Experiences in Close Relationships Scale. Men with previous DSM-III-R diagnoses were significantly less likely to be married and had higher levels of attachment insecurity at midlife. Marriage appeared to mitigate the effects of diagnosis on attachment security in men with externalizing diagnoses, but attachment insecurity was elevated among married men with histories of major depression. Understanding potential risk and preventive factors for interpersonal outcomes across the life course is critical because good interpersonal functioning and social support are important for quality of life in aging adults.

### THE EFFECT OF WIDOWHOOD ON HUSBANDS' AND WIVES' PHYSICAL ACTIVITY

S. Stahl, R. Schulz, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Although the psychosocial correlates of widowhood have been studied extensively, little is known about the effects of widowhood on health behaviors such as physical activity. This prospective study examined the effect of widowhood on physical activity by comparing widowed elders to health status-, age-, and sex-matched married controls. Participants included 396 widows/widowers age 64 to 91 (M age = 72.7 years) who experienced the death of their spouse while participating in a longitudinal, epidemiologic study. Physical activity was characterized in terms of kilocalories (kcal) expended per week using the Minnesota Leisure-Time Physical Activity Questionnaire. Our outcome measure, change in physical activity was defined as the difference in kcal expended before and after the death of one's spouse. We tested a multivariate model using widowhood status (vs. non-widowed control), years of widowhood, age, sex, body mass index, physical functioning, general health status, depressive symptomology, and baseline physical activity as predictors of kcal change. There was no significant effect for widowhood status; however, the widowhood status X sex interaction was significantly related to kcal change [ $F(11, 408) = 33.32, p < .01, R^2 = .47$ ]. Compared to married controls, widowed men, but not women, were more likely to increase their physical activity after the death of their spouse. This unexpected finding raises questions about the types of physical activity widowed men engage in post-death, whether or not these increases in physical activity are sustained over time, and whether they confer health benefits to widowed men.

## SESSION 1905 (PAPER)

### OBESITY & AGING

#### PAYING THE PRICE? THE IMPACT OF SMOKING AND OBESITY ON HEALTH INEQUALITIES IN LATER LIFE

S. Fors<sup>1</sup>, N. Agahi<sup>1</sup>, B.A. Shaw<sup>2</sup>, *1. Aging Research Center, Stockholm, Sweden, 2. University of Albany, Albany, New York*

Aims: The aims of the study are twofold: i) to explore the impact of socioeconomic position, as measured 13 years earlier, on cognitive functioning and mobility impairment in later life, and ii) to explore the extent to which obesity and smoking status can explain socioeconomic inequalities in cognitive and mobility impairments in later life. Methods: Data from a nationally representative sample of Swedish adults aged 56-76 in 1991 who were re-interviewed 13 years later in 2004, was analysed to explore the impact of socioeconomic position, smoking and obesity on cognitive and physical functioning in late life. Results: The results showed that both smoking and obesity in late mid-life were stratified by socioeconomic position. Moreover, the results showed significant associations between socioeconomic position and both cognitive and physical functioning in later life. However, these inequalities in late life function could only partially be explained by the socioeconomic differences in smoking and obesity. Conclusions: The findings of this study suggest that socioeconomic differences in the rates of smoking and obesity may explain some, but not all, of the socioeconomic inequalities in physical and cognitive functioning during old age.

### OBESITY, PHYSICAL ACTIVITY AND MORTALITY AMONG OLDER ADULTS

M. Stommel, *Michigan State University, East Lansing, Michigan*

This study focuses on the interplay of physical activity, BMI levels and mortality risks among persons who already survived at least to age 65. Using linked data files from the National Health Interview Survey (NHIS) from 1997-2004 and the National Death Index (NDI) from 1997-2006, the mortality risks of more than 46,000 U.S. residents older than 64 years of age will be examined. Based on available survey information, respondents were divided into five standard BMI categories and four physical activity levels (using the USDHHD 2008 Physical Activity guidelines). Mainly relying on Cox-proportional hazard models, the analysis of mortality risks focuses specifically on three age cohorts of older adults: U.S. residents aged 65-74, 75-84, and 85 and older (the "oldest old") to investigate trade-offs between physical activity and BMI levels. The models employ days to mortality as the main outcome (from 2 years after the interview—to avoid reverse causation problems—up to 10 years of follow-up) and numerous control variables, including sex, age (within the age categories), race/ethnicity, poverty status, smoking status, alcohol consumption, diagnosis of chronic conditions, etc. The results show that older Americans who are overweight or obese, but continue to exercise, have lower mortality risks than inactive older adults of normal weight. In fact, in each age cohort of older adults both greater physical activity and higher BMI tend to confer additional survival benefits. Reasons include the differential survival of relatively healthy obese persons at older ages.

### FOOD, EXERCISE, AND WEIGHT: THE LIFELONG INFLUENCE OF PARENTHOOD

C. Reczek<sup>1</sup>, M. Thomeer<sup>2</sup>, D. Umberson<sup>2</sup>, M. Underhill<sup>1</sup>, *1. Sociology, University of Cincinnati, Cincinnati, Ohio, 2. University of Texas at Austin, Austin, Ohio*

The transition to parenthood is associated with decreased levels of exercise, increased fatty food consumption, and weight gain, and recent evidence from national longitudinal data shows that these early parenthood experiences have important consequences for weight in later life. Moreover, the consequences of parenthood for weight, food consumption, and exercise vary by gender. However, few studies go beyond population trends to uncover the gendered processes that underlie these patterns. We analyze data from 45 retrospective in-depth interviews with mid to late life parents to examine how parenthood—from pregnancy, to a child's infancy, to adult childhood—shapes parental weight, food consumption patterns, and exercise behavior across the life course. Three primary themes emerge from this analysis. First, we uncover the ways in which transitioning into parenthood promotes and deters healthy eating, regular exercise, and weight gain. Second, we show how the early years of parenthood set a trajectory of weight gain into motion, and articulate how this trajectory is altered over time, as children become adolescents and then adults. Third, we identify how these patterns are gendered. Overall, we find that that early childhood and adolescent parent-child ties are strongly linked to weight gain, lack of exercise, and increased fatty foods as a result of the stress of parenthood, especially among women, and for some, ongoing relationships with adult children promote healthy eating, weight loss, and exercise habits. These findings have important implications for public health initiatives attempting to promote the health of aging parents.

### WEIGHT GAIN IN ADULTHOOD VERSUS LONG-TERM EXPOSURE TO EXCESS WEIGHT: WHAT'S MORE DETRIMENTAL TO HEALTH?

A. Zajacova<sup>1</sup>, J. Dowd<sup>2</sup>, *1. University of Wyoming, Laramie, Wyoming, 2. Hunter College, CUNY, New York, New York*

Research on health consequences of obesity has increasingly focused on long-term patterns of body weight. Two sets of findings have emerged: 1) exposure to excess body weight over a long period of time

is linked to worse health outcomes and 2) weight gain in adulthood was also linked to worse health outcomes. These two perspectives provide conflicting predictions on how excess weight at age 25 would be related to middle-aged health, net of current BMI. We test these two conflicting perspectives: how does early-adulthood body mass impact middle-age health profile, net of current body mass index? We use National Health and Nutrition Examination Survey (NHANES) 1999 to 2010 for data on 25,615 adults age 35-64. We estimate logistic and linear models of biomarkers (systolic and diastolic blood pressure, triglycerides, cholesterol, LDL, CRP, and functional limitations) on current body mass index and body mass index at age 25 (reported retroactively). Preliminary analyses show that independently, higher BMI at 25 and higher current BMI are both related to worse biomarker risk profile. Jointly, however, net of current BMI, BMI at age 25 is negatively associated with middle-aged health. Weight gain appears to be more detrimental to health than long-term exposure to excess body weight. This finding has strong implications for clinical recommendations across the entire adult life span.

### SENIORS' BODY IMAGE: IS THERE A LINK WITH EATING AND WEIGHT-RELATED DISORDERS?

M. Roy<sup>1</sup>, H. Payette<sup>1,2</sup>, 1. *Research Center on Aging, Health & Social Services Center-University Institute of Geriatrics of Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *Department of Community Health Sciences, Faculty of Medicine and Health Sciences, Université de Sherbrooke, Sherbrooke, Quebec, Canada*

Objective: Negative body image is linked with eating and weight-related disorders. There is however a dearth regarding seniors' body image and these disorders. Our objectives were to (1) estimate the prevalence of seniors' body dissatisfaction and eating and weight-related disorders, and (2) examine associations between these variables. Methods: Data were from the first annual follow-up of the Longitudinal Study on Nutrition and Successful Aging (NuAge; Québec (Canada), n=1416, 52.4% female, age=69-83). Gender-specific logistic regressions were conducted to examine associations between seniors' body dissatisfaction ("no" to "Currently, are you happy with your weight?") and prevalence of obesity (BMI (weight/height(m)<sup>2</sup>≥30) and anorexia (self-reported loss of appetite in the last 6 months). Results: Prevalence of seniors' body dissatisfaction was 46.2% (36.6% males, 54.9% females) whereas prevalences of obesity and anorexia were respectively 25.3% (24.6% males, 25.9% female) and 9.0% (7.0% males, 10.8% female). Body dissatisfaction increases the likelihood of being obese (male OR=4.50; 95%CI: 3.10, 6.54, female OR=2.83; 95%CI: 1.97, 4.06). Adjusting for age, education (<12 vs. ≥12 years), household annual income (<40,000\$ vs. ≥40,000\$), and marital status (married vs. other) increase the strength of this association (male OR=5.85; 95%CI: 3.95, 8.67, female OR=5.14; 95%CI: 3.32, 7.96). No significant association was observed between body dissatisfaction and anorexia. Conclusion: In this cohort of independent and generally healthy seniors, body dissatisfaction is quite prevalent and associated with obesity but not anorexia. Further studies will have to investigate correlates of anorexia of aging and whether body dissatisfaction is associated with underweight status and frailty.

## SESSION 1910 (SYMPOSIUM)

### BETTER CARE AND BETTER OUTCOMES THROUGH INTERDISCIPLINARY FAMILY CENTERED APPROACHES TO DELIRIUM ACROSS THE CONTINUUM

Chair: T.A. Cortes, *Nursing, NYU, New York, New York*

One of the most prevalent health issues as older adults move within the health care system is change in cognitive function. Patients with cognitive dysfunction, namely delirium and dementia, present chal-

lenges resulting in more complicated discharges and an increased length of stay. Delirium is of particular concern for older adults with and without dementia because it may not be recognized in the hospital, because patients may be transferred from the hospital to a long-term care facility before the delirium has fully resolved, and because older patients may develop delirium on transfer to the nursing home. Delirium has been described as a "medical emergency" that can lead to poor health outcomes, delayed discharge from a hospital, and re-admission to a hospital from a nursing home. This session will address the urgent need to identify and treat delirium in multiple settings and through transitions. Presentations describe the care environment, precipitating factors leading to delirium, and interventions to promote early diagnosis and resolution of delirium in acute care and in transitions to other settings through interprofessional team and family centered approaches.

### IMPACT OF A STANDARDIZED NURSING ASSESSMENT AND COMMUNICATION OF DELIRIUM ON AN ACUTE MEDICAL UNIT

L.C. Mion<sup>1</sup>, L.M. Solberg<sup>2</sup>, C. Plummer<sup>1</sup>, K.N. May<sup>3</sup>, 1. *Vanderbilt University School of Nursing, Nashville, Tennessee*, 2. *Vanderbilt University School of Medicine, Nashville, Tennessee*, 3. *Vanderbilt University Schools of Medicine and Nursing, Nashville, Tennessee*

A multi-component quality improvement study, using a 7-month pre-post nonrandomized comparative group design was completed to determine whether a structured, standardized nursing assessment for delirium, the Nursing Delirium Screening Scale (NuDESC), with a prompt in the electronic health record (EHR) to notify physicians would be feasible and demonstrate clinical utility. The Quality Improvement components consisted of a) nurse involvement in selecting the NuDESC screening tool and modifying EHR, b) didactic education on recognition of delirium to nurses and physicians, c) electronic health record modifications including prompt to notify the physician in the event of a positive NuDESC screen, and d) twice weekly rounds for ongoing feedback and reinforcement. Outcomes were measured by pre-post changes in recognition of delirium among nurses, nursing documentation of delirium, nurse to physician communication, and physician response. Results demonstrated that use of short, simple screening tool improved nurses' recognition, documentation, and communication to physicians about delirium

### INTEGRATING LANGUAGE AND PROCESSES IN A MULTI-SITE DELIRIUM INTERVENTION STUDY WITH DIFFERENT ELECTRONIC HEALTH RECORDS (EHRs)

D.M. Fick<sup>1</sup>, D. Ariosto<sup>2</sup>, L.C. Mion<sup>4</sup>, A. Yevchak<sup>1</sup>, S.K. Inouye<sup>3</sup>, 1. *Pennsylvania State University, University Park, Pennsylvania*, 2. *Vanderbilt Medical Center, Nashville, Tennessee*, 3. *Aging Brain Center, Boston, Massachusetts*, 4. *Vanderbilt University School of Nursing, Nashville, Tennessee*

Electronic Health Records (EHRs) are used to enhance patient care through structured data input screen design. Our challenge was to adapt local terminologies, screen displays, and documentation across a multi-site delirium study. Little is written on how to maintain treatment fidelity when local systems are integrated. The study objective was to create similar nursing documentation elements across multiple systems. Settings were a 200-bed community, 500-bed regional, and 1000-bed academic medical center in PA and TN. Twenty-seven concepts were organized under three delirium groupings: risk factors (e.g., dehydration), assessment, and interventions. Using the Unified Medical Language System (UMLS) search engine, terms were matched to NLM concept unique identifiers (CUIs). Interoperable data is key to facilitate data sharing across the continuum. Incorporating standard terminology early in study designs creates less disruption to existing clinical workflows,

increases ability to use the EHR data for timely reporting; and enhances the potential to quickly operationalize successful research findings

### **DELIRIUM INTERVENTION FROM ACUTE TO LONG TERM CARE**

T.A. Cortes, T.M. Easter, *Nursing, NYU, New York, New York*

Delirium is associated with complicated discharges. This pilot study examined the feasibility of implementing a process to support interdisciplinary family centered approach to early identification and treatment of patients with delirium and a systematic carryover of that care to a long term care setting. This model emphasizes the nurse and hospitalist co-management of delirium and the importance of the family member /care taker across the continuum from admission to acute care and into long term care to assess the impact of transition on the older adult. Daily from admission to acute care and through one week post readmission to long-term care the 3 Item Nursing Confusion Screen was used by nurses, and, if positive, the physician followed up with the CAM. Data was collected pre and post intervention to compare documented incidence of delirium at discharge from acute care, at admission to and after one week in long term care.

### **INTERDISCIPLINARY TEAM TRAINING FOR EARLY DETECTION AND TREATMENT OF DELIRIUM**

T. Smith, V. Fridman, *Maimonides Medical Center, Brooklyn, New York*

Delirium is often under-recognized in hospitalized older adults, contributing to poor patient outcomes and increased lengths of stay. A retrospective review of ICD-9 code assignment at a large urban medical center revealed that a smaller than expected percentage of discharged patients over age 65 were diagnosed with delirium by physicians. A pilot program was initiated on two patient care units in which nurses completed a daily CAM (Confusion Assessment Method) on older adult patients from the day of admission through discharge. Six months of data showed that 20% of older adult discharges had positive CAMs as assessed by nurses, but only 7% of these patients were assigned an ICD-9 code for delirium on discharge. To better understand this phenomenon, interdisciplinary team training on delirium detection and treatment was initiated so that nurses and physicians understood their collaborative roles in the assessment, identification and management of delirium in hospitalized older adults.

### **VALIDATION OF A SHORT DELIRIUM SURVEILLANCE SCREEN**

R.S. Young, A. Arseven, M.V. Williams, *Northwestern University Feinberg School of Medicine, Chicago, Illinois*

Delirium detection by bedside nurses and physicians is hampered by the lack of easy to use and highly sensitive psychometric screening assessments. We are currently validating a short instrument that employs common inattention tests, assessments of the patient's agitation and sedation, and patient report of having difficulty thinking clearly. Inpatients (age  $\geq$  60), with and without delirium are being assessed by clinical research assistants using the new screening instrument; these results are compared to assessments by trained physician validators using the Diagnostic and Statistical Manual of Mental Disorders IV TR criteria for delirium to determine the new instrument's sensitivity and specificity. The validated instrument would be employed in a serial Bayesian testing arrangement as a first line screening test for delirium, which if positive, would lead to a rigorous confirmatory assessment of delirium. Development of this testing arrangement would allow the implementation of systematic, interdisciplinary delirium surveillance on hospital inpatient units.

## **SESSION 1915 (SYMPOSIUM)**

### **NEUROLOGIC FACTORS RELATED TO PHYSICAL AND COGNITIVE FUNCTION: NOVEL INSIGHTS FROM THE HEALTH ABC STUDY**

Chair: *E.S. Strotmeyer, Epidemiology, University of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania*  
Discussant: *T.B. Harris, National Institute on Aging, Bethesda, Maryland*

Age-related neurologic declines are critical physiologic risk factors for cognitive and physical disability in older adults. Neurologic risk factors are important to incorporate into epidemiologic studies of cognitive and physical function. However, extensive neurologic tests are often not feasible for large epidemiologic studies in older adults due to burden on participants, length of tests, and cost-related issues. The Health, Aging and Body Composition (Health ABC) Study enrolled 3075 Medicare-eligible, well-functioning, ambulatory adults aged 70-79 years old (52% women, 42% black) in Pittsburgh, PA and Memphis, TN, in 1997-98, with contacts every 6 months continuing currently. Annual exams were through 2000-01 and bi-annually through 2006-07, with an additional 2007-08 ancillary exam to re-measure peripheral nerve function. Baseline exclusions were difficulty walking  $\frac{1}{4}$  mile, climbing 10 steps without rest, or performing basic ADLs and using mobility aids. We will relate neurologic factors feasible for epidemiologic studies of aging - peripheral nerve function, hearing, vitamin B12, and brain-derived neurotrophic factor (BDNF) - to physical and cognitive function. Poor peripheral nerve function's role in injurious falls (Strotmeyer) and lower quadriceps strength (Ward) will be described longitudinally. Evidence of a vitamin B12 threshold level, above that for clinical deficiency, in central and peripheral neurological function and decline will be presented (Leishear). BDNF will be related to 400-m walk performance (Nocera). Hearing loss associations with cognitive decline will be shown (Lin). The discussant (Harris) will critically review the current research, focusing on future directions to assess neurologic decline in studies of function among older adults.

### **POOR SENSORIMOTOR NERVE FUNCTION INCREASES THE RISK OF INJURIOUS FALLS**

E.S. Strotmeyer<sup>1</sup>, R.M. Boudreau<sup>3</sup>, J.A. Cauley<sup>1</sup>, S.M. Albert<sup>1</sup>, A.V. Schwartz<sup>2</sup>, S. Satterfield<sup>3</sup>, T.B. Harris<sup>4</sup>, A.B. Newman<sup>1</sup>, 1. *University of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania*, 2. *University of California, San Francisco, California*, 3. *University of Tennessee Health Science Center, Memphis, Tennessee*, 4. *National Institute on Aging, Bethesda, Maryland*

Older adults experience substantial sensorimotor nerve declines, though relationship to injurious falls is unknown. Seven-year nerve declines were related to semi-annual self-reported fall injuries (N=352; 248/352 self-reported medical treatment) over 2.5 subsequent years (1.6 $\pm$ 0.8 years) in 1131 Health ABC participants. Monofilament detection, sensory vibration threshold, peroneal motor nerve conduction velocity (NCV) and amplitude (CMAP) were assessed in 2000-01 (52.3% women, 32.8% black; 76.1 $\pm$ 2.8 years; 20.2% diabetes) and 2007-08 (28.9% diabetes). Cox regression showed transitioning to low (<1 nV) or sustained low CMAP had HR=1.5 (95%CI=1.05-2.25) and 1.7 (95%CI=1.01-2.73) respectively for first injurious fall and HR=2.1 (95%CI=1.25-3.62) for first medically treated fall with sustained low CMAP, adjusting for demographic, body composition, lifestyle and comorbidity variables. Sustained lack of 1.4-g monofilament detection was associated with first injurious fall: HR=1.3; 95%CI=1.02-1.74. Vibration threshold and NCV decline were not related. Poor CMAP and lack of monofilament detection over time increased injurious fall risk.

## SENSORY AND MOTOR PERIPHERAL NERVE FUNCTION PREDICT LONGITUDINAL LOWER-EXTREMITY QUADRICEPS STRENGTH

R.E. Ward<sup>1</sup>, R. Boudreau<sup>1</sup>, P. Caserotti<sup>2</sup>, T.B. Harris<sup>3</sup>, B. Goodpaster<sup>1</sup>, J.A. Cauley<sup>1</sup>, A.B. Newman<sup>1</sup>, E.S. Strotmeyer<sup>1</sup>, 1. *University of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania*, 2. *University of Southern Denmark, Odense, Denmark*, 3. *National Institute on Aging, Bethesda, Maryland*

Poor muscle strength predicts late-life disability and mortality. We assessed whether peripheral sensorimotor nerve function predicts longitudinal quadriceps strength in 1787 older adults (age=76.3±2.8, BMI=27.2±4.6, strength=96.3±34.7 Newton-meters (Nm), female=50.9%, black=34.9%, six-year strength decline=-17.0±22.4 Nm) from the Health ABC Study. Worse baseline peroneal motor amplitude ( $\beta$ =-2.0 Nm per SD lower amplitude;  $p$ <0.01) and velocity ( $\beta$ =-1.4 Nm/SD lower;  $p$ <0.05), 1.4g ( $\beta$ =-3.6,  $p$ =0.001) and 10g ( $\beta$ =-10.6,  $p$ <0.0001) monofilament detection, and average vibration perception ( $\beta$ =-3.3 Nm/SD higher,  $p$ <0.0001) were associated with lower quadriceps strength (isokinetic dynamometer) at baseline and 3 biannual follow-up visits using mixed models adjusted for age, sex, body composition, and diabetes. Strength declined over time ( $p$ <0.0001) at the same rate in all nerve function groups. Worse baseline sensorimotor nerve function predicted lower quadriceps strength but not a faster rate of strength decline longitudinally, suggesting a need for early intervention.

## VITAMIN B12 AND CENTRAL AND PERIPHERAL NEUROLOGICAL FUNCTION: IS THERE A THRESHOLD LEVEL?

K. Leishear<sup>1</sup>, R. Boudreau<sup>1</sup>, S. Studenski<sup>1</sup>, L. Ferrucci<sup>2</sup>, C. Rosano<sup>1</sup>, T.B. Harris<sup>3</sup>, A.B. Newman<sup>1</sup>, E.S. Strotmeyer<sup>1</sup>, 1. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *National Institute of Aging, Baltimore, Maryland*, 3. *National Institute of Aging, Bethesda, Maryland*

B12 deficiency may cause demyelination resulting in peripheral neuropathy and white matter damage. Threshold B12 levels, above clinical deficiency (<148 pmol/L), for central and peripheral neurological function were evaluated in 2326 Health ABC participants (76.5±2.9 years; 48.6% men; 38.4% black) with 2000-01 B12 levels and  $\geq 1$  nerve measure (1.4g/10g monofilament detection; vibration detection; peroneal nerve conduction amplitude and velocity [NCV]) or 2001-02 Digit Symbol Substitution Test [DSST] scores. Longitudinally, 1226 participants (47.1% men; 34.2% black) also had  $\geq 1$  2007-08 neurological measure. We found significant threshold levels of 390 pmol/L for higher NCV ( $p$ =0.02) and 410 pmol/L for lower DSST decline ( $p$ =0.01), adjusting for demographic/socioeconomic/lifestyle factors, CES-D, medications, and comorbidities. A 400 pmol/L threshold for 1.4g monofilament was significant unadjusted ( $p$ =0.04), but this and other outcomes became non-significant after adjustment. B12 levels around 400 pmol/L, 2.7 times the deficient cutpoint, may promote optimal neurological function and lower decline in older adults.

## EVALUATION OF BRAIN-DERIVED NEUROTROPHIC FACTOR AND PHYSICAL FUNCTION IN OLDER ADULTS FROM THE HEALTH ABC STUDY

J. Nocera<sup>1,2</sup>, K. Yaffe<sup>3</sup>, E.M. Simonsick<sup>4</sup>, J. Williamson<sup>5</sup>, A.B. Newman<sup>6</sup>, P. Caserotti<sup>7</sup>, T. Harris<sup>4</sup>, R.I. Shorr<sup>1,2</sup>, 1. *Department of Veterans Affairs, Gainesville, Florida*, 2. *University of Florida, Gainesville, Florida*, 3. *The University of California, San Francisco, San Francisco, California*, 4. *National Institutes of Health, Bethesda, Maryland*, 5. *Wake Forest Baptist Medical Center, Winston-Salem, North Carolina*, 6. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 7. *University of Southern Denmark, Odense, Denmark*

Accumulating evidence suggests that neurotrophins play a significant role in muscular function. We hypothesized that brain-derived neu-

rotrophic factor (BDNF) would be positively correlated with physical function. BDNF was assessed a part of a cognitive vitality substudy of Health ABC. We conducted cross-sectional analysis correlating levels of BDNF with walking speed among Health ABC participants completing a 400 meter walk test. 589 (51 % women; 47 % black; mean age 74.9 ± 3.0 years) subjects completed the 400 meter walk test and BDNF levels measured. Subjects in the lowest (slowest) quintile for walking speed had the highest levels of BDNF whereas those in the highest (fastest) quintile had the lowest levels of BDNF. We did not observe a positive cross-sectional correlation between walk speed and BDNF. Further studies are indicated to delineate the relationship between neurotrophins and muscle function.

## HEARING LOSS AND COGNITIVE DECLINE AMONG OLDER ADULTS

F.R. Lin<sup>1,5</sup>, K. Yaffe<sup>2</sup>, J. Xia<sup>5</sup>, Q. Xue<sup>5</sup>, T.B. Harris<sup>3</sup>, E. Purchase-Helzner<sup>4</sup>, L. Ferrucci<sup>3</sup>, E.M. Simonsick<sup>3</sup>, 1. *Otolaryngology-Head & Neck Surgery, Johns Hopkins, Baltimore, Maryland*, 2. *UCSF, San Francisco, California*, 3. *National Institute on Aging, Baltimore, Maryland*, 4. *SUNY-Downstate, New York, New York*, 5. *Johns Hopkins Center on Aging and Health, Baltimore, Maryland*

Background: Whether hearing loss is associated with cognitive decline is unknown. Methods: We studied 1984 participants (mean 77.4 years) in HealthABC who had audiometric testing in Year 5. Hearing loss was defined by a pure-tone average in the better ear of 25db or greater. Cognitive testing consisted of the Modified Mini-Mental State (3MS) and the Digit Symbol Substitution tests (DSS) performed in Years 5, 8, 10, and 11. Mixed-effects regression models were adjusted for demographic and cardiovascular risk factors. Results: Annual rates of cognitive decline in 3MS and DSS scores were 41% and 32% greater, respectively, in individuals with hearing loss versus normal hearing (3MS: -0.65 points/year [95% CI: -0.73 – -0.56] vs. -0.46/year [95% CI: -0.55 – -0.36],  $p$ =.004; DSS: -0.83 points/year [95% CI: -0.94 – -0.73] vs. -0.63/year [95% CI: -0.75 – -0.51],  $p$ =.015). Conclusions: Hearing loss is independently associated with accelerated cognitive decline in older adults.

## SESSION 1920 (SYMPOSIUM)

### THE VA HOME-BASED PRIMARY CARE MENTAL HEALTH INITIATIVE: INTEGRATED CARE FOR OLDER VETERANS IN THE HOME SETTING

Chair: M.J. Karel, VA Central Office, Washington, District of Columbia, VA Boston Healthcare System, Brockton, Massachusetts, Harvard Medical School, Boston, Massachusetts

The Department of Veterans Affairs (VA) Home-Based Primary Care (HBPC) Program provides comprehensive, longitudinal primary care by an interdisciplinary team in the homes of Veterans with complex, chronic, disabling diseases. The interdisciplinary team includes nurses, physicians, social workers, dietitians, pharmacists, and rehabilitation therapists. In 2007, the VA HBPC Mental Health Initiative integrated Psychologists and/or Psychiatrists into every HBPC team nationally, to respond to the complex mental and behavioral health needs of this population. Veterans in HBPC have high rates of depression, dementia, anxiety, post-traumatic stress disorder (PTSD), substance abuse, and serious mental illness, conditions which complicate management of chronic medical conditions. In the first paper, Dr. Thomas Edes will provide an overview of the VA HBPC model of care, demonstrated outcomes, and the rationale for the Mental Health Initiative. He will describe the emergence of HBPC in Medicare as the Independence at Home Demonstration. In the second paper, Drs. Bradley Karlin and Michele Karel will detail the roles of the Mental Health Provider on the HBPC team and discuss program implementation over the past few years. They will share results of a survey of the Mental Health Providers (N=132) and HBPC Program Directors (N=116) regarding the range of mental

health activities, clinical processes, and models for integrating mental health services in HBPC. In the third paper, Dr. Julie Wetherell, Psychologist, and Anthony Matthews, Social Worker, will describe their San Diego VA HBPC team's experience integrating mental health services into their model of care.

#### **THE VA HBPC MENTAL HEALTH INITIATIVE: PROGRAM IMPLEMENTATION AND PRELIMINARY OUTCOMES**

M.J. Karel<sup>1,2,3</sup>, B. Karlin<sup>1</sup>, *1. Office of Mental Health Services, VA Central Office, Washington, District of Columbia, 2. Mental Health, VA Boston Healthcare System, Brockton, Massachusetts, 3. Harvard Medical School, Boston, Massachusetts*

The VA Home-Based Primary Care Mental Health Initiative integrated Mental Health Providers into every VA HBPC team, to provide mental health assessment and intervention with Veterans and family members and to consult with and train the interdisciplinary team regarding mental and behavioral health issues. Since 2007, at least one Psychologist or Psychiatrist has joined each HBPC program nationally. A 2010 survey of 132 Mental Health Providers and 116 Program Directors found perceptions of fairly strong integration of mental health into the HBPC interdisciplinary care teams; clear patterns of clinical problems addressed and general clinical pathways for addressing mental health issues; and, wide variability across programs in time spent on particular mental health assessment and intervention activities. Ongoing program evaluation and development will focus on consolidating an evidence-based model of mental health care integration in HBPC and providing ongoing education and support for teams implementing this innovative model of care.

#### **INTEGRATING MENTAL HEALTH INTO HBPC INTERDISCIPLINARY TEAM CARE: A VIEW FROM THE FIELD**

J. Wetherell<sup>1,2</sup>, A. Matthews<sup>1</sup>, *1. VA San Diego Healthcare System, San Diego, California, 2. Dept. of Psychiatry, UCSD, La Jolla, California*

The HBPC team in San Diego serves approximately 90 Veterans and includes 5 nurses, 1 physician, 1 geriatric medicine fellow, 1 nurse practitioner, 1 social worker, 1 psychologist, and a part-time dietician and pharmacist, as well as 1 psychology fellow. The Psychologist joined the team in 2007. The team Psychologist and Social Worker will discuss the successes and challenges of integrating a mental health provider into the team's model of care, share what has been most helpful to the team, and how they believe Veterans and families have benefitted from integrated mental health care. The Psychologist will detail how she, and her trainees, provide interdisciplinary, collaborative, and evidence-based mental health care in the HBPC setting.

#### **HOME BASED PRIMARY CARE: FROM VA EXPERIENCE TO EMERGENCE IN MEDICARE**

T. Edes, *Dept of Veterans Affairs, Washington, District of Columbia*

The Department of Veterans Affairs (VA) is working to shift long-term care from institutional to non-institutional settings, toward optimal health, independence and safety. VA Home-Based Primary Care (HBPC) provides comprehensive, longitudinal primary care by an interdisciplinary team in the homes of Veterans with complex, chronic disabling diseases, including dementia and mental illness. The team includes physician, nurse, social worker, rehabilitation therapist, dietitian, pharmacist, and mental health provider. The VA Office of Geriatrics and Extended Care and Office of Mental Health Services collaborated to integrate a Psychologist or Psychiatrist into every HBPC team, to improve chronic disease management, alleviate suffering related to mental illness, improve quality of life, and support family caregivers. With evidence of reductions in both VA and Medicare inpatient days and total costs of care, HBPC is now emerging in Medicare in the Affordable

Care Act, with opportunity to expand access to mental health services for all Americans.

## **SESSION 1925 (SYMPOSIUM)**

#### **USING AN ADAPTIVE LEADERSHIP FRAMEWORK TO IMPROVE GERIATRIC NURSING CARE**

Chair: *K. Corazzini, Duke University School of Nursing, Durham, North Carolina*

Discussant: *R.A. Anderson, Duke University School of Nursing, Durham, North Carolina*

The 2010 IOM *The Future of Nursing* report calls for nurses to embrace "a new style of leadership" to improve care, whereby nurses develop behaviors fostering mutual respect and collaborative relationships, recognizing that "problems arise every day that do not have easy or singular solutions. Leaders who merely give directions and expect them to be followed will not succeed in this environment." (p. 222) We propose the Adaptive Leadership Model as one such "new style" of leadership that, if practiced, will ensure that patients receive the benefits of interdisciplinary team care arising from collaborative relationships and will create opportunities for patients to become full partners in care. This symposium will describe the adaptive leadership framework, based in complexity science, and describe how it has been used in research to examine clinical and managerial leadership for care of older adults. It moves nurses and other geriatric care providers to think beyond traditional, hierarchical management approaches, fostering leadership at all levels of an organization to address complex geriatric care problems. Adaptive leadership differentiates between addressing 'technical challenges' (i.e., care problems with known solutions through technical expertise, e.g., what medication to prescribe) and 'adaptive challenges', (i.e., care problems with no known solution, requiring shifting norms and belief sets, e.g., how an older adult will self-manage a complex medication regimen or how to create culture change). The symposium uses this lens to describe research being conducted at various system levels, including the provider-patient encounter, team-based transitional care, top level management, and culture change interventions.

#### **ENHANCING SELF-MANAGEMENT: THE IMPORTANCE OF PATIENT/PROVIDER INTERACTIONS**

D. Bailey, R.A. Anderson, *Duke University, Durham, North Carolina*

Prior research has described the unrelenting nature of symptoms in Chronic Hepatitis C (CHC) and recently approved therapy is expected to worsen treatment symptoms, creating a myriad of technical and adaptive challenges. Thus, this is a useful population of older adults in which to use the Adaptive Leadership model to examine provider interactions with patients and their potential to influence self-management (SM) of symptoms. This presentation will describe the AL model and how it will be applied in a longitudinal study of 18 older CHC patients and their care providers to describe technical and adaptive challenges and approaches during care encounters. We will describe our mixed-methods longitudinal case study protocol, to include data collection methods, coding, and the use of joint matrix analysis to integrate longitudinal qualitative and quantitative data.

#### **ADAPTIVE LEADERSHIP STRATEGIES INFLUENCE DISCHARGE PLANNING IN AN SNF**

M. Toles<sup>1</sup>, K. Abbott<sup>2</sup>, R.A. Anderson<sup>1</sup>, *1. Duke University, Durham, North Carolina, 2. University of Pennsylvania, Philadelphia, Pennsylvania*

Older adults require assistance from interdependent providers to plan discharges from skilled nursing facilities (SNF) to home. Using an adaptive leadership framework, we explored the technical work (e.g., patient teaching) to address technical problems and adaptive leadership

strategies (e.g., behaviors that foster information exchange and problem-solving) used by SNF staff (N=20) to facilitate the adaptive work of patients as they collaborated in discharge planning. Adaptive leadership strategies were described for three teams of patients and staff using social network analysis. Data from interviews and field observations were used to describe technical work and further explore adaptive leadership and associated discharge-planning outcomes. We found that weak mutual ties between social workers, licensed practical nurses and family members limited information exchange and problem-solving and, thereby, the timeliness, completeness and patient satisfaction with discharge planning. Our findings suggest that improved adaptive leadership strategies are important resources for effective discharge planning in SNFs.

#### RECONSIDERING HIGH NURSING HOME TURNOVER AS AN EXTREME CONDITION OF COMPLEX SYSTEMS

S.R. Hunt, K. Corazzini, R.A. Anderson, *School of Nursing, Duke University, Durham, North Carolina*

Viewing nursing homes (NH) as sluggish systems without extreme conditions fosters inattention and unpreparedness, both of which have resulted in rapid deterioration and failures in other industries. This study aims to examine NH staff turnover as an extreme condition, explore emergent behaviors in the context of extremity, and identify adaptive leadership intervention strategies. Longitudinal data from one NH case (n=97) experiencing extreme staff turnover were collected by two field researchers over a nine-month period, transcribed, and analyzed using Atlas.ti by an interdisciplinary research team. Literature-based and emergent codes facilitated analysis of the unfolding story. Coded data were sorted and analyzed for themes using matrices (Crabtree & Miller, 1999). New managers' responses to turnover intensified extremity recapitulating turnover over time. Emergent behaviors, practice conditions and care outcomes met criteria for extreme contexts; technical, command-and-control leadership by short-tenured managers failed to produce desired outcomes and highlight the need for adaptive leadership strategies.

#### IMPLEMENTING CULTURE CHANGE IN NURSING HOMES: AN ADAPTIVE LEADERSHIP FRAMEWORK

K. Corazzini<sup>1,4</sup>, J. Twersky<sup>2,4,3</sup>, H. White<sup>2,4</sup>, S.R. Hunt<sup>1</sup>, G.T. Buhr<sup>2,4</sup>, E.S. McConnell<sup>1,4,3</sup>, M. Weiner<sup>2,4,3</sup>, C. Colon-Emeric<sup>2,4,3</sup>, *1. Duke University School of Nursing, Durham, North Carolina, 2. Duke University School of Medicine, Durham, North Carolina, 3. Geriatric Research, Education and Clinical Center, Durham Veterans Affairs Medical Center, Durham, North Carolina, 4. Center for the Study of Aging and Human Development, Duke University, Durham, North Carolina*

The culture change movement in nursing homes aims to improve care by implementing person-directed care in home-like settings; it is estimated that well over 50% of nursing homes in the U.S. are engaged in some aspects of culture change (Doty, Koren, & Sturla, 2008). This study describes key facilitators and barriers to implementing culture change from the perspective of staff, using a complexity leadership framework. The study design was a qualitative, 'broad-involvement' focus group study design (Krueger & Casey, 2009) of staff perceptions in 3 nursing homes (N=8 groups of nursing staff, medical care providers, and administrators). Analysis was conducted using immersion/crystallization and template organizing techniques. Results indicate that nursing staff primarily identified adaptive leadership facilitators, whereas medical care providers and administrators articulated primarily administrative leadership facilitators. All groups identified adaptive challenges as barriers. Results are discussed in the context of developing effective leadership strategies to implement culture change.

## SESSION 1930 (PAPER)

### INTERNATIONAL APPROACHES TO OLDER ADULT CARE

#### SOCIOECONOMIC INEQUALITIES IN THE PROCESS OF DISABILITY AMONG CHILEAN OLDER PEOPLE: A LONGITUDINAL STUDY

A. Fuentes<sup>1</sup>, C. Albala<sup>2</sup>, H. Sanchez<sup>2</sup>, L. Marques<sup>2</sup>, *1. School of Public Health, Faculty of Medicine, University of Chile, Santiago, Chile, 2. Institute of Nutrition and Food Technology, University of Chile, Santiago, Chile*

**Introduction:** Developing countries are experiencing an accelerated process of population ageing in a context of growing economic inequalities. Chile is one of the Latin-American countries with more unequal income distribution, and one of the most aged countries of the region. Key to the process of human ageing is the maintenance of functionality. Environmental factors such as the socioeconomic position can play a key role in this process. **Aim:** To describe and compare the process of Chilean elderly disability by socioeconomic position, providing unprecedented information about the dynamics of disability in older adults among Latin-American countries. **Methods:** Data came from a longitudinal study following 2000-2010 the SABE cohort (Health, Welfare and Ageing). This is a probabilistic and representative sample of 1301 community-dwelling adults aged 60+y in the Chilean capital. Functional limitation was defined as difficulty or impossibility to perform 1 ADL, and/or 1 IADL and/or 3 mobility activities. Socioeconomic status was assessed combining household equipment, wealth, and education. **Results:** The initial prevalence of functional limitation was 47.3%(95%CI:44.2;50.4) with a clear socioeconomic gradient (60.1% low; 47.6% medium, and 28.7 high; p>0.001). In the following-up the gap by socioeconomic decreases, although significant differences remains. Mortality also shows large differences by SES having higher rates of death in low and middle socioeconomic levels. The gap decreased at 10 years follow-up. The annual incidence of limitation 2000-2010, is higher among older adults of high SES (4.6%) in comparison to those of the middle (4.2%) and low (3.7%) levels. **Conclusion:** This study corroborates the social stratification of health in the elderly, expressed in their functionality. In Latin-American countries, policies aimed at active aging should be focused on prevention of exposure to physical and environmental risks, and to try to compensate any deficiencies in both external and internal resources, particularly among poor older people.

#### IMPACT OF SOIL -TRANSMITTED HELMINTHIASIS ON EOSINOPHILIA AND ANEMIA AMONG ELDERLY IN THE PHILIPPINES

J.Z. Dungca<sup>1</sup>, C.M. Bermido<sup>2</sup>, *1. Research and Evaluation Office, Centro Escolar University, Manila, Philippines, 2. Centro Escolar University, Manila, Philippines*

Studies on parasitism among children are well documented, but the occurrence of parasitism among Filipino elderly, and its impact on anemia, has not been investigated. Soil transmitted helminthiasis was examined among 150 elderly (≥ 60 years old) living in the government-run institution (n=50) and in rural (n=50) and urban (n=50) communities. Stool samples of 48 males and 102 females were examined using formalin ether concentration technique. Blood samples of those who were positive for helminthes were tested for the relative eosinophil count, hemoglobin and hematocrit. The participants were also interviewed using self-made survey questionnaire on hygiene practices and health risk behavior related to parasite transmission. Infection rate was identified at 44%; 21% had multiple parasitism. *Ascaris lumbricoides* was the predominant helminth identified, followed by *Trichuris* and Hookworm. Eosinophilia was seen in 82.4% of those who were positive for helminthes; anemia was seen in 41.2% of those with eosinophilia. Very

significant positive correlations ( $p < 0.01$ ) were noted between helminthiasis and eosinophilia, and helminthiasis and anemia. A significantly higher prevalence rate was seen in older people living in the rural area (17.3%) and in government-run elderly home (16%) as compared to those in urban household (10.7%) ( $p < 0.01$ ). Direct contact with soil without foot wears, gardening, unsanitary practices, and congestion, were found as risk factors for transmitting helminthes. The results of this study have established direct evidence linking parasitism as the cause of anemia among the elderly. Deworming program and health education on helminthes' transmission should be made for this sector of society.

#### **MODIFIABLE FACTORS IN AGEING WELL: AUSTRALIAN LONGITUDINAL FINDINGS**

H. Kendig<sup>1</sup>, C. Browning<sup>2</sup>, 1. *University of Sydney, Centre of Excellence in Population Ageing, Faculty of Health Sciences, Sydney, New South Wales, Australia*, 2. *Monash University, Melbourne, Victoria, Australia*

This paper reports on an Australian longitudinal study identifying potentially improvable factors that can enable older people to 'age well', defined as continuing to live independently in the community with good self rated health and psychological well-being (these key features of ageing well were identified in qualitative research). The research was developed with support from the Victorian Health Promotion Foundation and subsequently funded by the National Health and Medical Research Council. Data were obtained from 1000 participants aged 65 years and over in the Melbourne Longitudinal Surveys of Ageing (MELSHA) in a 1994 community baseline survey at home with biennial follow-up through 2010. Survival analyses were applied to identify the most important baseline predictors for a hierarchy of ageing well outcomes. The most important risk factors for mortality were being male, older age, multi-morbidity, worse self-rated health, functional dependency, greater cognitive impairment, low strain and low levels of social activity. Similarly socio-demographic, health, and a limited range of life style factors predicted entry to residential care. Among survivors in the community, however, continuing health, independence, and well-being were predicted mainly by life style factors including physical activity, nutrition, weight, and social support. Risk factors were found to be different for men and women. The findings suggest that healthy life styles are important for quality of life among older people and the need to target health promotion interventions specifically to older men and women.

#### **SESSION 1935 (SYMPOSIUM)**

##### **EMERGING SETTINGS FOR PARTICIPANT-DIRECTED SERVICES: EXPLORING VETERANS' SERVICES, MANAGED CARE, AND BEHAVIORAL HEALTH PROGRAMS**

Chair: *L. Simon-Rusinowitz, School of Public Health, University of Maryland, College Park, Maryland*

Co-Chair: *K.J. Mahoney, School of Public Health, University of Maryland, College Park, Maryland*

Discussant: *K.J. Mahoney, School of Public Health, University of Maryland, College Park, Maryland*

The number of participant-directed (PD) programs for people of all ages, with diverse disabilities — including elders and people with cognitive impairment — has grown over the past decade. A national inventory of PD programs, including the Cash & Counseling model, identified over 240 programs nationwide. This symposium will discuss PD innovations (also called consumer-directed and self-directed) in three emerging settings: veterans' services, managed care, and behavioral health programs. The symposium will begin with an overview of PD programs. Next, Ellen Mahoney will present findings from a survey of program coordinators in the Veteran-Directed Home and Community-

Based Services Program. This program serves nursing home-eligible veterans with cognitive and functional impairments. Program coordinators rated the program's effectiveness in meeting veterans' needs and improving their ability to stay in their homes and communities. Mark Sciegaj will present findings from an inventory of PD options offered in managed care long-term services and supports programs, along with in-depth descriptions of how managed care plans, fiscal agents and participants coordinate in two states. Finally, Lori Simon-Rusinowitz will present findings from an "environmental scan" designed to understand barriers and facilitators to self-direction in behavioral health services and ascertain interest among key stakeholders. State and county program directors were invited to participate in an informative webinar, respond to a follow-up survey, and participate in follow-up interviews that explored their views and concerns. Results suggest interest in adapting and expanding the model to this important population. Kevin Mahoney will serve as a discussant

##### **HOW DO THE EXPERIENCES OF PROGRAM COORDINATORS SUPPORT SUSTAINABILITY OF VETERAN DIRECTED HCBS?**

E. Mahoney<sup>1</sup>, D. Schoeps<sup>2</sup>, D. Kayala<sup>3</sup>, H. Kapsak<sup>1</sup>, N. Foxe<sup>3</sup>, P. O'Keefe<sup>3</sup>, K.J. Mahoney<sup>3</sup>, 1. *Connell School of Nursing, Boston College, Chestnut Hill, Massachusetts*, 2. *Veterans Health Administration, Washington, DC, District of Columbia*, 3. *Boston College Graduate School of Social Work, National Resource Center for Participant-Directed Care, Chestnut Hill, Massachusetts*

Veteran Directed HCBS targets Veterans with cognitive and functional impairments who are nursing home eligible but prefer to remain at home. We conducted a national survey of Program Coordinators (N=27) from Medical Centers where 886 Veterans have participated in VDHCB as part of a process and outcome evaluation. Coordinators rated effectiveness (from 1 "not effective" to 5 "highly effective") in 4 domains: meeting Veteran's needs (M 4.1, SD 1.0), helping Veterans remain living at home (M 4.4, SD 0.8), improving satisfaction with services and care (M=4.2, SD 0.9), improving accessibility of goods and services (M=4.2, SD 0.9). Program aspects most predictive of these positive outcomes were identified from content analysis of qualitative data. Exemplars are used to gain insight into how a wide range of Veterans used the unique and flexible options to impact quality of care and quality of life. Implications for sustainability and future development will be discussed.

##### **PARTICIPANT-DIRECTED OPTIONS IN MANAGED LONG-TERM SERVICES AND SUPPORTS**

M. Sciegaj<sup>1,3</sup>, P. Saucier<sup>2</sup>, I. Selkow<sup>3</sup>, K.J. Mahoney<sup>3</sup>, 1. *Health Policy and Administration, Penn State University, University Park, Pennsylvania*, 2. *THOMSON REUTERS (HEALTHCARE) INC., CAMBRIDGE, Massachusetts*, 3. *National Resource Center for Participant-Directed Services, Boston College Graduate School of Social Work, Chestnut Hill, Massachusetts*

The number of publically funded participant-directed long-term services and supports (LTSS) programs has grown considerably over the past decade. There are also a growing number of states that either have implemented Medicaid Managed LTSS (MLTSS) or plan to in the near future. Using data from the National Survey of Publically Funded Participant-Directed Services Programs and Thomson Reuters' inventory of MLTSS, this presentation will describe the general characteristics of participant-directed options offered in MLTSS programs. Characteristics include population served, program size, financial management services (FMS) type, and services and supports offered. In addition, the presentation will provide in-depth descriptions of how managed care plans, FMS agents and participants interface in two states.

## ENVIRONMENTAL SCAN OF SELF-DIRECTION IN BEHAVIORAL HEALTH

L. Simon-Rusinowitz<sup>1</sup>, D.M. Loughlin<sup>1</sup>, B. Croft<sup>2</sup>, D. Hughes<sup>2</sup>, K.J. Mahoney<sup>3</sup>, 1. *School of Public Health, University of Maryland, College Park, Maryland*, 2. *Health Services Research Institute, Cambridge, Massachusetts*, 3. *Boston College, Chestnut Hill, Massachusetts*

> Self-direction is based on the premise that people with disabilities can and should make their own decisions about the supports and services they receive. Currently, self-directed programs (also called consumer- and participant-directed programs) help people of all ages and with all types of disabilities maintain independence by enabling them to determine what supports and services work best. However, behavioral health efforts have mainly focused on peer-provided services and shared decision-making, but not on a budget authority model. As part of an environmental scan designed to understand barriers and facilitators to self-direction in behavioral health, and ascertain interest among stakeholders, state and county agency directors were invited to participate in an informative webinar, respond to a follow-up survey, and participate in a longer interview that explored their views and concerns. Results suggest interest in adapting and expanding the model to this important population.

## SESSION 1940 (SYMPOSIUM)

### IOM REPORT ON THE MENTAL HEALTH/SUBSTANCE USE WORKFORCE FOR GERIATRIC POPULATIONS

Chair: R. Stone, *LeadingAge, Washington, District of Columbia*  
Discussant: P. Kemper, *US Department of Health and Human Services/ASPE, Washington, District of Columbia*

This symposium summarizes the findings and recommendations from a recently released Institute of Medicine (IOM) study on the current status and future of the mental health workforce caring for geriatric populations. Committee members will review the current and projected MH/SU needs of adults age 65 and older; describe the current MH/SU workforce, projected demand and barriers to successful development; identify promising MH/SU delivery models that will help to determine the knowledge, skills and competencies required of this workforce; and present the committee's policy and research recommendations. The first panelist will provide estimates of the prevalence of MH/SU conditions in the elderly population and highlight factors that will influence MH/SU trends among older adults in 2030. The second panelist will review trends in the size and composition of the MH/SU workforce caring for older adults, including family caregivers, and will discuss the challenges to improving this workforce and efforts designed to bridge these gaps. The third presentation will identify evidence-based models of service delivery to the geriatric population with MH/SU needs, highlighting implications for workforce capacity and the development of better training, education and incentives for recruitment and retention. The last panelist will summarize the committee's recommendations for improving federal and state-level policy, research and practice that include building on and implementing various Affordable Care Act provisions, developing interagency collaboration to help strengthen this workforce and targeting financial investments to this neglected area. A representative from the federal funding agency will provide closing observations and comments about next steps.

### THE GERIATRIC MENTAL HEALTH AND SUBSTANCE USE WORKFORCE. FINDINGS FROM THE IOM REPORT

M.P. Aranda, *Social Work, Univ Southern California, Hacienda Heights, California*

This presentation addresses the capacity and competence of the mental health and substance-use (MH/SU) workforce to meet the needs of the geriatric population in the U.S. Challenges exist in terms of ascertaining the nature/definition, location, qualifications, and size of work-

force with specific skills who are providing geriatric MH/SU services. Moreover, no single data source exists that provides a comprehensive picture of the workforce. The IOM committee solicited input from professional organizations on training and education, requirements and process for program accreditation, licensing and certification, and trends in the size and makeup of the workforce including direct care providers and family caregivers. We will discuss several distinct challenges in improving the geriatric workforce (e.g., stigma, lack of financial incentives and training opportunities, inadequate early career support and mentorship, difficulty recruiting racial/ethnic minority students) as well as efforts that have been implemented to strengthen the workforce.

### MENTAL HEALTH AND SUBSTANCE USE CONDITIONS IN OLDER PEOPLE: FINDINGS FROM AN IOM STUDY

K. Maslow<sup>2</sup>, R. Stone<sup>1</sup>, 1. *LeadingAge, Washington, District of Columbia*, 2. *Institute of Medicine, Washington, District of Columbia*

Older people have a wide array of mental health and substance use conditions, and many also have coexisting physical health conditions and cognitive impairment that complicate the detection, diagnosis and treatment of the conditions. The IOM Committee assembled available information to estimate the prevalence of mental health and substance use conditions in Americans age 65 and older in 2010. The Committee also reviewed factors that will influence the prevalence of these conditions in older people in 2030, including the growing diversity of the older population and existing mental health and substance use conditions and patterns of service use in the baby boom generation. After attending this session, participants will be aware of the current and future prevalence of mental health and substance use conditions in older people and implications for needed services and related workforce requirements.

### MODELS OF CARE FOR OLDER ADULTS WITH MENTAL HEALTH AND SUBSTANCE USE CONDITIONS

M. Snowden<sup>2</sup>, R. Stone<sup>1</sup>, 1. *LeadingAge, Washington, District of Columbia*, 2. *University of Washington School of Medicine, Seattle, Washington*

The mental health and substance use needs of older adults are complex and typically co-occur with other health problems. The Institute of Medicine Committee decided that to best plan for a more effective and efficient workforce, models of care developed to address chronic conditions and that to effectively treat mental health and substance use conditions should be examined to determine the implications these models have on how to optimize 1) the capacity of the workforce to yield better outcomes, and 2) the training and deployment of health care workers. The Chronic Care Model provides an overarching model for how an improved health care system can address chronic physical problems alongside mental health and substance use issues. Several examples of team-based, effective mental health and substance use programs illustrate the members and specific roles required for implementation of these models across primary care and specialty mental health and substance use settings.

### THE IOM STUDY OF THE MENTAL HEALTH/SUBSTANCE USE WORKFORCE CARING FOR GERIATRIC POPULATIONS: RECOMMENDATIONS FOR ACTION

R. Stone<sup>1</sup>, C.E. Bishop<sup>2</sup>, 1. *LeadingAge, Washington, District of Columbia*, 2. *Brandeis University Heller School, Waltham, Massachusetts*

This presentation summarizes the recommendations of a recent Institute of Medicine study committee that examined issues related to the MH/SU workforce caring for geriatric populations. It calls for relevant federal agencies (CMS, HRSA, NIMH, and SAMHSA) to be held accountable for their responsibilities in addressing the workforce concerns of older adults needing MH/SU care. The report also recommends the establishment of an interagency body within the U.S. Department

of Health and Human Services to coordinate efforts in this area including the development of core competencies, development and dissemination of model curricula and tools and support for wide scale implementation of evidence-based practices. It urges Congress to appropriate funds for training and loan forgiveness in the ACA for workforce development and to target dollars to incumbent and potential MH/SU care professionals. Finally, the study recommends a new national data collection and reporting strategy for geriatric NH/SU workforce planning.

## SESSION 1945 (SYMPOSIUM)

### PARKS, PETS, & PARSNIPS: HOW INTEGRATING AGING RESEARCH & POLICY CAN TRANSFORM THE URBAN ENVIRONMENT

Chair: *A. Glicksman, Research, Phila Corporation for Aging, Philadelphia, Pennsylvania*

Discussant: *A.J. Lehning, University of Michigan, Ann Arbor, Michigan*

An increased interest in the impact of environment and aging among researchers and policy makers alike calls for enhanced knowledge of more sophisticated methods for understanding this relationship and for finding more effective ways to translate research into policy and practice. This session will present findings from an NINR/NIH funded study of the influence that neighborhood environments have on the health of older adults, called Walkability's Impact on Senior Health (WISH). One goal of WISH is to support an effort called Age-friendly Philadelphia (AfP), catalyzed by the Area Agency on Aging, Philadelphia Corporation for Aging. Each of the four papers will demonstrate the ways in which researchers, policy makers, and practitioners from a variety of fields can together help transform cities to be more supportive of seniors. After an introductory overview, Ring will present findings from a Geographic Information Systems (GIS) driven quantitative analysis designed to examine the relation of health behaviors to the environment. Wang will describe a qualitative study of senior gardening and the relation of that study to AfP goals. The panel then turns to the translation of scientific findings into policy and practice. Clark will discuss the ways in which the AfP policy effort has used research findings, especially in regard to urban parks, and Hoffman will explain the use of research to help practitioners better understand the role of pets in the lives of seniors. Together the panelists will present an integrated research/policy effort and show the importance of these new innovative approaches.

### LOCATING PARKS, PETS & PARSNIPS: INTEGRATING GEOGRAPHIC INFORMATION (GIS) DATA INTO SURVEY RESEARCH

L.N. Ring<sup>1</sup>, A. Glicksman<sup>1</sup>, M.H. Kleban<sup>2</sup>, *1. Planning, Philadelphia Corporation for Aging, Philadelphia, Pennsylvania, 2. polisher reseach institute, north wales, Pennsylvania*

New tools for the study of environment and health are emerging from the field of spatial analyses and Geographic Information Systems (GIS). GIS based analyses promise the ability to better integrate the impact of spatial relations on health outcomes into traditional survey type research. Using these methods we tested two hypotheses from our NINR/NIH funded study regarding the impact of environment and age on health behaviors. Characteristics associated with poorer neighborhoods such as vacant properties and crime have effects on whether all adults are physically active and that lack of easy access to groceries have an effect on selected health behaviors as well. However, the interaction of age with health behaviors and environment is more nuanced than we expected. By describing the methods used to test our hypotheses and the results of those analyses we will demonstrate the value of integrating GIS and traditional survey methods in a single study.

### OLDER ADULTS AND PARSNIPS: THE SENIORS AND GARDENING EVALUATION (SAGE) STUDY

D.S. Wang, *Social Work, Long Island University, Brooklyn, New York*

Quantitative analyses allow us to examine the interaction of older adults to their environment but not to understand the motives for their behavior. Understanding the reasons for participation in activities is critical for research and policy designed to make the environment more supportive of older adults. This presentation will describe findings from a qualitative study of the reasons that older adults participate in gardening groups whose goals are to produce fruits and vegetables for consumption. The reason most often cited by respondents as a reason for gardening was the benefit to their mental health. This is a critical finding because improving mental health was not an original goal of the program but turned out to be a very important reason that people participate in this activity.

### PHILLY PETS AND SENIORS: FROM POLICY TO RESEARCH TO PRACTICE

C. Hoffman, A. Glicksman, K.O. Clark, L.N. Ring, *Philadelphia Corporation for Aging, Philadelphia, Pennsylvania*

While there is a growing literature on the impact of pets on human health, there is little research about pet ownership among older adults or about the role of pets in providing care to seniors. This presentation will describe how the Age-friendly Philadelphia effort has contributed to policy, research and practice in the area of pets and seniors. In 2010 GenPhilly, an organization of emerging leaders interested in aging, sponsored a program to bring together professionals and advocates from the animal welfare and aging service communities. A follow-up survey of participants and a new question regarding pet ownership in an omnibus health survey of the Philadelphia area have led to additional research and an informational web page for care managers and seniors called phillypetsandseniors.org. Attendees will learn how research, policy and practice can be mutual reinforcing and about the importance of 'pets and seniors' to each of these groups.

### AGE-FRIENDLY PARKS: HOW RESEARCH SUPPORTS COALITION BUILDING

K.O. Clark, *Planning, Philadelphia Corporation for Aging, Philadelphia, Pennsylvania*

Providing access to outdoor recreation facilities for older adults is a policy goal in many communities. In Philadelphia, which has extensive urban park system and a significant number of older adults with IADL impairments, ensuring that parkland is more accessible has become a key policy goal of the Age-friendly Philadelphia effort. Most parks are administered by the City's Philadelphia Parks & Recreation and fundraising for special improvements is led by the Fairmount Park Conservancy. In 2010, PCA facilitated a coalition with the two agencies and the local association of senior centers to identify, market, and ultimately program signature parks for seniors. The group drafted an age-friendly parks checklist, disseminated a white paper, created GIS maps, and then conducted focus groups. This presentation will cover this process and highlight short-term and long-term goals.

## SESSION 1950 (SYMPOSIUM)

### POLICY SERIES: CONGRESSIONAL AGING ISSUES UPDATE

Chair: *B.W. Lindberg, National Academy on an Aging Society, Washington, District of Columbia*

Discussant: *A. Montgomery, U.S. Senate Special Committee on Aging, Washington, District of Columbia* Discussant: *C. Goldstein, U.S. Senate Special Committee on Aging, Washington, District of Columbia*

Capitol Hill staff, including the Senate Special Committee on Aging, will discuss this year's legislative developments and plans for aging and health policy for 2013. Topics will include the Older Americans Act

reauthorization, income security, and health care reform implementation. Brian Lindberg, a Washington, DC, policy consultant, will moderate this session.

## SESSION 1955 (SYMPOSIUM)

### PROPOSING THAT LIFE GETS BETTER: PERSONAL ACCOUNTS, RESEARCH AND THEORY

Chair: *W. Lustbader, School of Social Work, University of Washington, Burton, Washington*

Discussant: *W. Lustbader, School of Social Work, University of Washington, Burton, Washington*

Age as decline is the dominant paradigm for physical aging based in biological processes. There is increasing support that psychologically, age may bring growth only possible in late-life. In a random telephone survey of over 340,000 Americans (Stone et al., 2010), most claimed that life had gotten better for them as they had gotten older. Theorists from Erikson to Carstensen have posited emotional strengthening, increased interest in contributing to the lives of others, and even a flowering of creativity in later life. Despite a wealth of experiential and scholarly testimony, the idea that life gets better with age still runs directly counter to the negative stereotypes about aging that prevail in American society. This symposium will probe the contention that life gets better as we get older on every level except the physical. Using ideas from her new book, *Life Gets Better: The Unexpected Pleasures of Growing Older*, Wendy Lustbader will explore the unexpected transformations that can occur when we open ourselves to the lessons that have accrued over the decades and release ourselves from prior constraints. Dialogue with symposium participants will be emphasized, following presentations incorporating both research and theory related to late-life growth and development.

### THE WAYS LIFE GETS BETTER: A JUNGIAN PERSPECTIVE

*J. Damron-Rodriguez, School of Public Affairs, University of California, Los Angeles, California*

In the last third of life, growth may come from in Carl Jung's terms "the yearning to explore the un-lived life." Jung presents seven tasks of late-life that lead to fulfillment. Erikson's late-life integrity resonates with aspects of the development of individuation described by Jung. The research of Swedish gerontologist Lars Tornstam resulted in a theory of evolvment known as gerotranscendence. Gene Cohen's descriptions of mature thought processes are further considerations of late-life psychological growth. Comparisons and contrasts of these frameworks for understanding the potential increased sense of self in late-life will be explored. The following questions will be considered: Is the proposal that "life gets better" normative or the description of a potential stage of growth that is extraordinary? If gerotranscendence is accomplished only by some are there predisposing variables that relate to reaching this late-life growth? What are the dimensions of a "better" late-life?

### WHEN LIFE GETS BETTER: VITAL INVOLVEMENT, CREATIVITY, AND ELDER INTEGRITY

*H.Q. Kivnick, School of Social Work, University of Minnesota, Saint Paul, Minnesota*

Recent research on brain physiology, arts participation, and community arts programming demonstrates unexpected potential for creative activity in older adulthood. Research also indicates that such creative activity can provide intrinsic personal satisfaction, promote positive physical and emotional health in participating elders, and contribute to overall community capacity. The construct of vital involvement (VI) (Erikson, Erikson, & Kivnick, 1986) provides a developmental framework for understanding the dynamics of creative activity as central to integrity in later life. Additionally, the VI construct provides a conceptual basis for optimizing creativity in elders, across a wide range of indi-

vidual disability, fragility, and robustness. VI also offers a blueprint for creating community structures (programs; organizations; policies) that support the expression of later-life creativity and celebrate its societal contributions. This presentation elaborates on the connection between VI, elder creativity and psychosocial health, and community vitality. The presentation provides illustrative examples from research and direct practice.

## SESSION 1960 (PAPER)

### EMPOWERING THE CONSUMER IN THE MANAGEMENT AND DELIVERY OF LONG TERM CARE SERVICES

#### FRAIL OLDER PEOPLE'S VIEWS ON RECEIVING ASSISTANCE FOR MOBILITY IN PERSONAL CARE ACTIVITIES

*A. Brandt, The National Resource Centre on Disability, Assistive Technology and Social Psychiatry, The National Board of Social Services, Århus C, Denmark*

With increasing age functional limitations may occur to such a degree that assistance from other people for mobility in personal care activities is required. Even though this kind of assistance is frequent, only little is known about how the persons who receive the assistance experience this. Once a year for three years face-to-face interviews were carried out in two Danish municipalities by experienced occupational therapists. In all 208 persons who had received assistance for a maximum of one year were interviewed by means of a structured interview guide, also including open questions. The participants' mean age was 78.3 years (SD 12.7), 57.2% were female, 35.6% lived in private homes and the remainder in sheltered housing or nursing homes. Most had several functional limitations, mostly in back/legs and arms, and suffered from dizziness. In all 12 assistance situations were investigated. The kinds of assistance the participants most frequently received were for showering, going to bed, and using the toilet. Their satisfaction and feeling of security was generally very high, while the feeling of comfort was in all situations somewhat lower. Getting help to get up from the floor after having fallen was the most uncomfortable situation. No changes between the three years and between the two municipalities were found. The main qualitative explanations for low feeling of comfort were carers' lack of experience and attention, whereas good communication and co-operation increased their feeling of comfort. Furthermore, the feeling of being dependent on other people was uncomfortable. Also concrete comments were given.

#### CHOICE-BASED POLICIES AND AGING

*P. Nadash, Gerontology, University of Massachusetts, Boston, Boston, Massachusetts*

Public policy is moving more and more toward approaches that rely on consumer choice as the driver for cost and quality improvements in health and social care, a trend which some see as the abandonment of vulnerable older individuals to the harsh mercies of the market. This presentation reviews a range of policy initiatives, in the US and abroad, that rely on this mechanism, and discusses developments in the US that fit into this paradigm. Data derive from several studies of choice-based policies conducted by the author. Specific policies discussed include the Swiss and Dutch healthcare systems; the English experiments with Personal Health Benefits (a budget allowing people to purchase a limited package of health services directly) and hospital choice; Cash and Counseling in the US; and recent proposals for transitioning Medicare toward a "premium support" model. The presentation presents a conceptual framework, incorporating findings from behavioral economics and research on older people's responses to such policies (for example, in the Medicare Part C, Part D, and Medigap markets), that suggests how the benefits of choice can be preserved while pro-

tecting those who might be overwhelmed by it. Moreover, the framework distinguishes among the types of choices that people have and identifies where choice-enhancing policies function to genuinely empower people versus where they are less likely to result in optimal outcomes.

### **DEVELOPING A HOME AND COMMUNITY-BASED PATIENT EXPERIENCE SURVEY FOR MULTIPLE POPULATIONS**

E. Frentzel<sup>1</sup>, S. Galantowicz<sup>2</sup>, 1. *Health, American Institutes for Research, Chapel Hill, North Carolina*, 2. *Thomsen Reuters, Cambridge, Massachusetts*

The number of older adults and people with disabilities who receive Medicaid-funded home- and community-based services (HCBS) has increased appreciably in the last decade. HCBS programs serve beneficiaries with a range of severe physical, mental, and developmental conditions, through an array of providers. Data have illustrated the health disparities experienced by people with disabilities; however, little is known about their experiences with HCBS programs. This study seeks to develop and validate a cross-disability patient survey that measures experiences of HCBS by individuals with age-related frailties, intellectual and developmental disabilities, acquired brain injuries, physical impairments, dementia, and behavioral health issues. Researchers obtained input from experts and conducted interviews to identify quality domains valued by people receiving HCBS. Survey items were subsequently tested in three rounds of cognitive interviews. The survey needs to work across all populations, thus the team administered two experiments comparing options for response patterns and global rating items, to evaluate recall, content, and comprehension. Frequency scales worked poorly for people with intellectual impairments, but were most appropriate for respondents with intact cognition. A dichotomous screening item paired with a frequency scale (e.g. Never/Sometimes/Usually/Always) for those capable of responding was most successful. Other findings include the challenges with ordinal scales and specific time references with intellectually-impaired respondents. For global ratings, adjectival scales (excellent to poor) and a willingness-to-recommend item performed better than numeric ratings. This research suggests that it is possible to obtain meaningful self-report by individuals with varying capabilities when accessible item wording and response options are used.

### **INCLUDING THE VOICES OF RESIDENTS, RELATIVES AND STAFF IN CARE HOME RESEARCH: CASE STUDIES FROM THE APPROACH PROJECT**

C. Victor<sup>1</sup>, C. Goodman<sup>2</sup>, A. Dickinson<sup>2</sup>, H. Masey<sup>1</sup>, S. Davies<sup>2</sup>, H. Morbey<sup>4</sup>, K. Frogatt<sup>4</sup>, S. Iliffe<sup>3</sup>, 1. *Brunel University, Uxbridge, United Kingdom*, 2. *University of Hertfordshire, Hatfield, United Kingdom*, 3. *University College London, London, United Kingdom*, 4. *University of Lancaster, Lancaster, United Kingdom*

Much research in care homes focuses upon enumerating the nature of the health and social care needs of residents; evaluating specific interventions such as fall prevention or describing the nature and composition of the care home work force with the perspectives of residents, staff and relatives rarely heard. This paper presents findings from the case study phase of a three year study of integrated working between care homes and the NHS and focuses upon the resident perspective. We focussed upon 39 residents across 6 care homes who were followed up for a year which involved reviewing residents' notes (127 reviews) and interviewing them up to 3 times (87 interviews in total) about their health care needs. We also interviewed the care home staff (n=31) and NHS and social care staff (n=38) who were involved in their care and relatives (where possible) (n=4). Care home staff often had a wealth of knowledge about residents and their (changing) needs that was not always recognised by NHS staff; residents expected that care home staff (and sometimes relatives) would act as mediators and advocates for

them when dealing with primary health care staff. By linking these perspectives with those of primary care staff we will explore these differing narratives and illustrate the resonances and, sometimes, dissonances between them. These findings indicate the importance of including the voice of residents, their families and the care home staff when undertaking work of this nature in care homes, even though this is challenging to researchers.

### **REDISCOVERING THE PERSON IN THE DELIVERY OF "PERSON-CENTERED" LONG-TERM SERVICES AND SUPPORTS**

K.G. Kietzman<sup>1</sup>, S. Wallace<sup>1</sup>, E. Durazo<sup>1</sup>, J. Torres<sup>1</sup>, A. Choi<sup>2</sup>, C. Mendez-Luck<sup>2</sup>, A. Benjamin<sup>1</sup>, 1. *UCLA Center for Health Policy Research, Los Angeles, California*, 2. *California State University, Dominguez Hills, Department of Interdisciplinary Studies, Los Angeles, California*, 3. *Oregon State University, College of Public Health and Human Sciences, Corvallis, Oregon*

The Affordable Care Act of 2010 supports consumer choice, independence, and service integration for persons with disabilities through the delivery of person-centered long-term services and supports in the home and community. A number of provisions explicitly recognize the central role of the consumer as an active participant in the delivery of care. Still, little is known about the meaning and experience of person-centered care from the home care consumer's point of view and how such definitions change over time. The Helping Older-adults Maintain independence (HOME) project investigated how over the course of one year, 33 older adults in California, dually-eligible for Medicare and Medi-Cal, managed a fragmented network of informal and formal care to continue to live independently at home. Four rounds of in-depth interviews conducted with older adults and their caregivers were transcribed and coded to identify key themes and patterns. The results move us beyond the notion that quality care is something that is passively received by consumers, revealing that it is instead the product of exchange between the individual providing care and the consumer who directs that care. These older adults illustrate how self-determination in the context of the caregiving exchange enhances their well-being, and how a sense of dignity and control are at the core of a truly person-centered approach to the delivery of care. The lessons learned can inform the realization, organization and management of person-centered care across the continuum of long-term services and supports, whether provided in the home or in an institutional setting.

### **SESSION 1965 (PAPER)**

#### **FAMILY CAREGIVING AND THE EFFECTS OF CAREGIVER SUPPORT INITIATIVES**

#### **THE STRAINS AND GAINS OF CAREGIVING: AN EXAMINATION OF THE EFFECTS OF PROVIDING PERSONAL CARE TO A PARTNER ON A RANGE OF PSYCHOLOGICAL OUTCOMES**

T. Hansen, B. Slagsvold, *Norwegian Social Research (NOVA), Oslo, Norway*

As the need for informal care rises it is important to know how caregiving affects well-being, to whom, and under which conditions. The literature so far has been limited by their scope of dependent variables and there has been little discrimination between groups of caregivers. This paper explores the effects of providing regular help with personal care to a partner along a wide range of measures of well-being (life satisfaction, marital satisfaction, self-esteem, mastery, happiness, positive and negative affect, depression, and loneliness), and sociodemographic moderators of these effects. We use cross-sectional data from the Norwegian Life Course, Ageing and Generation (LOGG) study (N~15,000, age 18-79), and two-wave panel data from the Norwegian study on Life course, Ageing and Generation (NorLAG) (N~3,000,

age 40-79). Among men, providing help with personal care to a partner has no effect on any indicator of well-being. Among women, caring for a partner has more detrimental impacts on well-being, but only to women with low-medium levels of education and only on some outcomes. Caregiving is also associated with greater sense of mastery among women. Panel analysis largely corroborates these findings. The results reviewed and presented indicate that caregiving has less detrimental effects in the Nordic countries than in other countries, highlighting the role of social policies in shaping the impact of caregiving on well-being.

#### **DEMENTIA MANAGEMENT SELF-EFFICACY: COMPARISON OF LATINO AND WHITE FAMILY CAREGIVERS**

R.H. Fortinsky<sup>1</sup>, A. Kleppinger<sup>1</sup>, J. Robison<sup>1</sup>, D. Gonzalez Sanders<sup>2</sup>, 1. *Center on Aging, University of Connecticut Health Center, Farmington, Connecticut*, 2. *Central Connecticut State University, New Britain, Connecticut*

Dementia management self-efficacy among family caregivers (CG) is an important precursor to successfully managing symptoms and accessing support services. Few studies have reported racial and ethnic group comparisons regarding dementia management self-efficacy. We compared reported dementia management self-efficacy levels between Latino and White CGs while accounting for several important covariates. Methods: We pooled data from two southern New England studies in which White and Latino (mostly Puerto Rican) CGs were asked identical questions from published measures of dementia management self-efficacy in two domains—symptom management and support service access. Each self-efficacy measure was analyzed as a dependent variable; independent variables in both multivariate regression models were Latino vs. White, gender, age, educational attainment (<high school (HS), HS grad, some college), and relationship (spouse, adult child, other relative). Results: Latino CGs (n=67) were more likely than Whites (n=76) to be female (94% vs. 66%,  $p<0.001$ ), younger (mean=51 vs 64 years,  $p<0.001$ ), more likely to have <HS education (34% vs 5%,  $p<0.001$ ), and less likely to be spouses (21% vs 46%,  $p=0.004$ ). Controlling for covariates, Latino CGs reported lower levels of dementia symptom management self-efficacy (beta=-0.262,  $p=0.012$ ), and lower levels of support service access self-efficacy (beta=-0.431,  $p<0.001$ ). CGs with <HS education also reported lower levels of support service access self-efficacy (beta=-.232,  $p=.009$ ). Conclusion: Latino CGs report substantially lower levels of dementia management self-efficacy than Whites. Latinos with low levels of education are particularly at risk for poor self-efficacy in the support service access domain, and should be targeted for community-based dementia resources.

#### **ELDERCARE CIRCUMSTANCES AND ASSOCIATIONS WITH HEALTH AND WORK-RELATED OUTCOMES AMONG MANUFACTURING SECTOR EMPLOYEES**

R.H. Fortinsky<sup>1</sup>, D. Farr<sup>1</sup>, J. Barnes-Farrell<sup>2</sup>, M. Cherniack<sup>1</sup>, 1. *Center on Aging, University of Connecticut Health Center, Farmington, Connecticut*, 2. *University of Connecticut, Storrs, Connecticut*

Little is known about circumstances and correlates of eldercare (caregiving) responsibilities among manufacturing sector employees. This report examined data from an ongoing longitudinal study of employees at six Connecticut companies. We determined associations among employee characteristics, caregiving circumstances, and family-work conflict (FWC), depressive symptoms, and self-rated health. Methods: Caregivers were those reporting that one or more adults age >65 depended on them in any way for help due to disability or chronic illness. Caregiving circumstances included: reported hours/week providing care; and whether personal care (ADL) and/or instrumental activities of daily living (IADL) help was provided. FWC was measured by a 2-item scale tapping impact of family on job, depressive symptoms by the 8-item CES-D, and self-rated health by a 5-point scale. We compared FWC, self-rated health, and depressive symptoms between care-

givers and non-caregivers; and, among caregivers, determined whether FWC, self-rated health, and depressive symptoms varied by caregiving circumstances. Results: Respondents (n=402) were: 70.6% male; mean age=49.0+11.1; 14% non-White. Caregivers (18% of sample) rated their health lower than non-caregivers ( $p=0.02$ ). Among employees aged > 55, caregivers reported greater FWC ( $p=0.02$ ) and more depressive symptoms ( $p=0.009$ ) than non-caregivers. Among caregivers, females reported more hours/week ( $p=0.003$ ), and were more likely to provide ADL help ( $p=0.01$ ), than males. Among caregivers aged >55, hours/week was positively associated with depressive symptoms ( $p=0.09$ ). Conclusions: Eldercare was associated with poorer self-rated health among manufacturing employees. Women caregivers reported providing more care time and more personal care than males. Older caregivers were particularly prone to FWC and depressive symptoms.

#### **THE EFFECTS OF SERVICE UTILIZATION ON CAREGIVER BURNOUT: SPOUSE AND ADULT CHILD CAREGIVERS COMPARISON**

J. Kim, *Sociology, Social Work and Criminal Justice, Idaho State University, Pocatello, Idaho*

This study examined how the frail elderly and their family caregivers utilized formal services; and how service utilizations were associated with caregiver burnout and health status. In the policy context, two service utilizations used in this study were proxies to measure services funded under the 1997 Balanced Budget Act and the 2000 National Family Caregiver Support Program. Conceptually, the caregiver's stress/appraisal model was modified by incorporating a relationship between formal and informal care from a health economics perspective. This study also explored moderating effects of the caregiver's relationship to older adult on structural paths in the hypothesized model. Using data drawn from the 2004 wave of National Long-term Care Survey, this study used the nationally representative sample of Medicare beneficiaries and their primary family caregivers (N=1,456). Findings indicated that older adults were more likely to receive the formal assistance for activities of daily living (ADLs) and instrumental activities of daily living (IADLs) when their primary caregivers were adult children than spouses. Adult child caregivers were more likely to utilize supplemental services than spouse caregivers. A multiple group comparison path model revealed that adult child caregivers were less likely to spend time on caring for elderly parents and were indirectly less likely to feel burden when elderly parents received the formal assistance for ADLs and IADLs. No significant findings associated with the formal assistance for ADLs and IADLs were found for spouse caregivers. Discussion and implications for research and social work policy and practice are presented.

#### **DOUBLE DUTY CAREGIVING: A KNOWLEDGE TRANSLATION INITIATIVE**

C. Ward-Griffin, J. Keefe, J. Brown, M. Kerr, O. St-Amant, *Western University, London, Ontario, Canada*

Double duty caregiving (DDC) - when health professionals provide care at home and at work- is likely to increase in a time of an aging population, aging health care workforce and a shortage of human health resources. Given the potential adverse health effects of DDC, it is important to invest in knowledge translation (KT) strategies to create and sustain healthy work environments and health care workforces. Based on evidence from our previous qualitative and quantitative investigations, the overall goals of this research are to: 1) identify refinements to DDC policies and practice; 2) engage in a collaborative, pan-Canadian development of these refinements; and 3) create collaborative opportunities for advocacy and implementation of practice and policies relevant to DDC and health human resources. In order to meet these project goals, a Transformative Knowledge Translation Workshop was conducted to bring together practitioners, administrators and policy makers for dialogue, reflection and action on this important health human resources issue. The workshop represented the cutting edge of theory-driven

knowledge exchange by working the intersections between integrated, end-of-grant, and transformative knowledge exchange. This presentation will highlight how the generation of practice-based evidence about DDC was accomplished through a socially interactive, action-oriented dialogue among the workshop participants. Furthermore we will discuss how this KT strategy enabled the creation of successful research and community partnerships that aimed to facilitate the uptake of research evidence into practice, policy and other areas to address DDC and health human resource challenges now and in the future.

## SESSION 1970 (PAPER)

### IMPROVING ACCESS AND QUALITY OF CARE IN COMMUNITY BASED LONG TERM CARE

#### A FORMATIVE EVALUATION OF THE VALUE OF COLLABORATION IN A MULTI-AGENCY CASE MANAGEMENT CONSORTIUM

N. Giunta<sup>1</sup>, J.K. Johnson<sup>2</sup>, C. Morano<sup>1</sup>, 1. Hunter College, City University of New York, New York, New York, 2. New York University, New York, New York

In response to significant budget cuts to home and community-based services for older adults, four urban case management service providers formed an innovative inter-organizational case management consortium to serve 1,000 homebound older adults. This formative evaluation used a participatory, mixed-methods approach to examine the structure and process of case management delivery through this inter-organizational model. The construct of partnership synergy, introduced by Lasker and colleagues, was used as a conceptual framework for this study. Results from 33 semi-structured in-person interviews, four focus groups, and an anonymous web survey with consortium staff suggest that a consortium model of service delivery offers an improved approach to providing case management, and addresses some common challenges of service delivery. Improvements over a single agency model include client and case manager access to a greater pool of resources (e.g., a wider breadth of knowledge about services and treatment modalities for specific issues, diverse cultural resources, and technological tools for improved communication and safety in the field). The consortium model also provides a single-point of entry into the case management system, which is valued as a mechanism to effectively align client needs with provider characteristics. Guided by participatory research principles, the results of this formative evaluation were shared with case management providers to design a subsequent examination of the relationship between the structure and process of the consortium and client outcomes. Implications of this evaluation for service delivery, policy, and future research will be discussed.

#### POTENTIALLY AVOIDABLE HOSPITALIZATIONS AMONG MEDICAID HOME AND COMMUNITY-BASED SERVICES WAIVER BENEFICIARIES

J. Wiener<sup>1</sup>, E.G. Walsh<sup>1</sup>, M. Freiman<sup>1</sup>, S. Haber<sup>1</sup>, A.W. Bragg<sup>1</sup>, J.G. Ouslander<sup>2</sup>, 1. *Aging, Disability and Long-Term Care, RTI International, Washington, District of Columbia*, 2. *Florida Atlantic University, Boca Raton, Florida*

Health and long-term care are fragmented for older people, reflecting that Medicare is the primary payer for acute care for older people and Medicaid is the primary payer for long-term care. As a result of this fragmentation, the medical care system neglects the long-term care needs of older people with disabilities and the long-term care system neglects their medical care needs. Using 2005 Medicare and Medicaid claims data, this study examines potentially avoidable hospitalizations among people who are dually eligible for Medicare and Medicaid and participating in Medicaid home and community-based services (HCBS) waivers. By federal law, waiver participants must need a nursing home level of care. Using the same criteria for people in the community and

residents in nursing homes, people in the community had 408 potentially avoidable hospitalizations per 1,000 person years, higher than for Medicaid nursing home residents but less than for people receiving Medicare-covered skilled nursing facility care. Over 40% of hospitalizations were potentially avoidable. Using a more restricted definition of potentially avoidable hospitalizations that takes into account that some medical conditions, once developed, cannot be safely treated at home, waiver beneficiaries had 250 potentially avoidable hospitalizations per 1,000 person years. Using the conservative definition of potentially avoidable hospitalizations, the hospitalization cost was \$463 million in 2005. The cost to Medicare for each potentially avoidable hospitalization was \$6,415; the cost to Medicaid was only \$325. Multivariate analyses suggests that states with well developed HCBS systems have lower rates of potentially avoidable hospitalizations among Medicaid waiver beneficiaries.

#### RACIAL AND ETHNIC DIFFERENCES IN USE OF LONG-TERM SUPPORTS AND SERVICES

A. Chattopadhyay, University of California at San Francisco, San Francisco, California

U.S. elders are increasingly of racial/ethnic minority, many of whom need long-term services and supports (LTSS) because of disabilities. Racial/ethnic minority groups are known to underutilize formal (paid) LTSS leading to higher levels of unmet needs and negative outcomes. The extent to which minorities underutilize the institutional and non-institutional components of formal LTSS and whether care setting mitigates racial/ethnic differences in formal LTSS use is unknown. Data on 2780 disabled adults aged 65+ from the 2002 Medicare Current Beneficiary Survey is used to determine racial/ethnic differences in the type of formal LTSS. Multivariable logistic and Poisson regression models on institutional service and home health (HH) visits were estimated. Coefficient estimates from both models were converted to relative-risks. Standard errors correct for the complex sampling design of MCBS. One thousand and fifty three disabled older adults had used institutional services; 861 used HH services. Controlling for age, gender, income, education, marital status and family size, all minority groups showed significantly lower likelihood of using institutional services compared to Whites (Black RR .67,  $p < .001$ ; Latino RR=.41,  $p < .001$ ; Asian RR=.50,  $p < .002$ , respectively), while Blacks and Asians used significantly more HH services than whites (RR=1.77,  $p < .001$  and RR=1.78,  $p = .04$ ). Latinos' use of HH services did not differ significantly from that of whites. Policy implications of the study results for LTSS delivery and reduction in racial/ethnic differences in formal LTSS are discussed

#### CMS NATIONAL BALANCING INDICATORS PROJECT (NBIP): DIRECT SERVICE WORKFORCE DATA COLLECTION

C. Blakeway<sup>1</sup>, S.A. Larson<sup>2</sup>, D. Foney<sup>1</sup>, 1. *The Lewin Group, Falls Church, Virginia*, 2. *ICI at the University of Minnesota, Minneapolis, Minnesota*

As the U.S. population ages and individuals below the age of 65 face permanent or long-lasting disabilities, the demand for long-term services and supports (LTSS) increases. Most of this population prefer to live in the community rather than in nursing facilities, thus states are working to re-orient their LTSS delivery systems toward home- and community-based settings and away from institutional ones. To do this, states need reliable information about their LTSS systems to identify successes, progress and service gaps. Currently, policymakers are hampered by a lack of reliable information about their Direct Service Workforce (DSW). The Centers for Medicare and Medicaid Services, together with IMPAQ International, LLC and The Lewin Group, assisted seven states to conduct universal surveys of: (a) individuals working as independent providers in LTSS programs and (b) employer organizations of workers serving older adults and people with disabilities through Medicaid-funded programs. After attending this session, participants will

better understand: (1) the state of the DSW workforce in these seven states, including workforce demographics, volume, stability, (e.g., turnover and vacancy rates), compensation, training needs, and recruitment and retention challenges; (2) implications of these findings for state LTSS reform and systems change; (3) the experience of the participating states in designing and fielding these surveys, and; (4) the potential advantages and disadvantages of routinely collecting workforce data using this same methodology.

## SESSION 1975 (POSTER)

### AGE AND COGNITION

#### AGE-RELATED CHANGES IN MONITORING AND CONTROL IN DISSOCIABLE LEARNING SYSTEMS

M.A. Gorlick, D. Schnyer, W. Maddox, *Psychology, University of Texas at Austin, Austin, Texas*

Cognitive psychology emphasizes two learning systems; a reflective system that is under conscious control and a reflexive system that functions implicitly. Research from our lab (Glass et al., 2011) found an age-related deficit in reflective learning but an age-related advantage in reflexive learning. During reflective learning, conscious knowledge about the current state of learning is updated (monitoring) and used to guide strategy selection (control). However, reflexive learning is an implicit process and does not rely on these mechanisms. Age-related declines in monitoring and control likely influence differences in reflective learning. Older adults both (a) struggle to monitor their learning and (b) have difficulty applying that knowledge to select the appropriate strategy. The present study provides evidence for an age-based deficit in monitoring reflective learning leading to poor control. Participants learned to classify exemplars modified from one prototype (AN; reflexive learning) or two prototypes (AB; reflective learning) and were then tested on both categories. During test, participants provided a confidence rating as a measure of online monitoring. Replicating Glass et al, older adults were less accurate than younger adults in the reflective task indicating poor control, but older adults outperformed younger adults in the reflexive task. Older adults revealed poorly calibrated monitoring relative to younger adults in the reflective task. Also as predicted, there were no age-related monitoring differences in the reflexive task. Overall, our results suggest that older adults are less successful than younger adults at monitoring reflective learning, potentially contributing to deficits in control that are critical for learning.

#### EFFECTS OF AGE, MARITAL STATUS AND COMPLEXITY ON PREFERENCES FOR COLLABORATIVE DECISION MAKING

C.L. Ortiz, J.M. Jacobs-Lawson, *Gerontology, Univ of Kentucky, Lexington, Kentucky*

When making decisions, older and younger individuals may actively involve others in the decision process. Research has shown that decisional and personal characteristics influence preferences for collaborating with others. The purpose of this study was to examine the effects of age, marital status, and decision complexity on women's preferences for collaborative decision making. In the study, married and widowed women (aged 50-90 years) were asked to make a hypothetical medical treatment decision. Half of the participants made a simple decision (deciding among three options) and the other half of the participants made a complex decision (deciding among six decisions). After completing the decision task, they were asked to indicate the degree to which they would prefer to collaborate with someone from their social network if they were to complete the decision task again. Separate regression models were conducted for married and widowed women. Results indicated that for married women, age and an age by task complexity interaction were significant predictors of collaboration. However for widowed women none of the predictors were significant. These results

suggest that married women may prefer collaboration based on their age and the complexity of the task. Understanding how age, marital status, and complexity influence preferences for collaboration will allow researchers to develop decision aids that coincide with individual preferences so that individuals can be effective decision makers.

#### A CROSS-CULTURAL PERSPECTIVE ON AGING AND MEMORY: COMPARISONS BETWEEN BANGLADESH AND SWEDEN

O. Sternä ng<sup>1,2</sup>, Z.N. Kabir<sup>4</sup>, J.D. Hamadani<sup>5</sup>, ÅKE. Wahlin<sup>3,2</sup>, *1. Institute of Gerontology, School of Health Sciences, Jönköping University, Jönköping, Sweden, 2. Stockholm Brain Institute, Stockholm, Sweden, 3. Department of Psychology, Stockholm University, Stockholm, Sweden, 4. Division of Nursing, NVS, Karolinska Institutet, Stockholm, Sweden, 5. International Centre for Diarrhoeal Disease Research, Bangladesh (ICDDR,B), Dhaka, Bangladesh*

Most studies on cognitive aging have been conducted in economically developed countries (mainly on Western populations). It is of importance to test the generalizability of obtained results with studies in cultural settings with different living conditions. However, the share of research conducted in cross-cultural cognitive aging is rather small, especially on memory. The main aim of this study was to compare relative importance of some commonly used predictors (age, sex, years of education, systolic blood pressure, vascular diseases, sensory-motor functioning, and processing speed) for episodic and semantic memory performance in older people ( $\geq 60$  years) from Bangladesh ( $n = 400$ ) and Sweden ( $n = 1098$ ), respectively. A main finding was that age variations did not have as much impact on episodic and semantic memory performance in Bangladesh as in Sweden, and sex was of greater importance for semantic memory performance in Bangladesh. In the western world, chronological age is believed to be strongly associated with memory performance in cross-sectional studies, especially in people above 60 years of age. This study indicates that the difference between the two countries (in relative importance of the predictors included in this study) is mainly due to that years of education is connected to age in the western world but to sex in Bangladesh. It remains to be examined whether earlier selective survival is also responsible for the relative absence of cognitive age differences in Bangladesh.

#### RELUCTANCE TO DESCRIBE "DISLIKED" OTHERS AS WE AGE

L.J. Medvene<sup>1</sup>, K. Nilsen<sup>1</sup>, B. Latronica<sup>1</sup>, C.K. Coleman<sup>2</sup>, M. Wachlarowicz<sup>1</sup>, *1. Psychology, Wichita State University, Wichita, Kansas, 2. University of Kansas, Lawrence, Kansas*

Socioemotional selectivity theory proposes that as we age we engage in emotional self-regulation with the goal of seeking positive emotional responses and avoiding negative ones (Carstensen et al, 1999). The present studies extend this line of research to a social perception task: assessing individuals' ability to describe others in relatively complex ways. The Role Category Questionnaire (RCQ) has been used to measure the number of psychological constructs used to describe "liked" and "disliked" others, and is correlated with person-centered communication-an ability related to satisfaction in caregiving relationships (Grosch, Medvene & Wolcott, 2008) and positive relationships more generally. Two studies were carried out using the RCQ as a measure of person perception. In the first study 24 residents of two geriatric care facilities and 23 certified nurse aides (CNAs) responded to the RCQ. CNAs used significantly more constructs than seniors to describe others. This difference was solely attributable to the finding that residents used fewer constructs to describe "disliked" others:  $M = 1.75$  versus  $M = 5.79$ ,  $p < .05$ . Results in the second study, involving 82 university undergraduates and 50 seniors recruited from the university's Center for Aging and Physical Activity, followed the same pattern. Seniors used significantly fewer constructs to describe "disliked" others:  $M = 5.12$  versus  $M = 8.7$ ,  $p < .05$ . These results suggest that as we age we use fewer cognitive resources to process negative information about "disliked" oth-

ers. Attendees of the session will learn about our reluctance to describe “disliked” others as we age.

### **CLOCK READING IN CENTENARIANS**

T.M. Neary<sup>1</sup>, S.L. Andersen<sup>1</sup>, M.H. Silver<sup>2</sup>, T.T. Perls<sup>1</sup>, *1. Medicine/Geriatrics, Boston University School of Medicine, Boston, Massachusetts, 2. Beth Israel Deaconess Medical Center, Boston, Massachusetts*

**Objective:** To evaluate clock reading errors in centenarians. **Methods:** Data were collected for a 12-item Clock Reading Test (CRT) with two conditions (with and without numbers). Subjects were 21 women and 5 men, 100 to 108 years of age, who were participants in the New England Centenarian Study (n=74). **Results:** A total of 253 clock readings were administered, with 138 readings (55%) answered correctly and 115 (45%) readings answered incorrectly. 122 errors were identified and categorized into 8 error types. The most prevalent error type (26%) occurred when participants did not account for the relative length of the clock hands. Another common error type (18%) was misreading the minute hand by five minutes or the hour hand by one hour. 16% of errors were categorized as stimulus-bound (i.e., reading the minute hand as both the minute and hour) and 4% of errors occurred as a result of a verbal problem (e.g., reading 4:20 as “20 of 4” rather than “20 past 4.”) 18% of error types were identified as “other.” **Conclusions:** Our results indicate that clock reading errors may reveal conceptual deficits as well as perceptual deficits in cognitive function. These results differ from some previous research that concludes that the CRT does not require executive processing. However, further research on clock reading with other populations is needed to determine if centenarians differ from other age groups in error types and if there is a similar incidence of specific neurodegenerative disorders.

### **CHILDHOOD DISADVANTAGE AND COGNITIVE FUNCTIONING: THE MEDIATIONAL ROLE OF PSYCHOSOCIAL AND BEHAVIORAL LIFESTYLE FACTORS**

J. Lyu<sup>1</sup>, S. Agrigoroaei<sup>2</sup>, *1. UMass Boston, Boston, Massachusetts, 2. Brandeis University, Waltham, Massachusetts*

There is accumulated evidence for the early childhood influences on health outcomes measured later in life. However, a small number of studies have focused on the impact of childhood disadvantage on cognitive functioning in adulthood. The purpose of this study was to investigate this relationship in a national longitudinal sample and to explore whether it is mediated by psychosocial and behavioral lifestyle factors. We used data from the Midlife in the United States (MIDUS) national longitudinal study. Childhood disadvantage, assessed at Time 1, was based on father’s education, mother’s education, childhood welfare, and financial level growing up. Cognitive performance was measured at Time 2 using the Brief Test of Adult Cognition by Telephone (BTACT). Psychosocial and behavioral lifestyle factors included control beliefs, quality of social support, physical exercise, and cognitive activity. Adjusted for age, gender, race/ethnicity, and respondent’s education, the results revealed a negative significant association between childhood disadvantage and executive functioning. In addition, the level of social support and engagement in cognitive activities partially mediated the association between childhood disadvantage and executive functioning. These findings suggest that childhood disadvantage is associated with different lifestyle factors which in turn explain individual differences in cognitive performance.

### **TASK SPECIFIC MIND WANDERING AND DIFFICULTY MEDIATE THE RELATIONSHIP BETWEEN ANXIETY AND PERFORMANCE**

C.B. Rosnick, J. Meeks, A. Ciskowski, *Psychology, Southern Illinois University Edwardsville, Edwardsville, Illinois*

There is a large body of literature that reports a negative relationship between anxiety and cognitive performance. Further, research sup-

ports the idea that intrusive thinking is negatively related to cognitive performance. However, this literature has not examined the role of task specific intrusive thinking and task difficulty on cognitive outcomes. A total of 227 participants ranging in age from 18-88 were used for the current analyses. The participants completed eight cognitive tasks that assessed several cognitive domains. Three of the cognitive tasks were administered on the computer and five of the tasks were in a paper-pencil format. After each cognitive task, participants were to rate the difficulty of the task and report the degree their mind wandered during the task. In addition, participants completed the STAI four times during the study protocol. Three multiple regressions were performed to test a three-path mediation model between anxiety, task specific mind wandering, task difficulty, and cognitive performance. The results revealed a significant three-path mediation model for the cognitive tasks that were administered in the paper-pencil format. Specifically, self-reported anxiety levels during the study period were positively related to mind wandering, mind wandering was positively related to task difficulty, and task difficulty was negatively related to performance. The model using the computerized cognitive tests was not significant. The current findings suggest that the relationship between anxiety and performance is mediated by task-specific mind wandering and difficulty for cognitive tests that participants must use paper and pencil but not for computerized assessments.

### **SUBJECTIVE MEMORY COMPLAINTS, HEALTH, MOOD, AND STRESS: CCRC RESIDENT EXPERIENCES**

K.B. Dassel<sup>1</sup>, H. Ewen<sup>2</sup>, *1. Western Kentucky University, Bowling Green, Kentucky, 2. Miami University, Oxford, Ohio*

Subjective memory complaints within the older adult population have been found to be related to a variety of factors including mood, stress, and general health. However, many of these studies have examined memory complaints in clinical rather than community settings. The purpose of the current study is to explore the relationship among subjective memory complaints, mood, stress, and health in a group of residents (n = 48) living in a continuing care retirement community (CCRC). Study participants were 76.7 years old (sd = 4.6), 56% were married, and 48% were female. The Metamemory Questionnaire (MQ) was used to assess subjective memory complaints in a variety of domains including word finding difficulty, disorientation while driving, and keeping track of appointments. Self-reported mood and overall health were obtained from the SF-36 and the total number of stressful life events was derived using the Holmes Rahe Social Readjustment Rating scale. This population of study participants functioned at a high level with 92% of respondents rating their health as “good” or “excellent”; 88% experienced three or fewer stressful events in the preceding year; 93% reported a positive mood; and 91% reported minor or no complaints regarding their memory. Pearson correlation coefficients were used to assess the relationship among the variables, and no significant associations were found. The results of this study suggest that subjective memory in high functioning community-dwelling older adults may be attributed to factors other than health, mood, and life stress.

### **EFFECTS OF A HOLISTIC MEMORY CLINIC FOR OLDER ADULTS**

L. Hyer<sup>1</sup>, C.V. Scott<sup>2</sup>, J. Dhahliwala<sup>3</sup>, *1. Georgia Neurosurgical Institute & Mercer University School of Medicine, Macon, Georgia, 2. Georgia Neurosurgical Institute, Macon, Georgia, 3. Medical Center of Central Georgia, Macon, Georgia*

Studies have shown that cognitive training for older adults is an asset to improving attention and working memory. Recent studies show promise that a more “holistic” and integrated approach are beneficial to less cognitively fit older adults. This analysis will examine whether the implementation of a 6-session, manualized memory training program can

assist with improving function and overall well-being. Consented participants (N = 112) from the Central Georgia community with Age Associated Memory Impairment (AAMI), Mild Cognitive Impairment (MCI), or mild dementia were asked to participate in memory training on cognitive habits, and attitudes, as well as function and adjustment. Compliance was also measured. We also had a Control group (N=30) who received no training. Finally, we classified participants by Risk Status—Low, Medium and High. Results showed that on the pre-measures the Memory Clinic group did not differ from the Control group. This pattern was also true of the post measures for the two groups. When the groups were separated by risk, however, the Low Risk Group was superior to the other groups, including Control, and continued to be superior in post measures on most cognitive assessments. Compliance also made a difference as those who complied performed better than those who did not. These tended to be Low and Medium Risk subjects. There were differences too on memory complaints and adjustment, again for the Low and Medium Risk Groups. Identifying high and low risk subjects was most helpful, resulting in clear differences between memory complaining subjects.

### THE EFFECTS OF AGE, DECISION STYLES, AND INFORMATION-PROCESSING STYLES ON THE CONSUMER CHOICE BETWEEN HEDONIC AND UTILITARIAN GOODS

X. Ma, *University of Houston Clear Lake, Houston, Texas*

Previous research has shown that consumer perceptions and preferences included both hedonic and utilitarian dimensions (e.g., Batra & Ahtola, 1990). For example, consumers choosing among different apartments may consider about utilitarian features (e.g., distance to work) as well as about hedonic features (e.g., the view of the apartment). The current study examined how consumer choice between two goods, one of which is seen as superior on a hedonic dimension and the other is seen as superior on a utilitarian dimension, was influenced by consumers' age, decision making styles, and information-processing styles. Sixty young (18-25 years old) and 60 older adults (over 60 years old) participated in the current study. They finished the apartment decision task, maximization and regret scale (Schwartz, Ward, Monterosso, Lyubomirsky, White, & Lehman, 2002), and the Rational-Experiential Inventory (REI; Epstein, Pacini, & Norris, 1998). Results showed that older adults were more likely to choose the apartment that was superior on hedonic features than young adults. Further, participants with lower maximization tendency were more likely to choose the apartment that was superior on hedonic features. In contrast, participants with higher rationality scores and higher regret scores were more likely to choose the apartment with superior utilitarian features. The current study made important contributions to our understanding of the factors that influence us make the fundamental trade-offs between hedonic and utilitarian goods.

