of the patients from the designated residential care homes for elderly (RCHE) was decreased by 10% and the unplanned readmission rate was decreased by 25%. **Conclusion :** The results demonstrate that the ACU is a promising service model for the care of the elders. It can improve the care journey of the patients and lessen the hospital service demand. **Keywords :** aged care unit

PP26 R-049

DEVELOPMENT OF A CLINICAL JUDGMENT RUBRIC FOR FALL PREVENTION CONSTRUCTED BY MULTIPLE PROFESSIONS

Mayumi KATO¹, Yoshimi TANIGUCHI¹, Mizue SUZUKI², Yasuyoshi ASAKAWA³, Tomoko HIRAMATSU¹, Tome IKEZOE⁴, Akiko SEKII⁵, Tadahiko KAMEGAYA³ (1. School of Health Sciences, Kanazawa University, Japan; 2. Department of Medicine, Hamamatsu University School of Medicine, Japan; 3. Graduate School of Medicine, Gunma University, Japan; 4. Graduate School of Medicine, Kyoto University, Japan; 5. Division of Health Sciences, Niigata University, Japan)

Introduction : Falls can cause various serious outcomes in the elderly. Elderly people in care facilities usually face multiple intrinsic and extrinsic factors because of their fragility and lack of ability to adapt to changing environments. Therefore, fall prevention interventions should involve clinical judgments related to individual risks. The aim of this study was to develop a clinical judgment rubric for fall prevention based on Lasater Clinical Judgment Rubric (2011) using viewpoints from multiple professions. The objective of the rubric was to facilitate learning and evaluation of skills and competencies for task training of fall prevention among novice staff. **Method :** The

professions were represented by nurses, physiotherapists, and an occupational therapist. Each participant was independently investigated to determine what was necessary for clinical judgment in fall prevention. Motor skills, cognitive skills, incontinence, environmental risks, a tool for fall risk assessment, team approach, and nursing administration were explored and integrated. Results : The dimensions of the rubric were adopted for the beginning, developing, accomplished, and exemplary stages. Expectations were integrated with “being able to observe and estimate fall risks,” “being able to detect unusual differences,” “being able to prioritize information,” “being able to interpret and integrate information,” “being able to intervene according to circumstances,” and “being able to make changes for improvement.” Conclusion : We need to examine whether this rubric would be valid to construct a method for clinical judgment for fall prevention. Keywords : fall prevention, clinical judgment rubric, multiple professions

PP26 R-050

DEVELOPMENT OF HOME CARE SUPPORT SYSTEM USING THE IPAD

Momoe UTSUMI¹, Satoshi SASAYAMA¹, Hiroshi DEKIGAI², Shinichi NOMOTO¹ (1. Department of Human Health Sciences, Kyoto University, Graduate School of Medicine, Japan; 2. Director, Dekigai Clinic, Japan)

Introduction : In home care, close interactions between doctors/nurses/caretakers, and patients/their family members are indispensable. Currently, however, a paper notebook is used among them in Japan. As a result, information sharing is not made on a timely basis. We developed an iPad application named “e-Renraku Notebook” (e-Communication Notebook, e-RN) for home care. The “e-RN” enables home-care patients and their families input their daily status and exchange information with healthcare staff on a timely basis. We report the study result of its usefulness. Method : Cloud computing is used for data management of this system. Home-care patients and healthcare staff were given “e-RN”-installed iPad for 2 months to input schedule, daily status such as vital signs. We carried out a survey before and after usage and analyzed the result of the survey. Results : Seven home-care patients and 6 healthcare teams participated in the trial. Home-care patients can input their information in the “e-RN” at home by iPad, and healthcare staff can do the same by iPad or PC. 66% of the information input was performed by home-care patients and their families, 30% by nurses, and 3% by medical doctors. 30% of the communications were about daily life excluding health information or inquiries. The communication was made mainly between patients /families and nurses. Conclusion : With the “e-RN” iPad application, we developed a new system allowing home healthcare information to be shared by anyone, anytime and anywhere. Effective usage of “e-RN” has a potential to improve the quality of home health care. Keywords : Home care, Information sharing, iPad

PP26 R-051

OLDER PERSONS TRANSITIONS IN CARE (OPTIC): CHALLENGES IN MEASURING TRANSITIONAL CARE ACROSS MULTIPLE SETTINGS

Greta CUMMINGS¹, Robert Colin REID², Carole ESTABROOKS¹, Peter NORTON³, Garnett CUMMINGS⁴, Adrian WAGG⁵, Brian ROWE⁴, Joanne KONNERT⁶, Glenda COLEMAN-MILLER⁷ (1. Nursing, University of Alberta, Canada; 2. Health and Exercise Sciences, University of British Columbia, Canada; 3. Department of Family Medicine, University of Calgary, Canada; 4. Department of Emergency Medicine, University of Alberta, Canada; 5. Division of Geriatric Medicine, Department of Medicine, University of Alberta,

Canada; 6. Interior Health Authority, Canada; 7. Alberta Health Services, Canada)

Introduction : The OPTIC study aims to identify: successful nursing home-to-emergency department (NH-ED) transitions from multiple perspectives, organizational and individual factors related to transition success; and improvements in care for frail elderly residents during NH-to-ED transitions. Review of Literature: NH residents frequently transition between NHs and EDs. Care during transitions is often suboptimal, and is complex due to involvement of different professionals, and this frail population’s degree of dementia and other chronic conditions. Method : OPTIC is a mixed method researcher/decision-maker partnership study. Phase 1 used qualitative methods to investigate residents’, family caregivers’, and healthcare providers’ perspectives of NH-to-ED transitions in each setting. Phase 2 consisted of pilot testing all data collection tools and then tracking transitions over a one-year period in two Western Canadian provinces. Phase 3 consists of data cleaning and analyses to identify successful transitions, avoidable transitions and factors influencing both, as well as making recommendations for implementation, policy and future research. Results : In Phase 1, 71 participants were interviewed, and 55 transitions were tracked over a 3-month pilot period. Results reflected differences by city demographics, organizational and provider characteristics, resident characteristics and other factors. NH-to-ED transitions were not universally successful. In Phase 2, full data collection was completed on 600 transitions from 41 nursing homes. Phase 3 analyses are currently underway. Conclusion : Patient care records and provider interviews are a valuable source to evaluate transitions. This presentation focuses on challenges to capturing data from multiple sources, settings and providers across transitions, and our results in identifying successful/unsuccessful transitions. Keywords : transitions nursing homes

PP26 R-052

SWISS PERSPECTIVE ON FUTURE REQUIREMENTS FOR RESEARCH ON APPLIED GERONTOLOGY

Stefanie BECKER¹, Mike MARTIN² (1. Institute on Ageing, Bern University of Applied Sciences, Switzerland, Swiss Society of Gerontology, Switzerland; 2. Department of Psychology - Gerontopsychology, University of Zurich, Switzerland, Switzerland)

Introduction : The Swiss Society of Gerontology (SSG) is a national society with several active working groups. The concern of the SSG mainly focuses on interconnecting professionals as well as private persons interested and working in all fields of applied gerontology and providing them with expert information. The SGG currently has 1.600 members in all parts of the quadrilingual country. Method : Since the SGG claims political guidance in the aging theme it is the duty of a national society to formulate political recommendations. Last year we set on our agenda the development of position papers for the future perspective of several topics in applied gerontology. One of these is the view on future requirements for research in applied gerontology. Results : The stated requirements in this position paper range from the better cooperation between basic and applied research as well as overall recommendations for research policy to promote the implementation of efficient research programs (use of national available data), the successful distribution of research funding up to the promotion of young academics in the field of gerontology. Conclusion : This contribution will discuss the national recommendations in a broader international context and ask the question of sustainability of research findings. Keywords : research, policy, internationalization

PP26 R-053

ANALYSIS ON THE INFLUENCE FACTORS OF LEISURE OF THE ELDERLY'S AND PREFERENTIAL POLICY OF CHINA

Hong WANG (*Institute of Gerontology, Renmin University of China, China*)

Introduction : This paper will make a study of the leisure preferential policy for the elderly in China based on the survey of China Health and Nutrition Survey for the Elderly conducted in 2006. Analysis on the influence of age, sex, marriage, education level, self-report health and Body Function and IADL (Instrumental Activities of Daily Living) for the leisure activities choice of elderly of china. Method : (1)Descriptive Statistic. (2)Multiple Logistic Regressions. Results : We will find that age, marriage, education level, employment status, self-report health, source of income and IADL have significant impacts on the leisure activities choice of elderly of China. Conclusion: We should consider fully these factors such as age, marriage, education level, employment status, self-report health, source of income and IADL when we make the leisure preferential policy for the Elderly. Keywords : leisure, preferential policy

PP26 R-054

TOWARDS COLLABORATION IN HEALTHCARE AND WELFARE ACROSS THE NETHERLANDS: THE NIJMEGEN NETWORK WITH VETO RIGHT FOR THE ELDERLY AS THE SOLUTION TOWARDS EMPOWERMENT OF OLDER SUBJECTS

Minke NIEUWBOER¹, Dick HERFST², Marcel OLDE RIKKERT³
(1. PVI, UMC St Radboud, Netherlands; 2. RvB, ZZG Zorggroep, Netherlands; 3. Geriatrics, UMC St Radboud, Netherlands)

Introduction : Older subjects are rarely partners in innovation. However, this changed in the Dutch National Care for the Elderly. This program stimulated the formation of regional networks of health services, and stimulated participation by older persons. Method : As one of the 8 networks, 15 partners in healthcare and welfare services around the University Medical Centre Nijmegen, started a network called "100, Welfare en Care for the elderly". A group of 12 older subjects formed the most important committee with a veto right for all developments. The network developed two main interventions: an Integrated Care Program for frail elderly, including EASYcare-Two Step Older frailty screening, and an e- health tool (Health and Welfare Information Portal, ZWIP) to facilitate older subjects in directing their own care, and improve coordination of their complex healthcare arrangements. Results : The 100-network succeeded in implementing the Two Step Older frailty screening in over 1500 subjects, because it was reliable (Cohen's Kappa 89%), valid (correlation .63 with Frailty Index), and most efficient, as only a minority (< 40%) of subjects needed explicit screening. The ZWIP e-tool was successfully implemented and used by over 300 frail elderly and their professionals, which greatly facilitated the development of multiprofessional care-plans. Conclusion : The Nijmegen Network gave older subjects the veto right in health and welfare innovations, which made them best partners in development, evaluation and implementation of health care innovations. Efficient frailty screening and e-tool implementation first target on elderly, who have active problems and are motivated to adopt innovations. Keywords : Patient participation, Network, Innovation

PP26 R-055

STUDY ABOUT EFFECTS THAT OLDER WORKERS HAD ON YOUTH EMPLOYMENT

Liu NINA (*School of Sociology and Population Studies, Renmin*

University of China, China)

Introduction : The study starts from the perspective of human capital theory and active aging, based on the absorption of domestic and foreign literature, focuses on the effects that old workers have on youth employment while estimating feasibility of delaying retirement with the size of it. It includes two descriptions and a demonstration: Two descriptions: the true state of China's urban elderly population in employment, the actual impact of retirement for the urban elderly employment; The demonstration is whether the elder prolong their career will squeeze the youth employment. Method : descriptive analysis; panel data regression(the key point); secondary data analysis. Results : Urban elderly employment is very low and retirement have strong effect on labor force participation rate. What's more, the old choose to continue to work in elastic retirement system, their industry contribution is absolutely different from the young's, excluding some minority industries. Conclusion : First, later retirement can release people's tremendous potential working capacity, which does good to maintain Chinese demographic dividend and to retain talents for industry's transformation and upgrading. Second, even though we carry out the later retirement policy, the old have not crowded the young out of job market. Delaying retirement has feasibility. Third, in minority of industries and areas, the elderly's employment has evident crowding-out effect on youth employment. In order to alleviate practical resistance of later retirement, the policy options should also involve differences in some industries and areas to properly protect labor force participation of younger people. Keywords : crowding-out effect, old workers, youth employment

PP26 R-056

PARTICIPATORY RESEARCH AS TOOL FOR DEVELOPING AGE-FRIENDLY POLICIES: THE CASE OF THE BELGIAN AGEING STUDIES

Nico DE WITTE¹, Liesbeth DE DONDER², Tine BUFFEL², Sarah DURY², An-Sofie SMETCOREN², Emily VERTE², Dominique VERTE² (1. University College Ghent, Belgium; 2. Adult Educational Sciences, Vrije Universiteit Brussel, Belgium)

Introduction : This contribution seeks to reflect on the challenges and opportunities of involving older people in aspects of research, policy and social change at a local level. The focus is the 'Belgian Ageing Studies', a research program which monitors the needs, as well as issues of quality of life, among home-dwelling older people in order to provide tools for evidenced-based 'age-friendly' policies at a local level. Method : The research program was developed in co-creation with older people, senior associations, senior advisory boards, local authorities, and other stakeholders. Older people are involved in this research as experts and actors by playing a role as voluntary poll-takers (peer-research). Every sample is representative in the municipality, offering local governments tools for evidenced-based policy. 159 municipalities (N=75319) in Belgium, the Netherlands and Italy participated in the research program. Results : The BAS-method is found to be a tool for creating community networks and empowerment of older people. The development of a community network between local authorities, members of local senior associations, third sector agencies and other community stakeholders is crucial for developing broadly based support around the theme of age- friendly environments. Empowerment is promoted through a cycle of research, participation, education, community action and policy-making. Conclusion : The process of the BAS-program in which older people actively engage as participants and develop a sense of co-ownership shows how participatory research can play a role in developing age-friendly policies. In particular, it is argued that certain

aspects of the BAS-method increase the opportunities for older people to participate in policymaking-processes. Keywords : Participatory research, age-friendly policy, evidence-based policy

PP26 R-057

THE DEVELOPMENT OF APIAS APPRAISAL SYSTEM: A POLICY APPRAISAL FOR MIPAA

Cheung Ming Alfred CHAN (*Asia-Pacific Institute of Ageing Studies, Lingnan University, Hong Kong*)

Introduction : In response to UNESCAP's calling to enact policies with reference to Shanghai Implementation Strategy (SIS), which was developed in echo of the Madrid International Plan of Action on Ageing (MIPAA), the Asia Pacific Institute of Ageing Studies (APIAS), Lingnan University Hong Kong, developed an appraisal system for both a comprehensive indicator of policy implementation and a validated instrument for end users' appraisal of life (i.e. Policy Implementation Index) and service quality as a result of services provided. Method : Adopting MIPAA's three policy pillars: older people and development, advancing health and well being, and enabling supportive environment, the research team has developed 88 policy indicators for policy-makers to score. Positive response scores a mark, making the maximum total of 88 marks. A service satisfaction survey consisting 156 items on a 4-points Likert developed from the WHO quality of life scale is used to tap users (N=500) appraisal for public services. The resultant scores are consolidated into an overall indexed score for 100 maximum. Results : The results show that government policy/services studied (i.e. social services in Macao) are fairly well implemented, as both policy-makers and elderly service users rated good (77% Vs 71%). Discrepancies are areas for further service refinements. reliabilities of both measures good. Conclusion : The appraisal system consisting two measures (i.e. the 88 items on policy implementation, and the 156 items on service satisfaction) is a simple and effective policy appraisal mechanism including both policy-makers and elderly inputs. Keywords : policy appraisal, elderly

PP26 R-058

PREPARATION AND RETIREMENT ADJUSTMENT

Ehsan FARIDI (*Law department, Shiraz University of Medical Science, Iran*)

Introduction : Retirement is a complex, and progressive transition phenomenon. The goal of this study is to explain how we can improve retirement adjustment by retirement preparation to prevent the negative consequence of retirement. Method : This review of literature on retirement preparation has been done to find the successful strategies for improving retirement adjustment. the research is structured around the key concepts of retirement consequence, retirement adjustment, and retirement preparation. Implication for practice and suggestions for future research are presented. Results : Retirement planning is the first, and the most important step of retirement preparation, that several years before retirement should be beginning to plan, and develop retirement adjustment by focusing on: finding the ways to meet financial needs and on detecting, exploring the ways to fill available time through part-time employment, leisure activities, volunteer positions, or adoption of a pet. pre-retirement counseling and planning, pre-retirement education, Postretirement counseling programmed such as vocational issues (developing skills for survival and self employment), leisure time activities (participation in community works) and help retirees to re-evaluate their goals and values, occupational therapy, volunteer work, intellectual profession and leisure, partial retirement (Bridge work retirement). Conclusion : Retirement has been projected by researchers in three interrelated

stages included; preparation for retirement; worker-retiree transition; and adjusting to retirement. However the majority of researches are focused on financial planning for retirement, but there are many other strategies for improving retire adjustment. If the article is accepted we will be able to explain more about these strategies. Keywords : retirement consequence, retirement adjustment, and retirement preparation

OLDER ADULTS' ONLINE TECHNOLOGY USE AND SOCIAL AND PHYSICAL ACTIVITIES PARTICIPATION

Jeehoon KIM¹, Hee YUN LEE² (*1. Dept. Sociology, Social Work and Criminal Justice, Idaho State University, USA; 2. School of Social Work, University of Minnesota, USA*)

Introduction : Zickuhr and Madden (2012) reported American older adults have been increasing to use the Internet or email over the past ten years. This study examined how older adults' online technology use was associated with engaging in social and physical activities. We explored its association with participation in various types of social activities and different levels of physical activities. Method : Using data drawn from the first round of the 2011 National Health and Aging Trend Study, this study used a nationally representative sample of Medicare beneficiaries aged 65 and older (N=5,039). Older adults actively engaged in social and physical activities over the last month. Majority of older adults visited to friends or family and went out for enjoyment. While 62% attending at religious services, about one third attended at clubs or voluntary activities. Majority of older adults either engaged in vigorous activities (40%) or walking (30%). 41% have used the Internet or texts using mobile phone. Results : We separately employed binary logistic regression analysis for each social activity, and multinomial logistic regression analysis for two levels of physical activities (base outcome=inactive group). Older adults who used the Internet or text were positively associated with participating in most of social activities except religious services and any level of physical activities. Conclusion : In the current technology driven environment, older adults and the boomer generation also have become technology savvy. Findings imply that online technology use would be a useful intervention tool for enhancing social and physical activities among older adults living in the community. Keywords : Online technology use, social activities, physical activities

Computer Science, University of Toronto, Canada;*

13. Factor-Inwentash Faculty of Social Work, University of Toronto, Canada; 14. Sociology, University of Victoria, Canada; 15. Pharmacy, University of Toronto, Canada)

Introduction : The National Institute for the Care of the Elderly (NICE) developed evidence-based social pocket tools (PTs). To broaden the accessibility of these tools to healthcare practitioners, community agencies, and seniors and their families across the globe, digital versions have been developed. **Method :** The development of the PTs was led by different NICE theme teams. The Caregiving Team developed tools aimed at health care practitioners and for informal support providers. The Mental Health Team developed tools related to the diagnosis/treatment of depression among seniors. The End-of-Life Issues and Elder Law teams developed tools supporting healthcare practitioners and family in the care of a dying person and with legal issues. The Elder Abuse Team worked on tools around the detection and prevention of elder abuse. Similarly, the Dementia Care Team worked on a dementia screening tool. The Financial Literacy Team built tools to improve the financial literacy and preparation of older adults for retirement. Digital versions of these PTs were uploaded onto the NICE website (www.nicenet.ca). **Results :** The digital PTs have been programmed to be used on various devices (i.e., smartphones, tablets), with some being embedded with interactive features to better support the decision-making process (i.e., screening tools). Preliminary usability assessment of the tools has been promising, and work is on-going to identify opportunities for further development/refinement. **Conclusion :** The translation of the PTs into digital formats has the potential to maximize the health and well-being of aging populations in Canada and internationally. Next we will develop an implementation strategy to maximize their uptake by stakeholders. **Keywords :** Digital Pocket Tools, NICE, Knowledge Mobilization

PP26 R-061

A STUDY OF COMPARING CARE WORKERS WORKING AT ELDERLY CARE FACILITIES IN AUSTRALIA AND JAPAN

Megumi YAMAMOTO¹, Kimika USUI¹, Mari MIYAKE², Miyo KANEDA¹, Midori SHIRAI³ (1. Graduate School of Nursing, Konan Women's University, Japan; 2. Dept. of Public Health, Graduate School of Medicine, Kansai Medical University, Japan; 3. Graduate School of Nursing, Osaka City University, Japan)

Introduction : Aging in Japan has been progressing at a speed unparalleled in the world. As the number of people requiring nursing care increases, necessary care services have become more diversified and upgraded in quality. The number of care workers has increased, but it is expected that further more care workers will be needed. As nursing care is considered to be hard labor with low payment in Japan. **Method :** we used a survey of 43 nursing care workers from S elderly care home in Australia and 37 nursing care workers from A elderly care home in Japan. We asked both to answer the "Quality of Working Life Questionnaire" issued by the National Institute for Occupational Safety and Health(NIOSH). The data were analyzed by using the SPSS program, version 19.0. **Results :** Australian workers showed a significantly higher satisfaction rate than Japanese workers regarding questions about the satisfaction they got from their work, help from supervisors, teamwork, the readiness requirements of their work and whether or not their knowledge is useful in their jobs. On the other hand, stress factors, including the degree of work requirements and physical environment, were significantly higher for Japanese than Australian workers. **Conclusion :** The result of this suggests that there are ways to improve education, teamwork and the physical environments at Japanese care working facilities. **Keywords :** The

National Institute for Occupational Safety and Health, nursing care worker, elderly care facility

TELEMEDICINE CONSULTATION FOR PATIENTS WITH CHRONIC WOUNDS

Nathalie SALLES¹, Joanne JENN¹, Martine BARATEAU¹, Ornella SARRY¹, Karine LIBERT¹, Martine BAUDINET¹, Muriel RAINFRAY¹, Isabelle BOURDEL-MARCHASSON² (1. Pole de Gerontologie Clinique, CHU Bordeaux, France; 2. CHU Bordeaux, UMR 5536 Univ Bordeaux Segalen, CNRS, France)

Introduction : Among the 3 themes identified by the Regional Program of Telemedicine, care of patients living in nursing homes was chosen for this experimentation. The project targets the care of older persons with chronic wounds in the context of dependency and polypathology. The aim of this experimentation was to improve both patients' access to care and continuity of care, and to promote training of caregivers. **Method :** This experimentation (September 2012 through September 2013) is based on teleconsultations that are organized two half-days per week by an expert team (geriatrician, nurse, occupational therapist, dietician, and secretary) in the Geriatric Center (CHU Bordeaux, France). In nursing homes, after obtaining patient's consent, the general practitioner (GP) and nurses are connected with the expert team either from the patient's room with a mobile chariot (nursing homes) or in patient's home using mini tablets (hospital at home). Following each teleconsultation, a report is written and sent via secure messaging to the GP. **Results :** A total of six nursing homes (Gironde, Dordogne) and one hospital at home (Landes) were included. Preliminary results showed a total of 16 teleconsultations: pressure ulcers (55.6%), vascular ulcers (33.3%), and traumatic ulcers (11.1%). Telemedicine permitted to reduce the cost of dressings by reducing both the number of classes and rhythm of dressing changes. Without Telemedicine, GP would have sent their patients to specialized consultation (33.3%) or day hospital (66.7%). **Conclusion :** Telemedicine will permit to allow the monitoring of older patients with chronic diseases requiring repeated hospitalizations and to maintain the skills of professionals. **Keywords :** telemedicine, wounds, elderly

PP26 R-063

ASSESSING ABUSE IN OLDER PERSONS IN SOUTH AFRICA

Susan HOWELL, Karen BOROCHOWITZ (Management, Dementia SA, South Africa)

Introduction : Older women in South Africa with dementia are especially vulnerable. Culturally, dementia is so stigmatised that some cultures simply do not recognise it. Some older women are killed as witches as they have developed a dementia and their behaviour has changed. Sometimes older women with dementia are killed and their body parts removed and sold for 'muti' medicine. But many other forms of abuse, for example, physical, emotional and economic abuse also exist, especially geared towards older women. **Method :** The poster will highlight possible signs of abuse and how to identify such abuse. **Results :** The results will be an informative poster. **Conclusion :** The poster will have a title, full colour images and text. **Keywords :** Abuse, Women, Dementia

PP26 S-001

EFFECTS OF VARIOUS DISPLAY CONDITIONS OF TRADITIONAL LCD AND ELECTRONIC PAPER DISPLAY ON VARIOUS AGED USERS' DISCRIMINATING PERFORMANCE

An-Hsiang WANG, Hui-Tzu KUO (Department of Labor Relations,
National Chung Cheng University, Taiwan)

Introduction : This study investigated the discriminating performance of young and elderly users for various text/background color combination, ambient luminance, luminance contrast and polarity by using traditional liquid-crystal (traditional LCD) and color electronic paper display. **Method :** Twenty four participants participated in the experiment, including 12 young participants and 12 elderly participants aged greater than 60. Participants were asked to distinguish the direction of the Landolt-C gap on the displays. **Results :** The results of this study showed that, participants had significantly better discriminating performance under negative polarity than positive polarity as using color electronic paper display; polarity had no significant effect on the participants' discriminating performance while as using traditional LCD. Under the ambient illuminance of 50 and 500 lx, participants have significantly better discriminating performance as using traditional LCD than using color electronic paper display; while under the ambient luminance of 12,000 lx, display had no significant effect on the participants' discriminating performance. Additionally under the ambient illuminance of 50 lx, participants have significantly better discriminating performance under blue-on-white than under black-on-white; while under the ambient luminance of 500 and 12000 lx, color combination had no significant effect on the participants' discriminating performance. Under the ambient illuminance of 50 and 500 lx, participants have significantly better discriminating performance under negative polarity than using positive polarity; while under the ambient luminance of 12,000 lx, polarity had no significant effect on the participants' discriminating performance. **Conclusion :** The results of this study may be the guides for the designers of color electronic paper displays. **Keywords :** color electronic paper display, text/background color combination, ambient illuminance, polarity

PP26 S-002

PREDICTION MODEL ON CAUSING FACTORS FOR DELIRIUM IN ICU PATIENTS

Dahye PARK (School of Nursing, Chung-Ang University, Korea)

Introduction : The purpose of this study was to make optimum prediction model of various causing factors for the delirium, and identify risk factors for the development of delirium in ICU by many kind of analysis from multi-point views and to offer theoretical framework for clinical nursing practice which would enable to prevent delirium in ICU. **Method :** The data collection period of this study was from January 1st, 2011 to September 30th, 2012. The subjects were 3,721 patients in medical and surgical intensive care unit and they were admitted to Chung-Ang University Medical Center in Seoul. The Collected data were analyzed by using SPSS program and SPSS Modeler program. **Results :** As a result of data analyses, Prediction model of causing factor of delirium presents the following 7 pathways. The analysis from these 7 pathways reveals next prediction factors which cause delirium in ICU. First, patient related prediction factors are history of operation and paralysis and weakness. Secondary, disease related prediction factors are conscious level, seductive drug, pain killer drug, mechanical ventilator, agitative state, blood pressure, pain. Lastly, environment related prediction factors is restraint. **Conclusion :** Thus, since the prediction model of delirium was suggested in this study can promote a patient's comfort and make a better recovery in ICU. It will be able to be screened high risk for delirium and utilized more usefully and effectively in clinical nursing practice. In addition, it is expected that the better result will come out in terms of the quality of post-ICU treatment and cost effective.

EVALUATING READABILITY AND READING COMPREHENSION OF ELDERLY INPATIENTS WITH PRINTED HEALTH INFORMATION MATERIALS

Ga Eon LEE¹, Yu Jeong KIM² (1. Dong-A University, Nursing Department, Korea; 2. Dong-A University Hospital, Nursing, Korea)

Introduction : The purpose of this study was to evaluate the readability and reading comprehension of elderly inpatients with printed health information materials. **Method :** The subjects of this study were 138 elderly Korean inpatients aged over 60years in a General Hospital. Printed health materials were the sheet for hospital life guideline and the informed consent form for use of CT contrast media. Readability was measured using with Gwang-Hae Kim's Korean language classification book and reading comprehension was measured with the reading comprehension items of Kim and Lee's(2008) functional health literacy scale and the items were revised for these health information materials. **Results :** The score of elderly inpatients' readability for CT media consent form(18.2±20.12points) was higher than that of hospital life guideline(7.2±9.61points). The mean score of reading comprehension was 1.9±1.57 on a 5 point scale. There were statistically significant differences in readability according to education, religion, social activities, monthly income, the sources of health information, friend, and the times of hospitalization in the last year. Reading comprehension was different according to age, education, religion, type of residence, social activity, monthly income, friend, and the times of hospitalization. The score of readability and reading comprehension of printed health information materials were negatively correlated, implying that the easier elderly inpatients reading the information materials, the higher their reading comprehension for the materials. **Conclusion :** Printed health information materials should be designed easy for the elderly inpatients to consider their reading comprehension and be tailored by their characteristics of the elderly. **Keywords :** readability, the aged, health literacy

PP26 S-004

THE CORRELATION BETWEEN THE LIFE SATISFACTION LEVEL AND SELF EVALUATION OF VOICE AMONG THE KOREAN ELDERLY: COMPARISON BETWEEN THE ELDERLY FROM URBAN AND RURAL REGIONS

Hyeju JANG, Sarang PARK, Taegyun KIM, Taeyeon KIM, Hyojong YOU, Jungwan KIM (Dept. of Speech & Language Pathology, College of Rehabilitation Sciences, Daegu University, Korea)

Introduction : This study is designed to look closely into the relation between the satisfaction level of life and self evaluation of voice for two aged groups in Korea respectively from a metropolitan city, which is Daegu, and rural regions, which are Hongcheon and Yecheon. **Method :** The targeted objects, who participated in the survey were 237 senior citizens over 65 years old. **Results :** First, the relation between the life satisfaction level and self voice evaluation for the elderly shows its possibility that they are in direct proportion. Second, the elderly from a major city are likely to appraise themselves more negatively in subjective voice recognition than the elderly from a rural area. Third, the elderly who live in rural areas show the high satisfaction level for their life quality as they are more positive in self voice evaluation than those who are in urban areas. **Conclusion :** These results suggest that the subjective satisfaction of one's own voice can be a significant factor for the satisfaction of life, and influences from

environmental characteristics of one's habitation should be thoroughly considered as well to verify the correlation between self voice evaluation and life quality. Keywords : Elderly, Life satisfaction, Voice

PP26 S-005

THE INTERVAL PERFORMANCE OF THE GENERATIVE NAMING TEST OF NORMAL ELDERLY: THE RELATIONSHIP BETWEEN AGE, LEVEL OF EDUCATION AND COGNITIVE ABILITY

Jaeho HWANG, Jungwan KIM (*Department of Speech-Language Pathology, Daegu University, Korea*)

Introduction : The semantic verbal fluency (SVF) test is a very useful test on detection and discrimination for degenerative dementia patients with memory disorders and for patients with word retrieval dysfunction due to frontal lobe damage. In addition, these cognitive processes can be explained through the SVF test within the normal elderly. But the total number of produced words alone cannot explain cognitive processes. Method : In this study, we examined the total number and the interval performance based on the result of an animal naming test of normal elderly women over 65 years (N=49, age=76.37±6.15, edu=3.51±3.39, MMSE=23.86±2.92) for 30 seconds, and then examined the relationship between age, education level and cognitive abilities. Results : First, it was found that the total number of produced words was 9.08 (±2.47) words, with most words produced in the first 10 sec interval (5.60 words), and fewest in the third 10 sec interval (1.44 words). Second, there was no significant correlation between the total number of produced words and demographic variables. However, we found a positive correlation ($r=.400$) between the performance of the first 10 sec interval and cognitive ability, and we found a negative correlation ($r=-.335$) between the performance of the third 10 sec interval and age. Conclusion : When the process was premised with changing from automatic information processing to controlled information processing as time goes on in the SVF test, word retrieval of automatic information processing is considered to be sensitive to cognitive ability and word retrieval of controlled information processing is considered to be sensitive to age. Keywords: normal elderly, generative naming test, interval performance

PP26 S-006

INDIVIDUAL DIFFERENCES IN WITHIN-PERSON VARIATION AND CO-VARIATION IN PAIN AND DEPRESSION LINKAGES OVER TIME

Jeong Eun LEE¹, Boaz KAHANA², Eva KAHANA³ (*1. Elderly Care Research Center, Case Western Reserve University, USA; 2. Psychology, Cleveland State University, USA; 3. Sociology, Case Western Reserve University, USA*)

Introduction : Pain and depression are prevalent physical and psychological symptom based disorders among older individuals. However, their reciprocal relationships and moderating factors have been inadequately studied, as most studies have relied on cross sectional data. The goals of this study were to 1) test whether arthritis related pain is an influential factor in producing depressive symptoms; and 2) to consider the moderating role of cognitive function on the association between pain and depressive symptoms. Method : Data are derived from annual interviews with 395 older adults (M= 85; SD=4.63) over 4 years as part of a long term study of residents of Florida retirement communities. Between-person and within-person variation in self-reported arthritis pain and depressive mood were examined using multilevel models. Results : Pain and depressive symptoms increased over time. There was also substantial between and

within person variation in both pain and in depressive mood. There was a significant linear fixed effect of cognitive function on the association between pain and depressive symptoms. After controlling for pain, persons with better cognitive functioning reported lower levels of depressive symptoms, and less within person variation in depressive mood over time. Interestingly, both between and within person co-variation of pain and depressive symptoms was stronger (i.e., more negative) in persons with lower cognitive abilities. Conclusion : The study found that arthritis pain and depressive symptoms co-varied over four years. It underscores the influence of intact cognitive functioning in shaping how pain influences depressive symptoms in late life. Keywords : Arthritis pain, Depressive symptoms, Cognitive Decline

PP26 S-007

WILL SIMPLIFIED TAI-CHI REDUCE PAIN AND THEREBY IMPROVE THE WAY ELDERLY PEOPLE WITH CHRONIC JOINT PAIN PERCEIVE THEIR HEALTH? : A RANDOMIZED CONTROL TRIAL

Justina Yat Wa LIU (*School of Nursing, The Hong Kong Polytechnic University, Hong Kong*)

Introduction : Chronic pain in older adults is common. It affects them physically, psychologically and socially and, by so doing gives them a false view of their general health. Tai Chi, a traditional mind-body exercise, has been shown to benefit health. This study evaluates the effect of Simplified Tai Chi exercises on reducing chronic joint pain and on improving self-perceived health in community-dwelling older adults. Method : A randomized controlled trial study is performed in Hong Kong. The intervention group (n=27) receives 1-hour Tai-chi training every week for 12-weeks. Subjects in the intervention group are divided into groups of 10 and Tai Chi is guided by researchers trained by a qualified instructor. The control group (n=22) receives no intervention. Data is collected at baseline and after 12 weeks. The pain intensity is measured by a Brief Pain Inventory focusing on different joints (neck, shoulder, back, hip and knee). Self-perceived health is measured by Chinese (HK) SF-12 Health Survey version 2. Results : The finding of this study showed that the intervention group reported significant reduction in both pain severity [-2.082 (0.0476), $p<0.001$] and interference of pain [-1.368 (0.329), $p<0.001$] in their daily lives, on normal work [-1.759(0.438), $p<0.001$] and enjoyment [-1.715(0.451), $p<0.001$]. The intervention group also showed significant improvement in self-perceived physical [5.247(1.7), $p=0.003$]. Conclusion : The 10-form modified Tai Chi reduces the chronic joint pain level of community dwelling older adults significantly and thereby leads to a significant improvement in self-perceived health. Keywords : Tai Chi, Pain Management, Exercise

PP26 S-008

WHAT DO OCCUPATIONAL THERAPISTS AND PHYSIOTHERAPISTS USE STANDARDIZED TESTS FOR IN GERIATRIC CARE?

Kariann KROHNE¹, Sandra TORRES², Ashild SLETTEBØ³, Astrid BERGLAND¹ (*1. Faculty of Health Sciences, Oslo University College of Applied Sciences, Norway; 2. Department of Sociology, Uppsala University, Sweden; 3. Nursing and Sports Sciences, University of Agder, Norway*)

Introduction : Health professionals are, nowadays, required to collect standardized data when assessing older patients' functional ability. Such data provides quantifiable documentation on health outcomes, and is believed to function as an objective base for communicating and discussing results with colleagues and patients. Little is known,

however, about how physiotherapists and occupational therapists test administrators use standardized tests and test scores in their daily work. Method : Drawing on seven months of fieldwork and observations of 26 test situations, interviews were performed with 14 physiotherapists and occupational therapists administering standardized tests on two geriatric hospital wards in Norway. Results : Physiotherapists and occupational therapists in acute geriatric care administer standardized tests on a daily basis, and they maintained that the test situation provided them with a general functional assessment of their older patients which proved useful in planning individual training and rehabilitation schemes. The test situation, also, enabled observation of patients' coping strategies; strategies often rendered invisible in test scores. While the test situation was considered clinically beneficial, skepticism towards test scores was noted. The therapists argued that a quantifiable test result did not provide a full picture of the patient. Nevertheless, test scores were found useful when comparing test results on patients admitted anew, in communication with colleagues, and, even, as means for admitting patients to care and rehabilitation institutions. Conclusion : The test administrator's perspective provides new knowledge on how standardized tests and test scores guide clinical practice since it offers insight into the difference between the test situation and its outcomes. Keywords : geriatric care, professionals, standardized tests

PP26 S-009

A CORRELATION WITH ACTIVITIES OF DAILY LIVING, COGNITIVE FUNCTION, DEPRESSION OF THE ELDERLY RESIDING HOME IN KOREA

Yeun Mi KIM¹, Mi Joon LEE² (1. Women Health Research Center, Hanyang University Nursing department, Korea; 2. Insurance Medical Center, Samsung Life Insurance, Korea)

Introduction : There has been a rapid graying in South Korea with 10.3% of elderly population rate in 2008 and expected to enter elderly society in 2018 with 14.3%, to become super-aged society in 2026 with 20.8%, also. The aim of this study was to identify the degree of activities of daily living, cognitive function, depression of the elderly residing home, then ultimately to help developing nursing intervention program that can promote their ADL and cognitive function, prevent their depression. Method : The subjects were 92 people were from the elderly residing home. The data was received question in some parts of area K Province, Korea. The instruments used for respective factors were: K-ADL, K-IADL, MMSE-DS and Short form Geriatric Depression Scale. The data was collected from June 13 to 30, 2012. The data was analyzed through SPSS WIN 18.0 program. Results : The elderly residing home was appeared ADL mean 8.25 score, IADL mean 14.71 score, cognitive function mean 22.97 score, depression 6.30 score. And there was observed positive correlations between ADL and depression, between IADL and depression. But there were observed negative correlations between ADL and cognitive function, between IADL and cognitive function, and between cognitive function and depression. Conclusion : It is significantly important to discover and manage the ADL dependency, cognitive function, and depression. Furthermore, concrete visiting nurse education guideline and development of visiting nurse intervention program is necessary for healthy and active aging in physical, emotional, mental aspects. Keywords : Elderly, Activities of Daily Living, Cognitive Function, Depression

PP26 S-010

PROSPECTIVE STUDY OF THE EFFECTS OF LONG- TERM CARE INSURANCE SERVICES AND INSTRUMENTAL ACTIVITIES OF DAILY LIVING ON ELDERLY COGNITIVE

CHANGE

Miki FUKUMA¹, Kuninori SHIWAKU², Kiyoko ADACHI³ (1. Faculty of Medicine, Shimane University, Japan; 2. Board of Directors, Shimane University, Japan; 3. Regional Comprehensive Support Center, Utsunomiya City, Japan)

Introduction : This study aimed to clarify how long-term care insurance services (Services) and IADL are related to elderly cognitive change. Method : A five-year prospective study of 1520 elderly persons (Home-group;1317 persons, Facility-group;203 persons)who were new recipients of elderly care insurance payments. The test was used to test associations with cognitive change after five years. The risk of cognitive change was analyzed using binomial logistic regression with subject characteristics, Services, and IADL as explanatory variables. Results : Cognitive deterioration was seen in a significantly higher proportion of the facility-group (48.8%) than the home-group(20.5%). A significantly greater cognitive decline in the Home-group was associated with: female sex; being non-users of Services at visit-care, visit-homemaking, visit-nursing, rehabilitation, and short stay; and being elderly with decreased IADL for swallowing, walking, eating, and insomnia. A significantly greater cognitive decline in the Facility-group was associated with: no baseline cognitive decline; non-users of Services at the health facility; and decreased IADL for swallowing, eating, and sleeping. In the Home-group, sex, baseline cognitive status, visit-care, walking, and eating were significantly related to cognitive change. In the Facility-group, care levels and baseline cognitive status were significantly related to cognitive change. Conclusion : Cognitive deterioration was less common in the Home-group than in the Facility-group. However, the results of cognitive function in the Home-group are not valid for general use day-care. Deterioration in cognitive function has been shown to result in deterioration in eating and walking. In the Facility-group, worsening of cognitive function was more common, as age and cognitive care levels were higher. Keywords : Cognitive function, care levels, long-term care insurance services

PP26 S-011

EVALUATION OF THE KOREAN VERSION OF THE STROKE DRIVERS' SCREENING ASSESSMENT: A PILOT STUDY

Myoungouk PARK¹, Young-Sun JIN², Hwa-Kyung SHIN³, Joonwoo SON⁴ (1. HumanLAB, Daegu Gyeongbuk Institute of Science and Technology, Korea; 2. Department of Psychology, Kyungpook National University, Korea; 3. Department of Physical therapy, Catholic University of Daegu, Korea; 4. HumanLAB, Daegu Gyeongbuk Institute of Science and Technology (DGIST), Korea)

Introduction : Driving is important activities of daily living affected by the motor and cognitive deficits after stroke. But, there are no standard practices of generally accepted and valid screening tools for stroke patients in Korea. This study presents the potential for predicting driving ability following stroke using an adapted version of the Stroke Drivers' Screening Assessment (SDSA), which is a set of cognitive tests to evaluate fitness to drive in stroke patients. Method : In this study, we adapted the original United Kingdom (UK) version of the SDSA to make it suitable for use in Korean road traffic environment by replacing all UK-specific traffic situations and road signs with their Korean equivalents. In order to apply the pass/fail SDSA equations of the original UK version of the SDSA, the road sign recognition subtest of K-SDSA was carefully investigated with healthy older drivers and revised the road scenarios to match with their UK peers' scores. The prediction accuracy of SDSA was evaluated by comparing 9 stroke patients' driving performance in a driving simulator. Results : The K-

SDSA predicted drive-to-fitness of stroke participants with higher accuracy than general cognitive impairment assessment tools such as mini mental status evaluation (MMSE). Conclusion : The results suggested that the K-SDSA had high potential for predicting stroke patients' drive-to-fitness and further study is required with the extended numbers of participants. Keywords : Screening Assessment, Driving Rehabilitation, Stroke patients

PP26 S-012

REGIONAL CEREBRAL GLUCOSE METABOLIC ASSOCIATED WITH LOCOMOTIVE ABILITIES IN HEALTHY COMMUNITY-DWELLING OLDER WOMEN

Ryota SAKURAI¹, Yoshinori FUJIWARA¹, Naoko SAKUMA², Shoji SHINKAI¹, Keiichi ODA³, Muneyuki SAKATA³, Jun TOYOHARA³, Kiichi ISHIWATA³, Kenji ISHII³ (1. Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan; 2. Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Institute of Gerontology, Japan; 3. Research Team for Neuroimaging, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : The objective of this study was to investigate the association between the locomotive abilities and the cerebral glucose metabolism in the regions related to motor control and gait function in healthy community-dwelling older women with functional independence of instrumental activities of daily living (IADL). Method : One hundred and sixty-eight community-dwelling older women without IADL/ mobility limitation (69.5 ± 6.7) underwent 18F-FDG Positron Emission Tomography (FDG-PET) at rest and tests for locomotive abilities. We measured regional cerebral glucose metabolism in 15 regions of interest. Each regional value was standardized by that of the cerebellum. Within 6 months of the FDG-PET, we measured comfortable/maximum walking speed (with step length) and assessed the Timed Up & Go test (TUG) as indices of locomotive ability of the participants. Association between each region's glucose metabolism and locomotive indices were examined by multiple linear regression analysis adjusted for demographics such as age, education, past illness, blood pressure, and body mass index. Results : Maximum walking speed was associated with the glucose metabolism in prefrontal, posterior cingulate, and parietal cortices (positive correlation). The TUG results were associated with the metabolism in occipital and parietal cortices (negative correlation). However, there was no significant association with comfortable walking speed and step length (both comfortable and maximum walking) and cerebral glucose metabolism. Conclusion : Cerebral glucose metabolism in specific regions was associated with individual differences in gait function, even in healthy older women. Understanding the cerebral glucose metabolism in these brain regions may be useful for planning an interventional strategy to prevent gait disturbance. Keywords : gait function, cerebral metabolic activity, FDG-PET

PP26 S-013

RELATED FACTORS ON NUTRITIONAL STATUS IN OLDER ADULTS RESIDING IN NURSING HOMES IN KOREA

Gwi-Ryung Son HONG, Sang Hee JEON (School of Nursing, Hanyang University, Korea)

Introduction : Nutritional status in older adults residing in nursing homes is one of the critical factors that can lead to the frailty and to even death. The purpose of the study is to investigate the related factors on nutritional status in nursing home residing older adults in Korea. Method : Descriptive study design was used through face-to-

face interviews. A convenience sample of 306 older adults were recruited from 7 nursing homes more than 80 beds, and if they were over 65 years of age, and had agreed to participate in the study. Main variables were included nutritional status using Mini-Nutrition Assessment (MNA), activities of daily living (ADL), mobility, mood, grip-strength, number of medical illness, physical condition, perceived health and personal control. Data were analyzed using one-way ANOVA with Scheffe test. Results : Mean age of the participants was 80.3 (SD=7.16), and the majority was female (73.9%). Nutritional status was categorized by the score of the MNA, representing 31.7% as malnourished, 56.5% as at risk of malnutrition, and 11.8% as no nutritional problem. All variables were only significant between malnourished and normal groups: ADL (F=76.03, p=.000), cognitive function (F=23.54, p=.000), mobility (lying to sitting) (F=6.08, p=.003), mobility (sitting to lying) (F=6.56, p=.002), mood (F=3.49, p=.032), grip strength (F=29.32, p=.000), number of medical illness (F=6.12, p=.003), physical condition (F=28.35, p=.000), perceived health (F=11.71, p=.000), and personal control (F=11.55, p=.000). Conclusion : In conclusion, it is important for nurses to identify related factors on nutritional status of older adults living in long-term care facilities to develop intervention and nutrition screening program. Keywords : nutrition, older adults, nursing home

PP26 S-014

RESIDENT AND FACILITY FACTORS RELATED TO RESIDENTS' LENGTH OF STAY IN SENIOR HOUSING IN SEOUL

Seung Youn HONG¹, Seung Kwan LIM² (1. Division of Senior Industry, Kangnam University, Korea; 2. Institute for Silver Industry Research (ISIR), Kangnam University., Korea)

Introduction : Despite the rising number of senior over 50 and their interest in retirement housing, determinants of the length of residency of older persons rarely are studied. The aim of this study was to examine demographic, sociobehavioral, health and functional capacity that predict length of residency in senior housing. Method : Design: cross-sectional Setting: S senior housing, Seoul Participants: 142 residents (Mean(SD) age: 82.66(6.56); Range: 64-97 years, 69% female) completed questionnaire Measure: Frequency of service utilization in senior housing, number of contact person, frequency of family contact, number of clubs joined in senior housing were collected by questionnaire. Perceived health, ADL, IADL, MMSE, GDS-K for depression, length of residency in month, health behavior, income status, BMI data collected from senior housing database. Analysis: Hierarchical regression analysis was conducted with SPSS 17.0. Results : 142 residents lived between 1997 to 2012 and the average length of residency was 107.45+59.91 month. The model for health behavior accounted for only 5.7% of the incremental variance in length of residency. The model for physical and cognitive function found 17.7% of the incremental variance in length of residency (F=4.72, p<.05), especially perceived health status (t=-2.207, p<.05), and ADL (t=-2.942, p<.01). The model for formal & informal social support networks for residents found that only 13% of the incremental variance in the length of residency (F=2.24, p<.01) with only ADL as a significant variable (t=-2.79, p<.01). The number of friends in senior housing was marginal significance variable (t=1.94, p=.055). Conclusion : Physical function was most important determinant predicting length of residency in senior housing. Keywords : senior housing, service network, physical function, MMSE

PP26 S-015

DIABETES SELF-MANAGEMENT ACCORDING TO THE DISC PERSONALITY TYPE AND DIABETES-RELATED

DISTRESS IN OLDER ADULTS WITH TYPE II DIABETES

Soo Jin LEE, Misoon SONG (*College of Nursing, Seoul National University, Korea*)

Introduction : It has been demonstrated that type II diabetes is the major chronic disease of older adults in Korea. Diagnoses of diabetes in older adults require changes in health behaviors. Self-management is essential for taking care of patients with diabetes. The performance of self-management shows individual differences, one of which is the personality type. **Method :** The purpose of this study was to identify differences in the personality type, diabetes-related distress, and diabetes self-management among older adults with type II diabetes. The personality type was measured by a instrument developed by Hong (2007) based on the Dominance, Influence, Steadiness, Conscientiousness (DISC). Diabetes-related distress was measured by the Diabetes Distress Scale. Diabetes self-management was measured by the Summary of Diabetes Self-Care Activities Questionnaire. The data of 180 older adults was collected at S senior center from between August 14 and October 14 of 2012. All statistical analyses were performed using an SPSS 20.0 program. **Results :** There were significant differences in self-management between individual personality types. The self-management level was lower in the dominance personality type than in the steadiness and conscientiousness types. There was no significant difference in diabetes-related distress, as assessed by the overall score or the mean score for each item, between individual personality types. **Conclusion :** The personality type was significantly related to diabetes self-management. The results of this study will provide appropriate intervention in terms of the personality type, diabetes-related distress, and diabetes self-management. In particular, simple and self-initiated intervention which focuses on the dominance personality type would be of great help in effective self-management. **Keywords :** Type II diabetes, DISC Personality, Diabetes-related distress, Diabetes self-management

PP26 S-016

EFFECTS OF SWANSON'S CARING ON ACTIVITIES OF DAILY LIVING AND WELL-BEING OF THAI ELDERLY STROKE SURVIVORS

Unchulee CHAIWONGNOI¹, Pornchai JULLAMATE², Waree KANGCHAI² (*1. Gerontological Nursing Department, ChaophyaAbhaibhubejhr Hospital, Thailand; 2. Gerontological Nursing Department, Faculty of Nursing, Burapha University, Thailand*)

Introduction : Elderly stroke survivors in Thailand are increasing rapidly and need more specific and effective nursing care so to meet their optimal functional status and well-being. It is very crucial and challenges nurses to find the appropriate nursing intervention to help them meet their optimal goals. This nursing intervention applied core domains of Swanson's caring theory: knowing, being with, doing for, enabling, and maintaining belief. **Method :** This two-group pretest and posttest quasi-experimental research aimed to study the effects of Swanson's caring on the ability in performing activities of daily living (ADL) and well-being of elderly with stroke. Forty - four Thai elderly diagnosed as first stroke were randomly selected and assigned into experimental and control group equally. The control group received usual nursing care whereas the experimental group received the nursing care base on Swanson's caring theory elaborated by the researcher. The instruments used included The Demographic Questionnaire, The Well-being Scale (reliability .83), and The Modified Barthel ADL Index (reliability .94). Frequency, percentage, mean, standard deviation, and independent t-test were computed for

data analysis. **Results :** Findings revealed that when finished this nursing intervention, the mean scores of well-being and ability in performing ADL of the experimental group were statistically higher than the control group ($t = -6.385$, $p < .001$; $t = -5.109$, $p < .001$). **Conclusion :** This proficient and practical Swanson's caring nursing intervention should be implemented for effectively taking care of older adults with stroke. In addition, it should be applied in other chronic ill patients for further study. **Keywords :** Elderly with stroke / Swanson's caring / Activity of Daily Living/ Well-being

PP26 S-017

CHRONIC DISEASE STATUS MODULATING ADVERSE RISK OF LIFE STRESS AND APO LIPOPROTEIN 4 VARIANT FOR SELF-REPORTED HEALTH AMONG OLDER ADULTS

Wen HU, Jiehua LU (*Department of Sociology, Peking University, China*)

Introduction : If-reported health has been widely used to measure overall health status among older adults. Most studies have focused on socioeconomic status, health behaviour or even genetic variants such as Apo lipoprotein (APOE), without considering chronic health conditions that may have intermediate effect on self-reported health. **Method :** In this study, based on data from a population-based representative survey of Taiwan in 2000, we examined association of chronic health conditions along with their interactions with APOE gene and life stress on self-reported health using logistic regression model. Several chronic diseases including diabetes (15.6 %), heart disease (16.5%), stomach ulcer (22.3%) and chronic obstructive pulmonary disease (12.8%) were found prevalent in older adults. **Results :** We found that those chronic diseases interacting with life stress and APOE gene significantly affected self-reported health. Specifically, life stress such as having monthly financial difficulty had significant interaction with status of diabetes (OR=4.36, $P=3.72 \times 10^{-4}$), heart disease (OR=3.73, $P=0.001$), ulcer (OR=3.68, $P=4.94 \times 10^{-5}$) and chronic obstructive pulmonary disease (OR=8.03, $P=6.86 \times 10^{-7}$) on self-reported health; and individuals who experienced housing damage by the earthquake in 1999 tend to have significant interaction with three chronic diseases of diabetes (OR=4.27, $P=0.006$), ulcer (OR=6.66, $P=9.6 \times 10^{-5}$), or chronic obstructive pulmonary disease (OR=2.74, $P=0.057$). Further, APOE4 gene carriers had significant interaction with diabetes (OR=2.48, $P=0.057$), heart disease (OR=5.09, $P=0.002$), ulcer (OR=3.65, $P=0.001$) and chronic obstructive pulmonary disease (OR=6.74, $P=0.001$). **Conclusion :** Our study indicate that chronic diseases significantly increase the likelihood of life stress factors and APOE gene as risk for self-reported health, and therefore should be included in the future study. **Keywords :** Self-reported health; chronic diseases; life stress

PP26 S-018

SLEEP PROBLEMS AND ITS CORRELATES AMONG THE COMMUNITY DWELLING ELDERLY IN KOREA

Ye Sun LEE, Young Ran TAK (*Department of Nursing, Hanyang University, Korea*)

Introduction : To examine the sleep problem among the elderly and its association with psychological, physical, and functional factors. **Method :** This study is the secondary data analysis based of 2011 National Studies on the Elderly Population and participants were 9,526. Instrument used this study were Geriatric Depression Scale(GDS-K), Mini Mental State Examination(MMSE-KC) Activity of Daily Living(K-ADL), Instrumental Activity of Daily Living (K-IADL), experience of fall down, fear of fall down, the practice and time of exercise , subjective health condition and health in comparison

to their peers. Results : Normal were 68.3%persons, 31.7%persons had sleep problems which is less than 5 hours sleep in night time and more than time 9hours all day. There are significant between group difference in depression($t=291.51$, $p<.0001$), cognition ability($t=77.60$, $p<.0001$), Activity of Daily Living($t=85.41$, $p<.0001$), Instrumental Activity of Daily Living($t=124.71$, $p<.0001$), experience of fall down($t=43.31$, $p<.0001$), fear of fall down($t=4.067$, $p<.0001$), subjective health condition($t=118.64$, $p<.0001$), and health condition in comparison to their peers($t=106.26$, $p<.0001$). Conclusion : Sleep disorders are a predictive factor for physical, psychological, and functional disturbance of the elderly. Further research on sleep disorders in different fields needs to be conducted to discover and prevent sleep disorders, and nursing intervention developed to improve the quality of life for the elderly. Keywords : Sleep disorder, elderly, Community dwelling

PP26 S-019

A COMPARATIVE STUDY ON THE FUNCTIONAL AND DISABILITY STATUS OF FILIPINO ELDERLY IN DIFFERENT CARE SETTINGS

Maria Luisa Tumandao UYAN¹, Masayo MATSUZAKI², Sayuri KOBAYASHI³, Sachiyo MURASHIMA⁴ (1. College of Nursing, University of the East Ramon Magsaysay Memorial Medical Center, Inc., Philippines; 2. Midwifery and Women's Health, The University of Tokyo Graduate School of Medicine, Japan; 3. Nursing School of Health Sciences, Tokyo University of Technology, Japan; 4. President, Oita University of Nursing and Health Sciences, Japan)

Introduction : The unstable economic condition of the Philippine government does not allow provision of appropriate home environment for the growing population of elderly Filipinos. There is a significant cultural controversy in placing elderly relatives in an institutional setting as well. The study aims to evaluate the outcome of institutionalized and home-based care provided to Filipino elderly. The study may also help Filipino families to choose better options for taking care of the elderly members of the family with changing needs. Method : Descriptive-correlation of the functional and disability status of institutionalized and home-based Filipino elderly were evaluated using the Late Life Functional and Disability Instrument. Purposive sampling was done to get 21 elderly community-based participants and 15 institution-based participants. Results : Community-based elderly Filipinos have significantly higher level of functionality, compared with institutionalized elderly Filipinos. Community-based elderly Filipinos reported that they were more involved with their social activities and had fewer limitations in performing life tasks compared with those residing in institutionalized geriatric facility. Under the Late Life Functional and Disability Instrument measure, both groups fall under a "warning zone" with their functional status. Conclusion : This study shows that community-based care provided by nuclear families to their elderly member promotes higher degree of functionality and fewer disabilities in performing life tasks. There is a need to evaluate institutional elderly care in order to assure quality care throughout the lifespan of Filipinos. Keywords : Filipino , elderly, health care setting

PP26 S-020

THE FUNCTIONAL STATUS OF THE ELDERLY IN CHINA

Wenjuan ZHANG (Institute of Gerontology Research, School of Sociology and Population Studies, Renmin University of China, China)

Introduction : The life expectancy of Chinese elderly in increasing stable and the oldest old population size is enlarging rapidly in recent decades. However living long doesn't meaning living healthy, the number of the elderly with functional disability in adding with the

development of population aging process in China. What about the trend in functional disability of Chinese elderly in recent years? Does the prevalence of functional disability in increasing simultaneously with life expectancy among the elderly? Further study should be done to the highlight this trend of the elderly. Method : Employing the data from "sampling survey of the aged population in urban/rural China" conducted in 2000, 2006 and 2010 respectively, this study analyzed the disability in items of ADL and IADL of the Chinese elderly, as well as the trends of functional disability in different aging population cohorts. Gender difference and rural-urban diversities in age specific prevalence of functional disability have been taken into consideration. Results : The analysis results indicated that the prevalence of functional disability of the Chinese elderly in increasing in recent ten years, more and more people with disabilities in ADLs and IADLs are able to live longer than before. The proportional of the elderly with functional disabilities is higher in female elderly than that in male ones and the functional disability is more freelanced in urban elderly than that in rural older people. Conclusion : The elderly with functional disability will grow up rapidly in the recent future in China which will bring great challenges to social aging support system. Keywords : functional disability, ADL, IADL

THE REALITY OF THE CENTENARIANS' LIFE IN YAMAGUCHI, JAPAN: EXAMINATION OF THE RELATIONSHIPS OF GENDER AND ADL FUNCTIONS

Makiko TANAKA, Nobuko YOSHIKANE, Miyuki GOTO, Kazuko KASAOKA, Chie NAKAMURA, Yuji NAGASAKA, Kotaro TANAKA (Health and Welfare, Yamaguchi Prefectural University, Japan)

Introduction : The changes of the elderly population is on the increase as shown in Figure 1, which shows the number of centenarians in Japan. Purpose: To clarify important factors in relation to "health support to living a vibrant life" based on the actual conditions of centenarians' life. Method : Preceding studies indicate significant differences in terms of sex and a daily life activities of centenarians. Therefore, these two factors were designated as independent variables with the latter having three groups: Excellent ADL, Medium ADL and Poor ADL. The statistical. Results : Cancer and diabetes have been pointed out to be factors to disturb longevity. Because the hypertensive prevalence is high even among the Excellent ADL group, it is thought to be important to control and manage lifestyle-related diseases in order to realize healthy longevity. Moreover, it also seems important to maintain the standing position functions because the proportions of the standing position and walking were equal for both Excellent and Medium ADL groups. Finally, hearing abilities, eyesight, conversation, and memory are related to activation of stimulation and therefore enrich life. It is an important factor for healthy longevity that such functions are maintained. Conclusion : 1) Diseases must be prevented and complications avoided. 2) A certain level of healthy teeth are required for healthy food life as well as sense functions such as hearing and sight for receiving stimuli. 3) It must be made sure that desirable life and eating habits be established. 4) Conscious awareness of longevity needs to be held and must be made sure of. In order. Keywords : centenarians' life, actual conditions, awareness of longevity

RISK FACTORS OF ALL-CAUSE MORTALITY AMONG NONAGENARIANS/CENTENARIANS IN DUJIANGYAN REGION OF SICHUAN PROVINCE: A COHORT STUDY

Yan ZHOU¹, Birong DONG², Yan ZHOU² (1. Geriatric Department,

West China Hospital, SCU, China; 2. Geriatric Department, West China Hospital, China)

Introduction : Researchers focused on risk factors of mortality in the elderly, but few studies were conducted among nonagenarians/centenarians. Our study was carried out in Dujiangyan, one of the famous “Native longevity places”, it may provide valuable information on longevity. **Method :** It was a cohort study. We recruited 872 people older than 90 years old. Data were collected at the beginning and mortality information was obtained 49 months later. SPSS 15.0 was used for statistical analysis. and the difference among groups was defined as statistically significant if $P < 0.05$. **Results :** we got survival information of 825 (dropout rate: 5.39%) persons after 49 months, and found (1) After single factor analyses, we found that age, the number of chronic diseases, personality, cognitive function, activity of daily living, housework, watching TV and listening to the radio, physical exercise and vegetarian diet were related to mortality. (2) We did log-rank tests and found that the personality of amiable and optimistic and doing housework were protective factors. (3) By using Cox proportional hazards model, We found that the number of chronic diseases (RR=1.08, 95%CI: 1.007~1.175), the score of mini-mental state examination, (RR=0.963, 95%CI: 0.939~0.987) (time orientation (RR=0.851, 95%CI: 0.770~0.941), language score (RR=0.884, 95%CI: 0.808~0.968)), ADL (RR=1.023, 95%CI: 1.006~1.040) and score of IADL (RR=1.030, 95%CI: 1.010~1.051) were factors influence mortality. **Conclusion :** The number of chronic diseases, impairment of cognitive function and activity of daily living are associated with increased mortality of the elderly older than 90y, and the personality of amiable and optimistic and doing housework are protective factors. **Keywords :** mortality, risk factors, elderly

School of Medicine, Keio University, Japan; 7. Research on Social and Human Sciences, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : Previous studies suggested that personality traits contribute to longevity by influencing health-related behavior, but their influence on food choices in old people remains unclear. Hence, this study explores the relationships between personality traits and nutrient intake in old adults. **Method :** Participants were 1,000 Japanese persons (men 479; age: 69-71 years). The Japanese version of the NEO-FFI was used to assess the Big Five personality traits. Nutrient intake was assessed with the Brief-type Self-administered Diet History Questionnaire (BDHQ). It comprises 80 items, on the kinds of foods and nutrients consumed in a month. BDHQ data were adjusted using the energy density method. Food items were classified into three groups on the basis of nutritional value: low, medium, and high. A one-way ANOVA was conducted to compare the mean scores for each personality trait among the three groups. Stratified analysis was conducted for gender, marital status, and residential status.

Results: Individual who ate more fruits and vegetables showed higher openness in both men and women except men living alone, who took more fat showed higher extraversion in men living alone, who ate more vegetables showed higher conscientiousness in men living with their spouse. **Conclusion :** Personality traits, gender, and marital status are related to eating habits in old adults. Previous reported association between personality traits and longevity may be mediated by food intake. **Keywords :** personality traits, eating habits, longevity

PP26 S-024

CONTINUING BONDS BETWEEN ELDERLY AND THEIR COMPANION ANIMAL

Chie NIKAI¹, Takatoshi ANDO² (1. Environment and Information Science, Yokohama National University Graduate School, Japan; 2. Faculty of Education and Human Sciences, Yokohama National University, Japan)

Introduction : Living with companion animal(CA) is not already special experience in Japan, so grief followed by of pet loss are being accepted. It is pointed out that some social supports by close relatives, passage of time, funeral of CA, visit to a grave, and routine like offering water and flower can recover sadness by pet loss of elderly people (Nikaido & Ando 2012). It seems particular in Japan for feeling grief to keep its mind to gone CA like pray to the picture of it after going. In addition Japanese opinion on death seems novel and shocking Western opinion on death which defines pathology on keeping relationship with the deceased. This viewpoint is the core of Continuing Bond Theory which Klass and Silverman did indoctrination. So the purpose of this study is if there is Continuing Bond in covering phase from facing death of its companion animals to have interview to elderly people who lost their CA. **Method :** 20 elderly people engaged in audio-recorded interviews that were conducted using a semi-structured interview guide mainly about rearing history of the CA and current mental state. Then worksheet for qualitative analysis revealed themes. **Results :** By the analysis of the interview, it found that all participants have continuing bond with deceased CA. **Conclusion :** Significant findings included some categories have ambivalent aspects. For example one of the main categories “Funeral and burial” have been mentioned by all participants, but it gets only available when brought to the timing they wanted. **Keywords :** Pet loss, Continuing Bond

PP26 S-025

KNOWLEDGE AND EXPERIENCE ON ADVANCE DIRECTIVES AMONG KOREAN ELDERLY

Jaewon PARK, Jun-Ah SONG (College of Nursing, Korea University, Korea)

Introduction : Although advance directives(AD) have been used to respect elderly patients' autonomy for end-of-life treatment in many countries, there have been no standardized guidelines or laws regarding AD in Korea. Considering increased interests and concerns about AD in Korea society today, it is necessary to understand knowledge and experience of Korean elderly regarding AD. **Method :** In this study, 181 elderly(mean age =78.61±7.16, Female = 65.7%) were recruited from senior citizens' centers, community welfare centers, and nursing homes located in the city of Seoul and Gyeonggi province. Face to face interviews with a structured questionnaire were performed to investigate knowledge and experience about AD including living will (LW), various life-sustaining treatments (LST) and durable power of attorney for health care (DPAHC). Data were analyzed using descriptive statistics and Chi-square tests. **Results :** Community dwelling elders (CDEs) knew AD (9.6%), LST (43.2%-

65.2%), LW (43.0%), and DPAHC (31.9%); while nursing home elders (NHEs) were aware of AD (3.5%), LST (12.8%-60.5%), LW (14.0%), and DPAHC (8.1%). As for experience, 36.8% of CDEs and 23.3% of NHEs had thought about their LST preferences; 31.6% of CDEs and 16.3% of NHEs had discussed these preferences with someone else; and most of CDEs (97.9%) and NHEs (100%) had never made a written document about their preferences on LSTs. Conclusion : Results of this study showed that most of the Korean elderly had limited knowledge and experience about AD. Therefore, various educational programs, consultations, and communication channels regarding AD for the elderly are needed. Keywords : advance directives, terminal care, aged

PP26 S-026

ETHICAL ANALYSIS OF LITERATURE OF EMPIRICAL STUDIES ON END-OF-LIFE CARE FOR KOREAN OLDER ADULTS

Myoung Sheen KANG¹, Youn-Suck KOH² (1. College of Dentistry, Gangneung-Wonju National University, Korea; 2. Dept. of Pulmonary & Critical Care Medicine, Dept. of Social Science and Medicine, Ulsan University College of Medicine, Korea)

Introduction : Many documents of empirical studies including cross-cultural studies on end-of-life care for Korean elderly have treated with value conflicts between traditional confucian family values like filial piety and 'reportedly' western values. This study reviews the literature of empirical studies on end-of-life care for Korean and other Asian elderly. And through analyzing the apparent conflicts especially on the medical futility issue from the ethical viewpoint, some critical considerations are drawn. Method : Systematic review approach to sociological, anthropological and cross-cultural studies on end-of-life care for Korean elderly. Focusing on the futility issue, the family dynamics around the traditional values, doctor-patient relationship, and doctor-family relationship are analyzed in terms of doctor's professional role. Results : Those studies chiefly concerns about cultural influence on clinical decision making process and result. They didn't intimately investigate doctor-patient relationship, which is the center of medical relationships. Too much emphasis on family values may bring about stereotyping and prejudice, which would turn out clinically unattended needs of patients and family. Considering the changes in Korean medical field, individual rights awareness increase, and Korean contemporary culture, those worries are warranted. Conclusion : Most results of the empirical studies seem to be helpful to understand Korean culture and to provide end-of-life care to Korean older adults. But viewpoint taken from the authors might tend to make prejudices not intended. Care for the best interest of patient and respect for patient autonomy are almost universal doctor's duties. And so are public education and sound criticism for public policy. Keywords : end-of-life care, empirical studies, ethical analysis, Korean older adults, value conflict

PP26 S-027

END-OF-LIFE CARE STRESS AND STRATEGIES OF COPING AND RELIEF AMONG CLINICAL NURSES

Soo Young PARK¹, Bo Kyoung KIM¹, Ju Hee KANG¹, Yoon Ji KIM¹, Jung Hwa SONG¹, Ji Hye KIM¹, Yu Jung LEE¹, Jung A. LEE¹, Jung Sun YOON¹, Yoon Sun CHOI¹, Kyungsook PARK² (1. Graduate School Student, Red Cross College of Nursing, Chung-Ang University, Korea; 2. Professor, Red Cross College of Nursing, Chung-Ang University, Korea)

Introduction : This study tried to provide basic materials to find positive and proper countermeasures against the stress factors

experienced during end-of-life care by identifying the stress of nurses in end-of-life care and how to deal with and release it. Method : The subjects were 150 nurses of 4 general hospitals in Seoul and Gyeonggi-do who have experience in end-of-life care were selected as subjects by convenience sampling. Using self-report type questionnaires, a survey was executed from November 14 to 23, 2012. Results : The major results of this study are as follows. 1)End-of-life Care stress of nurses was high as 152.11 ± 19.86 when full score is 200. 2)Nurses caring end-of-life patients used problem-entered coping more frequently. 3)When the difference in problem-entered coping according to general characteristics of nurses, those who have leisure activities or experience of education of care for oncologic patients for 1~4 weeks used emotion-entered coping more often. 4)There was positive correlation between the difficulties to allot time to end-of-life patients and emotion-entered coping. To Summarize the above results, nurses perceived high stress in end-of-life care and the biggest conflict area in the stress was found to be the conflicts against the medical limitation. In handling the end-of-life care stress, emotion-entered coping was more frequently used. Conclusion : Conclusively, to enable the nurses experiencing end-of-life care stress to properly respond to and cope with those stresses, professional support program in the dimension of organization as well as educational programs of death, end-of-life care, hospice care to make the nurses prepared for end-of-life care stress are needed. Keywords : End-of-life Care, Stress, Clinical nurse

PP26 S-028

HOW DO JAPANESE ELDERLY PEOPLE UTILIZE "ENDING NOTE"?

Tai TSUJIMOTO, Jun NAKAHARA (Clinical Thanatology and Geriatric Behavioral Sciences, Osaka University, Japan)

Introduction : It is important for the elderly to prepare for death. Recently, "Ending Note" (ED) have attracted attention as a useful tool for these preparations in Japan. An ED is a notebook for recording one's preferences in case of death or a serious illness that would lead to an inability to make decisions or communicate. Although not legally binding, an ED can be helpful to determine a person's preferences in the later stages of life. This study investigated how Japanese elderly people intend to utilize ED to prepare for death. Method : A sample of 169 elderly persons registered with a Silver Human Resource Center completed a questionnaire that asked them to rate their willingness to provide 17 kinds of information required in an ED, on a 5-point Likert scale. Results : Cluster analysis conducted using Ward's method, applying Euclidean distances, revealed four clusters: active utilization (N = 14), middle utilization (N = 73), passive utilization (N = 41), and irregular utilization (N = 41). Conclusion : Except for the active utilization group, each other group had a low or moderate average of score for each kind of information. We found that ED, despite the public attention they have attracted, are not widely accepted by elderly people. However, the existence of the irregular utilization group, which indicated interest in specific items (a funeral service and a burial method), imply that some elderly people think it important to prepare for specific aspects of their own death. Keywords : "Ending Note", death preparation

PP26 S-029

FACTORS MOTIVATING CANCER PATIENTS' PARTICIPATION IN GROUP THERAPY

Tomoko MATSUI¹, Kei HIRAI², Masako SHOKOJI³, Madoka TOKUYAMA³ (1. Graduate School of Human Sciences, Osaka University, Japan; 2. Support Office for Large-Scale Education & Research Projects, Osaka University, Japan; 3. Psychiatry, Toyonaka

Municipal Hospital, Japan)

Introduction : The prevalence of cancer in older adults is increasing. Physically ill individuals such as cancer patients are likely to be socially isolated and experience loneliness, which may have negative consequences such as depression. In an attempt to resolve this situation, we expect group therapy because it's said that it could increase patients' social support and help build social support networks. This study extracted the factors that contribute to cancer patients' motivation to participate in, route of, and expectations regarding group therapy. **Method :** Five cancer patients (mean age = 63 years; SD = 10.2) who participated in group therapy were interviewed about the above three topics. **Results :** Content analysis of the interview data revealed thirteen elements related to the above three topics: changes in daily life, mental distress, aspiration to break away from one's present state, perceived need for support, implementing new actions, interest in and concerns about the support program, interest in and concerns about psychotherapy, interest in and concerns about program content, invitation and introduction from the therapist, perception of notices, environmental factors, and physical factors. **Conclusion :** Many of participants already have contact with staff before taking part in group therapy, so it's important to make opportunity that patients and staff set aside time to be with each other and environment that patients are easy to have a talk. It's suggested that patients can use group therapy as a trigger to try new things and go outdoors. **Keywords :** cancer patients, group therapy

PP26 S-030

PREFERENCES AND ACTUAL PLACE OF DEATH AND CARE OF THE END-OF-LIFE FOR FRAIL ELDERLY IN JAPAN AND SOUTH KOREA

Jung-Nim KIM (*Social Welfare, Tokyo University and Graduate School of Social Welfare, Korea, Democratic Peoples' Republic*)

Introduction : The primary aim was to clarify determine the factors related to the preferences and actual place of death and care of the end-of-life for frail elderly with social support by family caregivers at home in Japan and South Korea. **Method :** The total sample size of research was 1500 in Japan and 930 in South Korea. I have used probit model. The dependent variables included preferences and actual place of death and care of the end-of-life for frail elderly. The independent variables included in-home services of 5 kinds: home help service, home visit bathing, day care service, short stay service, and rental service for equipment. **Results :** The results of the probit model analysis were as follows, in Japan, levels of care needs, emotional support from family and children of frail elderly, and purchasing and rental of equipment had statistically positive effects between the preferred and the actual place at home of death and care of the end-of-life for frail elderly. In Korea, co-residence of three generations had only statistically positive effects between the preferred and the actual place at home of death and care of the end-of-life for frail elderly. **Conclusion :** Regular discussions with frail elderly, family and children of frail elderly on family caregivers are needed. Social and professional support is of importance in meeting of preferences and actual place of death and care of the end-of-life for frail elderly. **Acknowledgements Funding sources:** this work was supported by Japan Society for the Promotion of Science KAKENHI Grant Numbers 21330121. **Keywords :** Preferences and actual place, death and care of the end-of-life, frail elderly

PP26 S-031

IS PERFORMANCE OF STANDARDIZED LANGUAGE TESTS REFLECTIVE OF SUBJECTIVE LANGUAGE COMPLAINTS

IN THE NORMAL ELDERLY?