### SESSION 1980 (POSTER)

#### AGEISM

#### CULTURAL PERSPECTIVES OF THE AGING SEMANTIC DIFFERENTIAL: ATTITUDES TOWARDS OLDER ADULTS AMONG COLLEGE STUDENTS IN CHINA

J. Tan<sup>1</sup>, E. Gonzales<sup>2</sup>, L.A. Marchiondo<sup>3</sup>, *1. Bridgewater State University, Bridgewater, Massachusetts, 2. Washington University in St. Louis, St. Louis, Missouri, 3. University of Michigan, Ann Arbor, Michigan*

Objectives. The Aging Semantic Differential (ASD, Rosencranz & McNevin, 1969) is the most widely utilized instrument to measure attitudes towards older adults within the United States. Our objective was to translate it to Mandarin Chinese and to examine its validity. Methods. Self-administrated anonymous paper-based questionnaires were distributed to a convenience sample (N = 380) of college students in

Shanghai, China. The structure of the data was analyzed using exploratory factor analysis (EFA) with maximum likelihood extraction and oblimin rotation. We then used confirmatory factor analyses (CFA) to confirm the resulting latent variables and compare them to Rosencranz's factors. Results. EFA revealed three meaningful ASD factors in China: (1) personality and mental health, (2) societal participation (social, financial, occupational), and (3) physical health. In a CFA, all items significantly loaded onto their hypothesized factors, and goodness of fit statistics revealed good fit. While Rosencranz's "personal acceptability" category overlapped well with our first factor, the items from his "instrumental-ineffective" and "autonomous-dependent" categories were divided primarily between our last two factors. A second CFA was conducted using Rosencranz's three factors. Comparison of the two CFAs revealed that our model fit the ASD data in China significantly better ( $\Delta df = 87$ ,  $\Delta\chi^2 = 577.2$ ,  $p < .001$ ). Implications. It is possible to use the ASD to assess young adults' attitudes in China. This finding poses implications for other cross-national comparisons of ageism, as well as interventions.

#### THE RELATIONSHIP BETWEEN SYMPTOM EXPERIENCE, AGEIST BELIEFS ABOUT SYMPTOM MANAGEMENT, AND SELF-EFFICACY IN KOREAN OLDER ADULTS

H. Yeom, *Nursing, Dongguk University, Gyeongju, Gyeongbuk, Republic of Korea*

Age-related beliefs and self-efficacy are important issues related to self-care for health problems in older people. The purposes of this study were 1) to examine the extent to which older adults have symptoms and negative ageist beliefs about symptom management and 2) to investigate how experiencing symptoms and negative beliefs about symptom management influence self-efficacy in Korea. Participants were 142 community-dwelling older women, aged 65 and over (M=76.2 yrs). Women completed structured, instruments about demographic information, comorbid health problems, symptoms, negative beliefs about symptom management and self-efficacy. The effect of symptom experience and negative ageist beliefs about symptom management on self-efficacy were tested using hierarchical multiple regression analyses. Women reported an average of nine symptoms (possible range=0-37). The number of symptoms was not significantly related to negative ageist beliefs about symptom management and self-efficacy. Negative ageist beliefs about symptom management was a significant predictor of self-efficacy ( $\beta = -.15$ ,  $p = .03$ ), after controlling for age, education, and the number of comorbid health problems and symptoms, as indicating that older women who had more negative ageist beliefs about symptom management were likely to have lower levels of self-efficacy. This study provides evidence that negative and stereotyped belief about old age is detrimental to self-efficacy of older adults. It highlights the importance of age-related beliefs for better health outcomes and suggests the need for psycho-educational interventions to modifying erroneous and stereotyped beliefs about old age.

#### SOCIAL CONTACT WITH THE ELDERLY AND DEGREE OF COLLECTIVISM AS CORRELATES OF AGEISM IN CAUCASIAN AND ASIAN-AMERICAN POPULATIONS

A. Beatty, *1. Chicago School of Professional Psychology, Elmhurst, Illinois, 2. Midwestern University, Downers Grove, Illinois*

Ageism is a multidimensional form of discrimination involving social, economic, and cultural components. This cross-sectional study correlated level of contact with the elderly and social values and degrees of individualism and collectivism with attitudes toward ageing and the elderly in European-American and Asian-American college students. Participants in this study were undergraduate students (N=114) enrolled in Midwestern community colleges. Ageism was measured by the Aging Semantic Differential. Individualism and collectivism were measured by the Individualism-Collectivism (INDCOL) scale. Level of con-

tact with the elderly was measured by the Hale social contact scale. Results of this study using Pearson's  $r$  correlations indicated that ageism was negatively correlated with collectivism and negatively correlated with contact with the elderly. However, results obtained using multiple regression analysis found that when the variable contact with the elderly was controlled, the contribution of collectivism to ageism was non-significant. The results suggest that ageism is both a socially and culturally related phenomena. Future research should investigate the social and cultural correlates of ageism, with specific emphasis on the origins and developmental influences these correlates have on the onset and maintenance of ageist beliefs.

### **OLDER DRIVERS: ROAD THREAT OR STEREOTYPE THREAT?**

M.J. Polito, M. Lachman, *Psychology Department, Brandeis University, Waltham, Massachusetts*

Driving research has focused on cognitive, perceptual, and physical changes with age to explain the driving performance of older adults, largely ignoring social influences such as stereotypes. There is good evidence that stereotype threat influences performance of older adults in other domains such as memory, but the effects of stereotypes on older adults' driving performance has received little attention. A first step is to clarify the nature of the age-related stereotypes associated with driving. A sample of 146 adults aged 18-85 participated in an online survey assessing general and personal views of older drivers compared to other ages. We found that those under age 50 personally endorsed more negative views of older drivers than those over age 50, though the views of both age groups were negative overall. In addition, both groups believed that most others in the US held views even more negative than their own. Analysis of the items on specific driving behaviors revealed that respondents believed older drivers drive too slowly, react too slowly to situations that arise, get overwhelmed on highways, and have trouble seeing while driving. In contrast, older drivers were seen as less likely to engage in risky behaviors such as driving while using a cell phone, driving while intoxicated, and speeding. Future research will use a stereotype threat paradigm to explore the consequences of these stereotypes on older adults' driving behavior.

### **AGE-IMPLICIT ASSOCIATION TEST (IAT): MEASURING CHILDREN'S STEREOTYPES OF OLDER ADULTS**

R.L. Babcock<sup>1</sup>, E.E. MaloneBeach<sup>1</sup>, B. Hou<sup>1</sup>, J. Hannighofer<sup>2</sup>, *1. Central Michigan University, Mount Pleasant, Michigan, 2. Berlin Institute of Technology, Berlin, Germany*

To examine the existence of stereotypes toward older people in children, a child-friendly version of the Implicit Association Test (IAT) was developed. To ensure efficacy of the Age-IAT for Children, a similar version of the IAT was first used, which was intended to detect a preference for flowers over insects. Besides the expected preference for flowers over insects, results indicated that 3rd and 4th grade children have a clear preference for young persons over older ones. Moreover a paired comparison task and a Smiley Rating Scale were used to measure explicit attitudes toward flowers/insects and older/young persons. Comparing implicit and explicit attitudes brings a clear divergence to light. Children at the age of about 9 years already show differences between their implicit and explicit attitudes toward older people. Assuming that self-presentation goals already influence children's expressions at this age, the importance of measuring implicit attitudes becomes clear. Having developed an Age-IAT for Children moreover offers the opportunity to ascertain whether children younger than those tested in this study would also possess such implicit attitudes toward older people. The possibility of using the Age-IAT for Children to further examine stereotypes and potential interventions is discussed.

### **PERCEPTIONS OF ELDERLY IDENTITIES AND AGEISM AMONG COLLEGE STUDENTS**

C.F. Brito<sup>1</sup>, S.M. Rauch<sup>2</sup>, A.N. Jones<sup>1</sup>, D.J. Pelletier<sup>1</sup>, G.M. Geraci<sup>1</sup>, H.A. Catan<sup>1</sup>, A.N. Hebron<sup>1</sup>, B.A. Byers<sup>1</sup>, *1. Psychology, Eastern Illinois University, Charleston, Illinois, 2. Providence College, Providence, Rhode Island*

The "reverse" golden section hypothesis suggests we organize information in a ratio of only 38.2% positive and 61.8% negative. We examined this pattern with several elderly identities, and their relationship to ageism. Participants (N=213) were administered (1) a questionnaire where they were presented with several identities (e.g., Elderly Person, Senior Citizen, Old Man, Old Woman) and adjective pairs with positive and negative poles (e.g., generous—stingy, unpleasant—pleasant), (2) the Fraboni Scale of Ageism (FSA), and (3) the Crowne-Marlowe Social Desirability Scale (SDS). The average number of times that each identity was assigned a positive pole (% positive) was calculated; and, the relationship among the elderly identities and FSA examined via partial correlations with SDS as the control variable. Participants expressed more positive attitudes toward elderly labels than those predicted by the reverse golden section hypothesis (38.2%). However, the labels for Elderly Person (42% of the time assigned a positive adjective), Senior Citizen (48%), and Old Woman (48%) were still below 50%; the "Old Man" identity was the most positive, at 50%. Correlations between the ratings of the identities and the FSA were small, but significant ( $r = -.202$  for elderly person,  $r = -.162$  for senior citizen, and  $r = -.159$  for old woman.) Ratings of the "Old Man" identity were the only ones that did not relate to ageism ( $r = -.08$ ). Overall, results show that certain elderly identities seem to evoke negative perceptions, perhaps suggesting stigmatization; and, most of these perceptions are somewhat related to ageist attitudes.

### **AN INTERVENTION TO REDUCE AGEISM IN CHILDREN**

B. Hou, R.L. Babcock, E.E. MaloneBeach, *Central Michigan University, Mount Pleasant, Michigan*

The purpose of this research was to determine the effectiveness of a 4-week intervention intended to reduce ageism in young children. At weeks 1 and 6, pre- and posttests were administered to all students in a local middle school (grades 3-5 inclusive). A four-part intervention with a 5th grade class (N=32) was implemented on four subsequent Thursdays. The interventions included the presentation of learning modules on aspects of aging (1. physical/biological; 2. Vision/audition; 3. Olfaction/taste; 4. Social/intergenerational). Each module included small-group discussions with an older adult, a writing session, an illustration, and the development of a glossary of new vocabulary words. The written material and illustrations from each child were compiled into a book; the children received copies of their books; the older adults received copies of the books developed by their group and the 5th grade teachers received copies of the teaching modules. The analyses tested for immediate effects of the intergenerational intervention, and for more peripheral effects on the other classes of children. The results found that children's levels of ageism were not decreased by this intervention. Ideas for improved intervention and evaluation will be discussed. Further, issues for implementing programs that include college students from multiple departments, the local Commission on Aging, and a public school will be discussed.

### **ARE INSTITUTIONAL REVIEW BOARDS FOR HUMAN SUBJECTS RESEARCH AGEIST?**

B.G. Knight<sup>1</sup>, N.A. Pachana<sup>2</sup>, C. Juang<sup>1</sup>, N.M. Peel<sup>2</sup>, *1. University of Southern California, Los Angeles, California, 2. University of Queensland, Brisbane, Queensland, Australia*

Institutional Review Boards (IRBs) for the protection of human subjects frequently raise concerns about research with older adults. A key question is whether the concerns are appropriate or represent stereotypes of older adults as always being frail cognitively or physically.

Sixty-one participants with doctoral level education were recruited and responded to questionnaires online. Content analysis was conducted to classify common themes of ethical issues raised by the IRBs. Results indicated that concerns regarding older adults' cognitive capacity to give consent (49%), concerns about physical frailty and stamina to endure the research protocol (40%) and to provide valid data (28%) were the most common. Implications of these ethical concerns are discussed. Thirty-one percent of the participants disagreed with IRB's comments, and three issues emerged as common complaints: inappropriate bias about all older adults' abilities (33%), overly broad concerns and restrictions (24%), and lack of knowledge of aging research (19%). The results suggested a need to educate IRBs regarding a more nuanced and accurate view of older adults abilities and so target their concerns more precisely.

## SESSION 1985 (POSTER)

### AGING ACROSS CULTURES

#### AGE DIFFERENCES IN TRUST: UNIVERSAL OR COUNTRY-SPECIFIC?

T. Li, H. Fung, *Psychology, The Chinese University of Hong Kong, Hong Kong, China*

Population aging is a global challenge in the twenty-first century. However, few psychological studies have studied age differences across multiple countries. As social relationships contribute significantly to older adults' well-being and trust lays the foundation of constructive social interactions, it is theoretical and practical significant to examine age differences in trust in a worldwide sample. The current study examined age differences in generalized trust and trust toward family members, friends, neighbors, and strangers, using data from the World Value Survey based on 57,497 individuals from 38 countries. We also tested whether the pattern of age differences in trust differed across countries as the result of varying country-level factors (i.e., income inequality, developing status, and individualism). Using hierarchical linear modeling, we found that age was positively related to all the five types of trust across the 38 countries. The magnitude of age differences in trust toward closer groups (family or friends) was relatively smaller than that in trust toward more distant groups (neighbors or strangers). Moreover, the magnitude of age differences in some types of trust was moderated by the country-level factors. From this study, one can obtain a global picture about how people's trust varies with age. We also speculate the possible mechanisms for the positive association between age and trust. Enhancing trust toward others may be the result of older adults' positive reappraisal. Through such process, older adults may maintain emotional connectedness with others. Future studies are encouraged to further investigate the underlying mechanism of age differences in trust.

#### STIGMATIZING HEALTH CONDITION IN NEPAL: EXTERNAL ATTRIBUTION AND INTERNALIZED CONSEQUENCES

J. Subedi<sup>1</sup>, J. Brown<sup>1</sup>, M. Tausig<sup>2</sup>, K. Basnyat<sup>1</sup>, S. Subedi<sup>1</sup>, *1. Sociology & Gerontology, Miami University, Oxford, Ohio, 2. University of Akron, Akron, Ohio*

An extensive literature has documented the stigmatization of poor health, especially mental health in industrialized nations. Less work, however, has examined this issue in the developing world, and even less research has focused on the consequences of internalizing that stigma for older adults in poor health. In this study, we use the Kathmandu Mental Health Survey and the Jiri Health Survey from Nepal to examine two questions: (1) what social factors predict the level of stigma that a healthy older person in Nepal attributes to a person with mental illness, and (2) what are the mental health consequences for an individual, especially for an older adult, who has internalized the negative stigma about their poor health status? Our results show that men in

particular are more likely to stigmatize mental illness in Nepal than women, while other predictors such as age and education are not related to this process. Among those who have poor health, being female and being older are related to having poorer mental health, while being married is related to better mental health outcomes. Additionally and more importantly, internalization of such stigma is related to increased risk of depression. We discuss the implications of these findings for both academic work in aging and health as well as for aging and health policy in Nepal.

#### A META-ANALYSIS OF THE FACTOR STRUCTURE OF THE GERIATRIC DEPRESSION SCALE (GDS): THE EFFECTS OF LANGUAGE

C. Huang<sup>1,3</sup>, G. Kim<sup>2,1</sup>, J. DeCoster<sup>4</sup>, A.N. Bryant<sup>1</sup>, *1. Department of Psychology, University of Alabama, Tuscaloosa, Alabama, 2. Center for Mental Health and Aging, University of Alabama, Tuscaloosa, Alabama, 3. Center for Community-Based Partnership, University of Alabama, Tuscaloosa, Alabama, 4. Center for Advanced Study of Teaching and Learning, University of Virginia, Charlottesville, Virginia*

**Objectives:** The Geriatric Depression Scale (GDS) has been widely used in diverse cultural groups and has been implemented in more than 30 different languages. The present meta-analysis examined whether the factor structure of the GDS varies by language. **Methods:** A total of 26 published studies (14,669 participants; 10 languages) met the inclusion criteria and were included in the meta-analysis. Exploratory factor analyses were conducted to examine the factor structure of the GDS in the overall sample as well as in each language, including Chinese, English, Greek, Hindi, Iranian, Italian, Japanese, Korean, & Portuguese. **Results:** The analysis of the overall sample resulted in a four-factor structure, whereas the analyses of the individual languages produced structures with 4 to 6 factors. The mean variable cosines comparing the observed factor structures of the GDS across different languages ranged from .780 to .854, suggesting that the different languages produced distinct factor structures. The three factors of dysphoria, social withdrawal-apathy-cognitive impairment, and positive mood were commonly observed across different languages. **Conclusions:** The findings provide strong evidence of language differences in the factor structure of the GDS. It is suggested that researchers and clinicians exercise caution when administer the GDS in different languages. Structural differences should be taken into account when interpret the scores yielded from different language versions of the GDS.

#### THE SECRETS TO LONGEVITY: THE IMPACT OF TRADITIONAL CUSTOMS AND SPIRITUALITY IN THE AMAMI ARCHIPELAGO

M. Takahashi<sup>1</sup>, K. Tomizawa<sup>2</sup>, *1. Northeastern Illinois University, Chicago, Illinois, 2. Ritsumeikan University, Kyoto, Kyoto, Japan*

This project explored possible longevity factors in the Amami islands (Amami-oshima, Tokuno-shima, and Yoron-to) of Japan where the centenarian ratio is significantly higher than that of the neighboring Okinawa (126.24 vs. 66.04 centenarians per 100,000). In particular, we focused on the psychological outlook associated with their traditional customs and spiritual practices. We "shadowed," documented, and interviewed nine oldest old (mean age=93.2) and three of their relatives, two local ethnographers, and two shamans among others who were involved in traditional rituals and festivals. The transcribed qualitative data were analyzed by a Modified Grounded Theory Approach (M-GTA). The overall results reveal four psychological longevity factors that are unique to this culture: a) a sense of interdependency cultivated through shared historical events (e.g., being a target of ethnic and religious discrimination) and severe climate; b) a strong sense of belongingness in the community in which a genuine respect for older adults is fostered and displayed in various rituals

and ceremonies throughout the year; c) a sense of spirituality derived from a indigenous “religious” belief that integrates animism, ancestor worship, Shintoism, Buddhism, and Christianity, and d) perhaps as a result of the above factors, the older adults in the Amami enjoy a slow, relaxed life style that revolves around its unique tradition. In addition to the conventional biogenetic factors, these results suggest that the interplay between the traditional customs/spirituality and the associated psychological outlook may play a significant role in promoting longevity.

### **CROSS-COUNTRY COMPARISON OF CHANGES IN CLINICAL RISK IN U.S., ENGLAND, MEXICO, TAIWAN, AND INDONESIA**

J. Kim, E. Crimmins, *University of Southern California, Los Angeles, California*

Recent longitudinal biomarker data in several countries provide an opportunity to examine changes in markers of physiological status with age as well as the onset of biological risk and factors that are associated with those changes across countries. This study examines the link between age and the values of clinical biomarkers. Using two waves of national datasets from five countries (U.S., England, Mexico, Taiwan and Indonesia), we examine changes in systolic and diastolic blood pressure and BMI in the five countries. Our analysis includes respondents age 50+ who participated in the physical examination and blood collection. We categorize the change in biological risk into those who moved into the high risk category, those who stayed in the normal range, those who stayed high risk, and those who got better, and use multinomial logistic regression to look at variability in change with age. The results show that persons at older ages are less likely to remain in and return to the normal range for BMI in Mexico and Indonesia; older ages are less likely to return to normal BMI in England; and older ages are less likely to maintain normal BMI but more likely to get worse in the United States. Older ages were more likely to be related to change in blood pressure status except in Mexico. This study provides a better understanding of physiological aging in different environmental and cultural circumstances.

## **SESSION 1990 (POSTER)**

### **AGING AND EMOTIONS**

#### **POSITIVITY EFFECTS IN OLD AGE – A QUESTION OF AROUSAL AND MODALITY?**

B. Streubel, U. Kunzmann, *Department of Psychology, University of Leipzig, Leipzig, Germany*

Positivity effects in older adults’ affective information processing have been demonstrated in attention and memory. This study investigated positivity effects in subjective and cardiovascular reactions to negative pictures differing in arousal. Proceeding from the idea that positivity effects will be evident on the level of controlled rather than automatic processes, we predicted that, in comparison with their younger counterparts, older adults will show smaller reactions to the negative pictures at later rather than early stages of information processing and only if the stimuli are low rather than high in arousal. Forty-one younger and 46 older adults rated their emotional experience of 58 negative pictures from the International Affective Picture System in terms of unpleasantness. In addition, phasic heart rate changes were assessed online and considered as an indicator for the allocation of attentional resources during picture viewing. As predicted, and consistent with previous findings, in comparison to their younger counterparts, older adults reported less unpleasantness in response to low-arousing negative pictures; however, there were no age differences in subjective reactions to pictures with high arousal. As to cardiovascular reactions during picture viewing, there were no age differences in the initial heart rate

deceleration; however, in comparison with their younger counterparts, older adults showed less pronounced mid-interval deceleration suggesting less sustained attention. Together, the present findings provide support for the idea that positivity effects in old age are evident on different levels of emotional functioning (i.e., subjective and physiological) and refer to controlled rather than automatic processes.

### **AGE DIFFERENCES IN EMOTION RECOGNITION: THE EFFECTS OF CONTEXT AND EMOTION QUALITY**

C. Wieck, U. Kunzmann, *University of Leipzig, Leipzig, Germany*

Past work suggests age deficits in various emotion recognition tasks. In these tasks, emotions are typically presented in isolated faces, voices, or written texts and little information about the contexts of these emotions is provided. Proceeding from the idea that age deficits in effortful cognitive processes such as emotion recognition can be reduced if the task is context-rich and age-relevant, the present study asked young and old adults to view twelve film clips, each portraying a woman while she relieved an emotional memory. The clips varied in the age of the protagonist (young vs. old), the emotional quality (anger, sadness, joy) and the age-relevance of the memory (young adults, older adults, age-neutral). After each film, participants rated the protagonists’ emotions via a list of 16 adjectives. Emotion recognition performance was computed as intraclass correlation between a participant’s other-ratings of the target’s emotions and the target’s self-ratings of her emotions. Preliminary analyses suggested age deficits in anger and sadness recognition, but only if the task was of little relevance to older adults or of no particular age-relevance. As predicted, age differences in negative emotion recognition were diminished if the task was of high relevance to older adults. Together, this evidence points to motivational processes that can compensate age deficits in cognitive demanding tasks.

### **CONTEXTUAL INFORMATION DISAMBIGUATES EMOTIONAL FACIAL EXPRESSIONS FOR OLDER ADULTS**

J.T. Stanley<sup>1,2</sup>, F. Blanchard-Fields<sup>2</sup>, *1. University of Akron, Akron, Ohio, 2. Georgia Institute of Technology, Atlanta, Georgia*

Young adults are more accurate than older adults at identifying emotional facial expressions (e.g., anger, sadness) in traditional laboratory tasks of emotion recognition. But the traditional emotion recognition task lacks context. In the present study, we investigated whether adding contextual information reduces age differences in emotion recognition accuracy. Seventy-six young adults (19-28 years) and 66 older adults (61-80 years) completed three emotion recognition tasks: a facial task, a lexical task, and a combined facial plus lexical task. The facial task was similar to the traditional emotion recognition task where participants viewed 35 static photos of facial expressions (5 each of anger, fear, disgust, happiness, sadness, surprise, and neutral) and chose an emotion label from a list. In the lexical task, participants heard 35 sentences presented in a neutral tone of voice and chose an emotion to identify what the character was feeling. In the combined task, participants viewed the 35 facial expressions while they simultaneously heard the emotionally-congruent sentences, or “context”. Again, participants chose an emotion from a list for each item. Consistent with our hypothesis, the addition of contextual information (in the combined condition) improved the emotion recognition accuracy of older adults more than that of young adults. Interestingly, age differences for anger recognition persisted, even in the combined condition. Overall, these findings suggest that contextual information can help disambiguate emotional information, especially for older adults. They also suggest that past work on aging and emotion recognition may have underestimated older adults’ ability to recognize emotions in daily life.

## ANXIOUS MOOD INDUCTION: USE OF A MUSIC AND MEMORY PROCEDURE WITH OLDER AND YOUNGER ADULTS

S. Rastegar, B.G. Knight, *Department of Psychology, University of Southern California, Los Angeles, California*

Mood induction procedures (MIPs) are a powerful tool for examining mood states under experimental conditions. MIPs have not frequently been used to evoke anxiety in older adults. Forty-one older and 76 younger adults were randomized to anxious or calm MIPs, involving mood-congruent music and autobiographical memory. Visual analog scale (VAS) anxiety ratings and 10-item Spielberger Trait Anxiety Inventory – State (STAI-S) scales were given at baseline, following MIPs, after a cognitive task, and following booster MIPs. Repeated-measures ANOVA analyzed the effects of the MIPs over time by induction and age group. Between-subjects results indicated that the MIPs produced differences in anxiety level by induction group (VAS anxiety:  $F(4,113)=50.023$ ,  $p<0.0001$ ; STAI-S:  $F(4, 112)=24.567$ ,  $p<0.0001$ ). There were no significant between-subjects age x induction interactions. Significant within-subject three-way interactions between time, age, and induction group were found on both the VAS anxiety (cubic interaction,  $F(4,113)=4.067$ ,  $p<0.05$ ) and the STAI-S (quadratic interaction,  $F(4, 112)=7.470$ ,  $p<0.01$ ). Post-hoc independent-samples t-tests revealed that, following the cognitive task, older adults no longer differed in anxiety ratings by induction group (VAS anxiety,  $t=-0.308$ ,  $p=0.759$ ; STAI-S,  $t=-0.300$ ,  $p=0.766$ ), whereas younger adults scores by induction group remained significantly different (VAS anxiety,  $t=-4.934$ ,  $p<0.0001$ ; STAI-S,  $t=-4.440$ ,  $p<0.0001$ ). Our findings suggest that an anxious MIP using music and autobiographical memory is effective in producing mood change in both older and younger adults, although it appears older adults may more quickly regulate their mood following these MIPs. Results add to research suggesting that older adults more rapidly recover from MIPs (Larcom & Isaacowitz, 2009).

## DAILY CO-OCCURRENCE OF AFFECT AND STRESS RESIDUE IN OLDER ADULTS

J.L. Ramsey<sup>1</sup>, S.D. Neupert<sup>1</sup>, D. Mroczek<sup>2</sup>, A. Spiro<sup>3</sup>, *1. Psychology, North Carolina State University, Raleigh, North Carolina, 2. Purdue University, West Lafayette, Indiana, 3. VA Boston Healthcare System and Boston University School of Public Health, Boston, Massachusetts*

Studies have indicated that increased emotional complexity, operationalized as daily co-occurrence of affect in this study, is related to reduced stress in older adults. Older age has been associated with a greater likelihood of experiencing positive and negative emotions at the same time. Research also suggests that stress residue from one day to the next may differentially impact an individual's ability to respond in a resilient and adaptive manner when faced with stress which continues to be present across days even if the original stressor no longer remains. The present study examined the relationship between daily co-occurrence of affect, stress residue, and negative affect in 311 older adults (60-89 years) responding to a daily diary study of the VA Normative Aging Study. Daily co-occurrence of affect was measured for each participant as their intraindividual correlation between positive and negative affect over the 8 days. Stress residue was operationalized as the within-person relationship between a stressor on one day and affect on a subsequent day, controlling for affect on the previous day and same-day reactivity. Results indicated a Daily Co-Occurrence of Affect X Stress Residue; people with a higher co-occurrence of affect tended to exhibit less stress residue while people with a lower co-occurrence of affect tended to exhibit more stress residue. These results suggest that daily co-occurrence of affect may be an important resilience factor for older adults.

## LIFE SATISFACTION, EMOTIONAL SUPPORT, AND HEALTH: THE IMPACT OF RACE-BASED REJECTION

Y. Cheng, D. Grün, *Department of Psychology, NC State University, Raleigh, North Carolina*

Chronic social rejection may have negative long-term effects on individuals' mental (e.g., life satisfaction) and physical health. In the present study, we investigate the effects of chronic rejection in the context of race. Race-based rejection is social rejection due to one's race or ethnicity. It can affect individuals' well-being both directly (e.g., emotional distress) and indirectly (e.g., social barriers in obtaining health care). We expect that individuals experiencing more race-based rejection not only report more rejection-related mental and physical symptoms, but also report poorer general physical and mental health and lower life satisfaction. To test this idea, we used data from the Behavioral Risk Factor Surveillance System (BRFSS), a representative telephone survey of U.S. adults. As part of an optional module, 10 states included questions about treatment compared to other races and physical and mental symptoms due to race-based rejection. For our research question, we only included non-white adults ( $N = 12,230$ ). Age ranged from 19 to 99 ( $M = 49.0$ ,  $SD = 16.7$ ). To address our research question, we analyzed path models including age and sex as predictors for both treatment and symptoms of race-based rejection. Both race-based rejection variables then were predictors for the three outcome variables: life satisfaction, emotional support, and physical health. In general, race-based rejection had negative effects on all outcome variables. Moreover, older adults reported lower race-based rejection than younger adults. Age also moderated the relationship between treatment and related symptoms. Findings are discussed in the context of theories of rejection.

## THE DIFFERENTIAL EFFECT OF CHOICE ON REGRET IN OLDER AND YOUNGER ADULTS: GIVEN THE SAME CHOICES, YOUNGER ADULTS REGRET THEIR DECISION MORE THAN OLDER ADULTS

M. Feng, G.C. Davison, *University of Southern California, Los Angeles, California*

Older adults have reported experiencing fewer regrets than younger adults; however it is unclear whether this age difference is due primarily to older adults' avoidance of potentially negative consequences or to differences in reaction to an unfavorable outcome. The proposed study employs a methodology that minimizes the use of antecedent-coping strategies to control their environment. We examined whether younger and older adults differed in their level of regret when reacting to a hypothetical scenario where they must choose between two airline flights. As the negative consequences of their choice unfold, participants rate their level of regret at different points throughout the scenario. A control condition engages participants in the same scenario but without the choice point. Analyses revealed a marginally significant interaction between age and choice condition on regret,  $F(1,180) = 3.55$ ,  $p = .06$ ,  $\eta^2 = .02$ . A significant main effect of age was found,  $F(1,180) = 5.28$ ,  $p = .02$ ,  $\eta^2 = .03$ ; however a main effect of choice condition was not significant  $F(1,180) = .09$ ,  $p = .77$ ,  $\eta^2 < .001$ . Post-hoc analyses revealed that younger adults were more regretful than older adults in the choice condition,  $F(1,92) = 14.26$ ,  $p < .001$ , whereas no age differences were found in the control condition,  $F(1,92) = .90$ ,  $p = .35$ . Results from this study suggest that older adults experience lower levels of post-decision regret than younger adults, even when encountered with the same choices and decision outcome.

## INTERPERSONAL DAILY STRESSORS AND PSYCHOLOGICAL WELL-BEING IN PERSONS WITH MILD COGNITIVE IMPAIRMENT

E.A. Hahn, W.E. Haley, R. Andel, *School of Aging Studies, University of South Florida, Tampa, Florida*

Introduction: Daily stressors may contribute to greater psychological distress in the daily lives of persons with mild cognitive impairment (MCI), but research examining daily experiences and their relationship to psychological well-being has been limited. This study

examined daily stressors in relation to psychological well-being by contrasting MCI and cognitively healthy older adults. Methods: A convenience sample of 13 MCI and 23 cognitively healthy participants were recruited from a university-based memory clinic. Participants completed a baseline interview and up to eight days of interviews, consisting of self-reported daily stressors, daily positive affect (PA) and daily negative affect (NA). Daily stressors were examined first as “any” stressors, and then as interpersonal (e.g., spousal conflict) and non-interpersonal (e.g., transportation problem). Controlling for depressive symptoms, multi-level modeling was used to examine within- and between-person daily stressors as predictors of PA and NA. Results: Most participants were female, White, married, had more than a high school education, and averaged 15 on the CES-D (SD=10.69). MCI participants had higher depressive symptoms, reported similar overall stressors, more interpersonal stressors, lower PA, and higher NA than controls ( $p < .05$ ). Reporting any daily stressor was not associated with affect. For both groups, on days when a participant reported an interpersonal stressor, they had decreased PA (Est=-0.20,  $p = .032$ ); for persons with MCI, only, they had higher NA (Est=0.22,  $p = 0.01$ ) compared to controls. Non-interpersonal stressors were not associated with affect. Discussion: MCI participants appeared to have worse psychological well-being than controls, and interpersonal stressors may contribute to distress in their daily lives.

### **INTRUSIVE THOUGHTS MEDIATE THE ASSOCIATION BETWEEN PERCEIVED DISCRIMINATION AND COGNITIVE PERFORMANCE IN ADULTS**

E. Munoz, J. Smyth, M. Sliwinski, *The Pennsylvania State University, University Park, Pennsylvania*

Perceived discrimination (PD) describes the extent to which individuals feel that they are treated unfairly in their daily lives. PD is a source of stress that is associated with poor physical and mental health (Hunte, 2011; Kessler, 1999). The emotional and cognitive responses associated with PD, such as negative affect (NA) and intrusive thoughts (IT), have been hypothesized to mediate the association between PD and various health outcomes (Jackson et al., 2006). This study focused on measures of cognitive health and sought to determine whether NA and IT mediate the association between PD and cognition. Because different theoretical perspectives may predict age-related deficits or increases in emotion-regulation abilities, we explored whether older adults were more or less affected by PD-related responses. A sample of adults ( $N = 324$ ) aged 19 to 83 years (Mage=49, SD=17; 50% female; 53% white, 37% black, 10% other) completed a battery of cognitive tasks and measures of PD, IT, and NA. Results indicated that PD was negatively associated with performance on working memory ( $\beta = -.04$ ,  $p < .01$ ), primary memory ( $\beta = -.03$ ,  $p < .01$ ), and fluid intelligence ( $\beta = -.18$ ,  $p < .05$ ). As hypothesized, IT mediated the association between PD and each cognitive measure ( $\beta$ s =  $-.05$  to  $-.01$ ,  $p < .01$ ), but NA did not. Contrary to expectations, age did not moderate the mediation results for IT. These findings demonstrate that IT may comprise an important pathway through which PD influences cognitive performance and suggests that older adults are just as affected as younger adults by experiences of IT.

### **ARTFUL AGING**

#### **CATHY RIGBY RETURNS TO NEVERLAND AT AGE 58: HOW ONE WOMAN REFUTES AND DEFINES FRAMES OF GENDER AND AGING**

K. Moody<sup>1</sup>, M. Rivera-Hernandez<sup>2</sup>, 1. *The University of Iowa, Iowa City, Iowa*, 2. *Miami University, Oxford, Ohio*

For years, Cathy Rigby defied traditional gender roles in society as the titular character of the Broadway musical *Peter Pan*, and was even

nominated for a Tony Award for her performance as the “boy who refuses to grow up” in 1991. Twenty years later, Rigby returned to the role as star and producer, and her story has changed from the discussion of her gender and its effect on performances to how her age has become a discussion point regarding her portrayal of Peter Pan. This study used discourse analysis and framing of news stories gathered over a six-month period from publications that specifically focus on theatrical productions and Broadway musicals, such as *The New York Times*, *The New Yorker*, and *Playbill*. In it, we explored how writers – and even Rigby herself – addressed the issue of aging, and extrapolate this information to provide a cultural perspective of aging within modern culture. Themes of possibility, impossibility, and perseverance are discussed, along with how modern entertainment media constructs aging by contrasting Rigby’s age with those of younger performances. Even the way that Rigby defines her own identity displays a personal frame of aging as one of dichotomy in self-efficacy, where her conflict stems from how she is able to negotiate her body’s ability to perform by contrasting herself against younger performers. These frames expand the literature of both communication studies about framing and the popular consciousness of aging within entertainment media.

### **FROM THE STAGE TO THE INTERNET PAGE: SOCIAL MEDIA’S INFLUENCE ON PERCEPTIONS OF LATE LIFE POTENTIAL**

J. Eaton, *University of Utah, Salt Lake City, Utah*

Aging and the arts literature emphasizes the ability of the arts to highlight potential in the aging individual. While older adults may experience increased self-efficacy, mastery, and possibility, the question arises as to the ability of the arts to enable others to acknowledge that same potential. Social media is untapped in terms of analysis of perceptions to aging and the arts. The purpose of this qualitative study is to better understand audience perceptions of artistic performance via social media. Purposive sampling was used to identify a professionally created online video, found on a popular social media site, incorporating older adult performance and popular music to increase heterogeneity of viewers. Ben Kwell’s *Penny on the Train Track* (2007) was chosen and included 62,983 views as of July 18, 2011. A total of 60 comments were posted to the video and analyzed using In Vivo coding, followed by a second cycle of coding to identify patterns. Comments focused on feelings of joy, self-reflection, personal hope for the future, respect, infantilization, and aging bias. Audiences were forced to view aging outside of their assumptions which was uncomfortable for some, but expanded the reactions of others demonstrating the opportunity of artistic performance to alter reactions to the aging experience. This study establishes a need for greater understanding about the influence of late life performance on perceptions of the social media audience. Future studies need to focus on performance utilizing individuals with a variety of abilities and levels of independence.

### **EVALUATING AN INTERACTIVE ART PROGRAM FOR OLDER ADULTS AND CAREGIVERS**

R.L. Berman<sup>1</sup>, K. Kiehn<sup>2</sup>, 1. *Leonard Schanfield Research Institute, CJE SeniorLife, Chicago, Illinois*, 2. *CJE SeniorLife, Chicago, Illinois*

Evaluating creative arts programs can pose significant challenges for researchers, particularly in community settings where attendance at multiple sessions is voluntary. This poster presents a case study of the process of designing and implementing an evaluation of Art in the Moment (AIM), developed in collaboration with the Art Institute of Chicago and based on Meet Me at the MOMA. AIM utilizes art as a vehicle for older people, including those with dementia, to communicate, reminisce, and reflect on their life experiences with caregivers and other companions. Participants engage in viewing and discussing famous works of art with a trained docent, followed by a related art-making activity. The anticipated program outcomes are improvement in mood

and meaningful personal interactions and dialogue between care partners and other participants. The evaluation process encompassed: 1) initial collaboration with program staff to clarify outcomes and identify feasible evaluation strategies, 2) development of specific methods to measure outcomes, and 3) ongoing review and use of interim results, and 4) modification of evaluation strategies for the final year of the project. Evaluation methods include a pre- and post- measure of mood (single item faces scale from Meet Me at the MOMA), self-report items regarding confidence in self expression and communication, satisfaction questions, open-ended phone interviews, and observations of participant engagement. Critical analysis of this case study in evaluation raises important issues and implications for evaluating the outcomes of arts-based interventions and programs.

#### **ART & ALZHEIMER'S: PARTICIPANTS' VIEWS OF THE ANDY WARHOL ART ENGAGEMENT ACTIVITY**

J.D. Flatt<sup>1</sup>, A. Liptak<sup>3</sup>, J. Googan<sup>2</sup>, T. Varner<sup>2</sup>, J. Lingler<sup>3</sup>, 1. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania*, 2. *Andy Warhol Museum, Pittsburgh, Pennsylvania*, 3. *University of Pittsburgh School of Nursing, Pittsburgh, Pennsylvania*

**Purpose:** To describe persons with Alzheimer's (AD) and their caregivers' subjective views and experiences regarding participation in an art engagement activity. **Methods:** Four focus groups were conducted with participants in a novel art engagement activity at the Andy Warhol Museum. Immediately following the completion of the activity, we recruited 10 persons with AD or cognitive impairment and 10 caregivers to share their views and experiences. Open-ended questions were asked in each focus group and we used the qualitative method of grounded theory to analyze the data. Participants also completed a brief satisfaction survey and associations were examined using nonparametric statistics. **Findings:** Three key themes were identified that described the aspects that participants' enjoyed overall: cognitive stimulation, social connections, and a sense of self. In addition, we identified programmatic issues such as participant characteristics, activity-specific concerns and program logistics that can be utilized to improve future program offerings. We also found that past experience with art and perceived social cohesion were correlated with participants' overall level of enjoyment of the program ( $r=.54$ ,  $p<.05$ ,  $r=.71$ ,  $p<.01$ , respectively). **Health Implications:** It is important to explore how meaningful activities such as the arts may benefit persons with AD and their caregivers. Enjoyment and a sense of connection with others may have important implications for improving quality of life and minimizing the stigma associated with AD and other dementias.

### **SESSION 2000 (POSTER)**

#### **ASSESSMENT AND MEASUREMENT**

##### **COMPONENT STRUCTURE OF THE GERIATRIC ANXIETY SCALE IN A SAMPLE OF OLDER ADULTS**

A. Mueller, D.L. Segal, M. Marty, *Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado*

**Introduction:** The Geriatric Anxiety Scale (GAS; Segal et al., 2010) is a promising new self-report screening measure of anxiety. The measure was developed to have three theoretically derived subscales (cognitive, affective, and somatic) which require empirical validation. The purpose of this study was to test the component structure of the GAS in a large sample. **Method:** Community-dwelling older adults ( $N=386$ ;  $M$  age = 72.13 years,  $SD = 7.57$ ; 63% European American; 62% women) recruited from a community mental health clinic and the voter registry of El Paso County completed the GAS as part of two larger studies. **Results:** The 25 items of the GAS were subjected to principal components analysis (PCA). PCA indicated the presence of five components with eigenvalues exceeding 1, explaining 41.5%, 5.7%, 4.9%, 4.4%, and 4.2% of the variance, respectively. Based on the screeplot, we

decided to retain the first two components, and PCA was conducted forcing two factors using a direct oblimin rotation. The two component solution explained 47.3% of the variance. The majority of items that loaded onto the first component were from the cognitive and affective subscales, and the majority of items that loaded onto the second component were from the somatic subscale. There was a strong positive correlation between the two components ( $r = .63$ ). **Discussion:** The GAS appears to have two primary components. The first appears to measure a combination of cognitive and affective symptoms of anxiety whereas the second appears to measure primarily bodily symptoms. Further validity studies of the underlying components are needed.

##### **THE MARWIT-MEUSER MINI CAREGIVER GRIEF INVENTORY (MMM-CGI)**

J. Strong, B.T. Mast, *Psychological and Brain Science, University of Louisville, Louisville, Kentucky*

The Marwit-Meuser Caregiver Grief Inventory (MM-CGI) is a 50 item questionnaire designed to assess three aspects of caregiver grief: personal sacrifice/burden (A), heartfelt sadness/longing (B), and worry/felt isolation (C). We sought to create and test a 10 item short form of the MM-CGI in 80 dementia caregivers. Ten items were selected based upon (1) their ability to discriminate between caregivers with high and low levels of grief/burden, (2) item-total correlations, and (3) their representation of the three subscales from the full MM-CGI. Based on this approach, we constructed a shorter version consisting of 10 items (four subscale A items, three items each for subscales B and C). The short-form had high internal consistency (Cronbach's alpha = .87) and the short form total score was highly correlated with the 50-item total score (0.96). The short-form subscale totals were highly and significantly correlated with the short-form total score at the  $p<0.001$  level (subscales A: 0.88; subscale B: 0.80; subscale C: 0.84). The short-form total score was also highly correlated with measures of depression (Geriatric Depression Scale: 0.43), another measure of anticipatory grief (Anticipatory Grief Scale: 0.75) and a measure of burden (Zarit Burden Interview: 0.70). Caregiver grief can be measured in a brief, yet reliable and valid manner, thus increasing its appeal for use in clinical settings.

##### **PREDICTORS OF PERFORMANCE-BASED INSTRUMENTAL ACTIVITIES OF DAILY LIVING**

E. Schmidt, L.A. Ross, K. Ball, *University of Alabama at Birmingham, Birmingham, Alabama*

Normal neurocognitive decline during aging can impinge on a range of cognitive domains, including memory, reasoning, and processing speed. Elevated chronic stress and depression have also been linked to greater cognitive dysfunction and may even be predictive of later mild cognitive impairment and dementia. Furthermore, cognitive functioning is strongly associated with the ability to independently perform instrumental activities of daily living (IADLs) such as driving, cooking, paying bills, and managing medications. Yet it remains unclear which cognitive assessments best predict functional performance on IADLs in at-risk adults. Additionally, psychological factors, such as depression and perceived stress, are often overlooked when evaluating IADL performance. This study investigates (1) the relationships of several cognitive constructs (memory, reasoning, and processing speed) to, and (2) the impact of psychological factors (depression and perceived stress) on performance-based IADLs in a sample of sedentary older adults with impaired processing speed ( $N=233$ ; mean age=75,  $SD=5.9$ ). Linear regression revealed that after accounting for age and education, significant predictors of IADL performance were measures of memory (Hopkins Verbal Learning-Recognition; Benton Visual Retention Test), reasoning (Letter Series), and processing speed (Complex Reaction Time),  $ps < .05$ . Additional regressions on subsamples investigated the impact of perceived stress ( $n=146$ ) and depressive symptoms ( $n=229$ ) on IADL performance. Implications, as well as the utility of objective performance-based measures of everyday functioning (versus self-report measures), will be discussed.

## THE FAUX PAS TEST PREDICTS CHANGES IN SOCIAL FUNCTIONING AT 15-MONTH FOLLOW-UP IN COMMUNITY-DWELLING OLDER ADULTS

S.V. Rowe<sup>1</sup>, J. Shouse<sup>2</sup>, B.T. Mast<sup>2</sup>, 1. *Salem Veterans Affairs Medical Center, Salem, Virginia*, 2. *University of Louisville, Louisville, Kentucky*

Theory of Mind (ToM) is the ability to infer the mental states of others and the self. Two measures of advanced ToM, the Faux Pas Test (FPT) and the Eyes Test, have demonstrated utility in distinguishing clinical populations with marked social deficits. There is evidence that ToM performance may decline with age, though empirical links between ToM and social functioning have not been established in community-dwelling older adults. In the baseline sample of the Study of Thinking and Relationships (STAR), no relationship was found between the ToM measures and multiple measures of social functioning (negative social exchanges, social inappropriateness, social support, and social network size) in community-dwelling older adults. The current study examines the longitudinal relationship between ToM performance at the STAR baseline and changes in social functioning at 15-month follow-up. Preliminary data analysis of 24 participants indicates that poor baseline FPT performance, but not Eyes Test performance, is associated with increases in socially inappropriate behaviors (FPT Content:  $r = .45$ ,  $p = .03$ ) and increases in negative social exchanges (FPT Empathy:  $r = .368$ ,  $p = .05$ ) 15 months later. The FPT Content score, which reflects an individual's ability to describe the faux pas in a given story, independently predicted increases in socially inappropriate behaviors after controlling for age, education, estimated verbal IQ, and global cognitive functioning ( $\beta = .52$ ,  $p = .02$ ). Though preliminary, the current results suggest that the FPT may be particularly sensitive in detecting underlying neurological or cognitive changes that have implications for adaptive social functioning in community-dwelling older adults.

## UTILITY OF THE DRS-2 SUBSCALES IN PREDICTING SOCIAL NETWORK CHANGES IN OLDER ADULTS

J. Shouse, S.V. Rowe, B.T. Mast, *Dept. of Psychological and Brain Sciences, University of Louisville, Louisville, Kentucky*

Recent research has demonstrated an association between cognitive functioning and social network size (SNS). The Dementia Rating Scale-2 is one of the most widely used screening measures with older adults. The present study examined the extent to which the DRS-2 subscales might be useful in identifying older adults with smaller social networks. Specifically, this study hypothesized that the Memory, Initiation/Perseveration and Conceptualization subscales would be related to social network sizes (SNS) as measured by the social convoy method. Executive functioning, represented in the I/P and Conceptualization subscales, has been linked previously with social functioning, while memory problems could also present social challenges (e.g. maintaining social contact and remembering significant events). Consistent with study predictions, among the DRS-2 subscales, Memory ( $r = .298$ ,  $p < .01$ ), I/P ( $r = .266$ ,  $p < .05$ ) and Conceptualization ( $r = .239$ ,  $p < .05$ ) emerged as significant correlates of fewer outer circle social network contacts. I/P was the only subscale which maintained significance after inclusion of demographic and control variables in a linear regression ( $\beta = .306$ ,  $p < .05$ ). The finding emphasizes the importance of executive functioning in maintaining an extended social network. These results suggest possible avenues of intervention for older adults experiencing social deficits and potential utility of the DRS-2 to identify socially at-risk elders. Dysregulation of inhibition and goal directed behavior observed in elders with lower EF, in addition to memory deficits, might accelerate network changes predicted by socioemotional selectivity theory.

## TOOLS TO ASSESS PAIN IN LONG TERM CARE PATIENTS WITH DEMENTIA: WHAT PROGRESSES HAVE WE MADE?

S. Zwakhalen, J. Hamers, *HSR, University Maastricht, Maastricht, Netherlands*

In recent years, research in the field of pain among elderly people with dementia focused on the development of tools to assess pain ade-

quately. In 2006 we presented the results of a systematic review (Zwakhalen et al., 2006). In this study we present an update that review and answer the following questions; 1. What tools are available to assess pain in elderly people with dementia? 2. What are the psychometric properties of these tools? 3. What is the clinical usefulness of the tools? We reviewed the relevant publications detected by an extensive search strategy, involving computer searches in Medline, Psycinfo and CINAHL. In addition references were screened and unpublished manuscripts were searched for. The search strategy focused on publications published after the review of 2006 by Zwakhalen. Data were extracted from the publications and quality judgment criteria were used to evaluate the psychometric properties. Currently over 20 tools are available. They differ extensively in quality, content, scoring methods and format. Although the majority of tools were developed to assess pain in an overall nursing home population, more recently specific tools became available. To assess pain in elderly osteoarthritis patients or other subgroups. The amount of scales become overwhelming and keep on growing. In comparison to the review of 2006 progresses have been made with regard to psychometric evaluation of the tools. However, none of the tools seems the best silver standard yet.

## SAFE SEX FOR OLDER WOMEN: ADAPTING THE SEXUAL RISKS SCALE

P. Weitzman<sup>1</sup>, L. Xing<sup>1</sup>, H. Chen<sup>1,2</sup>, 1. *Environment and Health Group, Inc., Cambridge, Massachusetts*, 2. *Harvard Medical School, Brookline, Massachusetts*

HIV is on the rise among American women over the age of 50. The increase coincides with the rise in gray divorce. Despite the rise in HIV infections among older women, there is a relative absence of research that examines older women's perceptions of their own sexual health risks. In tandem with that is a relative absence of measures to assess older women's knowledge about HIV risk, attitudes about safe sex, and intention to practice safer sex. DeHart & Birkimer (2001) developed a 38-item Sexual Risks Scale (SRS) for use with college students. It measures key domains related to HIV risk: attitudes about safer sex, normative beliefs, intention to try to practice safer sex, expectations about the feasibility of safer sex activity, and perceived susceptibility to HIV/AIDS. Based on the empirical literature, we adapted the SRS for use with older women. A focus group with older women was convened to test consumer response to the scale, and further adapt it. Adaptations centered on language that specifically references older women and menopause, as well as language about alcohol use to make it more appropriate for an older adult as compared to a college student. A total of 7 items were modified. Our next step is to conduct validity research.

## COGNITIVE COMPLAINTS UNRELATED TO CANS-MCI COMPUTERIZED MEMORY MEASURES JAMES SCANLAN, PHD\*, JOANNE LABOFF, MSW\*, EMORY HILL, PHD\*, \*SCREEN INC. SEATTLE, WA

J.M. Scanlan, J. LaBoff, E. Hill, *Screen, Inc., Seattle, Washington*

Objective: To compare subjective cognitive complaints with memory measures obtained by computerized testing. Subjects: 7778 subjects were tested in 347 US medical facilities (6/22/2011-2/15/2012) with the CANS-MCI, a self-administered, touch-screen computerized cognitive examination designed to detect early MCI. Sample included normal, mildly impaired and demented patients: age=67.9 (SD=15), 59% female. Median test time=34 min. Methods: We examined the relationships between memory measures and three subjective patient questions concerning mental clarity, concentration and memory. In a subset, CANS-MCI measures were also compared with clinician administered neuropsychological measures. Results: Patients self-reporting problems with mental clarity and concentration actually performed better on immediate, delayed and cued recall (all  $p < .0001$ , all  $F > 25$ ). Regression found the most powerful predictor of self-reported cognitive complaints was age, younger people reporting more than 65+

patients. Analyses restricted to > 65 yrs. old found weak, but similar relationships between mental clarity and concentration complaints with memory measures. In all age groups, subjective memory complaints were unrelated to computerized memory measures. In the > 65 cohort, the strongest predictors of self-reported cognitive complaints were depression, pain, and head injury history. Conclusions: Self-reported cognitive problems don't match objective memory measures and may mislead medical professionals, as age, depression, and pain all effect cognitive complaints. While the utility of caregiver/family assessment is indisputable, asking patients to self-identify memory problems is not. The failure to obtain positive results in this very large data set suggests that clinicians using subjective patient memory concerns as substitutes for objective testing are often misguided.

#### **MEASURING FUNCTIONAL STATUS CHANGES AMONG INSTITUTIONALIZED OLDER ADULTS WITH DEMENTIA**

M.E. Bowen<sup>1,2</sup>, M. Rowe<sup>2,1</sup>, 1. *HSR&D/RR&D Research Center of Excellence, James A. Haley Veterans Hospital, Tampa, Florida*, 2. *University of South Florida, Tampa, Florida*

**Objective:** Few tools have been developed specifically to measure functional status (FS) changes in older adults with dementia; of these, most have floor and ceiling effects—capturing early or severe declines in function. Given that it is the process of FS decline that offers the most opportunities for intervention, this study will examine a range of tools with varying sensitivity and specificity to increase our understanding of FS changes in this population. **Methods:** Using single-subject design, the FS of 20 residents was measured weekly for 4 months using 6 tools [Katz ADL, Barthel, Functional Independence Measure (FIM), Resident Assessment Instrument (RAI), Tinetti Gait and Balance, and grip strength]. These tools consisted of informant report (health care staff) and/or observational measures (e.g., eating, ambulating). **Results:** Using an expert as the gold standard, 7 residents experienced a FS change (e.g., infection, dementia-related behavior change). The Katz ADL was not sensitive to FS changes while Tinetti Gait and Balance and grip strength scores varied within persons by  $\geq 25\%$  when there were no FS changes. In other tools, weekly variation in informant reports (use of grab bar for shower/toilet in the FIM) and incontinence (FIM and Barthel) indicated FS changes when there were none. **Conclusion:** Of the tools tested, the RAI may be most sensitive to subtle changes in FS, largely because it does not rely entirely on informant reports or bowel/bladder incontinence. Other tools that combine informant ADL items with performance-based measures may be sensitive to early changes in FS in this population.

#### **THE RELATIONSHIP BETWEEN DEPRESSION, EXECUTIVE FUNCTION, AND PROSPECTIVE MEMORY IN A COMMUNITY-BASED MEMORY CLINIC**

B.N. Renn, *Psychology, University of Colorado, Colorado Springs, Colorado Springs, Colorado*

The present study examined executive function as a mediator of self-reported memory impairment in a low-cost community-based memory clinic. The clinic provides brief neuropsychological screening for individuals on a sliding-fee scale. Measures include a comprehensive demographic questionnaire, the Prospective and Retrospective Memory Questionnaire (PRMQ), the World Health Organization Well-Being Index (WHO-5), and a 45-minute screening battery, consisting of the Mini-Mental Status Examination (MMSE) as well as tests of auditory and visual memory, executive function, working memory, and attention and concentration. The average self-referred client was 68.78 years old, Caucasian-American (87.4%), female (65.8%), earning less than the area's median annual household income, and likely to have a family history of dementia (43.6%). Previous research suggests that depression is associated with impaired executive function and an increased likelihood of self-reporting memory impairment. Furthermore, impaired executive

function is associated with increased prospective memory difficulty. Test results from 199 clients indicate that in general, older clients endorsed less depressive symptomatology than their younger counterparts. After controlling for age, depression significantly predicted self-reported retrospective and prospective memory difficulty. Depression also significantly predicted impaired performance on a test of executive function (Trails B) after controlling for age. However, after controlling for depressive symptomatology, executive function did not predict self-reported prospective memory difficulty. Taken together, the results indicate that within a self-referred community-based older adult population, executive function does not seem to mediate the relationship between depression and self-reported memory impairment.

#### **FINANCIAL CAPACITY IN THE PRESENCE OF DIFFUSE CORTICAL ATROPHY: A SINGLE CASE STUDY**

L. Mitchell, G. Byrne, J. Wilson, C. Tilse, N.A. Pachana, *School of Psychology, University of Queensland, St Lucia, Queensland, Australia*

Financial capacity assessments are becoming increasingly important in the context of patients surviving longer after experiencing events such as stroke and traumatic brain injury, or receiving a diagnosis of dementia or other progressive neurological disease. Despite their importance, such assessments are often difficult, with decisions at times based on subjective, sometimes biased or inadequate, information. In addition, decisions on capacity can tend towards a focus on noting whether or not the person has capacity, when a person-environment fit approach, including consideration of areas of strength and deficit, may be warranted. This case study aims to illustrate the importance of a person-environment fit approach to financial capacity assessment. It presents the results of a financial capacity assessment for a 62-year-old female with diffuse cortical atrophy, diagnosed with probable dementia, who continued to perform well on financial-based tasks and cognitive assessments, including the Financial Competence Assessment Scale and the Addenbrooke's Cognitive Examination-Revised. The assessment was carried out as part of a larger Australian research project aiming to validate an objective approach to financial capacity assessment. Despite the atrophy and the diagnosis, she continues to manage household financial tasks with limited assistance. These results demonstrate the importance of an individualized approach to financial capacity assessment, devoid of assumptions based on physiological damage or diagnosis. As such, it further highlights the importance of identifying both areas of strength and deficit, allowing for compensatory and support strategies to be implemented, and maximizing level of independence and quality of life for the individual.

### **SESSION 2005 (POSTER)**

#### **CANCER**

#### **EMPLOYMENT, VOLUNTEERISM, AND THE WORK OF TRANSITIONAL CANCER SURVIVORSHIP: CRITICAL CASE PERSPECTIVES OF RURAL COMMUNITY-DWELLING OLDER ADULTS AND THEIR SUPPORT PERSONS**

R. Klimmek, J. Wenzel, *Johns Hopkins University School of Nursing, Baltimore, Maryland*

Transitional cancer survivorship (TCS) work is defined as survivor tasks, performed alone or with others, to carry out a plan of action for managing one or more aspects of life following primary cancer treatment. Theoretically, survivors engage in 3 reciprocally-interactive lines of work: (1) illness-related; (2) biographical; and (3) everyday life work. A prospective longitudinal dyadic study of rural community-dwelling African American older adults with cancer and their support persons was conducted using the concept of TCS work as a lens on survivor-

ship experiences. The purpose of the study was to understand the validity and utility of application of the concept of TCS work to survivorship outcomes within a population historically-impacted by health disparities. Dyads were followed from around the time of diagnosis with early-stage cancer through the first several months following completion of primary cancer treatment. In-depth interviews, geographic data, logs of bi-weekly phone calls to participants, daily participant journals, and self-report measures collected throughout the study were analyzed using recommended procedures for case study analysis. Part-time employment and volunteerism emerged as important components of transitional cancer survivorship. This poster will present theoretical perspectives on the roles and relationships between employment, volunteerism, TCS work, and survivorship outcomes. Critical cases of TCS work, derived from dyadic analyses, will be used to further detail and illustrate the emergent theory. An understanding of the role, complexities and importance of employment and volunteerism during survivorship may contribute to provider understanding of patient and caregiver experiences as well as recommendations during this period.

### **THE IMPACT OF CONTEXT AND CANCER EXPERIENCE ON OLDER ADULTS DECISION MAKING COMPETENCE**

C.C. Gayer<sup>1,2</sup>, J.M. Jacobs-Lawson<sup>1</sup>, M. Schumacher<sup>1</sup>, *1. University of Kentucky, Lexington, Kentucky, 2. Cancer Support Community, Philadelphia, Pennsylvania*

Older adults are increasingly likely to face difficult decisions in life threatening contexts as they move probabilistically closer to death, become increasingly likely to be diagnosed with life threatening diseases, and encounter more death within their social network, than younger adults (Greenberg, 2011). The purpose of the current study was to understand the impact of a life-threatening decision context centered around cancer, and personal experience with cancer diagnosis, on older adult's decision making competence. Participants age 55-90 (N=202) were randomly assigned to either a mundane or life threatening decision context condition and then completed the corresponding survey packet containing the measurement questionnaire. Analyses consisted of a series of 2 (condition-mundane/life-threatening) x 2 (cancer experience-previous diagnosis/no previous diagnosis) ANOVA's. The dependent variables were 3 major components of the DeBruin et al (2007) Adult Decision Making Competence Scale: (a) Resistance to Framing, (b) Resistance to Sunk Cost Bias, (c) Over/underconfidence, in addition to a measure of Maximizing Tendency (Diab et al., 2008). Analyses revealed mixed results. Specifically, decision context predicted older adult's ability to resist the sunk cost bias ( $F(7, 191) = 4.877, p = .000, R^2 = .152$ ). The results pertaining to the impact of Cancer Experience on older adult's decision making competence are more robust. Significant interactions between decision context and cancer experience occurred for resistance to framing ( $F(1,183) = 3.476, p = .064$ ), resistance to attribute framing ( $F(1,189) = 4.139, p = .043$ ), mean decision accuracy ( $F(1,198) = 3.662, p = .000$ ), and subjective appraisal of decision making competence ( $F(1,198) = 6.235, p = .013$ ). Main effects were also found for 4 of the 5 dependent variables. Results highlight the lasting impact of cancer survivorship on decision making competence and have implications in health care, psycho-oncology, and treatment decision making domains

### **SUCCESSFUL NAVIGATION OF PREVIOUS LIFE EXPERIENCES MAY MITIGATE CANCER DISTRESS IN OLDER ADULTS**

E.A. Mulligan<sup>1,2</sup>, A.L. Jahn<sup>1,2</sup>, A.D. Naik<sup>3</sup>, J. Gosian<sup>1</sup>, A. June<sup>1,2</sup>, L. Herman<sup>3</sup>, J. Moye<sup>1,2</sup>, *1. VA Boston Healthcare System, Brockton, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts, 3. Michael E. DeBakey VA Medical Center and Baylor College of Medicine, Houston, Texas*

By age 69 1 in 6 men and 1 in 10 women will have been diagnosed and treated for cancer. Some older adults respond to cancer with dis-

tress, whereas others are resilient and report growth. Previous life events may influence how individuals cope with the stress of cancer. For example, older adults may view their diagnosis differently if they have witnessed family members recovering from cancer than if their family members have passed away from cancer. Among military veterans, coping style following combat exposure may also influence responses to cancer. The purpose of the current analysis was to investigate the relationships between prior life events and both cancer-related distress and cancer-related growth in a sample of veterans. 115 military veterans (mean age=65.4, SD=8.9) completed quantitative and qualitative interviews 6 months after receiving a diagnosis of head and neck, colorectal, or esophageal/gastric cancer. Participants reported a variety of prior life stressors, including a personal history of other cancer(s) (30%), family death from cancer (53%), and combat (46%). Veterans with family members who survived cancer reported significantly fewer depressive symptoms in response to their own diagnosis than those without a family history of cancer survival ( $t = 2.0, p < .05$ ). Additionally, in comparison to both veterans who did not experience combat and veterans with current combat-related posttraumatic stress disorder (PTSD), combat veterans without PTSD reported significantly fewer symptoms of cancer-related PTSD ( $F = 15.2, p < .001$ ) and depression ( $F = 9.3, p < .001$ ). Previous adaptation to life threatening events may enhance resilience when confronted with cancer later in life.

### **HEALTH AND DEPRESSIVE SYMPTOMATOLOGY OF AGING MALE CANCER SURVIVORS: A MATCHED COMPARISON DESIGN**

A.L. Townsend<sup>1</sup>, Y. Oh<sup>1</sup>, K.J. Ishler<sup>1</sup>, J. Rose<sup>2</sup>, *1. Mandel School of Applied Social Sciences, Case Western Reserve University, Cleveland, Ohio, 2. School of Medicine, Case Western Reserve University, Cleveland, Ohio*

With an aging U.S. population, incidence and prevalence of cancer is expected to rise dramatically, and many cancer survivors are living longer (NCI, 2011). Evidence regarding physical and mental health of long-term cancer survivors is limited (IOM, 2006), particularly for males. This study drew on Verbrugge and Jette's (1994) disablement process model to (1) compare health status between 139 married male cancer survivors (M age = 59.8) and 139 married males matched on age (M = 59.7) and race/ethnicity but with no reported history of cancer and (2) investigate whether cancer status moderates the relationship of health to depressive symptomatology (CES-D8). Data were drawn from the 1992 Health and Retirement Study. Types of cancer varied broadly among survivors and years of survivorship ranged from < 1 to 20+ (M = 5.71). Cancer survivors reported significantly worse global health, more fatigue, doctor visits, bed days and physical limitations due to health, and greater prevalence of pain than their matched comparisons ( $p < .05$  in paired t-tests). There were no significant differences on number of comorbidities, sensory impairments, or depressive symptoms. In OLS hierarchical regression models, poor global health and pain more strongly predicted depressive symptomatology in men without a history of cancer, whereas greater health-related physical limitations more strongly predicted depressive symptomatology in cancer survivors. Findings highlight the need for long-term monitoring of male cancer survivors' health but challenge assumptions that their poor health will necessarily predict greater depressive symptomatology.

### **PREVALENCE OF MAMMOGRAPHY USE IN OLDER WOMEN BY 5-YEAR LIFE EXPECTANCY**

E.S. Breslau<sup>1</sup>, K. Bellizzi<sup>2</sup>, M.A. Schonberg<sup>3</sup>, *1. Division of Cancer Control and Population Sciences, National Cancer Institute, Bethesda, Maryland, 2. University of Connecticut, Storrs, Connecticut, 3. Harvard Medical School, Boston, Massachusetts*

Background: Some older American women are physically and cognitively robust while others are frail, have reduced functional ability,

or have multiple comorbid illnesses. To assist cancer screening decision-making beyond recommended guideline age cut-offs, we examined mammography use by 5-year life expectancy in older women. Methods: Our analytic sample consisted of 1,453 community dwelling women aged > 74 years who responded to the 2010 National Health Interview Survey. A validated index used 11 variables to categorize women into high, intermediate and low 5-year life expectancy. Results: The overall rate of breast cancer screening was 56.0%. When stratified by 5-year life expectancy, mammography screening rates were 68.0% in women with high life expectancy ( $\geq 48.0\%$  probability of 5-year mortality), 51.2% in women with intermediate life expectancy (16.0% to 47.0% probability), and 38.8% in women with low life expectancy ( $\leq 15.0\%$  probability). In multiple logistic regression analysis, variables related to higher rates of mammography use include women who were < 80 years of age (Odds ratio (OR) 2.30; 95% Confidence Interval (CI): 1.33-3.95). Lower use was seen in poorer women with incomes less than \$14,000 (OR 0.39; 95% CI: 0.21-0.72, and those with an intermediate life expectancy (OR 0.58; 95% CI: 0.37-0.93). Conclusions: A high proportion of older women with intermediate or low 5-year life expectancy continue to be screened for breast cancer despite the low likelihood of a survival benefit. Results suggest that a 5-year prognostic indicator may be of value when prioritizing clinical recommendations to prevent over testing and over treatment, or under treatment among the healthy.

### PROVIDING SUPPORTIVE CARE ACROSS THE CANCER CONTINUUM

A. June<sup>1</sup>, J. Moye<sup>1</sup>, E.A. Mulligan<sup>1</sup>, A.L. Jahn<sup>1</sup>, J. Gosian<sup>1</sup>, L. Herman<sup>2</sup>, A.D. Naik<sup>2</sup>, 1. VA Boston Healthcare System, Brockton, Massachusetts, 2. Michael E. DeBakey Medical Center and Baylor College of Medicine, Houston, Texas

Most adults with cancer are older, but the needs of older adults after cancer treatment have not been well studied. 80 Older (mean age 65+ 11) patients receiving care in the Veterans Health Administration were interviewed at 12-months post diagnosis of head/neck/esophageal (N=43) and gastric/colorectal (N=37) cancers, stages I or II (N=46%), III (N=32%), or IV (N=22%). Patients' understanding of their prognosis varied as "Active/Relapsed" (10%, N=7), "Remission/Cured" (60%, N=48), or "Unsure" (30%, N=24). Surprisingly, there was no relationship between cancer stage and the patients' perspective of their prognosis. Many patients endorsed elevated levels of pain (29%), fatigue (16%), depression (14%), and anxiety (16%). Patients who were "unsure" of their prognosis reported worse physical health (F=3.71; p=.03) and emotional health (F=2.48, p=.09), but not social health. Patients had high levels of interest in referrals for help with physical problems: nutrition/diet (63%), exercise (58%), PT or OT (48%), genetic risks (39%), and fertility (16%); emotional problems: psychopharmacology (45%), psychotherapy (38%), and in person support groups (33%); and with social problems: like finances (39%) and relationships (24%). Interest across domains was generally highest in Stage III patients. Patients reported that they avoided asking for help for reasons including being "tired of it all" (36%), afraid (23%), unsure how to ask (13%), and transportation (10%). Improving links between survivorship and palliative care is needed to provide support across all stages of cancer, with targeting of support considering the patients stage, perception of prognosis, and obstacles to care.

### EXPERIENCES AND KNOWLEDGE OF PAIN: WHAT DO OLDER ADULTS REALLY UNDERSTAND ABOUT THEIR CANCER-RELATED PAIN?

M.L. O'Connor<sup>2</sup>, T. Baker<sup>1</sup>, 1. University of South Florida, Tampa, Florida, 2. Psychology, University of Virginia, Charlottesville, Virginia

Data show that several vulnerable populations (e.g., older adults, cancer patients) are more likely to experience pain and endure inadequate pain treatment. However, little is known about older cancer

patients' subjective experiences of their pain, or how knowledgeable they are about their pain (e.g., addiction risks, medications). This study examined predictors of two outcome variables, self-reported knowledge of cancer pain and experiences managing chronic pain, among Black and White cancer patients 55+ years of age. Predictors included: demographics (age, income, education, gender, and race); health characteristics (self-efficacy for managing pain, physical functioning, pain severity, and co-morbidities); and patient satisfaction (satisfaction with pain treatment, communication with physicians, and trust of physicians). Hierarchical multiple regression analyses were performed for each outcome, with demographic variables entered first, health variables entered second, and patient satisfaction variables entered last. For pain knowledge, final model  $R^2 = 0.25$ ,  $p < 0.01$ ,  $\Delta R^2$  relative to the first model = 0.04. Higher income and self-identifying as Black were significantly associated with greater knowledge of pain ( $p < 0.05$  for all). For pain experiences, final model  $R^2 = 0.51$ ,  $p < 0.01$ ,  $\Delta R^2$  relative to the first model = 0.48. Higher self-efficacy, better physical functioning, and lower pain severity were significantly related to more positive experiences with pain ( $p < 0.05$  for all). These results show that socioeconomic status may significantly influence knowledge about pain above and beyond indicators of health and patient satisfaction, while experiences managing pain may be most strongly related to physical health.

### AGE DIFFERENCES IN QUALITY OF LIFE AND COPING WITH BREAST CANCER

A. Begovic-Juhant<sup>1</sup>, A. Chmielewski<sup>2</sup>, M. Milidonis<sup>1</sup>, B. Stanko<sup>1</sup>, 1. Health Sciences, Cleveland State University, Cleveland, Ohio, 2. Case Western Reserve University, Cleveland, Ohio

The objective was to examine age differences in quality of life and coping with breast cancer. The participants consisted of 99 women diagnosed with breast cancer in the last five years, and they ranged in age from 23 to 79 years (M = 50.74, SD = 10.06). Out of 99 participants, 61% were Caucasian and 37% were African American. Participants completed a semi-structured questionnaire consisting of instruments assessing coping with cancer (CCQ), proactive coping (BAPC-C), quality of life (EORTC QLQ-BR23 and FACT-G) along with demographic questions and questions related to breast cancer. The results revealed that there were no significant age differences in overall proactive coping and coping with breast cancer. However, task oriented coping was significantly higher for older women than young women, and young women were more likely to use emotion coping strategies. In addition, stress and breast cancer worry were lowest for older women and highest for the youngest group. In terms of quality of life, emotional adjustment to breast cancer was significantly better for older women as opposed to younger women, and older women were less concerned with their body image. In conclusion, the results of this study did show that breast cancer and associated treatments affected quality of life of all participants. However, it appears that older women adjusted to breast cancer diagnosis and treatment better than younger women. The clinical implication is for healthcare providers to encourage task oriented coping strategies for older women with breast cancer.

### OLDER BREAST CANCER SURVIVORS DRAGONBOAT PADDLE TO RECOVERY: A NEW FRONTIER FOR SURVIVORSHIP PROGRAMS

M.H. Parker, Institute for Palliative & Hospice Training, Inc., Oakpark, Virginia

The poster presents results from an Internet survey of breast cancer survivors sent to identified E-mail contacts for Breast Cancer Survivor Dragonboat Teams. The survey collected opinions of breast cancer survivors about their cancer experience and dragonboat paddling as a recovery activity. In 2011, results were received from 268 U.S. and Canadian women aged 60 to 80, 49% of the 542 respondents. As a result of paddling, 73% of older women reported exercising more than before their cancer and 88% reported finding new friends and social support

in the Team. 78 % reported their health as excellent or very good and 89% reported themselves as more fit (45%) or somewhat more fit than other women their age. 21% had lymphedema; 47% reported paddling improved their lymphedema; 44% reported no effect; 0% reported it worse. Older paddlers identified dragonboating as a life changing and affirming activity: "I never thought I would compete at my age!" 2012 survey data from BCS teams in Australia, New Zealand and South Africa and will be included in the poster. **CONCLUSION:** Dragonboat paddling provides a beneficial and supportive exercise activity for older breast cancer survivors. Dragonboat teams are a dynamic alternative to traditional meeting/talking support groups, combining the benefits of exercise (an important recovery and health benefit) with the psychosocial support of interaction and new friendships with women who have also experienced breast cancer. Survivor support programs should recognize the benefits of active team sports in helping older women return to fitness after cancer.

## **SESSION 2010 (POSTER)**

### **CARDIOVASCULAR DISEASE**

#### **PERCEPTIONS OF LIFESTYLE BEHAVIOR MODIFICATION AMONG OLDER WOMEN WITH AND WITHOUT CORONARY HEART DISEASE**

L.L. Lefler<sup>1,3</sup>, J.B. Meaux<sup>2</sup>, J. McSweeney<sup>1</sup>, K.K. Garner<sup>3,1</sup>, 1. *University of Arkansas for Medical Sciences, Little Rock, Arkansas*, 2. *University of Central Arkansas, Conway, Arkansas*, 3. *Central Arkansas Veterans Healthcare System, Little Rock, Arkansas*

**Purpose:** Risk factors for coronary heart disease (CHD) are at epidemic proportions among older women but few recognize their actual risk. Our purpose was to compare and contrast knowledge and attitudes concerning CHD lifestyle modification behaviors among older women without a CHD diagnosis with those who had experienced a cardiac event. **Method:** Using a mixed-methods design, we measured standard cardiac risk factors to determine actual risk and obtained measures of self-perceived risk among 20 older women, 6-12 months post cardiac event, and 24 community-dwelling women ( $\geq 60$  years) without a CHD diagnosis. Semi-structured interviews were conducted for knowledge and attitudes regarding CHD prevention and risk. Narratives were analyzed using content analysis and constant comparison. **Results:** Of the 44 women, 30% were African-American and 64% had some college education, with a mean age of 72 years. Despite a mean of 5.84 vs. 4.46 CHD risk factors (event vs. no CHD) indicating "high-risk" for both groups, personal risk perceptions were unrealistically low 4.47 vs. 1.95 (0-10 scale). Narrative data indicated a general lack of understanding in both groups regarding risk factors and lifestyle behaviors that would reduce probability for experiencing a first or recurrent cardiac event. Few engaged in lifestyle risk factor modification and felt limited control of their health or did not think change was necessary. Most felt that taking daily medications and visiting their Provider were sufficient. **Conclusions:** Tailored interventions that consider knowledge and attitudes about CHD risk and risk factors are needed to promote lifestyle behavior modification.

#### **HEART FAILURE AND COGNITIVE FUNCTIONING AMONG OLDER ADULTS**

J. Alwerdt<sup>1</sup>, P. Athilingam<sup>1</sup>, M.L. O'Connor<sup>2</sup>, E. Valdes<sup>1</sup>, J.D. Edwards<sup>1</sup>, 1. *Aging Studies, University of South Florida, Lutz, Florida*, 2. *University of Virginia, Charlottesville, Virginia*

Cognitive impairment may be a growing problem in heart failure (HF) treatment. Cognitive functioning is important for adhering to a treatment regimen and making decisions regarding health and independence, but the effects of HF on cognitive abilities have not been well-studied longitudinally. The current study utilized data from the Advanced Cognitive Training for Independent and Vital Elderly study

to examine baseline differences and five-year changes in memory, reasoning, and speed of processing among older adults. Some participants had HF at baseline (N=138), some developed HF over time (N=119), and some never had HF during the study (N=2533). Multivariate analysis of variance was used to examine baseline cognitive differences between the three groups, and mixed effects models extended these analyses longitudinally. At baseline, participants who never had HF performed better than those who had HF at baseline ( $p < .05$ ); both of whom performed better than those who developed HF over time ( $p < .05$ ) in memory (Auditory Verbal Learning Test) and speed of processing (Useful Field of View Test and Digit Symbol Substitution). Longitudinally, the three groups showed significantly different patterns of change for reasoning (Word Series). Participants without HF and those who developed HF showed improved reasoning, while participants with HF at baseline showed declines in reasoning over time. The results indicate that cognitive difficulties in memory and speed may occur prior to HF; while reasoning declines more rapidly subsequent to HF. HF disease progression may cause differing cognitive manifestations. Future studies should investigate if cognitive interventions could improve cognition and treatment outcomes.

#### **REDUCE RACIAL DISPARITIES IN HEART FAILURE BY PHYSICIAN AND PATIENT COMMUNICATION**

U. Piamjariyakul, C.E. Smith, *University of Kansas School of Nursing, Kansas City, Kansas*

**Background:** Physician-patient relationship has an important impact on disparities in medical care. Discussions after hospital discharge in clinic visits have been shown to vary depending on the race of the patient and if the patient has a list of questions for the physician visit. **Methods:** Patients completed a post-hospital survey about what was discussed in follow-up physician clinic appointments. Survey items included patients' home management of their medications, diet and symptoms. Patients were also asked about discussions of their next appointments, daily weighing and exercise and taking a list of questions to the appointment. **Results:** A total of 185 patients discharged with heart failure (HF) were enrolled. Eighty (43%) were African Americans. Age ( $M = 62$ ,  $SD = 13.4$  years) and 65.4% completed high school to 2-year college. Study patients (66% - 80%) reported discussing some aspects of home HF management practices with their doctors. Only 33% of patients brought a list of questions to the post-hospital discharge appointment. About 72% to 81% of patients discussed exercise or daily weight; 77% discussed diet/sodium; and 63% to 67% discussed medication concerns. At the visit 81% were instructed on what to do if their HF symptoms got worse. A significantly ( $p < .03$ ) greater percentage of white versus African Americans received an appointment for a follow-up visit. Notably 78% received a follow-up appointment. **Conclusions:** Physician and patient communication could promote HF self-management and reduce racial disparities. Patients and family members should be encouraged to bring their list of questions to their clinic appointments. Physician education programs now emphasize communication across racial groups.

#### **PATTERNS AND CONSEQUENCES OF HEALTH-RELATED SPOUSAL INFLUENCE ATTEMPTS FOR PATIENTS AND SPOUSES COPING WITH CHRONIC HEART FAILURE**

J. Kellough<sup>1</sup>, B.G. Knight<sup>1</sup>, M.J. Rohrbaugh<sup>2</sup>, V. Shoham<sup>2</sup>, 1. *University of Southern California, Los Angeles, California*, 2. *University of Arizona, Tucson, Arizona*

Coping with chronic heart failure (CHF) requires careful adherence to a complex medical regimen. Spouses are often the primary source of support for dealing with illness management. This analysis used path modeling to examine how spousal involvement in illness management affects both patients' and spouses' physical and mental health among 60 couples coping with CHF. Using data from the Arizona Family Heart Project, we examined the nature of spouses' attempts to influence the

patient to adhere to the treatment regimen, and the consequences of those attempts for patient and spouse physical and mental health. Influence attempts included positive behaviors like praising and engaging in desired behavior change with the patient and negative behaviors like arguing or criticizing the patient for not following the regimen. Consistent with the hypothesis, spouses' positive influence attempts had an indirect positive effect on the patients' physical health and mental health symptoms via patient compliance with the medical regimen. Contrary to the hypothesis, negative influence attempts had no effect on physical and mental health outcomes or on patient compliance. Positive influence attempts did not demonstrate the hypothesized protective effect on spouses' own physical or mental health. However, spouses' negative influence was significantly associated with poor mental health outcomes for the spouse, with no effect on spouses' physical health outcomes. These findings suggest that spouses' use of positive influence tactics can benefit the patient both mentally and physically, while the use of negative tactics are ineffective in helping the patient and can be detrimental to the spouse.

#### **STATE OF SCIENCE: TELEHOMECARE AND HEART FAILURE**

Y. Kang<sup>1</sup>, K.H. Bowles<sup>1</sup>, M. Topaz<sup>1</sup>, K.H. Dansky<sup>2</sup>, *1. Nursing, The University of Pennsylvania, Philadelphia, Pennsylvania, 2. Pennsylvania State University, University Park, Pennsylvania*

**Background:** Telehomecare (THC) may be a useful intervention for home care patients with heart failure (HF) to effectively communicate with health care providers and assist in managing their health conditions. No systematic review of telehealth studies focusing specifically on the home care HF population has been conducted in the United States. **Methods:** Pubmed, EMBASE, and CINAHL were searched for randomized controlled trials from January 2001 to November 2011 using the MeSH terms "telemedicine", "home telehealth", "telemonitoring", "home telecare", and "telehomecare" in conjunction with the keyword "heart failure". **Results:** Twenty-two studies met the selection criteria for this qualitative review. The majority of studies did not demonstrate a positive effect of THC intervention on patient outcomes. Nearly 70% of the studies reported participants with New York Heart Association class III, indicating that the majority of studies targeted older adults with advanced stage HF. Hospitalization rate was the most common outcome measure, along with quality of life, and length of the hospital stay. This review suggests that HF telehealth studies to date have not demonstrated optimal benefits due to a variety of reasons such as patient characteristics, lack of power to detect significance, and problems with adherence, recruitment and retention. In addition, great variation in the THC interventions and outcome measures makes it difficult to draw conclusions across the body of research. **Conclusion:** Future studies should include standardized outcomes to determine effect sizes, larger sample sizes, control for covariates, and subgroup analyses to determine which types of patients achieve the best response.

#### **SESSION 2015 (POSTER)**

##### **COMMUNICATION AND CREATIVITY**

##### **VERBAL PLAY AS AN INTERACTIONAL DISCOURSE RESOURCE IN HEALTHY AND DISORDERED AGING**

S. Shune<sup>1</sup>, M.C. Duff<sup>1,2</sup>, *1. Department of Communication Sciences and Disorders, The University of Iowa, Iowa City, Iowa, 2. Department of Neurology, Division of Behavioral Neurology and Cognitive Neuroscience, The University of Iowa, Iowa City, Iowa*

Verbal play, or the creative and playful use of language, is a pervasive and enjoyable component of social communication, serving important interpersonal functions. The effects of aging (healthy and disordered) on the use of verbal play, however, have not been examined. Using quantitative group comparisons and detailed discourse analysis,

we documented and characterized the quantity, quality, and interactional functions of verbal play in 1) healthy younger and older adults, and 2) individuals with very mild Alzheimer's disease (AD), each interacting with a familiar partner while completing multiple trials of a collaborative referencing task. All participants, irrespective of age or presence of AD, initiated and contributed to verbal play episodes. For healthy older and younger pairs, although there were no differences in the quantity of verbal play, striking age-related differences in the function and quality of verbal play emerged. For healthy older pairs, verbal play episodes were extended and used to support the communicative interactions between trials more than during the task. In contrast, healthy younger pairs engaged in shorter episodes for successful task completion. This finding suggests that age influences interactional discourse resources in communicative interaction, perhaps reflecting changes in the goals of social interaction across the lifespan. In AD, there were no differences in quantity or quality of verbal play between AD and demographically matched comparison pairs highlighting an area of preserved social communication. Verbal play is a rich discourse practice that is present and successfully deployed to create meaningful communication in both healthy and disordered aging.

##### **BEHAVIORAL RECIPROCITY IN PERSON-CENTERED CARE: AN ANALYSIS OF RESIDENTS AND NURSE AIDES**

L.J. Medvene, A. Runyan, K. Nilsen, *Psychology, Wichita State University, Wichita, Kansas*

Resident/aide relationships in long-term care are an important source of resident (Bowers et al., 2001) and aide satisfaction (Mittal et al., 2009). Recent work has focused on aides' person-centered abilities. Innovatively, the present study highlights the resident's role in creating and maintaining relationships with aides. This study adapted two operational coding measures previously used to assess aide's person-centered behaviors: the Person-Centered Caregiving Behavioral Inventory (PCBI) and the Global Behavioral Scale (GBS; Lann-Wolcott et al., 2011). Participants were 20 independent, distinct resident/aide dyads who were videotaped in 48 caregiving episodes. Independent raters used the caregiving videos to assess person-centeredness of residents by coding for nine verbal and three nonverbal relationship- and communication-based behaviors, as well as seven global categories. Good concurrent validity of the behavioral inventory and the global rating scale was found:  $r(48) = .38, p < .05$ . A strong relationship was found between residents' PCBI-R scores and their respective aides' PCBI scores:  $r(48) = .65, p < .05$ . A moderate relationship was found between resident's GBS-R and their aides' GBS ratings:  $r(48) = .35, p < .05$ . These correlations indicate substantial reciprocity between the aide and resident in engaging in person-centered behaviors, and suggest that residents influence their relationships with aides. Future research should explore how residents can be empowered to use their communication skills to influence their care and satisfaction even more. Attendees of the session will be able to assess residents' communication skills in contributing to the person-centeredness of their relationships with aides.

##### **FOR OLDER ADULTS, BETTER HEALTH IS JUST A CLICK AWAY**

C.J. O'Brien<sup>1,2</sup>, J. Davy<sup>2,3</sup>, E. Gross<sup>2</sup>, *1. University of Illinois at Chicago, Chicago, Illinois, 2. Mather LifeWays Institute on Aging, Evanston, Illinois, 3. University of Chicago, Chicago, Illinois*

Despite having the highest incidence of health-related problems, older adults have the lowest level of health literacy of any age group. While an increasing number of older adults are seeking health information online, there is little evidence as to whether or not these endeavors are beneficial. eHEALS is the most widely-used scale of e-health literacy. Studying the relationship between eHEALS and health outcomes enables us to: 1) assess the validity of the e-health literacy construct, and 2) provide preliminary evidence as to the benefits of this type of literacy. In this study, we used a cross-sectional survey design to

examine whether e-health literacy is correlated with three outcomes associated with health literacy: self-efficacy in doctor/patient interactions, self-reported health, and preventive health behaviors. The survey was distributed to a diverse sample of 84 older adults recruited from five locations in Chicagoland. We conducted correlation and regression analysis, controlling for a variety of demographic characteristics and personal traits. We found that e-health had small to moderate correlations with self-efficacy in doctor/patient interactions (.402,  $p=.001$ ), self-reported health (.339,  $p=.008$ ), and preventive health behaviors (.288,  $p=.022$ ). Our study provides preliminary evidence that increases in e-health literacy yield some of the same benefits as increases in health literacy. It further suggests that programming to increase e-health literacy may represent a promising strategy to improve the health of older adults. In addition to discussing these findings, we will describe an ongoing pilot program which provides electronic health literacy courses to older adults in the Chicago area.

### **COMPREHENSION OF MEDICAL INFORMATION AMONG ELDERLY FILIPINO AMERICANS: IMPLICATIONS FOR HEALTH LITERACY**

T.O. Santos, H. Ulatowska, *University of Texas at Dallas, Dallas, Texas*

According to the Institute of Medicine (2003), more than 90 million adults have difficulties comprehending and acting on medical information. Older adults, in particular, present with challenges in reading medical prescriptions or adhering to medical instructions. These difficulties are attributed to age-related decrements accompanying aging: poorer reading skills, as well as age-related cognitive declines. In a society dependent on written medical information - be it from health care information on the internet, health newsletters from AARP, or pamphlets at the physician's office, there is a need to address adequate comprehension of medical information among the elderly. Inadequate health knowledge negatively impacts one's health, resulting in low adherence to medical instructions, higher health care costs, and increased mortality. With the emerging field of narrative medicine, researchers are discovering the value of utilizing narratives in communicating health information to ethnically diverse groups. Utilizing health information adapted from the NIH Senior Health website, this study compares how elderly adults comprehend medical information presented in narrative versus expository genres. Comprehension of information is further evident in the themes pertinent to illness: symptoms, risk factors, timeline and treatment. The study discusses the influence of information structure on comprehension and the strategies employed by the elderly when reading written medical information. It also provides insight on how to better transmit health information in order to meet the needs of an aging, ethnically diverse America.

### **PERFORMANCE OF OLDER ARTISTS AND OLDER NONARTISTS ON THE ABBREVIATED TORRANCE TEST OF CREATIVITY**

R.E. Rieger, S.M. Zoller, L. Oglander, B.D. Carpenter, *Washington University, St. Louis, Missouri*

Recent research has suggested that older adults involved in creative pursuits may experience improved physical and psychological functioning. Although several standardized instruments exist to measure creativity, few of these instruments have been used with older adults. The purpose of this study was to examine the performance of older adults on the Abbreviated Torrance Test for Adults (ATTA). Eighty-five people over age 65 (Mean age = 76.3) participated in the study, including 43 artists and 42 nonartists. Artists were older adults whose artwork had been chosen for at least one juried art show, had been awarded a prize in at least one competition, or had been commissioned for a public or private venue. Multivariate analyses suggested no differences between artists and nonartists on the seven primary ATTA indices, Pillai's trace = .120,

$F(7,75) = 1.46, p = .20$ . Moreover, the ATTA was not significantly correlated with two other measures of creativity, the Runco Ideational Behavior Scale ( $r = .07$ ) and the Remote Associates Test ( $r = .14$ ), calling into further question the construct validity of the ATTA. Possible explanations include imprecise scoring criteria, low internal consistency reliability, and administration and scoring procedures that penalize older adults. Results from this study suggest that the ATTA may not be a valid instrument to measure creativity in older adults. In order to explore the benefits of creative engagement in older adults, future research is needed to develop and validate instruments to assess their creativity.

## **SESSION 2020 (POSTER)**

### **DEATH AND BEREAVEMENT**

#### **THE DUAL PROCESS MODEL OF BEREAVEMENT: THE ROLE OF MOTIVATION IN COPING WITH BEREAVEMENT**

K.M. Bennett, L. Arnott, V. Lowers, *Psychology, University of Liverpool, Liverpool, United Kingdom*

Stroebe and Schut (1999) propose two types of coping processes in their Dual Process Model (DPM) of bereavement. The first is loss-oriented and the second is restoration-oriented with oscillation between them. Within each type of coping process there are a number of specific stressors, three of which, in particular, are associated with engagement in activity: taking up new activities; distraction; and new roles/identities/relationships. Bennett et al. (2010) found that distraction was associated with poor psychological adjustment, new roles/identities/relationships were associated with good psychological adjustment, whilst new activities did not influence either types of adjustment. How can we explain why these different activity-related stressors have different adjustment outcomes? Qualitative interviews with 16 older widowed people examined the reasons why people engaged in new activities or continue with existing ones. The results indicate that it is the motivation underlying the commencement, or maintenance, of these activities that influences adjustment. Widow(er)s who undertake an activity as a means of distracting themselves from their loss are less likely to be adjusting well. On the other hand, widow(er)s who undertake activities for intrinsic interesting or because those activities add meaning to widow(er)s lives are more likely to be adjusting well. There is evidence, too, that whilst an activity may begin as a means of distraction it may develop into an activity providing new roles or identities, and therefore, in time, lead to better adjustment. Finally, a model of motivation and activity is proposed to further advance the Dual Process Model of bereavement and our understanding of adjustment to bereavement.

#### **INVESTIGATING WIDOWER'S EXPERIENCES OF INSTRUMENTAL INDEPENDENCE**

L.K. Soulsby, K.M. Bennett, *University of Liverpool, Liverpool, Merseyside, United Kingdom*

Bennett et al. (2010) investigated instrumental independence following spousal bereavement in British widows, evaluating the nature of changes in instrumental independence and factors that facilitated or hindered independence. This paper builds on Bennett et al.'s findings and attempts to explore men's instrumental independence following spousal bereavement. The research adopts a mixed methods design, using questionnaire data from 200 US widowers and qualitative interviews with a sample of 20 UK widowers. The questionnaire data supports Bennett et al.'s four typologies of instrumental independence (dependent (before)/dependent (after); dependent/ independent; independent/ independent; independent/ dependent). Importantly, unlike the widows in Bennett et al.'s study, a high proportion of older widowers report being independent in the home both before and after bereavement. There are, however, some differences when

individual domestic tasks (e.g. shopping; meal preparation) are considered. The qualitative interview data reveals similar patterns of change in instrumental tasks following bereavement. Further, the interviews reveal physical health, relationships with family and pre-bereavement levels of independence as predictors of adjustment to instrumental tasks in widowhood. Comparisons can also be made about the experiences of US and UK widowers in relation to changes in independence over time. Together, the findings enhance our understanding of instrumental independence in widowhood in later life and may be used to inform service providers on the delivery of instrumental support to older widowers.

### THE EFFECTS OF STRUCTURAL AND FUNCTIONAL SOCIAL SUPPORT COMPONENTS ON WELL-BEING DURING THE FIRST TWO YEARS OF WIDOWHOOD

S.M. Powers<sup>1</sup>, T. Bisconti<sup>1</sup>, C. Bergeman<sup>2</sup>, 1. *University of Akron, Akron, Ohio*, 2. *University of Notre Dame, Notre Dame, Indiana*

The death of a spouse can be one of the most challenging events an older adult can face in later life. Social support, which can be broken down into functional and structural components, has been shown to differentially influence the overall well-being of widows. The current study evaluated the predictive values of structural and functional support at 1 month postloss on changes in depression and life satisfaction across the first 2 years of widowhood in a sample of 57 recently bereaved women. Utilizing 8 time points at 2 and 4 month intervals, the use of growth curve modeling allowed us to understand well-being trajectories across time as predicted by levels of social support at baseline. Life satisfaction trajectories showed a curvilinear trend, whereas depression trajectories yielded a significant downward linear trend (i.e., decreased depression across time). Additionally, Perceived social control was a marginally significant predictor of depression. The results further our understanding of widowhood as a dynamic process and how social support has a protective role in that process. Understanding levels of depression and overall life satisfaction allow for the identification of key points during the transition into widowhood, which may have implications for formal health services and interventions.

### GROUP DYNAMICS MATTER: USING SUPPORT GROUPS AS A WAY TO ASSIST BEREAVED PERSONS

R. Utz<sup>1</sup>, D. Lund<sup>2</sup>, M. Caserta<sup>1</sup>, 1. *University of Utah, Salt Lake City, Utah*, 2. *California State University, San Bernardino, San Bernardino, California*

Bereavement support groups provide camaraderie, resources, and education to those who have experienced a recent loss. This presentation focuses on the longitudinal outcomes (depression, grief, loneliness, stress-related growth) of 328 recently bereaved spouses who participated in the Living After Loss study, a randomized intervention trial designed to evaluate the effectiveness of two models of facilitator-led support groups. The content of the two groups differed, but the timing, frequency, and length did not. Participants were randomized into one of the two models of support groups. Altogether there were 35 separate support groups (roughly half of each model), with an average of 9.4 persons per group. We used hierarchical linear modeling (HLM) to identify both individual and group-level characteristics that were associated with differential participant outcomes. Our analyses showed that outcomes were nearly identical for those assigned to support group model #1 versus #2. However, the participants in groups that had greater levels of group cohesion, more positive assessments of the facilitator, and a more prevalent exchange of support among group members had significantly more favorable levels of depression, loneliness, and stress-related growth over time. Thus, support groups, especially those that are well-led and have high levels of

group cohesion, do have the potential to support and assist recently bereaved persons, independent of the specific content or substantive focus of that group. Although the dynamics that lead to higher levels of group cohesion often occur organically, well-trained facilitators may help encourage higher levels of group cohesion among support group participants. (NIA R01-AG023090)

### ATTITUDE AND BELIEFS ABOUT DEATH, DYING, AND END-OF-LIFE CARE AMONG OLDER PEOPLE IN THE HINDU COMMUNITY IN THE U.S

P. Patel<sup>1</sup>, H. Matsuo<sup>2</sup>, L. Willoughby<sup>2</sup>, 1. *India Heritage Research Foundation, Rishikesh, Uttarakhand, India*, 2. *Saint Louis University, St. Louis, Missouri*

In 2005 there were approximately 1.7 million Hindus of Indian decent permanently living in the United States. This number is projected to increase drastically in the coming decades. The increase in cultural and religious presence coupled with the advancement of technology in medicine has raised serious concerns regarding the extent to which current medical care, especially at the end of life, is complimenting Hindu beliefs. This study explores the beliefs that older American Hindus of Indian decent hold regarding death, dying, and end-of-life care. Two major constructs examined were Attitudes on Death and Dying and Beliefs about Death and Dying. Two scales under each construct were created using cluster analyses (Positive thoughts about death, Negative thoughts about death, Active spiritual belief, and Passive spiritual belief). The survey instrument was translated into Gujarati and administered face-to-face by the first author. Data (n=33) were collected from Indian Hindu older adults who were 61 years of age or older (mean age = 69.42) in the greater Saint Louis area in Missouri. Most participants preferred that their pain be removed even if it means immediate death (80.6%). Among males, age and negative thoughts about death were positively correlated ( $r=0.705$ ,  $p<0.05$ ), such that older men have more negative thoughts about death than younger men. This correlation was not present among females. However, among females, passive spiritual belief and negative thoughts about death were positively correlated ( $r=0.587$ ,  $p<0.01$ ). These results provide some implications about end-of-life care among Hindu communities in the United States.

### "I'LL NEVER BE THE SAME AGAIN." UNDERSTANDING IDENTITY CHANGE IN WIDOWHOOD

L.K. Soulsby, K.M. Bennett, *University of Liverpool, Liverpool, Merseyside, United Kingdom*

This paper attempts to uncover the process of identity change involved in the adjustment to becoming widowed. Adopting a qualitative methodology, semi-structured interviews were conducted with 23 widowed men and women from the UK and transcripts were analysed using grounded theory. Interview questions focused on the respondents' social networks and supportive exchanges. During the interview respondents spontaneously described changes in their social and private identities following the death of their spouse. The data reveal that widowhood prompts a process of identity reconstruction for men and women, and particularly interesting is the relationship between identity change and social participation. Specifically, the construction of the social network, exchange of social support and nature of social activities, which shape an individual's sense of identity, suffer significant disruption in widowhood. These changes in social participation lead to the loss of the socially constructed self and trigger a process of identity reconstruction as a consequence of the adjustment to a new social role. Further, identity and social participation have a bi-directional relationship where identity, in turn, exerts an influence on social participation and provides an opportunity for personal growth. Experiences of identity

reconstruction are found to vary by age, gender and marital quality. These findings enhance the understanding of the experience of widowhood and highlight social participation as a facilitator and outcome of identity reconstruction and adjustment following spousal bereavement.

#### **AFFIRMING LIFE MEANS AFFIRMING DEATH? ATTITUDES TOWARD DYING AND DEATH AND SWB IN THE OLDEST-OLD**

O. Reidick<sup>1</sup>, O.K. Schilling<sup>1</sup>, H. Wahl<sup>1</sup>, F. Oswald<sup>2</sup>, 1. *Institute of Psychology, Department of Psychological Aging Research, Heidelberg University, Heidelberg, Baden-Württemberg, Germany*, 2. *Interdisciplinary Aging Research, Faculty of Educational Sciences, Goethe University, Frankfurt am Main, Hessen, Germany*

Recent empirical findings demonstrate that in spite of the large confirmation of the well-being satisfaction paradox into very old age, subjective well-being (SWB) shows significant decline close to death. Such findings serve as additional support for the assumption that facing the end of our life is possibly the most challenging developmental task of lifespan development. In the light of this indication, we examined the relationship between attitudes toward dying and death (ADD) and SWB (satisfaction with life, positive valuation of life, environmental mastery, autonomy, purpose in life and self-acceptance) in very old age. We hypothesized that anxiety of dying and death, two major components of ADD, and SWB should be negatively associated, whereas death acceptance, a third major component of ADD, and SWB should be positively correlated. Data were drawn from the first measurement wave of the project LateLine (N=113; age range 87-97 years, 78% female). Findings support our hypotheses, i.e. low anxiety of dying is predictive for high satisfaction with life and environmental mastery; moreover, death acceptance predicts high satisfaction with life, positive valuation of life and autonomy. Results were controlled for sex, age and education with the latter predicting purpose in life. Our results underpin the need to empirically address ADD in relation to SWB in late life. Due to declining SWB close to death and the need to face mortality in very old age, the significant relations of SWB and ADD variables demonstrated here provide a useful insight into the possibly last developmental task for the older person.

#### **“WIDOWERHOOD:” MASCULINITIES AND SPOUSAL LOSS IN THE 1960’S**

J. Bandini, E.H. Thompson, *Sociology and Anthropology, College of the Holy Cross, Worcester, Massachusetts*

Spousal bereavement and widowhood have rarely been studied from the perspective of what “widowerhood” means. Especially during the 1960s when gender was more restrictive, masculinity norms expected men to be partnered for life and to maintain a tough and independent front. We examined 19 widowers’ adaptations to spousal loss using longitudinal data from the 1960’s Harvard Bereavement Study. The study contained interviews conducted 3 weeks, 8 weeks, 13 months, and 2-4 years after the wife’s death. Our findings indicate that masculinities cannot be ignored with evaluating the ways in which men cope with spousal loss and being widowers. Men discussed the difficulties regarding whether or not to express their emotions, divulge their unspoken dependency and ask for help, and try to singlehandedly care for their children’s needs. Many men felt a need to bury themselves in a work environment as a distraction from their grief and as a way to gain social support without having to feel dependent. They also sought to reclaim masculinity, sometimes through remarriage and other times through added risk-taking, such as increased drinking and smoking. Further research is needed to fully understand how masculinity influences the bereavement experiences among contemporary samples of widowers.

## **SESSION 2025 (POSTER)**

### **DEMENTIA**

#### **WHAT CHARACTERISES RESILIENT SPOUSAL CARERS OF PEOPLE WITH DEMENTIA?**

K.M. Bennett, W.J. Donnellan-Smith, *Psychology, University of Liverpool, Liverpool, United Kingdom*

Much is known about the factors that make caring for a spouse with dementia burdensome. However, relatively little is known about factors that help some spouses become resilient. We undertook 13 in-depth qualitative interviews with spousal caregivers to examine factors contributing to resilience. They were asked about their married lives before their spouses were diagnosed with dementia and about their lives around the time dementia was diagnosed or suspected. Finally, they were asked about their lives since that time and how their lives were currently. Resilience was defined as “the process of negotiating, managing and adapting to significant sources of stress or trauma. Assets and resources within the individual, their life and environment facilitate this capacity for adaptation and ‘bouncing back’ in the face of adversity” (Windle & Bennett, 2012, p. 219). A third of the sample were resilient, and in addition, some participants gave evidence to suggest that they were moving towards resilience. Key features associated with resilience included learning about the condition, learning to be a ‘better person’ and the demonstration of expertise. Resilient carers also used more downward comparisons. Further, they were more likely to maintain continuity between pre- and post-dementia lives, where it was possible. As part of the process of moving towards resilience, carers discussed adapting to the transitions between spouse and carer. The study also considers what might help carers of spouses with dementia achieve resilience.

#### **LIVING WITH MCI: EXPERIENCES OF OVER A 7-YEAR PERIOD AMONG 17 INDIVIDUALS EVALUATED AT A MEMORY CLINIC**

A. Berg<sup>1,2</sup>, A. Wallin<sup>2</sup>, A. Nordlund<sup>2</sup>, B. Johansson<sup>1</sup>, 1. *Department of Psychology, University of Gothenburg, Gothenburg, Sweden*, 2. *Institute of Neuroscience and Physiology, The Sahlgrenska Academy at Göteborg, Gothenburg, Sweden*

MCI (Mild Cognitive Impairment) is a state of mildly impaired cognitive functioning but with an intact capability of performing basic daily activities. A major challenge in current research is to develop methods for better predictions of the likelihood for conversion from MCI to dementia, but few studies have targeted personal narratives of the process of being classified as and living with MCI. In the present study we explore individual experiences of living with a MCI-classification over a 7-year period. At a memory clinic, 17 individuals were classified as MCI-cases at 4 occasions over a time period 7-years. They were interviewed about their personal experiences of living with MCI and then in a second step asked to explore the role of life events, daily hassles and stress, coping mechanisms, psychosocial resources, and lifestyle behaviors. Interpretative phenomenological Analysis of the interview transcripts generated themes revolving around the life situation and events related to the first visit at the memory clinic, adjustment strategies in coping with lower cognitive capacity with the aim of enhancing quality of life, and worries about dementia and further cognitive deteriorations. The experiences of life with a long-term MCI classification indicate that changes in life situations such as long-term stress, retirement, the loss of relatives, perceived heritability of dementia, should be explored in the context of individual interpretation and personal meanings of their cognitive functioning. Addressing the intra-personal dynamics of cognitive functioning in the boundary between normal and pathological cognitive aging could improve diagnostic accuracy and guide the development of psychological interventions in the MCI group.

## PHYSICAL REACTIVITY TO STRESS AND INCIDENT DEMENTIA: 34-YEAR FOLLOW-UP OF THE SWEDISH TWIN REGISTRY

E.A. Hahn<sup>1</sup>, R. Andel<sup>1,2</sup>, M. Crowe<sup>3</sup>, N.L. Pedersen<sup>4,5</sup>, M. Gatz<sup>4,5</sup>, 1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. International Clinical Research Center, St. Anne's University Hospital, Brno, Czech Republic, 3. Department of Psychology, University of Alabama at Birmingham, Birmingham, Alabama, 4. Department of Medical Epidemiology and Biostatistics, Karolinska Institutet, Stockholm, SE-171 77, Sweden, 5. Department of Psychology, University of Southern California, Los Angeles, California

**Background:** Repeated exposure to stress can have negative physiological effects, including chronic dysregulation of the hypothalamic-pituitary-adrenal axis and increased proinflammatory cytokines, which in turn may facilitate neurodegeneration. We examined self-reported physical reactivity to stress as a risk factor for dementia. **Methods:** In 1967 or 1970, 10,366 twins responded to a questionnaire that included self-report of multiple, single, or no physical symptoms in response to stress (e.g., headache, stomachache, heart beating rapidly); dementia was identified using national medical records up to 34 years later. **Results:** Multi-symptom stress reactivity was associated with increased risk of dementia (hazard ratio [HR]=1.41,  $p<.05$ ) and Alzheimer's disease (HR=1.48,  $p<.05$ ), controlling for age, sex, education, financial difficulties, lack of time, vascular problems, smoking, drinking, and exercise. In stratified analyses, the reactivity-dementia association was stronger for women (HR=1.39,  $p=0.06$ ), less-educated participants (HR=1.57,  $p<.01$ ), former blue-collar workers (HR=1.89,  $p<.01$ ), those drinking alcohol excessively (HR=1.84,  $p<.05$ ), and those engaging in no/little exercise (HR=1.38,  $p<.05$ ). In co-twin control analyses, the covariate-adjusted dementia risk was more than double for twins with multi-symptom stress reactivity compared to co-twins reporting no symptoms (odds ratio=2.27,  $p<.01$ ). **Discussion:** Stress reactivity at mid-life increases risk of dementia later, particularly among women, less-educated individuals, and blue-collar workers. Interventions targeting positive health behaviors may reduce the negative effects of physical reactivity to stress on brain aging.

## CAREGIVER AGREEABLENESS PREDICTS RATE OF FUNCTIONAL DECLINE IN PERSONS WITH ALZHEIMER'S DISEASE

M.C. Norton<sup>1</sup>, C. Clark<sup>1</sup>, E.B. Fauth<sup>1</sup>, K. Piercy<sup>1</sup>, R. Pfister<sup>1</sup>, P. Rabins<sup>2</sup>, C. Lyketsos<sup>2</sup>, J. Tschanz<sup>1</sup>, 1. Family Consumer & Human Development, Utah State University, Logan, Utah, 2. the Johns Hopkins University, Baltimore, Maryland

Caregiver personality has been linked to caregiver mental and physical health. Few studies have examined its effect on clinical progression of dementia in care recipients. In a population-based sample of incident dementia cases, we previously demonstrated that high relationship closeness and more cognitively-stimulating activities predicted slower rates of cognitive and functional decline in persons with Alzheimer's disease (PWD). We now report results examining associations between five caregiver personality traits and functional decline in PWD. The functional status of 161 PWD (61% females; age  $M=83.1$ ,  $SD=6.0$  years) was assessed with the Clinical Dementia Rating Sum of Boxes, every 6-18 months (median 6.0 years follow-up). Neuroticism, Extraversion, Openness, Conscientiousness, and Agreeableness were self-reported by caregivers with the NEO-FFI or NEO-PIR. Caregivers were 55 spouses, and 106 adult offspring. Linear mixed models of functional trajectory were estimated separately for each domain, starting with dementia onset. When an overall personality domain was significant, individual facets were analyzed separately. Higher scores on Agreeableness overall (beta =-0.019 ;  $p=0.049$ ) and higher scores on facets of Compliance (beta =-0.021;  $p=0.042$ ) and Modesty (beta =-0.021;  $p=0.039$ ) were associated with slower functional decline in the PWD.

Caregiver kin relationship (spouse vs. offspring) did not moderate any associations. None of the other personality traits were significantly associated with functional trajectory. Caregiver agreeableness may be an important aspect of the caregiving environment, affecting clinical progression in PWD. Future work will examine possible mediation through reduction in PWD neuropsychiatric disturbances, better caregiver coping strategies, and greater PWD engagement in cognitively stimulating activities.

## WHY WORRY? EXPLAINING ALZHEIMER'S FEARS

L.G. Hodgson<sup>1</sup>, J. Gardner<sup>1</sup>, E. Hodgson<sup>1</sup>, S. Cutler<sup>2</sup>, 1. Sociology, Quinnipiac University, Hamden, Connecticut, 2. University of Vermont, Burlington, Vermont

According to recent studies, Alzheimer's disease (AD) is one of the most feared diseases of adult men and women, second only to cancer and more feared than heart disease or stroke. In 2000, Cutler and Hodgson conducted a baseline study (T1) of 258 middle-aged men and women on their personal concerns about developing AD. In 2005, 2nd wave (T2) follow-up data were collected from 80% of the original sample ( $N=206$ ); and in 2011, 3rd wave (T3) follow-up data were collected from 86% of the T2 sample ( $N=177$ ). This paper discusses one aspect of the T3 qualitative findings: reasons for personal concerns about developing AD. Of all respondents, 70% were either "very" or "somewhat" concerned; 30% were "not very" or "not at all" concerned. Respondents were then asked to explain their answers in depth. Grounded theory was employed to discern patterns and themes within the data. For those who reported concerns about developing AD, two explanatory themes stood out: a family history of the disease and fears of dependence. For those who reported little or no concern, three explanatory themes emerged: no family history of AD, other health/life concerns that took precedence, and fatalism. Exploring the basis for AD concern will allow researchers to better inform evidence-based practice as it relates to dealing with the dementia anxieties of middle-aged and older men and women.

## DEPICTION OF ALZHEIMER'S DISEASE FEATURES IN CHILDREN'S STORYBOOKS

E. Sakai, R.E. Rieger, B.D. Carpenter, Psychology, Washington Univ—EPS, St Louis, Missouri

**Introduction:** Enhancing health literacy about Alzheimer's disease (AD) is an important public health matter. Among the methods for educating the public, children's storybooks are understudied. The purpose of this study was to examine features of AD depicted in children's storybooks. **Methods:** Qualitative and quantitative analyses were conducted with 33 children's storybooks published between 1988 and 2009, written in English for ages 4-12. **Results:** The majority (88%) of storybooks labeled the phenomenon as "Alzheimer's disease," though none used the term "dementia." Only 18% made a distinction between AD and normal aging. Seventy-five percent of the storybooks did not discuss the diagnostic process, and 64% did not address prognosis. Few addressed whether there was a cure (21%) or treatments (18%) for AD. The prevalence of AD symptoms in the storybooks was variable relative to epidemiological data. Across the storybooks, 100% depicted at least one cognitive symptom, 42% at least one emotional symptom, 36% at least one behavioral symptom, and 21% at least one functional symptom. Nonetheless, symptom presentation was widely variable across storybooks. **Conclusions:** What children can learn about AD from storybooks depends on the book they read. Across books, there are notable gaps in essential information. Authors may leave out information they perceive as distressing or difficult for a young child to understand. Comprehensive, professionally reviewed storybooks are essential to adequate health literacy. Methods for creating recommended reading lists might adopt a more empirical approach.

## DEMENTIA CAREGIVING IN THE LATINO FAMILY: BEHAVIOR PROBLEMS, COPING, AND MAJOR CHALLENGES

R.M. Turner<sup>1</sup>, L. Hinton<sup>1</sup>, D. Gallagher-Thompson<sup>2</sup>, R. Valle<sup>3</sup>, 1. *University of California Davis, Sacramento, California*, 2. *Stanford University, Stanford, California*, 3. *San Diego State University, San Diego, California*

While a number of studies have found that Latino elderly with dementia dwelling in the community have higher levels of dementia neuropsychiatric symptoms compared with white non-Hispanics, we know relatively little about how Latino family caregivers recognize and cope with these symptoms in their day-to-day lives. In this qualitative study we analyze data from four focus groups of 42 Latino caregivers to elderly recipients with dementia. Goals of the study are to: 1) identify the most problematic behaviors experienced by caregivers, 2) explore the coping strategies caregivers used when managing difficult behaviors, and 3) describe the major challenges associated with caring for a loved one with dementia. Using an iterative coding technique, three independent raters reviewed transcribed data to determine themes for the three categories of constructs and then coded data using derived themes. Results indicate that diminished body function, diminished hygiene, aggression, wandering, and overt sexuality were the most challenging behaviors caregivers in this cohort dealt with. Caregivers described a range of productive coping strategies used to handle problem behaviors: acceptance, love, patience, assertiveness, flexibility, and the establishment of routine were used by caregivers to successfully navigate caregiving demands. Major caregiving challenges related to behavior problems were difficulties with healthcare providers, problematic family characteristics, limited knowledge of resources, emotional distress, and financial strains. These findings provide valuable information on how Latino caregivers perceive and experience dementia problems that may inform the development of culturally-tailored intervention strategies.

## NEUROPSYCHOLOGICAL AND CLINICAL FACTORS AFFECTING WANDERING BEHAVIOR OF COMMUNITY DWELLING OLDER ADULTS WITH MILD DEMENTIA

Y. Lim<sup>1</sup>, K. Park<sup>2</sup>, Y. Lee<sup>2</sup>, S. Park<sup>3</sup>, 1. *Yonsei Univ Wonju College of Medicine Department of Nursing, Wonju, Gangwon-do, Republic of Korea*, 2. *Yonsei University Wonju College of Medicine, Wonju, Gangwon-do, Republic of Korea*, 3. *Yonsei University, Wonju, Gangwon-do, Republic of Korea*

The purpose of the study was to determine neuropsychological and clinical factors affecting wandering behaviors of community dwelling older adults with mild dementia in Korea. This study used secondary data that was obtained from the survey for early detection and treatment of dementia among community dwelling older adults by the Korean Association for Dementia, and Ministry of Health and Welfare in 2011. The total sample in this study was 104 elders diagnosed with mild dementia over 65 years old in one rural area in Kangwon province. Logistic regression was used to test the hypothesis that wandering is a behavior predicted by neuropsychological and clinical factors. Instruments were constructional praxis test, constructional praxis recall test, GDS, and the Korea version of Short Blessed Test (SBT-K). For elders with mild dementia, constructional praxis delayed recall (OR=.459, p=.034) and the Korean version of Short Blessed Test (OR=1.224, p=.035) were predictors of wandering behavior, indicating that the odds of constructional praxis recall for elders with wandering behavior are 46% lower than the odds of constructional praxis recall for elders with no wandering behavior, and elders with wandering behavior are 1.22 times more likely to have high scores of SBT-K as elders with no wandering behavior. Results show that disorientation, poor concentration and impaired constructional praxis recall significantly influenced the wandering

behavior of elders with mild dementia. Implications of these findings for further research and application to health care professionals are discussed.

## SOCIAL ENGAGEMENT AND PROGRESSION FROM MILD TO SEVERE COGNITIVE IMPAIRMENT: THE MYHAT STUDY

T. Hughes, J.D. Flatt, B. Fu, C. Chang, M. Ganguli, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Preventing or delaying the progression of mild cognitive impairment (MCI) to more severely impaired cognitive states is of considerable public health importance. We examined the associations of level of, and change in, engagement in social activities with risk of progression from MCI to severe cognitive impairment, using data from the Monongahela-Youghiogheny Healthy Aging Team (MYHAT) Study - a prospective cohort study of MCI in the community. The study included 816 older adults with cognitively defined MCI (mean age of 78.04 (SD = 7.38), range 65-96 years), among whom 78 progressed to cognitively defined severe cognitive impairment and 738 whose MCI remained stable across up to three annual follow-up waves (mean = 2.17 (SD = 0.84) waves). Discrete time survival analyses were used to estimate the risk of progression with standardized composite measures of the number of, and frequency of engagement in, social activities as the main predictors. After adjusting for age, gender, education, and functional impairment, more frequent engagement in social activities (OR = 0.63, 95% CI: 0.43-0.93, p = 0.02) and a slower rate of decline in the number of activities over time (OR = 0.30, 95% CI: 0.09-0.97, p = 0.05) were associated with lower risk of progression to severe cognitive impairment. These findings confirm that social activities are associated with cognitive health outcomes in late life. Engagement in social activities may be beneficial for preventing or delaying further cognitive decline among older adults with mild cognitive impairment.

## PERCEIVED CONSEQUENCES OF ALZHEIMER'S DISEASE

A.K. Zaleta, B.D. Carpenter, L. Oglander, E.L. Rosen-Wachs, *Washington University, Saint Louis, Missouri*

Introduction. Concern about getting Alzheimer's disease (AD) is well documented, but few studies have evaluated people's perceptions of the specific consequences of having AD. This study extends previous research by allowing participants to provide open-ended responses about the consequences of AD, for both people with the disease and their caregivers. Methods. 33 individuals with varying AD experience (older adults without AD family history, AD relatives, AD caregivers, individuals with very mild AD, and AD health professionals) were asked to identify the three most stressful consequences of having AD. Non-professional participants rated their knowledge of AD on a 10-point Likert-type scale. Qualitative methods were used to sort responses into categories; responses were tallied by rank. Results. Participants identified consequences spanning several functional and interpersonal domains. Across all participants, the most frequently identified consequence was loss of independence (24% of participants). Loss of independence (30%) and awareness of functional changes (21%) were identified as the most stressful consequences for a person with AD. Stress from providing care (24%), managing behavioral problems (15%), and forgetting people (15%) were considered the most stressful consequences for a caregiver to a person with AD. Self-ratings of AD knowledge were variable (range: 2-10); knowledge ratings did not vary significantly across participant type (p > .05). Summary. Individuals vary in their perceptions of the most stressful consequences of AD, suggesting that no single consequence best characterizes concerns about getting AD. These consequences may have significant implications for older adults' efforts to manage the perceived threat of getting AD.

## EFFICACY OF FACIAL EXPRESSION TRAINING FOR NURSE AIDS IN DETECTING PAIN IN RESIDENTS WITH DEMENTIA

L. Lin, *National Yang-Ming University, Institute of Clinical and Community Health Nursing, Taipei, Taiwan*

**OBJECTIVE.** The aims of this study was to compare the effects of pain assessment and facial expression of pain, and a combination of pain assessment, facial expression of pain, and demonstration and return demonstration on pain detection and management for formal caregivers. **METHODS.** Subjects (372 residents and 162 nurse aids) were recruited from eight nursing homes. The eight institutions were randomly assigned into experimental group I (EI), experimental group II (EII) or the control group (CG). Nurse aids in EI received didactic training in pain assessment and the facial expression of pain, had video and discussion session on facial expression of pain, and demonstration and then return demonstration to record the facial expression of pain. The EII received didactic training in pain assessment and facial expression of pain. The CG received no special training. **RESULTS.** Before training, the Kappa coefficient for consistency of residents' self-reported pain and nurse aids' detected pain in the EI, EII and CG were 0.267, 0.042, and 0.125 respectively, while the Kappa coefficients after training in the EI, EII and control groups were 0.484, 0.440 and 0.188 respectively. Moreover, the resident pain frequency between pre- and post-training among the three groups were significantly different ( $F=3.384$ ,  $p=.035$ ;  $EI>C$ ,  $EII>C$ ). There were also significant differences in muscle relaxant use between pre- and post-training among the three groups were significant ( $F=3.530$ ,  $p=.03$ ;  $EI>EII$ ,  $EI>C$ ). **CONCLUSION.** During the study, staffs were hesitant to use pain relief medications due to concern over possible addiction. Further training about pain management is needed.

## META-ANALYSIS OF NON-PHARMACOLOGICAL INTERVENTIONS FOR APATHY IN DEMENTIA

Y. Jao<sup>1</sup>, J. Specht<sup>1,2</sup>, 1. *College of Nursing, The University of Iowa, Iowa City, Iowa*, 2. *John A. Hartford Center for Geriatric Nursing Excellence, Iowa City, Iowa*

**Background:** Apathy is the most prevalent behavioral and neuropsychiatric problem in dementia but is often not appropriately managed. A growing body of research has investigated the effect of non-pharmacological interventions on apathy yet the findings are conflicting and the results have not been quantitatively synthesized. **Purposes:** This study is to systematically review controlled clinical trials investigating the effects of non-pharmacological interventions for apathy in dementia and to statistically quantify their summary effect. **Methods:** The meta-analysis included published literature, dissertations, and unpublished reports. We searched five electronic databases, relevant reference lists, and conference proceedings. Twenty-three studies were enrolled. Data on characteristics of study design, study quality, participants, interventions, and effect sizes will be coded from each study. **Results:** The summary effect size will be indicated by a pooled standardized mean difference (d) on apathy scores between the intervention and control groups. The d value will be computed through combining individual sample size and effect size. Significance of the effect size will be determined through the z test. The Q statistic (weighted squared deviations), T (between-studies standard deviation), and I<sup>2</sup> (ratio of true variance) will be computed to describe between-studies variance of the summary effect. Preliminary data revealed that the summary effect size is 0.267 ( $P<.05$ ). **Discussion:** The results of summary effect size will help clarify the overall benefit of non-pharmacological interventions for apathy in people with dementia. Further, it may identify important characteristics of study design, interventions, and participants for the effect of interventions to guide future research and practice.

## SESSION 2030 (POSTER)

### DEPRESSION TREATMENT & SCREENING

#### CHARACTERISTICS OF OLDER ADULTS WHO USE SELF-HELP MATERIALS FOR DEPRESSION

A. Shah, F. Scogin, L. Brown, J.L. Shelton, M.P. Morthland, A.H. Presnell, E.A. DiNapoli, *Social Work, University of Alabama, Tuscaloosa, Alabama*

Self-administered treatments for depression are cost-effective, widely available, and potentially valuable as the first step in a stepped care treatment plan. Prior research supports the use of certain self-administered treatments for depression in older adults (Scogin, Welsh, Hanson, Stump, & Coates, 2005). However, no recent studies have evaluated how common self-help use for depression is among older adults. This study evaluates the use of self-help materials for mood in community dwelling older adults and assesses if depression (Patient Health Questionnaire) was related to self-help usage. Two samples were used to evaluate this information. The first sample consists of older adults ( $N = 100$ ;  $M$  age = 73.23) who were recruited from senior nutrition centers and primary care clinics. Those age 55 or above with adequate self-reported reading ability were approached about participating in a 20 minute survey on depression screening. Participants completed counterbalanced self-administered survey packets, which included a depression screen, demographics form, and a yes/no question about their use of self-help materials for mood. Older adults who had endorsed self-help usage for mood evidenced significantly higher scores on the PHQ-9 than those who did not ( $t(82) = -2.23$ ;  $M = 5.9$  vs.  $M = 2.73$ ). The second sample consists of baseline assessments of 51 depressed community dwelling older adults recruited for a depression treatment study evaluating self-administered treatments for depression. The same demographics questionnaire and question about self-administered treatment usage was provided to this sample. Tables will be provided to discuss the demographics characteristics of older adults who use self-administered mood materials.

#### ENHANCING MENTAL HEALTH TREATMENT FOR OLDER ADULTS IN MEDICAL REHABILITATION: A RANDOMIZED CLINICAL TRIAL

P.A. Lichtenberg, T.F. Russo, C. Lysack, C. Leach, D. Paulson, *Institute of Gerontology, Wayne State University, Detroit, Michigan*

Lysack, Lichtenberg and Schneider (2011 AJOT) described a Community based Participatory Research project that developed a 6-DVD training to help Occupational Therapists integrate mental health into their practice with older adults. The current study extended this effort in two ways; (1) Created and evaluated a train the trainer model of disseminating the DVD information and (2) Performing a Randomized Clinical Trial to investigate whether the train the trainer model was effective in changing clinical practice. Eight trainers were randomized into either the intervention or control group. Seventy Occupational Therapists were assigned to be in a group across the 8-trainers. All sites were geographically disparate so that there was no contamination during the intervention. Trainers in the intervention group significantly improved their knowledge following training ( $d=1.93$ ; large effect size). One hundred sixty medical record notes from 3 months before the training and then another 160 medical records 3 months after the trainers trained their staff were obtained from the intervention and control groups. Records were rated across 19 items by two blinded independent experts to determine clinical practices. Kappa value of .84 documented excellent inter-rater agreement. A 2x2 repeated measures ANOVA was performed to test the intervention. Large effect sizes were found ( $d=.82$ ) indicating that compared to the control group the intervention group significantly increased their assessment of and intervention with mental health problems. Most improved were screening rates for depression and cognition followed by interdisciplinary team communication, assessment of balance confidence and use of behavioral activation.

## DEVELOPMENT OF A MOBILE GERIATRIC MENTAL HEALTH SCREENING KIOSK FOR COMMUNITY MENTAL HEALTH SETTINGS

A.M. Napoles<sup>1</sup>, J. Chu<sup>2,1</sup>, C. Spensley<sup>3</sup>, M. Moore<sup>3</sup>, R. Bennett<sup>3</sup>, P.A. Arean<sup>1</sup>,  
1. *University of California San Francisco, San Francisco, California*, 2. *Palo Alto University, Palo Alto, California*, 3. *Family Service Agency of San Francisco, San Francisco, California*

**Background.** Client-centered mental health services result in better recovery outcomes. Systematic, brief diagnostic screeners that are appropriate for geriatric, low-income community mental health clients are needed to promote shared treatment decision making. **Purpose.** To describe the development and pretesting results of a mobile mental health screening tool for use in low-income geriatric populations seen in community mental health settings. **Methods.** Literature and expert reviews were employed to develop the screening tool. Open-ended cognitive interviews with 20 clients and 3 focus groups with clinicians assessed attitudes, barriers and facilitators to use of the screening tool and comprehension of items. **Results.** The majority of items were interpreted as intended by clients, although some items triggered emotional responses. Per clients, the tool addressed the concerns that brought them to the clinic. System-related barriers to implementation included technological and logistical challenges in conducting home visits. Client-related barriers were the frequent need for assistance in completing the screening tool, severity of mental illness, cognitive impairment, instability/case management needs, and trepidation over use of computers. Perceived benefits by clients and clinicians included efficient identification of potential mental health issues, sharing of immediate results, and improved client-clinician communication. Adaptations suggested by clients included simplification of terms and shortening of the tool. Clinicians recommended simplification of hoarding and mania items, integration of the tool with other reporting requirements, shortening, larger font size, and clarification of time frames for items. **Conclusions.** Pretesting of the mobile screening tool supported its usefulness and acceptance by clients and clinicians with some modifications.

## SESSION 2035 (POSTER)

### DISABILITY PREVALENCE AND PREVENTION

#### AN EXPLORATION OF THE RELATIONSHIP BETWEEN PAIN, DISABILITY AND DEPRESSION IN OLDER BLACK AND WHITE ADULTS WITH OSTEOARTHRITIS

N.G. Regier<sup>1</sup>, C. Azuero<sup>1</sup>, A. Shah<sup>2</sup>, P.A. Parmelee<sup>1</sup>, 1. *University of Alabama Center for Mental Health and Aging & Department of Psychology, Tuscaloosa, Alabama*, 2. *University of Alabama School of Social Work, Tuscaloosa, Alabama*

Previous studies have reported mixed results in examining racial and gender differences in the relationships between pain, disability and depression in older adults with osteoarthritis. The present study examined these relationships using data from the 2008 wave of the Health and Retirement Study, filtering for black and white individuals not currently living in a nursing home who also endorsed pain and were diagnosed with arthritis (N=3,894). Ordinary least squares regressions were used to model the relationships among race, gender, pain, disability, and depression (while controlling for covariates) using pain, disability, and depression as three separate outcome variables. Significant effects of race, sex, disability, and depression were detected in the model for pain. There were marginally significant race-by-pain and race-by-gender interactions in the model for disability, as well as main effects for pain and depression. Finally, there were main effects of disability, pain, race, and gender in the model for depression. These findings indicate that race and sex may influence perceptions of pain, depression and disability among older adults in complex ways. Greater understanding of these relationships is necessary to refine individualized clinical treatments.

## ASSOCIATION OF PHYSICAL ACTIVITY AND ARTHRITIS IN ELDERLY MEXICAN AMERICANS: FINDINGS FROM THE HEPESE

E. Grubert<sup>1</sup>, B.A. Shaw<sup>3</sup>, T. Baker<sup>2</sup>, K. Markides<sup>4</sup>, C. Siordia<sup>4</sup>, 1. *Epidemiology and Biostatistics, University at Albany (SUNY), Rensselaer, New York*, 2. *University of South Florida, South Florida, Florida*, 3. *University at Albany, SUNY, School of Public Health and Center for Social and Demographic Analysis, Rensselaer, New York*, 4. *University of Texas Medical Branch, Galveston, New York*

While older adults (> 65 and older) from more marginalized populations (e.g., diverse race and ethnic) experience a disproportionate burden of disease and mortality, they are also at an increased risk for reporting greater disability and functional limitations. Documented changes in functional status across the life span are broadly known among older adults with arthritis, however little is known about physical activity (PA) as a predictor of arthritis among aged Mexican Americans (MA). This study aimed to identify the influence of PA on self-reports of arthritis among older MA. Data were taken from the Hispanic Established Population for the Epidemiologic Study of the Elderly (HEPESE). The primary predictor variable, the Physical Activity Scale for the Elderly (PASE) was used to assess the influence of PA on current and future arthritis diagnoses among MA over 10 years (1995-2005). Our sample was 2166 MA with a mean age of 75±6.1 years, and 59% female. Logistic regression models showed that having an arthritis diagnosis was negatively associated with PASE scores and age. Data further showed that there was a modest association between PA and arthritis for both males (B= -0.002; p=0.17) and females (B= -0.002; p=0.05) at baseline. Baseline PA predicted future incidence of arthritis among females only. The results from this study emphasize the need for further studies examining the relationships between physical functioning, health behaviors, and clinical and psychosocial indicators within defined race and ethnic groups in order to provide meaningful comparisons between different race and ethnic groups.

### WORKING MEMORY AFFECTS RAPID STEPPING TASK PERFORMANCE IN HEALTHY OLDER MEN

K. Ishimatsu<sup>1</sup>, F. Togo<sup>2</sup>, A. Ohnishi<sup>3</sup>, 1. *Graduate School of Health Care Sciences, Jikei Institute, Osaka, Japan*, 2. *Graduate School of Education, The University of Tokyo, Tokyo, Japan*, 3. *National Institute of Occupational Safety and Health, Tokyo, Japan*

Recently, it is known that a decline in higher cognitive function, especially executive function, has been associated with an increased fall risk even in healthy older adults. In some situations, avoiding a fall requires a higher level of cognitive processing to select correct motor and stepping responses. The present study investigated how executive function (i.e., working memory: WM) influences performance of the rapid stepping task during two step conditions. Twenty-eight older males took 2 sessions of 37 trials of volitional front, side, and back steps in random order, and 2 sessions of 36 trials in non-random (clockwise and counterclockwise) orders of directions with at least 80% of maximal step length in response to visual commands on direction of steps. Rate of inaccurate steps were compared as a function of WM score which was measured by using the Digit Span subtest of the Wechsler Intelligence Scale-Third Edition. The error rate in the lowest WM quartile was significantly larger than that of the remaining three quartiles in both sessions. Furthermore, in the lowest WM quartile, error rate in the random session was larger than that of the non-random session where participants knew the sequence of directions of step in advance. These results suggest that the load on and the amount of WM could contribute to increase the accuracy of the rapid stepping task. It is also suggested that WM might be associated with fall risk in older adults.

## DISABILITY PREVALENCE AMONG CHINA'S OLDEST OLD: TESTING THE CUMULATIVE ADVANTAGE HYPOTHESIS

J.A. Burr, M. Nguyen, P. Xu, *Gerontology, Univ Mass Boston, Boston, Massachusetts*

In 2010, China had more than 1.3 billion people of which approximately 18 million (1.4%) were age 80 and older. By 2050, the oldest old population is projected to grow to 98 million. The objective of this study was to evaluate the relationships of childhood and adult SES with the prevalence of disability among the oldest old in China. The study was framed within the cumulative advantage hypothesis. We employed data from the 2005 Chinese Longitudinal Health and Longevity Survey to examine the relationships among ADL and IADL limitations and SES. We found that approximately 30% reported an ADL limitation and more than 80% reported an IADL limitation. Bivariate results showed that the prevalence of disability was higher when subjects grew up in an urban area (ADLs) and lower if they ever attended school. Disability prevalence was higher if they did not receive adequate medical care during childhood (IADLs) and if they routinely went to bed hungry as a child (ADLs). If father worked in agriculture when subject was a child, disability was lower for ADLs and higher for IADLs. For subjects currently residing in urban areas, disability prevalence was higher (ADL) and for those who worked in agriculture as an adult, the prevalence of disability was lower (ADL). After controlling for adult SES and covariates in our regression models, having ever attended school was not related to the likelihood of a disability (ADL). The results showed that the effect of schooling was fully mediated by the adult SES variables.

## TAI CHI MOVING FOR BETTER BALANCE (TCMBB) AS AN INTERVENTION FOR IMPROVING POSTURAL CONTROL

T. Chen<sup>1</sup>, M. Janke<sup>2</sup>, M.F. Avalos<sup>3</sup>, C.K. McHenry<sup>3</sup>, *1. University of South Florida, Tampa, Florida, 2. University of South Florida Polytechnic, Lakeland, Florida, 3. West Central Florida Area Agency on Aging, Inc., Tampa, Florida*

The TCMBB is an 8-form Tai Chi program targeting community-dwelling older adults. This program was successful in improving falls and postural control among older adults in the Pacific Northwest and researchers suggested examining the program in other locations. The purpose of this study was to examine the effectiveness of the TCMBB on postural control among older adults (N = 178) living in West Central Florida. The participants in this study had a mean age of 77 years (SD = 8.15) and were predominantly female (89%). The outcome variable was the time it took participants to complete the Chair Stand Test (CST). The data were analyzed using descriptive statistics and repeated measures ANCOVA. We examined the effect of age, gender, location, number of sessions attended, number of chronic conditions, and number of people in living in the household on the CST. The repeated measures ANCOVA showed a significant effect for Time on the CST, (MT1 = 15.69s vs. MT2 = 12.30s;  $F(1, 78) = 4.89, p \leq .05$ ). Improvement in the CST was significantly different among participants at the seven different locations for this study,  $F(6, 78) = 35.00, p \leq .001$ . There was also a significant interaction effect for location by time ( $F(6, 78) = 3.94, p \leq .01$ ). Our findings suggest that the TCMBB can effectively improve postural control among older adults in West Central Florida, and that the program location can potentially influence its ability to affect performance on this measure.

## WALKING AND SELF-EFFICACY IN INDEPENDENT/ASSISTED LIVING FACILITIES

N.A. Gallagher<sup>1</sup>, P. Clarke<sup>2</sup>, E.E. Carr<sup>2</sup>, J. Fenner<sup>2</sup>, A.F. Ciotti<sup>1</sup>, A. Shamus<sup>3</sup>, K. Wiser<sup>3</sup>, *1. Michigan State University, East Lansing, Michigan, 2. University of Michigan, Ann Arbor, Michigan, 3. Eastern Michigan University, Ypsilanti, Michigan*

Sedentary behavior in independent/assisted living facilities increases residents' risk of development/progression of mobility limitations. The purpose of this cross-sectional analysis was to describe characteristics

of sedentary older adults (N=17) residing in independent/assisted living facilities. At baseline the sample's mean age was 76.8 years (SD=7.81). Seventy-five percent of the participants' comfortable gait speed was less than 1m/sec (range=0.7-2.1 m/s; M=1.2m/s, SD=1.65). Walking was the only physical activity (PA) reported by participants. Half walked for one hour or more per week, and 57% walked outside regularly. Sixty-seven percent of participants used an assistive device for walking. Several types of self-efficacy were measured: Self-efficacy for Walking Duration (SEW), Self-efficacy for PA Barriers, Self-efficacy for Neighborhood/facility Barriers, Gait-efficacy Scale, and the Activities-specific Balance Confidence Scale (ABC). In this sample SEW was low (M=32.62, SD=29.98), as was self-efficacy for PA despite personal (M=32.63, SD=18.98) and neighborhood (M=31.49, SD=29.43) barriers. Participants reported slightly higher self-efficacy in their ability to navigate environmental challenges (GES) (M=43.03, SD=30.99). Although 41% of participants had fallen in the last year, ABC was moderately high (M=56.41, SD=30.00). Walking is a commonly chosen and important form of PA for older adults in independent/assisted living facilities, and can easily be incorporated into PA interventions. It is therefore critical to improve our understanding of the influences on this type of PA. This analysis is part of a larger study to examine the feasibility of a 16-week physical activity/walking intervention. Exploratory purposes will include examining trends in mobility disability and in the relationship between individual (self-efficacy) and neighborhood environmental factors and PA.

## EFFECTS OF INCOME AND WEALTH ON DISABILITY: EVIDENCE FROM A LARGE LONGITUDINAL STUDY

S.B. Laditka, J.N. Laditka, *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*

Many Americans recently lost income and wealth. It might be expected that those with more income or wealth would have less disability, but little research has examined that hypothesis. Similarly, we hypothesized that a substantial loss of wealth might affect health and later functional status. We studied risks of disability onset using 11 survey waves of the nationally representative Panel Study of Income Dynamics (PSID) (1992-2009), following a cohort age 55 and over in 1992 (2,165). The PSID includes detailed longitudinal measures of income, wealth, and disability, and about comorbidities and their time of diagnosis. Disability was defined by activities of daily living. Income was measured as the ratio of the previous year's household income to the poverty threshold. Discrete-time hazard models estimated the likelihood of becoming disabled associated with income and wealth, controlling for functional impairment before baseline, baseline functional status, self-reported health, ten comorbidities, sex, ethnicity, education, marital status and kin, unemployment in the previous year, and retirement. Most measures were updated at each survey wave. Adjusted results suggested a gradient of income risk; those in the three lower income quartiles were more likely to become disabled than those in the fourth, with odds ratios (ORs) and 95% confidence intervals (CIs) for quartiles respectively: 1.64, 1.29-2.10; 1.54, 1.25-1.89; 1.42, 1.20-1.69, p-trend <0.0001. Less wealth was also associated with higher adjusted odds of becoming disabled, as was a loss of wealth >25% (OR 1.19, CI 1.02-1.36). Findings suggest that the recent recession may increase the future prevalence of disability.

## SESSION 2040 (POSTER)

### ENVIRONMENTAL CONTEXT

#### CULTURE CHANGE IN NURSING HOMES: STAFF UTILIZATION OF A NURSES' STATION

E.J. Carlson, *Architectural Studies, University of Missouri, Columbia, Missouri*

Nurses' stations were originally designed to oversee and supervise nursing home residents and staff. However with current trends in change

from a medical model of care to a more resident-oriented model of care, nursing home staff members do not provide care from a fixed location at a nurses' station. Therefore, this paper addresses the following research question: In what ways is a nurses' station utilized by nursing home staff? A qualitative grounded theory research study was designed using direct observation and unstructured interviews. In this pilot study, observations and interviews revealed five central themes of how staff members utilize a nurses' station: communication, wayfinding, privacy, confidentiality, and territoriality. The results indicate there is a complex relationship between the organizational, social, and physical environments to create successful culture change. By first understanding these relationships, further research can take place to make these orchestrated changes to increase quality of life for residents and a better work environment for nursing home staff. While this study explored a deeper understanding of how a nurses' station is utilized by staff and residents in a case study, other themes began to emerge about how culture change initiatives can be implemented to improve staff efficiency through the use of the physical environment and how that can translate to higher quality of care for residents. Pragmatic design recommendations can be created based on outcomes of the data collected for this facility.

### **THE NEIGHBORHOOD EFFECT ON DEPRESSIVE SYMPTOMS AMONG OLDER KOREAN ADULTS IN SEOUL**

J. Ko<sup>1</sup>, S. Lee<sup>2</sup>, 1. *University of South Florida, Tampa, Florida*, 2. *Chung-Ang University, Seoul, Republic of Korea*

**Purpose:** This study examined the relationship between neighborhood characteristics and depressive symptoms among older adults in Seoul, Korea. **Methods:** The survey data of individuals aged 65 and above were drawn from the 2010 Seoul Welfare Panel Data (N=1,413), and they were combined with various administrative statistics collected by districts (N=25). These data then were analyzed via Hierarchical Generalized Linear Model (HGLM). **Results:** This study found that the neighborhood characteristics explained 20% of the log odds of having severe depressive symptoms. Among neighborhood level variables, district welfare budget for older adults and perceived level of neighborhood satisfaction were positively associated with the log odds of having severe symptoms of depression. District crime rate had a significant negative impact on the likelihood of having severe symptoms. Individual characteristics (i.e., age, poverty, disease, regular exercise) were more likely to increase the odds of having severe depressive while regular exercise was more likely to decrease the odds. **Conclusions:** The findings above illustrate the importance of neighborhood environment, which is in line with the "Age-Friendly City" that encompasses the concept of sustainability. The authors finally suggested a need to consider neighborhood context in any effort to facilitate prevention and early intervention of geriatric depression, and made recommendations in the areas of district welfare budget, crime prevention, and resident satisfaction on the neighborhood.

### **GREENING PRACTICES IN ASSISTED LIVING FACILITIES**

E.E. MaloneBeach, Q. Zuo, B. Wood-Nartker, *Human Development and Family Studies, Central Michigan University, Mount Pleasant, Michigan*

The relationship between the physical environment and the health and well-being of older adults has gained interest, yet research on sustainable practices in elder care facilities is lacking. The purpose of this study was to conduct a national survey of assisted living facilities (ALFs) in relation to environmental sustainability efforts. The development of an online survey was guided by the standards put forth by major organizations devoted to green building. Accordingly, questions were grouped into four areas: facility information, sustainable practices, motivations to go green, and views of sustainable certification, and addressed location and linkages, site development, water and energy efficiency, green materials, indoor environmental quality, and sustainability education. The survey was deployed to 400 randomly selected ALFs from nine

states with the highest population of persons 65+. The results indicated an overall movement towards environmental sustainability. The primary interests of the ALFs were in sustainable strategies that provide connection to the larger community, promote interaction with nature, and improve the quality of life for residents. Concerns and obstacles to integrating green products in the ALF industry were also identified. This study depicts the scope of AFL administrators' interest in sustainable practices, efforts made and planned, as well as the challenges they face in greening.

### **GROWING OLD IN PLACE: THE EXPERIENCES OF RURAL ELDERLY**

J. Strommen, G. Sanders, *College of Human Development and Education, North Dakota State University, Fargo, North Dakota*

The study examined older adults' experiences and perceptions of living in rural communities in North Dakota. In order to gain insights into the experience of aging in a rural community, the researcher utilized the basic interpretive model of qualitative research described by Merriam (2002). Personal interviews were conducted with 12 individuals age 65 years and older who had resided in their community for a minimum of 15 years. Analysis to date indicates the diversity of individual characteristics and community characteristics impacts the lived experience of people growing old in rural areas. Preliminary themes indicate that rural elders have a strong attachment to place in spite of deteriorating physical and social conditions. Fewer residents and services in the community cause rural elders to feel isolated and vulnerable. The ability to drive is critical to accessing services and engaging in social and leisure activities outside of the community. These findings suggest that the experience of aging in rural communities varies with the specific community context and context should be carefully considered in efforts to meet the needs of rural elders.

### **THE ROUTINE AND THE REMARK-ABLE: THE TEMPORAL DIMENSION OF EVERYDAY LIFE AMONG ADULTS AGE 80 YEARS AND OLDER**

B.R. Williams, P. Sawyer, R.M. Allman, *Medicine, University of Alabama at Birmingham, Birmingham, Alabama*

**PURPOSE:** Contextual data portraying the rhythm of daily life for adults age 80+ are sparse. We explore individual descriptions of everyday life to characterize contours of day-to-day living in this population. **METHODS:** Semi-structured interviews with older residents of single-family dwellings and senior-living communities were analyzed. We used content analysis of respondents' descriptions of a typical day, the places they went, and activities in which they engaged. **RESULTS:** Participants (n=26) had a mean age of 85.5 years (range 80-92), were predominantly white 69.2% (n=18), female 73.1% (N=19), and residents of single family dwellings 61.5% (n=16). Respondents' lives were structured by a sequence of activities beginning with morning rituals of hygiene, prayer /devotions, breakfast, tidying up, reading newspapers, catching TV news/weather, making telephone calls, and paying bills. Respondents' midmornings were spent in physical, cognitive, or socially stimulating activities, including shopping, church, healthcare, and visiting. The early afternoon was more loosely defined, occasionally punctuated with "remark-able" events generating enthusiastic descriptive accounts of excursions, celebrations, or entertainment. Late afternoon was a time for napping, reading, sorting mail, writing letters, doing puzzles, or watching TV. The evening meal marked the beginning of day's end, with post-meal activities such as favorite TV shows or relaxing projects preceding bedtime rituals. **CONCLUSIONS:** While out-of-the-ordinary events were high points, ordinary tasks had particular salience for the structure and substance of daily life. Attempts to alter daily routines should accommodate the ebb and flow of the typical day, targeting the early afternoon when the "remark-able" is a welcome diversion.

## AGE DIFFERENCES IN MENTAL HEALTH AND CRIMINAL HISTORY AMONG HOMELESS ADULTS

A.N. Harris, K.J. Kimbler, *Florida Gulf Coast University, Fort Myers, Florida*

Previous research has found correlations between age and mental health of homeless populations. This research suggests that age is a potentially important factor when examining the type and extent of mental illness homeless individuals are likely to experience (DeMallie, North, & Smith, 1997; Pluck, Lee, David, Spence, & Parks, 2011). Duration of homelessness, which can be higher in old age, seems to predict decline in cognitive function and more problems related to mental health (e.g., Pluck et al. 2011; Caton et al., 2005). The literature has also established late adulthood in the homeless population to be younger than in the normal population (most commonly age 50 older; Caton et al., 2005; Cohen, 1999). The current study investigated the mental health characteristics of young (ages 18 to 29;  $n = 135$ ), middle-aged (ages 30 to 49;  $n = 402$ ), and older (50-years-old and older;  $n = 210$ ) homeless individuals. Data was collected with a self-report questionnaire when participants first arrived at the shelter. Information related to current and previous mental health diagnoses and treatment was obtained. Age groups did not significantly differ based on whether individuals had a previous or on-going mental health diagnosis. There were also no age differences in whether past treatment had been administered ( $p > .05$ ). When examining current treatment, however, older adults (14.21%) were less likely to be receiving ongoing mental health treatment compared to middle-aged adults (21.39%;  $p < .05$ ). Specific diagnoses, medication usage, and arrest history will also be discussed.

## SOCIAL FACTORS AFFECTING THE PERCEPTION OF AGE-FRIENDLY FEATURES IN AN URBAN MINORITY COMMUNITY

A.W. Costley, *York College-CUNY, Queens, New York*

Background: This exploratory study in New York City assessed the perceptions that older, ethnic minority adults have of the age-friendly features (WHO 2007) of their community and the variables that can impact the perception and experience of these features. Methods: Survey data was collected from a convenience sample of 59 clients at three senior centers in study area in Queens, NY. With an age range of 60-90 (mean/SD = 74 +7.7), 53% were African-America, 32% Caribbean, and 10% Hispanic. Items included demographic data, functional ability, living situation, and awareness of "age-friendly" features. Chi-square analyses explored variables having significant impact ( $p < .05$ ) on the perception of these features. Results: Overall, while 72% said that shopping areas lacked adequate seating, this was reported more by African-American clients ( $p = .032$ ). While 69% did not feel safe going out at night, this was reported more by longer-term residents (11+) years ( $p = .011$ ). While 65% felt that public parks were not well-maintained, this was felt more by those with difficulty in 2-plus IADLs ( $p = .002$ ). While 55% felt that traffic was not well-managed, women felt this more than men ( $p = .024$ ). Finally, those with annual incomes below \$15,000, were less likely to feel active in civic life ( $p = .044$ ). Conclusions: The data suggest that when assessing the age-friendly status of a community, social factors do make a difference in perception and experience. Efforts to assess and develop age-friendly features should consider the demographics of a community and the extent to which different sub-groups experience these features.

## STORIES CONSTRUCT DESIGNS: AN INTERGENERATIONAL AND MULTIDISCIPLINARY APPROACH TO HELPING OLDER ADULTS AGE IN PLACE

T.A. Abramson, M. Siegel, *New York Institute of Technology, Old Westbury, New York*

Juxtaposed to the impact of demographic shifts, biases against working with older adults, and the resultant work force shortages, is the desire by the majority (86%) of older adults to remain in their homes for as

long as possible. Older adults often advocate for 'Aging-in-Place,' but this is not always feasible. Many homes are not designed to adequately meet the needs of people as they age in place and often require renovations and redesigns to accommodate physical disabilities. All of these factors make it crucial for emerging professionals to be able to incorporate a greater understanding and sensitivity to the needs of this population in creating interior spaces that meet the needs of the older adults. This project used a person-centered approach to develop an evidence-based interior design solution to transform the environments of a sample of older adults. By being more responsive to the human condition and simultaneously being spiritually enriching through the incorporation of a multidisciplinary, intergenerational approach these designs concentrated on an area rarely addressed. By having older adults serve as educators, sharing their experiences, desires, and needs for aging in place through narrative life storytelling, students from multiple disciplines gained an appreciation for the positive aspects of aging, and the importance for older adults to remain in aesthetically pleasing, functional, safe, and spiritually fulfilling environments. Sharing one's life history and participating in focus groups about the design of one's home, fostered empowerment and was found to be an uplifting, enriching process for older adult participants.

## SEASONS IN THE SUN: THE RHYTHMIC NATURE OF THE IMPACT OF THE BUILT ENVIRONMENT ON OLDER ADULTS

T. Perry, *University of Michigan, Ann Arbor, Michigan*

Older adults experience isolation due to various reasons such as decline of physical and cognitive ability, lack of transportation and lack of opportunities for social interaction. However, there may be other reasons why isolation occurs. This paper underscores the seasonality of isolation due to the impact of the built environment on the social experiences of older adults. Isolation can occur because of the difficulty of weather on social interactions and mobility, as well as the seasonal nature of older adult's desire to make housing transitions. This study of older adults, their family members and supportive professionals highlights the experiences of older adults and their network as they embark on relocation from their homes. To complete this project in the mid-western United States, I conducted interviews, participant observation of the moving process (packing, garage sales, moving day, adjustment) and document review with 35 older adults, their kin and supportive professionals in three stages: pre-move planning, move in-process, and post-move adjustment.

## IS THERE A HIDDEN "BLUE ZONE" IN UTAH?

T. Draper, *Brigham Young University, Provo, Utah*

"Blue zones" are geographic and cultural areas where people are likely to live to an extreme old age. In each area lifestyle is argued to be an important part of longevity. For example, one blue zone, Loma Linda, California, has a high portion of Seventh Day Adventists who follow strict religion-based dietary practices. Latter-day Saints (most prevalent in Utah) are also known for some of the same religious health practices as Adventists. Perhaps they would show similar longevity. 2011 census estimates show there is one centenarian per 8825 Utahans. This is similar to the one per 10,000 estimate for the USA. However, Utah also has the lowest median age in the USA. When the number of children in Utah is statistically corrected to the USA average the centenarian estimate drops to one in 6110. When the estimate is further refined to reflect only those Utahans who represent themselves as being Mormons, the ratio becomes one in 5,315. This is still not enough to qualify as a "Blue Zone". However, due to heavy smog, elderly individuals living in the main population centers in Utah are at above average risk for respiratory diseases. When those over 100 who live in and out of the Utah pollution zones are compared, those living in the pollution free areas live about one year longer ( $p < .05$ ). Therefore, the pos-

sibility exists that the parts of Utah without the ozone may contain a hidden “blue zone”.

## **A VISUAL EXAMINATION OF SENIOR LIVING FACILITIES IN THREE COUNTRIES**

B. Young, *Kwansei Gakuin University, Nishinomiya, Hyogo, Japan*

The ecological theory of aging states that we feel most comfortable in environments where we fit. Overall comfort in a living situation involves how well we fit in with other people, our ability to move and work in a space, our feelings about a place, and our identity within the space. This suggests that environments for the aged are not innately good or bad; they must be evaluated based on congruence with individual elders’ needs. With this in mind, this research seeks to bring an individualized perspective to the aging environment and elders’ interactions with it. This study investigated environmental conditions of senior living facilities in Turkey, France, and the United States through photographic documentation. The photography documents a variety of shared and private living spaces in these three countries and sheds light on individual interactions with the physical environment, adding specificity to environmental theories of aging such as Lawton’s competence-press model. The study was conducted over the course of one year, through one time visits and later, a ten day stay in a facility in Turkey. Results indicate similarities between approaches to design and physical environment for facilities in the United States and France. Differences between physical environment were more evident across socioeconomic boundaries than between countries.

## **ENVIRONMENTAL INFLUENCES ON ACTIVE AGEING**

S. Keeling, M. Annear, T.J. Wilkinson, *Medicine, University of Otago, Christchurch, Christchurch, New Zealand*

Research Question: Does Place Matter for Health and Activity Beyond 65? Methods: Participatory action research, using mixed methods, was conducted in conjunction with older adults across four research phases: a) systematic investigation of twelve urban areas; b) a postal survey completed by 355 community residents aged 65 years in those areas; c) activity diaries completed by 66 of the survey respondents, along with photovoice diaries contributed by 25 participants; and d) a series of community workshops with participants, for processing of findings and informing stakeholders. Results: During the course of the study, the city of Christchurch experienced earthquake disruptions of significant scale, in September 2010 and February 2011, creating an “unexpected environmental influence”. Results from the study as designed thus include additional evidence of both resilience and vulnerability from participants: over one third reported “psychological disturbance” including anxiety, depression, grief, and difficulty coping with the demands of everyday life. Activity patterns, while disrupted by the earthquakes, centre on a socio-spatial core, of home, local environment, and networks. Participation is also spread across two tiers of activities, with physical, social and cultural domains predominating over those classified as civic, spiritual and economic. Conclusions: Environmental effects are complex and interact within and across domains in an urban environment. These patterns are evident (and pronounced) even in the immediate aftermath of a major earthquake. Next steps include “growing up and growing old” as a society, drawing on principles of universal and age friendly design.

## **SESSION 2045 (POSTER)**

### **GERONTOLOGY, STUDY OF**

#### **CHARTING THE PATH FOR GERONTOLOGISTS THROUGH PROFESSIONAL IDENTITY DEVELOPMENT**

T. Gendron, E. Welleford, *Virginia Commonwealth University, Richmond, Virginia*

There has been much discussion over the legitimacy of gerontology as a discipline, a specialization, or a profession (Ferraro, 2006). In recent

decades, gerontology’s identity as a field of study has progressed developmentally, paralleling growth in both the body of research and the growth of the elder population. Gerontology is typically viewed as a multidisciplinary field of study (Bass & Ferraro, 2000), and this view of multidisciplinary within the field can create an atmosphere of confusion around the professional identity of gerontologists. Graduate education in gerontology has an essential role in providing the foundational knowledge required to work with a diverse aging population. Development of best-practice methods for educating gerontologists to promote professional identity is one method that can be explored to address how graduate level gerontology graduates will create their own professional paths. The primary goal of this study was to determine what factors predict the professional identity and career path of gerontologists. In addition, the study explored how experiential learning influenced professional identity for newcomers to the field and for those experienced in an aging-related field (“professional incumbents”). Graduates (N = 146) of AGHE-affiliated graduate programs participated. Professional identity as a gerontologist was predicted by length of time in the field, age, and satisfaction with coworkers. Experiential learning contributed to professional identity in important but different ways for newcomers to the field and for professional incumbents.

#### **PUSHING THE BOUNDRIES OF KNOWLEDGE: DISSERTATION TOPICS OF GERONTOLOGY DOCTORAL STUDENTS**

H. Ewen<sup>1</sup>, E.J. Bergman<sup>2</sup>, D.C. Carr<sup>3</sup>, *1. Miami University, Oxford, Ohio, 2. Ithaca College, Ithaca, New York, 3. University of North Carolina, Chapel Hill, North Carolina*

Since the inception of the first gerontology doctoral program in 1989, 220 individuals have obtained a PhD in Gerontology in the US. Despite nearly two decades of producing these scholars, we have little understanding of their contributions to the field of gerontology. The Gerontology Education Longitudinal Study (GELS), established in 2006, collects information about gerontology doctoral students, gerontology doctoral programs, and graduates from and faculty members in these programs. In this presentation, we use GELS data to examine the relationship between the dissertation topics of 84% (n=184) of the population of graduates of gerontology doctoral programs and the broader gerontological knowledge base as represented by research published in three flagship gerontology journals. Specifically, we analyzed the keywords for all research articles published in the flagship journals during a four-year period (2008-2011), identifying seven primary research topics: caregiving, long-term care, functional ability, global aging, policy, Alzheimer’s disease, and women. Dissertation topics were coded with three primary keywords. Cluster analyses of the dissertation keywords yielded ten distinct groupings of dissertation topics classified as: aging women, health, Alzheimer’s disease, caregiving, rural aging, home and community based services, social networks, long-term care, social policy, and disability. These findings indicate that the topics in flagship gerontology journals and the dissertation topics of gerontology doctoral students are congruent. This suggests that gerontology doctoral students are contributing to a base of knowledge that is valued by the broader discipline.

#### **AN INTERVENTION TO ASSIST OLDER PERSONS ADJUST TO HEARING AIDS**

K. Lane, *Nursing, Univ of Iowa, De Witt, Iowa*

Hearing loss affects millions of Americans each year, especially targeting older Americans. As many as 38% of elders aged 65-75 years are affected and these numbers rise rapidly with more than 42% affected by 80 years of age. The rise in the numbers of older persons in the United States makes hearing loss the third most common chronic illness in the US today. Of these persons, approximately 30% choose to purchase hearing aids, but an astounding 47.2% of these individuals are unable to adjust to the hearing aids in order to wear them daily. Ambient sounds

and physical discomfort from the presence of the device in the ear cause individuals to never wear the devices or stop wearing them after a short time. A one group pre/posttest design was implemented on individuals between the ages of 75-85 years of age who had previously failed to adjust to hearing aids. The Glasgow Hearing Aid Benefit Profile (GHABP) and hours of hearing aid use time were the primary outcome variables. This intervention study occurred over a four week period of time, with weekly face-to-face meetings with participants. Findings demonstrated that the intervention was feasible to administer in a group of community dwelling older persons (aged 75-85 years). All 15 participants completed the entire intervention, meeting each of 4 times with the researcher over a four week period. Forty percent of volunteers later declined to participate and 48% were turned away due to the small size of this pilot study. An overall increase of hearing aid use time was between 1-9 hours per day. A Wilcoxon signed rank test was performed ( $p < 0.0001$ ). Fifty three percent of participants ( $n=8$ ) increased their hearing aid use time  $>4$  hours while 46.7% increased their hearing aid use time  $<4$  hours. Hearing aid satisfaction, as measured by the GHABP, improved from 1-5 (0.0039). These results deem the intervention not only feasible, but statistically significant in improving both hearing aid use time and hearing aid satisfaction. Future studies should be aimed at advanced statistical analysis, randomized clinical trial with larger numbers to improve power, and expanding the age criteria for study inclusion. Implications for future research are significant, and focus on improving communication and quality of life in older persons.

## SESSION 2050 (POSTER)

### HOUSING

#### AT LAST 'BOOMERS' MOVE IN: INTRA-GENERATIONAL CHANGE ARRIVES IN ONE RETIREMENT COMMUNITY

S.A. Eisenhandler, *Sociology, Waterbury, Connecticut*

With their arrival long awaited and social change anticipated wherever they go, members of the baby boom generation are now establishing a visible presence in retirement communities. Indeed, housing coordinators have been showing units to young-old boomers for a few years and already understand how residential communities meet or do not meet boomer expectations—insufficient electrical outlets, thin walls, and lack of garage space are among the most glaring deficiencies noted by prospective 'boomer' residents. This research details experiences in a small retirement community that has recently welcomed boomer pioneers as residents. Their arrival coincides with the final year of a six year qualitative study. Residents from older, non-boomer cohorts now have younger neighbors with life course and historical backgrounds that differ in important ways from the social experiences of non-boomers and from the culture they established in the community. This micro-demographic shift is only beginning and constitutes a new frontier for the study of intra-generational relationships. Cohort succession within the entire generation has potential for creating cooperative relationships (especially around technology) as well as tension around some values and behaviors. The depiction and discussion of emerging relationships between boomer and non-boomer older residents is drawn from participant observation, interviews, and photographs of people and the retirement community.

#### CHARACTERISTICS OF OLDER PERSONS WAIT-LISTED FOR RENTAL ASSISTANCE IN PORTLAND, OREGON

P. Carder, G. Luhr, J. Weinstein, J. Kohon, *Institute on Aging, Portland State University, Portland, Oregon*

The characteristics of older persons who receive rental assistance, including rental apartments and Housing Choice Vouchers (HCV, or Section 8), have been described. However, almost no data are available for persons who have applied for and are on a waiting list for assistance. This poster reports findings from a 2011 survey of 1,128 applicants

age 55 and older wait-listed for rental assistance through the largest housing agency in Oregon. Of the 358 persons who completed a mailed survey (response rate 31.7%), 214 applied for an apartment in public housing, 117 for a HCV, and seven for both programs. Question domains included housing status, health status and service use, instrumental activities of daily living, food security, and demographics. Participants ranged in age from 55-96 (mean age 63), most were female, and 80% reported annual personal incomes of \$14,999 or less. Some reported being currently homeless (7.5%) and 20% were homeless in the prior 12 months. Over one-fourth (26.6%) wanted to move in the next month. The majority of respondents (56.6%) described their health as fair or poor, nearly half (48.1%) reported a major medical illness, and 47.6% visited the emergency room (ER) in the prior 12 months. Having enough food in the prior 30 days was a concern for 41.5%. Statistically significant differences between public housing and HCV applicants were found, with the public housing applicants scoring worse on several domains. These results indicate that significant numbers of older persons wait-listed for rental assistance have both housing and health-related needs.

#### SATISFACTION TO STIGMA: LIVING AND AGING IN A CCRC

H. Ewen<sup>1</sup>, K.B. Dassel<sup>2</sup>, J.K. Chahal<sup>1</sup>, *1. Miami University, Oxford, Ohio, 2. Bellarmine University, Louisville, Kentucky*

Continuing care retirement communities afford residents peace of mind in that they provide care for the duration of life in a safe campus environment. Older adults are able to transition to higher levels of care as their health or physical abilities decline. In a 9-year longitudinal study of residents in a new CCRC, participants were asked questions regarding their social environments, social stigma, and satisfaction with their housing and community. Social cliques were well established by the ninth year in residence and were reported to be most pronounced at evening meals and social events sponsored by the CCRC, with cliques not conforming to written rules of the facility, such as reserving tables. Nine years post-move into the CCRC, all residents surveyed said they were satisfied with their decision and would make the same choice if they had it to do over again. Residents socialize informally with one another, on average, twice per week and report contact with other residents daily. Satisfaction with aspects of the housing and the greater community was very high. Desired changes included reduced staff turnover and patronizing speech from younger staff members. Transitions among housing units was not largely related to health status (except for recent hospitalizations), but more related to family issues such as death of family and friends, financial difficulties, a family member needing assistance, troubles with neighbors, and conflict with children.

#### PERSON-ENVIRONMENT FIT AND RELOCATION: IMPROVING HOUSING ACCESSIBILITY

K. Stoeckel, *Hebrew University, Jerusalem, Israel*

The interconnectedness between functionality and housing environment is well documented in the environmental gerontology literature. However, few analyses examine what characterizes homes older adults move into to ascertain if accessibility improvement is prioritized. This analysis examined the characteristics of the non-institutional homes older adults move into in comparison to prior home environments. Characteristics of persons who elected to make housing accessibility improvements when relocating were also explored. The non-institutionalized sample was selected from the 1998-2006 waves of the Health and Retirement Study. The model controlled for demographics, worsening health and functionality, home accessibility and the person-environment fit of individuals and their spouse. Results suggest that the experience of environmental misfit increased the relative risk of moving into a home with more accessibility features than previous homes by 60 percent. Similar findings were found when spouses had poor person-environment fit, increasing the relative risk of such a move by 71 percent. However, worsening health or functionality did not predict moves into more acces-

sible homes. The findings suggest that negative encounters with unresponsive environments in previous homes, either personally or via their spouse's needs, increased awareness of the importance of accessibility while poor health or functionality did not.

## SESSION 2055 (POSTER)

### KIN CAREGIVING

#### COREGULATION OF NEUROENDOCRINE ACTIVITY IN PERSONS WITH MODERATE STAGE ALZHEIMER'S DISEASE AND THEIR PRIMARY FAMILY CAREGIVERS

N.A. Hodgson, L. Marineau, K. Crouse, *School of Nursing, Johns Hopkins University, Baltimore, Maryland*

Spousal caregivers (CGs) play a critical role in helping persons with dementia (PWD) remain at home by managing day to day needs, but often at tremendous burden. Evidence suggests a reciprocal relationship between CGs and PWD such that the wellbeing of one affects the wellbeing of the other. Yet the biosocial mechanisms underlying the reciprocal relationship involved in caregiving remains poorly understood. This study examines the extent to which neuroendocrine processes underlying CG's stress/burden have implications for the PWD by examining the physiological symmetry of the HPA and SNS stress response in dyad by assessing daily profiles in salivary cortisol (cort) and alpha amylase (sAA). In keeping with a negative reciprocity model we predicted that greater degrees of coregulation would be associated with negative clinical outcomes such that stronger within-dyad associations in cort/sAA would be associated with higher levels of neuropsychiatric symptoms and caregiver burden. Saliva samples were obtained from 20 community based dyads four times daily across 4 days. Neuropsychiatric symptoms were assessed using the NPI. CG burden was assessed using the Zarit Burden Form. To assess cross-dyad coregulation effects on CG burden and NPI scores the correlation between dyad's cort/sAA levels (intercepts) was tested in HLM models using the tau statistic. An inverse relationship was found between intensity of coregulation and NPI and CG burden. The results allow for better characterization of which CG dyads are at risk and support further research to investigate the nature of these relationships.

#### THE VALUE OF VIDEOPHONE SUPPORT GROUPS AMONG ETHNICALLY DIVERSE CAREGIVERS OF PERSON WITH DEMENTIA

D.M. Perdomo<sup>1</sup>, S. Czaja<sup>1</sup>, R. Schulz<sup>2</sup>, S.N. Nair<sup>1</sup>, *1. Psychiatry, University of Miami, Miami, Florida, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

Providing care to a person with Alzheimer's Disease or a Related Dementia (ADRD) is challenging and time consuming and often associated with adverse outcomes for caregivers. Many caregivers report difficulties obtaining needed social support and knowledge about resources and caregiving because of time constraints and logistical problems. The Videocare study examined the feasibility and benefits of technology-based psychosocial intervention, delivered via videophone, among an ethnically diverse sample of family caregivers of Dementia patients. Caregivers were randomly assigned to the technology-based intervention condition, an attention control condition, or an information only control condition. A key component of the intervention was providing caregivers with the opportunity to participate in five videophone support group sessions. The sessions were intended to enhance social support and knowledge about caregiving. The intervention sample included 14 African Americans, 16 Hispanics, and 5 Haitian caregivers. The groups were conducted in English, Spanish and Creole and followed a structured education/supportive format. In this paper we report on the perceived benefits and value of the support groups. In addition, we examine

difference in group attendance as a function of caregiver characteristics. Overall the results revealed that the majority (78%) of caregivers found the groups to be of great value, and most caregivers felt the groups increased their knowledge and caregiving skills. Group attendance was higher among the Hispanics and Hispanics and African Americans reported greater values than Haitian caregivers. Overall, the findings demonstrate that video technology is a viable and valuable option for conducting support groups with ethnically diverse caregivers.

#### LONG TERM PLANNING AND PARENTAL CAREGIVERS OF INDIVIDUALS WITH INTELLECTUAL DISABILITIES

T.A. Nicoll, S. Qualls, H. Layton, *Psychology, UCCS, Colorado Springs, Colorado*

Due to the increased lifespan of adults with intellectual disabilities (ID), many are now outliving their parents yet families report low rates of planning for the future when parents can no longer provide support or care. Little is known about factors that facilitate or impede planning. The present study examined the role of social support and education as facilitative factors. A survey was completed by 97 family caregivers of adults (aged 18 or older) diagnosed with intellectual disabilities living with the family, including the Preparation for Care Needs Scale (Sorensen & Pinquart, 2001), and the Modified Family Support Scale (Dunst et al., 1984). Multiple regression analyses showed that exposure to long term planning information and social support of caregivers of adult with ID were significant predictors of caregivers completing long term plans for their loved ones with ID, accounting for 36% of the variance in planning. Long term planning information needs to be widely disseminated among parental caregivers, and interventions need to include social support as a facilitative factor in planning. Keywords: intellectual disabilities, long term planning, interventions, social support

#### REFLEXOLOGY FOR TREATMENT OF BEHAVIORAL SYMPTOMS IN COMMUNITY RESIDING PERSONS WITH DEMENTIA : PROTOCOL DEVELOPMENT FOR AN EXPLORATORY CONTROLLED TRIAL

N.A. Hodgson, B. Morris, *School of Nursing, Johns Hopkins University, Baltimore, Maryland*

Nonpharmacologic sensory-based therapies that reduce stress and promote relaxation are one group of benign intervention techniques that ease behavioral symptoms in individuals with dementia (PWD). Evaluations of complementary tactile-based therapies have shown promise in reducing agitated behaviors in persons with Alzheimer's disease (PWD). However standardized methods for administering and evaluating the treatments have been lacking. The current study reports on the development and manualization of a standard reflexology protocol administration by family caregivers of PWD. Currently a trial is being conducted to evaluate the effect of a reflexology protocol as administered by trained family caregivers. We report on the development, pilot-testing and open trail of a reflexology protocol for primary family caregivers of PWD. The step-by-step manual and accompanying video were revised based on input from patients, caregivers, therapists, and Standards of Practice and Expert Guidelines of the American Massage Therapy Association (AMTA) and National Certification Board for Therapeutic Massage and Bodywork Standards of Practice. Outcomes from 10 open trial patients will be presented. Preliminary outcomes suggest a reduction in measures of stress (salivary cortisol, salivary alpha amylase) and neuropsychiatric symptoms (NPI) in PWD over the course of the intervention. Secondary outcomes include caregiver well being, caregiver confidence using intervention and caregiver satisfaction. Results will be discussed with implications for a subsequent RTC.

## DO CLOSER RELATIONSHIPS BETWEEN CAREGIVERS AND PERSONS WITH ALZHEIMER'S DEMENTIA AFFECT THE PROGRESSION OF NEUROPSYCHIATRIC SYMPTOMS IN THE CARE RECIPIENT?

E.B. Fauth<sup>1</sup>, S. Schwartz<sup>1</sup>, M.C. Norton<sup>1</sup>, K.W. Piercy<sup>1</sup>, C. Lyketsos<sup>2</sup>, J. Tschanz<sup>1</sup>, 1. *Family, Consumer, and Human Development, Utah State University, Logan, Utah*, 2. *Johns Hopkins University, Baltimore, Maryland*

Prior studies suggest that closer relationships in care dyads predict better outcomes for persons with Alzheimer's dementia (PWD), including slower cognitive and functional declines. The current study assessed whether a closer care dyad relationship predicts level and rate of change in neuropsychiatric symptoms (NPS) in PWD. Data analyzed involved 180 care dyads from the Cache County Dementia Progression Study, a population-based study of persons with incident dementia and their caregivers assessed semi-annually for up to 8.6 years (average time in study = 2.2 years; SD=2.0). Caregivers included spouses (n=70; 39%) and adult-offspring (n=110; 61%). The PWD had a mean dementia onset age of 83.2 years (SD = 6.1), 13.1 years (SD=3.0) of education, and 57.8% were female. Mixed models examined associations between baseline relationship closeness reported by each caregiver with the PWD and NPS over time (total score on the Neuropsychiatric Inventory, NPI). Covariates included caregiver depression, and spouse vs. adult-offspring caregivers, as well as characteristics of the PWD (gender, education, ApoE status, age of dementia onset). Among adult-offspring dyads, higher closeness ratings predicted on average 6.8 points lower NPI scores at dementia onset ( $p < 0.05$ ). In spousal care dyads, closeness predicted 1.2 points less of annual increase in NPI for every one point increase in mean closeness ( $p < 0.05$ ). We conclude that closer care dyad relationships may be protective against NPS, especially in spousal dyads. Future studies should examine mechanisms behind these associations (e.g. the use of more person-centered care in closer relationships).

## MULTIPLE DIMENSIONS OF POSITIVE ASPECTS OF CAREGIVING: FINDINGS FROM THE REACH PROJECT

J. Cho<sup>1,2</sup>, M.G. Ory<sup>2</sup>, A. Hochhalter<sup>1</sup>, A.B. Stevens<sup>1</sup>, 1. *Scott & White Healthcare, Temple, Texas*, 2. *School of Rural Public Health, Texas A&M Health Science Center, College Station, Texas*

**Objective.** Utilizing a socio-ecological perspective, this study examined the relationship of intrapersonal, interpersonal and formal care indicators to positive aspects of caregiving (PAC) for 642 dementia caregivers by ethnic group (Hispanic=212; African American=211; White=219) from the baseline data of the multi-site REACH II project. **Methods.** Six intrapersonal indicators (caregivers' age, sex, caregiving hours per day, living with recipients, relationships, basic economic status), five interpersonal indicators (overall satisfaction of social support, frequency, number of networks, negative interaction of social support, ethnic group), and nine indicators of formal cares (homemakers, home health aide, meal delivery, transportation, visiting nurses, attending daycare/senior health programs, ER visits, hospital stays, unaffordability for basic needs) were used. Preliminary analysis showed ethnic group was a significant factor for PAC. Blocked-multiple regression analyses by three ethnic groups were computed to examine significant factors related to PAC, after controlling for memory and behavioral problems among care-recipients. **Results.** Data showed significantly different indicators of PAC by ethnic group. Attending daycare/senior health programs ( $\beta = -.17, p < .05$ ) was a significant predictor for PAC among Hispanic caregivers; caregiving hours ( $\beta = .17, p < .05$ ), frequency of social support ( $\beta = .27, p < .01$ ), and formal help for basic needs ( $\beta = -.14, p < .05$ ) were significant for PAC among African American caregivers; and basic economic status ( $\beta = .16, p < .05$ ), frequency of social support ( $\beta = .17, p < .05$ ), and home health aide service ( $\beta = -.17, p < .05$ ) were signifi-

cant among White caregivers. **Conclusion.** The findings suggest that family caregivers of different culture groups may value unique benefit from multi-levels of indicators to optimally foster positive feeling about dementia caregiving.

## WHO ARE HELPING CHINESE FAMILY CAREGIVERS OF ALZHEIMER'S DISEASE IN HONG KONG?

S. Cheng, *Psychological Studies, Hong Kong Institute of Education, Tai Po, Hong Kong*

**Objective:** To investigate structural and functional characteristics of the "helping network" of family caregivers of Alzheimer's disease (AD). **Methods:** Adapted from the social convoy questionnaire, 142 primary caregivers were asked to list up to 10 persons in total who "currently help you in taking care of the family member with AD." Those who are "most helpful, and you probably couldn't get along without their help" were placed in the inner circle. Those "who don't help you quite as much but are still important sources of help" were placed in the middle circle. Finally, those who "help a little bit" were placed in the outer circle. Caregivers were asked to list up to 5 more persons who might be helping but not listed as a network member so as to ensure a complete picture of who were helping them. Caregiver rated the emotional support, instrumental support, and socializing provided by each network member, and indicated the extent to which they were satisfied with the social support they received. **Results:** Caregivers had a small helping network, averaging about 5 network members. Spouse caregivers received help primarily from adult children, whereas adult children were quite isolated and relied primarily on spouses and some siblings. Not surprisingly, few friends were named as helpers. Some were assisted by foreign domestic helpers. Satisfaction with social support was strongly predicted by helping network size, as well as by the degree of social support received. **Conclusions:** Caregivers are isolated, even in the context of familism in Hong Kong.

## FACTORS ASSOCIATED WITH MEDICATION USE IN FAMILY CAREGIVERS AND THEIR RELATIVES WITH DEMENTIA

P.E. Carlton, A.M. Reamy, S.H. Zarit, *The Pennsylvania State University, University Park, Pennsylvania*

The overuse of medications, particularly by older individuals, is a long-standing problem that affects health and functioning. Yet, little is known about the factors associated with such use, particularly in the case of family caregivers and their relatives with dementia. Informed by Andersen's Behavioral Model of Health Services Use, we sought to explore the predisposing characteristics, need-based factors, and health service use associated with the number of medications taken for treatment of behavior problems of the person with dementia and medical illnesses of the caregiver. The sample was 157 family caregivers providing regular care and assistance to individuals with dementia. Data were obtained in an in-person interview during which caregivers presented bottles of prescription medications for both themselves and their relative. Using multiple linear regression, we find that the number of medications taken by caregivers is significantly related to greater age, lower subjective health, and higher use of medical services, but were unrelated to stress associated with behavior problems of their relative. The number of medications taken by the individuals with dementia was not related to predisposing characteristics but rather was significantly associated with higher reports by caregivers of stress related to behavior problems. These findings indicate that while some medication use is related to predisposing factors and need, interventions that improve feelings of subjective health or caregivers' stress may decrease medication use for caregivers and/or their relatives with dementia.

## CAREGIVERS' APPRAISALS OF THE EFFECTIVENESS OF COMMUNICATION STRATEGIES DIFFER BY STAGE OF ALZHEIMER'S DISEASE

M.Y. Savundranayagam<sup>1</sup>, J.B. Orange<sup>2</sup>, 1. School of Health Studies, Western University, London, Ontario, Canada, 2. School of Communication Sciences and Disorders - Western University, London, Ontario, Canada

Communication between persons with Alzheimer's disease (AD) and family caregivers is complex and interactive. Earlier research identified AD-related communication problems as contributors to misunderstandings within AD dyads. However, communication breakdowns also can result from caregivers' use of ineffective strategies which are perceived as helpful. Using a sample (N=15) of AD family caregiver dyads, we examined whether caregivers' ratings of strategy effectiveness matched both effective and ineffective strategies found in their video-recorded mealtime conversations and those described in the literature. Conversations were analyzed using the trouble-source repair paradigm which identifies and rates the effectiveness of caregiver communication strategies to resolve breakdowns. Matched and mismatched appraisals of communication strategies varied across stages of AD. Caregivers of persons with early stage AD correctly appraised 68% of the 22 communication strategies, whereas caregivers of persons with middle and late stage AD correctly appraised 45% and 55% of the strategies, respectively. Similarly, caregivers of persons with early stage AD incorrectly appraised 32% of the 22 communication strategies, whereas caregivers of persons with middle and late stage AD incorrectly appraised 55% and 45% of the strategies, respectively. Moreover, most mismatched appraisals were for effective strategies that were appraised as ineffective. This is true especially for caregivers of persons with middle and late stage AD. Mismatches illustrate the need for communication education and training, particularly to establish empirically derived evidence-based communication strategies over the clinical course of AD.

## IS BETTER SURVIVAL IN CAREGIVERS REAL, OR A HEALTHY WORKER EFFECT BIAS? RESULTS FROM CAREGIVER-SOF

L. Fredman<sup>1</sup>, J. Lyons<sup>1</sup>, J.A. Cauley<sup>2</sup>, K. Ensrud<sup>3</sup>, T.A. Hillier<sup>4</sup>, M. Hochberg<sup>5</sup>, 1. Epidemiology Department, Boston University School of Public Health, Boston, Massachusetts, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, 3. University of Minnesota, Minneapolis, Minnesota, 4. Kaiser Permanente Center for Health Research, Portland, Oregon, 5. University of Maryland Baltimore, Baltimore, Maryland

Caregiving is often conceptualized as a "career" because its conditions and obligations mimic those of employment. Furthermore, findings of lower mortality rates in caregivers than non-caregivers parallel the Healthy Worker Effect: i.e., mortality rates are lower in workers than in the general population because better health is associated with being hired, remaining employed and increased length of employment. We investigated whether these reasons explained lower mortality rates found in caregivers in the Caregiver-Study of Osteoporotic Fractures. The baseline sample included 1069 women; mean age 81 years; 375 were caregivers, of whom 139 were caregivers for > 5 years. Over the first three annual study interviews, 46% of baseline caregivers stopped caregiving while 7% of non-caregivers began caregiving. Previous analyses found that fewer baseline caregivers (20%) than non-caregivers (27%) died over 8 years: adjusted hazards ratio (aHR) = 0.74 (95% CI = 0.56-0.89). New results did not find greater protection associated with longer time caregiving prior to baseline: aHRs ranged from 0.72-0.78 for <2 to >5 years caregiving before baseline. However, compared to non-caregivers, mortality rates were lower among women who were caregivers at all three interviews and non-caregivers who started caregiving (aHR=0.62 (0.42-0.90) and 0.63 (0.30-1.33), respectively) and were non-significantly higher among women who ceased caregiving (aHR = 1.34 (0.84-2.11)). Additional analyses are exploring whether

this "Healthy Caregiver Effect" is reduced by operationalizing caregiving as a time-varying exposure, and incorporating caregiving intensity and reason why caregiving ceased. Results suggest a health advantage in older women who become, and continue as, caregivers.

## ETHNIC AND CAREGIVER TYPE INFLUENCES ON CAREGIVER STYLE IN ADULTHOOD

M. Rodriguez, B. Hayslip, *Psychology, University of North Texas, Denton, Texas*

In order to explore how ethnicity and caregiver type relate to caregiving style, each of 389 participants, 152 of which were Alzheimer's caregivers (132 Caucasians, 20 African Americans) and 163 of which were grandparents caring for grandchildren (89 Caucasians, 74 African Americans) participated. Each caregiver completed the Caregiving Style Scale (CSS; King & Hayslip, 2005) assessing the particular interactional style employed in providing full-time care for either a spouse or parent with Alzheimer's disease or a grandchild. MANOVAs findings indicated ethnic differences in caregiving style to exist ( $p < .05$ ), wherein African American caregivers were more likely to endorse physical/emotional control and authoritarian-structured caregiving styles and White caregivers were more likely to endorse authoritative/warmth-reasoning and anger caregiving styles. MANOVAs indicated caregiver group membership to predict caregiver style ( $p < .05$ ), wherein caregivers of adults with Alzheimer's disease were more likely to endorse supportive/obligatory style than were grandparents caring for their grandchildren. MANOVAs also suggested ( $p < .05$ ) that caregiver styles were a function of the interaction of caregiver group membership and ethnicity. Among grandparents caring for grandchildren, African Americans were more likely to endorse physical/emotional control than White caregivers. Among Alzheimer's disease caregivers, no such differences were observed. These findings suggest that in the context of having adapted a particular interpersonal orientation to providing care, either ethnic-specific styles of interacting with the care receiver exist or the particular demands of the caregiving context influence caregiver style. In addition, the interaction of these two factors jointly influences one's interactional style.

## COPING WITH BEHAVIORAL PROBLEMS OF PATIENTS WITH ALZHEIMER'S DISEASES: THE EXPERIENCE OF CHINESE AMERICAN FAMILY CAREGIVERS

F. Sun, X. Gao, *School of Social Work, ASU, Phoenix, Arizona*

Purposes: This study aims to understand the stress and coping experience of Chinese American family caregivers of a relative of dementia living in areas where there are no established Chinese communities. Methods: This study used the baseline interview data of a 12-month longitudinal qualitative study on a sample of 21 Chinese American family caregivers recruited in metropolitan Phoenix area. Caregiver ages range from 43 to 81; thirteen are providing care for an elder parent or a parent-in-law; and eight for their spouses. Semi-structured interviews were used to collect information regarding perceived stressful behavioral problems of care recipients (CR), strategies or tactics used to deal with stress, and cultural explanations of their appraisal of caregiving situations and behaviors. Results: Thematic analysis revealed three major themes: 1) behavioral problems are most stressful when posing risks to the safety or health of CR; 2) family is a source of strength to overcome caregiving stress but also a place to trigger family conflict that exacerbates stress; and 3) caregivers draw on education, spirituality, cultural beliefs (i.e., fatalism, filial piety, and family cohesion), technology, and informal networks as coping strategies. Discussion: Chinese American dementia family caregivers living in non-aggregated Chinese communities may lack access to formal resources. Formal service agencies need to help increase caregiver awareness and acceptance of formal support through activities such as promoting outreach via

informal networks and culturally-sensitive educational programs. Caregiver intervention programs need to cultivate coping strategies that can bring individual peace and family harmony in this cultural group.

#### **GRANDPARENT CAREGIVING AND THE DEVELOPMENT OF PROSOCIAL ATTITUDES AMONG ADOLESCENTS**

S. Hamill, A. Shapiro, *CSU San Marcos, San Marcos, California*

At present, 1.4 million young people under the age of 18 serve as caregivers, primarily to grandparents (NAC & UHF, 2005). Research demonstrates that adolescents are particularly sensitive to socialization for prosocial attitudes and behaviors (Chase-Lansdale, et al., 1995). Caregiving may provide a unique opportunity for adolescents to develop these characteristics through the transmission of positive values via their parents' caregiving and through the direct provision of care, particularly when supported by other family members. The present study tested two hypotheses: (1) Adolescent females, ethnic minorities, and those who provided direct care to grandparents were expected to exhibit higher levels of collectivism and empathy; (2) For those adolescents who provided direct care, females, ethnic minorities, those with greater caregiving responsibilities and social support would display greater collectivism and empathy. Freshmen ( $n = 446$ ) from a multi-ethnic high school completed surveys assessing family responsibilities and a variety of attitudinal measures. Over half came from caregiving families; over two-thirds personally assisted with caregiving for grandparents. Results from multiple regression analyses indicated that females and those who provided direct care exhibited higher levels of collectivism and empathy. For those adolescents who provided direct care, greater social support for caregiving efforts predicted higher collectivism scores; females and those with greater social support reported greater empathy. The need to provide social support to young caregivers in order to promote the development of prosocial attitudes is emphasized.

#### **INFLUENCE OF OPTIMISM ON CAREGIVING AND PERCEIVED STRESS AMONG OLDER COMMUNITY-DWELLING ADULTS**

S.O. Stuver<sup>1</sup>, J. Beckmann<sup>1</sup>, L. Fredman<sup>1</sup>, T. Heeren<sup>2</sup>, J. Lyons<sup>1</sup>, *1. Epidemiology, Boston University School of Public Health, Boston, Massachusetts, 2. Biostatistics, Boston University School of Public Health, Boston, Massachusetts*

Caregiving, especially high intensity caregiving, is associated with higher levels of stress. However, personality traits, such as optimism, may influence individuals' reactions to stressful experiences. In a study of older community-dwelling adults (mean age=73.8 years), we examined whether optimism modified perceived stress among 92 caregivers of persons with Alzheimer's or Parkinson's Disease, and 137 non-caregivers. Caregiving intensity was based on the median number of Instrumental and basic ADL tasks caregivers helped the care recipient with (high intensity:  $\geq 6$  IADLs or  $\geq 3$  ADLs). High and low optimism level was determined by the median score of the Life Orientation Test-Revised. In multivariate linear regression models adjusted for sociodemographics, comorbidities, IADL limitations, and 20m walking speed, mean Perceived Stress Scale (PSS) scores were considerably higher among high intensity caregivers (5.80 points,  $p < 0.001$ ) and slightly higher among low intensity caregivers (2.93 points,  $p = 0.06$ ) compared to non-caregivers. In stratified analyses, high intensity caregivers reported significantly more stress than non-caregivers within both the high and low optimism groups: mean PSS scores were 6.93 and 4.53 points higher, respectively ( $p < 0.01$ ). Although participants with high optimism reported lower perceived stress in non-caregivers and each group of caregivers, high optimism did not erase the association between greater caregiving intensity and stress. Rather, high-intensity caregivers with high optimism reported the same stress as non-caregivers with low optimism (mean PSS score=18). High intensity caregivers with low optimism had the most stress (mean PSS score=22.64 $\pm$ 1.39). These results

suggest that optimism may influence the impact of stress among older caregivers and non-caregivers.

#### **MINORITY AGING RESEARCH**

#### **PREDICTING MORTALITY AND INCIDENT DISABILITY IN MEXICAN AMERICANS AGED 75 AND OVER: REVISITING PERFORMANCE MEASURES IN THE HISPANIC EPESE**

L. Panas<sup>1</sup>, K. Markides<sup>1</sup>, K. Eschbach<sup>1</sup>, R. Angel<sup>2</sup>, C. Siordia<sup>1</sup>, *1. University of Texas Medical Branch, Galveston, Texas, 2. University of Texas, Austin, Texas*

To test the longitudinal association between Short Physical Performance Battery (SPPB) and a short walk (SW) test with mortality and incident disability in a sample of older Mexican Americans (MAs), aged 75+. Data from Wave 5 and 6 of the Hispanic Established Population for the Epidemiological Study of the Elderly (EPESE) is used to test SPPB and SW measures for predicting mortality and incident disability among older MAs. A sample of 1,448 is used in the mortality analysis and reduced the sample in the disability analysis ( $n = 905$ ), which excludes disabled at Wave 5. After controlling relevant factors, we find that, except for those unable to perform the tests, neither the SPPB nor the SW predict mortality risk in oldest MAs. Both the SPPB and the SW are significant predictors of incident disability. Those unable to perform the SPPB have 3.2 times higher odds of disability onset compared to the best scorers (OR 3.2; 95% CI 1.3-7.6). Respondents scoring poorly (1-3) on the SPPB had 2.8 times higher risk for developing ADL limitations (OR 2.8; 1.5-7.6), while those scoring 4-6 or 7-8 points were also significantly more likely to develop ADL limitations over the 2½ year study period. Our findings suggest that neither SPPB nor SW are strong predictors of mortality in this very aged MA population. Both measures predict onset of disability, with the SPPB showing a somewhat stronger association than SW. These findings encourage further exploration into how SPPB and SW influence health outcomes among the very old.

#### **RACIAL AND ETHNIC DISPARITIES IN HEALTHCARE USE, DELAYED CARE, AND MANAGEMENT FOR DIABETES AMONG OLDER ADULTS IN CALIFORNIA**

K. Ford<sup>1</sup>, G. Kim<sup>1</sup>, D.A. Chiriboga<sup>2</sup>, D. Sorkin<sup>3</sup>, *1. University of Alabama, Tuscaloosa, Alabama, 2. University of South Florida, Tampa, Florida, 3. University of California, Irvine, Irvine, California*

This study examined racial and ethnic differences in healthcare use, delayed care, and management among diabetic elders in California. Data were drawn from the 2009 California Health Interview Survey (CHIS). Selected samples included 3,003 adults aged 60 and older with diabetes from five racial/ethnic groups: Whites ( $n = 2,153$ ), African Americans/Blacks ( $n = 213$ ), Latinos/Hispanics ( $n = 336$ ), Asians ( $n = 306$ ), and American Indians/Alaska Natives (AI/AN) ( $n = 59$ ). Descriptive statistics and logistic regression analyses were conducted using weighted data. Results from adjusted logistic regressions show that compared to Whites, African Americans were significantly less likely to see a doctor (AOR=0.45) and have a usual source of care (AOR=0.36), and more likely to visit an ER for diabetes (AOR=3.91) and have a foot exam (AOR=1.75). Latinos were significantly less likely to take medicine to lower cholesterol (AOR=0.50) but more likely to test blood glucose regularly (AOR=3.69). Asians were significantly less likely than Whites to test blood glucose regularly (AOR=0.35) and have a foot exam (AOR=0.38). Compared to Whites, AI/ANs were significantly less likely to see a doctor (AOR=0.28), visit an ER (AOR=0.02), and take medicine to reduce heart attack risk (AOR=0.27), but more likely to use insulin or pills, or both (AOR=3.41). The findings suggest areas that can be developed for racial/ethnic-specific interventions for managing

diabetes, which may eventually help reduce existing racial/ethnic disparities in geriatric populations.

#### **RACIAL/ETHNIC DIFFERENCES IN THE ASSOCIATION BETWEEN SYMPTOMS OF DEPRESSION AND SELF-RATED MENTAL HEALTH AMONG OLDER ADULTS**

Y. Jang<sup>1</sup>, N. Park<sup>1</sup>, S. Kang<sup>2</sup>, N.G. Choi<sup>3</sup>, D.A. Chiriboga<sup>1</sup>, *1. University of South Florida, Tampa, Florida, 2. Binghamton University State University of New York, Binghamton, New York, 3. University of Texas at Austin, Austin, Texas*

The study examined racial/ethnic differences in the association between symptoms of depression and self-rated mental health among older adults. Data came from the first wave of the National Social Life, Health, and Aging Project (NSHAP), a population-based study of non-institutionalized older adults aged 57 to 85. The sample consisted of non-Hispanic Whites (n = 2,110), Blacks (n = 509), and Hispanics (n = 304). The association between symptoms of depression and self-rated mental health was weaker among minority groups than that among non-Hispanic Whites. Tests of interaction effects showed that the predictability of depressive symptoms to self-rated mental health was substantially weakened among Blacks of advanced ages and Hispanics with multiple chronic conditions. The study explored potential sources of racial/ethnic differences in subjective reports of mental health and called attention to older minorities with advanced ages and comorbid conditions in mental health services and interventions.

#### **LATINO/A SURVEY: ATTITUDES TOWARD ELDERLY CARE AND FAMILIARITY WITH AVAILABLE SERVICES**

G.Q. Zhan, M. Chung, *psychology, Kennesaw State University, Kennesaw, Georgia*

Research suggests Latino/as tend to underutilize elderly care services compared to Whites or African Americans (Wallace & Lew-Ting, 1992). This poster presents a research project examining elderly care within Latino community in the suburbs of Atlanta. One hundred thirty-five participants filled out a questionnaire (English and Spanish versions available) on attitudes toward elderly care, preference for types of care, and their knowledge of services available. Results indicate that a majority of the respondents (63%) preferred family care to institutional care, and only 18% would consider any outside home care facilities. The main two reasons cited for family care preference were cultural and traditional factors such as filial piety and perceived high cost. About 50% of the respondents were not knowledgeable at all with available care services such as nursing homes, assisted living facilities or hospices, and only 11% were familiar with these facilities. Results also suggest that while educational level is positively related to better knowledge of care services available, it is however not related to care preferences. Further, the length of residency in the US or English proficiency is not correlated with their familiarity with the care services available or their care preferences. After reading the poster, the participants will have a better understanding of Latino community's preferences and needs. The findings may have implications for government and NGOs in designing elderly care programs that better serve the Latino population by incorporating their cultural tradition into the care plan; offering more financial help; and improving their knowledge of what's available.

#### **CULTURALLY COMPETENT SCHOLARSHIP: METHODOLOGICAL ISSUES IN FIELD RESEARCH OF MINORITY ELDERS**

N. Chu, *Texas Christian University, Fort Worth, Texas*

With an increase in the diversity of aging population in the 21st century and increase in inequity of access to health care, there is an urgency to develop culturally competent care. One approach to achieve a deeper and insightful understanding of the diversity in aging is not limit knowledge of aging and health care to treating culture as a label

or most often as a proxy for populations, rituals, race and/or color. To ensure rigor and credibility in culturally competent scholarship, Meleis (1996) proposed these eight criteria: contextuality, relevance, communication styles, awareness of identity and power differentials, disclosure, reciprocation, empowerment, and time. A secondary analysis was conducted on interview data from a previous ethnographic study of 2008. The purposive sample N=57 (27 elders, 6 providers, 13 community leaders and 11 adults) was recruited from a Vietnamese community. The data were analyzed using NVivo 8 software and Meleis' eight criteria as a framework. The data revealed three criteria as methodological issues that are challenging to the field researcher: disclosure, empowerment and time. The findings suggest Meleis' criteria may be a useful tool to measure the quality of culturally competent research; it can enhance a deeper understanding of the diversity in aging and capture the elder's experience. Implications for future research in aging include the application of Meleis' criteria across various care settings and cultures in care interventions to ultimately improve care delivery and services.

#### **PREDICTING SURVIVAL IN OLDER MEXICAN AMERICANS OVER 17 YEARS**

K. Markides, *University of Texas Medical Branch, Galveston, Texas*

We employ data from the on-going Hispanic Established Population for the epidemiological Study of the Elderly (Hispanic EPESE) in order to identify predictors of survival over 17 years in Mexican Americans aged 65 to 80 at the study's baseline in 1993-1994. Of the 2,184 subjects with complete information at baseline 633 were determined to still be living 17 years later during 2010-2011 when they were aged 82 and over while 1,551 were determined to have been deceased. A number of demographic, psychosocial and health-related predictors at baseline were examined using Survival Analysis. The analysis excluded subjects who were determined to have died within two years of the baseline. As expected age and female gender were strong predictors. Other strong predictors included low depressive symptoms, not self-reporting diabetes, reporting no problems with IADL's, scoring high on a lower body function performance test, and having a Body Mass Index of 30 to 35. While overweight and moderate obesity have been associated with lower mortality in older people in general our data on older Mexican Americans suggest that obesity appears to me more protective than in other populations over a long period and it is protective when compared to a BMI of 22 to 25 which is often considered ideal weight. Further research examining the influence of other measures of weight on mortality in older Mexican Americans is needed.

#### **ISSES IN MIXING QUALITATIVE AND QUANTITATIVE APPROACHES TO RESEARCH WITH RACIAL/ETHNIC ELDERS**

C. Browne, K.L. Braun, N. Mokuau, L.S. Kaopua, *University of Hawaii School of Social Work, Honolulu, Hawaii*

Mixed method design often involves some combination of qualitative and quantitative approaches to research. Mixed method designs can be especially useful with racial/ethnic elder populations as we strive to better identify and understand the serious social and health disparities some groups continue to face. Researchers use mixed methods to enrich the understanding of an experience or issue through the confirmation of conclusions, the extension of knowledge, or by initiating new ways of thinking about the subject. This poster will present a research model developed by Ha Kupuna, National Resource Center for Native Hawaiian Elders at the University of Hawaii, that used a mixed method design to identify and understand the health and long-term care needs of a racial/ethnic elder population—Native Hawaiians. The rationale for this study design is presented, along with a number of definitional, paradigmatic and methodological issues. The research model is then described along with the advantages and disadvantages of study approaches—systematic literature review, key informant, focus group,

and census data analysis. Methods used for the integration of data, along with key results, are presented.

## SESSION 2065 (POSTER)

### NEUROSCIENCE & NEURODEGENERATIVE CONDITIONS

#### PRELIMINARY EVIDENCE FOR MALADAPTIVE CORTISOL STRESS RESPONSE PATTERNS IN POSTMENOPAUSAL WOMEN

N. Rohleder, X. Chen, D. Gianferante, L. Hanlin, A. Fiksdal, M.V. Thoma, *Psychology, Brandeis University, Waltham, Massachusetts*

**Objective:** Aging is associated with physiological alterations, and related with increased morbidity. The aging process is becoming better understood at the molecular and cellular level, but less is known about the causes of interindividual differences. Differences in how individuals respond physiologically to stressful events in their lives might explain some of the variation. Maladaptive acute stress response patterns might predispose to physiological damage and contribute to disease, but evidence on stress response patterns in older adults is still scarce. **Methods:** A sample of  $n=26$  young (mean age 22.0 yrs.;  $SD=4.5$ ), and  $n=23$  older adults (57.4 yrs.;  $SD=5.8$ ) of both genders were exposed to repeated acute stress (Trier Social Stress Test). HPA axis activation and habituation was assessed by measuring cortisol in repeated saliva samples taken both days. **Results:** As expected, female participants of both age groups showed significantly lower HPA axis responses to acute stress than males ( $F=3.23$ ;  $p=0.042$ ). While the overall group showed only a trend towards lower cortisol responses to the second TSST ( $F=2.26$ ;  $p=0.095$ ), habituation was strong in the younger group ( $F=3.70$ ;  $p=0.02$ ), but absent in the older group ( $F=0.99$ ;  $p=0.39$ ). Furthermore, in the older group, a marginally significant interaction of gender with repeated stress exposure ( $F=3.49$ ;  $p=0.066$ ) was found: Older men showed habituation, while in postmenopausal women, HPA axis responses, although smaller than those of older men, showed signs of sensitization. **Conclusions:** Although preliminary, the current data allow the cautious conclusion that older age is associated with changes in acute stress response patterns. Particularly in older, postmenopausal women, sensitization of HPA axis responses to repeated stress might be a sign of development of a maladaptive pattern. Data on peripheral inflammation will be presented at the conference and will allow conclusions about the potential health effect of the observed HPA axis response pattern.

#### DIFFERENCES IN OERP ACTIVITY DURING RETRIEVAL USING ODORS VERSUS RETRIEVAL USING ODOR LABELS AS CUES IN AN ODOR MEMORY TASK

L. Graves<sup>1</sup>, M. Cervantez<sup>1</sup>, A. Green<sup>2</sup>, C. Morgan<sup>1</sup>, C. Murphy<sup>1,2</sup>, *1. San Diego State University, San Diego, California, 2. University of California, San Diego, La Jolla, California*

Alzheimer's disease is a debilitating neurodegenerative disease associated with cognitive decline that is more severe than that of normal aging. Evidence suggests that individuals who are positive for the ApoE  $\epsilon 4$  allele are at higher risk for developing the disease. Studies have also shown that ApoE  $\epsilon 4$  is linked to olfactory decline. Olfactory event-related potentials (OERP) have been used to analyze performance in tasks of odor memory. Their high temporal resolution makes them a valuable resource for understanding the neural correlates of olfactory processing and functioning. This study investigated the effects of age, ApoE  $\epsilon 4$  status, electrode site, and response type on OERP latency and amplitude during retrieval in an odor memory task. Participants were divided into three equal age groups: younger, middle, and older. Each age group was matched on gender and ApoE  $\epsilon 4$  status. The study design was composed of separate parallel visual and olfactory components. The visual component was used as a comparison modality. Pictures were presented on a computer monitor and

odors were presented with a computer-controlled olfactometer. Participants were informed during encoding that this was a task of odor memory. Results indicated differences in OERP activity between the two retrieval sessions, suggesting that different processes occur in the retrieval of information about odors, depending on the nature of the cue.

#### CLASSIFICATION OF MORNING CORTISOL RESPONDERS AND NON-RESPONDERS: DO PREDICTORS VARY WITH AGE?

E. Bower<sup>1</sup>, C. Murphy<sup>1,2</sup>, *1. Psychology, San Diego State University, San Diego, California, 2. University of California San Diego, La Jolla, California*

The Cortisol Awakening Response (CAR) is a sharp increase in cortisol occurring within 30-45 minutes after awakening in many, but not all individuals. It is not known why some people do not have a CAR, although factors such as depression and chronic pain may blunt the size of the response. However these factors do not necessarily correlate with CAR non-response, and healthy adults can be non-responders. There is also discrepancy in the literature as to whether time of awakening and sleep duration affect the CAR. Given that sleep patterns change with age, it is possible that factors affecting CAR may also change with age. The current study analyzed CAR response patterns (i.e. responder vs. non-responder) in older (60-85 years) and younger (18-26 years) adults using discriminant analyses to determine if age, time of awakening, and sleep duration could predict CAR responders. Non-responders were defined as those who had less than a .09  $\mu\text{g}/\text{dL}$  change in cortisol between awakening and 30 minutes post-awakening. Time of awakening and sleep duration were significant predictors of CAR responders in older, but not younger adults. Responders slept fewer hours and woke up earlier than older adults who did not have a CAR response. Age was not a significant predictor within the young or the older adult groups. These findings suggest that the effect of sleep duration and time of awakening on the morning cortisol response may be age-dependent. Longitudinal studies are needed to determine if CAR response changes with age. Supported by AG04085-25 from NIA.

#### WORK COMPLEXITY, WORK-RELATED PHYSICAL DEMANDS, AND RISK OF PARKINSON'S DISEASE

E. Valdes<sup>1</sup>, R. Andel<sup>1</sup>, J.D. Edwards<sup>1</sup>, A.L. Feldman<sup>2</sup>, K. Wirdefeldt<sup>2</sup>, *1. University of South Florida, Tampa, Florida, 2. Karolinska Institutet, Stockholm, Sweden*

**Objective:** The etiology of Parkinson's disease (PD) remains unclear. Environmental factors such as occupation are of interest. This study investigated two aspects of occupation—complexity (with data, people, and things) and physical demands—in relation to risk of PD. **Methods:** The study population included individuals from the Swedish Twin Registry born between 1886 and 1958. PD diagnoses were derived from a combination of clinical work-ups and health register data. Occupational complexity scores were based on self-reported occupation. As previous studies have shown smoking to be inversely correlated with risk of PD, it was also included in the analyses and we accounted for confounding by age, gender, and smoking. **Results:** Results show that high complexity of work with people was associated with increased risk of PD compared to low complexity of work with people ( $p<.05$ ). Occupational complexity with data and things, and work-related physical demands were not significantly related to risk of PD ( $p's>.05$ ). In stratified analyses, complexity with people conferred an increased risk of PD in non-smokers ( $p<.001$ ) but not in smokers ( $p>.05$ ). **Conclusions:** High complexity of work with people may increase risk of PD, particularly in non-smokers. The underlying mechanisms of this finding are unclear, but familial traits such as those contributing to occupational selection or stress are potential candidates.