Hyang Hee KIM¹, Bo Seon KIM² (*1. Graduate Program in Speech and Language Pathology, Department of Rehabilitation Medicine, Yonsei University College of Medicine, Korea; 2. Graduate Program in Speech and Language Pathology, Yonsei University, Korea*)

Introduction : Subjective language complaints (SLCs) are frequently reported in elderly people, and SLCs appear to be related to language abilities and cognitive function. Therefore, the aim of this study is to test whether SLCs are associative with performance of standardized language tests and clinical variables such as the Geriatric Depression Scale (GDS) and the Mini-Mental State Examination (MMSE). **Method :** Two questions about SLCs (i.e., "How are you satisfied with your speaking/listening/reading/writing abilities?" "How are your speaking/listening/reading/writing abilities compared with one year ago?"), the Boston Naming Test (BNT), verbal fluency task, GDS, and MMSE were performed by 294 normal elderly (age: 75.44±6.3, range: 57~94). Responses of SLCs were rated as 'very dissatisfied (0 points),' 'dissatisfied (1 points),' 'neutral (2 points),' 'satisfied (3 points),' or 'very satisfied (4 points).' Pearson correlation coefficients were computed to investigate the association between SLCs score and scores of BNT, verbal fluency, GDS, and MMSE. **Results :** Results showed that SLCs were positively correlated with BNT ($r = .275$), verbal fluency ($r = .118$), and MMSE ($r = .223$) ($p < .001$). In addition, SLCs were negatively correlated with GDS ($r = -.287$) ($p < .001$). **Conclusion :** The elderly who rated lower SLCs score are likely to perform worse in standardized language tests. Thus, this study might indicate that SLCs about one's language abilities are not subjective but reflective of performance of language abilities. In addition, the elderly with higher GDS score are more discontent with their language abilities. **Keywords :** subjective language complaints, aging, language abilities, cognition

PP26 S-032

COMPARISON OF PHYSICAL FUNCTION BETWEEN CANCER SURVIVORS AND THE GENERAL ELDERLY PERSONS

Bumjo OH¹, Dongwook SHIN², Belong CHO² (*1. Department of Family Medicine, SMG-SNU Boramae Medical Center, Korea; 2. Department of Family Medicine, SNUH, Korea*)

Introduction : To the authors' knowledge, few data currently are available regarding the physical and social function in older cancer patients. Instrumental activities of daily living (IADLs) are the complex skills needed to successfully live independently. This study evaluated the changes in instrumental activities of daily living(IADL) in geriatric oncology patients compared to general public. **Method :** We surveyed the patients who received care services related to cancer in Korea. Control individuals were selected from participants in the first round of the fourth Korea National Health and Nutrition Examination Survey and were matched with cancer patients using the propensity score method to optimize our comparative analysis. Self-reported Instrumental activities of daily living (IADLs) was surveyed, and multivariate logistic regression analysis was used to evaluate the relationship between cancer survivorship and each outcome measure. **Results :** Compared with the general population, cancer survivors were more likely to be dependent in "Laundry" (7.0% vs. 19.1%; adjusted odds ratio (aOR) 0.29; 95% confidence interval (CI), 0.14-0.62) and "Outgoing for a short distance" (3.8% vs. 13.3%; adjusted odds ratio (aOR) 0.22; 95% confidence interval (CI), 0.08-0.57). Functional impairment was found significantly in cancer survivors, and increasing "age" and "the married state(single)" had a negative influence on the function. **Conclusion :** Our results show that the cancer survivors

experience health problems related to physical and social function. Undertaking a few simple baseline assessments in elderly cancer patients may help predict their risk of worsening physical function. However, several methodological limitations of our study prompt further research on this issue. Keywords : Cancer survivors, IADL, Elderly person

PP26 S-033

HOME BASED OCCUPATIONAL THERAPY OF PHYSICAL FUNCTION IN PATIENTS WITH TERMINAL CANCER

Daisuke SATO (*Rehabilitation Sciences, Chiba Prefectural University of Health Sciences, Japan*)

Introduction : The objective of this study was to evaluate the effectiveness of a structured home based occupational therapy program on physical function and quality of life patients with terminal cancer after 1 and 3 months' follow up, and to compare these results with those for a concurrent control group who receive ordinary occupational therapy program. Method : Physical function was measured by Physical Performance Test battery (PPT battery) at baseline and after 1 and 3 months' follow up. PPT battery comprised a series of 11 tasks (50-foot fast walk, 50-foot preferred speed walk, unloaded forward reach, loaded reach, timed repeated sit-to-stand, sock test, timed repeated reach up, timed belt tie, distance walk in 6 minutes). Additionally, QOL was evaluated using a self-administered questionnaire consisting of the European Organization for Research and Treatment of Cancer QLQ-C30 (EORTC QLQ-C30). Comparison of the groups was using propensity scoring. Results : One hundred ninety-four patients with terminal cancer started the structured home based occupational therapy program, of whom 142 (77%) completed 3 months' follow up. The mean relative improvement compared with baseline was statistically significant after 3 months' follow up for 50-foot preferred walk and timed belt tie ($p < 0.05$), and EORTC QLQ-C30 ($p < 0.05$). Conclusion : Structured home based occupational therapy program is effective in improving both physical function and QOL in patients with terminal cancer and may be considered as a valuable alternative to ordinary occupational therapy program. Keywords : terminal cancer, occupational therapy

PP26 S-034

WORK OUTCOMES OF PATIENTS WITH TERMINAL CANCER WHO RECEIVE COMPREHENSIVE OCCUPATIONAL THERAPY

Daisuke SATO (*Rehabilitation Sciences, Chiba Prefectural University of Health Sciences, Japan*)

Introduction : Work disability is a serious consequence of terminal cancer. We conducted a 6 month, prospective randomized controlled trial comparing assessments of disease activity, function, work, and coping in employed patients with terminal cancer receiving occupational therapy versus usual care. Method : Employed patients with terminal cancer with increased perceived fatigue and stress of work were identified by the Cumulative Fatigue Symptoms Index (CFSI ; score > 30). Patients were stratified into medium fatigue and stress (score > 30 and < 50) and maximum fatigue and stress (> 50) groups, then randomized into occupational therapy or usual care groups. Assessments were conducted at baseline and 1 month. The primary outcome was the Canadian Occupational Performance Measure (COPM), and a standardized patient self-report of function was the MD Anderson Symptom Inventory (MDASI). Results : We recruited 78 employed patients with terminal cancer. At baseline the groups were well matched. At 1 month the improvement in the occupational therapy group was significantly greater than that in the

usual care group for all functional outcomes (COPM satisfaction $p < 0.05$, COPM importance $p < 0.05$, FIMp < 0.05) and most work outcomes (CFSI $p < 0.05$, VAS work satisfaction $p < 0.05$, VAS work performance $p < 0.05$). Conclusion : Comprehensive occupational therapy improves functional and work related outcomes in employed terminal cancer patients at risk of work disability. Keywords : terminal cancer, function, work

PP26 S-035

THE EFFECTS OF THE EVIDENCE-BASED FALL PREVENTION PROTOCOL ON FALL KNOWLEDGE, FALL ATTITUDE, AND FALL PREVENTION SELF-ESTEEM OF CARE WORKERS IN A LONG-TERM CARE FACILITY

Dukyoo JUNG, Rye-Won MA, Hea-Jin KIM (*Division of Nursing, Ewha Womans University, Korea*)

Introduction : Introduction: Falling is one of the most devastated accidents in nursing home. Applying practice guideline for fall prevention was an effective way to identify the risk factors of falling and implement interventions. Therefore, the purpose of the study was to examine the effects of the evidence-based fall prevention protocol (EBFP) on fall knowledge, fall attitude, and fall prevention self-esteem of care workers in a long-term care facility. Method : Method: The design of this study is nonequivalent control group with repeated measuring by quasi-experimental study. The experimental group participated in a 12-week EBFP program. The subjects of this study, composing of experimental group of 27 and control group of 31 were collected from two long-term care facilities in Seoul. Fall knowledge, attitude, and fall prevention self-esteem were measured with standardized measurements. The data were analyzed by repeated measure ANOVA. Results : Results: The experimental group taking the EBFP reported the significant difference in fall knowledge ($F=5.291, p=.002$), fall attitude ($F=9.045, p=.000$), and fall prevention self-efficacy ($F=4.127, p=.014$) as time goes by. Conclusion : Conclusion: The effects of EBFP on increasing fall knowledge, fall attitude, and fall prevention self-efficacy of care workers were supported from this study. Nurse can imply the EBFP in the long term care facility to minimize the fall rates and provide systematical fall prevention approach. Furthermore, nurse can educate care workers how they apply fall EBFP. Keywords : fall prevention, evidence-based protocol

PP26 S-036

THE IMPACT OF FRAILTY ON HEALTH RELATED QUALITY OF LIFE AMONG COMMUNITY-DWELLING ELDERLY IN KOREA

Gyeong-Suk JEON¹, Soong-Nang JANG² (*1. Department of Nursing, Mokpo National University, Korea; 2. Red Cross College of Nursing, Chung-Ang University, Korea*)

Introduction : Verifying the effect of frailty on health-related quality of life may help us better understand the impact of frailty. Therefore, the present study was to explore the relationship between frailty and health-related quality of life among community-dwelling Korean elders. Method : Older adults aged 65 years or over recruited by judgment sampling of the population of Seocho-gu in Seoul were surveyed in 2011. The Korean frailty index measure developed by Korean geriatric society was used as an outcome variable. Proportional odds model was used to evaluate the relationship between health-related quality of life and frailty. Results : We found that, after adjusting for sociodemographic covariates, being pre-frail or frail significantly increased proportional odds for lowering health-related quality of life than being non-frail. In addition, among five

components of health-related quality of life, the magnitude of the adverse effects of frailty on HRQOL was largest for pain/discomfort and next was for anxiety/depression. Conclusion : When compared to persons who are not frail, older Korean individuals identified as frail and pre-frail exhibit significantly lower health-related quality of life scores. Such an association between Korean frailty measures and a generic measure of the HRQOL may offer new information to understand frailty within the broader context of frailty. Keywords : frailty, pre-frailty, health-related quality of life

PP26 S-037

EFFECTIVENESS OF FALL PREVENTION IN RESIDENTIAL CARE CENTER

Hae Sung KIM¹, Hyunah KIM² (1. College of Social Welfare, Kangnam University, Korea; 2. Care Service Team, Seongam Center of Senior Health, Korea)

Introduction : Falls are growing health concern in residential care facilities. However, few studies exist effectiveness of fall prevention programs in residential care services. The purpose of this study is to investigate the effectiveness of fall prevention program located in Seoung Nam Si in South Korea. Method : Participants were assigned to the experimental group(11) based on their consent of participation of program, otherwise to the control group(18). The experimental group received program which includes providing information how to seek helping behavior and making practices in daily situation. Main focus of this program is the tailored intervention in order to consider individual circumstances such as cognitive ability and physical function. The control group received regular care services. Results : There was a significant decrease of fall rate in the experimental group from 21.21% to 7.27%. In the control group, there was a weak increase of fall rate from 11.1% to 13.33%. Conclusion : Fall prevention program turns out to be effective in reducing falls among elderly in residential care facility. Especially, there needs to develop fall prevention program which combine strongly with cognitive and physical therapy. In process evaluation, participants report frequently uncomfortable and shameful feeling when they cannot move by themselves, therefore they try not to seek help which may induce falls. Further study should consider how to enhance cultural sensitivity in developing fall prevention for fragile elderly. Keywords: Fall prevention residential care center

PP26 S-038

DIFFERENCES IN SLEEP PATTERN, PHYSICAL ACTIVITY, AND MOBILITY BETWEEN OLDER ADULTS WITH CANCER AND WITHOUT CANCER

Hye-A YEOM¹, Sang-Young ROH², Carol BALDWIN³, Myung-Ah LEE² (1. The Catholic University of Korea College of Nursing, Korea; 2. The Catholic University of Korea College of Medicine, Korea; 3. Arizona State University College of Nursing and Health Innovation, USA)

Introduction : Mobility is a major indicator of frailty in older adults and is prevalent in geriatric patients with multiple chronic illnesses. However, association of lifestyle profiles including sleep patterns and physical activity with the level of mobility has not been clearly explored in older adults with chronic illnesses including cancer. Method : This study was designed to examine differences in sleep pattern, physical activity, and walking mobility between community-dwelling older adults with cancer and without cancer. This was a cross-sectional descriptive study. A total of 284 community-dwelling older adults with multiple chronic illnesses including cancer participated in this study. Participants completed semi-structured

interviews focused on sleep pattern measured using Sleep Habit Questionnaire, physical activity measured using American College of Sport Medicine criteria, and walking mobility measured using 6 Minute Walk Test. Results : Of 284 participants, 56 older adults (19.7%) were cancer patients and 229 were non-cancer patients. The mean age of the participants was 74 years, ranging from 64 to 95 years. Sixty one percent (n=173) were female. Overall sleep quality was moderate with the mean score of 2.3 on 4-point Likert scale. Walking mobility in older adults was negatively correlated with older age ($r = -.27, p = .000$). There was no difference in the level of physical activity between cancer and non-cancer patients. Conclusion : Findings of this study may show that sleep quality and mobility in cancer patients are not significantly less than older adults with other chronic illnesses. Keywords : Mobility, Physical Activity, Aged

PP26 S-039

TEMPORAL INCOORDINATION OF PHONATION AND ARTICULATION IN KOREAN NORMAL ELDERLY: VOICE ONSET TIME ANALYSIS OF STOP CONSONANTS

Hyunji YOO¹, Hyanghee KIM² (1. Graduate Program in Speech and Language Pathology, Yonsei University, Korea; 2. Graduate Program in Speech and Language, Department and Research Institute of Rehabilitation Medicine, Yonsei University College of Medicine, Korea)

Introduction : Changes in speech production in normal elderly might be subtle and gradual. Voice onset time(VOT), one of the widely used acoustic parameters, refers to duration between 'articulator opening' and 'initiation of vocal vibration', which may be indicative of articulatory-phonatory coordination ability. There are three different classes of Korean stop consonants(i.e., lenis /t/, fortis /t*/, aspirated /th/) with distinct VOT values. The purpose of this study is to identify the differences of VOT in three Korean normal women groups. Method : The subjects were 23 women using standard Korean, and are divided into three age groups; 60s(65.50±2.52 y.o.), 70s(74.64±2.65), and 80s(83.00±2.68). Speech sample of 27 randomized one-syllable words [3 places(bilabial, alveolar, velar)•3 phonation types(lenis, fortis, aspirate)•3 following vowels(/a/, /i/, /u/)] per subject was analyzed via Praat (ver.5.2.23). Results : Results showed that the women in their 80s had longer VOT in fortis /p*il, p*ul, t*al/ than those in their 70s, indicating a delay of phonatory initiation. On the contrary, they had shorter VOT in aspirates /thil, thul, khul/ than 70s, implying diminished duration of aspiration. These results indicate that distinct phonetic values of each stop consonant become weaker with advancing age. Conclusion : In conclusion, simple acoustic analysis of VOT of speech sounds might give rich information on temporal incoordination between articulation and phonation in the elderly, which may be a sign of aging on speech motor performance. Keywords : speech, temporal incoordination, VOT analysis

PP26 S-040

CHARACTERISTICS OF HANDWRITING IN THE NORMAL ELDERLY

Ji Hye YOON¹, Sooryon KIM², Jungwan KIM³, Hyanghee KIM⁴ (1. Department of Speech Pathology and Audiology, Hallym University, Korea; 2. Graduate Program in Speech and Language Pathology, Yonsei University, Korea; 3. Department of Speech and Language Pathology, Daegu University, Korea; 4. Graduate Program in Speech Pathology, Department and Research Institute of Rehabilitation Medicine, Yonsei University College of Medicine, Korea)

Introduction : Motor performance for writing requires coordinated

function mediated by the brain in concert with the neuromuscular and visual systems. Even though aging process may affect handwriting performance, handwriting changes due to aging is poorly understood. The aim of this study was to delineate the characteristics of the handwriting of healthy Korean elderly people. Method : One hundred-ninety one healthy adults aged from 62 to 91 years old participated as subjects for the study. Mean(\pm 3.12) years of education was 8.65(\pm 3.12) (range: 6 to 18). The Mini-Mental State Examination (MMSE) was administered to all participants. The subjects were asked to write a standard word to dictation. The test material was a four-syllabic word with one-to-one grapheme to phoneme correspondence. Size (area) of each syllable in the word was measured using Image J program. Word alignment to baseline was assessed using a multiple-choice checklist. Results : As compared to handwriting by the younger subjects in the group, the older subjects showed more variable writing size of the syllables within the word. Furthermore, there was a tendency to orient the words slightly upward/downward or undulating motion relative to the margins. Conclusion : It is assumed that the unequal size (area) between syllables in the elderly may result from irregular control of spatio-temporal handwriting movement. Undulating motion of writing might be due to the disturbance of sensory feedback which controls the line of writing straight and properly oriented on the given template. These data suggest that handwriting may be sensitive in predicting aging process. Keywords : aging, writing, deterioration

PP26 S-041

SWALLOWING, COGNITIVE FUNCTION, AND PHYSICAL ACTIVITY IN THE NORMAL ELDERLY

Ji Hye YOON¹, Jungwan KIM², Hyo Suk NAM³, Hyanghee KIM⁴ (1. Department of Speech Pathology and Audiology, Hallym University, Korea; 2. Department of Speech and Language Pathology, Daegu University, Korea; 3. Department of Neurology, Yonsei University College of Medicine, Korea; 4. Graduate Program in Speech Pathology, Department and Research Institute of Rehabilitation Medicine, Yonsei University College of Medicine, Korea)

Introduction : Dysphagia is a common problem among the elderly that reflects the physical status. In addition to the physical status, cognitive function might be also related with the swallowing function. The aim of this study was to delineate the associations among swallowing, physical activity, and cognitive function of healthy Korean elderly people. Method : Eighty four healthy elderly aged from 58 to 86 years(mean: 73.3 \pm 5.5) old participated as subjects for the study. Mean year of education was 8.1(\pm 3.8)(range: 0 to 16). The subjects were asked to answer for questionnaire of swallowing composing of the following four items: Q1) Have you experienced choking?; Q2) Have you had any trouble with mastication?; Q3) Have you experienced drooling?; Q4) Could you do self-expectoration when you choke? The subjects rated one of five scoring categories; 'not at all', 'seldom', 'quite a bit', 'sometimes', or 'frequently'. In order to measure cognitive functions, the MMSE was administered to all participants. Self-reported physical activity was assessed by a questionnaire on exercise. The participants had to report the average frequency of exercise over the past week. Results : There were significant negative relationships between the MMSE score and difficulty in mastication($r = -.252, p = .023$). There was no relationship between the physical activities and swallowing. Conclusion : The responses to the simple questionnaire of screening for dysphagia might reflect the cognitive conditions in the elderly. Based on the results, efforts to enhance the swallowing-related activity (i.e., mastication) in a daily living might stimulate sensorimotor cortex, thus activating the brain to

work better in the aging process. Keywords : aging, swallowing, cognitive function

PP26 S-042

EFFECT OF THE FALL PREVENTION PROGRAM ON FALL KNOWLEDGE, FALL BURDEN, PREVENTION SELF-EFFICACY, AND FALL PREVENTION BEHAVIORS OF CARE HELPERS IN ELDERLY CARE FACILITY

Min Suk KIM¹, Jeong Sun KIM² (1. Department of Nursing, Graduate School, Chonnam National University, Korea; 2. College of Nursing, Chonnam National University, Korea)

Introduction : This study was done to examine the effects on knowledge of fall, fall burden, self-efficacy on fall prevention, and fall prevention behavior after applying the fall prevention program to care helpers who provide care directly in the care facilities for elderly people. Method : The fall prevention program developed for this study was implemented for 80 minutes per session and four sessions in total. Participants included a total of 47 subjects (the experimental group: 24, the control group: 23). The program application was conducted from July 16 thru August 31, 2012. The collected data were analyzed _-test, independent t-test, and ANCOVA using the SPSS/Win 19.0 program. Results : According to the pre-and post-test, the experimental group participated in the fall prevention program showed an increase in the level of knowledge of fall ($F=92.89, p<.001$), a decrease of the fall burden ($F=14.27, p<.001$), an increase of the self-efficacy on fall prevention, and an increase of the fall prevention behavior ($F=49.50, p<.001$) compared to the control group after the program intervention. Conclusion : From the results, it was verified that the fall prevention program developed for care helpers of care facilities for elderly people in this study was effective intervention to decrease fall burden, and increase fall knowledge, fall prevention self-efficacy, and prevention behaviors related to fall. Therefore, it is suggested that this fall prevention program is provided as an education material for care helpers to prevent fall in care facilities for elderly people. Keywords : Falls, Program Development, Caregivers

PP26 S-043

AGE-DEPENDENT MANIFESTATION OF SEMANTIC FEATURES IN WORD DEFINITION TASK IN NORMAL ELDERLY

Hyang Hee KIM¹, Sooryon KIM² (1. Graduate Program in Speech and Language Pathology, Department of Rehabilitation Medicine, Yonsei University College of Medicine, Korea; 2. Graduate Program in Speech and Language Pathology, Yonsei University, Korea)

Introduction : There are few studies of performance on word definition task in normal elderly in the aspect of semantics of language. They mostly covered quantitative analysis (e.g., total score) or did not subdivide into age groups. The aim of this study is to manifest semantic features in word definition task between two different age groups of normal elderly. Method : The subjects were 15 young-old females (mean age \pm SD = 69.5 \pm 2.5 y.o.) and 15 middle-old females (mean age \pm SD = 78.1 \pm 2.4 y.o.) with the scores above 24 in MMSE. Two groups were matched in years of education. They performed the word definition task comprised of ten words (e.g., train). The verbal outputs were divided into two categories with 'core' and 'supplementary' meaning. The numbers with 'core', 'supplementary' meanings, and 'wrong' responses (e.g., repeating the same meaning) as well as the total scores were obtained. Results : The results demonstrated that there were statistical differences in the numbers of 'core' ($t_{28} = 2.15, p = .040$) and 'supplementary' meanings ($t_{28} = 2.27, p = .031$) between the two groups, but not in total scores ($t_{28} =$

1.84, $p = .077$) and the numbers of 'wrong' responses ($t_{28} = -0.42$, $p = .469$). The middle-old group produced fewer in numbers of 'core' and 'supplementary' meanings than the young-old. Conclusion : In conclusion, the ability of defining a word with abundant and diverse semantic features is declined with age. Keywords : word definition, semantic features, normal elderly

PP26 S-044

THE RISK OF DYSPHAGIA IN THE ELDERLY COMMUNITY, SOCIAL ACTIVITIES, AND NUTRITIONAL STATUS

Sun Woo YIM¹, Young Hae KIM², Youngju JEE³ (1. Pusan National University, Master Student, Korea; 2. Pusan National University, Professor of Nursing, Korea; 3. Kyungnam University, Professor of Nursing, Korea)

Introduction : Dysphagia closely related to aspiration pneumonia in the elderly, and increase mortality risk factors, so important senior health issues. This research survey is performed to provide the basic data needed to prepare, and social activities, and the relationship between nutrition and the risk of dysphagia screening of the Elderly in Nursing interventions for dysphagia risk group to identify the narrative. Method : The sample consisted of 320 older adults recruited by convenience sampling from 6 social welfare centers, 5 senior centers and Park in Busan and Kyungnam. Data were collected from January 3, 2013 to March 20, 2013. The questionnaire used in this study was 23 about dysphagia risks, 1 about social activity, and 6 about short-form mini-nutritional assessment(MNA-SF). Data was analyzed by SPSS WIN 18. Results : The mean score for dysphagia risks was 9.40(SD=7.60), social activity was 3.17(SD=1.13) and MNA-SF was 21.21(SD=5.41). 208 participants(65.0%) were at dysphagia risk and 43(13.4%) were Malnutrition, 201(62.8%) were malnutrition, 76(23.8%) were nutrition usually. There was a statistically significant difference in dysphagia risks according to social activity($\chi^2=34.10$, $p<.001$) and MNA-SF($\chi^2=33.10$, $p<.001$). There were statistically significant associations of dysphagia risks with social activity($r=.165$, $p=.003$) and MNA-SF($r=-.408$, $p<.000$). Conclusion : Findings showed that the vast majority of the study sample had significant relationships were found between dysphagia risks with social activity and nutrition. Future research is warranted to identify risks associated dysphagia in older adults with various health conditions including healthy community dwelling elders. Nursing interventions to prevent dysphagia that are tailored to levels of social activity and nutrition are necessary. Keywords : Dysphagia , Elderly, Nutrition

PP26 S-045

THE EFFECT OF THE EDUCATIONAL PROGRAM FOR RESIDENTIAL ENVIRONMENT IMPROVEMENT FOR FALL PREVENTION OF THE ELDERLY ON FALLS EFFICACY

Miseon JANG, Yeunsook LEE (Housing and Interior Design, Yonsei University, Korea)

Introduction : The increasing number of older people suffering from falls causes increasing medical costs. Almost half of all safety accidents occurring at home can be prevented by eliminating risk factors in the home. However, the elderly tend not to recognize the necessity of renovating their houses. This study intends to identify the effect of the education for residential environment improvement for fall prevention of older people upon the falls efficacy. Method : This study carried out a quasi-experimental research to identify the differences in falls efficacy by implementing the education for residential environment improvement to prevent falls through the fall efficacy scale. The test group participated in the education for 6

weeks: 3 weeks of general education for fall prevention and 3 weeks of education to improve residential environment, with the control group participating in only general education for 3 weeks. Total subjects of the study were 36 older people and their falls efficacy was measured twice, both before and after education was provided. Results : The falls efficacy of the test group and the control group was similar before the education was provided. However, the study revealed that after the education, the test group showed a higher level of fall efficacy than the control group. Generally aged people have a fear of falling but if they attain high falls efficacy, the chances of falling are greatly reduced. Conclusion : This study is meaningful because the education for residential environment improvement developed has promoted fall efficacy of aged people thus improving the chances of fall prevention. Keywords : Fall prevention, Falls efficacy, Education for residential environment improvement

PP26 S-046

CORRELATION BETWEEN SPEECH RATE AND DEPRESSION IN WOMEN IN LATE ADULTHOOD

Yun Kyung HWANG¹, Min Ah BAIK¹, Hyunji YOO¹, Hyanghee KIM² (1. Graduate Program in Speech and Language Pathology, Yonsei University, Korea; 2. Graduate Program in Speech and Language, Department and Research Institute of Rehabilitation Medicine, Yonsei University College of Medicine, Korea)

Introduction : Previous studies have revealed that there is effect of depression on speech. In order to support these findings, this study was designed to identify correlation between articulatory phonetic features (i.e., fundamental frequency (f0), pitch range, speech rate) in numerical counting task and the Geriatric Depression Scale (GDS) scores of the women the late adulthood. The hypothesis predicts that the participants will show negative relationship between the GDS results and articulatory phonetic features. Method : Participants were 64 normal healthy women (age=74.22±4.92). The mean (SD) of the Mini-Mental State Examination (MMSE) scores was 25.51(±2.77). The participants' automatic speech was analyzed by Praat(v5.2.16). Pearson correlation coefficient method was used for statistical analysis. Results : The results demonstrated that speech rate indicated inverse relationship ($p<0.05$) with GDS scores indicating the higher GDS, the slower speech rate. On the other hand, GDS scores did not have any relationship with f0 and pitch range. Conclusion : Slower speech rate might be indicative of depression in women in late adulthood. Further studies utilizing larger sample size and various phonetic features may increase validity of the findings. Keywords : Depression, Articulatory Phonetic, Late adulthood

PP26 S-047

FALL PREVALENCE AND RISK ASSESSMENT AMONG COMMUNITY DWELLING OLDER ADULTS (AGED 50 YEARS AND ABOVE) IN MALAYSIA

Asmidawati ASHARI¹, Keith HILL², Aizan HAMID³, Rizal HUSSAIN³ (1. Institute Gerontology, University Putra Malaysia, Malaysia; 2. School of Physiotherapy, Curtin University of Technology, Australia; 3. Institute Gerontology, Universiti Putra Malaysia, Malaysia)

Introduction : Falls are a major public health problem for older people worldwide, however there is growing evidence the prevalence rate of fall are varies and differences in some risk factors between countries and cultures that mean that data on risk and effective interventions cannot necessarily be translated between countries. Method : A cross sectional study among community dwelling older adult age 50 years and above using convenience sampling. A structured series of self-

administered questionnaires, retrospective recall of fall in previous 12 months, physical assessment and clinical measures of balances were carried out on a single occasion. Results : The prevalence rate of falls was 31.0%, with 26.6% experiencing one fall and 4.4% having two or more falls within the previous twelve months from the date of interview. Almost half (49%) of fallers reported that the falls was due to a slip, 26.5% a trip and 20.0% were reported as caused by loss of balance. More than half (54.5%) falls occurred in the afternoon. The most common area where falls occurred were inside the home (32.7%), outside home (30.6%), and 36.7% were at the community area. Among those who fell, it was noted that 40 (82%) suffered injuries and 18 (36.1%) required medical treatment and 6.1% reported had a severe injury such as fracture or dislocation. Conclusion : In conclusion the prevalence and pattern of falls are common among studied population. Finding could provide baseline information of fall in Malaysia. In future, larger study which focused on fall risk assessment should be tailored culturally appropriate fall prevention program. Keywords : falls, community

PP26 S-048

EVALUATE HEALTH CARE SERVICES PROVIDED FOR OLDER PERSONS IN PRIMARY HEALTH CARE CENTERS IN RIYADH CITY, KINGDOM OF SAUDI ARABIA-A FIRST STEP TOWARDS AGE FRIENDLY PRIMARY HEALTH CARE CENTERS

Adel ALHAMDAN¹, Saad BINDAWAS¹, Saada AL-ORF¹, May AL-MUAMMAR¹, Essam AL-GHAMDI², Maysoun AL-AMOUD², Tariq HAMEED³, Sulaiman ALSHAMMARI¹ (1. *Health Care Development for Elderly Research Chair, King Saud University, Saudi Arabia*; 2. *General Directorate of Primary Health Care Centers, Ministry of Health, Saudi Arabia*; 3. *Community Health Sciences Department, College of Applied Medical Sciences, King Saud University, Saudi Arabia*)

Introduction : In the Kingdom of Saudi Arabia (KSA), the proportion of older persons (≥ 60 years) make up about 5.2% of the total population, and this population is expected to increase to reach 21.8% by the year 2050. The WHO calls for age-friendly primary health care centers (PHCCs), as the provision of necessary health services at PHCCs, for older persons, would inevitably reduce the risk of developing chronic diseases and/or their complications, and would result in a better return for the economy. The present study aimed to evaluate the services provided by PHCCs for older persons, in Riyadh, KSA. Method : The study is a part of a large project, funded by the National Plan for Sciences and Technology (Project No. 10MED121902), King Saud University, to evaluate the services provided for older persons at PHCCs, including their internal environment, and to assess their health status in Riyadh city, KSA, for a period of two years of a total amount of (\$439,950). Results : Preliminary results show that all PHCCs do screening of cholesterol. For osteoporosis screening, the centers do the screening by referral, if required. About 90% of PHCCs use familiar pictures in order to increase recognition, for those with cognitive impairment. none of the centers have dedicated parking lot for older persons. Only 60% of public toilets, in the PHCCs, were accessible to the wheel chair users. Conclusion : We expect that the project will provide a strong base for development of future health-care strategies for the wellbeing of the older-Saudis people towards age friendly PHCCs. Keywords : Older persons, Primary Health Care Centers, Health services

PP26 S-049

KAZAKHSTAN HEALTH STUDY : THE STUDY OF THE DETERMINANTS OF METABOLIC SYNDROME IN

ELDERLY POPULATION

Adil SUPIYEV, Alibek KOSSUMOV, Leila UTEPOVA, Almagul KUSHUGULOVA, Talgat NURGOZHIN, Zhaxybay ZHUMADILOV (Department of Translational Medicine, Longevity and Global Health, Center for Life Sciences, Nazarbayev University, Kazakhstan)

Introduction : The Center for life sciences developed the KHS study as part of a Center's survey program to compile comprehensive information on the health and well-being of adult populations in Kazakhstan. The aim of the project is a comprehensive study of various markers and biomarkers of aging in elderly persons in the Republic of Kazakhstan. Method : a cross-sectional study of random population sample in Astana (Kazakhstan) was conducted. Socioeconomic circumstances and health behaviours were available from 500 pilot subjects aged 50-75 years. Data was collected in a form of standardized questionnaires, clinical data and laboratory results. A standardized questionnaire includes an overall assessment of the patient's health, medical history, lifestyle, socio-economic and psychosocial indicators, as well as physical examination and biometric indicators: height, weight, body length, waist and hip circumference, blood pressure, cognitive function, objective measurements of physical functioning. Also blood samples was collected: Plasma, Serum, Full blood, and Buffy coats (DNA). Results : The associations between socio-economic indicators and health behaviour showed heterogeneity in comparison with countries. Future studies should consider multiple measures of socio-economic position. Population genetics to be analysed this year (2013). Addressing health inequalities is high on international agenda. Our finding of a pronounced social gradient in physical functioning and health behaviours in the population sample in Astana is crucial for policy makers in public health. Conclusion : Investigation of the patterns of socio-demographic aspects of aging population in Kazakhstan is the basis for identifying the ways to address the socio-economic problems. Keywords : aging, epidemiology, health survey

A NEW EXPLANATORY MODEL OF EMERGENCY DEPARTMENT USE AMONG COMMUNITY-DWELLING OLDER ADULTS

Andrew P. COSTA¹, John P. HIRDES² (1. *School of Public Health and Health Systems; Department of Medicine, University of Waterloo; McMaster University, Canada*; 2. *School of Public Health and Health Systems, University of Waterloo, Canada*)

Introduction : Emergency department use among older adults is associated adverse outcomes and increased health care costs. Approximately 8% of adults over the age of 65 and 33% of adults over the age of 85 in Canada receive home care services. The objective of this study was to develop and validate an ED risk model for use in home and community care. Method : A multi-year cohort study was conducted on elderly Canadian home care clients in two Canadian provinces (N=617,035). Census-level data from RAI Home Care assessments were linked to census-level emergency department records. Unplanned ED use was totaled for 6 months after each assessment. Decision tree models were created from a regionally stratified data partition using manual Chi-Square Automatic Interaction Detection and based on Andersen Behaviour Model. A final model was validated on a separate partition (N=154,262). Results: Overall, 41.2% of home care clients have at least one unplanned emergency department visit within 6 months of an assessment. The final model showed good statistical performance as well as practical potential at the point of care. It achieved an area under the curve of 0.62 (95% CI: 0.61-0.62) and showed clear

differentiation in Kaplan-Meier plots. The model outperformed existing models that were derived from the data set. Predisposing and enabling characteristics provided very little added differentiation beyond evaluated need. Conclusion : The model serves as a clear articulation of the chronic conditions and symptoms that drive emergency department visits. It can support the targeting of preventative services as well as better communication strategies with primary care. Keywords : emergency department, home care, screening

PP26 S-051

ASSESSMENT OF ELDERLY SELF-PERCEIVED APPETITE IN SOUTHERN BRAZIL

Claudine Lamanna SCHIRMER¹, Maria Marina Serrao CABRAL², Angelo Jose G. BOS¹ (1. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil; 2. Nutrition, Federal University of Rio Grande do Sul, Brazil)

Introduction : Self-perceived health includes aspects of physical, cognitive and emotional. In the elderly population, appetite reduction is related to the same, unintentional weight loss and cachexia. Objectives: To assess the perception of appetite elderly. Method : This study is a result of the research 'Older Adults' Profile in RS' involving 7316 older adults from 59 different cities. They answered a questionnaire based on the WHO report "Global Age-Friendly Cities: A Guide". The questionnaire encompassed choice questions simple as: 'I would say that overall, their appetite or desire to eat has been ...' Statistical analysis of data was by Epi Info version 3.5.3. Results : When asked about the desire to eat, most seniors report having a good appetite, among these 59.1% (n = 2,237) of women and 58.4% (n = 2,060) of men, 22.9% (n = 867) of women and 22.6% (n = 796) of men consider their great appetite, 16.8% (n = 636) females and 18.5% (n = 652) of men reported feeling hungry in regular intensity and only 33 women (0.9%) and 18 men (0.5%) consider their appetite bad. Conclusion : It is concluded that most of the elderly have an appetite considered good, enabling better health promotion and healthy aging through good nutrition throughout life. Keywords : Health promotion, Eating habits, Self report

ASSOCIATIONS BETWEEN STAGES OF CHANGE FOR EXERCISE AND PHYSICAL FUNCTION AND PHYSICAL ACTIVITY IN COMMUNITY-DWELLING OLD-OLD PEOPLE

Atsushi MIZUMOTO¹, Hikaru IHIRA¹, Keisuke YASUDA¹, Keitaro MAKINO¹, Yoko MIYABE¹, Kaori YOKOYAMA², Shigeyuki SAITO³, Ohnishi HIROFUMI⁴, Takao SUZUKI⁵, Seiji YASUMURA⁶, Taketo FURUNA¹ (1. School of Health Sciences, Sapporo Medical University, Japan; 2. Department of Social Health & Welfare, Bibai City Office, Japan; 3. Department of Nursing and 2nd Department of Internal Medicine, Sapporo Medical University, Japan; 4. Department of Public Health and 2nd Department of Internal Medicine, Sapporo Medical University, Japan; 5. National Institute of Longevity Science, National Center for Geriatrics and Gerontology, Japan; 6. Department of Public Health, School of Medicine, Fukushima Medical University, Japan)

Introduction : The transtheoretical model of behavior change (TTM) is used for clarifying changes of health behavior. Although TTM would be a tool to measure behavior and motivational readiness, there were few studies focusing on the change of exercise behavior in older adults. This study aimed to examine the relationship among stages of change for exercise behavior, physical performance and physical activity in community-dwelling older adults. Method : 273 older adults

aged 75 years and over participated in the first wave of the Population-based and Inspiring Potential Activity for Old-old Inhabitants (PIPAOI) study. To measure behavioral changes of exercise, a questionnaire developed by Oka was employed, which consisted of five scales: Pre-contemplation, Contemplation, Preparation, Action and Maintenance. Physical performances included grip power, knee extension power and 5m maximum walking time. A walking time per day would be a parameter of physical activity. Statistical analyses were performed using ANOVA and a Kruskal-Wallis test. Results : With respect to the distribution of stages of changes for exercise, Pre-contemplation was 27.8%, Contemplation was 14.7%, Preparation was 20.1%, Action was 1.5% and Maintenance was 35.9%. Significant associations were found between stages of change for exercise and grip power (F=6.05, p<0.01), knee extension power (F=4.39, p<0.01), 5m maximum walking time (F=9.21, p<0.01) and physical activity (F=6.07, p<0.01). Conclusion : It is demonstrated that subjects with higher functions and activities are on the advanced stage of changes for exercise behavior. These results show that appropriate interventions for each stage would be important for older people. Keywords : transtheoretical model, behavior change, exercise behavior

PP26 S-053

CANCER LITERACY ASSESSMENT TOOL FOR IMMIGRANT WOMEN

Barbara W.K. YEE¹, Lydia BUKI², Asha RATHINA-PANDI³ (1. Family and Consumer Sciences, University of Hawaii at Manoa, USA; 2. Education and Psychological Studies, University of Miami 312 Merrick Building Coral Gables Florida 33146, USA; 3. Asia Research Institute, National University of Singapore, Singapore)

Introduction : Half of all mortality can be attributed to behavioral factors, lifestyle choices, and health literacy. Western acculturation processes may increase the risk of poorer health. For example, higher breast cancer rates have increased dramatically among Asian, American born women, those who have lived in the U.S. for many years, as well as immigrant women who have adopted an American lifestyle. Method : This poster will describe the development of a breast and cervical cancer literacy measure for Filipina and Mexican American immigrant women who were 39 to 88 years of age, average age of 63 years of age (SD = 12.78), Median length of time in the U.S. @ 34 years (SD = 14.62), average years of formal schooling 7.58 (SD = 13.20) between the 4th to 8th grade. Demographics, Breast and Cervical Cancer Literacy Measure, Acculturation Scale and the Short Test of Health Literacy in Adults. Results : This study found both universal and unique cultural literacy issues among Filipino and Mexican American immigrant women. While some Mexican women were uncomfortable discussing cancer issues, they still discussed it because they felt it was important. In contrast, some Filipina women feared getting cancer by merely talking about cancer. Conclusion : These cultural differences influenced these women's ability to obtain, understand, process, and use health information to promote breast and cervical health. Longitudinal research is needed to examine acculturation processes and its health risk by literacy levels. Keywords: cancer literacy acculturation immigrant women

PP26 S-054

LOGISTIC REGRESSION MODELS TO AID THE DIAGNOSIS OF THE ELDER'S MENTAL HEALTH PROBLEM

Bungon KUMPHON, Anong MANEERONG (Mathematics, Faculty of Science, Mahasarakham University, Thailand)

Introduction : One of the important problem of public health in Thailand is the increase number of the elder's mental health problems.

Method : 425 elders were selected from stratified random sampling and using Thai General Health Questionnaires (GHQ-12) as a instrument. Results : The results from this research revealed that 360 (83.3%) of elderly had no mental health problems and 72 (16.7%) had mental health problems. A pool of 16 variables has been evaluated with logistic regression model for mental health prediction. 8 variables as status, education, region, occupation, source of income, disease, self-care ability and age can be a first aid to diagnose with 88.1 percentage of correction. Conclusion : For the future planning in mental health solving, the stakeholder should be concerned about these variables. Keywords : Mental Health Status, Elderly, Logistic Regression

PP26 S-055

EFFECT OF FIVE-MONTH GROUP-BASED WALKING PROGRAM ON COGNITIVE, HEALTH STATUS AMONG COMMUNITY DWELLERS: A RANDOMIZED CONTROLLED TRIAL

Chiaki URA, Fumiko MIYAMAE, Mika SUGIYAMA, Narumi KOJIMA, Ryo HIRAYAMA, Shuichi AWATA, Ryutara TAKAHASHI (*Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : We have developed an intervention program to help maintain the cognitive functions of community-dwelling older adults through group-based physical activities including walking. Earlier findings indicated that three-month participation in this program has a limited effect; a significant increase in cognitive functions was observed only for those with mild cognitive impairment. Our aim in this study is to identify whether longer (i.e., five months) participation might improve the cognitive as well as other health status of older adults without regard to their pre-intervention cognitive functions. Method : One hundred eighteen community dwellers age 65-79 who were aware of cognitive decline but not diagnosed with dementia were divided randomly into intervention and control groups. After those in the intervention group participated in the program for five months, we conducted ANCOVA to examine whether multiple dimensions of cognitive and health status differed by group. Results : Overall, limited effects of the program were indicated. A significant group difference was found in emotional well-being but not in any index of cognitive functions. Yet, when analyses were restricted to participants with a lower score on Mini-Mental State Examination (MMSE; 26 or under) as well as a smaller number of daily steps at pre-intervention, both verbal fluency and motor functioning improved among those in intervention but not in control groups. Conclusion : Although the cognitive effects did not differ remarkably by the length of the program, five-month participation may improve not only cognitive but also motor functioning. Keywords : Walking Program, Randomized Controlled Trial, Cognitive Functions

PP26 S-056

EFFECT OF EXERCISE PROGRAM FOR ELDERLY DISASTER VICTIMS OF THE GREAT EAST JAPAN DISASTER

Chieko GREINER¹, Kana ONO¹, Chizuru OTOGURO¹, Kyoko CHIBA¹, Noriko KUWADA¹, Chizuru SAKAGUCHI¹, Tokiko ISOWA² (*1. School of Nursing, The Japanese Red Cross College of Nursing, Japan; 2. School of Medicine, Mie University, Japan*)

Introduction : The purpose of this study was to develop an exercise program to achieve sustenance and improvement of physical function for elderly disaster victims of the Great East Japan Disaster and verify the effectiveness of the program. Method : Participants were 45 elderly disaster victims, from whom consent was obtained for this study. A

pamphlet describing stretches and muscle training exercises was developed and distributed to the participants. The exercise classes based on the pamphlet were staged once a week for six months at a facility in a temporary housing area. The one-hour classes held consisted of exercises and tea-time. A portable calendar and a stamp were also distributed to each participant. Functional reach test (FRT), time of standing on one foot (TSF), timed Up & Go Test (UGT), and sit on chair and stand up test (SCST) were measured before, and after three and six months from the exercise classes. Data was analyzed using ANOVA. This study was approved by a research ethics review board at the first author's affiliated university. Results : 27 (female 26) of 45 participants could continue the classes for six months. Mean age was 70.1 (SD£25.0). As results analyzed using ANOVA, FRT (p£0.000), TSF (p£0.007), and SCST (p£0.000) showed significant improvements. Conclusion : Inferior limb muscle power and balance functions improved after participation in the exercise program. The distribution of calendars and stamps to participants was shown to increase participant's motivation for doing exercises. Holding tea-time after classes to promote participants' interaction encouraged participants to continue attending the classes. Keywords : exercise program, elderly disaster victims, physical function

PP26 S-057

IMMEDIATE CORONAL PLANE KINETIC EFFECTS OF NOVEL LATERAL OFFSET SHOES AND LATERAL WEDGED INSOLE SHOES IN HEALTHY SUBJECTS

Jongwoo KANG¹, Haesoo PARK², Chunkyun NA³, Jongwoong PARK⁴, Jungwha HONG⁵, Soonhyuck LEE⁴ (*1. Department of Orthopedic Surgery, Inje University, Korea; 2. Department of Footwear Engineering, Dongseo University, Korea; 3. Bando Hospital, Korea; 4. Department of Orthopedic Surgery, Korea University, Korea; 5. Department of Control and Instrumentation Engineering, Korea University, Korea*)

Introduction : Knee osteoarthritis affects an estimated 20-40% of individuals over the age of 65. Medial compartment knee osteoarthritis is 10 times more common than lateral compartment. This discrepancy is the result of greater load on the medial compartment cartilage of the knee joint. Although, the lateral wedged insole shoes reduce the peak knee adduction moment, they induce excessive ankle abduction moment, and may cause ankle joint problems. The novel lateral offset shoes (trapezoid soled shoes) would not only reduce the peak knee adduction moment but also minimize increases of the ankle and hip abduction moments. In addition, trapezoid-soled shoes may ameliorate the progression and reduce the degree of pain associated with medial compartment knee osteoarthritis, while inducing fewer ankle and hip joint problems. Method : Forty-eight healthy Korean subjects were recruited. Three different types of shoe were tested: conventional shoes (Control), lateral offset sole shoes (Condition A), and lateral wedged insole shoes (Condition B) by using a motion analysis system to check the knee adduction, ankle abduction and hip abduction moments. Results : Both lateral offset sole shoes and lateral wedged insole shoes reduced peak knee adduction moments compared with the Control condition. The peak knee adduction moment was not significantly different in both shoes. However, lateral wedged shoes demonstrated increased ankle abduction moment compared to others. Conclusion : Wearing lateral offset shoes can reduce the peak knee adduction moment with less influence on the ankle joint than wearing lateral wedged shoes. Therefore, the design of our lateral offset sole shoes are more beneficial than others. Keywords : osteoarthritis, lateral offset shoes, trapezoid soled shoes

PP26 S-058

EFFECTS OF PROGRAM INTEGRATING SOUND SCIENTIFIC CONCEPTS WITH HEARING CARE KNOWLEDGE FOR THE ELDERLY IN THE COMMUNITY

Chwen-Chi WANG¹, Jin-Jong CHEN², Chao-Ti HSIUNG¹
(1. Department of Science Education, National Taipei University of Education, Taiwan; 2. Department of Physical Therapy and Assistive Technology, National Yang-Ming University, Taiwan)

Introduction : Hearing loss not only affects the daily life communication, security and social activities closely related to the deterioration of cognitive function and quality of life. Therefore, this study aims to develop a program integrating sound scientific concepts and hearing care knowledge for the elderly. **Method :** Sixteen (6 males, 10 females) healthy elderly residents (70.3 ± 5.2 y/o) were recruited from Beitou Community College as volunteers in this study. Total 200- minute program is divided into two courses. First 100-minute course of sound scientific concepts teaching includes: (1) the generation of the sound; (2) the propagation of the sound; (3) the sound three elements, and (4) noise sound. Second 100-minute course of hearing care includes: (1) the structure of the ear; (2) common hearing problems; (3) hearing care, and the actual hearing test. Two different six-item tests designed for the two courses respectively were conducted before and immediately after the teaching program to evaluate the teaching effects. **Results :** Results revealed that the sound scientific literacy and hearing care knowledge of all subjects were improved significant ($p < .01$). Moreover, the feature of sound scientific concepts teaching emphasis on 'learning by doing' improved their conceptual understanding of sound. In addition, all 16 subjects agreed that these courses coincided to their preference and applicable for their life. **Conclusion :** In conclusion, the program integrating sound science concepts and hearing care knowledge could be interesting and effective for elderly lifelong health education. **Keywords :** sound scientific concepts, learning by doing, lifelong education, hearing care

PP26 S-059

THE EFFECTS OF LIFE STORY WORK ON THE PSYCHOLOGICAL OUTCOMES OF COMMUNITY-DWELLING SENIORS

Claudia Ky LAI, E. Angela CHAN (School of Nursing, The Hong Kong Polytechnic University, China)

Introduction : To date, strong evidence of the benefits of life story work (LSW) is lacking. This study aimed to examine whether LSW for community-dwelling seniors would lead to a higher level of life satisfaction and an increased sense of self-esteem and wellbeing. **Method :** The participants were randomly drawn and recruited from the membership list of 17 community and daycare centers. Participants in the intervention group worked with trained volunteers to produce their life story book through four to six semi-structured sessions either at the senior's home or at the social centers. The outcome measures included: (i) The Life Satisfaction Scale (LSI-A); (ii) the Rosenberg's Self-Esteem Scale (RSES); (iii) the General Health Questionnaire; and (iv) the Geriatric Depression Scale (GDS). Immediate outcomes (T1) of the LSB intervention were compared against the baseline (T0), and measurements taken three months (T2) and six months (T3) post-intervention. **Results :** 244 participants were randomly allocated to the intervention (n=124) and control group (n=120). There was no interaction effect of time and group on any of the outcome variables. Compared to T0, all outcome variables were more satisfying for both groups at T3, and the changes in LIS-A and RSES reached a level of significance. GDS, LIS-A, RSES, GHQ, time, sleep quality, monthly income, number of chronic illnesses, social network within the family,

social network with friends, IADL, BI, negative life events, and number of children alive were key variables in predicting outcomes. **Conclusion :** The findings did not show that LSW has significant effects on the psychological wellbeing of community-dwelling seniors. **Keywords :** life story work, community-dwelling seniors, intervention study, psychological outcomes

PP26 S-060

RESEARCH OF THEME PARK PLANNING AND SPACE DESIGN BASED ON THE REQUIREMENT ANALYSIS OF THE NEW SILVER GENERATION

Da Yeon LEE (Space Based Story Telling, Exhibition Planning, Graduated Graduate School of Creative Industry, Andong National University, Korea)

Introduction : Rapid aging dictates many cultural and financial changes. The cultural perspectives of the Silver Generation have changed in recent times as the generation looks to improve their quality of life by enjoying leisure and cultural activities. The New Silver Generation now demand the needs to enjoy leisurely activities but these are limited due to lack of both culture and leisure centers which can accommodate their needs. **Method :** The value of this research is significant in targeting the New Silver Generation from the wide range of the elderly population and basis of the requirement analysis is derived from surveys, in-depth interviews, and case studies to accommodate the needs of the subject to plan and design the proposed theme park. **Results :** The New Silver Generation's needs portrayed in their proud actions which are rooted on the notions that "health is the most important thing in life," Therefore, from such needs and desires, the concept of the new silver theme park has been derived as "preparing for a healthy life and future." It shall be named the "Health Aging Park." **Conclusion :** The main focus of Health Aging Park is health. In relation to the concentration of health; light exercise, leisure activities, means and medical care are the theme park's four prime objectives. It is anticipated that the programs designed for fun exercise at Health Aging Park will slow the effects of aging and help extend the health of the entering members of the New Silver Generation. **Keywords :** Healthcare, New Silver Generation, Theme park

PP26 S-061

FACTORS WHICH AFFECT THE HEALTH RELATED QUALITY OF LIFE OF OLDER ADULTS IN KOREA

Eunhee CHOI (Department of Nursing, Yeungnam College of Science and Technology, Korea)

Introduction : Older adults are generally characterized in Korean society as weak and physically in a degenerative state. At least 69% of the entire older adult populations surveyed are afflicted by one or more illnesses. Moreover, their psychiatric needs are greater than their physical needs, but neither are expressions of health related quality of life. In order to have a healthier older adult population, attention must be given to their health related quality of life that strongly related with successful aging. The EQ-5D instrument is an appropriate method to access the health related quality of life of older adults⁴ and will be instrumental in future research in finding solution to this growing problem. **Method :** Data used in this study was obtained from the Korean National Health and Nutrition Examination Survey (KNHANES IV-1). The SPSS 12.0 software program was used in the analysis of the numerical data, percentages, Pearson correlation, and multiple logistic regression. **Results :** The factors that are associated with health related quality of life are: home ownership, perception of health, discomfort during the previous two weeks, limitations in

activity, lying sick in bed during the previous month, depression lasting over a two week period, and contemplating suicide. The factors that affect health related quality of life are: limitations in activity, perceived health, contemplating suicide, discomfort during the previous two weeks, and home ownership. Conclusion : The findings suggested that the older adult had main factors affecting on quality of life. Nursing interventions tailored on the elder's characteristics that affect on the quality of life. Keywords : EQ-5D, Older adults, Korea

THE EFFECTS OF EXERCISE PRESCRIPTION SERVICES CUSTOMISED FOR THE AGED INDIVIDUALS ON THEIR FUNCTIONAL FITNESS

Hee Eun NAM, Mi Ran LEE (Department of Social Welfare, Kosin University, Korea)

Introduction : This study is to examine the effects of exercise prescription services customised for the aged individuals on their functional fitness by implementing mixed exercise prescription programs that mainly deal with physical activities as preventive treatment such as Yoga, Dancing, and Sports massage. Method : 60 elderly women over the age of 60 living in Y-gu in B-metropolitan city were used as subjects of this study and twenty persons per program were allocated to Yoga, Dancing, and Sports massage to observe the difference in the functional strength of the subjects with different exercise prescription applied. Results : As results of the study, it was observed that all of the three exercises of Yoga, Dancing, and Sports massage show improved muscular strengths in the upper limbs, flexibility of pelvic limb, and agility after the exercise, compared with them before the exercise and the extents of the effects generated by each of them differed. Conclusion : Significance of this study was the basis for a more effective program data were obtained through the comparison on the effects of social service programs 'personalized exercise prescription elderly services'. Keywords : The aged, Exercise Prescription Service, Functional fitness.

PP26 S-063

THE LONGITUDINAL FACTORS RELATED TO THE DEPRESSION OF ELDERLY: COMPARISON OF YOUNGER-OLD AND OLDER-OLD

Hye-Kyung KIM, Jun Mo SUNG (Division of Social Welfare, Korea Nazarene University, Korea)

Introduction : It is well known that the depression is main psychological problem of the elderly, however, very few approach was conducted using longitudinal data-set in Korea. The purpose of this study is to investigate the longitudinal factors related to the change of depression of elderly focusing on the comparison between the younger-old and older-old. Method : We analyzed elderly data from the wave 1 to wave 4 of Korean Welfare Panel Study(KWPS). KWPS is representative nationwide panel data. Final analysis subjects are 2,766, 2,552, 2,351, and 1,765 in each year. Dependent variable is CES-D(Center for Epidemiological studies for Depression Scale), and independent variables are family, health, housing, social, and economic factors. Sex, age, educational level, living area, and religion are controlled. Fixed effects model of GLD(Generalized Least Squares) was employed to examine the longitudinal correlations between dependent and independent variables both age group. Results: Main results are as follows. Satisfaction with family relation, health, housing environment, and leisure had negative influence on the depression both younger and older-old. On the other hand, basic livelihood recipient showed higher depression score only in younger-old. Conclusion : Our findings suggests that the determinant of

depression of elderly are such as family, health, housing environment and leisure satisfaction regardless of age. However, the importance of economic status is more important in younger-old. The policy directions for reduce depression level in ole age was discussed. Keywords : depression, panel data, younger-old, older-old.

PP26 S-064

A STUDY ON THE ANALYSIS OF OLDER ADULTS' EXERCISE PARTICIPATION IN TAIWAN

I-Yao FANG¹, Shao-Hsi CHANG², Eva Hui-Ping CHENG³, Ming-Chun HSUEH¹ (1. Department of Physical Education, National Taiwan Normal University, Taiwan; 2. Graduate Institute of Sport, Leisure & Hospitality Management, National Taiwan Normal University, Taiwan; 3. Department of Leisure and Sport Management, National Taipei University, Taiwan)

Introduction : In 2011, older adults aged 65 years and over in Taiwan represented 10.89% of the total population. Taiwan will soon become an aged society in 2017, and a super-aged society in 2025 as the aging population will be more than 20% at the time. The aging phenomenon is comprehensively in its scope and future impacts on societies. In order to assist people to stay healthy, the main official strategy is to promote national-wide physical activity programs (sports activities). Therefore, the purpose of this study was to analyze the sports participation of older adults aged 65 years and over, and come up with suggestions based on the study results. Method : Content analysis was adopted as the research method and the government official publications between 2009 and 2012 on national survey on sports were analyzed. Results : 1)Most Taiwanese older adults started to exercise regularly after reaching 60 years old. 2)The percentage of regular exercise was as high as 56.25% (at least 3 times per week, at least 30 minutes per time), and 39% for exercise daily. 3)The main physical activities of older adults were low intensity activities such as walking, brisk walking, and exercise. 4)The intensity of the elderly exercise is mostly perspiring but not breathing heavily, representing 44.2%. 5). The main exercise venues are surrounding parks, green places and schools nearby. Conclusion : Conclusion: the government should develop professional exercise programs for older people, to provide instructors in accessible venues and therefore to strengthen their sports-related skills and knowledge. Keywords : older adults, elderly physical activities, exercise participation

PP26 S-065

INFLUENCE OF INCOME AND SELF RATED SOCIOECONOMIC POSITION ON LIFESTYLE, PHYSICAL AND PSYCHOLOGICAL FUNCTION IN CHINESE OLDER ADULTS AGED 65 YEARS AND OVER

Jean WOO¹, Jason LEUNG², Ruth CHAN¹, P.H. CHAU³ (1. Medicine & Therapeutics, The Chinese University of Hong Kong, Hong Kong; 2. Jockey Club Centre for Osteoporosis Care and Control, The Chinese University of Hong Kong, Hong Kong; 3. Faculty of Social Sciences, The Chinese University of Hong Kong, Hong Kong)

Introduction : In order to examine the whether socioeconomic factors contribute to health disparities in older populations in a society with universally accessible low cost health care and social welfare system, we examined the influence of absolute income, disposable income and self-rated socioeconomic position on lifestyle and various health outcomes in a cohort of community-living people aged 65 years and over. Method : 1324 participants (605 men, 719 women) aged 65 years and over living in the community were recruited as part of a health survey, which included information regarding demographics, medical history, smoking, alcohol intake, physical activity level, dietary intake,

activities of daily living, depressive symptoms, health-related quality of life, and physical performance measures. Self-rated socioeconomic status was assessed by asking participants to place a mark on a picture of an upright ladder. Details regarding monthly expenditure, monthly income and whether participants viewed that they had enough money, were also obtained. Results : More associations were observed between the two self rated SES status and health outcomes compared with the objective income indicators. In general higher SES status is associated with better physical and psychological function. A disposable income \geq \$500 was associated with better physical component of health related quality of life in women. Conclusion : In the older population, even with universally accessible health care and social welfare, associations between SES and health outcomes are still observed. Self-rated SES scales may be useful measures for health outcomes relevant to the elderly. Keywords : socioeconomic status

PP26 S-066
THE KOREAN LONGEVITY WALKING METHOD -
JANGSAENG BOBUP 長生步法

Jin Kyung AN (*Brain Education Institute, University of Brain Education, Korea*)

Introduction : This research deals with the longevity technique Jangsaeng bobup (眞生步法), which help the true longevity accomplished in modern Korean Sundo (尊道), Korean traditional Taoism. The Jangsaeng bobup in modern Korean Sundo is a walking method that focuses on the yongcheon (眞氣) acupuncture point of foot and applies acupressure on the front of the foot when walking. The breath, the stream of qi (氣) energy, and acupuncture points are important in Jangsaeng bobup. Method : This research compares the three western walking techniques of Masai walking, Power walking, and Nordic walking that have high general awareness and popularity with walking in modern Korean Sundo longevity techniques. Results : The most difference of Jangsaeng bobup from the three western walking techniques is on consuming and accumulating of the energy. The purpose of the three western walking is to promote calories, build up muscles, reduce fats, and improve cardiovascular fitness. They maximize the effectiveness of energy consumption, release the toxic waste matters, and enhance the mobility and function of the body. While western techniques mainly focus on the physical improvement and health maintenance, Jangsaeng bobup is more related to the accumulation of qi. In other words, it is a method to use and supplement qi that is kept consuming in daily life. And its concentration training on the body when Jangsaeng bobup can makes the walker meditating status. Conclusion : Jangsaeng bobup is the longevity technique to attain the mental and spiritual health and complete the human in ourselves on the basis of physical health. Keywords : walking, Jangsaeng bobup (眞生步法), qi (氣) energy

PP26 S-067
IMPROVEMENT OF FUNCTION AND SELF ESTEEM AFTER
1 YEAR PROGRAM OF LOCAL GOVERNMENT'S HEALTH
CENTER FOR THE OLD DISABLED PEOPLE

Joon-Sung KIM¹, Seong-Hoon LIM², Boyoung HONG¹
(1. Department of Rehabilitation Medicine, St. Vincent's Hospital The Catholic University of Korea, Korea; 2. Rehabilitation Medicine, St. Vincent's Hospital The Catholic University of Korea, Korea)

Introduction : Increasing number of old people in Korea is one of the leading problems in nowadays. There are very few places that they can spend their time, especially for the disabled people and very elderly people. Method : One of the local governments, Hawseong-si operated the health center for the elderly who have mild disability and disease.

The members of this center were comprised of one nurse, one occupational therapist and two assistants. The older people who enrolled the center were received 1 year program daily. The program was consisted of physical therapy, occupational therapy, cognitive training, stretching and strengthening exercise and some recreational activities. Results : Total numbers are 36 (M: 7, F 29). Mean age is 76.5 \pm 4.2. Most of them have disease such as hypertension, diabetes, dementia, stroke and arthritis. After the 1 year program, most of indexes improved, MMSE-K (22.0 \pm 4.0 to 23.4 \pm 3.6), FIM (107 \pm 13.3 to 110 \pm 11.3), Grasp power (25.1 \pm 6.8 to 30.4 \pm 10.3) and depression scale (20.3 \pm 3.1 to 17.5 \pm 3.9) respectively. Conclusion : The comprehensive program for the very elderly and disabled old people in Hwaseung-si is useful for the improvement of function and depression. Keywords : health center, elderly, function

REDUCING HUNGER AMONG MEXICAN-ORIGIN SENIORS
IN TEXAS BORDER COMMUNITIES

Joseph SHARKEY¹, Wesley DEAN¹, Melissa GOMEZ¹, Maria CASTILLO², Natalie RANGEL², Eba MUNGUIA² (1. Program for Research in Nutrition and Health Disparities, Texas Healthy Aging Research Network School of Rural Public Health, USA; 2. Program for Research in Nutrition and Health Disparities, School of Rural Public Health, USA)

Introduction : Nutrition-related health conditions disproportionately affect disadvantaged populations that face increased vulnerability to food insecurity and poor nutritional health, such as hard-to-reach older adults residing in colonias along the U.S.-Mexico border. Mexican-origin older adults face physical, economic, and sociocultural contextual challenges to the accessibility, affordability, adequacy, and appropriateness of food resources on multiple levels: individual and community. Method : In February 2012, seniors were recruited for 14 focus groups (FG) in four geographic areas to understand food acquisition and preparation knowledge and skills, and learning styles. All FG guides were written in an iterative process with team promotoras and community partners. All FGs were conducted by a highly trained promotora in Spanish and audio-recorded. a six-stage process was used for audio data transcription and translation in to English. All FG data were organized into segments, read through with themes identified and assigned, and sorting and sifting to identify similar phrases, patterns, themes, and common sequences. Results : Seniors described their experiences and beliefs in discussing the following topics: how they get food to eat at home; experiences when they do not have enough money for food; experiences when they do not have enough food to eat; major concerns; decision-making when confronting competing demands for resources; childhood experiences; planning for meal preparation; source of nutrition information; community resources; and community needs. Conclusion : Seniors will be key in identifying issues regarding food acquisition and food preparation knowledge and skills needed to reduce food insecurity. This will be key for increasing the knowledge and skills of Mexican-origin seniors. Keywords : hunger , immigrants, food insecurity

PP26 S-069
THE FACTORS INFLUENCING HEALTHY AGING IN
KOREANS

Eun Joo SEO¹, Eun-Young JEON², Kwuy-Bun KIM³ (1. Prof. Dep. of Nursing, Daegu Health College, Korea; 2. Prof. Dep. of Nursing, Daegu University, Korea; 3. Prof. College of Nursing Science, Kyung Hee University, Korea)

Introduction : This study was to examine the factors related to healthy

aging in Koreans. Method : The period of collecting the material was from August 1th to 20th of 2012, a preliminary search prior to the main investigation was carried out for the selection of analysis tools. Afterwards, the main investigation was carried out from September 5th to 25th of 2012 , by surveying 275 in person from 45 years old age. Data were analyzed with SPSS Window 20.0 program. To meet the purpose of the research, descriptive statistics, and multiple regression were performed. Results : 1. Demographic characteristics of subjects and healthy aging the results of the comparison of the differences, age, education status, living status and economic status were found significant differences. 2. The results of correlation between healthy aging were as follows. perceived health status, self-esteem, depression(), ego-integrity(), achievements, leisure activities, loneliness() was found in correlation to each other. 3. The predictors of healthy aging in Koreans were leisure activities, perceived health status, ego integrity, achievements and self-esteem. The biggest factor was leisure activities(B=0.273). These factors enabled to explain 52.6% of the total variance in persons. Conclusion : Based on these findings , the above major influencing factors leisure activities in Koreans, should be considered to develop a new nursing program for the healthy aging. Keywords : Factors, Healthy Aging, Korean

PP26 S-070

EDENTULISM IN THE BRAZILIAN ELDERLY AND ASSOCIATED FACTORS

Luisa Helena Do Nascimento TORRES¹, Juliana Balbinot HILGERT², Fernando Neves HUGO², Maria Da Luz Rosario De SOUSA¹ (1. Community Dentistry Department, Piracicaba Dental School, University of Campinas - UNICAMP, Brazil; 2. Community Dentistry Department, Federal University of Rio Grande do Sul, Brazil)

Introduction : Edentulism is a major public health concern, especially in developing countries because it affects quality of life and well-being of the elderly. Also, it is one of the leading causes of years lost due to disability. The aim of this study was to verify the association between edentulism and sociodemographic, general health and dental service use data. Method : This report is based on partial data retrieved from the second follow up of a cohort study carried out in Brazil, The Carlos Barbosa Cohort Study (CBCS), using preliminary data from 295 older subjects. The outcome was being edentulous or not. The independent variables were gender (male/female), age (<73/≥ 73 years-old), local of residence (urban/rural), income (0-2 /≥3 minimum wage), number of medications in use (0-1/2-13), depression (present/absent), dental care attendance (never/when having a problem, sometimes or regularly), type of dental service (particular or convenio/public). Associations between the outcome and sociodemographic data, general health and dental service use were assessed using Poisson regression. Results : The mean age was 73.16 and the mean schooling was 3.84. The variables associated with edentulism were gender (female, RP=1.80, CI95% 1.35-2.40), age (≥ 73 years-old, RP=1.34, IC 95% 1.10-1.63), dental care attendance (never go to the dentist, RP=1.66, CI95% 1.38-2.00), dental service type (public, RP=0.64, 0.49-0.84). Conclusion : The results suggest that sociodemographic and dental service use are associated with edentulism. Keywords : Tooth loss, Geriatric Dentistry, Health Services Accessibility

PP26 S-071

COMORBIDITY AND HEALTH HABITS AMONG DEMENTIA, MILD COGNITIVE IMPAIRMENT, AND COGNITIVELY NORMAL ELDERLY INDIVIDUALS IN SEOUL

Mi Ra SUNG¹, Myonghwa PARK², Dong Young LEE³ (1. General.

PhD. professor, Seoul Metropolitan Center For Dementia. Kyung-in women`s college, Korea; 2. Professor; College of Nursing, Chungnam National University, Korea; 3. Director, Professor; Department of Neuropsychiatry, Seoul Metropolitan Center for Dementia, Seoul National University Hospital, Korea)

Introduction : The aim of this study is to clarify the actual condition of the elderly of dementia, mild cognitive impairment, and cognitively normal who registered in Seoul Dementia Management Project. Method : In the present study, total 11,163(Dementia 5,312, MCI 2,814, cognitively normal, 3,037) elderly were analyzed including demographic characteristics, comorbidity, and healthy lifestyle habits. The data were collected in the data of Seoul Dementia Management Project. The diagnostic process for dementia, mild cognitive impairment, and cognitively normal involves assessment of MMSE as a screening and CERAD or SNSB as a diagnostic measure. Results : Demographic characteristics were revealed as followings at dementia; 78 years of the mean age at the time of definite diagnosis, and female(69.3%), and 4.55 years of educational period. There were several comorbidities including hypertension(61.7%), DM(31.8%),hypercholesterolemia(10.2%), heart disease(11.1%), obesity(4.2%), and strokes(21.4%). MCI were several comorbidities including women (62.0%) hypertension (56.5%), DM (26.8%), hypercholesterolemia (14.0%),heart disease(10.4%), and stroke(9.2%). Alcoholic history was found in 31.3% of the elders, and smoking in 24.4%. Cognitively normal demographic characteristics were more women(67.0%) compared to men(33.0%) and 6.7 yr was the average length of education. There were several comorbidities including hypertension (55.8%), diabetes mellitus (20.2%), hypercholesterolemia (15.8%), heart disease (9.3%), strok (5.0%). Alcoholic history was found in 29.8% of the elders, and smoking in 23.5%. Regular exercise was done more than 57.9% of the elders. Conclusion : Healthy lifestyle such as smoking, Exercise and alcoholic consumption could represent an important and potent protective factor for cognitive decline in elderly persons Authors expect that the present data will be used for establishment of dementia associated projects and policies. Keywords : elderly, Physical comorbidity, health-Habits

PP26 S-072

THE FACTORS THAT AFFECT MEANING OF LIFE THE ADULT AND THE ELDERLY

Mi Yeon JEONG¹, Eun Joo SEO², Kwuy-Bun KIM³ (1. Master's candidate, College of Nursing Science, Kyung Hee University, Korea; 2. Prof. Dep. of Nursing, Daegu Health College, Korea; 3. Prof. College of Nursing Science, Kyung Hee University, Korea)

Introduction : This study was to examine the factors related to meaning of life in the adult and the elderly. Method : The period of collecting the material was from August 1 of to 20th of 2012, a preliminary search prior to the main investigation was carried out for the selection of analysis tools. Afterwards, the main investigation was carried out from September 10th to 30th of 2012, by surveying by surveying 210 in adults from 45 to 64 years old and 198 in elders above the age of 65 in the areas of Seoul, Incheon. Data were analyzed with SPSS Window 20.0 program. To meet the purpose of the research, descriptive statistics, and multiple regression were performed. Results : 1. The degree of meaning of life in adults were significantly higher than in elders (F= 4.253 , p=.040). 2. The degree of meaning of life(t=3.611, p <.000), successful aging(t=2.563, p <.011), self-transcendence value(t=4.967, p <.000) showed significantly difference between in adults and elders. 3.The predictors of meaning of life in adults and elders were successful aging(=0.353),

hope($r=0.289$), self-transcendence value($r=0.189$), and allowance($r=0.117$) in adults and hope($r=0.351$), life satisfaction($r=0.272$), successful aging($r=0.274$) in elders. The biggest factor was successful aging in adults and hope in elders. These factors enabled to explain 51.9% of the total variance in adults and 59.4 % in elders. Conclusion : Based on these findings , the above major influencing factors, (successful aging in adults and hope in elders, especially) should be considered to develop a new nursing program for the meaning of life. Keywords : meaning of life, adult, elderly

PP26 S-073

RELATIONSHIP BETWEEN EPA/AA RATIO IN THE BLOOD AND LIFE SPAN AT A NURSING HOME

Miho MATSUDA¹, Hiroki MATSUDA², Minoru TAKEMOTO³, Yukio MATSUDA⁴ (1. *Special Nursing Home for the Elderly, Gerontopia Niigata (social welfare corporation), Japan*; 2. *Department of Gastroenterological Internal Medicine, Yokosuka Kyosai Hospital, Japan*; 3. *Department of Clinical Cell Biology and Medicine, Chiba University Graduate School of Medicine, Japan*; 4. *Sunayama Clinic, Miyoshikai, Japan*)

Introduction : EPA, unsaturated fatty acids mostly found in fish, is likely to have an anti-atherosclerotic effect. Method : Fasting EPA/AA ratios were measured early in the morning of 91 people who were currently residing at the nursing home without history of taking EPA drugs. The correlation between nursing care level, the degree of activities of daily life (ADL) in the elderly, and the degree of independence of the elderly with dementia, Hasegawa Dementia Scale-Revised (HDS-R) and life span were investigated. Statistical analyses were done using SPSS 15.0J. Results : The average age was 88 years old, the HDS-R average was 4.3 and the average of EPA/AA ratio was 0.5 (minimum value 0.1, maximum value 0.82). There was a positive correlation between nursing care level, the degree of ADL, and the degree of independence of the elderly with dementia ($r=0.279$, 0.3 , 0.26 , $p<0.05$). Within about a year after measuring their EPA/AA ratio, 10 people died. EPA/AA ratio was tended lower in people who died compared to people who survived. (people who survived 0.5 ± 0.1 vs. people who died 0.43 ± 0.16 , $p<0.056$). Conclusion : It was found that the EPA/AA ratio for elders on exactly the same diet varied between a minimum of 0.1 and a maximum of 0.82 suggesting that there might be individual differences in absorption of fatty acids from foods. In this study, it was suggested that the possible existence of a correlation between low EPA/AA ratio and lower life span. Keywords: EPA/AA

DEMENTIA, A CHALLENGE FOR THE PUBLIC HEALTH SYSTEM, BRASOV, ROMANIA

Minerva GURGU¹, Andreea ZAMFIRESCU², Ana Maria STROIE³, Doina MILHEM⁴, Aurel ROMILA⁵ (1. *Geriatrics, MD, PhD attendant, Emergency Hospital, Brasov University of Medicine and Pharmacy, Bucharest, Romania*; 2. *Geriatrics, MD, PhD attendant, Clinic of Geriatrics, "Sf. Luca" Hospital, University of Medicine and Pharmacy 'Carol Davila', Romania*; 3. *Geriatrics, MD, PhD attendant, Department of Geriatrics, Hospitalier Bretagne, University of Medicine and Pharmacy 'Carol Davila', France*; 4. *General Practitioner, Private Practice, Romania*; 5. *Psychiatry, MD, PhD, University of Medicine and Pharmacy 'Carol Davila', Romania*)

Introduction : Frequently, in primary care, the diagnosis of dementia is delayed; we need a strategy to encourage the early diagnosis. The goal of this project was to evaluate the cognitive function in a group of

community subjects. Method : During Oct 2011 - Oct 2012, Romanian Alzheimer Society, held a campaign for the evaluation of cognitive function and physical health. There were used 2 screening scales: MMSE, CT (Clock Test) and enquires that evaluated the life style, risk factors, chronic diseases and the frequency of medical visits. Patients with dementia were excluded from the study. The patients scores were compared with the normative values, differentiated on age, education level, risk factors and comorbidities. Results : A group of 356 subjects were evaluated; the average age was 69.5 years; 74% were females; 70% had a medium level of education; 26% had a high level of education and 4% had a low level of education. A high level of SMI was scored, 88.48%; 81.74% of the patients had a normal MMSE score; 16.01% had minor memory impairment; 2.24% had medium memory impairment. The CT scores ranged similarly to the MMSE scores. 93% of the subjects visit their GP on a regular basis, which is in direct correlation with the prevalence of chronic diseases. Conclusion : SMI has a high prevalence. For patients with risk factors and chronic diseases, it is required a regular monitoring of the cognitive function, using MMSE and CT. MMSE is easy to use and should be included in the national evaluation program. Keywords : MMSE, early diagnosis

PP26 S-075

EFFECT OF IMB (INFORMATION-MOTIVATION-BEHAVIORAL) MODEL BASED SELF-MANAGEMENT EDUCATION PROGRAM FOR OLDER ADULTS WITH DIABETES: A PILOT STUDY

Misoon SONG¹, Suyoung CHOI², Se-An KIM¹, Kyoungsan SEO¹, Soo Jin LEE¹, Eun Ho KIM¹ (1. *College of Nursing, Seoul National University, Korea*; 2. *Research Institute of Nursing Science, College of Nursing, Seoul National University, Korea*)

Introduction : Self-management is an important concept in terms of change life style and habit in order to prevent complications for older adults with diabetes. It has been known that providing knowledge to client is not enough in improving self-management behavior. IMB (Information-Motivation-Behavioral) model is a theory of behavior change that propose three important factors for behavior change; Information, motivation and behavioral skills. This is a pilot study that tested the effect of IMB model based self-management program for older adults with diabetes. Method : Ten older adults who were diagnosed with type 2 diabetes were recruited at a senior center in Seoul Korea. The intervention program is consisted with 12 weekly sessions with each session lasted 1 and 1/2 hours. The topics of the program were concord to guideline of the American Association of Diabetes Educators. Measurements were made at pretest (T0), 13th week (PT1), and 3 months later (PT2); weight, body fat, waist circumference, HgbA1c, Lipids, depression, diabetes knowledge, motivation, self-efficacy of self-management behavior, and self-management behavior. Results : There was no difference in HgbA1c between T0 and PT1, but it was significantly improved between PT1 and PT2. The level of motivation was improved between T0 and PT1, but no change was seen between PT1 and PT2. The self-management behavior was significantly improved between T0 and PT1, but no difference was shown between PT1 and PT2. Other dependent variables were shown no differences between times. Conclusion : The IMB model based self- management education program showed some potential benefit for older people with diabetes. Keywords : diabetes, IMB model, self-management

THE DEVELOPMENT OF A HEALTH FITNESS PROGRAM BASED ON ORIENTAL MEDICINE FOR KOREAN SENIORS

Moon Mi JUNG¹, Seung Jae PARK² (1. Graduate School, Yonsei University, Korea; 2. Oriental Medical Doctor, WOOJOO Korean Medical Clinic, Korea)

Introduction : The purpose of this research is to implement a health fitness program that focuses on the energy(gi) passages within the body which are connected to acupressure and acupuncture points to positively influence the body's internal rhythm. Within the government and private organizations the majority of health fitness programs that have been developed for seniors focus on the function of the body's musculoskeletal system. Because of the overwhelming presence of western medicine based approaches there are a lack of traditional Korean medicine based programs, which is why this research is necessary. **Method :** This research was based on the 'dong-eui-bo-gam' methods of Dr. Heojun and the 'sa-sang medical methods' of Dr. Jaema Lee. **Results :** As a result, it was found through Heo's method that people live in accordance with their energy levels, and that the thriving of one's energy is deeply connected to one's mental state and health. Furthermore, if one cultivates one's energy by tempering a sound mind that a longer lifespan will result. This suggested that the cultivation and care of one's energy flow is important. In the case of Lee's method, it was found that sickness and old age are caused by the depletion of spiritual essence which is caused by the loss of control over one's body. **Conclusion :** Therefore it was necessary to develop a health fitness program which will return control to one's body through the revitalization of one's spirit. **Keywords :** Korean Seniors , Health Fitness Program , Oriental Medicine

COMPUTERIZED INTERACTIVE MULTIMEDIA EDUCATION

Myonghwa PARK (College of Nursing, Chungnam National University, Korea)

Introduction : Interactive multimedia education using computer technology is increasing in the area of health education. The purpose of this study was to examine the effects of interactive multimedia education on community dwelling older adults' knowledge and efficacy for safe medication in Korea. **Method :** A nonequivalent control group pre and post-test design was used in this study. The interactive multimedia education was designed to suit the disease and medication characteristics of older adults. Education consisted of seven modules which contained the contents of medication name, usage, side effects, interactions, and storage requirements. Computerized interactive learning activities consisted of animation processes and games. A total of 60 older adults from local senior centers were recruited and assigned to the experimental and control group. Twenty six participants used the interactive multimedia education on laptop computers. **Results :** Subjects receiving interactive multimedia education had significantly higher self-efficacy ($t = 3.69, p = .001$) and knowledge ($t = 3.74, p < .001$) cores than the control group at post intervention. The participants believed the animations and games were useful. They agreed the program was easy and fun to use. They responded that much of the information was new for them and they would recommend the program to their friends. **Conclusion :** The study results suggest that the interactive multimedia education is an effective teaching method that empowers older adults with low information literacy to facilitate individual learning using computer technology. * This work was supported by the Korea Research Foundation (KRF) grant funded by the Korea government(MEST) (No. 2009-0067767) **Keywords :** computerized education, medication

COMPARISONS OF BODY COMPOSITION, BLOOD CONCENTRATIONS OF BONE METABOLIC MARKERS AND CRP RESPONSES TO THE DIFFERENT EXERCISE TRAINING

Nayoung AHN, Changbum KANG, Seoung-ho JANG, Youngsik JU, Sooryun JUNG, Jayoung BYUN, Kijin KIM (Department of Physical Education, Keimyung University, Korea)

Introduction : The body's mass of bone very closely reflects the balance of bone formation and absorption. So bone loss may be as an imbalance of bone formation and absorption in a state of increased bone change. The purpose of this study is that comparing body composition between the type of exercise in postmenopausal elderly women and insulin resistance index, bone metabolic marker, and the CRP concentration change. **Method :** Subjects were 33 Korea elderly women. Their age were average above 75 years old. Exercise intervention were yoga, the strength training with Theraband and the elderly dance for 12 weeks, and we analyzed body composition before and after exercise, and insulin resistance-related indicator, serum osteocalcin, total alkaline phosphatase, and serum inflammation-related markers like a CRP. **Results :** Elderly women, especially after menopause, theraband exercise for 12 weeks is proved that alkaline phosphatase levels significantly ($p < .05$) reduced, so affected the decrease in serum concentrations of CRP, and Theraband exercise and elderly dance exercise for 12 weeks appeared to affect on improvement in BMC of the postmenopausal elderly women. **Conclusion :** This study showed that Theraband exercise and seniors dance group have increase bone density markers but yoga group is no difference changes. Also Theraband exercise and the elderly dance group are a significant reduction of the serum total alkaline, is verified, the reduction of CRP verify the tendency. The Theraband exercise and the elderly dance exercise for Korea elderly women after menopause are expected to be a positive improvement in body composition and bone metabolic markers. **Keywords :** elderly women, exercise, bone metabolic

PP26 S-079

MENTAL HEALTH STATUS AND HOPE OF ELDERLY

Narisa WONGPANARAK¹, Bungon KUMPHON² (1. Faculty of Nursing, Mahasarakham University, Thailand; 2. Faculty of Science, Mahasarakham University, Thailand)

Introduction : The purposes of this research are to determine the level of mental health status and hope and its association with socio-demographic factors among the elderly in Maha sarakham Municipality. **Method :** 432 sample of elders were selected. The instruments of this study consist of 1) Socio-demographic information, 2) Thai General Health Questionnaires (GHQ-12) and 3) The Herth Hope Index (HHI). The internal consistency of The GHQ-12 and HHI was examined using Cronbach's alpha coefficient which gave values of 0.82 and 0.77, respectively. The data were analyzed by descriptive statistic, Chi-Square test of association and Cramer's χ^2 and Phi coefficient. **Results :** The results revealed that 283 (65.5%) of elderly had no mental health problems and 149 (34.5%) had mental health problems. Most of the elderly had moderate and high level of hope 310 (71.8%) and 118 (27.3%), respectively. The association between mental health status and hope was investigated by test of association. There was a significant between mental health status and hope ($\chi^2 = 4.196, p\text{-value} = 0.123$), and the low correlation with Cramer's coefficient $V = 0.099$. Seven factors associated with the mental health status were age, education, income, source of income, social welfare, club member, and present illness. Meanwhile, marital status,

education, income, and social welfare were four factors related to hope. Conclusion : The findings suggested that mental health promoting activities should be implemented in elderly people in order to promote the mental health status and hope underpinning important factors among elderly people. Keywords : Mental Health Status, Hope, Elderly

PP26 S-080

GENDERED ANTI-AGING WORK AMONG MIDDLE-AGED PEOPLE IN THE U.S.