## **GROWING HEALTH DISPARITIES FOR PERSONS WHO ARE AGING WITH INTELLECTUAL AND DEVELOPMENTAL DISABILITIES: THE SOCIAL WORK LINCHPIN**

J. Dauenhauer<sup>1</sup>, L. Robinson<sup>2</sup>, K. Bishop<sup>2</sup>, J. Baxter<sup>3</sup>, *1. College at Brockport, Brockport, New York, 2. University of Rochester Medical Center, Rochester, New York, 3. Easter Seals, Rochester, New York*

Over 640,000 adults with intellectual and developmental disabilities (IDD) over the age of 60 were identified in the United States in 2000; this number is expected to double by 2030. The increase in life expectancy can be attributed to improved medical knowledge, access to health care, deinstitutionalization, and better living conditions. Increased longevity has presented challenges for service providers who work with people with IDD and their families. Health care practitioners and community services providers often do not have sufficient knowledge and skills to provide appropriate interventions for this unique aging population due to lack of awareness, research, and formal education within health professions training programs. Social workers play an important role in meeting the needs of those who are aging with IDD. Specifically, social workers provide assessment, intervention, and advocacy for people with IDD and their families. Although these basic skills are taught within both undergraduate and graduate social work programs, formal education specifically targeting the unique needs of people who are aging with IDD is limited. Therefore, finding social workers adept, or even familiar, in aging and IDD is rare. Thus, the purpose of this presentation is to bring attention to the limited presence of social workers in the IDD field, the lack of educational opportunities to support the current and future social workers in this field, and the impact of these trends on health disparities experienced by people who are aging with IDD.

## **SESSION 2070 (POSTER)**

### **PALLIATIVE CARE**

#### **RACIAL DISPARITIES IN END-OF-LIFE PLANNING AND SERVICES FOR DECEASED NURSING HOME RESIDENTS**

K.A. Frahm, L.M. Brown, K. Hyer, *Aging and Mental Health Disparities, University of South Florida, Tampa, Florida*

Using the 2007 Minimum Data Set of long-stay resident assessment data (N=183,841), this study examined the relationship between race and advance directives, hospice services, and hospitalization at the end of life. Linear regression models were fitted to each dependent variable with the main predictor of race. Across different types of advance directives, Black, Hispanic, and Asian nursing home residents were significantly less likely to have recorded documentation of these compared with White residents ( $p<.0001$ ). Asian residents were also significantly less likely to receive hospice ( $p<.0001$ ), while Hispanic residents were more likely to receive services ( $p<.0001$ ). All racial groups were more likely to experience hospitalization within 90 days prior to death, regardless of documentation of a do not hospitalize order ( $p<.0001$ ). As nursing home residents become more diverse, recognizing differences in end-of-life planning and treatment preferences, as well as implementing programs tailored for specific groups, will continue to increase in importance.

#### **DELIRIUM: ASSESSMENT AND MANAGEMENT FOR OPTIMAL END OF LIFE IN AN IN-PATIENT HOSPICE SETTING**

C. Luz, M. Ensberg, S. Zhou, *Family Medicine, Michigan State University, East Lansing, Michigan*

Evidence exists that symptoms of delirium are not well understood in nursing homes and hospice settings. It is frequently misdiagnosed and inappropriately treated. Symptoms are seldom differentiated from dementia or depression. Rather, they may all be grouped under headings such as "terminal restlessness". Pharmacotherapy is the most common response to a range of symptoms including agitation, anxiety, sleep

disruption, emotional lability, and hyperactivity. This represents a critical gap in best practices since delirium and depression are distinctly different from dementia in that they are potentially reversible. Appropriate assessment and management is essential as delirium disrupts quality of life and can be stressful for staff. In 2011, the Geriatric Education Center of Michigan developed a training program for health teams working with older adults at end of life who are exhibiting symptoms of delirium, depression and dementia. It was presented to all staff of a mid-Michigan in-patient hospice unit and consisted of a 2 hour didactic in-service, and weekly team meetings for applied learning using actual case reviews. Content focused on understanding delirium; use of an evidence-based screening tool; differentiating delirium from dementia; non-pharmaceutical interventions, the family role; and effective interdisciplinary care planning. 45 staff members representing 6 disciplines participated with immediate positive outcomes. Pre-posttests indicated significant knowledge gain; team meeting notes and care plans indicated translation of knowledge into clinical practice; staff expressed improved satisfaction; and organizational changes were made including determining family goals upon admission. Plans are underway for additional evaluation and expanding the program to other settings.

#### **SAFE PASSAGE: DISCHARGE PLANNING FOR HOSPITALIZED PALLIATIVE CARE PATIENTS**

B. Powers, S.A. Norton, L. Hogan, M. Buckley, M. Schmitt, M. Metzger, E. Fairbanks, T. Quill, *Rochester, New York*

Customizing discharge planning for palliative care patients and their families is one function of hospital-based palliative care teams (PCTs) that specialize in pain and symptom management, providing emotional support, clarifying goals of care, assisting with difficult medical decisions, and coordinating care for patients and their primary caregivers. In an NIH funded 5-year ethnographic study of the integration of PCT services within the culture of a large academic medical center, data from months of participant-observation provided contextual background for 28 multifaceted cases. On analysis, 64% (18/28) of the cases illustrated complexities involved in planning for the safe hospital discharge of medically fragile, mostly older, adults in different stages of advanced disease progression. Investigation of each case included multiple in-depth interviews with patients, families, and members of both PCT and referring medical teams. Findings: Medical caregiving capacities of patients' potential discharge destinations (home, rehabilitation facility, skilled nursing home, or hospice) were not the only factors considered in efforts to ensure their safe passage between care settings. Patients' and families' discharge decisions also involved practical, psychosocial, spiritual, and existential components associated with their values and beliefs about qualities of living and dying. Conclusion: Thematic analysis revealed that the unique contribution of PCT involvement in the discharge planning process was in creating opportunities for patients and families to make informed, active choices about how and where they preferred to live in the time remaining to them as well as how and where they wished to die.

#### **PAIN AMONG HOSPICE ADMISSIONS AND RECRUITMENT INTO A GROUP RANDOMIZED TRIAL**

J.G. Cagle<sup>1,2</sup>, S. Zimmerman<sup>2</sup>, L.W. Cohen<sup>2</sup>, D.A. Reed<sup>2</sup>, *1. University of California, San Francisco, San Francisco, California, 2. University of North Carolina, Chapel Hill, North Carolina*

A major challenge to conducting hospice research is the recruitment of family to participate given how overwhelmed families feel at the time of hospice enrollment. As a component of an AHRQ randomized trial to reduce barriers to pain management, family caregivers were recruited from four North Carolina hospice agencies to participate in telephone interviews. Families were screened by hospice staff during admission for the following eligibility criteria: patient 18 years of age or older; patient has pain or is taking pain medications; patient resides

in a private residence; presence of a family caregiver; and fluent in English. Recruitment began Fall of 2011. As of Spring 2012, 375 families were screened for eligibility. Among those, 226 (60%) were identified as eligible, 135 (60%) of whom signed a HIPPA waiver with the agency to share the family's contact information with the project team. Among the 149 identified as ineligible, 126 (85%) did not have pain and were not taking pain medicines, 3 (2%) did not have a family caregiver, and 1 (1%) was not fluent in English. Among the families who agreed to be contacted by the project team, 100% participated in the project. Contrary to existing estimates, a large proportion of hospice patients do not have pain and do not take pain medicines. In terms of recruitment into research, the modest rate of signed waivers may be evidence of gate-keeping by hospice staff or suggest that alternate enrollment strategies should be considered.

### **WOODWORK EFFECT: WILL HOSPICE INPATIENT FACILITIES ENTICE PATIENTS OUT OF THEIR OWN HOMES?**

K. Chung, S.C. Burke, *Health Sciences, California State University, Northridge, Northridge, California*

A rising number of hospice agencies directly provide inpatient care within their own hospice facilities (HFs). Policy makers confronted with a huge increase in hospice expenses have expressed concerns about the "Woodwork effect" – will individuals who would have received hospice services in their private homes be able to elect placement in HFs because the option is available only through newly constructed HFs? Using data from the 2007 National Home and Hospice Care Survey, we assessed whether the "Woodwork effect" exists. First, we divided individuals who had been in hospitals prior to hospice care enrollment into two groups: 1) those who stayed in hospitals for hospice care until hospice care was terminated; 2) those who received hospice care at HFs. There were no statistically significant differences between the two groups with regard to diseases, length of stay, age, marital status, mobility, payment source, and whether they had a primary caregiver or not. In separate analyses, we divided individuals who began hospice care at home into four groups: 1) those who continued to stay at home until hospice care was terminated; 2) those transferred to HFs; 3) those transferred to hospitals; 4) those transferred to nursing homes. Compared with Home and Hospital groups, HF group was significantly more likely to be unmarried ( $p < 0.05$ ), have no primary caregiver ( $p < 0.01$ ), and be alone ( $p < 0.01$ ). Our findings suggest that HFs have more of a positive effect than the "Woodwork effect" by meeting the needs of people who cannot reside at home.

### **DOES OPERATING A HOSPICE FACILITY HELP THE HOSPICE AGENCY FINANCIALLY? IF SO, IN WHAT WAY?**

K. Chung, S. Petrosyan, *Health Sciences, California State University, Northridge, Northridge, California*

Hospice agencies are eager to increase the number of hospice facility (HF) beds and/or build HFs that cost hundreds of millions of dollars to construct. They push states by claiming that more HFs and/or more HF beds are the next best solution for terminally ill individuals who cannot reside at home, raising an increasingly important policy question to be addressed by policy makers who have been confronted with a huge rise in Medicare and Medicaid Hospice expenses in recent years. Using hospice data available from the California Office of Statewide Health Planning and Development, we aimed to explain the notable popularity of HFs among hospice agencies. Compared to agencies without HFs, those with HFs reported higher mean revenues per patient and per patient-day (\$24,256 vs \$12,566 per patient; \$360 vs \$206 per patient-day). By comparison, there was little difference in operating costs between the two (\$12,324 vs \$11,582 per patient; \$196 vs \$193 per patient-day). Consequently, agencies with HFs showed greater financial performance (\$11,932 vs \$955 per person; \$164 vs \$13 per patient-day). This was largely due to disproportionately higher rates of higher

revenue-generating levels of care delivered by agencies with HFs; that is, routine home care, the lowest reimbursement level, accounted for 94.5 percent of total patient days among agencies with HFs, compared to 98.4 percent reported by agencies without HFs. Further research is needed to determine whether such a disproportionately higher rate of more expensive levels of care observed among agencies with HFs is justifiable.

## **SESSION 2075 (POSTER)**

### **PHYSICAL ACTIVITY & HEALTH PROMOTION**

#### **KEY INDICATORS OF HEALTH AND WELL-BEING FOR OLDER ADULTS: THE STATE OF AGING AND HEALTH IN AMERICA REPORT**

L. Anderson, *Centers for Disease Control and Prevention, Atlanta, Georgia*

In public health the saying "what gets measured gets done" is frequently used to remind us that data is the foundation which guides our work. In the last 5 years there has been a shift in the leading causes of morbidity and mortality among adults age 65 and older. To ensure that essential health data are available about older adults in an easily-accessible format, CDC and its partners publish The State of Aging and Health in America report series and interactive Website ([www.cdc.gov/aging](http://www.cdc.gov/aging)). This presentation will describe the 15 key indicators of older adult health and well-being included in the newly released 2012 report, which focus on four areas: health status (physically unhealthy days, frequent mental distress, disability and oral health), health risk behaviors (physical inactivity, eating fruits and vegetables, obesity, and smoking), preventive care and screening (influenza and pneumococcal vaccination, colorectal cancer screening, mammography, taking medication for high blood pressure, and up-to-date on selected screenings), and injury (falls with injuries). Data are available at the national, state, regional, and MMSA levels to support grant writing, strategic priority setting, program planning, and tracking against Healthy People 2020 targets. The presentation will also highlight the report's Calls to Action, which provide evidence-based strategies, tools, and information about older adult health, identify gaps in knowledge, and recommend individual, local, state, or national level actions. The Calls to Action can often serve as catalysts for identifying future research projects and new opportunities for public health response.

#### **FACTORS RELATED TO YOUNG AND OLDER WOMEN'S PHYSICAL AND MENTAL HEALTH**

V. Cicirelli, *Psychological Sciences, Purdue University, West Lafayette, Indiana*

Increased demands on individuals in late adolescence and old age have possible negative effects on health. Bowlby's attachment theory holds that distress related to illness activates individuals' attachment system. Employing Bartholomew's attachment dimensions, those with lower anxiety (more positive view of self) and lower avoidance (more positive view of others) are hypothesized to have better health. Environmental factors (social support, stress) and factors of well being are also hypothesized to be related to health, with a stronger relationship among the old than the young. Participants: 100 older women (age = 75.0) in independent living facilities and 251 college women (age 18.9) enrolled in an introductory course. Measures: physical and mental health, attachment anxiety and avoidance, stress, social support, self esteem, and depression. Using multiple regression, attachment dimensions were entered in model one, environmental variables in model two, well being measures in model three. Hypothesized predictors explained 8.6% of physical health variance among the young, and 20.8% among the old ( $p < .01$ ). Significant predictors for the young: anxiety, social support, and self esteem; for the old: anxiety and depression. The predictors explained

39.9% of mental health variance among the young, and 47.4% among the old ( $p < .01$ ) Significant predictors for the young: anxiety, stress, social support, self esteem, and depression; for the old: anxiety, social support, self esteem, and depression. Notably, only the attachment anxiety dimension predicted health. Also, stress predicted mental health only among the young. Implications for theory and practice are discussed.

#### **COMPARATIVE EFFECTIVENESS OF CUSTOMARY FIT AND STRONG! VS. FIT AND STRONG! PLUS**

S.L. Hughes, M. Fitzgibbon, P. Desai, R. Smith-Ray, *Center for Research on Health and Aging, Univ Illinois, Chicago, Illinois*

Osteoarthritis (OA), particularly in the lower extremity (LE) joints, is a major cause of disability among older adults (Dunlop et al., 1998). Fit and Strong! is an evidence-based program that targets older adults with LE OA and has demonstrated multiple significant benefits on participants out to 18 months (Hughes et al., 2010). However, the program does not address diet/ weight management issues. This is an important omission because obesity is strongly associated with both the incidence and exacerbation of knee OA (Felson et al., 1992; Messier, 1994). To address this issue we have developed Fit and Strong! Plus—an enhanced version of Fit and Strong! that targets overweight/obese persons with OA and addresses physical activity (PA) and diet/ weight management. We have been funded by NIA to compare the effectiveness of customary Fit and Strong! to Fit and Strong! Plus over 24 months using an RCT with 400 participants at three community sites. Both groups will receive tapered telephone reinforcement to support behavior change maintenance. We will also examine health care use before and after the interventions. We hypothesize that Fit and Strong! Plus participants will show differential, significant improvements in diet behaviors at 2 months, followed by weight loss  $\geq 5\%$  at 6 months that will be maintained at 24 months. Fit and Strong! Plus participants will also show differential statistically significant improvements in PA maintenance, LE pain, stiffness, and function, and depression and anxiety at all posttests. This presentation will review study design, pilot findings and implementation issues.

#### **SELF-REPORTED HEALTH BIAS WITHIN AN EVERYDAY CONTEXT: CONSIDERING AFFECTIVE VALENCE AND AROUSAL**

B. Whitehead, C. Bergeman, *University of Notre Dame, Notre Dame, Indiana*

Objective. The present study addresses current gaps in the affect-related health bias literature by a) investigating health bias while considering both valence and arousal components of positive and negative affect (PA/NA); b) establishing the presence of and variability in affective health bias on the daily level; and c) exploring daily health bias in a non-clinical, community sample of adults. Methods. Participants were 585 midlife and older adults (aged 33-92 years;  $M=63.4$ ) who participated in the 56-day daily diary burst in Year 3 of the Notre Dame Study of Health and Well-Being. Measures included a daily health events checklist, a daily rating of health satisfaction, and a 4 daily affect scales (low-arousal NA, high-arousal NA, low-arousal PA, high-arousal PA). Health bias was conceptualized as present when the effect of a given day's health events on that day's health satisfaction was significantly moderated by that day's affect. Multilevel modeling was used to investigate fixed and random within-day effects. Results. Significant interaction effects indicated the presence of a general health bias on the daily level: positively-valenced affect buffered the negative impact of health events on health satisfaction, whereas negatively-valenced affect exacerbated this association. Both valence and arousal components of affect demonstrated unique effects, and all effects had significant intraindividual variability across days. Conclusions. The results indi-

cate that both valence and arousal components of affect are important to consider when investigating health bias, and that these health bias effects operate to some degree within an everyday, non-clinical context for the general population of adults.

#### **PROMOTING HEALTHY AGING THROUGH GOOD NUTRITION: AN EDUCATIONAL EVALUATION OF NUTRITION WORKSHOP AMONG U.S. CHINESE OLDER ADULTS**

Y. Li<sup>1</sup>, M.A. Simon<sup>3</sup>, E. Wong<sup>2</sup>, B. Wong<sup>2</sup>, E. Chang<sup>1</sup>, F. Huang<sup>1</sup>, X. Dong<sup>1</sup>, *1. Rush Institute for Healthy Aging, Chicago, Illinois, 2. Chinese American Service League, Chicago, Illinois, 3. Northwestern University, Chicago, Illinois*

Background: Promoting active healthy aging through good nutrition is critical, yet little is known on the knowledge base of nutrition among U.S. Chinese older adults, whose needs are often under-addressed due to significant cultural and linguistic barriers. Our study aims to create a culturally-appropriate educational workshop on nutrition and evaluate its effectiveness. Methods: Community-based participatory research approach was utilized to partner with Chicago Chinese community. Participants received a one-hour didactic workshop on nutrition, diet, and food guide pyramids for older adults. The workshop was conducted in English, Cantonese, and Mandarin. We performed a 15-question pre- and post- workshop test, and follow-up test in 3 weeks' time. SPSS analysis was performed. Results: The test scores are based on the accuracy of each question from all participants. Among 87 participants, 65% were female. Their knowledge increased from 28% in pre-test, to 34% of post-test, to 36% in follow-up test. "The best source of Vitamin E" had the lowest accuracy score in pre-test (2%) whereas "Older adult tend to lose muscle mass" had the highest (84%). "Medications can reduce appetite" received the highest accuracy rate, from 44% in pre-test to 66% in post test, indicating a 22% increase after the session. With respect to gender, no significant differences in score was found between genders ( $p=0.593$ ). Conclusion: Our study call for culturally and linguistically appropriate educational workshops in the minority aging community. Implications for devising future health educational programs on nutrition and health will be discussed based on these findings.

#### **VISION COACH: NORMATIVE DATA FOR HEALTHY YOUNGER AND OLDER ADULTS**

J.O. Brooks<sup>1,2</sup>, N. Drouin<sup>3</sup>, M. Mossey<sup>1</sup>, M. Collins<sup>1</sup>, M.N. Youssef<sup>3</sup>, J. Mckee<sup>3</sup>, *1. Clemson University, Greenville, South Carolina, 2. Greenville Hospital System University Medical Center, Greenville, South Carolina, 3. Roger C. Peace Rehabilitation Hospital, Greenville, South Carolina*

The VISION COACH is an interactive light board that offers no "cues" as to where the lights will appear and is being utilized as a therapeutic training tool. The board attaches to a wall-mounted slider that is counter balanced for ease of positioning height (floor to ceiling). Over 250 younger adults (18 to 29 years) and older adults (50+ years) completed a task where 120 lights are presented in random patterns across the 50" by 34" surface. The volunteer reacts to the lights as they appear in different patterns by depressing the light(s) as quickly as it appears. Participants completed the task a total of six times to identify peak performance and possible fatigue effects, thus allowing therapists to determine the number of trials needed for a variety of clinical applications. Age and gender norms will be reported, allowing clinicians to evaluate patients and develop treatment plans. The current study sought to collect reaction time data from healthy individuals, permitting future studies to compare these data with clinical populations. Reports for therapists and patients have also been developed and will be discussed.

## GENETIC AND ENVIRONMENTAL INFLUENCES ON TRAJECTORIES OF CHANGE IN MOTOR FUNCTIONING IN LATE ADULTHOOD

D. Finkel<sup>1</sup>, M. Ernsth-Bravell<sup>2</sup>, 1. *School of Social Sciences, Indiana University Southeast, New Albany, Indiana*, 2. *Institute of Gerontology, Jonkoping, Sweden*

Maintenance of basic motor functioning is both an indicator of general physical functioning and contributes to quality of life. It is important, therefore, to determine the extent to which genetic and environmental factors contribute to individual differences in motor functioning in order to support more effective interventions. Twenty different assessments of motor functioning have been collected as part of the longitudinal Swedish Adoption/Twin Study of Aging. Data were available from 859 twins ranging in age from 50 to 88 years at the first measurement wave. Participants completed up to six assessments covering a 19-year period. Given the skew evident in motor functioning (most individuals perform well into their mid60s), performance on the 20 motor functioning tasks was assessed as without difficulty, with difficulty, or impossible. Factor analysis was used to create 3 motor factors: balance, flexibility, and fine motor skills. Latent growth curve analysis demonstrates an accelerating increase in difficulty in mean functioning in these 3 domains beginning at age 60; individual differences (variability) also increase exponentially after age 60. Quantitative genetic analyses demonstrated that genetic variance in motor functioning remains constant across the adult lifespan; increases in variance are attributed entirely to increasing environmental variance. It is important to note that although idiosyncratic environmental influences account for most of this increase, correlated and shared rearing environmental effects also play a role. Thus, both micro-environmental (individual) and macro-environmental (family and cultural) effects play a role in maintaining motor functioning in late adulthood.

## ASSESSING BEHAVIORAL CHANGES AMONG OLDER PARTICIPANTS IN THE GROUP-BASED WALKING PROGRAM

C. Ura, F. Miyamae, M. Sugiyama, N. Kojima, R. Hirayama, S. Awata, R. Takahashi, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

We reported on the effect of our group-based walking program on the mental, and performance status of older adults. At the same time, it also is important to assess whether our program is effective in helping older adults build a walking habit. DESIGN: Participants were 127 community dwellers aged 65-79 years and aware of cognitive decline but not diagnosed with dementia. Our program was designed to encourage participants to build a walking habit through group activities; participants took a walk together weekly over the course of 12 weeks. To examine the effect of our program on participants' behavior, we focused on (a) participants' average numbers of daily steps and (b) their attitudes associated with behavioral changes such as outcome expectancy, self-efficacy, and collective efficacy. RESULTS: The participation rate throughout program was 86.9%. A significant increase was found in participants' average numbers of daily steps before and after their participation. In addition, the majority of participants gave a higher score to almost all items regarding outcome expectancy, self-efficacy, and collective efficacy. Furthermore, there was a difference by gender and cognitive functions in how much participants believe they can continue to record the number of their daily steps (i.e., self-efficacy in keeping recording); in average score on this aspect of self-efficacy, men were higher than women, and those with a lower score on MMSE were higher than their higher-score counterparts. CONCLUSION: Analyses suggest that our group-based walking program is effective in helping older adults build a walking habit in community settings.

## SOCIAL ECOLOGICAL MODEL OF PHYSICAL ACTIVITY AMONG MIDDLE- AND OLDER-AGE ADULTS IN INDIA

S. Ghosh<sup>1</sup>, B.D. Capistrant<sup>2</sup>, 1. *Brandeis University, Waltham, Massachusetts*, 2. *Harvard University, Cambridge, Massachusetts*

Background: India's population is aging rapidly and simultaneously undergoing an epidemiologic transition partially due to an increase in sedentary behaviors. Yet little is known about what factors influence physical activity among Indian adults. We use Bronfenbrenner's social ecological model to explore how factors at multiple levels of influence are associated with physical activity among Indian middle and older aged adults. Methods: We use cross-sectional data from the Longitudinal Aging Study in India, the first nationally representative sample of 1683 mid-life and older Indian adults, collected in 2010. We use forward selection logistic regression models to determine significant predictors of any self-reported vigorous (e.g. jogging, swimming) and moderate physical activity (e.g., stretching, simple household tasks). Predictors include individual-level factors (demographics and health); family level factors; social factors; and neighborhood factors. Models adjust for complex sampling. Results: Approximately 55% of the total study population did not report regularly engaging in any form of exercise. Factors at multiple levels significantly predicted engaging in physical activity. Not having a work-inhibiting health limitation, not being socially isolated, living in rural areas, living in walkable neighborhoods and where public spaces are well maintained were associated with increased odds of both moderate and vigorous physical activities. Specifically, being a male increased the odds of vigorous physical activity by 59%. Conclusions: The majority of Indian adults in middle and older age are not physically active. Public health interventions to encourage physical activity in this population should consider operating at multiple levels of influence.

## GOOD LIFE FITNESS: SUCCESSFUL AGING AND OPTIMAL PHYSICAL AND MENTAL HEALTH IMPLICATIONS

W.B. Disch<sup>1</sup>, C. Andreoletti<sup>1</sup>, J. Norko<sup>2</sup>, E. Copes<sup>2</sup>, A. Longo<sup>1</sup>, 1. *Psychology, Central Connecticut State University, New Britain, Connecticut*, 2. *Central Connecticut Senior Health Services, Southington, Connecticut*

Healthy aging and increases in quality of life in older adults is highly related to the level of consistent physical activity. Our Good Life Fitness program includes community and residential older adults and consists of an initial physical assessment, participation in a variety of age-appropriate physical activities, as well as periodic physical assessment updates. Two primary areas of concern for this study are healthy weight and fall reduction/balance. Results from preliminary analyses of 117 older adults from 66 to 102 years in age show that participants in the normal Body Mass Index range (18.5 to 25) compared with overweight (26-30) and obese (31 and higher), had significantly lower diastolic blood pressure and significantly higher balance/flexibility. They also had the lowest systolic blood pressure and the highest reach (flexibility). Additional results from a program quality and needs assessment showed that participants feel that information and activities for arthritis and nutrition were most important. Results are discussed related to successful aging and optimizing the Good Life Fitness program for both mental and physical health implications.

## PROGRAM DEVELOPMENT FOR HEALTHY AGING

J. Lee<sup>1</sup>, E. Lee<sup>2</sup>, 1. *Boston College, Chestnut Hill, Massachusetts*, 2. *University of North Carolina Charlotte, Charlotte, North Carolina*

Helping the rapidly growing number of older adults in South Korea maintain good health is a major challenge. This community-based, health promotion intervention for older adults provided a comprehensive review of the effects of body-mind-spirit (BMS) interventions on health behaviors. The 12-week curriculum offered sessions on exercise, nutrition, sexuality, leisure, stress management, cognitive behavioral therapy, for-

giveness, and happiness. We developed facilitators' manual, which included didactic presentations, group discussion questions, in-class activities, and case examples. Seventy community-dwelling older adults were recruited at two senior centers and assigned to experimental and control groups. A mixed method quasi-experimental research design used pre-and-post-tests groups to examine the outcomes for experimental (n=32) and control groups (n=38). Using the grounded theory approach, qualitative feedback from older participants and facilitator' field notes were analyzed. Quantitative data indicated that participation in the BMS program contributed to better outcomes in the physical and spiritual dimensions of health. Overall, the content of the BMS intervention was favorably received by the participants, group facilitators, and the staff. Examination of field notes revealed that continued attendance allowed even less extroverted members to become involved more and develop a sense of belonging. Facilitators observed that female participants, who were quiet in the beginning, appeared to gain their voice and actively engage in discussions. Group cohesiveness and strong motivation brought by the older participants enriched the curriculum and active learning processes. Gerontologists should continue developing lifestyle intervention models to help older adults maintain a strong motivation and thirst for active learning.

## **SESSION 2080 (POSTER)**

### **PRODUCTIVE AGING**

#### **CHANGING VOLUNTEERING RATES AMONG AMERICANS 65+: AGE GROUP AND GENDER EFFECTS**

N. Danigelis<sup>2</sup>, B. McIntosh<sup>1</sup>, 1. *School of Business Administration, University of Vermont, Burlington, Vermont*, 2. *University of Vermont-Sociology Department, Burlington, Vermont*

Conventional wisdom posits and some previous research findings suggest that volunteering rates tend to decrease with age (Independent Sector, 2000; Prisuta, 2003; Zedlewski and Schaner, 2005; Morrow-Howell, 2010). Recent evidence, however, indicates that the opposite may be true among those 65+ (McIntosh and Danigelis, 2011). We compare data from the 2006-7 and 2010 Bureau of Labor Statistics' American Time Use Surveys (ATUS), which employ a day-after diary format to measure time use. In 2006-7, Ns = 1,826 for ages 65 – 74 and 1,654 for ages 75+. In 2010, the respective Ns are 1,123 and 927. Employing difference of proportions tests and logistic regressions, we compare the effect of age group and gender on overall volunteering, religious volunteering, and non-religious volunteering for each of the two time periods, controlling for race, self-described health, education, labor force status, household income, and presence or absence of a household partner. Results show an increase between 2006-7 and 2010 in the percent who volunteer – regardless of type of volunteering. When background is controlled, we find (1) significantly greater percentages volunteering in the 75+ age group for all volunteering and for religious volunteering in general and among women in both 2006-7 and 2010, and (2) for men no age group differences in 2006-7 but a significantly greater likelihood of the older age group volunteering in 2010. Results are discussed in terms of social cognition (Fiske and Taylor, 1991), well-being (Van Willigen, 2000) and types of leisure (Kelly, 1983; Henderson et al., 1989).

#### **FACTORS AFFECTING SHIFT TO AN INTERGENERATIONAL VOLUNTEER ACTIVITIES FROM HEALTH ENHANCEMENT PROGRAM**

H. Jung<sup>2,1</sup>, H. Suzuki<sup>1</sup>, T. Naganuma<sup>1</sup>, K. Nonaka<sup>1</sup>, H. Ohba<sup>1</sup>, M. Kuraoka<sup>1</sup>, Y. Kanbayashi<sup>2</sup>, Y. Fujiwara<sup>1</sup>, 1. *Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 2. *Chou university, Hachioji-shi, Tokyo, Japan*

It has been acknowledged that the development of social activities for the elderly in communities would solve various issues in modern

society. However, actual community involvement and activities for senior citizens are scarce. Although elderly people have a social participation activity intention, the intention is not satisfied and activity intention and an activity situation are not necessarily in agreement. This requires a strategy to promote more participation of seniors in community activities. The authors conducted a dementia prevention program, which was expected to be the health enhancement effect to seniors. In the program the seniors were trained to master the method of reading picture books. After the program, 26 participants wish intergenerational activities. The research examined various factors about participants in the volunteer group activity. The results suggested that those who do not have social obligations and are psychologically independent would continue to participate in the program group.

#### **WHO PARTICIPATES AND WHO BENEFITS? DETERMINANTS OF SOCIAL PARTICIPATION AND CHANGES IN HEALTH**

M. Voorpostel, *FORS, Lausanne, Switzerland*

There is strong evidence that social participation, such as volunteering, has beneficial effects on health of aging adults (e.g. Lum & Lightfoot, 2005) as well as on their social connectedness (Cornwell, Laumann & Schumm, 2008). Older adults' civic participation and social involvement are driven by needs and resources (Kohli, Hank & Künemund, 2009), which suggests that the differences in beneficial effects may result at least partly from selection bias (volunteer elite bias). Using longitudinal data from Switzerland (1999-2010), we examine (1) the extent to which volunteering, organizational membership and contacts in the community among adults aged 55+ are explained by the level of resources (e.g. education, work history, presence of a partner, initial health status), as well as (2) to what extent changes in these resources are associated with changes in participation over time (e.g. loss of a partner, retirement) and (3) how this relates to changes in health status. Results will give insight into which groups are most likely to have high levels of participation and to whom it is most beneficial. Preliminary cross-sectional results using only the 2004 data, confirm the importance of resources such as education, time availability (retirement), and the presence of a partner for being active as a volunteer, holding a membership to an organization and for the frequency of contact with friends and neighbors. It also shows a strong positive association between participation and health. Multilevel models for change will be estimated to assess the determinants of changes in these forms of social participation as well as to assess the relation to changes in health.

#### **EFFECT OF INTERGENERATIONAL PROGRAMS BETWEEN PRIMARY SCHOOL CHILDREN AND SENIOR VOLUNTEERS ON THE SOCIAL SUPPORT**

M. Yasunaga, Y. Murayama, R. Takeuchi, H. Ohba, K. Nonaka, M. Nishi, S. Shinkai, Y. Fujiwara, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

Objective: This study examined effects of intergenerational programs between 6th grade primary school students and senior volunteers on social support, in Japan. The intergenerational program: The intergenerational programs by 31 senior volunteers (age= 68.7±5.9) were provided for 163 students of a primary school in Kawasaki City for 7 periods in 2011. In the programs, the senior volunteers instructed the students how to read picture books for other students. At the final period of the programs, the students actually read picture books for 1st grade students. The Method of the program evaluation: Baseline survey was conducted for 163 students who took the programs. The students were asked if they can expect support from parents, teachers, friends, and the senior volunteers, using the Scale of Expectancy of Social Support (SESS). We also asked Social Desirability Scale (SDSC) and gender. After the completion of 7 periods of the programs, we conducted a follow-up survey to ask same questions. We used analysis of covariance (repeated-measures design), and covariates were SDSC scores, class, and sex. Results:

The comparison of SES scores between the baseline and the follow-up surveys revealed that SES score from the senior volunteers was significantly improved ( $F(1,104) = 4.59, p=0.04$ ). However, there were no significant interactions between SES score and parents, teachers and friends. Conclusion: The intergenerational program can be effective for students by providing them with alternative support from parents, teachers, and friends.

#### DOING IT MY WAY

L. Skemp<sup>1,2</sup>, M. Maas<sup>2</sup>, M. Umbarger-Mackey<sup>2</sup>, 1. *School of Nursing, Our Lady of the Lake College, Baton Rouge*, 2. *University of Iowa, Iowa City, Iowa*

Society's ability to provide care for older persons is an increasing social and health care issue. Hotels, motels and single room occupancy residences have historically provided room, board and support services to elders and those with limited resources. There is limited research on elders who have sufficient resources choosing to live in a motel. This ethnographic community study research conducted over three years describes how a group of middle-income elders in one rural community in the Midwestern United States acquired the things they needed to live and experiences they desired to have in the community. Purpose: The purpose of this presentation is description of seven of the rural elders who were living in a motel setting as a strategy to acquire the "things" they needed to live. Design and Methods: Using a modified community study ethnographic design and the strategies of formal and informal interviews, participant observation and inductive comparative case study analysis, a description of why the middle-income elders decided to call the motel "home" and how this has facilitated their living in the community is discussed. Results: Four themes of "saving my energy for living", safety, connections and privacy, and the freedom to come and go capture the reasons for living at the motel in this rural setting. Implications: This work informs elder care theory and highlights mechanisms for the development of community capacity for healthy aging in one typical Midwestern rural setting.

#### THE EFFECTS OF VISITING THE LOCAL MORNING MARKET ON THE MENTAL HEALTH OF SENIOR CITIZENS IN JAPAN

K. Abe<sup>1</sup>, A. Ohashi<sup>2</sup>, C. Ohi<sup>2</sup>, K. Mizuno<sup>2</sup>, Y. Arai<sup>2</sup>, 1. *Department of Human Sciences, Kansai University of International Studies, Miki-shi, Hyogo, Japan*, 2. *Chubu Gakuin University, Seki, Gifu, Japan*

Objectives: Local morning markets in Gifu prefecture are famous and popular all over Japan. Most visitors are senior citizens but the number of younger visitors is increasing. In the morning markets, visitors enjoy communicating in a particular dialect and purchase fresh vegetables. Therefore, visiting the morning markets may have a positive effect on the health of senior citizens. There is, however, little evidence of this. In this study, we aim to examine the relationship between visiting the local morning markets and the mental health of senior citizens. Method: In this study, we used data from the 2010 Healthy Life Survey of Senior Citizens of Gujo city, Gifu prefecture. Gujo city is in the mountainous region of Tokai area (it is positioned roughly in the center of Japan). Out of the 3,483 people aged 65 years or above who reside in Gujo city, 3,424 were surveyed. The collection rate was 95.3% and the valid response rate was 95.1%. In this study, responses that had a large number of missing values were excluded from the analysis. The data of the remaining 1,995 people was used for the analysis. Results: The rate of visiting the morning markets was 38.3%. The rate of people who ship their crops to sellers at the morning market was 10.4%. In the data, 187 people resided alone and their visitation and shipping rates were 32.2% and 7.5%. Correlation and multiple regression analysis revealed a significant relationship between visiting the morning markets and mental health (Geriatric Depression Scale) of senior citizens. Discussion: The results of this study showed the relationship between visiting the morning markets and the mental health of senior citizens.

#### INTERGENERATIONAL SERVICE PROGRAM : CONSTRUCTION OF COMMUNITY SOCIAL SUPPORT NETWORK FOR THE ELDERLY

L. Liu, Y. Lin, *Tunghai University, Taichung City, Taiwan*

In modern society extended families are no longer the norm. It is not uncommon that older adults do not live together with their young family members in communities. The significantly increased older population living alone and lack of social support networks in communities have raised some fundamental issues, such as family relationships, generation stereotypes, and negative with low self-esteem of the elderly. Intergenerational programs served by community organizations give us the opportunity to bring old and young generations back together. In addition, it allows us to create a strong sense of community as a whole and to empower residents engaging in community revitalization. Using experimental design, this study presents how a nonprofit organization in mid-Taiwan collaborated with district schools as well as faculty members of a university to develop an intergenerational service program with serious activities, including: (1) health and mental activation activities; (2) life experiences learning; (3) community network construction; and (4) Humanities Tea Ceremony. The paper shows how the intergenerational program has improved connections between generations and changed the stereotypes of young generations toward old population in communities. In addition, it made community residents began to care about senior citizens and developed the social support network for the elderly in their neighborhoods. It has also enhanced the self-esteem and self-respect of the elderly.

#### MAKING A "SOUL CHOICE:" VOLUNTEERING AND RELIGIOSITY IN ELDER NATIVE MEXICAN POPULATION

M. Rivera-Hernandez, *Gerontology, Oxford, Ohio*

The connection between religiosity, church attendance and membership and volunteering has received a lot of attention in the past decades. Volunteering encompasses various forms of unpaid help and/or services offered for the benefit of the community. Despite the importance of religion for older Mexicans, there is limited information and empirical evidence about the role of religion and volunteering in Mexico. Using data from the Mexican Health and Aging Study (MHAS/ENASEM) collected in 2003, the current study explored the effect of the importance of religion in one's life and volunteering. Approximately 15.33% of older Mexicans volunteer (and 61.46% are women). Among those who did volunteer, 94.40% go to church, and 90.31% agreed that religion is very important in their lives, respectively. One of the most important observations from this study is that religiosity's influence on volunteering goes beyond church attendance. Church does not foster volunteer participation. However, there are other dimensions of religiosity – such as participation in religious events or activities, and the salience of religion – that predict volunteering. According to the results, people that attend religious events at least once a week and once in a while have 3.2 and 1.5 times higher odds, respectively, of volunteering in later life than people that never attended. Similarly, people who considered religion very important are 2.5 times more likely to volunteer than those who reported that it was only somewhat important or not important at all. This difference persists despite controls for sociodemographic and chronic conditions.

#### SESSION 2085 (POSTER)

##### SOCIAL CONNECTIONS IN LATER LIFE

##### NEIGHBORHOOD COHESION IN OLD AGE: DOES COMPETENCY IN SOCIAL SKILLS MAKE A DIFFERENCE?

P. Lu, *Graduate Institute of Social Work, National Chengchi University, Taipei, Taiwan*

Objectives: -To examine the factors which are related to neighborhood cohesion. -To explore the effect of competency in social skills on

neighborhood cohesion. Furthermore, to examine whether the effect of social skills varied with the urbanization of residence township. Background: The factors related to neighborhood cohesion have been documented in the existent literature, such as neighborhood environment, and neighbors' support. However, individual's competency in social skills is a crucial factor in developing and maintaining social relationships. This study investigated whether neighborhood cohesion for older adults differs by their social skills. Methods: This study collected data from interview survey. We interviewed 400 older adults living in ten townships. Hierarchical regression analysis was applied to capture the effect of social skills on neighborhood cohesion. Findings: 1. Poor neighborhood environment is negatively related to neighborhood cohesion, while the higher satisfaction with housing and neighborhood environment is positively related to neighborhood cohesion. 2. The more support the respondents gained from their neighbors, the stronger the cohesion. 3. After controlling for the effects of neighborhood environments and neighbor's support, competency in social skills was related to stronger cohesion. The effect of social skills is greater in rural areas than in urban areas. Conclusions and implications: The results support the importance of social skills on neighborhood cohesion. Community organization workers should cultivate social skills of the elderly when designing the elder friendly community programs to increase neighborhood cohesion.

### **SEX SEGREGATION IN MIDDLE-AGED AND OLDER ADULT'S FRIENDSHIPS**

C. Mehta<sup>1,2,3</sup>, S. Hamilton<sup>1</sup>, B.J. Ayotte<sup>4</sup>, 1. Emmanuel College, Boston, Massachusetts, 2. Children's Hospital Boston, Boston, Massachusetts, 3. Harvard Medical School, Boston, Massachusetts, 4. University of Massachusetts at Dartmouth, Dartmouth, Massachusetts

Sex segregation, the tendency to separate by sex in friendships (Thorne & Luria, 1976), is well documented in childhood and adolescence. Less is known about sex segregation in adulthood (Mehta & Strough, 2009). We conducted in-depth interviews with 10 married adults aged between 55-82 years to investigate sex segregation in friendships among middle-aged and older adults. Participants were asked about the sex of their friends, changes in friendships over time, activities shared with friends, and whether they perceived sex segregation in their friendships. Two overall themes related to sex segregation were identified using interpretive phenomenological analysis. These themes were (a) Barriers to cross-sex friendships, which included marriage (e.g., "wives and husbands may feel uncomfortable with it"), sexual attraction (e.g., "there was always like 'a little something'"), cultural acceptance (e.g., "it's just not part of the American way"); and comfort with same-sex friends (e.g., "girls are easier to talk to"); and (b) facilitators of cross-sex friendships, which included couple friendships (e.g., "I spend time with them when my husband is around"), and interaction style of other-sex friends (e.g., "they wouldn't be so critical of you, they would joke more and be more lighthearted"). Results suggest that sex segregation exists in the friendships of the middle-aged and older adults who were interviewed. Because friendships play an important role in mental and physical well-being across the lifespan, it is important to understand the factors that are related to the formation and maintenance of friendships at all stages of development.

### **LIVING ARRANGEMENTS, SOCIAL SUPPORT AND SELF-RATED HEALTH OF OLDER WOMEN WITH CHRONIC ILLNESS**

C. Warner, K.B. Adams, A.R. Roberts, J. Lee, FPB School of Nursing, Case Western Reserve University, Cleveland, Ohio

The importance of living arrangements, family and social resources for older women with chronic conditions warrants more attention in community-based research. Living alone can be a risk factor for loneliness and social isolation among older adults. According to A Profile

of Older Americans, 72% of non-institutionalized older adults living alone in 2010 were women; the likelihood of living alone increases with age. A sample of 130 community-dwelling women, 65 years and older with one or more medically-diagnosed chronic conditions participated in this 2-wave study, six months apart. Mailed questionnaires included measures of self-rated health, social support provided by family and friends, and living arrangements. Sixty-six percent of the sample, lived alone (n=91) and 34% lived with a spouse/partner or other family member (n=47). Both groups of women reported an average of four chronic illnesses and had mean ages of approximately 72 years. Results from Repeated-measures ANOVA revealed a statistically significant between-subjects (living alone versus living with others) difference for self-rated health. Women who lived with others rated their general health higher (M=3.26, SD=.85) than women who lived alone (M=2.75, SD=.84). There were no statistically significant results for within-subjects (time) or interaction of time by group. The instrumental and subjective social support variables did not differ by group or by time. The findings highlight the importance of living arrangements and the vulnerability of older women with chronic illness who live alone. The importance of self-assessed health in the lives of chronically-ill women and the practice implications will be discussed.

### **SOCIAL CAPITAL AND SOCIAL ENGAGEMENT AMONG SENIOR CITIZENS IN HONG KONG**

S. Liu, A.M. Chong, Applied Social Studies, City University of Hong Kong, Hong Kong, Hong Kong

Aim: The study examines three types of social capital — structural social capital (social network closeness and types of social support), cognitive social capital (trust), bonding social capital (social cohesion and inclusion) – and how they affect older adults' social engagement in terms of volunteerism, group participation and social organizational involvement in Hong Kong. Methods: Face-to-face interviews were conducted by trained interviewers with 251 Chinese respondents aged 60 or above in a randomized household survey in 2009. Results: Family members were perceived as the most important among different social ties, followed by friends. In terms of cognitive social capital, classmates and co-workers were regarded as the most trustworthy. Over half (54.6%) of the respondents were satisfied with the cohesiveness and inclusiveness in the community they were living in. However, 34.3% of the respondents were not involved in any social activities. Hierarchical regression analysis showed that cognitive and structural social capital significantly explained 11% variances of social engagement after age, gender and educational level were controlled ( $p < .001$ ). Conclusion: The study is one of the very few that examine older Chinese' social capital. Having more close social ties (especially among families and friends) as well as higher social trust were found to facilitate older people's social engagement. However, older Hong Kong Chinese tended to have a low level of involvement in social activities; the participation rate was lower than those of the western counterparts (Liu & Besser, 2003). Studies are recommended to find out the reasons behind.

### **THE STABILITY OF SOCIAL NETWORKS IN HOME CARE - CHALLENGES AND OPPORTUNITIES**

M. Roes, Institute for Quality and Case Management (IQC), University of Applied Sciences Bremen, Bremen, Germany

Network analysis focuses on the relations among actors and see individual people nested within networks of face-to-face relations with other persons. Often these networks of interpersonal relations become "social facts" and take on a life of their own. In Home Care, nurses not only work with the patient but with the family members, their friends or the neighborhood as well. To stay at home the social network - which represents close relations among a set of people - is very often the 'private homecare agency'. Method: 17 nurse case managers (working for a private insurance company) were asked to draw a picture of the social network for one case, which represented their view on the network. The

network (social entities) included the role of the different people, their way to interact with each other and how strong the connection seemed to be. Analysis: Measured were the ties or relations to be for the selected nodes (each person in the network). The networks were analyzed with an additional Program Excel Template NodeXL, starting with a selection of a focal node (in this case the patient) and to identify the nodes (other people) to which they are connected and how strong the connection is (Ego-centric networks). Findings: Analysis of 17 social network cases in homecare settings who are part of a case management service program. In six out of 17 cases the out-patient did not have a social network to support the care at home. In seven out of 17 cases the out-patient did have a social network, but a weak one; thus the ability to stay at home relied on the support from a direct family caregiver and the case manager (who does not provide home care services). The analysis of the strength of the ties in their network produced the information that - if the family caregiver can't provide any care at home - there is no other private person, who could provide care. Only in 3 out of 17 cases a stable social network could be identified. Conclusion: Homecare services have to add the analysis of the stability of the social network in their assessment. To conclude, that just because there are family members, doesn't mean that they are able to take over. If we ignore the stability and density of the triangle between the (in/out)patient - the social network - the professional system, we ignore the potential and risks that lie within these social networks and probably ignore the existence of a 'structural whole in their network'. Therefore, the ability to stay at home as long as possible can't work if there isn't a social-emotional and instrumental-material care structure close by.

#### **SOCIAL CAPITAL AND SELF-RATED HEALTH AMONG OLDER KOREAN IMMIGRANTS**

B. Kim<sup>1</sup>, L.B. Maradik Harris<sup>2</sup>, 1. *School of Social Work, University of Hawaii at Manoa, Honolulu, Hawaii*, 2. *UCLA, LA, California*

**BACKGROUND:** This study aimed to investigate the determinants of self-rated health and describe their association with social capital and socioeconomic characteristics among older Korean immigrants. **METHODS:** A cross-sectional study of 205 older Korean immigrants (aged 60 years and older) was conducted in Los Angeles County. Independent variables included age, gender, marital status, income, and social capital (social norms, trust, partnership with the community, information sharing and political participation). Self-rated health was the dependent variable. **RESULTS:** Descriptive analyses were done to show group differences in self-rated health and logistic regression analyses to identify determinants of self-rated health. Gender (male), high income, and high levels of information sharing were significant determinants of high self-rated health status among older Korean immigrants. **IMPLICATIONS:** This population-based study provides empirical evidence that gender, income and information sharing are directly associated with the self-rated health status of older Korean immigrants.

#### **A RANDOMIZED CONTROLLED TRIAL STUDY ON GAINS ON CREATIVITY AND SOCIAL CAPITAL OF HEALTHY OLDER ADULTS AFTER PARTICIPATION IN A COMMUNITY COLLABORATIVE ARTS PROGRAM**

A.N. Hui<sup>1</sup>, D. Yeung<sup>1</sup>, S. Cheng<sup>3</sup>, K. Chan<sup>2</sup>, C. Sue-Chan<sup>1</sup>, D. Hui<sup>4</sup>, 1. *Applied Social Studies, City University of Hong Kong, Hong Kong, Hong Kong*, 2. *Hong Kong Baptist University, Kowloon Tong, Hong Kong*, 3. *Hong Kong Institute of Education, Tai Po, Hong Kong*, 4. *Chinese University of Hong Kong, Tai Po, Hong Kong*

The present study investigates if taking part in collaborative creative arts program can enhance creativity and social capital in older adults. Participants included 36 healthy older adults aged between 60 and 87 participating in a community collaborative arts program. The participants were randomly assigned to two groups (18 persons in the Experimental Group and 18 persons in the Control Group). In the pretest, no significant differences were found in the cognitive abilities as meas-

ured by Raven's Progressive Matrices (RPM), and Mini-Mental State Examination (MMSE), as well as their verbal creativity as measured by the Wallach-Kogan Creativity Tests (WKCT, Wallach & Kogan, 1965), figural creativity assessed by the Test for Creative Thinking - Drawing Production (TCT-DP, Urban & Jellen, 1996), and problem solving ability measured by the Everyday Problem Solving Inventory (EPSI, Cornelius & Caspi, 1987), except in the fluency scores of WKCT. The Experimental Group took part in a 10-session collaborative and integrated arts programs consisting of drama and visual arts. After controlling for the cognitive abilities, significant differences were found in the verbal and figural creativity. Implications on enhancing creative abilities and engaging older adults in community and collaborative creative arts activities will also be discussed.

## **SESSION 2090 (POSTER)**

### **SUCCESSFUL AGING**

#### **MEANING, WELL-BEING AND AGEING**

P. Derckx, *University for Humanistics, Utrecht, Netherlands*

The meaning of life does not exist in the sense that people have different views on this and in the sense that even for one person there are many aspects to a meaningful life, not just one. In this paper the concept of a meaningful life and its different dimensions will be explicated. After that a first empirical exploration of meaning in ageing will be given. This will be done through a meta-analysis of (a) the relatively scarce empirical research on meaning in life and (b) the larger body of work on well-being in ageing. The concept of well-being is not the same as meaning in life but they show considerable overlap. The two strands of well-being research on ageing that will be considered are the "subjective well-being" approach of Ed Diener (University of Illinois at Urbana-Champaign) and colleagues and the "psychological well-being" approach of Carol D. Ryff (University of Wisconsin at Madison) and colleagues.

#### **AN EXPLORATION OF SERIOUS LEISURE TYPES AND FLOW EXPERIENCES AMONG OLDER ADULTS**

C. Lee, L.L. Payne, *Recreation, Sport and Tourism, University of Illinois at Urbana-Champaign, Champaign, Illinois*

Serious leisure is one activity type that may benefit the quality of life for older adults (Heo & Lee, 2010). Also, it is considered an ideal environment for one to experience flow, which is believed to be an optimal experience (Stebbins, 1992; Kelly & Freysinger, 2000). This is because flow is mostly experienced when people are intensely involved in an activity. This study explores the relationship between different types of serious leisure activities and experiencing flow (frequency and quality of flow). A purposive sample of 141 older adults completed a survey in several community sites (e.g., rec centers, congregate meal sites). The seriousness of leisure activity, the frequency of flow and the quality of flow were measured by 18-item Serious Leisure Inventory Measurement (Chronbach's alpha = .865), 1-item Flow Questionnaire and 5-item Quality of Flow Experience Scale (Chronbach's alpha = .693). Cluster analysis was used to classify how socially, cognitively and physically stimulating serious leisure activities were into 5 groups: 1) physical and social centered stimulating, 2) cognitive centered stimulating, 3) diversely low stimulating, 4) diversely high stimulating, and 5) cognitive and socially stimulating. Results indicated the cognitively-centered stimulating, the diversely high stimulating, and the cognitively and socially-centered stimulating activity groups had significantly higher scores for frequency of flow than the diversely low stimulating activity group. However, there were no significant differences between groups in terms of quality of flow. This indicates cognitive factors in leisure activity could be the most influential factor to experience flow.

### THIRD AGE VERSUS FOURTH AGE STUDIES

C.J. Gilleard, P. Higgs, *University College London, London, United Kingdom*

This paper proposes the separation of ‘aging studies’ into two distinct fields of inquiry, a third and a fourth age studies. Later life we argue can no longer be deemed a coherent entity. The concerns, circumstances and experiences of those who are no longer young should be explored within a framework that is not dominated by health and social care policy. In a similar fashion, those whose personal identity risks being dominated by their status within the institutions of health and social care should be the focus of a fourth age perspective. Lifestyle is the central theme of the third age; while dependency is the core of the fourth age. While there may be some opposition to this binary distinction, we argue that the benefits of this heuristic division outweigh objections to it. The advantages of adopting such a dualistic strategy are that the concerns, circumstances and experiences of later life can be examined separately from the categorisation of old age and the institutional responses to it. How later life is lived, how and to what extent it is or is not oriented toward ‘age’ and ‘agedness’ should be the central themes of third age studies. In contrast, the representation of old age as the last stage of life, limited by the body and constrained by the institutions surrounding it should be the proper subject of fourth age studies. We propose this as a resolution of the contemporary conflicts over ageing and its place within society.

### THE IMPORTANCE OF INTERNAL AND EXTERNAL RESOURCES AND SELECTION, OPTIMIZATION AND COMPENSATION ADAPTIVE STRATEGIES IN THE DEPRESSIVE SYMPTOMS OF OLDER WOMEN WITH CHRONIC ILLNESS

J. Lee, C. Warner, K.B. Adams, *Case Western Reserve University, Cleveland, Ohio*

For older women with chronic illness, strategies of selection, optimization, and compensation (SOC) assist in managing their limited resources. Adequate use of SOC along with sufficient internal and external resources, such as self-efficacy, social support, and income adequacy, may prevent depressive symptoms, but little research has examined the possible role of SOC. We investigated whether health, SOC, and internal and external resources predicted depressive symptoms in older women with chronic illness. We also tested the mediator effects of SOC and the resources on the relationship between poor health and depressive symptoms. A total of 127 community dwelling older women with chronic illness completed questionnaires at two time points six months apart. Measures included CES-D (depressive symptoms) number of illnesses (health), Lorig’s self-efficacy subscale, subjective social support, and income adequacy (resources), and a twelve-item adapted measure of SOC strategies with three subscales. A hierarchical regression model, including age, health, SOC strategies, and internal and external resources at T1, accounted for 49% of depressive symptoms at T2. Health, self-efficacy, and social supports were significant predictors of depressive symptoms. SOC total score was non-significant; however, greater use of compensation, a SOC sub-strategy, predicted fewer depressive symptoms, but the relationship disappeared after controlling for resources, suggesting a limited role for SOC. The significance of the relationship between health and depressive symptoms after six months decreased when self-efficacy and social supports were controlled, thus internal (self-efficacy) and external (social supports) partially mediated the relationship between health and depressive symptoms.

### FACTORS ASSOCIATED WITH SUCCESSFUL AGING IN BRAZIL

F.D. Andrade<sup>1</sup>, A. Schwingel<sup>1</sup>, M.L. Lebrão<sup>2</sup>, Y. Duarte<sup>2</sup>, *1. Kinesiology and Community Health, University of Illinois at Urbana-Champaign, Champaign, Illinois, 2. Universidade de São Paulo, São Paulo, Brazil*

Objective: Population aging process is accelerated in developing countries. Although previous studies have explored the role of relevant

measures related to successful aging, most studies were based on cross-sectional data. We use longitudinal data to evaluate how relevant measures help predict health transitions, particularly those related to maintaining a successful aging. Method: Two waves (2000, 2006) of the longitudinal SABE conducted in São Paulo city, Brazil was used in the analyses (n = 2,143). Successful aging was defined in multidimensional manner, including comorbidity, disability, depression, cognitive impairment, self-rated health and financial security measures. We explored the role of relevant predictors of successful aging (demographic, socioeconomic, lifestyle, health related). Multivariate logistic and multinomial regressions were used in the analyses. Results: Only 4.6% of the population had all indicators of successful aging. The main factors restricting successful aging among older Brazilians were presence of physical limitations, comorbid conditions, self-reported poor health and financial insecurity at baseline. Higher education was positively associated with remaining free of disability among men and women. Among women, literacy was positively associated with maintaining good self-rated health and cognitive skills. Physical activity was positively associated with remaining free of disability among women; and free of depression among men. Higher levels of grip strength were positively associated with better self-reported health. Discussion: Physical activity, grip strength and education were important protective factors associated with successful aging. Interventions aimed at improving levels of physical activities and policies aimed at increasing educational levels can contribute to promote successful aging in Brazil.

### PERSONALITY CORRELATES OF EXCEPTIONAL HEALTH IN OLDER PARTICIPANTS IN THE BALTIMORE LONGITUDINAL STUDY OF AGING (BLSA)

M. Tolea<sup>1</sup>, E.M. Simonsick<sup>2</sup>, *1. University of Missouri St Louis, St Louis, Missouri, 2. National Institute on Aging, Baltimore, Maryland*

Personality traits as measured by the Five Factor Model have been consistently associated with health and functionality in later life. However, most research has focused on identifying ‘risky’ traits although ‘advantageous’ traits may help explain why some individuals age better than others. This study sought to examine whether individuals aged 70 years and older in excellent health exhibit distinct personality features relative to individuals not in excellent health. Excellent health was determined using a hierarchic algorithm ruling out physical and cognitive limitations and major chronic diseases and disease-related symptoms and conditions based on self-report and laboratory parameters. Data on BLSA participants who were administered the NEO Personality Inventory (NEO-PI-R) and had their health status evaluated using this algorithm were used (N=502 observations, age=79.7mean ± 6.1SD, 42.4% female). Conscientiousness and its components of order and achievement striving were associated with higher odds of being in excellent health (OR=1.42, 95%CI:1.03-1.96; OR=1.44, 95%CI:1.09-1.91; and OR=1.64, 95%CI: 1.18-2.28 respectively). The activity subcomponent of extraversion was also a positive correlate (OR=1.95, 95%CI: 1.42-2.68). These associations were independent of age, sex, education, and other personality traits, were partially explained by physical activity level, and appeared to operate mostly in the younger old, diminishing with increasing age. Findings suggest that personal organization, a sense of direction and a need for personal achievement, as well as a fast living pace may be important personality markers of optimal health, potentially through promoting health protective behaviors.

### EXPLORING THE ROLE OF TRANSCENDENCE IN AGING

V.L. McCarthy, A. Bockweg, *University of Louisville, Louisville, Kentucky*

Interest in transcendence as a dimension of aging has grown, but empirically testable ways of looking at transcendence are limited. Using concept analysis, transcendence was examined to describe the concept and identify commonalities among existing theories and definitions.

Multiple databases yielded 123 citations for articles, books and webpages; 78 met criteria for inclusion in the analysis, including literature from philosophy, theology, psychology, sociology, psychiatry, and nursing. The analysis suggested antecedents of transcendence included altruism, generativity, creativity, positive solitude, existential questioning, and mindfulness of a dimension beyond the self. Essential attributes of transcendence were a change in perspective or worldview; connectedness to self, others and a higher power; a sense of being an integral part of the universe; decreased concern for social roles and expectations; and increased focus on personally valued relationships and activities. Based on integrating the literature with existing theory, a definition of transcendence was synthesized: Transcendence is a shift in perspective from a rational, materialistic view to a wider world view characterized by broadened personal boundaries within interpersonal, intrapersonal, transpersonal and temporal dimensions. Potential outcomes of transcendence were a sense of meaning in life, increased self-acceptance, ego integrity, and decreased fear of death. A conceptual model was also developed to aid in understanding relationships among these factors, grouped within five domains: relationships, creativity, introspection, contemplation, and spirituality. Transcendence may be an important variable within the spiritual or existential domain that provides a theoretical basis for planning cost-effective, efficacious interventions to improve the aging experience.

## SESSION 2095 (POSTER)

### TECHNOLOGICAL APPLICATIONS

#### COMMUNICATION TECHNOLOGY, INTERNATIONAL MIGRATION AND IMPACT ON THE CAREGIVING: CASE STUDY BANGLADESH

I. Amin, *University of North Texas at Dallas, Dallas, Texas*

This study explores how the use of telecommunication technologies such as mobile phones and Internet based telecommunications such as Skype, Facebook and others are influencing the Bangladeshi emigrants' long-distance caregiving pattern for their elderly parents and relatives. Bangladesh has millions of migrant workers working and living in Middle east, far eastern countries, Europe and North America. While overseas wage earners have significant economic impact on the country's economy, this emigration trend has mixed impact on the elders as traditionally almost all the eldercare is done by the family which is already experiencing declining caregiver availability accompanied by shrinkage of family size, and women's increasing labor force participation. The sample included 28 purposively selected elderly persons having at least one family member living abroad. Data were collected through semi-structured interviews. Computer software Nvivo 9 was used to code and analyze the transcribed interviews. Findings indicate that most of the emigrants use mobile phones and Internet to provide long distance caregiving to their elderly relatives. They actively participate in the decision making for the care of elderly parents and family members. Increased use of telecommunication technologies by the emigrants and elders has resulted in increased psychological wellbeing for both the emigrant and the elderly persons. Although money received from children abroad contributes to financial well-being of the elder parents and family members, lack of formal services and other socio-cultural factors pose challenges for elders to utilize that money for their optimum well-being.

#### THE ROLE OF TECHNOLOGY GENERATIONS AND GENDER IN EVALUATING DIFFERENT TYPES OF MODERN TECHNOLOGY

K. Classen<sup>1</sup>, F. Oswald<sup>2</sup>, H. Wahl<sup>1</sup>, *1. Heidelberg University, Institute of Psychology, Dept. of Psychological Ageing Research, Heidelberg, Germany, 2. Goethe University Frankfurt, Faculty of Educational Sciences, Interdisciplinary Ageing Research, Frankfurt am Main, Germany*

The project aims at identifying differences in technology acceptance between two technology generations. In particular, the so-called "mechanical generation" (born before 1939) and the "household appliance generation" (born 1939-1951) are compared in terms of technology attitudes and evaluation, i.e. intention, perceived usefulness, perceived ease of use and output quality. The internationally renowned Technology Acceptance Model (TAM; version 3) in a modified version was applied as theoretical background. Study participants were 357 German persons aged 60 to 99, representing the two technology generations (mechanical generation N=165; household appliance generation N=192). Three technological devices, representing the areas of care and prevention (sensor mat), household management (robotic vacuum cleaner), and leisure time use (video game console) were selected. In a MANOVA data-analytic approach, no technology generation differences appeared in terms of the intention to use the three technological devices. Technology generations did also not differ in perceived usefulness across all three devices. However, the younger household appliance generation rated the three devices higher in their ease of use. Device specific uni-variate ANOVA showed that particularly the robotic vacuum cleaner and even more the video game console, but not the sensor mat were evaluated differently in ease of use by the two technology generations. Furthermore gender interaction effects were found in that the female participants were responsible for the generation differences in output quality of the robotic vacuum cleaner. Findings underscore that technology generation is an important construct to understand technology acceptance, while gender continues to play a role across technology generations.

#### VIDEO GAMES AND AGING: WHAT WE KNOW AND WHERE WE NEED TO GO

E.A. Fenster, *Miami University, Oxford, Ohio*

Gaming accommodates different lifestyles, resources, and preferences. This flexibility is appealing to many adults; one study noted 29% of players were over 50 (ESA, 2011). However, research on video games in relation to aging has concentrated on health or integration into long-term care (e.g., Clark and Kraemer, 2009; Hwang, Hong, Hao, and Jong, 2011), and less on social or life course aspects. The goal of this discussion is to examine why other research directions can benefit both gaming and gerontological literature. Gaming is important because it has potential to influence different parts of one's life. One's gaming experience is shaped by factors such as games played, level of commitment to play, and sociability of environment; these elements help develop unique and variable contexts and communities, emphasizing the notion that gaming can be considered a type of leisure, support, or element of identity. Furthermore, there is increased accessibility to games through diverse platform options, leading to more individuals identifying as casual gamers (Juul, 2010). Although broad information is available, theoretical application is needed. The life course perspective could supplement this knowledge by providing a lens to explore how ideas about gaming are shaped by life experiences, as well as how changing societal attitudes towards gaming impact who plays. By thinking more broadly about gaming in relation to aging, we can understand how gaming habits evolve throughout the life course, why some begin gaming later in life, and in what ways it can be a helpful resource to older users.

## **DEVELOPMENT OF AN INTERNET-BASED INTERVENTION TO IMPROVE SELF-MANAGEMENT SKILLS AND WELL-BEING IN OLDER ADULTS**

I.F. van Asch<sup>1</sup>, H.H. de Koning-Fikse<sup>1</sup>, A. Pot<sup>1,2</sup>, *1. Program on Aging, The Netherlands Institute of Mental Health and Addiction, Utrecht, Netherlands, 2. VU University, Amsterdam, Netherlands*

**Background:** Improving Self-Management Skills in Older Adults May Improve Well-being and Resilience and Decrease Feelings of Loneliness. For This Reason, an Internet-based Intervention is Developed to Improve Six Self-Management Abilities: Self-efficacy Beliefs, a Positive Frame of Mind, Taking the Initiative, Investment Behavior, Multifunctionality of Resources and Variety in Resources. The Intervention is Focused on Different Aspects of Well-being: Comfort, Stimulation, Affection, Network and Status. **Method:** Literature is Searched, Existing E-mental Health Interventions Are Studied and Focus Groups with Older Adults (N=8) and Professionals (N=7) Were Held to Design the Intervention. At the End of the Development Process Older Adults (N=12) Are Consulted Again to Give Their Advice. Subsequently, a Pilot Study Will Be Carried out to Investigate Whether or Not the Intervention Has an Impact on Personal Competence, Interpersonal Control, Self-esteem, Level of Happiness, Loneliness and Resilience. **A Process Evaluation Will Give Insight into the Conceptual and Technical Experience. Results:** The Intervention Will Be Ready by Autumn 2012. During This Poster Session the Development and Content of the Intervention as Well as the Design of the Pilot Study Will Be Presented. **Discussion:** On the Basis of the Results of the Pilot, the Intervention Will Be Adapted. The Final Version Will Be Implemented at Nationwide Level and is Accessible for All Older Adults.

## **A MOTIVATIONAL TEXT MESSAGING WALKING PROGRAM FOR OLDER AFRICAN AMERICANS: A PILOT STUDY**

B. Kim, K. Glanz, *University of Pennsylvania, Philadelphia, Pennsylvania*

**OBJECTIVES:** To examine if a six week program of motivational text messaging will increase physical activity (step count) among older African Americans in an urban setting. **DESIGN:** Randomized, controlled trial pilot study with allocation to a motivational text messaging group or a control group. **SETTING:** General community. **PARTICIPANTS:** Thirty-six African Americans aged 60 to 85. **INTERVENTION:** Both groups received pedometers and walking manuals to record step counts. The intervention group received motivational text messages three times a day, three days a week, for six weeks. **MEASURES:** Primary outcome measure was step count. Secondary outcome measures were Body Mass Index (BMI) and the Leisure Time Exercise Questionnaire (LTEQ). **RESULTS:** Motivational text messaging three times a week for six weeks led to greater improvements in step count (+879 vs. +398;  $P < .05$ ) and LTEQ ( $P < .05$ ) along with lower BMI ( $P < .05$ ) than the group who did not receive any text messages. **CONCLUSION:** Motivational text messaging three times a week for six weeks was effective in increasing step count and self-reported leisure time exercise behavior, and decreasing BMI among older African Americans. Larger and longer-term studies are needed to examine the impact of text messaging and maintenance of healthier life choices through text messaging in this population.

## **AN EXPLORATION OF THE FACTORS THAT PROMOTE OR INHIBIT THE UPTAKE AND USE OF ASSISTIVE TECHNOLOGY (AT) AMONG OLDER PEOPLE**

K. Brittain, G.W. Pritchard, *Newcastle University, Newcastle upon Tyne, United Kingdom*

The current health and social care systems in the UK are not sustainable due to the rapidly growing demand from an ageing population. Assistive Technology (AT) – which we broadly define as any product or service used to overcome cognitive, physical or communication

difficulties – has been heralded as something of a panacea for the plethora of cost and care related challenges associated with the ageing population. It has also been described as an enabler that allows an often-maligned social group to live independently in their own homes for longer and forgoes the immediacy of institutionalization. However, despite these perceived benefits, evidence suggests that uptake of AT among older people has been low and an emerging area of academic inquiry has speculated on the reasons for this. This paper presents findings of an on-going research project examining older people's (with diverse care and support need) perspectives on AT. The work forms part of a large integrated ('SALT') project, and brings together a strong consortium of academics, businesses, health and social care professionals, third sector organizations and user representatives. Our data derives from a qualitative methodology, which incorporates semi-structured interviews, focus groups and observational fieldwork. Our findings suggest that previous research in this area has failed to fully exploit the meaningful conceptual insights from social theory and we suggest a more sociologically-focused research agenda organized around the three central themes of identity; social inequality and the emerging 'social model of ageing'.

## **EFFECTS OF VIDEOGAMING ON OLDER ADULTS' EMOTIONAL WELL-BEING**

S. Sörensen<sup>1</sup>, J. Swan<sup>1</sup>, A. Baroah<sup>1</sup>, A. Anderson<sup>2</sup>, R. Kludt<sup>2</sup>, D. Bavelier<sup>2</sup>, *1. University of Rochester School of Medicine, Rochester, New York, 2. Brain and Cognitive Sciences, University of Rochester, Rochester, New York*

Videogaming has been suggested as an effective approach to brain-training for older adults, but little is known about its emotional effects. We investigated whether videogaming is related to intra-individual change in four emotional well-being variables after a three month in-home gaming period. Forty-eight adults aged 60-84 (Mean age=67.9) trained to play either "Medal of Honor" (n=14), "Rayman Raving Rabbits" (n=7), or several commercial brain training games (n=15). After pre-test they played 30-60 minutes per day, tracking their progress and receiving weekly phone check-ups or instruction. Post-test occurred after 50 hours of in-home play. Participants were 15% Black/African American, 85% White; 29% were male; 37.5% lived alone; mean years of schooling was 15.7 (sd=2.4). Repeated measures analyses for 2 time points were conducted, with age as a covariate. Positive Affect decreased significantly ( $p=.04$ ) from pretest to posttest, but Negative Affect did not. Participants aged 65+ had lower positive affect at post-test, whereas players aged 60-65 reported slight improvement (time x age,  $p=.028$ ). A similar trend ( $p=.067$ ) was found for Life Satisfaction, but older players experienced an increase, while younger players decreased in life satisfaction. All players reported a drop in Negative Self-Perceptions of Aging ( $p=.029$ ); this was driven by the older players (time x game interaction  $p=.022$ ). These preliminary results suggest that videogaming can have both positive and negative effect on older adults' well-being. The effects vary by subject age, but not the type of game played. Given the small sample and unbalanced design, results should be replicated and gender and other potential covariates controlled.

## **THE EFFECTS OF AGE, COGNITION, AND HEALTH NUMERACY ON USE OF AN ELECTRONIC PATIENT PORTAL**

J. Taha, J. Sharit, S.J. Czaja, *University of Miami, Miami, Florida*

Diverse patient populations are increasingly using patient portals that are tethered to their electronic medical record (EMR). Patients using portals can view their medical history, review laboratory results and medication lists, and follow links to credible health information online. Yet little is known about the actual ability of patients to use the information contained in portals to manage their health. This study evaluated the ability of 107 middle-aged and older adults (aged 40-85 years,

M = 58.87, SD = 11.89) to use a simulated patient portal of an EMR to perform 15 common health management tasks encompassing medication management, review/interpretation of lab/test results, and health maintenance activities. We also examined how individual characteristics, such as health numeracy and cognitive abilities, impact the use of these systems. Results indicated that older adult participants had lower mean scores on the more complex tasks and overall performance than the middle-aged adults. Individual characteristics such as age, cognitive variables, health numeracy (a component of health literacy), and Internet experience had a significant impact on performance for both the middle-aged and older adults. Individuals with lower verbal ability, executive functioning, reasoning skills and health numeracy skills had lower performance. Overall, the findings indicated that demands on these skills should be considered in the design of patient portals. In addition, careful consideration needs to be given to health numeracy demands such as the presentation of numerical information and demands related to interpretation of mathematical information.

### **OLDER ADULTS AND ONLINE HEALTH INFORMATION-SEEKING**

T.M. Luger, J. Suls, *Univ Iowa, Iowa City, Iowa*

Two-thirds of older adults with internet access search for health information online (Pew Internet and American Life Project, 2010). Many studies have focused on adapting features such as text size to accommodate older adults (Czaja & Lee, 2008). However, studying the cognitive processes used during search may help to provide older adults with the most relevant health information. Our study investigates the goals and search strategies of an online health search. Participants aged 50 years or older ( $N=55$ ) were recruited from Johnson County, Iowa ( $M_{age} = 64.94$  years). Participants were randomly assigned to use the Google search engine or WebMD's Symptom Checker while attempting to diagnose the symptoms of either mononucleosis or scarlet fever as depicted in a vignette. Participants engaged in a "think aloud" while searching and completed a semi-structured interview to provide insight into the cognitive processes used to search. A Q sort method (McKeown & Thomas, 1998) was employed for analysis. Results showed that, while searching, older adults attempted to match the vignette symptoms to a particular condition, gather information about a specific symptom, or gather information about the proper health behavior to take when presented with such symptoms (e.g. when to seek care). Older adults seemed to utilize their expectations about disease such as the probability of a particular diagnosis or previous experience with a particular illness to eliminate conditions when diagnosing. Knowing how older adults approach an online health search may help to provide a productive search experience.

### **SESSION 2100 (POSTER)**

#### **TECHNOLOGY: APPLICATIONS AND IMPLICATIONS**

##### **'CARE IN BUSINESS': HOW NEW TECHNOLOGIES HELP IMPROVE THE QUALITY OF LIFE OF OLDER PEOPLE AND CARERS**

J.E. Phillips, S. Hillcoat-Nalletamby, M. Allen, *Centre for Innovative Ageing, Swansea University, Swansea, United Kingdom*

'Care in Business' brings together academia, business, care-organisations, carers and older people to create a vision of care and explore how new assistive living technologies and emerging trends in the ICT sector can be exploited innovatively to meet care needs. Integrated solutions are needed across sectors to maintain older people's independence and quality of life, and in turn support the role of remote carers, particularly carers in the workplace. To date, ICT and carers' sectors have had limited opportunity to work together and learn from each other about evolving trends in their fields. 'Care in Business' facilitated these much

needed cross-disciplinary exchanges through a series of focus groups carried out in 2011 and 2012. A number of product ideas developed through inter-sector and inter-disciplinary collaboration. Project partners developed a greater understanding of the gaps in research knowledge, the market potential for businesses, and the aspiration expressed by carers and older people to be treated as active rather than passive consumers, in both the design and consumption of products and services. The project highlighted the need to bridge the gap between the producer and the consumer and fuel a consumer led rather than institutional led market in the UK. Older people and carers were prepared to spend money on innovative 'off the shelf' solutions but there is a clear need to actively engage them in the design process and ensure products and services reflect both their needs and aspirations.

### **WHAT DO OLDER ADULTS WANT THEIR PERSONAL ROBOTS TO DO?**

W.A. Rogers, T.L. Mitzner, C. Smarr, J.M. Beer, A. Prakash, T.L. Chen, C.C. Kemp, *School of Psychology, Georgia Institute of Technology, Atlanta, Georgia*

Demographics of the world population make clear that people are living longer and society needs to plan for providing care and support for older adults in a range of environments (e.g., independent homes, assisted living facilities). Personal robotics has much potential in this space. For robots to achieve that potential, they must be designed to be appropriate, useful, and accepted by older adults. If robotic technology is to be successful in supporting older adult care recipients and their care providers there are a number of research questions that must first be answered. The purpose of this project was to: a) identify the needs and preferences of older adults with which personal robots might assist; and b) determine the factors that lead to acceptance of such robotic assistance (and potential barriers to acceptance). Participants were 21 independent living seniors (65-93) who completed questionnaires to assess different aspects of acceptance (Robot Familiarity; Robot Opinions; Assistance Preference). They then participated in small-group structured interviews, which provided in-depth information about their needs, preferences, and attitudes regarding the potential for robots to support home-based tasks. Overall, the older adults were open to the idea of having robot support in their home, especially to assist with tasks such as household duties (e.g., cleaning, laundry/ironing) or manual labor (e.g., lawn work, lifting/moving heavy objects). They also reported some concerns about the robots related to performance reliability and physical presence. These results provide an initial framework for design and deployment of personal robots to support older adults.

### **COMPUTER BASED REAL-TIME ACTIVITY REPORTING AMONG OLDER ADULTS: INNOVATIONS AND CHALLENGES**

K. Wild, N.C. Mattek, B.L. Stone, J. Kaye, *Oregon Health & Science University, Portland, Oregon*

A key assumption of remote in-home monitoring is that activities and behaviors of interest are accurately captured by systematically placed sensors. At the same time, retrospective self-reports have been shown to be disconcertingly inaccurate in a variety of settings. Thus, verification of sensor data currently relies on a less than perfect gold standard. We have previously used a daily diary system to gauge the accuracy of in-home sensor based monitoring, and concluded that there may still be limitations as to the fidelity of recalled events and behaviors reported with these day reconstruction methods. In the present study we administered an online activity survey to all current computer users in our ongoing longitudinal study of in-home ubiquitous monitoring. The intent was to reduce the burden of daily diary recording on older adults, while still collecting data suitable for comparison with sensor-detected activity. In this survey, participants were asked to report their activity, location in the home, and time of activity for the two hours immediately preceding completion of the survey. Of 95 participants who completed

the two-hour activity log, nearly one quarter (n=22) did not complete the task adequately, as determined by failure to include at least one activity, location, and time that could potentially be compared with sensor data. Between group comparisons showed significantly lower mental status scores ( $p = 0.04$ ) in those who did not submit usable activity reports than those who did. Validation of real-time activity data poses unique problems for an older adult population, particularly in those with incipient cognitive decline.

### REMOTE MONITORING WITHIN THE HOME'S OF OLDER PEOPLE, CAN THIS BE CONCEPTUALISED AS AN EXTENSION OF BODYWORK?

K. Brittain, M. Lie, S. Lindsay, P. Olivier, *Newcastle University, Newcastle upon Tyne, United Kingdom*

'Bodywork' or 'dirty work' is a neglected area in both formal and informal care (Twigg, 2000). Hughes (1984) phrased the term 'dirty work' as part of the process of caring for someone where the type of 'caring' work transgresses social and personal boundaries within our society. Although Twigg (2000) primarily looks at the formal setting for care work this concept can also be applied to the informal process of caring (Brittain & Shaw 2008). Paid roles and professionals who work with the body are accorded status and higher remuneration by placing a distance between themselves and the body, sometimes through the use of technology (Lawler, 1997; Twigg, 2000). Technology to support 'ageing in place' has increasingly become a government priority with the preferred site of care being the home, reflecting trends in community care policies since the 1950s. One proposed solution is remote monitoring (both in formal and informal caring environments), consisting of sensors and warning systems that alert carers when behaviour patterns change. There is increasingly a move within the computing community to investigate in more detail the use of lifestyle monitoring in being able to detect illness and decline in later life. This paper discusses the concept of 'bodywork' in relation to remote monitoring practices, and explores whether such practices transgress social, personal and ethical boundaries.

### HEALTH INFORMATION TECHNOLOGY USE AMONG ADULTS: ANALYSIS OF THE HEALTH INFORMATION NATIONAL TREND SURVEY

E. Lee<sup>1</sup>, Y. Yeo<sup>2</sup>, S. LevKoff<sup>3</sup>, 1. *Social Work, University of North Carolina Charlotte, Charlotte, North Carolina*, 2. *University of South Carolina, Columbia, South Carolina*, 3. *University of South Carolina, Columbia, South Carolina*

Although older adults are the most frequent and heaviest users of health services, they still lag far behind in their adoption of use of the Internet and health information technology (HIT). This study examined older adults' HIT use for health/cancer information and digital divide among three age cohorts. The data for this study were drawn from the 2007 US Health Information National Trend Survey (HINTS), a nationally representative household survey to collect data on HIT use. Three cohort of older adults is comprised of young boomers (aged 43-52, n=1,482), older boomers (aged 53-61, n=1,674), and silent/G.I. generation (aged 62 and older, n=2464). Logistic regression analysis was conducted to examine factors associated with older adults' search for health/cancer information. Silent/G.I. generation is less likely to use the Internet for health information (OR = 0.365;  $p < 0.001$ ) and for cancer information (OR = 0.382;  $p < 0.001$ ) than boomers. Results: Older searchers of health information were more likely to be female, higher income, college-educated, and comfortable about medical exam: They are less likely to be living alone and foreign-born. They value the importance of getting electronic medical record. While cancer information seekers were more likely to be college-educated, feel comfortable about medical exam, and value

the electronic health records, they were less likely to be silent generation and unhealthy. Implications. Considering the digital divide, intervention should be developed to reach out those who are at risks (e.g., the oldest-old, lower socioeconomic status, living alone, immigrant, etc.).

### COMPUTER BASED COGNITIVE TRAINING FOR OLDER ADULTS – THE SPECIFIC REQUIREMENTS OF OLDER ADULTS WITH MCI

M. Haesner, M. Gövercin, E. Steinhagen-Thiessen, *Geriatrics Research Group, Charité, Berlin, Germany*

As the natural process of ageing humans experience a decline in overall cognitive function. However the cognitive development can be influenced favourably in a stimulating environment (Wilson et al. 2002). Learning is possible up to a well-advanced age and can delay cognitive decline (Zehnder et al. 2009, Lustig et al. 2009, Husemann 2009). The benefit of software-based cognitive training is highly controversial in science (Frank and Konta 2005) and few recent RCT-studies and meta-analytic studies exist (Owen 2010, Ball et al 2002, Zehnder et al. 2009). In clinical setting cognitive training software is used during normal neuropsychological therapy. For self-training there is a lack of evidence-based cognitive training software for the home environment. Therefore in a German public funded project a Web 2.0 platform with cognitive training exercises will be developed. Taking into account the user-centered-design process in a first step requirements of the target group were raised. The purpose of this study was to detect, through qualitative research, requirements of older adults on the design of exercises, forms of communication on the platform, output devices or control devices. The questions of the interview guideline were evaluated in a pre-test and then used in semi-structured interviews. Twelve interviews were conducted. Half of the recruited subjects were diagnosed with a mild cognitive impairment (MCI). Results reveal interesting differences between these two groups, e.g. the cognitive impaired expressed significantly more preferences for therapy-based psychological exercises in contrast to motivating gaming exercises such as Sudoku or crossword puzzles.

### SOCIAL MEDIA USE IN OLD AGE: USER PROFILES, EFFECTS, BEST PRACTICES

A.K. Leist<sup>1,2</sup>, G. Reljic<sup>1</sup>, D. Ferring<sup>1</sup>, 1. *University of Luxembourg, Walferdange, Luxembourg*, 2. *Erasmus Medical Center, Rotterdam, Netherlands*

Internet use of older adults is increasing steadily and is highly desirable in various domains such as training, political and consumer information, and health communication. The use of Informations Communications Technology (ICT) in general, and social media use in particular may fulfill other needs and wishes beyond these general desiderata. One of the additional benefits may be to promote social connectedness and to alleviate loneliness by increasing the social circle and maintaining contact with relatives and friends. However, social media use in old age, in particular the use of online social networks is to date still very low. To develop best practices for engaging older adults in this area and extending a literature review, this contribution will provide a theoretical framework of social media use in old age focusing on user profiles, potential effects, and recommendations for the development of interfaces facilitating social media use in old age. Concerning user profiles, the need for a differential approach to ICT use will be presented with a focus on ICT experience, socioeconomic differences, and physical limitations in older age. Regarding the effects of social media use, potential benefits and caveats will be presented, highlighting benefits of self-efficacy, control, and social connectedness, as well as problems arising with anonymity and valid-

ity of information given in social media. To illustrate recommendations in making social media more accessible for older adults, the user-centered design of a mobile platform developed in the European AAL project V2me aiming at alleviating loneliness in old age will be presented.

#### **USING SOCIAL MEDIA TECHNOLOGIES TO EXTEND SOCIAL INCLUSION IN THE 4TH AGE**

M.L. Johnson, 1. *University of Bristol, Bristol, United Kingdom*, 2. *University of Bath, Bath, United Kingdom*

This paper reports a substantial representative study of the extent to which digital and 'social' media technologies can facilitate greater social inclusion for care home residents. We aim to enhance contact for care home residents in three areas: (i) between residents and people who matter most to them (ii) with visitors and volunteers. (iii) to promote the Homes' growing role as a social hub i.e. to put residents in touch with each other, with other local residents and (potentially) with other organisations (such as social workers, health staff and others who might assist them to regain lost autonomy. Existing studies focus on older people in the 3rd age. To address the wishes of those in the 4th age requires intensive listening to expressed needs rather than seeking to overcome barriers to IT. Using this data we will fashion interfaces with people and technologies designed to achieve their ends.

#### **OLDER ADULTS' INTERNET USAGE FOR HEALTHCARE RELATED INFORMATION**

J.T. Romeo<sup>1</sup>, T.K. Amador<sup>2</sup>, 1. *Memorial Health System, Colorado Springs, Colorado*, 2. *Health Services Administration Dept., Regis University, Denver, Colorado*

Introduction: Older adults are increasingly accessing the internet and are using it to obtain healthcare related information (Crabb, Rafie, & Weingardt, 2012). It is important for providers and others to understand how older adults use the internet for healthcare related information and how this usage may impact their healthcare decisions. Literature Review: The U.S. Census Bureau (2009) reported that 42% of older adults age 65 and over are internet users. This percentage is significant and will continue increasing with the aging of the tech savvy Baby Boomers. More specifically, individuals are accessing the internet for healthcare related information to research medical issues (Romeo, 2011). Methodology: Qualitative methods were utilized in this study of nine adults aged 65 and older. Data collection included tape-recorded, semi-structured interviews with the use of an interview guide. Data analysis included transcribed interviews, a codebook, content analysis, and a second coder. The Cohen's Kappa was 80% which indicates high reliability of findings. Findings: Participants used the internet to research chronic health conditions, new diagnoses, and/or newly prescribed medications. They reported learning in-depth information about these issues online, developing additional questions, and, as a result, going to their primary care physician for further discussion. Conclusions: These participants felt more engaged in their healthcare and empowered to make healthcare related decisions. The results of this research show that older adults may benefit from accessing the internet for health care related information. Further, it appears that patient and physician communication may improve as well. References Crabb, R.M., Rafie, S., & Weingardt, K.R. (2012). Health-related internet use in older primary care patients. *Gerontology*, 58(2), 164-170. Romeo, J. (2011). Older adults' accessing the internet for healthcare. (Unpublished master's thesis). Reported Internet Usage for Individuals 3 Years and Older, by Selected Characteristics: 2009]. Retrieved from <http://www.census.gov/hhes/computer/publications/2009.html>

## **SESSION 2105 (POSTER)**

### **TRANSPORTATION**

#### **PARATRANSIT: A VIABLE OPTION TO SENIOR MOBILITY?**

D.P. McCarthy, 1. *Occupational Therapy Department, Florida International University, Miami, Florida*, 2. *Lehman Center for Transportation Research, Miami, Florida*

The Americans with Disabilities Act requires public transportation providers to offer paratransit services for those who are unable to use the public transportation system due to functional limitations. While reported barriers to paratransit use (e.g., long wait and travel times due to shared rides, need for advanced scheduling) may prohibit some seniors' use, paratransit options typically offer somewhat more flexible travel times than public transportation and offer door to door service. Miami Dade's Special Transportation Service provided over 1.5 million trips in the last fiscal year. The purpose of this study was to learn more about Miami Dade's senior paratransit users. Of the 275 participants who completed the South Florida Senior Travel Survey, 46 people (16.7%), aged between 65 and over 90 years, reported that they currently used paratransit services. When compared to the Miami Dade population, users were disproportionately White (63.0%), female (71.7%), and lived alone (63.0%). Participants who reported having used paratransit in the past week (n=20) averaged 2.9 trips per week and most trips took less than 2 hours (1.2 hours, SD .38). There was a high overall satisfaction rate (94.3%) among users, including safety (97.3%), reliability (91.9%), cost (93.5%), and timeliness (97.3%). Most riders (94.6%) said that STS met their travel needs. Paratransit services enable eligible seniors who cannot use public transportation to remain active, engage in favored activities, and access needed goods and services to remain independent in the community. Paratransit appears to play a key role in maintaining senior mobility.

#### **UNDERSTANDING THE ROLE OF PERSONALITY IN UNSAFE DRIVER BEHAVIOUR ACROSS THE LIFESPAN**

J. Riendeau<sup>1,2,3</sup>, M. Bedard<sup>1,2,3</sup>, 1. *Centre for Research on Safe Driving, Thunder Bay, Ontario, Canada*, 2. *Lakehead University, Thunder Bay, Ontario, Canada*, 3. *St. Joseph's Care Group, Thunder Bay, Ontario, Canada*

Young and older drivers are overrepresented in crash statistics. Personality is consistently linked to dangerous driving among young drivers but little research has examined the role of personality among older drivers. Given the relationship between personality and driver safety among younger populations and the relative stability of personality throughout adulthood, it is important to examine whether personality traits may be related to unsafe driving in older adults. We recruited 114 active drivers ranging in age from 18 to 89 years (M = 42.30 years; SD = 26.50 years). A series of questionnaires measured personality traits and self-reported driving habits. Driving performance was measured during a 30-min simulated drive. Our results did not provide support for the role of personality in the prediction of self-reported unsafe driver behaviour, thus raising considerable doubt about the continued use of self-report inventories as measures of driver behaviour. However, some personality factors (e.g., Extraversion, Neuroticism) emerged as significant predictors of observed driving performance. In addition, the linear ( $p < .01$ ) and quadratic ( $p < .05$ ) components of the age by Conscientiousness interaction were statistically significant, suggesting that personality may not have equal effects on all groups of drivers. To the best of our knowledge, this is the first investigation of the role of personality in the prediction of unsafe driving behaviour among both young and older adults concurrently. Further investigation is needed to provide more conclusive inferences. Prevention programs designed to reduce crash risk may need to be tailored depending on age and personality attributes.

## EVALUATION OF COGNITIVE IMPAIRMENT AND FIT TO DRIVE IN A MEMORY CLINIC IN JAPAN

E. Horikawa, *Saga University, Saga, Japan*

The number of the people who are 65 years or older is increasing rapidly in Japan. Similarly, the number of people with dementia and cognitive impairment is also increasing. In addition, car driving is the best way to keep mobility for the elderly people in Japan. There are deep concern with the relationships between cognitive ability and fit to drive. We evaluated cognitive abilities and driving skills of the people with dementia and Mild cognitive impairment in a memory clinic in Japan. Several medical diagnosis, neuropsychological tests and evaluation of driving ability using driving simulator were administered. Many of the patients indicated the low driving skills and they should stop driving immediately from the results of driving simulator. But the correlation between accidental history and cognitive impairment was not clear. Although the persuasions by medical staffs and patient's family, some of patients denies stop to driving. The reasons of not stop driving included that their feeling on the result s of driving simulator was low and there was no way to keep mobility without driving. We need the further analysis on the relationships between driving skills and cognitive impairment. More easy methods to evaluate the actual driving skill is also needed.

## A QUANTITATIVE ANALYSIS OF A TEXAS CAREGIVER ORGANIZATION FOR OLDER ADULTS

P.C. Dew, *Sociology, Texas State University-San Marcos, Austin, Texas*

The purpose of this research is to identify patterns associated with service use of clients of a Texas-based non-profit organization NCC, which provides free transportation services to anyone over 60. This research is important because it fills gaps in current literature regarding transportation services provided for older adults. This is a quantitative analysis of the 2011 NCC Client Survey. The survey consists of 71 of the 251 current active clients. Several tests were used to determine statistically significant relationships present including t-tests, ANOVA and chi-square tests of independence. A proxy variable, wealth, is used to describe the median home value per zip code. The sample consists of 25% male clients and 75% female clients. The ethnicity of the sample is a majority Caucasian (82.6%) with 8.7% Hispanic, 6.5% African American, and 2.2% Asian. The marital status of the respondents is 48.7% married, 33.3% widowed, and 17.9% divorced/single. Statistically significant relationships exist among the variables age and affordability ( $F = 4.835$  and  $t = 3.09$ ), wealth and affordability ( $t = 3.095$ ), marital status and availability ( $\text{chi-square} = 20.124$ ), and affordability and participation in senior day out ( $\text{chi-square} = 10.463$ ). A significant relationship did not exist between wealth and availability.

## SESSION 2110 (POSTER)

### WEALTH ACCUMULATION

#### WEALTH ACCUMULATION OF OLDER ADULTS IN THE UNITED STATES

G. Bayaz-Ozturk, *Hunter College, CUNY, New York, New York*

This paper presents an analysis of wealth holdings of older people using data from the Health and Retirement Study. Besides financial wealth which is widely studied in the literature, we evaluate economic well-being of those who are nearing retirement by using a comprehensive measure of wealth. Our wealth measure includes regular items such as housing and financial wealth as well as often-neglected wealth measures from Social Security, employer pensions, life annuities and transfer payments such as Supplemental Security Income, Food Stamps and veterans' benefits. To understand the degree of dispersion in asset values or wealth from annuity-like benefits, we calculate wealth inequality using different measures of inequality. Moreover, we make use of decomposition techniques that determine the portion of cross-sectional and inter-temporal inequality attributable to specific components of

wealth. We found that Gini coefficient for total household wealth rose from 0.501 in 1992 to 0.561 in 2004. Our findings indicate that net financial wealth was the most important source of inequality which explained more than half of the wealth inequality and it was followed by pension and social security wealth. Changes in the shares of wealth components were the major factors underlying the overall change in wealth inequality over the whole period. We also observed that components of wealth were less equally distributed over time explaining approximately half of the change in overall inequality.

## EXPLAINING THE USE OF PROFESSIONAL FINANCIAL ADVISORS AMONG THE PRE-RETIRED IN CANADA AND USA

L. Stone<sup>1</sup>, C. Rainville<sup>2</sup>, *1. Demography, University of Montreal, Ottawa, Ontario, Canada, 2. AARP, Washington, District of Columbia*

This paper analyses the use of professional financial advisors in the pre-retired population. The analyses employ microdata files from three 2009 to 2010 surveys: two conducted in Canada and one in USA. Among the predictors of seeking help from professional financial advisors, using Employee Benefit Research Institute data (USA), the statistically strongest are worry about economic dependency in retirement, nearness of the expected date of retirement, and membership in a workplace pension or retirement savings plan. In the Canadian Financial Capacity Survey dataset, among the measured predictors of seeking help from professional financial advisors, occupation, financial self-assurance, immigrant status, and net worth class are the statistically most important contributors to the goodness of fit of the model. Unusually high probabilities of receiving professional financial assistance can be found in population segments that comprise younger Canadian-born persons with education below university degree, who were in the managerial occupations and in the higher net worth ranks. In contrast, a very low probability of receiving financial advice from a professional source is found among well-educated immigrant women in the lower net worth classes and in the sales and service occupations. Among the predictors of trust in professional financial advisors, the priority assigned to retirement planning and confidence about one's future in retirement are statistically the key determinants, according to the EBRI data for the USA. Patterns of association of key factors with three dependent variables are discussed, and policy implications are mentioned.

## SAVE FOR RETIREMENT AND FINANCIAL LITERACY: AN EXPERIMENT IN URBAN AND RURAL COMMUNITIES

L. Cheng, *Social Work, National Taiwan University, Taipei, Taiwan*

Taiwan has witnessed a trend of fast graying population for the past two decades. But, economic safety net limitation and family erosion has placed huge challenges on the sustainability for the old age people of the society. How individuals could cope with the risks of economic insufficiency during their retirement time period? The study has two objectives. First, the study intends to design and revise a financial education handbook regarding saving for retirement appropriate for the near old-aged. Secondly, the study examines the relationship between improving financial literacy and attitudes toward preparing for retirement. The study included two parts. First, a financial education handbook was created based on in-depth interviews the financial regulators and local NGOs and focus group interviews with local residents in two selected communities, one urban and one rural. Secondly, financial education classes were given to the recruited participants between 40 and 60 year old residents from two study sites. Pre- and post measures were used to examine the level of financial literacy to members of experimental and comparison groups. And a follow-up questionnaire was mailed to them six months later. Statistical analyses indicated that financial educational classes in experimental groups, compared to comparison groups, did improve financial knowledge significantly among pre, post, and follow up measures. Further, participants from urban site carried more

financial behaviors significantly than the other participants. Policy implications are included.

### **WHY IS RETIREMENT PLANNING ADVICE OFTEN INCONSISTENT?**

G.A. Mackenzie<sup>1</sup>, J.A. Turner<sup>2</sup>, 1. *AARP, Washington, District of Columbia*, 2. *Pension Policy Center, Washington, District of Columbia*

Sound financial planning for persons approaching retirement is of the utmost importance. Mistakes can condemn retired households to deprivation if not outright penalty. Nonetheless, financial experts often disagree strongly on key principles of retirement finances or give poor or biased advice. To take several examples: There is basic disagreement over how safe investing in the stock market is, and over the value of expert advice in picking stocks. Both theory and evidence imply that the small investor is better off in index funds, but that view is hotly contested. The replacement rate (the ratio of income in retirement to a measure of income late in working life) is a basic tool of retirement planning. However, it suffers not only from important measurement issues, but is criticized for lacking a sound conceptual basis. About one in two older Americans decide to claim Social Security retirement benefits at the earliest opportunity, even though delaying for several years would substantially increase their benefit. Many retiring Americans do not receive adequate advice on when to claim, or on the related question of the merits of annuities. Our paper aims to describe clearly the roots of these contrary views, and to resolve them to the extent possible.

## **SESSION 2115 (POSTER)**

### **WORK AND RETIREMENT**

#### **HEALTH-RELATED PREDICTORS OF DESIRED RETIREMENT AGE: A NATION-WIDE STUDY OF OLDER SWEDISH WORKERS**

B. Caracciolo, M. Hyde, H. Westerlund, *Stockholm Stress Center, Stress Research Institute, Stockholm University, Stockholm, Sweden*

**Aims:** To assess the associations between health-related factors and desired retirement age, taking into account socio-demographic characteristics. **Methods:** The study included 5,537 respondents to the second (2008) or third (2010) wave of the Swedish Longitudinal Occupational Survey of Health (SLOSH), who were aged 50 to 64 years at the time of the survey. The associations between desired retirement age, health-related factors and socio-demographic characteristics were assessed using Multinomial Logistic Regression models. The outcome categories "early desired retirement" and "late desired retirement" described persons wishing to retire before or after the expected retirement age of 65. **Results:** In mutually adjusted models, having at least one disease and having more than one disease (multimorbidity) were both associated with the desire to retire early (OR 1.3, 1.02-1.7; OR 1.4, 1.1-1.8) and with reduced odds of late desired retirement (OR 0.7, 0.5-0.9; 0.7, 0.5-0.9). Depressive symptoms and subjective cognitive impairment were associated with increased odds of early desired retirement (OR 1.4, 1.2-1.7; OR 1.3, 1.01-1.8) but did not predict late desired retirement. Socio-demographic characteristics were an important predictor of both early and late desired retirement. In particular, older age and being a man increased the odds of late desired retirement (OR 1.6, 1.4-1.8; OR 1.5, 1.2-1.8) while younger age and being married were associated to early desired retirement (OR 2.2, 1.8-2.8; 1.4, 1.2-1.7). **Conclusions:** While physical health influences both early and late desired retirement, cognitive and mental health are mostly associated to the wish to retire early.

#### **WORK-RELATED BURNOUT IN AFRICAN-AMERICAN AND RUSSIAN-SPEAKING HOME CARE AIDES: THE FACTOR STRUCTURE AND ITS EQUIVALENCE**

V. Lukyanova, N. Muramatsu, *University of Illinois at Chicago, Chicago, Illinois*

Work-related stress and burnout are significant problems in home care aides (HCAs) who help disabled older Americans with housekeeping and personal assistance in their homes. To understand and compare the stress process leading to burnout among racially and ethnically diverse HCAs, it is critical to develop a valid and comparable measure of work-related burnout that is applicable for multiple ethnic groups. The purpose of this study is to examine the structure of work-related burnout among African-American and Russian-speaking HCAs who constitute major ethnic groups in a large Midwestern city. Data came from a survey of 644 African-American and 159 Russian-speaking HCAs. Burnout (exhaustion in two domains: the organization's work environment and client-related work) was assessed by the Copenhagen Burnout Inventory, which was developed to be used specifically for human service personnel. Confirmatory factor analysis was conducted to test two-factor models that include work and client domains separately and a one-factor model that combines the two domains. The one-factor model provided the best fit to the data compared with the two-factor models. The one-factor model was found to apply equally well to African-American and Russian HCAs. Results suggest that work and client domains are inseparable for HCAs who provide care in their clients' home, unlike other healthcare professionals that work in a well-defined setting (e.g., a hospital). The results will help compare the levels of burnout between African-American and Russian HCAs and help understand their experience with stress in home care.

#### **DO PSYCHOSOCIAL CHARACTERISTICS AFFECT LATER-LIFE TRANSITIONS? AN EXAMINATION OF RACE DIFFERENCES IN JOB CHANGES**

L. Best, *Pan-African Studies & Sociology, University of Louisville, Louisville, Kentucky*

Prior research on retirement and well being is mixed, with literature illustrating negative, positive, or no impact on well being in later life. While research has shown associations between retirement and physical health outcomes, few studies explore whether distinct personality characteristics and other psychosocial factors contribute to how older individuals deal with occupational changes. Using the three waves (2004, 2006, & 2008) of the Health and Retirement Study, I identify individuals over the age of 60 who have undergone a job transition (e.g. retirement, job change, job loss) within this four-year span. From there, I evaluate the differences in the reports of chronic stress as well as disease outcomes among White, African-American, and Hispanics. I also examine the variation in personality characteristics, as measured by the Five Factor Model of Personality, which measures dimensions of Extraversion, Agreeableness, Conscientiousness, Neuroticism, Agreeableness, and Openness to Experience by race and by occupational transition. Finally, I explore whether variations in personality characteristics play a buffer, if any, in significant changes in stress and health outcomes of those individuals who have experienced a job loss, job change, or retirement. Preliminary findings suggest that there are significant race differences in how one handles occupational transitions, particularly job loss. Personality traits vary by race/ethnic group; however, these differences are partly accounted for by socio-demographic characteristics.

#### **AGE AND INEQUALITY IN WORKPLACES**

C. Krekula, *Dept of Social Studies, Karlstad University, Karlstad, Sweden*

The demographic transition entails a greater need for more workers working longer. Therefore there is a need for knowledge on the mechanisms of exclusion that affect older workers in the workplace. Research

has revealed that older workers are discriminated against in recruitment and downsizing processes, among other areas, and that older workers manipulate signs of being of a high age to reduce their vulnerability to ageism. Revealing this age based inequality in the workplace is important, but to achieve equal age relations knowledge of the processes that create age based inequality and exclusion of the elderly is also necessary. This paper takes its part of departure in theoretical claims that argue that inequality is created in everyday practices for interacting and is expressed through categories and the notion that people are different due, for example, to age. Through analyzing focus group interviews and through observations of individuals' interactions and how workplaces are organized, I illustrate how age categories are translated into organizing principles in workplaces. The results reveal how age codings, i.e. practices of distinction that are based on and maintain notions of a phenomenon as appropriate for demarcated ages, are institutionalized and the consequences this has for different age groups. The results also illustrate how age hierarchies vary with context and in line with how responsibilities in the workplace are coded.