Neal KING, Toni CALASANTI (*Sociology, Virginia Tech, USA*)

Introduction : Age relations subject even the most privileged men to ageism as they move through middle age, but those men respond in ways rooted in the hegemony of manhood. This paper draws on data from pilot interviews of nine middle-aged men and ten middle-aged women in the U.S. to show that, though both women and men concern themselves with the anti-aging preservation of bodies, they do so in gendered ways such that men distance themselves from consumer roles and link themselves Method : We analyze in-depth interviews conducted with 19 men and women in the U.S., aged 43-61. Grounded analyses of these semi-structured interviews sought to understand how people come to view changes in their bodies. Results : Male and female respondents answered questions about products used, regimens observed, bodily concerns, and work done, in different ways. Though men are as concerned with appearance as women are, they focus verbally on performance at work and at athletic play, emphasizing the “fight”, “work” and being “natural” in ways that women do not. Women concern themselves with attractiveness; and, while they often engage in hard work in this regard, they do not describe it in those terms. Conclusion : Men distance themselves from “passive” consumerism often associated with femininity and focus instead on hegemonic ideals of work, as if to claim a more successful aging than women claim, and thus to vie for some continued gender privilege. Keywords : aging, gender, work

PP26 S-081

EFFECTS OF THE SELF-EFFICACY AND SOCIAL SUPPORT ENHANCEMENT PROGRAM ON FOOT CARE BEHAVIOR AMONG THAI ELDERLY WITH DIABETES MELLITUS

Pissamai PHANPHUECH¹, Pornchai JULLAMATE², Raweevan PAOKANHA³ (*1. Nursing Department, Ao Udom Hospital, Thailand; 2. Gerontological Nursing Department, Faculty of Nursing, Burapha University, Thailand; 3. Adult Nursing Department, Faculty of Nursing, Ubonratchathane University, Thailand*)

Introduction : Foot problem in older adults with diabetes mellitus (DM) is vital. To prevent this problem, nursing intervention to enhance foot care behavior is crucial and necessary. This two-group pretest posttest quasi-experimental research aimed to examine the effect of self-efficacy and social support enhancement program on foot care behavior among Thai elderly with DM. Method : Sixty diabetes elderly were randomly selected and assigned into experimental and control group equally. The control group received usual care from health care staffs while the experimental group received the 8-week self-efficacy and social support enhancement program from the researcher together with their primary caregivers in group. During the program, telephone follow up also was performed to stimulate the diabetes elderly in taking care of their feet. Data were collected using The Demographic Data Form and The Foot Care Behavior Questionnaire (reliability .79). Descriptive statistics, dependent and independent t-test were computed for data analysis. Results : Findings revealed that after receiving the program, the experimental group had

significantly higher score of foot care behavior than prior to starting the program ($t=13.97$ $p < .001$). In addition, once finished the intervention, the experimental group had significantly higher score of foot care behavior than the control group had ($t=10.50$ $p < .001$). Conclusion : This self-efficacy and social support enhancement program obviously increases foot care behavior of the diabetic elderly. Therefore, nurses should apply this efficient program for taking good care of DM patients so to promote foot care behavior. Nursing research by applying this program in other chronic population was also recommended. Keywords : Elderly, Diabetes Mellitus, Self-Efficacy, Social support, Foot care behavior

PP26 S-082

DIFFERENCES IN THE DEGREE OF HEALTH PROMOTION BEHAVIOR PRACTICES OF KORAN ELDERLY RESIDING IN A RETIREMENT COMMUNITY BY DEMOGRAPHIC CHARACTERISTICS

Seon Sook KIM¹, Jun-Ah SONG² (*1. Doctoral Student, College of Nursing, Korea University, Korea; 2. Associate Professor, College of Nursing, Korea University, Korea*)

Introduction : As aging population grows rapidly in Korean society, there have been increased interests about health promotion programs targeted for elderly to increase their active life expectancy and quality of life. Knowledge of differences in the degree of health promotion behavior practices (HPBP) of elderly by demographic variables has important implications for the study and care of related people. Method : This study used a convenient sample of 170 older adults (Mean age = 72.59 ± 7.11) recruited from a retirement community located in Seoul, Korea. Using a face-to-face interview, participants were assessed demographic characteristics and HPBP using the Health Promotion Lifestyle Profile (HPLP) consisting of 6 subscales including nutrition, stress management (SM), interpersonal relationships (IR), exercise, health responsibility (HR), and self-actualization (SA). The data were analyzed using descriptive statistics, t-tests, and ANOVAs. Results : Mean score of participants' HPLP was 3.05 (SD=.54), with the highest score on the subscale of exercise (Mean=3.26, SD=.71); and the lowest score on the stress management (Mean=2.74±.51). The overall score of HPLP differs significantly by economic status ($F=5.44$, $p = .001$). Subscale scores of the HPLP were significantly different by religion (for IR), education level (for SA), economic status (for nutrition, exercise, HR, and SA), and family members living together/ occupation/ number of diagnosed illness (for nutrition). Conclusion : Results of this study provide a basis for the development of nursing strategies to increase a retirement community residents' level of HPBP. However, further studies using large random samples from various sites are needed to confirm the findings from this study. Keywords : health promotion behavior, retirement community, HPLP

PP26 S-083

CONCEPTS RELATED TO THE AGING EXPERIENCE IN OLDER AFRICAN IMMIGRANT WOMEN

Sharon G. MCRAE, Barbara COCHRANE (*School of Nursing, University of Washington, USA*)

Introduction : Older African immigrants are among the fastest growing immigrant group in the United States. Few studies have been conducted with older African immigrant women from varying ethnic origins. As these women become long-term U.S. residents, they experience a decline in health and an increase risk for chronic diseases. Older African immigrant women's perspectives and experience are particularly important because of their central role in addressing,

healthy aging, as well as possible concepts and health practices from their home country that differ markedly from those in the U.S. The goals of this integrative literature review are to: (1) identify concepts related to the experience of aging relevant to older African immigrants' lives; (2) identify the contexts within which older African immigrants have been studied; (3) identify research gaps in our knowledge. Method : A systematic, integrative review of the literature was undertaken. U.S. and international research and theoretical publications indexed in PubMed, PsycINFO and CINAHL databases from 1990 to 2012 were identified. Results : Although U. S. and international research reveals functional status, social and cultural connectedness, and cognitive functioning as concepts of aging in older non-African immigrant populations, absent from empirical studies is what is known among African immigrants, particularly older women, about chronic disease and aging. This literature review revealed a paucity of research regarding older African immigrant women in the U.S. or even older African immigrants overall. Conclusion : Additional qualitative research is needed to understand relevant concepts and experiences of chronic disease and aging among older African immigrant women. Keywords : Aging, African, Women, Immigrant

A COMPARATIVE STUDY OF THE FACTORS INFLUENCING SUCCESSFUL AGING BETWEEN ADULTS AND ELDERLY

Shin Jeong KIM¹, Yun Jung LEE², Eun-Young JEON³, Kwuy-Bun KIM⁴ (1. Master's candidate, College of Nursing Science, Kyung Hee University, Korea; 2. Prof., Department of Nursing, Shin Gyeong University, Korea; 3. Prof., Dept. of Nursing, Daegu University, Korea; 4. Prof., College of Nursing Science, Kyung Hee University, Korea)

Introduction : This study was to compare and to examine the factors related to successful aging between adults and elders. Method : The period of collecting the material was from August 1 to 20th of 2012, a preliminary search prior to the main investigation was carried out for the selection of analysis tools. Afterwards, the main investigation was carried out from September 1 to 20th of 2012, by surveying 204 in adults from 45 to 64 years old and 199 in elders above the age of 65 . Data were analyzed with SPSS Window 20.0 program. To meet the purpose of the research, descriptive statistics, and multiple regression were performed. Results : 1. The degree of successful aging in adults and elders were significantly higher than in aging ($F=2.640$, $p=.010$). 2. The degree of purposeful life ($t=6.094^{***}$), Attitude of aging ($t=2.974^{**}$), well-being ($t=4.452^{***}$), ego-achievements ($t=2.308^*$), and self-esteem ($t=3.808^{***}$) showed significantly difference between in adults and elders. 3. The predictors of successful aging elders were purposeful life, well-being, self-esteem in adults and purposeful life, self-esteem, Attitude of aging, perceived health status in elders. The biggest factor was purposeful life in adults and elders. These factors enabled to explain 56.1% of the total variance in adults and 51.4 % in elders. Conclusion : Based on these findings , the above major influencing factors, (purposeful life in adults and elders, especially) should be considered to develop a new nursing program for the successful aging. Keywords : Successful Aging, Adults , Elders

CONTENT ANALYSIS ON RESEARCH EXERCISE AND OLDER ADULTS IN TAIWAN

Ching- Show LIN¹, Shou-Wen CHENG², Shou-Yen CHENG³, Jian-Xun LU⁴ (1. Graduate School of Gerontechnology and Service Management, Nan Kai University of Technology, Taiwan; 2. Graduate

School of Gerontic Technology and Service Management, Nan Kai University of Technology, Taiwan; 3. Graduate Institute of Electrical Engineering & Computer Science, Nan Kai University of Technology, Taiwan; 4. Department of business Administration, National Chung Hsing University, Taiwan)

Introduction : The 70% older adults have at least one or more chronic diseases [1]. For instance, cardiovascular, high blood pressure, stroke, Parkinson's disease, and diabetes, etc. The chronic diseases and mental diseases have positive correlation significant relationship [2, 3]. Exercise can reduce physical illnesses or mental diseases (depression). In Taiwan, 2009 National Health Interview Survey (65 years old or older), this reported having had exercise during the past two weeks only 53.1% [4]. Many studies indicated that regular exercises had a significant influence on depression symptoms. This study aimed to analyze the content and trend of past research of evidence regarding the effectiveness of exercise in elder adults. Method : The method employed in this study was content analysis. Our data consisted of 52 journal articles taken from PerioPath Index to Taiwan Periodical Literature System; the key words were elderly and exercise. The articles were analyzed on the aspects of research types, topics, variables, and scales. Results : The three raters in this study attained an inter-rater reliability of 0.923 on average, while the intra-rater reliability had an average of 0.887; > 0.8 . For content analysis these are sufficiently high values [5]. Conclusion : It was found that researchers' backgrounds could be categorized into six main groups, the most importances are including public health nursing, 17 papers, and physical, 15 papers. Journals currently studying Taiwan's elderly exercise publish mostly comprehensive review papers (35), with few original research papers (17). Most of the results showed that exercise effective to improve or maintain the ability of physical activity. Keywords : content analysis, exercise, elderly

PP26 S-086

THE FACTORS THAT AFFECT BURDEN OF FAMILY CARE GIVER OF THE ELDERLY

So Yeong KANG¹, Yun Jung LEE², Kwuy-Bun KIM³ (1. Master's candidate, College of Nursing Science, Kyung Hee University, Korea; 2. Prof., Department of Nursing, Shin Gyeong University, Korea; 3. Prof., College of Nursing Science, Kyung Hee University, Korea)

Introduction : This study was to examine the factors related to burden of family care giver of the elderly in Koreans. Method : The period of collecting the material was from August 10th to 25th of 2012, a preliminary search prior to the main investigation was carried out for the selection of analysis tools. Afterwards, the main investigation was carried out from September 12th to 28th of 2012, by surveying 215 family care giver for the elderly above the age of 65, residing in the areas of Seoul and Pusan city. Data were analyzed with SPSS Window 20.0 program. To meet the purpose of the research, descriptive statistics, and multiple regression were performed. Results : 1. The average Burden of family rate of the elderly was 2.75, which was lower than expected. The rates for related factors, social support(3.23), family support(3.18), stress(3.09), burnout(2.48) depression(2.32) were found to be respectively. 2. According to the analysis on the relationship between Burden of family and its factors, stress, depression and burnout showed positive correlations. However, social support, family support showed negative correlations. 3. Stress($r=.401$) showed to be the most important of the Burden of family factors for the elderly. Burnout($r=.360$), educational status($r=.191$), relation of family($r=.117$) orderly. These factors enabled to explain 55.1% of the total variance in adults and 58.9 % in

Burden of family. Conclusion : Based on the results of the research, a new nursing program should be developed for Burden of family care giver of the elderly and enhance its efficiency, applying it in the real world. Keywords : factors, Burden of family care giver, elderly

PP26 S-087

INFLUENCING FACTORS ON DEPRESSION OF OLDER ADULTS IN COMMUNITY

Soonrim SUH¹, Jiae SON² (1. College of Nursing, Kyungpook National University, Korea; 2. Nursing, Kyungpook rehabilitation hospital, Korea)

Introduction : The previous study reported that depression was influenced on sociodemographic factors. However, there were a few studies including stress and mistreat of older adults as influencing factors on depression and older residents in rural community. This study was to identify influencing factors on depression older adults who live in rural community. Method : A cross-sectional and correlational design was used. A total of 228 older adults were surveyed using a written questionnaire at 4 myeon areas in a province. The data were analyzed using descriptive statistics, t-test, ANOVA, Pearson correlation, and multiple regression. Results : There was few disability of activity of daily living of participants. The score of stress was below the medium level and subjective health status was the middle level. The score of depression was moderate level. The score of mistreat on older adults was low level. Variables such as stress, neglect, subjective health status, physical mistreat, age, and economic state accounted for 65.1%. Stress among them was the most predictive factor and then neglect was the second factor. Conclusion : The effect of stress, neglect, and subjective health status is significant to decrease depression of older adults. Consequently, nursing intervention for depression prevention need to include reducing stress and promoting health status with community support system. Keywords : Aged, Depression, stress, mistreat, health status

PP26 S-088

ASSOCIATION BETWEEN BODY WEIGHT AND PSYCHOLOGICAL WELL-BEING OF OLDER ADULTS IN SOUTH KOREA

Sujin CHAE (School of Social Science, Seoul Women's University, Korea)

Introduction : Body weight is one of the most important factors that explain the health status and mortality. While the physical health or mortality correlations with BMI are fairly well established, the association between BMI and psychological well-being has not been dealt with. This study was conducted to investigate whether underweight, normal-weight, over-weight, and obese older adults differ in aspect of their depression and life satisfaction. Method : This study used data from the KLoSA in 2008 (n=9026). The study sample was 5,044 older adults who were over the age of 60 in South Korea. The research assessed the prevalence of 4 body weight groups, examined associations between body weight and demographic characters, depression, life satisfaction. Results : The study revealed that the life satisfaction of underweight group was lowest and the depression of them was highest among 4 groups (p<.000). And both life satisfaction and the depression were negatively affected by underweight, even though controlling other variables (sex, age, education, comorbid). Implication of the result is discussed healthy weight maintenance are important for old adults to improve their quality of life. Conclusion : This study found that Korean older people have detectable differences, according to BMI status. It is suggested that the underweight status is one of the most negative factors that

influence the psychological well-being of Korean older people. These results have important implications that the older people with underweight could be vulnerable to threaten their psychological well-being, and it should be necessary to establish multidisciplinary networks and to develop interventions for improving their psychological well-being. Keywords : elderly, BMI, psychological well-being

PP26 S-089

DEVELOPMENT AND PSYCHOMETRIC EVALUATION OF GERIATRIC SELF-EFFICACY SCALE FOR SELF-MANAGEMENT OF TYPE 2 DIABETES MELLITUS (GSES-DM)

Suyoung CHOI¹, Misoon SONG², Se-An KIM², Kyoungsan SEO², Soo Jin LEE², Eun Ho KIM² (1. Research Institute of Nursing Science, College of Nursing, Seoul National University, Korea; 2. College of Nursing, Seoul National University, Korea)

Introduction : One of the central goals of diabetes education is to enhance self-management skills and confidence to achieve the appropriate self-management behaviors for improvement over health status of older adults with diabetes. Most of the instruments currently used to assess diabetes self-efficacy lack adequate testing for applicability with older adults. The purpose of this study was to develop and validate a geriatric self-efficacy scale for self-management of type 2 diabetes mellitus (GSES-DM). Method : A preliminary GSES-DM of 22 was derived from literature reviews and focus group interviews with type 2 diabetes older adults. Seventeen items were finally confirmed through item analysis and factor analysis. Psychometric testing was performed with a convenience sample of 150 older adults with type 2 diabetes. The data were analyzed using factor analysis, Cronbach's alpha, and Pearson correlation coefficients. Results : From the factor analysis, 17 significant items in six subscales were derived. The subscales were named problem solving for hypoglycemia and self-monitoring blood glucose, problem solving for hyperglycemia, coping with psychological distress and medication taking, reducing risks of diabetes complications, appropriate exercise, and healthy eating. The GSES-DM also established a concurrent validity with Self-efficacy for Diabetes and known-groups validity. The internal consistency, Cronbach's alpha, was .84, and reliability of the subscales ranged from .55 to .80. Conclusion : This study suggests that the GSES-DM is easy, reliable and valid instrument to measure self-efficacy for self-management of older adults with type 2 diabetes. Keywords : Type 2 Diabetes Mellitus, Self-management, Self-efficacy

PP26 S-090

COMPARISON OF CHARACTERISTICS OF RISK BEHAVIORS AND INJURIES BETWEEN ELDERLY AND YOUNGER POPULATION

Yang Ju TAK (Department of Paramedic Science, Korea National University of Transportation, Korea)

Introduction : The purpose of this study was to compare the incidence and characteristics of risk behaviors and injuries between elderly and younger population. Method : This research was conducted as a secondary analysis of data collected from annual nationwide large scale survey, Community Health Survey (CHS). The original data was collected from a CHS in 2010 from an adult population (over 19 years old) through one-on-one interviews from a structured questionnaire using CAPI system. There were a total of 229,229 subjects in the study, and this population was split into the elderly group (n=54,254) who were above 65 years old ; and the younger group (n=174,975) who were below 65 years old. Risk behaviors such as drunken driving,

lack of seat belt use and lack of helmet use and incidence and cause of injuries were compared amongst the two groups. Results : The elderly group showed significantly higher rates of driver seat belt use (85.16% v 78.81%), passenger seat belt use (77.45% v 71.39%), motorcycle helmet use (60.16% v 51.87%), drunken motorcycle driving (1.54% v 0.75%), injury incidence (5.6% v 4.76%), and unintentional injury (99.14% v 98.5%) at a statistically significant rate when compared to the younger group. On the other hand, the younger group showed significantly higher rates of riding drunken driver's car (8.94% v 2.14%) and bicycle helmet use (4.82% v 2.37%) at a statistically significant rate when compared to the elderly group. There was no statistically significant difference in the rates of drunken driving and intentional self-injury. Conclusion : The elderly people showed different characteristics of risk behaviors and injury incidence than younger population. Keywords : Community health survey, risk behavior, injury

PP26 S-091

COMPARISON OF HEALTH BEHAVIORS IN ELDERLY POPULATION WITH AND WITHOUT CHRONIC CARDIOVASCULAR RISK FACTORS

Yang Ju TAK¹, Jun PARK², Hyun Sook KIM³ (1. Department of Paramedic Science, Korea National University of Transportation, Korea; 2. Medical Research Information Center, College of Medicine, Chungbuk National University, Korea; 3. Department of Social Welfare, Korea National University of Transportation, Korea)

Introduction : The purpose of this study was to compare the health behaviors of the geriatric population that are currently living with cardiovascular disease to those who do not have disease. Method : This research was conducted as a secondary analysis of data collected from national large scale study. The original data was collected from a Community Health Survey (CHS) in 2010 from an adult population (over 19 years old). The information was collected by trained interviewers through one-on-one interviews from a structured questionnaire. There were a total of 229,229 original subjects in the study, out of which 54,254 were above 65 years old. This population was split into the disease group (n=20,135) based on reported history of hypertension and/or diabetes mellitus; and the control group (n=23,676) if there was no reported history of disease. Health behaviors such as smoking, drinking, physical activity level, and stress level were compared amongst the two groups. Results : The control group showed higher rates of smoking (16.58% v 10.95%), moderate intensity physical activity (20.84% v 16.27%), and walking (43.69% v 40.73%) at a statistically significant rate when compared to the disease group. On the other hand, the disease group showed higher rates of obesity (25.74% v 13.42%) and stress (22.03% v 19.45%) at a statistically significant rate when compared to the control. There was no statistically significant difference in the rates of drinking. Conclusion : The information from this study could be used to tailor the national public health program and optimize resources available in promoting healthy behaviors. Keywords : Community health survey, health behavior, Diabetes, Hypertension

THE EFFECTIVENESS OF CARDIOPULMONARY REHABILITATION ON ELDERLY PATIENTS AFTER CARDIAC SURGERY

Yi-Chen LEE (Nursing, Chi Mei Medical Center, Taiwan)

Introduction : Activity intolerance is a major physiological problem on elderly patients after cardiac surgery. The purpose of this study was to explore the effectiveness of cardiopulmonary rehabilitation to improve

early ambulation after cardiac surgery using a Taiwanese elderly sample. Method : Use the checklist to collect 44 cardiac surgery elderly patient's basic information and observe their activities. A qualitative interview was conducted to explore the reasons of elderly patient for delaying ambulatory before, then set up the cardiopulmonary rehabilitation measures. Results : The mean age of 44 sample was 66.2 years, Data showed that patients in the intervene the cardiopulmonary rehabilitation measures of multidisciplinary team: 'Hosting the education of cardiopulmonary rehabilitation'; 'Development the care plans of cardiac rehabilitation team'; 'Develop the care guidelines of cardiopulmonary rehabilitation'; 'Develop the health education pamphlets and shooting the videos of cardiopulmonary rehabilitation'; 'Increase set of the assisted ambulation tools'. The incidence of got out of bed on Elderly Patients after Cardiac Surgery from 22.7% to 88.4% after cardiopulmonary rehabilitation of average length of hospital stay were 13.4 days to 10.6 days, and when they activities did not feel laborious, beats per minute than the rest did not increase more than 20 times. Conclusion : Through team work to perform care plan can improve elderly patient's activity intolerance and shorten the length of hospital stay. The article to intervene cardiopulmonary rehabilitation measures, on elderly patients after cardiac surgery can early ambulation and enhance the quality of care. Keywords : Cardiopulmonary Rehabilitation on Elderly Patients, Cardiac Surgery

PP26 S-093

THE EFFECT OF HEALTH BEHAVIOR PRACTICE PROGRAM OF GRANDPARENTS IN RURAL KOREA AREA

Yoo Hyang CHO (Department of Nursing, Chodang University, Korea)

Introduction : The purpose of this study was to examine effect of the health behaviors practice program of grandparents. Method : The interview survey and health behavior practice program were performed from July 2012 and January 2013 with a structured questionnaire to 60 grandparents of grandparent - grandchildren families who were served intervention services lived in Muan-Gun of Chunnam Province. The intervention services were provided by electronic voucher a day per week. The health behavior practice program was served 16 items. The questionnaire composed of general characteristics of grandparents, health status, MMSE, ADL, IADL, depression scale, and 16 items of health life style and 19 items of independence life behavior. The research method used SPSS program with F-test, Chi-square test and t-test. Results : This result was only 1st survey. 2nd survey will conduct at January 2013. Among the elderly 60.0% were female, and 85.0% had education below elementary school. There were more drug management and oral care and money management among 16 health behavior practice items. And there were less reading newspaper, writing diary, having a good time with hobby and drinking water 1,500cc per day among 16 health behavior practice items. The grandparents considered their IADL, depression, MMSE and health promotion behaviors worse. This intervention services for grandparents will change the health behaviors and health condition of grandparents. Conclusion : We suggest recommended change for health behavior of grandparents in rural area. Intervention services for GP-GC family should included health behavior practice program contents. Keywords : Grandparent, program effect, health behavior practice

PP26 S-094

THE EFFECTS OF INTERNET USE ON HEALTH INFORMATION SEEKING BEHAVIOR OF THE ELDERLY WITH CHRONIC DISEASES IN THE U.S.

Yongsam OH, Jeong Woo LEE (Case Western Reserve University, USA)

Introduction : With an aging U.S. population, the incidence and prevalence of chronic disease is expected to rise dramatically (NCHS, 2010), and the necessity of increasing health information seeking behavior has become an important issue in the field of aging (Ladha et al., 2009). **Method :** According to the data from the Health Tracking study (2010) by the Pew Internet and American Life Project, in which the research subjects were the elderly with chronic diseases (n = 198) using the internet, types of chronic diseases among the elderly (≥ 60 years) are put into five categories: diabetes, high blood pressure, respiratory disease, heart disease, and cancer. Based on previous research (Zhao, 2006), this study classified internet usage into two categories: solitary activity (0 to 6) and social activity (0 to 5). The health information seeking behavior (0 to 14) is measured by fifteen items asking about the behavior of looking for information about certain health or medical issues on the internet. Using zip code, community types are categorized as rural, suburban, and urban (reference). **Results :** In the final hierarchical regression model, the centered solitary activity ($b = .787^{***}$) and rural community ($b = 1.893^{**}$) was significantly related to the health information seeking behavior. The interaction effect on the health information seeking behavior also was observed between the solitary activity and rural community (.77*). **Conclusion :** Findings demonstrate that internet uses of the elderly are highly related to their health information seeking behavior, and simultaneously this relationship can be moderated by the effect of community types. **Keywords :** Health Information Seeking Behavior , Internet Use , Elderly with Chronic Diseases

PREVALENCE OF DEPRESSION AND PHYSICAL ACTIVITY AMONG ADULTS IN THE U.S.

Mi Ryeong SONG¹, Young-Shin LEE², Jong-Duek BAEK³, Marci MILLER⁴ (1. Department of Nursing, The Research Institute for Basic Sciences, Hoseo University, Korea; 2. School of Nursing, San Diego State University, USA; 3. Graduate School of Public Health, San Diego State University, USA; 4. Department of Nursing, San Diego State University, USA)

Introduction : Depression is a worldwide health problem . The purpose of this study was to identify the prevalence of depression and examine physical activity amounts among adults with depression. **Method :** This study was a cross-sectional descriptive study with the National Health and Nutritional Examination Survey 2005-2006. The sample of this study was a total of 4058 men and women aged 20 years and older. Self-reported Patient Health Questionnaire [PHQ-9], for depression, accelerometer counts for physical activity amount, demographic information, and self-reported health status were analyzed by applying and weighting to represent population estimates. Bivariate analysis and multivariate logistic regression were applied to data. **Results :** Overall the prevalence of depression was 13.9% in mild and 5.6% in moderate to severe levels. Adults in the mild depression group spent significantly less time doing both light ($p < .01$) and moderate ($p < .001$) intensity physical activity than the non-depression groups. And also adults in the moderate to severe depression group spent significantly less time doing both light ($p < .001$) and moderate ($p < .01$) intensity physical activity than the non-depression groups. After controlling for socio-demographic factors, those at greater risk for depression reported poor health ($p < .001$), less moderate intensity physical activity ($p < .05$) and were middle-aged ($p < .01$) and female ($p < .01$). **Conclusion :** An exercise program is needed to prevent

depression among middle aged women with poor health and who do not engage in moderately intense physical activity. Public education regarding the efficacy of physical activity and encouragement of appropriate activity levels could contribute to the prevention and treatment of depression. **Keywords :** physical activity, depression

PP26 S-096

A COMPARISON OF FACTORS INFLUENCING HEALTH BEHAVIOR COMPLIANCE BY TYPE D PERSONALITY IN THE PATIENTS WITH CORONARY ARTERY DISEASE

Yun Ok CHOI¹, Jung Sun KIM² (1. Department of Nursing, Graduate School of Chonnam National University, Korea; 2. College of Nursing, Chonnam National University, Korea)

Introduction : This study is to compare the factors influencing health behavior compliance (HBC) by Type D personality in the patients with coronary artery disease (CAD). **Method :** The study was performed in 240 patients, older than 50 years old, who were diagnosed CAD. Data were collected by personal interviews utilizing the questionnaire from January 9th to march 6th 2012. The collected data was analyzed by descriptive statistics, Chi-square test, t-test, ANOVA, Duncan test, Pearson correlation, and Linear Regression. **Results :** Of 240 patients, 92 (38.3%) were classified as Type D personality. Type D patients showed higher stress, higher passive coping, and higher depression scores compared to that of Non-type D patients. Type D patients have a statistically significant positive correlation between stress and depression ($r = .35, p < .001$), depression and passive coping ($r = .35, p < .001$), and HBC and active coping ($r = .22, p = .031$). On the other hand, Non-type D patients have a statistically significant positive correlation between stress and depression ($r = .42, p < .001$), HBC and active coping ($r = .40, p < .001$), HBC and neutral coping ($r = .24, p = .003$), and HBC and passive coping ($r = .27, p = .001$). In the factors influencing HBC by Type D personality, diet, hospitalization, active coping, living arrangement, depression, and smoking account for 36.9% of the factors in Type D patients. Active coping, diet, stress, hospitalization, exercise, current life satisfaction, educational level, and living arrangement explained 35.8% of the factors in Non-type D patients. **Conclusion :** Type D patients showed low current life satisfaction, negative perception on self-rated health status, and stress and depression of high level. Furthermore, they utilized passive coping more frequently than that of Non-type D patients. **Keywords :** Coronary artery disease, Personality, Health behavior

DEVELOPMENT OF AN EXERCISE DVD WITH MUSIC FOR OLDER PEOPLE TO PROMOTE PHYSICAL ACTIVITIES FOR HEALTH

T.M.U. Sanjeewa TUNPATTU (Physiotherapy, National Hospital of Sri Lanka, Sri Lanka)

Introduction : Promoting and facilitating the regular practice of physical activity in older adults is especially important because this population group is very often the least physically active. Efforts to promote physical activity in older adults will generally place less emphasis on attaining high volumes of activity, or engaging in vigorous intensity activity. However, the health status and abilities of older adults vary widely, and some older adults are capable of, and regularly perform, high volumes of moderate- and vigorous-intensity activity. **Method :** Exercises suitable for elderly people and traditional music appropriate for exercises were selected and pre tested in the community settings. A group of elderly people were selected and trained to demonstrate the group exercises in the DVD. Two physiotherapy students were selected and trained to demonstrate

exercises in the DVD. Explanation of the exercises including benefits of the each exercise and safety information was prepared to be illustrated in the DVD. Results : Final edition of the DVD is prepared with 3 components 1. Explanation of the exercises including benefits of the each exercise and safety information. 2. Demonstration of exercises by instructors. 3. Demonstration of exercises elderly people. Conclusion : Suitable exercise focused endurance, strengthening, stretching and balance and coordination training gives lot of health benefits for elderly people. This DVD can be used for 1. To train the health education officers in exercises for elderly people 2. To guide the elderly people in exercise programs 3. To health promotion purposes by displaying waiting areas of different settings where elderly people gathered. Keywords : Exercises, physical activities, Older people

A LONG JOURNEY OR A JOURNEY ALONE? A PRELIMINARY STUDY ON EXPERIENCES OF FAMILY CARERS IN TAIWAN

Chia Ming YEN (*Adult and Continuing Education (PhD Candidate), National Chung Cheng University, Taiwan*)

Introduction : This pilot study looks at the changes of meaning-making from three family carers who care a family with dementia in Taiwan. Due to the increased number of dementia patients in the past decade and many of them are reported stay in their own houses particularly for those with mild cognitive impairment. Family carers, usually son, daughter-in-law, daughter or spouse, are therefore facing various challenges while looking after their be loved one. Despite these challenges, this pilot study investigates that family carers are able to find the positive aspects and feel self-growth under certain circumstances throughout the processes of caring. Method : An in-depth interview is conducted with three family carers. Their experiences, both positive and negative ones, of caring a family with dementia are collected and analysed. Results : The results show the changes from negative experiences to positive ones among the three family carers are possibly found but they are suggested to be occurred under certain circumstances. The results will also provide the type of information as significant sources and references when the main study is conducted later on. Conclusion : This pilot study concludes that gaining positive meaning among the family carers are crucial and this will help and provide a better quality of life and quality of caring for both care givers and care recipient. Keywords : dementia, family carer, meaning-making

SOCIO-ECONOMIC STATUS AND DEMENTIA AMONG THE OLD: THE AGES PROJECT

Chiyoe MURATA¹, Tokunori TAKEDA², Kayo SUZUKI³, Seungwon JEONG¹, Katsunori KONDO⁴ (*1. Dept. of Social Science, National Center for Geriatrics and Gerontology (NCGG), Japan; 2. Division of Occupational Therapy, Seijo University, Japan; 3. Center for Well-being and Society, Nihon Fukushi University, Japan; 4. Faculty of Social Welfare, Nihon Fukushi University, Japan*)

Introduction : Our society is aging and dementia is a major cause of disability among the old. Depression, illnesses or social isolation are risk factors for dementia. All these are prevalent among low income elderly. However, the association between income and dementia remains unclear. Our study purpose is to investigate such association using a 4-year follow-up data. Method : AGES project is a prospective cohort in Japan. Self-administered survey in 2003 in 6 municipalities was used in our study. Respondents 65 years or older (6, 813 men and 7,473 women) were followed for 4 years (2003 to 2007) for dementia

onset. Dementia onset was determined according to the criterion used in Japan's Public Long-Term Care Insurance System. Cox hazard proportional model stratified by sex was employed to calculate the hazard ratios for dementia onset. Those died or moved out from the study site during the follow-up period was considered censored. Results : Out of 14,286 subjects, 333 men (4.9%) and 468 women (6.3%) developed dementia during the follow-up. In Cox models, even after adjustment for age and illnesses, lower income and education were significantly associated with higher incidence of dementia among men but not among women. After adding depression (GDS-15), such association disappeared, indicating that depression was a stronger predictor for dementia irrespective of income with hazard ratios of 1.83 (p<.000) for mild and 2.57 (p<.000) for severe depression. Among women, such hazards were 2.00 (p< .000) and 2.91 (p<.000), respectively. Conclusion : Our results indicated the need to deal with old age depression when considering health disparity. Keywords : socio-economic status, depression

PP26 S-100

EFFECTIVENESS OF AROMATHERAPY MASSAGE PERFORMED BY FAMILY MEMBERS CARING FOR SEVERE DEMENTIA PATIENTS

Chiyoko SEKI, Kazuyuki SUGINO, Kazue SAWAMI, Kiyoshi NAWAI, Osamu URAYAMA (*Health Sciences, Tsukuba International University, Japan*)

Introduction : We investigated the effectiveness of aromatherapy massage (AM) on caregivers' mood and dementia patients' response, by surveying family members caring for dementia patients. Method : Twenty-seven subjects were chosen who had participated in an AM workshop, and 4 caregivers who subsequently used AM at home while caring for severe dementia patients. The profile of mood states (POMS) was used to evaluate the caregivers' mood, and each assessment was repeated 4 times: before and after the workshop, and 1 and 2 months later. Dementia patients' reactions and caregivers' feelings during AM were recorded. Further, the subjects completed a final questionnaire. Results : In the survey results immediately after the workshop, the average POMS scores decreased for all negative mood states, namely, tension, depression, anger, fatigue, and confusion compared to those before the workshop; only the positive mood state, vigor, exhibited the highest score in the "iceberg" profile. However, 2 months after performing AM at home, among the low scores for negative mood states that were generally observed in the caregivers, only 2 showed high scores for positive mood state. Records showed that caregivers expressed satisfaction and happiness at the positive responses of dementia patients. Further, many subjects specified that they "Want to find out more" about aromatherapy. Conclusion : Our study suggested that AM performed by family members caring for dementia patients may have a positive effect on both the caregivers and those for whom they care. Future studies are required to verify the effectiveness of AM on institutionalized patients and patients with different levels of dementia. Keywords : dementia, caregiver, aromatherapy massage

PP26 S-101

EFFECTIVENESS OF AROMATHERAPY MASSAGE PERFORMED BY CARERS FOR PEOPLE WITH DEMENTIA IN A DEMENTIA ELDERLY PERSON GROUP HOME

Chiyoko SEKI, Kazue SAWAMI, Kazuyuki SUGINO, Kiyoshi NAWAI, Osamu URAYAMA (*Health Sciences, Tsukuba International University, Japan*)

Introduction : This study aimed to investigate the effectiveness of

aromatherapy massage (AM) on the mood of dementia carers and the responses of people with dementia. Method : A practical program was designed to provide effective care for people with dementia. Six carers participated in an AM workshop and provided AM to eight people with dementia. The Profile of Mood States (POMS) was used to evaluate the carers' mood, and this process was repeated 4 times in 2 months. The responses of people with dementia and their carers' feelings were recorded during AM. Finally, the carers completed a questionnaire. Results : The results showed that the average POMS scores for all negative mood states, namely, tension, depression, anger, fatigue, and confusion, decreased after the workshop; a positive mood state, vigor, exhibited the highest score in the "iceberg" profile. The main behavior modification in people with dementia was the appearance of a certain level of psychological and/or physical comfort (8; 100%), improved verbal communication (4; 50%), and reduction in the behavioral and psychological symptoms of dementia (3; 100%). The results indicate that AM not only helps people with dementia but also their carers; both groups felt comfortable, healed, and positive but did not experience tiredness. Conclusion : We have found that AM is effective for people with dementia and that their positive reactions affect their carers' moods positively. Keywords : dementia, carer, aromatherapy massage

PP26 S-102

IMPORTANCE OF AND INFLUENCING FACTORS ON DEMENTIA CARE COMPETENCES OF GERIATRIC CAREGIVERS

Chun-Gill KIM (*Nursing, Korean Gerontological Nursing Society, Hallym University, Korea*)

Introduction : The complexity of dementia care requires multidisciplinary collaboration. Geriatric caregivers are charged with direct care for demented elders. The study investigated the importance of caregivers' dementia care competences and identified influencing factors on caregivers' dementia care competences for demented elders. Method : Data were collected through questionnaires from 201 geriatric caregivers in institutional dementia settings between 2011 and 2012, and analyzed by applying descriptive statistics, t-test, ANOVA, Duncan test, Pearson's correlation coefficient and stepwise multiple regression with SPSS/WIN 19.0. Results : The average score for importance of caregivers' dementia care competences was 3.63, showing ranges from the score of 1 to 5 and 'dementia patient care' factor such as knowledge, attitudes, and skills was the highest level. The mean score of dementia care dependency burden was 3.44 and job satisfaction, 3.71. Dementia care competences had a significant positive correlation with job satisfaction, caregivers' career and the numbers of dementia care education. Four significant variables influencing factors on caregivers' dementia care competences were job satisfaction, gender, working area and dementia care dependency burden. Conclusion : With the results of this study, importance of caregivers' dementia care competences can be improved by intervening the factors affecting this importance. Based on the findings, further dementia care practice and research for caregivers' caring the demented elders should be focused on job satisfaction, care dependency burden, caregiver's gender and working area. Keywords : Dementia care competences, Job satisfaction, Care dependency burden

PP26 S-104

CAREGIVER BURDEN IN AFRICAN AMERICANS: A CRITICAL REVIEW

Debbie Yong STEVENS, Kenneth HEPBURN (*Nell Hodgson Woodruff School of Nursing, Emory University, USA*)

Introduction : Caregiver burden has repeatedly been linked with poor health outcomes in those caring for older adults with Alzheimer's disease. Despite having greater financial hardship, keeping elders at home longer, and perceiving greater needs, African American (AA) caregivers are reportedly less burdened than whites. The purpose of this review was to examine how burden has been conceptualized and measured in AA caring for adults with Alzheimer's dementia. Method: CINAHL, PubMed, and Web of Science databases were comprehensively searched. Articles were limited to primary research reports involving human adults and published in English. The search strategy produced a total of 163 journal titles. Further review of the full text articles was conducted to identify studies that focused exclusively on caregiver burden in AA caring for adults with Alzheimer's dementia, resulting in a final selection of 17 quantitative and 11 qualitative studies. Results : Results from the quantitative studies show a difference in levels of caregiver burden by race. AA caregivers consistently reported lower levels of burden on a variety of measures, although such results were not seen in very recent studies. Qualitative reports, however, show a very different picture. Several qualitative studies suggest that AA are, indeed, burdened by caregiving responsibilities, but may express burden differently. Conclusion : The review provides a way to broaden the discourse about burden among AA caregivers, raises the possibility that there are cohort differences among AA caregivers, and poses questions about whether standard measures of burden or stress account sufficiently for the cultural context of AA caregiving. Keywords : Caregiver Burden African-American

PP26 S-105

MEDICATION ADHERENCE IN CHINESE OLDER ADULTS WITH CHRONIC DISEASES IN THE COMMUNITY

Doris Y.P. LEUNG¹, Angela Y.M. LEUNG², Iris CHI³ (*1. Nethersole School of Nursing, The Chinese University of Hong Kong, Hong Kong; 2. School of Nursing, University of Hong Kong, Hong Kong; 3. School of Social Work, University of Southern California, USA*)

Introduction : Medication management of chronic comorbid conditions requires treatment adherence. Poor treatment adherence was associated with worse health outcomes. Little is known about medication adherence in community-dwelling older adults in Hong Kong. Method: A secondary analysis of data from all the 10,331 community dwellers who applied for long-term care service in Hong Kong in 2006. Data on medication adherence, demographics, health and psychosocial factors were collected using self-reports. We included 3167 adults aged ≥60 who had private home, no prior/current home care services, and chronic disease in the analysis. Results : Their mean age was 79.4 years old (SD=7.4), 60.2% were female, 43.2% were married, 26.6% had no education and 90.8% reported always compliant to the prescribed medications. 13 variables were found to be associated with medication adherence ($p < .2$) in bivariate analyses and were included in the logistic regression model. Patients who were more ADL dependent (OR=1.68, $p < .01$), had stroke (OR=1.56, $p = .01$), and had received more informal care support (OR=1.24, $p = .01$) were more likely while those who were cognitively impaired (OR=0.82, $p = .01$), perceived poor health (OR=0.61, $p < .01$), had no drug check by doctors (OR=0.15, $p = .01$), and had negative mood (OR=0.91, $p < .01$) were less likely to report medication adherence. Conclusion : The prevalence of medication adherence reported in this study might be overestimated due to social desirability. Nevertheless, both healthcare professionals and caregivers can play an important role to further boost medication adherence in Chinese older adults: healthcare professionals check medication usage more frequently and caregivers provide more care support, especially to cognitively impaired patients. Keywords :

Medication adherence, community-dwelling, Chinese older adults

PP26 S-106

KOREAN AMERICAN CAREGIVERS' PERCEPTIONS OF DEMENTIA

Eunhi KONG (*School of Nursing, Gachon university, Korea*)

Introduction : Family caregivers' perceptions of dementia are very important because it has great impact on the caregivers' help-seeking, utilization of formal support, and caring. The purpose of this study was to describe the perceptions of Korean American family caregivers of old adults with dementia. Method : This study used a qualitative descriptive method and a purposive sampling method. A total 17 in-depth interviews were conducted. Symbolic interactionism and cultural models were used as theoretical frameworks. Qualitative content analysis was used to analyze the data. Results : Four themes were identified: is a brain disease, caused by lack of interaction, precipitated by lack of interaction, and delayed by family contact. While they described dementia as death of brain cells, and changes in brain structure and function, they believed that their care recipient's dementia was caused by a lack of interactions. In addition, they thought that the progress of dementia would be delayed by frequent family visits and communication, and would be precipitated by lack of interactions. Conclusion : Regarding beliefs about dementia, Korean American family caregivers combined the biomedical model with their cultural model. Future research should continue to examine the perceptions about dementia among other minority caregivers. Keywords : Korean-American, caregiver, dementia

PP26 S-107

KNOWLEDGE AND ATTITUDE ABOUT DEMENTIA OF THE WORKERS AT THE ELDERLY CARE FACILITIES

Eun Hye HWANG¹, Kyungsook PARK² (*1. Gerontological Nursing, The Graduate School of Chung-Ang University, Korea; 2. Chung-Ang University, Chung-Ang University Red Cross College of Nursing, Korea*)

Introduction : This is a descriptive research conducted for providing fundamental data which strengthen knowledge education and positive attitude for dementia by grasping knowledge and attitude about dementia of the workers at the elderly care facilities and examining their relations. Method : The data were collected from Feb. 5, 2013 to Feb. 22, 2013 and the subject was 190 workers at 5 elderly care facilities selected by convenience sampling. For the data analysis, PASW 20.0 statistical program was used. Results : 1)The subject's knowledge about dementia showed relatively low standard as average 7.75 ± 2.03 score of perfectly 16 score. The knowledge question of the highest score was "Regular life and periodical physical examination are effective for the prevention of dementia" and showed the percentage of correct answers of 91%. The knowledge question of the lowest score was "Dementia can be completely recovered by drugs" and showed the percentage of correct answers of 5%. 2)The subject's attitude about dementia showed generally positive attitude as average 4.04 ± 0.52 score of perfectly 5 score. The question of the lowest score was "I don't want to approach dementia patients if possible" and showed 3.71 ± 1.09 score. 3)The correlations between subject's knowledge and attitude about dementia was not significant. Conclusion : The results of this research showed that improvement of knowledge standard about dementia and strengthening of positive attitude for their negative attitude should be necessary for workers at the elderly care facilities. To achieve them, it's necessary to provide correct knowledge and information about dementia and develop various educational programs for cultivating positive attitude in the

future. Keywords : dementia, knowledge, attitude

PP26 S-108

EFFECT OF INFORMAL CAREGIVER'S CHARACTERISTICS ON THE USE OF FORMAL LONG-TERM CARE IN SOUTH KOREA

Eun-Young KIM, Jeng Ok KWON (*Dept. of Nursing, Dong-A University, Korea*)

Introduction : In July 2008, the system for caring for the elderly in South Korea was changed drastically with the launch of new long-term care insurance. We investigated whether the presence and characteristics of a family caregiver still affect formal service use (nursing home, daycare, visiting nurse, home help, home bath service, and loan of devices) under the new system. Method : A cross-sectional study was conducted. The main family caregivers of 332 applicants for long-term care insurance with a caregiver and 32 applicants without a caregiver, living in one city. Data were collected from November 2010 to June 2011 using self-report questionnaires. The applicant's gender, age, physical function, and cognitive function, existence of a family caregiver, family caregiver's gender, age, opportunity cost, and service use for each service covered by long-term care insurance. Data were analysed using t-test, chi-square test, and multiple logistic regression. Results : The effect of the existence of a family caregiver on the use of long-term care facility was significant. Nursing home was used more when the applicant had no family caregiver. The use of nursing home was related to higher functional dependency, less children number, and less when a spouse was caring. Conclusion : The use of formal services may be decided not only by the care level of the applicant but also by the needs of caregivers. To successfully implement the new system, consideration of the caregiver situation should be included in policy making. Keywords : informal care, long-term care insurance, formal care

PP26 S-109

OLDER PEOPLE, TELECARE AND THE DEHUMANIZATION OF LATER LIFE

Gary PRITCHARD, Katie BRITAIN (*Institute of Health and Society, Newcastle University, United Kingdom*)

Introduction : Telecare is an umbrella terms for various types of equipment used to remotely care for older and/or disabled people. Currently, in its simplest form, it consists of a fitted wall unit with a speaker connected to a call center. An alert can be triggered either by a person directly by pressing a button on a pendant, usually worn around the neck, or by a combination of sensors around the home. Telecare, as a method of is being pursued as a rational response to the escalating costs associated with an ageing population. Our study looks at how older people interact with these new technologies and compare it to more traditional, human-centered, care provision. Method : Our data is derived from focus groups (N=10), semi-structured interviews (n=20) and in-depth ethnographic fieldwork conducted with older telecare users and their carers. Visual prompts, videos and technological artifacts were used to facilitate discussions, which were audio-recorded, transcribed and anonymised. Transcripts were then coded and analysed vigorously. Results : We show that while telecare as a technique of caring for older people has some undoubted benefits, it can also have dehumanisation outcomes. We show how it can be detrimental to honest and meaningful human exchange, reduce social capital and decrease autonomy. Conclusion : As the worldwide population ages, telecare will become more and more ubiquitous and future research needs to address the capacity of older people to resist the dehumanizing potential of this type of monitoring equipment.

Keywords : Telecare, Dehumanization

INVESTIGATING MOBILITY, SELF-CARE, AND COMMUNICATION IN ELDERLY PATIENTS WITH NEUROLOGICAL CONDITIONS

Haejung LEE¹, Dongjin YI², Kango OH², Yiae KIM² (1. Dept. of Physical Therapy, Silla University, Korea; 2. Physical Therapy, Silla University, Korea)

Introduction : The services for elderly patients in rehabilitation centers are not quite clear whether they are suitable for the service users. Therefore, the aim of this study was to investigate functional status including mobility, self-care and communication in in-patients with neurological impairments in rehabilitation centers. Method : One hundred and fifty-nine patients (aged over 65) with CNS disorders recruited from five rehabilitation centers located in Busan and Kyongsangnamdo, Korea. Their functional status was assessed using a questionnaire, which contains three categories; mobility, self-care and communication. It was administered by a physical therapist, independent from treatment providers. All subjects responded to each item base on their health. Results : In mobility, 54% of subjects reported needing help or supervision when moving around places from a hospital or inside a hospital. In their self-care, 76% of subjects required 'need help or supervision' in showering or bathing. About 50% of subjects needed help or supervision during their dressing and toileting whereas most of subjects had no difficulties of their communication. Conclusion : In-patients aged over 65 years with CNS problems experience difficulties in moving around from a hospital, showering or bathing, dressing and toileting. Most of them also reported needing a help sometimes for understanding their communication. Those of difficulties should be addressed to rehabilitation services for elderly patients with CNS conditions. Therefore, assessing functional status of patients with CNS problems is important to provide appropriate rehabilitation services to patients. Keywords : function, mobility, self-care

PP26 S-111
COUNSELING THE BENEFICIARY IN LONG TERM CARE INSURANCE SYSTEM IN KOREA

Hung Sa LEE (Department of Nursing, Daegu Haany University, Korea)

Introduction : The numbers of older people dramatic increase in the after 2000. It has led to concurrent increase in the number of long term care facilities in which the older people being taken care. After 2008, introducing the long-term care insurance system, many type of the nursing facilities were established, especially the visiting nursing facilities were rapidly increased in the number. In the other hand it is difficult to find eligible nursing facilities for the elder. Method : This study accomplished to analyze factors influencing the counseling, and to find the way, frequency and time of counseling when the nurses or social workers counsel the older who wanted to have a long term care service. Questionnaires included socio-demographic characteristics, time, frequency, way and contents of counseling were used. Results : 1. Average age of participants was 77.02 years old. 11.09 % were living alone, 42.69% were living with spouse. 83.02% had visiting long term care services, 13.05% had services at nursing home. 2. The way of counseling were 3 types. Initial counseling for beneficiary was done through visiting home (58.35%), visiting facility (6.28%), by telephone (8.36%), the beneficiary lead (26.13%). The average counseling time was 17.8 minutes in first counseling, 37.2 minutes in second counseling, 21.2 minutes in third counseling. 3. The initial

counseling was came through around once a year (0.14/y) as soon as older authorized beneficiary, regular counseling was twice a year (0.43/y). Conclusion : Based this result, the government should establish active counseling system, should be provided according to elderly's exact health status. Keywords : elderly, counseling, long term care

RELATED FACTORS OF URINARY INCONTINENCE AMONG OLDER ADULTS IN LONG-TERM CARE FACILITIES

Gwi-Ryung SON HONG, Hyekyung KANG (Department of Nursing, Hanyang University, Korea)

Introduction : Urinary incontinence (UI) is a risk factor for nursing home admission, and is one of the critical predicting factors for both frailty and quality of life in nursing home residing older adults. The purpose of the study was to identify the associated factors of UI based on demographic and health related factors. Method : Descriptive study design was used through face-to-face interviews with older adults and staff nurses. Data was collected from 7 nursing homes more than 80 beds in Korea. A convenience sample of 314 older adults were included if they were over 65years of age, and had agreed to participate in the study. Data were analyzed using chi-square, t-test, and logistic regression. Results : Mean age of the participants was 80.3 (± 7.49), and the prevalence of UI was 57.8%. There were statistically differences in age, gender, type of facility, hypertension, arthritis, cataract, delirium, insomnia, number of chronic diseases, number of medication, depressive symptoms, cognitive impairment, ADL, nutritional status, and mental functioning between continence and incontinence group at univariate analysis. Number of chronic diseases (OR 2.08; CI=1.462-2.895, $p < .000$), depressive symptoms (OR 2.65; CI=1.077-6.520, $p < .05$), and ability to control urine (OR .16; CI=.045-.527, $p < .005$) were the significant predictors of UI. Conclusion : It is important for future studies to examine the impact of environmental and organizational factors on UI in long-term care facilities to develop a comprehensive intervention for this population. Keywords : Urinary Incontinence, older adults, long-term care facility

PP26 S-113
THE EFFECT ON SOCIAL WORKER'S PSYCHO-EDUCATIONAL INTERVENTION PROGRAM ON FAMILY CAREGIVERS' UNDERSTANDING END-OF-LIFE DECISION FOR KOREAN DEMENTED OLDERS IN LONG TERM CARE SERVICES

Jihyeon PARK¹, Sooyoun K. HAN², Taehyun KIM³, Hongjik LEE⁴ (1. Research & Education, CARE the Right, Korea; 2. Executive Director, CARE the Right, USA; 3. Social Welfare, Sungshin Women's University, Korea; 4. Social Welfare, Kangnam University, Korea)

Introduction : The purpose of this study was to examine the benefits of a psycho-educational intervention program (PEIP) on family caregiver(FC)'s understanding about end-of-life decision (EOLD) for demented, Korean elders in Long Term Care Service(LTCS). Method : This study used a quasi-experiments single case, AB designn to identify that PEIP would enhance FC to understand about EOLD in pre and post test. Using a two-hour long PEIP(Kim, Han, Lee & Kim, 2012) was designed to educate FC about dementia prognosis and symptoms, life sustaining treatment choices, and the EOLD procedure, all by using supportive counseling skills. The telephone interview included semi close-ended questions with regard to how well FC understood EOLD and knowledge of Dementia. Data was analyzed by SPSS 19, using paired T-test. Results : Results indicate that FC who

received PEIP showed statistically significant increased to their knowledge of Dementia, understanding on EOLD. FCs satisfied with the PEIP in terms of how it helped increase their knowledge of Dementia and their level of comfort in dealing with EOLD. Conclusion : If PEIP works in such a positive way to improve the quality of EOLD for demented elders, more people need to encourage policy makers and healthcare providers to be more cognizant of the system's current shortcomings in caring for and educating FCs is needed in order to effectively address them. Keywords : Educational Intervention Program, Demented Elders, Family Caregiver, Social Worker

THE EFFECT OF PSYCHO-EDUCATIONAL INTERVENTION PROGRAM ON COMPLETION OF END OF LIFE DECISION FOR KOREAN DEMENTED OLDERS IN LONG TERM CARE SERVICES

Jihyeon PARK¹, Sooyoun K. HAN², Hongjik LEE³, Taehyun KIM⁴
(1. Research & Education, CARE the Right, Korea; 2. Executive Director, CARE the Right, USA; 3. Social Welfare, Kangnam University, Korea; 4. Social Welfare, Sungshin University, Korea)

Introduction : The study examined the effect of a psycho-educational intervention program (PEIP) on completion of end-of-life decision (EOLD) for demented, Korean in Long Term Care Services. Method : This study used a classic pre and post-test control group design to identify that PEIP would enhance family caregiver(FC) to complete EOLD in comparison pre and post test. A two-hour long PEIP(Kim, Han, Lee & Kim, 2012) was designed to educate FC about dementia prognosis and symptoms, life sustaining treatment choices, and the EOLD procedure, all by using supportive counseling skills. The telephone interview included semi close-ended questions with regard to how many FCs had actually completed EOLD or consulted physicians, and why the FCs decided to complete EOLD. Data analyzed by SPSS 19, using paired T-test. Results : Results indicate that FC who received PEIP showed statistically significantly increase EOLD completion rate than before PEIP. They involved in EOLD to help elderly residents' pain relief, elder's dignity, medical condition. Conclusion : This study suggests if PEIP works in such a positive way to improve the quality of EOLD for demented elders, encouraging policy maker and healthcare providers to be more cognizant of the system's current shortcomings in caring for and educating minority elders and FCs is needed in order to effectively address them. Keywords : End-of-Life Decision, Korean Older, Family Caregiver

ILLNESS EXPERIENCES OF ELDERLY PEOPLE LIVING WITH PULMONARY TUBERCULOSIS

Jirapa SIRIWATANAMETHANON¹, Kanjana PHAWINRUM², Tanyaluk PRANPRASERT³ (1. Community Nursing Department, Faculty of Nursing Mahasarakham University, Thailand; 2. Out Patient Department, Yangtalad Hospital Yangtalad District, Thailand; 3. In Patient Department, Yangtalad Hospital Yangtalad District, Thailand)

Introduction : The qualitative research of this study was to explore the illness experience of elderly people living with Pulmonary Tuberculosis in Rural Community Thailand. Method : Participants includes 18 elderly people diagnosed with Pulmonary Tuberculosis. They were recruited from an TB clinic and by snowballing. Data were gathered through in-depth interviews, participant observations and field notes made during home visits. The interviews were tape-recorded and transcribed verbatim. Results : Findings revealed that the

illness experience of elderly people living with Pulmonary Tuberculosis consisted of 5 themes including 1) being diagnosed with Pulmonary Tuberculosis, 2) being stigmatized, 3) being suffered 4) being shamed, 5) being feared, and 6) learning about TB. This study provided better understanding about the perception of the illness experience of elderly people living with pulmonary tuberculosis. Conclusion : Findings of this study can be applied and integrated by health professionals for developing holistic care interventions that can effectively meet the needs of elderly living with the disease in their home. Keywords : Illness experiences, elderly people, pulmonary tuberculosis

PP26 S-116

REDUCING THE BURDEN OF CARE BY USING AROMATHERAPY MASSAGE IN A GERIATRIC HEALTH SERVICES FACILITY

Kazue SAWAMI, Chiyoko SEKI, Kazuyuki SUGINO, Kiyoshi NAWAI, Osamu URAYAMA (Medical health, Tsukuba International University, Japan)

Introduction : In Japan, the number of elderly people with dementia is increasing with the aging of the population. Furthermore, people taking care of elderly people with dementia often feel that such care is a heavy burden. Thus, a method for effectively caring for elderly people with dementia, without putting a large strain on caregivers, is in demand. In this study, we examined whether one method - aromatherapy massage - could reduce the burden on caregivers. Method : Participants were 25 people taking care of elderly people with dementia in a geriatric health services facility. First, participants were taught the aromatherapy massage method. They then filled out a questionnaire on their feelings of burden from caregiving as well as their thoughts about the aromatherapy massage. Results : Forty-eight percent of the caregivers reported they were fatigued in response to violence and violent language from people of the dementia. In addition, 40% suffered from a sleep disorder. The aromatherapy massage was practiced on the patients with the hope of relieving these feelings of unrest, sleeplessness, and uneasiness. Conclusion : Caregivers and relatives of elderly people with dementia wish for them to have peaceful lives. The results of this study suggest that aromatherapy massage can ease the negative feelings of elderly people with dementia, thus reducing care workers' feelings of burden. Keywords : aromatherapy massage, dementia, burden, ease

PP26 S-117

AGE AND SEX DISTRIBUTION OF THE RESIDENTS AT THE RESIDENTIAL CARE HOMES FOR THE ELDERLY IN A 300-THOUSAND POPULATED TOWN IN HONG KONG

Kwun Man LO¹, Joyce HO¹, Siu Yin CHAN¹, Elsie HUI², Philip LI²
(1. Community Outreach Services Team, Alice Ho Miu Ling Nethersole Hospital, Hong Kong; 2. Community Outreach Services Team, Prince of Wales Hospital, New Territories East Cluster, Hong Kong)

Introduction : The ageing problem is inevitable in the community-dwelling population in Hong Kong. It is observed that residents are aged older than before at the residential care homes for the elderly (RCHEs). However, little is known on the age and sex distribution of people living at RCHEs. Method : A cross-sectional survey was conducted at all the RCHEs in a 300-thousand populated town in Hong Kong. The age and sex distribution of the residents were reported by the supervisors of the RCHEs. The number of the residents and the sex distributions were plotted against the age. Finally, the cumulative age distribution of the residents was plotted for analysis. Results : We

achieved 100% response rate from the RCHEs. There were 3099 residents living at the RCHEs in a 300-thousand populated town in Hong Kong. There were more women (1874) than men (1125) living at the RCHEs or at a female to male ratio of 1.67 to 1. There were 2.7% residents aged less than 60 living at the aged homes. Approximately half of the residents (51%) and a quarter of the residents (26%) were aged at 85 and 90 or above respectively. Conclusion : The survey supported our observation that the ageing problem is inevitably true at RCHEs. Community service strategies should be devised and targeted to support the oldest old population at the aged home. The higher proportion of women at the aged homes may prompt us to address for the special needs of the women in the health care services, manpower arrangement and facilities planning. Keywords : residential care , age, sex

PP26 S-118

CAREGIVING TASKS AND BURDEN AMONG FAMILY MEMBERS OF CENTENARIANS AND OCTOGENARIANS

Kyuhoo LEE¹, Peter MARTIN¹, Maurice Marcus MACDONALD², Leonard W. POON³ (1. *Human Development and Family Studies, Iowa State University, USA*; 2. *Family Studies & Human Services, Kansas State University, USA*; 3. *Gerontology, University of Georgia, USA*)

Introduction : Many centenarians depend on others for care, but their children are typically of advanced age themselves. The purpose of this study was to assess caregiving tasks and burden among family members of centenarians and octogenarians. Method : Self-ratings and proxy informant ratings were obtained from three hundred and six participants of Georgia Centenarian Study. Octogenarians' data were also used for comparison. All participants were asked questions about different types of care and caregiver burden. Demographic characteristics and mental health of the centenarians were assessed and descriptive statistics and multiple regression analysis were computed to assess predictors of caregivers' feeling of burden. Results : The results indicate that octogenarians (26.5%) received more personal care from unpaid family members than octogenarians (12.5%). The difference of financial support from a family member was not significant between two age groups. The caregiving family members' overall feeling of burden was associated with participants' residence ($\beta = -.17, p = .015$), indicating that centenarians living in a care facilities had the lowest and those living at home the highest scores of burden. The level of loneliness of the participants observed by the proxies was also associated with caregivers' feelings of burden ($\beta = .27, p = .001$). Conclusion : We conclude that caregiving support for centenarians is relatively low, particularly from family members whose relative resides in a care facility. Loneliness of oldest-old adult, on the other hand, is an important predictor of caregiver burden. Keywords : centenarian, octogenarian, feeling of burden

PP26 S-119

CAREGIVING NEEDS FOR CHINESE SENIORS LIVING WITH HEART DISEASE AND STROKE

Lichun Willa LIU¹, Helen LEUNG², Ratsamy PATHAMMAVONG³, Alice MUI⁴, Betty DUONG⁴, Leqin LU³ (1. *Prentice Institute for Global Population & Economy, University of Lethbridge, Canada*; 2. *Administration, Carefirst Seniors and Community Service Association, Canada*; 3. *Dept. of Diversity, Heart and Stroke Foundation of Ontario, Canada, Canada*; 4. *Program Development, Carefirst Seniors and Community Services Association, Canada*)

Introduction : Funded by the Heart and Stroke Foundation, Canada (2012), this paper examines the service gaps, needs, and barriers faced

by Chinese Ontarians living with heart disease or stroke and their family caregivers, as well as the strategies they utilized in self-care and self-management. Method : Mixed research methods were used in data collection, which included focus groups (n=9), individual interviews (n=8), and an open-ended email survey (n=10). Sixty-two informants participated in the study, including 26 survivors of cardiovascular diseases, 19 family caregivers, and 17 health care providers from the Greater Toronto Areas and five other regions in Ontario, Canada. Results : Data analysis highlighted findings in the following areas: 1. Insufficient Chinese-speaking family doctors and specialists lead to long waiting time and cause delay in treatment. 2. Due to language barriers, many survivors sought health information and medical advice from "non-professionals" sources in Chinese. 3. Many recent immigrants used traditional Chinese herbal medicine alongside prescribed Western medicine, which may affect the efficacy of the prescribed medicine and mislead the doctors in diagnosis. 4. Self-management and self-care practices include physical exercises on a daily basis, eating healthy food and maintaining a healthy lifestyle, actively seeking health information from various sources, and developing a positive/optimistic outlook. Conclusion : Improved integration and coordination of care services are needed and more ethnically and linguistically appropriate programs were recommended. Keywords : caregiving, service gaps

PP26 S-120

THE HOME HEALTH CARE WORKERS' STRESS AND ITS EFFECT ON THEIR JOB SATISFACTION

Meeryoung KIM, Jeong Won SHIM (*Department of Community Development and Welfare, Daegu University, Korea*)

Introduction : The study is based on the stress theory to find out whether the stress of home health workers' job affect their job satisfaction. If the job stressors of home health care workers were reduced, they may work efficiently. Also, it will affect the receivers' welfare. Therefore, the aim of this study is to find out whether the job stressors such as preventing job autonomy, salary level and role overload are affecting the job satisfaction of home health care workers and to increase their job satisfaction and receivers' welfare. Method : The target population of this study is home care workers who took care of older adults in the long-term care centers in Kyung-nam Province. The sample size of this study is 205 and the data was collected in 2010. To test the differences of job stressors by demographical variables, t-tests were used. To test the effect on the job satisfaction of the home care workers' job stress, hierarchical regressions were used. Results : There are statistically significant positive effects of home health care workers' education, experience and health on job satisfaction. Also, the task related variables such as salary, the work time, the distance and reeducation affected the job satisfaction in a statistically significant level. When the salary was increased and the role overload was reduced, the job satisfaction increased in a statistically significant level. Thus, to increase job satisfaction, reducing role overload and reasonable salary are necessary. Conclusion : To increase job satisfaction of homehealth care workeres, reducing role overload and reasonable salary are necessary. Keywords: home health care workers, job stress, job satisfaction

PP26 S-121

EFFECTIVENESS OF MULTI-COMPONENT INTERVENTION ON NURSING HOME RESIDENTS: EFFECTS ON FUNCTION, DEPRESSION AND QUALITY OF LIFE

Seung-Youn HONG (*Division of Silver Industry, Kangnam University, Korea*)

Introduction : Since the Long-term care policy was applied in 2008, the number of nursing home residents has been increased. However, there is little experimental evidence of interventions in that setting. Therefore, we examined the effects of 8 week multi-component program on functional capacity, depression and quality of life in nursing home residents who had been identified as having low physical activity levels. **Method :** Design: Pretest-post test with outcome measures taken before and after 8 weeks of intervention. **Setting:** Three Nursing homes in Y city, Republic of Korea **Participants:** 35 residents (from the three nursing home) (Mean age: 80.97+8.93; Range: 61-95 years, 78% female) completed 8 week intervention program **Intervention:** All residents participated in once a week of 45 minutes multi-component intervention: 10-min warm-up activities, 10-min memory game, and 20-minute recreation activities. **Measure:** GDS-K for depression, 4 questions of 36-SFT for vitality, 3 SFT tests (chair stand, shoulder flex and arm curl) were measured before and after 8 week of intervention. **Results :** Result: There were no significant differences in perceived health status, any of functional capacities (chair stand, arm curl and shoulder flex), and depression. Eight weeks of multi-component intervention, however, produced significant improvement in vitality of quality of life ($t=-2.6$, $p=.019$). Also, there were no side effects, such as increases in falls or cardiovascular complications, due to the intervention. **Conclusion :** Eight-week multi-component intervention by ambulatory nursing home residents produced significant improvements in vitality in quality of life. No other significant changes were noted in function, perceived health and depression in groups. **Keywords :** Nursing home, intervention, vitality, depression

EXAMINING CAREGIVER DISTRESS OF INFORMAL CAREGIVERS OF THE OLDEST OLD RECEIVING COMMUNITY HOME CARE SERVICES IN ONTARIO, CANADA

Shannon FREEMAN, John P. HIRDES (*School of Public Health and Health Systems, University of Waterloo, Canada*)

Introduction : Enabling caregivers to continue caregiving duties can reduce demands on health care systems and ensure older adults are able to remain at home. This study examined factors driving caregiver distress for informal caregivers of the oldest old (aged 80 or greater) receiving community based home care services and identified factors amenable to intervention. **Method :** This study examined community-based home care clients assessed with the interRAI Home Care assessment (interRAI HC) as part of normal clinical practice between 2003 and 2010 (N=829,402). The main study outcome was the presence of one or both indicators of caregiver distress: helper(s) unable to continue caring activities; primary informal helper expresses feelings of distress, anger, or depression. **Results :** Caregiver distress was evident among about 16.5% of community homecare clients (N=137,115). Caregivers provided on average 17.9 hours of care per week. 30% of spousal caregivers exhibited distressed compared to 14% of children, 11% of other relatives, and 7% of neighbour caregivers respectively. 1 in 4 caregivers who lived with the care recipient expressed distress compared to less than 1 in 10 for those who did not. Multivariate regression analyses examined client level predictors (including functional, cognitive, psychosocial, and demographic characteristics), as well as caregiver and agency characteristics, to identify factors affecting prevalence of caregiver distress. **Conclusion :** Informal caregivers are vital to ensuring quality of life and care older adults. Results emphasize to the need for a care planning protocol that may be used on a targeted basis for clients experiencing or at elevated risk of caregiver distress. **Keywords :**

caregiver burden, interRAI, assessment

AN INTERVENTION ON IMPROVEMENT OF INCONTINENCE FOR NURSING HOME RESIDENTS

Sing Shueh HUNG¹, Tsuann KUO² (*1. Eldercare, Central Taiwan University of Science and Technology, Taiwan. 2. Medical Sociology and Social Work, Chung Shan Medical University, Taiwan*)

Introduction : Incontinence is one of the major issues for older adults to lose their independent ability and dignity at home or at a nursing home setting. An effective strategy to improve incontinence based on quality and respect requires a creative and evidence-based methodology as well as cooperation between staff and residents. The purpose of this research was to evaluate an intervention created to remind residents about toileting and promote friendly-service attitudes to assist residents in making toilet runs. **Method :** Staff and a few residents served as volunteers were divided into teams to remind all residents to go to the toilet by following a structured and instructed manual developed by the author. The intervention ran for six months and the incontinence rate and the quality of toileting were compared before and after the intervention. **Results :** The frequency of toileting improved from 61.3% to 85% among the residents in the nursing home. In addition, the ability to control and finish toileting without accidents improved from 61.5% to 64.5%, an improvement of 3%. **Conclusion :** The study showed that the intervention was effective by improving incontinence and toileting quality. Therefore, an intervention which guides staff to pay attention to incontinence and to create a way so the residents can improve their toileting ability, avoid embarrassing incontinence moments and gain self-esteem and dignity. The instruction of this intervention can be disseminated among nursing homes in the future. **Keywords :** Incontinence, Nursing Home, Long-term Care

PP26 S-124

THE EFFECT OF PSYCHO-EDUCATIONAL INTERVENTION PROGRAM ON FAMILY CAREGIVERS' UNDERSTANDING ABOUT END OF LIFE DECISION FOR KOREAN-AMERICAN, DEMENTED OLDERS

Sooyoun K. HAN¹, John KIM², Jason J. HAN³, Hongjik LEE⁴ (*1. Executive Director, CARE the Right, USA; 2. Internal Medicine and Geriatrics, Bergen Regional Medical Center, USA; 3. Exercise Physiology Laboratory, VAD & Cardiac Transplant Program, Center for Advanced Cardiac Care, Columbia University Medical Center, USA. 4. Social Welfare, Kangnam University, Korea*)

Introduction : The purpose of this study was to examine the benefits of a psycho-educational intervention program (PEIP) on family caregiver(FC)'s understanding about end-of-life Decision (EOLD) for demented, Korean-American, nursing home residents. **Method :** This study used a classic pre and post-test control group design to identify that PEIP would enhance FC to understand about EOLD in comparison to the control group, receiving only the standard information routinely provided in Korean. A two-hour long PEIP was designed to educate FCs about dementia prognosis and symptoms, life sustaining treatment choices, and the EOLD procedure, all by using supportive counseling skills. The telephone interview included semi close-ended questions with regard to how well FC understood EOLD or knowledge of Dementia. Data was analyzed by SPSS 19, using the One-Way Analysis of Covariance(ANCOVA). **Results :** Results indicate that FCs who received PEIP statistically significant scored higher FCs' understanding of EOLD than the control group between pre and post test. They increased in understanding about the definition

of patient's self determination, the Right of Good Death, and respecting of elderly patient's value in EOLD. They significantly increased their knowledge of dementia to compare with the control group after three month of PEIP. Conclusion : If PEIP works in such a positive way to improve the quality of EOLD for minority elders, encouraging policy makers and healthcare providers to be more cognizant of the system's current shortcomings in caring for and educating minority elders and FCs is needed in order to effectively address them. Keywords : Psycho-Educational Intervention Program, End-of-Life Decision, Family Caregiver

PP26 S-125

HOME CARE, INSTITUTIONAL CARE AND SPOUSAL CARE IN EUROPE

Thijs VAN DEN BROEK (*Sociology, Erasmus University Rotterdam, Netherlands*)

Introduction : Many studies have shown that spouses are the main providers of informal care for dependent older adults. Yet, the association between public long-term care and spousal care has thus far received little attention from scholars. In this study we assess to what extent country differences in the propensity of spousal care are attributable to long-term care arrangements. We distinguish two forms of public long-term care as these are expected to be distinctively associated with spousal care. Institutional care diminishes necessity and opportunities for spousal care, while home care typically comes together with expectations towards capable spouses. We thus expect spousal care to be positively associated with receiving home care, but negatively associated with the availability of institutional care. Method: Multilevel logistic regression analyses of SHARE data on older adults with functional limitations who are married to a person with no functional limitations. Micro data are enriched with country level indicators from the MULTILINKS database. Results : As expected, the availability of public institutional care is negatively associated with spousal care, while receiving public home care is positively associated with spousal care. Conclusion : Our results suggest that public home care and spousal care are complimentary, while widely available institutional care tends to substitute spousal care. In advanced welfare states the long-term care balance is shifting away from institutional care and toward home care. This may reinforce the role of spouses as care providers. Keywords : spousal care, substitution, crowding out

PP26 S-126

THE EFFECT OF ABMINAL MASSAGE AND FAMILY PARTICIPATION ON CONSTIPATION IN BEDRIDDEN ELDERLY PATIENTS

Kim TOSSAPUK¹, Pornchai JULLAMATE², Naiyana PIPHATVANITCHA² (*1. Gerontological Nursing Department, Nangrong Hospital, Thailand; 2. Gerontological Nursing Department, Faculty of Nursing, Burapha University, Thailand*)

Introduction : Constipation in bedridden population becomes a crucial and serious problem in this current "grey" society in Thailand. Non-pharmacologic intervention challenges nurses who responsible for this important issue. Method : This two- group pretest and posttest quasi-experimental research aimed to study the effect of abdominal massage and family participation on constipation in bedridden elderly patients. Forty-four bedridden elderly diagnosed with constipation were randomly selected and assigned into experimental group and control group equally. The control group received usual nursing care whereas the experimental group received individual abdominal massage together with family participation five days a week for four weeks

consecutively. Data were gathered using 1) The Demographic Data Interview Form 2) The Bowel Pattern Assessment Form 3) The Defecation Form, and 4) The Family Participation Record Form. Frequency, percentage, mean, standard deviation, dependent and independent t-test were computed for data analysis. Results : Findings revealed that when finished this nursing massage together with family participation intervention, the bedridden elderly in the experimental group had statistically significant lower constipation's mean score than the control group had ($t = 6.510, p < .001$). Additionally, once finishing the nursing intervention, the constipation's mean score of the elderly in the experimental group significantly decreased at the level of significance of .01 ($t = -3.843, p < .001$). Conclusion : This nursing abdominal massage together with family participation is practical and effective in reducing the constipation of bedridden elderly. Therefore, this should be applied in improving quality of care for hospitalized bedridden elderly who had constipation. Keywords : Elderly, Bedridden, Constipation, Abdominal Massage, Family Participation

CAREGIVER SUPPORT: THE EFFECTIVENESS OF "POWERFUL TOOLS FOR CAREGIVERS" ON ROLE STRESS AND WELL-BEING OF THAI ELDERCARE PROVIDERS

Pornchai JULLAMATE¹, Ed ROSENBERG², Zaida AZEREDO³, Rarcharneeporn SUBGRANON¹, Wanida NOIMONTREE¹ (*1. Gerontological Nursing, Faculty of Nursing, Burapha University, Thailand; 2. Department of Sociology, Appalachian State University, USA; 3. Public Health, Institute of Piaget, Portugal*)

Introduction : As in most nations, Thai eldercare is mainly family-based. Caregiver burden, especially among family members caring for chronically-ill elderly, can be overwhelming, resulting in role stress and lower well-being. Nursing intervention can play a crucial role in assisting and empowering family caregivers. This study explored the effectiveness of the "Powerful Tools for Caregivers" (PT4C) program on role stress and well-being of caregivers of community-dwelling chronically-ill elderly. Method : A two-group pretest-posttest quasi-experimental design was used. One hundred family caregivers of chronically-ill elderly were divided into experimental and control groups. The control group received the usual supportive care, while the experimental group also received PT4C training, consisting of four weekly meetings. Data analysis included pretest and posttest means, standard deviation, and independent t-tests for role stress and well-being for both groups. Results : 1. Posttest role stress levels for the experimental (PT4C) group were significantly lower than for the control group. 2. Posttest well-being levels for the experimental (PT4C) group were significantly higher than for the control group. Conclusion : PT4C lowers role stress and raises well-being in informal caregivers of chronically-ill elderly. This enhances caregiver efficacy and thus the quality of life of care recipients. Nurses and other health care professionals should consider including PT4C as part of the support, education and training they provide for family-based eldercare. Keywords : Powerful Tools, Elderly, Chronic Illness, Community

PP26 S-128

PRIVATE LONG TERM CARE INSURANCE PURCHASES BY ADULT CHILDREN: DO THEIR CARE EXPERIENCES FOR AGING PARENTS MATTER?