### **WHO ARE WE NOW: A STUDY OF IDENTITY IN LATER LIFE**

H. Kempler, D. Barlow, M. Damon, P. King, M. Reeder, S. Tishler, R. Wald, *Harvard Institute of Learning in Retirement, Cambridge, Massachusetts*

This paper is about the changes in identity of retired and aging seniors, all members of a learning in retirement institute. Thirty two randomly selected volunteers, between 60-89, equally divided between men and women, were interviewed by their peers. Our questionnaire focused on family and social connections, future concerns, spirituality, wisdom and on change and/or continuity in self-perception. A majority of participants maintain their identity- their values, attitudes, personal traits- developed pre-retirement. A few identified a change in identity- a woman with a new passion for writing, a man dealing with health challenges. Some women mentioned becoming more independent, assertive and self accepting. While acknowledging the loss of centrality in the lives of their children, the group was pursuing social connections even in their 80's. Retirement did not lead to changes in spirituality. Some people continue affiliation with traditional religious institutions while others prefer individual expression through nature, music and Buddhism. Feelings of freedom and relief from multiple past responsibilities were associated with the discovery of new interests, family involvement and volunteering. Future concerns dealt with the inevitability of death, but also revealed strong feelings about wanting control over pain, suffering and venue at end of life. Besides emphasizing autonomy and choice in the retirement process, the results show the value of engagement with a community in purposeful activities like learning and attention to end of life policies mindful of individual dignity. Future research might focus on resilience and support for positive identity in the face of the challenges of aging.

### **EXPECTATIONS OF SATISFACTION WITH LIFE IN RETIREMENT: AN AGE COMPARATIVE INVESTIGATION**

H.C. Gutierrez, D.A. Hershey, *Psychology, Oklahoma State University, Stillwater, Oklahoma*

To date, most research on retirement satisfaction has focused on the perceptions of retirees. However, understanding pre-retirees expectations of late life is important, because one's perceptions of the future can significantly shape life planning behaviors—such as the extent to which one plans and saves for retirement. In this paper, two statistical models are tested in which the dependent measure is expectations of future satisfaction with retirement. One model was constructed for a group of undergraduate students (M age = 19.55, SD = 2.28), and the other was developed for a group of middle-aged working adults (M age = 49.09, SD = 7.91). In these two theoretically-driven, hierarchically-structured path models, perceptions of one's future satisfaction

with retirement were regressed on indicators of financial knowledge, future time perspective, financial risk tolerance, and parental financial values. Both models were successful in accounting for significant variance in perceptions of future retirement satisfaction (R-squared young = 23%; R-squared old = 15%). One particularly influential predictor of perceived retirement satisfaction among college students was their parents' financial values. Superior predictors for members of the older sample, in contrast, included financial knowledge and financial risk tolerance. The results of this research have implications for retirement counselors and intervention specialists who seek to cultivate positive perceptions of late life among individuals of different ages. Specifically, retirement intervention specialists could benefit by targeting different types of constructs for younger and older adults in an effort to motivate individuals to adaptively plan and save for the future.

### **ANTICIPATING RETIREMENT AND FUTURE CARE NEEDS: INTERVIEWING LESBIANS BETWEEN 50 TO 65 YEARS OLD**

C.R. Bennett, *Doctoral Program in Gerontology, UMBC/UMB, Baltimore, Maryland*

Lesbian older adults are underserved and understudied. Although nearly seven percent of the female population of the US identifies as lesbian, there is limited research on lesbian adults between the ages of fifty and sixty-five. This cohort represents those at a pre-retirement or planning age for older adulthood and although there are reasons to suggest that lesbians plan for retirement and long-term care needs differently than other women, there is a lack of research related to childless lesbians adults compared to their heterosexual counterparts. Reasons that lesbian adults may plan differently for their retirement include issues of life-long discrimination and fear of healthcare and related services, unequal treatment under Social Security and pension plans, as well as durable power of attorney needs and issues of survivorship and inheritance. Similarly, childless older adults plan for their future care needs differently than childed peers; without children to anticipate meeting traditional care and planning roles, childless older adults may seek to foster fictive kin relationships in lieu of traditional child caregivers, for example. This poster examines (1) conscious development of fictive kin relationships; (2) concerns about future caregiving needs; and (3) financial and legal planning. Data for this poster are drawn from an ongoing study of lesbian adults from the upstate New York geographical area. Semi-structured interviews were conducted and tape-recorded, transcribed, coded and analyzed using Atlas.ti software for key themes and meaning related to retirement and long-term care. This poster will inform future policy and program planning for community-dwelling lesbian older adults.

### **THE EFFECTS OF EMPLOYMENT STATUS AND DAILY STRESSORS ON TIME SPENT ON DAILY HOUSEHOLD CHORES IN MIDDLE-AGED AND OLDER ADULTS**

J.D. Wong<sup>1</sup>, D. Almeida<sup>2</sup>, *1. Waisman Center, University of Wisconsin, Madison, Madison, Wisconsin, 2. Pennsylvania State University, University Park, Pennsylvania*

The transition from paid work to retirement may lead to a recalibration of one's time use in daily activities. This study assesses how employment status (worker vs. retiree) and life course influences (age, gender, and marital status) are associated with time spent on daily household chores. Secondly, this study examines whether the associations between daily stressors and time spent on daily household chores differ as a function of employment status and life course influences. Men and women aged 55 to 74 from the National Study of Daily Experiences (N=268; 133 workers and 135 retirees), a part of the National Survey of Midlife in the United States (MIDUS), completed telephone interviews regarding their daily experiences across eight consecutive evenings. Results showed that working women spent more than double

the amount of time on daily household chores than working men. Unmarried retirees spent the most amount of time on daily household chores than their counterparts. There was a trend towards significance for the association between home stressors from the previous day and time spent on daily household chores as a function of employment and marital status. These findings highlight the importance of gender and marital status in the associations between employment status and time spent on daily household chores, and the role that daily stressors, in particular home stressful events, have on daily household chore participation.

## SESSION 2120 (POSTER)

### HOSPITAL AND ACUTE CARE

#### IN-HOSPITAL FUNCTIONAL DECLINE OF OLDER ADULTS AND GREATER SATISFACTION WITH NURSING CARE

A. Zisberg<sup>1</sup>, C. Zlotnick<sup>1</sup>, E. Shadmi<sup>1</sup>, G. Sinoff<sup>2,3</sup>, N. Gur-Yaish<sup>4</sup>, *1. The Cheryl Spencer Department of Nursing, Haifa University, Haifa, Israel, 2. Department of Geriatrics, Carmel Medical Center, Haifa, Israel, 3. Department of Gerontology, Faculty of Social Welfare and Health Sciences, University of Haifa, Haifa, Israel, 4. Center for Research and Study of Aging, Faculty of Social Welfare & Health Sciences, University of Haifa, Haifa, Israel*

Patient satisfaction represents hospitalized patients' perceptions, but these perceptions are molded by their expectations as well as hospital outcomes. Since older adults, compared to younger individuals, have higher rates of hospital admissions and longer hospital stays, it is important to identify patient characteristics and outcomes related to nursing satisfaction of older adults. Objective: Although some studies have examined the impact of change in functional status on satisfaction with medical care among older adults, no studies have assessed this relationship with satisfaction for in-hospital nursing care. Methods: A sample of adults 70 years or older (n=393) admitted to a large hospital in Israel for non-disabling conditions were recruited for this study. Three parameters of satisfaction with nursing care were measured: the art of nursing care (ANC) comprising the most sophisticated aspects of nursing interventions; the tangible aspects of nursing care (TNC) comprising the more basic functions; and a general overall measure of nursing (GNC). Results: Decline in functional status over the course of hospitalization was the most powerful predictor of satisfaction with ANC and TNC. Other characteristics such as depression and having a live-in paid caregiver also exhibited an influence on the satisfaction with nursing care measures. Discussion: This finding suggests that patients who have a greater need for professional nursing care report greater satisfaction with ANC and TNC functions. Older adults who regularly receive one-on-one care from a paid live-in caregiver may have higher expectations of general care, and these expectations may be reflected in scores given on satisfaction surveys.

#### CARE DELIVERY CONSEQUENCES OF POOR QUALITY HOSPITAL-TO-SKILLED NURSING FACILITY TRANSITIONS: A QUALITATIVE STUDY

B.J. King, A. Kind, A.L. Gilmore, R. Roiland, K.E. Pecanac, N. Husain, B. Bowers, *University of Wisconsin-Madison, Madison, Wisconsin*

Background: Poorly executed transitions from the hospital to home can result in care fragmentation and lapses in patient safety. Research has focused on transitions from hospital to home with few studies on the highly vulnerable population: older adults transferring from the hospital to a Skilled Nursing Facility (SNF). Nurses in SNFs design a resident's plan of care based on orders/information received from the hospital physician and nursing staff. The purpose of this study is to explore how nurses in SNFs transition care of residents admitted from hospitals, the barriers they experience and consequences to residents, nursing staff, and facility that occur related to the transition. Methods: This qualitative study utilized Grounded Dimensional Analysis, a variant of

Grounded Theory. Registered nurses (n=27) employed at 5 SNFs in Wisconsin participated in focus groups with in-depth interviews. Data was analyzed using open, axial and selective coding. Results: SNFs nurses indicated that patient information from hospitals was always inaccurate, incomplete and/or missing, requiring nurses to repeat a time-consuming cyclic process of information gathering and reconciliation and compromising construction of the resident plan of care. This resulted in negative consequences such as delays in care delivery, nurses having to work blindly/use caution when providing care to residents, increase in staff stress and a perpetuation of the negative image of SNFs. Conclusions: Nurses in SNFs identify multiple deficiencies in hospital-to-SNF transitions, which impact care delivery to residents. Results of this study can inform interventions to improve hospital-to-SNF care transitions and communication.

#### INFLUENCE OF HEALTH SYSTEM FACTORS ON OUTCOMES OF HOSPITALISATION FOR PEOPLE WITH DEMENTIA

B. Draper<sup>1,2</sup>, N. Chan<sup>3</sup>, R. Karmel<sup>3,4</sup>, A. Peut<sup>3,4</sup>, D. Gibson<sup>4</sup>, C. Hudson<sup>3</sup>, P. Anderson<sup>3,4</sup>, *1. University of New South Wales, Sydney, New South Wales, Australia, 2. Prince of Wales Hospital, Sydney, New South Wales, Australia, 3. Australian Institute of Health and Welfare, Canberra, Australian Capital Territory, Australia, 4. University of Canberra, Canberra, Australian Capital Territory, Australia*

Objectives: Our aim was to determine the influence of hospital- and community-based aged care and dementia services on outcomes of hospitalisation for people with dementia. Methods: The sample was people aged 50 years and over who had at least one overnight stay in a public hospital in New South Wales (NSW), Australia that ended in the year to June 2007 (N=252,719). Data were integrated from three sources to provide information about patient demographics and health (NSW Admitted Patient Data Collection); availability of hospital aged care and dementia services and staff (NSW public hospital survey; n=163, response rate 82%); and availability of community-based and residential care (Aged and Community Care Management Information System). Negative binomial and logistic regression analyses using information from patient's first hospital stay ending in 2006-07 were undertaken to examine the influence of these factors on placement into residential care and length of hospital stay for people with dementia. Results: Having access to specialist aged care medical staff while in hospital was associated with lower likelihood of placement into residential care (b=.32, p<.01) and shorter stays (b=-.13, p<.01) after allowing for other factors. Presence of dementia education forums but not dementia or delirium policies was associated with lower likelihood of placement into care and shorter stays. Neither pre-admission nor post-discharge hospital services were related to likelihood of placement into care or length of stay. Conclusion: Findings suggest that specialist aged care staff and staff education are associated with better outcomes of hospitalisation for people with dementia.

#### PREDICTORS OF PAIN INTENSITY IN OLDER HOSPITALIZED CANCER PATIENTS

G.L. Towsley<sup>1</sup>, J. Guo<sup>1</sup>, J. Brant<sup>2</sup>, E. Smith<sup>3</sup>, P.H. Berry<sup>1</sup>, M. Pett<sup>1</sup>, S.L. Beck<sup>1</sup>, *1. University of Utah, Salt Lake City, Utah, 2. Billings Clinic Inpatient Cancer Care, Billings, Montana, 3. University of Michigan, Ann Arbor, Michigan*

Pain is highly prevalent in hospitalized cancer patients. The purpose of this study was to examine factors associated with pain intensity in older hospitalized cancer patients. Existing data for this cross-sectional, descriptive study were utilized from a larger study focused on testing the PainCQ survey, which measured pain care quality in individuals with various types of cancer from three hospitals in the U.S. Pain intensity included the mean of four items from the Brief Pain Inventory (worst pain, least pain, average pain, and pain now). Descriptive statistics and regression analyses were conducted to evaluate factors associated with

pain intensity in hospitalized cancer patients age 60 and older. Independent variables included age, gender, race, ethnicity, education, comorbid diseases (e.g., diabetes), and pain quality—the Efficacy of Pain Management subscale of the PainCQ. The sample included 126 patients ranging in age from 60 to 97 (Mean = 69.07); 53.2% were female, 99.2% White, 65.3% married, and 58.3% had some college or higher. Pain intensity subscale items ranged from 0 to 10 (mean = 3.72, SD = 2.03). Three variables were significant negative predictors of pain intensity; Efficacy of Pain Management, education, and arthritis accounted for a significant amount of variance in pain intensity,  $R^2 = .17$ ,  $F(3,121) = 7.99$ ,  $p < .001$ . Patients with lower pain quality efficacy scores, less education, or the presence of arthritis had higher pain intensity scores. The impact of gender was likely confounded with arthritis. Funded by the Robert Wood Johnson Foundation INQRI Program.

#### **FREQUENCY AND DURATION OF NURSE-ASSISTED OLDER PATIENT AMBULATION IN A HOSPITAL SETTING**

B.J. King<sup>1</sup>, J.E. Mahoney<sup>2</sup>, K.E. Pecanac<sup>2</sup>, J. Yoon<sup>2</sup>, R.L. Brown<sup>2</sup>, 1. William S. Middleton Memorial Veterans Hospital, Madison, Wisconsin, 2. University of Wisconsin- Madison, Madison, Wisconsin

**Background:** Loss in ability to independently ambulate occurs in 16-59% of hospitalized older adults. Bed rest and limited ambulation during hospitalization have been identified as the most predictable and preventable causes of walking disability in older adults. Because of their 24-hour presence at the bedside, registered nurses (RN) have been identified as key health care providers who can prevent decline in walking ability in older adults. The purpose of this study was to measure the frequency and duration of nurse-assisted ambulation of older patients in hospital settings. **Methods:** RNs were observed for eight-hour periods for a total of 114 hours. Frequency and duration of five types of nurse-assisted patient ambulation were measured: standing at bedside, transferring to a chair, walking to and from the bathroom, walking within the patient room and walking in the hallway. Research members used Android tablets loaded with a time motion software program to record activity events. **Results:** Older patients spent the majority of their time in bed. Average duration of total patient ambulation activity per 8 hour observation period was 16.69 minutes and percentage time for all patient ambulation activity was 3.48%. Percentage of time RNs engaged patients in ambulation activity included: Standing 0.84% transferring 0.31%, walking to and from bathroom 0.49%, walking in patient room 0.11%, and walking in hallway 1.71%. **Conclusion:** Loss of ability to ambulate is a common problem for hospitalized older adults. Research efforts should be focused on strategies that increase the frequency and duration of nurse assisted patient ambulation.

#### **CASCADE IATROGENESIS: POSTOPERATIVE RESPIRATORY FAILURE IN HOSPITALIZED OLDER ADULTS**

D.K. Thornlow, E. Oddone, R.A. Anderson, Duke University, Durham, North Carolina

**Aims:** Describe postoperative care trajectories of older adult surgical patients who developed postoperative respiratory complications and nurses' attempts to recognize emerging conditions and institute preventive measures. The goal was to outline the events that led to an episode of respiratory dysfunction or failure and identify nursing care that prevented, mitigated, or exacerbated its occurrence. **Methods:** We conducted seven focus group interviews with 30 nurses who worked in one of three hospitals in a health system in the Southeastern United States. The interview guide included 'open-ended' questions with probes intended to encourage narratives from the nurses' perspectives. Text was coded according to the variables in our conceptual model and then the coded data were analyzed to identify patterns or themes. **Results:** Ambulation, pain management, and surveillance comprised key nursing activities during the postoperative period. Nurses supported patients using goal setting, coaching, and education. The nurses described that patients

could be barriers, for example by not doing breathing exercises, and thus noted that enlisting cooperation of patients and families in meeting expected milestones was necessary to achieve desired outcomes. Nurses' judgment, collaboration, and the care environment (e.g., staffing, acuity) also played a role in nurses' ability to recognize emerging conditions and effectively intervene. **Conclusions:** Nurses reported activities consistent with our conceptual framework (e.g., surveillance, ambulation), yet highlighted others: support, cooperation, judgment, and relationships. Identifying nurses' attempts to recognize emerging conditions and institute preventive measures in the postoperative setting are necessary prerequisites for designing solutions to prevent cascading complications in hospitalized older adults.

#### **PREOPERATIVE ASSESSMENT OF THE OLDER ADULT HAVING SURGERY FOR CANCER: TRANSLATING INFORMATION TO IMPROVE POSTOPERATIVE NURSING CARE**

J. Coleman, Department of Surgery, Johns Hopkins Hospital, Baltimore, Maryland

Aging is the most significant risk factor for the development of cancer. The number of persons 65 years and older in the United States is rapidly growing. This expanding older population, with its associated increased risk, creates a demand for oncology care. There is a paucity of data on what nurses perceive as necessary preoperative information about the older adult having surgery for cancer to provide quality care and improve patient outcomes. Thirty patients, 65 years and older, having elective surgery for hepatobiliary and pancreas cancer were administered the Preoperative Assessment for Cancer in the Elderly (PACE) tool. Results were provided to the nurses caring for the patient postoperatively. A nursing questionnaire was administered to each nurse who cared for the patient to assess information identified as necessary for assisting in providing care, instituting safety measures, and discharge planning. A total of 30 questionnaires were obtained either at the time of or after the patient's discharge. Knowledge of the older patient's preoperative performance status was perceived by experienced nurses as significant in order to provide appropriate and adequate postoperative care (Pearson correlation 0.01). Nurses perceived the following information as helpful or necessary at 96.8%: activities of daily living, current medications, and family involvement in care. Knowledge of the older patient's living condition and comorbidities were also perceived to be helpful by more than 90% of the nurses. Nurses need accurate preoperative information about the older patient having surgery for hepatobiliary or pancreas cancer to provide interventions for optimal patient care.

#### **THE RELATIONSHIP BETWEEN DEMENTIA AND ALTERNATE LEVEL OF CARE PATIENTS IN HOSPITALS**

P. Jarrett<sup>1,3</sup>, R.M. McCloskey<sup>2</sup>, C. Stewart<sup>2</sup>, 1. Geriatric Medicine, Horizon Health Network, Saint John, New Brunswick, Canada, 2. University of New Brunswick, Saint John, New Brunswick, Canada, 3. Dalhousie University, Halifax, Nova Scotia, Canada

**Purpose:** The growing number of Alternate Level of Care (ALC) patients in Canadian hospitals is a national trend. The purpose of this study was to characterize these patients by diagnoses, living situation prior to admission, hospital utilization, and length of stay. **Methods and Analysis:** A chart review on all ALC patients as of July 1, 2009 in two hospitals in an urban center in New Brunswick was conducted. **Findings:** Of the 568 acute care hospital beds, 181 (31.87%) of these beds were occupied by ALC patients. The average age was 79.3 years (range 29-98). The average duration of the hospital stay was 379.6 days (range 5-6861). Within one year prior to this hospitalization, 61% had had no hospital admissions and 43% had not been seen in the emergency room. Seventy six (42.4%) were living alone in the community and 85 (47.5%) were living with others. Fifty eight percent had no homemaker assistance prior to hospitalization. Sixty six percent of the patients/families

reported that the living/support system in the home prior to admission was inadequate. Eighty one (45.3%) had a known diagnosis of dementia at the time of admission to hospital. Thirty three patients were diagnosed with dementia during their hospitalization. Discussion/Conclusion: The majority of the ALC patients had a diagnosis of dementia, many of whom were not diagnosed prior to admission. Many of these patients came from their own homes, either living alone or with others. Most had no formal homemaker supports in place prior to admission.

### EFFECTS OF THE DETAILED NURSING MANAGEMENT METHODS ON PREVENTING FALLS AMONG HOSPITALIZED OLDER PEOPLE IN CHINA

D. Baofeng, *Beijing Geriatric Hospital, Beijing, China*

**Objective:** To investigate the effectiveness of detailed nursing management measures for preventing falls of the elderly in hospital. **Methods:** During 2009.6—2010.6, all patients  $\geq 60$  years of age in the Beijing Geriatric Hospital were invited for this study. Overall, 2638 older people participated in this research. 2052 hospitalized older people ( $\geq 60$  years old) in the same hospital from 2008.6 to 2009.6 were regarded as the control group. The fall risk level and related risk factors were evaluated by the Fall Risk Assessment (FRA) for each participant when they first come to the hospital. The detailed nursing management measures were established at the same time for each one according to the results of the FRA. Which include the first-time inform system, the family participatory management model, the reporting system and detailed risk factors correction plan. **Results:** The incidence rate of fall was 0.45% after using the FRA and the detailed nursing management methods. That was 1.07% for the control group. The Chi-square analysis revealed that the incidence of fall for the study group was significantly lower ( $\chi^2=6.110$ ;  $P=0.013$ ). The complaint rate was decreased from 3 times a year to zero. **Conclusion:** Using the FRA to evaluate fall risk level and related risk factors, and taking oriented detailed nursing management measures for each one can effectively reduce fall incidence among the elderly in hospital.

### NUMBER OF FRAILTY CHARACTERISTICS IS ASSOCIATED WITH HOSPITALIZATION IN OLDER MEXICAN AMERICANS AND EUROPEAN AMERICANS INDEPENDENTLY OF SOCIODEMOGRAPHIC FACTORS AND DISEASE

S.E. Espinoza<sup>1,2</sup>, H.P. Hazuda<sup>1,2</sup>, 1. *UT Health Science Center, San Antonio, Texas*, 2. *South Texas Veterans Healthcare System, San Antonio, Texas*

**Background:** Frailty has been associated with hospitalization. This study examined whether number of frailty characteristics is associated with hospitalization. **Methods:** Subjects were 689 Mexican Americans and European Americans participants (age 65+) in the San Antonio Longitudinal Study of Aging baseline exam. Frailty score (range: 0-5) was determined using standard criteria as presence of: weakness, slowness, exhaustion, low physical activity, and weight loss. Number of hospital days in the last year was assessed by self-report, and categorized as none versus any. Multiple logistic regression examined odds of hospitalization by frailty score adjusting for: age, sex, ethnic group, education, income, diabetes, comorbidity, mini mental state exam and geriatric depression scale scores. Diabetes was classified using ADA criteria. Comorbidity was defined as  $\geq 2$  of: hypertension, angina, myocardial infarction, stroke, proteinuria, chronic obstructive pulmonary disease, peripheral arterial disease, non-skin cancer, arthritis. **Results:** Mean age was  $69.7 \pm 3.4$  years (range: 65-80). 18% ( $n=124$ ) of participants were hospitalized during the previous year; average number of hospital days was 8.2, range: 1-45. Frailty score was independently associated with odds of hospitalization (OR=1.35, 95%CI: 1.08-1.68,  $p=.008$ ). Thus, with each 1-point increase in frailty score the odds of hospitalization increased by 35%. Other covariates independently associated with hospitalization were diabetes (OR=1.74, 95%CI: 1.04-2.9,  $p=.033$ ) and

comorbidity (OR=2.05, 95%CI: 1.27-3.31,  $p=.003$ ). **Conclusion:** Each increase in number of frailty characteristics was associated with increased odds of hospitalization, regardless of overall frailty status. Geriatricians should consider screening for frailty characteristics as part of clinical practice in order to identify at-risk older adults.

### CAREGIVER SUPPORT AFTER HOSPITALIZATION FOR ACUTE CORONARY SYNDROME

J. Hyde<sup>1</sup>, M. Waring<sup>1,3</sup>, A. Hajduk<sup>1,3</sup>, D. McManus<sup>1,2</sup>, S. Lemon<sup>2</sup>, J. Saczynski<sup>1,2</sup>, 1. *Meyers Primary Care Institute, Worcester, Massachusetts*, 2. *The University of Massachusetts Medical School, Department of Medicine, Worcester, Massachusetts*, 3. *The University of Massachusetts Medical School, Department of Quantitative Health Sciences, Worcester, Massachusetts*

**Background/Aim:** Support from informal caregivers after hospital discharge can improve patient outcomes. However, support received by patients with acute coronary syndromes (ACS) has not been described. We examine the prevalence and characteristics of caregiver support, and associations with demographic factors, depression and cognitive status among ACS survivors. **Methods:** Adults in central MA without dementia or delirium were interviewed during hospitalization for ACS as part of the ongoing Transitions, Risk, and Actions in Coronary Events: Center for Outcomes Research and Education (TRACE-CORE). A subset ( $n=128$  to date) reported on caregiver support received the week after discharge. Patients reported receipt of assistance with 6 tasks pertaining to instrumental (assistance with activities) and informational (assistance with knowledge) support. Cognitive impairment and depression were assessed using the Telephone Interview of Cognitive Status (range = 0-41;  $\leq 30$ =impaired) and the Patient Health Questionnaire-9 ( $>4$ =high depressive symptoms), respectively. **Results:** Participants were 28% female, 77% non-Hispanic white with mean age of  $62.5 \pm 11.0$  years. The majority reported receiving instrumental support (87%; help with: household: 70%; errands: 59%; getting to appointments: 41%), and informational support (66%; help with: medications: 31%; identifying symptoms: 25%; ACS-related knowledge: 33%). Depressed participants were significantly more likely to receive any informational, but not instrumental, support than non-depressed participants ( $p=0.04$ ). Receipt of support did not vary according to demographic characteristics (age, sex, race, marital status, education, or income), or cognitive status. **Conclusions:** The majority of ACS survivors report receiving caregiver support the week after hospital discharge. Caregivers may be important for transitional care planning after ACS.

### EMERGENCY DEPARTMENTS AND OLDER ADULTS: ANALYSIS OF THE EMERGING TREND OF SENIOR EMERGENCY CENTERS

J. Schumacher, *University of Maryland, Baltimore County, Baltimore, Maryland*

Beginning in 2009 a growing number of hospitals have opened emergency departments or dedicated parts of their emergency department exclusively to the treatment of acute, older adult patients in units sometimes called "Senior Emergency Centers (SECs)" or "Senior Emergency Departments (SEDs)." The structure and organization of these older adult focused ED units varies considerably in terms of admission criteria, staffing levels & composition (e.g., physician, nurses, social work, other staff, etc), physical environment (e.g., # of beds, flooring, lighting, occupancy), billing, and other factors. This research analyzes available data and reports on characteristics of these initial Senior Emergency Centers (N=15) nationwide. Results indicate widely varying admission criteria, staffing models, staff satisfaction, patient satisfaction and uneven tracking of patient level outcome data (e.g, readmissions, preventable hospitalization rates). Conclusions of this research articulate policy level implications and make recommendations for the design, implementation, and study of these emerging dedicated settings for the treatment of older adults.

## A COMPARISON OF TIME-AND-MOTION OBSERVATION AND SELF-REPORT OF NURSE ASSISTED OLDER PATIENT AMBULATION IN HOSPITAL SETTINGS

J. Yoon<sup>1</sup>, B.J. King<sup>2</sup>, K.E. Pecanac<sup>1</sup>, B. Bowers<sup>1</sup>, R.L. Brown<sup>1</sup>, T. Schiefelbein<sup>1</sup>, *1. School of Nursing, Univ of Wisconsin-Madison, Madison, Wisconsin, 2. William S. Middleton Memorial Veterans Administration Hospital, madison, Wisconsin*

Nurses are key health care providers who can promote independent functional walking in hospitalized older patients. The frequency and duration of nurse assisted patient ambulation in hospital settings has not been well documented. Traditionally, nursing studies have used self-report to measure frequency and duration of nursing care. However, limitations related to objectivity and accuracy of data recorded by nurses has been reported. Patient ambulation consists of several activities such as, transferring, walking within the patient room and hallway, which could limit accuracy of nurses self report of care activity. An observational study of nurse assisted patient ambulation was conducted. Registered nurses (RN) were observed for 114 hours. Frequency and duration of nurse assisted patient ambulation activity was collected by 1) observation by research members using Android tablets loaded with time motion software and 2) self-report by nursing staff using paper and pencil method. Four patient ambulation activities were measured, transferring, walking to the bathroom, walking in patient room and walking in the hallway. Nurses underreported frequencies of all four types of ambulatory activity. Time estimates for transferring and walking to the bathroom were over-reported and walking in patient room and hallway were under-reported. Most nurses documented patient ambulation several hours after the activity occurred and estimated time rather than using a watch to measure time spent. Nurse self report of patient ambulation activity was inaccurate. Observation should be used to obtain reliable and accurate estimates of nursing care activity related to patient ambulation.

## USE OF HAND HELD COMPUTERS TO DOCUMENT PHASES OF AMBULATION OF OLDER ADULTS IN A HOSPITAL SETTING

K.E. Pecanac<sup>1</sup>, B. King<sup>2</sup>, J. Yoon<sup>1</sup>, R.L. Brown<sup>1</sup>, T. Schiefelbein<sup>1</sup>, B. Bowers<sup>1</sup>, *1. University of Wisconsin-Madison, Madison, Wisconsin, 2. William S. Middleton Memorial Veterans Administration Hospital, Madison, Wisconsin*

Background: Observational studies have found that 72.9-95.9% of the time hospitalized older patients are not engaged in ambulatory activity. Studies on patient ambulation have primarily used accelerometers to document frequency and duration of patient ambulation. Registered nurses (RN) are identified as key health care providers who can facilitate patient ambulation. Qualitative studies have demonstrated that RNs use a step-wise approach (standing, transferring, then walking) when engaging patients in ambulation. This step-wise approach has not been adequately captured by use of accelerometers. Other technology is needed to document the entire series of mobility activity involved in patient ambulation. This study used an innovative approach to document the phases of patient mobility as well as ambulation by testing hand held computers loaded with time series software to record the frequency and duration of nurse assisted patient ambulation. Methods: Android tablets were used, loaded with a flexible software program (FSP) to record the frequency and duration of mobility activities including ambulation of older patients. One hundred fourteen RN work hours were observed. Results: Advantages of the FSP and tablet were ease in navigation, recording events of short duration (2 seconds), ability to memo field notes related to barriers and facilitators of ambulation, and integration with Excel for easy and accurate data importing. Disadvantages included hand fatigue and errors in event selection related to screen sensitivity. Conclusions: Hand held computers, with a flexible software program, offer viable options for documenting the frequency and duration of patient ambulation in hospital settings.

## SESSION 2125 (POSTER)

### LONG TERM CARE

#### BLADDER BUZZ: A URINARY INCONTINENCE EDUCATIONAL PROGRAM FOR NURSING HOME STAFF

K. Ehlman, S. Mathis, R. Dugger, *University of Southern Indiana, Evansville, Indiana*

Issues around urinary incontinence (UI) are challenging for nursing home staff members who provide emotional and physical care to residents. The rate of UI is estimated at between 45% and 70% for residents in long-term care. A knowledge gap exists among nursing home staff members in the areas of attitude toward UI, types of UI, and assessment of UI. To reduce the existing knowledge gap, an interdisciplinary research team created an evidence-based UI education program entitled Bladder Buzz. The purpose of the Bladder Buzz program is to dispel myths about UI, improve knowledge on the types of UI and improve management and treatment of UI among nursing home staff. This feasibility study explored differences in attitude and knowledge related to UI among nursing personnel who provide care for nursing home residents. A quasi-experimental, within-subject longitudinal design was used to assess within group differences. Data were collected before and after the program was provided. Thirty-eight nursing staff members provided pre-and-post data, which assessed attitude and knowledge about UI. The study intervention resulted in a significant positive change in attitude toward UI and knowledge about types of UI. Providing nursing home administrators and staff educators with tools to improve knowledge about UI can potentially reduce the number of UI episodes residents experience, improve residents' health related quality of life, and improve nursing home quality.

#### INFECTION PREVENTION IN LONG-TERM CARE: A SYSTEMATIC REVIEW OF RANDOMIZED AND NON-RANDOMIZED TRIALS

M. Uchida<sup>1</sup>, M. Pogorzelska<sup>1</sup>, P.W. Smith<sup>2</sup>, E.L. Larson<sup>1</sup>, *1. Columbia University, New York, New York, 2. University of Nebraska Medical Center, Omaha, Nebraska*

Background: Little is known about infection prevention interventions in long-term care (LTC). Objective: To critically review and synthesize current evidence and the methodological quality of infection prevention interventions in LTC. Methods: Two reviewers systematically searched 3 electronic databases MEDLINE, PUBMED, and Cochrane Controlled Trials Register for studies published over the last decade assessing randomized and non-randomized trials with older adults in which primary outcomes were infection rates and reductions of risk factors related to infections. To establish clarity and standardized reporting of findings, the PRISMA (preferred reporting items for systematic reviews and meta-analyses) checklist was used. Data Analysis: Data were extracted based on study design, sample size, type and duration of interventions, outcome measures reported, and findings. Study quality was assessed by two reviewers using a validated standardized quality assessment tool. Inter-rater reliability was found to be excellent. Results: 24 articles met inclusion criteria. The majority were randomized control trials (67%), where the primary interest was to reduce pneumonia (63%) and focused on therapeutic interventions (71%). Thirteen (54%) of 24 studies reported statistically significant results in favor of interventions on at least one of their outcome measures. The interventions audited for this review varied considerably in terms of their nature, point of initiation, intensity, and duration. The methodological clarity of available evidence was limited, placing them at potential risk of bias. Conclusions/ Implications: Gaps and inconsistencies surrounding interventions in LTC are evident. Future interventional studies need to enhance methodological clarity using clearly defined outcome measures and standardized reporting of findings.

## PHARMACIST-MANAGED WARFARIN PROTOCOL IN LONG-TERM CARE

R. Sargent<sup>1,2,7</sup>, C. Brocklebank<sup>3,4</sup>, P. Quail<sup>2,5,7</sup>, D. Turner<sup>2,6</sup>, T. Williamson<sup>7</sup>, H. Tam<sup>1,7</sup>, N. Drummond<sup>1,7</sup>, 1. *Department of Family Medicine, University of Calgary, Calgary, Alberta, Canada*, 2. *Integrated, Facilitated, Supportive Living, Alberta Health Services, Calgary, Alberta, Canada*, 3. *Chronic Disease Management, Alberta Health Services, Calgary, Alberta, Canada*, 4. *Anticoagulation Management Services, Alberta Health Services, Calgary, Alberta, Canada*, 5. *Intercare Corporate Group Incorporated, Calgary, Alberta, Canada*, 6. *Carewest, Calgary, Alberta, Canada*, 7. *Southern Alberta Primary Care Research Network, Calgary, Alberta, Canada*

**Rationale:** Warfarin is an anticoagulant used particularly among the elderly to reduce the risk of thromboembolic events. Due to the variability of responses to this medication in individuals, protocols with nomograms are increasingly used for warfarin management. **Objectives:** This study seeks to investigate the effectiveness of a pharmacist-led warfarin protocol on long-term care (LTC) residents' outcomes, safety, and staff workload. **Methods:** Residents on warfarin from three LTC organizations in Calgary, Alberta, were included in this study. Two of the organizations used a pharmacist-led warfarin protocol. The first phase of the project compared outcomes in residents on warfarin in facilities that used and did not use the protocol. The second phase surveyed staff workloads relating to anticoagulation management among physicians, pharmacists, and nurses. Outcome measures included the proportion of International Normalized Ratio (INR) tests in target range and frequency of major bleeding events. **Results:** INR values of time in target range on a per patient basis showed no statistical differences between residents in the protocol group (72.7%, n=104) and control group (65.2%, n=93), p-value=0.260. Of the 13 major bleeding events identified, 10 were from the protocol group. There was no statistical difference found in workload with 43.5% of staff from the control group (n=69) expressing high workload from the current management of warfarin dosing in their facility compared to 42.2% in the protocol group (n=102) (p-value=0.864). **Conclusion:** Results from this study suggest that protocol-based, pharmacist-led, warfarin management is at least as effective in LTC residents as usual care.

## THE IMPLEMENTATION OF PRACTICE CHANGE TO IMPROVE DEMENTIA CARE IN RURAL NURSING HOMES: AN AUSTRALIAN EXAMPLE

S. Davis<sup>1</sup>, A. Campbell<sup>1</sup>, B. McCarthy<sup>2</sup>, 1. *Palliative and Supportive Services, Flinders University, Adelaide, South Australia, Australia*, 2. *McCarthy Psychology Services, Melbourne, Victoria, Australia*

Person-centred dementia care is increasingly being regarded as synonymous with quality dementia care. Yet despite widespread policy mandates, nursing homes struggle to implement and sustain the practice of a person centred approach to care delivery. This paper reports on a two year study funded by the Australian Government Department of Health and Ageing aimed at implementing practice change to improve dementia care in seven rural aged care homes. Using a pre-posttest non-experimental design for the evaluation, outcome measures included levels of psychotropic drug use, frequency of behaviours of concerns, individualized care measures, quality of life and family involvement. The framework of culture change comprised of processes to target philosophy, management support, leadership, skilled staff and environment. While staff in all seven nursing homes showed increased individualized care scores, analysis revealed that observed differences were significant in only five out of the seven locations (observed differences between  $t = -2.264$ , p.028 and  $t = -6.317$ , p.000). This paper will report on data illustrating nursing homes showing higher levels of improvement in staff individualized care scores also had larger decreases in daytime sleeping, negative interactions between staff and residents, behaviours of concern and in the use of psychotropic medications, showed improvements in family involvement and effectively targeted environmental

modifications. Differences in outcomes are examined in relation to implementation processes specific to educating staff, management support, leadership and staff engagement. This will provide insight into overcoming key factors in nursing home organisations that inhibit the implementation of sustainable person centred dementia care.

## STAFF PERCEPTIONS OF END-OF-LIFE COMMUNICATION WITH FAMILY MEMBERS IN JAPANESE NURSING HOMES

H. Fukahori<sup>1</sup>, N. Yamamoto-Mitani<sup>1</sup>, T. Sugiyama<sup>2</sup>, Y. Chiba<sup>3</sup>, M. Miyashita<sup>4</sup>, M. Ersek<sup>3</sup>, 1. *Tokyo Medical and Dental University, Bunkyo-ku, Tokyo, Japan*, 2. *Faculty of Health Care and Nursing, Juntendo University, Bunkyo-ku, Tokyo, Japan*, 3. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*, 4. *Palliative Nursing, School of Medicine, Tohoku University, Sendai-city, Miyagi, Japan*

Communication between health care professionals and family members at the end-of-life (EOL) is indispensable for quality care for nursing home residents. Little is known, however, about EOL communication in Japanese nursing homes. The purpose of this cross-sectional study was to describe nursing staff's perception of EOL communication between staff and family members in a national sample of 301 nurses 822 CWs in 435 Japanese nursing homes. Data were collected using a 10 items self-administered questionnaire regarding aspects of communication (e.g. asking about preferences of care, education about symptoms, addressing differences between family and residents). Respondents used a 4-point Likert scale that was dichotomized into frequent ("often") and infrequent ("never," "seldom," and "sometimes,"). Nurses had an average of 7.9 (SD: 6.2) and CWs 7.3 (SD: 5.2) years experience in working at their current nursing home. Subjects reported that most frequent communication was "Asking about preferences for care (80.4% and 45.1% for nurses and CWs, respectively)" and the least frequent one was "Discussing differences in attitude on EOL care among family members (36.2% and 18.2% for nurses and CWs, respectively). In all items, nurses communicated more frequently than CWs. Findings suggest that although nurses frequently ask residents about preference of care, Japanese nurses appear to be hesitant to address discrepancies in preferences among family members. It suggests that nurses should be educated to work with family members in nursing homes. CWs also frequently discuss EOL issues with residents and families and should receive education regarding EOL care issues.

## PREVALENCE OF AND RISK FACTORS OF MUSCULOSKELETAL DISORDERS AMONG CARE WORKERS IN LONGTERM CARE FACILITIES IN SOUTH KOREA

M. Park<sup>1</sup>, S. Yu<sup>2</sup>, H. Seo<sup>3</sup>, K. Kang<sup>4</sup>, M. Yu<sup>5</sup>, 1. *Nursing Science, Sunmoon University, Asan, Republic of Korea*, 2. *Sangji University, Wonju, Republic of Korea*, 3. *Gangdong University, Echon, Republic of Korea*, 4. *Paichai University, Daejun, Republic of Korea*, 5. *Namseoul University, Cheonan, Republic of Korea*

**Introduction.** The residents of longterm care facilities are functionally dependent on care workers. Although musculoskeletal disorders of them has been reported as a major problem around world, there is limited information on the prevalence and risk factors of its in South Korea. **Aim.** The purpose of this study is to investigate the prevalence and risk factors of musculoskeletal disorders among care workers in the longterm care facilities. **Methods.** A cross sectional study was conducted among 256 randomly selected care workers from 7 longterm care facilities. A self administered questionnaire, including demographic data, Korean Questionnaire for musculoskeletal disorders, physical and psychosocial workload was used. The criteria of National Institute for Occupational Safety and Health(NIOSH) for musculoskeletal disorders was used as a diagnostic tool. Logistic regression was used to analyze the risk factors of musculoskeletal disorders in care workers. **Results.** The

prevalence of musculoskeletal disorders was 62% at shoulder, 61.3% at low back, 46.6% at hands, 40.6% at legs, 36.1% at arms and 35% at neck. Two predictors of shoulder pain were identified: Career as care worker (above 3 year) (OR=2.78, 95% CI: 1.10-7.52), burden of care activity, especially assistance of toileting (OR=5.90, 95% CI: 1.60-21.75) and Two predictors of low back pain were identified: uncomfortable posture during working (OR= 3.99, 95% CI: 1.49-10.66), fixed posture during working (OR= 4.09, 95% CI: 1.25-13.38). Conclusion: The prevalence of musculoskeletal disorders, especially shoulder and low back pain among care workers in South Korea is high. The nursing interventions, such as education about skill of transfer are needed to reduce the risk factors of musculoskeletal disorders.

### **JOURNEY ACROSS THE CARE CONTINUUM PATIENT AND FAMILY PERSPECTIVES**

R. McCloskey<sup>1</sup>, P. Jarrett<sup>2</sup>, C. Stewart<sup>1</sup>, *1. University of New Brunswick, Saint John, New Brunswick, Canada, 2. Horizon Health Network, Saint John, New Brunswick, Canada*

**PURPOSE:** Delayed discharges from hospital back to the community are a serious issue within many healthcare organizations. In most cases, these delays involve older adults requiring supportive care, such as a long-term care facility. In Canada alone, it is estimated that 14% of the country's acute care beds are occupied each day by people waiting for community services. Although delayed discharges are a priority issue within many healthcare organizations, much of this focus is on the utilization of health services, hospital budgets, overcrowding and wait times. Considerably less attention is given to the individuals who experience delayed discharges. Interviews were conducted with patients and families who were waiting in hospital for long-term care. **FINDINGS:** The majority of participants acknowledged the need for additional services prior to the hospital admission but did not know how to access them. For many, the hospital represented the most accessible way to access long-term care services. Participants did not feel a part of their own discharge plans and experienced extreme guilt over occupying hospital beds that could be better utilized by others and over the fact that their anticipated discharge was contingent on the death of someone currently residing in their preferred long-term care facility. **DISCUSSION/CONCLUSION:** Delayed discharges may be avoided if community based services were more accessible. People waiting for hospital discharge should be active participants in the discharge process and have many emotional and psychological needs that must be addressed.

### **PHARMACEUTICAL CARE PROCESS PROBLEMS IN A BRAZILIAN NURSING HOME**

L.F. Gerlack, A.G. Bós, *Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, RS, Brazil*

To evaluate the Pharmaceutical Care process in nursing homes we conducted a cross-sectional observational study. Data was collected by reviewing nursing home medical records, medicine purchase receipts and interviews with residents and nursing homes professionals and observation of the researcher. In the collection period, 113 of the elderly residing in ILPI only 2 did not use any medications. The average drugs consumption was 5.2±2.33. Using the Beers criteria, 27(24.3%) prescriptions contained inappropriate drugs. We observed, in 40(36%) prescriptions 99 drug interactions, 64.9 of those had moderate severity and 22.9% were high severity. The storage conditions of drugs were far from desirable, where most of the expected quality criteria were not met. We observed drugs in high humidity location, presence of mold, boxes placed in direct contact with the ground, and without any control records. A wide range of problems concerning all processes related to the pharmaceutical care was observed, from the purchase to the final use by the elderly. In detailing many problems observed in this study and the complexity of the pharmaceutical care process, whether related to the purchase, access, storage, distribution and use, was identified the

need for inclusion of the pharmacist in nursing home teams working in Brazil. As has been occurring in foreign countries, the presence of a pharmacist generates positive impacts both nursing homes and their elderly residents, and consequently to the health system.

### **MUSCLE MASS, STRENGTH, AND THE ONSET OF NEED FOR THE LONG-TERM CARE INSURANCE SYSTEM IN THE JAPANESE ELDERLY**

Y. Nofuji, H. Yoshida, Y. Fujiwara, M. Nishi, H. Murayama, M. Kim, H. Amano, S. Shinkai, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

**Objective:** To compare the predictive values of muscle mass and strength for the onset of need for the Long-Term Care Insurance (LTCI) system in a prospective cohort of community-dwelling older Japanese. **Methods:** A total of 437 individuals (men 189, women 248) aged 70 years or older who participated in a baseline survey in 2005 or 2006 and were not qualified for service user under the LTCI system were followed up for 3.8 years (from July 2006 to April 2010). Skeletal muscle mass (SM) and hand grip-strength was measured by the bioelectrical impedance method (InBody 730, Biospace) and by a dynamometer, respectively. Participants were divided into tertiles according to baseline SM, percentage SM (%SM=SM/body mass×100) and grip strength, respectively. **Results:** During the follow-up period, a total of 51 participants exhibited the onset of need for the LTCI system. The Cox proportional model showed that SM was not a predictor for the onset of service use independent of age and sex. However, %SM was marginal and grip strength was significant predictor for the onset of service use, respectively. The age- and sex-adjusted hazard ratio for the onset of service use was 3.31 (95% CI: 1.24-8.78) in the lowest tertile of grip-strength compared with that in the highest tertile. The association remained significant even after additional adjustment for %SM. **Conclusion:** Grip strength, not muscle mass was a good predictor for the onset of need for the LTCI system in Japanese elderly.

### **RESIDENT OUTCOMES OF PERSON-CENTERED CARE IN LONG-TERM CARE: A SYSTEMATIC REVIEW**

J. Li, Y. Chang, D. Porock, *University at Buffalo, Buffalo, New York*

**Purpose:** This paper synthesizes the published evidence on the effectiveness of person-centered care (PCC) on resident outcomes in long-term care. **Background:** Our aging society has dramatically escalated the demand for long-term care services and is driving care quality. PCC claims to be an innovative change in the culture of elder care from the traditional medical model. It focuses on creating a more homelike environment, enabling residents to direct their own care, and empowering the caregivers to corresponding to residents' needs. PCC is being increasingly adopted by long-term care providers across the U.S to improve the resident outcomes. **Method:** A search was conducted using CINAHL, MEDLINE, PubMed, and PsychINFO databases with the following keywords : person-centered care, resident-centered care, relationship-centered care, culture change, green house, eden alternative, wellspring model, pioneer network, long-term care, nursing home. Databases searched, limited to the years 1995 and 2012 and published in English. **Results and conclusions:** All 12 PCC intervention studies reviewed were quasi-experimental longitudinal designs. Eight interventions were developed based on culture change models and 4 interventions were developed from PCC principles. Physical environment, autonomy and staff-resident communication were central components across the interventions. Overall, PCC showed inconsistent effects on residents' cognitive ability, physical function, and quality of life. However, resident's mood and behavioral outcomes were improved in most of the studies. Due to a lack of theoretical and operational definitions, different PCC components were emphasized in different studies, which led

to the conflicted findings. Rigorous research is needed to evaluate the effectiveness of PCC.

### **PROFESSIONAL SUPPORT FOR NURSING HOME NURSE LEADERS: ADAPTATION AND APPLICATION OF THE CONVOY MODEL**

A. Rao, *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

For decades, academics, activists, and policy makers have voiced concerns regarding the quality of care in nursing homes. Nursing home directors of nursing (DONs) are integral to the delivery of quality care because they assume responsibility for both coordinating clinical care and managing nursing staff. They are, however, often ill-prepared to do either. Typically educated in diploma or associate degree nursing programs, many DONs have little or no formal training in leadership or management, and their awareness of and access to professional development opportunities are limited. Their knowledge gap hampers DONs' abilities to provide the effective leadership necessary to maintain quality. To close this gap and succeed in their roles, DONs are heavily reliant on their organizations to provide support and information that fosters professional development and cultivates organizational knowledge. One of the ways in which DONs can access resources like support is through their professional networks. The purpose of this poster is to explore the utility of adapting the Convoy Model of Social Relations to examine the professional support available to DONs within their professional networks. Little is known about the networks in which DONs are embedded; but understanding to whom DONs are connected and the nature of these relationships may provide insight into systemic factors that enhance or inhibit DON success. Current explanations for DON performance fail to capture the organizational complexity in which DONs are situated. Network explanations, however, may add richness to our perspectives about how to empower DONs to lead their facilities toward improved outcomes.

### **NURSE DIRECTOR PERCEPTIONS OF NURSING HOME CULTURE CHANGE**

D.L. Sturdevant, B.J. Holtzclaw, J.S. Wilson, *University of Oklahoma HSC, Oklahoma City, Oklahoma*

Concerns about quality of life and care of nursing home residents are well-known. However the last decade's national movement termed "culture change," has gained ground toward improving quality of life and care of nursing home residents. Culture change promotes a "person-centered" care model to replace institutional models. Culture change views older adults living in long-term care facilities as not merely waiting to die, but instead seeking to live a purposeful and happy life. Changing care and delivery practices requires change in the roles and responsibilities of those providing that care, including frontline caregivers, licensed nursing staff and Directors of Nursing (DONs). Although the inclusion of nursing in culture change activities has been found to improve implementation and sustainability, little information is available in the literature as to the role of nursing in the process. Purpose: this study was designed to gain information about nursing home DONs understanding of culture change evolution in their facility, their own role perceptions, as well as perceptions of how that role has changed. Data were sought to inform future development of an instrument regarding culture change. Methods: A phenomenological qualitative research design, used structured interviews of 15 DONs. Analysis included recorded field notes, data coding, and categories to identify common themes. Findings revealed general agreement of patient benefits, but diverse experiences in barriers, role impacts, and ways culture change takes place. Responses suggest concepts to be included in future instrument development for study of nursing home culture change.

### **STATE OF THE SCIENCE: PERSISTENT VOCALIZATIONS IN NURSING HOME RESIDENTS WITH MODERATE TO SEVERE DEMENTIA**

J.S. Sefcik, *University of Pennsylvania, Philadelphia, Pennsylvania*

Among the nursing home population, persistent vocalizations are common. Persistent vocalizations, a term used to describe any repetitive vocal noises, can have a negative impact on the residents themselves as well as others in their immediate environment including other residents, staff and family members. These vocalizations can be both episodic with intervals lasting less than 5 minutes to constant and lasting over an entire shift. A systematic review of the literature was conducted using PubMed, Medline and Scopus databases. Search terms used in combination with dementia were persistent vocalizations, vocal behaviors, disruptive vocalization, disruptive vocalizations, problematic vocalizations, and vocally disruptive behaviors. The search produced 79 articles for review. Peer-reviewed articles were selected for review if the research was conducted in a nursing home setting with all residents identified as having dementia. Additionally, articles were selected that focused specifically on persistent vocalizations and not combined with other behavioral symptoms. After the review of the articles, 12 relevant articles remained and 1 additional article was identified (8 descriptive studies and 5 interventional studies). This search has revealed that there is little evidence in the literature regarding effective nonpharmacological interventions used with residents with moderate to advanced dementia who exhibit persistent vocalizations. A comparison of identified studies is complicated by inconsistent definitions and typologies of persistent vocalizations. The implication of this review is that additional research is needed to identify non-pharmacological interventions that are effective for reducing persistent vocalizations in nursing homes.

### **CONFLICT AND POWER: WHY HASN'T PALLIATIVE CARE BEEN EMBRACED IN US NURSING HOMES?**

J.G. Carpenter, *University of Utah, Salt Lake City, Utah*

Older adults compose approximately 88% of the population living in US nursing homes, and in less than 10 years it is expected that 40% of older Americans will die there. Palliative Care (PC) can improve quality of life and death for nursing home residents but is not widely available. Barriers to PC include inadequate staff training accompanied by high turnover, poor communication between clinicians, care setting transitions, lack of facility acceptance of PC, and staff concentration on assigned duties over a focus on resident-centered care. The current approaches to examining and understanding system barriers, including policy and regulatory issues, is limited and has not resulted in actionable strategies to advance PC delivery. US nursing homes have been described as complex adaptive systems with diverse cultures subject to various social influences. A novel and promising approach is through critical inquiry. This theoretical perspective allows for continual examination of person-level resident and staff interactions, assessment of relationships among staff, and potential differences between staff goals and resident needs. Critical inquiry moves from simply understanding the day-to-day situation to exploring the conflict that may be preventing integration of PC in nursing homes and determine approaches that will advance PC delivery. The interplay of power structure, culture, and the healthcare environment of US nursing homes demands knowledge that is socially constructed with a connection between theory and practice critical inquiry can achieve.

### **SYSTEM LEVEL CHALLENGES TO CONDUCTING A RCT OF HAND FEEDING VS. PEG TUBE-FEEDING IN NURSING HOMES**

E.J. Amella<sup>1</sup>, M. Madisetti<sup>1</sup>, C.M. Spencer<sup>1</sup>, V.L. Durkalski<sup>1</sup>, M.B. Aselage<sup>2</sup>, J. Zapka<sup>1</sup>, *1. College of Nursing, Medical University of South Carolina, Charleston, South Carolina, 2. Duke University, Durham, North Carolina*

Background: Studies suggest that in individuals with late-stage dementia, percutaneous endoscopic gastrostomy (PEG) tubes are no

better than hand feeding yet this practice is supported in nursing homes (NHs). Purpose: To identify system level challenges to conducting an RCT of hand and PEG feeding among nursing home administrators (NHA) and corporate officials (CO). Method: As part of a feasibility study, online surveys were sent to 150 NHAs with 9 responding (4 for-profit, 2 non-profit, 1 governmental), and 20 COs with 4 responding, (3 for-profit, 1 not profit) regarding their perceptions of and willingness to enter into a research agreement. Findings: A majority (n=7) NHA would support this RCT, while COs were split (n=2); 2 NHA and COs had previous trial experience; 2 NHA had policies against research. No CO reported having a formal process to review RCTs; and, 2 had facilities with prior trials. Top NHA enablers were need to establish the better feeding option, and improved quality of services. Top barriers included: ethical issues, employee burden, and organizational liability. Top CO enablers were: improved service quality, and key facility personnel support. Top barriers included: consumer satisfaction, subject risk, and lack of infrastructure. Research Attitude Questionnaire means were similar for NHAs and COs; both rated organizational attitude lower. Conclusions: This survey demonstrates the difficulty in accessing the decision-makers responsible for approving RCTs in NHs, the lack of structure to vet RCTs and how attitudes toward research and corporate culture challenge getting real-world answers for critical clinical and ethical issues.

#### **VALIDATING THE PROFESSIONAL ENVIRONMENT ASSESSMENT PROTOCOL: NURSING HOME MILIEU & RESIDENT MOBILITY**

S. Slaughter<sup>1</sup>, D.G. Morgan<sup>2</sup>, *1. Univ of Alberta, Edmonton, Alberta, Canada, 2. University of Saskatchewan, Saskatoon, Saskatchewan, Canada*

**Introduction** This paper examines associations between dimensions of nursing home environments and mobility of residents with dementia, and contributes to psychometric development of the Professional Environmental Assessment Protocol (PEAP). **Methods** This one-year prospective cohort study included a convenience sample of 120 ambulatory residents with dementia in 15 nursing homes. Residents' walking abilities were observed biweekly for a year. At the end of the year, immediately following an interview with unit managers, we used the PEAP to measure the extent nine dimensions of nursing home environments supported the mobility of residents. Cox proportional hazards models evaluated effect of specific environmental features on time to walking disability. **Results** The environmental dimensions associated with reduced hazard of walking disability included 'support of functional ability' (Hazard Ratio (HR) = 0.64; p = 0.02), 'maximizing awareness and orientation' (HR = 0.75; p = 0.04) and better 'quality of stimulation' (HR = 0.70; p = 0.02). Cox Proportional Hazard models using the 13-point PEAP scale were not significantly different from models using the 5-point PEAP scale, indicating the scales did not differ in their ability to discriminate between more and less supportive environments. **Discussion** Specific dimensions of nursing home environments reduced the hazard of walking disability. Modifying these dimensions may reduce disability in residents with dementia. The 5-point PEAP scale discriminates between nursing home environments as well as the 13-point scale. Evidence that resident outcomes vary in relation to environmental dimensions contributes to the construct validity of the PEAP scale.

#### **JOB SATISFACTION IN DEMENTIA CAREGIVERS: AN ORGANIZATIONAL AND INTERPERSONAL APPROACH**

C.K. Coleman, R.E. Herman, K.N. Williams, *School of Nursing, Univ of Kansas, Kansas City, Kansas*

Job satisfaction is important in determining turnover in long-term care and identifying ways to maintain or increase job satisfaction in nursing assistants is a key area of intervention (Castle et al, 2007). This

study investigates the relation between overall job satisfaction, nurse supervisor satisfaction, and relationship closeness with the residents. It is anticipated that both organizational and interpersonal variables would predict total satisfaction (Parsons et al, 2003). As part of a larger intervention study aimed at increasing communication skills in dementia caregivers, participants completed three short questionnaires at two observation periods three weeks apart. The Staff Experience Working with Demented Residents measure assessed overall job satisfaction (Astrom et al., 1991), The Staff Perceptions of Supervisory Scale assessed nurse supervisor satisfaction (Forbes-Thompson et al, 2006), and the Mutuality Scale assessed relationship closeness with the residents (Archbold et al., 1990, Heliker, 2010). Two standard multiple regression analyses were conducted. At observation one, the regression equation was significant,  $R = .65$ , adjusted  $R^2 = .38$ ,  $F(2, 25) = 9.23$ ,  $p < .001$  and, at observation two, the regression equation was also significant,  $R = .70$ , adjusted  $R^2 = .44$ ,  $F(2, 19) = 9.23$ ,  $p < .001$ . At both observations times, more than a third of the variability in job satisfaction is predicted by nurse supervisor satisfaction and relationship closeness with the residents. Results indicate that both variables contribute independently to total job satisfaction and may warrant different types of interventions.

#### **OVERUSE OF WHEELCHAIRS IN NURSING HOMES? FEASIBILITY OF ALTERNATIVE MOBILITY DEVICES**

D. Gavin-Dreschnack, H. Moore, *VA, Tampa, Florida*

This feasibility study explores residents' and other stakeholders' feelings regarding mobility and use of wheelchairs in nursing homes. Through individual interviews with residents and administrators, and focus groups conducted with nursing and rehabilitation staff, we identify factors that define mobility in this setting. Wheelchair use in nursing homes is justified by two goals: improvement in mobility and increased safety, yet residents propel their wheelchairs only about 4% of the time, and improperly maintained or ill-fitted wheelchairs account for 16% of nursing home falls. Up to 84% of residents spend time in a wheelchair every day, regardless of their potential to ambulate. Possible explanations for this include: convenience, entitlement, assumption of need, lack of motivation of residents and staff, and fear of liability and litigation resulting from falls. Unfortunately, indiscriminate wheelchair use increases likelihood of deconditioning. Results from this study will highlight the need for ad hoc assessment of residents' functional mobility and consideration of alternative mobility devices before routinely assigning a wheelchair. Appropriate mobility technology could: 1) reduce risk of pressure ulcer formation, 2) enhance quality of care as a result of increased nursing efficiency, (e.g., minimize/eliminate need for repositioning residents in poorly-fitting wheelchairs and pushing residents in wheelchairs that do not foster independent propulsion), 3) decrease risk of falls, 4) enhance safety, and 5) improve QoL, socialization and independence/self-determination for nursing home residents. This study is a precursor to an intervention study that incorporates mobility assessment and consideration of alternative mobility devices for residents with potential to ambulate.

#### **QUALITATIVE EVALUATION OF A STAFF QUALITY IMPROVEMENT PROGRAM TO REDUCE FALLS IN NURSING HOMES**

K.M. Simpson<sup>1,2,3</sup>, C. Colon-Emeric<sup>1,2</sup>, R.A. Anderson<sup>2</sup>, K.A. Porter<sup>2</sup>, E.S. McConnell<sup>1,2</sup>, K. Daily<sup>2</sup>, A. Stalzer<sup>2</sup>, S. Pinheiro<sup>2</sup>, *1. GRECC, Durham VA Medical Center, Durham, North Carolina, 2. Duke University School of Nursing, Durham, North Carolina, 3. KayeM, Inc, Durham, North Carolina*

Staff education programs have been slow to reduce falls rates in nursing homes. One potential explanation may be that education programs associated with falls reduction quality improvement (QI) programs use approaches that focus on transmission of content and individual mastery, overlooking the social and contextual aspects of learning. As part

of a randomized controlled trial (CONNECT for Quality), eight nursing homes were block randomized to receive either a traditional falls education program (FALLS only), or an innovative social constructivist program in which staff learn to improve their connections and interactions with co-workers, followed by the traditional falls reduction QI program (CONNECT+FALLS). Each education program was delivered over 3 months by trained research assistants and targeted all staff with direct resident contact (n=674). Following the interventions, focus groups (n=16) were conducted with staff who had participated in at least one intervention component (n=87). Using framework analysis, we analyzed staff perceptions of the educational interventions, specifically their perceptions of acceptability and effectiveness of content, instructional methods, and how learning occurred. We also explored their perceptions of how the interventions influenced staff implementation of falls prevention and management in their facilities. Comparative results suggest that staff receiving CONNECT+FALLS perceived more team-oriented working patterns, opportunities for open dialogue, and emphasis on falls prevention as a collective effort. These findings suggest that social constructivist educational approaches may extend learning in nursing homes beyond individual mastery to influence system-level factors that may promote improved falls reductions practices.

### THE USE OF LONG-TERM CARE SERVICES: EFFECTS OF ONSET VERSUS PROGRESSION CHRONIC HEALTH PROBLEMS

R. Basu, *Scott & White Healthcare, Temple, Texas*

**Research Objectives:** The primary objective of this study is to examine how different stages (onset versus progression) of health problems impact the likelihood of long-term health care use among individuals aged 50 or older. **Study Design:** This study employs four waves (2000-2006) of the Health and Retirement Survey (HRS) data to examine how different stages of chronic health problems impact the use of long-term formal home care services and nursing home care. Two outcome variables of interest are likelihood of any long-term care use, and nursing home use. Two main covariates of interest are onset and progression of health problems. The onset of health problem was measured by the transition from the good health status to the onset of one or more chronic health problems between time periods. The progression of health problem was measured by the change in number of chronic health conditions and severity of conditions between successive waves. The random intercept logistic regression model was used to account for correlation among responses for the same individuals given the covariates by the generalized latent and mixed modeling technique. **Results:** Both onset and progression (severity) of health problems are associated with the increased likelihood of the use of formal home care services ( $p < 0.001$ ). Severity of conditions is also correlated with the nursing home care ( $p < 0.001$ ). Older age, poor self-rated health status, and smoking are significantly correlated with higher likelihood of using long-term care services. **Conclusion:** Rebalancing long-term care policies should focus on the different stages of chronic health problems

### RESIDENT AND FAMILY PERCEPTIONS OF THE NURSE PRACTITIONER ROLE IN LONG TERM CARE SETTINGS

J. Ploeg<sup>1</sup>, S. Kaasalainen<sup>1</sup>, C. McAiney<sup>1</sup>, R. Martin-Misener<sup>2</sup>, F. Donald<sup>3</sup>, A. Wickson<sup>3</sup>, N. Carter<sup>1</sup>, E. Sangster-Gormley<sup>4</sup>, *1. School of Nursing, McMaster University, Hamilton, Ontario, Canada, 2. Dalhousie University, Halifax, Nova Scotia, Canada, 3. Ryerson University, Toronto, Ontario, Canada, 4. University of Victoria, Victoria, British Columbia, Canada*

**Background:** Nurse Practitioners (NP) have provided services in long term care (LTC) homes in the United States for several decades, but only for the past decade in Canada. While there is increased emphasis on putting residents and families first, little is known about the perceptions of residents and family members related to the role of the NP in these homes. In this study we explored the perceptions of residents and

family members related to the NP role in LTC homes. **Methods:** An exploratory multiple case study was conducted in four long term care homes across Canada. The homes were selected to represent diversity in size, location, and funding model. Data were collected using in-depth face-to-face individual interviews and focus groups. **Results:** Residents (n=14) and family members (n=21) participated in seven focus groups and three individual interviews across the four sites. Analysis revealed three major themes: (1) fostering relationship centred partnerships, (2) providing enhanced quality of care, and (3) optimizing and sustaining the NP role. Participants explained that NPs had an intimate knowledge of residents, provided informational and emotional support, and facilitated participation of residents and families in decision making. They also described how the NPs used their expert knowledge and skills to improve availability and more timely access to care and prevented or delayed hospitalization. **Conclusion:** Findings suggest that residents and family members view the NP role as critical in providing person centred care and enhancing quality of care in LTC homes.

### TRAINING AND COACHING TO PROMOTE HIGH PERFORMANCE IN VA NURSING HOME CARE

R.L. Engle<sup>1</sup>, J.L. Sullivan<sup>1,2</sup>, D. Tyler<sup>1,3</sup>, V. Parker<sup>1,2</sup>, C. VanDeusen Lukas<sup>1,2</sup>, *1. VA Boston Healthcare System, Boston, Massachusetts, 2. Boston University School of Public Health, Boston, Massachusetts, 3. Brown University Center for Gerontology and Health Care Research, Providence, Rhode Island*

**Background:** This study explored the feasibility of an educational intervention to strengthen workplace-learning systems in VA Community Living Centers (CLCs). **Methods:** Four VA CLCs received Direct Care Worker (DCW) and Coaching Supervision (CS) trainings using a train-the-trainer approach. Pre- and post- intervention qualitative interviews were conducted with trainers from each CLC to assess factors influencing effectiveness of implementation and to understand the impact of the trainings on participants. **Results:** Trainers reported the training sessions were well run, informative, and valuable to their work. Three CLCs successfully implemented the CS training addressing management and supervision practices. Two CLCs also implemented the DCW training targeting clinical knowledge. Both trainings targeted effective communication. One CLC was unable to implement either of the trainings due to staff turnover. Trainers were confident in their ability to deliver the training to other CLC staff and reported positive feedback from their CLC colleagues who received the training. Barriers to implementation included lack of leadership buy-in, initial confusion about the content of the trainings, and lack of staff and time to complete the trainings. **Conclusion:** The project generated knowledge about the feasibility and effectiveness of a multi-level, contextualized training approach that led to the submission of a larger grant proposal and has potential applicability to other settings in which DCWs provide care to veterans. Strategies for successful implementation include initial meetings with leadership and middle managers to get buy-in for the training, obtaining support from VA Central Office, and better coordinating training with existing VA training requirements.

### SESSION 2130 (POSTER)

#### MENTAL HEALTH

#### PAIN AND COGNITIVE FUNCTION IN MID-LIFE WOMEN: CONSIDERING THE ROLE OF DEPRESSIVE SYMPTOMS

K. Tomey<sup>1</sup>, G.A. Greendale<sup>2</sup>, H.M. Kravitz<sup>3</sup>, J. Bromberger<sup>4</sup>, J. Burns<sup>3</sup>, S. Dugan<sup>3</sup>, *1. School of Public Health (Epidemiology), University of Michigan, Ann Arbor, Michigan, 2. University of California, Los Angeles, Los Angeles, California, 3. Rush University Medical Center, Chicago, Illinois, 4. University of Pittsburgh, Pittsburgh, Pennsylvania*

In patient-based samples, poorer cognitive performance has been linked to chronic pain. Less is known about whether pain is associated

with cognitive function in community samples. This cross-sectional analysis evaluated associations between cognitive function and four measures of pain. It also examined whether the effect of pain on cognition was greater in the presence of depressive symptoms. Participants are from the Study of Women's Health Across the Nation, a multiethnic, community-based study of midlife women. An overall cognitive performance score was created by converting raw scores from the Digit Backward, Symbol Digit Modalities, East Boston Memory Immediate and Delayed Recall tests to z scores, then averaging them. We collected self-reported measures of pain intensity, pain interference, frequency of stiffness/soreness, and frequency of back aches/pains. We used ordinary least squares regression to obtain estimates of adjusted associations. Interference from pain was associated with cognitive score (adjusted for demographic factors and depressive symptoms) [ $\beta$  (SE) -0.07 (0.02)  $p=0.0005$ ]. Intensity of pain was associated with cognitive score (adjusted for demographics) [ $\beta$  (SE) -0.04 (0.02)  $P=0.02$ ]. Association with aches was significant only in those with depressive symptoms [ $\beta$  (SE) -0.16 (0.05)  $p=0.002$ ] but this association was not significant after adjustment. Stiffness/soreness was not associated with cognitive score. Cognitive function is associated with some but not all measures of pain and the association with aches is only present in those with depressive symptoms. Supported by NIH/ DHHS, through the NIA, NINR and the NIH ORWH (Grants NR004061; AG012505, AG012535, AG012531, AG012539, AG012546, AG012553, AG012554, AG012495).

#### **INTEGRATION OF MENTAL HEALTH SERVICES INTO A GERIATRICS PRIMARY CARE PRACTICE**

M. Anderson<sup>1</sup>, R. Abrams<sup>1</sup>, R. Adelman<sup>1</sup>, R. Breckman<sup>1</sup>, R. Goralewicz<sup>2</sup>, M. Palombo<sup>2</sup>, R. Shengelia<sup>1</sup>, A. Stern<sup>2</sup>, 1. *Geriatrics & Gerontology, Weill Cornell Medical College, New York, New York*, 2. *NewYork-Presbyterian Hospital, New York, New York*

**PURPOSE:** From 2008 to the present, we conducted a demonstration project to integrate screening, triage and treatment for depression and anxiety into a geriatric primary care practice. A full-time psychiatric nurse practitioner was added to the staff to enhance our mental health team. The other members of the team included a full-time social worker and a part-time gero-psychiatrist. **METHOD:** All new and most established patients were screened for depression and anxiety utilizing standard screening instruments – PHQ-9 and GAD-7. Results were reviewed by the mental health team. For those screening positive further assessment was done to determine severity of symptoms and need for treatment. Referrals were made for appropriate treatment modalities. Patients were re-screened at varying intervals – every three months for those screening positive, annually for those screening negative. **RESULTS:** - 1,921 patients were screened in 3.5 years - Over 600 patients screened positive for depression, anxiety or both - 93% identified as positive and needing mental health services were assessed and treated by the team or referred to a community mental health provider - 3% had active suicidal symptoms or signs and either received or were directed to appropriate services - Of those receiving mental health services, a significant number showed improvement when most recently reassessed **CONCLUSION:** Taken together, these findings present a compelling picture of need for integration of mental health screening, assessment and treatment in geriatric primary care. These conditions might not have been identified without the screening program.

#### **FAMILY RELATIONSHIPS, SOCIAL CONNECTIONS AND DEPRESSION AMONG OLDER CHINESE IMMIGRANTS**

J. Liu<sup>1</sup>, M. Guo<sup>1</sup>, I. Chi<sup>2</sup>, 1. *School of Social Work, University of Iowa, Iowa City, Iowa*, 2. *University of Southern California, Los Angeles, California*

Mental health status among older adult minorities has emerged as an important social issue because age and racial/ethnic disparities are likely to increase their risk of developing mental disorders. Previous

studies indicated that family relationships and social connections are crucial in shaping mental well-being of older racial/ethnic minorities. Focusing on older Chinese immigrants, one of the fastest growing older minority groups in the US, this study explored whether and how family relationships and social connections affect their level of depression. The sample was from the cross-sectional survey data of 156 older Chinese immigrants in Los Angeles in 2010. Multiple regressions were conducted to predict levels of depression among the older adults using variables representing family relationships and social connections. Demographic characteristics, socioeconomic status and acculturation were considered as control variables. Among the variables of family relationship and social connection, perceived filial piety of children and amount of friends were the most significant predictors of depression in older Chinese immigrants. The older adults who considered their children more respectful and supportive to parents, and who have more friends in their communities tended to report lower level of depression. Other predictors of lower depression included older age, being a male and having better health. The finding suggests that maintaining traditional culture in parent-child relationship and developing social network may be helpful to prevent depression among older Chinese immigrants.

#### **CORRELATES OF SERIOUS PSYCHOLOGICAL DISTRESS AMONG LATINO AND ASIAN IMMIGRANT ELDERS**

B. Rodriguez, G. Kim, *The University of Alabama, Tuscaloosa, Alabama*

**Objectives:** The present study sought to (1) examine the prevalence of serious psychological distress (SPD) and (2) identify factors associated with SPD among Latino and Asian immigrant elders. **Methods:** Data were drawn from the 2009 California Health Interview Survey (CHIS). Selected samples included 650 Latino and 1,288 Asian immigrant adults aged 60 and older. Descriptive statistics and hierarchical logistic regression analyses were conducted. **Results:** Results from descriptive analyses show that Asian immigrant elders had a significantly higher prevalence of SPD than their US-born counterparts ( $p < .01$ ), whereas there were no significant differences in the prevalence of SPD between Latino immigrant and US-born elders. Results from hierarchical logistic regression analyses indicate that for Asian immigrants, unmarried status, greater poverty, a greater number of chronic diseases, and disability were associated with SPD and for Latino immigrants, disability was a significant correlate of SPD. After controlling for demographic characteristics and health characteristics, limited English proficiency was a significant correlate of SPD for both Latino (OR = 9.41, 95% CI = 1.12, 78.92) and Asian (OR = 2.50, 95% CI = 1.05, 5.99) immigrant elders. **Discussion:** The findings suggest that English proficiency has an important role in immigrant mental health, which highlights the need to develop immigrant-specific intervention strategies in order to improve immigrant mental health. **Word count:** 213 (250 maximum)

#### **THE IMPACT OF TRAUMA-RELATED GUILT AND COGNITIVE APPRAISAL ON POSTTRAUMATIC GROWTH IN OLDER VETERANS WITH PTSD**

H. Sones<sup>1,2</sup>, L. Moreno<sup>2</sup>, S. Schuitemoerder<sup>2</sup>, J. Fidler<sup>2</sup>, Z. Agha<sup>2,5</sup>, S.R. Thorp<sup>2,3,4</sup>, 1. *San Diego State University/University of California, San Diego, San Diego, California*, 2. *VA San Diego Healthcare System, San Diego, California*, 3. *VA Center of Excellence for Stress and Mental Health, San Diego, California*, 4. *University of California, San Diego, Department of Psychiatry, San Diego, California*, 5. *University of California, San Diego, Department of Family Medicine, San Diego, California*

Prior research has found that posttraumatic growth (PTG) can serve as a protective factor against the development and/or worsening of posttraumatic stress disorder (PTSD) symptoms. The relationship between these two constructs, however, remains unclear.

Given that PTG may provide a valuable buffer against the development of PTSD, this relationship deserves further examination. Utilizing a sample of 200 older male Veterans diagnosed with PTSD who participated in psychotherapy clinical trials, the current study will examine whether the experience of trauma-related guilt and negative cognitive appraisals impacts the degree of PTG experienced. The sample includes men ages 60-81, who have experienced a wide range of traumatic events (e.g., combat, sexual trauma, accidents). We hypothesize the following: 1) A curvilinear (i.e., 'inverted U') relationship will exist between PTG and PTSD, 2) After controlling for PTSD severity, trauma-related guilt will be negatively correlated with PTG, and 3) After controlling for PTSD severity, negative cognitive appraisals of the traumatic event will be associated with lower levels of PTG. These hypotheses will be addressed in hopes of better qualifying the relationship between PTSD and PTG in the older adult population, which in turn can inform the development of interventions focused on bolstering PTG in older trauma survivors.

### INSTITUTIONALIZED AGING OF PATIENTS WITH MENTAL HEALTH CONDITIONS: THE PSYCHIATRIC HOSPITAL NURSING PROFESSIONALS' LIVING AND CARING

C.G. Hansel, J. Da Silva, *medical surgical, Anna Nery School of Nursing, Petropolis, Rio de Janeiro, Brazil*

Research with a mix-methods approach has as objective to describe the institutionalized aging process of patients with mental conditions in a psychiatric institution located in the Sierras Region of Rio de Janeiro State. The quantitative sample size was determined by the number of inpatients 60 and over years old who aged institutionalized. The demographic data and clinical diagnosis were obtained through patient file and hospital document analysis and patient functional status was obtained through the Activities of Daily Living (Katz et al., 1970). Results indicate a hospital stay varying from two to thirty-six years. Among the psychiatric diagnosis in patient files, 60% were of residual schizophrenia (F20.5) being 40% in women and 36.8% in men. The study followed recommendations of the National Council of Health 196/96 Resolution about research with human beings. The informed consent to participate in the study approved by the Ethics Review Board of the Anna Nery School of Nursing / Federal University of Rio de Janeiro. Results indicate that despite the new direction brought to mental health care by the psychiatric reform and its role in preventing other people from growing old institutionalized, deprived from social and family environments, one cannot forget the transition moment we live – where there are still many older people with mental health conditions institutionalized, who need care twice differentiated, for being psychiatric patients and now older adults.

## SESSION 2135 (POSTER)

### NEUROSCIENCE & NEURODEGENERATIVE CONDITIONS

#### REGIONAL CEREBELLAR GREY MATTER VOLUME, PROCESSING SPEED AND GAIT MEASURES

N.K. Nadkarni<sup>1,4</sup>, K.A. Nunley<sup>1</sup>, H. Aizenstein<sup>1</sup>, T.B. Harris<sup>2</sup>, K. Yaffe<sup>3</sup>, J. Brach<sup>1</sup>, A.B. Newman<sup>1</sup>, C. Rosano<sup>1,4</sup>, 1. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *National Institute on Aging, Bethesda, Maryland*, 3. *University of California, San Francisco, California*, 4. *Pittsburgh Older Americans Independence Center, Pittsburgh, Pennsylvania*

Objective: Functional roles ascribed to the cerebellum include motor-control and executive-function based on lesion and functional-imaging research. We investigated whether this functional specialization exists in older adults without cerebellar pathology by exploring the association between regional cerebellar grey matter volumes (rCGMV) and

executive-function and gait measures. Methods: Of the 313 participants of the Health ABC Study cohort who completed 3T-MRI, we analyzed data in 231 free of stroke, significant cognitive impairment or alcohol consumption. Gait-speed and step-length variability, on the GaitMat II, and processing speed, on the Digit Symbol Substitution test (DSST), were assessed. We obtained rCGMV by an automated process that involved segmentation, classification and registration to a standard atlas and volumes were aggregated based on their hypothesized functions as cognitive (Lobules VI, VII, VIII and crus I, II), sensorimotor (Lobules II, IV, V) and vestibular (Lobules IX and X) rCGMV. Partial correlations were adjusted for total intracranial volume, age and gender. Results: Mean age was 82 years with 58% female and 62% Caucasian. Larger cognitive rCGMV correlated with faster gait-speed and smaller step-length variability ( $r=0.15$  and  $-0.13$ , both  $p=0.04$ ), and higher DSST scores ( $r=0.24$ ,  $p<0.001$ ). Larger sensorimotor rCGMV correlated significantly with higher DSST ( $r=0.15$ ,  $p=0.02$ ) but not with gait-speed ( $p=0.06$ ) and step-length variability ( $p=0.2$ ). Vestibular rCGMV showed no significant correlations. After adjusting for DSST, the significant association between cognitive rCGMV, gait-speed and step-length variability disappeared. Conclusion: Cerebellar regions linked to executive-function control may also play a role in gait control and this association appears to be partly mediated by processing speed.

### RESPIRATORY PERIODICITY, EEG AROUSAL, AND CEREBRAL OXYGEN DURING SLEEP IN ELDERS WITHOUT SLEEP APNEA

B. Carlson<sup>1</sup>, V.J. Neelon<sup>1</sup>, J. Carlson<sup>1</sup>, D. Bliwise<sup>2</sup>, 1. *School of Nursing, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 2. *School of Medicine, Emory University, Atlanta, Georgia*

**Background:** Like heart rate variability, respiratory periodicity reflects the degree to which the respiratory system can adjust to momentary shifts in metabolic demands, such as during an EEG arousal. The aim of this study was to examine the relationships between respiratory periodicity, EEG arousal, and cerebral oxygenation during sleep in community-dwelling elders without sleep apnea. **Methods:** Subjects (72 women, 40 men,  $\geq 70$  years) underwent one night of polysomnography, including cerebral oximetry. Each consecutive 5-minute segment of recording of sleep was classified as either: (1) *High Respiratory Periodicity [HIGH\_RP]* defined by high variability in the amplitude and frequency of breathing cycles; (2) *Type A-Low Respiratory Periodicity [Type\_A\_LOW]* defined by low variability in amplitude and frequency of cycles; or (3) *Type B-Low Respiratory Periodicity [Type\_B\_LOW]* defined by low variability in the amplitude but high variability in the frequency of cycles. Presence of EEG arousal and the average percent cerebral oxyhemoglobin saturation ( $rcSO_2$ ) was also determined for each segment. General estimating equations, which clustered segments by subject, assessed the relationships between pattern of respiratory periodicity, EEG arousal, and  $rcSO_2$  during sleep. **Results:** *HIGH\_RP* and *Type\_A\_LOW* were associated with EEG arousal ( $X^2_{(df=2)}=60.6$ ,  $p<0.001$ ). *Type\_B\_LOW* was not associated with EEG arousal ( $X^2_{(df=1)}=0.08$ ) but with declines in  $rcSO_2$  ( $X^2_{(df=1)}=4.56$ ,  $p<0.01$ ). Elders with more *Type\_B\_LOW* had lower presleep  $rcSO_2$  ( $r=-.21$ ,  $p=0.03$ ) and greater declines in  $rcSO_2$  during sleep ( $r=-.25$ ,  $p<0.01$ ) than elders with less *Type\_B\_LOW*. **Conclusions:** Predominance of certain breathing patterns, like *Type\_B\_LOW*, may mark elders with low cerebral oxygenation and greater risk for hypoxic injury during sleep. **Support:** NRO8032, M01RR00046, UL1RR025747

### AFFECTS AND MECHANISM OF RAPAMYCIN AS AN INTERVENTION IN THE MOUSE MODEL FOR THE HUMAN MITOCHONDRIAL DISEASE LEIGH SYNDROME

S.C. Johnson, A.S. Castanza, M. Kaeberlein, *Pathology, University of Washington, Seattle, Washington*

Leigh syndrome is a rare genetic disease caused by any of several mutations in proteins required for assembly or function of the electron

transport chain in the mitochondrial inner membrane. Manifestations of the disease include developmental delay, optic atrophy, hypotonia, ataxia, breathing abnormalities, necrotic brain lesions, and drastically shortened lifespan. In mice, Leigh syndrome has been modeled by knockout of NADH dehydrogenase [ubiquinone] iron-sulfur protein 4 (Ndufs4), a component of the multi-subunit respiratory chain complex 1. Ndufs4 knockout mice experience many of the phenotypes associated with the human presentation of Leigh syndrome including necrosis and neurological deficit, delayed development, ataxia, and short lifespan. Currently no effective interventions exist for treating mitochondrial disorders of any etiology. In this study we examined the therapeutic potential of the drug Rapamycin in treating the Ndufs4 mouse model of Leigh syndrome. Ndufs4 knockout mice experienced a partial rescue of many Leigh syndrome associated phenotypes when treated with Rapamycin. We are exploring three potential mechanisms of Rapamycin's action in this disease model. First, through its function as an inhibitor of the mTOR complex of the AKT growth-signaling pathway suppressing the translation initiation factor eIF4E. Second, up regulating cellular and mitochondrial autophagy. Third, by acting through its immunomodulatory activity, as inflammation is a hallmark of this disease. Rapamycin is currently approved by the FDA for use in human patients as an immunosuppressant used for prevention of organ transplant rejection.

### **COGNITIVE AND STRUCTURAL BRAIN CORRELATES OF PHYSICAL ACTIVITY AND FITNESS IN HEALTHY AGING**

Z.Z. Zlatar<sup>1</sup>, K. McGregor<sup>2</sup>, J.M. Dzierzewski<sup>1</sup>, M. Marsiske<sup>1</sup>, T. Manini<sup>1</sup>, B. Crosson<sup>2,1</sup>, *1. University of Florida, Gainesville, Florida, 2. Brain Rehabilitation Research Center Malcolm Randall VAMC, Gainesville, Florida*

The current study investigated whether fitness level (12 minute treadmill challenge) or self-reported physical activity (weekly monitoring questionnaire) is a better predictor of gray matter density in healthy older adults (N=29) between the ages of 60 and 85 using voxel-based morphometry (VBM). The direct relationship between age, executive function, and gray matter density was also assessed. Multiple regressions were carried out on FSL with fitness, physical activity, age, and executive function predicting gray matter density. It was found that fitness level, and not self-reported physical activity, displayed a protective role on gray matter density as age increased, in regions previously shown to be affected by the aging process, such as the cerebellum bilaterally, fusiform/inferior lateral occipital cortex/lingual gyrus, and left hippocampus and parahippocampal gyrus (TFCE corrected  $p < .05$ ). Gray matter density did not predict executive function performance above and beyond the contribution of age  $F(1,27) = .12$ ,  $p = .73$ ,  $R^2 = .005$ ,  $\beta = -.15$ . Hence fitness level moderated the relationship between age and gray matter density in areas previously reported to decline as a function of age, while self-reported physical activity level failed to detect this finding.

### **ASSOCIATION BETWEEN ENDURANCE WALK CAPACITY AND INTEGRITY OF BRAIN REGIONS IMPORTANT FOR PROCESSING SPEED IN VERY OLD ADULTS**

Q. Tian<sup>1</sup>, K. Erickson<sup>1</sup>, E.M. Simonsick<sup>2</sup>, H. Aizenstein<sup>1</sup>, N.W. Glynn<sup>1</sup>, K. Yaffe<sup>3</sup>, A.B. Newman<sup>1</sup>, C. Rosano<sup>1</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. National Institute on Aging, Bethesda, Maryland, 3. University of California, San Francisco, San Francisco, California*

Purpose: This study examined the association between endurance capacity measured by Long-Distance Corridor Walk (LDCW) and brain MRI markers among very old adults. Methods: Brain MRI and LDCW data were obtained from 313 participants (56% female, 42% black, mean age 82.9 yrs) in 2006-07. LDCW consisted of a 2-minute walk followed immediately by a 400-m walk with the instruction to "walk as quickly as possible". Endurance capacity was categorized as most fit, somewhat

fit, least fit, stopped, and excluded for medical contraindications. Multivariable regression models adjusted for age, sex, race, education, and body weight. Results: Compared to those with contraindications (N=56, 17.9%), those who completed (N=187, 59.7%) and those who stopped (N= 58, 18.5%) were younger and more likely to be male and white, and had a lower BMI. Compared to those with contraindications, those who were somewhat fit and least fit had: (1) greater volume in dorsal cingulate, and (2) lower mean diffusivity (MD) of processing speed-related regions (dorsolateral prefrontal, posterior parietal, and anterior cingulate cortices) and dorsal cingulate adjusted for covariates (all  $p < .05$ ). No differences were observed in brain MRI markers between those with contraindications and those who stopped. Conclusions: Very old persons exhibiting some endurance capacity relative to those with evidence of cardio-vascular disease show less gray matter atrophy in dorsal cingulate and less MD of processing speed-related regions and dorsal cingulate. Implications: Future studies should examine whether endurance walk test performance could be used as a marker of underlying gray matter integrity in late adulthood.

### **HEART AND BRAIN: LONGITUDINAL ASSOCIATIONS BETWEEN MARKERS OF AUTONOMIC FUNCTION AND BRAIN SMALL VESSEL DISEASE IN THE CARDIOVASCULAR HEALTH STUDY**

Q. Tian<sup>1</sup>, P.K. Stein<sup>2</sup>, L.H. Kuller<sup>1</sup>, C. Rosano<sup>1</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. Washington University School of Medicine, St. Louis, Missouri*

Background: Heart rate variability (HRV), a marker of autonomic function, and white matter hyperintensities (WMH), a marker of small vessel disease, are associated with mortality and dementia. Longitudinal data on the association between HRV and WMH are sparse. Such a relationship would be important because HRV is known to be an earlier marker for increased risk of adverse cardiovascular outcomes. Purpose: Estimate associations between HRV and WMH obtained over eight years in older adults. Methods: Four HRV measures were obtained via 24-hour Holters at study entry (yr2): ln very low frequency power, ln low frequency power, power law slope and short-term fractal scaling exponent. Presence of WMH was quantified at years 5 and 10 of the study. Logistic regression models predicted yr10 WMH after adjustment for age, gender, yr2 health factors (clinical and subclinical cardiovascular disease, hypertension, diabetes, drug therapy, cognitive function and blocks walking) and yr5 WMH. Results: Participants (N=580) were  $70.6 \pm 4.0$  yrs, 59.5% female, 3.1% black. Lower power law slope was associated with higher WMH at yr10 (OR=.174,  $p = .011$ ), independent of WMH at yr5 (OR=.128,  $p = .010$ ) or of covariates (OR=.159,  $p = .010$ ). No other HRV markers were associated with WMH at yr10 after adjustment for WMH at yr5. Conclusions: The temporal relationship observed in this study suggests that power law slope, a non-linear measure of HRV, captures autonomic abnormalities that may precede clinically manifest small vessel disease and may help identify older adults who would benefit from interventions to prevent or delay the progression of brain abnormalities including dementia.

### **FREE-LIVING PHYSICAL ACTIVITY AND BRAIN STRUCTURES IN OLDER ADULTS**

Q. Tian<sup>1</sup>, E.M. Simonsick<sup>2</sup>, N.W. Glynn<sup>1</sup>, H. Aizenstein<sup>1</sup>, K. Yaffe<sup>3</sup>, T.B. Harris<sup>2</sup>, A.B. Newman<sup>1</sup>, C. Rosano<sup>1</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. National Institute on Aging, Bethesda, Pennsylvania, 3. University of California, San Francisco, San Francisco, California*

Purpose: This study examined longitudinal associations of free-living physical activity (PA) dose with brain MRI markers in older adults. Methods: PA dose was computed at study entry (1997-98) by self-report questionnaire assessing intensity, activity type, and volume. Brain MRI was obtained on 3Tesla scanners in 2006-07. Macro-structural measures included volumes of gray and white matter hyperintensities.

Integrity of micro-structure was measured using DTI separately for normal appearing gray (mean diffusivity, MD) and white matter (fractional anisotropy, FA). Multivariable regression models with PA dose were adjusted for age, sex, race, education, smoking status, alcohol consumption, and DSST at study entry and changes in 3MSE over 9 years. Results: The mean age of the cohort (N=313) was 82.9 yrs in 2006-07, 56% female, and 42% black. Compared to sedentary participants, those engaging in light and moderate intensity PA at study entry, had larger hippocampus and parahippocampus ( $p < .05$ ). Participants who were exercise active had lower MD in cingulate cortex ( $p < .05$ ). Results remained similar after adjustment for other covariates. Volume was not associated with any brain MRI markers. Conclusions: Findings indicate that PA intensity and type, but not volume, are associated with characteristics of gray matter 9 years later in older adults. Intensity was associated with macrostructures of memory-related regions, whereas type was associated with mean diffusivity of cingulate cortex, an important hub for processing speed and memory. Implications: These preliminary findings suggest that engaging in a variety of physical activities at light and moderate intensity may be optimal for brain health over time.

#### **GAIT AND CNS HIPPOCAMPAL VOLUME IN OLDER ADULTS WITH AND WITHOUT AMNESTIC MILD COGNITIVE IMPAIRMENT**

E.L. McGough<sup>1</sup>, V.E. Kelly<sup>1</sup>, R.G. Logsdon<sup>2</sup>, K.E. Weaver<sup>3</sup>, E.H. Aylward<sup>3</sup>, S.M. McCurry<sup>2</sup>, L. Teri<sup>2</sup>, 1. *University of Washington, Department of Rehabilitation Medicine, Seattle, Washington*, 2. *University of Washington, School of Nursing, Seattle, Washington*, 3. *University of Washington, Department of Radiology, Seattle, Washington*

Gait variability is higher in older adults with amnesic mild cognitive impairment (aMCI) than cognitively healthy (CH) older adults. In this study, we aimed to examine relationships between gait and hippocampal volume in older adults with and without aMCI. This was a cross-sectional study of 20 older adults (12 aMCI, 8 CH) mean age 84.8 (SD 4.6). The Mini Mental Status Exam (MMSE), Wechsler Logical Memory (LM) and Clinical Dementia Rating Scale (CDRS) were used for group assignments. Structural Magnetic Resonance Imaging (T1 MRI) was used to measure hippocampal volumes and intra-cranial volume (ICV). Quantitative gait analysis was used to examine gait speed (m/sec) and variability during usual and fast paced walking. Statistical analysis included 1) independent T-tests to examine mean differences between aMCI and CH, and 2) partial correlations, adjusting for age, to examine associations between hippocampal volume and gait. ICV-adjusted hippocampal volumes were larger in the CH group (left:  $p = .008$ ; right:  $p = .05$ ). On average, CH were faster during the usual pace ( $p = .02$ ) and fast pace ( $p = .01$ ) walking, with less stride length variability at faster speeds ( $p = .03$ ). After adjusting for age, greater stride length variability during fast walking was associated with smaller hippocampal volume (left:  $r = -.57$ ,  $p = .02$ ; right:  $r = -.58$ ,  $p = .01$ ). Trends between slower gait speed and smaller hippocampal volume occurred at usual and fast paces ( $r = .47$ ,  $p = .06$ ). In summary, reduced hippocampal volume, a marker of neurodegenerative disease, was associated with slower gait speed and increased stride-to-stride variability after adjusting for age.

#### **SESSION 2140 (POSTER)**

##### **NURSING SCIENCE**

#### **CONTENT ANALYSIS UTILIZED TO DEMONSTRATE THE UPTAKE OF NURSING PROCESS LANGUAGE FOUND IN STUDENT NURSE JOURNALS**

M. Murphy, *Fairfield University, Fairfield, Connecticut*

Content analysis of student nurse journals provides an opportunity to demonstrate student nurse uptake of nursing process language within text. The nursing process provides a framework to deliver standardized

nursing care with valid measurement of patient outcomes. The student nurses are instructed to submit initial and final journals with entries consisting of reflection on activities, observations, knowledge and perspectives gained, as well as feelings experienced, while caring for their first clients. The objective is to determine if final student nurse journals contain more language use related to various aspects of the nursing process when compared to their initial journal submissions, thus demonstrating student nurse application of the course objectives. Content analysis reports the initial student nurse journals contain significantly less uptake of language relating to the nursing process step of implementation when compared to uptake of implementation language found in the final journals. Conversely, uptake of language use reflecting assessment, planning, and evaluation is surprisingly more frequent in the initial journals, but does not reach the level of significance. Success in meeting course objectives may be demonstrated with student uptake of language appropriately applied within the nursing process framework standardizing nursing care with valid measurement of outcomes.

#### **E-LEARNING RESOURCES FOR USE IN GERONTOLOGY ADVANCED PRACTICE NURSING EDUCATION**

H.J. Thompson, M.L. Morrison, A. Doorenbos, B. Belza, *University of Washington, Seattle, Washington*

Purpose: To 1) identify relevant available electronic learning resources (ELR) for use in enhancing geriatric advanced practice nursing (APRN) education and 2) to evaluate the educational utility of identified ELRs based on established criteria. Methods: A multi-level search strategy was used. First, a literature search was performed from 2001-Feb 2012 to identify relevant articles. Second, POGO-e and MedEd-Portal repositories were searched. Third, websites of relevant professional organizations were searched for available ELR as well as references to ELR from other organizations. Finally, we performed a structured search using Google. Two independent team members reviewed the identified ELR against established criteria to ensure credibility. Only resources meeting all criteria were retained as credible. End of life and palliative care is used as an exemplar for this poster. Results: Sixteen resources were found that met all these criteria and ranged in format from self-paced tutorials to slide kits and interactive case studies. Half of the sixteen resources were identified using strategy four, and not through traditional search or search of existing geriatric repositories. In addition, reliable, available resources known by subject matter experts were not returned any of the methods used, indicating particular issues with search engine optimization. The resources identified have been useful to advanced practice educators in improving specific lecture and seminar content in the specific area as well as providing students and preceptors with additional self-learning resources. Conclusion: Efforts are underway to publicize the availability of repositories among educators for the sharing of geriatric teaching resources; however given that half the resources which met all the educational utility criteria were found using non-traditional methods and that search strategies are not optimized, an ongoing concern is accessibility of these ELRs. Addressing both access and sustainability within geriatric education is critical for sharing of best practices among educators and for sustainability of teaching and related resources.

#### **THE RELATIONSHIP OF IRREGULARITIES IN DAYTIME ACTIVITY TO SLEEP, BEHAVIORAL AND EMOTIONAL DEMENTIA SYMPTOMS**

C.R. Kovach, *University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*

People with dementia have profound irregularities in activity/rest rhythms. The purposes of this feasibility study with a sample of 33 nursing home residents were to describe: a) the average useable recording duration of actigraph activity and light measures; b) the relationship of sustained episodes of both high level activity and disengaged wakeful-

ness during the daytime to agitation, nighttime sleep and emotional expression; and c) determine the equivalence between actigraph, observed and caregiver reported estimates of activity. Actigraphs with light meters recorded two nights and one day of activity and light exposure. A research assistant concurrently observed and rated daytime activity, emotional expression and agitation every 15 minutes. Actigraph data was complete for 97% participants. The average loss of light data was 42% (SD = .25) of daytime epochs. The intraclass correlation for minutes of sustained activity between the actigraph, research assistant nursing assistant observations was .876 ( $p < .001$ ). Time spent in sustained high level and disengaged low level activity during the daytime was significantly associated with poorer sleep the following night, but the previous night's sleep quality did not account for sustained activity. Agitation during time periods of sustained activity averaged 43.48 (SD = 27.55) and averaged 27.06 (SD = 22.65) during time periods of fluctuating activity levels. Time spent in sustained activity was negatively associated with emotional expression ( $r = -.448$ ). In summary, temporal associations between sustained activity level during the daytime and negative outcomes suggest a possible need to regulate daytime activity schedules.

**A CONCEPT ANALYSIS: NURSE NAVIGATION PURPOSES/AIMS: TO PRESENT A CONCEPT ANALYSIS OF THE STATE OF THE SCIENCE REGARDING NURSE NAVIGATION, IDENTIFY GAPS IN CURRENT KNOWLEDGE, AND PROPOSE AREAS FOR FUTURE RESEARCH**

P.J. Johnson, 1. School of Nursing, OHSU, Portland, Oregon, 2. John A. Hartford Foundation's Building Academic Geriatric Nursing Capacity Award Program, Washington D.C., District of Columbia

Rationale/Background: The elderly population in the United States is projected to double by 2030, meaning approximately 70 million people will be 65 years or older. Cancer has a disproportionately higher rate of occurrence in the elderly. The elderly are increasingly suffering from multiple co-morbidities and chronic illnesses that intersect with the cancer trajectory, thus impacting treatment options and outcomes. Diagnosis of cancer and the associated onset of treatment decisions are extremely complex and stressful for elderly persons and their families. There are higher rates of depression and anxiety, increased risk of drug interactions, and greater likelihood of negative or serious side effects from treatment options. Given the challenges posed by such circumstances, there is a critical need to address the care needs and improve support of elderly persons diagnosed with cancer. Nurse navigation poses potential for managing the care of this population. To date, the nurse navigator role has been poorly defined, inadequately differentiated from other nursing roles, and minimal research has been conducted on the nature and impact in cancer care. Implications: The emerging field of nurse navigation offers a promising opportunity for nurses to expand their influence and develop interdisciplinary team approaches to help patients and families steer through the complex and challenging world of cancer and chronic illness. Nurse navigators are a natural and essential extension of emerging care models. The conceptual intersection of nurse navigation with the call for innovative models to improve care indicate a need for further exploration of the role of nurse navigation.

**IMPROVING QUALITY OF CARE: INCORPORATING GERIATRIC CARE PLANNING WITH NURSE CARE PLANNING**

T. Davis<sup>1</sup>, S. Rosenberg<sup>2</sup>, 1. Gerontology, University of KY, Lexington, Kentucky, 2. University of Central Florida, Orlando, Florida

One way to improve the quality of care provided to older adults, as a whole, in medical settings is to incorporate methods of geriatric care planning with nurse care planning. With the increasing numbers of older adults living longer, it is essential that nurses under-

stand the aging patient as a whole and not just as a medical patient. The purpose of this research is to identify differences among geriatric and nurse care planning, as well as to identify areas in which nurses can incorporate aspects of geriatric care planning in an effort to increase the quality of care provided to older patients. By presenting data on the current state of care planning in both fields, students, professors and nurses will recognize the need to incorporate aspects of geriatric care planning into nurse care planning and, as a result quality of care will increase amongst the aging population in medical care settings.

**THE EFFECTS OF DEPRESSION AND BURDEN ON DEMENTIA CAREGIVERS SLEEP**

H. Peng<sup>1</sup>, Y. Chang<sup>1</sup>, L.O. Wray<sup>2</sup>, 1. The University of New York at Buffalo, School of Nursing, Buffalo, New York, 2. Buffalo VA medical Center, Center for Integrated Healthcare, Buffalo, New York

Background: Providing informal care to a loved one with dementia compromises caregivers' mental and physical health. Family caregivers may experience sleep disturbance due to overwhelming caregiving task provided to their care recipient. Insufficient sleep may cause serious consequences that can affect caregivers' immune system and daily functioning. Purpose: This study aims to examine the effects of depression and burden on dementia caregivers' sleep. Method: This ongoing study uses a cross-sectional design. Participants are recruited from the Alzheimer's Association Western New York Chapter at Buffalo and Buffalo VA Medical Center. Caregivers' sleep are measured by Actigraph (a wrist-watch measuring movement and light; wore for 7 days) and Pittsburgh Sleep Quality Index (PSQI). Other measures include burden (Caregiver Burden Inventory) and depression (Center for Epidemiologic Studies Depression). Descriptive and regression statistics are used for data analysis. Results: We expect that a total of 60 family caregivers will participate in this study. Preliminary findings indicate that caregiver burden is associated with awaking up during the night ( $r = .40$ ,  $p < 0.05$ ) and awaking times ( $r = .43$ ,  $p < 0.05$ ) measured by Actigraph. Caregiver burden is associated with PSQI global score ( $r = .68$ ,  $p < 0.001$ ), sleep disturbance ( $r = .64$ ,  $p < 0.001$ ), and sleep latency ( $r = .60$ ,  $p < 0.001$ ). Caregivers depression is associated with PSQI global score ( $r = .89$ ,  $p < 0.001$ ) and sleep efficiency ( $r = -.57$ ,  $p < 0.05$ ). Regression analysis will be used to further examine the association between caregiver burden, depression, and sleep. Conclusion: Our findings suggested that caregiver depression and burden may influence their sleep. Research is needed to identify effective interventions to improve caregivers' sleep.