Wonah YOON (*Retirement Research, Samsung Retirement Research Center, Korea*)

Introduction : The purpose of this study is to investigate how

consumer insurance decisions are influenced by personal experiences concerning LTC risks. Limited consumer information and knowledge in long-term care (LTC) situations, such as erroneous risk perception, is believed to be one major reason for the low demand for LTC insurance. Learning from experiences allows individuals to develop more optimal strategies to guard against uncertain risk (Einhorn 1982). If people have an opportunity to closely observe LTC situations, they more realistically perceive their own future risks and the costs associated with LTC options. Method : We estimate a conditional fixed effect logit model of having LTC insurance, using data from seven waves of the HRS (Health and Retirement Study) data from 1998 to 2010. We focus on respondents whose ages are 50 to 64. The final observations used in analyses are 41,257. Results : The results show that those who helped their parents with activities of daily living (ADLs) are more likely to have LTC insurances. Quantitatively, the personal care experience for fragile parents increases the odds that the adult children buy a LTC insurance by 21.7%. But those who parents simply needed LTC are less likely to hold private LTC insurance. Conclusion : Our findings have important policy implications for preparations for long-term care needs in later years: providing environments where individuals are exposed to information and experience related to long term care in earlier life stages. Keywords : Long-term Care Insurance, Limited Rationality, Caregiving Experiences

PP26 S-129

ASSOCIATIONS OF SELF-TRANSCENDENCE AND DEPRESSIVE SYMPTOMS IN TAIWANESE ELDERS

Ya-Chuan HSU¹, Cheryl WRIGHT² (1. Nursing, Chang Jung Christian University, Taiwan; 2. Nursing, Oregon Health and Science University, USA)

Introduction : Self-transcendence, a capability to expand self-boundaries, has been considered a psychosocial resource of personal maturity to promote individuals' spiritual and mental health. The literature has consistently indicated an inverse relationship between self-transcendence and depressive symptoms in both community-dwelling and institutionalized elders in western countries, but there is limited research in Asian cultures, thus warranting study replication to evaluate the relationship between self-transcendence and depressive symptoms in an Asian culture. In addition, the recent trend of gender differentiation is being recognized as an important issue in health. Therefore, to differentiate factors influencing depressive symptoms from a gender perspective is worthwhile. The purpose of study was to examine the association of self-transcendence, depressive symptoms and gender among Taiwanese elders living in long-term care facilities. Method : This cross-sectional study recruited a convenience sample of 176 cognitively intact elders with mean age of 78.59 years from 13 long-term care facilities in Eastern Taiwan. Reed's Self-Transcendence Scale was used to measure the levels of self-transcendence. Depressive symptoms were measured by the Geriatric Depression Scale. Results : A partial correlation coefficient indicated strong inverse relationship between self-transcendence and depressive symptoms. An ANCOVA controlled for functional impairment and length of institutionalization and indicated men and women showed no significant difference in levels of self-transcendence. Conclusion : Findings suggest the importance of providing nursing interventions to promote self-transcendence, regardless gender, which may alleviate depression in institutionalized elders. This is particularly salient for those elders who require greater assistance with daily activities due to increased frailty and physical disabilities. Keywords : depressive symptoms, self-transcendence

A CRITICAL REVIEW OF THE LITERATURE RELATING TO INTERVENTIONS FOR FAMILY CAREGIVERS OF THE ELDERLY WITH DEMENTIA

Yoon Hee CHO (Department of Nursing, Eulji University, Korea)

Introduction : In recent years, researchers have performed an increasing number of clinical trials for family caregivers of the elderly with dementia. To analyze the contents and approach of interventions for family caregivers, previously published studies were reviewed. Method : CINAHL, MEDLINE, KISS and RISS, free search engines for accessing the database, were used to search articles on related topics. A total 51 international articles and 20 Korean articles were retrieved from the four search engines using the following terms: dementia and caregiver; dementia and family; Alzheimer and caregiver; and Alzheimer and family. At the same time, three conditions, namely, clinical trial (type of article), nursing journal (journal groups), and English (language), were attached as limit conditions when the articles were retrieved on CINAHL and MEDLINE. In addition, two conditions, namely, clinical trial (type of article) and Korean (language) were added on KISS and RISS. Finally, 18 articles fit the above search criteria and, accordingly, were analyzed. Results : International articles introduced a number of approaches, such as group sessions, home visits, computer links, watching videotapes, phone calls, etc. On the other hand, the approaches used in Korea were not diverse. The Korean studies tended to the following: 1) Intervention contents were not diverse; 2) Group session were most often used; and 3) Monitoring period after main intervention was not provided. Conclusion : Many researchers in Korea need comprehensive works to help caregivers taking care of the elderly with dementia. In order to further promote the effectiveness of the intervention, intervention needs to be provided intensively and diversely. Keywords : family caregiver, dementia, intervention

PP26 S-131

EVALUATION OF A HOME-BASED, COMPREHENSIVE INTERVENTION PROGRAM FOR DEMENTIA PATIENTS' FAMILY CAREGIVERS

Yoon Hee CHO (College of Nursing, Eulji University, Korea)

Introduction : This study was a randomized controlled trial to evaluate the effectiveness of a home-based and comprehensive intervention program for family caregivers who take care of the elderly with dementia at home. Method : The intervention program was developed by conceptual framework and validity test. The program used in this study contains six components: 1) emotional support, 2) knowledge improvement, 3) skills training, 4) self-care ability, 5) communication, and 6) use of resources. The program includes various contents simultaneously. The study period for program was six weeks including home visits, group meetings, and supportive phone-calls. A total of 63 caregivers were randomly assigned to the intervention group (n=31) or the control group (n=32). Data collection was conducted from February to June, 2010. To measure the effectiveness of the intervention program, caregivers' knowledge, self-efficacy, burden, personal growth, preventive health behaviors, and family coping strategies were checked. Descriptive statistics, χ^2 test, independent t-test, Pearson correlations, MANCOVA, and multiple regression analysis with SPSS/Win 15.0 were used to analyze the data. Results : The home-based, comprehensive intervention program for family caregivers was found to improve caregivers' knowledge, self-efficacy, family burden, and family coping strategies. However, it did not appear to have a favorable effect on personal growth and preventive health behaviors. Conclusion : The home-based and comprehensive

intervention program applied in this study was effective in improving caregivers' knowledge, self-efficacy, burden, and coping strategies. Therefore, an intensive and comprehensive intervention including diversified contents based on individual approaches should be utilized in order to maximize the effectiveness. Keywords : Program evaluation, Family caregiver, Dementia

PP26 S-132

FACTORS ASSOCIATED WITH PHYSICAL RESTRAINT AMONG OLDER ADULTS WITH DEMENTIA IN LONG-TERM CARE HOSPITAL AND NURSING HOME

Young Mi LIM¹, Hae Jung LEE² (1. Department of Nursing, Yonsei University Wonju College of Medicine, Korea. 2. College of Nursing, Pusan National University, Korea)

Introduction : Although there are many studies on physical restraint in geriatric care setting, little attention has been paid to identifying the prevalence and factors of use of physical restraint in terms of demented elders' characteristics such as impaired cognitive status, risk of falls, and wandering in the long-term care hospital and nursing homes. The purpose of the study was to determine factors affecting use of physical restraint among older adults with dementia in long-term care hospital and nursing home in Korea. Method : We evaluated 3121 older adults with dementia from the Nationwide Survey on Dementia Care of Korea in 2011. Mini-Mental State Exam (MMSE), Morse Fall Scale (MFS), and Revised Algeas Wandering Scale (RAWS) were used. We employed logistic regression to identify predictors influencing on the use of physical restraint in the long-term care hospital and nursing homes. Results : For the long-term care hospital, MMSE(Odds Ratio=.879, p=.000) was a predictor of the use of physical restraint. For nursing home, MMSE (OR=.893, p=.000) and wandering (OR=.500, p=.000) were predictors of the use of physical restraint among older adults with dementia. Conclusion : Results show that impaired cognitive status and wandering significantly influenced the use of physical restraint among older adults with dementia in nursing home. Researchers and clinicians should continue to focus efforts on developing a variety of approaches that reduce the use of physical restraint among older adults with dementia in the long-term care hospital and nursing homes. Keywords : physical restraint, dementia

PP26 S-133

THE EFFECTS OF MULTI-SENSORY STIMULATION INTERVENTION PROGRAM USING FAMILIARITY KOREAN TRADITION ON PERSONS WITH DEMENTIA IN LONG TERM CARE FACILITY IN KOREA

Young-Sun PARK (Department of Nursing, Kyungbok University, Korea)

Introduction : Korea is becoming an aging society, there is a rapid increasing number of people with dementia. There has been practicing various treatment for the elderly people with dementia in facilities and institutions, but its effectiveness has not been verified yet. The purpose of the study was to examine the effects of Multi-Sensory Stimulation intervention program (MSS) using familiarity Korean tradition on Persons with Dementia (PWDs). Method : A nonequivalent control group with pre and post tests was used. 46 PWDs were included of they: 1)were over 65yr old, 2)were diagnosed with dementia, 3)had no visual or speech impairments, 4)were able to communicate, 5)had spent more than one month in a long term care facility. The outcome variables included cognitive function (MMSE-KC), emotion (SGDS-K), physical function (Barthel Activity of Daily Living Index), psychobehavior function (NPI-K). Repeated ANOVA was used for

data analysis. MSS was conducted twice a week for 10 weeks. Results: After the program, the cognitive functions (MMSE-KC) (F=3.69, p=.029), emotional functions (SGDS-K) (F=7.03, p=.001), physical functions (Barthel ADL Index) (F=9.53, p<.001), and psychobehavioral functions (NPI-K) (F=7.58, p=.009) of the experimental group was significantly better than those of the control group. Conclusion : A MSS using familiarity based on Korean tradition was effective in improving cognition functions, emotion functions, findings, physical functions, psychobehavioral functions of PWDs. Therefore, this program should be considered as a positive program for cognitive, emotional, physical and psychobehavioral improve for persons with dementia. Keywords : Dementia, Familiarity, Multisensory

PP26 S-134

THE EFFECTS OF COGNITIVE AND PHYSICAL FUNCTION OF INTERVENTION PROGRAM USING FAMILIARITY KOREAN TRADITION ON PERSONS WITH DEMENTIA (PWDS) IN LONG TERM CARE FACILITY IN KOREA

Young-Sun PARK¹, Jin-Yeong CHOE² (1. Department of Nursing, Kyungbok University, Korea; 2. Department of Neuropsychiatry, Seoul National University Bundang Hospital, Korea)

Introduction : The purpose of the study was to examine the effects on cognitive and physical function of intervention program using familiarity Korean tradition on Persons with Dementia(PWDs). Method : A nonequivalent control group with pre and post tests was used. 46 PWDs were included of they: 1) were over 65yr old, 2) were diagnosed with dementia, 3) had no visual or speech impairments, 4) were able to communicate, 5) had spent more than one month in a nursing home. The outcome variables included cognition (SCIRS), activities of daily living (Barthel Activity of Daily Living Index), Balance in SPPB (Side-by-Side, Semi-Tandem, Tandem, Sum), and UPST (Unipedal Stance Test). Repeated ANOVA was used for data analysis. It was conducted twice a week for 10 weeks. Results : There were no significant differences in demographics or the main variables at pretest. After the program, the cognitive function (SCIRS)(F=1.49 p=.229), activities of daily living(Barthel ADL Index)(F=8.33, p=.006), and Balance in SPPB {(Side-by-Side)(F=5.69 p=.021), (Semi-Tandem)(F=6.04 p=.018), (Tandem))(F=1.68 p=.203), (Sum)(F=4.14 p=.048)} of the experimental group was significantly better than those of the control group. UPST did not show significant differences(F=.31 p=.578). Conclusion : Intervention program using familiarity based on Korean tradition was effective in improving physical functions of PWDs, and marginally effective in improving cognition function. Therefore, this program should be considered as a positive program for cognitive, and physical improve for persons with dementia. Keywords : Dementia, Familiarity, Intervention

ANTIPSYCHOTIC MEDICATIONS USE IN OUR NURSING HOMES PATIENTS: QUALITY IMPROVEMENT PROJECT

Tezo KAREDAN, Daniel TISMAL, Halina Gajlewicz KUSZ (Medical Education, McLaren Flint Health Care/Michigan State University, USA)

Introduction : Behavioral problems in older nursing home patients with dementia are common and antipsychotics are widely used as first-line treatment agents. Method : In our residency training program, residents are assigned for longitudinal care of a panel of nursing home (LTC) patients. Current practices in the LTC facilities are that geriatric psychiatry service is managing patients with dementia and behavioral problems. The pharmacy based intervention and multidisciplinary

team regular clinical review are the main control systems for antipsychotics use. We as physicians usually approve their recommendations. Our quality improvement (QI) workshop suggested the need for some modification of our current practice. The overall goal is to increase our awareness about potential misuse of antipsychotics by improving physicians' documentation. Our aim was that within 3 months of implementation, 75% of our LTC patients on antipsychotic medications will have documented in physicians' note indication for their use and a plan to monitor therapy. Results : We obtained our Institutional Research Board and LTC administrators' approval. We presented the project to residents and faculty on our QI Forum. Starting November 1st 2011, we provided information regarding antipsychotics management for all residents. Three months later review of physicians' documentation indicated that we had 65% of patients on antipsychotics for various diagnoses and only 30% of these patients had a definite plan of dose adjustment and/or discontinuation of therapy. Conclusion : Increasing physicians' responsibility for appropriate antipsychotic medications management is a standard which might significantly improve quality of patient's care. Advancing system-based practice may require several cycles of quality improvement process. Keywords : Dementia with Behavioral Problems and Antipsychotic Medications

PP26 S-136

THE RECOVERY OF ELDERLY WOMAN'S SEXUALITY

In A. PARK¹, Eun Kyung KIM² (1. *Social Welfare, The Graduate school Seoul Christian University, Korea*; 2. *Social Welfare, The Graduate school Sungkyunkwan University, Korea*)

Introduction : For the past decades the sex act of elderly women had been repressed, ignored, and regarded even as bad things in Korea. Now we need to have an open discussion about the sex act of the elderly women in order to help the elderly women have their own sexual identity and lead a healthy sex life. Method : What kind of meaning do the elderly women attribute to the recovery of their sexuality? Qualitative data collected from 19 elderly women participants over 65 years old had been analyzed using qualitative research methods. Results : The recovery of elderly women's sexuality can be interpreted as the effort of finding out their femininity. They were trying to love themselves with confidence in the capacity of their femininity and love for themselves. Moreover, they were trying to learn standing alone for the remaining life time with liberty by getting freedom from their husband's restraint. They tried to take care of their feminine appearance in order not to lose the beauty of women. Conclusion : Finding sex in the old age is the issue on female identity and freedom and old women have desire to show female beauty to all the people even at the old age and the to live in a stately manner and freely as a woman, unconstrained by anybody, which was found. Thus, the effort to assure the senescent women living with psychological and mental freedom with identity of women and the right of living freely with the identity of women is needed. Keywords : Elderly women's sex life, sexuality, Elderly women's life

PP26 S-137

RELATED FACTORS WITH SEXUAL BEHAVIOR OF THAI FEMALE ELDERLY RECEIVING HEALTH CARE SERVICE AT MENOPAUSE CLINIC

Monrudee POPIJAN¹, Pornchai JULLAMATE², Waree KANGCHAI¹ (1. *Gerontological Nursing Department, Suan sunandha Rajabhat University, Thailand*; 2. *Gerontological Nursing Department, Faculty of Nursing, Burapha University, Thailand*)

Introduction : Sexual behavior of female elderly is very significance

and understudied in Thai culture. This correlational study aimed to research the relationship between knowledge of and attitude towards sexual behaviors, health status, relationship with spouse and sexual behavior of Thai female elderly. Method : Eighty two older adults with 60-69 years of age attending menopause clinic at one hospital in Bangkok, Thailand were randomly selected to participate in this study. Instruments used included The Demographic Questionnaire, The Knowledge about Sexual Behavior Questionnaire (reliability .80), The Health Status Questionnaire (reliability .80), The Attitudes towards Sexual Behavior Questionnaire (reliability .80), The Relationship with Spouse Questionnaire (reliability .86), and The Sexual Behavior Questionnaire (reliability .82). Data were computed as range, mean, standard deviation, and Pearson's Product Moment Correlation Coefficient was also calculated. Results : Findings revealed that attitudes towards sexual behavior and relationship with spouse of Thai female elderly positively related with sexual behavior at the moderate level with the significance level of .01 ($r = 0.56$, $r = 0.39$ respectively). Conclusion : Nursing intervention for promoting appropriate sexual behavior of Thai female elderly by applying attitude towards elderly sexual behavior and relationship with spouse was strongly recommended for further study. Keywords : female , elderly , sexual behavior

PP26 S-138

PREDICTORS OF DRIVING CESSATION IN RETIREMENT LIVING SENIORS: PRELIMINARY FINDINGS

Alexander Michael CRIZZLE¹, Anita M. MYERS², Courtney JANSSEN-GRIEVE², Sarah SOUSA², Susan BROWN³, Kaylen PFISTERER³ (1. *School of Rehabilitation Science, McMaster University, Canada*; 2. *School of Public Health and Health Systems, University of Waterloo, Canada*; 3. *Research Institute for Aging, Schlegel University of Waterloo Research Institute for Aging, Canada*)

Introduction : Older adults are often reliant on driving to remain engaged in community activities and to access services. However, age related deficits and/or medical conditions can impact on driving and ultimately, aging in place. While prior studies have examined driving status in community settings, little is known about the association between driving and relocation to retirement facilities. Thus, the purpose of this study was to examine the driving status of this population. Method : We surveyed 206 residents (141 women and 64 men) living in four retirement villages in southern Ontario (Mean age 85.1 ± 6.4). Results : Nearly 29% of the residents were currently driving, while 63% had stopped driving and 9% had never driven. Those who had never driven were predominately women (94%), widowed (83%), living alone and receiving more support services. Current drivers were more likely to be men, married and live in apartments ($p < .01$). When modeled into a regression analysis controlling for age, living arrangements and marriage status ($N=187$, -2Log Likelihood Ratio = 172.779; Nagelkerke $R^2 = .347$), gender (female) and needing supportive services were independent predictors ($p < .01$) of driving status (no longer versus still driving). Many residents had quit driving the year before (45%) or the same year (39%) they relocated, while 16% stopped driving shortly after they moved to the village. Conclusion : These findings suggest that there may be a temporal association between residential relocation and the transition to non-driving. Keywords : driving cessation, retirement homes, older adults

PP26 S-139

THE EFFECT OF SUPPORT BURDEN ON THE USE OF ELDER CARE SERVICE

Chang Gi KIM (*Social Welfare, Korea National University of*

Transportation, Korea)

Introduction : The burden of family members in caring for older people ranges from physical, to economic, emotional and social. The purpose of the study was to examine the effect of caregiver burden of family members on the use of elder care service, including residential and home care services. Method : The study was conducted using a quantitative method. For this study, there were 164 respondents who were family members of older people using the National Long-Term Care Insurance in Chungcheongbuk-do. To measure support burden, Caregiver Burden Inventory, developed by Novak & Guest and Stommel et al. was used. Data were analyzed using frequency analysis and description statistics analysis, as well as logistic regression analysis. Results : The findings of the study show that more than 50 per cent of respondents (n=83) used residential care service, and 49.4 per cent (n=81) used home care service. Home care service was likely to be used when social and economic burden was high, while residential care service was favored when emotional burden, including negative family relationships, was high. The majority of elder care facilities used by the respondents were government-funded or public organizations (72.2 per cent). The level of support burden was relatively high average 3.779) in general, and economic burden was the highest (average 3.88) among sub-variables. Conclusion : This study indicates that the types of support burden can affect the use of elder care service. The support burden of family members should be considered to develop the National Long-Term Care Insurance in the future. Keywords : support burden, elder care, Korea

PP26 S-140

A STUDY ON MAIN CAUSE ON LIFE-SATISFACTION OF THE ELDERLY IN RURAL VILLAGE

Chang Gi KIM (*Department of Social Welfare, Korea National University of Transportation, Korea*)

Introduction : Elderly life-satisfaction is subjective satisfaction feeling caused by agreement between expectation on life and meet in real. It is a complex feeling that is affected by personal physical characteristic, psychological characteristic and environmental factors and it will affect various factors such as physical, economical, social factors and etc Financial independence rate in rural village is also low. Its Elderly Care Services is inadequate compare to urban area and its elderly's health condition is also appeared low as they live in a disadvantageous geographic environment that is far from welfare health care center or health care related organization. Method : 250 elderly, aged more than 65 in rural village in Chungcheongbuk-do are the subject. First, descriptive statistic is conducted to survey the level of everyday life ability, everyday life ability, economical stress, social support, avocation and life-satisfaction. Second, Multiple Regression Analysis is conducted to survey the effect of everyday life ability, economical stress, social support, avocation and life-satisfaction. Results : As a result of Multiple Regression Analysis, in effective characteristics on elderly in rural village, economical stress is the highest as a negative effect and self-esteem and avocation are the second and third highest as a positive effect. Conclusion : First, it is analyzed that economical stress is the most affective than other variables on life-satisfaction of elderly in rural village. Second, it is assumed that traditional education method is acted for elderly in rural village Third, continuing activity should also keep being practiced through compensation for motivating, participating and avocation to activate avocation properly. Keywords : Elderly in Rural Village, Life-Satisfaction

PP26 S-141

THE INFLUENCE OF OLDER PEOPLE'S SATISFACTION

FACTORS OF HOUSING ENVIRONMENT ON THEIR QUALITY OF LIFE: FOCUSING ON THE MEDIATING EFFECT OF SELF-ESTEEM AND DEPRESSION

Hyunjeong NAM (*Graduate school of Social welfare, Yonsei University, Korea*)

Introduction : This study was performed to test the influence of older people's satisfaction factors (safety and convenience) of housing environment on their quality of life and the mediating effect of self-esteem and depression. Method : In this study, from 386 older people over the age of 60 in senior welfare center and senior club of Cheongju region, the data were collected by questionnaire during October, 2012. Results : First, safety had not any significant influence on older people's quality of life, while convenience had a significant positive influence on their quality of life. Second, safety had not any significant influence on older people's self-esteem and depression, while convenience had a significant positive influence on older people's self-esteem and it had a significant negative influence on their depression Third, older people's self-esteem had a significant positive influence on their quality of life, while older people's depression had a significant negative influence on their quality of life. Fourth, between safety and older people's quality of life, the indirect effects of older people's self-esteem and depression as mediating variables were not found. However, between convenience and older people's quality of life, the indirect effects of older people's self-esteem and depression as mediating variable were found. Conclusion : Through the above results of this study, it was found that convenience among older people's satisfaction factors of housing environment was important. Also, this study shows that various measures for convenience of housing environment need to be prepared to increase older people's quality of life and self-esteem and to lessen their depression. Keywords : satisfaction factor of housing environment, quality of life, self-esteem and depression

PP26 S-142

CHARICTERISTIC OF JAPAN COMMUNITY CENTERS AS A LOCAL COMMUNAL BASE FACILITY IN ULTRA AGEING SOCIETY

Jae Hyun PARK¹, Yeun Sook LEE², Eun Ji YEOM¹, Yun Jee JUNG¹(*1. Housing & Interior Design, Graduate School of Yonsei Univ., Korea; 2. Housing & Interior Design, Professor, Graduate School of Yonsei Univ., Korea*)

Introduction : Population ageing will cause many problem in city environment plan. As the aged population grow, people highly require spaces for the local society. Community Center of Japan in the ultra Aged Society with long history of communal facilities can be a reference to spatial improvement of the other following nations. The purpose is to delineate characteristics of both space planning and management for the community centers in Japan. Method : This research is a field study and the researchers have visited Keiyaki community center in Musashino city, Japan on February 4th, 2012 and Shounandai community center in Fujisawa city, Japan on February 5th, 2012. The research has conducted spatial observation and depth-interviews with residents who are managing the facilities. Results : The result of this research shows that the Keiyaki facility is small sized, resident-participated and open plan with autonomic management. On the other hand, the Shonandai facility is big sized, multi-functional complex and closed characteristics among different functional facilities with top-down plan and commissioned management. Conclusion : These two cases give direction of the community's base facilities for a place where the local development is related with absolute idle manpower in super-ageing society. These

cases can be used for discussion to explore better plan and management direction when a community center is expected to be built. It is especially useful when a society is facing rapid ageing. Keywords : Community Facility, Field study, Ageing in Place

PP26 S-143

A STUDY ON SPACE DESIGN EVALUATION OF JAPANESE COMMUNITY FACILITY BASED ON USER BENEFIT THEORY

Eun Ji YEOM¹, Yeun Sook LEE², Chang Houn AHN¹, Ting QI¹ (1. *Housing & Interior Design, Graduate School of Yonsei Univ., Korea*; 2. *Housing & Interior Design, Professor, Graduate School of Yonsei Univ., Korea*)

Introduction : Because architecture is built for user, the congruence between the architecture and user is very important. Fortunately, as democratic society has been developed emphasizing residents' benefits and this trend is more important for the community center to be actively used due to ageing society. Therefore, this study aims to evaluate the space design of the leading community center based on UBC theory. Method : This is a case study by local visit and the target is Keiyaki facility in Musasino city. For data collection we observed and recorded the target space and data analysis was made by the four characteristics of UBC for each space. In addition reliability of each evaluator was drawn by analyzing the photos by three persons at the time contents analysis. Results : As natural lightening and ventilation were well prepared overall behavioral-facilitation and physiological maintenance were fairly provided. Regarding perceptual-maintenance, broad windows induce much light, wind and exposure to landscape bringing much visual and perceptive effect. Besides, visual observability can be made among spaces very easily, and moving lines meet naturally enhancing the social-facilitation. All these characters derive from the big southern windows and open structures. Conclusion: This shows how community life can be led well when community facility is built in communication with the outside local environment and with a system communicating indoor spaces. This implies that in case of community facility that increasing number of local seniors may use due to aging society, users' benefits available from the facility should be considered in planning the facility. Keywords : Community Facility, User Benefit Criteria Theory, Space Plan for the Elderly

PP26 S-144

A STUDY ON EVALUATION OF EXAMPLES OF MULTIFUNCTION ELDERLY HOUSINGS AT HIJIRIGAOKA IN JAPAN

Ga Young YOUN, Yeun Sook LEE, Chang Houn AHN, Hyun Jin LIM (Housing and Interior Design, Yonsei University, Korea)

Introduction : Aging society has become global phenomena and new models worthy enough to share, have been developed through trials and errors especially in advanced countries where aging has started early. This study aims to evaluate by the users' benefit theory the multi-functional elderly housings that have been recently developed in Japan which has entered the super aging society already. Method : Study target is the examples of Hijirigaoka elderly home with rents in Tama city Tokyo Prefecture that has complex functions of independent life and individual health care. Method of study was to have local survey by visiting the facility to have interviews with the facility staff and recordings about the elderly home through actual observations. Collected data were analyzed by the theory of users' benefits. Results : The results of this study were analyzed primarily by the UBC (Users' Benefit Category) theory according to the types of spaces, such as

the multi-purpose cafeteria for the community, the group houses of several unit houses of the individual users. the elderly homes with care services, the day care center and short stay room. Conclusion : This means the study results of these examples not only helps to understand the architectural examples by papers and graphs but also shows what kinds of benefits are provided to the users of these environments and will be effective to expand the scope of understanding such spaces. Keywords : Multi-function Elderly Housings , Users' Benefit Category

PP26 S-145

A STUDY ON EVALUATION OF ELDERLY RESIDENCE BASED ON FALL PREVENTION DESIGN GUIDELINE

Hyun Jin LIM, Yeunsook LEE, Chang Houn AHN, Gayoung YOUN (Housing & Interior Design, Yonsei University, Korea)

Introduction : Falls are accidents that fatally damage the quality of life for the elderly and are typical accidents due to aging that stress the neighbors. While most houses are not prepared for the aged life, significant portions of population live in conventional houses. This study intends to evaluate the current houses where the elderly people reside from the viewpoint of fall prevention guidelines. Method : Three apartments were selected as the target examples of elderly houses among the apartments that are the typical residential form of Korea and in order to study the changes by times, the apartments were chosen each from those built in 1990s, 2000s and 2010s respectively and their size ranges from small to medium scale. Study method adopted local site visit and interviews and in order to check the characteristics of fall prevention guidelines composed of items were used. Results : Recently built apartments are more likely to be safe to prevent falls than the old apartments owing to the culture of construction market that utilizes the universal design. However, because of the tendency to increase the number of rooms instead of considering the number of the residents, the apartments had inefficient characters from the viewpoint of management and space utilities for the residence of a single elderly person or an aged couple, and the safety considerations to prevent falls were required to be improved. Conclusion : It is necessary to consider the designs for fall prevention as the primary fundamental factor in Korean housing market. Keywords : Fall prevention, Elderly Residence, Fall Prevention Design Guideline

PP26 S-146

A RESEARCH OF KOREAN APARTMENT EVALUATIONS IN SOCIAL HEALTH PERSPECTIVES

Jaehyun PARK¹, Yeunsook LEE¹, Jaewoo CHANG¹, Changhoun AHN¹, Lei ZHANG² and Siin DANG² (1. *Housing and Interior Design, Yonsei University, Korea*; 2. *Yonsei University, China*)

Introduction : The rapid industrialization in Korea in the 20th century, during which over nine million apartment units had been built over 50 years, contributed to enhancement of overall quality of life. However, the social health of housing became a great concern as social spaces for the community have been overlooked in the process of apartment building, especially in the rapidly aging current society. The purpose of this study is to find out how the Korean apartments are planned for supporting social health. Method : For the study three apartment complexes that had been recently completed were chosen and the design plan was analyzed with a focus on the spatial characteristics for social exchange between residents. And actual residents' interaction that takes place in one apartment complex, was analyzed through real behavioral observation. Four divisions were applied by the social facilitation in the User Benefit Criteria of Murtha & Lee for an analysis. Results : The result of this research shows the apartment complexes have improvements in diverse aspects. However, in the

apartment plan emphasis is placed on keeping the privacy and minimizing social contact, thus making residents' communication much limited. Conclusion : In case spaces for social contact in apartments are not considered continually, the existing apartments will lack adaptation capacity that is inevitable in the super-aging society. It will become a burden that will deepen the social problem. Keywords : Apartment, Social Health, Behavioral Observation

PP26 S-147

A CASE STUDY ON SERVICED ELDERLY HOUSING COMPLEX IN SYMBIOTIC RELATIONSHIP WITH COMMUNITY OF REGENERATED AREA

Jihye HWANG, Yeunsook LEE, Yeaji LIM (*Department of Interior Architecture & Built Environment, Yonsei University, Korea*)

Introduction : The purpose of this study is to analyze the characteristics of elderly housing development projects in Japan with multi services where it was implemented with cooperation of community for regeneration of urban apartment complex. Method : As a means of research "Takanedai Chutoinoie" facilities recently built in Hunabashi City Chiba Prefecture in Japan were chosen as target of analysis and by visiting the local site all the aspects were recorded through interviews with survey sheets and observation methods. All the data gathered were analyzed regarding the characteristics of the spaces based on the four dimensions of UBC(User Benefit Criteria) Theory. Results : The results of study revealed that the facilities of this community are small sized facilities with multiple functions that support and provide services suitable for diverse types of elderly people. Elderly facilities in the complex reflected the changing trends of the times and space was well designed through accumulated know-how and further, with the participation of the residents in the community. Conclusion : Therefore, this study can show a good example for Korean society where animosity for elderly facilities is still prevalent that the elderly facilities can function well to preserve the value of the community not by operating them separately from the community but by operating them in close relationship with the community. And it is also expected that to understand such development case will improve the design capabilities for facilities that are friendly to both communities and users. Keywords : Elderly, Community Regeneration, User Benefit Criteria

PP26 S-148

THE EFFECTIVENESS OF CONSISTENT PULSE MONITORING WRIST-WORN WATCH ON OUTPATIENT VISIT INCIDENCE AND EMOTIONAL SATISFACTION FOR ELDERLY PEOPLE LIVING ALONE

Juoh KANG¹, Tag HEO² (*1. Medical Department, Chonnam National University Hwasun Geriatric Hospital, Korea; 2. Cerebral Resuscitation, Toxicology, Emergency Medical Service System, Chonnam National University Hospital, Emergency Medicine, Korea*)

Introduction : The growth of the elderly people and increase in life expectancy have led to produce several social problems to Korean population. Growing medical expenditure and increase in elderly people living alone is a serious problem in the countries with growing population. Method : Measuring a real time data from wrist worn watch and survey from elderly and their family we evaluate the difference of 119 ambulance transports use and the clinical significances of the Emergency Medical Service System(EMSS) by analysis of medical consults, the effectiveness of wrist worn watch on outpatient visit incidence and emotional satisfaction in Elderly people living alone. Local elderly people three hundred in 1st trial, four hundred fifty in 2nd trial with chronic illness wear pulse monitoring

watch and the data has been transmitted to Emergency Medical Information Center(EMIC). Results : Studies have shown a high emotional satisfaction rate(by Likert scale), an ordinary ease of use, and a good compliance with the use of remote monitoring systems. We can show that the mean difference in number of outpatient visits per month between pre and post trial was significant (P = 0.01). Conclusion : Tele-monitoring system using updated equipment gives a quite successful emotional satisfaction to elderly living alone with chronic disease and gives us a chance to study reducing medical costs by outpatient visit incidence decrease. Keywords : tele-monitoring system, elderly living alone, outpatient visit incidence

PP26 S-149

A STUDY ON BATHROOM DESIGN FOR ELDERLY AND COHABITING FAMILIES HOUSEHOLD FOR AGING IN PLACE

Hye Shin KIM, Soo Been PARK (*Dept. of Housing and Interior Design, Pusan National University, Korea*)

Introduction : Bathroom is the indispensable space related to the quality of normal life, as well as the space with high probability of safety accidents. Hence, this space requires not only the functional requirement responding to aging, but also safety and comfort as well. Method : Study tools were composed by general characteristics (household characteristics and residence characteristics) and preference on bathroom composition(use, composition of bathroom and preference on color plans). For survey on the bathroom user method, bathroom facilities and bathroom color preference, 3D computer modeling on bathroom was used. Results : The result on the analysis of bathroom use and user method of facilities therein shows that main usage of bathroom is discharging, washing, shower&bath by elderly resident and cohabiting families, in identical purpose of use. This study analyzed recognition on bathroom by elderly resident as well as cohabiting families, inconveniences in bathroom use and overall satisfaction level on bathroom. As for preference on bathroom design, this study analyzed bathroom composition, bathroom ancillary space preferred to be established additionally, bathroom facilities, bathroom closets. Conclusion : By comparative analysis of the use, satisfaction level and design preference on the bathroom by the elderly resident as well as cohabiting families, this study provides the base for bathroom design for Aging in place, by minimizing the inconvenience factors and providing safe and pleasant space to elderly resident and cohabiting families in their use of bathroom. Keywords : Bathroom Design, Aging in place, Satisfaction, Elderly, cohabiting families

THE EFFECTS OF ACCULTURATION, HEALTH, SOCIOECONOMIC STATUS, AND PERCEIVED RESPECT ON OLDER ADULT DEPRESSION: ANALYSIS OF KOREAN AMERICAN OLDER ADULTS IN CHICAGO

Kyungsoo SIM (*School of Social Work, Loyola University Chicago, USA*)

Introduction : This study explored the extent to which acculturation level, health condition, SES, and geographical environment contributes to depressive symptomology among 121 older Korean-American immigrants in the Chicago area. Method : A multi-method approach was imported to analyze self-collected quantitative survey data from two groups of 57 participants in Chicago and 64 in the suburbs, qualitative interview data from 4 focus groups, 2 in-depth interviews and GIS (Geographic Information Systems). In the survey, Suinn-Lew Asian Stress-Identity Acculturation Scale, Geriatric Depression Scale-30, Functional Assessment of Chronic Illness Therapy-Fatigue, Health

Perception Questionnaire-36, 13-item questions for respect, and ZIP codes were utilized. Results : This study produced results by stepwise and hierarchical regression, ATLAS. ti, and GIS analysis. When their perceptions about health ($r(191)=-.417, p<.001$) and SES ($r(191)=-.335, p<.001$) were high, the participants experienced less depressive symptoms. SES and perceived health condition proved to be associated with each other ($r(191)=.264, p<.001$). The suburban participants had a stronger relationship between SES and perceived health condition than the Chicago participants. Qualitative analysis revealed that acculturation could influence depressive symptoms and that depressive symptoms could also be associated with hope and communication. Conclusion : The GIS analysis finding confirmed the findings from the quantitative analysis and suggested ways in which to develop and utilize community-based resources from mental healthcare management policy. These findings suggested that services given by service providers need to focus on communication and respect of the older Korean-American immigrants' self-determination, for they depend on it greatly when faced with the sufferings of adjusting to new residences. Keywords : Depression, Older population, Geographical background

PP26 S-151

THE ROLE OF PHYSICAL ENVIRONMENTS IN CULTURE CHANGE IN LONG-TERM CARE FACILITIES FOR THE ELDERLY

Min-Ah LEE (*Department of Housing and Interior Design, Kunsan National University, Korea*)

Introduction : This study investigates the role of physical environments in culture change in long-term care facilities for the elderly through the analysis of journal articles from 1990 to 2012. Method : The article search was performed on Google scholar using the keywords "culture change," "nursing," and "environment." The researcher included articles dealing with all three topics, and a total of forty-nine articles were collected for the analysis. Results : The articles were grouped into studies about the physical environment as an element of culture change and empirical case studies on implemented culture change. The study investigated the influence of the physical environment. The results of the study are as follows: First, home-like environments include the household or neighborhood model, and elderly residents are likely to place value on individual-directed care that allows autonomy, independence, privacy, and a life of dignity. Second, the case study showed the adaptation process going into appropriating the culture change model through the trial and error of design renovations. Assisted living facilities, which increased in number while the nursing home culture change was politicized, positively influenced the self-identity, privacy, and dignity of residents. Small sized environments encouraged the residents' interaction and program participation. Conclusion : Researchers need to provide various choices to the residents about where they will go in the facility, what they can use, and when and how they can interact with others. It will ultimately have a positive influence on the increase in elderly autonomy and independence. Keywords : Culture Change, Long-Term Care Facilities for the Elderly, Physical Environments

PP26 S-152

RESIDENTS' USE OF SITTING AREAS IN ASSISTANT LIVING FACILITIES

Min-Ah LEE (*Department of Housing and Interior Design, Kunsan National University, Korea*)

Introduction : This study investigates the use of sitting areas by residents in assisted living facilities, and analyzes the differences in

their characteristics. Method : Eight facilities of Brazos Valley, Texas, were invited to participate in the study. 66 residents and 36 staff members were asked about the two most frequently used sitting areas by residents, and the frequency and duration of their use. Results : The most frequently used sitting areas, in descending order, were the dining area, lounge, activity area, and outdoor area. The most frequently mentioned sitting area was the lounge as per the staff, but the activity area, outdoor area, and hallway, as per the residents. These areas were used, in descending order, for conversation, games, and rest. Staff reported that the residents use the lounge for socialization and watching TV, and the dining area for exercising and eating. Residents living in a single-floor building or having higher level of mobility assistance were more likely to use the lounge. The outdoor area was used more by the younger residents, and the library, by residents having lower level of mobility assistance. Conclusion : Diverse survey methods need to be developed for a more in-depth collection and analysis of data from functionally frail older residents and staff caring for them. A follow-up study should be conducted to identify the differences in their perceptions of these sitting areas. Keywords : Assisted living facilities, Sitting areas, Residents' use

PP26 S-153

A STUDY ON REMODELING CHARACTERISTICS OF THE ELDERLY HOUSING FROM THE VIEWPOINT OF USER BENEFIT THEORY

Meiluo JIN, Yeunsook LEE, Changhoun AHN, Boae KIM (*Housing & Interior, Yonsei University, Korea*)

Introduction : The issue of low fertility and aging society has become global issue. However, the housings built past do not support enough the physical deterioration of the aged people due to aging and in-house accidents such as falls make the aged people dependent, The purpose of this study is to find out what kinds of environmental benefits have been added in remodeled houses has been renovated. Method : This paper analyzed eight examples of remodeled houses in Japan where super aging society has come already, by the theory of Murtha & Lee's UBC (User Benefit Criteria). It is composed of four factors, behavior facilitation, physiological maintenance, perceptual maintenance and social facilitation. The relationship between such characteristics of remodeling and the users' benefits was verified by the inter-rater reliability checking process of the evaluators. Results : The results of such housing renovations analysis revealed that these renovations basically support the physiological maintenance. And behavior facilitation was the next support. These two factors imply physiological maintenance and perceptual maintenance are the direct cause for renovation, while social facilitation and perceptual maintenance have comparatively less influence upon the renovations. Conclusion : This study result indicates that when elderly housings are renovated, holistic environmental affordance supports are not pursued but their essential parts are improved. However, because in order to improve quality of life, all the four factors are important, it should be bear in mind that understanding of housing for the elderly people must be made fundamentally in the beginning of planning elderly housings. Keywords : Elderly Housing , Remodeling , User Benefit Theory

PP26 S-154

AN EXPLORATORY STUDY ON THE DEVELOPMENT OF HOUSING ALTERNATIVES FOR KOREAN SENIORS

Oh Jung KWON, Haehwa HA, Jinyoung KIM, Yong Min LEE, Hye-Shil YEOM (*Dept. of Housing Environment, Konkuk Univ., Korea*)

Introduction : Elderly population in Korea has been dramatically increased. Over the past 40 years, since 1970, elderly population

increased by 342%. The aging population now reached over 12% of total population in 2010 and this rate is expected to jump up to 14% in 2018 and 20.5% in 2026. Also, housing needs of the elderly are becoming more diverse than the past according to household types, economic status, health status, education level, family relations, or housing experiences through their lifetime etc.. Seniors expected to live in a housing option appropriate to their housing preferences. But, in reality, there is a lack of housing alternatives to fit into their needs. Method : This study attempts to provide the information on the development of housing alternatives for Korean seniors. On-line survey with open-ended questions is conducted to 50 housing researchers and facility staffs. The findings will be analyzed and the implications for developing various housing alternatives will be discussed. Results : Professionals' opinions in the field of housing were surveyed. Questions related to housing situations of Korean seniors, supply and demand of senior housing and physical/social/organizational aspects of senior welfare housing, nursing homes, and other types of elderly facilities, existing housing policies and programs, difficulties of providing various housing options for Korean elderly were asked. Conclusion : Various housing alternatives should be developed for making Korean seniors live the place where they want to live. Keywords : housing alternatives for Korean seniors, housing situation of Korean seniors, difficulties of providing housing for Korean elderly

PP26 S-155

THE EFFECTS OF SOCIOECONOMIC STATUS ON ENVIRONMENTAL EXPOSURE AND HEALTH OUTCOMES OF OLDER PEOPLE IN KOREA

Seyune LEE¹, Hongsoo KIM¹, Young-II JUNG¹, Yong-Bae KIM², Sung-Roul KIM³, Kiyong LEE¹, Yoon-hyeong CHOI⁴, Yun-Chul HONG⁴ (1. Graduate School of Public Health, Seoul National University, Korea; 2. College of Medicine, Soonchunhyang University, Korea; 3. Department of Environmental Health Science, Soonchunhyang University, Korea; 4. College of Medicine, Seoul National University, Korea)

Introduction : It is widely known that socio-economic status(SES) affects health outcomes, but the pathways of how social inequality in health occurs are still unclear. Studies have reported the impact of environmental exposure on health outcomes, yet not many empirical studies have examined the contributions of such factors to health inequality among the elderly. The purpose of this study is to investigate the effects of SES on environmental exposures and health outcomes of older people in Korea. Method : The sample of this study included a total of 600 elderly people residing in urban(Seoul), suburban(Cheonan), and rural(Asan) areas. Data on SES, environmental exposure from residential environment, exposure-related behaviors, and health impact measured by self-rated health and depressive symptoms(SGDS-K) were collected. The relationships of SES to environmental exposure and health outcomes were analyzed using descriptive statistics and multivariate regressions. Results : Study participants' SES was significantly associated with environmental exposure: older people with a greater monthly allowance ventilated longer; and those with a higher education level did not allow indoor smoking, and washed hands more frequently. Education level was consistently associated with the both health outcome measures. While adjusting for SES, indoor smoking was associated with lower self-rated health, and ventilation time was associated with higher depressive symptoms. Conclusion : The findings show inequality in environmental exposure and health outcomes by SES, and imply environmental exposure could be a critical mediator in explaining health inequality by SES in the Korean

elderly. Further studies are necessary to better understand the causal relationships among SES, environmental exposure, and health outcomes. Keywords : Social Disparity, Environmental Health, Health Inequality

PP26 S-156

AGEING FARMER'S SUCCESSOR AND THE IMMIGRATION OF FEMALE ASIAN SPOUSES IN RURAL JAPAN

Shoji OKUYAMA (Contemporary Law, Tokyo Keizai University, Japan)

Introduction : Over the past two decades in rural Japan there has been a dramatic increase in the number of marriages between middle-aged Japanese males and Asian female immigrants. The objective of this study was to document this trend in a rural district of Yamagata Prefecture and to investigate potential problems within this newly emerging marriage pattern. Method : I focused on the Mogami District in Yamagata, which consists of 1 small city, 4 towns, and 3 villages (See Figure 1). My research consist of 2 points of view as Follows: (1) I analyzed trends in census data concerning unmarried men and women. (2) I conducted case study interviews with thirty bi cultural couples in this rural district. Results : In Japan many rural farming households are considerably more wealthy than their salaried urban counterparts, and many households often find the rural lifestyle quite attractive. Therefore when economic conditions are favorable most young women opt to remain in their rural communities; however, when there is an economic downturn the numbers of rural females who decide to relocate to urban areas increases significantly. Consequently in many rural communities, male successors, who must continue the farming household, have considerable difficulty finding suitable brides, particularly during an economic slump. Conclusion : The Japanese census confirms that in recent years the population of rural unmarried middle-aged males is increasing much more rapidly than the unmarried female population. Keywords : Immigration, Asian Spouses, Rural Japan

PP26 S-157

EFFECT OF BUILT-ENVIRONMENT ON THE BEHAVIORS OF RESIDENTS WITH DEMENTIA: COMPARISON OF A SMALL-SCALE UNIT AND A TRADITIONAL CARE UNIT

Sookyoung LEE¹, Habib CHAUDHURY², Soojin LEE³ (1. Gerontology Research Centre, Simon Fraser University, Canada; 2. Department of Gerontology, Simon Fraser University, Canada; 3. Environmental Design, Yonsei University, Korea)

Introduction : This study comparatively observed the influence of a small-scale dementia care unit and a traditional dementia care unit on the behavior of the residents. Method : A purpose-built small-scale dementia care unit and a traditional dementia care unit were selected through several phases in Vancouver, Canada. Physical environment assessments were performed using two standardized environmental assessment tools: i) Professional Environmental Assessment Protocol (PEAP) and ii) Therapeutic Environment Screening Survey for Nursing Homes (TESS-NH) and an analysis of floor plan of the primary social space. For the assessment of behaviors of the residents, three specific assessment tools were used between February and March 2012: i) Multidimensional Observation Scale for Elderly Subjects (MOSES), ii) Minimum Data Set-Version 2.0 (MDS), and iii) Dementia Care Mapping (DCM). Results : The study found that the residents living in a small-scale environment were more engaged in activities and more likely to respond in understanding their fellow residents. Meanwhile, the residents living in a traditional long-term

care environment exhibited fewer signs of interaction/engagement with anyone or anything around them. Conclusion : The overall results of the study provide evidence that a small-scale residential care facility can serve as therapeutic environment for residents with dementia and a traditional care facility tends to influence withdrawn behaviors in the residents. The findings suggest that it may be helpful for a traditional long-term care facility to organize small groups within the larger whole and create more personalized and homelike atmospheres. Keywords : dementia, environmental design, small-scale

PP26 S-158

PERCEIVED NEIGHBORHOOD ENVIRONMENT ON HEALTH AND DEPRESSION AMONG KOREAN IMMIGRANT OLDER ADULTS IN THE U.S.

Soonhee ROH¹, Yuri JANG², David A CHIRIBOGA³, Sunhee CHO⁴, Kunsook Song BERNSTEIN⁵ (1. *Social Work, University of South Dakota, USA*; 2. *School of Social Work, University of Texas at Austin, USA*; 3. *Department of Child and Family Studies, University of South Florida, USA*; 4. *Department of Nursing, Mokpo National University, Korea*; 5. *School of Nursing, Hunter College, City University of New York, USA*)

Introduction : Neighborhood environment profoundly affects the physical and psychological well-being of older adults, because the latter tend to have decreased mobility, and hence have an increased reliance on resources in the immediate neighborhood. This study examined how older adults' subjective perceptions of the neighborhood environment (e.g., perceived ethnic density, safety, social cohesion, and satisfaction) are associated with perceived health and depressive symptoms among older Korean immigrants. Method : A questionnaire survey was conducted with 420 community-dwelling Korean immigrant older adults residing in the New York City metropolitan area. Hierarchical regression models for health perceptions and depressive symptoms were estimated. For both sets of models, the same predictive variable blocks were entered in the following sequence: (1) background variables (demographic information and acculturation), (2) health-related variables (chronic conditions and functional disability), (3) perceived neighborhood environment (ethnic density, safety, social cohesion, and satisfaction). Results : Perceptions of the neighborhood environment were strongly associated with both depression and perceived health, even after controlling for the individual level, sociodemographic variables. Older Korean immigrants who had lower satisfaction with their overall neighborhood environment were more likely to report depressive symptoms and poor health. A negative perception of neighborhood safety was strongly associated with depressive symptoms. Conclusion: Among Korean immigrant elders, perceptions of the neighborhood environment influence self-reported health and depression. Findings have important implications in assessing programs for health promotions and provide critical information that may help in the development of intervention programs to improve the quality of life among older Korean immigrants. Keywords : Perceived neighborhood environment, physical health, mental health

PP26 S-159

RISK PERCEPTIONS AND HEALTH BEHAVIORS CONCERNING INDOOR AIR QUALITY AMONG OLDER ADULTS IN KOREA

Sowoon KIM¹, Hongsoo KIM¹, Young-Il JUNG¹, Seyune LEE¹, Yong-Bae KIM², Sung-Roul KIM³, Kiyoung LEE¹, Yoon-Hyeong CHOI⁴, Yun-Chul HONG⁴ (1. *School of Public Health, Seoul National University, Korea*; 2. *College of Medicine, Soonchunhyang University, Korea*; 3. *Department of Environmental Health Science,*

Soonchunhyang University, Korea; 4. *College of Medicine, Seoul National University, Korea*)

Introduction : Risk perception is a key determinant of health behaviors, but the relationship between risk perceptions and environment-related health behaviors among older adults has rarely been explored. As older adults are likely to spend much time indoors, health behaviors concerning indoor air quality is a critical component for their health. The purpose of this study is to investigate the association between health-related risk perceptions and health behaviors concerning indoor air quality among older adults in Korea. Method : The sample includes a total of 559 elderly people in urban(Seoul), suburban(Cheonan), and rural(Asan) areas. Health-related risk perceptions were measured by three questions; risk perceptions of individual body, individual life, and people's lives. Health behaviors concerning indoor air quality-indoor smoking, second-hand smoking, fuel use, ventilation time, and pesticide use were surveyed. Multivariate regression analyses were conducted. Results : Health-related risk perceptions differ by self-reported health, number of chronic diseases, and location of residence: Health-related risk perceptions were higher among older adults with worse self-reported health status, a higher number of chronic diseases, and residing in suburb. After adjusting for socio-demographic covariates, older people with the high level of health-risk perceptions were as 1.82 times as likely to prohibit indoor smoking (95% CI: 1.03-3.22), compared to those with low level of risk perceptions. Conclusion : Health status and residence location implying socio-economic position could be critical components in explaining health-risk perceptions in the Korean elderly. Positive health behaviors concerning indoor air quality could be promoted by the increase of perception of health risks. Keywords : Risk Perceptions, Health Behaviors, Indoor Air Quality

PP26 S-160

CASE EVALUATION OF NURSING HOME BASED ON DEMENTIA HOME DESIGN GUIDELINES

Yeaji LIM, Yeunsook LEE, Jihye HWANG, Jihye LEE (*Housing & Interior Design, Yonsei University, Korea*)

Introduction : The rapid aging speed of Korea has steadfastly increased the number of the elderly facility, especially nursing home and dementia home. However, as the elaborate design guidelines have been unavailable, lots of homes lack quality enough to secure dignity and care efficiency. The purpose of this study is to evaluate a current rebuilt nursing home based on recently developed dementia home design guidelines. Method : The dementia home design guidelines developed through the check of care professionals in precedent research, was composed of 118 items. Three of the middle-sized nursing homes were selected, located in the capital area of Korea. Site visit, observation and interview were conducted, all the features of the spatial environment were thoroughly recorded as data for analysis. Results : Nursing home cases were evaluated as spaces which require more concern seriously about the elderly residents and care-givers from a viewpoint of design guidelines. Especially, important aspects which reflect humanity were overlooked such as comfortable and intimate environment like home, while emphasizing the convenience and efficiency of management. Conclusion : The good nursing home is the guaranteed space for welfare of the elderly with dementia and professional care. However, as current nursing home cases have left room for improvement, the role of welfare space design professionals are required to make the better nursing home in the future. Keywords : Nursing home, Dementia Home Design Guideline, Case Evaluation

PP26 S-161

SPATIAL CHARACTERISTICS OF A SPECIALLY DESIGNED NURSING HOME 'KAJENOMURA'

Yeunsook LEE, Jihye HWANG, Changhoun AHN, Seojung KIM
(Department of Interior Architecture & Built Environment, Yonsei University, Korea)

Introduction : The purpose of this study is to analyze the design characteristics of an innovative model in special elderly nursing home in Japan that has brought a qualitative innovation for elderly nursing facilities. **Method :** As a means of study, special elderly home "Kajenomura" at Yamata City Chiba Prefecture in Japan was chosen as target of analysis. By visiting the local site, all aspects of spaces were recorded through survey sheets and observing techniques and information about operational aspects of facilities and characteristics of space was collected through interviews with nursing home managers and documents. All data were analyzed regarding characteristics of spaces based on four dimensions of UBC(User Benefit Criteria) Theory. **Results :** As a result of this study this nursing home was accommodating 80 elderly people with memory impaired (mostly with dementia) by expanding the old buildings with new buildings. By utilizing the experiences of operating and managing the old buildings, more efficient space plans for new group homes in new buildings were projected. Spaces of the nursing home were planned with four categories of "Public," "Semi-public," "Semi-private" and "Private" by applying Privacy Theory. According to this category, detailed spatial systems were described in UBC Theory. **Conclusion :** This study shows that even existing nursing home with disrespect can be converted to a new nursing home with preference by applying new approach method, thus showing How architects and designers can work more professionally based on spatial knowledge. **Keywords :** Elderly, Nursing Home, User Benefit Criteria

PP26 S-162 THE PERCEPTION OF THE HEALING ENVIRONMENT AMONG THE NURSES WORKING IN LONG-TERM CARE FACILITIES AND GENERAL HOSPITAL IN KOREA

Young-Ran TAK, So-Young JUNG, Hae Young WOO (Department of Nursing, Hanyang University, Korea)

Introduction : The concept of a Healing environment suggests that physical environment of a healthcare setting is close related to health of those who use it. So recently, many architecture designs of Long-term Care healthcare facilities have changed for healing environment. The start of those changes must be the perception of nurse about healing environment, one of main staff of healthcare facilities. This study aims to compare the perception of the healing environment among the nurses working in long-term care settings and General Hospital in Korea. **Method :** A convenience sample was recruited from Long-term Care Facilities and General Hospital. The data is based on a survey questionnaire including close-ended questions such as the nurses' perception of the healing environment. A total of 465 Korean nurses participated in the survey. 158 nurses are working in long-term care settings and 306 nurses are working in General Hospital. Their experiences are sounded by self-report, and the answers have been processed using SPSS. **Results :** As a result, the mean of total items is 4.15 (SD=±0.52, range 0-5) and 4.30(SD=±0.52, range 0-5), which means that the nurses working in General Hospital have relatively higher awareness of the healing environment than the nurses working Long-term Care Facilities in Korea. **Conclusion :** Out of consideration to the elder's vulnerability of environment, the nurses working Long-term Care Facilities need more education about healing environment. Therefore, it is highly desirable to take into consideration the nurses' perception of the healing environment in healthcare architecture

design. **Keywords :** healing environment, nurses' perception, long-term care facility

PP26 S-163 AN APPLICATION AND EVALUATION OF ALZHEIMER'S GARDEN AUDIT TOOL TO ASSESS OUTDOOR SPACE OF THE LONG-TERM CARE FACILITY IN KOREA

Young-Ran TAK¹, Ji-Yeon AN², So Young JUNG¹ (1. Department of Nursing, Hanyang University, Korea; 2. Department of Nursing, Hanbuk University, Korea)

Introduction : Korea is the highest speed of population aging. Thus since 2008, the National Long term Care Insurance, a number of long term care facilities have established during short time in Korea. Especially, the environmental assessment tool is important for managing healing environment in a long term care facility for the elderly. Alzheimer's Garden Audit Tool(AGAT) is used to assess whether a garden incorporates those elements and qualities as healing outdoor space. In this paper, we discuss the benefits, limitations, and future directions of the assessment tool for long-term care facilities. **Method :** The AGAT audit was done through content analysis by 5 experts from diverse discipline as post occupancy evaluation of a long term care facility located in suburban area. The expert group was asked to describe their comments for modification and improvement in application of AGAT. **Results :** The results of this study show that it is necessary to refine the instrument's items to better meet the needs of the subdomains and elements for Korean culture-friendly tool. Especially, greenhouse elements (various plants, birds etc.), multisensory experiences, users-oriented space, programmed activities in garden, and hazards on pathway has somewhat limitation as measurement to assess outdoor of long-term care facilities in Korea. **Conclusion :** Consequently, AGAT could be applicable to evaluate the outdoor space of long term care facility in Korea with culturally sensitive revision. **Keywords :** healing environment, long-term care facility, outdoor space

PP26 S-164 RESIDENTS' EVALUATION ABOUT A COMMUNITY CENTER DESIGN OF THE ELDERLY CONCENTRATION AREA

Yunjee JUNG, Yeunsook LEE, Dongjoo LEE (Yonsei University, Housing and Interior Design, Korea)

Introduction : Due to aging society, urban space planning needs changes. Accordingly, the welfare facilities for the elderly exclusively have been developed and the pros and cons about them and intergenerational community facilities have been discussed. The purpose is to figure out the local residents' response to and improvement of the architectural design of later case, planned for the deprived area where the elderly are concentrated. **Method :** The target area is the community facility constructed in deteriorated residential area of Nosong-dong, Jeonju-si, South Korea and the analysis target is the design awarded in a contest. This study analyzed the characteristics of space planning which are inherent in this design by using content analysis method and carried out workshops with the local community representatives to figure out their response to facilities planning. **Results :** Through this study, we identified the residents' response to relations among diverse spaces, relative sizes, location, and so on. We organized the residents' opinions about the reason why the design needed changes through their response. Particularly, we figured out the preference for the elderly on how to share and divide the spaces with other local residents and identified the reason. **Conclusion :** Success of a building and resident satisfaction depend on the suitability between a

building and its needs. This study shows the experts' top down designs result in better directions with the residents' bottom up approaches. This result means how the residents' needs, especially in aged society, can be well reflected in local community. Keywords : Community Facility, Residents' Evaluation, Elderly Concentration Area, Workshop

PP26 S-165

A COMPARATIVE STUDY OF THE LIVING CONDITIONS OF URBAN ELDERLY

Yanhui ZHENG (*Institute of Gerontology, Renmin University of China, China*)

Introduction : This paper takes the living styles of the urban elderly as the key point, investigates their needs and satisfactions status under different living arrangements, and studies the families' modern characteristic of our country. Method : This paper employs a method of depth interview, labors resource flows between two generations and the satisfactions of the elderly under different living arrangements. It also interprets the modern characteristic that reflected by different living arrangements, such as intergenerational concept, status and so on. Results : Family distance has been greatly extended, and the member of same family may be scattered in different places. Living style of the old people will directly affect the quality of their life. Conclusion : Living nearby is the choice after some level of rational and emotional consideration of the old people. Keywords : Living arrangement³Urban elderly³Living conditions

PP26 S-166

HOW THE ELDERLY COMMUNICATE AND KEEPS INFORMED IN SOUTHERN BRAZIL?

Leticia GERLACK¹, Angelo BOS¹, Margo KARNIKOWSKI² (*1. Instituto de Geriatria e Gerontologia, Pontificia Universidade Catolica do Rio Grande do Sul, Brazil; 2. Pos-graduacao em ciencias da saude, Universidade de Brasilia, Brazil*)

Introduction : This study aims to determine how the elderly in the state of Rio Grande do Sul, Brazil, get information and their communication resources, based on the urban life aspects that can improve the ageing-friendly cities. Method : We studied seniors, 60 years or older, both genders and residents in urban and rural households in the state of Rio Grande do Sul, southern Brazil. We made a random selection of households and conducted sixteen interviews by census sectors, respecting the percentage ratio for men and women. The questionnaire consisted of closed questions, grouped into thematic blocks, including Information and Communication. For the analyzes we used the Epi Info. Results : 7315 elderly people were interviewed between 2010 and 2011. Television was the media most used (95%) and 12% used to access it once a week. About 70% of seniors had phone or mobile. 90% not accessed the internet and 83% showed no willingness to take classes or courses in this area. About 85% wouldn't like to make crafts activities, music, gymnastics or similar. High proportion (80%) of the elderly did not wish to be literate or finish formation and 90% had no interest in making language courses. Conclusion : It is important to invest in television programs more appropriate for elderly public awakening critical consciousness for active aging. The restricted access to the internet and low interest in participating in educational courses may reflect a demand for educational projects more attractive to elderly. Keywords : Aging, communication, healthy city.

PP26 S-167

A STUDY ON BURNOUT RESILIENCE OF SENIOR WELFARE CENTER WORKERS

Hee Eun NAM¹, Nam Sook KIM² (*1. Department of Social Welfare,*

Kosin University, Korea; 2. Department of Social Welfare, Tongmyong University, Korea)

Introduction : Senior welfare center and the workers are growing more in many countries include Korea. However, very few studies have been conducted on senior welfare center worker's burnout in Korea. Target the elderly, it needs to pay more attention in the sense that there is a ripple effect on human services and agencies, rather than simply staying on the problem of personal burnout leads to difficulties arising from these business professionals. Identifying the correct status for the exhausted and exhausted the workers, as well as institutions, and subject to undesirable consequences such as this to understand the mechanism for the development of policies to solve them by the results of this study to utilize expectations. Method : 10 senior welfare centers centers, 160 workers are replied this survey.. Gathering data analyzed as career, age, gender, working part, position, schooling, religion. Descriptive statistics computed for each of the factors of burnout, using SPSS 18.0. Analysis of variance(ANOVA), Multiple Reression Analysis used means tests to determine where significant differences between pairs of respondent characteristics would be present. Results : 1. significant differences in worker burnout according to the variables of educational level, age, marita status, service length and and position. 2. effects of burnout resilience on burnout. Conclusion : The purpose of this study is to further understanding of senior welfare center worker's burnout in their daily job stress. After understanding the factor to their emotional burnout as burnout resilience, burnout risk, the focus on this study is how we can predict and prevent to worker's emotional problems. Keywords : senior welfare center, worker's burn out, burnout resilience

PP26 S-168

ACTIVE AGING AND SELF-SUPPORT FOR LATER LIFE ? FOCUS ON YOUNG OLD PEOPLE IN URBAN CHINA

Jieyu HUANG (*Institute of Gerontology, Renmin University of China, China*)

Introduction : Chinese people tended to devote a huge percentage of their mid-age life to the next generation, while seldom prepared economically or spiritually for their later life. However, socio-economic development, accompanied with increased population mobility and changes in family size or structure, makes it more impractical for Chinese family to carry out support to elderly members. Under this social background, self-support for later life should be promoted as an important part in elderly support system. In this thesis, the author focused on the young old people in urban China and explored the prospect of self-support for later life , using'active ageing' perspective. Method : Literature analysis; Second-hand material and data analysis. Results : Firstly, data showed that it is necessary for young old people in urban China (especially the parents of the only child) to practice self-support for later life. Secondly, it is proved that self-support for later life for young old people in urban China is individually and socially possibly. Thirdly, under a life-course perspective, mid-age Chinese people should start preparing for their own later life. Conclusion : Influenced by the traditional ' raising children for old age' idea and a negative elderly identity, family support for elderly people is most common in China.However, family support is being challenged by social status quo. 'Active ageing' theory redefined the concept of 'elderly people' and refigured their social rule, and it is inner related to the practice of self-support for later life. We should promote self-support among young old people, even mid-age people in urban China. Keywords : Urban China; Young Old People; Self-support for Later Life

PP26 S-169

COMPARISON OF THE ENJOYMENT FOR MASTERS SPORTS EVENTS PARTICIPANTS BY AGE GROUPS; FROM THE CASE OF “MASTERS KOSHIEEN”

Yutaka UEDA¹, Kento YOSHIDA¹, Daichi TANAKA¹, Rie NAKAI¹, Makoto CHOGAHARA², Megumi TANI¹, Kei HIKOJI³, Daichi SONODA¹, Yuki MATSUMURA¹ (1. Graduate School of Human Development, Kobe University, Japan; 2. Faculty of Graduate School of Human Development, Kobe University, Japan; 3. Faculty of Education, Wakayama University, Japan)

Introduction : The purpose of this study was to explore the enjoyment for participants of “Masters Koshien” and to examine how the benefits differ with age groups. **Method :** In the present survey, 1499 participants from Masters Koshien 2006 to 2009 were used. The self-administered questionnaire was distributed and the number of valid responses was 1230. The questionnaire consisted of “Masters Sports Enjoyment Scale” (MSES, 32 items), individual belonging and career of sports. **Results :** As a result of the cross tabulation between the four age groups (~29,30~39,40~49,50~) and 32 items about the enjoyment of Masters Sports, it was revealed that 1) All age groups showed a tendency to respond the enjoyment of “remember the past,” “exhilaration and tensions obtained by playing” and “welcome from volunteers.” 2) The age group of over 50 years old and under 29 years old marked higher scores than the other age groups in terms of “supporting and cheering teammates of other age groups.” 3) The age group of 40-49 years old showed the highest scores in terms of “technical improvement and physical development”. **Conclusion :** Regardless of age, the study subjects gained “pleasure,” “exhilaration” and “human relations” as the enjoyment of Masters Sports. These were beneficial aspects which all age groups universally have. Additionally, the subjects felt “recollection of their younger days” strongly with aging. It can be suggested that this is the characteristic benefit not only of the case of Masters Koshien but also of all Masters Sports. **Keywords :** Enjoyment, Masters Sports

PP26 S-170

A STUDY ON REVITALIZATION OF THE SENIOR CENTER AS A CULTURAL ACTIVITY CENTER FOR THE BABY-BOOM GENERATION IN KOREA

Na Rae BAE¹, Chung Sun PARK² (1. Dept. of Management of Long Term Care Facilities, Konyang Cyber Univ, Korea; 2. Dept. of Family Welfare, University of Daegu, Korea)

Introduction : The purpose of this study is to propose revitalization of the existing senior centers as a new place for social and cultural activity centers of the baby-boom generation. Unlike the previous senior generation, the baby-boom generation (born in 1955-1963) has strong desires to actively participate in various social activities as well as simply working for their livelihood. In order to meet their needs, it is proposed that the existing senior centers should be redesigned and transformed from elderly welfare perspectives. **Method :** The data were collected by using the structured questionnaire including socio-economic backgrounds, needs for cultural activities, needs for social activities, and needs for job-training programs. The total 250 baby-boomers were used for the final analysis. The collected data were analyzed by cross-tabulation and ANOVA techniques. **Results :** The major findings are as follows: most of the baby-boom generation strongly agreed that they were very different from the previous elderly generation in terms of education, social and economic environments. So, a new system for the senior centers which can integrate various needs is suggested to encourage the baby-boomers to participate more actively even after their retirements. **Conclusion :** Based on the

research results, a new paradigm for the senior centers is proposed in order to enhance the quality of the senior centers. The application and practice of our research results would be very important, because larger numbers of baby-boomers are gradually retiring from the workforce, and it is necessary to keep them incorporating to on-going society for further development of the society in general. **Keywords :** the Senior Center, the Baby-boom Generation,

PP26 S-171

FACTORS INFLUENCING LIFE SATISFACTION OF OLDER ADULTS: FOCUSED ON WHO'S GUIDELINES OF AGE-FRIENDLY CITIES

Soon-Dool CHUNG, Sung-Won KIM, Ye-Sol KIM, Song-Ju SEO, Hyo-Jin PARK, Eunjin LEE (Graduate School of Social Welfare, Ewha Womans University, Korea)

Introduction : The purpose of this study was to examine the effects of fulfillment of WHO's guidelines of age-friendly cities on life satisfaction of older adults. Data used for this study were from '2011 National survey for older adults' by Korea Institute for Health and Social Affairs. Questions appropriate to show the degree of age friendliness on WHO's guidelines were selected to obtain study purposes. **Method :** A total of 2,312 older adults resided in seven special metropolitan cities among 10,674 senior respondents were chosen to analyze the data and data were analyzed by regression analysis. **Results :** Results showed life satisfaction of older adults was different by residential areas of study population. In order to explain these differences, further analysis was performed with several questions related to age friendliness based on 8 scopes of the WHO's guidelines of the Age-friendly cities. Socio-demographic variables such as employment, salary, education, and chronic disease were appeared to explain significantly life satisfaction of older adults. Among the individual level variables, transportation, participation in political and social organization, participation in life-long learning, experiences of volunteering, participation in the Job Creating Project, and ability to take advantage of the Internet variables were appeared as significant variables to predict life satisfaction of the elderly. **Conclusion :** Based on these results, further discussions for social work intervention concerning life satisfaction of older adults and age-friendliness were provided. **Keywords :** life satisfaction of the elder, Age-friendly cities, degree of age-friendliness

PP26 S-172

EMPOWERING OLDER ADULTS BY ADOPTING AN ACTIVE PARTICIPATORY APPROACH IN A UNIVERSITY SETTING

Teresa TSIEN, Wendy NGAN (Institute of Active Ageing, The Hong Kong Polytechnic University, Hong Kong)

Introduction : In 2012, Hong Kong became the city with the longest longevity in the world with men at 80 years and women at 86 years. This brings about new opportunities, including the potential for more knowledge on ageing and an expanding pool of older human capital. **Method :** The Institute of Active Ageing (IAA) of The Hong Kong Polytechnic University, adopts a unique and comprehensive model in the promotion of active ageing. It is supported by 45 faculty members from 23 disciplines across 5 faculties of the University. IAA is committed to innovative research, interdisciplinary education and evidence-based practices for the promotion of active ageing. IAA is unique in that it emphasizes the importance of empowering older adults for independent, healthy and active ageing by instilling a proactive, self help approach through the facilitation of their participation in lifelong learning, volunteer work, and gainful

employment under the Project for the Third Age. Results : By involving older adults as planners and trainers, teachers and students, leaders and members, they become advocates to help instill a positive image of older adults to the mass public. Conclusion : This paper will discuss the process in empowering the older adults through their participation in the "Self- help Management Committee" and the "Train- the- trainer Programme", and how this practice arm is supported by the interdisciplinary research and education strategic areas. The challenges and issues of this unique empowerment model will be analyzed. Finally, some recommendations will be outlined as to how it can be applied to other universities. Keywords : empowerment, self-help, evidence-based practices

PP26 S-173

THE COMPARISON OF MUSIC AND HORTICULTURAL THERAPIES ON OLDER ADULTS IN ADULT DAY CARE CENTER IN TAIWAN

Chin-Ying YU¹, Man-Tsu LIU¹, Tsuann KUO² (1. Department of Eldercare, Central Taiwan University of Science and Technology, Taiwan; 2. Medical Sociology and Social Work, Chung Shan Medical University, Taiwan)

Introduction : The use of music and horticultural therapies on older adults in community-based adult day care centers has been popular in Taiwan. This paper analyses and compares the use of music care and horticultural activities, or the combination of the two, on 7 older adults with different degrees of cognitive or functional limitations. Method : The elderly participated in music and horticultural activities for three months at once a week and 80 minutes per session. A detailed observational record was kept by taking photo, written notes, as well as conducting interviews with the elderly. After three months, workers were interviewed to express their views on the effectiveness of the two types of therapies on older adults. Results : After transcribing the observational notes combined with photo viewing, several themes revealed the effectiveness of the two therapies: 1. Music care allowed participants to relax and learn music skills after consistent practices led by the program leader. The participants seemed to have more self-confidence as a result. 2. Horticultural activities required more hands-on techniques sometimes can be difficult for participants. 3. Although the participants were willing to participate, people with Dementia could not always participate the whole way. Conclusion : Both music and horticultural therapies had positive effects on older adults. The leaders played an important role in guiding the older adults and designing programs based on their needs. The future design of these programs can be more effective by adding staff's reviews or letting different staff play a leader role in conducting the programs. Keywords: Music Care, Horticultural Therapy, Adult Day Care Center

PP26 S-174

THE EFFECTIVENESS OF MUSIC AND FITNESS PROGRAM FOR OLDER ADULTS AT A COMMUNITY-BASED CENTER IN TAIWAN

Li Chi CHANG¹, Yu Hsien CHIANG², Chin Ying CHAN³ (1. Eldercare, Central Taiwan University of Science and Technology, Taiwan; 2. Eldercare, The Red Cross Society of Republic of China's Taichung Branch, Taiwan; 3. Eldercare, Buddhist Tzu Chi Taichung General Hospital Nuclear Medicine, Taiwan)

Introduction : Over the past 5 years, more than 1,600 community-based centers were established to promote health and wellness of older adults and to serve as a complement of family care in Taiwan. This study examines the effectiveness of a creative program combining music and fitness for older adults with different chronic health issues.

Method : This study used focus groups and detailed observations to gather feedback from five participants whose functional status differed and ranged from normal to physical limitations or cognitive impairment. The effectiveness of music and fitness activities at biopsychosocial levels were the main purpose of evaluation. Results : The combination of music and fitness training added the fun and creative life aspects for the elderly participants. The elderly were more willing to participate because they seemed to have their fitness goals and life satisfaction met. Many elders changed their behaviors as well as the biological, psychological and social well-beings. For example, people changed from not willing to walk due to stroke, from having bad temper and not willing to interact with others, to confidently performed in front of others. The stabilization of emotions and relief of caregiving burden for people with Dementia were also evident. Conclusion : The combination of music and fitness program is an effective way to improve the well-beings of the elderly. A proper design of fitness difficulty and the right selection of music with reminiscence flavors are two keys to successful outcomes. This study will conclude by sharing the program design and the evaluation feedback. Keywords : Community-based center, health promotion, elderly

INNOVATIVE TECHNOLOGIES IN THE AREA OF MEDICAL-PSYCHOLOGICAL AND MEDICAL-SOCIAL REHABILITATION OF WAR VETERANS

Oleg YAKOVLEV, Nikolay LYSOV, Vladimir ARSHIN, Stanislav BORINSKIY, Sergey VASEMAZOV (Samara Regional Clinical Hospital for War Veterans, First research institute of rehabilitation of war veterans of Medical Institute 'REAVIZ', Russia)

Introduction : The purpose of rehabilitation as a part of innovative direction in medical practice of Samara Regional Clinical Hospital of War Veterans (SRCHWV) lies in the creation of system allowing to form, preserve, recover and promote health of veterans. Method : The main modern principles of organizing the process of rehabilitation in SRCHWV include: 1. Early start 2. Continuity 3. Staging 4. Sequence 5. Succession The complex rehabilitation in SRCHWV provides for conducting medical, social health, psychological health, household, spiritual, sports, endoecological rehabilitation. The school of household adaptation is a model of living space equipped with technical means for rehabilitation and training of disabled patients and the staff to adopt the rules of using and developing necessary skills related to illness specifics. The innovative technology in complex rehabilitation - high gravity stand, developed by a team of experts of Samara State Medical University headed by MD, Associate of RAMS, Professor G.P. Kotelnikov. Results : Our system of rehabilitation of SRCHWV and the First research institute of rehabilitation of war veterans of Medical Institute 'REAVIZ' allows to form, preserve, recover and promote health of veterans through realizing health potential for leading proper social and personal lifestyle, decreasing the rate of aging, premature mortality, and illness, increasing the average lifespan and quality of life, and improving the country demographics. Conclusion : The school of household adaptation, gravitation therapy stand, art therapy are among new unique effective innovative directions of the system of health rehabilitation. Keywords : innovative technologies, rehabilitation, war veterans

PP26 S-176

THE ARTISTIC EXPRESSION IN OLDER FEMALE CANCER PATIENTS: A PHENOMENOLOGICAL PERSPECTIVE

Carlos LARANJEIRA (Higher School of Health Sciences, Piaget College, Portugal)

Introduction : Cancer was chosen from the many chronic illnesses that affect older people because it is feared almost universally as a potentially life threatening illness, has a greater incidence in this population. Conventional approaches to cancer treatment typically do not address the personal experiences of the women with gynaecological cancer. The aim of this study was to develop a structural description of the lived experience of older women with gynaecological cancer who create art, specifically through painting, sketching or drawing. **Method :** A phenomenological approach was employed to explore the meaning of creating art for four elderly women (65 years and older) with a diagnosis of gynaecological cancer. Data were collected through face-to-face interviews and follow up telephone conversations. Giorgi's method for analyzing phenomenological data was used to elicit an invariant description of the meaning that creating art had for the participants. **Results :** Three predominate themes emerged from the analysis. Contextual constituents of the phenomenon were identified as that of giving back and time to create. Dynamic components consisted of creative space and creative expression. Enduring factors consisted of the creative experience and sense of self. **Conclusion :** The process of creating art serves as a form of meditation for some individuals. Whether in the form of gardening or painting, the creative outlet provides a spiritual transcendence for the individual. Nurses are in a unique position to facilitate the creative art process which holds the potential for self-healing and self-responsibility for their patients. **Keywords :** cancer, transcendence, creativity

PP26 S-177

HORTICULTURAL ACTIVITIES FOR ELDERLY WITH DEMENTIA AT AN ADULT DAY CARE IN TAIWAN

Man-Tsu LIU¹, Chin-Ying YU¹, Tsuann KUO² (1. *Eldercare, Central Taiwan University of Science and Technology, Taiwan*; 2. *Medical Sociology and Social Work, Chung Shan Medical University, Taiwan*)

Introduction : More people were diagnosed with Dementia and faced daily challenges on cognitive, emotional, activities difficulties in Taiwan. From literature review, the horticultural therapy was shown to reduce anxiety, increase social interactions, and improve functions for people with Dementia. **Method :** The purpose of this study was to evaluate the effects of horticultural activities on 10 elders with different degrees of Dementia at an adult day care center in Taichung, Taiwan. The activity was once a week for three months. The author used an observational method and a horticultural activity evaluation form to examine the effects on biological, social, cognitive and emotional domains. **Results :** The results showed that the elders started from very shy away from participating, or lack of knowing how to performing horticultural procedures, to welcoming the activities. From the observational notes and horticultural evaluation, the older adults were able to perform step-by-step and make small-plant products (biological effect), to appreciate others' work and have interactions (social effect) and to smile and wanting to participate (emotional and cognitive effects). **Conclusion :** A horticultural therapy can be used as an effective way to improve the bio-psycho-social side of demented elders so they can be more receptive to environmental stimulation, ability to express self and positive interactions. The detailed horticultural activities and step-by-step guidelines are also discussed in this study so information can be disseminated to more adult day care centers in the future. **Keywords :** Horticultural Therapy, Adult Day Care, Dementia

PP26 S-178

RE-TWEETING ABOUT THE "END-OF-LIFE": INFORMATION SHARING ON TWITTER

Jisue LEE¹, Jungup LEE², Ara JO³, Hohyon RYU⁴, Kyunghwa CHO⁵ (1. *College of Communication and Information Studies, Florida State University, USA*; 2. *College of Social Work, Florida State University, USA*; 3. *Sport Management, College of Education, Florida State University, USA*; 4. *School of Information, University of Texas-Austin, USA*; 5. *Educational Measurement and Statistics, College of Education, Florida State University, USA*)

Introduction : Many developed countries including Italy, Germany, France, the United Kingdom, and the United States have seen a dramatic increase of the aging population (Population Reference Bureau, 2011). This global growth of the aging population has allowed scholars in various disciplines to conduct research on the lives of seniors and the "end-of-life" stage. **Method :** This research explores information sharing on Twitter to understand how people communicate and exchange both information and opinions regarding the "end-of-life." This study particularly examines the most frequently re-tweeted messages including "end-of-life." This enables us to understand the ideas most popularly talked about and exchanged as a "community behavior of agreement or consensus" in a new social media of Twitter (Dann, 2010, p. 1). **Results :** The data set consists of the top 100 most frequently re-tweeted messages including "end-of-life" collected through Python Twitter API from October 9 to October 28, 2012. Messages were classified to examine various purposes of users' re-tweeting behavior: Information Sharing (58%), News Sharing (19%), Opinion (20%), Event Report (2%), and Job Information (1%). The messages including the actual URLs (65%) are more often re-tweeted than those without URLs (35%). The United Kingdom and the United States currently appear to lead the conversation about "end-of-life" on Twitter. The topical terms most frequently tweeted by Twitter users include palliative, social, support, debate, trust, government, research, and action. **Conclusion :** The discussion about "end-of-life" on Twitter is in its infancy, but this study suggests the growing potential of social media for distributing/exchanging information and opinions on "end-of-life." **Keywords :** Information Sharing, Twitter, End-of-Life

PP26 S-179

AAL-WELL- AMBIENT ASSISTIVE LIVING TECHNOLOGIES FOR WELLNESS, ENGAGEMENT, AND LONG LIFE

Andrew SIXSMITH¹, Alex MIHAILIDIS², Arlene ASTELL³, Louise NYGARD⁴ (1. *Gerontology Research Centre, Simon Fraser University, Canada*; 2. *Dept of Occupational Science and Occupational Therapy, University of Toronto, Canada*; 3. *School of Psychology and Neuroscience, St Andrews University, United Kingdom*; 4. *Department of Neurobiology, Care Sciences and Society, Karolinska Institutet, Sweden*)

Introduction : A globally aging population demands innovative approaches to ensure people across societies can live and age well. The AAL-WELL project aims to explore how ambient assistive living (AAL) technologies can be used to promote active and healthy aging, particularly amongst people with mild cognitive impairment. The project comprises partners in Canada, Sweden and the UK and is funded by the European Research Area in Ageing 2 (ERA-AGE) program. **Method :** The project comprises three parts in which we will: i. work with older adults to identify their priorities for active and healthy aging; ii. develop novel AAL technologies to support these priorities; and iii. test the technologies in the real-world by putting them into the older adult's homes. **Results :** The focus is on identifying the priorities of older adults in two key areas - independent completion of self-care activities and keeping mentally active. This information

will be used to develop specific examples of innovative and novel AAL technologies, which we will show to older adults to get their feedback at each stage of the development process. The novel technologies will be tested in real-life situations in the homes of older people to assess their usability, acceptability and effectiveness. Conclusion : Knowledge translation is an important component of the project. The AAL-WELL research is relevant to people with different national and cultural backgrounds. The project will ensure that information reaches the appropriate organisations and services: groups that support older adults, health and social care providers, policy makers and technology companies. Keywords : ambient assisted living, mild cognitive impairment

LEARNING HEALTH LITERACY VIA ONLINE LEARNING SYSTEM AMONG UNIVERSITY STUDENTS IN HONG KONG

Angela Yee Man LEUNG¹, William H.C. LI¹, Athena LIU², Eliza M.L. WONG³, Vico Chung Lim CHIANG⁴ (1. School of Nursing, The University of Hong Kong, China; 2. Faculty of Law, The University of Hong Kong, China; 3. Nethersole School of Nursing, The Chinese University of Hong Kong, China; 4. School of Nursing, The Polytechnic University of Hong Kong, China)

Introduction : Health knowledge is needed by students from all disciplines. Being the consumers in health care system, university students should be trained with the skills to understand and critically evaluate the health information. An e-health literacy online learning platform was set up to train university students the essential skills in online health information searching and critically evaluating the reliability of the sources of health information. This study reported the participants' performance before and after the online learning, and their reflection of their learning experience. Method : A randomized controlled trial design. A 8-item e-health literacy scale was used. Results : A total of 117 students were recruited, 88 students completed all the activities in the project. 43 students were randomized to intervention group (IG) and 45 to control group (CG). E-health literacy level of all students increased from pre-intervention mean (SD) = 24.13 (6.26) to post-intervention mean (SD) = 29.58 (4.61) ($p < 0.002$); however there was no significant difference between IG and CG ($p = 0.284$). However, student indicated that this online training was useful and they learnt how to engage in online searching for health knowledge (mean (SD) = 3.74 (1.12) and learnt to think more critically (mean (SD) = 3.19(0.85)). Conclusion : E-health literacy level of the participants increased significantly after their online learning. However there was no significant difference between IG and CG. Future study in e-health literacy is warrant. Keywords : e-health literacy, online health information, Chinese,

PP26 S-181

PROFESSIONAL BURNOUT AMONG NURSING HOME PERSONNEL: EFFECTS OF INTERACTIVE TRAINING INTERVENTION

Joan Julia BRANIN¹, Gloria JUAREZ² (1. Center for Health & Aging, University of La Verne, USA; 2. Nursing Research and Education, City of Hope, USA)

Introduction : Burnout among nursing home personnel has been associated with declines in professional effectiveness and empathy towards patients and can lead to deterioration in the quality of patient care. Among the principal contributors to burnout are work-related interpersonal conflicts. The purpose of this research was to investigate the effects of a training intervention program on empathy, group cohesion and burnout among nursing home personnel. Method : Fifty-

three nursing home personnel participated in a four-module computer interactive training program designed to increase group cohesiveness and empathic tendencies and decrease perceived levels of burnout. The majority of the participants were females (97%), ages 18-35 (43%) with daily direct patient contact (69.8%), employed full-time (77%), worked days (66%), and had a high school diploma (60%). Pre- and post-training measurements of burnout, empathy, and group cohesion were obtained using the Maslach Burnout Inventory Human Services survey (MBI), the Mehrabian Emotional Empathy Scale (MES), and Seashore's Group Cohesiveness Index. Results : Nursing home personnel reported significantly lower levels of professional burnout ($t = 3.11, p < .01$) after the training. Feelings of emotional exhaustion and depersonalization decreased while sense of personal accomplishment increased significantly ($t = 3.45, p < .001$). Decreased perceived burnout was associated with increased willingness to help one another on the job and greater feelings of getting along with one another and sticking together. Conclusion : These findings suggest that nursing home personnel can benefit from the time and money spent on computer-based training designed to enhance their feelings of personal accomplishment, improve group cohesiveness, and increase their empathy tendencies toward patients while decreasing overall professional. Keywords : Professional burnout, nursing home personnel

VIDEOCONFERENCING BETWEEN HOSPITALS : EMBRUN AND AIGUILLES - HAUTES ALPES - FRANCE

Pierre LUTZLER¹, Alain SOLIVERES², Odile BAUGE-FARALDI³, Olivier DRUNAT⁴ (1. Geriatric Department, Hospital Embrun - Aiguilles, France; 2. Association, AGEtIS, France; 3. Geriatric Department, Hospital Compiègne, France; 4. Geriatric Department, AP HP Paris, France)

Introduction : Situated in the Hautes Alpes is a population base comprised of four districts: the Queyras Valley, the Guillestrois region, and the towns of Embrun and Savines le Lac. These districts have a significant geriatric contingent; of the 19,000 residents, 20% are older than 65 in age, and 10% exceed the age of 75. This is a vast mountainous area, with the effect of isolating communities and resources. This population base is served by four medical establishments with a combined total of 450 beds. Method : In order to be able to provide a rapid response adapted to the needs, we have opted for a telemedicine network, joining the hospitals at Embrun and Aiguilles. The local hospital at Aiguilles (caller) is equipped with a patient station which includes a large screen and a video camera on a mobile cart stationed at the patient's bedside. The central hospital in Embrun (respondent) is equipped with a fixed-in-place system and a PC which permits access to computerized medical records. Results : In our experience over the last three years, this system addresses the challenges of isolation and lack of direct access to care by geriatric patients. Conclusion : Consequently, medical professionals are able to communicate easily without need for significant travel. The use of this tool by these teams has been well received, and improves patient comfort by obviating transport to other establishments. Also improved are working conditions, diagnostics, and decision making. Furthermore, the tool has provided a structural improvement of the medical activities. Keywords : Geriatric - Videoconferencing - Network

PP26 S-183

EXPERIENCES OF INTERNET USE IN THEIR DAILY LIVES AND ITS MEANING AMONG OLDER ADULTS

Jung-Don KWON¹, Yujin KIM², Tae-Young UM³ (1. Department of

Social Work, Mokwon University, Korea; 2. Department of Social Welfare, Kyungpook National University, Korea; 3. Department of Social Welfare, Kyungil University, Korea)

Introduction : The recent trend shows that the number of internet users among older adults and their level of the ability to use internet have been increased. The purpose of this study is to investigate the phenomenon of senior information technology. **Method :** Using qualitative descriptive method, this study aims to explore how and in which context older adults use internet. It also aims to address the nature and the outcomes of elderly people's use of internet in their daily lives. In-depth interviews with 16 older participants were analyzed with qualitative content analysis and constant comparison method. **Results :** The finding shows as follows: ① Á agonies felt by the "ambiguous" age group in the modern society, ② È the analogue generation joining the digital, ③ Ê daily changes according to the internet use, ④ Í senior information technology and its flip side of coin. **Conclusion :** Based on the research findings, implications for senior information policy are addressed in three ways: promoting productive use of internet among older adults, meeting their health-related concerns using internet, and finding ways to integrate the idea of humanities into senior information technology. **Keywords :** senior information technology, internet use, qualitative descriptive study

PP26 S-184
DOES TYPE OF ACTIVITIES MATTER? AGE AND GENDER DIFFERENCES IN LEISURE ACTIVITIES AMONG JAPANESE OLDER ADULTS

Madoka OGAWA¹, Yoshiko ISHIOKA², Yasuyuki GONDO³, Marina KOZONO², Yukie MASUI¹, Takeshi NAKAGAWA³, Megumi TABUCHI⁴, Yukiko TATSUHIRA², Kazunori IKEBE⁵, Kei KAMIDE⁶, Yasumichi ARAI⁷, Ryutaro TAKAHASHI⁸ (1. Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan; 2. Graduate School of Human Sciences, Osaka University, Japan; 3. Clinical Thanatology and Geriatric Behavioral Science, Osaka University, Japan; 4. Department of Psychological Science, Kwansei Gakuin University, Japan; 5. Graduate School of Dentistry, Osaka University, Japan; 6. Department of Geriatric Medicine, Osaka University, Japan; 7. Department of Internal Medicine, Keio University School of Medicine, Japan; 8. Vice-Director, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : Our aim in this study is to explore whether and how participation in different types of leisure activities might vary by age and gender among Japanese older adults. Because level of involvement in leisure activities is closely associated with health status in older age, better understanding of individual differences in leisure activities is critical to identify who, among the older population, are less likely to participate in potentially health-promoting activities. **Method :** We used data from 1,966 older participants in the Septuagenarian, Octogenarian, Nonagenarian Investigation With Centenarian (SONIC), a multi-cohort survey project in Japan. Participants answered the number of activities they participate in regularly in each of the 11 categories (e.g., physical activities, social activities with close social partners, religious activities). Using the total number of activities in each category as participants' activity score, we conducted two-way analysis of variance to examine whether there is a difference in scores on each category by age cohort (age 70 versus 80) and by gender. **Results :** Significant differences by age and gender were observed for 3 categories: physical activities, social activities with close social partners, and travel. Of the age-by-gender groups, eighty-year-old women were significantly lower in scores on physical activities whereas eighty-year-old men were significantly less likely to

participate in social activities with close social partners. Scores on travel were lower for eighty-year-old than seventy-year-old participants. **Conclusion :** Age and gender differences in participation in leisure activities are not consistent across types of activities. **Keywords :** leisure activities, age and gender

PP26 S-185
LEISURE-TIME ACTIVITY REDUCES DEPRESSIVE SYMPTOMS: ARE THERE ANY AGE AND GENDER VARIATIONS

Shiau-Fang CHAO (Department of Social Work, National Taiwan University, Taiwan)

Introduction : Leisure-time activity is considered a key for enhancing psychological well-being in later life. However, relatively little information is available regarding the prevalence, trends, and long-term effects of leisure-time activity participation among the elderly in Taiwan. This session is interested in exploring the effects of leisure-time activities against depression across different age and gender groups. The objectives of this session are as follows: 1.To present the trajectories of leisure-time activity participation among the elderly in Taiwan. 2.To compare the relative effectiveness of various leisure-time activities on depressive symptoms across different age and gender groups. 3.To offer insights on improving program delivery to promote leisure-time activity participation and psychological well-being of Chinese elderly. **Method :** Data were drawn from the "Survey of Health and Living Status of the Elderly in Taiwan", involving up to six repeated observations of a national sample of 4,049 adults older than 60 years of age between 1989 and 2007. A series of hierarchical linear models were estimated. **Results :** 1.Rates of participation in outdoor activities, learning activities and solitary activities decreased over time. 2. The decreases in outdoor activities were steeper for older-old adults compared with younger-old. The declines in learning activities were steeper for older men than older women. 3. The effects of outdoor activities against depression were superior to other activities. 4. The benefits of increasing outdoor activities on reducing depressive symptoms arose primarily among older women. **Conclusion :** The results emphasize a good match among age, gender, and types of leisure-time activities could exert an optimal effect on psychological well-being in later life. **Keywords :** leisure, activity, depressive symptom

PP26 S-186
THE EFFECT OF LEISURE CULTURE ACTIVITIES ON DEPRESSION IN GRANDPARENTS RAISING GRANDCHILDREN

Yoon Jung LEE (Social Welfare for the Elderly, Hoseo Univ., Korea)

Introduction : Recently, an interest on parenting stress and depression of grandparents raising grandchildren is rising according to the increase of working couple and divorce. Discussing around developmental task of elderly, one of the influencing factors on increase of grandparents' parenting stress and depression is leisure restriction. But, this factor has received far less rigorous analysis. So, the purpose of this article is to offer an analysis of the effect of leisure culture activities on depression in grandparents raising grandchildren. **Method :** The data was collected from 172 grandparents raising their grandchildren in 2011 national survey results on the elderly life conditions. Their analyses were composed of descriptive statistic and multiple regression analysis. **Results :** First, grandparents' mean score of depression was 7.1 of 15 what suggests middle level of depression. Second, the rate of grandparents who take exercise is 41%, the rate of travel experienced grandparents is 21% and the rate of grandparents

who do leisure culture activities except exercise and travel is 18%. The score of leisure culture activities satisfaction is 2.9 on a five-point scale. Third, the depressive symptom of grandparents who are female, have spouse, uneducated (In comparison with graduated from middle school), have more chronic illnesses, have less leisure culture activities satisfaction, have more communication with relatives and friends, and do not exercise is higher. Conclusion : Although they could not have limited time for doing preference leisure culture activities, they have to be provided deliberate chances to relax and enjoy leisure activities to make good use of their leisure time through social support. Keywords : leisure, depression, grandparents raising their grandchildren

PP26 S-187

CHILDHOOD ADVERSITY EXPERIENCES, SELF-ESTEEM, AND DEPRESSION AMONG KOREAN MALE BABY-BOOMERS AND OLDER MALE ADULTS

Hey Jung JUN¹, Myoung Yong KIM², Janice I. WASSEL³, Kyu Young CHO¹ (1. Department of Child and Family Studies, Yonsei University, Korea; 2. Administration Bureau, Seoul Metropolitan Government, Korea; 3. The UNCG Gerontology Program, University of North Carolina Greensboro, USA)

Introduction : Although studies on adulthood health disparities from the life-course perspective are recently increasing, little is known on the association between childhood hardships and mental health in later adulthood. From the life-course perspective, this study examines the effects of childhood adversity experiences on depression in later adulthood and the differences between male baby-boomers and older male adults. Method : This study used the national longitudinal data (2006 to 2010) from the Korea Welfare Panel Study (KOWEPS). The sample included male baby-boomers (N=1,096) and older male adults (N=1,541). The structural equation model was used to identify longitudinal changes in depression and tested the mediating impact of self-esteem while controlling other socio-economic and demographic factors. Data analysis was conducted with Mplus 6.0. Results : This study found that childhood adversity experiences had no direct effects on the depression of neither male baby-boomers nor older male adults. However, it showed indirect impacts on the depression of older male adults through their level of self-esteem, while no such effects were found in the male baby-boomers. Conclusion : Childhood adversity experiences impacted on the depression level of only older male adults, with self-esteem playing a mediating role in the causal pathway. The mental health and well-being of older adults originates at an early age and casts a long shadow throughout the life-course. Thus, we need to pay more attention to the negative impact of childhood hardships and how to enhance self-esteem. Further, differentiated intervention approaches for baby-boomers and older adults are needed to prevent and reduce depression in later adult life. Keywords : Life course perspective, Childhood adversity experiences, depression in later adulthood

PP26 S-188

THE ANTECEDENT AND CONSEQUENCE OF SPOUSAL VIOLENCE

Hey Jung JUN¹, Miae CHUN², Min Kyoung PARK¹ (1. Department of Child and Family Studies, Yonsei University, Korea; 2. Department of Social Work, Chongshin University, Korea)

Introduction : There has been a growing concern regarding spousal violence in elderly populations. However, little is known on spousal violence perpetration. Given this, it is necessary to achieve a comprehensive understanding of spousal violence perpetration in terms of both its antecedents and consequences. From a life-course

perspective, this study aims to explore the association between childhood socio-economic status, spousal violence perpetration, self-esteem and depression and the gender differences of these associations among older Koreans. Method : Data for the present study were taken from the Korea Welfare Panel Study. The sample included the aged over 65 living together with their spouses at 2006 (male=1,362, female=931). For analyses, Mplus 6.12 for Structure Equation Modeling was used. Results : The results indicated that inflicting either verbal or physical violence on one's spouse was associated with childhood SES, elderly self-esteem among male respondents. Lower childhood SES had effects on higher level of tendency to perpetrate. Further, older male perpetrators demonstrated lower self-esteem, and ultimately the elderly who reported lower self-esteem showed higher levels of depression. For female respondents, there was no such significant association. Conclusion : This study makes an important contribution to the understanding of how childhood SES impacts later life in terms of the perpetration of spousal violence, self-esteem and depression as the consequences. The findings suggest that the policy makers, practitioners, and researchers not only need to consider appropriate prevention methods for present perpetrators, but also need to identify the portentous characteristics of potential perpetrators and implement early intervention programs from a more long-term point of view. Keywords : Childhood socio-economic status, Spousal violence perpetration, Depression in later life

PP26 S-189

QUALITY OF LIFE OF OLDER PERSONS IN URBAN AND RURAL SETTINGS IN THE KHOMAS REGION, NAMIBIA

Janet ANANIAS¹, Herman STRYDOM² (1. Social Work, University of Namibia, Namibia; 2. Social Work, North-West University, Potchefstroom Campus, South Africa)

Introduction : Namibia is one of few African countries that have a social protection system in the form of a non-contributory pension scheme to all citizens above the age of 60 years. However, older people in Namibia are still facing many socio-economic challenges because of the increasing costs of living that affect their quality of life. Few research projects have been done to examine the socio-economic conditions and quality of life of older people living in urban and rural areas in Namibia. Thus, the objective of this presentation is to report on the findings from a needs assessment on the quality of life of older people living in urban and rural settings in the Khomas region in Namibia. Method : Key informant interviews were conducted with professionals and community leaders, while focus group discussions were held with older people and informal caregivers. Results : Key themes identified in this study were food security of older people, outstanding debts of older people, poor public and private transport and substandard housing. Findings suggest that older people in urban and rural settings face unique challenges. In urban areas, influences due to westernization and urbanization robs older people from enjoying peace of mind, while social and economic infrastructure are out of reach of older people from rural areas. Conclusion : The study implies that equal resource distribution between urban and rural settings can improve the quality of life of aging communities. Keywords : quality of life, older persons, Namibia

PP26 S-190

PSYCHOGENETIC ANALYSIS OF COGNITIVE FUNCTIONS IN ELDERLY TWINS

Liudmila Filippovna OBUKHOVA¹, Olga Borisovna OBUKHOVA² (1. Developmental Psychology, Moscow Psychologo-Pedagogical University, Russia; 2. Clinical Psychology, Moscow State University of Psychology and Education, Russia)

Introduction : Interest in old age due to demographic changes in the world, and especially in the developed countries. Understanding of old age as a total involution is gradually replaced by examining the various compensatory mechanisms for the elderly not to reduce the level of physical and mental performance. In psychological studies of the elderly found fact increase interindividual variability indicators of mental regulation of behavior on many cognitive criteria - fluid intelligence, reaction time, certain types of memory (Barton et al., Morse). What is the etiology of individual differences and the reasons for the increased variability in the elderly? The answer to this question can be obtained within psychogenetic studies of cognitive functions in the elderly. **Hypothesis :** In old age, there are features of the development which gives reason to expect changes in the genotype-environmental relations in the interindividual variability of psychological (cognitive) function. **Subjects.** 32 pairs of monozygotic twins and 27 pairs of dizygotic twins, living in Moscow. Only 118 people. Age of subjects from 43 to 62 years. Gender, sample characteristics - 38 men and 80 women. **Methods :** Wechsler test, neuropsychological methodology (Luria), a formal survey of dynamic properties of individuality (Rusalov), SPSS. **Results :** It was shown that aging in the cognitive process begins primarily in the area of non-verbal intelligence. **Conclusion :** Changes in genotype-environmental relations in the variability of cognitive functions (Plomin, McGue, Fulker, etc.) during late stages ontogeny confirmed the data obtained on twins aged in Russia. **Keywords :** aging, genotype-environmental relations

PP26 S-191

TIME USAGE AND PATTERNS OF TIME USE: AGE DIFFERENCES

Soondool CHUNG¹, Hyeji CHOP¹, Eunjin LEE¹, Suhyun KIM¹, Yuhwi KIM¹, Minhyeon SUNG¹, Heesoo YOUN¹, Kyoungmin LEE² (1. Graduate School of Social Welfare, Ewha Womans University, Korea; 2. Dept. of Social Work, Seoul Women's University, Korea)

Introduction : The purpose of this study was to understand time usage and pattern of time use by three different age groups such as the young, the middle-aged, and the elderly. **Method :** The data used for this study were from "Korean Time Use Survey" which is collected every five years by Statistics Korea (KOSTAT). Data collected in 1999, 2004, and 2009 were used for the analysis. **Results :** The results are summarized as following: The amount of time usage for personal care took first place in all age groups, followed by social life/recreation and leisure activities. Learning, work, and household care took third place and it was appeared to be different from each age group. Three different patterns of time use were classified based on the cluster analysis, which were work-centering, learning-centering, and social life/recreation and leisure-centering cluster. It was revealed mainly higher as for learning-centering in the young, work-centering in the young and the middle-aged, and society/leisure activity-centering in the elderly. The patterns of time use represented by three clusters have not been changed across the data for three different years, except for a few differences in the amount of time use at each pattern. **Conclusion :** Further discussions concerning no significant differences in time usage by age were provided and measures for changing time use in later life were discussed. **Keywords :** time usage, patterns of time use, age differences

PP26 S-192

THE CONCEPTUALIZATION OF PERSONAL GROWTH AFTER SPOUSAL BEREAVEMENT IN LATE LIFE

Sujie CHANG (Department of Social Welfare, Kyungsung University, Korea)

Introduction : The purpose of this study is to explore the personal growth process after loss of a spouse in late life, and to conceptualize "personal growth after spousal bereavement." **Method :** A qualitative study was conducted. The participants of the study were 17 seniors who experienced the death of a spouse within the past 10 years and in-depth interviews were conducted. The data were analyzed according to Strauss & Corbin's grounded theory(1998). **Results :** The analysis resulted in 134 concepts, 40 subcategories, and 18 categories. Paradigm showed that during the growth process after spousal loss, the causal conditions were "marital relationships," "independent/dependent tendencies," and "emotional readiness for spousal death," and the phenomena were "depression," "hopelessness," "daily stress," "psychological intimidation," "regret," and "sense of being freed." The contextual conditions were "desire for intimate personal relationships" and "desire to maintain independence"; the action/interaction strategies were "facing reality" and "efforts for the new life"; and the mediating conditions were "social support" and "spirituality." The results were "reconstruction of the meaning in life," "increase in self-esteem," and "embrace and acceptance." Furthermore, when personal growth after spousal bereavement was analyzed focusing on changes over time, the growth process consisted of three steps: "sadness and despair," "embracing and moving forward," and "personal growth". **Conclusion :** The results of the study show that personal growth after spousal loss is an integrative process in life after crisis, and can be conceptualized as the process of overcoming the despair that follows spouse's death, seeking a new life by actively taking control, and discovering a strengthened self. **Keywords :** Spousal bereavement, late life, personal growth

PP26 S-193

THE EFFECTS OF NEGATIVE LIFE EVENTS IN PRE-ADULTHOOD ON PSYCHOLOGICAL WELL-BEING OF MIDDLE AGED ADULTS: A COMPARATIVE STUDY ON SOUTH KOREA AND THE UNITED STATES

Yu Jeong KIM¹, Jeong Shin AN² (1. Master, Dept. of Child & Family Studies, Pusan National University, Korea; 2. Associate Professor, Dept. of Child & Family Studies, Pusan National University, Korea)

Introduction : The purposes of this study examined whether negative life events in pre-adulthood had influences on psychological well-being of middle aged adults in Korean and American. **Method :** The data came from 511 adults in Korea and 1622 in U.S. (using the MIDUS± data) aged 40-59. **Results :** The negative life events concerning parent($\beta = -.18, p < .001$), violence($\beta = .15, p < .001$), and death($\beta = .11, p < .01$) were significant predictors of psychological well-being in Korean middle aged adults. In, U.S., negative life events concerning school($\beta = -.08, p < .001$), parent($\beta = -.10, p < .001$), and violence($\beta = .13, p < .001$) effected on psychological well-being in mid-adulthood. There were significant differences in the associations between negative life events and psychological well-being dimensions. **Conclusion :** These findings support life course perspective that past experiences have cumulative effects and the individual life is connected with people having meaningful relationships. The negative life events had diverse influence in each dimension of psychological well-being for Korean and American differently. These differences might be due to cultural differences between Korea and the U.S. Overall, findings suggest that negative life events in pre-adulthood are significantly associated with various dimensions of psychological well-being of middle aged adults, sometimes contingent on the cultural context, supporting the assumptions of life course perspective. **Keywords :** psychological well-being, life events, life-course perspective

PP26 S-194

RETIREMENT PLANNING AND DECISION-MAKING PROCESSES AMONG MARRIED COUPLES

Sung-Eun YOON (*Retirement Research Center, Samsung Life Insurance, Korea*)

Introduction : The purpose of this study is to examine the impact of various types of financial management and decision-making among married couples in preparing for retirement. Special attention is given to how the distribution of financial decision-making power between spouses affects their level of financial retirement preparation. How couples make decisions about household finances and the role that each spouse plays is a critical part in determining the allocation of family resources, thereby affecting the couples' long term preparation for retirement. However, there is little empirical investigation on the issue. This study is a modest step to fill the gap in this area of retirement studies. **Method :** Data was gathered from 1,220 married non-retirees residing in 6 metropolitan areas in South Korea. Statistical methods used for the data analysis include descriptive statistics and multiple regression using the SPSS 19.0 program. Average monthly total household savings and retirement savings, and the level of overall financial retirement preparation were measured and compared by the type of decision-making arrangement of each household (i.e., Husband-dominant, Wife-dominant, and Shared). **Results :** Results show that couples who share financial decision-making power devote more effort to retirement preparation compared to other types of couples. Results of regression analysis show that Shared Couples not only have higher levels of total household savings and retirement savings, but also are generally better prepared for retirement than Wife-dominant Couples. **Conclusion :** This research shows the importance of financial teamwork in marriage in preparing for retirement. Implications of the study are discussed in detail. **Keywords:** married couples, financial decision-making, retirement preparation

PP26 S-195

EXPECTATIONS AND PLANS OF ACADEMICIANS AFTER RETIREMENT

Ayşe CANATAN (*Sociology, Gazi University, Turkey*)

Introduction : Retirement is an important stage in human life. In 20th.century people enrolled social security system, they work at least 25 years. How do people accomodate retirement days after the long working years? What do they think about their salary decrease? Some jobs suitable to put a stop, such as official, public servant, but for academicians is not easy to put a stop working, they continue to work after retirement (if they want) can study outside of university. In this research it was asked the questions about their retirement plans and what do they think about retirement. It is important to know their plans to prepare new areas for them. In our country (Turkey) scientists and academicians are valuable for our development. **Method :** The sample of the research was composed to women and men academicians working and newly retired (for one year). Sample size is 200 (112 men and 88 women) and sampling format is purposive sampling. Data analysing is made by SPSS 21.0. The first hypothesis of this research is women retiries can easy accomodate than men to retirement stage. The second one is men are more willing to work than women after retirement. **Results :** These two hypothesis of research are corrected. Women accomodate to retirement more easily than men. After retirement men are more wiiling to work after retirement. **Conclusion :** Retirement is one of the most important stages, coming at transititon to old age. In this era, in our country the number of retired people and elderly people are increasing. **Keywords :** retirement, academicians,

old age

PP26 S-196

AGING AND RELIGIOUS PARTICIPATION IN LATE LIFE

Kuan-Yuan WANG¹, Kyle KERCHER², Jui-Yen HUANG³, Wen-Ming WANG⁴, Ming-Shyan HUANG⁵, Karl KOSLOSKI² (*1. Department of Internal Medicine, Kaohsiung Municipal Hsiao-Kang Hospital, Taiwan; 2. Department of Gerontology, University of Nebraska at Omaha, USA; 3. Department of Maternal and Child Health, Gillings School of Public Health, University of North Carolina at Chapel Hill, USA; 4. Department of Internal Medicine, Kaohsiung Municipal Ta-Tung Hospital, Taiwan; 5. Division of Geriatrics and Gerontology, Department of Internal Medicine, Kaohsiung Medical University Hospital, Taiwan*)

Introduction : The aim of the study is to evaluate the relationship between two dimensions of religiosity, religious service attendance and religious beliefs, and the process of aging. **Method :** Secondary analysis of longitudinal data from the Florida Retirement Study was used to assess the trajectories of religious development over time. We analyzed data from six interview waves (Waves 1 and 5 - 9) with 1000 older adults age 72 or over. Covariates included demographic factors (age, gender, marital status, income, education and religious preference), functional disability, and self-rated global health. A latent variable growth model of religious attendance and religious belief was estimated using Mplus version 6.1. **Results :** A baseline model of growth processes only indicated significant variation and mean decline in religious attendance, but no significant variation nor mean change in religious beliefs over time. A second model was estimated that included an intercept for both latent variables, but included a slope term for religious attendance only. Finally, a third model was estimated that included the latent variables of model 2 and constrained error variances, plus a set of 17 covariates. The model fit statistics for the final model of religious attendance indicated very good fit for this latent growth curve model. **Conclusion :** The decline in mean religious attendance across time did not accompany a mean increase in religious beliefs as expected. There were numerous individual differences in the trajectory of decline for religious attendance, as well as in the initial levels of attendance and religious beliefs. **Keywords :** Aging, Religion, Health

PP26 S-197

RELIGIOSITY PATTERNS AMONG OLDER KOREAN IMMIGRANTS IN U.S.: A LATENT PROFILE ANALYSIS

Soonhee ROH¹, Yeon-Shim LEE², Jaehoon LEE³, Michael J. LAWLER⁴, Elizabeth TALBOT⁵, Kyunghag LEE⁶, Dongpil YOON⁷ (*1. Department of Social Work, University of South Dakota, USA; 2. Social Work, San Francisco State University, USA; 3. Center for Research Methods and Data Analysis, University of Kansas, USA; 4. School of Health Sciences, University of South Dakota, USA; 5. Social Work, University of South Dakota, USA; 6. Social Work, Wichita State University, USA; 7. Social Work, University of Missouri-Columbia, USA*)

Introduction : Using Latent Profile Analysis (LPA), the purposes of this study were to: (1) empirically develop profiles of religiosity and (2) examine the association of the religiosity profiles to depression and life satisfaction in older Korean immigrants. **Method :** A total of 200 older Korean immigrants residing in New York City (M age=72.50, SD= 5.10; 42.5% female) participated in the surveys. LPA was conducted to identify classes that are homogenous within and heterogeneous between groups in religiosity. Religiosity was measured by daily spiritual experience, values/beliefs, forgiveness, private

religious practice, religious/spiritual coping, and religious support. Identified profiles were examined to differentiate levels in depression and life satisfaction. Results : Two distinct latent profiles were identified: Profile 1 (25.6%) constituted low levels of religiosity ("Low-R"), whereas Profile 2 (74.3%) showed high levels of religiosity ("High-R"). These two latent profiles did not differ in age, education, income, marriage status, and living arrangement of their members. Yet there were more Korean elderly women in the "Low-R" than older Korean men. Although a level of depression was similar across the two latent profiles, greater levels of social support and life satisfaction were found in the "High-R". Conclusion : This study found the strong association of religiosity profiles with life satisfaction among older Korean immigrants, but not with depression. Geriatric clinicians need to consider gender as an important factor in specifying the association between religiosity and quality of life, and address how to best formulate policy toward creating more health-promotion interventions. Keywords : Religiosity , depression, life satisfaction, latent profile analysis

PP26 S-198

PREDICTORS OF SUCCESSFUL AGING AND SUBJECTIVE WELL-BEING OF KOREAN-AMERICAN ELDERLY IN HONOLULU, HI

Haekyung CHOI (*Department of Social Welfare, Chungnam National University, Korea*)

Introduction : The purpose of this study was to investigate the level of Korean-American elderly's quality of life in terms of successful aging and subjective well-being and to examine the effects of various personal resources and formal welfare benefits and resource utilization. Method : Data were collected from 117 elders aged 60+ by face to face interview or self-administered survey using structured questionnaires. SPSS 19.0 software was used for descriptive analysis of successful aging and subjective well-being and multiple regression analysis measured the impact of personal resources, filial responsibility expectations, formal support on successful aging and subjective well-being. Results : The findings indicated that the mean score of Korean concept of successful aging measured by 5 point likert scale was 3.53 and regarding subjective well-being measured by Philadelphia Geriatric Center Morale Scale, the mean was 10.21. 34.9% among 117 participants were classified by low morale (under 9 points in high morale responses) and 27.4% were mid-range morale (10-12 points in high morale responses) while 37.7% were high morale (13-17 points in high morale responses). Results of the multivariate analysis indicated that significant variables predicting quality of life were Korean-American elderly's informal social support, economic status, and health status. Conclusion : The substantial numbers of elders aged 60+ in Honolulu, HI were fairly good with their quality of life in terms of successful aging and psychological well-being. However, their quality of life was significantly influenced by personal resources. Based on the findings, implications for social welfare interventions in order to improve Korean-American elderly's successful aging and subjective well-being were discussed. Keywords: successful aging, subjective well-being, predictors

PP26 S-199

OLDER KOREAN IMMIGRANTS IN THE US: PERSPECTIVES ON WISDOM

Holly NELSON-BECKER, Younhee HARM (*School of Social Work, Loyola University Chicago, USA*)

Introduction : The ancient search for wisdom and wise behavior is an increasingly important area for modern gerontology. While some

scholars define wisdom as expert knowledge (Baltes & Staudinger, 2000; Sternberg & Jordan, 2005), others explore implicit wisdom available to all (Ardelt, 2004). Although wisdom may not be a set of rules or virtues that can be easily transmitted, it does form part of optimal living. Thus exploring people's beliefs about what wisdom is and how it is expressed can add to understanding of positive aging. Method : This qualitative study explored views of wisdom among older Korean immigrants in the US. Two focus groups (FG) were conducted in a midwestern city (n=8) and suburb (n=10). The former FG had an age range of 79 to 97, while the latter had an age range of 66-83. Data was analyzed using a constant comparative method and Atlas.ti software. Results : Participants in FG1 were generally older and more religiously oriented, while participants in FG2 were younger and represented broader philosophical, religious, and political views. Elements of social, emotional, and religious wisdom were highlighted in the first FG that suggested learning control of one's mind, one's feelings, and respecting others were important. The second FG underscored political and social influences of wisdom, including skillful social interaction, environmental experience, and balancing feminism and Korean mothers' judgment. Conclusion : Implications suggest that achieving harmonious relationships, holding back first reactions and striving for learning in all, even adverse, situations are important to these groups of older immigrant Koreans.

Keywords : wisdom, Korean immigrants

SELF-REPORTED EXHAUSTION AMONG OLDER ADULTS WITH MILD COGNITIVE IMPAIRMENT; PHYSICAL FUNCTION, PHYSICAL ACTIVITY LIFE SPACE

Kota TSUTSUMIMOTO¹, Takehiko DOI¹, Hiroyuki SHIMADA¹, Hyunte PARK², Hyuma MAKIZAKO¹, Daisuke YOSHIDA¹, Sangyoon LEE², Yuya ANAN¹, Kazuki UEMURA¹, Tadashi ITO¹, Takao SUZUKI³ (*1. Section for Health Promotion, National Center for Geriatrics and Gerontology, Japan; 2. Section for Physical Functioning Activation, National Center for Geriatrics and Gerontology, Japan; 3. Research Institute, National Center for Geriatrics and Gerontology, Japan*)

Introduction : Exhaustion among older adults is one component of frailty and related to several aspects of walking activities; speed, endurance, quantity. Cognitive impairment, such as mild cognitive impairment (MCI), was a risk of transition to frailty. However, which aspects of walking-related activity were associated with exhaustion among MCI subjects. The aim of this study was to investigate whether exhaustion had relation with walking speed, gait endurance, quantity of physical activity, and life-space among older adults with MCI. Method : Participants in this study met the definition of MCI using Petersen's criteria and were recruited from our databases (n = 5104). Self-reported exhaustion was assessed using the criteria from SOF index and participants were classified into exhausted group: EG (n = 62) and, non-exhausted group: non-EG (n = 294). We measured demographic data, walking speed, six minutes walking test, physical activity and life-space assessment. Results : EG had significantly smaller life space, compared to non-EG (p < 0.001). Even if using stepwise backward method, life space was independently associated with exhaustion state (OR = 0.97 [0.95 - 0.99]). Conclusion : Smaller life space was associated with having exhaustion among older adults with MCI. As the outer shell of walking-related activity, life-space may precociously be deteriorated by exhaustion compared to other aspects. To elucidate the association between exhaustion and function among MCI subjects would contribute to successful aging in older adults with cognitive impairment. Keywords : Self-reported exhaustion, mild cognitive impairment, life space

PP26 S-201

I AM ACTIVE: EFFECTS OF A PROGRAM FOR PROMOTING SUCCESSFUL AGING

Neyda M.A. MENDOZA RUVALCABA¹, Elva Dolores ARIAS MERINO², Jazmin CUEVA CONTRERAS³, Beatriz Adriana CORONA FIGUEROA³ (1. Department of Health Sciences, University of Guadalajara. CUTONALA, Mexico; 2. Department of Public Health, University of Guadalajara. CUCS., Mexico; 3. Department of Public Health, University of Guadalajara. CUCS. PhD Program in Public Health, Mexico)

Introduction : I AM ACTIVE is a program designed to encourage successful aging in people 60 years and over, through improved physical activity, healthy nutritional habits and cognitive functioning, that promotes better quality of life. The objective of this study is to assess the effectiveness of this program. Method : Longitudinal Design (RCT). 64 healthy elderly (experimental n=31, control n=33), the program consisted in theoretical-practical sessions of physical exercise, nutrition habits and cognitive training, based on the Precaution Adoption Process Model. A pre-post and 6 month follow-up battery was applied. Mean differences and effect size was calculated. Results : Groups were similar at baseline. After the program the experimental group improved significantly in the different areas compared with the control group: Physical activity: risk of falls(p<.05,d-Cohen=.34), balance(p<.05,d-Cohen=.40), range of motion(p<.05,d-Cohen=.65), self-efficacy for physical activity(p<.001,Cohen-d=.76). Nutrition: nutrition self-efficacy(p<.01,d-Cohen=.61), nutritional status(or<.05), water consumption(p<.05). Cognitive performance: processing speed(p<.001,d-Cohen=.50), working memory(p<.05), self-efficacy to improve memory(p<.001,d-Cohen=.89). QOL: general(p<.01,d-Cohen=.63), health-functionality(p<.01,d-Cohen=.54), psychological and spiritual(p<.05,d-Cohen=.44) and family(p<.05,d-Cohen=.36). In the follow-up, improvements remained at risk of falls, self-efficacy for physical activity, self-efficacy for nutrition, processing speed, QOL general and its spiritual and psychological component. Most of the experimental group progressed of stage in the behavioral change from PAMP between pre-post test, and maintained at follow-up, while the control group remained without significant changes. Conclusion : Findings show that the program promotes a behavioral change for the enhancement in domains of successful aging as well as in quality of life in healthy elders. Keywords : successful aging, active aging, physical activity, nutrition, cognitive function

PP26 S-202

THANK GOODNESS FOR MY COMPUTER!: CASE STUDY OF A 95 YEAR OLD AUSTRALIAN WOMAN

Suzanne BYERS (Palliative and Supportive Services, Flinders University, Australia)

Introduction : The application of technology in older age often revolves around the opportunities to enhance independent living. Exploration and examination of the role of technology for the purposes of recreational pleasure, social networking and healthy ageing remains more limited. This paper considers the role of computer technology in the quality of life of a now 95 year old Australian woman. Method : Personal interviews and observational studies were conducted across a span of fifteen years. Results : The introduction of a computer to the life of a single woman of 80 years old created an important foundation of compensation as skills, physical abilities, particularly mobility and social networks decreased over time. Personal interests were able to be maintained across a fifteen year life span such as playing scrabble, completing jigsaws puzzles, keeping in touch with distant relations, and staying connected with music, books and global events.

Conclusion : Decreased mobility and frailty can have a significant impact on the quality of life of an older person. Digital technology should be considered within the suite of interventions to assist an older person in maintaining preferred lifestyle choices and a good quality of life. Keywords : Older people; social environments; computer technology

PP26 S-203

THE ASSOCIATION BETWEEN LIFETIME MUSICAL ACTIVITIES AND COGNITIVE FUNCTION OF THE ELDERLY

Alicia NEVRIANA¹, Pandu RIONO¹, Tri Budi Wahyuni RAHARDJO² (1. Biostatistics and Population Studies, Faculty of Public Health, Universitas Indonesia, Indonesia; 2. Center for Ageing Studies, Universitas Indonesia, Indonesia)

Introduction : Decreasing cognitive function of the elderly is one of the most common problems that might affect their quality of life. Music is an element that is believed to be able to contribute to quality of life of the elderly. However, whether musical activities that are done throughout the life span related to cognitive function is unclear. In this research, we evaluated the association between lifetime musical activities and cognitive function. Method : Fifty three older adults from three nursing homes in East Jakarta were selected and interviewed regarding their characteristics and lifetime musical activities. Cognitive function was also measured using MMSE. Results: The results of this preliminary study revealed that a possibility of an association between lifetime musical activities and cognitive function of the elderly was indicated. The result also showed that the participants who were not actively involved in musical activities during their lifetime were twice more likely to develop cognitive function impairment than the elderly who were actively involved in musical activities, after being adjusted by the characteristics. Conclusion : These results suggest the beneficial effect of musical activities throughout the life span on cognitive functioning for the elderly. Keywords : Ageing, Cognitive function, Music

PP26 S-204

THE RELATIONSHIPS BETWEEN MULTIPLE DIMENSIONS OF NOSTALGIA AND POSITIVE EMOTION

Ayumi ISHII, Yasuyuki GONDO, Shinichi SATO (Graduate School of Human Sciences, Osaka University, Japan)

Introduction : Previous research has shown that nostalgia is an affective process that can accompany autobiographical memories. Nostalgia has been described as a complex feeling that elicits positive emotion. However, most of these studies have measured nostalgia on only a single dimension, so it remains unclear which dimension is responsible for positive emotion. This study aimed to develop a scale that measures multiple dimensions of nostalgia and to determine which of these dimensions elicit positive emotion. In this study, we focus on nostalgia evoked by music because recent investigations have suggested that nostalgia is often triggered by music. Method : Participants were 41 undergraduates and graduate students. They were asked to answer a multi-dimensional nostalgia scale after listening to nostalgic music for their generation. They also answered two scales on the elicited deactivating-positive emotion and the musical mood. Results : Exploratory factor analysis identified three factors: familiarity, wistfulness, and old-fashioned humor . Multilevel model analysis showed that only wistfulness significantly enhanced deactivating-positive emotion, even when controlling for the musical mood. Conclusion : The wistfulness dimension of nostalgia comprises several ambivalent emotions such as missing someone/something,

sentimentality, and longing, which can be linked with autobiographical memories for a specific target. Ambivalent emotions and these autobiographical memories triggered by music might interact to enhance deactivating-positive emotion. Future research is required on whether the findings could be replicated among older adults, as people generally have more nostalgic experiences associated with music as they age. Keywords : nostalgia, positive emotion, music therapy

PP26 S-205

SELF-PERCEPTION OF AGING IN WESTERN MEXICO

Jazmin CUEVA-CONTRERAS¹, Elva Dolores ARIAS MERINO¹, Neyda M.A. MENDOZA-RUVALCABA², Martha Judith ARIAS-MERINO², Martha Elena VAZQUEZ-ARIAS³ (1. *Public Health, CUCS, University Of Guadalajara, Mexico*; 2. *Health Sciences, CUTONALA, University Of Guadalajara, Mexico*; 3. *Maestria en Gestion y Politicas de la Educacion Superior, CUCEA, University Of Guadalajara, Mexico*)

Introduction : The self-perception of aging is a very important component in the lives of people as they get older. Have a positive self-perceptions of aging are indicators of active aging, age-identity and part of the processes of self-regulation and adaptation. Method : This study was developed from Self-perception of Aging Study in the CASOENAC project, FONCICYT-94670 (EU-CONACYT). A cross-cultural study in western Mexico, with a sample of 1564 people aged between 60 and 108. Analysis was performed on SPSS program. Results : Mean age was 70.78±8.4, 51.7% female, 54.3% reported being married, 59.9%, only the 7.0 obtained an upper level degree, and 31.4% have elementary school. In average more people lives in the same household (3.2). The values showed that the elderly people perceived the subjective age 60.39±19.02 and looks like 66.37±25.18. The self-perception was associated with educational level (p=.000), satisfaction of life (p=.000), optimism (p=.002), subjective health (p=.000), doubts of generativity (p=.012), integrity-acceptation (p=.001) and the same way integrity-transcendence (p=.011), the concern of generativity was not significant (p=.111). Conclusion : In general the elderly people had a perception of their age most favorable, which is reflected in a sense of having fewer years than they actually had because this they feel lest identifying themselves as part of the group of elderly. The people are not of sure of their contributions to the betterment of the community. The participants also perceived social exclusion to older persons, which involves being seen as useless (after working life). Keywords : self-perception of aging

PP26 S-206

TRAFFIC SAFETY FOR OLDER ADULTS: THE EXPERIENCE OF THE TAICHUNG-BEITUN LIFELONG LEARNING CENTER

Keng Shen LIN¹, Man-Tsu LIU², Chin-Ying YU², Li Chi CHANG² (1. *Eldercare, Feng An Hospital, Taiwan*; 2. *Eldercare, Central Taiwan University of Science and Technology, Taiwan*)

Introduction : In 2009, one in every four deaths from traffic accidents was someone 65 years old or over. The percentage of traffic accidents continues to increase and has become one of the top ten reasons for deaths among the elderly in Taiwan. Therefore, the purpose of this study was to examine the effectiveness of traffic safety education and its creative design to be promoted throughout the Taichung-Beitun Lifelong Learning Center. Method : Several methods to promote awareness on traffic safety were designed by using pamphlets, songs, films, case studies, and personal testimonials. Through group discussions or one-on-one education, the elderly were taught to pay attention to traffic accidents especially during early morning or

evening, to equip with safety devices, as well as to be aware of personal frailty such as vision and mobility. Results : After 30 different sessions spread over six months, the elderly were able to answer various questions on traffic safety, practice safety rules and help promote safety behaviors in their communities. The outcomes of such results were also noticeable and awarded at a national level by the Department of Transportation. Conclusion : The promotion of traffic safety for older adults requires a creative design of educational materials and fun activities so the elderly can remember the information, which later can be transformed into knowledge and behaviors for safety practice. The content on how to promote traffic safety will also be shared and discussed in this study. Keywords : Traffic Safety, Lifelong Education, Elderly

PP26 S-207

AGE DIFFERENCES IN THE RELATIVE IMPORTANCE OF SIX COGNITIVE CHANGE FACTORS IN FORGIVING PROCESS

Kyeong-Sun WEE, Gahyun YOUN (Department of Psychology, Chonnam National University, Korea)

Introduction : In previous studies, six cognitive change factors on the forgiving process in old age were found [F1: children's ascent in their SES level, F2: interaction with the others, F3: deterioration in health, F4: observation of death owing to natural disaster, F5: healing through religion, F6: indirect intervention such as education]. With a sample of older generation, there found differences in the relative importance of the factors according to the ages when they had forgiven. This study was to explore if there would be any similarity in the relative importance of the six factors across different generations including younger participants. Method : Participants were 397 male, 408 female community-dwellers, aged 30-83 years. A research instrument was a questionnaire with 19 items representing the six factors, with a 5-point Likert type response format. Results : The relative importance of the factors was similar to that with older generation only. For instance, participants in their 50s of this study evaluated F1 and F5 as important as older generations did when they had forgiven in their 50s. Moreover, F2 was important for the older generations when they had forgiven in their 30s while participants in their 30s of this study evaluated it as important. However, there was an obvious difference in assessing F3. That is, F3 was not an important factor for the older generations at whatever age they had forgiven, but participants in their 50s or 60s of this study evaluated it as very important. Conclusion : All the findings were discussed in the context of the healthy aging. Keywords : Cognitive change factor, Forgiving process, Older generation

PP26 S-208

THE RELATIONSHIP BETWEEN LEISURE ACTIVITIES AND COGNITIVE FUNCTION IN OLDER ADULTS IN JAPAN

Marina KOZONO¹, Yasuyuki GONDO¹, Madoka OGAWA², Yoshiko ISHIOKA¹, Yukie MASUI², Takeshi NAKAGAWA¹, Megumi TABUCHI³, Yukiko TATSUHIRA¹, Kazunori IKEBE⁴, Kei KAMIDE⁵, Yasumichi ARAI⁶, Ryutaro TAKAHASHI⁷ (1. *Graduate School of Human Sciences, Osaka University, Japan*; 2. *Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan*; 3. *Center for Applied Psychological Science, Kwansai Gakuin University, Japan*; 4. *Graduate School of Dentistry, Osaka University, Japan*; 5. *Graduate School of Medicine, Osaka University, Japan*; 6. *Graduate School of Medicine, Keio University, Japan*; 7. *Research on Social and Human Sciences, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : Leisure activities occupy a considerable part of older adults' lives. Previous research has shown significant associations between leisure activities and cognitive function among older adults. However, there seems to be unclear that which elements of leisure activities affect cognition in old age. Thus, we examined the relationship between leisure activities and cognitive function in older adults. We evaluated leisure activities by counting total number and total duration in which older adults participated. **Method :** Participants were 1000 adults, aged 69-72 years. They completed a questionnaire about various leisure activities and the time spent on those activities per week. The items of activities were divided into 11 activity categories and participants' scores were summed for each category. The duration of leisure activities in which older adults participated was calculated. We conducted four assessments of cognitive function: the Montreal Cognitive Assessment (MoCA) and immediate free recall, recognition, and inductive reasoning. **Results :** The total number score of the "experimental activity" category (e.g., watching movies and shodo) was associated with MoCA, immediate free recall, and inductive reasoning scores. There was no correlation between time spent on leisure activities and all measures of cognitive performance. **Conclusion :** The results showed that the relationship between cognitive function and leisure activities lies in the quality of the leisure activities, and not time spent on those activities. Future research should investigate what elements of activities and how these elements affect cognitive function. Furthermore, we must reappraise the "experimental activity" category because it includes a wide range of items. **Keywords :** Lifestyle, Leisure activity, cognitive function

PP26 S-209

ART THERAPY AND SPIRITUAL REHABILITATION - OPTIMISTIC FACTORS OF MENTAL HEALTH OF WAR VETERANS

Oleg YAKOVLEV (*Samara Regional Clinical Hospital for War Veterans, First Research Institute of Rehabilitation of War Veterans of Medical Institute 'REAVIZ', Russia*)

Introduction : The history of art therapy in Samara Regional Clinical Hospital of War Veterans (SRCHWV) has a long and successful history since 1943. The hospital is headed by M.D., Professor O.G. Yakovlev, since 1986. Who is also the head of hospital's amateur art activities, while preserving and multiplying the traditions of art therapy. **Method :** In 1995 a Board of Trustees of SRCHWV was introduced. It consists of honorable, respected and socially responsible people of our region - Governor, heads of large enterprises and organizations, creative teams. The method of art and faith therapy is based upon the idea of self-expression, which lets patients with physical and mental deviations enlarge their rehabilitation potential. For the first time among hospitals in Russia in 1995 SRCHWV hosted an Orthodox temple of George the Victorious and prayer room for Muslims. The service in the orthodox temple is held by the monks of Sviato-Voskresensky monastery. **Results :** The hospital's club hosts over 68 concerts and 50 film screenings per year. The hospital's library offers more than 5000 items of high-quality books. The halls and the departments feature artworks of V.D. Gerasimov depicting military and patriotic themes (triptych, panel). **Conclusion :** Art therapy and spiritual rehabilitation uncover the creative potential of every person on the way to reaching spiritual health, internal bliss and social harmony. **Keywords :** art-therapy, spiritual rehabilitation, spiritual health

PP26 S-210

"ONCE UPON A TIME..." THE CONTRIBUTION OF OLDER PERSONS' LIFE STORIES AND ITS VALUE ON YOUNG

ADULTS

Susan JANSEN VAN RENSBURG (*Psychology, Department of Psychology North West University Potchefstroom Campus South Africa, South Africa*)

Introduction : The aim of this presentation is to describe the value of stories of older persons for young adults. The theoretical framework that underpinned this research is that relationships are continuously created through on going communication. The stories voiced by older people are regarded as a form of communication with young adults. **Method :** Eighteen white and coloured, Afrikaans- and English-speaking students (aged 21 to 31) from a tertiary educational context participated. Data were collected through the Mmogo method®, a projective visual research method, focus group discussions, individual interviews, as well as personal journal entries. The participants were asked to make visual representations of their relationships with older people (aged 60 years and older), using clay, beads and straws. Data were analysed thematically and by applying visual data analysis. **Results :** The findings revealed young adults expresses appreciation for the knowledge that older people share with them. The young adults conveyed that they value the wisdom of older people; that they learn from how the older people displayed resilience, despite challenging life situations and they appreciate the positive outlook of older people. **Conclusion :** In conclusion these stories seem to involve the relational capacity of young adults to adapt, grow and recover from adversities and become more resourceful. It is recommended that these findings serve to inform the development and application of further research. **Keywords :** positive outlook, resilience

PP26 S-211

WELL-AGING IN KOREA: MOVING TOWARD MATURED AGING

Young-Sook CHONG (*Department of Psychology, Pusan National University, Korea*)

Introduction : In last 20 years, there were numbers of researches about successful aging in Western and Korean cultures. We identified the problems of successful aging studies in two cultures: diversity of successful aging concept, different rate of successfully aged people based on diverse measurements, lack of considerations about the different characteristics of older adults and cultural differences. Therefore, this study aimed to develop and introduce the matured aging as a complimentary construct of successful aging. **Method :** We reviewed 79 researches on successful aging in Western and Korean cultures. We identified several problems of successful aging studies. **Results :** First, there was no academic agreement about successful aging concept among researches. Successful aging was accessed with various different components and there was mixed using of components and influential factors of successful aging in diverse empirical studies. Second, there were differences on rate of elderly's reports as successful aging because of the disagreement of what was successful aging. Lastly, this study compared the components and influential factors of successful aging between two different culture. **Conclusion :** We found cultural influences on conceptualization of successful aging and necessity of reconceptualization of aging well in Korea. We suggest the matured aging construct which is emphasizing psycho-socially matured characteristics of the elderly: Especially, we present the matured aging model from the confucianism with 3 dimensions: self-discipline, harmonized relationships, and social responsibility. **Keywords :** successful aging, matured aging, cultural differences

PP26 S-212

DESCRIPTIVE DATA FOR THE MONTREAL COGNITIVE

ASSESSMENT (MOCA) IN A SAMPLE OF JAPANESE COMMUNITY-DWELLING ELDERLY

Yukiko TATSUHIRA¹, Yasuyuki GONDO¹, Hiroki INAGAKI², Yukie MASUI³, Madoka OGAWA³, Takeshi NAKAGAWA¹, Megumi TABUCHI⁴, Yoshiko ISHIOKA¹, Marina KOZONO¹, Kazunori IKEBE⁵, Kei KAMIDE⁶, Yasumichi ARAI⁷, Ryutaro TAKAHASHI⁸
(1. Graduate School of Human Sciences, Osaka University, Japan; 2. Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Institute of Gerontology, Japan; 3. Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Japan; 4. Department of Psychological Science, Kwansai Gakuin University, Japan; 5. Graduate School of Dentistry, Osaka University, Japan; 6. Graduate School of Medicine, Osaka University, Japan; 7. School of Medicine, Keio University, Japan; 8. Research on Social and Human Sciences, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : The Montreal Cognitive Assessment (MoCA) is a brief measure of global cognitive function that was originally developed to detect mild cognitive impairment (MCI). Its translated versions have been developed in several international populations, but no data are available for the general Japanese population. The present study provided descriptive data for the MoCA in a sample of Japanese community-dwelling elderly persons. **Method :** The Japanese version of the MoCA (score range: 0-30, cutoff point: 25/26) was administered by trained personnel to 1000 septuagenarians aged 69-72 and 973 octogenarians aged 78-82 (participation rate: 23.2% and 18.1%, respectively). Raw scores were calculated according to the MoCA manual. To correct for education effects, 1 point was added to the total MoCA scores of participants with 12 years of education or less (if score was below 30). **Results :** The mean total MoCA scores of septuagenarians was 23.46 (SD = 3.28, skew = -.50, kurtosis = .27), and of octogenarians was 21.79 (SD = 3.83, skew = -.53, kurtosis = .63). The distribution of septuagenarians with scores below the cutoff (<26) was 71.9% (77.8% without correction for education) and of octogenarians was 81.8% (87.9% without correction for education). **Conclusion :** Normality of the MoCA score distributions was almost confirmed in this study. Thus, the MoCA can accurately measure general cognitive function. However, the cutoff score might over-detect MCI. It should thus be re-examined for Japanese community-dwelling elderly persons. **Keywords :** The Montreal Cognitive Assessment (MoCA), Descriptive data, community-dwelling elderly

PP26 S-213

CHALLENGES ON LIFELONG EDUCATION IN TAIWAN - A PRACTICE EXPERIENCE IN "TAICHUNG CITY BEITUN DISTRICT PLEASANT AGE LEARNING CENTER"

Ming-Fang HSU, Tsuann KUO, Man-Tsu LIU, Chin-Ying YU
(Eldercare, Taiwan University of Science and Technology, Taiwan)

Introduction : How to promote the healthy living of the elderly has been an important objective of planning elderly welfare. In this study, we focus on lifelong education, as to be called "pleasant age learning" in Taiwan. **Method :** In this empirical study, we analyzed how to design attractive curriculum for three centers in the past three years. The objective of curriculum design is "P.H.D", which means Prevention, Health, and Dream Aging. Under this objective, senior members can go to any of the three learning centers and learn different contents. In this report, we will clarify how curriculum design influences senior members by analyzing the original statistical data and observational data which we recorded and collected over 3 years. **Results :** The main findings about changes in senior members are as followed. 1. Increasing personal attractiveness: more smiling, friendly, desire for knowledge. 2. Became more sociable: inviting her/his

grandchildren, relatives and friends join the classes. 3. Increasing confidence: make suggestions about course design and methods of presentation on learning. 4. Desire to study became stronger: some senior members went to different learning center to study. Some members started self learning. **Conclusion :** From this study, it is very clear if we can design courses in accordance with pleasant learning, it is useful to most seniors to increase their confidence. Besides, most of them have better relationships with their family and they made new social networks. These are all useful for seniors' health promotion and active aging. **Keywords :** Taiwan, Health Promotion, Lifelong Education

PP26 S-214

OLDER-ADULTS INTERESTED IN FORMAL EDUCATION IN SOUTHERN BRAZIL

Angelo Jose G. BOS¹, Vera Lucia FELICETTI² (1. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil; 2. Master's in Education, UNILASALLE, Brazil)

Introduction : The fast population aging in developing countries as Brazil is getting public health concerns. Under Active Ageing Philosophy of the World Health Organization (WHO), an age-friendly society should also provide resources for education and information for the older-adults. Thus it is important to understand who are the older-adults that want to continue their formal education. **Objectives:** To show the sociodemographic characteristics of those older-adults, living in Southern Brazil, willing to or engaging in formal education. **Method :** This study is a result of the research "Older Adults Profile in RS" involving 7316 older adults from 59 different cities. They answered a questionnaire based on the WHO report "Global Age-Friendly Cities: A Guide". Participant answered about the willingness to engage or who are currently getting formal education. We exclude those questionnaires answered by care-givers and did not want to include their level of education. Education levels were divided into 6 levels from alphabets to higher education and more. Logistic regression was used to assess the chances of willing to continue formal education. **Results :** We analyzed data from 6580 respondents, 1004 (15%) of them wanted to continue formal education (only 58 actually studying). Women at younger ages were more likely to desire continuing formal education. Lower and higher levels of education were least likely to want to continue formal education even when adjusting for age and gender. **Conclusion :** We conclude that older-adult are willing to continue formal education which should also be a concern for the modern societies. Special programs should be improved for this end. **Keywords :** Education, Age-friendly Society, Adult Education

PP26 S-215

SOCIAL WORK EDUCATION TO PROMOTE AGEING IN PLACE IN RURAL AREAS

Arja KILPELAINEN¹, Kirsi PAYKKONEN², Maarit KAIRALA²
(1. Social Sciences, Social Work, University of Lapland, Finland; 2. Social Work, University of Lapland, Finland)

Introduction : Lately, population of peripheral rural areas has been at the same time ageing and decreasing globally. Despite the migration of the younger people to urban areas, most ageing persons wish to age in place and remain at their homes in depopulating villages. This development places significant challenges to the community? How to provide statutory welfare services to sparsely inhabited areas? Many services cut down to be offered only in population centres due to retrenchments. This makes daily lives of remaining elderly in rural

villages harder since the services they need are no longer available near them, and at the same time their mobility outside home might be decreasing. Conclusion : Because of long distances, the trend in developing services stresses ICT-mediated e-services. This trend highlights new know-how needs for service providers and social workers. In best case scenario, accessible and easy-to-use e-services promote independent living of the aged people in rural areas. To design, implement and provide such services, we need to meet changing demands of the field of welfare services. The University of Lapland has Master's Degree Program of e-Competence in Social which combines the disciplines of social work and applied information technology. The program gives students competence in social work and readiness to utilize ICTs as a tool to improve social services also in sparsely populated areas. In this presentation we analyze how social work education enhances e-competence to produce ICT-mediated services. Keywords : rural areas, social work education, e-services

PP26 S-216

A NEW APPROACH TO GERONTOLOGICAL EDUCATION IN UNDERGRADUATE TRAINING

Eric TAM, Teresa TSIEN (*Institute of Active Ageing, The Hong Kong Polytechnic University, Hong Kong*)

Introduction : The growing population of elderly worldwide has greatly increased the demand for individuals to work in the field of ageing. In Hong Kong, one out of eight people are now aged 65 or above. This population is expected to grow double by 2030. With the advancement of medicine, older adults are expected to have better health and longer lives. These elderly will have high demand on their quality of life. This paradigm shift will bring enormous opportunities to the silver market industries. In order to prepare our young generation to face the challenges of ageing in the society, a new program in applied ageing studies has recently been developed. Method : Unlike other undergraduate training which have their focus in the health and welfare sectors; this program adopted a holistic and interdisciplinary approach. Drawing from biological, social and behavioral sciences, finance, business and management, technology, design and environmental study, policy and cultural study, our program aims to equip students with a broad-based of knowledge, education and skills as required in ageing-related practice and industries. In addition to equip students with an enquiry base mindset through research works, this program also put emphasis on having practical experiences in the silver markets. Results : Over 800 applicants applied for the program and among them, 46 students were admitted. These students received either an associate degree or higher diploma in social sciences; health studies; psychology; general science and/or business administration. Conclusion : This presentation will discuss the benefits and challenges encountered in this new program. Keywords : undergraduate education, apply ageing studies

PP26 S-217

EDUCATION FOR OLDER PEOPLE IN RUSSIA: TRADITIONS AND CURRENT SITUATION

Gulnara Afruzovna MINNIGALEEVA (*Centre for Studies of Civil Society and Nonprofit Sector, National Research University Higher School of Economics, Russia*)

Introduction : Despite the slowly recovering birth rate and low life expectancy in 2016 older population is predicted to constitute almost a quarter of the Russian population (24.8%). After the economic and political transition of the 1990-s - 2000-s the situation of older people in the Russian Federation, though still not perfect, has improved both in terms of financial situation, visibility in the society and range of

services offered for them by governmental and non-governmental organizations. Method : The data from literature review, content analysis of the media, over 40 interviews with service providers and questionnaire of over 1100 older adults from 8 cities in the Russian Federation is used for this report. Results : Whereas in late 1990-s nationwide there were just a few branches of the "Znanie" ("Knowledge") Nonprofit Association offering education for older adults, nowadays there are several dozens of "People's universities for older people" throughout the country, which mostly follow the tradition of informal education set by "Znanie", are trying to respond to the needs of older people by offering a wide range of classes (computer skills, gardening, languages, etc). However, most of them are still limited by traditional view of the role of older people in the society, hobbies oriented rather than teaching skills for employment, volunteering or self-development. In many regions the role of governments has increased as they have started sponsoring and organizing special educational programs for older people. Conclusion : The need for older adults's education has been recognized in Russia by NGOs and government but needs improvement and further development. Keywords : education, Russia, older people