**THE INVESTIGATION ON TOBACCO-RELATED KNOWLEDGE OF THE TERTIARY HOSPITALS' NURSES FROM SIX URBAN DISTRICT OF BEIJING**

Q. Wang, People's Hospital, Peking University, Beijing, China

Method: A cross-sectional survey was conducted among 294 nurses who are from six hospitals in six urban district of Beijing, and the relevant questionnaires have been filled in validly. Result: Most participants knew that tobacco is bad for health (12.0%-96.8%) and can result in respiratory disorders (85.6%-100%). Conclusion: Most nurses have general knowledge about tobacco and health and tobacco-related diseases, but they underestimate the risk of tobacco and are not familiar with tobacco dependency treatment. Key words: Nurses; Smoking-cessation; Knowledge

**SESSION 2145 (POSTER)**

**OLDER ADULT ONCOLOGY**

**EARLY-ONSET FRAILTY IN OLDER BREAST CANCER SURVIVORS**

J. Bennett, K. Winters-Stone, J. Dobek, L. Nail, School of Nursing, Oregon Health & Science University, Portland, Oregon

Introduction. Older breast cancer survivors (BCS) and are at risk for persistent symptoms caused by long-term effects of cancer treatment.

These symptoms may be considered a syndrome of accelerated aging or early-onset frailty. The purpose of this study was to compare prevalence of frailty in BCS and older women without cancer. Methods. Frailty was described in 216 older BCS (age 53-87, mean 66.7 ± 7.3 years). Frailty was defined as ≥ 3 of 5 components of the Frailty Phenotype developed for older adults: weight loss, exhaustion, low activity level, slowness, and weakness. Data were compared to published frailty findings from two population-based studies: 1) 1741 women in the Cardiovascular Health Study (CHS) aged 70-79, and 2) 786 women in the Women's Health and Aging Studies (WHAS) aged 70-79. Results. Though BCS in this study were generally younger than comparison samples, 12% were frail, compared to 12% in CHS and 11% in WHAS, suggesting onset of frailty at a younger age in BCS. Exploratory analysis of 66 BCS of same age as women in CHS and WHAS (70-79 years) showed that 18% of BCS were frail, higher than CHS and WHAS samples of same age. Conclusion. The similar prevalence of frailty in BCS at a younger age than that of women without cancer in CHS and WHAS studies provides preliminary evidence of early onset frailty in BCS who have undergone treatment. Further research to assess frailty in cancer survivors is warranted and primary care providers should be alert for indicators of early onset frailty.

### COLORECTAL CANCER SCREENING IN OLDER ADULTS BY 5 YEAR LIFE EXPECTANCY

K. Bellizzi<sup>1</sup>, E.S. Breslau<sup>2</sup>, *1. HDFS, UConn, Storrs, Connecticut, 2. National Cancer Institute, Bethesda, Maryland*

Background: The decision to screen or discontinue screening for colorectal cancer in older adults is complex since it includes issues beyond age alone. The purpose of this study is to describe colorectal screening patterns in adults 75 years and older by 5 year life expectancy. Methods: The analytic sample comprised 1,027 men and women 75 years and older from the 2010 National Health Interview Survey. Colorectal cancer screening guidelines were assessed according to United States Preventive Services Task Force recommendations. A validated 5 year mortality index was used to assess individual life expectancy. Results: Among men and women in our sample, screening rates varied by estimated 5 year life expectancy: rates were 63.9% in individuals with high life expectancy (<15% probability of 5-year mortality), 56.1% in men and women with intermediate life expectancy (16% to 48% probability), and 52.5% in individuals with low life expectancy (> 48% probability). In multivariate logistic regression models, older age and education were related to higher screening rates; whereas, Hispanic race/ethnicity, fewer comorbid conditions were related to lower screening rates. Discussion: In an era of escalating healthcare utilization and expenditures in the United States, identifying areas for cost containment while concurrently improving quality of care in our healthcare system is increasingly paramount. These findings point to the large proportion of older adults (52.5%) with low life expectancy that continue to be screened despite the low likelihood of screening providing any survival benefit. Benefits and harms of continued screening need to be discussed with patients.

### PERCEIVED INFLUENCES ON EARLY STAGE PROSTATE CANCER TREATMENT DECISION MAKING IN AT-RISK MEN: THE ROLE OF AGE, NUMERACY AND HEALTH LITERACY

K. Echt<sup>1,2,3</sup>, T.W. Gillespie<sup>1,2</sup>, J.A. Petros<sup>1,2</sup>, J. Lipscomb<sup>1,3</sup>, L. Herrell<sup>1</sup>, L. Britan<sup>2</sup>, J. Rowell<sup>3</sup>, M. Goodman<sup>3</sup>, *1. Emory University School of Medicine, Atlanta, Georgia, 2. Atlanta VA Medical Center, Decatur, Georgia, 3. Emory University Rollins School of Public Health, Atlanta, Georgia*

Prostate cancer (PCa) is the most common cancer diagnosed among US men, and ranks second in tumor site-specific mortality. PCa treatment options are primarily determined by tumor grade and patient life expectancy. This study investigated the perceived influence of selected

PCa treatment decision-making factors of at-risk men (n=212; 66% African American) with normal screening PSA results recruited from five national study sites. The men ranged in age from 45 to 74 years (M=60; SD=7) and 28% were age 65 or older; 72% were low numerate and 50% were low health literate. Overall, the men most frequently identified the doctor's treatment recommendation (89.5%), curative potential (77.1%), and spouse's preference (74.8%) as influential factors in PCa treatment decision-making. Low health literate men reported significantly fewer influences overall on decision-making. Information seeking in particular was perceived as an influential factor by only 51% of the low health literate men compared to 75% of higher health literate men (p<.001). While older men (65.5%) more frequently reported the influence of cost relative to younger men (51.3%; p=.06), no additional differences based on age were found in treatment decision-making factors including side effect profile, curative potential, or life expectancy after treatment. These findings highlight the need for improved patient education and decision support strategies, especially for men who are older, to address important gaps in knowledge such as the role of life expectancy in PCa treatment informed decision-making.

### THE RELATIONSHIP BETWEEN SELF-RATED HEALTH, FUNCTIONAL STATUS AND OUTCOMES OF CANCER AND TREATMENT

M. Puts<sup>1</sup>, J. Monette<sup>2</sup>, V. Girre<sup>3</sup>, M. Monette<sup>2</sup>, C. Wolfson<sup>4</sup>, G. Batist<sup>2</sup>, H. Bergman<sup>2</sup>, *1. Lawrence S. Bloomberg Faculty of Nursing, University of Toronto, Toronto, Ontario, Canada, 2. Jewish General Hospital, Montreal, Quebec, Canada, 3. Centre Hospitalier Departemental, La Roche sur Yon, France, 4. McGill University Health Centre, Montreal, Quebec, Canada*

Introduction: SRH has shown to predict functional decline and mortality in community-dwelling older adults, but it has been less frequently studied in older cancer patients. The one-item SRH question can provide a clinician with a quick tool to evaluate subjective health status. Methods: Patients aged > 65 newly diagnosed with cancer were recruited for a prospective pilot study at the Jewish General Hospital, Montreal, Canada. SRH was evaluated prior to the start of treatment, and at 3, 6 and 12 months. Treatment toxicity and mortality data were abstracted from the chart. Correlation was used to examine the association between SRH, comorbidity and functional status (frailty using seven frailty markers: grip strength, nutrition, fatigue, physical activity, mood, cognition and weight loss), instrumental and basic activities of daily living (IADL and ADL), and ECOG performance status (ECOG PS)). Logistic and Cox regression were used to examine the association between SRH (dichotomized as very good/good vs. fair, poor and very poor) and treatment toxicity/ time to death. Results: 112 participants participated, median age 74.1, 70% women. At baseline, 74 (66.1%) had a good SRH and 38 (33.9%) had poor SRH and those had more comorbidities, more frailty markers present, lower ECOG PS and IADL impairments. There was no association between SRH and toxicity or mortality. Conclusion: There was a moderate correlation between SRH and the number of frailty markers, IADL disability and comorbidities but it did not predict toxicity or time to death.

### HOW OFTEN DO OLDER CANCER PATIENTS FALL PRIOR TO AND DURING THE FIRST SIX MONTHS AFTER DIAGNOSIS?

M. Puts<sup>1</sup>, J. Monette<sup>2</sup>, V. Girre<sup>3</sup>, M. Monette<sup>2</sup>, C. Wolfson<sup>4</sup>, G. Batist<sup>2</sup>, H. Bergman<sup>2</sup>, *1. Lawrence S. Bloomberg Faculty of Nursing, University of Toronto, Toronto, Ontario, Canada, 2. Jewish General Hospital, Montreal, Quebec, Canada, 3. Centre Hospitalier Departemental, La Roche sur Yon, France, 4. McGill University Health Centre, Montreal, Quebec, Canada*

Introduction: Evidence suggests cancer patients are at high risk for falls due to disease and treatment but this has not been frequently stud-

ied in older newly diagnosed cancer patients prospectively. Objectives 1) To explore the number of older adults who report a fall during the course of the six months after diagnosis; 2) To explore if those who fell are frailer than those who did not fall. Methods: Patients aged 65 and older with a new cancer diagnosis using a prospective pilot study, Jewish General Hospital, Montreal, Canada. Falls in the previous three months were assessed at baseline, three and six month's follow-up. The frailty markers and functional status was obtained at baseline, three and six month's follow-up. Chi-square and t-tests were used to compare the fallers to the non-fallers. Results: During the six month follow-up period, 17 participants (15.2%) reported one or more falls. Fifteen participants reported one or more falls prior to baseline. The fallers and non-fallers were not different in terms of health and functioning. None of the sociodemographic and health characteristics were associated with falls. Conclusion: Falls are common in cancer patients. Fifteen percent of participants reported one or more falls during the six month follow-up. 13% had a one or previous fall(s) prior to the cancer diagnosis. The fallers were not frailer than the non-fallers, nor did they differ in terms of health and functional status.

#### **A SYSTEMATIC REVIEW OF UNMET NEEDS OF NEWLY DIAGNOSED OLDER CANCER PATIENTS RECEIVING TREATMENT**

M. Puts, A. Papoutsis, E. Springall, A. Tourangeau, *Lawrence S. Bloomberg Faculty of Nursing, University of Toronto, Toronto, Ontario, Canada*

Cancer and its treatment can lead to physical disability, psychological distress and increased health care needs. No systematic review on needs in older adults has been conducted. Research questions: 1) what are the unmet care needs of older persons diagnosed with cancer that are undergoing active cancer treatment? 2) What are the predictors of unmet needs of older persons while undergoing active cancer treatment? Methods: a systematic review of the literature published between January 1996 and December 2010 was completed. Manuscripts could be published in English, French, Dutch or German searching the Medline, Embase, Psycinfo, Cinahl and the Cochrane Library databases. The literature search was performed by two researchers with the assistance of a university librarian. Abstracts were reviewed by two reviewers for inclusion. Results: Thirty studies were included. A significant proportion of newly-diagnosed patients undergoing cancer treatment had unmet needs, ranging from 15% to 93%. The most common needs varied by study but included psychological needs, information needs, and needs in the physical domain. Most studies showed that the level of unmet needs was highest after diagnosis and start of treatment and decreased over time. Predictors of unmet needs included: younger age, female gender, depression, physical symptoms, marital status, treatment type, income and education. Conclusions: The level of unmet needs is high, and the most common needs are psychological and information needs. More research is needed which would focus on the needs of older adults with comorbid conditions, and how these comorbid conditions influence the level of unmet needs.

#### **THE ROLE OF FEVER IN CLARIFYING THE CANCER SYMPTOM CLUSTER OF PAIN, FATIGUE, AND SLEEP PROBLEMS**

R.B. Francoeur, *Adelphi University, Garden City, New York*

Objectives: Sickness behavior theory posits fever as the initial symptom of illness that triggers and aggravates pain and other symptoms. This study assesses whether pain-based symptom clusters co-moderated by fever can explain symptom clusters in the literature of pain/fatigue/sleep problems. Methods: Secondary data were from 268 outpatients (ages: 30-90; 97.4% over 40; 85.8% over 50) initiating palliative radiation for bone pain. Frequencies were calculated across ordinal categories for degree of control over physical symptoms and Depressed Affect, an indicator of sickness malaise. Three descriptive

quadratic and moderated multiple regressions (QMMRs) tested whether the Pain-Depressed Affect relationship was moderated by each symptom (i.e., Fatigue-weakness, Fever, Sleep) and symptom pair. An explanatory QMMR was executed with the three 3-way Pain-related interactions, the remaining 3-way interaction (Fever/Fatigue-weakness/Sleep), and all derivative interactions/terms. Results: In a descriptive QMMR, Pain/Fatigue-weakness/Sleep was tentatively significant ( $p=.102$ , increasing slightly in an explanatory run). Pain/Fever/Sleep was significant ( $p<.05$ ) only as a descriptive QMMR. Pain/Fever ( $p<.05$ ) and Pain/Fever/Fatigue-weakness ( $p<.01$ ) were robust in descriptive and explanatory runs, and Sleep-related interactions became newly significant in the explanatory run. Post-hoc analysis revealed Sleep (no control) magnified the Pain-Depressive Affect relationship only when there was no control of Fever. Fever (no control) magnified the Pain-Depressive Affect relationship when there was no control of Fatigue-weakness—at six times greater than the buffering effect when Fever was completely controlled. Conclusions: Fever is supported as a sentinel symptom that aggravates pain and malaise in sickness behavior and helps explain the symptom cluster of pain/fatigue/sleep problems.

#### **CANCER OF THE PALATE; 2-YEARS TO DIAGNOSIS: A CASE REPORT WITH REVIEW OF THE LITERATURE**

K.E. Noel<sup>1,2</sup>, M.S. Cappuccilli<sup>1</sup>, J. York<sup>1,2</sup>, S. Zwetchkenbaum<sup>2</sup>, *1. Community Health, UMDNJ-New Jersey Dental School, Somerdale, New Jersey, 2. UMDNJ-School of Osteopathic Medicine, Stratford, New Jersey*

Oral squamous cell carcinoma (OSCC) makes up more than 90% of all oral malignancies. This disease has the potential to have a major negative impact on a patient's quality of life. All areas of the oral cavity can be affected. The initial clinical appearance of OSCC can be deceiving; presenting in some cases as a barely noticeable white or red spot on the oral mucosa. Early surface lesions can be treated surgically with a resultant high cure rate. Most lesions are diagnosed at the stage when the neoplasm is invading the underlying sub-mucosal regions with ready access to nerves and vasculature; arteries, capillaries, veins and lymphatics. Our patient is a 74 year old woman who presented with a chief complaint of "an infection in the upper part of my mouth", "painful sore throat radiating to ears and trouble swallowing". A liquid diet resulted in weight loss of about 25-pounds. Oral exam revealed a palatal mass that the patient claimed was present for more than 2-years. The population segment most frequently affected by OSCC is the over 40-age group. With an increasingly aging population; it is essential for the healthcare community to employ aggressive cancer detection methods in order to identify malignant oral lesions early. This would require clinicians, who treat senior patients to receive education and training with a focus on identifying pathologic changes on the visible surfaces of the oral mucosa. Preclinical curriculum for dental and medical students should also provide greater emphasis understanding oral mucosal changes.

#### **PHYSICIANS DISCUSS BENEFITS, BUT NOT RISKS OF CANCER SCREENING: A LOOK AT THE HEALTH AND RETIREMENT STUDY**

K. Garcia, E. Crimmins, *University of Southern California, Los Angeles, California*

A high percentage of older Americans undergo cancer screening well past the recommended age for routine screening. Due to insufficient evidence of the mortality benefit of screening adults beyond a certain age, individualized screening decisions are of critical importance. Although screening guidelines recommend discussing the risks and benefits with a health care provider (HCP), there has been limited information on whether these discussions occur. We examined the prevalence of patient-provider discussions before making a decision to screen for breast or prostate cancer by age. Data were analyzed from the ninth wave (2008) of the Health and Retirement Study, a nationally representative study

of individuals born in 1960 or earlier and their spouses. The analytic sample included 1044 individuals 40 years and older with no history of breast or prostate cancer who completed a cancer screening module, and reported receiving a test (mammogram/PSA test) or had discussed the option with a HCP in the previous two years. Overall, 66.9% of respondents (40-69: 69.1%; 70+:63.6%) reported having a discussion about screening with their HCP before making a decision. HCPs discussed the pros of a test in ~75% of the discussions in both age groups but infrequently addressed the cons (40-69: 12.1%; 70+:15.6%). Only 12.9% of respondents reported discussion of both the pros and cons of screening. There was no significant relationship between age and having a discussion ( $P=0.12$ ) or discussion of the pros ( $P=0.91$ ) or cons ( $P=0.15$ ). Our findings suggest adults are not being fully informed by HCPs, especially among older ages.

## SESSION 2150 (POSTER)

### PHYSICAL ACTIVITY & EXERCISE

#### CHANGES IN PATTERNS OF PHYSICAL ACTIVITY IN A MOUSE MODEL OF AGING

S.L. Hong, A. Houston, S.J. Barton, G.V. Rebec, *Indiana University, Bloomington, Indiana*

Physical activity and exercise are key components of healthy aging. We tracked changes in amount and distribution of exercise wheel activity in a normally aging mouse. Eleven mice were placed into individualized cages with exercise wheels at age 5 weeks, where the number of complete revolutions of the wheel was recorded hourly over a period of 6 to 7 months (equivalent to teens to early middle age). The mice were kept in constant 12-hour light (7AM-7PM) and dark (7PM-7AM) cycle. Because mice are normally most active in the dark and were undisturbed once the lights were turned off, we analyzed only the patterns of exercise wheel use from 7PM-7AM. Data were taken from the first and last 30 days that the mice spent within the cage. Interestingly, we did not observe significant declines in the amount of exercise engaged in by the mice in terms of either the maximum number of revolutions within an hour or the average over a one month period. We also analyzed the distribution of activity using information entropy. With age, the entropy of exercise wheel revolutions decreases, indicative of a narrower distribution. Similar to humans, heterogeneity of variance in the amount and pattern of exercise increased with age, supporting the idea of increased inter-individual variability with age. Our results suggest that the aging process alone does not result in a decrease in levels of physical activity. Instead, aging results in a narrowing of the distribution of high and low volume bouts of physical activity.

#### STRENGTHENING EXERCISE FOR OLDER ADULTS: COGNITIVE BENEFITS AND SALIVARY BDNF

V. Yerokhin<sup>1</sup>, C. Anderson-Hanley<sup>1</sup>, M. Hogan<sup>2</sup>, M. Dunnam<sup>3</sup>, D. Huber<sup>3</sup>, S. Osborne<sup>3</sup>, M. Glennon<sup>2</sup>, M. Shulan<sup>3</sup>, *1. Union College, Schenectady, New York, 2. National University of Ireland, Galway, Ireland, 3. Veterans Affairs Medical Center, Albany, New York*

Exercise may help older adults offset declines in cognition (Colcombe et al., 2004) and may even promote neurogenesis (Erickson et al., 2011). Recent research (Anderson-Hanley, 2010) has shown similar promise for strengthening exercise an alternative to aerobic exercise which may be contraindicated in some older adults with cardiovascular risk factors. We recently reported neuropsychological and neurophysiological benefits following ten weeks of strengthening exercise for older adults with and without dementia (Yerokhin, 2011). The mechanism of change is unclear. A variety of biomarkers linking exercise to brain health are under investigation. Brain Derived Neurotrophic Factor (BDNF) has been found to promote neuronal development, while low levels of BDNF have been associated with deteriorated working memory (Erickson et al., 2011). BDNF is typically measured in serum,

but blood draws can be a deterrent to research participation. Some researchers have begun investigating BDNF via saliva as a non-invasive, cost-effective method (Mandel et al., 2011). Salivary BDNF was measured in a subset of 11 older adults participating in the ten-week strengthening exercise program noted above (age = 72; education = 12). Salivary samples were collected pre-, mid-, and post-exercise. Neuropsychological function was assessed pre- and post-exercise. Increased salivary BDNF was associated ( $r = -.52$ ) with decreased time to complete Color Trails (B-A). This pilot lends credibility to the novel use salivary BDNF may be a viable biomarker of improved executive function associated with exercise.

#### PHYSICAL ACTIVITY OF OLDER ADULTS RELATIVE TO THE BUILT AND NATURAL GEOGRAPHY OF WHERE THEY LIVE

K. Tsunoda<sup>1</sup>, Y. Soma<sup>1</sup>, N. Kitano<sup>1</sup>, T. Muraki<sup>2</sup>, K. Hotta<sup>2</sup>, I. Sanada<sup>2</sup>, T. Monma<sup>1</sup>, T. Okura<sup>1</sup>, *1. University of Tsukuba, Tsukuba, Ibaraki, Japan, 2. Ibaraki Prefectural University of Health Sciences, Ami, Ibaraki, Japan*

In this cross-sectional study, we investigated whether total physical activity (PA) of older adults is related to environmental characteristics as estimated by a geographic information system. We randomly selected 3,000 rural Japanese adults aged 65–85 years, and obtained 521 eligible samples (73.3±5.2 years old). We estimated residential density, built environmental attributes, green space, altitude, street length, and number of street intersections within each 1 km grid square. Scores for these items were divided by tertile. Additionally, we assessed distances from residential addresses to public transportation, medical facilities, shops, recreational facilities, and parks. Each distance was categorized as short ( $\leq 500$  m), middle ( $\leq 1000$  m), or long ( $> 1000$  m). Total PA, including leisure-time, household, and occupational PA, was assessed using the physical activity scale for the elderly (PASE). An analysis of covariance was performed, controlling for age, gender, education, and clinical history. Older adults living in areas with the longest tertile of street length, which means a good traffic network, were significantly more inactive than those living within the shortest tertile (PASE score: 112.1±55.7 vs. 131.4±63.4 points). Those who lived within a short distance from public transportation (115.4±57.7 vs. 132.6±65.6), medical facilities (117.1±58.6 vs. 138.7±73.9), or shops (114.9±57.0 vs. 137.2±66.9) indicated a lower level of total PA compared with those who lived long distances from these destinations. Several of our findings differ from previous studies. Older Japanese adults who live in a convenient location might be more sedentary than those who live in less convenient locations.

#### WEIGHT-BEARING ACTIVITY AND LINKS TO FOOT HEALTH IN NATIVE AMERICANS WITH DIABETES

E.T. Cuaderes, B.J. Holtzclaw, *College of Nursing, University of Oklahoma HSC, Norman, Oklahoma*

Diabetes, referred to as an accelerated aging disease, contributes to sensory peripheral neuropathy which has been linked to lower limb abnormalities that raise the risk for foot ulcers (DFU) and amputations. These conditions affect mobility, comfort, and employability, and they account for a significant portion of health care costs worldwide. Since amputations are one of the most common reasons for hospitalizations in Native Americans (NA), it is of critical importance to gain insight into DFU risk factors in this population. With inadequate evidence, the American Diabetes Association (ADA) recommends that severe neuropathic individuals consider nonweight-bearing exercise because of the higher risk for ulceration. The physical forces and inflammatory processes of weight-bearing activity (WBA) foot stress may contribute to ulceration but more recent studies have found no link between WBA and ulcers. The purpose of this study was to compare self-reported levels of WBA with foot characteristics that have been known to contribute to DFU. T tests for unequal sample sizes found no differences between

exercisers and nonexercisers in plantar pressures, skin hardness and surface skin temperatures except for higher temperatures at the first metatarsal head ( $p = 0.02$ ) in exercisers, a site that is common for ulceration. Neuropathic individuals tended to have harder plantar skin ( $p \leq 0.04$ ), but contrary to previous findings, lower pressures. A multiple regression analysis revealed that older age predicted more neuropathy and higher plantar pressures. Results of this study partially support the ADA recommendations.

#### **BALANCE CONTROL DURING SEATED TAI CHI**

B.L. Roberts<sup>1</sup>, H. Li<sup>2</sup>, R. Geib<sup>2</sup>, G.N. Waite<sup>2</sup>, P. Lam<sup>4</sup>, G. Paganacco<sup>3</sup>, E. Oggero<sup>3</sup>, 1. *University of Florida, Gainesville, Florida*, 2. *Indiana University School of Medicine, Terre Haute, Indiana*, 3. *University of Wyoming, Laramie, Wyoming*, 4. *Tai Chi for Health Institute, Sydney, New South Wales, Australia*

**Background:** Tai chi consistently has been found to improve balance in older adults. Although seated tai chi is recommended for those unable to do it standing, little is known about balance control while seated. **Purpose:** Use posturography to assess differences between experts and non-expert practitioners of seated tai chi. **Methods:** 5 men and 18 women (mean age=60 years) were recruited from those attending 10-day tai chi workshop. Master (n=3) and senior trainers (n=3) were considered experts because they were certified in seated tai chi and taught instructors. All others were non-experts. While seated in a hard back chair centered on a force platform, participants performed for 1 minute individual Sun style movements (commence, open/close, single whip and wave hands) and then did them in a continuous sequence. All participants were familiar with Sun style. Center of pressure (COP) indices to assess balance were normalized by height. **Results:** For the entire sequence and open/close, experts had significantly greater average velocity and path length ( $p < .05$ ) but not for 95% ellipse of the COP. No significant differences in the COP were found for commence, single whip and wave hands. **Conclusion:** A few differences in balance control in seated tai chi movements were found. Future biomechanical and kinetic studies are needed to determine whether these can be accounted for by quality of the tai chi movements or factors associated with the seated position. More research is needed to determine whether seated tai chi has similar balance enhancing effects as standing tai chi.

#### **EFFECTS OF ACTIVE VIDEO GAMES (WII FIT™) ON SENIOR ADULT BALANCE, FITNESS AND MOOD**

D. Fent, C. Little, K. Garver, C. Murray, J. Todd, *Kinesiology and Health Studies, University of Central Oklahoma, Edmond, Oklahoma*

Active video games are being utilized to increase physical activity levels and potentially improve balance in senior populations. The aim of this pilot study was to assess and compare balance, balance confidence, fitness levels, and mood in six senior adults (approximately 74 years old) recruited from a local retirement center. Two participants were assigned to one of three groups: a traditional balance class, a Wii Fit™ balance program and a control group who refrained from participating in additional daily physical activity. The seniors in the two balance classes participated in 35 minutes of activity consisting of 20 minutes of strength training exercises and 15 minutes of balance exercises twice a week for 6 months. Pre, mid and post assessments were conducted utilizing components of the Senior Fitness Test (chair stand, arm curl, chair sit-and-reach, back scratch and 8-ft. up-and-go) and grip strength to evaluate functional performance measures. Similarly, balance was evaluated utilizing the Berg Balance Scale and the Activities-specific Balance Confidence (ABC) Scale. And, mood was assessed via the Positive and Negative Affect Schedule (PANAS). Differences between pre, mid and post measurements, as well as differences between groups, were analyzed using analysis of variance (SAS) and effect size. There were very few instances in which significant differences ( $p < .05$ ) occurred. However, the majority of comparisons indicated a large effect ( $\eta^2 p > .14$ ). These findings imply that future studies with larger sam-

ple sizes may result in clarification of how Wii Fit™ impacts seniors' balance.

#### **CHANGES IN FITNESS OF THE ELDERLY BASED ON LONGITUDINAL DATA AND INCREASED TENDENCY TO FALL**

M. Kimura, Y. Yamada, Y. Okayama, E. Yamagata, *Kyoto Prefectural University of Medicine, Kyoto, Japan*

The objective of this study was to evaluate the relationship between longitudinal changes in fitness and tendency to fall in the elderly. The subjects were 175 elderly people with analyzable data among those who had participated in annual fitness measurement events over 9 years from 2002 to 2010. Eleven items including the grip strength and walking speed were examined as indices of fitness. During the 9-year observation period, 81 had no incident of falling (Group A), 66 had less than 1 fall per year (Group B), and 28 had 1 or more falls per year (Group C). Changes in the fitness test results were greater in those aged 75 years or above at the beginning of observation than in those aged less than 75 years. The declines of walking speed, grip strength, and agility differed significantly among Groups A, B, and C. The age was higher, and the declines of fitness test results were greater, in Group C than in Group A. These results suggest that a rapid exacerbation of the fitness level as well as a high age is related to increased tendency to fall in elderly people.

#### **THE POSITIVE EFFECT OF PHYSICAL FITNESS ON EXECUTIVE FUNCTIONS IN HEALTHY YOUNGER AND OLDER WOMEN**

J. Payette<sup>1,2</sup>, L. Desjardins-Crépeau<sup>1,2</sup>, S. Mekary<sup>2,3</sup>, F. Lesage<sup>4</sup>, R. Hoge<sup>2,3</sup>, M. Desjardins<sup>4</sup>, C. Gauthier<sup>2,3</sup>, L. Bherer<sup>1,2</sup>, 1. *Université du Québec à Montréal, Montreal, Quebec, Canada*, 2. *Centre de Recherche de l'Institut de Gériatrie de Montréal, Montreal, Quebec, Canada*, 3. *Université de Montréal, Montreal, Quebec, Canada*, 4. *École Polytechnique de Montréal, Montreal, Quebec, Canada*

Many studies suggest that physical exercise training improves cognition. However, few of these have used cardiorespiratory function measures as a factor to discriminate participants on neuropsychological assessment. In this study, 22 younger women (M=24,63; SD=3,69) and 35 older women (M=62,89; SD=5,4) underwent a direct VO<sub>2</sub>max test and a computerized stoop task. For analysis purposes, we separated our sample into two fitness groups using Shvartz & Reibold's (1990) norms on VO<sub>2</sub>max measures. Our results show a Fitness x Condition interaction ( $p < .05$ ) such that higher fit women scored better on measures of executive functions than the lower fit participants. Indeed, they had better scores on the switching condition of a modified Stroop computerized task. No effect was observed on the non-executive condition of this test. Importantly, there was no interaction between age and fitness, thus suggesting that good cardiorespiratory functions have a positive impact on cognition, regardless of age. These results support the notion that physical fitness training could help improve cognition and that this benefit can be explained by higher cardiorespiratory functions as measured by VO<sub>2</sub>max in higher fit participants. This study also demonstrates that the positive effect of improved cardiorespiratory functions on cognition is the equivalent in both younger and older adults.

#### **TESTING THE USE OF INCENTIVES TO INCREASE MODERATE PHYSICAL ACTIVITY IN SEDENTARY OLDER ADULTS**

J. Purath, J. Roll, *WSU College of Nursing, Spokane, Washington*

In many behavioral intervention studies to increase physical activity (PA), older adults increase their activity, but still do not achieve recommended levels of 150 minutes/week or more of moderate-intensity

activity. Contingency management-based interventions (CM) are powerful behavior change interventions. CM delivers incentives contingent on the initiation or completion of a behavior. The strategy of providing incentives to increase PA is endorsed by older adults. However, to date we have limited information on the efficacy of CM to promote activity. This pilot study tested the hypotheses that sedentary older adults who receive a CM intervention will increase 1) objectively measured and 2) self-reported moderate PA. Acceptability and feasibility of the intervention components was also tested. A single-group repeated-measures design with baseline and weekly follow-up for four weeks determined accelerometer and self-reported PA changes overtime in 7 physically inactive older adults. Participants with accelerometer results of 30 minutes of moderate activity on 5 days per week or more received an incentive. Data were analyzed using descriptive statistics and ANCOVA. Based on accelerometer measurement, five of seven participants met or exceeded PA guidelines during all 4 weeks of the study, one met recommendations for 3 of 4 weeks and one was active for 15-30 minute 5 days/week or more. Participants significantly increased their weekly self-reported minutes of moderate activity ( $F=4.9$ ;  $p=0.03$ ) and weekly frequency of moderate activity ( $F=4.9$ ,  $p=0.02$ ). Accelerometer-measured minutes doing moderate PA increased, but not significantly. The project provides initial support for the hypothesis that incentives can increase moderate PA.

#### **EFFECTIVE ADAPTATION OF ENHANCE FITNESS EXERCISE INTERVENTION FOR A SENIOR LIVING SETTING**

J.S. Hahn<sup>1</sup>, B. Fish<sup>2</sup>, 1. Center for Gerontology, Western Michigan University, Kalamazoo, Michigan, 2. Heritage Community, Kalamazoo, Michigan

This session addresses adaptation, implementation, and results of a fitness program in a continuing care retirement facility. The evidence-based Enhance Fitness program was adapted for elders living in independent and assisted living. Due to higher rates of disability, exercises were altered to be more chair-based and moderate. This included lowering the weight lifted in strength training, lowering the number of repetitions, and allowing the use of a walker for some measures and activities. Participants were assessed at many points during the program. Investigators evaluated outcomes for 40 participants. Without controlling for other variables, the number of times a person could stand from a chair in 30 seconds improved for 50% of the participants, stayed the same for 13%, and decreased for 27%. Participants reported improved flexibility, lower pain, and increased strength after participation. We will share outcomes and specific recommendations for exercise adaptation, as well as methods to increase and sustain program participation.

#### **CLINICALLY IMPORTANT EFFECTS OF EXERCISE ON FUNCTIONAL PERFORMANCE IN PATIENTS WITH HEART FAILURE**

E. Cress<sup>1</sup>, M.K. Higgins<sup>2</sup>, R. Gary<sup>2</sup>, 1. University of Georgia, Athens, Georgia, 2. Emory University, Atlanta, Georgia

Background: Exercise interventions improve physical function in patients with heart failure (HF) (Gary et al., 2011), however the clinical importance of these changes on health related quality of life (HRQoL) is not fully understood. Methods: Men and women ( $n=97$ ; 65(13) yrs; 31-91) diagnosed with NYHA II (45%) and III (54%) HF were randomized into exercise (EX;  $n=47$ ) or attention control (AC;  $n=50$ ) for 12 weeks of progressive exercise training. Primary outcomes included the Continuous Scale Physical Functional Performance test (CS-PFP10 test; 0-100; 100, better function), 6-min walk (m), and the Minnesota Living with HF questionnaire (MLHFQ; 0-105; 0, better health). A sequential (hierarchical) regression was used to evaluate the baseline and changes scores adjusted for baseline. Results: MLHFQ: baseline/change AC 37,6(24,9)/-4.8(14.4) EX 39.4(23.7)/-

9.8(19.8) CS-PFP10: baseline/change AC 36.3(15.2)/1.0(9.6); EX 40.7(17.5)/5.6 (8.4)  $\alpha$  6-min walk(m) baseline/change AC 301.1(129.7)/-7.7(72.1) EX337.7(117.5)/27.5(59.3)  $\theta$   $\alpha p=.027$ ;  $\theta p=.012$  Baseline and change of CS-PFP10 accounted for 30.4% ( $R^2=.304$ ;  $p<.001$ ) and 4.7% ( $R^2=.047$ ;  $p=.026$ ) of the variance in the MLHFQ, respectively. One unit change in CS-PFP10 was associated with 0.413 units of improved MLHFQ. Discussion: Where a participant improved functional performance by 5 units the expected improvement in HRQoL would be 2.1 units over that enjoyed by the AC, thus indicating that exercise therapy is clinically important in this sample of patients with HF.

#### **RELATIONSHIP BETWEEN PHYSICAL FUNCTION SELF-PERCEPTION AND PERFORMANCE IN COMMUNITY DWELLING OLDER ADULTS**

R.L. Cromwell, P.E. Meyers, Office of Sponsored Programs, University of Houston-Clear Lake, Houston, Texas

Tools assessing self-report of physical activity in older adults are often used as indicators of actual physical function in older adults. This study examined the relationship between responses on the Medical Outcomes Short Form-20 (SF-20) physical function subscale and physical activity performance. Forty healthy community-dwelling older adults aged  $73.2 \pm 6.6$  years old responded to the SF-20. Participants were then tested using the timed up and go (TUG), backward reach, sit and reach, walking velocity and the gait stability ratio (GSR). Average score for the SF-20 physical function subscale was  $83.3 \pm 15.7$ . Scores for the TUG averaged  $10.4 \pm 2.5$  sec, backward reach  $21.1 \pm 5.2$  cm, sit and reach  $19.9 \pm 8.2$  cm, walking velocity  $2.4 \pm 0.6$  m/s, and GSR  $0.9 \pm 0.2$  steps/m. Regression analyses revealed no significant correlations between perceptions of physical activity and actual performance ( $p > 0.05$ ). These results indicate that self-perceptions of physical function should be used with caution. Tests of physical function should be used whenever possible when assessing older adults physical abilities.

#### **EFFECTS OF GROUP EXERCISE PROGRAM WITH EXERCISE PROGRAM USING I-PAD COMPUTER ON PERCEIVED HEALTH STATUS, FLEXIBILITY, STRENGTH, DEPRESSION, AND COGNITIVE FUNCTION OF THE ELDERLY**

D. Jung<sup>1</sup>, J. Lee<sup>2</sup>, 1. Ewha, Seoul, Republic of Korea, 2. Yonsei, Seoul, Republic of Korea

Purpose: The purpose of this study was to identify the effects of the group exercise program with I-pad computer on perceived health status, flexibility, strength, depression, and cognitive function of the elderly. Methods: A total of 25 subjects were ( $exp=16$ ,  $control=9$ ) elderly of the experimental group and 9 elderly of the control group. The exercise program was carried out one time for 8 weeks as group exercise program and individualized exercise with I-pad computer in their home for daily exercise bases. The dependent variables were measured by Perceived Health Status Scale, The Senior Fitness Test, K-MMSE, and GDS-K. The collected data were analyzed by Fisher's exact test, Chi-square test and t-test, and ANCOVA using SPSS 18.0 program. Results: Overall, group exercise program using I-pad computer was effective on elderly physical strength and cognitive function with significant differences. Perceived health status and depression were not significant different among groups. Conclusion: In this study, the group exercise program and individualized I-pad exercise was effective and safe for the elderly, and resulted in improving physical and cognitive status in the elderly. This demonstrated that the group exercise program with I-pad computer on the basis of the subject's fitness played an essential role in maintaining and improving the health for old adults.

## SHORT-TERM EFFECT OF PHYSICAL ACTIVITY AND OBESITY ON FUNCTIONAL DEPENDENCE IN A SAMPLE OF RURAL ELDERLY IN MEXICO

A. Salinas-Rodríguez, K. Moreno-Tamayo, B. Manrique-Espinoza, M. Tellez-Rojo Solís, *Instituto Nacional de Salud Pública, Cuernavaca, Morelos, Mexico*

The negative consequences of functional dependence (FD) in the elderly are multifold. It undermines their health, self-esteem, perception of well-being and quality of life, exacerbates the burden on hospital services, heightens the demand for health care, and constitutes an important mortality predictor. Among the main risk factors for FD are physical activity and obesity. In order to estimate the effect of physical activity and obesity on the cumulative incidence of functional dependence (FD), a longitudinal cohort study was carried out among a sample of elderly participants in the impact evaluation study of a non-contributory pension program in México. For this study we selected 2,460 elderly without FD in ADLs at baseline. Body Mass Index (BMI), physical activity and covariates were measured at baseline. Katz index was used to assess FD in basic ADLs, both at baseline and follow-up (2007, 2009). The effect of physical activity and obesity on the cumulative incidence of functional dependence was estimated by using a logistic regression model. After 14-months of follow-up, the cumulative incidence of FD in ADLs reached 10.1%. High physical activity was found to reduce FD risk (OR=0.74, IC95%=0.55-0.99), and the association between obesity and FD was marginally significant (OR=1.36; IC95%=0.96-1.94). Also, higher risk for FD (OR=1.68; CI95%=1.26-2.25) was observed for elderly with arthritis and/or arthritis symptoms. High physical activity and obesity constitutes protective factors in the development of FD. Since both of them are modifiable factors, interventions are needed to increase physical activity and reduce levels of BMI.

## META-ANALYSIS MODERATOR ANALYSES OF SUPERVISED EXERCISE INTERVENTIONS AND ANTHROPOMETRIC OUTCOMES AMONG HEALTHY OLDER ADULTS

J. Chase, T. Ruppert, L.J. Phillips, V.S. Conn, *University of Missouri-Columbia, Columbia, Missouri*

**Purpose:** To determine if characteristics of supervised exercise interventions are associated with better anthropometric outcomes among healthy older adults. **Methods:** Meta-analysis moderator analyses of 11 intervention characteristics were conducted across 48 studies among healthy adults age 60 and older. Potential moderator variables included gender, body mass index (BMI), randomization, number of sessions, number of supervised exercise minutes, number of days over which the intervention was delivered, exercise frequency, exercise intensity, presence of resistance or flexibility components, and type of personnel delivering the intervention. Meta-analysis analogues of regression and ANOVA were used to analyze continuous and dichotomous variables respectively. **Results:** Higher intensity exercise ( $d=0.23$ ) was significantly more effective than lower intensity exercise ( $d=0.20$ ) in improving anthropometric outcomes ( $p=.005$ ). Interventions were similarly effective in improving anthropometric outcomes across demographic, exercise dose, and interventionist characteristics. **Conclusions:** Supervised exercise interventions are effective in positively changing anthropometric outcomes among healthy older adults despite variations across intervention characteristics and subject demographics. Clinicians should consider recommending these interventions for their healthy older adult patients, emphasizing higher intensity exercise for better anthropometric outcomes. Further research could explore mechanisms of enrollment and retention into supervised exercise programs among healthy older adults and subsequent effects on health outcomes and chronic illness prevention in this population.

## EFFECTS OF RESISTANCE TRAINING INTERVENTION ON BALANCE CONFIDENCE AND EXERCISE SELF-EFFICACY

K. Hubble<sup>1</sup>, R. Westrup<sup>1</sup>, K. Bogda<sup>1</sup>, K. Garver<sup>1</sup>, M. Powers<sup>1</sup>, M. Gray<sup>2</sup>, *1. University of Central Oklahoma, Edmond, Oklahoma, 2. University of Arkansas, Fayetteville, Oklahoma*

The purpose of this study was to assess changes in self-efficacy and balance confidence in a one-year resistance training intervention. Fifty-four adults over the age of 75 years were recruited. Subjects were randomly assigned to one of three groups: low velocity (LV), high velocity (HV), or the control group. Assessments included an Exercise Self-Efficacy (ESE) Survey and the Activities-specific Balance Confidence (ABC) Scale. Measurements were taken at baseline, six months, and 12 months. Repeated measures ANOVA and univariate effect sizes were conducted for analysis. No significant interactions or time effects were found. Effect sizes indicate a moderate improvement in balance confidence in the HV group ( $d = 0.47$ ) and a strong decline in exercise self-efficacy in the LV group ( $d = -0.93$ ). Although non-significant statistically, results suggest that HV training may be more beneficial for improving balance confidence. Reasons for the decline in exercise self-efficacy for LV was not evident, thus further research is warranted.

## EFFECTS OF RESISTANCE TRAINING ON MOOD, LIFE SATISFACTION, AND DEPRESSION

K. Garver<sup>1</sup>, K. Bogda<sup>1</sup>, R. Westrup<sup>1</sup>, K. Hubble<sup>1</sup>, M. Gray<sup>2</sup>, M. Powers<sup>1</sup>, *1. University of Central Oklahoma, Edmond, Oklahoma, 2. University of Arkansas, Fayetteville, Arkansas*

The purpose of this one-year study was to assess the impact of resistance training protocols on mood, depression, and life satisfaction among older adults. Participants over the age of 75 years were randomly assigned to the active control (AC), low velocity (LV), or high velocity (HV) group ( $n = 54$ ). All groups trained two days per week following their designated protocol. Participants were assessed by the Visual Analog Mood Scale (VAMS), Center for Epidemiological Studies Depression Scale (CES-D), and the Satisfaction with Life Scale (SLS) at baseline, six months, and one year. Repeated measures ANOVAs were used for analyses and univariate effect sizes were calculated. Results indicated no significant group-by-time interactions for any of the three scales. There were significant time effects for the VAMS subscales of afraid ( $F = 3.79$ ,  $p = .033$ ), happy ( $F = 6.60$ ,  $p = .009$ ), and tense ( $F = 6.72$ ,  $p = .015$ ). Dependent t-tests indicated significant differences between baseline testing and six-month testing as well as baseline testing and 12-month testing for happy and tense ( $p \leq .05$ ), while there were no significant differences for afraid. The strongest effects for improvements were in the AC group for sad, angry, energetic, and happy ( $d \geq .80$ ). LV had a strong effect for an increase in depressive symptoms ( $d = -1.47$ ). While preliminary, results indicate exercising without weights has more positive effects on mood than exercising with weights.

## RELATIONSHIP BETWEEN DEPRESSION SYMPTOMS AND LEG STRENGTH OR ENDURANCE CAPACITY IN HEALTHY ELDERLY

E. Yamagata<sup>1,2</sup>, Y. Yamada<sup>1</sup>, Y. Sugihara<sup>1</sup>, M. Komatsu<sup>1</sup>, M. Kimura<sup>1</sup>, Y. Okayama<sup>1</sup>, *1. Kyoto Prefectural University of Medicine, Kyoto, Japan, 2. Doshisha University, Kyoto, Japan*

**Background:** The aim of this study was to examine the relationship between geriatric depression scale (GDS) and elements of physical fitness in the community-dwelling, healthy, female elderly in Japan. **Methods:** This is a cross-sectional study. A total of 886 healthy, female elderly aged 65- years living in Kyoto prefecture who were willing to participate the physical performance tests were participated in this study. One leg standing, leg power, leg strength, grip strength, endurance capacity, trunk flexion, usual and maximal gait speed, chair stand, chair stepping, and functional reach tests were examined. 15-item GDS and a battery of health status questionnaires were used to assess the participants' health status. **Results:** The 21 percent of the participants scored five or

less in GDS and were categorized a group of depressive symptoms (D group). Leg power, leg strength, endurance capacity, gait speed and chair stepping were significantly less ( $P < 0.05$ ) in D group than in the group without depressive symptoms (ND group). After adjustment with physical characteristics and eating and physical activity habits as co-variances, leg power, leg strength, and endurance capacity were still significantly less in D group than in ND group ( $P < 0.05$ ). Conclusions: Non-negligible number of healthy elderly reported depressive symptoms. The leg power and strength were associated with depressive symptoms independently of physical activity habits. The results suggest that increase of leg strength and endurance capacity might be a factor to improve depression symptoms in the elderly.

### THE QUANTITY OF PHYSICAL ACTIVITY FOR DISCRIMINATING LOW-GAIT SPEED IN OLDER ADULTS

Y. Osuka, N. Yabushita, S. Seino, M. Nemoto, S. Jung, Y. Okubo, R. Figueroa, K. Tanaka, *University of Tsukuba, Tsukuba, Japan*

**Background:** Although physical activity is well-associated with usual gait speed (UGS), quantity of physical activity for discriminating low-gait speed is unclear after adjusted for various confounders (e.g., age, disease). Classification and regression tree (CART) analysis can identify the interaction by stratification and segmentation. The purpose of this study was to identify the association between objective physical activity and UGS using CART analysis in older adults. **Methods:** A cross-sectional analysis was conducted on data from 466 older Japanese adults, aged 60-89 years ( $73.2 \pm 6.0$  years: 104 male, 362 female). Subjects were interviewed about medical history, joint pain, cohabitation, smoking, drinking, depression. Physical activity (step counts: SC) was assessed by using a uniaxial accelerometer. UGS less than the lowest quarter ( $\leq 1.05$  m/s) was defined as low-UGS. CART analysis was performed to identify a hierarchical order and interaction between SC and other variables (age, number of medications, low back pain, knee joint pain, depression) with low-UGS. **Results:** Age and SC were significantly associated with low-UGS. Age ( $\geq 77.5$  years) was the most decisive factor to increase the prevalence of low-UGS. For those aged less than 77.5 years, there was no factor associated with low-UGS. SC ( $< 7661$  steps/day) was the secondary decisive factor to increase the prevalence of low-UGS in those aged over 77.5 years. Misclassification rate of this tree was 19.1%. **Conclusion:** It is suggested that adults aged 78 years or over who do not participate in gait activity ( $\leq 7500$  steps/day), are likely to have low-UGS.

### ASSOCIATION BETWEEN INACTIVITY AND METABOLIC SYNDROME AMONG JAPANESE OLDER WOMEN

R. Kawakami<sup>1,2</sup>, H. Murakami<sup>2</sup>, Y. Gando<sup>1</sup>, M. Higuchi<sup>1</sup>, M. Miyachi<sup>2</sup>, *1. Waseda University, Tokorozawa, Japan, 2. National Institute of Health and Nutrition, Tokyo, Japan*

**PURPOSE:** Moderate-to-vigorous intensity physical activity (MVPA) are beneficially associated with the prevention of metabolic syndrome (MetS). Recent studies have shown that sedentary time, such as sitting and watching television evaluated by using questionnaire, is related to developing MetS. However, it is unclear whether day-long inactivity time assessed objectively is associated with MetS. Therefore, this cross-sectional study aimed to examine the association between inactivity determined by a tri-axial accelerometer and MetS among Japanese older women. **METHODS:** A total of 118 women, aged 61 to 80 years, participated in this study. Time spent of inactivity and MVPA ( $> 3.0$  METs) were measured objectively by a tri-axial accelerometer. The time spent in inactivity was defined as the sum of sedentary ( $< 1.1$  METs), and non-wearing time such as taking a bath and sleeping. The Japanese criteria for MetS were used to evaluate and categorize as MetS or pre-MetS. The association between inactivity and MetS was analyzed using logistic regression with adjusted for MVPA. **RESULTS:** The body mass, %body fat, and fasting glucose in the longer inactivity group were significantly higher than those in the shorter inactivity group. Moreover, the odds ratio in both MetS and pre-MetS in the longer inactivity

group was 6.36 (95%CI 1.35-29.94) compared with the shorter inactivity group. However, there was no association between time spent in inactivity and MetS (OR 4.12, 95%CI 0.45-37.82). **Conclusion:** These results of the cross-sectional study suggest that the longer time spent in inactivity was associated with higher risk of MetS/pre-MetS in Japanese older women.

### MODERATE PHYSICAL ACTIVITY AND WATER DISTRIBUTION IN COMMUNITY-DWELLING ELDERLY IN JAPAN

M. Ikenaga<sup>1</sup>, Y. Yamada<sup>3</sup>, N. Takeda<sup>2</sup>, Y. Higaki<sup>1,2</sup>, H. Tanaka<sup>1,2</sup>, A. Kiyonaga<sup>1,2</sup>, N. Group<sup>2</sup>, *1. Graduate School of Sports and Health Science, Fukuoka University, Fukuoka, Fukuoka, Japan, 2. The Fukuoka University Institute for Physical Activity, Fukuoka, Fukuoka, Japan, 3. Kyoto Prefectural University of Medicine, Kyoto, Kyoto, Japan*

Regular daily physical activity is associated with muscle atrophy (Sarcopenia) in the elderly. We previously reported that the expansion of extracellular water (ECW) relative to intracellular water (ICW) masked actual muscle cell atrophy with aging. We investigated the association between the duration of moderate physical activity ( $> 3$  METs, MPA) and the distribution of cell water. Participants were 484 men and 512 women free-living Japanese, aged 65-93. Physical activity (number of steps and intensity of activity) was measured by a triaxial accelerometer. The total water (TW), ICW, and ECW in the upper and lower extremities was estimated by segmental multifrequency bioelectric impedance spectroscopy (S-BIS). Knee isometric extension strength and grip strength were measured to assess the lower and upper muscle strength. There is a positive correlation between MPA and ICW after adjustment for age, sex, and body weight. Men and Women data were divided into quartiles based on the duration of MPA. Lower and upper muscle strength were decreased significantly ( $p < 0.05$ ) in the lowest quartile ( $< 13$  min/day). In addition, lower and upper extremities ICW/TW ratios were decreased ( $p < 0.001$ ), and ECW/TW ratios were increased significantly ( $p < 0.001$ ) in the lowest quartile. Duration of MPA was associated with water distribution and muscle strength. The results suggest that the very low MPA ( $< 13$  min/day) may be associated with a water imbalance in the elderly.

### EXPLORING LEVELS, TYPES, AND DEMOGRAPHIC DETERMINANTS OF PHYSICAL ACTIVITY IN OLDER ADULTS RAISING CHILDREN

T.L. Young<sup>1</sup>, M. Janke<sup>2</sup>, *1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. University of South Florida Polytechnic, Lakeland, Florida*

The number of older adults engaged in raising children has increased over the past twenty years. Researchers suggest older adults who raise children may be at an increased risk for health issues. Physical activity (PA) may reduce health issues experienced by these caregivers. However, there is a lack research that specifically examines levels, types, and predictors of PA engagement in this population. Using a national representative sample of older adults who are raising children from the 2010 Health and Retirement Study, levels, types (i.e. vigorous, moderate, and light), and demographic predictors of PA were examined using t-test, descriptive, and linear regression analyses. The sample consisted of 251 older adults with a mean age of 69. On average, older adults had two chronic illnesses and rated their health as good. T-test results indicated a significant mean difference among the types of PA suggesting caregivers engaged in mild PA more than moderate or vigorous PA. Linear regression analyses illustrated that self-rated health and number of chronic conditions was associated with engaging in vigorous, moderate, and mild PA. In addition, race was associated with vig-

orous PA and education, Hispanic ethnicity, and being married was related to mild PA. Limitations and future directions for research are discussed.

### IS AWARENESS AND PROXIMITY TO COMMUNITY-BASED FITNESS RESOURCES PREDICTIVE OF PHYSICAL ACTIVITY IN OLDER ADULTS?

C. Dondzila, A. Swartz, R. Azen, K. Finco, S. Strath, *University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*

**PURPOSE** The purpose of this study was to examine if awareness and distance from community-based fitness resources (CBFR) could predict physical activity (PA) engagement in older adults. **METHODS** Two hundred seventy seven older adults ( $72.7 \pm 7.8$  years) were randomly recruited from three spatial tiers ( $\leq 1$ , 1-2, and  $>2-5$  miles) surrounding six sites with CBFR. Participants were mailed and returned a CBFR questionnaire and the CHAMPS PA survey. Low/high moderate-vigorous PA (MVPA) was delineated based upon MVPA median values. Chi square tests were performed to examine if awareness of CBFR differed across spatial tiers. Logistic regression analyses were performed to examine if awareness and distance from CBFR were significant predictors of high MVPA, after controlling for age, gender, education, income, and car ownership. **RESULTS** There were no differences in awareness of CBFR across spatial tiers ( $\chi^2=4.7$ ,  $df=2$ ,  $p=0.93$ ). Within this sample 45% were aware of CBFR in  $\leq 1$  mile radius, 60% in the 1-2 mile radius, and 44% in the  $>2-5$  mile radius. Awareness of CBFR was not a significant predictor of high MVPA, whereas distance from CBFR was. Specifically, those residing in the  $>2-5$  mile radius were 2.4 times more likely to engage in high MVPA compared with those in the  $\leq 1$  mile radius. **DISCUSSION AND CONCLUSION** The lack of difference in awareness of CBFR across spatial tiers, coupled with the increased likelihood to accrue more MVPA the further one resides from CBFR, indicate that other determinants of PA engagement in this population are paramount and warrant greater exploration.

### THE EFFECTS OF USING VIRTUAL REALITY GAMING TECHNOLOGY TO PROMOTE PHYSICAL ACTIVITY IN OLDER ADULTS: STATE OF THE SCIENCE

Y. Chao, Y. Scherer, *SUNY-BUFFALO, Amherst, New York*

**Purpose:** Virtual reality offers 3-dimensional interactive environments and hierarchical tasks. Gaming technology such as the Nintendo Wii™ gaming system is increasingly used as a therapeutic tool in health care. The purpose of this literature review is to summarize and synthesize the effects of using virtual reality gaming technology to promote physical activity in older adults. **Methods:** To identify relevant studies published in English, a search was conducted on MEDLINE, CINAHL, PubMed, and PsycINFO. The search was limited to empirical studies and particular attention was paid to the effects of physical function, cognition and psychosocial benefits in older adults. **Results:** A total of 8 empirical studies that met the inclusion criteria were included in this review. Sample size ranged from 1 to 31 and age of participants ranged from 60 to 92 years old. Settings included hospitals, long term care settings, and community-based environments. The frequency of the exercise ranged from 2 to 4 days a week and the duration of exercise programs ranged from 1 to 12 weeks. Positive effects included improving upper and lower extremity function (e.g., strength, flexibility, balance, and mobility), improvements in cognition, anxiety, depression, and quality of life. Improved socialization and motivation to exercise were also reported. **Conclusions and implications:** Using virtual reality gaming technology does show promise as an intervention to promote physical activity in older adults. Additional research is needed to test its effectiveness on elderly in different types of long term care facilities utilizing large sample size.

### PHYSICAL ACTIVITY AND ACTIVITY PARTICIPATION PREDICT ONE YEAR MORTALITY IN LONG TERM CARE – THE SHELTER PROJECT

M.D. Denkinger<sup>1</sup>, A. Lukas<sup>1</sup>, D. Fialova<sup>4</sup>, J. Gindin<sup>2</sup>, R. Bernabei<sup>3</sup>, G. Onder<sup>3</sup>, T. Nikolaus<sup>1</sup>, *1. Agaplesion Bethesda Hospital, Ulm, Germany, 2. Kaplan Medical Center, Rehovot, Israel, 3. Università Cattolica del Sacro Cuore, Rome, Israel, 4. Dept of Geriatrics and Gerontology, Charles University, Prague, Czech Republic*

**Background:** Despite its importance in population-based studies physical activity and participation have rarely been examined with respect to mortality in long term care facilities. **Methods:** The Services and Health for Elderly in Long TERM care (SHELTER) study is a prospective cohort study that was conducted in 57 nursing homes in seven countries from the European Union and Israel. A complete dataset with regard to mortality was available from 2758 residents. All participants were assessed using the InterRAI LTCF instrument. The follow-up time was twelve months. Different activity dimensions were tested separately in multiple logistic regression models controlled for common risk factors (age, sex, BMI, drugs, comorbidity, different diseases, unstable condition, immobility, oxygen therapy, activities of daily living, fixation). Activity levels were estimated via different scores, ranked into quartiles: (a) participation in different activities, (b) all physical activities, (c) psychosocial aspects of physical and cognitive activities “i.e. feeling involved” and (d) physical exercise in last three days. **Results:** Participation (a) and physical activity (b) significantly predicted mortality with an odds of 1.64 (least participation versus highest participation, CI 95% 1.18-2.28) and an odds of 1.86 (least activity versus highest activity, CI 95% 1.25-2.75). Intermediate quartiles were also significantly different from the highest activity level. Sense of involvement (c) and physical exercise in the last three days (d) were not related to one year mortality. **Discussion:** Participation in cognitive and physical activities and overall physical activity significantly influenced survival in nursing home residents and should be included in common prediction models.

### IMPACT OF HIGH-VELOCITY TRAINING BODY COMPOSITION OF ELDER ADULTS

M. Powers<sup>1</sup>, K. Garver<sup>1</sup>, K. Hubble<sup>1</sup>, K. Bogda<sup>1</sup>, R. Westrup<sup>1</sup>, M. Gray<sup>2</sup>, *1. University of Central Oklahoma, Edmond, Oklahoma, 2. University of Arkansas, Fayetteville, Arkansas*

The purpose of this study was to examine changes in body composition following high-intensity, low-velocity resistance training (LV) and low-intensity, high-velocity resistance training (HV). Thirty-seven adults over the age of 75 were randomly assigned to a LV or HV group. Both groups trained two days per week using free-weight resistance. HV completed 24 weeks of LV before transitioning to HV. Body composition was assessed as fat mass, lean tissue mass, total mass, and percent body fat using a GE Lunar iDXA total body scan at baseline, 24 weeks, and 52 weeks. Repeated measures ANOVAs were conducted for each dependent variable. Results indicated a significant time effect for the total mass variable ( $p < .05$ ) with total mass decreasing from 162.18 pounds to 160.39 pounds. There was also trend toward a time effect for fat mass ( $p = .07$ ). Fat mass decreased by 1.20 pounds. The interaction effect approached significance for lean tissue mass ( $p = .08$ ). The LV group experienced a slight increase in lean tissue mass (+0.34 pounds) from 24 to 52 weeks, while the HV group experienced a decrease in lean tissue mass (-1.43 pounds) during the same time period. No significant effects were observed for percent body fat. These results indicate that both LV and HV training may reduce total body mass and fat mass. Although non-conclusive, there is evidence that LV training may be more beneficial for lean tissue mass. This may be due to the training intensity which was higher in the LV group.

## IS OCCUPATIONAL PHYSICAL ACTIVITY RELATED TO DISABILITY IN OLD AGE? THE SNAC-KUNGSOLMEN STUDY

E. Rydwick, A. Welmer, S. Angleman, L. Fratiglioni, H. Wang, *Neurobiology, Caring Science and Society, Aging Research Center, Karolinska Institutet, Stockholm, Sweden*

**Objectives:** It is known that leisure-time physical activity (PA) is related to number of years lived without disability. However, less is known about the relationship between occupational PA and disability in old age. Therefore, the aim of the study is to investigate if occupational PA during the longest held occupation in mid-life is related to late-life disability. **Methods:** The study population was derived from the Swedish National Study on Aging and Care, and consisted of a random sample of 1804 subjects, aged 70+ years. Occupational PA during the longest held occupation in relation to disability in old age was analyzed with logistic regression. **Results:** There were no significant relationship between occupational PA and disability in activities of daily living (ADL) after controlling for demographic and health-related factors. However, moderate occupational PA decreased the risk for dependency in personal ADL (OR=0.34 95% CI 0.12-0.98) in white collar workers. **Conclusions:** The study showed that occupational PA in mid-life was not associated with either PADL or IADL disability in late-life. However, moderate occupational PA decreased the risk of PADL disability among white but not among blue collar workers. These findings highlight the importance of taking into account level and the quality of PA, either at work or at leisure time.

## PERCEPTION OF NEIGHBORHOOD BUILT ENVIRONMENT AND HEALTH ON WALKING IN MINORITY URBAN OLDER ADULTS

A.B. Mitchell, *University of Pennsylvania, Philadelphia, Pennsylvania*

A descriptive, cross sectional, non-experimental survey with a sample of 140 minority adults over age 65 was conducted in a large northeastern city. The purpose was to describe the relationship of self-reported health status and perceived neighborhood built environment with the amount of self-reported walking. The theoretical framework was based on the Ecological Theory of Aging (Nahemow & Lawton). The quantitative instruments used were: the SF-12 Health Survey, Neighborhood Environment Walkability Scale (NEWS), and the Community Healthy Activities Model Program Seniors (CHAMPS). Multiple regression analysis found that older age ( $p = .001$ ), BMI ( $p = .002$ ), and gender ( $p = .007$ ) were significant for less total minutes of walking per week. For transport walking, having access to a car ( $p = .013$ ) 48 less walking minutes, and health problems such as pain or unsteady gait ( $p = .018$ ) 27 less walking minutes per week were significant, yet the number of comorbidities was not. In non-transport walking, BMI was most significant, ( $p = .006$ ). For NEWS subscales, significant were access to services ( $p = .041$ ) for transport walking and neighborhood surroundings ( $p = .040$ ) for non-transport walking. Crime and traffic subscales were not significant. For the SF-12, the PCS ( $p = .004$ ) was significant for total walking and transport walking ( $p = .011$ ), while the MCS ( $p = .046$ ) was significant for non-transport walking. The significance of age, gender and BMI were similar to findings with non-minority samples. Health perceptions were statistically more significant than built environment features. Implications are to address health symptoms and to modify the environment to accommodate health conditions, and promote neighborhood walking.

## "IT'S GOOD FOR ME": PHYSICAL ACTIVITY IN OLDER ADULTS WITH SCHIZOPHRENIA

H. Leutwyler<sup>1</sup>, E. Hubbard<sup>1</sup>, D. Jeste<sup>2</sup>, *1. Physiological Nursing, UCSF, San Francisco, California, 2. UCSD, San Diego, California*

Older adults with schizophrenia are a growing segment of the population yet their physical function is poor. Targeted physical activity interventions to improve their physical function are necessary but cur-

rently not available. Given disordered thought processes and institutionalization, it is likely that older adults with schizophrenia have unique barriers and facilitators to physical activity. The perceptions of older adults with schizophrenia about barriers to and facilitators of physical activity must be considered in order to design a feasible intervention. The purpose of this study was to describe the perceptions of older adults with schizophrenia about barriers and facilitators to engage in physical activities that promote physical function. **Design and Method:** We conducted qualitative interviews with 16 older adults with schizophrenia from a locked facility, a transitional residential facility, and an assertive community treatment center. Data were collected and analyzed with grounded theory methodology. **Results:** The majority of participants expressed interest in becoming more physically active for a variety of perceived benefits including pain management, psychiatric symptom management, vitality, joy, and maintenance of basic function. Key barriers and facilitators to physical activity emerged in two broad categories: Patient and Environmental. The most commonly discussed barriers were physical limitations and no longer feeling like a "spring chicken". Facilitators included ease of access, pride, regularly scheduled activities, friends, and boredom. **Implications:** Given that older adults with schizophrenia want to be physically active, interventions in this population should address negative attitudes towards aging and promote activities that enhance joy, companionship, and minimize boredom.

## SESSION 2155 (POSTER)

### REHABILITATIVE CARE & PHYSICAL THERAPY

#### IMPLEMENTATION OF THE SPACED RETRIEVAL TECHNIQUE BY A CAREGIVER

R. Karim<sup>1</sup>, P. Higgins<sup>3,1</sup>, T. Hornick<sup>1,2</sup>, *1. Cleveland VISN 10 GRECC, Louis Stokes Cleveland Department of Veterans Affairs Medical Center, Cleveland, Ohio, 2. Case Western Reserve School of Medicine, Cleveland, Ohio, 3. Case Western Reserve, Frances Payne Bolton School of Nursing, Cleveland, Ohio*

**Background and Purpose.** Family caregivers are often ill prepared to face the challenges of living with a person with dementia (PWD). This case report describes how to teach a caregiver to use spaced retrieval (SR), a memory augmentation technique that uses verbal cues and positive reinforcement, to help a PWD perform a basic activity of daily living. **Case Description.** The participants were an 86 year-old male, MMSE 9/30, GDS 0/15 and his primary caregiver (daughter). The caregiver chose the task: improve her father's bedtime routine by helping him respond to verbal cues to place his dentures in two pre-filled cups in the bathroom. **Intervention.** The intervention was developed and refined with input from geriatric clinicians and researchers and an SR expert. After consent was obtained, a certified geriatric physical therapist (PT) made five home visits over a two-week period. During the home visits the PT instructed the caregiver in the 2-part SR technique: 1) a name-face association task that demonstrated that the caregiver was capable of performing SR and the PWD was responsive to the technique; 2) prompting the PWD to place his dentures in the cup. **Outcomes.** The caregiver successfully used SR to teach both tasks. Motor learning of the ADL task occurred by the fourth week with retention of performance at week eight. **Conclusion.** This case study supports past research on the preserved ability for motor learning in a person with severe dementia. The simple methodology and low risk are ideal for family caregivers to use at home.

## MEANINGFUL CHANGE IN THE WALKING SPEED OF OLDER ADULTS

K.K. Chui<sup>1</sup>, E. Hood<sup>2</sup>, D. Klima<sup>3</sup>, 1. *Physical Therapy and Human Movement Science, Sacred Heart University, Fairfield, Connecticut*, 2. *St. Luke's Warren Hospital Balance Center, Phillipsburg, New Jersey*, 3. *University of Maryland Eastern Shore, Princess Anne, Maryland*

In addition to considering clinometric properties such as reliability, validity, and feasibility, the evidence-based practitioner must also consider the sensitivity to change or “responsiveness” of an outcome measure. The responsiveness of an outcome measure refers to its ability to accurately detect a change or difference when it has occurred and the importance of calculating and reporting this clinometric property in physical therapy research has been emphasized. Walking speed is a robust outcome measure, especially for older adults, since it predicts important health outcomes (e.g., overall survival, risk of hospitalization, discharge destination following hospitalization, risk of functional decline, and risk for future hip fracture). In this synthesis of recent literature on walking speed, the 6th vital sign, we summarize walking speed data from older adults who are: 1) community-dwelling, 2) patients with neurologic conditions (i.e., stroke, Parkinson's disease, and Alzheimer disease), and 3) patients with orthopedic conditions (i.e., hip fracture and knee osteoarthritis). We also report the most commonly published distribution-based and anchor-based indexes of responsiveness, which include effect size, standard error of the measurement, minimal detectable change, standardized response mean, and minimally clinically important difference. Whenever possible, we also calculate the minimal detectable change (MDC90) to better enable the user to compare and contrast the responsiveness of walking speed from different populations of older adults. For each study cited, we describe the population examined, the method and distance used to measure walking speed, and the index of responsiveness.

## PROPERTIES OF RELATIONSHIPS BETWEEN IN PHYSICAL, COGNITIVE FUNCTION AND REACTION TIME IN INSTITUTIONAL RESIDENTS

T. Komatsu<sup>1,2</sup>, F. Togo<sup>3</sup>, H. Park<sup>3</sup>, T. Mitani<sup>4</sup>, T. Midorikawa<sup>4</sup>, 1. *School of Health Science, Dep of Physical Therapy, Tokyo University of Technology, Tokyo, Japan*, 2. *The University of Tokyo, Tokyo, Japan*, 3. *National Center for Geriatrics and Gerontology, Nagoya, Japan*, 4. *Watanabe Hospital, Kamisu, Japan*

Relationship between physical and cognitive functions in elderly institutional residents with cognitive dysfunction is unclear. The aim of this study was to investigate physical and cognitive functions in elderly institutional residents. Subjects were 32 elderly institutional residents (age 71-95) with cognitive impairment (MoCA) in this subjects. All subjects were able to walk independently or with the help of a walking aid. The Flanker Task (Ericsson) refers to a set of reaction time (RT) used in cognitive psychology to examination the ability. The Flanker displayed arrow line segments (neutral), all targets and all facing the same direction (congruent), all is facing the opposite direction (incongruent) on the PC screen. There were conducted total task of 96 enforcements that intervals of 4 sec each stimulus 32 enforcements in random order. There were make examination RT of each subject under each condition. Statistical were examined the correlation between each variable by other bodily functions. And, make analysis using partial correlation analysis and control variables age. We examined the characteristics of physical function for 65 to 74 as elderly and elderly aged over 75. Total RT as the multiple with neutral and congruent and incongruent and showed significant correlations with single-leg standing (time) ( $r=0.643$ ,  $p<0.05$ ) for 65 to 74 as elderly. On the other hand, MoCA showed significant correlations only Total RT ( $r=-0.573$ ,  $p<0.05$ ) for elderly aged over 75. Our results showed that physical function decreased only in the group of subjects with reduced reaction time, suggesting that cognitive decline might cause prevention to falls.

## NOVEL MOVIE THERAPY ENHANCES RECOVERY IN OLDER VETERANS

B.A. Bensadon<sup>1,2</sup>, K.H. Sorocco<sup>1,2</sup>, 1. *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*, 2. *Oklahoma City VA Medical Center, Oklahoma City, Oklahoma*

Bibliotherapy and life review have been established as viable, evidence-based, therapeutic modalities for enhancing older adult mental health, particularly in patients diagnosed with clinical depression and/or anxiety. Less is known about the efficacy of similar, modified approaches implemented with older medical patients in skilled nursing or rehabilitation settings. To fill this void, the Aging Film Series was created and continues to be implemented with a heterogeneous older Veteran population receiving care in the Community Living Center of a Midwestern VA Medical Center. Consistent with the VA's national focus on patient-centered care and cultural transformation, this monthly film series provides an innovative and informal forum in which to address aging-specific challenges and model various coping strategies. Films such as “Up” and “Grumpier Old Men” were shown on a large screen TV in a short-stay rehab unit. Veterans and interdisciplinary providers watched the films together. Qualitative case-based examples illustrate the films' effectiveness in stimulating participant reflection and empathy, reducing feelings of isolation, and providing a heightened sense of empowerment that appeared to facilitate recovery. In addition to these individual outcomes, the series has provided an environment of camaraderie that fosters socialization and interaction between patients and their providers. The program's theoretical rationale and clinical implications were reinforced by the data. The poster's discussant will offer templates for replicating this program in other facilities.

## ADVANCING CLINICAL ASSESSMENT OF MOBILITY FOR OLDER ADULTS LIVING IN CONGREGATE CARE

K. Van Ooteghem<sup>1,2</sup>, B. Badiuk<sup>1</sup>, M. Sharratt<sup>3</sup>, W. McIlroy<sup>1,2</sup>, 1. *University of Waterloo, Waterloo, Ontario, Canada*, 2. *Toronto Rehabilitation Institute, Toronto, Ontario, Canada*, 3. *Schlegel-UW Research Institute for Aging, Waterloo, Ontario, Canada*

Detecting subtle changes in mobility among older adults can inform early therapeutic strategies and help to maintain and maximize functional independence. Lack of sensitivity among current clinical mobility assessments (CMAs) however limits their ability to reveal onset of meaningful changes. We propose two approaches for advancing assessment, both serving to improve diagnostic and therapeutic utility: 1) incorporating inexpensive and unobtrusive technologies to aid in quantifying function, and 2) evaluating multiple dimensions of mobility to identify underlying deficits. Methods: To date, 53 residents living in congregate care have completed a CMA comprised of 13 tasks simulating everyday activities that challenge static and dynamic balance, gait, strength, and endurance. Participants wore accelerometers affixed to each ankle and the waist. For tasks assessing balance, participants placed each foot on a Nintendo Wii balance board. Customized algorithms extracted balance and gait characteristics specific to each task (e.g. sway path during standing). Preliminary correlational analyses were conducted to examine relationships between variables. Findings: Measures derived from the added technologies revealed balance and gait challenges that would not have been detected by conventional clinical assessment. Correlational analyses revealed no relationships between variables (range:  $R^2=-0.21$  to  $0.3$ ) suggesting that static and dynamic balance, gait, strength, and endurance represent independent dimensions of mobility. Implications: Accelerometer and Wii technology adds significant utility to a CMA by augmenting its sensitivity to detect subtle changes in balance and gait function. The multi-dimensional nature of mobility warrants assessment of individual elements to identify underlying deficits and guide intervention. Early and targeted interventions

will help older adults to maintain and maximize functional independence. Acknowledgements: Funding support from CIHR Team Grant (Mobility and Aging) and NSERC

#### LEARNING HOW TO USE ASSISTIVE DEVICES IN OLDER ADULTS: ARE ILLUSTRATIONS HELPFUL?

C. Liu, S. Pape, K. Bayson, M. Hahn, L. Stahl, B. Powers, *Indiana University at Indianapolis, Indianapolis, Indiana*

Rehabilitation therapists often teach older adults how to use assistive devices to increase independence. Some assistive devices can be purchased without proper instructions from therapists. In this case, older adults may need to rely on print instructions to learn how to use these devices. Prior research has shown that older adults do not effectively use illustrations to understand disease knowledge. However, illustrations may be beneficial to help older adults understand the correct and safe procedure for using assistive devices. The purpose of this study was to examine whether incorporating illustrations into print instructional materials could improve older adults' understanding and proper use of assistive devices, such as a walker. Twenty-seven older adults without prior experience of using a walker were randomized to read either text-only instructions or a text with illustration instructions. After reading the instructions, participants demonstrated how to use a walker and completed a text comprehension test. A ceiling effect was found in the text comprehension test. However, the demonstration results were less than optimal. Error analyses show that fewer participants who read the text with illustration instructions were able to correctly demonstrate to move the walker forward, keep walker still while stepping into it, and place both feet inside the walker before moving it forward. Additionally, more participants who read the text with illustration instructions made recall errors. This study suggests that illustrations may not assist older adults learning how to use assistive devices. Older adults should consult rehabilitation therapists for purchasing and using any assistive devices.

#### USABILITY OF A FEEDBACK MEDIATED ORTHOPEDIC TRAINING SYSTEM – RESULTS FROM A RANDOMIZED CONTROLLED CLINICAL TRIAL

M. Gövercin, A. Ratzinger, E. Steinhagen-Thiessen, *Charité-Universitätsmedizin Berlin, Berlin, Berlin, Germany*

Objektive: Hip fractures are often caused by falls and are a major cause for immobility. Early and prolonged physiotherapy treatment could avoid the physical deterioration. The compliance for carrying out prolonged physiotherapy exercises increases when the elderly patient is motivated (1,2,3,4). Design: We performed a three armed multicentered randomized controlled clinical trial with two intervention groups and one control group. The first intervention group consisted of participants with intensive (5x/week) paper based self-administered physiotherapy treatment. The second group had a self-therapy training with the orthopedic trainer (5x/week). The control-group had a 2x/week paper based self-therapy (usual care). Main goal was to detect the effectiveness of a motivational self administered physiotherapy training program for elderly. Secondary outcomes were the assessment of motivation, usability and the cost-efficiency of the orthopedic trainer versus a conventional, paper-based self-therapy. A follow-up was conducted after six month including the analysis of harris-hip scores, Barthel-Index, Usability-Questionnaires and ADL. Results: 78 patients were recruited within two rehabilitation centers. 23 women and 55 men with hip fracture were randomized. The self-therapy with the orthopedic trainer was almost as usable as paper based training for elderly people after hip surgery regarding to the questionnaires USE-FORT, USE-IT, IMAGINE-FORT. The orthopedic trainer group was highly motivated to perform the exercises. The use of the orthopedic trainer appears to consume more cognitive resources than the paper based therapy. Main barriers that affect the usability were difficulties in putting on the sensors of the wearable sensor system and the understanding of the dialog system.

#### THE EFFECTIVENESS OF PHYSICAL THERAPY CONSISTING OF MANUAL THERAPY, THERAPEUTIC EXERCISES, AND PATIENT EDUCATION FOR TREATING OLDER ADULTS WITH ADHESIVE CAPSULITIS

K.K. Chui, *Physical Therapy and Human Movement Science and Program in Geriatric Health & Wellness, Sacred Heart University, Fairfield, Connecticut*

Introduction: While an increasing number of studies have reported the effectiveness of manual therapy for treating middle-aged adults with adhesive capsulitis, few studies have examined older adults. The purpose of this retrospective case series was to examine the effectiveness of physical therapy consisting of manual therapy, therapeutic exercises, and patient education for treating older adults with adhesive capsulitis. Methods: Six older adults (mean age =  $70.7 \pm 4.4$  years, 100% female) referred to physical therapy with adhesive capsulitis (mean duration =  $4.3 \pm 1.3$  months) participated in this retrospective case series (mean number of sessions =  $13.0 \pm 3.4$ ). All participants had impaired shoulder range of motion (ROM), measured with a goniometer, when compared to their uninvolved shoulder and published norms. All patients reported pain and disability on the Shoulder Pain and Disability Index (SPADI). Physical therapy interventions included passive joint mobilization techniques (i.e., anterior glide, posterior glide and distraction), manual stretching, and patient education on self-mobilization techniques and self-stretching exercises, among others interventions (mean visits =  $9.8 \pm 4.4$ ). Results: Average ROM improvements were obtained for flexion ( $44.0 \pm 15.5$  deg), abduction ( $47.0 \pm 9.6$  deg), external rotation ( $35.5 \pm 12.4$  deg), and internal rotation ( $18.7 \pm 7.2$  deg). Average SPADI pain scale scores decreased by  $41.3 \pm 13.4\%$  and average disability scale scores decreased by  $43.7 \pm 15.4\%$ . Conclusions: Physical therapy consisting of manual therapy, therapeutic exercises, and patient education improved shoulder ROM, decreased pain, and decreased disability in older adults with adhesive capsulitis. Furthermore, these interventions were done without adverse effects.

#### SPINAL CURVATURE AND POSTURAL SWAY IN OLDER ADULTS

M. Saghazadeh<sup>1</sup>, T. Okura<sup>2</sup>, Y. Mitsuishi<sup>1</sup>, K. Tsunoda<sup>1</sup>, *1. Doctoral program in Health and Sport Sciences, University of Tsukuba, Tsukuba, Ibaraki, Japan, 2. Faculty of Health and Sport Sciences, University of Tsukuba, Tsukuba, Ibaraki, Japan*

Numerous studies have been reported; ageing, history of falls, muscle weakness and home hazards as risk factors for falls. Spinal deformity might represent another possible risk factor for balance impairments and falls. Twenty elderly women ( $65.6 \pm 1.2$  years old) were evaluated. A flexicurve ruler was used to measure the degree of kyphosis (T2-T12) and lordosis (T12-S2). To convert the collected data to degree, the equation,  $\text{degree} = 4 \text{ Arc tang } 2H/L$  was used. In the equation, L is a straight line connecting two obtained spinous process and the H is the length of a perpendicular line drawn from the L to the deepest part of the curve. Total Path Length (TPL) and Area of Center of Pressure (CoP) were evaluated while standing on force distribution using the Zebris FDM measuring system. Relationships among spinal curvature and postural sway were analyzed using Pearson's correlation coefficients. According to the obtained results, no significant correlations were observed between postural sway scores and angle of kyphosis. However there was significant positive correlation between the score of TPL of CoP and lordosis in older adults ( $r = 0.457$ ;  $p < 0.05$ ). These results possibly occurred due to reduction of muscle strength and displacement of the Center of Gravity (CoG) following spinal deformity, which in turn would result in increasing body sway. Moreover compensatory mechanism for lumbar changes in spinal, comparing to thoracic, is limited. These results suggest that lumbar curvature, lordosis,

might be an important factor in defining postural sway and balance control in older adults.

### **MOTOR SKILLS ASSOCIATED WITH FUNCTIONAL AUTONOMY OF OLDER ADULTS: RESULTS FROM THE NUAGE STUDY**

A. Carrier<sup>1,2</sup>, M. Levasseur<sup>1,2</sup>, H. Payette<sup>2,3</sup>, 1. School of Rehabilitation, Faculty of Medicine and Health Sciences, Université de Sherbrooke, Sherbrooke, Quebec, Canada, 2. Research Centre on Aging, Health and Social Services Centre – University Institute of Geriatrics of Sherbrooke (CSSS-IUGS), Sherbrooke, Quebec, Canada, 3. Department of Community Medicine, Faculty of Medicine and Health Sciences, Université de Sherbrooke, Sherbrooke, Quebec, Canada

**Introduction.** Functional autonomy level has a major impact on older adults' daily activities and social participation. Despite their potential importance as explaining variables, motor skills' associations with functional autonomy level have not been comprehensively studied. **Aim.** Identify among a range of motor skills the variables that best explain functional autonomy of older women and men. **Methods.** This research is embedded in NuAge, a multi-centric observational longitudinal study of older adults. Recruitment was realized using a random stratified by gender and age strategy. Data included functional autonomy and motor skills variables such as strength (hands, arms and legs), balance (unipodal and dynamic), change of position, and walking (normal and fast pace). Controlling for age, a multiple linear backward regression strategy was used separately for women and men. **Results.** Both female (n = 652) and male (n = 616) participants were aged 73 years on average and had a mild to moderate loss of functional autonomy. For women, a higher level of functional autonomy was explained by greater unipodal and dynamic balance, and greater biceps strength ( $R^2 = 0.31$ ;  $p \leq 0.001$ ). Greater unipodal balance and faster walking pace explained higher functional autonomy of men ( $R^2 = 0.12$ ;  $p \leq 0.001$ ). **Conclusion.** This study informs health professionals on which motor skills to target in their interventions to optimize functional autonomy of their older clients. Further studies are needed to better understand gender differences.

### **ACCEPTANCE AND USE OF VIRTUAL GAMING AS AN INTERVENTION WITH OLDER ADULTS IN OCCUPATIONAL THERAPY**

B. Walker, 1. School of Occupational Therapy, University of Indianapolis, Indianapolis, Indiana, 2. Indiana University Bloomington, Bloomington, Indiana

Virtual gaming has taken the world by storm and is being used by a much larger population than originally anticipated. Since the Wii was put on the market, occupational therapists around the world have begun to incorporate its use as an intervention strategy for patients recovering from a wide scope of ailments. This use is ad hoc, intuitive, and idiosyncratic on the part of individual occupational therapists. Little research has been done to investigate the factors influencing occupational therapists' acceptance and use of virtual gaming as an intervention strategy to enhance the occupational performance of their older adult clients. The purpose of this study is to investigate the appropriateness of using the Unified Theory of Acceptance and Use of Technology (Venkatesh et al., 2003) to explain occupational therapist's acceptance and use of off-the-shelf virtual gaming as an intervention strategy with their older adult clients. In order to prepare for the future and respond appropriately to the demands of an aging society within an evolving healthcare arena, it is essential to examine the factors that influence or deter acceptance and use of all therapeutic strategies used with older adults.

## **SESSION 2160 (POSTER)**

### **LONG TERM CARE; SESSION 2**

#### **THE TRAINING NEEDS OF NURSING FACILITY SOCIAL WORKERS DISCHARGING RESIDENTS**

E. Beaulieu, School of Social Work, Simmons College, Scituate, Massachusetts

There are over 2 million individuals annually discharged from the nation's 14,000 skilled nursing facilities. Social workers in SNFs are the primary resource for short-term patient discharge planning and their need for training in this area is crucial for effective work with older adults and families. This study provides a clearer understanding of the current SNF social work practice of discharging short-stay individuals and the training that prepares them to assess and to understand the multifaceted needs of older adults' transitional care and engage appropriate post-discharge services. Almost 40% of nursing facilities discharge between 6-19 individuals per month, many SNF social workers, have not received training in key discharge areas; risk assessments for hospital re-admission (67%), assessment of need for housing/assisted living (65%), or care transition models (94%). This study suggests that training for currently practicing SNF social workers better prepares them to meet these needs.

#### **THE INFLUENCE OF INDIVIDUAL AND CONTEXTUAL CHARACTERISTICS ON THE PROVISION OF INDIVIDUALIZED CARE**

S. Caspar<sup>1</sup>, S.W. MacDonald<sup>2</sup>, 1. Univ. of British Columbia, Vancouver, British Columbia, Canada, 2. University of Victoria, Victoria, British Columbia, Canada

**Purpose:** Previous research examining improved individualized care (I-Care) in long-term care (LTC) facilities has largely considered contextual influences (e.g., culture change models) with little consideration for the influence of individual staff characteristics. The present study examined the impact that both individual and contextual characteristics exerted on care staffs' reported ability to provide I-Care in LTC facilities. **Methods:** Linear mixed models were used to examine 567 care staffs' reported ability to provide I-Care, nested within 41 LTC facilities. Specifically, I-Care was modeled as a function of within-individual (e.g., age, job title, experience) and between-context (e.g., facility ownership status, culture change models, staffing assignments) variables. Independent of these predictors, we then assessed the influence of staffs' perceived access to support and informal power on reported ability to provide I-Care. **Results and Implications:** Computation of the intraclass correlation coefficient indicated that 91.7% of the total variance in perceived ability to provide I-Care reflected within- vs. between-person differences. The addition of support and informal power accounted for 46% of this within-person variance in perceived ability to provide I-Care, with these variables clearly more influential in predicting quality of care than factors such as years of experience or education. Notably, between-context variables (e.g., facility ownership status) did not significantly influence provision of I-Care, and did not further modify the influence of support or informal power on I-Care. These findings suggest that individual-level factors, which have largely been ignored in the literature, need to be carefully considered when studying the provision of I-Care in LTC facilities.

#### **THE EXAMINATION OF SERVICE UTILIZATION PATTERNS AFTER TAIWAN'S IMPLEMENTATION OF THE TEN-YEAR LONG-TERM CARE PLAN**

Y. Lin<sup>1</sup>, T. Kuo<sup>2</sup>, 1. Long Term Care Management Center, Taichung, Taiwan, 2. Central Taiwan University of Science and Technology, Taichung, Taiwan

Taiwan has become the fastest aging places in the world. In 2007, Taiwan government passed the "Ten-year Long Term Care Plan" to

implement basic long-term care services in hoping to develop a universal long-term insurance. This Ten-year Plan included services such as home care and adult day care, home-based nursing, community rehabilitation, assistive devices, transportation, nutrition, respite care and institutionalized services. Depending on the functional and income levels, individuals can receive different ranges of services after a careful assessment by care management professionals. The purpose of this paper was to analyze and compare service utilization patterns among users in 2009 from one of the biggest counties in Taiwan. More specifically, it was the first study that examined reasons and factors for variations in service utilization types and quantity. The demographic characteristics and service data were extracted and analyzed from the Long Term Care Management Center, excluding personal identifiers. The results showed that the majority of the users were men, people with moderate income, and people who lived with others. The most frequently used services were home care and institutional respite service, followed by community-based rehabilitation services, transportation and assistive devices. Unlike common beliefs, this paper found that long-term care services were not used by the most needy (low income or isolated individuals) but by those who knew how to best use services. The conclusion discussed suggestions on how government should ensure that the resources and services were equitably distributed and efficiently delivered to those really in need.

#### **DEVELOPING A TYPOLOGY OF QUEBEC'S PRIVATE RESIDENTIAL CARE FACILITIES FOR OLDER ADULTS**

C. Lestage<sup>1,2</sup>, N. Dubuc<sup>1,2</sup>, G. Bravo<sup>1,2</sup>, 1. *Health and Social Services Centre - Sherbrooke Geriatric University Institute, Sherbrooke, Quebec, Canada*, 2. *Research Centre on Aging, Université de Sherbrooke, Sherbrooke, Quebec, Canada*

**Rationale.** As in other countries, Canadian Residential Long-Term Care Facilities (RCFs) fill the gap between independent housing and nursing homes. In the province of Quebec, RCFs have, until recently, operated without government regulation. There are, however, marked differences between RCFs, such as facility size, staffing mix, and services provided. **Objective.** To identify different types of RCFs based on their physical and organizational features. **Methods.** We conducted a provincial census of 1,989 RCFs. The data was collected with a new self-report questionnaire on the physical and organizational environments of RCFs, called the EPO questionnaire. We used different combinations of cluster analysis methods to identify plausible typologies. They were evaluated based on their stability, reproducibility, homogeneity, and clinical meaningfulness. The final choice was made by a committee of experts with clinical experience. **Results.** Of the 1,989 RCF owners, 552 (28%) returned the questionnaire. No significant differences were found between participants and non-participants with regard to facility size and geographical location. Three plausible solutions were submitted to the expert committee. The selected typology was derived from combining the Ward and K-means methods. It contains five clusters that differ according to eleven dimensions of the questionnaire such as availability of services, level of privacy and security. **Conclusion.** RCFs vary considerably. This heterogeneity often makes it difficult to compare facilities. Our typology contains five types of RCFs that share common features. This typology may help health professionals, older adults and families compare facilities and select the one most appropriate when the time comes.

#### **AN INVESTIGATION OF STATE TRENDS IN THE HOME CARE WORKFORCE, 2005-2007 TO 2008-2010**

C.M. Kelly<sup>1</sup>, J. Deichert<sup>2</sup>, L. Holley<sup>2</sup>, K. Kosloski<sup>2</sup>, 1. *Gerontology, University of Nebraska, Lincoln, Nebraska*, 2. *University of Nebraska at Omaha, Omaha, Nebraska*

Home care workers comprise two distinct populations: nursing, psychiatric and home health aides who provide medical services (such as changing bandages, taking blood pressure, and administering oral medications) and personal and home care aides who provide non-medical

services (such as ADL and IADL assistance). The present study compares the proportional distribution of these two types of workers by state over two recent three-year periods (2005-2007 and 2008-2010), using the American Community Survey Public Use Microdata Samples (ACS PUMS). The ACS is an ongoing survey covering every county in the U.S. and identifies workers by industry and occupation. Our findings indicate that personal and home care aides grew at the fastest rate (26.6%) over this six-year period and currently represent a majority (50.7%) of the home care workforce. However, while the overall national trend in the home care workforce is toward a higher proportion of personal and home care aides (who are mostly non-credentialed), we identified unique trends within certain states: 1) states with greater than 3X the national growth in personal and home care aides (e.g. North Dakota, Louisiana, and New Hampshire) or nursing, psychiatric, and home care aides (e.g., Wyoming, Delaware, and the District of Columbia) from 2005 to 2010 and 2) states with a decline in personal and home care aides (e.g. South Dakota and the District of Columbia) or nursing, psychiatric, and home care aides (e.g. Hawaii, Idaho, Mississippi, and Utah) over this six-year period. Given population aging and the overall growth of home care services, the second set of findings is the most surprising and suggests that state-level factors such as client demographics, labor force trends, and public policy merit further consideration.

#### **VERIFICATION OF FACTORS INFLUENCING ELIGIBILITY AND BENEFITS OF LONG-TERM CARE INSURANCE IN JAPAN**

H. Sumii<sup>1</sup>, Y. Makihata<sup>2</sup>, Y. Sawada<sup>3</sup>, A. Kariya<sup>1</sup>, S. Imaizumi<sup>1</sup>, 1. *Health and Welfare, Prefectural University of Hiroshima, Mihara, Hiroshima, Japan*, 2. *NPO Japan Kaigo Research, Mihara, Hiroshima, Japan*, 3. *Nihon Fukushi University, Nagoya, Aichi, Japan*

**Purpose:** Japanese government has enacted several changes to long-term care insurance (LTCI) eligibility/benefits assessment form and government computer program in the fiscal year 2009. The purpose of this study is to verify the differences and effects of changes on LTCI eligibility determination and benefits before and after 2009. **Methods and Participants:** This study, which was conducted from October 2009-January 2010, selected 400 residents from 8 long-term care facilities and 208 clients from 8 home care agencies across the country. During the study period, assessors assessed the participants using two different assessment forms created by the Ministry of Health, Labour and Welfare of Japan for the years of 2006 and 2009. The results of these assessments were then analyzed by two government computer programs, versions 2006 and 2009, created by above mentioned ministry, to determine the LTCI eligibility and benefits. **Results:** Although the assessment form version 2006 had 82 assessment items, the version 2009 had 74 items. Of those, 69 assessment items were the same on both forms. When the results of assessment version 2006 were analyzed by the computer program version 2009, it showed a significantly higher number of nursing care hours that should be provided to participants (median 1.70 min.;  $p < 0.003$ ). However, when the results of assessment version 2009 were analyzed by the computer program version 2006, it did not show statistically significance ( $p < 0.579$ ). **Conclusion:** The results suggest that the computer program changes may have a greater effect than assessment item changes do on LTCI eligibility/benefits determination.

#### **TIME STUDY OF SOCIAL SERVICES COORDINATORS AND CARE MANAGERS IN LONG-TERM CARE FACILITIES IN JAPAN**

Y. Sawada<sup>1</sup>, K. Kageyama<sup>2</sup>, H. Ishida<sup>3</sup>, M. Kunisada<sup>2</sup>, H. Sumii<sup>2</sup>, 1. *Center for Well-Being and Society, Nihon Fukushi University, Nagoya, Aichi, Japan*, 2. *Prefectural University of Hiroshima, Mihara, Hiroshima, Japan*, 3. *NPO Japan Kaigo Research, Mihara, Hiroshima, Japan*

**Purpose:** To determine the role of social services coordinators (SSCs) and care managers (CMs), and the services they provide in long-term

care facilities in Japan. Methods: Study data came from a time-study worksheet mailed to 2000 SSCs and 2000 CMs of 2000 long-term care facilities across the country. Participants were asked to record the number of minutes they spent in each of their activities as well as the types of activities performed during a period of 2 consecutive days from October 15-November 30, 2010. A total of 1312 responses (654 SSCs and 658 CMs of 896 facilities) were received (33%). The reported activities were coded and grouped into 10 large and 110 smaller categories. The average amount of time and frequency per day and activity were analyzed using Spearman's rank correlation and Mann-Whitney rank tests. Results: While SSCs were primarily involved in indirect activities (e.g., documentation; 80.76 min.), non-resident care (e.g., break time; 53.88 min.) and team management (28.76 min.), CMs were primarily involved in indirect activities (51.50 min.), constructing care plans (46.38 min.) and non-resident care (46.00 min.). Moreover, the SSCs had a higher frequency in indirect activities and pre-admission assessments, whereas the CMs had a higher frequency in creation of care plans and regular assessments. Conclusion: While the role of CMs is to manage care processes of resident assessment and care planning in accordance with Long-Term Care Insurance Law, that of SSCs is characterized by a wide range of activities ranging from admissions to community social work.

### **NORC-SSP AS A LTC OPTION IN CHINA: EXPLORING THE POSSIBILITY**

J.J. Liang, K. McGrew, *MU, Ohio, Oxford, Ohio*

The Naturally Occurring Retirement Community-Supportive Services Program (NORC-SSP) is recognized as a consumer-driven, person-centered long-term care alternative. NORC-SSPs have developed in the US in response to the desire of older Americans to age in place. Findings from a phenomenological study conducted in Xi'an City, China, suggest possibilities for application of the NORC-SSP concept to neighborhoods in urban China. In-depth qualitative interviews were conducted with ten people born in the 1950s to explore components of a meaningful retirement and perceived challenges to the self-defined meaningful retirement life. A remarkable finding is the importance of the existing work unit residential compounds. Workers retire and age in their compounds. These are quintessential naturally occurring retirement communities. Members of the 1950s birth cohort hold negative stereotypes of institutional care at the same time they experience unavailability of familial care provided by adult children. They express a desire to stay at home and a willingness to volunteer in their communities. These factors suggest great promise for the application of the NORC-SSP paradigm. We propose a collaborative, locally-adapted model for China, through developing partnerships among residents, volunteers, community service centers, government, enterprises, philanthropic organizations, research institutes, and colleges, to assist those who are aging at home in their work unit residential compounds. We conclude by applying a model developed by Vladeck (2004) to include service programs (physical, medical, social, educational, recreational, cultural and spiritual) that aim to promote quality of life for Chinese elders and a cost-effective LTC option in urban China.

### **ASSESSING THE ORGANIZATIONAL NEEDS OF LONG TERM CARE ORGANIZATIONS IN SOUTHERN ALABAMA**

G.T. Savage<sup>1</sup>, V.A. Yeager<sup>2</sup>, C.N. Goolsby<sup>1</sup>, 1. *MISQ, University of Alabama at Birmingham, Birmingham, Alabama*, 2. *UNiversity of Alabama at Birmingham- SOPH, Birmingham, Alabama*

The purpose of this study was to examine the infrastructure and needs of Long Term Care organizations (LTCs) in the region of Alabama affected by the 2010 Gulf Oil Spill. We conducted a paper-based, mail survey of LTCs in the eight southern counties of Alabama, with a 41.2% (n=14) response rate. Despite being medically necessary, LTCs reported difficulties accessing the following services for patients: transportation services (n=7 LTCs, 50%), inpatient mental health care (n=5, 35.7%),

and high quality outpatient mental health services (n=5, 35.7%). The lack of timely reports from other physicians/facilities was perceived to be a problem among 12 (85.7%) LTCs. Patients' inability to pay for needed care was perceived to be a problem by almost all LTCs in the region (n=13, 92.8%). Lastly, the lack of qualified specialists/therapists in the area was also a problem among the majority of LTCs (n=8, 57.1%). Findings from this study highlight the potential for telemedicine in LTC setting as it may address the need for improved access to qualified specialists/therapists. Further, these findings emphasize the need for electronic health records as a means of sharing findings/reports from other health care providers.

### **ACCESS DISPARITIES IN IN-HOME CARE SERVICE USAGE AFTER INTRODUCING LONG-TERM CARE INSURANCE IN JAPAN**

H. Sugisawa<sup>1</sup>, Y. Nakatani<sup>2</sup>, Y. Sugihara<sup>3</sup>, M. Shimmei<sup>3</sup>, H. Kodama<sup>3</sup>, Y. Watanabe<sup>4</sup>, 1. *J.F. Oberlin University, Machida, Tokyo, Japan*, 2. *Japan Women's University, Bunkyo-ku, Tokyo, Japan*, 3. *Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan*, 4. *Musashino University, Nishitokyo, Tokyo, Japan*

We investigated whether disparities in accessing in-home care, based on care needs and economic status changed after introducing the long-term care insurance (LTCI) system in Japan. Five repeated cross-sectional surveys were conducted to family caregivers to frail elders in 1996 and 1998 prior to introducing the reforms, and in 2002, 2004, and 2010, after the new system was introduced. Participants in the study were selected by a screening survey to identify elderly with or without care needs among a randomly selected sample of elderly people living in a suburban city of Tokyo. The need for in-home care services was assessed based on three indices; activities of daily living, cognitive symptoms, and caregiver burden. Economic status was measured by subjective financial position. Access disparities were examined for three types of in-home care services: home help, respite, and day-care. In the first step of logistic regression analyses we entered each care usage indices as dependent variables and care needs, economic status, and survey year as independent variables. In the next step, interaction terms for each need variable and economic status by survey year were entered. Results indicated that access to each type of care service was facilitated after the enforcement of the new system, even after controlling for care needs and economic status. Especially, access to day-care services improved among people with high caregiver burden. In addition, access disparities in the use of home help; regardless of available sub-caregiver, disappeared after the new system was introduced.

### **USING THEATRE AS A KNOWLEDGE EXCHANGE STRATEGY IN THE CARE OF OLDER ADULTS**

M. Speechley<sup>1</sup>, I. Gutmanis<sup>2,1</sup>, R.T. DeForge<sup>1</sup>, L. VanBusse<sup>1,2</sup>, S. Horgans<sup>3</sup>, C. Ward-Griffin<sup>1</sup>, 1. *Epidemiology & Biostatistics, Western University, London, Ontario, Canada*, 2. *St. Joseph's Health Care, London, Ontario, Canada*, 3. *Providence Care, Mental Health Services, Kingston, Ontario, Canada*

We are exploring theatre as a knowledge exchange strategy with frontline care providers for older adults, by writing and presenting two short (<25 minute) plays. Both scripts present themes identified in qualitative analyses of transcripts from focus groups of providers and family members. Each play tells a story about the care of older adults, with a Personal Support Worker and family members as central characters. Parts of the fictional characters' dialogue are based on verbatim quotes from the transcripts. One play, All Behaviour Has Meaning, is set in a long-term care facility. A major theme is the meaning behind responsive behaviours among residents. The second play, Advocating For Hilda, concerns an older woman with dementia who is able to remain in her house with minimal home care. A major theme is the contrast between effective and ineffective care networks. Both plays have been presented live to providers and managers in long term care facilities and home

care agencies. Workshopping involves trained facilitators discussing the play with the audience immediately afterwards. The audience is encouraged to comment on issues ranging from the resonance of the themes to the realism of the dialogue. The feedback is used to refine the script, which is then performed for another audience. One evaluation strategy is to return to the site of a previous performance months after the play was presented, to see how issues raised post-performance are being addressed in that facility. Results suggest that this strategy may be superior to traditional methods of teaching and problem solving which have yielded minimal uptake of best practices.

#### **“SHE’S LIKE A DAUGHTER TO ME:” OLDER ADULTS AND PAID CAREGIVING IN A CONSUMER MODEL OF CARE**

A. Choi<sup>1,2</sup>, K.G. Kietzman<sup>2</sup>, S. Wallace<sup>2</sup>, E. Durazo<sup>2</sup>, J. Torres<sup>2</sup>, C. Mendez-Luck<sup>2</sup>, A. Benjamin<sup>2</sup>, 1. *California State University Dominguez Hills, Carson, California*, 2. *UCLA Center for Health Policy Research, Los Angeles, California*

The focus on consumer driven care in the US is part of the larger “aging in place” movement that emphasizes independence for older adults. However, there is limited research on how older adults who need home-based care recruit and hire non-family paid caregivers and manage their care. Drawing on a sample of qualitative interviews from a study of California older adults, who qualify for publically financed in-home supportive services (IHSS), this paper examines the relationships between older adults and their paid caregivers. Data were collected over a one year-period on older adults (age 65 and over) who are consumers of public programs that provide long-term in-home care services and supports. In-depth, face-to-face interviews were conducted with the older adult and their paid caregiver. Data were independently coded by two researchers. The results of thematic analyses suggest that in a consumer-driven model, some older adults had significant difficulties finding and interviewing non-family caregivers, and negotiating the care that they needed. Additionally, it was discovered that the nature of relationship had a significant impact on consumer satisfaction. For example, some older adults needed the care, and especially intimate personal care, to be framed in the discourse of familial ties such as “she is like a daughter to me.” Others felt much more at ease with a clear employer-employee relationship. More often than not, in successful consumer-caregiver relationships, it was a mix of these two understandings that created the best quality of life and an enhanced sense of independence for the older adult.