PP26 S-218

POSITION ANALYSIS OF ADULT TEACHER'S ROLES IN TAIWAN

Hsiu-Lan Lucy CHIN¹, Jenn-Chuen LIN², Ying-Tsun HUNG³
(1. Department of Aged Welfare and Social Work, Toko University, Taiwan; 2. Department of Adult & Continuing Education, National Taiwan Normal University, Taiwan; 3. Department of Senior Citizen Service in Management, Ching Kuo Institute of Management and Health, Taiwan)

Introduction : This research is the position analysis of the adult teacher's roles and the comparison of cognitive properties of these roles. Method : The participants are 36 adult teachers. All the participants and researcher sort out 10 adult teacher's roles, and designs the "Questionnaire of Adult Teaching Role Position Analysis." Through the analysis by two dimensions of Multi-Dimensional-Scaling (MDS) and get the Derived Stimulus Configuration. Results : The MDS data shows 10 teaching roles can be roughly summarized as:(1)Quadrant I: the property of Cluster A is highly interactive, individualized guidance orientation. (2)Quadrant II: the property of Cluster B is highly interactive, group guidance orientation. (3)Quadrant III: the property of Cluster C is high teacher-led, group guidance orientation. (4)Quadrant IV: the property of Cluster D is high teacher-led, individualized guidance orientation. Therefore, the researcher combines 'teacher-led' and 'teaching interaction' as the property of "X"-axis, and name the "X"-axis as "the teaching interaction level". Then, combine 'group-led teaching' and 'individualized guidance' as the property as the 'Y' axis. And name the Y-axis as "the teaching orientation level". Conclusion : The research discovers four clusters teaching roles. (1)Cluster A: curriculum-planner, counselor and coaches. The properties of these roles are highly interactive teaching and individualized guidance. (2)Cluster B: learning-guide, group-leader. The properties of these roles are highly interactive teaching and group-led learning. (3)Cluster C:teaching-manager, role-model and good-questioner. The properties of these roles are highly teacher-led high and group-led learning. (4)Cluster D: facilitator and listener. The properties of these roles are highly teacher-led and individualized guidance. Keywords : adult teachers, adult teaching, position analysis of teacher's roles

THE BENEFIT OF REGISTERED FINANCIAL

GERONTOLOGIST (RFG) PROGRAM: COMPREHENSIVE UNDERSTANDING OF AGING AND UTILIZATION OF ACQUIRED KNOWLEDGE

Joe HAN¹, Eun Ock SONG², Soo Hyung KIM², Min Woo YOO²
(1. Executive Director, Future Mosaic Institute, Korea; 2. Department of Education & Research, Future Mosaic Institute, Korea)

Introduction : Researching the effectiveness of RFG program in promoting enhanced sensitivity and knowledge of older clients and increasing job performance, by attending to their needs. Method : Using a quantitative study, we conducted a survey of questionnaire to the RFG graduates covering an extensive set of topics. Results : Upon completion of the RFG program, survey proves that the RFG graduates felt a significant increase in both the understanding of aging and benefit in job performance. Conclusion : The RFG program benefits the older clients by providing financial gerontologists professionally trained to attend to their specific needs, and also benefits the RFG graduates by giving them a new set of skills that will ultimately increase their performance and sales. In the future, we can apply the same approach to various industries other than finance. Comprehensive understanding of gerontology will benefit both the consumer and corporations in all aspects. Keywords : Registered Financial Gerontologist, Multi-disciplinary, Aging, Older clients, Financial Professionals, Financial Gerontology

PP26 S-220

THE RESEARCH ON GENDERS' DIFFERENCES IN THE CASE OF ELDERS' ACTIVE AGING LEARNING NEEDS AND PARTICIPATION IN TAIWAN

Peggy Hui-Chuan WEI¹, Juo Hsiang SUN¹, Yu Feng HSIAL²
(1. Department of Adults and Continuing Education, National Chung Cheng University, Taiwan; 2. Department of Aged Welfare and Social Work, Toko University, Taiwan)

Introduction : The study aims to explore the genders' difference in the case of elders' active aging learning needs and participation in Taiwan. Method : Questionnaire survey method was adopted in the current study. The subjects were sampled from elder learners in active learning resource center (209), active learning college (56) and Evergreen Academy (290). Each organization was given 10 copies of questionnaires, a total of 5,870 questionnaires were distributed and 3080 valid ones were received (valid response rate of 52.5%) for data analysis. The collected data were analyzed based on mean, standard deviation, frequency distribution, percentage, chi-square test, t-test. The main results are as Results : The highest level of active aging learning needs of male and female elder learners in Taiwan are exercise/health, followed by living and safety, spiritual growth, social interaction and contribution service. Besides, as for the levels of participation of Taiwan's male and female elder learners' active aging learning, "participated" is the highest among each learning theme. Taiwan's senior learners' active aging learning needs were significantly different because of different genders. The female elder learners' learning needs are higher than those of their male counterparts when it comes to exercise/health, spiritual growth, social interaction and contribution service, but there was no substantial difference in the participation level of living and safety. Conclusion : According to the results of this study, it is recommended that the elderly educational institutions in Taiwan can develop diversified and suitable curricula based on different levels of participation and various active aging learning needs of different genders of senior learners. Keywords : active aging, learning needs, learning participation, elderly learners, Taiwan

PP26 S-221

PREDICTING ACCIDENT RISK IN JAPANESE ELDERLY PEOPLE

Kazue SAWAMI, Chiyoko SEKI (Medical Health, Tsukuba International University, Japan)

Background : As for the risk management in gerontology nursing, importance is increasing by social aging. About the accident which can be predicted, training which takes preventive measures is important. Basic research was performed in order to evolve the method of accident forecast training. Purpose: Using an accident prediction sheet, the student nurses of gerontology carry out elderly people's simulation, and extract the factors of a risk forecast from their description. Method: Target people were junior years and were 69 students of gerontology nursing. The skill training of the predicting accident is called KYT (Kiken Yochi Training) in Japanese. In this research, elderly people's simulation was performed using the tool for predicting a risk of calling it a KYT sheet. Furthermore, the influence about the significance of predicting a high risk was extracted from students' description. Results : The students who answered that the result of the simulation was higher-risk than prior anticipation reached to 94.2%. Bathing, wheelchair operation, stairs, the slope, and the elevator had the high correlativity of the situations which were higher-risk than prior prediction ($r > 0.5$). A concrete high-risk situation and solution were extracted from content analysis. Conclusion : The simulation using the KYT sheet in the student nurses of gerontology raised the skill which predicts the risk. They explain the concrete situation and evolve the solution. This paper describes a number of concrete accident situations and explains how risk may be reduced. In this way, the high-risk accident situations for elderly people and their solutions can be generalized and better predicted. Keywords : risk management, elderly, prediction, accident, skill training

PP26 S-222

THE CONSTRUCTIONS OF CORE COMPETENCE INDICATORS AMONG TEACHERS FROM ELDERLY EDUCATION AND THE NEEDS OF ON-THE-JOB TRAINING AND OUTCOMES ASSESSMENT

Meng Ching HU¹, Chia Ming YEN², Yi-Fen WANG² (1. Adult and Continuing Education (Professor), National Chung Cheng University, Taiwan; 2. Adult and Continuing Education, National Chung Cheng University, Taiwan)

Introduction : Due to the arrival of ageing society in Taiwan, it has shown the lacks of insufficiency of on-the-job training among the teachers from the elderly education. Also the teaching knowledge and skills on ageing and the needs and outcomes assessment in terms of on-the-job training are seldom seen and rarely to be available in Taiwan. Hence the first phase of this two-year length study is mainly focused on the constructions of core competence indicators among the teachers from the elderly education. Then, this study will be in the position to draw out two models. Method : The first year study adopts document analyses, focus group interviews and Delphi technique. A set of indicators are drawn from the questionnaires where Delphi technique is used to collect the data. Survey and content analyses will be used in the second year study. Results : The results of first year study concluded that, in total, 132 indicators are developed. The indicators of core competences among the teachers cover two aspects: 1) teacher's current and further needs of teaching knowledge and 2) teacher's current and further needs of teaching skills. The previous is categorized into six, the latter is categorized into two. Conclusion : The above indicators will be used as the resources, as it is planned in the second year of this study, to develop "A Core Competence Model"

and “A Core Competence Training Programme Model” to promote, and assess at the same time, the teaching capabilities among the teachers from elderly education in the future in Taiwan. Keywords : teaching knowledge and skills on ageing, indicators of core competence, needs assessment,

PP26 S-223

EDUCATIONAL PROGRAMS FOR GROUP HOME MANAGERS IN JAPAN;FOR COMMUNITY-ORIENTED CARE

Wonkyung KIM¹, Yuko OKUDA², Shigeyuki TAKAMURO³, Takayuki HIRANO⁴ (1. *Research Promotion Center for Community Care, Nihon Fukushi University, Research Promotion Center for Community Care, Korea*; 2. *Research Promotion Center for Community Care, Nihon Fukushi University, Japan*; 3. *Chief, Caretown Reserch Institute, Japan*; 4. *Professor, Social Policy, Nihon Fukushi University, Japan*)

Introduction : The general management of group homes (GH) for those with dementia, a residency service in Japan aimed at providing cohabitation and care to cope with dementia, is the responsibility of a single manager. Previous research has revealed that these managers experience several difficulties in their work, such as lack of staff education and managing complaints and accidents. This research clarifies the types of programs required to address the GH managers' problems. Method : Individual interviews were conducted with five GH managers, followed by a focus group interview. Codes and categories were inductively created from the verbatim records of these interviews. Results : °Analysis revealed the following educational programs GH managers require to help them run the GH: (1) A systematized advanced dementia care program,(2) A nursing care program,(3) A human resource training and management program,(4) A risk management program, and (5) Supervision. Conclusion : As of now, no official educational programs have been available to GH managers in Japan. As this survey indicates, GH managers require a wide range of educational programs;this in turn indicates the need to systematize educational programs based on, for instance, years of service and qualifications of GH managers. Another issue is the future creation and validation of educational programs for GH managers. Keywords : Educational Programs for Group Home Managers

PP26 S-224

THE EFFECTIVENESS OF A TRAINING PROGRAM FOR TRAFFIC SAFETY EDUCATION OF ELDER VOLUNTEERS

Yi-Hsin KU¹, Ya-Hui LEE², Hui-Chuan WEI², Meng-Ching HU² (1. *Graduate Institute of Elder Education, National Chung Cheng University, Taiwan*; 2. *Department of Adult and Continuing Education, National Chung Cheng University, Taiwan*)

Introduction : The security of the elders is one of the three basic pillars within WHO's policy framework 2002 for Active ageing. The traffic safety deeply affects the quality of the daily life of the elder people. Method : In order to provide a friendly traffic environment and to help senior citizens understand the importance of road safety, the Ministry of Transportation and Communications (MOTC) in Taiwan has implemented an annual “Volunteer Training Program of Traffic Safety Education for the elders” since 2011. Results : The aim of this study is to discuss the changes and the empowerments of the voluntary trainees in the aforesaid programs. Conclusion : The authors present a qualitative study and conduct it with a semi-structured interview with ten trainees to understand the changes and the empowerments on their advocacies to the elders. Keywords : Traffic Safety for Elders, Elders, Training Program

PP26 S-225

THE DEVELOPMENT ON THE FIRST TWO-YEAR BACHELOR PROGRAM OF GERONTOLOGY IN TAIWAN

Yi-Hsiu LIN¹, Tsuann KUO² (1. *Department of Eldercare, Central Taiwan University of Science and Technology, Taiwan*; 2. *Medical Sociology and Social Work, Chung Shan Medical University, Taiwan*)

Introduction : Taiwan has become one of the fastest aging places in the world. The Ministry of Education in Taiwan granted the establishment of gerontology programs offering Bachelor Degrees since six years ago. The Department of Eldercare at the Central Taiwan University of Science and Technology thus became the first two-year program aiming to train professionals in aging services. The main professional roles to be trained were Care Workers, Community Workers, and Long-term Care Managers. Method : This study examined training competencies for this Bachelor program and evaluated whether the curriculum was design to fulfill the 8 competencies set by faculty members. For each course, the course outline, weekly topics and matching competencies were designed, weighed and examined. Results : The competencies in which the courses attempted to accomplish were somewhat lower than the original goals set by the faculty members. Three competencies such as Ethics, leadership, and role development were consistently rated lower than targeted for all three professional roles. Two competencies such as reflection and caring as well as creativity and expression were rated lower than targeted for Care Workers and Long-term Care Managers. Conclusion: detailed examinations of competencies on all required courses, the department can find its weakness in designing courses. The future design of gerontological programs is to put more weights on training competencies such as ethics, leadership and role development. This study completes with a discussion on how future competencies can be set for newly established gerontological programs in Taiwan or other parts of the world. Keywords : Gerontology Education, Competencies, Curriculum Design

PP26 S-226

DO WE STILL NEED EMPATHY IN MEDICAL PROFESSION?

Halina Gajlewicz KUSZ, Anne DOHRENWEND, Jamie FOREBACK (Medical Education, McLaren Flint Health Care/ Michigan State University, USA)

Introduction : A literature search on empathy and medical profession revealed that contemporary physicians may be losing the ability to empathize, even while medical education continues to value of empathy and promote the need to nurture it as a skill. (1,2). Our primary objective is to review current methods on where and how we teach clinical empathy in our residency training program. Our second objective is to investigate empathy levels in our residents. Method : In 1999 at McLaren-Flint, community-based, university-affiliated internal medicine residency program we developed and implemented behavioral science and geriatric medicine curricula. Curricular structure includes block rotation in behavioral science which is lead by the psychologist, and one-month geriatric block rotation with longitudinal nursing home experience lead by geriatrician. The main goal for both curricula is to teach empathetic and compassionate care of patients. Empathy and communication skills are especially reinforced throughout bedside teaching, direct interactions with older and demented patients and faculty role modeling. Faculty evaluates residents by direct observation and video-tape review. Constructive feedback is given to each resident. Results : Residents' satisfaction with the rotations is reported as high. Subjectively, faculty can attest that some residents are empathetic. To measure residents' level of

empathy, we are planning use The Jefferson Scale of Physicians Empathy (JSPE). The results will be included. Conclusion : The empathy as the most desirable from physicians by their patients can not be neglected in practicing evidence-based medicine. Behavioral science and geriatric medicine offers some promise to fulfill this educational need. Keywords : Empaty and Medical Education

PP26 S-227

AGE DIFFERENCES IN HANDLING WORKPLACE CONFLICTS AND STRESS

Dannii Y. YEUNG (*Dept of Applied Social Studies, City University of Hong Kong, Hong Kong*)

Introduction : With a growing number of older workers in the workforce, it becomes increasingly important to understand the ways they handle workplace conflicts and stress, relative to their younger counterparts. Socioemotional selectivity theory posits that older people focus more on emotionally meaningful goals when they perceive future time as increasingly limited (Carstensen, 2006). Emphasis on emotional goals may motivate older workers to utilize more passive emotion-focused strategies to deal with workplace conflicts and stressful situations. This study therefore investigates age differences in conflict and emotion regulatory strategies. Method : Chinese younger and older workers were invited to complete a set of questionnaires that assessed their behavioral responses in handling workplace conflicts and stressful situations. Results : Preliminary analyses (N=268) showed that older workers were less likely to use dominating and comprising strategies than younger workers. Age differences in avoiding strategies were also shown. Conclusion : Older and younger workers react differently when dealing with interpersonal conflicts and stressful situations. Implications on training and development will also be discussed. Keywords : Older workers; workplace conflict; stress

THE IMPACT OF THE OLD WAGE EARNERS FORM ON THE LIFE SATISFACTION

Mee Hye KIM, Wonji LEE, Pyunghwa JUNG, Sang A. LEE, Enkyung SHIN (*Graduate School of Social Welfare, Ewha Womans University, Korea*)

Introduction : To promote employment and labor support for the elderly, a variety of employment policy is executed in the country. However, jobs that are provided by the country are low quality of labor and the contract period is very short less than seven months. I want to investigate that how these precarious employment forms affects the lives of individuals in addition to insufficient income guarantee. Method : National retirement security panel v.3.6 which was conducted at the Korea National Pension Researchers in 2011 is used. Total of 2473 old wage earners over the age of 55 were analysed using the SPSS 18.0. Descriptive statistics was used to evaluate the average of the life satisfaction. ANOVA was used for group-specific differences of the life satisfaction. Regression analysis was performed to see the impact of labor forms on the life satisfaction. The independent variable was the form of employment and the dependent variable was life satisfaction. Results : Regular life satisfaction was the 3.29 points, the highest in three groups. The difference of the group specific form of labor on the life satisfaction showed significant. Daily and temporary employment forms influenced negativity on the life satisfaction. Regular showed no significant affect on the life satisfaction. Conclusion : Research results showed that the stable form of employment was an important factor in order to improve the quality of life of old wage earners. Keywords : life satisfaction, old wage earners , old wage earners

EMPLOYMENT PROMOTION INTERVENTION FOR IMMIGRANT WOMEN IN KOREA: THE RESULTS AND CHALLENGES IN PROVIDING CERTIFIED CARE WORKERS TRAINING PROGRAM

Hae Sung KIM¹, Jeong In JANG² (*1. College of Social Welfare, Kangnam University, Korea; 2. Welfare Work Team, Seongnam Center of Senior Health, Korea*)

Introduction : Statistics(2012) demonstrates that immigrant women through transnational marriage face financial difficulties, language barriers, high rate of unemployment. Previous literature reports that immigrant women experience inadqaute employem,ent and discrimination in labor market. With a large immigrant population, Seongnam si starts to be aware the need to provide job training program for immigrants. Especially for women it is because gender discrimination could be more worse in job market. As Korea is ageing rapidly, Seongnam si is no exception and create large care service job market. Method : 'Employment Promotion' is a job traning program of the 2012 from Seongnam Center of Senior Health located at Seongnam Si, aiming empolyment promotion of immigrant women in care service job market which require national licence for certified care workers. This program is a multilevel intervention which comprises job education and training, outreach services, counseling, home visit, and parenting education. Seven immigrant women participated in this study. Group based services and individual services were provided along with the circumstances such as child care or language proficiency. Results : The primary outcome was the ratio of successful acquisition of national certificate of care workers, The ratio of success among participants is 85%, while the average ratio in nation is 78.2% in which almost all of testers are born in Korea. Participants reported frequently positive experience with husband and child(children) and felt appreciated their strengths to challenge from the neighborhood too. Conclusion : Further step is needed to find for participants a job place which fits with the needs and strengths of participants. Keywords : employment promotion immigrant women care worker

THE WORK ENVIRONMENT OF VISITING NURSES IN JAPAN

Keiko ONO (*Department of Home Health Care Nursing, Gumma Paz College, and Research Division, The Dia Foundation for Research on Ageing Societies, Japan*)

Introduction : The role of home-visit nursing care is increasingly important in Japan following the implementation of Long-Term Care Insurance (LTCI) for ageing in 2000. The number of Visiting Nurse Stations (VNSs) is less than sufficient to provide nursing services to patients at home and there is a lack of research on the topic. The purpose of this study was to identify productivity in home-visit nursing care in Japan and to examine relationships between nurse characteristics, productivity and job satisfaction. Method : A descriptive correlational design was used. There were 28 VNSs and 100 visiting nurses providing data and two instruments in the survey: the nurse workload form (time survey) and the nurse questionnaire (the Nursing Work Index-Revised and a single item indicator of satisfaction using a visual analog scale). The study was approved by the Institutional Review Board of the Case Western Reserve University at August in 2007, and was conducted through December in 2007. Results : There was a weak negative correlation ($r=-.19$; $p<.05$) between productivity and job satisfaction score from the NWI-R. Productivity was 3.76 (SD=1.05) visits/day using the formula that included both direct and indirect care. The proportion of direct care /

indirect care was 58/42 ratio. The percentage for the amount of indirect care time spent on each activity was as follows: travel (41.5%), documentation (20.2%), telephone (4.5%), meeting (14.4%), preparation (8.0%), and others (11.4%). Conclusion : The results of the present study are important in understanding the work environment of nurses in home health care settings in Japan. Keywords : Nurse, Japan, Productivity

PP26 S-231

WORKING LONGER? RETIREMENT DUE TO CARING RESPONSIBILITIES

Liesbeth DE DONDER¹, Nico DE WITTE², Sarah DURY¹, Dominique VERTE¹ (1. *Adult Educational Sciences, Vrije Universiteit Brussel, Belgium*; 2 *University College Ghent, Belgium*)

Introduction : This contribution focuses on the reconciliation of paid work and informal care. Caring for ill or disabled spouses, elder parents or grandchildren will increasingly be required and performed by active workers. Consequently, it can be expected that older adults will increasingly need to combine multiple roles including paid employee, parent, grandparent, carer ... This study aims to examine the impact of conflicts between multiple roles (informal carer vs. employee) on labour market exit decisions (decision to retire) among older adults. Following, the individual profile (e.g., socio-demographic, socio-economic, type of work) of people who leave the labour market due to family responsibilities will be examined. Method: Survey data from the Belgian Ageing Studies, a research program that collected data from 65,650 older adults from 142 municipalities across Belgium, provided the empirical evidence for the analysis. Results : The results reveal that 11,3% of older adults retired because of caring responsibilities. Women, older adults with an average education or income, widowed or never married older adults, and former office workers, were more likely to retire due to caring roles. Analyses also demonstrate that those people retired earlier than on average. Conclusion : The implications of these findings in terms of inclusion and participation of older people in the labour market are highlighted. In order to enable a longer working life, health and labour sectors need to develop more supportive actions to reconcile work and informal care. Finally, attention is given to the presentation of a future research project in this field. Keywords : retirement, caring, work-family conflict

PP26 S-232

THE PSYCHOLOGICAL EFFECTS OF ELDERLY WORK PROGRAM

Seonhee MO (*Dept. of Social Welfare, Kongju National University, Korea*)

Introduction : Along with the rapid increasing aged population, Elderly Work Program has been one of the major elderly welfare policies since 2004 in Korea. The purpose of this study is to examine the psychological (depression and self-esteem) effects of Elderly Work Program and to analyze the differences of depression and self-esteem by demographic variables and work types. Method : The purposive and blocked samplings by regions were used. The respondents were 917 participants and 303 screen-outs, as compared group, who applied for work program but not selected. The data were collected by face-to-face interviews in 2008. The psychological effects were analyzed by Propensity Score Matching (PSM) method. Also, t-test and ANOVA analysis were used. Results : The results of PSM method analysis showed no statistically significant effects. Although the psychological effects were not significant, there were noteworthy changes in depression: the depression was increased by 13.5% among participants

in public program but decreased by 39.7% among those in educational program and by 16.0% among those in welfare program. The level of depression and self-esteem were significantly different by age, region, type of living, educational level, and work types. After work participation, some positive perceptions such as self-reliance and valuable person in the society were found. Conclusion : The Elderly Work Program is very important to improve the quality of life for the elderly by social participation. The findings imply the possibilities of different psychological effects by work types. The work types and individual differences should be significantly considered for job training of Elderly Work Program. Keywords : elderly work program, depression, self-esteem

PP26 S-233

GRANDPARENTS WHO CARE FOR THEIR GRANDCHILDREN IN CHINA: FACTS AND EFFECTS

Juanjuan SUN (*Institute of Gerontology, School of Sociology and Population Studies, Renmin University of China, China*)

Introduction : In China, due to traditional intergenerational support among family members, older adults are also important provider of support to their grandchildren. It is a productive activity and generates immense economic and social value. However in China, little research has been done on the effects of grandchildren caring on the older grandparents. The aim of this study is analyzing the situations, reasons and effects of grandparents as caregiver, and trying to get implications for public policy. Method : Based on the Longitudinal Survey Data on the Situation of Urban and Rural Elderly of China in 2006, this study explores the characteristics of the Chinese older grandparents and the effects of the care on their psychological well-being, life satisfaction etc., by using qualitative and quantitative research methods. Results : There are about 40% of older people provide care for their grandchildren in China. Traditional intergenerational support, rapid urbanization, incomplete social service system as well as increased women's labor participation are the main reasons to the popular grandparents' care-giving. Rural older grandparents especially those in the "skipped-generation" families face much heavier burden to provide the care. Although the care of grandchildren may improve older grandparents' positive psychological feelings and life satisfaction, the results show that there are a number of difficulties for these older adults. Conclusion : Grandparents play a major role in taking care of grandchildren in China. The activity is beneficial to the different generations including grandparents themselves. Social support policies and programs for the group are very necessary to enhance their quality of life. Keywords : grandparents, grandchildren, care

PP26 S-234

THE SOCIAL PARTICIPATION AND SUCCESSFUL AGING

Bo Sun KOH¹, Eun Jung KO² (1. *Department of Social Welfare, Jeju International University, Korea*; 2. *Department of Social Welfare, Soongsil University, Graduate School, Korea*)

Introduction : The purpose of this research was to test causal relationships among health status, self-esteem, mental health, and successful aging in the social activity participated elderly. Method : A questionnaire was used to interview a sample of 200 elderly over 65 years old, who live in Jeju, Korea, 2011. Dependent variable was successful aging(KSAS; Kim, M.H. & Shin, K.L., 2005). Independent variables were health status, self-esteem(Rosenberg, 1965), and mental health(KGHQ-20; Shin, S.I., 2001). Statistics analyses included descriptive analysis, Pearson's correlation, Hierarchical regression, and path analysis. SPSS for the WIN 12.0 program was used for these analysis. Results : Self-esteem and mental health were exposed as

important variable and self-esteem was the strongest predictor of the successful aging for the social activity participated elderly. The greatest total causal effect of successful aging was health status and health status had higher indirect effect of successful aging than direct effect of it. Health status and self-esteem appeared to be important intervening variables(H3) and this research model was supported. Conclusion : Successful aging is human capital. In order to enhance of successful aging, it is need to keep social activity interactions and improves mental health along with this. These efforts leads to various social capital in community. Successful aging is cooperative efforts. This is required joint efforts of old people, family, community, and nation. Successful aging is a significant subject to solve aging and integrate between the younger generation and older generation in society. Keywords : Successful Aging, Social Participation, Health status, Self-esteem, Mental health

MOVE TOWARDS AN EXTRAPROFESSIONAL LIFE AFTER RETIREMENT: A CASE STUDY OF 6 RETIRED TEACHERS' EXPERIENCE OF VOLUNTEER IN MUSEUM

Ching-Yi YANG¹, Ying-Tsun HUNG² (1. Center for General Education, Army Academy R.O.C., Taiwan; 2. Department of Senior Citizen Service Management, Ching Kuo Institute of Management and Health, Taiwan)

Introduction : The primary purpose of this study would like to explore how to create an extraprofessional life and re-include the wisdom or energy into society with the new way through volunteer. Method : Six retired teachers volunteering in the National Museum of Nature Science, Taiwan (60 years and older, being a volunteer docent more than 5 years) were in-depth interviewed and observed in order to understand their successful experiences with volunteer. Results : For the retired elders in this study, participate in museum volunteer was a serious leisure as well as an "intermediary stage" before they re-integrate into society with new identities. There were three reasons to promote them to dedicate the rest of personal time and energy to it, moreover, encourage them to exceed in performances and move for professional. (1) Achieve a new social role to replace the lost one because of retirement. The symbolic signification behind museum and museum volunteer docent conform to a lifestyle and an idea identity they desire for. (2) Seek identification of a new social role from others, as educators, peers and visitors of museum. (3) Enjoy the satisfactions offered by museum environment and volunteer of guide tour, such as possess a variety of multi-sensory and creative experiences different from daily life, share with others and affect other people. Conclusion : Implications for enhancing productive and active retirement living through volunteer were discussed. Keywords : volunteer docents, museum, identification

PP26 S-236

A STUDY OF THE INFLUENCE OF ELDERS' PARTICIPATION IN SOCIAL ACTIVITIES ON SATISFACTION IN LIFE- FOCUSING ON PARTICIPATION IN THE NATIONAL SENIOR PUBLIC WORK AND SENIOR VOLUNTEER ACTIVITIES

Mee Hye KIM, Yong Hee KWON, Eun Kyung SHIN (Graduate School of Welfare, Ewha Womans University, Korea)

Introduction : South Korea has been making great efforts to encourage old people to take part in social activities since 2000, and these are exemplified by the National Senior Public Work(NSPW) and Senior Volunteer Activities(SVA). Based on the types of elders' participation in social activities, the present study shall examine the difference

between features in sociology of population and satisfaction with life, aiming to analyze the influential factors that affect the difference. Method : This research has used the fifth year of data in the Korea Welfare Panel Study (2010), and analyzed 331 participants in the NSPW and SVA who are over 60 years old. The SPSS 18.0 has been used as a research tool to carry out a t-test and multiple regression analysis. Results : The degree of satisfaction of the participants in the NSPW has shown a meaningful difference from that of the participants in SVA: the latter is a bit higher than the former. The degree of the latter's satisfaction with life has appeared to be affected by the level of education, the status of health, and familial support, yet the degree of the former's satisfaction with life has appeared to be influenced by the existence of the spouse, the level of education, the status of health, the existence of chronic illnesses, and familial support. Conclusion : It is necessary not only to consider the quantitative expansion of elders' participation in social activities but also to put serious attention to the factors that improve satisfaction with life according to the type of a participant. Keywords : National Senior Public Work, Senior Volunteer Activities, Satisfaction in Life

PP26 S-237

DEMENTIA AND IMAGINATION: CONNECTING COMMUNITIES AND DEVELOPING WELL-BEING THROUGH SOCIALLY ENGAGED VISUAL ARTS PRACTICE

Gill WINDLE (Dementia Services Development Centre, Bangor University, United Kingdom)

Introduction : People with dementia and their families often become disconnected from society through the stigmatizing effect dementia has on taking part in everyday activities. Added to this, the current economic climate has meant reductions in many services, and there is often a lack of meaningful activity available to this population. Method : This poster presents the first phase a new research study which aims to address the disconnection and marginalisation of people with dementia. It will explore how the vision for dementia supportive communities might benefit from creative activities. Specifically, it will use a visual art intervention as the catalyst for change for understanding community connectivity, challenging attitudes and promoting well being. Results : To understand the impact, the research will assess changes over time in the well-being and social connectedness of people with dementia, and how these changes can in turn have positive effects in communities (facilitate change in societal attitudes and promote participation and inclusion) through social contagion. The processes and outcomes of the research will be assessed using a range of quantitative and qualitative approaches, and will use art, both as a tool for analysis and for visual, creative representations of the results. Conclusion : The research builds on existing relationships and develops new ones with community and policy partners, such as arts organisations, museums, galleries, health and social care practitioners, charities and local government. This will ensure full engagement and maximum benefit and impact for research, policy and practice. It will also contribute towards building future sustainability. Keywords : Dementia, participation, art

PP26 S-238

DO TYPES OF PARTICIPATION IN ACTIVITIES MATTER IN IMPROVING HEALTH AND MENTAL HEALTH OF OLDER CANCER SURVIVORS?

Hee Yun LEE¹, Jeehoon KIM², Greg RHEE³ (1. School of Social Work, University of Minnesota, Twin Cities, USA; 2. Dept. of Sociology, Social Work and Criminal Justice, Idaho State University, USA; 3. School of Public Health, University of Minnesota, Twin Cities, USA)

Introduction : This study examines how older cancer survivors' self-reported health status and depression were associated with different types of activities, including: (1) social activities; (2) physical activities; and (3) activities involved in online technology use. **Method:** 1,430 older cancer survivors were drawn from the first round of 2011 U.S. National Health and Aging Trend Study, a nationally representative study of community-dwelling Medicare beneficiaries aged 65 and over. The outcome variables are older cancer survivors' self-reported health status and depression. Social activities include older cancer survivors' visiting to friends or family, attending clubs or organized activities, and going out for enjoyment in the last month. Physical activities are measured as participating in light exercise or vigorous activities (e.g. walking out, swimming, running or biking) in the last month. Online technology uses are measured as email or text use, or seeking health information using the Internet. **Results :** Older cancer survivors' health status was positively associated with social, physical, and online activities. For example, participating in clubs or other organized activities ($\beta=.10$), going out for enjoyment ($\beta=.09$), walking ($\beta=.07$), and email or text use ($\beta=.07$) were positively associated with older cancer survivors' health status. For depression, all types of social activities were negatively associated, and physical and online activities were not associated with respondents' feeling depressed. **Conclusion :** This study revealed that different types of activities matter in improving health or mental health status. Online technology use can be a pronounced medium to promote health among cancer survivors while encouraging social activities can specifically endorsing mental health elevation. **Keywords :** Activity participation, health status, technology use

PP26 S-239

WHAT RESOURCES ACCOUNT FOR VOLUNTEERING INTENTIONS: COMPARISON OF BABY BOOMER AND CURRENT OLDER ADULTS

Hyunkee LEE (*Department of Welfare for the Older People, Joongbu University, Korea*)

Introduction : We make attempts to determine what resources do cause Korean baby boomers and Older adults to make volunteering-participation intentions and examine what resource factors are different in affecting two age cohorts. we argue that resource uses are differential owing to different life stage. **Method :** For the analysis, we uses Statistics Korea's 2009 Social Survey data. The data include totally 37,049 subjects aged from 17 to 109. As a study sample, the paper selects 6,903 baby boomers who are born in 1955-1963 and 10,268 senior people who are born before 1954. The research estimates the coefficients of resource factors as independent variables for two age cohorts by using ordered multinomial logistic regression. In this equation, the statistical model controls for environmental variables and socio-demographic variables. **Results :** The results show that all variables come to be in statistically significant relationships with volunteering-participation intention for both baby boomers and older adults. However, there are slight differences in effects of resource variable for two groups. For Korean baby boomers, education is the most strongest among human resource variables, but subjective health is the strongest for older adults. Also, social resource variables are more stronger for older adults, compared to the baby boomer. **Conclusion :** This results suggests that a cohort difference exists in utilization of resources in volunteering intention. In addition, for volunteer recruit of baby boomer, individuals with higher education are more likely to participate in volunteering than ones with lower education. Finally, for both groups, utilization of individual social resources is desired in recruiting and retention. **Keywords :** volunteering intention, resource approach, Baby boomers

PP26 S-240

THE EFFECTS OF LIFE ENVIRONMENTS ON VOLUNTEERING AMONG OLDER ADULTS

Hyunkee LEE (*Department of Welfare for the Older People, Joongbu University, Korea*)

Introduction : The paper aims to determine effects of life environments on volunteering among older adults in South Korea and explain how the life environmental variables affects the volunteering participation and yearly frequency with the concepts of environmental gerontology which has been recently conceptualized by Wahl and Oswald(2010). We apply two major concepts of experiences and behavioral levels, Belonging and Agency to person-environments(p-e) interaction. **Method :** For the purpose, the study uses 2009 Statistics Korea data of Korean Social Survey and selects a sample of 10,268 people who are more than 55 years old. The Binary Logit model and Tobit model are used for data analysis. **Results :** he results show that a dependent variable, money volunteering participation is positively related to all environmental variables in statistically meaningful level($p<.000$). Also, another dependent variable, yearly frequency of money volunteering is positively related to social environmental variables in statistically meaningful level but the study fail to find statistically meaningful relationships between the latter dependent variable and residence environment variables. **Conclusion :** Under the thesis of environmental theory on aging the results are interpreted as follows. Money volunteering among the older people is promoted by identity and autonomy which become formed by Belonging and Agency which are emergent in the process of p-e interaction and as result of long aging in place. This suggests that civic engagement among senior citizens can be improved by bettering environmental conditions in place and environmental variables are considered to be important in the volunteering studies. **Keywords :** volunteering, Environmental Gerontology, Tobit

PP26 S-241

INTEGRATION OF ELDERLY PEOPLE IN A SOCIAL CARE HOME AS A PARTICIPATION PROCESS

Ineta ROBINA (*Faculty of Education, Psychology and Art, University of Latvia, Latvia*)

Introduction : This study is actualized in socio political and economical contexts related to active ageing comprehension and the necessity of providing participation opportunities of elderly people in integration process in the social care home as a new social environment. **Objectives are:** 1) to explore the subjective well-being of the elderly people in social care home; 2) to describe the intervention of social pedagogue for facilitation of opportunities of elderly people participation in design of life and work activities in social care home; 3) to explore the interaction structures between the elderly people wellbeing and quality of institutional integration by providing of participation opportunities. **Method :** Mix-methods (video observation, semi-structured interview) has been conducted to find the evidences to elderly people wellbeing in integration process related to participation opportunities provided by social pedagogue. The theoretical background of research is based on inter-disciplinary understanding of wellbeing as quality indicator in institution integration process. 62 respondents of the age 65-86 were involved into the research, 8 of them (active participants) were selected for interviewing and video observation. **Results :** The data processing applying AQUAD-6 programme, the code linkages explore implicit interaction structures between wellbeing and participation meta-codes and explore the implicate interaction structures between participation codes and wellbeing codes. **Conclusion :** Participation in institutional integration

establishes and enhances the well-being of elderly people. It gives people an opportunity of confidence rebirth. Keywords : well-being, participation, social care home.

PP26 S-242

COLLEGE STUDENT VOLUNTEERS' MOTIVATIONS, BENEFITS, SATISFACTIONS IN MOBILE PHONE EDUCATION FOR THE ELDERLY

Jungran HAN (*Department of Aging Welfare, Hanseo University, Korea*)

Introduction : The purpose of this study is to analyze motivations, benefits, and satisfactions of the college student volunteers. Method : We carry out the pre-to-post survey with 615 college student volunteers (male 245, female 367) who have participated in the mobile education program for the elderly funded by a Telecom. The instruments consist of VFI (Volunteer Functions Inventory) developed by Clary & Snyder (1999), including 30 items for motivations, 12 items for achievements, and 5 items for satisfactions of volunteering. The items for motivations and achievements are comprised of 6 subcategories: career, value, understanding, protective, enhancement, and social. Results : The results of this study are as follows: ① Enhancement motivation is the highest, followed by understanding, value, career, protective, and social motivation. ② Social benefit is the highest, followed enhancement, career, understanding, value, protective benefit. ③ The difference between motivation and benefit in social category is the largest, followed by career, enhancement, value, protective, and understanding category. While benefit is higher than motivation in all other categories, motivation is higher than benefit just in value category. ④ High motivation-high benefit, high motivation-low benefit, low motivation-high benefit, and low motivation-low benefit groups are dichotomized by the median of each motivation and benefit. In all six categories, high motivation-high benefit group shows the highest satisfaction, but low motivation-low benefit group shows the lowest. Conclusion : We can conclude that benefit shows stronger correlation with satisfaction than motivation does in volunteering. Keywords : motivation to volunteer, benefit to volunteer, satisfaction to volunteer

PP26 S-243

A LIFELONG LEARNING CURRICULUM HAS PROMOTED 2000 SENIORS FOR VOLUNTEER INSTRUCTORS IN JAPAN

Satoko SHOWA¹, Sumiko OSHIMA², Kazutoshi KITAZAWA¹ (*1. Public Health, Sapporo Medical University, Japan; 2. Department of Psychology and Communication, Hokusei Gakuen University, Japan*)

Introduction : In Japan, 80% of senior people older than 65 years old are free of care and spending active life. In order to promote these active seniors for volunteers who teach exercise program to people in the communities, we developed a short curriculum of lifelong learning education. Method : This curriculum has two unique characteristics. One is the unique exercise program, Fumanet™. The Fumanet is a 4 m _ 1.5 m net and comprises twenty-four 50 cm side grids arranged in a 3 _ 8 fashion. Participants were required to walk, carefully but rhythmically, from one end of the Fumanet to the other, without stepping on the ropes or getting caught in the net. The second point is the support system of these senior volunteers. A non-profit organization for community health was established in Hokkaido in 2005. This NPO has been providing courses for the short curriculum and supporting senior exercise activities by providing training programs and publishing newsletters. Results : With this curriculum, more than two thousands of active seniors (average age 63 years old,

the oldest 89 years old) have contributed to provide exercise opportunities in the communities of their neighborhood in Japan. Conclusion : An attractive program and institutionalized support are effective to encourage seniors' volunteer activities. Keywords : Volunteer, lifelong learning, NPO

PP26 S-244

A STUDY ON FACTORS AFFECTING INTENTION TO PARTICIPATE IN VOLUNTARY ACTIVITIES FOR LATER LIFE OF THE BABY-BOOMERS

Meehye KIM, Kiok SEONG, Junghwa MOON (*Graduate School of Social Welfare, Ewha Womans University, Korea*)

Introduction : Korean baby-boomers reach 14.6% of total population. Expecting that Korea is going to enter the aged society in 2019, all of baby-boomers would be the aged in 2018. In later life, the social participation like voluntary activities is important. The voluntary activities are known to give roles to the aged, promote self-esteem, help to overcome the sense of alienation, and improve QOL. This study aimed to figure the factors affecting intention to participate in it for later life of the baby-boomers. Method : This study is based on 2011's survey of the study project about baby-boomers. We operated frequency analysis, descriptive statistical analysis, t-test and binary logistic regression(n=1,021). The dependent variable is the intention of voluntary activities for later life, and the independent variables are demographic factors, resources factors, social participation factors, and psycho-social factors. Results : 77.3% of baby-boomers hope to be a volunteer in later life. More women than men had the intention of volunteering. Family total assets and subjective assessment of economic state showed positive relation with it. Experience of preparation program for later life, experience as volunteers, and the intention of donation are connected to it. Leisure hours showed negative relation with it. Conclusion : There need to expand the chances of volunteering and make fields where baby-boomers in financial stability can participate in. We need to develop the preparation programs for later life that take interest in community spirit. The policy to lean men who return to community after retirement in it is important. Keywords : Baby-boomer, Voluntary Activity, Social Participation

PP26 S-245

OLD PEOPLE VOLUNTEERING IN RESIDENTIAL CARE HOMES: AN EXAMPLE OF IZMIR-TURKEY

Sema OGLAK¹, Shereen HUSSEIN² (*1. Vocational School of Health Care, Dokuz Eylul University, Turkey; 2. Social Care Workforce Research Unit, King's College London, United Kingdom*)

Introduction : Social inclusion and participation, including civic engagements such as volunteering, can be regarded as one of the prerequisites for increasing the quality of life of individuals particularly among older people. In the context of low retirement age in Turkey and a general lack of public activities of older people, volunteering can provide meaningful way to achieve social inclusion and improve quality of life. Increasingly new strategies facilitating the involvement of elderly people in community and volunteer working in Turkey have come to prominence. At the same time changes in the population demographics increases demand for long-term care and volunteering can address both the shortages of formal care as well as potential benefits for volunteers themselves. The current study reports on research aimed to determine the extent of voluntary work in for profit as well. Method : This study is a descriptive and cross-sectional field study and covers state, municipal, foundation as well as private residential care homes operating within the borders of the Izmir

Province, we researched on these 41 residential care homes. This study was conducted between the 14th of April and 30th of May of 2011. Data were collected by contacting all residential care homes and through written and telephone interviews. Results : The findings indicate that nearly 10 percent of Izmir residential care homes had benefited from older peoples voluntary work. Conclusion : While considerable percentages of care services appeared not to utilise voluntary work of the older population, those who did indicated high level of satisfaction with the contribution of older volunteers. Keywords : older people, volunteering, residential care

PP26 S-246

COMMITTED SERVICE OF RETIRED FIREFIGHTERS

Stacey KOLOMER (*Social Work, University of North Carolina Wilmington, USA*)

Introduction : For over 20 years, the GFBB has operated a weeklong summer camp named Burn Camp for children with burn injuries. This organization boasts an extremely high return rate of camp volunteers. Many returning volunteers are now retired from the fire service. Camp may serve as a means of self-care for retired volunteers. Method : To better understand why these retired firefighters volunteer at Burn Camp, a series of in-depth qualitative interviews were conducted to explore what volunteering at the camp means to them. Some interviewees had volunteered for the past 15 years. The data presented will be based on responses of six retired firefighters. Results : Several common themes were identified from the interviews. These themes include, but are not limited to 1) campers are an inspiration, 2) camp feels like family, and 3) interactions with children who have been burned helps one to appreciate his own life. Conclusion : Working with burn-injured children is meaningful and inspiring to long-term volunteers. Identity and bonding with other volunteers has as much meaning as the experience of helping children. Anecdotal evidence has long suggested that volunteering at Burn Camp appears to be as beneficial and meaningful for the volunteers as it is for the children. The interviewees identified that camp provides support and comfort for volunteers and campers. As fire service personnel retire much earlier in the U.S. than their same age cohort, they appear less prepared for not working. Tactics to increase service participation of retired firefighters and program development for this population will be discussed. Keywords : Volunteering, Retirement

PP26 S-247

A WORKSHOP PROGRAM TO INCREASE THE UNDERSTANDING OF SENIORS THROUGH INTERGENERATIONAL COMMUNICATION

Sungsook PARK (*Intergenerational Practice Project Team, Donbaek Co., LTD, Korea*)

Introduction : This workshop is designed to increase intergenerational communication effectively targeting on teenagers. The participants attend to 5 session activities to understand the principal of intergenerational communication. They have a chance to think and discuss aging issue. Method : The "Mokdong Community Explorer Initiative" (MCEI) is a voluntary group to know about seniors at their local community. MCEI consists of teenage students from primary school to high school. MCEI attends 5 sessions include orientation, workshop, interview, sharing the result and making a report. The orientation is planned to write/ draw the image of the seniors and take pretest of aging issue and their intention to intergenerational practice. Teenagers attend half day workshop about the principal of intergenerational communication. They have a chance to think and discuss the following issues; 1) what intergenerational communication

is, 2) why it is important, 3) How benefits it has, 4) the possible activities how to integrate the different generations effectively. They also learn to how to interview seniors using both mobile and paper. The next session is to share the result of interview. The final session is to analyze them and discuss the gap of the image or thought and make a report. There is other purpose to develop a book targeting on teenagers to address aging issues and give them appropriate education of them through the workshop with the focus group. Results : This project is planned during the winter vacation and starts in January 2013. It will be discussed later. Conclusion : It will be discussed after enhancing the project. Keywords : image of seniors, community participation, intergenerational communication

A STUDY OF CONSTRUCTING ELDER VOLUNTEERS TRAINING MODEL : AN EXAMPLE OF ELDERLY TRANSPORTATION SAFETY EDUCATION PROGRAM

Hui-Chuan WEI, Meng-Ching HU, Ya-Hui LEE, Yi-Fen WANG (*Adult & Continuing Education, National Chung Cheng University, Taiwan*)

Introduction : Many medical units, social welfare units, educational institutions, and non-governmental organizations use the power of volunteers, even develop many volunteer recruitment, training, supervision, evaluation and reward approach, for using the society's human resources effectively in public affairs. Method : The purpose of this study is to develop a training mode among the elderly educators by using Kirkpatrick's theory, in the context of 2012 transportation safety education program. Results : In the first part of training, the study used "Single group pretest and posttest experimental" with 142 volunteers, finding significant differences after their training, showing that they were wake-upon this issue of great importance and the concept of change. Secondly, qualitative research method was adopted in this study, in depth interviews with 10 volunteers who preached transportation safety education, to understand their empowerment and energizing after the end of training. Conclusion : Based on the study conclusions, the study constructs elder volunteers training model, and provide the recommendations to the public and private sectors. Keywords : Volunteer, training model

PP26 S-249

ELDERLIES ACTING AS CAREGIVERS AND SUPPORTERS

Yolanda Maria GARCIA¹, Valmari Cristina ARANHA², Claudia Emi REGIS², Erica GONCALVES³, Wilson JACOB³ (*1. Clinical Medicine, Sao Paulo University Medical School, Brazil; 2. Psychology, Clinics Hospital - Medical School of Sao Paulo University, Brazil; 3. Geriatrics Division, Clinics Hospital - Medical School of Sao Paulo University, Brazil*)

Introduction : The participation of elderly individuals with important comorbidities in housekeeping and as caregiving receivers or providers may be underestimated. Method : Ninety-five out-patients of the Geriatrics Division from Clinics Hospital of Medical School of Sao Paulo University where invited to be interviewed, regarding to their social condition: income, sharing of home expenses, offering or receiving financial of physical support. Results were compared by ANOVA and Chi squared test. Results : Mean age was 76,36 years (62 to 81); 73 (76,04%) were females. All had at least three different and significant clinical diseases; 19,79% worked, 17,71% were paid for it; 88,54% had a social security income, 84,38% participated on home expenses; from those who provided this information, 27,08% offered financial help to people not living with them or to an institution; 72,92% received financial help, 61,46% from people not living with

them; 80,21% participated on housekeeping; 30,21% received, and 32,29% offered physical support from/to others. Mean age of those who participated on housekeeping was 75,59, and 79,47 of those who didn't (p=0,0142). Mean age of those who received or not physical support was not different. Mean age of those who offered physical support was 74,74, and those who didn't was 77,15 (p=0,07609). The proportion of females participating on housekeeping was higher (p=0,0010). No gender difference was found for receiving or offering physical support. Conclusion : Despite its high age and poor health condition, this elderly population had an important participation on living arrangements of their social groups. Higher age, more than gender, interfered on their participation. Keywords : caregiving, social participation

PP26 S-250

GERIATRIC CARE MODEL IN CHILE: COSTS OF BENEFITS DELIVERED IN THE DIFFERENT LEVELS OF CARE IN THE NATIONAL INSTITUTE OF GERIATRICS

Juana SILVA¹, Carlos ARANDA², Pablo FLORES³, Edgardo CAROZZI², Carolina PEREZ³, Sergio CASTRO⁴ (1. Director, National Institute of Geriatrics, Chile; 2. Management control unit, National Institute of Geriatrics, Chile; 3. Research and teaching departament (DIDE), National Institute of Geriatrics, Chile; 4. Day Hospital, National Institute of Geriatrics, Chile)

Introduction : The National Institute on Geriatrics (INGER), is a public hospital in Chile and is known for being the only establishment nationwide to give attention exclusively aimed at the elderly, also assisting in the formulation of national policies and providing ongoing training to health professionals. Method : Descriptive, using own statistical data and those provided by the system WinSIG (PAHO), that allows analytical information and management information system regarding the financial management of the establishment. Results : For 2012, ran the following levels of care: Geriatric Unit Acute Inpatient, 26 beds, with an average monthly expenditure of 73, 10 day stay at a cost of US\$3,320 per discharge; Specialty Center Ambulatory, with 514 consultations per month, at a cost of US\$77 per visit; unit Neurology and geriatric psychology, with 173 consultations per month at a cost of US\$165 per visit, and Day Hospital, with 50 beds daily, with 279 consultations per month at a cost of US\$225. Conclusion : The level of care that showed a higher cost was the Geriatric Unit Acute Hospitalization. This implies that to achieve greater efficiency and effectiveness in geriatric patient care, the treble unit must be integrated with other levels of care in geriatrics, which will facilitate the implementation of the monitoring and control of patients discharged after his hospitalization. This will reduce the likelihood of readmission to hospital, preventing patients functional impairment and associated cost of care. Keywords : Elderly, integrated units, cost of care

PP26 S-251

HOME PRODUCTION AND INTERGENERATIONAL TRANSFER : FOCUSING ON ELDERLY

Namhui HWANG (Population Strategy Research Division, Korea Institute for Health and Social Affairs, Korea)

Introduction : If we understand the full age-nature of consumption and production, we should consider not only money but also time. Because time input such as household chores can also improve economic welfare. In this sense, we examine patterns of production, consumption and transfer by age in home production. Method : The National Time Transfer Account (NTTA) and Korean Time Use Survey in 2004 are used. NTTA is new methodology to examine how people produce,

consume and transfer by age and gender in home production based on time input. Results : The annual scale of home production is represented approximately 2.3% of the GDP. Especially, the scale of female elderly is about 1.9% of the GDP and 3~8 million won per capita. In view of intergenerational resource allocation of home production by gender, males are the net beneficiary that consumption is larger than production regardless of their ages. It is about 200 million won per capital annually and mainly financed by females throughout intrahousehold transfer. On the other hand females are identified to be the net contributor in only the prime working ages but also elderly over 65. Conclusion : Elderly also plays the role of subject of production if considering home production and it is allocated by intergenerational transfer. It is needed to positively change the recognition into the recognition that the elderly also is a subject of production that contributes partially to the national economy. Keywords : home production, intergenerational transfer, National Time Transfer Account

PP26 S-252

THE IMPACT OF INCOME AND ASSETS ON FINANCIAL INDEPENDENCE OF KOREANS OVER 50 YEARS OLD

Seojin WON¹, Yongpil MOON², Inuk SONG¹ (1. Department of Social Welfare, Daegu Cyber University, Korea; 2. Department of Social Welfare, University of Seoul, Korea)

Introduction : While life expectancy is getting higher, retirement age has been decreasing since the economic crisis of the late 1990s. Although the current elderly population has more retired lives than their previous generation, social security does not fully support the financial needs of the elderly. Thus, this study addressed the effect of public and private income sources, as well as assets, on financial independence. Method : Researchers conducted a secondary data analysis using the third wave of the Korean Retirement and Income Study from the National Pension Service. Logistic regression was implemented to identify whether income and assets influence financial independence. Based on the Andersen model, age, sex, education, and marital status were included as predisposing factors. For enabling factors, income and assets were included. Need factors were monthly living expenses, expenses to family, perceived health condition, ADL, and IADL. Results : Results indicated that monthly salary was positively related to financial independence for those who were between 50 and 69 years old (OR=1.001, 1.001). Income from real estate was significant in all age groups; however, it had a greater impact on the older generation. Special professional pension had a significant impact on financial independence in all age groups (OR=6.719, 14.876, 19.912, 20.715), while national pension was significant among those in their 60s and 70s (OR=1.660, 2.686). Private pension was not significant in any of the age groups. Conclusion : Based on the result of this study, it is considered to strengthen the multilayer pension system and reduce gap between national pension and special pension benefits. Keywords : financial independence, social security, pension

PP26 S-253

UNEQUAL ACCESS TO FOOD IN OLD AGE: EVIDENCE FOR MEXICO CITY

Alberto RIVERA-MARQUEZ¹, Concepcion DIAZ DE LEON² (1. Health Care, Metropolitan Autonomous University (Xochimilco), Mexico; 2. Faculty of Medicine, National Autonomous University of Mexico, Mexico)

Introduction : For some, poverty is not a problem during old age as the elderly were capable of saving and cumulate assets in early stages of

the life cycle. This assumption is, at least for older populations of Mexico City and its metropolitan zone, not true. There is strong evidence suggesting that unequal access to food due to socioeconomic inequalities and poverty is a major concern in households with elderly members. The objective of this paper is to analyze associations between access to food and socioeconomic group based on household expenditure measures. Method : Using multivariate methods adjusted for design effect, food insecurity and socioeconomic variables were explored in a multi-stage sample of 1,247 households with elderly members from Mexico City and its metropolitan zone. The study population was divided in quintiles of per capita household monthly expenditure, as a proxy for poverty. Results : 60.0% of the elderly had no secure sources of economic resources. Lack of access to food (i.e. food insecurity) affects 45.0% of the elderly in the poorest quintile, whereas 1 out of 10 subjects from the wealthiest quintile has experienced limited or uncertain access to food ($p = 0.000$). Diet is less diverse in the poorest socioeconomic group than in the wealthiest quintile (44% vs 26%; $p < 0.01$). Conclusion : Both socioeconomic inequalities and poverty are crucial for the understanding of access to food in old age. These issues should be taken into account by both the local and the federal governments. Keywords : food insecurity, poverty, Mexico City

PP26 S-254

ECONOMIC INDICATORS OF EXPECTED OLDER ADULT POPULATION GROWTH

Anthony SETARI (*Family Sciences, University of Kentucky, School of Human Environmental Sciences, USA*)

Introduction : It is expected that the percent of the U.S. population that are older adults will rise as the Baby Boomer generation ages into older adulthood during the coming years. The rise in the older adult population is expected to increase demand for healthcare providers and related services more so than has previously been seen. To prepare, many areas have begun to encourage the hiring and training of healthcare professionals and to develop more healthcare facilities. The purpose of this study is to test if the expected growth in the older adult population can be explained using variables related to an area's economic climate. Method : For the analysis, the 120 counties within the state of Kentucky will serve as the subjects and the percent change in the older adult population from 2010 through 2050 will serve as the dependent variable. The independent variables for the study are rural/urban status, median household income, poverty level, and unemployment level. Kentucky counties were selected for their variety regarding rural/urban status, their overall number which aids in detecting effect sizes, and given that the state is not traditionally known for having a large older adult population. Results : It is expected that, of all the independent variables, rural/urban status of a county will have the strongest positive effect on explaining the percent change of the older adult population. Conclusion : Findings from this study could aid governments or institutions in determining where to further develop healthcare facilities to meet the expected increases in need. Keywords : Population, Economic, Community

PP26 S-255

ANALYSIS OF THE PRESENT CONDITION OF THE GOVERNMENT R&D INVESTMENT TO THE FUTURE AGED SOCIETY

Hyun-Sook CHANG (*Department of Elderly Welfare, Namseoul University, Korea*)

Introduction : Toward ultimate goal of successful ageing and sustaining healthy life, it is essential for the government to invest

preemptive R&D budget. The purpose of this study is to analyze the present status on Korea government R&D investment on the elderly in order to provide basic data for establishing national strategies for future R&D investment on this area. Method : The study data was collected from database of the National Technology Information System (NTIS www.ntis.go.kr) using the key words related to the elderly selected by the expert panel. Also we developed the classification system of R&D topics for the elderly for the R&D planning and management. R&D topics can be classified to area of 10; research for policy making, biological ageing mechanism, clinical medicine and epidemiology, social behavioral science, elderly disease prevention and cure technology, prevention of chronic diseases and cure devices. long-term care and residential facilities, assistive devices, education and training program, statistics and information management. Results : We finally analyzed expenditure, field of research, related ministries and subject of research projects of some 980 performed (\$ 205 millions) during from 2007 to 2009. For examples of fields, biological ageing mechanism, 204 projects (\$ 24,494,000), clinical medicine and epidemiology, 172 projects (\$ 26,516,000), social behavioral science, 26 projects (\$ 1,411,000), long-term care and residential facilities, 41 projects (\$ 5,970,000). Conclusion : Policy direction of government R&D Investment to a brighter future, active and systematic investment of government R&D focused on quality of life and longer healthy life expectancy. Induction of the standards classification system for R&D investment focused on aged society. Keywords : Aged society, Government R&D Investment, Classification System,

PP26 S-256

OLDER WORKER POLICIES IN EU COUNTRIES - RESULTS OF PROJECT 'EQUALISING OPPORTUNITIES ON LABOUR MARKET FOR PEOPLE AGED 50+'

Piotr SZUKALSKI (*Institute of Sociology, University of Lodz, Poland*)

Introduction : The European Union is experiencing rapid population ageing which leaves an impression of labour market. Poland is one of the countries where the scale of changes concerning the economic activity of people over 50 is still relatively low. The Polish Ministry of Labour and Social Policy decided to disseminate an idea of equalizing opportunities in the labour market to people aged 50+. The Ministry commissioned a special research project whose one element is research on solutions promoting active ageing in selected EU Member States. The paper is result of the project which is conducted in 2011-2013. Method : Two different methods were used: analysis of secondary data (documents, papers, articles) and collecting information during study visit in national institutions responsible for older workers policy. Results : There are 3 types of preferred older workers policies aimed at: 1) working older people; 2) unemployed older people; 3) reforming pension systems. The preferences are differentiated and the main reason of differences could be found not in economic circumstances but rather in dominant ideals on life-course. Conclusion : Good measures of older worker policies could be found in almost all EU countries but only in part of them the measures form holistic programs affecting simultaneously basic careers (professional, educational, familial ones) and statuses (health). And only the holistic approach is prerequisite of successful older worker policy. Keywords : older workers policy

RESEARCH ON THE PROFESSIONS OF CARE MANAGERS AT HOME-BASED CARE MANAGEMENT PROVIDERS BY COMPARISON WITH GERIATRIC WELFARE FACILITIES IN JAPAN

Hiroshi SUMII¹, Akiko SAKAI², Mika KUNISADA¹, Kana KAGEYAMA³, Hiroshi ISHIDA⁴, Hyeon-Kyu SEON⁵, Choon-Seek RIM⁶ (1. Faculty of Health and Welfare, Prefectural University of Hiroshima, Japan; 2. Graduate School of Comprehensive Scientific Research, Prefectural University of Hiroshima, Japan; 3. Medical Sciences, Health Sciences, Ph.D. of Science, University of Kyushu, Japan; 4. Graduate of Gerontology, University of Oberlin, Japan; 5. Faculty of International Business Administration, Kyoei University, Japan; 6. President emeritus, Korean Society for Welfare of the Aged, Korea)

Introduction : This study detected the professions of care managers at the home-based care management provider by comparison with geriatric welfare facilities in Japan to grasp the difference of care managements. Their performances could be especially influenced not only by personal but also environmental factors. **Method :** The mailing surveys revealed 374 care managers at 148 home-based care management providers selected around the country. We compared them and 799 care managers at 342 geriatric welfare facilities. **Results:** The care managers consisted of mainly certified care workers by national licenses (68.7% at home-based, 80.9% at geriatric ones), though less nursing licenses (14.4% at home-based, 7.8% at geriatric ones). As their average age of 41.5 years old at home-based, they are 1.8 years older than at geriatric ones. Average 14.2 years of total experience in the care managers at home-based was shorter 0.8 years than at geriatric ones in significant level by Mann-Whitney analysis. The average 30.2 cases and 27.6 care plans were treated by a care manager with their rate of full-time jobs and part-time distributed from 86.9% to 11.2% at home-based ones. **Conclusion :** To enhance their management performances of care managers at the in-home care management providers, it is necessary to revise the processes of care management systems according to their professions. As their performances were influenced not only by personal but also environmental factors, care managers should make multiple efforts to adjust the users to their social municipal resources. **Keywords :** Care Management, Care Manager, Care Management Provider

PP26 S-258 **ISSUES IN DEMOGRAPHIC CHARACTERISTICS OF CARE MANAGERS IN JAPAN**

Kana KAGEYAMA¹, Yuki SAWADA², Hiroshi SUMII³, Mika KUNISADA³ (1. Department of Health Sciences, Graduate School of Medical Sciences, Kyushu University, Japan; 2. Center for Well-Being and Society, Nihon Fukushi University, Japan; 3. Department of Health and Welfare, Prefectural University of Hiroshima, Japan)

Introduction : In 2000, the government of Japan established the Long-Term Care Insurance (LTCI) system which mandated the development of individualized care plan by care managers (CMs). The purpose of this study is to determine whether there are any issues in demographic characteristics of CMs that can be addressed. **Method :** Survey questionnaires were mailed to 745 CMs of 308 home care agencies between October 15th and December 18th, 2011. Of those agencies, 141 agencies were individually approached and 90 agreed to participate. The rest of agencies (n=167) were randomly selected from the Welfare and Medical Service Network System (WAM NET; a web-based program that offers information for LTCI-certified nursing homes and home care agencies) based on the distribution of population in Japan. A total of 374 responses were received from 138 agencies (50.2%). **Results :** The majority of CMs are female (82.6%) and nearly one-thirds of them aged 50 years and over (32.1%). Nearly one-half of all CMs (45.4%) had at least a junior college degree. While less than one-sixth of CMs (14.4%) had a nursing license, many of them had a

nurse's aide certification (68.7%), home care aid certification (38%), social service director certification (22.7%) and social worker license (12.3%). Over four-fifths of CMs (86.9%) were full-time employees. **Conclusion :** Although care plans are an important part of providing care, many of them are created by non-health professionals and/or those whose highest level of education is high school or less. It suggests that there is a need to discuss the qualifications for becoming a CM. **Keywords :** Long-Term Care Insurance, Care Managers, Demographic Characteristics

PP26 S-259 **AN IMPACT ANALYSIS OF THE MARKETIZATION OF WELFARE: A CASE STUDY OF THE LONG-TERM CARE INSURANCE PROVIDERS IN KOREA** Seonhee CHOI (Tokyo Metropolitan University, Japan)

Introduction : This study empirically investigates the efficacy of marketization in welfare in Korea, where the long-term care insurance scheme for the elderly been introduced since 2008. **Method :** By conducting semi-structured interviews with the sixteen long-term care service providers, this study analyzes effects experienced by different types of providers, including profit and non-profit, as well as institutional and in-home service providers. In addition, this study focuses on the differences in the efficacy between preexisted providers and the other new providers that have been in the quasi-market since the introduction of the insurance scheme. The study employs five indicators to systematically evaluate impact, including efficiency, responsiveness, choice, equity, and service quality. **Results :** Results show that: (1) lower efficiency is reported among the new providers; (2) higher responsiveness is perceived for the new in-home service providers; (3) the range of choice is no relevance between the preexisted and the new providers; (4) inequity is increased for the new providers; and (5) service quality is improved for the new providers. **Conclusion :** In conclusion, this study indicates that marketization of welfare led to different effects among various types of service providers; more detailed investigation is required to verify its efficacy. Finally it is suggested that appropriate measures should be employed by the public authority to maximize the efficacy of the scheme by reducing negative effects caused by the marketization. **Keywords :** Long-term care service in Korea, Marketization of welfare, Impact analysis

PP26 S-260 **EXPLORING EMPIRICAL PATHWAYS IN THE USE OF HOME MODIFICATION FOR AGEING-IN-PLACE** Songiee HONG¹, Mi Jin LEE², Chang-keun HAN³, Mingi JEONG⁴ (1. Department of Social Work, National University of Singapore, Singapore; 2. Department of Social Welfare, Konkuk University, Korea; 3. Department of Social Welfare, Sungkyunkwan University, Korea; 4. Department of Social Work, Japan College of Social Work, Japan)

Introduction : Although ageing-in-place is valued by older adults and their families in Korea, households of Korean older adults rarely use home modification services, which is essential to realizing ageing-in-place especially for older adults with disabilities. We aim to study how functionally disabled older adults who are using assistive devices and their family caregivers are adapting to their home environment through home modification services. **Method :** Qualitative in-depth interviews were designed as a tripartite set of an older adult, his or her family caregiver, and a formal helper supported through the National Long-Term Care Insurance. The interview data from seven households of older adults were audio-taped, and then transcribed and independently

coded by the investigators. Data coding was crosschecked to enhance analytic decisions during data analysis and interpretation for accurate coding validity. Results : Using the Andersen model (1995), we identified service needs, enabling resources, health care system and outcomes of home modification services. Intriguingly, more diverse and comprehensive behavioral, psychosocial, and cultural factors which facilitate or deter older adults and their family caregivers' home modification service use were found. The dynamic and recursive nature of home modification service use model incorporating outcomes was illustrated. Conclusion : The findings may contribute to improving the Andersen model's explanatory power. Furthermore, we discuss policy implications for restructuring systematic service use barriers and facilitators that are responsive to concerns and preferences of potential service users of home modification and may lead more disabled older adults to stay in their community. Keywords : home modification services, assistive devices, ageing-in-place

PP26 S-261

HOW ARE EFFECTS OF RETIREMENT TRANSITIONS AND EMPLOYMENT DURATIONS ON OLD-AGE PENSIONS CHANGING IN GERMANY?

Julia SIMONSON, Laura ROMEU GORDO (*Research, German Centre of Gerontology, Germany*)

Introduction : An ongoing welfare state reform in Germany gradually increases legal retirement age to 67. Additionally, in recent years the opportunities for early retirement have been progressively reduced. These developments evoke the question, how far employees are able to prolong their working lives and arrange their transitions to retirement without serious consequences for their old-age incomes. Method : Using panel data from the German Ageing Survey (DEAS) by means of regression analyses we examine how types of retirement transitions as well as duration of employment affect old-age pensions and how these effects have changed from 1996 to 2011. Results : Over the observed period the effective retirement age has increased by one year and more people retire directly from employment than from other states like unemployment or disability. However, for people who do not directly change to retirement the distance between end of working life and commencement of pension has increased. Furthermore, both a direct transition to retirement and longer durations of employment positively affect old-age pensions. These effects have not changed over time. Conclusion : There is an increasing proportion of people who postpone their exit of working life as reaction to the postponement of retirement age. However, several people are not able to adapt to these legal reforms. As a result they get lower old-age incomes due to increasing deductions of pensions. Therefore, welfare policy has to spend special attention to these groups. Keywords : Retirement transition, Pension, Old-age income

PP26 S-262

THE FUTURE DIRECTION OF THE LONG-TERM CARE INSURANCE OF JAPAN BY THE INCREASING COSTS BURDEN

Kyung Sung HWANG¹, Jin Pil UM² (*1. Department of Health and Social Welfare, Nanyo City University, Japan; 2. Centre for Research on Ageing, University of Southampton, United Kingdom*)

Introduction : It passed more than 10 years after introduced the Long-term care insurance system in Japan. The number of users of the system has been more than double from 1.49 million Yen of 2000 to 4.92million Yen of 2010 and the cost from 3.6trillion Yen of 2000 to 7.9 trillion Yen of 2010. The uneasiness of the users and heavy financial burden to government caused by the costs are increasing

every year while the satisfaction has been high ever. Method : We tried to analyse datas which were released by the government and other academic papers after the system has started. Results : There were twice regular revisions of 2005 and 2011 and significant changes in many points, especially to save the costs and try to make reasonable system like putting new agencies for supporting carer givers and care recipients. However although the system has done very helpful roll for them, the burden to the government is increasing every year therefore the contents of revisions were very serious for the carers and care recipients whenever it has revised. For example, in the revision of 2005, there was strict classification deviding 'care 1' into 'support 2' which means lower than before and put burden to pay the hotel costs in domiciliary care recipients. Another burden of the insurance rate for elderly people continued to rise every year from three thousand of 2000 Yen upto five thousand Yen of 2012. Conclusion : Like this serious fiscal situation will make more significant reform in the fure unless dramatic economic change. Keywords : Long-term care in Japan, Long-term care, carers, care recipients

PP26 S-263

THE DEVELOPMENT OF COMMUNITY-BASED ELDER CARE IN CHINA ?A CASE STUDY OF VIRTUAL NURSING HOME IN LANZHOU, GANSU

Xiulin GAO¹, Baozhen LUO², Feifei SHAN¹ (*1. Public Management, Lanzhou University, China; 2. Sociology, Western Washington University, USA*)

Introduction : To meet the increasing need of elder care, community-based care was brought on the table by the Chinese government to subsidize family and institutional care. The goal is to allow elders to age at home by receiving the much needed care at a low cost at community. "Virtual Nursing Home" in Lanzhou city is a successful example of such programs. This study offers a thorough exploration of the development and utilization of the virtual nursing home. Method : In-depth interviews with 1 government cadre, 13 service-providing business owners, 4 coordination center staff, 1 volunteer organization, 13 community administrative staff, and 224 seniors. Results : Several obstacles are presented: 1) sole reliance on local government funding makes it difficult to implement in economically disadvantaged areas where services are needed the most; 2) Due to the lack of regulations, care providers are not trained professionally which often lead to miscommunication between caregivers and care receivers; 3) The level of utilization due to seniors' preference to care provided by adults children and unwillingness to purchase outside services; 4) The services provided are largely one-dimensional, neglecting the importance of emotional support. Conclusion : The authors are calling for more involvement from the central government regarding financial and policy support and a deeper understanding of the impact of filial piety on seniors' utilization of community-based care by all party involved. A follow-up two-year project will soon be conducted to address the above concerns in a more detailed manner. Keywords : Community-Based Care, Government, Policy Support, Regulations, Filial Piety

PP26 S-264

ORGANIZATIONAL EFFICIENCY: A COMPARATIVE ANALYSIS OF EXERCISE PROGRAM PROVIDING AGENCIES FOR THE ELDERLY

Chang-Hwan KIM, Jung Won LEE (*Dept. of Physical & Rehabilitation Medicine, College of Medicine, Inha University, Korea*)

Introduction : To increase opportunities for participation of the elderly in exercise, and improve effectiveness of community investment

projects, we studied a nationwide analysis on the seniors exercise programs in four kinds of providing organizations. Method : Four kinds of institutions: Ministry of Health and Community Services investment business service provider 22 locations, 50 locations nationwide health center, senior center opening 150, Ward Athletic Center, and similar institutions were enrolled in 60 centers. Age structure, accessibility, price, category diseases, types of exercise program, participation rate and duration, assessment of exercise capacity, facilities, standards, qualities of leadership were investigated. Results : Service providers 22 clinics, health centers of 23 sites, senior center opened 33, 41 similar institutions, data centers have sent replies. Programs offered in all four groups: located 80.7% in urban areas. For transportation 40.9% had been operated a shuttle bus except local health center. Program participation rate was 67.5% in elderly women. Classification of disease was used in 37.8%. Conclusion : Facility standards, the type of exercise, the leader in eligibility criteria showed similar results for four agencies were. However, the service price offer business services in the community service investment institutions are overestimated. Elderly in small and medium sized cities have fewer opportunities to participate in exercise service. New investment programs for small city dwellers would be needed to improve health. Keywords : organizational efficiency, government, exercise

PP26 S-265 SUPPORTIVE COMMUNITY

Yitzhak BRICK (*Gerontology, University of Haifa, Israel*)

Introduction : Supportive Community The rapid increase in the number of elderly people increases the need for exploring for new and innovative programs that will be sustainable and inexpensive. The general trended in planning services for the elderly is for services which will make it possible for the elderly to continue to live at home. This presentation is about an innovative program which meets the goal of aging in place, sustainability and low expenditures to the public sector. The program was initiated and developed in Israel by Eshel, a national agency established by the JDC The supportive community program is based on a basic package of services provided to elderly people who live at home. each 'Supportive Community' Includes 200 households living in a defined geographic area. The basket of services includes : 1. Community father - A paid staff person who is on call around the clock. Provides assistance to the participants in the program. 2. Emergency call system - Connection to a call center by an alarm system to call in emergency cases. 3. Medical services - home visits by a doctor at nights, weekends and holidays and ambulance service. 4. Social activities - Group activities, trips, holidays parties. The cost of the program is about \$30 per month for every household. Follow up studies indicated high satisfaction. Method : Questionnaire and interviews. Results : High satisfaction by the elderly residents, strong feeling of security and improvement in quality of life. Conclusion: It is a successful, sustainable and inexpensive program. Keywords : services, community

PP26 S-266 THE HISTORY AND LOGIC OF STUDYING GLOBAL AGING

Frank J. WHITTINGTON¹, Suzanne KUNKEL², J. Scott BROWN³, Jasleen K. CHAHAL³ (*1. College of Health and Human Services, George Mason University, USA; 2. Scripps Gerontology Center, Miami University, USA*)

Introduction : For nearly half a century (roughly from 1945-1990) formal gerontology focused almost exclusively on aging in the U.S. and Europe. Thus, until about 1990 most of what gerontologists knew about aging was really only about aging in their own cultures. During

the 1990s the field began to expand into many other countries in Asia, Africa, and Latin America. Method : We review the brief history of gerontology and the study of global aging, focusing on Palmore, Whittington, and Kunkel's (2009) third edition of the International Handbook on Aging. Results : The Handbook documents a startling amount of growth and development in gerontology, geriatrics, and aging policy initiatives in all regions of the world but focuses on 46 countries with significant aging research, education, and public policies. The evidence presented makes clear that interest in aging, scholarly research, and formal training programs for both practitioners and scientists are on the rise in the non-western world, especially in the major Asian nations (Japan, Korea, and China) and in Latin America (primarily in Brazil, Argentina, and Mexico), but even in many developing countries with limited scholarly traditions and even more limited economic resources (Botswana, Cuba, Estonia, Malaysia, Pakistan, Uganda, and Zimbabwe). Conclusion : We argue that the study of aging globally and the comparison of findings across societies is necessary for gerontologists in all countries for 3 main reasons: 1) it is required for a complete scientific explanation of aging; 2) it is in our own economic self-interest; 3) it is politically wise. Keywords : Global aging, history

PP26 S-267 REQUIREMENT OF MULTI-DIMENSIONAL REGIONAL COALITION AND EDUCATION TO ESTABLISH DEMENTIA CARE IN COMMUNITY

Hajime TAKECHI¹, Toshio MORI², Takeya HASHIMOTO³, Shigenon NAKAMURA⁴ (*1. Geriatrics, Kyoto University, Japan; 2. Psychiatry, Kyoto Prefectural Rakunan Hospital, Japan; 3. Welfare, Dowan Long-term Care Facility, Japan; 4. Neurology, Otowa Hospital, Japan*)

Introduction : Patients suffering from dementia steadily increase. It is important to establish community care for dementia. In order to design the load map for effective community care for dementia, it is required to know present status of it. Method : Modified Delphi Method is employed to analyze present status of community care for dementia. Three times of questionnaire are carried out by an expert committee consisting of 26 members who are psychiatrists, geriatricians, neurologists, primary care physicians, nurses, care managers, care professionals, social workers and leaders of family caregivers. Results: Total 477 statements are raised for 9 questions and 236 statements reached agreement. Regarding what is accomplished at present, among 63 raised statements, only 2, e.g. "recognition of citizens about availability of long-term care insurance service for dementia", were agreed. As for unmet needs of patients and caregivers, 46 of 50 statements were agreed. Factors that cause difficulties in care consisted of 144 statements, resulting in 51 agreements which are classified to two categories; one for recipients, another for providers of care, consisting of health and care professionals and community people. The former further divided into four problems; stigma or complex emotional conflict of family members, lack of care for early stage of dementia, aggressive behaviors and comorbid physical condition. As for solutions to establish community care, among 155 statements raised, 112 were agreed. Conclusion : It was recognized that there are many subjects to be addressed to establish community care for dementia. Comprehensive approach would be required for the purpose. Keywords : dementia, community care

PP26 S-268 A STUDY ON SOCIAL EXCLUSION OF SINGLE AND MARRIED ELDERLY HOUSEHOLDS IN KOREA

Jeonghwa LEE, Young-Eun OH (*Department of Family Environment*)

and Welfare, Chonnam National University, Korea)

Introduction : The incidence of single and married elderly households is increasing rapidly in Korea, but the growing aging population face serious problems because they are unprepared to take realistic precautions. After reaching retirement age, many elderly Koreans find themselves in economic trouble due to exclusion from employment opportunities. The physical, social, and psychological health of impoverished elders is in danger. In this context, we need to discuss 'social exclusion', or the deprivation of and exclusion from resources for social, economic, and political participation. In this study, we investigated the degree of social exclusion in single and married elderly households as well as elderly citizens' experiences of multiple exclusion in Korea. multiple exclusion was calculated that how many the upper six exclusions were overlapped. **Method :** 527 people over the age of 60 who do not live with their adult children were selected for this study, which ran in July and August, 2012. The statistical analyses used in this study were frequency, percentage, and chi-square tests. **Results :** First, we found that all the social exclusions Korean elderly households face, health exclusion is the greatest, followed by residence, economy, education, social activity, and relations. Second, we analyzed differences of social exclusion by gender, age, and marital status. In conclusion, we found that women, the very old, and single people more frequently experience social and multiple exclusion. **Conclusion :** There is a great need to reduce social exclusion for women, the very old, and single people in Korea. **Keywords :** Social Exclusion, Single and Married Elderly Households

PP26 S-269

A STUDY ON LOCAL GOVERNMENTS' AGE-FRIENDLY COMMUNITIES: A COMPARISON OF SOCIAL WELFARE PROGRAMS FOR THE ELDERLY

Jin KIM¹, Seo-Young LEE² (1. Dept. of Elderly Care Management, Catholic University of Pusan, Korea; 2. Dept. of Elderly Welfare, Seoul Cyber University, Korea)

Introduction : A decreasing birthrate and an increase in longevity have accelerated the "greying" of the world's population. There have been changes in political paradigms and the theoretical development of concepts of aging to address the socioeconomic problems caused by rapid aging. In fact, as found in the World Health Organization's (WHO) guidelines on age-friendly cities, there are movements that emphasize the importance of responsibilities and functions of both the central government and local governments. **Method :** The framework is established based on the eight areas(outdoor spaces&Buildings, Transportation, Housing, Social participation, Respect&Social Inclusion, Civic Participation & Employment, Communication & Information) that WHO recommends for developing age-friendly communities. This targets local governments' welfare programs for elderly people. The characteristics of local governments (urban/rural type) are considered, and such government bodies are then categorized. It will focus on analyzing the welfare programs of local governments. **Results :** The following are the expected results of this study. Recommendations on the current status of preparation for aging populations at the local government level, based on WHO standards, will be made. Additionally, the performance of each of the eight areas will be compared in detail, which will enable an in-depth evaluation of the programs. **Conclusion :** This study will recognize problems local governments are facing based on not only international standards but also a comparison between local governments' policies on aging populations. This study suggests a direction of active post-retirement life policy by examining the elder friendliness of communities in Korea based on international standards of welfare programs for elderly

people. **Keywords :** again populations, age-friendly cities, welfare programs

PP26 S-270

ACTIVE AGING VIEWPOINT A STUDY OF IMPLEMENTATION MODEL FOR ELDER EDUCATION IN TAIWAN

Yao CHING-TENG (Institute of Adult and Continuing Education, National Chung Cheng University, Taiwan)

Introduction : According to the Taiwan Ministry of the Interior census statistics, in 1993, 7.1% of the population was above the age of 65, surpassing the UNESCO defined 7% benchmark for an aging society. By December 2011, a record breaking 10.89% of the total population. Consequently, the issues surrounding an aging population has become increasingly important, and the topic on the elder education requires in-depth analysis and discussion. **Method :** The research method is analysis of literatures, theories, and interviews. This research aims to understand the current progress on the implementation of elder education, and discusses the Taiwan governing polices, established laws, budget situation, and resource integration mechanisms. Further analysis demonstrates the possibility of innovating elder education practices and provides strategic recommendations to resolve current implementation challenges. **Results :** The result showed that elder education was traditionally spearheaded by social agencies and has in place a wide variety of educational establishments and facilities. Following the amendment of the Senior Citizens' Welfare Act in 2007 and the issuance of the White Paper on Senior Education Policy, the government has demonstrated its commitment to elder education by allowing educational agencies to assume the leading role. Elder education has since shifted from a form of social welfare to an education-oriented policy. **Conclusion :** Despite recent progress, elder education still faces the challenges of policy implementation, legislative hurdles, budget funding, practical applications, academic research, and talent building. Learning from the experiences of developed nations, Taiwan can gain from the aspects of attitude, budget support, resource integration, marketing, and assistance programs. **Keywords :** Active Aging, Elder Education, Policy

PP26 S-271

ACTIVE AGEING INDEX 2012 FOR 27 EU MEMBER STATES

Asghar ZAIDI¹, Katrin GASIOR², Maria M. HOFMARCHER², Orsolya LELKES², Bernd MARIN², Ricardo RODRIGUES², Andrea SCHMIDT², Pieter VANHUYSSSE², Eszter ZOLYOMI¹ (1. Social Sciences, University of Southampton, United Kingdom; 2. European Centre for Social Welfare Policy and Research, Austria)

Introduction : The AAI provides a new tool for policymakers in European countries enabling them to devise evidence-informed strategies in dealing with challenges/opportunities of population ageing. The context is that 2012 was the European Year for Active Ageing and marked the second 5-year cycle of review and appraisal of the MIPAA implementation. **Method :** The AAI draws from the WHO widely quoted definition; bases itself on the three strands of the European Year 2012; and makes use of the methodology similar to the HDI of the UNDP. It enables comparisons between 27 EU countries by quantifying the differential extent to which older people have the unrealised potential in the distinct domains of employment; social participation; independent and healthy living and capability. The breakdown by gender highlights the specific social policy goal of reducing gender disparity in active experiences of ageing. **Results :** Two Nordic countries, Sweden and Denmark, and Ireland, the UK and Netherlands come at the top of the ranking. In contrast, majority of the

Eastern European countries, and Greece, are at the bottom. In almost all countries, women fare worse than men, particularly in Cyprus, Malta and Greece but also in the Netherlands and Luxembourg. A positive correlation with per/capita GDP shows that the countries with relatively higher standards-of-living are generally more successful. Conclusion : Additional future research required is to explore the link between active ageing and the quality of life of older people. What social policy contexts are important? What impact of life-course experiences? The toolset is publicly available for its adaptations and use. Keywords : Active and healthy Ageing, European Union

PP26 S-272

THE HEALTH OF ELDERLY KOREAN, CHINESE, AND OTHER HOME CARE CLIENTS, AND CAREGIVER DISTRESS IN ONTARIO, CANADA

Byung Wook CHANG, John P. HIRDES (*SPHHS, University of Waterloo, Canada*)

Introduction : Korean immigrants comprise about 0.3% of the total Canadian population. However, this population is increasing faster with a growth rate of 53% compared with 19% growth in the Chinese-Canadian population and only 4% for the general population between 1996 and 2001. Immigration later in life is a stressful because it forces cultural adjustments and may pose language barriers. Elderly Korean immigrants often lack information and preparation to adjust to the major changes in cultural norms and social conditions. The purpose of this study is to examine the health of elderly Korean-Canadians with a particular emphasis on distress among caregivers. Method : A cross-cultural comparison of Korean, Chinese and other Canadian home care clients was done using the Resident Assessment Instrument - Home Care (RAI-HC). The assessments were done as a part of normal clinical practice between January 2002 and December 2012 within Ontario. To investigate risk factors for caregiver distress, data from a sample of 773,276 home care clients were analyzed using descriptive statistics and chi-square analysis at the bivariate level and multiple logistic regression models. Results : The major finding of the present study was that Korean clients had higher physical impairments and higher prevalence of major chronic diseases but they were less likely to receive personal support or nursing services. Moreover, the results provide clear evidence of the importance of language barriers for all linguistic minorities, including Korean-Canadians. Conclusion : In addition to ensuring cultural competence of staff members dealing with minority home care clients, the practical problems caused by language barriers should be addressed by health and social service providers. Keywords : Home care, Ethnicity, interRAI, Caregiving

THE INTERACTION OF SOCIAL SUPPORTS AND DEPRESSION BETWEEN THE IN-HOME CARE ELDERLY WITH DEMENTIA AND THEIR FAMILY CAREGIVERS

Eun Sil JANG¹, Ki Woong KIM¹, Soong-Nang JANG², Kyung Sook CHOP¹ (*1. Department of Neuropsychiatry, Seoul National University Bundang Hospital, Korea; 2. Department of Nursing, Chung-Ang University, Korea*)

Introduction : This study has been attempted to provide basic data necessary for the development of effective nursing intervention by caregiving types of family caregivers for the aged people with dementia, analyzing their interactions with their family caregivers between social supports and their depression. Method : Research participants as the in-home care elderly who are more than 60 years of age in their local community and their family caregivers, are participated in 'Korean Longitudinal Study on Cognitive Aging and

Dementia (KLOSCAD)' which has been studied since 2011. The collected data have analyzed by use of the SAS statistic program based on Actor-Partner Interdependence Model (APIM) suggested by Kenny(1996). APIM is a model of dyadic relationships that integrates a conceptual view of interdependence in two-person relationships, and in this study, the research participants as the in-home care elderly and their family caregivers are 491 persons. Results : The interactive effects between social supports and depression of the participants of the elderly with dementia and the family caregivers are significantly shown in actors' effects. However partners' effects have been shown with the result that the partners' social supports do not impact upon actors' depression, but the partners' depression is impacted directly on actors' depression. Conclusion : As the above research results, the understanding of the interactive effects between the in-home care elderly with dementia and their family caregivers' social supports and depression are necessary for multi-dimensional approaches according to caregiving types of caregivers, for the managerial prevention from the depression of the elderly with dementia and their caregivers. Keywords : family caregiver, social support, depression

PP26 S-274

DEMENTIA, CAREGIVER AND HYPNOSIS

Josiane TARDIEU (*General Practitioner, Cabinet Medical, France*)

Introduction : The author wants to show if there is a link in between hypnosis sessions in order to help the caregiver and the behavior of the dement person. Method : After filling a NPIES scale, several sessions of hypnosis have been held in order to help the anxiety and the anger of the main caregiver. A second NPIES scale has been done afterwards. Results : A mild improvement appears specially for the apathy. Conclusion : Hypnosis could be another way to help the caregivers without using new drugs for the dement patient. Keywords : Dementia, caregiver, hypnosis

PP26 S-275

THE EFFECT ON EGO-INTEGRITY TO BE AFFECTED BY THE ELDERLY'S HEALTH AND FAMILY SUPPORT

Mi Ran LEE (*Department of Social Welfare, Kosin University, Korea*)

Introduction : This study is to investigate a mediated effect of family support in ego-Integrity and health, to grasp the relationship of the physical, the psychological, the social health, family support and ego-Integrity, with targeting 603 people of 65 years old or over residing in B city. Method : The collected data were analysed with reliability, validity, factor analysis and structural equation. Results : The results of summary are as follows. First, of the health of the elders, only social health affected family support, and all of the physical, the psychological and the social health affected ego-Integrity. In particular, the physical health showed the negative effect of ego-Integrity and psychological and the social health showed the positive effect of ego-Integrity. Second, out of the health, the physical health in the direct effect of ego-Integrity affected negative effects in the ego-Integrity, and the psychological and the social health affected the positive effect in the ego-Integrity. Only the social health in the restriction model, which controls the direct effect, affected ego-Integrity thru a family support, and total effect was bigger than the direct effect, which showed a partial mediated effect of family support. Conclusion : This study concluded that elderly people's ego-integrity is improved when family members support their roles and participation in social activities. Therefore, the managing strategy of family's support for special groups is necessary to be developed, and the informal support system from the point of old people's welfare level is needed to be strengthened. Keywords : elderly welfare, health, family

support, ego-Integrity

PP26 S-276

THE STRESS OF FAMILY CAREGIVERS FOR DEMENTIA PATIENTS IN LONG-TERM CARE SETTINGS

Mi Sook KIM¹, Hyun Sook KIM² (1. Graduate School, Department of Elderly Welfare, Korea National University of Transportation, Jeungpyung elderly nursing home, Korea; 2. Department of Social Welfare, Korea National University of Transportation, Korea)

Introduction : The purpose of this study is to provide basic data useful for preparing measures in relieving the stress of family caregivers for dementia patients in long-term care settings. Method : The subjects of this study were 222 family caregivers for people with dementia in geriatric medical and welfare facilities in Chungbuk province, Korea. The data were collected using the structured questionnaires including Korean version of Caregiver Burden Inventory (CBI) originally developed by Novak and Guest (1989) by self-reporting method or interview by research assistant. The survey data were analyzed using SPSS 18.0 for windows - descriptive analysis, t-test, or ANOVA, correlation analysis and multiple regression analysis. Results : Firstly, total stress score of family caregivers for dementia patients in long-term care settings were 94.70 ± 18.95 . The order of sub-domain family caregiver stress was arranged as follows: time dependence, economic burden, developmental burden, physical burden, social burden, and emotional burden. Secondly, the factors affecting the total family caregiver stress are the extrafamilial social support, degree of cognitive ability of the elderly care receiver, the cost needed to support them, and their disease conditions other than dementia. The adjusted R² value of these variables was 17.9, and the most influential factor was the extrafamilial support. Conclusion : This study finds that the most influencing variable that relieves the stress of the family caregiver for dementia patients in long-term care settings is extrafamilial social support. Hence, we strongly recommend to develop programs that improve social support for caregivers of dementia patients. *This study is part of the Mi Sook Kim's MSW thesis. Keywords : long-term care settings, dementia, family caregiver stress

PP26 S-277

THE EFFECT OF THE ELDERLY COUPLE RELATIONSHIP IMPROVEMENT PROGRAM

Nam Sook KIM (Dept. of Social welfare, Tongmyong University, Korea)

Introduction : It is expected that the number of the elderly couple households will be increased more and more. Husband retired to stay home and wife become familiar with the social activities outside, the couple's roles change! After retirement, the couple have conflict and relational problems because of their maladjustment in the changing role and lack of understanding. To make matter worse, their children are separated due to job or marriage. In 2000 more than 50's divorce cases number 7,481 accounted for 6.2% of the total, but 20,852 cases of divorce accounted for 12.4% of the entire in 2010. Method : 1. attention and period : from March 2012 to December 2012, 16 elderly couple households who are recommended by family counsel center. 2. committed program : Personality Type Test, Couples Psychotherapy, Couples Sex Education, Diary Exchange, Marital Communication Skill, sport dance, Couple Self-help Group, remind wedding photo, covenant ceremony 3. scale: Scale of Gender Role Attitudes, Scale of Marital Communication, Scale of Couple Sexual Satisfaction. Scale of Couple Relationship Results : Gender Role Attitudes : $51.2 \Rightarrow 52.3$ (1.1 $_$) Marital Communication : $64.8 \Rightarrow 66.2$ (1.4 $_$) Couple Sexual

Satisfaction : $66.8 \Rightarrow 70.0$ (3.2 $_$) Couple Relationship : $68.6 \Rightarrow 87.7$ (19.7 $_$) Conclusion : For the elderly couples who does not live with adult children as well as take themselves as a center of their daily family lives, it is assumed that active interactions between husbands and wives, such as effective couple programs are prerequisite for improving family life satisfaction. Keywords : the elderly couple, the elderly couple relationship, the elderly couple relationship improvement program

PP26 S-278

RELATIONAL PERSONHOOD: EXPLORING DEMENTIA CARING IN CHINESE IMMIGRANT FAMILIES IN GREATER VANCOUVER, BC, CANADA

Sing Mei CHAN¹, Deborah O'CONNOR² (1. Social Work and Family Studies, University of British Columbia, Canada; 2 Social Work, University of British Columbia, Canada)

Introduction : There is ongoing debate on best practices of care for persons with dementia (PWD). Some advocate for Kitwood's personhood or person-centred approach that focuses on the PWD. Others argue for relationship-centred care that emphasizes the importance of relationships around the PWD. Method : Given that there is extremely little information on the Chinese PWD, and even less on her or his relationship and interactions with the carer, this study used the case study method to explore whether and how four Chinese families actually practice and perform everyday caring for an elderly relative with dementia from a person-centred or relationship-centred approach. Each case comprising two or more family members and/or a service provider participated in in-depth interviews and observation sessions. Data were analyzed using ATLAS.ti. Results : Findings showed that these Chinese families practice cultural norms of a relational self whereby the individual and the relationship are not easily separable. Ironically, the emphasis of these carers on the relationship and its inherent obligation focuses attention on and affection for the PWD. As a result, this norm of a relational self fosters an inclusive kind of caring that in turn enhances the PWD, the carer and the relationship itself. Conclusion : Albeit a small sample, this study provides support to how, in a Chinese family setting, carers can practice the personhood and relational aspects of dementia caring in unison, and proposes the notion of relational personhood that embraces the individual-in-relationships as a viable approach to understanding and working with PWD and their families. Keywords : relational personhood, dementia, Chinese immigrant families

PP26 S-279

THE EFFECTS OF SELF-ESTEEM AND FAMILY FUNCTION ON SUICIDAL THOUGHTS OF ELDERLY ONLY HOUSEHOLDS IN KOREA

Jeong Hwa LEE¹, Eun Bi KWON² (1. Dept. of Family Environment & Welfare, Chonnam National University, Korea; 2. Ph.D. Candidate, Chon Nam National University, Korea)

Introduction : Suicides among the elderly in South Korea had become a serious social problem. According to the OECD (Organization for Economic Cooperation and Development), South Korea has the highest suicide rate in the world. To make matters works, the rate at which elderly people are committing suicide is rapidly increasing. Suicide among the elderly is caused by a number of variables. Method: Data were gathered from 533 elderly people living alone or with a spouse in G City, South Korea, using a structured questionnaire. The statistical methods used for data analysis were descriptive statistics, t-test, and hierarchical regression analysis with the SPSS 18.0 program. Results : It has been found that elderly people living alone are

older, in worse health and face tougher economic situations. They have lower self-esteem and lower family function. In addition, their level of suicidal thinking is higher than that of elderly people living with a spouse. The level of suicidal thinking of elders living alone is affected by family function, self-esteem and their subjective economic situation. The level of suicidal thinking among elderly people living with a spouse is affected by family function and self-esteem. Conclusion : These results demonstrate the importance of family function and self-esteem in the elderly. They show that the economic situation of elderly people living alone affects their likelihood of having suicidal thoughts. This study also indicates that elderly people living alone often experience economic difficulties and require help to solve the problems associated with poverty. Keywords : suicide-thinking, family function, self-esteem

PP26 S-280

A STUDY ON FAMILY VALUES, PREPARATION FOR OLD AGE AND LIFE SATISFACTION FOR BABY-BOOM GENERATION

Seong Ryung KIM, Chung-Sun PARK (*Family Welfare, Daegu University, Korea*)

Introduction : The purpose of this study is to investigate family values, preparation for old age, and life satisfaction, and to find out the factors influencing life satisfaction for the baby-boom generation. This study also aimed at providing preliminary data not only for enhancing the life satisfaction, but also deciding the direction of welfare policy for baby-boom generation. Method : The subjects were 206 baby boomers(born from 1955~1963) living in Daegu city and Gyeongbuk province. The data were collected by trained interviewers using the structured questionnaires. The collected data were analyzed using SPSS Win 18.0 with frequency analysis, reliability test, t-test, analysis of variance, correlation analysis and regression analysis. Results : The results of analysis are as follows: First, Most of baby-boomer showed relatively modern values about family values, and especially about gender roles Second, the preparation for old age was ongoing tasks for baby-boom generation. The emotional preparation showed the highest score, while the preparation for physical sphere showed the lowest. Third, with regards to life satisfaction for baby-boom generation, gender, religion, family structure, and family income were shown to significantly influence their life satisfaction. Fourth, among several factors, preparation for old age turned out to be the most important factor to influence life satisfaction for baby-boom generation. Conclusion : Therefore, in order to prepare for later life for baby-boom generation, the extensive support programs in physical, emotional, and economic spheres should be provided not only at individual level, but also at governmental level in near future. Keywords : Baby-boom generation, Family values, Life Satisfaction

PP26 S-281

THE EFFECTS OF BABYBOOMERS' LIFESTYLE ON THE SOCIAL PREPARATION FOR OLD AGE -CENTERING ON THE MEDIATED EFFECTS OF THE SATISFACTION WITH FAMILY RELATION

Mee Hye KIM, Eun Kyung SHIN, Yong Hee KWON (*Graduate School of Social Welfare, Ewha Womans University, Korea*)

Introduction : babyboomers have grown older, their lifestyles have been differentiated from those of previous generations and considered as an important factor to measure the old age life. also, social preparation for old age that deals with the insufficient social roles or social relations has not been discussed yet. Therefore, this study aimed to understand how babyboomers are socially preparing for their old

age according to the kinds of lifestyles and explore the relationship between lifestyles and family-related variables, for babyboomers are likely to have the closest social relations in family. Method : For this study, the data of total 965 babyboomers were analyzed by whether having spouse or not based on the data of the 2010 Population and Housing Census in South Korea. For the data analysis, SPSS 18.0 was employed for elementary statistics and Amos 20.0 for measuring model and mediated effects. Results : Conservative family values also directly or indirectly affect social preparation for old age as mediated by the satisfaction with family relation; among direct factors to affect social preparation for old age, the lifestyle to pursue health and leisure positively affects it, but the lifestyle to pursue outgoing challenge negatively affects it. Conclusion : To heighten the probability of the social preparation of babyboomers for old age, the lifestyle needs to be changed into valuing family and promoting cooperation among family members and, furthermore, social atmosphere and policy that are family-oriented need to be developed actively. Keywords : Babyboomers, Lifestyle, Social Preparation for Old Age

PP26 S-282

SIBLING RELATIONSHIPS AND PSYCHOLOGICAL WELL-BEING IN KOREAN OLDER ADULTS: DOES SIBLING SEX MATTER?

Yeon Kyung CHEE¹, Mihye LIM² (*1. Human Ecology Research Institute, Ewha Womans University, Korea; 2. Department of Psychology, Ewha Womans University, Korea*)

Introduction : In a close knit family-oriented society like Korea, relationships with siblings who have shared a long personal and family history can exert significant impacts on mental health in later life. Based on the hierarchical compensatory model suggesting that a preferred order exists in receiving informal support in elderly persons, we examined sibling relationships (warmth, conflict), social support, and life stress as predictors of psychological well-being (depression, life satisfaction) in different sex constellations of siblings (sisters, brothers, mixed sex siblings). Method : Data were drawn from 249 older adults (M age = 71.18, SD = 6.79) recruited in Korea with one closest sibling in mind. Results : Regression analysis showed significant interaction effects of sibling conflict and social support on depression as well as interaction effects of sibling conflict and life stress on life satisfaction in the entire sample. Further analysis of interaction effects indicated that brothers receiving low social support with high sibling conflict experienced greater depressive symptoms compared to those with low sibling conflict ($p < .05$). Also, brothers experiencing more life stress with high sibling conflict had lower life satisfaction than those with low sibling conflict ($p < .05$). Sisters only with high sibling conflict reported higher depression levels than those with low sibling conflict ($p < .05$). In mixed-sex siblings, no statistically significant main and interaction effects were found on both depression and life satisfaction. Conclusion : Findings partially confirmed the roles of siblings as support sources among same sex siblings in old age. Keywords : Sibling Conflict, Well-being, Korea

PP26 S-283

INTEGRATIVE REVIEW OF GERONTOLOGY NURSING PRACTICE IN A HOMECARE FACILITY

Pearl Ed Gillera CUEVAS (*Secretariat, Gerontology Nurses Association of the Philippines, Philippines*)

Introduction : Nursing leads the field in gerontology as nurses were the first professionals in the United States to be certified as geriatric specialists (Ebersole, 2001). Therefore, gerontology nurses need to know the facts about the older persons population to effectively deliver

services and educate the general public (Eliopoulos, 2005). The study's problem statement focused on how gerontology nursing practice is viewed in a homecare facility as a setting. Method : Literature published between 2000-2010 was reviewed from the University of the Philippines Library System and On-line sources was also reviewed using MEDLINE and the Cumulative Index of Nursing and Allied Health Literature (CINAHL) using the key words "gerontology" and "nursing practice of older persons". Results : The characteristics of gerontology nursing practice as explicated in the light of a homecare facility setting included the following: understanding the 'aging' process, key role of nurses in health promotion, giving holistic nursing care, fostering quality of life for the older person and rendering nursing practice that is reflected on the older persons needs. Nursing the older person appears to be relationship- centered and therapeutic for both the patient and the nurse. A nursing model is derived from these findings. Conclusion : Gerontology nursing practice develops as nurses' experience what it means to care for the older person in a homecare facility. Reflective nursing practice is advocated for nurses to learn from their experiences with the older persons. The nurses are likewise encouraged to develop meaningful relationships with the older person, their significant others and other members of the health team. Keywords : Gerontology Nursing Practice, Nursing Practice of Older Persons

"LEARNING TO FIND BENEFITS FROM FAMILY CAREGIVERS' EXPERIENCE" THE STUDY PROTOCOL OF AN INTERVENTION FOR CAREGIVERS OF PERSONS WITH ALZHEIMER DISEASE: A RANDOMIZED CONTROLLED TRIAL

Mak Pui Man EMILY, Cheng Sheung TAK, Ng Siu Siu NATALIE, Lau Wing Lam ROSANNA (*Psychological Studies, The Hong Kong Institute of Education, Hong Kong*)

Introduction : Caregivers of relatives with Alzheimer's disease are highly stressful and at risk harming physical and psychiatric conditions. Usually, intervention for caregivers focuses on delivering knowledge of dementia, skills, and support to help them coping with stress. To a certain extent, this practice is right however it neglects the construction of caregivers' stress. Caregivers also report rewards, uplifts, and gains, such as personal growth except burden. Benefit-finding through positive reappraisal may counteract the effect of caregivers' outcome. Method : Two randomized controlled trials are planned. They are essentially the same except that Trial 1 is randomization based on groups of participants whereas in Trial 2, randomization is based on individuals. Participants are randomized into three groups?benefit-finding, psychoeducation, and simplified psychoeducation. Participants in each group receive approximately 12 hours of training. Booster sessions are provided at around 14 months after the initial treatment. Results : The primary outcomes are caregiver stress, perceived benefits, subjective health, psychological well-being, and depression. The secondary outcomes are caregiver coping, and behavioral problems and functional impairment of the care-recipient. Outcome measures are obtained at baseline, post-treatment (2 months), and 6, 12, 18 and 30 months. Conclusion : The emphasis on benefits rather than losses and difficulties provides a new dimension to the way interventions for caregivers can be conceptualized and delivered. By focusing on the positive, caregivers may be empowered to sustain caregiving efforts in the long term despite the day-to-day challenges. The two parallel trials will provide an assessment of whether the effectiveness of the intervention depends on the mode of delivery. Keywords : Alzheimer Disease, Positive aspects of caregiving, Burden

PP26 S-285

A RANDOMIZED CONTROLLED TRIAL IN REDUCING BURDEN OF FAMILY CAREGIVERS OF ALZHEIMER'S DISEASE

Siu Siu NG (*Psychological Studies, Hong Kong Institute of Education, Hong Kong*)

Introduction : The burden from caregiving often results in depression and poor health, thus interfering with the ability of the caregiver (CG) to deliver care effectively. This paper reports results from a randomized controlled trial of an intervention intended to reduce stress through positive reappraisal training over a month's duration. Method : To evaluate this program, 101 primary CGs were randomly assigned into one of three experimental conditions: (a) psychoeducation, (b) psychoeducation plus benefit finding, and (c) simplified psychoeducation (control). The outcome measures were CG burden and role overload. Covariates included care-recipient behavioral and psychological symptoms, functional impairment and Clinical Dementia Rating-sum of box. Measures were taken at baseline and after the intervention. Data were analyzed using analysis of covariance. Results : Result supported the effectiveness of benefit-finding cum psychoeducation in reducing CG's role overload ($p=0.04$) and subjective burden ($p=0.02$). Psychoeducation alone had no effect. Conclusion : Caring for family member with dementia is a chronically stressful experience. Results from the present study supported the effectiveness of the benefit-finding intervention in reducing CG burden by altering the way CGs perceived the caregiving experience. This study revealed a mechanism to enhance the resilience of dementia CGs, i.e., by positive reappraisal training and daily reflections of benefit. Keywords : Alzheimer's Disease, Caregiver, benefit-finding

PENSAMIENTO DE SU SEXUALIDAD EN LA MUJER MAYOR DE 60 ANOS

Francisco AMADO (*Servicio de Geriatria y de Gerontologia, Hospital Nacional Arzobispo Loayza, Peru*)

Introduction : Seleccion de 110 personas de sexo femenino - Mujeres mayores de 60 a 75 anos. - No tener enfermedades cronicas. Method : Captacion de la informacion: se realizo a traves de la entrevista (vaciado de encuesta) durante los meses de abril a octubre del 2011). Results : la aceptacion del coito fue positivo en el 41.8 % y en el 50 % no hubo interes. En relacion la calidad del acto sexual, fue considerado como bueno el 26.3%. El 61.8 % refirieron haber tenido por lo menos un orgasmo durante el acto sexual. El 16.3 % estuvieron de acuerdo con la masturbacion. El 10 % manifesto el uso de juguetes eroticos con acompanamiento Con respecto a las fantasias sexuales: El 31.8 % refirio el deseo de tener un amante. El 52.7 % refirio tener conocimiento de las posiciones para realizar el coito. El 6.3 % refirio el deseo del sexo oral, el 22.7 % el deseo del sexo anal. El 70.9 % por el sexo vaginal. Sexo y envejecimiento: Solo el 25.4 % manifestaron que la frigidez es propia de la ancianidad. El 32.7 % lo relacionaron con la impotencia y ancianidad. Conclusion : Conclusiones: 1.- El deseo sexual de la mujer mayor ha sufrido una desinhibicion. 2.- La realizacion de la actividad sexual es muy importante para el desarrollo armonico de las actividades de la vida diaria de las Personas Mayores. 3.- La actividad sexual esta relacionada con el placer y con la realizacion de las fantasias sexuales predominantes en esta etapa de vida. Keywords : Frigidez ,Fantasias sexuales ,Actividad sexual

THE EFFECT OF THE ELDERLY'S DEPRESSION ON THEIR LIFE DISSATISFACTION-THE MEDIATION EFFECT OF

THEIR DISCRIMINATORY EXPERIENCES-

Dongbae KIM¹, Byungsun YOO², Jihee YUN¹ (1. Graduate School of Social Welfare, Yonsei University, Korea; 2. Gyeonggi Welfare Foundation, Korea)

Introduction : In case of Korea, the aging speed has been proceeding most rapidly. With the aging, due to a collapse with respect for the aged and filial piety, the discrimination against the elderly has been also on the rise as the serious social problem. According to the recent statistics, the old people, who experienced discrimination, are exposed to be 79.5% of all the aged. In this background, the goal of this research is to evaluate the effect of the depression of the elderly on their life satisfaction, and to verify the mediation effect of their discriminatory experiences between the depression and life satisfaction. **Method :** The independent variable is the depression of the elderly, and the dependent variable is the life satisfaction of the elderly, and the mediation variable is the discriminatory experiences against the old people. The data are used from the Seoul City Welfare Panel data of 2010. The structural equation model is employed using Amos program. **Results :** First, depression level has an influence on the life satisfaction of the elderly. Second, depression level also has associated with the old people's experiences of discrimination. Third, it is confirmed that the old people's experiences of discrimination have partial mediation effect on the relation between the depression and the life satisfaction of the elderly. **Conclusion :** Accordingly, eliminating the discrimination against the old people must be acknowledged as the important actions. With the society overall, the consciousness reformation about the discrimination against old people will have to be accomplished. **Keywords :** the depression of the elderly, the life satisfaction, the discriminatory experiences against the old people

INFLUENCES OF INTERGENERATIONAL LEARNING ON COLLEGE STUDENTS' RELATIONSHIPS WITH THEIR FAMILY AND OLD ADULT

Chiao Wei CHENG, Stephanie Yu-Ching CHEN (Department of Adult and Continuing Education & Graduate Institute of Elder Education, National Chung Cheng University, Taiwan)

Introduction : To explore students' experiences of participating in intergenerational learning, this study examined alterations in students' attitudes toward old adult and their relationships with senior family members. **Method :** The study adopted semi-structural interview to study six students in graduate programs on elder education. The interviewees averaged 24.6 years old. Five of the interviewees were females and one was male. Each interviewee participated, for longer than two months, in more than two intergenerational learning courses or activities, including intergenerational service learning, intergenerational co-learning, or intergenerational reminiscence activities. **Results :** Based on the results, the interviewees experienced dramatic changes in their relationships with elderly family members after participating in intergenerational activities to understand the life stories of seniors. There were five levels of learning alterations. From shallow to deep, the levels are as follows: (1) students demonstrated increased care for elderly members; (2) students were more willing to communicate with old adults; (3) intergenerational learning assisted students in establishing harmonious methods of interacting with old adults; (4) students learned to assume a role of consultant for elderly' healthcare and to serves as mediators between seniors and other family members; and (5) intergenerational learning united families and facilitated the continuation of familial culture. **Conclusion :** Intergenerational learning constitutes a learning model that should be promoted and explored because it improves college students' attitudes

toward elderly people, transforming their relationships with family members and old adult. **Keywords :** Intergenerational learning, elder education, intergenerational relationships in family

PP26 S-289

BOWEN'S CONCEPT OF DIFFERENTIATION IN PREDICTING PSYCHOLOGICAL DISTRESS IN THE AGED

Dohee KIM-APPEL¹, Jonathan APPEL² (1. Art Therapy and Counseling, Ursuline College, USA; 2. Behavioral and Social Sciences, Tiffin University, USA)

Introduction : This study examines the relationship between Murray Bowen's family system theory's concept of differentiation of self and psychological symptom status in individuals age 62 years and older. Specifically, this study examines through regression methods whether the self-reported differentiation dimensions of Emotional Reactivity, "I" Position, Emotional Cutoff, and Fusion with Others (FO) accurately predicted the level of psychological symptom status as measured by a brief symptom checklist. **Method :** The data in the current study were obtained from 227 participants age 62 years and older, who lived in assisted/independent living and retirement situations in Ohio, U.S.A. These individuals were from a nonclinical population. Multiple linear regression (MLR) was utilized as a means to test the research hypotheses of the study. Full and restricted MLR models represented each hypothesis and were used to determine the significance of the independent variables in predicting the dependent variables. The research hypotheses included (a) the level of Bowen's four self-differentiation dimensions (ER, IP, EC, and FO) will predict symptomatology in individuals age 62 years and older. **Results :** The major hypotheses of this study were found to be supportive of Bowen's theory of differentiation, even across the stages of later life (with the exception of the FO dimension). These findings have meaningful implications for the assessment and treatment of older individuals. **Conclusion :** The findings from this investigation support that clinical psychological distress in older adults is simultaneously an individual psychological (intrapsychic) and an interpersonal family relational phenomenon. This confirms the utility of a family relational perspective in assessment, diagnosis, and treatment. **Keywords :** Family Systems, Aged, Differentiation

PP26 S-290

INTERGENERATIONAL SUPPORT TO AGING PARENTS: THE EFFECTS OF ADULT CHILDREN'S LIFE EVENTS

Hui-Chih WANG, Ju-Ping LIN, Tzu-I. WEN (Human Development and Family Studies, National Taiwan Normal University, Taiwan)

Introduction : Taiwan is experiencing a rapid aging process. Influenced by the filial piety concept of Confucianism, compared to Western countries, most of the elderly in Taiwan still live with their children but the percentage has lowered. Whether this trend influences the intergenerational support between adult children and their parents has become an important issue. **Method :** This study examined the ways that life events (e.g., change in marital status, employment status, or birth of a child) affect adult children's provisions of financial support to their older parents, and whether patterns differ by gender. Data were taken from the Taiwan Panel Study of Family Dynamics in 2004 and 2007. In this study, only subjects aged from 20-50, with at least one of whose parents is alive were analyzed. Multiple regression analysis was used to determine whether the life events influence the relations between adult and elderly parents. **Results :** In Taiwan, sons remain the major providers of intergenerational financial support for their aging parents. While adult son have children of their own, they would provide more financial support to their older parents. Adult

daughters who get married, with lower income, tend to decrease the financial support for their older parents. Conclusion : Adult child's life events are associated with intergenerational support behavior, but divergent patterns between son and daughter. The changes of adult children's provisions of financial supports to older parents are mainly resulted from their own resources, not from the needs of their parents. Keywords : intergenerational support, life event, intergenerational relations

PP26 S-291

OLDER PEOPLE'S PERCEPTIONS OF GRANDPARENTHOOD AND LIFE SATISFACTION IN TAIWAN

Ping-Shan TAI, Ju-Ping LIN (*Department of Human Development & Family Studies, National Taiwan Normal University, Taiwan*)

Introduction : Chinese traditional culture is "The elder is always precious in a family." The elderly play the important role in family. However, little is known about the impact of perception of grandparenthood on life satisfaction in old age. The purpose of this study was to explore the perceptions of grandparenthood held by the elderly and explore whether the role perception has a positive impact on life satisfaction. Method : The sample consisted of 511 elders who are over 55 years old and at least have one grandchild. Factor analysis and hierarchical multiple regression were used. Results : The results shows that older people's perceptions of grandparenthood includes a multitude of meanings : "Family Historian", "valued elder", "indulgence", "playmate and companionate" "surrogate parent" and "mentor". The role perception of grandparenthood significantly related to elders' life satisfaction in Taiwan, particularly for those individuals who enjoy of playing with their grandchild and watching them grow up instead of teaching and caring them. Conclusion : There is relationship between grandparenthood experience and life satisfaction. Cultural context may influence the effects of older people's perceptions of grandparenthood on their life satisfaction. Keywords : Grandparenthood, Life Satisfaction, Taiwan's Older People

GRANDPARENTHOOD AND INTERGENERATIONAL RELATIONSHIPS IN CONTEMPORARY WESTERN SOCIETY: REVIEW OF THE LITERATURE

Rogério Manuel Clemente RODRIGUES, Isabel Margarida Marques Monteiro Dias MENDES, Rosa Cristina Correia LOPES, Zaida Aguiar Sa AZEREDO (*UICISA-E, Escola Superior de Enfermagem de Coimbra, Portugal*)

Introduction : As a result of demographic changes, the grandparent/grandchild relationship has the potential for spanning three to four decades of life. As a consequence, grandparenthood and its associated roles and relationships are achieving a growing prominence in contemporary Western society. By this way intergenerational support relationships between grandparents and grandchildren are a reality that can improve the communication among generations. Method : Objective: to review published studies about the role of grandparenthood and the intergenerational relationship in contemporary Western society. Method: Literature review using data bases in B-On, Academic Google, and Pub-Med. The search was limited to articles published from 2000-2011 in English, French, Portuguese and Spanish languages. Results : 45 studies were selected from 2710 articles of the Data bases. The main common themes found were: the role of grandparents as a family balance between generations, with interaction patterns of proximity, emotional closeness, and social support; mothers' intergenerational ties across lineage lines appeared to be more influential for grandparent-

grandchild relationships than father. Finally, grandparents bring the sense of intergenerational family identity, positively related to well-being of all members. Conclusion : Conclusion: The changes in the family structure and in the family life cycle together with the new roles and functions of each member can be a constrain of the intergeneration relationships, but the new grand-parents role on supporting and taking care of grand- children can improve the communication between generations, bringing the importance of the intergenerational relations in promoting a healthy ageing for the elder's and a healthy development for the younger's. Keywords : Intergenerational relationship , Grandparenthood, Family

PP26 S-293

FILIAL PIETY OF A TAMIL SON IN MALAYSIA

Elangovan SUBBIAH (*Kinta District Health Department, Ministry of Health Malaysia, Malaysia*)

Introduction : The Tamils in Malaysia are the largest of the Indians who migrated from India to Malaysia in the early 1900s. The Tamils are from the South Indian state of Tamil Nadu. They carry with them rich cultural and family traditions. Method : The role of a Tamil son to his parents, grandparents, family and his children will be illustrated. A Tamil son plays different roles in all this situations. Many of this roles have connections in the Hindu mythology. They are passed on from one generation to the other. The Tamil son's role is very unique and very special in a Tamil family. Various roles of a Tamil son will be discussed in various situations in Malaysia. Comparison of a Tamil son with the sons of other races in Malaysia will be illustrated. The current modernization and the challenges facing this ancient tradition will be discussed. The intergenerational living arrangements of the Tamil males in Malaysia will be discussed. Results : The role of a Tamil son is of paramount importance to a Hindu family. It cannot be eroded by modern times or by the digital divide. The Tamil son is a vanguard to the honour of a Tamilian family. He keeps up to the honour of his family at all costs. This tradition is ancient and still being maintained in Malaysia. Conclusion : The filial piety of a Tamil son to his parents is of utmost importance in the Tamilian way of life. It has withstood the rampant changes brought about time and modernity in this digital era. Keywords : Tamilian, Filial Piety, Intergenerational.

ACTIVE AGING FROM A COLLECTIVE CULTURAL PERSPECTIVE

Amone REDELINGHUYS (*School for Psychosocial Behavioural Sciences, North West University, South Africa*)

Introduction : Active ageing is an adaptive, lifelong process with the aim to maintain optimal physical and psychological health. Active ageing implies an engagement with life and social relations. The objective of this presentation is to describe active ageing through the eyes of an older African woman who function in a collectivistic culture. A collective culture emphasises relationships and a community orientation. Method : An intrinsic single case study, involving an older African woman, aged 76, from an informal settlement in South Africa was used in the research. Multiple types of qualitative data were gathered, namely extant text (documents about the awards that she received for communal upliftment projects), three personal in-depth interviews, and the Mmogo-method®, a cultural sensitive research method, consisting of malleable clay, beads and straws was used to make visual constructions of her lived experiences. The textual data were thematically analysed. Results : Active ageing implies an active involvement in the community to assist vulnerable groups of people to address their needs for security and protection.

Active ageing is also a relational phenomenon ? older people age actively in relation to members of the community, ancestors and a Divine reality. It is recommended that the findings be verified with a more diverse research population to better understand active ageing in a collectivistic culture. Conclusion : The findings revealed that active ageing in a collective culture is experiences in social, ancestral and spiritual terms. Keywords : Active ageing, collective culture, older woman,

PP26 S-295

MULTIDIMENSIONAL EFFECTS OF ACCULTURATION ON PSYCHOLOGICAL WELL-BEING OF OLDER IMMIGRANT IN THE U.S.

Borin KIM¹, Eunwoo LEE² (1. Health Management and Policy, School of Public Health, University of Michigan, USA; 2. Workforce Development, Korean Community Services of Metropolitan New York, Inc., USA)

Introduction : The goal of this study is to investigate how acculturation, particularly ethnic solidarity and English fluency, independently and jointly influences mental health among immigrant older adults in the U.S. Method : Data came from the 2002-2003 National Latino and Asian American Study. Our sample was restricted to respondents over 60 years who were not born in the U.S. (N=501). Weighted logistic regression was used to examine the effects of ethnic solidarity and English fluency on self-rated mental health (poor or good). Ethnic solidarity was measured using four indexes: (1) how close they identify with others of same racial/ethnic descent, (2) how much they feel close in their feelings with people of same racial descent, (3) how much time they would like to spend with people of same racial/ethnic group, and (4) how important of same racial/ethnic group marriage to them. Results : Weak ethnic solidarity and strong English fluency were associated with better mental health. However, the effect of ethnic solidarity on mental health varied depending on English fluency. While ethnic solidarity positively influenced mental health among elders who spoke English fluently, strong ethnic solidarity was negatively associated with mental health among elders with poor English. Conclusion : It has been believed that high level of acculturation is associated with better mental health, which can be achieved when abandoning the original ethnic identity and assimilating into the host culture. However, this study suggests that the most positive acculturation strategy for mental health is to maintain own cultural/ethnic solidarity as well as to adopt the host culture. Keywords: Ethnic Solidarity, English Fluency, Mental Health

PP26 S-296

FOOD CHOICE PATTERNS AMONG FRAIL OLDER ADULTS: THE ASSOCIATION BETWEEN SOCIAL NETWORK, DIET QUALITY AND FOOD CHOICE VALUE

Chang-O. KIM (Department of District Health Care Service, Gangbuk-gu Community Health Center, Korea)

Introduction : Social network may affect personal food systems by the value negotiating process because food choice decisions are made by not as individuals but often as groups. In this study, we aim to investigate the association between social network, diet quality and food choice value and suggests food choice patterns among community-dwelling frail older adults in South Korea. Method : A total 87 frail older adults were participated in this cross sectional study from National Home Healthcare Services in Gangbuk-gu, Seoul, South Korea. Social network, diet quality and food choice value were measured by Wenger's network typology, mean adequacy ratio (MAR, n=13) and Food Choice Questionnaire. All analyses were adjusted for

age, gender, education, income, and number of chronic diseases. Results : Participants with private restricted and local self-contained network type were more likely to be motivated by price (OR=3.93, p=.012) and health (OR=6.41, p=.005) in their food choice, respectively; while locally integrated type was less likely to be motivated by price (OR=0.34, p=.016) or health (OR=0.39, p=.025). Participants with family dependent type were less likely to be motivated by sensory appeal (OR=0.26, p=.043). Participants who think importance of health (β =5.34; p=.030) and natural content (β =5.03; p=.033) were associated with increased MAR; however, participants who tend to choose familiar food were associated with decreased MAR (β =-9.43; p=.006). Conclusion : This study is one of the first to suggest food choice patterns concordance in social network type. Efforts to improve diet quality by community-based interventions must carefully consider individuals' food choice value as well as social network type. Keywords : social network, diet quality, food choice value

PP26 S-297

CULTURAL ACTIVITIES WITH THE ELDERLY FROM THE CARTOLA CULTURAL CENTER - MANGUEIRA COMMUNITY- RIO DE JANEIRO- BRAZIL

Regina Nunes ANDRADE¹, Constance Silva BALLALAI² (1. Programa de Pos Graduacao em Psicologia Social, Universidade do Estado do Rio de Janeiro, Brazil; 2. Post-graduate Program in Social Psychology, Universidade do Estado do Rio de Janeiro, Brazil)

Introduction : The research carried out at the CARTOLA CULTURAL CENTER is the result of Partnerships between THE UNIVERSITY OF THE STATE OF RIO DE JANEIRO (UERJ) Brazil and the Post-Graduation in Social Psychology. This gerontology research has two goals: check how the elderly register in their memories their relation with the internal migration which they have lived and how they have kept their will to live. Method : The group is formed by the students of the ball room dance classes who want to create a positive image of growing old as "a period of life to be lived in a more mature and fruitful way" (DEBERT, 1999, p. 149) . The triggering sentence of the research for the collecting of data was "what I brought from the Northeast?" and through the interviews of histories of life it rescued: migration and aspects which motivated their moving, cultural identity, joy to live. Results : In most of the cases the subjects are the elderly who migrated from the Northeast of Brazil to the city of Rio de Janeiro thirty or fifty years ago. Our intention is to present our findings which point to a group of elderly who went through migration. Conclusion : They suffered the acculturation processes and adaptations to the new needy territory where they live, but also what keeping the joy to live means (joie de vivre), and their representation as the true guardians of the Brazilian culture. (YUDICE, 2004,p.161). Keywords : elderly, dance, cultural activities

PP26 S-298

WIDOWED AND DEPRESSIVE SYMPTOMS AMONG KOREAN ELDERS: THE ROLE OF SOCIAL TIES

Gyeong Suk JEON¹, Soong-Nang JANG² (1. Department of Nursing, Mokpo National University, Korea; 2. Red Cross College of Nursing, Chung-Ang University, Korea)

Introduction : This study examines the impact of social ties on the relationship between spousal loss/widowed through death and depressive symptoms among the older Korean population, as well as the moderators and mediators influencing this association. Method : Data were derived from the baseline survey of the Korean Longitudinal Study of Aging. The sample consisted of 1,953 men and

2,469 women aged >60 years who were married and had at least one child. The 10-item Center for Epidemiological Studies-Depression scale was the outcome measure. Multiple linear regression was used to evaluate the relationship between spousal loss/widowed and depressive symptoms. Results : Social ties accounted for 35.4% of the difference in depressive symptoms between married and widowed women but only 4.6% of it between married and widowed men. In widowers. The interaction of spousal loss/widowed and quality of relationships with children was significant only among men, and the interaction of this status and the cohabitation with married children was significant only among women. Conclusion : Korean widows who lacked social ties with children or friends were more likely to be depressed. Cohabitation with children may buffer mental distress for such women, and qualitatively good relationships with children may be important for the mental health of older Korean widowers. Keywords : Widowed, Depressive symptom, Social tie

PP26 S-299

HOLISTIC MODEL OF EMOTIONAL REGULATION PROGRAM DESIGN FOR THE ELDERLY & ACTION RESEARCH OF CARERS' PRAXIS COMMUNITY

Hsiu-Lan CHIN¹, Ming-Fen LI², Ying-Tsun HUNG³, Yu-Fen HSIAO⁴
(1. Department of Elderly Welfare & Social Work, Toko University, Taiwan; 2. Professor of Department of Adult & Continuing Education, NTNU, Taiwan; 3. Department of Senior Citizen Service Management, Ching Kuo Institute of Management and Health, Taiwan; 4. Department of Elderly Welfare & Social Work, Toko University, Taiwan)

Introduction : "Health Promotion" on health service for the elderly is the perspectives on "Health Economy". There are more and more research about the emotional regulation on cognitive declination and focus on holistic model program design which is the center of the organizational caring system. Method : The "carers' praxis community" is composed of the researcher and carers on organizational level, and work on emotional regulation program designed for the elderly through dynamic workshops of all the participants. Through holistic dialogue, observational research, program design and Self-Assessment Manikin, this study is an action research. Results : The research will last for 2 years and this paper is the first stage of it. Therefore, the contribution of this paper contains: (1) Form the "carers' praxis community" which can promote the value of the research on organizational practice; (2) Appeal to the public for much more attention to emotional regulation and release the mental pressure of old people; (3) Develop a series of emotional regulation programs according to the Wholeness Praxis Paradigm, and manifest the perspectives of "Health Economy"; (4) The design of emotional regulation programs includes three sets of the activities which related to mind, emotion and body levels. Conclusion : All the series of programs are designed by the participants from organizational social worker. This is the pilot study of carers' praxis community in Taiwan which can promote the value of the research on organizational practice. And the contribution of this research is obviously significant. Keywords : Carers' Praxis Community, Emotional Regulation, Holistic Model, Program Design

PP26 S-300

AN AUTO-ETHNOGRAPHIC STUDY OF A YOUNG WOMAN'S RELATIONAL EXPERIENCES OF OLDER PERSONS

Janine VAN AARDT (Department of Psychology North-West University South-Africa, North-West University South-Africa Potchefstroom Campus Reseach-Psychology, South Africa)

Introduction : People are embedded in social networks, including family, friends and the broader community. The aim of this study is to explore the relational experiences of a young woman and older persons in the different social networks in which she functions. Method : An auto-ethnographic research design was used, which is a self-narrative method focusing on the understanding of the self, others and the culture. The participant is a 22-year old female and her social networks can be described as multi-racial (Indian, White and Colored) and multi-lingual (Afrikaans, English and Hindi). Data were gathered by means of a personal journal as well as the Mmogo-methodTM. The journal was completed by means of open-ended questions reflecting the experiences of the younger woman's relationship with older persons and the Mmogo-methodTM is regarded as a visual data gathering method, consisting of clay, beads and straws, which are used to make visual constructions which are regarded as projections. Data were analysed by means of thematic analysis. Results : The findings revealed that the young woman's community networks consist of different social networks, varying in their levels of closeness and with different motivations for their involvement with one another, formed her understanding of relationships. In these diverse relational networks she developed respect for diversity irrespective of race and age. She developed sensitivity and adaptability towards older persons in various social and cultural contexts. Conclusion : In conclusion being exposed to diverse relational networks contributed to her ability to interact emphatically to people across different cultures. Keywords : Social Networks, Embedded, interact

PP26 S-301

THE RELATIONSHIP BETWEEN EGO-INTEGRITY AND FRIENDS SUPPORT ON ELDERLY'S DEATH ANXIETY : FOCUSING ON GENDER DIFFERENCES

Jin Jin PARK, Jeong Shin AN (Dept. of Child & Family Studies, Pusan National University, Korea)

Introduction : The purpose of this study was to examine the relationship between ego-integrity and friends support on elderly's death anxiety focusing on gender differences. Method : The subjects of the study were 345 elderly over 65 years of age in Korea. For data analysis, frequency, Cronbach's α , Pearson's correlation coefficients and multiple regression were used. Results : The results showed that the relation between ego-integrity and friends support on elderly's death anxiety were different by gender. In case of males, both receiving and providing friends support had influence on death anxiety of the elderly. However, in case of females, both receiving and providing friends support had indirect influence on death anxiety through ego-integrity. Conclusion : The result was discussed in terms of gender differences and the influence of friend support in educational programs for the elderly. Keywords : death anxiety, friends support, ego-integrity

PP26 S-302

CORRELATES OF HEALTH-RELATED QUALITY OF LIFE AMONG KOREAN IMMIGRANT ELDERS

Jong-Eun LEE¹, Miyong KIM², Hae-Ra HAN² (1. College of Nursing, Catholic University of Korea, Korea; 2. School of Nursing, Johns Hopkins University, USA)

Introduction : Health-related quality of life (HRQOL) is an important clinical outcome, particularly for individuals with chronic conditions such as hypertension (HTN). While some evidence indicates that social support may play a protective role in promoting HRQOL in the presence of adverse symptoms such as depression, QoL among KAs with HTN has rarely been studied. This study was aimed to identify

factors associated with HRQOL in hypertensive Korean American (KA) elderly (? 60 years of age) with a focus on their social support. Method : A total of 440 Korean elders with HTN (systolic blood pressure \geq 140 mm Hg and/or diastolic blood pressure \geq 90 mm Hg or on antihypertensive medication) participated in the study between February 2008-March 2009. Measurements included demographics, disease characteristics (years of HTN, antihypertensive medication, comorbidity, blood pressure), psychosocial variables (social support, depression), and HRQOL. Results : The hierarchical regression model for HRQOL explained 32.8% of the variance. Female gender ($\beta=.109$, $p=.036$), a greater number of comorbid conditions ($\beta=.183$, $p=.000$), lower social support ($\beta=-.240$, $p=.000$), and greater depressive symptoms ($\beta=.402$, $p=.000$) were associated with poorer HRQOL. Depression was the most potent correlate of HRQOL among elderly Korean Americans with HTN. Conclusion : Future intervention should consider managing depression as an essential component of comprehensive HTN care for this minority population. In addition, the results point to the need for research to further investigate the potential benefits of social support as a means of improving HRQOL in hypertensive patients. Keywords : Depression, Hypertension, Quality of life

PP26 S-303

IMPACT OF SPOUSAL HEALTH PROBLEMS ON MEN AND WOMEN'S SOCIAL INTEGRATION IN MID-LIFE

Jung-Hwa HA¹, Joohyun KIM², Gyounghae HAN² (1. Department of Social Welfare, Seoul National University, Korea; 2. SNU Institute on Aging, Seoul National University, Korea)

Introduction : Active social engagement is one of the key determinants of social and psychological well-being. However, stressful life events, such as spouse's serious health problems, can threaten one's ability to participate in social roles outside the family. In the current study, we examine (1) the effects of spousal health problems on midlife adults' social network size, interactions with friends and relatives, and formal social participation; and (2) the extent to which these effects differ by gender. Method : Analyses are based on data from Korean Baby Boomers' Panel Study, a probability sample of 4,668 adults aged 47-55. We used data from the baseline interview conducted in 2010. Results : The results showed that among men, having experienced spouse's serious health problem did not exert any significant influence on the size of one's social network. In terms of social interactions, those who experienced spousal health problems reported fewer interactions with relatives. On the other hand, among women, those who experienced spouse's serious health problem reported greater network size and greater formal social participation. Conclusion : The findings suggest that women are more likely to draw on their social network to cope with spousal health problem, whereas men may become more socially isolated when their spouse becomes sick. The findings encourage gender-tailored approach to maintaining and maximizing benefits from social engagement in the face of spouse's health problem in midlife. Keywords : health, social integration, gender

PP26 S-304

IN-HOME SENSOR DEVICES AND THE ELDERLY: THE POSSIBILITIES FOR MEETING THE NEEDS AND EXPECTATIONS OF SOCIAL WORKERS

Kumiko NONAKA¹, Takashi KOIKE¹, Tarou FUKAYA¹, Masami HASEBE¹, Reiko WATANABE², Shuichiro WATANABE³, Shouzoh UEKI⁴, Naoko ARAYAMA⁴, Hihohito YOSHIDA⁴, Tomoko KAMEI⁵, Masumi MATSUMOTO⁵, Chiaki TANAKA⁶, Takayuki HOSOI⁷, Yoshinori FUJIWARA⁸ (1. Tokyo Metropolitan Institute of

Gerontology, Japan; 2. St. Luke's College of Nursing, Japan; 3. Graduate School of Gerontology, J. F. Oberlin University, Japan; 4. Faculty of Medical Science & Welfare, Tohoku Bunka Gakuen University, Japan; 5. Department of Architecture and Building Engineering A, Tokyo Metropolitan University, Japan; 6. Division of Integrated Sciences, J. F. Oberlin University, Japan; 7. Department of Clinical Research and Development, National Center for Geriatrics and Gerontology, Japan; 8. Tokyo Metropolitan Institute of Gerontology, Tokyo Metropolitan Institute of Gerontology, Japan)

Introduction : Installing sensor devices (e.g., living room, toilet, and bed room) are expected to provide long-term care professionals with information about elderly clients' daily life. The devices are useful in monitoring and detecting deterioration of health conditions in elderly living alone. However, these devices are underutilized by social workers involved in health management of community dwelling independent elderly. This research explored how sensor devices met the needs and expectations of social workers. We proposed effective ways for social workers to incorporate these devices into their care systems, leading to the detection of early symptoms of deterioration; thus helping to maintain independent living at home. Method : We recruited 20 social workers responsible for monitoring health conditions and allocation of in-home long-term care services for 36 elderly clients living alone. Semi-structured, in-depth interviews were conducted in 2011 and 2012. Qualitative data from transcribed interviews was analyzed, using a grounded-theory-approach. Results : Professionals tended to monitor their clients' health conditions based on reports from in-home long-term care service providers, making it harder for them to assess health conditions of those with higher IADL. Expectations for sensor devices varied based on clients' health conditions and levels of dementia. For example, frequency of going-out was considered useful to monitor health conditions of the elderly with higher IADL, while levels of activity at home were considered useful when monitoring elderly with severe health problems. Conclusion : The findings suggested that sensor devices can provide social workers with specific information relating to their clients' health conditions. Keywords : monitoring sensor, elderly living alone, in-home long-term care

PP26 S-306

JOB STRESS AND SATISFACTION OF ADMINISTRATORS OF VISITING NURSING STATIONS IN JAPAN

Midori NISHIO (Health Sciences, Kyushu University, Japan)

Introduction : The purpose of this study is to determine the job stress and satisfaction of administrators of visiting nursing stations in Japan. The roles of the visiting nurses have been more crucial, since the policy of medical system was changed to promote home medical care for patients who have to be discharged from hospitals. The tasks of the visiting nurses include providing care for patients at home, assessment of the patient conditions to judge the needs to change the care plans. It is clear that the visiting nurses have been highly stressed. It is required to clarify the actual status and problems of the administrators, since which will make it clearer that the satisfaction of nurses for their jobs correlate with the satisfaction of the patients who are cared by the nurses. Method : Quantitative research. Results : The results of the Nursing Job Stress showed that the stress of the administrators was not higher than the staff nurses (0.08) for the sub scale of "Stressor associated with facing with patient's death". The total scores for "the job satisfaction" showed the satisfaction of staff nurses was significantly higher than the administrators (0.05). Conclusion : In visiting nursing stations, administrators are expected to manage the business affairs. As the roles of visiting nursing station will be larger

in the future, it is required to address the business affairs so that the administrators feel satisfied with their jobs, as well as their staff nurses, in order to provide high quality services. Keywords : visiting nursing stations. administrators. job stress.satisfaction

ASSOCIATION OF SOCIAL SUPPORT WITH DEPRESSIVE STATE IN JAPANESE ELDERLY: JAGES PROJECT

Misuzu FUJITA¹, Kayo SUZUKI², Chiyo MURATA³, Noriko CABLE⁴, Katsunori KONDO², Akira HATA¹ (1. Department of Public Health, Chiba University Graduate School of Medicine, Japan; 2. Center for Well-being and Society, Nihon Fukushi University, Japan; 3. Department of Social Science, National Center for Geriatrics and Gerontology, Japan; 4. Research Department of Epidemiology and Public Health, University College London, United Kingdom)

Introduction : Little is known what types of support would protect individuals, especially elderly people, from depression in a non-western country. Our aim is to explore associations between types, direction, and source of social support and depressive state, using an elderly sample in Japan. Method : The subjects of this cross-sectional study were 57,818 elderly Japanese from the Japan Gerontological Evaluation Study (JAGES) project, targeting independently living elderly in selected municipalities. Using multinomial logistic regression, we examined the associations between social support by types (emotional or instrumental), direction (reception and provision) and source (spouse, children living together, children or relatives living apart, neighbors, friends, other people), and 3 levels of depressive states (none, depressive, depressed) indicated by the short version of the Geriatric Depression Scale (GDS-15). All effects were adjusted for age, marital status, income, living alone status, and health factors. Results : Emotional support was the most protective from depressed state when received from a partner (OR=0.56, 95%CI=0.47-0.67 in men and OR=0.65, 95%CI=0.54-0.79 in women) or provided to friends (OR=0.56, 95%CI=0.46-0.68 in men and OR=0.53, 95%CI=0.45-0.63 in women). Lack of instrumental support from a partner was associated with depressive state (OR=0.55, 95%CI=0.44-0.69 in men and OR=0.39, 95%CI=0.33-0.47 in women). In addition, providing instrumental support to children or relatives living apart was beneficial to depressed state (OR=0.73, 95%CI=0.61-0.88 in men and OR=0.80, 95%CI=0.69-0.93 in women). Conclusion : Receiving emotional and instrumental support from a partner, as well as providing emotional and instrumental support to non-family individuals, appeared to be protective from depressive state in Japanese elderly. Keywords : social support depression

PP26 S-308

DETERMINATION OF BARRIERS IN SOCIALIZATION OF ELDERLY PEOPLE WITH CHRONIC DISEASES

Nalan AKBAYRAK, Ayla DEMIRTAS (Internal Medicine Nursing, Gulhane Military Academy, Turkey)

Introduction : Health conditions effect the aspect for the life and social compliance of elderly people. The difficulties of elderly patients with chronic diseases in socialization should be considered. The aim of this research is the determination of these barriers. Method : A qualitative and phenomenological design was used. The study was performed with 15 patients over 65 years old with at least a chronic disease between June 1st and September 30th, 2012 at a Research and Training Hospital. Semi-structured interview form was used and in-depth interviews were audio taped. The duration of interviews ranged from 30 to 40 minutes. All interview reports are reviewed multiple

times to analyze the data with the Colaizzi method of analysis. Results: This study is conducted with 7 female and 8 male participants between 65 and 79 years old. Category.1: Insufficient time to socialize. Subtheme.1.1, Wasting all the time for the illness and needs of the illness, Subtheme.1.2 Negative effect of the change in the progress of the illness in an unexpected time. Category.2: Lack of personal energy to socialize. Subtheme.2.1, Lack of energy for personal and household hygiene Subtheme. 2.2, Reduction of energy due to emotional condition. Category.3: Poverty. Subtheme.3.1, Increase in expenses with aging and chronic illness, Subtheme.3.2, Lack of money for the needs of socialization. Conclusion : It is observed that the elderly people with chronic diseases can not socialize and live alone but do not feel the need to socialize. Nurses should support elderly people in socialization with the respect to individuality. Keywords : Socialization, elderly people,Chronic disease

PP26 S-309

WELL-BEING AND SAFETY OF THE ELDERLY LIVING AT HOME, A SURVEY INITIATED BY RESPECT SENIORS

Nicolas BERG¹, Dominique LANGHENDRIES², Laurent NISEN³, Marie-Therese CASMAN³ (1. Geriatric, CHR Citadelle Liege and Respect Seniors, Belgium; 2. Respect Seniors, Walloon Agency to Combat Elder Abuse, Belgium; 3. Panel Demographie Familiale, Universite de Liege, Belgium)

Introduction : "Respect Seniors", the Walloon Agency to Combat Elder Abuse, has initiated a survey the goal of which is to estimate the prevalence of abuse towards the elderly (aged 70 and up) in Wallonia, with the collaboration of the University of Liege. Method : We defined abuse as "a repetitive or isolated act, or an absence of actions within a relationship resulting in negative consequences for the victim". Seven types of abuse have been covered: neglect, psychological, physical, sexual, financial, civic and medical abuses. 766 persons were interviewed, face to face, to answer the questionnaire. Results : 28.19% of those surveyed have experienced at least one type of abuse. Gender, level of education and income have no clearly identifiable impact. Those who have no children are most often the victims of psychological abuse. A factor against neglect and physical and sexual abuse appears to be being married or living with a partner. The main protection factor is social integration. On the opposite, a bad health status is a factor of risk. The people to whom the victims confide in are family members (46.76%), friends (25.93%), doctors (10.19%) and the police (8.80%). However, 32% have not reported the abuse to anyone. Conclusion : The importance of a social network and the health as factors of protection. These two points could lead to create policies giving a specific attention to potential victims. A permeability between the different types of abuse exists: 44% of abuse victims report at least two violations within different domains (for example physical and psychological). Keywords : Elder abuse, Health, Social network

PP26 S-310

THE STEREOTYPICAL BELIEFS ON THE OLD WORKERS IN KOREA

Seon Hee MO, Dong Seon KIM (Social Welfare Department, Kongju National University, Korea)

Introduction : It is widespread in Korea to make old workers first victims of restructuring and set age limit in their recruitment. As age discrimination in the workplace is related with stereotypical beliefs on old workers, this study was to examine the extent of stereotypical beliefs on Korean old workers and to find out influential variables affecting stereotypical beliefs. Method : 300 employees in middle and small companies were interviewed by telephone about stereotypical

beliefs on old workers. The scale of stereotypical beliefs comprises 21 items derived from the literatures and interviews with the labor experts. Results : Mean value of stereotypical beliefs was 2.64 of 5 points. The factor analysis results show that stereotypical beliefs are composed of 3 factors: sociability(2.83), competence(2.84) and fidelity(2.15). In multiple regression, company's hierarchy, the old workers' job performance, industry types, the level of age discrimination, and individual variables such as job position, relations with old workers are significantly related to the overall stereotypical beliefs on the old workers. The strongest predictor is company's hierarchy(.25), the old workers' job performance(-.24) followed by the level of age discrimination(.21). Conclusion : In conclusion, it is suggested to improve old workers' job performance, to adopt age-free organizations, to discard discriminatory policies and to encourage contacts with different age groups in the workplace for lowering or eliminating negative stereotypical beliefs on the old workers. Keywords : stereotypical beliefs on old workers, age discrimination, Korean old workers

PP26 S-311

HEALTH AND SOCIAL NETWORK CHANGES: A LONGITUDINAL PERSPECTIVE

Sojung PARK¹, Bo Rin KIM² (1. School of Social Work, University of Michigan, USA; 2. School of Public Health, University of Michigan, USA)

Introduction : Social relationship changes as people age and the negative impact of isolated social network on health has been established. However, how health conditions influence changes in social network is fairly under researched in general. This study aims to investigate the effects of health conditions on changes in social network among Korean older adults aged 65 and above. As a first longitudinal research on social network typology, we first examined the pattern of changes in the social network and then examined how physical and mental health conditions affect the changes in the network types. Method : Data were from the 2006 and 2008 waves of the Korean Longitudinal Study of Aging (KLoSA; N = 3501). Latent Class Analytical approach was employed to identify network types from five indicators of network structure such as marital status, social participation, family size, frequency of contact with children, frequency of contact with friends. Multinomial logistic regression models were used to determine the extent to which changes in health status affect the transitions among the network types. Results : Four network change types were derived including Remain Restricted, Remain Non_Restricted, Become Non_Restricted, and Become Restricted. Regression findings show that older adults with worsening changes in functional limitation, self rated health, cognitive health are more likely to remain restricted or become restricted in their social relations. Conclusion : Our study contributes to the extremely limited body of literature on longitudinal network typology, and on the dynamic association between health and social networks among older adults. Keywords : Social Networks, Health, Changes

PP26 S-312

STUDY ON THE FACTORS TO SUPPORT DAILY LIFE OF ELDERLY PEOPLE LIVING ALONE AT HOME SEEN FROM THE CHANGE OF THE INDIVIDUAL ELDERLY IN SOCIAL SUPPORT PROCESS

Soyoun PARK (Graduate Department of Social Welfare, Graduate Schools of Japan College of Social Work, Japan)

Introduction : The purpose of this study is to describe the factors which affect the support processes, by analyzing how elderly people

living alone at home think about, form and maintain their relations with the social support network and support processes. The social support network includes families and relatives of these elderly and non-blood related people such as friends, neighbors and professional workers. Method : I selected the 30 subjects living in Mizumaki town, Onga County, Fukuoka Prefecture, Japan, by using the snow-fall sampling. The semi-structured interviews were conducted from August to October in 2012. The interviewed contents were analyzed based on the modified grounded theory approach (M-GTA). Results : 1. The process that the anxiety about their daily life led the elderly living alone at home to maintain their relations with the social support network was described. 2. The self-support ability of these elderly people who want to remain autonomous evidently works between the support process and the factors (mutual support, public support) to support its process. Conclusion : The results suggested that a multi-layered support plan which combines self support, mutual support and public support is important in a daily life support service for elderly people living alone at home in the community. In order to create a life support model based on this study in future, we need to describe a change of support process accompanied by the time series change such as the decline of movement ability of the elderly and the influence among the self support, mutual and public support. Keywords : elderly people living alone at home, social support network, community care system

PP26 S-313

COMMUNITY MAPPING USING GIS OF MOBILE AS INTERGENERATIONAL APPROACH

Sungsook PARK (Intergenerational Practice Project Team, Dongbaek Co., LTD, Korea)

Introduction : The risk factors of environmental access tend to reduce natural communication or networking neighborhood among the elderly. Our goal is to figure out the environmental risk factors for the elderly. Method : We set up Mokdong safe community network council including senior groups. The council takes the action on the environmental risk or interview of seniors targeting on accident or safety issue. The first goal is to try community mapping using GIS of mobile to figure out dangerous areas for them. The younger generations make teams with seniors to walk around the targeting area to find dangerous spots using GIS of Mobile. The seniors communicate with each team how dangerous its spots are from their perspective. Results : The community mapping using GIS of mobile is developed to figure out dangerous areas for the risk groups. Seniors are able to bring their problems and solutions and deal with them using technology through intergenerational approach. They submit the result to local government to ask to get them repaired. It helps to decrease in accident rate among seniors. The younger generations also learn the aging issues or accident prevention information from the perspective of the seniors. Conclusion : This project is to figure out the environmental risk factors for the elderly. It results in developing safe community mapping information using GIS of mobile through intergenerational approach matching senior group with younger generation. It helps for younger generation to realize the aging issue or environmental risk from the perspective of seniors through the process of the all activities. Keywords : safe community for active aging, intergenerational practice, community development

A LIFE REVIEW PROGRAM USING GUIDED AUTOBIOGRAPHY TO PROMOTE ACTIVE AGING IN TAIWAN

Tsuann KUO (Medical Sociology and Social Work, Chung Shan

Medical University, Taiwan)

Introduction : As the aging rate in Taiwan tops the world's fastest, community-based centers are coming up with programs to promote active aging. Programs based on life reviews were shown to improve emotional well-being, self efficacy and life satisfaction. Thus, a series of life review topics were organized by trained volunteers and social workers to lead the elders in making their own life story books. **Method :** A ten-week structured life review program was created based on Birren's Guided Autobiographic framework. A total of 204 elderly spread over 15 community-based senior centers over a two-year period participated in the program. The pre- and post- tests were conducted to measure depressive symptoms, self-efficacy, and life satisfaction before and after the program. **Results :** The elderly were multi-lingual, with 78 years old on average, and the majority being female 80% and having a level of an elementary school education (59%). At the end of the ten weeks, every participant made a life story book on their own and each told stories about their lives. Both the life satisfaction and depression scores improved, from 18.84 to 19.31 (3%) and 6.14 to 5.78 (6%, negatively reversed), respectively. **Conclusion :** This study showed that a life review program improved emotional well-being and self efficacy for elderly participating in community-based center. Based on their life experiences, the elderly made life books that served as a treasure for their families. The implications for such a program can be drawn to promote active aging and psycho-social well-being in the future. **Keywords :** Life Review, Active Aging, Guided Autobiography

PP26 S-315

CHILDLESSNESS AND SUBJECTIVE WELL-BEING IN CHINESE SPOUSAL CAREGIVERS IN WIDOWHOOD

Sheung Tak CHENG, Wing Lam Rosanna LAU (*Department of Psychological Studies, Hong Kong Institute of Education, Hong Kong*)

Introduction : This study examined the effect of childlessness on psychological well-being in widowed caregivers taking into account the influences of social network variables. **Method :** 73 Chinese widowed caregivers (mean age=74 years) who were community-dwelling formed the sample of this study. Sixteen percent (n=44) were childless. Social network variables, instrumental activities of daily living, chronic illnesses, depressive symptoms, life satisfaction, positive affect, and negative affect were assessed. **Results :** Childlessness was significantly associated with all outcomes of psychological well-being even after controlling for network size. After positive and negative exchanges were taken into account, the effect of childlessness on depression and life satisfaction became nonsignificant but remained significant on positive and negative affect. Furthermore, the effects of childlessness on depression and life satisfaction were significantly stronger in women than in men. Childlessness also had a stronger association with depression in those with functional impairments. **Conclusion :** Findings support the importance of children, and supportive exchanges with them, for the subjective well-being of Chinese widowed caregivers. Being female and having physical dependencies might amplify the effects of childlessness. **Keywords :** Social network, Well-being, Caregivers

PP26 S-316

EFFECT OF SOCIAL NETWORK ON BODY MASS INDEX AMONG THE ELDERLY

Won Joon LEE (*Department of Preventive Medicine, Yonsei University College of Medicine, Korea*)

Introduction : It is known that obesity appears to spread through social ties. The association between other variables related to social network

and obesity are unclear. This study aimed to identify density or interaction degree of communication correlated with obesity in the elderly. **Method :** This cross-sectional study analyzed data from 660 Koreans (275 men, 385 women) aged 60 years or older, who participated in Korean Social Life, Health and Aging Project (KSHAP) in 2011. Communication density is the number of connections in the network reported a fraction of the total links possible, and interaction degree of communication is average frequency (days per year) of communication between network members. The association between density or interaction degree of communication and body mass index (BMI, kg/m²) was investigated by multiple linear regression analysis. **Results :** BMI decreased according to tertile or density of interaction degree of communication both men and women (p for trend<0.05). After adjusted for potential confounders, in men, lower tertile of communication density was associated with higher BMI (regression coefficient $\beta=1.049$, $p=0.041$), but interaction degree was not significantly associated. By contrast, in women, communication density was not significantly associated, but lower tertile of Interaction degree was associated with higher BMI ($\beta=0.896$, $p=0.043$). **Conclusion :** Our study suggests that there is a gender difference in the relationship between density or interaction degree of communication and obesity in the elderly. **Keywords :** Social networks, Body mass index, Aged

PP26 S-317

THE RESTRUCTURING OF OLDER HUSBANDS' SOCIAL NETWORKS AFTER TRANSITION TO SPOUSAL CAREGIVING IN SOUTH KOREA

Wonjee CHO¹, Denise C. LEWIS² (*1. Institute on Aging, Seoul National University, Korea; 2. Department of Human Development and Family Science, University of Georgia, USA*)

Introduction : The rapidly growing older population in South Korea has raised concerns about eldercare. Older husbands also are increasingly engaging in eldercare. For husband caregivers, caregiver role acquisition has been considered as a negative life event restricting their social life. Little is known about older husband caregivers' experience of adjusting to the restricted personal/social life and of re-arranging social networks. **Method :** To explore how social networks were restricted and arranged in spousal caregiving, in-depth interviews were conducted with 23 Korean men aged 60 and over who, as primary caregivers, have taken care of their wives with illnesses and/or disabilities. Phenomenological data analysis was used to derive essential themes, related to the restricting of their social networks after the transition to spousal caregiving in South Korea, from their accounts of lived experience in spousal caregiving. **Results :** This study found that becoming a spousal caregiving primarily caused time and geographic restrictions in the caregiving life. It changed husband caregivers' lifestyle in personal, social life. It meant husbands had to give up or reduce their previous activities. In their new life as a husband caregiver, former networks (friends, relatives, neighbors, & religion-related people) shrank due to difficulties associated with continuing engagement in outside activities, reluctance to embrace a caregiving identity, and decreasing interactions with previous acquaintances. However, new networks (formal care, medical professionals, social welfare benefits, other caregivers/their care-recipients, & community) emerged as social resources for husband caregivers and as significant relationships in caregiving. **Conclusion :** The caregiver role reorganized older husbands' social networks in the caregiving situation. **Keywords :** older husband caregiver, spousal caregiving, social network

PP26 S-318

COMMUNITY ORGANIZATION FOR ELDERLY PEOPLE WITH DEPRESSIVE SYMPTOMS

Yumi OSHITA (*Health and Welfare, Prefectural University of Hiroshima, Japan*)

Introduction : The purpose of this study was to construct a theoretical and therapeutic framework for community organization to improve adaptation levels of elderly people. **Method :** We constructed a community mental health theory that can explain the dynamics of the correlated change processes between depressive symptoms of elderly people and interpersonal relationships within a community. We systemized a therapeutic framework based on community mental health theory. The therapeutic intervention skills comprise the Calgary School circular questions and the skills of solution-focused brief psychotherapy to transform a maladaptive transactional process within a community. Moreover, we constructed a method of measuring the effects of the interventions with this theory. Case studies of maladaptive elderly people exemplified the intervention methodology. The effectiveness of the interventions was measured with the new measurement tool. **Results :** Our case studies proved that this therapeutic framework can assess and transform the dynamics between pathological transactions within a community and the adaptation level of elderly people. **Conclusion :** This new intervention methodology based on community mental health theory is an effective method for solving the adaptation problems of elderly people. **Keywords :** community organization, improve adaptation levels, depressive symptoms

PP26 S-319

SOCIAL NETWORK TYPE OF ELDERLY PEOPLE WITH DEMENTIA AND QUALITY OF LIFE

Yun Jo BAE¹, Sungkook LEE² (*1. Kyungpook National University, Department of Public Health, Korea; 2. Kyungpook National University, Department of Public Health, Kyungpook National University School of Medicine, Korea*)

Introduction : The aim of this study is to classify the social network types among elderly people with dementia, and to examine the relationship of network type to quality of life. This is to identify influence of social network on quality of life of elderly people with dementia. **Method :** The data of 222 elderly people with dementia used in this study were collected from a health center and elderly people with dementia living in the community in Daegu. The interview was conducted from July 17 to August 31 in 2012 using a structured questionnaire. And network types were derived by Hierarchical cluster analysis, based upon four differentiating criteria: composition, size, social club attendance, frequency of contact. **Results :** Three network types are classified: (1) active independent (2) inactive dependent (3) inactive restricted networks. Respondents in the different network types are found to have different degrees of quality of life. Respondents active independent networks are reported to have the highest quality of life, while those with inactive restricted network are the lowest. **Conclusion :** The results of the study suggest that the classification of network types allows consideration of the interpersonal environments of elderly people with dementia. The relative effects on quality of life for elderly people with dementia, evident in the current analysis, are the case in point. Therefore Social service programs should focus on different groups based on social network type. **Keywords :** Social network typology, Elderly people with dementia, Quality of life

PP26 S-320

EFFECTS OF A WATCH ORGANIZATION TRAINING

PROGRAM

Seiko MASUDA, Chieko TSUMURA (*Faculty of Nursing and Rehabilitation, Konan Women's University, Japan*)

Introduction : When elderly people fall into a critical state, the situation where the circumference cannot be asked for help has social-problem-ized. While relation of people between the neighborhoods dilutes, it watches and can set in an organization -- it is necessary to watch and to examine the state of activity. **Method :** Training, 2005 21 And fiscal year 22 Of the fiscal year 2 Watch over the years, members of the Organization 42 Name (Watch volunteer Commissioners,) To experience the dramatic relief and made based on group work discussion afterwards. Record the remarks made in the group work mathematical system for Text Mining Studio4.1 (mathematical system) by analysis. Confirmed training effect questionnaire and comments after the training. **Results :** The inside of the same site of a questionnaire to 91.3% of the collective housing, and the same neighborhood--watching--it was possible and 'a greeting and voice, or Mounting'(56.2%) was mainly performed. In the comparison in the Heisei 21 fiscal year and the Heisei 22 fiscal year a positive utterance, such as 'watching, and enabling it to consult with the naysayer'by/voice or Mounting etc. when a candidate is required ', was seen. **Conclusion :** In the training using dramatic relief, box of an organization member it can watch and can learn actively and positively. It was shown that it is a program which can understand the importance which is watched and an organization member watches from the contents of an utterance of group work and an after-training questionnaire. **Keywords :** Watch, Organization training program

PP26 S-321

THE IMPACT OF ELDER ABUSE ON NEGATIVE ATTITUDES TOWARD BEING OLD OF CARE-GIVERS

Misook CHO (*Department of Social Welfare, Sahmyook University, Korea*)

Introduction : Studies show that by 2019, about 14 percent of the population will be seniors aged 65 and over in South Korea. The increase of the aged population brings a primary interest in the elderly abuse. Until now, the major issues of criminology are concentrated in adolescent and woman related crimes. Therefore, strong interests in aged abuse are lacking. Especially education for ageism or rather the lack of it, is the main reason why elder abuse gets passed over. Ageism adversely affects older people and restricts the roles and alternatives available to them. So, the government should be preparing institutional support and intervention for preventing further aged mistreatment. **Method :** In this article, First, We tried to define the elderly abuse based upon the Korean traditional family culture. Second, We analyzed types of mistreatment for theoretical foundation of "Johnson's Abuse Indicator". Third, We explored various factors of the Impact of Elder Abuse on negative attitudes toward being old on Care-givers abasement. **Results :** It is not older people, but, rather the younger aged groups who determine the status and position of older people in a society. The young and middle-aged not only determine the future, but also their own treatment as they age. **Conclusion :** Finally, we attempted to analyze the present condition of the aged mistreatment cases in this piece and sought to plan to correct the aged abuse issues by focusing on the current criminal policy. Above all, in order to handle the aged abuse issue, confidence in the judicial system by the aged, must be enhanced. We also find that systemic or institutional grids are necessary for remedying damaged the aged and they should have their legal human rights protected. For the protection of minority rights, the restoration of communication channels modern Korea society is not well equipped to handle this crisis is needed and respect

for the aged should be of greater concern. Keywords : Elder Abuse, Ageism, Human rights of Older Person.