#### **COMPARING STAKEHOLDERS ON INFLUENTIAL FACTORS IN PROXY CONSENT FOR DEMENTIA RESEARCH**

G. Bravo<sup>1</sup>, S.Y. Kim<sup>4</sup>, M. Dubois<sup>1</sup>, C. Cohen<sup>2</sup>, S. Wildeman<sup>3</sup>, J.E. Graham<sup>3</sup>, 1. *University of Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*, 3. *Dalhousie University, Halifax, Nova Scotia, Canada*, 4. *University of Michigan, Ann Arbor, Michigan*

Dementia research often involves individuals who lack the capacity to consent. Permission to enroll such subjects must be provided by proxies, usually family members. Knowledge of the factors that influence proxy consent is critical to the success of dementia studies. Objective: To compare stakeholders on factors that would influence their decision to let a decisionally-incapacitated relative participate in research. Methods: We surveyed 2,060 Canadians: 679 adults aged 65 and over, 384 informal caregivers, 495 physicians, 177 researchers, and 325 Institutional Review Board (IRB) members. Survey participants were given a list of seven factors and asked to select those that would most and least influence their decision to allow a close relative to participate in a study. Results: The prospect of direct benefits to the incapacitated relative was the most influential factor for 55.8% of the respondents, followed by the possibility of adverse events (30.0%). Inconvenience and prospect of benefits to the proxy were least influential for 42.2% and 20.9% of

the respondents. Older adults, informal caregivers and physicians considered direct benefits as more influential than risks in proxy consent, while the reverse was observed among researchers and most IRB members. Conclusions: Our survey shows the overall tendencies in how individuals perceive research studies. Older adults, informal caregivers and physicians tend to see therapeutic opportunities; researchers tend to see research’s long term goals. Consequently, IRBs must ensure that study risks are minimized and justified, while researchers and physicians must highlight research risks when soliciting consent from prospective subjects and proxies.

#### **MEDICAL STAFF MODELS IN VETERANS HEALTH ADMINISTRATION COMMUNITY LIVING CENTERS**

O. Intrator<sup>1,2</sup>, S. Hyde<sup>1</sup>, S. Cai<sup>1,2</sup>, G. Kochersberger<sup>3</sup>, J. Karuza<sup>3</sup>, C. Hojlo<sup>4</sup>, P. Katz<sup>5</sup>, 1. *Providence VAMC, Providence, Rhode Island*, 2. *Center for Gerontology and Health Care Research, Brown University, Providence, Rhode Island*, 3. *Canandaigua VAMC, Canandaigua, New York*, 4. *VA Center Office, Washington, District of Columbia*, 5. *Baycrest, Toronto, Ontario, Canada*

The variation in organization of medical staff (MSO) in nursing homes among health systems has not been described. We sought to compare MSO in Veteran Health Administration Community Living Centers (CLCs) with MSO in free-standing and hospital-based community nursing homes (FSNHs, HBNHs). MSO characteristics were obtained from medical directors of 103 of 134 CLCs in 2010, and a random sample of 202 FSNHs and 10 HBNHs which participated in a study conducted in 2006/7. Previously validated measures of MSO were quantified on a 5-point Likert scale. Statistically significant differences in average system results are presented (CLC, FSNH, HBNH). Although there were fewer physicians in CLCs, total physician FTE was higher than in FSNH and HBNHs (1.78, 0.5, 0.8 respectively, henceforth in this order). Physician cohesiveness was higher in CLCs (3.5, 3.0, 3.0) as was physician supervision (3.1, 2.7, 2.6) and, expected physician participation in care planning meetings (3.9, 2.0, 2.2). CLCs had more formal review processes (4.0, 1.0, 2.0), but perception of relationships with administrator and director of nursing was modestly worst (3.5, 3.9, 4.0). CLC Medical Directors were more likely to be women (50%, 30%, 30%), had more administrative responsibilities (35.2%, 25.5%, 10.0%) and were less involved in clinical work (49.0%, 73.2%, 40.0%). On average, CLCs medical staff were more cohesive, integrated, and supervised, and were more likely to participate in care planning meetings, while medical directors had more administrative duties and conducted less clinical work. Future work should examine relationship of MSO and outcomes of resident care.

#### **PLACING THE LONG-TERM CARE PROVISIONS OF THE PATIENT PROTECTION AND AFFORDABLE CARE ACT INTO HISTORICAL CONTEXT**

E.A. Miller, P. Nadash, *Gerontology, Univ Mass Boston, Boston, Massachusetts*

The Patient Protection and Affordable Care Act (ACA) includes a number of provisions aimed at addressing extant deficiencies in the long-term care (LTC) sector. The most prominent was the Community Living Assistance Services and Supports Act, a national voluntary LTC insurance program, implementation of which has since been suspended by the Obama Administration due to concerns over program solvency. Other pertinent provisions include incentives and options for expanding Medicaid home- and community-based services (HCBS), a number of research and demonstration projects, particularly in the areas of chronic care coordination and the Medicare-Medicaid dually eligible, and a grab bag of quality reforms meant to increase transparency and prevent elder abuse and neglect. There are also provisions that could improve the quality of the LTC workforce and slow down the rate of growth in Medicare’s skilled nursing facility and home health benefits. The purpose of this study is to place the ACA’s LTC provisions into a

broader historical context, beginning with the late-1990s on through the present day. Key trends and events in three major areas are analyzed: quality improvement and regulation (regulatory enforcement, culture change, quality measurement, malpractice litigation, disaster preparedness/responsiveness); financing and insurance (Medicare, Medicaid, personal preparation, asset accumulation, private insurance); and service organization (HCBS expansion, managed LTC, consumer direction). Findings indicate that the LTC reforms adopted by the ACA represent a natural outgrowth of policy choices and business decisions that have impacted the way LTC is regulated, delivered, and financed for well over a decade.

## SESSION 2165 (POSTER)

### MENTAL HEALTH AND AGING

#### NATURE AND PREVALENCE OF SUBSTANCE MISUSE DISORDERS AMONG OLDER PUBLIC HOUSING RESIDENTS

S.M. Cummings, L. Cooper, *College of Social Work, University of Tennessee, Nashville, Tennessee*

This study investigated the nature and prevalence of substance abuse among low income residents of two public housing facilities in a mid-size southern city. In-home surveys were conducted to examine substance abuse, mental health disorders, physical illness and treatment usage among residents 50 years and over (n=187). The majority of residents were African American (75.3%) males (54.5%). Ages ranged from 50 – 89 years (M= 66.2, SD=7.6). Eighty percent had incomes of \$900/month or less. Mental health symptoms at clinical levels were found for depression (18.2%) and anxiety (10.2%). Half of the residents reported their health as being very bad-fair and 46% reported elevated pain levels. Over half (54%) smoked. Thirty-one percent reported one or more substance misuse problems - alcohol (23%), illegal drugs (6.4%), and prescription medications (5.9%). Of those abusing alcohol, 34.2% were hazardous drinkers (>14 drinks/wk) and 40.7% were binge drinkers (> 4 drinks per sitting). Less than 5% received mental health services and none received substance abuse treatment. Regression analysis, conducted to determine factors related to alcohol misuse, indicated that race (African American),  $\beta=.194$ ,  $p=.006$ , age (younger),  $\beta=-.192$ ,  $p=.011$ , gender (male),  $\beta=-.186$ ,  $p=.01$ , and smoking (more years smoking),  $\beta=.21$ ,  $p=.003$ ,  $R^2=20.8$ ,  $F=6.3$ ,  $p=.000$ , were significant predictors of alcohol misuse. Older public housing residents in this study had high levels of substance misuse and mental and physical health problems but received little treatment. Implications are discussed.

#### MENTAL HEALTH CURRICULA FOR AGING HOLOCAUST SURVIVORS: A TREATMENT MODEL FOR ADDRESSING THE INTERACTION OF AGING AND TRAUMA ISSUES

D. Greenberg, A. Scalmati, G. Kennedy, *Geriatrics Division, Montefiore Medical Center, Bronx, New York*

Purpose: The population of holocaust survivors is rapidly aging and few mental health providers have training in providing care with either a geriatric medical or mental health focus for these older adults. In 2010, the Montefiore Medical Center, Division of Geriatric Psychiatry implemented a consultation service to offer specialized training to providers of care to holocaust survivors and to introduce issues common in work with the geriatric population and the impact of past trauma on that work. Methods: Consultations were offered to social service agencies through staff identified cases discussed through assessment interviews or group supervision. Staff training presentations and participation in conference lectures on geriatric mental health issues in treatment of older survivors were offered. A training manual with curricula was developed for those working with older adults for addressing the mental health needs of holocaust survivors. Results: The lectures, assessments and consultations focused around trauma, aging and end of life care. Tools for eval-

uating elder mistreatment, performing a capacity assessment and introducing a will to live scale were offered as methodologies to help determine long and short term care plans Conclusion: Addressing mental health needs of holocaust survivors, a specific population, can be a model for the care of older adults, such as aging veterans, can be the basis for generalized geriatric mental health care for traumatized populations. Staff trained in providing services to aging survivors develop treatment skills in the area of trauma and aging, understand the interaction between them which can be replicated in other settings.

#### COPING RESPONSE TO DEPRESSIVE SYMPTOMS AMONG HOMEBOUND OLDER ADULTS: EFFECT ON TREATMENT OUTCOME

N.G. Choi, *School of Social Work, University of Texas at Austin, Austin, Texas*

Due to their homebound state, lack of financial resources, and/or other life demands, a significant proportion of depressed, low-income homebound older adults experience depression. However, little research has been conducted regarding the nature of coping responses to their depressive symptoms among older adults in general and homebound older adults in particular. The purposes of the present study were to examine the type of coping responses to depressed mood and the effect of passive coping responses on depression severity and treatment outcomes among low-income homebound older adults (n=121) who participated in a pilot randomized controlled trial of problem-solving therapy (PST). Depressive symptoms were measured at baseline and 12- and 24-week follow-ups with the 24-item Hamilton Rating Scale for Depression. Coping responses were measured with a 22-item checklist of coping responses to depression was compiled based on the findings of a previous study of depressed, low-income older adults' help-seeking behaviors. The findings show that cognitive passive coping, but not behavioral passive coping, was significantly associated with baseline depressive symptoms. The main effect of baseline cognitive passive coping response was also significant in mixed-effects regression analysis, but the interaction between coping pattern and group (PST vs. attention control) was not significant. The results point to a possibility that cognitive passive copers may have benefited as much from PST as the rest of the PST participants. Coping responses to depressive symptoms need to be further examined as a moderator in the future research of treatment efficacy of psychosocial interventions for late-life depression.

#### ANXIETY, DEPRESSION, AND HEALTH SERVICES UTILIZATION: FINDINGS FROM THE 2010 NSDUH

K. Mazurek<sup>1</sup>, J. Ciesla<sup>2</sup>, 1. *University of Illinois Urbana-Champaign, Urbana, Illinois*, 2. *Northern Illinois University, DeKalb, Illinois*

According to the National Institute of Mental Health, depression is under-diagnosed and commonly linked with suicide among older adults. Anxiety disorders often accompany depression and are associated with many chronic conditions. Therefore, it is important to advance the goals of Healthy People 2020 to improve mental health by ensuring access to appropriate mental health services. The purpose of this research is to examine mental health service utilization among elders with depression and anxiety using the National Survey on Drug Use and Health, 2010. This research provides odds ratios in three settings: inpatient hospital, outpatient hospital, community based mental health clinics. Findings indicate that elders with depression are 4.054 times more likely to receive hospital-based outpatient care (OR: 4.054, 95% CI 4.038 to 4.069,  $p\leq.000$ ) and 94.3 times more likely to receive hospital-based inpatient care (OR: 94.303, 95% CI 92.912 to 95.715,  $p\leq.000$ ). However, elders are considerably less likely to receive treatment at community based mental health clinics (OR: 0.080, 95% CI .079 to 0.080,  $p\leq.000$ ). Further findings indicate that elders with anxiety are 2.043 times more likely to receive hospital-based outpatient care (OR: 2.043, 95%

CI 2.517 to 2.538,  $p \leq .000$ ) and 26.5 times more likely to receive hospital-based inpatient care (OR: 26.535, 95% CI 26.272 to 26.801,  $p \leq .000$ ). However, elders are considerably less likely to receive treatment at community-based mental health clinics (OR: 0.120, 95% CI 0.119 to 0.121,  $p \leq .000$ ). This presentation will discuss the policy implications of disproportionately high admission rates to hospital-based treatment.

### DEPRESSIVE SYMPTOMS AMONG AGING INDIVIDUALS IN CHINA: DOES THE ENVIRONMENT MATTER?

L. Li, J. Liang, *School of Social Work, University of Michigan, Ann Arbor, Michigan*

**Purpose:** This study analyzes depressive symptoms as a function of individual attributes within the context of household, community, and province among middle-age and older adults in China. **Methods:** Data came from the Chinese Health and Retirement Longitudinal Study (CHARLS) in which a probability sample of adults age 45 and older and their spouses, if living together, in two Chinese provinces (Zhejiang & Gansu) were interviewed ( $N=2,685$ ). Data about the respondents' community were obtained through interviews with local leaders. Depressive symptoms were assessed by the 10-item CES-D. A 4-level mixed effects model was employed to examine depressive symptoms at the individual, household, community, and provincial levels. **Results:** Some 50% of the total variance in depressive symptoms was accounted for at the individual level. In addition, attributes at the levels of household, neighborhood, and province explained respectively 34%, 5%, and 11% of the total variance. Depressive symptoms were significantly associated with not only individual attributes (i.e., age, education, and health) but also characteristics of the household (i.e., composition and socioeconomic status [SES]), community (i.e., rural/urban, SES) and province (i.e., GDP). There is indication that community SES moderates the effects of household income and individual's education on depressive symptoms. **Implications:** This study suggests that environmental contexts are as important as individual characteristics in understanding depression in middle and old age. Future research is needed to examine how household and community environment exerts its influence.

### ASSESSING THE UNMET NEEDS OF OLDER ADULTS WITH SERIOUS MENTAL ILLNESS (SMI) IN THE REPUBLIC OF GEORGIA

K.A. Zurlo<sup>1</sup>, E. Chkonia<sup>2</sup>, *1. Rutgers University, New Brunswick, New Jersey, 2. Tbilisi State Medical University, Tbilisi, Georgia*

The Republic of Georgia (Georgia) became independent in 1991 and initiated health care reform in 1995. Since that time, mental health care has become a national priority, but services are limited by scarce financial resources. Although psychiatric care in Georgia is universally available, state provision satisfies only about 30 percent of existing need, which is under-estimated and does not reflect actual demand for services. Short-term and long-term institutional care is the mainstay of mental health service provision, which includes treatment from psychotropic drugs exclusively. Because existing mental health services are minimal in scope, there is significant risk associated in meeting the current and future mental health needs of Georgia's growing older adult population. As a result, this study explores methods that can be used to assess the unmet needs of this population. The perspectives of the patient, primary caregiver, and physician are solicited so one can ascertain differences in perceptions of need and more accurately guide the delivery of care in proposed community-based services. Using these three perspectives, qualitative and quantitative survey data must be compiled. Quantitative surveys administered include the Brief Psychiatric Rating Scale (BPRS), the Camberwell Assessment of Need - Elderly (CANE), and the Health of National Outcomes Scale (HONOS). Additionally, qualitative sur-

vey questions are critical to understanding the needs of this population and are derived from the results of the quantitative survey data.

### PUNJABI SENIORS WELLNESS INITIATIVE: EXPLORING THE DETERMINANTS OF MENTAL HEALTH

S.D. Koehn<sup>1,2</sup>, S.K. Bains<sup>3</sup>, *1. Simon Fraser University, Vancouver, British Columbia, Canada, 2. Providence Health Care, Vancouver, British Columbia, Canada, 3. University of the Fraser Valley, Abbotsford, British Columbia, Canada*

The Punjabi Seniors Wellness Coalition is a group of researchers and community partners engaged in health promotion. In 2010, the group secured Community Action Initiative funding to explore the extent to which community services targeted at Punjabi seniors in the Fraser Valley, British Columbia, address the social determinants of mental health, as identified by Keleher and Armstrong (2005). These determinants fall into three broad categories: social inclusion, freedom from violence and discrimination, and access to economic resources. Two groups of participants—Punjabi seniors ( $n = 20-25$ /forum) and community service providers ( $n=14$ /forum)—were involved in each of two forums held in Abbotsford and Surrey. Ethics clearance was secured. Punjabi seniors were interviewed in gender-specific focus groups about their experiences of these determinants and the community supports that they accessed; community service providers separately discussed if and how their work with Punjabi seniors addresses these determinants of mental health. Our consultations confirmed that Punjabi older adults are hard to reach and a relatively vulnerable population in terms of their mental health needs. Social inclusion is an important determinant of mental health and wellness in this population, in terms of the need to feel respected and valued, to have supportive relationships, to participate in the community and to have access to basic human entitlements. Service providers play a key role in facilitating social inclusion and other determinants of mental health but need additional supports in terms of training and sustainable resources to adequately support the mental health needs of their clients.

### A STUDY OF INDEFINITE CONFINEMENT OF OLDER SEX OFFENDERS TO MENTAL HEALTH TREATMENT FACILITIES

D. Mukherjee, *Social Work, SIUC, Carbondale, Illinois*

At least seventeen states in the US have passed various versions of "sexual predator" legislations along with nursing home care acts that encourage indefinite involuntary commitment of older adults with history of sex offense to mental health treatment facilities. The impetus for these legislations were to make nursing homes comply with emergency rules and repeal of the indeterminate sentencing laws under which serious sex offenders previously were confined in prison until prison officials were satisfied that they were no longer a threat to society. This study carries out a survey of the mental health treatment facilities ( $N = 78$ ) in 15 states to explore this trend of older non-mentally ill sex offenders being put up in such facilities. Furthermore, it conducts 9 qualitative interviews of nursing home administrators to understand their attitudes towards accommodating older persons of similar profiles. The study is based on the value that the mental health system is not the appropriate place for long-term confinement of older sex offenders as they do not necessarily have any treatable mental illness. Thus, the paper argues that the "sex predator" legislations do not constitute sound public policy. Moreover, the findings from the qualitative component of the study identify several themes that show that nursing homes in general are unwilling to accommodate older sex offenders because of the monetary commitment that such admissions entails under various nursing home care acts. The paper concludes by making a case of human rights violations against older sex offenders under current legislations.

## A STUDY USING WEB-BASED TOOLS TO ENHANCE THE INFORMED CONSENT PROCESS IN SCHIZOPHRENIA RESEARCH

A. Harmell<sup>1,2</sup>, B. Palmer<sup>1,3</sup>, D. Jeste<sup>1,3</sup>, 1. *University of California San Diego, Department of Psychiatry, La Jolla, California*, 2. *San Diego State University, Department of Psychology, San Diego, California*, 3. *Stein Institute for Research on Aging, La Jolla, California*

**Objective:** To examine the feasibility and effectiveness of a computer/web-based multimedia aided consent procedure among people with schizophrenia and normal comparison (NC) subjects. **Method:** 19 middle-aged and older people with schizophrenia and 16 normal comparison (NC) subjects were randomly assigned to either a web-media aided or a routine consent procedure for a hypothetical clinical drug trial. Participant comprehension was measured using the UCSD Brief Assessment of Capacity to Consent (UBACC) and the MacArthur Competence Assessment Tool for Clinical Research (MacCAT-CR). Participants also rated their satisfaction with the simulated consent procedure. **Results:** Relative to patients receiving the routine consent procedure, patients receiving web-media consent had significantly better performance on the UBACC with an effect size in the "large effect size" range ( $d=0.94$ ). Although power to detect significant differences was limited by the sample size, the overall pattern for patients on the MacCAT-CR was consistently toward better performance among those receiving the web-media consent (Understanding subscale  $d=0.81$ , Appreciation  $d=0.33$ , Reasoning  $d=0.45$ ). Further, 60% of the NC and 44% of the patients with schizophrenia rated the quality of the web-media aided procedure as "better" than prior experiences, and no subjects reported the current experience as worse. There were no significant effects of consent condition among NC subjects, but both NC groups evidenced near ceiling performances. **Conclusions:** Findings suggest that a web-based multimedia consent aid is feasible and at least as effective, and perhaps more effective than use of printed consent forms in schizophrenia research.

## SESSION 2170 (POSTER)

### OLDER WORKERS AND RETIREMENT

#### ORGANIZATIONS' VIEWS ON EMPLOYEES WITH CARE RESPONSIBILITIES FOR OLDER FAMILY MEMBERS IN EUROPE

A. Principi<sup>1</sup>, M. Di Rosa<sup>1</sup>, J. Perek-Bialas<sup>2</sup>, G. Lamura<sup>1</sup>, 1. *Centre of Socio-economic Gerontological Research, National Institute of Health and Science on Aging (INRCA), Ancona, Italy*, 2. *Institute of Statistics and Demography, Warsaw School of Economics, Warsaw, Poland*

**Purpose:** Due to the growth in the number of older people with high support needs, to the trend to a later retirement age and to a larger female labour force participation, the issue of reconciling paid work with family elder care is becoming crucial in Europe. Notwithstanding, little is known on how European organizations perceive this topic, e.g. whether employers think that elder care responsibilities may affect employees' daily work and productivity. **Methods:** The comparative ASPA survey addressed a total of 4,919 organizations in 6 EU-countries: Denmark, Germany, Italy, the Netherlands, Poland and Sweden. Data collection took place from March to November 2009. Four main ways of coping with the combination of work and family elder care responsibilities were investigated: reducing working hours; giving up working; taking up sick leaves; early retirement. **Findings:** Especially Italian and Dutch employers (about one in two) perceive that elder care responsibilities disrupt the daily work of (both male and female) middle aged employees. Overall, employers indicated the reduction of working time (40% of employers) and absenteeism (39% of them) as the strategies mostly used by their employees to reconcile work and family duties, while only 26% and 19% of them stated that employees deal with this by respectively retiring early and giving up working. Public employees are reported to

use the four coping strategies more frequently, as do those working in organizations with higher shares of female workers. Interpretation. Employers perceive reconciliation issues differently across countries and sectors, and according to their workforce structure.

#### HEALTH, PRODUCTIVITY AND SAFETY IN THE WORKFORCE: DOES AGE MAKE A DIFFERENCE?

A. Cohen-Callow, J. Jacobson, P. Osteen, J. Ko, *University of Maryland The Founding Campus, School of Social Work, Baltimore, Maryland*

Older workers benefit workplaces with their knowledge, experience, advanced skills, engagement and commitment; yet, they are at greater risk for chronic health conditions compared to their younger counterparts contributing to decreased productivity. Productivity drives decisions about support programs for employees; however, employers have become more responsive to programs and policies related to the changing employee demographics, especially those focused on the needs of an aging workforce. This study compared three age groups ( $\leq 34$ , 35–49 and  $\geq 50$ ) of workers at two Department of Energy national laboratories on the prevalence of chronic health conditions, productivity, and safety. Anonymous surveys were administered to 4000 randomly selected employees; 1854 surveys were returned (46% response rate) and 1147 surveys were used for this study. The researchers used the HPQ-Select (Kessler et al., 2003), to measure employees' health conditions, productivity [Relative Hours Worked (RHW), Self-Reported Job Performance] and safety. Workers varied on 29 health conditions. Results for those with one or more chronic condition were not different on RHW [ $F(2,12)=1.587, p=.205$ ]; however, differences in Self-reported Job Performance was significant [ $F(2,1018)=7.320, p=.001$ ], with lower scores for those  $\leq 34$  than those  $\geq 50$  ( $p=.001$ ). There were no differences on safety questions by age groups. Older workers with at least one health condition were just as productive and safe as compared to younger workers in the study. Results to be discussed relate to an aging workforce, health related productivity improvement opportunities and accident prevention strategies. Strengths and limitations of this research will be reviewed along with future research opportunities.

#### PRODUCTIVE ENGAGEMENT AND LONGEVITY IN TRANSITION TO RETIREMENT

E. Choi<sup>1</sup>, F. Tang<sup>2</sup>, 1. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *School of Social Work, University of Pittsburgh, Pittsburgh, Pennsylvania*

Currently, an increasing number of older adults simultaneously engage in productive activities, such as paid work and unpaid volunteer work. For older adults volunteering is linked with a wide array of mental and physical health benefits. Existing studies, however, provide inconsistent evidence for the positive association between working and health and fail to consider varied work statuses in transition to retirement. Moreover, our knowledge of the effect of concurrent engagement in paid work and volunteering on longevity is fragmentary. Based on the role enhancement perspective, which postulates that taking multiple roles may promote older adults' well-being, we examined the relationship between productive engagement and longevity using five waves of Health and Retirement Study data. First, we identified four latent statuses in the dynamic latent structure of work-retirement transition: full-time worker, part-time worker, fully-retired, and partly-retired. Then we assessed the effects of engagement in volunteer work, paid work, and both activities on self-rated health and mortality using growth curve modeling and logistic regression. The results indicated that volunteering had independent protective effects against decline in self-rated health over time and that volunteering at baseline was related to a lower risk of mortality. Concurrent engagement in both activities was not significantly associated with longevity. This study implies that meaningful engagement in volunteering is contributive to longevity and that stable employment status promotes perceived health among older adults. Policies and practices are needed to facilitate older adults in productive

engagement, which in turn benefit society as well as the older participants.

### **FALLING BETWEEN THE CRACKS: THE INTERSECTION OF AGE AND GENDER IN ORGANIZATIONAL POLICY-MAKING**

P. Taylor<sup>1</sup>, E. Lynn<sup>1</sup>, R. Williams<sup>1</sup>, E. Brooke<sup>2</sup>, *1. Monash University, Churchill, Victoria, Australia, 2. Swinburne University of Technology, Melbourne, Victoria, Australia*

Older women form a significant proportion of the paid workforce, but understanding of their place in organizational policy-making is lacking. This paper will consider the intersection of age and gender within three Australian industry sectors: Financial services, state and emergency services and higher education. It is based on analysis of qualitative data collected in an Australian Research Council research project, Retiring Women: Understanding Older Female Work-life Transitions. In-depth interviews were conducted with 56 Human Resource Managers and 39 key external stakeholders, including trade unions, advocacy groups and industry bodies. These revealed a significant disjunction between the two sets of interviewees in terms of understanding of the specific needs of older women. The former, in contrast to the latter, were generally unable to articulate how different equity agendas could be combined or even to recognize the potential efficacy of an integrated approach. Instead, age and gender were treated by HR managers as two operationally distinct categories and seldom integrated in their application. It is concluded that older women are misunderstood as an entity at the workplace level, generally falling between the cracks of current HR policy and practice.

### **THE IMPACT OF AGE AND GENDER ON THE PROMOTION DECISIONS OF OLDER WORKERS IN THE IRISH CIVIL SERVICE**

A. Ni Leime, *Irish Centre for Social Gerontology, NUI, Galway, Galway, Ireland*

Demographic aging means that there is an increase in the proportion of older workers in many European countries. This suggests a need for research into the experiences of older workers in order to inform policy at government and employer level. This paper is based on a qualitative study of older workers in the Irish civil service. It explores the impact of age, gender and age discrimination on their promotion decision-making. The methodology employed involved conducting semi-structured interviews with 105 older men and women aged 50–64 working at various grades in the Irish civil service. A lifecourse approach was adopted which enabled an exploration of how the previous work-life biographies of individuals impacts on their current employment decisions. This paper focuses on promotion decision-making and found that gender, age, age discrimination and previous work-life history impact on current decision-making. This suggests that political economy of ageing approaches to analysis are useful in accounting for the socio-economic context; however this needs to be supplemented by a life course approach which can account for the impact of agency, gender norms, and previous work life-history on the individual's promotion decision. These findings help uncover the processes which affect older workers – they clearly illustrate cumulative disadvantage/advantage, show that structural inequalities still exist and that gendered norms in relation to caring remain strong and suggests that employment policy needs to take this into account.

### **A UNIVERSAL SOCIAL SECURITY RETIREMENT SYSTEM: THE EXPERIENCE OF ARGENTINA POST 2008**

R. Eleta-De Filippis, *Sociologie, Université du Havre, Le Raincy, France*

: Under the new system of public pensions in Argentina the role of contributions by the employer and employee is no longer closely linked to the receipt of benefits. Now the system is universal. This contrasts

with the period of partial privatization from 1994 to 2008 where benefit levels were closely linked to contributions. Under the previous system differences in work histories and employment patterns had a strong impact on the level of benefit. Those who had only part-time work, or worked in the non-formal sector were greatly disadvantaged. The difference between the average man's work history and the average woman's work history was reflected in a lower benefit level for the average woman. In addition this partial privatization of retirement benefits left many workers and non-working women with no coverage at all. Today women receive the same minimum benefit as men who have worked in the formal sector at low wages. But the men have made contributions, together with those of their employer. These men are unhappy with the fact that women who have made no contributions receive the same benefit level. This raises the question of how to design a universal system of retirement benefits which can be accepted as equitable by both men and women. How can the unpaid work of women be acknowledged in the retirement years?

## **SESSION 2175 (POSTER)**

### **PRIMARY, CHRONIC, AND REHABILITATION CARE**

#### **RACIAL DIFFERENCES IN MONITORING AND TREATING METABOLIC PARAMETERS AMONG SCHIZOPHRENIA PATIENTS RECEIVING ANTIPSYCHOTIC MEDICATIONS**

K.L. Phillips<sup>1</sup>, L. Copeland<sup>2</sup>, J. Zeber<sup>2</sup>, R. Beswick<sup>2</sup>, *1. Atlantic Philanthropies, Silver Spring, Maryland, 2. Scott & White Healthcare, Temple, Texas*

**BACKGROUND:** Patients with schizophrenia taking antipsychotic medications are at an increased risk for developing metabolic syndrome. There is a lack of research that has examined the development of metabolic parameters specifically in older (50+) diverse populations. The purpose of this study was to examine if there are changes in monitoring metabolic parameters over the period 2002–2005 differ by minority vs non-minority race/ethnic status among older VA patients with schizophrenia. **METHODS:** VA patients with schizophrenia over age 50 with valid metabolic parameters were included (N = 11,418). To approximate the five components of metabolic syndrome, we used body mass index for central obesity, triglycerides, high-density lipoprotein (HDL), blood pressure readings, and A1c/proxy fasting-glucose tests validated in prior work. Data were examined over four years to assess differences by race (black vs white). **RESULTS:** Black veterans comprised 28% of the sample (n=3,166) and were somewhat less likely to have metabolic parameters assessed (29% vs 32% white veterans [n=8,252]). Black veterans were more likely to have high blood pressure readings (76% vs 70% at baseline, 73% vs 67% FY2005). White patients were more likely to have low HDL (48% whites vs 38% blacks FY2002; 51% vs 41% FY2005) and high triglycerides (35% vs 24% FY2002; 30% vs 22% FY2005). **DISCUSSION:** Racial disparity in monitoring and in observed metabolic parameters among older VA patients with schizophrenia was scarcely evident in this retrospective analysis, suggesting care equity.

#### **CHRONIC DISEASES AND PSYCHOLOGICAL OUTCOMES AMONG THE OLDER AFRICAN AMERICANS: THE ROLES OF INTERPERSONAL SUPPORT AND RELIGIOSITY/SPIRITUALITY**

E. Yoon, *Jackson State University, Jackson, Mississippi*

**Purposes:** This study is to examine the complex relationships among chronic diseases and learned helplessness depression development and the mediating role of social support and religiosity and spirituality in older African Americans in the Jackson Heart Study. **Methods:** The parent study is a large, community, population-based cohort study including medical history, physical examination, stress, coping, spirituality, racism and discrimination and socioeconomic position. For

this paper, the secondary analysis included a total of 1303 participants over 55 year older out of total 5,301 participants. The rationale of variable selection for the hierarchical regression analysis is conceptual in nature, addressing the hypothesized effects of daily spiritual experience and religious coping and interpersonal support on helplessness and depressive symptoms after adjusting selected socioeconomic variables and chronic health condition. Results Majority of older participants have multiple chronic health conditions ( $M=1.73$ ,  $SD=1.13$ ) such as Diabetes (25.5%), CVD (10.8%), Hypertension (78.6%), Kidney (17.8%), Asthma (12.2%), Lung (12.3%), Cancer (8.8%), and Stroke (7.1%). Descriptive statistics revealed the relatively higher symptoms of depression ( $M = 10.20$ ,  $SD = 6.84$ ) measured by the CES-D. With cut-off score of 16, 14.6% of respondents might be classified as "depressed". The correlational analyses revealed that lower socio-economic factors, poorer chronic health conditions are all significantly associated with helplessness. Multiple regression analysis identified several significant predictors to the depressive symptoms (20.2% variance explained): The negative associations with education ( $t = -2.94$ ) & Interpersonal support ( $t = -7.600$ ) and positive relations with self-rated health ( $t = 5.499$ ). Further, there is a significant relationship ( $t = -2.155$ ) between the Daily Spiritual Experience Scale (DSES) and the depression (CES-D). Additionally, selected variables such education ( $t=-6.258$ ), DSES ( $t=-2.891$ ), religious coping ( $t = 4.147$ ), and interpersonal support ( $t=-13.297$ ) are significantly related with helplessness( $R^2 = .246$ ) Implications It is found that majority of older African Americans are experiencing multiple chronic disease and a higher level of depression and despair in which immediate diagnosis and treatment is needed. Further, it is supported the significant mediating role of interpersonal support rather than social network to improved mental health condition. This study highlighted the enduring importance of supportive social relationships to psychological well-being among older African Americans.

#### **LINKING RACIAL/ETHNIC DISPARITY TO CORONARY HEART DISEASE THROUGH DEPRESSION AMONG MINORITY OLDER ADULTS**

Y. Kim<sup>1</sup>, H. Kanno<sup>2</sup>, J. Lim<sup>3</sup>, 1. *Univ. of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *Valdosta State University, Valdosta, Georgia*, 3. *Yongin University, College of Public Health & Welfare, GYEONGGI-DO, Republic of Korea*

Coronary heart disease (CHD) is the leading cause of death in the United States, strongly affecting the aging population. A link between discrimination and CHD among African Americans has long been established on the basis of the proposition that perceived discrimination may contribute to the elevated prevalence of hypertension; however, the extant findings have been mixed. Recognizing that psychological well-being may be the path through which discriminatory experience can affect health, the present study hypothesizes a potential mechanism between discriminatory experience and CHD through the pathway of depression. Data came from the National Health Measurement Study 2005-2006 which was comprised of 3844 community-dwelling adults aged 35 to 89 years. The study selected 203 racial/ethnic minority older adults over 65, who reported having discriminatory experiences derived from their race and ethnicity. To build a structural equation model, the EQS 6.1 version was used while adjusting the weights for differential response rates by age, race, and sex. There was a good fit, CFI = .96, GFI = .97, and RMSEA = .02. There was a significant prediction of depression by everyday perceived discrimination,  $\beta = .33$ ,  $z = 5.11$ ,  $p < .01$ , which in turn predicted a CHD diagnosis  $\beta = .21$ ,  $z = 2.98$ ,  $p < .01$ . The study provides a path model through which greater exposure to racial/ethnic discrimination may lead to low socioeconomic status that is directly and indirectly related to increased risk for negative psychological outcome and CHD among minority older adults.

#### **ADHERENCE TO DISCHARGE INSTRUCTIONS POST INPATIENT REHABILITATION FOR STROKE OR ORTHOPEDIC SURGERY**

A. Hunsaker<sup>1</sup>, E. Whyte<sup>2</sup>, D. Rosen<sup>1</sup>, 1. *University of Pittsburgh School of Social Work, Pittsburgh, Pennsylvania*, 2. *University of Pittsburgh School of Medicine, Pittsburgh, Pennsylvania*

Adherence to discharge instructions following inpatient rehabilitation is critical for continued recovery, yet the discharge process is complex, particularly for older adults with comorbid conditions. This quality assurance study examines adherence to discharge instructions three months post discharge from inpatient rehabilitation. Semi-structured interviews were completed with stroke survivors and orthopedic patients or their family members to explore barriers to discharge plan adherence. Participants were contacted in random order within groupings of 15-day blocks according to discharge date, with the final sample representing 13% of all discharges over a 14-week period. Discharge instructions were abstracted from medical records in order to compare it to patient and family report of care. The sample ( $n=36$ ) was predominantly white (89%), 53% female and had a mean age of 73 (range, 45 - 92). Adherence was higher for services that were ordered prior to discharge, including therapy (87%) and in-home nursing (76%). Regarding physician follow-up, adherence for primary care was highest (84%), while just roughly half of patients reported follow-up with specialists. Patient and family-identified barriers to adherence included transportation, difficulty scheduling appointments or a belief that the service was unnecessary. Sixty-five percent of patients and 80% of caregivers felt involved in decision-making about discharge planning, and the majority (100% of orthopedic respondents and 81% of stroke respondents) reported confidence in managing their care at home. These findings point to the need to improve patient understanding of the importance of specialist follow-up following discharge and for increased assistance in transportation to appointments.

#### **EFFECT OF HOME-BASED NURSE CARE COORDINATION WITH MEDICATION MANAGEMENT ON COSTS TO THE MEDICARE PROGRAM**

K. Marek<sup>1</sup>, S.J. Adams<sup>2</sup>, F. Stetzer<sup>2</sup>, 1. *College of Nursing & Health Innovation, Arizona State University, Phoenix, Arizona*, 2. *University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*

Purpose: The primary aim of this study was to determine whether a home-based nurse care coordination program with medication management for frail older adults would affect Medicare costs. Methods: A randomized controlled three-arm longitudinal design was used. A total of 414 older adults identified as having difficulty managing their medications were recruited at discharge from three Medicare-certified home health care agencies in a large Midwestern urban area and followed for 12 months. Intervention: A team of both Advance Practice Nurses and Registered Nurses delivered care to two intervention groups: one that received the MD.2 medication dispensing machine and nurse care coordination (Group 1) and one that received nurse care coordination with no machine (Group 2). The control group received no intervention, except a pharmacy screen, which was provided to all three groups. Measurement: Total costs to the Medicare program were examined using Medicare claims data from 2006 through 2010. Results: Controlling for Medicare costs in the six months prior, fixed effects and multiple regression models were used to estimate the relationship of both nurse care coordination and the medication-dispensing machine on Medicare costs. Total Medicare quarterly costs were lower in the 12 months during the intervention ( $p < .10$ ) in both group 1 and 2, when compared to the control group. Conclusion: Participants who received the nurse care coordination intervention had lower Medicare costs when compared to the Control Group, but the addition of the MD.2 machine to nurse care coordination did not result in lower Medicare costs.

## OLDER HISPANICS' PERCEPTIONS OF THEIR PROVIDERS AND THE IMPACT ON CANCER SCREENING BEHAVIORS

T. Cadet<sup>1</sup>, P. Maramaldi<sup>1,2</sup>, *I. Simmons College, Boston, Massachusetts, 2. Harvard School of Dental Medicine, Boston, Massachusetts*

The elimination of cancer screening barriers among low-income and minority populations is an important aspect of the national priority to eliminate health disparities among racial, ethnic, and income groups. Empirical studies indicate that provider-patient connectedness is increasingly associated with improved health outcomes. Specifically, patients without a close relationship with a provider are less likely to complete recommended testing for preventive care, such as cancer screenings. Higher cancer mortality among older Hispanics may be attributed to lower participation in cancer screenings. This may be associated with a lack of connectedness to their health care providers. We conducted a secondary analysis of focus group data collected from older Hispanics and Caucasians, aged 65 and older living in the Mountain West, regarding their attitudes toward colorectal cancer screening. The original study sample (N=24) included 11 Hispanic and 13 Caucasian participants, with a mean age of 75.2 (SD 7.38). The purpose of our secondary analysis was to explore approaches to health promotion using cultural communication theory among older Hispanics. Our analysis focused on the role of connectedness between providers and patients as a potential mediator influencing older Hispanics' colorectal cancer screening behaviors. Constructs from cross-cultural communication theory—power distance, collectivism, and high and low context communication—underscore the importance of older Hispanics' need for connectedness with their healthcare providers. Our findings evidence the importance of these theoretically supported factors in providers' communication with older Hispanics.

## SESSION 2180 (POSTER)

### SERVICE INTERVENTIONS, POLICY, AND FINANCING

#### THE INFLUENCE OF BENEFITS FOR NURSE AIDES

N. Castle, J.C. Ferguson-Rome, *University of Pittsburgh, Pittsburgh, Pennsylvania*

In this research, we focus on the influence of benefits for Nurse Aides (NAs) in nursing homes. We focus on both job satisfaction and turnover. Surveys were sent to nursing home administrators (NHAs) in all unionized nursing homes in New York City (i.e., 263) and to 10 NAs working in each of these facilities. These facilities tend to have high benefits. In addition, surveys were sent to NHAs in 131 up-state NY nursing homes and to 10 NAs working in each of these facilities. NAs were randomly selected from the complete roster. We used a job satisfaction instrument specifically developed for use with nursing homes and NAs. In addition, questions were included specifically to address health insurance, pay, training, and benefits. Turnover of NAs was lower in high-benefit facilities (7.2%) compared to low-benefit nursing homes (31.6%). Lower use of agency staff was found in high-benefit facilities compared to low-benefit nursing homes. The threshold pay for leaving the current facility was much higher in high-benefit facilities at \$5.57 per hour compared to low-benefit nursing homes (\$2.98 per hour). Of the 31 questions asked in the job satisfaction section, NAs working in high-benefit nursing homes were more satisfied in 20 areas compared to low-benefit NAs. In the multivariate analyses examining 9 job satisfaction domains, NAs in high-benefit nursing homes were significantly more satisfied in 6 of these areas than NAs working in low-benefit nursing homes. The findings show that high-benefits have a pervasive influence on nursing homes and staff.

## HUMAN RESOURCE MANAGEMENT IN NURSING HOMES IN XIAN CHINA: AN INITIAL APPLICATION OF HIGH COMMITMENT WORK SYSTEM CHINESE VERSION SCALE

X. Zhong, V. Lou, *Social Work and Social Administration, University of Hong Kong, Hong Kong, Hong Kong*

Introduction: The increasing number of nursing homes in China calls for scientific and efficient human resource management (HRM) practices to ensure a healthy development of nursing homes. High Commitment Work System (HCWS) refers to a system of HRM practice aiming to maximize employee's work commitment, and thus improve organization performance. While HCWS has been widely adopted in many sectors such as manufacturing, retailing, and hotel industries, little is known about whether or not HCWS is suitable to elderly service organizations. Moreover, a Chinese context is even less discussed in the literature. This study aims to explore how HCWS has been applied to China's nursing homes. Method: A survey was conducted in all 34 nursing homes in the urban area of Xi'an, a provincial capital in Western China. 345 participants including front-line care workers, professionals and managers replied a structured questionnaire which includes 15-item HCWS Chinese scale. Result: Exploratory factor analysis (EFA) of original 15 items showed 4 factors, with 10 items whose factor loading values were over 0.5 in one factor, and  $\alpha$  value is 0.798. EFA has been done within 10 items illustrated 35% of the total variance and  $\alpha$  value is 0.785. All the correlations between 10 items were significant at 0.01 level. 5 items including 1) promotion from within; 2) job security; 3) enlarged job; 4) ownership; 5) Egalitarianism were excluded. Conclusion: To a large extent, HCWS is suitable to China's nursing homes. Contents of 10 items should be enhanced in HRM to achieve employees' high working commitment.

## THE OLMSTEAD ACT AND AGING PARENTS OF ADULT CHILDREN WITH DISABILITIES: IMPORTANT CONSIDERATIONS FOR PLANNERS AND POLICY MAKERS

N. Kelley-Gillespie, K. Rolf, *Grace Abbott School of Social Work, University of Nebraska at Omaha, Omaha, Nebraska*

The prevalence of aging parents caring for their adult children with disabilities is increasing at an unprecedented rate. This study examines the changing characteristics of these households and looks at the effects of the 1999 Olmstead Act. Data from the U.S. Census and American Community Survey were used to examine changes in the prevalence and demographic characteristics of these households over time (1970-2010). Multiple cross sections of the National Health Interview Survey during this time period were used to examine health needs, service utilization, and health care utilization patterns. Findings show the changing demographic, service utilization, and residential characteristics of households with aging parents and disabled adult children. This research has important implications for planners, policy makers, and service providers. Policy-makers and service providers will be better equipped to integrate aging and disability services that will bridge gaps across the continuum of care. Results from this research may help to ensure the 1999 Olmstead Act mandate to provide least-restrictive alternatives to institutionalization.

## STATE SOCIAL WORK SCOPE OF PRACTICE GUIDELINES AND FEDERAL REGULATION: A POLICY ANALYSIS

C.L. Barragan, C.N. Marsack, F.P. Hopp, *Wayne State University, Detroit, Michigan*

Background: The Nursing Home Reform Act (NHRA) outlines minimum standards for staff who work in long-term care facilities including social services. However, in many states, social service positions are often filled by non-social workers (Bern-Klug, 2008). While the NHRA gives clear guidelines regarding qualifications of other profes-

sions, responsibilities and expectations of social services lacks connection with social work values, ethics, skills, and licensure. Methods: We use qualitative content analysis to examine the NHRA in comparison with social work scope of practice guidelines in 5 mid-western states. Findings: The skills needed to satisfactorily perform as a nursing home social worker are minimally at a Bachelor's in Social Work (BSW) level scope of practice. Keywords that indicate level of practice and necessary skills, such as intervention and identify - are present in both state level scope of practice guidelines for a BSW practitioner and the NHRA. Implications: Medical professionals are fully aware of their professional limitations and would never jeopardize their license based on the requests of an employer, yet nursing home social workers are expected to do this every day. The results of this study support Department of Human Services (2003) recommendations, which call for revisiting of social work credentials given the needs of residents and observed inconsistencies across states. This also further supports the urgent need for licensed and degreed social workers in long-term care to ensure the psychosocial needs of residents are being met.

#### **NURSING HOME TRANSITION AND DIVERSION: 2010 AGING NETWORK SURVEY OF AREA AGENCIES ON AGING RESULTS**

E. Robbins<sup>1</sup>, E. Carpio<sup>2</sup>, S. Kunkel<sup>2</sup>, M. Kaschack<sup>3</sup>, *1. Mather LifeWays Institute on Aging, Evanston, Illinois, 2. Scripps Gerontology Center, Miami University, Oxford, Ohio, 3. National Association of Area Agencies on Aging (n4a), Washington, District of Columbia*

With a grant from the Administration on Aging (AoA), the National Association of Area Agencies on Aging (n4a) partnered with Scripps Gerontology Center of Excellence to conduct the 2010 Aging Network Survey of Area Agencies on Aging (AAAs). The survey, launched in September of 2010 to all AAAs, concluded data collection in February 2011 with over 71% of AAAs responding. Results show that AAAs provide a number of services that aid individuals at risk for institutional care remain in the community or transition back to the community when long-term care facility placement is no longer necessary. AAAs use several strategies to maintain or transition individuals back to a community setting: working with the care recipient's family, options counseling and developing partnerships with hospitals. Empowering individuals, nearly three-quarters of AAAs have plans in place or have made progress towards encouraging individuals to take responsibility for their long-term care needs and nearly two-thirds have plans in place to assist consumers in planning in advance for long-term care. Additionally, AAAs were involved in a number of activities related to livable communities. More than half have developed projects to promote aging in place, met with other entities to address housing or transportation needs and established coalitions to promote coordination across service sectors. There is, however, considerable room for growth in AAAs' involvement in developing initiatives to plan for livable communities including designating staff within the organization to develop/work on livable community projects and obtaining funding for livable community planning/work.

#### **AVOIDING FINANCIAL EXPLOITATION: PROMISING PRACTICES TO PROTECT ELDERLY AND VULNERABLE ADULTS**

S.Y. Jones, *Department of Human Services, Adult Protective Services, Washington, DC, District of Columbia*

Financial exploitation seemingly is emerging as one of the most prevalent form of elder mistreatment. Elder financial abuse has grown to epidemic proportions. This session will address the striking but real increase in Financial Exploitation across the country with focused discussion on the positive outcomes that have resulted from implementing prevention practices that assisted in the abatement of further exploitation. Examples of case studies are being offered in the District of Columbia, which according to Adult Protective Services

has seen a significant increase in these cases. Cases include Medicaid recipients, persons with disabilities, and persons of some financial stature. The increased life expectancy, rising numbers of older persons, loss revenue and the complexity of financial exploitation have forced local and state jurisdictions to look more carefully at this issue. However, this persistent challenge lacks a national reporting repository and the ability to track cases often breaks down across state lines. Proving financial abuse or neglect is an arduous and tedious task. In a downturned economy regulators and elected officials often believe they see equally pressing issues. Many financial exploitation cases come with family, social and cultural baggage. The result is shame, humiliation and failure to report how pervasive the problems are and what solutions are needed. This session will offer research, policy and practical guidance needed to address this emerging challenge.

#### **DELAWARE'S SENIOR CENTER GRANT-IN-AID FUNDING FORMULA: AN ASSESSMENT TOOL FOR LEGISLATIVE DECISION-MAKING**

J. O'Hanlon, R. Linstead Goldsmith, *Institute for Public Administration, University of Delaware, Newark, Delaware*

The Senior Center Grant-in-Aid Funding Formula uses geographic, demographic, and programmatic factors to provide the state legislature with an objective and comprehensive assessment for funding Delaware's senior centers. The formula was designed to incentivize senior centers to offer a full array of services and better engage older adults. It is applied to new funding and does not affect the base funds historically apportioned to centers. The formula consists of two tiers. The first tier allocates funding across the state's four regions based on demographic determinants. The second tier allots funding according to a center's average attendance and service offerings. Categories for each variable have been determined, and in the case of the service level categories, they are based upon national recommendations for nutrition, transportation, health and wellness, social interaction, physical fitness, education and outreach. The formula also facilitates continuous adjustment of funding according to demographic shifts. The number of Delawareans 65+ is expected to double by 2030 from 2000 levels. In one county, adults age 85+ will increase by nearly 7-fold in this period. Thus, the formula supports aging in place by ensuring funding reaches the communities where seniors live. Federal aging programs, such as Home and Community-Based Supportive Services, use population-based formulas, yet Delaware is unique in its utilization of a multi-tier formula at the state-level. This poster will contribute to GSA poster sessions by demonstrating the value of formula-based service assessment in quantitative and qualitative terms, as well as how such a formula has been implemented in Delaware.

#### **SOCIAL WORK DECISION-MAKING PROCESSES AND OUTCOMES FOR HOME AND COMMUNITY-BASED SERVICES TO MEET THE PSYCHOSOCIAL/PHYSICAL NEEDS AND PREFERENCES OF OLDER ADULTS WITH FUNCTIONAL HEALTH LIMITATIONS TRANSITIONED FROM ACUTE CARE TO URBAN COMMUNITY SETTINGS**

D. Joosten, *School of Social Work, University of Southern California, Los Angeles, California*

The number of adults 65 and older will increase from 12.4 percent of the total population in 2004 to 20 percent in 2030 (Administration on Aging, 2005). Among older adults chronic illnesses such as heart disease, arthritis, dementia, and diabetes are associated with increased difficulties with daily activities (Ferrini & Ferrini, 2008). The 2007 National Health Interview Study reveals limitations in daily activities among 43% of older adults age 75+ with one or more chronic illness

(Adams, Barnes, & Vickerie, 2008). As the proportion of older adults increase the number of older adults with chronic conditions in need of ADL and/or IADL assistance will also increase. This growing population of older adults will likely present social workers and case managers with larger caseloads and challenges to identify appropriate services to meet specific IADL and ADL needs. Efficiency in matching older adult clients' needs with appropriate Home and Community-based Services (HCBS) referrals in a timely manner will become essential in efforts to provide coordination of care for older adults discharged from acute care to community settings. Such efficiency will be vital to the well-being of homebound older adult clients with physical limitations in preventing costly rehospitalizations and/or premature institutionalization. The Affordable Care Act (ACA) (P.L. 111-148) enacted March 23, 2010 includes several provisions aimed at improving care for community dwelling older adults with chronic diseases with functional limitations through demonstration projects such as the Medicaid Community First Choice effective October 1, 2011 that requires states provide a person-centered plan for supportive and HCBS services to assist with physical and health related activities (U.S. Department of Health & Human Services, 2010). In an effort to inform care coordination this study identifies: specific HCBS provided to 249 homebound older adults transitioned from acute care to community settings in the South Bay of Los Angeles County, the patients preferences for implementing such HCBS at the time of a social work home visit, specific sets of HCBS homebound older adults transitioned from acute care need, and the decision-making processes clinical social workers use when making referrals for sets of HCBS to homebound older adults after acute care discharge.

#### **PREDICTIVE VALIDITY OF AN ONLINE ASSESSMENT TO MEASURE AGENCY READINESS TO IMPLEMENT HEALTHY IDEAS**

L. Hasche<sup>1</sup>, N.L. Wilson<sup>2</sup>, E. Dessem<sup>3</sup>, 1. *Graduate School of Social Work, University of Denver, Denver, Colorado*, 2. *Baylor College of Medicine, Houston, Texas*, 3. *National Council on Aging, Washington, District of Columbia*

The gap between knowledge of effective interventions and usual care is problematic—especially, for late life depression care. A 30-minute, online assessment of organizational readiness may help improve adoption of effective depression care practices. Based on Rogers' diffusion of innovations theory, the National Council on Aging developed the Innovative Readiness Assessment (IRA). The IRA examined organizational capacity (staffing, current practice, etc.) and willingness to implement core components for Healthy IDEAS, an evidence-based depression care intervention. This study aimed to test how accurately the IRA predicts adoption of Healthy IDEAS. Methods: Analysis was conducted of the measurement properties of the Healthy IDEAS' 47 IRA items and of the second-order factors for capacity and willingness (rated as high, medium, or low). Then, by abstracting data from Healthy IDEAS' tracking database of agencies' implementation activities (e.g., technical assistance calls, customization of procedures, establishment of coaches, trainings completed, and use of Healthy IDEAS), regression analysis tested how capacity and willingness predicted agency case managers' use of Healthy IDEAS. Results: Since September 2009, 86 agencies from 16 states have completed the IRA and have engaged in implementation of Healthy IDEAS, of which 57% had high willingness, 16% had high capacity, and 45% have used Healthy IDEAS. Regression results indicate a trend toward capacity and willingness being associated with the percent of agency case managers using Healthy IDEAS (capacity  $p=0.073$ ; willingness  $p=0.066$ ). Implications: Accurately measuring organizational readiness can inform the customization of implementation activities to agency context and help maximize the successful adoption of Healthy IDEAS.

#### **AN INTERDISCIPLINARY APPROACH TO ASSESSING THE SERVICE NEEDS OF VULNERABLE SENIORS LIVING IN POVERTY**

K. Blumenfeld<sup>1</sup>, M. Hong<sup>2</sup>, M. Piwowarski<sup>4</sup>, A. Harbert<sup>3</sup>, A. Brychta<sup>3</sup>, T. Love-Geffen<sup>1</sup>, J. Min<sup>3</sup>, 1. *San Diego State University, School of Speech, Language, & Hearing Sciences, San Diego, California*, 2. *San Diego State University, School of Exercise & Nutritional Sciences, San Diego, California*, 3. *San Diego State University, School of Social Work, San Diego, California*, 4. *Senior Community Center of San Diego, San Diego, California*

**Background and Purpose** An interdisciplinary approach to assessing the needs of vulnerable seniors living in poverty (VSLP) is essential as both linguistic abilities and nutritional habits have significant impacts on successful aging and quality of life. In this study, linguistic and nutritional information was collected to evaluate service needs of diverse VSLP's. Study Methods 45 seniors (mean age=73, SD=7) from the West Senior Wellness Center in San Diego completed face-to-face questionnaires, health evaluations, and were asked to identify perceived barriers to services. Results Language: 70% of participants reported proficiency in non-English languages. Among bilinguals, native Spanish speakers used English most (65%) while native Mandarin speakers used it least (23%),  $p < .01$ . As expected, participants reported more frequent use of languages with higher self-rated proficiency (native language:  $r=.5$ ; second language:  $r=-.7$ ). Interestingly, increased age was associated with lower perceived proficiency in the second language ( $r=-.4$ ). Nutrition: 22 individuals completed a nutrition survey. Data showed an average BMI=28 with a calculated ideal body weight=135%. 50% were considered clinically overweight or obese, and 10% underweight. Seniors reporting light physical activity showed a higher BMI value ( $p=0.06$ ) with higher body fat being strongly correlated with high BMI ( $r2=0.918$ ,  $p<0.01$ ). Conclusions Findings suggest that: (1) Older bilinguals show increasing vulnerabilities in second-language (English) communication; and (2) raising awareness of nutritional status may motivate at-risk seniors to initiate steps toward improving their health. Further efforts are needed to ameliorate the nutritional/health status of VLSPs and we believe a multilingual approach may provide this vehicle.

#### **SESSION 2185 (POSTER)**

#### **STUDY OF GERONTOLOGY, PUBLIC INFORMATION, AND EDUCATION**

#### **GERONTOLOGY IN WIKIPEDIA: IS A WIKIPROJECT NEEDED?**

D.L. Infeld, W.C. Adams, *Trachtenberg School of Public Policy & Public Administration, The George Washington University, Washington, District of Columbia*

The public, including seniors and professions, increasingly turns to the Internet for important information and Wikipedia is a widely used site. Wikipedia is an open-source online encyclopedia that allows individuals and groups, formed as WikiProjects and Task Forces, to contribute content and to edit and assess the quality of its content. Among Wikipedia's nearly 4 million English-version articles, how well are important aging-related topics covered? A total of 317 aging-related terms were identified using Bettelheim's Aging A-Z (2002) as a starting point. Eighty-five of these terms did not have Wikipedia pages. Further analysis suggests that 18 are noteworthy and rather surprising omissions including a few leading organizations (ASA, NCOA, and the Leadership Council of Aging Organizations) and basic concepts (functional assessment, IADLs, successful aging). Not all of the pages on topics of relevance to aging actually mention aging, however. Among these age-relevant articles, four out of ten do not specifically address aging. While not strikingly different, age-specific pages tend to be longer, have many more citations, more hotlinks, more page visits, have been updated more recently, have more WikiProjects reviewing them, and

to have a slightly higher scores on quality and importance. Having a WikiProject attending to an article does not guarantee good scores but does correlate with higher quality. Thus, gerontologists at this session will gain understanding about the potential contribution of forming an aging/gerontological WikiProject to ensure the accuracy of aging-content read by a large and growing share of the population.

### REFLECTIONS ON SERVICE LEARNING: THE STUDENT PERSPECTIVE

M. Claver, L. Lares, *Gerontology Program, Calif State Univ Long Beach, Long Beach, California*

Providing students in a gerontology course with meaningful, real-life interaction with older adults has been shown to improve attitudes about aging and increase interest in working with this population. Students from a variety of majors took an upper-division gerontology course that required a 21-hour service-learning component and record their experiences (i.e., What did you do? How did you feel about it? Make connections between service learning and course materials). The goal of this study was to explore three research questions: How did students feel about the service learning experience?; What did students gain from classroom debriefing sessions?; What did students gain/learn from reflective journaling about their service learning experiences? Qualitative analysis of students' written responses showed that students felt that service-learning gave them better insight into how to be advocates for the elderly. They also gained a sense of respect for the elderly and learned how to communicate better with the older population. In-class debriefing sessions throughout the semester allowed students to feel a connection with other students in the course and encouraged them to feel that they were working as a team to serve the elderly. Classroom discussions also allowed them to learn from each other's experiences, since students were placed in one of four agencies serving older adults with a range of functional ability. Reflection journals gave students the opportunity to review their entries and see their personal growth, especially about stereotypes, expectations and preconceived notions of the older population.

### GERONTOLOGY AS GENERAL EDUCATION: THE UCLA FRONTIERS IN HUMAN AGING CLUSTER

D. Gans, P. Hsu, R. Effros, E. Richardson, J. Damron-Rodriguez, *UCLA, Los Angeles, California*

The longevity revolution and the recognition that lifelong health behaviors are associated with healthy aging make gerontology a compelling content area for undergraduate general education (GE). However, given the complexity and interdisciplinary nature of the field, it cannot be effectively taught in a traditional one quarter/semester GE course. The UCLA "Frontiers in Human Aging" Cluster is an exemplary innovation representing a didactic movement from the conventional GE approach of taking a little of "this and that" to a series of year-long Cluster courses revolving around compelling issues of our time. Using a community of learners modality, UCLA Clusters aim to (1) increase understanding of the interdisciplinary nature of complex phenomena, in this case, aging; (2) strengthen writing and communication skills; and (3) develop critical, interpretive, and analytical skills. The Aging Cluster further aims to introduce students to career opportunities in geriatrics and gerontology. Students are taught evidence-based knowledge in bio-psycho-social aspects of aging and related public health policy by the core interdisciplinary faculty team, and fulfill 15 hours of service learning in community organizations serving older adults in Los Angeles. Averaging 160 students a year since its inception in 2000, approximately 1,500 students have completed the Cluster, and can now enroll in the newly developed UCLA Gerontology Interdisciplinary Minor. Additionally, 30 doctoral teaching fellows were trained in this innovative teaching method and are now entering positions in the field of aging. The Cluster has increased students' undergraduate academic

success while preparing them to live and work in an intergenerational society.

### LTC DEDICATED EDUCATION UNIT: EVALUATION OF AN INNOVATIVE CLINICAL EDUCATION MODEL

L.M. Abdallah<sup>1,2</sup>, L. Dodge<sup>1,2</sup>, J. Dowling<sup>1,2</sup>, N. Prendergast<sup>2,1</sup>, A. Rathbone<sup>2,1</sup>, R. Remington<sup>1,2</sup>, C. Thornton<sup>2,1</sup>, K. Melillo<sup>1,2</sup>, *1. Nursing, University of Massachusetts Lowell, Lowell, Massachusetts, 2. DYouville Center for Advanced Therapy, Lowell, Massachusetts*

Nursing education and healthcare institutions must adapt to meet the needs of adults 55 and older with multiple chronic illnesses and post-acute care needs as they transition from shorter hospital stays to home or long term care facilities. Providing innovative, cost-effective, patient-centered clinical experiences that include comprehensive education in the care of older adults for nursing students and staff is imperative. The purpose of this project was to improve education of nursing students, nursing staff, and faculty in gerontological nursing. Using a university-community partnership model approach, a Transitional Care Dedicated Education Unit (TCDEU) was developed. Partnership activities included development of preceptor training manuals, conducting joint training sessions for faculty and staff, implementing student summer internships to foster long-term care as a primary career option for new BSN graduates, development of clinical placements for junior nursing students, and hosting a workshop for long-term care facilities and Massachusetts institutions of higher education to provide hands-on training materials. A quasi-experimental pre-/post-test design was utilized to determine the effectiveness of the program on BS students' eldercare cultural self-efficacy using the Shellman (2006) Elder Care Cultural Self Efficacy Scale. Contextual data were collected via focus groups to evaluate program satisfaction and learning outcomes. Data show increases in students' confidence in caring for older adults. Students, clinical teachers and partners report high satisfaction with the program. Results indicate this TCDEU is an innovative nursing education model that integrates long-term care into nursing education and promotes long-term care as a primary career option for nursing students. Implications for gerontological nursing education and practice will be discussed.

### COMPETENCY-BASED POST-GRADUATE EDUCATION: MEASUREMENT DEVELOPMENT

J. Damron-Rodriguez<sup>2</sup>, J. Frank<sup>1</sup>, J. Fassbinder<sup>3,1</sup>, B. Kramer<sup>4,1</sup>, *1. David Geffen School of Medicine at UCLA, Los Angeles, CA, United States, Los Angeles, California, 2. Luskin School of Public Affairs at UCLA, Los Angeles, CA, United States, Los Angeles, California, 3. California Council on Gerontology and Geriatrics, Los Angeles, California, 4. VA Greater Los Angeles Healthcare System, Los Angeles, California*

Background: The IOM Report: Retooling for an Aging America asserted the need for increased competence in geriatrics for all health professionals including currently practicing care providers. Competency-based education and evaluation (CBE) emphasizes the role of outcome measurements. Aims: The Geriatric Social Work (GSW) Competency Scale II developed within the Hartford Partnership in Aging Education (HPPAE) for graduate education was used, in combination with other methods to measure and compare social work graduate school outcomes to post-graduate geriatric outcomes from the Geriatric Scholars Program (GSP) Social Work Track (2009-2012). Methods: The GSW Competency Scale II was used to identify competency content for all 45 lectures delivered during a 4-day intensive geriatrics post-graduate course, noting the "dose" or intensity of coverage. Social workers (n = 35) completed pre, post training GSW Competency surveys and a 3 month follow-up. Qualitative data was garnered through learner journals noting anticipated application of knowledge and skill to practice. Outcomes: Significant gains pre to post training (p=.000 to p=.04) were reported in 5 of 6 domains of competence. On a scale of 1-10, the mean

competency gain ranged from 5.4 to 7.9. Journals and follow-up provided rich descriptions of skill application to practice. Post-graduate GSW scores were on average higher than graduate student comparisons. The content “dose” produced variation in some competency outcomes. Implications: Advancing CBE measurement requires the need to consider level of training as well as intensity of competence coverage in post-graduate education.

### THE “COST & BENEFIT” OF LIVING AT HOME FOR 65 & OLDER ADULTS

H. Koduri, *Gerontology, School of Nursing, University of Utah, SALT LAKE CITY, Utah*

Aging in place is gaining popularity among senior American citizens. This research paper provides unknown information about service options available to 65 and older adults who can afford to stay at home through Home Health Agencies in Utah. Most of the people are unaware of a fact that they can approach Home Health Agencies for services even before hospitalization of their loved ones. For people who take care of their aged parents (who are willing to stay at home), this research paper might be a quick guide to analyze the price ranges of different types of HHA agencies in Utah and decide which is the best option for their parents. Secondary goal of this paper is to relieve sandwich generation, a generation of people who take care of their own children and also their aging parents from stress by educating them on when is the right time to consult a HH Agency and why is it important. Final yet the most alluring goal of this paper is to provide a new option for seniors who are 65 and older to stay home and stay health as long as possible. This paper further provides suggestions to the clients who approach Home Health Agencies to ask few questions which might be considered as important and beneficial for clients. Again, the options mentioned in this article are for seniors who can afford to stay at home as it is bit expensive but serves the purpose of 65 and older American citizens who prefer and who can afford to stay at home by avoiding unnecessary pre-mature hospital admissions. Coming up with a policy proposal to extend the Medicare or other insurance coverage period for 65 and older adults who obtain Home Health services.

### EDUCATIONAL BACKGROUND AND REASONS FOR SEEKING CONTINUING EDUCATION AMONG OHIO'S PROFESSIONALS IN AGING

S.M. Leson<sup>1</sup>, D.J. Van Dussen<sup>1</sup>, H. Ewen<sup>2</sup>, 1. *Department of Human Ecology, Youngstown State University, Youngstown, Ohio*, 2. *Miami University of Ohio, Oxford, Ohio*

The current research examines the educational background, continuing education needs and reasons for seeking gerontological education among professionals working with older adults in Ohio. The sample consists of healthcare practitioners, mental health professionals, health care administrators and long term care administrators. The purpose of the study is to better understand how higher education can serve existing professionals in aging (n=760). Within the sample population 24.9% of professionals working with older adults have had no formal training in aging related education, and 15.7% have learned on the job. The most requested topics of further education involve dementia (27.6%), medications (14.1%) and mental health issues (7.8%). Professionals reported that they prefer continuing education, certificate programs, and master's degree programs. The three most reported reasons for seeking further gerontology education were to do a better job, increased job satisfaction, and higher pay. The biggest barriers to receiving further aging related education were time, cost and distance to Youngstown State University or Miami University. Significant correlations between these barriers are explored in the current research. Future efforts should seek to reduce barriers and increase our outreach to current professionals so they may receive the education they need to better serve the older adult populations. Future research should examine urban and rural differences in reasons for seeking aging education and barriers to seeking future

education particularly since Ohio's proportion of rural dwelling older adults have unique challenges and face depopulation of younger adults.

## SESSION 2190 (POSTER)

### SUCCESSFUL AGING

#### DO SUCCESSFUL AGING TRAJECTORIES PREDICT LATER HEALTH CARE UTILIZATION

H. Hsu, *Department of Health Care Administration, Asia University, Taichung, Taiwan*

Objectives: The aim of this study was to examine trajectories of successful aging indicators in predicting later health care utilization by a longitudinal panel data of the older adults. Methods: A 5-wave panel sample of elderly during year 1993 to 2007 was used (n=1232). Trajectories of six successful aging indicators 1993 to 2007 were identified by group-based trajectory analysis, then the successful aging trajectories were used to predict whether the respondents use acute and long-term care or not and the amount of utilization in 2007. Successful aging indicators were defined by chronic diseases, physical function disabilities, depressive symptoms, social support, social participation, and economic satisfaction. Results: Four successful aging trajectories were identified: Successful Aging (27.1%), Usual Aging (36.0%), Health Declining (24.5%), and Care Demanding (12.4%). Compared with Successful Aging group, Usual Aging and Health Declining elders were more likely to use hospital admission (OR=1.69 & 2.06), emergency room (OR=2.15 & 2.52), and care attendants (OR=7.35 & 19.70). Usual Aging elders more likely went to physician clinic (OR=1.58) and Health Declining elders more likely to use nursing homes (OR=29.21). Care Demanding elders were more likely to use nursing home (OR=8.31) and care attendants (OR=20.06) but no difference in acute care. Usual Aging elders used more physician visits and care attendant days; Health Declining elders used more hospital days, nursing home and care attendant days; Care Demanding elders used more nursing home and care attendant days. Conclusion: Past successful aging trajectories predict the later health care utilization.

#### THE CHALLENGE AND THE PROMISE OF AUTISM SPECTRUM DISORDERS IN ADULTHOOD AND AGING: A SYSTEMATIC REVIEW OF THE LITERATURE (1990-2012)

S.D. Wright<sup>1</sup>, V. D'Astous<sup>1</sup>, T. Grandin<sup>2</sup>, 1. *Gerontology Program, University of Utah, Salt Lake City, Utah*, 2. *Colorado State University, Ft. Collins, Colorado*

There has been a noticeable increase in the past ten years in the number of publications that address the issues of autism spectrum disorders (ASD) into the domain of adulthood and aging, and yet, this still represents an extremely small proportion of the overall literature that is predominantly focused on childhood and adolescence. This presentation presents the results of a systematic review of the literature (though August, 2012) based on the results of search activities in five electronic databases using selected key words for the extant literature on autism in adulthood and aging. This review of the literature is different than previous examples in that it emphasizes: 1) intergenerational factors; 2) multidisciplinary perspectives; 3) is life-course oriented, and 4) reviews the strength-based research that has indicated the abilities, strengths, and talents of ASD. A heuristic framework is then used to organize the literature, highlight major emergent themes, and interconnected threads among the publications that have examined autism in the context of adulthood and aging thus far. We also propose the top-five exemplar publications per emergent theme. This presentation will also indicate the critical educational and clinical services and program implications for what is examined thus far, and will propose several recommendations for future research, educational interventions, and policy implications. This presentation will also review the promise and poten-

tial of neurodiversity and underscore the abilities and capabilities that are possible into adulthood and aging.

### ACTIVITY DOMAINS AND ENGAGEMENT PATTERNS: AN EMPIRICAL EXPLORATION

M. Putnam<sup>1</sup>, N. Morrow-Howell<sup>2</sup>, Y. Lee<sup>2</sup>, M. Inoue<sup>3</sup>, J.C. Greenfield<sup>2</sup>, 1. School of Social Work, Simmons College, Boston, Massachusetts, 2. Washington University, Saint Louis, Missouri, 3. Boston College, Boston, Massachusetts

**Aims.** The aims are: 1) To explore ways to conceptually and empirically consolidate discrete activities into domains or patterns; 2) To explore statistical models with activity domains/patterns as dependent and independent variables, and 3) To compare two data sets on activity items, domains, and patterns. **Methods.** For each of two public and nationally representative data sets, the Panel Study of Income Dynamics and the Health and Retirement Study Activity Supplement, we identify survey items regarding activity engagement. We used exploratory and confirmatory factor analysis to identify activity domains, and latent-class analysis to identify activity patterns. We then used structural equation modeling to identify demographic factors that affect these patterns and the effects of these factors on well-being outcomes in subsequent waves of data. We compared results between the two data sets. **Findings.** There was nine activity items in the PSID and no factors were identified to support the concept of activity domain. Three activity groups were identified, differentiated only in terms of amount of activity, not type of activity. There were 46 activity items in the HRS. Seven activity domains and four activity patterns were identified. In both data sets, the activity patterns were associated with some demographic factors and with well-being outcomes. **Implications.** The empirical issue of how to analyze multiple activities is a challenge to advancing knowledge about activity engagement. These findings demonstrate that discrete activity items can be consolidated and used in statistical models, and publically available national data sets offer different potential for studying activity engagement.

### “THIS IS NOT GOD’S WAITING ROOM”: PERCEPTIONS OF HEALTH IN AN ACTIVE ADULT COMMUNITY

C. VandeWeerd, J. Corvin, D. Petersen, A.R. Williams, E. Sussman, University of South Florida, Tampa, Florida

By 2030, older adults will comprise more than 20% of the US population. This unprecedented rise in the aging population will be met with a dramatic increase in health care expenditures. To reduce this burden and advance public health’s mission to achieve longer, healthier and more productive lives across the lifespan, models of healthy aging must be promoted. In an effort to meet this challenge, USF Health, in partnership with The Villages, a 55 and older active adult retirement community, completed a formative health assessment to understand barriers and facilitators to successful, healthy aging. Specifically, this exploratory study aimed to identify prominent definitions of health; assess perceptions of the importance of good health; and recognize factors perceived to enhance overall quality of life. Fifty nine focus groups, stratified by age, gender, and health status, were conducted between September and December of 2011 with a convenience sample of residents (n=451) in three phases: general inquiry, in-depth exploration of emergent themes, and member validation. Results indicate a shared definition of ‘good health’ focused on one’s ability to conduct daily activities consistently, while maintaining physical fitness and mental acuity; and reveal an emphasis on health and wellness among residents. Results also suggest the importance of positive community engagement and social support in promoting successful aging. The emergence of key health concerns suggest barriers (i.e. access to services, chronic conditions) and facilitators (i.e. community services and support, social capital) that impact models of healthy aging. Implications of findings for policy and practice are discussed.

### COMMUNITY-DWELLING OLDER ADULTS’ PERCEPTIONS OF DIGNITY IN THE COURSE OF EVERYDAY LIVING: MEANING, SUPPORTS, CHALLENGES, AND OPPORTUNITIES

K. Black<sup>1</sup>, D.J. Dobbs<sup>2</sup>, T.L. Young<sup>2</sup>, 1. College of Arts and Sciences, University of South Florida at Sarasota-Manatee, Sarasota, Florida, 2. University of South Florida, Tampa, Florida

Dignity is a universally important concept to all persons, yet little attention has focused on how community-dwelling older adults view dignity in the course of their everyday life and interactions. This study employed multiple methods of qualitative inquiry to explore the meaning of dignity as well as supports and challenges to dignity from the perspectives of older adults residing in one of the United States most populous communities of older residents. Focus groups and surveys were used to collect data from 268 older adults representing a wide range of socio-demographic characteristics. Data was analyzed by a research team using a grounded theory approach. The meaning of dignity was described as three key themes including: autonomy, interactions with others, and self-identity. Challenges to dignity included: health problems, ageism, life course situations, family, economic insecurity, key settings, and ageing. Supports to dignity included: informal supports, family, personal behaviors and attitudes, activities, organizations, and ageing. Practical suggestions to enhance dignity in the course of daily life interactions are suggested.

## SESSION 2195 (SYMPOSIUM)

### FUTURE LEADERS/FUTURE DIRECTIONS IN AGING RESEARCH: NOVEL METHODS/NOVEL APPROACHES TO UNDERSTANDING AGING

Chair: D.A. Sinclair, Harvard University, Boston, Massachusetts  
Co-Chair: D.A. Sinclair, Harvard University, Boston, Massachusetts  
Co-Chair: T. Vasilopoulos, University of Chicago, Chicago, Illinois

This symposium is designed to bring young, talented investigators to the attention of members of the gerontological community and provide a forum to showcase their research efforts. Each of the individuals selected for this honor has been awarded a K99 award funded through NIA. For 2012, the topic title will be “New Methods / Novel approaches to understanding aging.

### MONITORING MOLECULAR AGING WITH $P16^{INK4A}$ -LUCIFERASE MICE

C. Burd, K.S. Clark, N.E. Sharpless, Genetics, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina

The  $p16^{INK4a}$  tumor suppressor is a robust and dynamic biomarker of aging in humans and mice. Exploiting these properties, we generated a new mouse model ( $p16^{LUC}$ ) to visualize aging *in vivo*. In this model, expression of firefly luciferase is driven by the endogenous  $p16^{INK4a}$  promoter and can be monitored and quantified using whole-animal luminescent imaging. Serial assessment of  $p16^{LUC/+}$  mice over a period of 2 years revealed a direct correlation between log<sub>2</sub>-transformed luminescence and chronological age. Comparing the age-related increase in mouse luminescence to the expression of  $p16^{INK4a}$  in human T-cells, we found that  $p16^{INK4a}$  induction occurs faster in mice than in humans. Notably, the human/mouse ratio of  $p16^{INK4a}$ -doubling times correlated with the ratio of human/mouse lifespan. Following this seminar, viewers will understand the role of  $p16^{INK4a}$  as an aging biomarker and be able to explain how the  $p16^{LUC}$  mouse may contribute to the assessment environmental and therapeutic aging interventions.

## AGING MAKES HUMAN MAMMARY GLAND MORE VULNERABLE TO CANCER

M.A. LaBarge, *Life Science Division, Lawrence Berkeley National Laboratory, Berkeley, California*

Women over 50 years of age account for 75% of new breast cancer diagnoses, and the majority of those tumors are of a luminal subtype. Acquired mutations are probably factors in all cancers; however, breast cancers are genetically heterogeneous, and specific mutations do not correlate with the prevalence of age-related onset. Women share age-associated systemic body changes, such as endocrine profiles, and alterations to the breast microenvironments, such as density and stromal composition. These age-associated changes can cause intrinsic changes to cells that may increase cancer risk. Yet the cohorts to study the underlying mechanisms are lacking. A large collection of normal human mammary epithelial cell strains from women aged 16 to 91 years was generated from primary tissues to enable functional and molecular interrogation of aging. We demonstrate fundamental changes in the composition and function of the mammary epithelium with age, which increases the potential for malignant transformation.

## HYPOXIA RESPONSES INFLUENCE PROTEOSTASIS MECHANISMS

E.M. Fawcett<sup>1,2</sup>, N.N. Iranon<sup>1,2</sup>, D.L. Miller<sup>1</sup>, *1. Biochemistry, University of Washington, Seattle, Washington, 2. Graduate program in Molecular and Cellular Biology, Seattle, Washington*

The ability to maintain homeostasis is critical for survival and maximum longevity. The progressive decline in physiological function associated with aging results in a decreased ability to maintain homeostasis. We are using *C. elegans* to investigate homeostatic mechanisms that allow for survival in low O<sub>2</sub> (hypoxia). *C. elegans* has a remarkable ability to survive exposure to a wide range of O<sub>2</sub> concentrations. We have found that the response to specific low concentrations of O<sub>2</sub> leads to a perturbation of protein homeostasis. Both aggregation and toxicity of polyglutamine proteins are enhanced when animals are exposed to hypoxia. The hypoxia-induced perturbation of proteostasis can be modulated by both genetic and environmental factors, suggesting that it is not simply a passive consequence of decreased energy production. The same hypoxic O<sub>2</sub> concentrations that disrupt proteostasis also induce a developmental and reproductive diapause. We hypothesize that hypoxia activates a physiological switch that allows animals to conserve limited energy for essential survival mechanisms at the expense of proteostasis.

## SESSION 2200 (PAPER)

### EXERCISE, PHYSICAL ACTIVITY AND PHYSICAL FUNCTION

#### POWER TRAINING IN OLDER ADULTS: MUSCLE MECHANICAL, MORPHOLOGICAL AND FUNCTIONAL CHANGES

P. Caserotti<sup>1,2</sup>, T.B. Harris<sup>2</sup>, L. Puggaard<sup>1</sup>, C. Rasmussen<sup>3</sup>, P. Aagaard<sup>1</sup>, *1. Institute of Sports Science and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark, 2. Laboratory of Epidemiology, Demography and Biometry, National Institute on Aging, Bethesda, Maryland, 3. Institute of Public Health, University of Aarhus, Aarhus, Denmark*

Emerging evidence suggests that the age-related decline in maximal muscle power (the product of contractile force and movement velocity) and rate of force development (RFD) are associated with risk of falls, motor impairments and disability. Despite recent exercise guidelines for older adults recommend targeting muscle power, it is still unclear whether power training is associated with morphological and functional improvements along with the gain in mechanical muscle function. The effect of 12-week power training was investigated in 60-65

(mean age 62.8±2.2, n=34) and 80-85 yr older women (mean age 81.8±2.2, n=24) who were randomized into training (TG60 and TG80) or controls (CG60 and CG80). Measurements included: i) maximal muscle power, RFD, strength; ii) quadriceps and hamstring muscle and fat volumes (MRI); iii) function (gait, chair-rise, physical performance battery test (PPT)). Total muscle and quadriceps volume increased post training in TG with no changes in the hamstrings, and no changes in CG. Strength and specific strength (normalized by muscle volume) increased by 28% and 24% (TG80) and 22% and 15% (TG60). RFD increased in TG80 (42-59%) and TG60 (12-19%) whereas specific RFD increased in TG80 only (31-43%). Muscle power increased 28% (TG80) and 14% (TG60). Chair-rise increased in TG80 (12%) and TG60 (12%) while PPT increased in TG80 only (7%). No changes in gait speed occurred. These findings suggest that power training leads to substantial gains in muscle power, RFD, strength and functional capacity in old and very old women that are partially mediated by increases in muscle mass.

#### ROLE OF INTERLEUKIN-15 IN EXERCISE ENDURANCE, ENERGY METABOLISM, AND BODY COMPOSITION

L.S. Quinn<sup>1,2</sup>, T. Wolden-Hanson<sup>1</sup>, *1. GRECC S-182, VA Puget Sound Health Care System, Seattle, Washington, 2. University of Washington, Seattle, Washington*

Interleukin-15 (IL-15) is a cytokine that is upregulated in skeletal muscle following exercise and correlates with leanness and insulin sensitivity; however, IL-15 levels decrease during aging. Transgenic mice with elevated IL-15 levels (IL-15 Tg mice) and mice that lack IL-15 (IL-15 KO mice) were compared with controls. Untrained IL-15 Tg mice were lean, insulin sensitive, and could run twice as far as controls, whereas IL-15 KO mice ran half as far as controls. IL-15 Tg mice preferentially utilized fat for energy metabolism, while IL-15 KO mice preferentially utilized carbohydrates and exhibited increased adiposity. Muscles in IL-15 Tg mice exhibited high expression of pro-oxidative mRNA species, including SIRT1, PPAR $\delta$ , and PGC-1 $\beta$ , and had increased oxidative myofibrillar isoform expression patterns. These findings support a role for IL-15 in the favorable metabolic adaptations induced by exercise, and suggest declining IL-15 levels in aging may play a role in frailty and insulin resistance.

#### TESTOSTERONE AND RESISTANCE EXERCISE EFFECTS ON FUNCTION, STRENGTH AND BODY COMPOSITION IN OLDER MEN

K. Hildreth<sup>1</sup>, D. Barry<sup>2</sup>, K. Moreau<sup>1</sup>, T. Nakamura<sup>1</sup>, J. Vande Griend<sup>4</sup>, P. Wolfe<sup>3</sup>, R. Schwartz<sup>1</sup>, *1. Department of Medicine, Division of Geriatrics, University of Colorado Anschutz Medical Campus, Aurora, Colorado, 2. Kaiser Permanente, Denver, Colorado, 3. Colorado Biostatistical Consortium, Colorado School of Public Health, University of Colorado, Denver, Aurora, Colorado, 4. University of Colorado Skaggs School of Pharmacy and Pharmaceutical Sciences, Aurora, Colorado*

Background: Gonadal aging in men is associated with physiologic changes that can result in frailty and increased mortality. However, the benefits of testosterone (T) supplementation in older men are inconclusive. It is also unclear whether T supplementation augments exercise-induced improvements in strength or function. Methods: We randomized 167 generally healthy older men (66 ± 5 yrs) with baseline [T] of 200-350 ng/dL to placebo or T gel targeting a lower [400-550] or higher [600-1000] [T] range, and to either progressive resistance training (PRT) or no exercise for 12 months. Primary outcomes were function, strength and body composition. Results: 143 men completed the study. Baseline [T] was 296 ± 41. At 12 months [T] was 287 ± 65, 457 ± 278 and 598 ± 385 with placebo, lower- (5.0 ± 2.0 g/d) and higher-dose (8.7 ± 1.8 g/d) T, respectively (p = 0.001 for lower- vs. higher-dose [T]). In the PRT group, any-T treatment was associated with greater improvements in fat mass (FM; p=.04) and fat-free mass (FFM; p=.01)

but not strength or function compared to placebo gel. In non-exercising subjects, any-T treatment was associated with greater improvements in FM ( $p=.005$ ), FFM ( $p=.03$ ) and upper body strength ( $p=.03$ ) compared to placebo gel. Any-T produced dose-related increases in hematoctrit but no increase in cardiovascular events. Conclusions: T supplementation was well tolerated in this population and associated with improvements in body composition. Although T improved upper body strength in non-exercisers, it did not augment strength or function beyond that achieved with PRT alone.

### PHYSICAL ACTIVITY, OBESITY, AND INCIDENT DIABETES IN MIDDLE-AGED AND OLDER ADULTS – A POPULATION-BASED STUDY

P. Lee, C. Blaum, C. Cigolle, *Internal Medicine, Univ Michigan, Ann Arbor, Michigan*

Population-based estimate of incidence of diabetes based on glycosylated hemoglobin A1c (A1c) has not been established; controversy remains on whether female and male equally benefit from physical activity in prevention of diabetes. Our study aims to establish a population-based estimate of incidence of diabetes among middle-aged and older adults using A1c measurement, and compare the effect of physical activity on incidence of diabetes by gender. We analyzed data from waves 2006-2010 of the Health and Retirement Study, a longitudinal, nationally representative survey of adults aged  $\geq 51$  years. Respondents reported to have no diabetes in 2006 were classified as having prediabetes (A1c 5.7%-6.4%) or no dysglycemia (A1c  $< 6.4\%$ ). Physical activity was based on self-reported participation in low, moderate, and vigorous level activities in a week. New diabetes cases were self-reported diabetes in 2008 and 2010. Descriptive analyses and Wald proportion estimation were performed. In 2006, 3,239 adults had no diabetes, 1,803 had prediabetes. By 2010, 162 of the prediabetes respondents developed diabetes (incidence rate 2.2% per year), 68 of no-dysglycemia respondents developed diabetes (incidence rate 0.6% per year). Respondents who developed diabetes were more likely to be obese, female, and poor. Female, not male, who were obese were significantly less likely to develop diabetes if they were physically active ( $p=0.02$ ). Our findings support the use of A1c to screen for middle-aged and older adults with prediabetes. Future studies should aim to elucidate the underlying reason for the gender difference in the protective effect of physical activity on the development of diabetes.

## SESSION 2205 (SYMPOSIUM)

### BEYOND CONTROL: SELF-REGULATION AT THE END OF LIFE AND WITH SEVERE DISABILITY

Chair: *J. Heckhausen, Psych & Soc. Beh., UC Irvine, Irvine, California*

Co-Chair: *D. Gerstorf, Humboldt University, Berlin, Berlin, Germany*

Symposium addresses the unique challenges to the regulation of motivation and emotion that emerge at the end of life and under conditions of severe disability. The Motivational Theory of Life-Span Development guiding empirical presentations in this symposium proposes that primary control striving has functional primacy across the life span, but that under conditions of constrained control opportunities individuals benefit if they disengage from unattainable primary-control goals. The unique challenges at the end of life and with severe disability result from extreme restrictions of primary control capacity and force individuals to utilize strategies that reach beyond primary control. Heckhausen, Wrosch, and Schulz propose a Lines of Defense model of motivational regulation that reflects a step-by-step adjustment of health and functioning goals to progressive disease and disability. Schulz, Monin, Matire, and Connelly show that patients with spinal cord injury who downwardly adjust the personal importance of carrying out activities of daily living independently report less depressive symptoms and better physical health. Nina Vogel reports that affective changes in advanced

old age is following an accelerated downward trend to the end of life. Gerstorf, Heckhausen, Ram, Infurna, Schupp, and Wagner show that individuals who report effective developmental control strivings subsequently experience higher late-life well-being, as well as less steep and later onset of end-of-life declines in well-being.

### TIME-TO-DEATH RELATED ANALYSES OF CHANGE IN POSITIVE AND NEGATIVE AFFECT IN OLDER ADULTS APPROACHING THE END OF LIFE

N. Vogel<sup>1,2</sup>, O.K. Schilling<sup>3</sup>, H. Wahl<sup>3</sup>, B. Penninx<sup>4</sup>, A. Beekman<sup>4,5</sup>, *1. Humboldt University, Berlin, Germany, 2. German Institute for Economic Research (DIW), Berlin, Germany, 3. University of Heidelberg, Heidelberg, Germany, 4. VU University Medical Center, Amsterdam, Netherlands, 5. GGZ inGeest, Amsterdam, Netherlands*

Late-life development may imply terminal processes related with time-to-death, rather than with chronological age. Expecting that affective well-being might be particularly sensitive to degradation processes preceding death, we used a 15-year observational interval including 5 measurement occasions with deceased participants ( $N = 1671$ ) from the Longitudinal Aging Study Amsterdam (LASA) to examine (1) whether intraindividual trajectories in positive (PA) and negative affect (NA) can be better described in terms of time-to-death as compared to chronological age; and (2) whether possible time-to-death-related change in PA and NA follows a terminal decline (linear change) versus terminal drop (non-linear, accelerating change) pattern. For both PA and NA, multilevel mixed models confirmed that time-to-death accounts for more intra-individual variance and reveals a better fit to the data than chronological age, following a terminal drop pattern. In conclusion, late-life development of affect may be better understood as death-related, rather than age-graded process.

### PERCEIVED EFFECTIVE CONTROL OF DEVELOPMENT BUFFERS TERMINAL DROP IN WELL-BEING

D. Gerstorf<sup>1,2,3</sup>, J. Heckhausen<sup>5</sup>, N. Ram<sup>2,3,4</sup>, F.J. Infurna<sup>1,2,3</sup>, J. Schupp<sup>3</sup>, G.G. Wagner<sup>3,4</sup>, *1. Institute of Psychology, Humboldt University Berlin, Berlin, Germany, 2. Pennsylvania State University, University Park, Pennsylvania, 3. DIW Berlin, Berlin, Germany, 4. Max Planck Institute for Human Development, Berlin, Germany, 5. University of California, Irvine, Irvine, California*

Recent research has repeatedly demonstrated that well-being typically evinces precipitous deterioration close to the end of life. Yet, individual differences in these terminal declines in well-being are very substantial and to-date poorly understood. In this study, we examine the role of effective developmental control strivings as potential buffers against such terminal declines in well-being. We applied single- and multi-phase growth models to 25-year longitudinal data from 1,641 now deceased participants of the national German Socio-Economic Panel (SOEP; age at death:  $M = 74$ ;  $SD = 14$ ; 19 to 101 years; 49% women). Results revealed that self-reports of effective developmental control strivings were related to subsequent higher late-life well-being, shallower rates of late-life declines, and a later onset of terminal decline. These findings suggest that perceptions of being engaged in effective control striving may serve a protective role against end-of-life terminal decline in well-being. We also discuss scenarios for when and how giving up control and goal disengagement may become beneficial.

### LINES OF DEFENSE WHEN FACING PROGRESSIVE DISEASE, DISABILITY, AND THE END OF LIFE: AN APPLICATION OF THE MOTIVATIONAL THEORY OF LIFE-SPAN DEVELOPMENT

J. Heckhausen<sup>1</sup>, C. Wrosch<sup>2</sup>, R. Schulz<sup>3</sup>, *1. Psych & Soc Beh, UC Irvine, Irvine, California, 2. Concordia University, Montreal, Quebec, Canada, 3. University of Pittsburgh, Pittsburgh, Pennsylvania*

As older individuals face challenges of progressive disease and increasing disability and approach the end of their lives, their capacity

for controlling the environment and their own health and functioning declines precipitously. The Lines of Defense Model is based on the Motivational Theory of Life-Span Development and proposes that individuals organize their adjustments of control striving to the progressive physical decline in distinctly organized cycles of goal engagement and goal disengagement and adjustment that reflect sequentially organized lines of defense. This organized pattern of adjustment allows individuals to hold onto and defend still feasible levels of functioning in activities of daily living, while adjusting to increasing impairments. As physical constraints become more severe towards the end of life, avoiding psychological suffering becomes the focus of individuals' strivings for control. The lines of defense model can also be applied to the inverse process of growth in functioning during recovery and rehabilitation.

#### **ADAPTATION TO DECLINING FUNCTIONAL ABILITY AMONG THE SEVERELY DISABLED**

R. Schulz<sup>1</sup>, J. Monin<sup>2</sup>, L. Martire<sup>3</sup>, S. Czaja<sup>4</sup>, D. Connelly<sup>2</sup>, 1. *U. of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *Yale U., New Haven, Connecticut*, 3. *Penn State U., State College, Pennsylvania*, 4. *U. Miami, Miami, Florida*

This study examined how independence centrality – the personal importance of carrying out activities of daily living independently – related to depressive symptoms among older persons with spinal cord injury (SCI). Drawing from the life-span theory of control, it was hypothesized that downgrading independence centrality protects people from experiencing greater depressive symptomatology when they become more disabled. Using data from a randomized controlled trial (Schulz, Czaja, Lustig, Zdaniuk, Martire, & Perdomo, 2009), we focused on 173 SCI survivors who completed baseline and 12-month follow-up measures of independence centrality, disability, and psychological and physical health. Results revealed that a higher level of independence centrality was associated with more depressive symptoms and poorer perceived physical health at baseline, and more depressive symptoms over time for survivors who became more disabled. Declines in independence centrality among persons who experienced declining physical functioning was associated with lower levels of depression. This study demonstrates the psychological benefits of shifting priorities in the face of functional declines.

### **SESSION 2210 (SYMPOSIUM)**

#### **HOW LIFE COURSE PATTERNS OF EMPLOYMENT, SOCIOECONOMIC POSITION, AND FAMILY SHAPE PHYSICAL AND MENTAL HEALTH IN LATE LIFE**

Chair: P. Herd, *UW-Madison, Madison, Connecticut*

This symposium explores how education, work, and family experiences across the life course shape physical and psychological health in late life. All of these papers utilize a unique longitudinal study of aging, the Wisconsin Longitudinal Study, which has following a cohort of high school graduates (and a selected sibling) since 1957. Two papers focus on the links between socioeconomic position and health behaviors and mortality in later life. One of these papers focuses on the links between socioeconomic position, obesity, and mortality. The other paper specifically focuses on how education, including academic performance, links to smoking and obesity in late life. The other two papers focus on how employment and expectations surrounding employment ultimately shape mental health and mortality in late life. One of these papers specifically focuses on employment patterns—including unemployment spells—across the entire life course of these participants. The other paper focuses on an intense caregiving experience—raising children with significant disabilities—and how that experience helps pattern employment experiences and expectations and ultimately mental health in late life.

#### **EMPLOYMENT HISTORIES AND LATE MID-LIFE MORTALITY**

J. Raymo<sup>1</sup>, J. Warren<sup>2</sup>, A. Halpern-Manners<sup>2</sup>, 1. *Sociology, Univ of Wisconsin, Madison, Wisconsin*, 2. *Univ of Minnesota, Minneapolis, Minnesota*

We examine relationships between mid-career employment trajectories and mortality prior to age 70 for the large cohort of men and women in the Wisconsin Longitudinal Study. We begin by summarizing yearly measures of employment circumstances as latent trajectories of employment status and exposure to “bad jobs” across mid career (ages 35-54). We then estimate parametric models for mortality between ages 54-70 as a function of the latent employment trajectories and posited mediators measured at age 54. Intermittent employment and loss of health insurance and pension coverage in mid-career are associated with a higher risk of mortality for men and these relationships disappear when we control for job characteristics and health status at age 54. Higher mortality among women with limited employment across the life course and lower mortality among women who worked part-time and those who retired early from stable employment remain significant net of a wide range of controls.

#### **EDUCATION AND HEALTH BEHAVIORS: UNDERSTANDING THE ROLE OF COGNITIVE AND PSYCHOLOGICAL HUMAN CAPITAL**

A. Karraker, P. Herd, *University of Wisconsin-Madison, Madison, Wisconsin*

Unhealthy behaviors are strongly patterned by educational attainment, but the mechanisms underlying this relationship are unclear. One potential explanation is that education fosters and reflects human capital accumulation. Human capital can impact health behaviors via cognitive means (which may, for example, increase individual responsiveness to public health messages about the risks of certain behaviors) and psychological means (such as personality traits such as environmental mastery that facilitate maintaining health behaviors). Using data from the Wisconsin Longitudinal Study (WLS), we examine the extent to which the association between education and health behaviors (smoking, obesity) is explained by measures of cognitive (academic performance) and psychological human capital (traits such as mastery and conscientiousness). We find that cognitive human capital measures—particularly high school rank—substantially mediate the association between education and health behaviors. However, analyses also reveal substantial variations by gender and highlight the importance of life course processes in health behavior formation and maintenance.

#### **FAMILY CAREGIVING AND TRANSITION TO RETIREMENT AMONG PARENTS OF CHILDREN WITH INTELLECTUAL AND DEVELOPMENTAL DISABILITIES**

J. Hong<sup>1</sup>, J.D. Wong<sup>1</sup>, M. Mailick Seltzer<sup>1</sup>, J. Greenberg<sup>1</sup>, C.G. Mandic<sup>2</sup>, J. Song<sup>1</sup>, 1. *Waisman Center, Univ. of Wisconsin-Madison, Madison, Wisconsin*, 2. *San Francisco State University, San Francisco, California*

Caregiving responsibilities of parents of adult children with intellectual and developmental disabilities (IDD) often begin early in the parents' adulthood and continue into old age. Yet, less is known about the retirement processes of individuals who have engaged in family caregiving for many decades. Using data from the Wisconsin Longitudinal Study, this study examines whether retirement-age employment status, realization of employment preferences, and depressive symptoms associated with employment status differ between parents of children with IDD (n=284) and parents in the general population (n=2840). Results showed that fathers of adult children with IDD were less likely to retire at their later stage of life. Being retired was associated with lower level of depression for fathers, regardless of their child's IDD status. Mothers of adult children with IDD were more likely to work less

than they preferred a decade earlier, and they showed higher level of depression than comparison mothers.

### **EARLY-LIFE SOCIOECONOMIC STATUS, OBESITY IN ADULTHOOD, AND LATER-LIFE CARDIOVASCULAR MORTALITY**

T. Pudrovska, *Pennsylvania State University, University Park, Pennsylvania*

From a life course perspective, mortality in later life cannot be understood without considering exposures in childhood and adolescence. This study examines how early-life socioeconomic status affects cardiovascular mortality in later life, and whether obesity in adulthood moderates this effect. Results from continuous-time parametric survival models indicate that higher levels of parents' education were associated with a reduced risk of cardiovascular mortality, but only among persons who were not obese at midlife. Among obese individuals, higher parental education did not protect against cardiovascular mortality. On the other hand, children of low-educated parents did not have a significantly elevated risk of cardiovascular mortality if they maintained healthy weight in adulthood. After attending this activity, participants will be able to discuss the life-course accumulation of risks and resources that affect mortality, and to explain how healthy lifestyle in adulthood can compensate for early-life social disadvantage.

## **SESSION 2215 (SYMPOSIUM)**

---

### **INTEGRATING A FAMILY-FOCUS INTO HEALTH & HEALTH CARE: IMPLICATIONS OF RESEARCH FOR POLICY & PRACTICE**

Chair: *D. Carr, Institute for Health, Health Care Policy, and Aging Research, Rutgers University, New Brunswick, New Jersey*  
Discussant: *S. Qualls, University of Colorado-Colorado Springs, Colorado Springs, Colorado*

A vast body of research reveals that health, health behaviors, and access to care are shaped by family roles and relations. Despite this evidence, however, health care is still delivered in a patient-focused rather than family-focused manner. The four papers in this symposium use a range of research methods and samples to reveal the ways that families can foster (or in some cases, impede) health, health behaviors, and disease management among older adults. Robles and colleagues conducted a meta-analytic review of studies on marital satisfaction and physical health outcomes published over the past 50 years, with particular attention to how these associations differ over the life course. Umberson examined how committed relationships affect health-related behavior and health care, and how those processes vary across gay, lesbian, and heterosexual unions. By comparing cohabiting and married couples, she shows how legal marriage differs from cohabitation in shaping relationship and health dynamics. Rook and colleagues explored the ways that interpersonal processes in couples both enhance and undermine disease management, and identified forms of involvement that are helpful versus unhelpful. Boerner & Carr found that both supportive and critical relationships with spouse and children affect one's advance care planning, including the appointment of a specific durable power of attorney for health care (DPAHC). The authors and discussant will highlight the implications of their work for developing family-focused interventions and practices, and discuss the ways that current debates over health care reform may be informed by a family- rather than individual patient focus.

### **MARITAL QUALITY AND HEALTH: A META-ANALYTIC REVIEW**

T. Robles<sup>1</sup>, R. Slatcher<sup>2</sup>, J.M. Trombello<sup>1</sup>, M. McGinn<sup>1</sup>, *1. Psychology, UCLA, Los Angeles, California, 2. Wayne State University, Detroit, Michigan*

This meta-analysis reviews all the published empirical articles describing relationships between marital relationship quality and health outcomes over the past 50 years. Health outcomes included objective assessments of participant or patient function, disease severity, and survival; subjective assessments of health, particularly self-rated health and pain; and biomarkers that are established substitutes for clinical endpoints, such as blood pressure. Greater marital quality was related to better health, with effect sizes ranging from  $r = .04$  -  $.21$ , similar in magnitude to health behaviors like diet and physical activity, even after accounting for demographic covariates and other potential confounding factors. Notably, there were no differences between younger and older samples. We highlight the need to test potential explanatory mechanisms in future research and propose that future research primarily focus on moderating factors, particularly age, gender, and contextual factors including socioeconomic status and stressful life events.

### **MARRIAGE AND HEALTH CARE: POLICY IMPLICATIONS FOR SAME-SEX COUPLES**

D. Umberson, *Population Research Center, University of Texas at Austin, Austin, Texas*

Since same-sex couples cannot legally marry in most parts of the United States, we know very little about the health implications of marriage for aging gay and lesbian couples. I consider how committed long-term relationships affect the utilization of health care and how these processes vary across gay, lesbian, and heterosexual unions. By comparing cohabiting and married couples, I explore how legal marriage differs from cohabitation in shaping these processes. I discuss how partner dynamics around the use of health care vary for different union types, and the implications of these dynamics for health policy. Policy strategies that result in more effective partner participation in health care and more efficient use of health care systems have the potential to reduce health care costs, while improving the health and well-being of aging individuals and couples.