PP26 S-322

ELDER ABUSE AND QUALITY OF LIFE

Bo Sun KOH (*Department of Social Welfare, Jeju International University, Korea*)

Introduction : The purpose of this research was to test causal relationships among family function, social support, mental health, and subjective quality of life for the abused elderly and non-abused elderly. Method : A structured questionnaire was used to interview a sample of 200 abused elderly and 200 non-abused elderly over 65 years old, who live in Jeju, Korea, 2008. Independent variables consisted of family function(Kim, Y.S., 2001), social support(Koh, B.S., 2004), and mental health(KGHQ-20; Shin, S.I., 2001). Dependent variable was subjective quality of life(Greenley, et al., 1997). Statistics analyses included t-test, Pearson's Product Moment Correlation, Hierarchical regression, and Path analysis. SPSS for the WIN 12.0 program was used for these analysis. Results : Family function, social support, mental health had significant and positive effects on the subjective quality of life in both the abused elderly and non-abused elderly. The strongest predictor of subjective quality of life for the abused elderly was family function, otherwise mental health was the greatest predictor of subjective quality of life in the non-abused elderly. Mental health appeared to be important intervening variable in the subjective quality of life in both the abused elderly and non-abused elderly(H3). Conclusion : Quality of life is a recognition of self-value in life. The victim has loss of self-value and significance of existence in their life. Elder abuse is a complex problem with multiple risks and causes. In particular, family environment is important context to solve the elder abuse problem. Elder abuse protection system has to cooperate multi-dimensional efforts including the victim and assaulter, family, and community. Keywords : Quality of life, Elder abuse, Family function, Social support, Mental health

PP26 S-323

RESILIENCY AND VULNERABILITY TO ELDER ABUSE ACROSS ETHNICITY AND CULTURES

Jonathan APPEL¹, Dohee KIM-APPEL² (*1. Behavioral and Social Sciences, Tiffin University, USA; 2. Art Therapy and Counseling, Ursuline College, USA*)

Introduction : With the explosion of a global aging population, the topic of elderly abuse warrants great attention. Participants will explore strengths and limitations of a systems approach for working conjointly with aging families within the human service professions. Participants will receive information and research to identify high-risk families across ethnic and cultural backgrounds, assess the current country specific protection laws, and explore intervention, prevention strategies, family configurations, and service utilization. Method : Review of pertinent literature including research and appropriate legal statutes and interventions strategies. Theories of Abuse and Neglect will be explored. Results : Existing research in the elder abuse and aging literature will be addressed--as well as mention of gaps in the literature and research. Conclusion : Elder Abuse is a highly complex and multifaceted phenomenon. This issue is even more complex in a global context. A multidimensional and integrated and culture specific approach to address elder abuse world-wide is urgently needed. Keywords : Elder Abuse, Aging Legal

PP26 S-324

ELDER ABUSE IN RESIDENTIAL AGED CARE:

PERCEPTIONS, PRACTICE AND POLICY

Josephine WOLL, Catherine HALL, Barbara PARKER (*School of Nursing and Midwifery, University of South Australia, Australia*)

Introduction : In Australia and internationally, there is a paucity of research about elder abuse specifically within Residential Aged Care Facility's (RACF's) and it remains a hidden problem. To date government reports and media stories have provided the only estimate of the prevalence of elder abuse within RACF's. In 2007, the Federal Government implemented a number of regulatory initiatives to address issues highlighted by a small number of highly publicised cases in 2006. Minimal evidence was found regarding a reduction in the reported incidents of elder abuse within RACF's since the introduction of these initiatives. Method : The aim of this research is to examine elder abuse specifically within RACF's and to determine from the perspective of the residents, family and health care workers what is understood by the term elder abuse. The research also examines current work practices and organisational policies to gain an understanding of how violations are approached and decisions for reporting are made. Results : Utilising an action research approach in consultation and collaboration with health care workers, current care practices within RACF's are reviewed in association with research findings. Preliminary findings from stage 2 will be presented including observation, interviews, focus groups and questionnaire data. Conclusion : The findings from this study add to current knowledge of elder abuse by developing a broad perspective using comprehensive data on the perceptions and causes of elder abuse within RACF's. This study will lead to a review of current care practices within RACF's and could lead to policy and practice changes and further research. Keywords : Aged Care, Elder Abuse

PP26 S-325

ABUSE AND VIOLENCE AGAINST COMMUNITY-DWELLING OLDER WOMEN: A MULTI-NATIONAL EUROPEAN STUDY

Liesbeth DE DONDER¹, Minna-Liisa LUOMA², Gert LANG³, Jose FERREIRA ALVES⁴, Iiona TAMUTIENE⁵, Bridget PENHALE⁶, Dominique VERTE¹ (*1. Adult Educational Sciences, Vrije Universiteit Brussel, Belgium; 2. Department of Living Conditions, Health and Wellbeing, National Institute for Welfare and Health (THL), Finland, Finland; 3. Research Institute of the Red Cross, Austria, Austria; 4. Department of Psychology (IEP), University of Minho, Portugal; 5. Sociology Department, Vytautas, Magnus University, Lithuania; 6. Centre for Health and Social Care Studies & Service Development, School of Nursing and Midwifery University of East Anglia, United Kingdom*)

Introduction : This contribution presents the findings of an extensive multi-national survey of abuse of older women in five European countries that took place from 2009-2011. Combating elder abuse requires an integral understanding of those patterns and forces that underlie it. Therefore, this contribution examines the social or ecological risk factors at different levels of severity of abuse against older women. Method : Data from 2,880 older women is randomly collected in five European countries (Austria, Belgium, Finland, Lithuania and Portugal) using a standardized questionnaire. Results : Results indicate that overall 30.1 % older women had at least one experience of abuse in the past year. A typology of severity of abuse has been created which offers a nuanced picture of the issue, indicating that 6.5 % older women were victim of very severe abuse. Moreover, the presentation offers specific numbers for the prevalence of different types of abuse (physical, psychological, sexual, financial, violation of personal rights and neglect) in the different participating countries and

offers additional insights by presenting results about the main risk factors for the different levels of abuse. Conclusion : The findings demonstrate that a single emphasis on personal indicators is too simple: abuse and violence are multi-faceted and are embedded in environmental as well as cultural levels and contexts. Recommendations for policy and practice to reduce abuse among older women, and suggestions for further research will be offered. Keywords : elder abuse, older women

PP26 S-326

THE PREVALENCE AND CHARACTERISTICS OF SOCIAL ISOLATION

Mariko NISHI, Taro FUKAYA, Takashi KOIKE, Hiroyuki SUZUKI, Kumiko NONAKA, Hiroshi MURAYAMA, Erika KOBAYASHI, Shouji SHINKAI, Yoshinori FUJIWARA (*Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Japan*)

Introduction : Purpose of this study was to determine the prevalence and characteristics of social isolation among community-dwelling elderly (over 65) who live alone and who live with others. Method : A survey was conducted in Wako-city, Saitama-prefecture in 2012. Data were obtained from 8,304 elderly (response rate 74.3%). Frequencies of contacts with other people (non-resident children, relatives, friends, and neighbors) were used to define the state of social isolation; contact less than 2-3 times a month defined as "isolated" and contact more than once a week defined as "non-isolated". Results : The major findings were as follows. 1) The prevalence of "isolated" were 23.0% in elderly living alone and 30.0% in elderly living with others, and was higher in men than in women with either household composition. 2) Within elderly living with others, the prevalence of "isolated" increased as 5-year age-group raised. On the contrary, prevalence reduced as 5-year age-group raised within elderly living alone. 3) Compared with "non-isolated" group, "isolated" group tend to have low/poor state in many aspects (such as one's estate, mental health status, evaluation toward one's neighborhood) for both household composition. 4) Some exceptions were seen. For example, the result of physical health status and anxiety about future differed between household composition: low/poor state in "isolated" group in those living with others, and differences not salient between isolated-state in those living alone. Conclusion : The prevalence and characteristics of socially isolated elderly were not completely consistent between household composition. These findings would be useful when considering an efficient way of supporting isolated elderly. Keywords : social isolation, prevalence, characteristics , community-dwelling elderly , health

ADAPTING A QUEBEC (FRENCH CANADA) PRACTICE GUIDE IN ELDER ABUSE(EN MAINS, IN HAND) TO THE WALLOON (FRENCH BELGIUM) CONTEXT

Marie BEAULIEU¹, Nicolas BERG², Dominique LANGHENDRIES³, Melanie OUDEWATER⁴, Louise BELZILE⁵ (*1. Gerontology, University of Sherbrooke, Canada; 2. Geriatric, Hopital la Citadelle, Belgium; 3. Direction, Respect Seniors, Belgium; 4. Clinical supervision, Respect Seniors, Belgium; 5. Gerontologie, University of Sherbrooke, Canada*)

Introduction : There are only a few validated tools regarding follow-up of cases in elder abuse. En Mains was developed in Quebec (French Canada) with the concurrence of practitioners. It presents 3 scenarios of intervention: suspension of follow-up, accompaniment and formal protective intervention. In 2011, Respect Senior (RS) (The Walloon

agency - Belgium - responsible of intervention in cases of elder abuse) decided to review their practice. A research action of acceptability and adaptation of the En Mains toll was initiated. This poster aims to describe the research action process and the modified En Mains tool as a result of 1,5 years of work. Method : Data was collected in 3 steps with all the practitioners and managers of RS. 1) An acceptability questionnaire ; 2) A focus group to understand the context of practice and the needs of adaptation; 3) A 18 month process to adapt, implement and monitor the changes in order to ascertain that the Walloon version of En Mains suits the needs of a best practice. Results: The acceptability questionnaire revealed a high level of acceptability with minor changes proposed regarding legislation, social policies and language. The scenario of "formal protective interventions" was the less acceptable. The adaptation process permitted to include the revised 3 scenarios in a computerised intake and follow-up database. Conclusion : En Mains is now integrated to the Walloon practice. It takes several months and the contribution of all practitioners to succeed in such an implementation. Keywords : elder abuse, follow-up, adaptation of tools to different context.

PP26 S-327

WORLD ELDER ABUSE AWARENESS DAY: BUILDING ON ITS SUCCESS TO ADDRESS OTHER ACTIONS IDENTIFIED IN MIPAA TO COMBAT ELDER ABUSE

Gloria GUTMAN¹, Yongjie YON² (*1. Gerontology Research Centre, Simon Fraser University, Canada; 2. Davis School of Gerontology, University of Southern California, USA*)

Introduction : In 2002, prevention of elder abuse, neglect and violence against older persons was recognized as a critical issue in the United Nations' Madrid International Plan of Action on Ageing (MIPAA). Among actions identified in MIPAA to eliminate these were sensitizing professionals and educating the general public concerning their characteristics and causes, since they are often hidden problems, reported by only an estimated one in five victims; furthermore many victims are unaware of available support services in their community. Method : In 2006, the International Network for the Prevention of Elder Abuse (INPEA), with the support of global organizations, including the International Association of Gerontology and Geriatrics, launched World Elder Abuse Awareness Day (WEAAD). INPEA also developed tool kits to help local organizations raise awareness and direct victims and their families to available resources in their community. Results : Since 2006, WEAAD has been embraced by NGOs, government agencies, health and social care providers, law enforcement professionals and others and has been celebrated in every region of the world. In 2011, the United Nations officially designated June 15th as WEAAD. Conclusion : In the short time since its inception WEAAD has played a significant role in raising awareness of elder abuse. INPEA seeks to build on the momentum generated by WEAAD to assist national governments and local organizations to implement other actions identified in MIPAA. The goal of this presentation is to review the history of WEAAD, discuss why it has been successful and explore new directions that could be taken. Keywords : Elder Abuse and Neglect, Madrid International Plan of Action on Ageing

PP26 S-328

ELDERLY ABUSE AT HOME AND THE HEALTH PROFESSIONALS - A REFLEXION

Zaida Aguiar Sa AZEREDO, Beatriz Azeredo TOMAZ (*UNIFAI, Portugal*)

Introduction : The proportion of elderly is increasing fast while family

structure is changing. Also, the prevalence of chronic diseases is increasing. Among them mental disorders becomes a society problem. Elderly abuse is another social and health problem which arise in Portugal. Method : The authors (Family Doctor and Psychologist) taking into account literature review and their own experience in practice and the elderly reports, analyse causes/ circumstances such as: type of elderly diseases, fatigue/ burn-out of carers, environment and its relation to elderly abuse. Also they think about the health professional role on elderly abuse. Results : The Authors understand that the elderly abuse sometimes is a consequence among two victims (the old person and the carer 9. Sometimes the person who is responsible for the injuries is also a victim of fatigue, loneliness and burn-out. People with Dementia, is more in danger to suffer violence than others. Conclusion : The Authors think elderly abuse is a worry thing, but to prevent it it is important to analyse what is behind the event, and to understand family dynamic. The health professional have an important role not only to identify victims, but to prevent the violence and to help other professional during the follow-up. Keywords : elderly abuse, social environment

PP26 S-329

DO BRAZILIAN OLDER PEOPLE VOTE?

Angelo Jose G. BOS, Cletiane Dias RODRIGUES (*Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Brazil*)

Introduction : Civic participation of the elderly is considered by the World Health Organization one of the most important social contributions this season of life. Method : We interviewed 7315 older gauchos randomly identified and interviewed in their homes in 59 cities in the State of Rio Grande do Sul. The research was. The study was part of a comprehensive assessment inspired by the Guide for Aging Friendly Cities of the WHO aiming to describe a new profile of older gauchos, Among the questions we asked the participation of older people in the last election. Results : The result was that 91% of aged 60 to 69 years, required to vote, attended in the last election. This percentage is higher than the 85% of voters in the presidential election of 2010, according to data from the TSE. Among seniors aged 70 to 79 years, despite being exempt from voting, the majority (55%) fulfilled their civic right. The percentage of voters aged between 80 and 89 years remains significant, with 32%. What is most striking in the survey is the number of voters age 90 or older: while facing the weight of his years spent, 16% made a point of letting their votes at the ballot box in 2010. Conclusion : So we can say that the elderly represent a range of population increasingly active in society and the politicians of our country should be aware of this age often so neglected. Keywords : Civic participation, Social right, Active aging

PP26 S-330

STRUCTURAL MODEL OF THE ELDERLY'S INTENT OF ADVANCE DIRECTIVES REGARDING THE DISCONTINUATION OF MEANINGLESS LIFE-SUSTAINING TREATMENT

Mihee Mi LEE (*Internal Medicine OPD, Hallym Kangnam Nursing Dept., Korea*)

Introduction : The purpose of this study is to develop and verify an explanatory model of the elderly's intent of advance directives regarding the discontinuation of meaningless life-sustaining treatment. Method : Data were collected from March 14 to April 2, 2011 through face-to-face interviews by using a structured questionnaire from a convenience sample of older adults. The descriptive and correlation statistics were analyzed using SPSS/WIN 18.0, and the proposed

model was tested and modified using structural equation modeling in AMOS 18.0. Results : The results demonstrated that the intention of advance directives was directly influenced by family and peer support, attitude toward the discontinuation of meaningless life-sustaining treatment, and the efficacy of advance directives. In addition, the intention of advance directives was indirectly influenced by family and peer support and end-of-life preparation. Attitude toward the discontinuation of meaningless life-sustaining treatment was directly influenced by end-of-life preparation and family and peer support. The efficacy of advance directives was directly influenced by end-of-life preparation and family and peer support. All of the latent variables explained 47% of the variance in the intention of advance directives. Conclusion : The results of this study suggest that in order to improve the elderly's intent of advance directives regarding the discontinuation of meaningless life-sustaining treatment, nursing interventions should focus on enhancing their attitude toward the discontinuation of meaningless life-sustaining treatment and the efficacy of advance directives. Keywords : elderly, discontinuation of meaningless life-sustaining

PP26 S-331

A STUDY OF REGIONAL SUPPORTING THE ELDERLY WITH DEMENTIA

Minyoung JANG (*Social Welfare, Meijigakuin University, Japan*)

Introduction : Regarding the revision of the long-term care insurance law in 2005, "Preservation of Dignity" for the elderly is mentioned, various supports have been devised to ensure the human rights. Within the overall elderly population, those with dementia have a higher likelihood of being the victims of human rights abuses due to the specific nature of the symptoms of their infirmities. The government established "Comprehensive Regional Support Centers(CRSC)." These centers function as regional consulting offices to ensure the dignity of individuals. This study aims to validate these CRSCs, to evaluate how effectively they support the elderly with dementia and their families, and to identify whether they are able to guarantee human rights of those suffering from dementia. Method : In this study empirical research was conducted based on the defined objectives. A survey was (1) distributed to the CRSC of 17 prefectures in eastern Japan. (2) The recovery rate for valid survey responses was 20.0%, for a total of 409 responses. (3) The survey period was from January through March, 2012. Results : The survey results were analyzed using text mining and typological identification: "Sponsored Training Course Support", "introduction to adult guardianship", abuse awareness", "building networks for abuse prevention", and "education of community residents". Conclusion : The problems with elderly suffering from dementia, such as social isolation resulting from disruption of service, deterioration of mental health are evident. In comparison with other activities the support activities focusing on regional networks and awareness promotion were limited in scope. In the future these areas must continue to be improved and strengthened. Keywords : dementia, regional support, dignity

PP26 S-332

AGEING DISCOURSES IN THAI SOCIETY: MEANING AND SOCIAL PRACTICE

Nitikul THONGNUAM (*Medical Service, Geriatric Institute, Thailand*)

Introduction : Nowadays the increasing proportion and quantity amount of ageing people in Thailand become to "ageing society". Most of people understand that ageing relate with year of age and the changing of body and mind. Exactly the meaning. Method : The

process exploring of meaning by using documentary review about the ageing policy, content analysis, discourse analysis and social practice that reveal the construction of ageing meaning and social practice. Results : The finding shows that the diversity and fluidity meaning of ageing in Thailand are constructed on hegemony of direction of social development. The ageing policies in the past show the meaning of subjective value in experience and knowledge. The meaning related to the sociocultural changing context from the socialist policy that the ageing became the economic dependent body. The marginal should be supported by social welfare. The strength hegemony of western medicine show the ageing meaning into ageing process. The media discourse meanings are responded to the consumerism and constructed the ageing meaning become through the benefit commodity in alternative health service. The post modernism ageing are represented to be social unwanted person and decrease their social value and role. Conclusion : This study suggest that to understanding in thinking behind set of meaning of ageing language practice is important for ageing which can be released power of discourse that embodied through self and identity of ageing and show that the resistant meaning and resistant discourse constructed that reflex the ageing power. Keywords : Ageing, Discourses, Society

PROSPECT THEORY AND FAMILY APPROACHES TO END-OF-LIFE DECISIONS WITH AND ON BEHALF OF NURSING HOME RESIDENTS

Mercedes BERN-KLUG (*School of Social Work & Aging Studies Program, The University of Iowa, USA*)

Method : Qualitative interviews with 20 family members of persons with cancer living in a nursing home (NH) were conducted to learn how family members approach decision-making with and on behalf of a NH resident. Results : Older adults who have battled cancer in the past and are living with a cancer diagnosis in a nursing home setting were reported to have expressed clear wishes to not have their dying prolonged. Conclusion : One of the key findings of the study underscores the importance of framing. In term of this study, 'what is the opposite of perfect health?' Many families in this study alluded to the belief that they and their loved one believed there was a fate worse than death, worth attempting to avoid by accepting death. Would the same results hold true if the NH resident was interviewed? Keywords : advance directive, dying, palliative care

PP26 S-334

DISEASE AWARENESS PROCESS IN PRIMARY FAMILY CAREGIVER OF DEMENTED ELDERLY

Mi Ra SUNG (*General. PhD, Professor, Seoul Metropolitan Center For Dementia. Kyung-in Women's College, Korea*)

Introduction : This study was carried out to develop the entity concept through analyzing and explaining the disease awareness process of the primary caregivers who take care of the elderly with dementia. Method: The period of research was from June, 2010 to November, 2011. The data was collected until it reached at the saturated condition that the new characteristics and categories are no further discovered. In addition, the data was continuously analyzed by using the comparative method and the contents reviewed by researcher were recorded in notes and analyzed by using memo and figures. Results : The key category regarding the disease awareness process of the primary caregivers of the elderly with dementia was 'to struggle with difficulties of relation'. The disease awareness processes were 'to be doubtful', 'to recognize situation', 'to find methods' and 'to accept'. In addition, the provider's types of accepting dementia were 'obsessing

past type', 'pessimistic type', 'active realistic type' and 'conforming type'. Conclusion : Through this study, it was concluded that there were so many cases that the primary caregivers of the elderly with dementia accepted this disease only after the disease condition had worsen due to the lack of recognition for dementia. Owing to this belated recognition, the primary caregivers felt fear for supporting the elderly with dementia and exhausted with the negative prognosis for disease. Also it gave family with burden for supporting. Therefore, solutions are necessary to recognize and handle this disease at the initiatory stage by analyzing the disease awareness process of the primary caregivers. Keywords : Dementia. Primary family Caregiver. Disease Awareness Process

PP26 S-335

VALIDATING AND VERIFYING A 'SEEKING PURPOSE IN LIFE' MODEL FOR OLDER PEOPLE: INTERACTIVE MOTIVATION AND EFFICACY

Nahoko KUSAKA, Nobuyuki UEDA, Eriko MIYAKE (*Faculty of Contemporary Social Studies, Doshisha Women's College of Liberal Arts, Japan*)

Introduction : This study aims to develop a new psychometric instrument for researching 'seeking purpose in life' models for older people. Initially we surveyed 135 university students using a 63-item, four-point Likert-type scale (Seeking Purpose in Life Inventory: SPLI) measuring two major domains - the motivation and efficacy relating to orientation to life purpose and to personal goals. Method : Through factor analysis of the 63 items, four subscales of 27 items were shortlisted and 49 older people then surveyed. We measured their 'sense of purpose in life' as 'tenacious and flexible purpose adjustment' (G_Will), 'trust' as 'trust-related hope' (G_Hope), 'autonomy in motivated practical goals' (P_Autonomy), and self-efficacy perceived controllability in 'pursuit of practical goals' (P_SE). We also tested using the following instruments: Psychological well-being (PWB, Plaut et al., 1989), the State Hope Scale (SHS, Snyder et al, 1996), Self-Efficacy (SE, Shere et al., 1982), and Tenacious goal pursuit (TGP, Brandtstadter J, Renner G., 1990). Results : In the older subjects the Cronbach's alpha coefficients for each SPLI subscale were above 0.7, and internal consistency was confirmed. Our "G_Will" data showed significant positive correlation with PWB, SHS, and SE. Likewise "G_Hope" correlated with SHS, TGP, and SE. Also "P_SE" correlated with SHS and SE, and, for "P_autonomy", the "integrative motivation" index correlated with PWB, SHS, TGP, and SE. Conclusion : Our study validates SPLI for older people. Our conference report will detail our factor analysis, consistencies relating to pursuit of purpose in life, and correlations between autonomy, trust, and subjective well-being. Keywords : Purpose in life, Motivation, Self-efficacy

PP26 S-336

RESPECT FOR THE ELDERLY: THEORETICAL APPROACH

Anton A. SMOL'KIN (*Faculty of Philosophy and Sociology, The Russian Presidential Academy of National Economy & Public Administration, Russia*)

Introduction : Everyday practices of respect for old age are understudied and severely undertheorised in sociology. Respect is the form of recognition expressed in a set of actions, corresponding to the status of the object of respect. Method : Stephen Darwall, following Kant, suggests distinguishing between "recognition respect" (according appropriate value to that fact that the object of respect is a human) and "appraisal respect" addressed to people with particular characteristics. Results : However, forms of respect for an anonymous

representative of a certain social group cannot be reduced to the first type (which does not provide for differences in respect to different people) nor to the second one (as in the context of a personal acquaintance we cannot distinguish between the attitude towards a particular person and the attitude towards them as a representative of a social group). For cases when recognition respect is insufficient, I suggest to use two kinds of respect to the anonymous representative of a social group based on Darwall's ideas. They are "compensation recognition respect" (addressed to children, the disabled, etc.: that is, to groups which are considered to need support in a certain context) and "culturally specific appraisal respect" (addressed to representatives of groups "deserving" additional respect, e.g. war veterans, representatives of "heroic"/socially significant professions, to "ancestors", etc.- in other words, groups to whom we are morally indebted). Conclusion : Elderly people are a unique group that sits in both types of this classification, being regarded both as an object of potential care and as an object of gratitude. Keywords : respect, attitudes to the elderly, secondary groups

PP26 S-337

AGEISM

Audrey GUY (*Business, Governance and Law, University of Canberra, Australia*)

Introduction : Ageism is the third 'ism' and parallels and differs from sexism and racism. Method : Members of all three groups are regarded as less capable, second class citizens. Conferences on ageing are usually run by younger people, speakers are largely from the same cohort, as is the audience. The views of older people, no matter how well qualified, are not heard. Ageism does not evoke shame in the community. Ageism rescinds opportunities and freedoms gained in adulthood and takes people back to a more dependant state. Past lives and achievements seem to be replaced by an assumption that the person is merely an older person with no abilities or valuable ideas, possibly displaying senility. Wrinkles and grey hair are the external symptoms of a new universal personality and signify a second class citizen with limited capability. Results : As populations' age and older people are seen merely as a financial burden on their countries, ageist attitudes will ensure that this is fulfilled. The talents, ideas, skills, knowledge and wisdom which this increasing section of the population has to offer, which are necessary for the well-being of each country, are being lost. No country can run efficiently on the contributions of a reducing proportion of its citizens. Conclusion : The internet is one area which is ageism free and use of it should be encouraged to combat ageist negativity. In a world beset by problems, casting older people, with their abundant knowledge and wisdom, on the scrap heap of humanity through ageism merely increases the problems. Keywords: Ageism, Ageing, Internet

PP26 S-338

CULTURAL PERSPECTIVES ON THE AGING SEMANTIC DIFFERENTIAL: ATTITUDES TOWARDS OLDER ADULTS AMONG COLLEGE STUDENTS IN CHINA

Jing TAN¹, Ernest GONZALES², Lisa A. MARCHIONDO³, Huajuan CHEN⁴, Yi WANG⁵ (*1. Social Work, Bridgewater State University, USA; 2. Social Work, Washington Univeristy, USA; 3. Psychology, Wayne State University, USA; 4. Social Work, Washington University in St. Louis, USA; 5. Social Work, Washington University, USA*)

Introduction : The Aging Semantic Differential (ASD, Rosencranz & McNevin, 1969) is the most widely utilized instrument to measure attitudes towards older adults within the United States. Our objective was to translate it to Mandarin Chinese and to examine its validity.

Method : Self-administrated anonymous paper-based questionnaires were distributed to a convenience sample (N = 380) of college students in Shanghai, China. The structure of the data was analyzed using exploratory factor analysis (EFA) with maximum likelihood extraction and oblimin rotation. We then used confirmatory factor analyses (CFA) to confirm the resulting latent variables and compare them to Rosencranz's factors. Results : EFA revealed three meaningful ASD factors in China: (1) personality and mental health, (2) societal participation (social, financial, occupational), and (3) physical health. In a CFA, all items significantly loaded onto their hypothesized factors, and goodness of fit statistics revealed good fit. While Rosencranz's "personal acceptability" category overlapped well with our first factor, the items from his "instrumental-ineffective" and "autonomous-dependent" categories were divided primarily between our last two factors. A second CFA was conducted using Rosencranz's three factors. Comparison of the two CFAs revealed that our model fit the ASD data in China significantly better ($\chi^2_{df=87} = 577.2, p < .001$). Conclusion : It is possible to use the ASD to assess young adults' attitudes in China. This finding poses implications for other cross-national comparisons of ageism, as well as interventions. Keywords : Ageism, factor analysis, China

PP26 S-339

MALLEABILITY OF AGEING SELF-PERCEPTIONS: EFFECTS OF EXPERIMENTALLY INDUCED AGEING PHENOMENOLOGY ON DIFFERENT INDICATORS OF SUBJECTIVE AGEING

Martina MICHE, Hans-Werner WAHL (*Dept. of Psychological Aging Research, Heidelberg University, Germany*)

Introduction : Previous research has found support for what has been coined "labeling theory", suggesting that negative age stereotypes may undermine older adults' self-perceptions of ageing. In these studies, one-item subjective age measures were used as a proxy of ageing self-perceptions. The aim of this study was to test whether the effect of age stereotypes varies, when a wider range of indicators of subjective ageing as in previous work is considered. Method : Forty-four older adults between the ages of 60-70 years were randomly assigned to two age-stereotype conditions or a control group. After completing a speed-accuracy trade-off task measuring attention and concentration, participants received either positive or negative feedback comparing their performance to that of younger adults in order to activate a negative or positive age stereotype. No feedback was given in the control group. Four dimensions of subjective age (felt age, look age, do age, and interest age) were measured before and after stereotype activation. Between-group comparisons were conducted on additional indicators of ageing self-perceptions. Results : Participants who received negative feedback about their test performances reported older subjective "do ages" at post-test compared to participants in the positive age-stereotype condition. No effect was found for felt age, look age, interest age, and other, alternative measures of subjective age. Conclusion : Using different measures of ageing self-perceptions may be important for understanding the differential effect of age stereotype activation. Older adults seem to integrate self-relevant, age-stereotypical information into the momentary and less conscious indicators of ageing self-perceptions. Keywords : Age Stereotypes, Ageing Self-Perceptions, Subjective Age, Social Comparison

PP26 S-340

VALIDATION OF THE KOREAN VERSION SLEEP HABITS QUESTIONNAIRE IN OLDER KOREANS WITH CHRONIC ILLNESSES

Hye-A YEOM¹, Carol BALDWIN², Su-Jeong KIM¹ (*1. The Catholic*

University of Korea College of Nursing, The Catholic University of Korea College of Nursing, Korea; 2. Arizona State University College of Nursing and Health Innovation, Arizona State University College of Nursing and Health Innovation, USA)

Introduction : The purpose of this study was to examine the psychometric properties of the Korean Version of the Sleep Habit Questionnaire (KSHQ) designed to measure individuals' sleep pattern and quality in a group of older Koreans with chronic illnesses. **Method:** The development of the KSHQ was guided by Brislin's translation model. The KSHQ was administered to a sample of 290 older Koreans with multiple chronic illnesses. Participants were a convenience sample recruited from senior centers and outpatient clinics of a university hospital in Seoul, Korea. Participants completed the KSHQ, measures of fatigue and pain, and provided demographic information. Translation, back-translation, and cross-language validation of the Sleep Habit Questionnaire were conducted to ensure linguistic and cultural equivalency of the KSHQ. **Results :** The Korean version Sleep Habit Questionnaire showed cultural and content equivalency. The internal consistency of the KSHQ was high with Cronbach's alpha of .77. There was evidence of concurrent validity of the KSHQ based on its high correlation with theoretically relevant variable of fatigue ($r=.40$, $p = .000$). Sleep quality was significantly correlated with sleep hours ($r=.23$ $p = .000$). There was no significant correlation between KSHQ and pain. **Conclusion :** The KSHQ is a reliable and valid measure to assess sleep pattern and quality in older Koreans with chronic illnesses. **Keywords :** Fatigue, Sleep Habits

PP26 S-341

A KNOWLEDGE TRANSFER INITIATIVE PROMOTING DIGITAL SOCIAL POCKET TOOLS FOR HEALTHY AGING

Lynn MCDONALD¹, Elsa MARZIALI², Lawrence KRYZANOWSKI³, John RIETSCHLIN⁴, Madelyn IRIS⁵, Gail WIDEMAN⁶, Peter DONAHUE⁷, Gloria GUTMAN⁸, Marie BEAULIEU⁹, Ariela LOWENSTEIN¹⁰, Corey MACKENZIE¹¹, Ronald BAECKER¹², Esme FULLER-THOMSON¹³, Karen KOBAYASHI¹⁴, Sander HITZIG¹, Tal SPALTER¹ (1. Social Work, University of Toronto, Canada; 2. Kunin-Lunenfeld Applied Research Unit, Baycrest Centre for Geriatric Care, Canada; 3. Finance, Concordia University, Canada; 4. Policy Research Directorate, Social Research Division, Human Resources and Skills Development Canada, Canada; 5. Council for Jewish Elderly, Leonard Schanfield Research Institute, USA; 6. School of Social Work, Memorial University of Newfoundland, Canada; 7. School of Social Work, Renison University College, Canada; 8. Gerontology Research Centre, Simon Fraser University, Canada; 9. Service Social, Université de Sherbrooke, Canada; 10. Faculty of Welfare and Health Sciences, University of Haifa, Israel; 11. Psychology, University of Manitoba, Canada; 12. Computer Science, University of Toronto, Canada; 13. Factor-Inwentash Faculty of Social Work, University of Toronto, Canada; 14. Sociology, University of Victoria, Canada)

Introduction : To help promote better health and well-being for aging populations and their caregivers, the National Institute for the Care of the Elderly (NICE; www.nicenet.ca) has translated their evidence-based pocket tools (PTs) into digital formats. A challenge, however, is to identify appropriate strategies to promote the PTs to relevant stakeholders (e.g., seniors and caregivers in the community, healthcare professionals, policymakers, etc.). **Method :** Using the Conceptual Model of Knowledge Exchange (Meagher et al, 2008) as a guiding framework, a multi-phase KT initiative is being implemented to promote, sustain, and evaluate the PTs. The first phase involves promotion of the PTs through academic (i.e., conference presentations)

and non-academic channels (i.e., social media, media campaign). The subsequent phases will be: 1) assess stakeholders' current knowledge and use of PTs ($n = 800$); 2) assess the impact of tool acquisition on practice and behaviors (digital vs. paper; $n = 200$); and 3) identify strategies to facilitate PT acquisition ($n = 40$). **Results :** Given that the paper-versions of the PTs have mainly been distributed within Ontario Canada (approx. 70%), identifying strategies for implementing the digital PTs may serve to widen their accessibility to a broader audience. A key outcome includes monitoring the association of dissemination activities with monthly traffic reports from the website hosting the PTs. **Conclusion :** Given the lack of knowledge related to KT in the health field, the described initiative serves as a theory driven model that offers healthcare professionals working with aging populations with practical approaches for assessing the impact of their own digital KT initiatives. **Keywords :** Knowledge Mobilization, Promoting model, Digital Pocket Tools

MOOD STATE OF KOREAN AMERICAN AND KOREAN ELDERLY

Sang Hoon CHOI¹, Sun Hee SONG², Eun Ja YEUN³ (1. Hoseo Graduate School of Venture, Hoseo University, Korea; 2. College of Liberal Education, Hoseo University, Korea; 3. Department of Nursing, Konkuk University, Korea)

Introduction : The acculturation process is multidimensional, including physical, psychological, financial, spiritual, social, language, and family adjustment(1). This process can be very stressful for immigrant elders(1, 2). The negative effects of acculturation on psychosocial health have been reported by previous studies. Today's Korean American elderly are predominantly first-generation immigrants who face stern challenges of acculturation(3). This study aimed to investigate and compare the mood state of Korean American and Korean elderly. **Method :** This study included 105 elderly (43 Korean American, 62 Korean). Korean version of Profile of Mood State Brief form (K-POMS-B) was used to measure the mood state of participants. A questionnaire survey was carried out in the United States and Korean. Collected data were analyzed on SPSS WIN 16.0 program. **Results :** The average age of Korean American was 71.23 ± 4.65 and Korean was 72.57 ± 5.99 . For Korean American elderly, the mean scores of subscales of K-POMS-B as follows; tension 8.52 ± 3.54 , depression 8.44 ± 3.47 ; anger 8.76 ± 3.67 , vigor 13.80 ± 7.80 , fatigue 8.92 ± 4.04 , and confusion 8.80 ± 2.55 . For Korean elderly, tension 4.96 ± 3.90 , depression 4.43 ± 3.97 ; anger 4.56 ± 3.21 , vigor 6.07 ± 3.42 , fatigue 5.60 ± 3.99 , and confusion 7.22 ± 2.65 . The mean scores of TMD were 29.72 ± 16.29 for Korean American elderly and 20.71 ± 16.40 for Korean elderly. There were statistical differences in all six subscales of K-POMS-B and TMD between two groups. **Conclusion :** Korean American elderly significantly more tense, depressed, angered, tired, and confused and less energetic than Korean elderly. Exploration of strategies to improve mood state for Korean American would be necessary in order to decrease incidence of negative mood and mood disturbance. **Keywords :** Asian American, Affect, Cross-cultural comparison,

PP26 S-343

PRESENTATION OF AN INNOVATIVE SOLUTION TO EVALUATE AND REEDUCATE THE BALANCE IN ORDER TO PREVENTE THE ELDERLIES' FALLS,IN SEINE ET MARNE, FRANCE

Alain SOLIVERES¹, Pierre LUTZLER², Oilivier DRUNAT³, Odile BAUGE-FARALDI⁴ (1. ASSOCIATION, AGETIS, France; 2. Geriatric, Hospital - Embrun, France; 3. Geriatric, AP HP, France;

4. Geriatric, Hospital - Compiègne, France)

Introduction : One person out of five who falls after 65 years old because of balance disorders dies in the year which follows its fall (it represents 9 000 deaths a year) (HAS on 2007). After reaching 65 years old, approximately one person on three falls at least once in the year. In this context and for a better follow up of equilibrium's disorders, I opted with my colleagues for the innovative solution BioRescue. **Method :** The equipment includes the use of an extra slim platform which integrates 1600 pressure sensors, a computer equipped with the software SyCoMoRe and a wide screen. Starting point We analyze foot-mark, the hexa-sequential analysis and the limits of balance on the platform. An assessment is then realized and the display of the results allows us to establish goals for the reeducation with BioRescue which set the parameters for the exercises. The patient works his balance and will slowly reach the limits which he couldn't have during the initial test. After receiving visual and audible biofeedback from a few sessions, the improvement of the postural control can be reached. **Results :** The biofeedback increases the patient's performances because of the information feedback and to the entertaining nature of the exercises. Patients are completely involved in their reeducation which represents an important factor of success. **Conclusion :** It increases the self-esteem, the motivation and the elderly's implication on the task. **Keywords :** elderly's falls biofeedback motivation

PP26 S-344

THE EFFECT OF THE SATISFACTION WITH MEALS ON WHEELS SERVICE ON SENIOR CITIZENS' LIFE QUALITY IN A RURAL AREA IN KOREA

Chang Gi KIM (*Social Welfare, Korea National University of Transportation, Korea*)

Introduction : Senior citizens' life quality is affected by a range of factors including, physical health, psychological well-being, social relationships, economic sources and even religious participation. Life quality can be also related to older people's nutrition. The purpose of this study was to examine the effect of the satisfaction with meals on wheels service on the life quality of senior citizens in a rural area in Korea. **Method :** A quantitative approach was employed to examine older people's satisfaction with meals on wheels service. There were 254 respondents who were senior citizens in a rural area in Chungcheongbuk-do. To measure the respondents' perception of meals on wheels service, 26 survey questionnaires were used from Lee Sun-mi (2011). To measure life quality, WHOQOL-BREF, developed by WHO, was used. Data were analyzed using frequency analysis, description statistics analysis and multiple regression analysis. **Results :** The findings of the study show that older people's satisfaction with meals on wheels service had a positive effect on life quality. To improve senior citizens' nutrition and their life satisfaction level, meals on wheels service should be developed based on older people's preference, desire, and their health condition. **Conclusion :** This study indicates that meals on wheels service requires social support and education for social service staff. **Keywords :** Meals on Wheels, Korea, life quality

PP26 S-346

IMBALANCED REGIONAL DISTRIBUTION OF NURSES IN SENIOR CARE FACILITIES

Donghwan KIM¹, Hanju LEE² 1. *Healthcare Policy Research Department, Health Insurance Review and Assessment Service, Korea;* 2. *Department of Nursing, Sangmyung University, Korea*

Introduction : The rapidly aging population has necessitated an increase in the quality and quantity of senior care facilities. Consequently, the number of care facilities is rapidly increasing, but there is a shortage of nurses at specific regions, owing to nurses' preferences for particular regions and the level of medical institutions. So, this study attempts to determine the factors that influence the ratio of nurses at senior care facilities. **Method :** Data were obtained from the health insurance reimbursement records of 377 senior care facilities for claims of the Health Insurance Review and Assessment Service between January 1, 2008, and December 31, 2010. Data were analyzed using one-way panel regression. The dependent variable was the ratio of nurses. The independent variables were case-mix index, regional hospital bed supply, and the interaction between these two variables. The analysis also included the number of patients per bed, proportion of patients over 65 and 80 years of age, number of doctors per bed, number of beds, utilization of beds, and established subject. **Results :** Positive relationships were found between the nurse ratio and the care-mix index and density of general hospitals in metropolitan. This ratio was lower in medium-sized cities where the density of senior care facilities was high. Regions with a large number of general hospitals and senior care facilities had higher nurse ratios. **Conclusion :** In conclusion, it is easy to hire nurses in big cities where a large number of general hospitals are concentrated. A regional imbalance was observed in human resources available for senior care facilities. **Keywords :** nurse ratio, senior care facility

PP26 S-347

DOES COMPUTER AND INTERNET-TRAINING INTERVENTION AFFECT LONELINESS, DEPRESSION, AND LIFE SATISFACTION?: A META-ANALYSIS

Mona CHOI¹, Dukyoo JUNG² 1. *School of Nursing, Yonsei University, Korea;* 2. *Division of Nursing, College of Health Sciences, Ewha Womans University, Korea*

Introduction : This study conducts a meta-analysis to examine the effectiveness of computer and Internet-training interventions intended to reduce loneliness, depression, and life satisfaction in older adults. **Method :** Searches were performed to retrieve studies that had been published in peer-reviewed journals from January 2001 to July 2012 and written in English from PubMed, CINAHL, Scopus, and PsycINFO. We used combinations of the keywords for population, intervention, and psychosocial problems. A meta-analysis was employed to summarize the findings of studies on computer and Internet interventions for older adults. An overall mean weighted effect size for each outcome was calculated, and Q statistics were used to test heterogeneity of variance in effect sizes. **Results :** As the Q statistics revealed heterogeneity, random effects models were chosen for the meta-analysis. Overall mean weighted effect size for loneliness from five studies was statistically significant for decreased loneliness ($Z = 2.085, p = 0.037$). However, the overall mean weighted effect sizes for depression from five studies ($Z = 1.190, p = 0.234$) and life satisfaction from 2 studies ($Z = 0.852, p = 0.394$) was not statistically significant. **Conclusion :** These results suggest that computer and Internet-training intervention were effective in managing loneliness among older adults. Therefore, further computer-mediated social support should be considered to help manage loneliness in this population. As a number of studies of computer and Internet-training intervention for older adults are very limited, future research is required to investigate whether this kind of interventions has effects on depression and satisfaction with life as well. **Keywords :** meta-analysis, psychological outcomes, computers

PP26 S-348

COMPARISON OF ENVIRONMENTAL DETERMINANTS OF SELF-PERCEIVED HEALTH SYMPTOMS BETWEEN SENIORS AGED 60 YEARS OR OLDER IN URBAN (CHEON-AN) AND RURAL (ASAN) AREAS OF SOUTH KOREA

Ara JUNG¹, Dongmin YUN¹, Yoonhyung CHOI², Yongbae KIM³, Kiyong LEE⁴, Hongsu KIM⁴, Yoonchul HONG², Sungroul KIM¹
1. Environmental Health Science, SoonChunHyang University, Korea; 2. Preventive Medicine, Seoul National University, Korea; 3. Preventive Medicine, SoonChunHyang University, Korea; 4. Public Health, Seoul National University, Korea)

Introduction : The population aged 60 years and older in South Korea is increasing. Evidence-based risk management strategies should be employed to tackle aging population's health problems. This study aims to evaluate the association of self-perceived health symptoms with exposure to environmental risk factors among seniors aged 60 years and older in urban and rural areas of South Korea. **Method :** The participants of this study were randomly recruited from urban (Cheon-An, N = 200) and rural (Asan, N = 276) areas. Logistic regression analysis was used to assess the association of exposure to potential environmental risk factors (pesticide, mosquito repellents, petroleum, or other chemicals) with the reported self-perceived health symptoms. **Results :** In the rural area, 76.4% of participants reported that they had at least 10 years of farming experience. The percentage of male or female participants who used mosquito repellents was 2.4 or 1.9 times higher, respectively, in rural areas than that in the urban areas ($p < 0.001$). The adjusted odds ratio (OR) for self-perceived health symptoms of palpitation, numbness, depression, and headache was higher in women who had long-term farming experience (10 years or longer) than that in those with little (3 years or fewer) or no farming experience. **Conclusion :** Our study showed that a difference in the frequency of exposure to the potential environmental risk factors was positively associated with the difference in the prevalence of the self-perceived health symptoms between the two areas. Such positive associations were greater among women than in men. **Keywords :** aging population, environmental risk factors, self-perceived health symptoms

PP26 S-349

SOCIAL PROTECTION AND CULTURES: ENHANCING YOUNG PEOPLES' RESPONSIVENESS IN CARING OLDER PERSONS

Obot David (Chairman, Board of Directors, Uganda Reach the Aged Association (URAA), Uganda)

Introduction : Culture is dynamic and is best for promoting social protection of older persons (Ops). Cultural expressions of passion, love, care and empathy are easily communicated among persons of similar background. Cultural expressions are in words, speeches and actions learnt from the early years of life. Older persons are custodians and transmitters of cultural knowledge and practices. **Method :** Method used was case study of the Uganda Reach the Aged Association (URAA) members in Uganda. **Results :** Unfortunately urbanization prompted by quest to find economic opportunities in urban areas always see young people detached from older persons from whom they can significantly learn cultural practices relevant to social protection. Similarly, displacements through wars, conflicts or large scale investments contribute to disintegration of families, households and communities. In most cases older persons remain closest to the areas they call traditional homes while young people move further and end up in areas distant from older persons. **Conclusion :** It is the mandate of the government to ensure cultural policies integrate social protection principles and promote practices that are integral in cultural

learning and behavior modeling appropriate to encourage young people to appreciate and extend care and protection of older persons in whatever culture there is and wherever older persons live. Such will enhance social support and security of older persons. **Keywords :** culture, care, protection

PP26 S-350

HEALTH-RELATED CHARACTERISTICS OF ELDERLY PARTICIPATE IN INFORMATIZATION EDUCATION

Woo Sik JUNG¹, Eunhye KIM¹, Min Hyun SUK², Hyung Gon KANG³ (1. Dept. of Health Administration, Social Welfare & Health Information, CHA University, Korea; 2. Dept. of Nursing, CHA University, Korea; 3. Dept. of Preventive Medicine, School of Medicine, CHA University, Korea)

Introduction : Improving the quality of life of elderly population is an important issue. Informatization education for the elderly has been operating in most social welfare and community centers. The purpose of this study was to investigate health-related characteristics of the elderly who participated in informatization education program, and provide basic data to develop programs for health care in elderly. **Method :** The data were collected 563 elder persons over 55 years of age from Seoul and Gyeonggi provinces. They were participating in informatization education program of social welfare and community center. The data were collected by a structured questionnaire. **Results :** Fifty-one percent were female, and 51.1% were under the age of 65. The education level was higher than that of the general elderly population in South Korea: high school graduates (27.9%) and college graduates (45.7%). Forty-eight percent responded that perceived health status was good, and 30.8% were average. Chronic diseases were present in 77.7%. Preservation and promotion health activities were exercise (74.4%), health screening (45.5%), smoking cessation (42.5%), taking health supplements (33.4%), regular diet and nutrition management (28.6%), and mental health management (20.1%). Measures for acquisition health-related information were mass media (46.9%), health care providers (40.3%), internet searchin The g (20.3%), and health education (19.9%). **Conclusion :** The percentages of health promotion activities other than exercise were very low. Despite wide propagation of internet, the elderly people commonly gets health-related information through the traditional route such as mass media and health care providers, suggesting necessity for educational program of internet to the elderly. **Keywords :** Elderly people, Health Information, Informatization Education

PP26 S-351

THE EFFECTS OF HYPERTENSION MANAGEMENT PROGRAM AMONG RURAL OLDER ADULTS IN SOUTH KOREA

Dong-soo SHIN¹, Jin Sun KIM² (1. Division of Nursing, Hallym University, Korea; 2. Dangrim, Community Health Post, Korea)

Introduction : This study aimed to examine the effectiveness of hypertension self-management program via empowering rural older adults in South Korea. **Method :** Older adults with hypertension recruited from three primary health care posts in small farming area. Empowered group (n=41) received 8 weekly sessions for 12 weeks and monthly community meeting and weekly telephone call for a year. Control group (n=46) received conventional hypertension care from the primary health care posts. The effectiveness was evaluated by systolic blood pressure, blood pressure control rates, cholesterol levels, renal functions (physical indicators), self-care and medication adherence levels (lifestyle modification indicators) and self-efficacy and social support levels (psychosocial indicators). Data were

analyzed by t-test and Chi-square for confirm homogeneity between empowered and control group. Then, repeated measure ANOVA and Chi-square test were applied to identify group differences. Results : Levels of cholesterol, self-care, self-efficacy and social supports were significantly improved than those of control group. Renal function in empowered group was decreased after 6 month which was farming seasons, but recovered on 12 month in agricultural-free seasons. Changes of blood pressure control rates were not significant. However, those increased in empowered group while those of control group decreased. Only medication adherence levels was not changed both empowered and control groups. Conclusion : The health education program for increasing self-managements was effective in hypertension control. The importance of supporting rural older adults with hypertension during farming seasons was confirmed. Assessing medication adherences need further investigation among rural older adults. Keywords : hypertension, rural older adults, self-management

PP26 S-352

UNDERSTANDINGS OF ETHNIC 'OTHERNESS' AND CROSS-CULTURAL CARE ENCOUNTERS AMONGST PALLIATIVE CARE WORKERS

Pernilla AGARD¹, Sandra TORRES² (1. Private person, Sweden; 2. Department of Sociology, Uppsala Universitet, Sweden)

Introduction : Ideas regarding culture-appropriateness are central to taken for granted assumptions about how elderly care in general, and end-of-life care in particular, should be designed to meet the needs of diverse populations. There is, however, very little research about how culture-appropriateness is understood by health and social care workers. This study- which is informed by critical gerontology - departs from the research gap that exists in the literature on palliative care which acknowledges that research on cross-cultural interaction in this setting is scarce and that the debate on culture-appropriateness within palliative care needs to be problematized. Method : The empirical point of departure is focus group interviews with palliative care workers in Sweden (n=50) who have been interviewed about their understandings and experiences of cross-cultural interaction within the specific context that is end-of-life care. Departing from the socialconstructivist perspective and from Membership Categorization Analysis (MCA), this study sheds light on palliative care workers' understandings of cross-cultural interaction in care settings. Results : The findings show that these workers regard this type of interaction as challenging because they take for granted that this interaction entails communicating with and relating to ethnic 'Others'. As such, they understand ethnic 'Otherness' as a barrier to user-friendly and highquality end-of-life care and cross-cultural interaction as challenge to palliative care practice. Our analysis shows also that these workers' understandings are guided by the debate on culture-appropriate care and the assumptions about culture that this debate makes. Conclusion : This presentation problematizes therefore this debate and the understandings. Keywords : Cross-Cultural Encounters, cultureappropriateness

PP26 S-353

PREDICTION MODEL FOR COGNITIVE DECLINE IN OLDER ADULTS

J.H. BACK¹, Y. LEE², C. H. HONG³, K. S. LEE⁴, S. J. SON⁵, S. Y. MOON⁶, S. Y. LEE², H. KANG⁷ (1. National Health Insurance service, Health Insurance Policy Research Institute, Korea; 2. Department of Preventive Medicine and Public Health, Ajou University School of Medicine, Korea; 3. Department of Psychiatry, Ajou University School of Medicine, Korea; 4. Department of Psychiatry, CHA University School of Medicine, Korea; 5. Department of Psychiatry, Kwandong

University College of Medicine, Korea; 6. Department of Neurology, Ajou University School of Medicine, Korea; 7. Department of Informational Statistics, Hoseo University, Korea)

Introduction : With population aging, cognitive decline in older people poses as a major public health issue. This study examined cognitive decline and its determinants in older adults to develop a prediction model for cognitive decline. Method : Data were from the 2005-2011 Gwangju Dementia and Mild Cognitive Impairment Study (GDEM CIS), a community-based cohort consisting of 1,838 aged 65 years and older. Cognitive decline was defined as slope less than 0 on the Mini-Mental State Examination (MMSE), with ≤ 1 standard deviation (SD) categorized as minor decliner and > 1 SD as major decliner, based on the random slope and intercept linear mixed model. Baseline demographics, health behaviors, and health-related and genetic factors were analyzed to identify factors predictive of cognitive decline. Best model fit was assessed using regression, decision tree, neural network, and Bagging methods. Results : Among the study participants 7.4% showed cognitive decline, with 5.3 to 6.2% as minor decliners and 1.3 to 2.1% as major decliners. Significant predictors of cognitive decline identified were age, gender, education, baseline MMSE, and physical activity. Among the different methods used for assessing the performance of the prediction model based on area under the curve (AUC), Bagging method was judged to demonstrate the best fit. The correct classification rate of the prediction model was 94.8%. Conclusion : This study developed a prediction model for cognitive decline in older people. The model can be used in identifying population at risk of cognitive decline in the community-dwelling older adults. Keywords : cognitive decline, prediction

PP26 S-354

THE INFLUENCE OF THE AGED'S SOCIAL CAPITAL ON DEPRESSION

Mee Hye KIM, Boram KIM (Social Welfare, Ewha Graduate School of Social Welfare, Korea)

Introduction : In general, The aged's depression has been studied with individual characteristics such as demographic factor, economic factor, health factor, etc. However, studies analyzing the influence of the aged's social capital on their depression are rare. The purpose of this study is to figure out how social capital has an impact on its depression by analyzing how much the aged possess social capital. Method : The 2nd panel data of Korean Longitudinal Study of Ageing was used. This study was carried out by targeting the 4,040 aged older than 65 years. Social capital was measured with participation, social assistance, social network, citizen participation. Depression was measured by points of CES-10 item. Results : Poverty degree showed that the poor aged has more social assistance than the non-poor aged. Also, the non-poor aged have more social network than the poor aged. Moreover, the more the aged take social participation, the bigger their social networks are. These participation and networks help the aged have the less depression in social capital model. According to the integration model, only social networks in social capital significantly affects the decrease in depression. Also, there is a tendency for the male, person living with a spouse and judging they are healthy to have less depression rate than people with opposed characters. Conclusion : Since the aged's social participation and networks become significant variables in decreasing depression, they should enlarge their participating in various groups and participate in associations or expand the range of close relatives in order to prevent senescence's isolation. Keywords : social capital, the aged's depression

PP26 S-355

DOES VOLUNTARY ACTIVITY EFFECT DEPRESSION FOR OLDER ADULTS?

Rebekah NELSON¹, Jungup LEE¹, Jisue LEE², Ara JO³ (1. College of Social Work, Florida State University, USA; 2. College of Communication and Information Studies, Florida State University, USA; 3. Sport Management, College of Education, Florida State University, USA)

Introduction : What effectively protects older adults against the effects of depression? One factor that has been studied is participating in activities described as "voluntary". These voluntary activities usually consist of spending time outside of the home, interacting with people and participating in activities where the person feels a sense of accomplishment, and have been shown to help moderate levels of depression. Volunteering outside the home can be especially helpful for older adults who are past the age of retirement, and who feel a sense of loss due to the changes in activity levels as compared to when they were actively employed. Method : Data are drawn from the Americans' Changing Lives survey, a nationally representative panel study collected data in 1986, 1989, 1994, and 2002. The current analysis focused on adults aged 60 and older with data from the fourth wave of the Americans' Changing Lives (N = 487). The average age of participants was 77.48. 72.1% of sample was female and 54.2 % was widowed. Results : Older adults who are female and poor physical health condition are more likely to have depressive symptom. Voluntary activity is associated with lower depressive symptoms after controlling for age, gender, marital status, and self-reported health status. Additionally sociodemographic and health behavior variables mediated the effect of voluntary activity on depression. Conclusion : This study provides significant information regarding the relationship between voluntary activity and depression. It enables older adults to maintain high levels of voluntary activity as one of essential ways to help their mental health. Keywords : Voluntary activity, depression, and older adults

PP26 S-356

PLANNING FOR THE THIRD AGE : RELATIONSHIP BETWEEN READINESS FOR RETIREMENT AND LIFE SATISFACTION

Sang Yeol YOON¹, Yeong-Ran PARK² (1. Institute for Silver Industry Research, Kangnam University, Korea; 2. Silver Industry, Kangnam University, Korea)

Introduction : Preparing for the third age has become one of major social issues in Korea lately. The purpose of this research is to analyze the relationship between readiness for retirement and life satisfaction of the older residents living in the Yongin city in Korea. Method : A survey was conducted for 387 residents living in three districts in Yongin city in September through October, 2012. A structured questionnaire was used to ask socio demographic characteristics, participating activities, readiness for retirement and life satisfaction. Results : Preliminary analysis shows that the average score of life satisfaction is 3.41(sd=1.10). There is no difference between men and women, but statistical difference was found among the age groups. The average score for readiness for retirement is 2.7 (sd=1.10). Future analysis will include more comparisons among different groups, correlations between independent and dependent variables, and the impact of readiness on life satisfaction. Conclusion : According to this research, the respondents showed different levels of readiness in the readiness dimensions of the third age. Implications will be drawn for further research and program development for planning the third age. Keywords : third age, readiness for retirement life satisfaction

PP26 S-357

DEPRESSION AMONG OLDER CHINESE IN CHINA

Lu MU¹, Bum Jung KIM¹, Erica AUH² (1. School of Social Work, University of Hawaii at Manoa, USA; 2. School of Social Welfare, Ewha Womens University, Korea)

Introduction : In recent years, aging become a big issue in China; as a result, more elders need professional care. Although China government pays more attention on elders' material needs, few mental health services have been provided to them. Depression as the one of the biggest elders' mental issue, few studies presented it. Method : This study used qualitative research to review the relative resources to find the factors and implications of Chinese elders' depression. Results : As a result, Chinese elders' depression usually caused by financial, cultural, physical and behavioral factors. Conclusion : According to these factors, community support groups, case management and Senior agencies' support and volunteer program had presented as interventions to help the depressed elders. Keywords : Depression, Older Chinese, Risk Factors

PP26 S-358

POLYPHARMACY AND INAPPROPRIATE MEDICATION USE OF THE ELDERLY IN NURSING HOME

Jeong Sun KIM¹, Sook KANG² (1. College of Nursing, Chonnam National University, Korea; 2. Department of Nursing, Chonnam Techno University, Korea)

Introduction : Elderly people who are admitted in nursing homes is increasing due to decrease of family caring functions. Most of them have complex chronic diseases, so they depend on taking various drugs at the same time and will be use inappropriate medications. This study was done to investigate status of polypharmacy and inappropriate medications use in the elderly of nursing homes. Method : The subjects of this study were 230 elderly people in the nursing homes of A city. In this study, the medications were classified by Anatomical Therapeutic Chemical (ATC) code, polypharmacy was defined as taking medications more than five, and inappropriate medications use were identified by Beers criteria. Data was analyzed by using descriptive statistics and χ^2 -test. Results : The elderly people who were taking prescribed medications by two-step classification of ATC code were 136 (10.0%) taking medications for psychoanleptics, and 135(10.0%) taking medications for acid related disorders. Among the over-the-counter medications, 10(20.8%) were depending on antifungals for dermatological use, and 7(4.6%) were taking ophthalmologicals. The subjects with polypharmacy were 159(69.1%), and with inappropriate medications prescription were 116(50.4%). There was a significant difference in the polypharmacy according to the number of diseases ($p<.001$), fall experience($p=.004$) and the inappropriate medications prescription according to fall experience ($p=.045$). Conclusion : An ongoing medication monitoring system is necessary to minimize the adverse drug reactions of elderly. Keywords: Nursing homes, Polypharmacy, Inappropriate prescribing

PP26 S-359

AGE-RELATED LIFE SATISFACTION DECREASE IN THE ELDERLY IN THE POST-SOVIET COUNTRIES

Daria KHALTOURINA¹, Danila MEDVEDEV² (1. Council for Public Health and Demography, Russia; 2. Leader of the Project 'Aging Diagram', Russia)

Introduction : The analysis of the recent data from the World Values Survey shows that in most countries there is no significant correlation between age and life satisfaction. At the same time, the older people in

the post-Soviet countries make an exception. The goal of this study is to determine the reasons for this. Method : The set of correlations and multiple regression tests was performed using all available World Values Samples. The results were interpreted on the basis of the social and economic context of Post-Soviet societies. Results : There level of life satisfaction and happiness is significantly lower in the Post-Soviet countries than in the worldwide sample. Life satisfaction in women falls abruptly right by the age of 50, and it falls in males more gradually but quite visibly by the age of 60. This tendency does not take place in most countries of the world in the survey. The correlates of life satisfaction and happiness among the Post-Soviet elderly people are not different than in the rest of world, so the social context must be analyzed to explain this unusual trend. Conclusion : Social exclusion seems to be the best explanatory factor of low life satisfaction of the elderly people in the Post-Soviet countries. Traditional social networks like kinship and neighbor ties have been weakened due to the social transformation of the Soviet period. Low retirement age is responsible for early disruption of the social ties of the elderly people. At the same time, new type of social networks like volunteer and charity networks are only being formed. Keywords : aging, life satisfaction, Post-Soviet countries

PP26 S-360

SPOUSES' OPEN COMMUNICATION WITH CANCER PATIENTS ABOUT ILLNESS AND DEATH: A COMPARISON BETWEEN MEN AND WOMEN

Yaacov G BACHNER, Nily Y SELA, Sara CARMEL (*Public Health, Ben Gurion University, Israel*)

Introduction : Numerous studies document that caregivers face severe difficulties in communicating openly with their loved ones about both illness and death. The current study compares the communication level of male and female caregivers, and examines the contribution of different caregiver characteristics and situational variables to the explanation of communication level within both male and female groups. Method : 77 spouses--who were primary caregivers of terminal cancer patients--comprised of 29 males and 48 females, participated in the study. The questionnaire included measures of caregiver communication, caregiver characteristics (i.e. age, gender, education level, optimism, self-efficacy) and situational variables (i.e. duration and intensity of care). Results : Female spouses communicated more with their loved ones about the illness and death compared to their male counterparts. Among males, ethnic origin ($\beta=0.50$, $p<0.01$) and duration of care ($\beta=-0.38$, $p<0.05$) emerged as significant predictors of caregivers' level of communication. The model explained 44.1% of the variance. Among females, self-efficacy ($\beta=0.50$, $p<0.001$) and ethnic origin ($\beta=-0.26$, $p<0.05$) emerged as significant predictors and the model explained 30.5% of the variance. Conclusion : This study demonstrates the importance of gender to caregivers' level of communication with terminal cancer patients about illness and death. Additionally, among male and female caregivers, the caregiver ethnic origin was found to be significant predictor of communication. This should be considered by professionals when developing intervention programs for increasing caregivers' level of communication with dying patients. Keywords : communication, cancer, spouses

PP26 S-361

OLDER INDIVIDUALS HAVE LOWER RISK PERCEPTION SCORE: A STUDY ON RURAL MALAYSIA

Nazar Mohd Zabadi MOHD AZAHAR¹, Ambigga Devi KRISHNAPILLAI², Mohd Shahril AHMAD SAMAN², Khalid YUSOFF² (*1. Centre for Translational Research and Epidemiology,*

Faculty of Medicine, Universiti Teknologi MARA, Malaysia; 2. Faculty of Medicine, Universiti Teknologi MARA, Malaysia)

Introduction : Theoretical models proposed that perception of risk may play a significant role for behavioral changes. Underestimation of risk could impede prevention strategies. This study aimed to determine the level of cardiovascular risk perception among rural community in Malaysia. Method : This community-based study involving rural communities in the district of Raub, Pahang, Malaysia in 2010-2011. Community rural-dwellers aged 30 years old and above participated in this study. Framingham risk score (FRS) was calculated based on 'Framingham Heart Study' online calculator. A set of modified Risk and Health Behaviours Questionnaire (Cronbach's Alpha=0.972) were administered to the respondents. Results : A total of 600 respondents completed the questionnaire in this study, mean age 59.5 ± 10.7 years; 45% were aged ≥ 60 years old. Among those aged ≥ 60 years old, 43% were males, 70.2% were at high risk for CVD. Elderly respondents had significantly higher FRS compared to younger respondents (34 ± 20.2 vs 14.8 ± 12.2 , $p<0.001$). Mean for cardiovascular risk perception score was 118 ± 26 . Bivariate analysis showed that cardiovascular risk perception score was significantly lower among those aged ≥ 60 years old (116 ± 24) as compared to those aged <60 years old (120 ± 27) ($t(598)=1.936$, $p<0.05$). . Further, high risk for CVD respondents had significantly lowest cardiovascular risk perception score compared to moderate and low risk respondents ($p<0.05$). Conclusion : Elderly and high risk for CVD respondents in this study perceived their risk to be low for future cardiovascular events. Patient education is essential in order to make sure that our community understands their risk for cardiovascular disease. Keywords : cardiovascular risk perception, rural Malaysia, elderly

SS25 507-B-4

DISCOVERY OF VASCULAR CALCIFYING PROGENITOR CELLS: MECHANISM OF ATHEROSCLEROTIC CALCIFICATION

Hyo-soo KIM (*Department of MMBS (Molecular Medicine & Biopharmaceutical Sciences), Seoul National University, Korea*)

Introduction : To investigate the modulation or reversal of vascular calcification, we searched for calcifying progenitor cells in vessel. Method : Cells from the aortas of mice were sorted into four groups using Sca-1 and PDGFR α markers. Results : Sca-1+ progenitor cells exhibited greater osteoblastic differentiation potentials than Sca-1- cells. Among Sca-1+progenitor populations, PDGFR α - cells possessed bidirectional differentiation potentials towards both osteoblastic and osteoclastic lineages, whereas PDGFR α + cells differentiated into an osteoblastic lineage unidirectionally. When treated with PPAR γ agonist, Sca-1+/PDGFR α - cells preferentially differentiated into osteoclast-like cells. Sca-1+ progenitor cells in the artery originated from the bone marrow (BM) and could be clonally expanded. Systemic infusion of Sca-1+/PDGFR α - cells into Apoe $^{-/-}$ mice increased the severity of calcified atherosclerotic plaques, which was prevented by PPAR γ agonist. Conclusion : A subtype of BM-derived and vessel-resident progenitor cells offer a therapeutic target for the prevention of vascular calcification.(PLOS Biology 2013). Keywords : Vascular calcification; stem cell; vascular aging

SS24 507-R-1

THE CANADIAN BEVERIDGE MODEL AND ITS IMPLICATIONS FOR 'LATE STARTERS'

Howard BERGMAN (*Family Medicine, McGill University, Canada*)

Health care systems around the world are faced with the challenge of improving the health of their populations, meeting their health and

social service needs assuring quality of care and guaranteeing equity; all of this while striving to be cost-effective. Aging and chronic disease are two key issues in the challenge to improve the health of our populations and delay the onset of dependency and promote independent healthy aging. It can be said, without exaggeration, that the health and quality of life of older persons in the coming 50 years as well as the sustainability of our healthcare system depends on our ability to meet these challenges. In spite of major changes in the demography and epidemiologic transition, the paradigm of the acute care hospital and its relation with the community has not really changed in the past 60 years. There has not been sufficient debate on this question in the Canadian healthcare system which is based on a taxation foundation of financing of health and social services, the Beveridge model. This is due, in part, to certain assumptions, mainly that whatever you do will cost too much or any different incentives will have perverse effects. Based on the paradigm of care for older persons, this presentation will examine this question and lessons for «late starters». Keywords : canada; organisation; financing

THE JOURNAL OF FRAILTY & AGING

<http://www.jfrailtyaging.com>

The Journal of Frailty & Aging is a peer-reviewed international journal aimed at presenting articles that are related to research in the area of aging and age-related (sub)clinical conditions. In particular, the journal publishes high-quality papers describing and discussing social, biological, and clinical features underlying the onset and development of frailty in older persons. The Journal of Frailty & Aging is composed by five different sections :

- ***Biology of frailty and aging:*** In this section, the journal presents reports from preclinical studies and experiences focused at identifying, describing, and understanding the subclinical pathophysiological mechanisms at the basis of frailty and aging.
- ***Physical frailty and age-related body composition modifications:*** Studies exploring the physical and functional components of frailty are contained in this section. Moreover, since body composition plays a major role in determining physical frailty and, at the same time, represents the most evident feature of the aging process, special attention is given to studies focused on sarcopenia and obesity at older age.
- ***Neurosciences of frailty and aging:*** The section presents results from studies exploring the cognitive and neurological aspects of frailty and age-related conditions. In particular, papers on neurodegenerative conditions of advanced age are welcomed.
- ***Frailty and aging in clinics and public health:*** This journal's section is devoted at presenting studies on clinical issues of frailty and age-related conditions. This multidisciplinary section particularly welcomes reports from clinicians coming from different backgrounds and specialties dealing with the heterogeneous clinical manifestations of advanced age. Moreover, this part of the journal also contains reports on frailty- and age-related social and public health issues.
- ***Clinical trials and therapeutics:*** This final section contains all the manuscripts presenting data on (pharmacological and non-pharmacological) interventions aimed at preventing, delaying, or treating frailty and age-related conditions.

The Journal of Frailty & Aging is a quarterly publication of original papers, review articles, case reports, controversies, letters to the Editor, and book reviews. Manuscripts will be evaluated by the editorial staff and, if suitable, by expert reviewers assigned by the editors. The journal particularly welcomes papers by researchers from different backgrounds and specialties who may want to share their views and experiences on the common themes of frailty and aging.