### **THE SOCIAL CONTEXT OF CHRONIC ILLNESS MANAGEMENT: HELPFUL VS. UNHELPFUL FORMS OF FAMILY INVOLVEMENT**

K.S. Rook<sup>1</sup>, M. Franks<sup>2</sup>, M.P. Stephens<sup>3</sup>, *1. University of California, Irvine, California, 2. Purdue University, West Lafayette, Indiana, 3. Kent State University, Kent, Ohio*

The day-to-day management of chronic illness often occurs in a social context, in which family members observe, seek to influence, or participate in patients' efforts to adhere to a treatment regimen. Some, though not all, forms of family involvement may benefit patients' adherence and, in turn, their illness outcomes. Well-intentioned actions by family members, such as persistent efforts to foster improved adherence, may be ineffective or may succeed with unwanted side effects. Other actions may inadvertently undermine patients' efforts to adhere to a treatment regimen. The purpose of this presentation is to survey the literature on family members' involvement in older adults' chronic illness management, to distill what is known about forms of involvement that are helpful versus unhelpful. Our review emphasizes spousal involvement because spouses are involved more often than are other family members in older adults' disease management. Implications for research and interventions will be discussed.

## THE ROLE OF FAMILY RELATIONSHIPS IN ADVANCE CARE PLANNING: HOW DO THEY ENCOURAGE OR HINDER PLANNING?

K. Boerner<sup>1,2</sup>, D. Carr<sup>3</sup>, 1. *Jewish Home Lifecare/Mount Sinai School of Medicine, New York, New York*, 2. *Mount Sinai School of Medicine, New York, New York*, 3. *Rutgers University, New Brunswick, New Jersey*

Little is known about the association between family dynamics and advance care planning (ACP). ACP encompasses formal planning (i.e., living will and durable power of attorney, DPAHC) and informal discussions. We evaluated the effects of family relationship attributes on ACP in 305 elders. Better overall family functioning increased the odds of having discussions and engaging in formal ACP. Greater spousal support and criticism increased the odds of having discussions, yet spousal criticism reduced the odds that spouse was named as DPAHC. Criticism from children increased the odds of relying on formal ACP only; emotional support increased the odds that a child was named as DPAHC. In an effort to reduce potential unnecessary cost and burden at the end of life, we recommend that patient-provider discussions of end-of-life care consider how family dynamics may affect ACP, so that potential barriers related to family relationships can be addressed and overcome.

## SESSION 2220 (SYMPOSIUM)

### NEW FRONTIERS IN GEROPSYCHIATRIC NURSING RESEARCH: DIVERSE ISSUES WITH COMMON GOALS

Chair: M. Eckfield, *UCSF School of Nursing, San Francisco, California*

The field of Geropsychiatric Nursing Research is expanding to address the complex ways mental and physical health issues affect older adults. While geropsychiatric nurses have traditionally been involved in research on psychiatric issues related to dementia, nursing researchers are now leading efforts on new frontiers in the study of cognition, well-being, mood and behavioral disorders, and aggression in older adults. In this symposium, geropsychiatric nurses who are a part of the John A. Hartford Foundation's Building Academic Geriatric Nursing Capacity program discuss their common goal to improve our understanding of and response to psychiatric-related issues in older adults, as well as the common challenges faced when working with this vulnerable population. The presentation of four current research studies highlights the breadth and range of geropsychiatric nursing research. Studies include the challenges of decision-making among older adults with mild cognitive impairment; the overlooked issue of male-oriented activities for men living in nursing homes; the strategies used by those with hoarding disorder to maintain their perception of control; and new evidence on elder perpetrated violence in long-term care and geropsychiatric units. This collection of studies illustrates the complexity of mental health issues in older adults and focuses fresh attention on the role of geropsychiatric nursing research to guide clinical practice and inform interdisciplinary interventions.

### HEALTH CARE DECISION-MAKING AMONG OLDER ADULTS WITH MILD COGNITIVE IMPAIRMENT

A.M. Mayo<sup>1</sup>, M.I. Wallhagen<sup>2</sup>, J. Johnson<sup>2</sup>, B. Miller<sup>2</sup>, 1. *Hahn School of Nursing & Health Science, University of San Diego, San Diego, California*, 2. *University of California, San Francisco, San Francisco, California*

Background: Management of chronic illnesses that increase with age often necessitates complex health care decision-making. Yet, little is known about decision-making in persons with mild cognitive impairment (MCI), an abnormal condition affecting 20-30% of older adults. Methods: A cross-sectional, comparative design was utilized to measure functional decision-making abilities (reasoning, understanding, appreciation, and expressing a choice) among older adults with normal cognition and MCI. Results: Participants (n=51) had a mean age of 69.6

years; 22 with MCI and 29 normal cognition. Normal cognition participants scored higher in understanding (p<0.01) and appreciation (p<0.05) of health care decisions. There were no significant differences between the two groups in reasoning or expressing a choice involved in health care decisions. Conclusions: Older adults with MCI may need additional support to ensure they understand and appreciate their choices when making health care decisions. Study findings can be used to design decision supports for this vulnerable population.

### LINKING CHARACTERISTICS OF ACTIVITIES AND MALE RESIDENT ENGAGEMENT: IMPROVING THE VITALITY OF MEN IN NURSING HOMES

B. Buron<sup>1</sup>, T. Killian<sup>2</sup>, 1. *University of Arkansas for Medical Sciences Northwest Campus, Fayetteville, Arkansas*, 2. *University of Arkansas, Fayetteville, Arkansas*

Activity Directors (ADs), predominantly female, are instrumental in promoting the vitality and well being of residents living in nursing homes (NHs). A recent study found a disconnect between the types of activities ADs actually provided and the types of activities they perceived that men would most enjoy. The purpose of this qualitative study was to identify characteristics of activities most likely to engage male residents. Forty ADs working in Arkansas NHs described a total of ninety-six popular activities and rated the activities on how likely male and female residents engaged in them. Researchers, using qualitative content analysis, coded open-ended descriptions of activities, seeking to identify and describe activity characteristics likely to result in higher levels of male resident engagement. The implications of this research provide guidelines for improving the vitality of men in NH facilities. More studies are needed to develop AD training materials to expand this approach to care.

### STRATEGIES USED BY OLDER ADULTS WITH HOARDING DISORDER TO MAINTAIN A SENSE OF CONTROL

M. Eckfield, M.I. Wallhagen, *UCSF School of Nursing, San Francisco, California*

Individuals often use a variety of strategies to maintain a sense of control, especially after major life events such as retirement, changes in types of social support, and loss of a spouse. The current paper focuses on how older adults with Hoarding Disorder (HD) attempted to maintain a sense of control. Using Grounded Theory methodology, 22 adults (age 65-91, M=74) with HD were interviewed. Verbatim transcripts were analyzed using Atlas TI. Three categories of strategies emerged: clinging to items from the past to maintain their identity; redefining themselves in roles that included hoarding behaviors; and applying successful survival strategies from the past to the present. Several of these contributed to the worsening of hoarding behaviors. By understanding these responses to late-life changes, clinicians and researchers can develop new strategies to help of older adults with HD cope with transitions in more effective ways.

### VICTIM OR PERPETRATOR? PERCEPTIONS OF RESIDENT-TO-RESIDENT VIOLENCE IN NURSING HOMES

S. Snellgrove, *Arkansas State University, State University (Jonesboro), Arkansas*

Violence between residents is a threat to the safety and quality of life of people residing in nursing homes. To date, little evidence regarding resident-to-resident violence (RRV) or strategies for managing and preventing it exists. This qualitative study explored nursing home violence from the perspective of residents who considered themselves "victims." Using a semi-structured interview guide, a demographic form, and medical records, seven participants were asked about their perceptions of RRV and factors surrounding the events in which they were involved. Data were analyzed using content analysis and constant comparison. Three factors that contributed to episodes of RRV were "feel-

ing frustrated,” “feeling threatened,” and “taking it personally.” These sub-themes were combined into the over-riding theme “perceptions.” The results of this study provide new insights into the perceptions of violence among residents in nursing homes and may provide an important foundation for the development of interventions to prevent RRV.

## SESSION 2225 (SYMPOSIUM)

### PREDICTORS OF MORTALITY IN THE OLDEST-OLD - CROSS-COUNTRY PERSPECTIVES AND ANALYTIC CHALLENGES

Chair: *M. Jylhä, University of Tampere, Tampere, Finland*  
Co-Chair: *E. Crimmins, University of Southern California, Los Angeles, California*  
Discussant: *J.M. Guralnik, University of Maryland, Baltimore, Maryland*

Predictors of mortality in the oldest-old may differ from the predictors in middle-aged or aging populations, due to high overall mortality, selective survival and high level of many risk factors, but also to the changing biological role of many commonly used predictors. Our understanding of predictors of mortality and survival in this age group is poor, since studies are often limited by selected study populations, exclusion of institutionalized individuals, and low participation rates, as well as short follow-up times. In this symposium we will present findings from four representative population-based studies of the oldest-old in three European countries and the US. The presentations focus on (1) the association of several health-related and psychosocial factors with mortality and survival, (2) the gender differences in indicators that predict mortality, and (3) methodological challenges in study design and analysis. The data presented include the Danish 1905 Cohort Study and the Longitudinal Study of Danish Twins, the Newcastle 85+ Study in the UK, the Vitality 90+ Study in Tampere, Finland, and the Third National Health and Nutrition Examination Survey (NHANES III) in the US. The discussant will bring the results together, focusing on the similarities and differences across the studies and addressing the methodological challenges in predicting mortality at very old age.

### GENDER DIFFERENCES IN THE ASSOCIATION BETWEEN SELF-RATED HEALTH AND MORTALITY: RESULTS FROM THE NEWCASTLE 85+ STUDY

C. Jagger<sup>1</sup>, J. Bond<sup>2</sup>, L. Robinson<sup>2</sup>, A. Kingston<sup>1</sup>, J. Collerton<sup>1</sup>, K. Davies<sup>1</sup>, T. von Zglinicki<sup>1</sup>, T. Kirkwood<sup>1</sup>, *1. Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom, 2. Institute of Health & Society, Newcastle University, Newcastle upon Tyne, United Kingdom*

We explore the association between self-rated health (age-comparative) and 4-yr mortality in an unselected cohort of 85-year olds (1921 birth cohort). Cox regression models were fitted to the 828 individuals (98%; 316 men, 512 women) with complete information on self-rated health (SRH). In unadjusted models men and women reporting fair/poor SRH had increased risks of death (HR(95%CI): men=2.2(1.4-3.3), women=1.7(1.2-2.5)), compared to those reporting excellent/very good SRH. Effects were attenuated but remained significant for men after adjustment for socio-demographic and lifestyle confounders (education, marital status, smoking, physical activity, BMI) and then disease and functioning (MMSE, disease from medical records, disability, pain, falls) (men=2.1(1.3-3.4); women=1.3(0.8-2.0)). After adjustment for biomarkers (TNF- $\alpha$ , IL-6, albumin, white blood cell count, haemoglobin, HDL cholesterol, creatinine) SRH was no longer significant overall. However men reporting fair/poor health still had an increased risk of death (men=1.9(1.1-3.3); women=1.2(0.8-2.0)), providing some evidence that men may incorporate interoceptive information in their SRH.

### DECLINING ASSOCIATION BETWEEN PHYSICAL ABILITIES AND MORTALITY AT AGE 70-95 - ANALYTICAL CHALLENGES

M. Thinggaard<sup>1</sup>, M. McGue<sup>1,2</sup>, B. Jeune<sup>1</sup>, K. Christensen<sup>1,3</sup>, *1. Danish Aging Research Center, Epidemiology, Institute of Public Health, University of Southern Denmark, Odense C, Denmark, 2. Department of Psychology, University of Minnesota, Minneapolis, Minnesota, 3. Department of Clinical Genetics and Department of Clinical Biochemistry and Pharmacology, Odense University Hospital, Odense C, Denmark*

Phenotypes that predict mortality in middle-aged and young elderly usually show weaker associations among the oldest old. For non-fixed phenotypes, this poses an analytical challenge. We analyzed the association between physical ability and mortality in a population-based sample of 5,415 Danes aged 70-95 years, with up to four longitudinal measures and complete follow-up for at least 8 years. A traditional Cox regression showed that baseline measure of ADL and grip strength was significantly stronger associated with mortality among people aged 70-85 than among people aged 85-95 (P-value<0.001). However, proportional hazard was not fulfilled for baseline measures and the results from longitudinal measurements in a multiple-record survival analysis showed that there was only a change in strength of association with age for ADL. Evaluation of declining association between non-fixed phenotypes and mortality with age requires either that the proportional hazard assumption is fulfilled for baseline measures or multiple-record survival analysis.

### PREDICTING MORTALITY AMONG THE OLD AND OLDEST-OLD IN THE UNITED STATES

E. Crimmins, M.E. Levine, J.A. Ailshire, *University of Southern California, Los Angeles, California*

Numerous studies have sought to construct models to predict survival outcomes using measures of frailty, psychosocial, biological markers, and indicators of physical and social functioning. However, what predicts mortality among the oldest-old may be different from the predictors in an aging but not yet very old population. In this presentation, we examine a diverse set of factors encompassing frailty, anthropometric measures, cognitive and physical functioning, physiological state, psychosocial well-being, and behavior, to develop predictive models of mortality. We use two data sources to investigate subsequent mortality among persons aged 70-89 at baseline. Subjects include persons from the U.S. Third National Health and Nutrition Examination Survey (NHANES III) and the longitudinal Health and Retirement Study (HRS). The research demonstrates that the factors predicting mortality vary between younger and older groups. The identification of constructs that predict mortality among very old cohorts may facilitate the development of preventative interventions to impact longevity.

### PREDICTORS OF MORTALITY IN NONAGENARIAN WOMEN AND MEN - THE VITALITY 90+ STUDY

M. Jylhä, K. Tiainen, L. Enroth, A. Hervonen, *University of Tampere, Tampere, Finland*

In nonagenarians, predictors of mortality may differ from those in younger old age. However, in many studies the reliability is limited due to small and biased study samples. In Vitality 90+ Study we investigated mortality during 9 years in a total cohort of individuals aged 90 and older in the area of Tampere in Finland, including also institutionalized people. Baseline data was collected using mailed surveys (N=888, response rate 79%). Several socio-economic and health indicators were used as potential predictors. Older age, male gender, and institutionalization increased risk of mortality in the total study group. In men, difficulties in ADL and mobility were strong predictors, while in women, comorbidity and poor self-rated health were more important. Occupational class did not predict mortality, but individuals in lower classes seemed to live more years with disability than the upper classes. The

findings suggest that predictors of mortality in very old groups may differ between the genders.

## SESSION 2230 (SYMPOSIUM)

---

### RECRUITING STUDENTS TO SOCIAL WORK WITH OLDER ADULTS THROUGH EXPERIENTIAL LEARNING

Chair: *N. Hooyman, University of Washington, Seattle, Washington*  
Discussant: *N. Hooyman, University of Washington, Seattle, Washington*

The job market for baccalaureate social workers in the aging network and long-term care settings is strong and growing. Yet, relatively few Bachelors of Social Work (BSW) programs offer learning experiences where students directly interact with older adults. BSW students often gravitate toward careers with younger populations. The gap between the growing employment opportunities and the limited number of gerontologically-competent BSW graduates was the impetus for the Council on Social Work Education's BSW Experiential Learning (BEL) Program, which has funded 30 grantees over two funding cycles (2008-2010 and 2010-2012). Grantees embed and sustain experiential learning activities with older adults into one or more required generalist courses as a recruitment strategy for gerontological social work. Approximately 3,200 students have participated in the BEL program thus far. Quantitative data from the Cycle 1 grantees (Cycle 2 data is not yet available) indicate significant improvements in students' self-reported likelihood to pursue field placements, course work, graduate study, and a career in gerontological social work as a result of the BEL Program. The cost of the program per student is relatively low, ranging from approximately \$24 to \$70 per student over the course of the two years. This session will describe the BEL program's rationale, implementation, outcomes, and lessons learned. Grantees will describe their programs' outcomes and provide specific action steps for those who may want to implement such a program. While the BEL Program focused on BSW students, this session has applicability for Master's level students and students in different degree fields.

### ENGAGING UNDERGRADUATE STUDENTS IN GERONTOLOGICAL SOCIAL WORK: CHALLENGES AND SUCCESSES

A. Rogers, *University of Portland, Portland, Oregon*

This paper will describe the aims, outcomes, and lessons learned of a project that examined the extent to which exposing undergraduate students to gerontological-related curriculum and experiences could increase their interest and engagement in aging-related social work. Students in a research methods course and a senior practicum course participated in gero-specific activities over the course of an academic year. Students were assessed before and after their course experiences on their exposure to older adults; comfort level in working with older adults; knowledge about working with older adults; likelihood of working with older adults in the future; and perceived gerontological competencies in working with older adults. At the end of the symposium, participants will be able to 1.) Identify specific strategies to engage undergraduate students in gerontological social work, and 2.) Identify challenges to employing strategies to their undergraduate curriculum.

### RECRUITING STUDENTS TO SOCIAL WORK WITH OLDER ADULTS THROUGH EXPERIENTIAL LEARNING

E.T. Mazza, *School of Social Work, Monmouth University, West Long Branch, New Jersey*

Students preparing to enter the helping professions rarely express an initial aspiration to work with older people. Meanwhile, the growing population of older people and the shortage of social workers and other human service professionals who are prepared and competent to meet the needs of this vulnerable population offer both challenges and opportunities for educators in professional education programs. Though

curriculum change is almost always daunting, by partnering with community agencies and making adjustments to experiential activities in entry level core social work curriculum, one Northeast school of social work appreciated a 300% increase in the number of undergraduate social work students pursuing senior field internships with older people. Designed to encourage students to assess and evaluate their own values and judgments regarding aging and older people, curriculum changes included: 1) sensitivity training, 2) volunteer work with older people, and 3) journaling and classroom facilitated discussions regarding the experiential activities.

### BSW STUDENTS AND AGING POPULATIONS: RECOGNIZING AND VALUING IN RURAL SETTINGS

B. Jeffrey, *California University of Pennsylvania, California, Pennsylvania*

This presentation focuses on lessons learned during a multi-semester CSWE Gero-Ed Cycle 2 BEL Program in rural southwestern Pennsylvania. Over 200 BSW students and 100 healthy adults age 65 years and older completed over 300 hours of interviewing and shared a common interest in continuing relationships that will benefit senior populations. Through intergenerational programming students recognized the value of volunteerism of older adults in rural communities; gained knowledge that allowed them to understand, capture, and celebrate the contributions of the aging; and created possible bridges for intergenerational relationships. Healthy older adults, celebrated and illustrated self-determination, dignity, values, and rich diversity through sharing their seminal life experiences that began in the 20th century and continued into 21st century. Results from student ratings on Subscale I. Values, Ethics, and Theoretical Perspectives of the Geriatric Social Work Competency Scale II with Life-Long Leadership Skills will be discussed.

## SESSION 2235 (SYMPOSIUM)

---

### THE MULTIDIMENSIONAL NATURE OF THE TRAJECTORIES OF SUBJECTIVE WELL-BEING (SWB) IN LATER LIFE

Chair: *V. Ryser, FORS- Swiss Centre of Expertise in the Social Sciences, Lausanne, Switzerland*

Despite the increase in frailty with the aging process, SWB remains quite stable in old and very old age. The stability of SWB is explained through both personal resources and processes of regulation. However, regardless of the effectiveness of personal resources and processes of regulation it has been shown that SWB deterioration at the end of life reflects a combination of age, mortality and pathology-related processes. In this symposium we highlight end-of-life trajectories of SWB taking into account three aspects: personal resources, processes of regulation and mortality related processes. The aim of the first contribution by Brandt et al. is to demonstrate that apart from individual and network features, social cohesion is of great importance to enhance self-rated health and more generally quality of life in older age. The second contribution by Borrat-Besson et al. shows how processes of regulation, such as the capacity to fulfill personal needs, mediates the negative impact of frailty deterioration on different dimensions of SWB at the end of life. The third contribution by Berg et al. will demonstrate how time-to-death-related processes impact each one of the dimensions of the Life Satisfaction Index-Z using specifically satisfaction with the present and satisfaction with the past. The fourth contribution by Schilling et al. shows how time-to-death impacts on positive and negative affect in the approach of end of life. We expect that the findings of these different works will improve our understanding of the mechanisms underlying the effect of impending death on SWB in later life.

## **SOCIAL COHESION, SOCIAL NETWORKS, AND LATER LIFE HEALTH**

M. Brandt<sup>1</sup>, C. Deindl<sup>2</sup>, K. Hank<sup>2</sup>, 1. *MEA, Max Planck Institute for Social Law and Social Policy, Munich, Germany*, 2. *University of Cologne, Cologne, Germany*

Following a multilevel approach we examine the associations between social network characteristics, social cohesion and self-rated health of older populations in 15 European countries based on SHARE. The aim of the paper is to contribute to the discourse on healthy and active ageing in ageing societies by assessing the relation between (a) the composition of social networks, (b) social support and (c) activities and self-rated health in older age on the individual level. The societal embeddedness of healthy ageing is considered by introducing (d) contextual factors such as social cohesion on a country level.

## **TRANSITION BETWEEN FRAILTY STATES, SUBJECTIVE WELL-BEING AND PSYCHOLOGICAL REGULATION PROCESSES**

C. Borrat-Besson, V. Ryser, B. Wernli, *FORS, Lausanne, Switzerland*

Frailty research has documented the negative effect of frailty on subjective well-being (SWB) and has shown that psychological regulation processes attenuate this negative effect. But it has often ignored the dynamic aspect of frailty state changes. Indeed, little is known on the natural course of frailty and the impact of frailty state transitions on SWB. Adapted from the work of Girardin Kecior and Spini (2006) and using the longitudinal data from participants of the SHARE study (individuals aged 50+, measured 2004, 2006 and 2011, N 2004-2006=16'617, N 2006-2011=14'440), this paper examines how changes in frailty states (i.e. non-frail, prefrail, frail) between two consecutive waves influence life satisfaction and negative affects. Further, it investigates the role played by psychological regulation processes, and particularly the capacity to fulfill personal needs, in mediating or moderating this relationship.

## **PREDICTORS OF LATE LIFE CHANGES IN THE LIFE SATISFACTION INDEX-Z (LSI-Z) FACTORS OF CONGRUENCE, MOOD AND ZEST OVER A 6 YEAR PERIOD**

A. Berg, B. Johansson, *Department of Psychology, University of Gothenburg, Gothenburg, Sweden*

Life Satisfaction Index (LSI-Z) is widely used in well-being research on older adults, but most analyses of level and change has used a total-sum-of-score, disregarding the subscales. Confirmatory factor analysis of the scale, however, provides support for a three-factor-solution of the LSI-Z, reflecting satisfaction with the past (Congruence), present (Mood) and future (Zest). This study investigates changes in Congruence, Mood, and Zest, and effects of health-related and psychosocial resources on level and change, across four measurement occasions over six years. Participants were 453 cognitively healthy individuals aged 80-98 years old at baseline. Separate analyses of the subscales generated contradictory results. Mood and Zest decreased over time, but Congruence remained unchanged. Health and psychosocial resources had unique effects on level and change across the factors. Research on well-being in older adults needs to attend to the unique contexts and conditions of late life, and incorporate the temporal position that individuals take.

## **AGE-GRADED VERSUS TERMINAL CHANGES IN POSITIVE AND NEGATIVE AFFECT IN VERY OLD AGE**

O.K. Schilling, H. Wahl, *Department of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany*

Late-life development of affect may unfold in terms of time-to-death-related terminal changes, reflecting end-of-life degradation processes. This study analyzes terminal change in Negative (NA) and Positive Affect (PA), using 2-wave longitudinal data from a sample of very old (projects ENABLE-AGE and LateLine, N=140, born 1911-1921, meas-

ured 2002 and 2003, up to 9 years to death). Nonlinear time-to-death and age effects on PA and NA were analyzed by means of Latent Change Score Models. No time-to-death-related effects, but linear age-related decline of PA was found. For NA, results indicate a terminal increase, turning around to a drop close to death. Thus, NA may follow a twofold time-to-death dynamic. First, increase of NA across a larger period preceding death may mirror basic processes of degradation of the human system. Second, approaching the end, these processes may exhaust negative activation and prompt a terminal drop of NA close to death.

## **SESSION 2240 (SYMPOSIUM)**

### **THEORIZING CROSS-CULTURAL COMPARISON IN AGING RESEARCH**

Chair: *R. Schrauf, Applied Linguistics, Pennsylvania State University, University Park, Pennsylvania*

Discussant: *A. Glicksman, Philadelphia Corporation on Aging, Philadelphia, Pennsylvania*

Comparative or cross-cultural gerontology involves the systematic comparison of data collected in two or more cultural contexts. Such comparisons make it possible to document the inherent variability in human aging and to challenge the normativity of dominant assumptions. Cross-cultural studies also provide 'natural experiments' in which social variables are found in different combinations and configurations. However, as in other areas of gerontology, the field is often 'data-rich but theory-poor.' In this panel, we develop theoretical frames and conceptual tools for cross-cultural research from several disciplinary fields: anthropology, psychology, sociology, and political science. Dilworth-Anderson argues that attention to cultural values and a critical look at existing theories of diversity are essential to fresh theorizing about diversity and aging. Her abundant research in sociology concerns minority aging, dementia among minority populations (2008), and family caregiving (2000, 2005, 2011). From anthropology, Schrauf theorizes the interrelation of four kinds of cultural variation: intercultural variation, intracultural variation, distributed cognition, and contextual variation. These are illustrated from work on older ethnic adults' knowledge of illness domains (2002, 2008, 2010, 2011). In sociological research, Torres shows how an overarching theory of cultural values can illumine cultural variation in values orientations both before and after immigration among Iranian immigrants in Sweden (1999, 2001, 2003). Reflecting on recent, large-scale, cross-national databases on aging in Europe, von Kondratowitz (political science and sociology) and Tesch-Roemer (psychology) articulate basic principles of cross-cultural research generally and specify testable, candidate theories from social gerontology (2004, 2005, 2006).

### **CULTURE, THEORY AND AGING RESEARCH**

P. Dilworth-Anderson, *UNC Chapel Hill, Chapel Hill, North Carolina*

This theoretical presentation focuses on using conceptual and theoretical ideas to inform, shape, and direct culturally competent aging and gerontological research. As the American society becomes increasingly diverse, especially in later life, with older minorities growing at a faster rate than their white counterparts, and coupled with increasing number of older immigrants, researchers and theorists need to understand diversity beyond racial/ethnic categories. This presentation provides information to address this concern by discussing: 1) Importance of values and beliefs of cultural groups under study in the context of research to inform conceptual views for culturally relevant research; 2) Awareness of the boundaries and limitations of existing theories regarding diverse cultures to inform conceptual views for culturally relevant research; and, 3) Usefulness of reframing existing conceptual and theoretical ideas

to inform and provide guidance to designing new ways to theorize about diverse cultures to inform culturally relevant research.

#### **FOUR KEY CONCEPTS OF CULTURAL VARIATION IN SOCIAL GERONTOLOGY**

R. Schrauf, *Applied Linguistics, Pennsylvania State University, University Park, Pennsylvania*

This paper examines four key sources of variation in cross-cultural research, where the emphasis is on cultural knowledge, beliefs, and attitudes: intercultural variation, intracultural variation, distributed cognition, and contextual variation. Between-group differences are captured as inter-cultural variation, and within-group differences as intra-cultural differentiation. However, in gerontology the temporal dynamics of cultural variation are paramount, so that when and where people acquire or apply their cultural knowledge becomes a critical consideration. First, some knowledge and expertise may be available in a group without necessarily implying that every member know it at all times (i.e. individuals 'acquire' it only when necessary). This is the concept of distributed cognition. Second, culture-members can accurately articulate group beliefs yet differentially apply those beliefs from context to context. This is contextual variation. These notions are exemplified using data on Alzheimer's disease from three US ethnic groups (African Americans, Mexican Americans, refugees/immigrants from the Former Soviet Union).

#### **THEORY IN CROSS-CULTURAL GERONTOLOGY: A MODEL FOR THE STUDY OF SUCCESSFUL AGING AS AN EXAMPLE**

S. Torres, *Uppsala University, Uppsala, Sweden*

The gerontological sub-discipline concerned with cross-cultural studies of aging was denounced to be atheoretical in the late 90's. Although some attempts have been made to address this predicament, we have yet to seriously engage in theory development in our field. Lack of theoretical frameworks that address the role that culture play in relation to the research questions we pose as cross-cultural gerontologists has meant that we often confuse culture-specificity for culture-relevance. This presentation departs from a theoretical framework developed in the late 90's for studies of cultural values' influence on understandings of successful aging. Preliminary findings based on this framework will also be presented in order to show one way in which we could engage on the theory formulation and testing in cross-cultural gerontology.

#### **BEING AWARE OF DIFFERENT APPROACHES TO COMPARATIVE AGING RESEARCH**

H. von Kondratowitz, C. Tesch-Roemer, *DZA, Berlin, Germany*

Due to the diversity of European societies, comparative aging research is important and gets more support today than ever. To study the impact of different societies and cultures in a comparative vein is important for the analysis of societal and cultural factors in development over the life course. Two perspectives are usually discussed: a nomothetic perspective looks for similarities and communalities in different societies and cultures; an idiographic perspective wants to emphasize societal and cultural specificity and distinctiveness. However, comparative work in aging needs more reasoning and reflections. The contribution will therefore discuss aims and ambitions of comparative aging research. Comparative theories and aging theories are mutually referred to each other in order to test their abilities to serve as a basis for comparative aging research. The rationale of comparative aging research is described and illustrated by empirical examples. Also some epistemological and methodological pitfalls are critically discussed in order to qualify comparative aging research.

## **SESSION 2245 (SYMPOSIUM)**

### **UNDERSTANDING RETIREMENT DECISION-MAKING AND QUALITY OF LIFE IN RETIREMENT: RECENT RESEARCH ADVANCES**

Chair: *M. Wang, Management, University of Florida, Gainesville, Florida*

Co-Chair: *K. Henkens, Netherlands Interdisciplinary Demographic Institute, Hague, Netherlands*

Discussant: *W. Gallo, City University of New York, Hunter College, New York City, New York*

Applying the life course perspective, recent theoretical development has suggested that retirement decision-making and quality of life in retirement are influenced by (a) the specific contextual factors of retirement (e.g., individual attributes, work and life history, and past work experience), (b) the expected and actual characteristics of the retirement transition, and (c) the impact from other life spheres such as family life. The general purpose of this proposed symposium is to introduce to session attendees the recent advances made in testing these theoretical premises and identifying previously unexamined individual attributes as well as work and family factors that are associated with retirement decision and quality of life in retirement. Specifically, we plan to present four studies. Using data from a three-wave longitudinal panel study, Damman et al. examined the roles of family and work history in determining Dutch women's retirement timing. The longitudinal study by Wang and Zhan examined the roles of expected transition difficulty and work attitudes in predicting Chinese workers' retirement and bridge employment decisions making and in turn, these decisions' effects on retirement satisfaction and life satisfaction. Hershey and Henkens examined the impact of different types of retirement transitions, including voluntariness of retirement, health changes, and marital status changes, on Dutch retirees' post-retirement life satisfaction. Finally, Xie et al. investigated how American retirees' attitudes and behaviors regarding technology use (e.g., perceptions and use of iPads) are associated with their health information seeking and health care quality in retirement.

### **THE CRITICAL ROLE OF RETIREMENT DECISION IN LINKING PRE-RETIREMENT ATTITUDES TO POST-RETIREMENT LIFE QUALITY**

M. Wang<sup>1</sup>, Y. Zhan<sup>2</sup>, *1. Management, University of Florida, Gainesville, Florida, 2. Wilfrid Laurier University, Waterloo, Ontario, Canada*

This study applied the life course perspective to examine the effects of expected transition difficulty and pre-retirement work attitudes on retirees' post-retirement life quality (i.e., retirement satisfaction and life satisfaction). Specifically, retirees' retirement decisions (i.e., full-time retirement vs. different types of bridge employment), were examined as mediators of these effects. Three-wave longitudinal data from a sample of 377 Chinese workers were used to test this mediation model. The results revealed that retirees who expected higher levels of transition difficulty were more likely to choose career bridge employment and bridge employment with the pre-retirement employer than full-time retirement. Retirees who had better attitudes toward work were in general more likely to choose bridge employment than full-time retirement. In turn, retirees who chose bridge employment options fared better in terms of their retirement satisfaction and life satisfaction than those who engaged in full-time retirement.

### **EXPLAINING WOMEN'S RETIREMENT TIMING: DO FAMILY AND WORK HISTORY MATTER?**

M. Damman<sup>1</sup>, K. Henkens<sup>1,2</sup>, M. Kalmijn<sup>2</sup>, *1. Netherlands Interdisciplinary Demographic Institute (NIDI), The Hague, Netherlands, 2. Tilburg University, Tilburg, Netherlands*

Labor force participation of older women has increased considerably during the last decades in many industrialized countries. This study

aims to improve our understanding of women's retirement, by studying the impact of family and work histories on both women's retirement timing intentions and behavior, and by examining the mediating role of various aspects of the preretirement opportunity structure in these relationships. Three-wave panel data collected in 2001, 2006, and 2011 among Dutch older women (all employed in 2001; N=412) are analyzed to reach this aim. Generally, our results show that women's family (timing of first birth, timing of divorce) and work (years in the labor market, part-time work) histories are relevant for understanding retirement timing intentions. Some of the relationships between mid-life experiences and retirement are (partly) mediated by the preretirement family, work, or financial situation, whereas other effects remain significant when controlling for these proximal precursors of retirement.

### **IMPACT OF DIFFERENT TYPES OF RETIREMENT TRANSITIONS ON SATISFACTION WITH LIFE**

D.A. Hershey<sup>1</sup>, K. Henkens<sup>2,3</sup>, 1. *Psychology, Oklahoma State University, Stillwater, Oklahoma*, 2. *Netherlands Interdisciplinary Demographic Institute, The Hague, Netherlands*, 3. *Tilburg University, Tilburg, Netherlands*

Although numerous studies have examined life satisfaction and how it changes upon entering retirement, no published investigations have appeared that focus on how the nature of the retirement transition affects satisfaction with one's life. In this investigation a modified version of the Diener et al. (1985) Satisfaction with Life Scale was administered to 1,595 older Dutch workers on two occasions, separated by six years. During that time more than half of participants (57%) entered retirement. Analyses revealed that members of the reference group (i.e., those who continued working across the six-year period) showed significant declines in satisfaction with life, as did those whose workforce departures were involuntary (e.g., health reasons, organizational pressures). Individuals whose departure from the workforce was voluntary, however, showed no decline in satisfaction with life. These findings have implications for the understanding of factors that shape individuals' perceptions of how they view the quality of their lives.

### **RETIRES' PERCEPTIONS AND USE OF IPADS FOR EHEALTH**

I. Watkins, B. Xie, *University of Maryland, College Park, Maryland*

Life course theory suggests that psychological, contextual, and experiential factors influence wellbeing during retirement. iPads offer retirees new ways to interact with the world around them (e.g., improved access to health information and social support), and such new experience may affect retirees' wellbeing in various ways. However, to date retirees' perception and use of iPads remains largely unclear, likely due to the newness of the technology. This exploratory study investigated retirees' perception and use of iPads for health-related purposes through focus group interviews and observation with 12 older adults in spring 2012. Data were analyzed using the techniques of inductive thematic analysis. Major findings include: retirees perceived iPad's touch screen as more usable than traditional computer input devices, and as useful for accessing electronic health information. However, retirees lacked sufficient literacy with iPads' functionality and encountered usability issues such as small text. Implications for design and educational interventions are discussed.

## **SESSION 2250 (PAPER)**

### **CORRELATES OF SLEEP QUALITY**

#### **SLEEP DISTURBANCE IN OSTEOARTHRITIS: ASSOCIATIONS WITH PAIN, DISABILITY, AND DEPRESSION**

R. Zamora<sup>1</sup>, P.A. Parmelee<sup>1</sup>, T.L. Harralson<sup>2</sup>, 1. *Center for Mental Health & Aging, The University of Alabama, Tuscaloosa, Alabama*, 2. *Polaris Health Directions, Philadelphia, Pennsylvania*

Osteoarthritis pain is known clinically to be associated with sleep disturbance; however, there has been little empirical exploration of how

sleep problems interact with physical function and emotional well-being of older adults with osteoarthritis. Therefore, the present study examines the relationships of self-reported insomnia with pain, disability, and depressive symptoms in a sample of 369 older adults with physician-diagnosed osteoarthritis of the knee. Regression analyses explicated cross-sectional and longitudinal linkages of insomnia (captured on a 4-point scale during a clinical diagnostic interview) with pain (PGC Pain Scale), functional disability (AIMS-2) and depressive symptoms (CESD). Demographic characteristics and general health were controlled in all analyses. Cross-sectionally, sleep disturbance was uniquely associated with depression and pain, but not functional disability. The effect for depression was robust even after controlling pain and functional disability; in contrast, the association with pain washed out after covarying depression and functional status. Longitudinal analyses displayed a different pattern. Insomnia significantly predicted one-year increase in both depression and functional disability, even after control for covariates. In contrast, change in pain over one year was not affected by baseline sleep problems. Exploratory analysis of subtypes of sleep disturbance (initial, middle and terminal insomnia) revealed that initial insomnia was the strongest cross-sectional predictor of depression, and also of change in function over the one-year interval. Middle insomnia also predicted depression cross-sectionally, and was a marginal longitudinal predictor. Results are discussed in terms of clinical implications and future research directions. (Supported by R01-MH51800, P. Parmelee, PI).

#### **SLEEP MEDICATIONS AND MORTALITY: DOES SOCIOECONOMIC POSITION, INTELLIGENCE, COHABITATION AND PSYCHIATRIC DISEASE EXPLAIN THE ASSOCIATION?**

M. Kriegbaum, *University of Copenhagen, Copenhagen, Denmark*

Background: The prevalence of use of sleep medications increase with age and a large proportion of the general population use sleep medications. However, there is concern about the possible hazards of sleep medications. Previous studies have reported an excess mortality among users of sleep medications, but the excess risk depends on measure of sleep medication and included covariates. Hence, it is important to study possible confounders of the association between sleep medication and mortality. Aim: To study if the association between use of hypnotics and mortality is confounded by socioeconomic position, intelligence, cohabitation and psychiatric disease. Methods: Cohort study of 10 571 Danish men born in 1953. Exposure was 'low use': (30 or less DDD (defined daily dose) per year) or 'high use': (more than 30 DDD per year) from The Danish National Prescription Registry purchased by outpatients in 1995. Follow-up was from 1st Jan 1996 to Jun 2010. Intelligence was derived from draft-board data, information on socioeconomic position and cohabitations was derived from Statistics Denmark and psychiatric disease was defined as any admission to a psychiatric ward between 1968 and 1995. Results: The crude HR was 'low use': HR 2.71 95% CI (1.91-3.84); 'high use': HR 4.43 95% CI (3.53-5.55). These estimates were reduced to low use: HR 1.87 95% CI (1.32-2.66); high use: HR 1.79 95% CI (1.41-2.27) after control for all covariates. Conclusions: Socioeconomic position, intelligence, cohabitation and psychiatric disease substantially reduced the association between hypnotics and all-cause mortality, but a significant association remained.

#### **AGE GROUP DIFFERENCES IN THE AMOUNT OF DYSREGULATION OF BEHAVIORAL RHYTHMS REQUIRED TO PREDICT SLEEP OUTCOMES**

N.D. Dautovich<sup>1</sup>, C.S. McCrae<sup>2</sup>, 1. *Psychology, University of Alabama, Tuscaloosa, Alabama*, 2. *University of Florida, Gainesville, Florida*

Introduction: Behavioral circadian rhythms (timing of daily activities) are shown to affect underlying biological circadian rhythms (e.g., sleep/wake cycle). Older adults exhibit less robust biological rhythms suggesting that more potent zeitgebers, or environmental cues, are

required to entrain these rhythms. The present study compared two levels of potency of behavior rhythms (daily versus weekly) to determine what level of regularity/dysregulation is required for sleep disruption. Methods: 50 younger ( $M=19.88$ ,  $SD=2.76$ ) and 50 older ( $M=67.81$ ,  $SD=6.73$ ) community-dwelling adults completed 14 consecutive days of daily diaries assessing daily activity regularity (Social Rhythm Metric-17) and sleep. Multilevel modeling analyses compared the ability of dysregulation on a daily (level 1) versus weekly (level 2) level to predict sleep disruption (sleep onset latency and sleep efficiency). Results: The sleep of both age groups was highly variable night-to-night (63-85% of total variability in sleep was attributed to within-person fluctuations). Dysregulation of activities on a weekly (not daily) level interacted with age to significantly predict sleep onset latency ( $b=0.22$ ,  $SE=0.10$ ) and sleep efficiency ( $b=-0.09$ ,  $SE=0.04$ ). Younger adults with more disruption in activities on a weekly basis took longer to fall asleep and spent less time asleep while in bed. Conclusions: Dysregulation of behavioral rhythms on a weekly scale best predicted poorer sleep for younger adults, suggesting a cumulative effect of activity dysregulation is required to see associated sleep deficits. Nonetheless, dysregulation on a weekly scale was insufficient for predicting older adult sleep outcomes. Explanations for age-differences are discussed (e.g., health, lifestyle, and affect).

## SESSION 2255 (PAPER)

### DISCOVERY EXCHANGE: CONTRIBUTIONS TO COGNITIVE FUNCTIONING

#### IS ANEMIA ASSOCIATED WITH COGNITIVE PERFORMANCE AND BRAIN VOLUME IN THE ELDERLY?

C. Jonassaint, G. Harris, V.R. Varma, Y. Chuang, M. Carlson, Johns Hopkins, Baltimore, Maryland

Individuals suffering from chronic anemia are at increased risk of cognitive impairment and dementia. This may in part be due to lower hemoglobin availability and reduced oxygen delivery to the brain. No studies have examined the effect of low hemoglobin on brain volume in the general population. Therefore, the current study aimed to test the association of hemoglobin level with cognitive performance and brain volume. Methods: Blood, cognitive and MRI measures were collected at baseline in 88 older adults (85% female) from the Brain Health Study, a substudy within the Baltimore Experience Corps Trial. Hemoglobin was modeled as a continuous independent variables in multivariate linear regressions predicting performance on measures of executive function, processing speed, and working memory, and measures of brain volume [total intracranial (ICV), white and gray matter, hippocampus and amygdala volumes]. Results: Higher hemoglobin was associated with better performance on measures of processing speed (Trails A, Pattern Comparison) and working memory (Digit Span Backward;  $p's < .05$ ). Hemoglobin was also positively associated with ICV ( $p < .001$ ) even when controlling for BMI. Hemoglobin was not associated with total brain or structural volumes after adjustment for ICV. Conclusion: Consistent with prior studies, we found an association between lower hemoglobin and poorer cognitive performance, particularly on tests of processing speed. Hemoglobin was associated with total ICV; however, no associations were detected with brain or structural volumes adjusted for ICV. This suggests that the chronic effect of anemia may be evident in both brain and behavior.

#### PRELIMINARY FINDINGS FROM THE PROSPECTIVE MEMORY INTERVENTION TO IMPROVE MEDICATION ADHERENCE

K. Insel<sup>1</sup>, G.O. Einstein<sup>2</sup>, D. Morrow<sup>3</sup>, K.M. Koerner<sup>1</sup>, 1. University of Arizona, Tucson, Arizona, 2. Furman University, Greenville, Arizona, 3. University of Illinois, Champaign Urbana, Champaign Urbana, Illinois

Estimated medication adherence rates are less than 50%. While non-adherence reflects many factors, a common problem is prospective memory failure (forgetting to take medications). This paper reports preliminary findings of a randomized clinical trial testing the effect of an intervention that supports prospective memory among community dwelling older adults who are self-managing medication. After 4 weeks of baseline adherence monitoring, participants were assigned to the study if adherence was  $\leq 90\%$  to the interdose interval (using an electronic medication monitoring system). Currently, 56 participants have completed the education-only control and 51 participants completed the education plus intervention (mean age of 76.62 years with 26 males and 81 females participating). Nurses made weekly home visits for 4 weeks. At the completion of the weekly visits, the intervention group showed a significant improvement in adherence using difference scores from baseline adherence ( $t(105) = -4.02$ ,  $p < .01$ ). Significant differences in overall adherence at the end of the 6 month monitoring were found ( $t(105) = -2.08$ ,  $p < .05$ ). This study is ongoing with plans for subgroup analysis to examine who benefits from the intervention.

#### AGE AND DEPRESSION EFFECTS ON RUMINATION ABOUT MEMORY PERFORMANCE

A. Pearman, 1. Georgia State University, Atlanta, Georgia, 2. Aging and Geropsychology Institute of Georgia, Atlanta, Georgia

Memory complaints are often unrelated to actual memory performance in older adults. Research has shown, however, that depression is an important predictor of memory complaints. Depressive rumination about performance has been suggested as a possible mechanism for this relationship. The current study was designed to explore individuals' ruminative thoughts about cognitive testing 3-weeks after a laboratory testing session. One hundred and eleven participants took part in this study (52 young adults and 59 older adults). The participants took a series of cognitive tests and answered a series of questionnaires (including a depression scale) over a one-hour testing session. Three weeks later, a follow-up phone call was made, and participants answered a series of questions about their experience with the testing. The specific outcome variable for this report is "How much have you thought about the testing over the past three weeks with 1 = not at all and 5 = every day" with age and depression as the independent variables. Older adults reported spending significantly more time thinking about the testing. In addition, there was also a significant interaction (age x depression), such that older adults with higher depression scores reported thinking more about the testing than older adults with lower depression scores but the reverse pattern was true for younger adults. This suggests that depression in older adults may actually cause older adults to spend more time thinking or ruminating about their memory performance.

#### LONG-TERM DEPRESSIVE SYMPTOM BURDEN AND RISK OF COGNITIVE DECLINE AND DEMENTIA AMONG VERY OLD WOMEN

A. Zeki Al Hazzouri<sup>1</sup>, E. Vittinghoff<sup>1</sup>, A.L. Byers<sup>1</sup>, K. Covinsky<sup>1</sup>, D.G. Blazer<sup>2</sup>, S. Diem<sup>3</sup>, K. Ensrud<sup>3</sup>, K. Yaffe<sup>1</sup>, 1. University of California San Francisco, San Francisco, California, 2. Duke University School of Medicine, Durham, North Carolina, 3. University of Minnesota, Minneapolis, Minnesota

Objective: Little is known about the impact of long-term depressive symptom burden on cognitive decline and dementia. Most prior studies assessed one time point, while we used 20 years of data to examine cumulative burden of depressive symptomatology. Methods: We

studied 7,240 older women from an ongoing prospective study. We assessed depressive symptoms at years 2, 6, 10, 16 and 20 using the Geriatric Depression Scale (GDS). We used a poisson model with random slopes to determine GDS trajectories and then estimated depressive symptom burden based on the area under the curve and corresponding quartiles (quartile 1 to 4=minimal to high burden). We lagged values of GDS burden by 3 years. Cognitive outcomes included adjudicated dementia/MCI status at year 20 and repeated measures of the Mini Mental State Exam (MMSE) and Trails-B scores. Lower MMSE or higher Trails-B scores denote worse cognitive function. Results: After adjusting for age, education, living status, smoking, alcohol, BMI, exercise, history of hypertension, heart attack, stroke, diabetes, and antidepressants use, the odds of dementia/MCI was 2 times greater in quartile 4 (OR=2.0; 95%CI=1.38, 2.90), compared to quartile 1. On average, MMSE scores were 19% lower in quartile 4 (95%CI=-14%, -23%) and Trails-B scores were 19% higher in quartile 4 (95%CI=16%, 22%), compared to quartile 1. These associations denote average change in cognitive scores as a function of change in GDS quartiles. Conclusions: Long-term depressive symptom burden was associated with cognitive decline and greater odds of dementia/MCI. Early intervention and careful monitoring may delay cognitive decline and dementia.

### **COGNITIVE FUNCTIONING AMONG OLDER AFRICAN AMERICAN ADULTS: THE ROLES OF PROVIDING AND RECEIVING SOCIAL SUPPORT**

B.J. Ayotte<sup>1</sup>, J.C. Allaire<sup>2</sup>, K.E. Whitfield<sup>3</sup>, 1. *Psychology, University of Massachusetts Dartmouth, North Dartmouth, Massachusetts*, 2. *North Carolina State University, Raleigh, North Carolina*, 3. *Duke University, Durham, North Carolina*

Social support is related to a number of outcomes in later life among African Americans, including cognitive performance. This study examined how providing and receiving social support was related to fluid and crystallized cognitive abilities among aging African American adults after accounting for functional limitations, age, education, sex, income, and self-reported health. Participants completed a battery of cognitive tests assessing fluid and crystallized abilities. Data from 602 African American adults (M = 69.08, SD = 9.74; 25% male) were analyzed using latent variable modeling. Fluid ability was a second-order factor indicated by verbal memory, working memory, perceptual speed, and inductive reasoning. Crystallized ability was a first-order factor indicated by three measures that assessed vocabulary (Shipley Verbal Meaning Test and parts A and B of the ETS Vocabulary Test). Results indicated that the receipt of social support was negatively related to both fluid and crystallized abilities, while the provision of support was positively related to fluid and crystallized abilities. Follow-up tests found that the receipt of support was more strongly related to fluid ability than crystallized ability. There was no difference regarding the relationship of provision of support with fluid ability compared to the relationship of provision of support with crystallized ability. Results discuss the importance of considering the health and social context of older adults when examining cognitive ability.

### **PATHWAYS THROUGH WHICH PERCEIVED SOCIOECONOMIC STATUS IS ASSOCIATED WITH COGNITION IN THREE LONGITUDINAL STUDIES OF AGING TWINS**

C. Zavala<sup>1</sup>, M. Gatz<sup>2,3</sup>, B. Johansson<sup>4</sup>, B. Malmberg<sup>5</sup>, N.L. Pedersen<sup>3,2</sup>, C.A. Reynolds<sup>1</sup>, 1. *Psychology, University of California, Riverside, Riverside, California*, 2. *University of Southern California, Los Angeles, California*, 3. *Karolinska Institutet, Stockholm, Sweden*, 4. *University of Gothenburg, Gothenburg, Sweden*, 5. *Jönköping University, Jönköping, Sweden*

Lower socioeconomic status (SES) is a risk factor for late-life cognitive decline, however, the pathways between SES and cognitive aging have yet to be fully elucidated. Subjective social status and financial

disability have been linked to increased risk for infection and mortality, and we have recently shown that higher perceived socioeconomic status predicted better maintenance of cognitive performance above and beyond the effect of objective SES. The current study examined twin pair similarities and differences in perceived SES and cognitive performance to address etiological factors that underlie the observed associations. Three longitudinal studies of aging originating from the Swedish Twin Registry included 4 identical cognitive tasks (verbal, spatial, episodic memory, processing speed) with up to 6 waves of testing and harmonized measures of objective and perceived socioeconomic status (SES) (N = 1850 individuals). Twin similarity for perceived SES corresponded with genetic similarities in twin pairs, such that identical twins had a higher correlation ( $r = .32, p < .01, N = 240$  pairs) compared to same-sex fraternal ( $r = .21, p < .01, N = 353$  pairs) and opposite-sex fraternal twins ( $r = .11, p = .09, N = 243$  pairs). Initial analyses of pair similarities and differences, including biometrical modeling, suggested that perceived SES and cognitive trajectories may be associated largely via common genetic factors after adjusting for sex, education and cohort. Overall, current patterns suggest complex genetic and environmental pathways through which perceived environments (such as perceived SES) are associated with cognitive aging.

### **SESSION 2260 (PAPER)**

#### **HOUSING: THE POWER OF PLACE**

##### **CONTINUING CARE RETIREMENT COMMUNITIES: AMERICAN AND ISRAELI ATTITUDES AND RESIDENCE SATISFACTION**

A. Gum<sup>1</sup>, L. Ayalon<sup>2</sup>, J. Greene<sup>1</sup>, 1. *Mental Health Law & Policy, University of South Florida, Tampa, Florida*, 2. *Bar Ilan University, Ramat-Gan, Israel*

**BACKGROUND:** Growing numbers of American and Israeli older adults are moving to continuing care retirement communities (CCRCs). Limited information is available regarding attitudes and satisfaction with residence. **AIMS:** This study aims to examine attitudes about CCRCs and satisfaction with residence by country (Israel, US) and residence (new CCRC resident, community dwelling). **METHODS:** New CCRC residents (104 Israeli, 52 American) and individuals who contacted CCRCs but decided to remain in their homes (50 Israeli, 49 American) completed interviews about attitudes regarding CCRCs and satisfaction with residence. **RESULTS:** Americans had more positive attitudes about CCRCs than Israelis ( $p < 0.001$ ), and CCRC residents had more positive attitudes than non-residents ( $p < 0.001$ ). Both American residents (100%) and Israeli residents (91%) were more likely than their non-resident counterparts to endorse that CCRCs are “right for people like me” (53% and 43%, respectively). Israeli non-residents were most likely to agree that “you lose control over your life” upon moving to a CCRC (37% vs. 4-18% for other three groups). Americans were more satisfied with residence than Israelis ( $p < 0.001$ ), and CCRC residents were more satisfied than non-residents ( $p = 0.01$ ). Israeli non-residents were least satisfied ( $p = 0.03$ ), particularly with recreational activities (46% vs 84-96%) and social support (27% vs. 70-96%) at their residence. **CONCLUSIONS:** American and Israeli CCRC residents have positive attitudes and are satisfied. Community-dwelling Israeli older adults have less positive attitudes about CCRCs but are less satisfied with their residence, possibly because of limited services and social support.

##### **MOVING IN OLD AGE: ‘ROOTED IN PLACE’ AND ‘NOMADS’**

O.H. Jolanki, *Dept. of Social Sciences and Philosophy, University of Jyväskylä, Jyväskylä, Finland*

This study focuses on housing and moving decisions of older people and identities constructed in moving narratives. The theoretical

framework of 'housing pathways' (Clapham 2005, 2010) emphasizes the need to study individual and family biographies and subjective meaning of housing and moving. The data come from face-to-face interviews of Finnish people aged 75 or older. The analysis employed discursive-narrative approach. According to the results narratives of moving can be divided into two main pathways and identities i.e. 'rooted in place' and 'nomads'. 'Rooted in place' narratives picture people firmly rooted in their current homes and to a living area which gives a chance to maintain lifelong interests and social networks. In these narratives home and the place of living offer sense of belonging and being part of the community and moving takes place or is considered only out of necessity. In the 'nomad narratives' moving and relocation has been and is an essential part of the entire life-course and identity. 'Nomad' narratives picture people who are accustomed of making a new home and setting up new social networks and consider 'staying put' out of necessity. Nomadic identity is less attached to a particular physical place but to an idea of a place. The results show that older people differ not just in their resources and needs but in their moving wishes and aims. The image of older people reluctant to move and consequently the ideal of 'ageing-in-place' adopted in service planning do not apply to all older people.

### HOUSING ADJUSTMENT IN LATER LIFE: THE IMPACT OF PERSON-ENVIRONMENT FIT

K. Stoeckel, *Hebrew University, Jerusalem, Israel*

The intersection between individual competency and environmental contexts, theoretically defined as environmental press (Lawton & Nahemow, 1973) becomes increasingly relevant as people advance in age and experience decreased physical health, mobility or cognitive functionality. The analysis considered the influence of the built environment on the likelihood of making a subsequent housing adjustment using a non-institutionalized sample selected from the 1998 – 2006 waves of the Health and Retirement Study. The model controlled for individual levels of competency, home environment characteristics, environmental press and various background variables. An innovative measure of person-environment misfit was developed to sensitize the results to the impact of environmental press on housing adjustment outcomes. The analysis provides empirical evidence of the theoretical assertion of the Ecological Theory of Aging (Lawton & Nahemow, 1973) that individuals and environments are interconnected. The results revealed that each additional misfit between individual and home environment, indicative of experiences of heightened environmental demand, increased the relative risk of making a housing adjustment by 18 percent. In addition, the results also suggested that supportive housing features of a structural nature may reduce or offset the need for housing adjustments in later life. Wheelchair accessibility lowered the relative risk of making a housing adjustment by 34 percent.

### THE BUILT ENVIRONMENT AND NEIGHBORLY SOCIAL RELATIONS

K.E. King, *Center for the Study of Aging and Human Development, Duke University, Durham, North Carolina*

Neighborhood social relations are considered to be particularly important for the well-being of older adults, who may be very invested in their homes and for whom social support is particularly crucial. Older adults also tend to live in certain types of neighborhoods, particularly in single-family houses. Physical features of urban neighborhoods including housing and walkable urban form, along with social composition and residential stability, have been hypothesized to influence neighborhood social relations (cohesion, control, intergenerational closure, and reciprocal exchange) previously linked with downstream health, social, and behavioral risks. Analyses of the Chicago Community Adult Health Survey are used to evaluate three potential mechanisms: (1) influence of urban form on walking patterns leading to social interaction, (2) associations of housing characteristics with residential

stability, and (3) stability in the underlying built environment itself. Evidence supports all three mechanisms. Housing building types, especially detached houses and high-rise apartments, significantly predict social relations, both independently and through their association with residential stability. Housing and urban form also have differential associations with social relations outcomes according to the neighborhood socioeconomic status. A gradual pace of redevelopment resulting in historical diversity of housing significantly predicts social relations. Walkable urban form (residential density, mixed land use, and street connectivity) appears less important but shows promise in predicting reciprocal exchange. The finding that physical conditions like housing and urban form have implications for social relations should encourage efforts to develop urban planning policies designed to foster neighborly social relations along with other related beneficial outcomes.

### RETIRING TO THE DORMS: UNIVERSITY BASED RETIREMENT COMMUNITIES AND SOCIAL-PHYSICAL PLACE OVER TIME THEORY

E. Rozek, E.K. Smith, K. Diaz Moore, *Gerontology, University of Kansas, Lawrence, Kansas*

A case study was conducted to examine Lawrence, Kansas' potential as a University Based Retirement Community (UBRC). Lawrence, a college town, is home to the University of Kansas, which has a number of significant features necessary for supporting a UBRC. UBRCs can take a number of forms including: Leisure Oriented Retirement Communities, Continuing Care Retirement Communities, and Naturally Occurring Retirement Communities. Carle(2006) identifies CCRCs as the best model for a UBRC. He outlines five key principles for a UBRC's success: proximity to the university, two directional programming, continuing care, financial link to the university, and a minimum 10% resident connection to the university. After defining these principles we examined how each component was applied in existing UBRCs, and then made comparisons to the University of Kansas. These comparisons fit within the broader framework of Social-Physical Place Over Time(SPOT)(Wahl & Lang, 2003). SPOT focuses on the interactions between social and physical places something UBRCs commit to within Carle's five principles. UBRCs are valuable because they provide the social and physical place where older adults can live when they retire allowing an effortless shift from individual agency to belongingness, a key tenet of SPOT. Integrating UBRCs' criteria into the SPOT framework builds on this relatively new meta-theory in environmental gerontology. SPOT effectively highlights how UBRCs benefit older adults and the broader community by bringing together the physical places and social environments in a deliberate way.

### SESSION 2265 (PAPER)

#### LONG TERM CARE

#### RESIDENT CHARACTERISTICS RELATED TO THE LACK OF MORNING CARE PROVISION IN LONG TERM CARE

S.F. Simmons<sup>1,2</sup>, D.W. Durkin<sup>1</sup>, A. Rahman<sup>5</sup>, L. Choi<sup>3</sup>, L. Beuscher<sup>1,4</sup>, J. Schnelle<sup>1,2</sup>, 1. *Division of General Internal Medicine & Public Health, Vanderbilt University, Center for Quality Aging, Nashville, Tennessee, 2. VA Medical Center, Nashville, Tennessee, 3. Vanderbilt University Department of Biostatistics, Nashville, Tennessee, 4. Vanderbilt University School of Nursing, Nashville, Tennessee, 5. University of Southern California, Los Angeles, California*

Purpose: The purpose of this study was to examine usual long-term care (LTC) practices related to morning care and determine if there were resident characteristics related to the lack of care. Design and Methods: Participants were 169 long-stay residents in four community LTC facilities who required staff assistance with either transfer out of bed, dressing, and/or incontinence care and were able to respond to structured interview questions about their morning care preferences. Trained

research staff conducted standardized observations during four consecutive morning hours once per week per participant for three consecutive months during usual LTC conditions and interviewed participants about their morning care preferences using a structured interview protocol once per month during this same time period. Results: Overall, 40% of the observations showed a lack of any morning care provision, including any staff-resident communication about care, during the 4-hour observation period. Participants rated by staff as more physically dependent and requiring two staff for transfer were more likely to not receive morning care. Even when care in a particular area was absent, the majority of participants expressed a stable preference for care to remain the “same” (range of proportions was 0.75 to 0.87 for this study’s three care areas) and infrequently made requests for care. Implications: Efforts to promote resident-directed care should consider staffing issues related to missed care occurrences and resident issues related to level of dependency on staff as well as reduced expectations for care, which can lead to resident acceptance of low care frequencies.

#### **DIFFERENCES IN FUNCTIONAL STATUS AMONG ELDERS LIVING IN RESIDENTIAL CARE SETTINGS AND IN PRIVATE HOMES IN THE COMMUNITY: FINDINGS FROM TWO NATIONAL SURVEYS**

M. Sengupta, E. Park-Lee, L. Harris-Kojetin, *CDC/NCHS, Hyattsville, Maryland*

Long-term care needs of older Americans are met through a spectrum of services and living options, based on the needs, preferences, and circumstances of the recipient. Residential care, such as assisted living, an important part of this spectrum, provides assistance to elders not capable of living independently in their homes but generally not requiring skilled nursing care. While some believe that residential care may be a downward step from living at home and perhaps moving closer to nursing home placement, there is little empirical evidence that compares functional ability of residential care and community-dwelling elders. Using the 2010 National Survey of Residential Care Facilities, a first-time national survey of residential care facilities and their residents and the 2010 National Health Interview Survey, a survey of the U.S. civilian non-institutionalized population, this paper compared the functional status (measured by limitations in activities of daily living and Nagi items) of older adults (people aged 65 and older) living in residential care settings to those living in private homes in the community. Differences were tested using chi square and t-tests. Results suggest over three-fourths of older residential care residents had at least some difficulty walking a quarter of a mile and walking up 10 steps without resting. In contrast, about 35% and 25% of elders in the community had some difficulty walking a quarter of a mile and walking up 10 steps, respectively. Overall, preliminary results suggest that older residential care residents are more likely to be functionally impaired compared to older community residents.

#### **FACILITY AND RESIDENT-LEVEL PREDICTORS OF QUALITY OF LIFE IN LONG-TERM CARE**

T.P. Shippee<sup>1</sup>, S. Alang<sup>1</sup>, C. Henning-Smith<sup>1</sup>, R. Kane<sup>1</sup>, T. Lewis<sup>2</sup>, *1. Health Policy and Management, University of Minnesota, 420 Delaware St. SE, MMC 729, Minnesota, 2. MN Department of Human Services, St. Paul, Minnesota*

Objective: Despite its policy relevance, quality of life (QOL) for nursing home (NH) residents has not been sufficiently explored. Previous research has mainly examined NH residents’ quality of care (reported by staff), with only few items devoted to QOL. We identified facility-level and resident-level characteristics that are significantly associated with the self-reported QOL of Minnesota NH residents in 2010. Methods: Measures of QOL were collected through face-to-face interviews with a representative sample of Minnesota NH residents. Clinical data were obtained from the Minimum Data Set (MDS). Facility characteristics were obtained from reports to the

Department of Human Services. The combined data set consisted of 11,621 residents in 376 Minnesota nursing facilities. Factor analyses were used to identify seven QOL domains: activity, autonomy, privacy, food, security, satisfaction and positive mood. We controlled for resident clinical and demographic characteristics. Adjusting for relevant covariates, we applied hierarchical linear models to examine how residents’ medical conditions and facility characteristics affect the resident self-reported QOL. Findings: Overall QOL score was higher for married residents and those residing in smaller, not-for-profit facilities with lower Medicaid reimbursement rates and higher staff retention. In modeling separate QOL domains, resident age, cognitive status, anxiety and mood disorders were consistent predictors. Conclusions: The results illustrate the complex nature of QOL for NH residents. Generally, residents with more chronic mental or physical conditions reported lower QOL, as did residents in larger facilities with a larger Medicaid case-mix. This study can inform quality improvement efforts undertaken by states.

#### **SMALL HOUSE SETTINGS FOR LONG TERM CARE IN NOVA SCOTIA, CANADA: CAREGIVER PERSPECTIVES**

E. Roberts, *Human Environmental Sciences, University of Missouri-Columbia, Columbia, Missouri*

The Province of Nova Scotia, Canada recently implemented a Continuing Care Strategy (CCS) in which issues of home care and long term care were addressed. As a result of the CCS, the provincial government has built 11 new LTC facilities to support the vision of “living well in a place you can call home” (CCS, 2006), with each building built in the model of the small house community, with multiple households (cottages) of 12-14 residents. In addition, implementation of person centered care, in which residents are given choices in their daily activities, is an operational requirement in the new communities. Care staff (CCA’s) are trained to carry out roles in assistance with activities of daily living, as well as food preparation, cleaning and activities in the cottages. A qualitative study took place in two LTC communities in Nova Scotia in early 2012, one which was built prior to the CCS and one after. Observations took place for 8 weeks in both settings and included interviews with staff, residents, and resident family members, focussing on the caregiver perspective of the new model of care. Study results indicate that the government guidelines for the physical environment and care model have had a direct impact on staff perception their jobs, and of their role in resident’s lives.

### **SESSION 2270 (SYMPOSIUM)**

#### **FINDINGS FROM EARLY STAGE INVESTIGATORS AT THE NHLBI CENTERS FOR CARDIOVASCULAR OUTCOMES RESEARCH**

Chair: *J. Saczynski, UMass Medical School; Department of Medicine, Worcester, Massachusetts, Meyers Primary Care Institute, Worcester, Massachusetts*

Co-Chair: *S. Chaudhry, Yale University School of Medicine; Department of Internal Medicine, New Haven, Connecticut*  
Discussant: *H. Krumholz, Yale University School of Medicine; Division of Geriatrics, New Haven, Massachusetts*

Program Overview (Limit 250 Words): Major challenges exist in translating advances in cardiovascular research into clinical practice. The NHLBI sponsored Centers for Cardiovascular Outcomes Research (CCOR) were funded in 2010 and focus on understanding and bridging gaps in knowledge and practice. The papers in this symposium illustrate early findings from Early Stage Investigators at two of the CCORs. Dr. Bonds (NHLBI Program Officer) will provide an overview of the vision of the CCORs and major center activities. The first paper (Chaudhry) will report on physician recognition of cognitive impairment among older patients hospitalized for

heart failure by comparing hospital discharge summaries to objective performance on the Mini-Mental State Examination (MMSE). Cognitive impairment is highly prevalent and frequently unrecognized in this population. The second paper (Dodson) reports on preferences for deactivation of implantable cardioverter defibrillators (ICDs) in the setting of scenarios reflecting hypothetical advanced illness. Nearly three quarters of patients reported that they would want ICD deactivation, most commonly in the setting of incurable disease. The third paper (McManus) examines concordance between patient report and medical record documentation of designation of a health care proxy (HCP). The concordance rate was 67.8% ( $\kappa=0.31$ , indicating "fair" agreement). The fourth paper (Saczynski) examines remediation of cognitive impairment in the month after hospital discharge for an acute coronary syndrome. One quarter of patients were cognitively impaired during hospitalization, but 78% of these patients remediated to a non-impaired score 1-month after hospital discharge. Dr. Krumholz (PI; Yale CCOR) will serve as a discussant. Words=248

#### RECOGNITION OF COGNITIVE IMPAIRMENT IN OLDER ADULTS HOSPITALIZED FOR HEART FAILURE

J.A. Dodson<sup>1</sup>, T. Truong<sup>2</sup>, V. Towle<sup>1</sup>, G.J. Kerins<sup>3</sup>, S. Chaudhry<sup>2</sup>, 1. *Division of Geriatrics, Yale University School of Medicine, New Haven, Connecticut*, 2. *Yale University School of Medicine; Department of Internal Medicine, New Haven, Connecticut*, 3. *The Hospital of Saint Raphael, New Haven, Connecticut*

Background: We evaluated physician recognition of cognitive impairment at time of discharge in older adults hospitalized for heart failure (HF). Methods: A Folstein Mini-Mental State Examination (MMSE) score of 21-24 indicated mild cognitive impairment, and a score of  $\leq 20$  indicated moderate to severe impairment. Physician recognition was assessed through review of hospital discharge summaries. Results: 282 patients were included; their mean age was 80 years, 18.8% were nonwhite, and 53.2% were female. Cognitive impairment was present in 46.8% of patients overall; 25.2% had mild impairment and 21.6% had moderate-severe impairment. Among those with cognitive impairment, 22.7% were recognized as such by physicians. Compared with patients whose impairment was recognized, those unrecognized were younger (81.3 years vs. 85.2 years,  $P<0.05$ ), and had less severe impairment (median MMSE score 22.0 vs. 18.0,  $P<0.01$ ). Conclusions: Cognitive impairment is common in older adults hospitalized for HF, and is frequently unrecognized by physicians.

#### PREFERENCES FOR DEACTIVATION OF IMPLANTABLE CARDIOVERTER DEFIBRILLATORS IN THE SETTING OF ADVANCED ILLNESS

J.A. Dodson<sup>1</sup>, T.R. Fried<sup>1</sup>, P.H. Van Ness<sup>1,2</sup>, N. Goldstein<sup>3</sup>, R. Lampert<sup>2</sup>, 1. *Division of Geriatrics, Yale University School of Medicine, New Haven, Connecticut*, 2. *Yale University School of Medicine; Department of Internal Medicine, New Haven, Connecticut*, 3. *Mount Sinai School of Medicine, New York, New York*

To explore older adults' preferences for ICD deactivation in the setting of hypothetical advanced illness, we conducted a telephone survey of ICD patients age  $\geq 50$ . We obtained demographic and clinical characteristics, and subsequently asked patients whether they would consider ICD deactivation in five scenarios: (1) permanently bedbound, (2) permanent memory problems, (3) burden to family, (4) on breathing machine  $>1$  month, (5) advanced incurable disease. Surveys were completed in 95 patients (mean age 71 years, 28% female). 71% considered ICD deactivation in  $\geq 1$  scenario. Patients considered deactivation most often with advanced incurable disease (61%), and least often if permanently unable to get out of bed (24%). Patients were more likely to consider deactivation if they were white or had instrumental activity of daily living disability. In conclusion, the majority of ICD patients would consider deactivation in at least one scenario reflecting advanced illness, most commonly with incurable disease.

#### CONCORDANCE OF PATIENT REPORT OF HEALTH CARE PROXY DESIGNATION AND DOCUMENTATION IN THE MEDICAL RECORD: PRELIMINARY FINDINGS FROM TRACE-CORE

R. McManus<sup>1</sup>, J. Saczynski<sup>2,3</sup>, R.J. Goldberg<sup>1</sup>, C. Kiefe<sup>1</sup>, 1. *University of Massachusetts Medical School; Department of Quantitative Health Sciences, Worcester, Massachusetts*, 2. *University of Massachusetts Medical School; Department of Medicine, Worcester, Massachusetts*, 3. *Meyers Primary Care Institute, Worcester, Massachusetts*

Individuals with heart disease are at risk for a cardiac event that might limit their ability to effectively communicate. Health care proxies (HCP) offer an option for communicating treatment preferences. Effective use of HCPs, however, requires documentation in the medical record. A subset of adults ( $n=128$  to date) were interviewed 1-week post-hospitalization for an acute coronary syndrome as part of a large longitudinal study (TRACE-CORE) and asked if they had completed a HCP form. Medical records were reviewed for presence of a HCP. Of those with complete data ( $n=115$ ), 86(74.8%) reported designating an HCP. The HCP was documented in the medical record for 65(56.5%). The concordance rate was 67.8% ( $K=0.31$ , indicating "fair" agreement beyond chance). Unadjusted analyses found women's reports/records were more likely to be concordant (81.5%;  $K=0.56$ ) than men's (63.0%;  $K=0.22$ ). Discordance may result in ethical dilemmas; future research should explore predictors of concordance.

#### CHANGE IN COGNITIVE STATUS IN THE MONTH AFTER HOSPITALIZATION FOR AN ACUTE CORONARY SYNDROME: PRELIMINARY FINDINGS FROM TRACE-CORE

J. Saczynski<sup>1,2</sup>, M. Waring<sup>3,3</sup>, D. McManus<sup>1,2</sup>, M. Anatchkova<sup>3</sup>, R. McManus<sup>3</sup>, D.C. Parish<sup>4</sup>, C. Kiefe<sup>3</sup>, 1. *University of Massachusetts Medical School; Department of Medicine, Worcester, Massachusetts*, 2. *Meyers Primary Care Institute, Worcester, Massachusetts*, 3. *University of Massachusetts Medical School; Department of Quantitative Health Sciences, Worcester, Massachusetts*, 4. *Mercer University; Department of Internal Medicine, Macon, Georgia*

Cognitive impairment (CI) during hospitalization is associated with poor long-term outcomes but limited data exist on the resolution of CI soon after discharge. Adults ( $n=505$  to date) without dementia or delirium were interviewed during hospitalization for an Acute Coronary Syndrome (ACS) and at 1-month post-discharge. CI was indicated by a score  $\leq 30$  on the Telephone Interview of Cognitive Status (TICS; range: 0-41). Remediation of CI was defined as TICS  $>30$  at 1 month among those impaired at baseline. Patients reported demographic characteristics and anxiety, depression, and stress. Participants were 66% male, 80% non-Hispanic white, and aged  $63 \pm 11$  years. Of participants with CI at baseline (26%;  $n=131$ ), 78% remediated by 1-month (mean improvement=4.9 points). Patients with high anxiety were less likely to remediate ( $p=0.02$ ). Remediation did not differ by demographics, depression, or stress. CI is prevalent among patients hospitalized for an ACS but many remediate in the early post-discharge period.

#### SESSION 2275 (SYMPOSIUM)

##### INSIGHTS ON THE MAINTENANCE OF FUNCTION AND WELL-BEING: RESULTS FROM THE CARDIOVASCULAR HEALTH STUDY

Chair: M. Odden, *Oregon State University, Corvallis, Oregon*  
Co-Chair: A.B. Newman, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Discussant: E. Crimmins, *University of Southern California, Los Angeles, California*

The paradigm of meaningful clinical research in older adults has shifted towards improving patient-centered outcomes, including the maintenance of physical and cognitive function, the prevention of frailty and disability, the extension of years of active life, and the preservation of well-being. The

first step towards maintenance of these health states is to characterize the transition between these states in older adults. Prior research has identified notable differences across the genders in the development of disability and longevity; therefore, research that better characterizes these health transitions in men and women may help elucidate the important contributing factors. Second, investigations need to identify the factors that promote or inhibit the maintenance of function and well-being, and consider they may differ compared with those associated with the development of disease. Physiologic factors that have a broad impact across multiple organ systems - such as vascular disease and advanced glycation endproducts - are strong candidates for determinants of functional status. This symposium will include recent investigations on the determinants of the preservation of function and well-being in the Cardiovascular Health Study (CHS). The CHS is a community-based study of 5,888 black and white adults aged 65 years and older. The approximately 1,500 survivors of the cohort, now nearing mean age 90 years, continue under active surveillance for health, function, and longevity. The length of follow-up of this well-characterized cohort has afforded a unique opportunity for the CHS to expand into a study of the determinants of healthy aging and longevity.

#### **YEARS OF ACTIVE AND DISABLED LIFE IN THE CARDIOVASCULAR HEALTH STUDY (CHS)**

A.B. Newman<sup>1</sup>, P. Diehr<sup>2</sup>, P. Chaves<sup>3</sup>, C. Hirsch<sup>4</sup>, D. Siscovick<sup>2</sup>, 1. *Epidemiology and Division of Geriatric Medicine, University of Pittsburgh, Graduate School of Public Health and School of Medicine, Pittsburgh, Pennsylvania*, 2. *University of Washington, Seattle, Washington*, 3. *Johns Hopkins School of Public Health, Baltimore, Maryland*, 4. *University of California - Davis, Sacramento, California*

A goal of aging research is to identify factors that promote years of active life (YAL). We examined age, sex and race differences in YAL in the CHS, a contemporary cohort of older adults [5888 US men and women (16% black), well characterized for factors that may influence YAL. YAL was defined as years of follow-up (9 for whites, 6 for blacks) with no difficulty with activities of daily living (ADL); years of disabled life (YDL) was years with difficulty in ADL's. 1641 (30%) were deceased. Large disparities in YAL were noted. White women aged 65-69 lived 9.5 (1.5) more years while white men (same age) lived 9.0 (2.2) years. YDL increased with age in all groups. White women aged 80+ had double the remaining YDL compared to white women aged 65-69 [3 (39%) vs. 1.5 (16%) YDL]. Modifiable risk factors influenced but did not explain these findings.

#### **BURDEN OF MICROVASCULAR AND MACROVASCULAR DISEASE AND FUNCTIONAL STATUS IN COMMUNITY-DWELLING OLDER ADULTS: THE CARDIOVASCULAR HEALTH STUDY**

D.H. Kim<sup>1,2,3</sup>, K. Patel<sup>4</sup>, A.B. Newman<sup>5</sup>, P.H. Chaves<sup>6</sup>, R. Klein<sup>7</sup>, M. Sarnak<sup>8</sup>, L. Lipsitz<sup>1,2</sup>, 1. *Gerontology, Beth Israel Deaconess Medical Center, Boston, Massachusetts*, 2. *Hebrew SeniorLife, Boston, Massachusetts*, 3. *Harvard School of Public Health, Boston, Massachusetts*, 4. *National Institute on Aging, Bethesda, Maryland*, 5. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 6. *Johns Hopkins University, Baltimore, Maryland*, 7. *University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin*, 8. *Tufts Medical Center, Boston, Massachusetts*

The role of microvascular and macrovascular disease in age-related functional loss is poorly understood. In the 9th to 11th years of the Cardiovascular Health Study, microvascular disease as detected by brain magnetic resonance imaging, retinal photography, albuminuria, and Cystatin-C, and macrovascular disease as detected by carotid ultrasonography, ankle-arm index, and electrocardiography were determined. Among 2380 participants (mean age 79) who had at least 3 measures of each disease, the majority had evidence of predominant microvascular (9%), predominant macrovascular (37%), or both diseases (41%). Microvascular index (range: 0-10, per unit increase) was associated with lower mini-mental state examination score

(-0.30; p=0.02), longer time in trail making test B (3.4 sec; p=0.02), slower gait (-0.02 m/sec; p<0.001), and lower grip strength (-0.45 kg; p=0.001), whereas macrovascular index (range: 0-10, per unit increase) was associated with slower gait (-0.01 m/sec; p=0.002). These suggest potentially different implications of microvascular and macrovascular disease in aging.

#### **ASSOCIATION OF N-CARBOXYMETHYL-LISINE (CML) AND FRAILTY IN OLDER MEN AND WOMEN: THE CARDIOVASCULAR HEALTH STUDY**

H.E. Whitson<sup>1,2</sup>, A. Arnold<sup>3</sup>, K. Mukamal<sup>4</sup>, J.R. Kizer<sup>5</sup>, D. Siscovick<sup>3</sup>, S.M. Thielke<sup>3</sup>, C. Hirsch<sup>6</sup>, S. Zeman<sup>7</sup>, 1. *Internal Medicine, Duke, Durham, North Carolina*, 2. *Durham VA, Durham, North Carolina*, 3. *University of Washington, Seattle, Washington*, 4. *Harvard Medical School, Boston, Massachusetts*, 5. *Cornell Weill Medical College, New York, New York*, 6. *UC Davis, Davis, California*, 7. *NIH, Bethesda, Maryland*

Advanced glycation endproducts (AGEs) are biologically active compounds that accumulate in diabetes and normal aging. CML, a ubiquitous human AGE, has been linked to mortality in middle-aged women, but not men, regardless of diabetes status. We investigated the cross-sectional association between CML and phenotypic frailty among older women (n=2,007) and men (n=1,332). Frailty was defined as  $\geq 3$  of 5 criteria: weakness, weight loss, exhaustion, slowness, low physical activity. The association of CML with frailty varied by sex (p=0.04). CML was not associated with frailty in women. In men, the odds ratio for frailty =1.28 (1.12, 1.45) per standard deviation increase in CML and OR=3.69 (1.99, 6.84) for CML >1000ng/ml. In men, the association between CML and exhaustion, weakness, and physical activity remained significant after adjustment for age, race, diabetes, and cardiovascular conditions. The sex-based difference in the CML-frailty relationship may reflect different physiologic effects of CML in men and women.

#### **TRANSITIONS IN HEALTH STATES USING TWELVE MEASURES OF SUCCESSFUL AGING**

S.M. Thielke<sup>1,2</sup>, P. Diehr<sup>1</sup>, 1. *University of Washington, Seattle, Washington*, 2. *Puget Sound VA Medical Center, Seattle, Washington*

Introduction Successful aging has many dimensions which may vary over time. Methods We analyzed twelve health measures in CHS over 10 years: self-rated health, ADLs, IADLs, depression, cognition, timed walk, days spent in bed, blocks walked, extremity strength, recent hospitalizations, feelings about life as a whole, and life satisfaction. We dichotomized responses for each variable into "healthy" or "sick", and estimated the probability of transitioning from one state to another, or dying, during yearly intervals. We compared men and women, and three age groups. Findings All transitions in successful aging showed similar results, except for hospitalizations and cognition. Men had a higher death rate than women, regardless of health status, and were also more likely to be healthy. Conclusion Most participants remained healthy even into advanced ages. Health declined with advancing age for all measures. Men did not simply "age faster" than women.

#### **SESSION 2280 (SYMPOSIUM)**

##### **PRO-ACTIVE APPROACH TOWARDS FRAILTY BY SCREENING AND ASSESSMENT IN CLINICAL PRACTICE - RESULTS FROM THE LONGITUDINAL URBAN COHORT AGEING STUDY (LUCAS) HAMBURG, GERMANY**

Chair: *W. von Renteln-Kruse, Albertinen-Haus, Centre for Geriatrics and Gerontology, Hamburg, Germany*

Discussant: *M. Vass, University of Copenhagen, Institute of Public Health, Copenhagen, Denmark*

The LUCAS research consortium was established to study particular aspects of functional competence, its changes with ageing, to detect pre-clinical signs of functional decline, and to address questions on how to maintain functional competence and to prevent adverse outcome.

Therefore, the LUCAS projects apply the following methodological approaches: a true longitudinal representative cohort of independent urban community-dwelling people 60 years and older, recruited in 2000/2001, as well as cross-sectional comparative studies, and prospective interventional studies. Random subsamples from the participants of the longitudinal cohort underwent further investigation. In particular, screening and assessment instruments for specific target groups were developed and evaluated. The contributions to the symposium present a classification system of elderly persons as fit, pre-frail and frail to be used in clinical practice. The other presentations report results with particular focus on mobility, gait and balance, and on determinants of psychological health. Health related domains and concrete items of screening and assessment considering risks as well as older persons' resources will be presented and discussed in detail. In clinical practice, the challenge is to recognize distinct target groups because of different intervention strategies to be planned and recommended. Implications for practical health promotion and preventive measures, as well as different approaches of health-service delivery for community-dwelling elderly persons will be discussed. Therefore, the Discussant, a Danish general practitioner, will contribute extensive experience from the Danish concept, compared to the German health-care system.

**SCREENING FOR FUNCTIONAL COMPETENCE AND FRAILTY IN COMMUNITY-DWELLING ELDERLY PEOPLE - RESULTS FROM THE SELF-FILLING LUCAS SCREENING TOOL (SYMPOSIUM: PRO-ACTIVE APPROACH TOWARDS FRAILTY BY SCREENING AND ASSESSMENT IN CLINICAL PRACTICE - RESULTS FROM THE LONGITUDINAL URBAN COHORT AGEING STUDY (LUCAS) HAMBURG, GERMANY)**

U. Dapp<sup>1</sup>, J. Anders<sup>1</sup>, C.E. Minder<sup>2</sup>, S. Golgert<sup>1</sup>, W. von Renteln-Kruse<sup>1</sup>, 1. *Scientific Department at the University of Hamburg, Albertinen-Haus, Centre for Geriatrics and Gerontology, Hamburg, Germany*, 2. *University of Zurich, Medical Faculty, Zurich, Switzerland*

Background: The concept of frailty arouses increasing interest despite considerable uncertainty regarding its definition and ways of screening community-dwelling seniors. Methods: We present a new screening tool for assessing the functional and prognostic state of elderly people and for grading function. The indicators used relate to objective facts – including risks and resources – such as activities and ways to do things, not on subjective judgments (e.g. exhaustion). It was developed in the Longitudinal Urban Cohort Ageing Study (LUCAS) with 3.326 initially (year 2000) independently living seniors 60plus in 21 general practices in Hamburg, Germany. Conclusions: The classification is predictive over 7 years of need for nursing care and mortality and proposes operational definitions to the terms robust, pre-frail and frail. It provides a simple, cost-effective way for routinely screening elderly people for early signs of declining function. Responses permit GPs to see immediately where deterioration took place, permitting timely preventative action.

**NEW STRATEGIES OF ASSESSMENT AND PREVENTION IN COMMUNITY-DWELLING ELDERLY POPULATION (SYMPOSIUM: PRO-ACTIVE APPROACH TOWARDS FRAILTY BY SCREENING AND ASSESSMENT IN CLINICAL PRACTICE - RESULTS FROM THE LONGITUDINAL URBAN COHORT AGEING STUDY (LUCAS) HAMBURG, GERMANY)**

J. Anders<sup>1</sup>, F. Pröfener<sup>2</sup>, U. Dapp<sup>1</sup>, C.E. Minder<sup>4</sup>, A. Daubmann<sup>3</sup>, S. Golgert<sup>3</sup>, W. von Renteln-Kruse<sup>1</sup>, 1. *Research, Albertinen-Haus, Hamburg, Germany*, 2. *Hamburgische Pflegegesellschaft, Hamburg, Germany*, 3. *Department of Medical Biometry and Epidemiology, University Medical Center Hamburg-Eppendorf, Hamburg, Germany*, 4. *University of Zurich, Faculty of Medicine, Zurich, Switzerland*

It is a challenge to distinct natural ageing from proceeded functional decline. New instruments avoiding ceiling effects and tailoring pre-

ventative measures will be presented. Methods: Robust, pre-frail and frail participants (10% samples of the LUCAS longitudinal cohort) regarding interactions of comorbidity and competence by extended assessments (e.g. stress-tests). Results: While fit or robust persons (n = 102) enjoyed their later years, pre-frail individuals (n = 65) were often suffering from onset of impact diseases. Stress-tests and gait-analyses were applied in a geriatric mobility centre. Underlying problems were covering all fields of medicine. Frail persons (n = 64) show serious restrictions in mobility and needed home visits to conduct geriatric assessments. All patients and their GP get supportive recommendations. Conclusions: Pre-frailty and Frailty are serious problems requiring special attention and geriatric knowledge. Long-term effects (interruption of frailty-cascade) will be evaluated.

**PSYCHOLOGICAL VIEWS ON FRAILTY**

S. Freitag, S. Schmidt, *Health & Prevention, University Greifswald, Greifswald, Germany*

Frailty is a syndrome primarily described by physiological decline and biological factors. The LUCAS project has also taken psychological factors into account like depression or cognitive performance. We will present the state of the art psychological aspects that contribute to frailty (e.g. depression, traumatic stress, cognitive decline) as well as components that prevent frailty in the course of aging (social integration, attitude towards aging, quality of life). In a sub study of the LUCAS project psychological variables and frailty status of former World War II children was investigated. N=313 participants were assigned a robust/pre-frail/frail status. A regression analysis was performed to predict frailty status with psychological indicators. We found that subjective quality of life was a better predictor of frailty status than depression. Research findings of psychological determinants of frailty will be presented and discussed.

**SESSION 2285 (PAPER)**

**DEMENTIA AND DELIRIUM: MORE THAN COGNITION**

**EXPLORING THE UTILITY OF ULTRA-BRIEF DELIRIUM ASSESSMENTS IN NON-INTENSIVE CARE GERIATRIC POPULATION: THE GEM STUDY**

J.S. Powers<sup>1,2</sup>, T. Doering<sup>3</sup>, S. Gordon<sup>2</sup>, S. Eden<sup>1</sup>, A. Shintani<sup>1</sup>, E.W. Ely<sup>1,2</sup>, J. Schnelle<sup>1,2</sup>, 1. *Medicine, Vanderbilt, Nashville, Tennessee*, 2. *Tennessee Valley Geriatric Research Education and Clinical Center (GRECC), Tennessee Valley Healthcare System, Nashville, Tennessee*, 3. *Baptist Hospital, University of Tennessee Internal Medicine Residency Program, Nashville, Tennessee*

Objective: To determine how an ultra-brief structured tool that would require usually less than a minute for delirium assessment compares to an unstructured clinical assessment in a geriatric post-acute care (PAC) rehabilitation unit. Design: Prospective observational cohort study Setting: Post-acute geriatric hospital ward of a Veteran's Affairs (VA) hospital. Participants: Patients 50 to 100 years old admitted for post-acute medical care Measurements: Two teams, blinded to one another's evaluations, performed daily delirium assessments using either the Confusion Assessment Method for the ICU (CAM-ICU) or an unstructured clinical assessment. There was not a formal DSM IV rater involved with this investigation. Results: There were 61 patients enrolled (median 73 years old, IQR 62, 82), who underwent 521 paired observations. Delirium was detected in 18 patients (29.5%) by either of the two screening methods over the course of the study, most of whom (14 patients, 23%) were delirious on the first day of enrollment. Delirium was identified by the CAM-ICU on 12.6% of the observations and by the unstructured clinical assessment on 6% of the observations (kappa = .25, 95% CI .09, .40), and this doubling of delirium detection held regardless of the presence or absence of baseline dementia. Hypoactive delirium

was the predominant motoric subtype identified, accounting for 98% (105/107) of observations. Conclusions: The structured approach using the CAM-ICU detected delirium twice as frequently as did the unstructured approach, which is more commonly used. The fact that most delirium is of the hypoactive form and not highly visible provides one explanation for why a structured approach using defined assessment procedures, even when ultra-brief, may detect more delirium than an unstructured approach based on clinical judgment in sites that are not routinely conducting comprehensive DSM or full CAM-based evaluations.

### SENIORWISE MEMORY TRAINING PLUS YOGA FOR INDEPENDENT OLDER ADULTS WITH POOR MEMORY PERFORMANCE

G.J. McDougall<sup>1</sup>, P.W. Vaughan<sup>2</sup>, V.A. Wells<sup>1</sup>, *1. School of Nursing, University of Texas at Austin, Austin, Texas, 2. Texas State University, San Marcos, Texas*

SeniorWISE Memory Training plus Yoga for Independent Older Adults with Poor Memory Performance Graham J. McDougall Jr., RN, PhD, FAAN, FGSA1, Phillip W. Vaughan, PhD2 Vonnette A. Wells1 1The University of Texas at Austin School of Nursing 2Texas State University Mild cognitive impairment (MCI) is becoming increasingly significant in understanding the cognitive losses in older adults. Many individuals who might have this diagnosis are attempting to maintain their independence by either living at home or in retirement communities. In this study we targeted individuals with "Poor" memory performance. Our hypothesis was that older adults who participated in twelve hours of the SeniorWISE memory training intervention plus Yoga at each session would show significantly better outcomes post intervention. We recruited adults from four retirement communities in Central Texas. One hundred and thirty three participants were assessed at baseline with eighty three who completed the training were tested in five weeks at post intervention. A septuagenarian licensed psychologist taught memory training and Yoga was taught by a certified yoga instructor. Individuals had to complete a minimum nine hours of training. The MMSE was used to screen out impairment. Rivermead SPS and DAFS-Extended scores increased (both  $p < .001$ ), while CES-D scores ( $p = .003$ ) and memory complaints ( $p < .001$ ) decreased. Changes in state and trait anxiety and MMSE scores were not statistically significant. We saw significant improvements in memory self-efficacy (59.77 vs. 71.72), memory performance (14.66 vs. 16.93), instrumental activities of daily living on the DAFS-E (49.26 vs. 51.26), fewer memory complaints (3.22 vs. 3.15), and less depressive symptoms (10.06 vs. 8.26). Those individuals in the intention to treat group who did not complete had significantly lower memory performance and instrumental activity scores at baseline. We acknowledge the St. Davids Community Health foundation for funding this study.

### ACCEPTABILITY OF SCREENING FOR MEMORY PROBLEMS IN PRIMARY CARE VETERANS

L.O. Wray<sup>1,2</sup>, C.L. Vair<sup>1,3</sup>, E. Pikoff<sup>1,4</sup>, D.J. Hutchison<sup>1</sup>, P.R. King<sup>1</sup>, G.P. Beehler<sup>1,2</sup>, *1. VA Center for Integrated Healthcare, Buffalo, New York, 2. University at Buffalo, Buffalo, New York, 3. University at Colorado, Colorado Springs, Colorado, 4. VA Western New York Healthcare System, Buffalo, New York*

Dementia is a common but under-diagnosed condition in older Veteran primary care patients. Current national guidelines state that there is insufficient evidence for or against age-based screening of asymptomatic individuals. One argument against screening is poor acceptability in the patient population but few studies have addressed this issue. As part of a qualitative study on Veterans' perceptions of Primary Care Mental Health Integration (PC-MHI) services, we sought to examine the acceptability of screening for memory problems across focus groups from different combat eras. Participants were randomly selected from all Veterans with a diagnosed mental health condition who attended a

primary care appointment at the Buffalo VA within the prior year. Fifty-seven Veterans (71.4% White; age  $M = 58.5$ ,  $SD = 19.62$ ; 94.7% male) attended one of nine, 90-minute focus groups designed to elicit perceptions of PC-MHI services. Opinions regarding acceptability of screening for memory problems and the use of a telephone screening program were collected. Preliminary qualitative analysis indicated that Veterans in all combat eras were overwhelmingly in favor of screening for memory problems. Reactions to the screening program were positive although several comments indicated preference for non-telephone contact. Most Veterans identified primary care as the first resource they would seek to address concerns about memory. Many reported concern about memory after witnessing peers and family with dementia. Final qualitative results will be presented. Future projects based on these findings will focus on determining the prevalence and distribution of opinions in the full range of Veteran primary care patients.

### TITLE: APATHY IN DEMENTIA METHYLPHENIDATE TRIAL (ADMET) – PRELIMINARY EFFICACY REPORT

J. Mintzer<sup>1,2</sup>, P. Rosenberg<sup>5</sup>, L. Drye<sup>5</sup>, R. Scherer<sup>5</sup>, N. Herrmann<sup>3,4</sup>, K. Lancôt<sup>1,3,4</sup>, *1. Alzheimer's Research & Clinical Programs, Medical University of South Carolina, North Charleston, South Carolina, 2. Ralph H. Johnson VA Medical Center, Charleston, South Carolina, 3. University of Toronto, Toronto, Ontario, Canada, 4. Sunnybrook Health Sciences Centre, Toronto, Ontario, Canada, 5. Johns Hopkins University, Baltimore, Maryland*

Background: Apathy is a distinct syndrome affecting 50 percent of Alzheimer's disease (AD) patients. Its etiology is unknown. Recent studies show an association between dopaminergic disruption and apathy in AD. Preliminary data suggests that methylphenidate, a dopamine stimulant, may be effective on apathy in AD. The goal of ADMET was to explore the efficacy and safety of Methylphenidate in the treatment of apathy in AD. Methods: ADMET was a multi-site, 6 week, randomized placebo-controlled trial of the efficacy and safety of methylphenidate in mild-to-moderate AD. Patients with a major depressive episode (DSM-IV TR criteria) or psychotic symptoms were excluded. Cognition was assessed using the MMSE. Apathy and other behaviours were assessed using the Apathy Evaluation Scale (AES) and the Neuropsychiatric Inventory (NPI). Efficacy was assessed as the change in score of the AES and the Alzheimer's disease Cooperative Study - Clinical Global Impression of Change (CGIC) scale from baseline to 6 weeks. Secondary efficacy was assessed as the change in Digit Span from baseline to 6 weeks. Results: In total, 60 patients were recruited. Retention was excellent (95%). Participants showed apathy on both the AES ( $51 \pm 12$ ), and NPI Apathy subscale ( $7.5 \pm 2.3$ ). Concomitant medications included cholinesterase inhibitors (72%), memantine (62%) and SSRIs (19%) and 13% of participants had a history of mood disorders. Preliminary results of the primary and secondary measures will be unveiled during this presentation. Conclusion: We hope the results of this study will provide relevant information to clinicians managing this difficult group of patients

### RELATIONSHIP BETWEEN OBSERVABLE EMOTIONAL EXPRESSION AND WANDERING BEHAVIOR OF PEOPLE WITH DEMENTIA

K. Lee<sup>1</sup>, D. Algate<sup>2</sup>, E.S. McConnell<sup>1</sup>, *1. Duke University, Durham, North Carolina, 2. University of Toledo, Toledo, Michigan*

Background: Wandering, one of the most common dementia-related behavioral disturbances, has been associated with patient morbidity and mortality due to safety risks including elopements, falls, and injuries. However, few studies have examined to association between emotion and wandering behaviors of people with dementia (PWD). Purpose: This study was to explore the relationship of observable emotional expression to wandering behaviors of PWD. Methods: This study applied a secondary data analysis utilizing a multi-site study that used a cross-sectional design with repeated measure nested within subjects. A total

of 142 PWD in 17 nursing homes and six assisted living facilities in Michigan and Pennsylvania were included. Subjects were randomly assigned to six 20-minute observation periods, conducted on two non-consecutive days; their behaviors were videotaped (n = 1105 observations). Wandering behavior was coded using direct observations; the Observable Displays of Affect Scale (ODAS) was used to capture emotional expression of PWD. Poisson hierarchical linear modeling (HLM) was used to determine factors associated with wandering. Results: An average of 13.4 (SD±12.4) episodes of positive emotional expression (PEE) per observation; only 1.5 (SD±2.2) episodes of negative emotional expression (NEE) were noted per observation. The mean wandering rate was 2.9 (SD±6.9) per hour. PEE was positively related to wandering rates whereas NEE and higher MMSE score were negatively related to wandering rates after controlling for other predictors (age, education, gender, and time of day). Conclusions: A tailored intervention that addresses both emotional and cognitive functioning may be useful to improve wandering behaviors of PWD.

## SESSION 2290 (PAPER)

### EPIDEMIOLOGIC APPROACH TO FUNCTIONAL AGING

#### THE ASSOCIATION BETWEEN MID-LIFE PHYSICAL ACTIVITY AND LOWER EXTREMITY FUNCTION IN OLDER ADULTS: ROLE OF COGNITIVE FUNCTION, AGE GENE/ENVIRONMENT SUSCEPTIBILITY (AGES) - REYKJAVIK STUDY

M. Chang<sup>1</sup>, J. Snaedal<sup>1,2</sup>, B. Einarsson<sup>1,2</sup>, J. Saczynski<sup>3</sup>, V. Gudnason<sup>2,4</sup>, L.J. Launer<sup>5</sup>, T.B. Harris<sup>5</sup>, P.V. Jonsson<sup>1,2</sup>, 1. Geriatric Research Center, Landspítali University Hospital, Reykjavik, Iceland, 2. Faculty of Medicine, University of Iceland, Reykjavik, Iceland, 3. Department of Medicine and Meyers Primary Care Institute, University of Massachusetts Medical School, Worcester, Massachusetts, 4. Icelandic Heart Association, Kopavogur, Iceland, 5. Laboratory of Epidemiology, Demography and Biometry, National Institute on Aging, Bethesda, Maryland

**OBJECTIVES:** To examine the long-term association between mid-life physical activity (PA) and lower extremity function (LEF) in late-life, specifically controlling for the effect of cognitive function. **METHODS:** A large community-based population of 4753 men and women (mean age 76±6 yrs) from the Age Gene/Environment Susceptibility - Reykjavik Study was followed since 1967 as a part of the Reykjavik Study. Based on leisure time PA reported in mid-life examination, participants were classified as active (31%) and inactive (69 %). Measures of LEF in late-life included gait speed from 6m walk (meter per second), Timed Up and Go (TUG, second), and Knee Extension (KE) strength (kg) tests. Linear regression analysis was used to examine the association. **RESULTS:** The Active group had significantly better LEF in late-life compared with inactive group, after adjusting for socio-demographic, and cardiovascular risk factors. After adjustment for cognitive function in late life (speed of processing, memory, and executive function), active group still had significantly faster gait speed ( $\beta = 0.04$ ,  $p \leq 0.001$ ), faster TUG time ( $\beta = -0.34$ ,  $p \leq 0.001$ ), and greater KE strength ( $\beta = 0.87$ ,  $p \leq 0.001$ ) in old age compared with inactive group. The effect of adjusting for various aspects of cognitive function was much larger (up to 41 % attenuation) compared with adjusting only for a global cognition (up to 11 % attenuation). Among three cognitive domains, speed of processing had the strongest effect on the association. **CONCLUSIONS:** Regular PA reported in mid-life is associated with better LEF in later life, even after controlling for various domains of cognitive function.

### LATENT CLASS TRAJECTORIES OF FUNCTIONAL AGING BASED ON ACTIVITIES OF DAILY LIVING

L. Han<sup>1</sup>, H. Allore<sup>1</sup>, T.E. Murphy<sup>1</sup>, T.M. Gill<sup>1</sup>, H. Lin<sup>2</sup>, 1. Internal Medicine, Yale University, New haven, Connecticut, 2. Yale University-Department of Epidemiology & Public Health, New Haven, Connecticut

754 community-living persons 70+ years from the Precipitating Events Project were assessed monthly for activities of daily living (ADL) over seven 18-month intervals. A generalized growth mixture model was used to identify latent classes of functional aging based on longitudinal trajectories of ADL disability. Participants were allowed to switch between trajectories every 18-months when the predictors of trajectory membership, including age, living alone, frailty, depression, cognitive impairment and chronic conditions, were updated. Five distinct trajectories were identified. The predominant trajectory maintained ADL independence (61.6% of person-intervals), while a minority (7.0% of person-intervals) stayed at high level of disability (3 or 4 ADLs). The remaining three either maintained mild disability (1 or 2 ADLs, 13.6% of person-intervals) or worsened from independent or mild disability (11.2% and 6.6% of person-intervals, respectively) towards greater disability. When each participant was tracked through seven intervals or until death or lost to follow-up, only 31% of the cohort remained in the same trajectory. The majority (48%) switched to a more disabled trajectory and 20% had both recovery and worsening. Recovery to a less disabled trajectory without subsequent worsening was rare (2%). These results suggest that the course of functional aging is heterogeneous and dynamic.

### INTAKE OF ANTIOXIDANTS AND SUBSEQUENT DECLINE IN PHYSICAL FUNCTION

B. Bartali, T. Curto, N.N. Maserejian, A.B. Araujo, *Epidemiology, New England Research Institute, Watertown, Massachusetts*

**Background/Objectives:** Oxidative stress is considered a risk factor for physical function (PF) decline with aging. The objective of this study was to examine the relation of antioxidant intake to change in self-reported PF over a 5-year period. **Methods:** The Boston Area Community Health (BACH) Survey is a population-based longitudinal study of a racially/ethnically diverse population. Change in PF from baseline (2002-2005) to follow-up (2006-2010) was assessed using the SF-12 questionnaire. Intake of antioxidants (combining dietary and supplemental) was estimated at baseline using the validated Block FFQ. In total, 2827 persons aged 29-80 years had complete assessments at both baseline and follow-up. General linear models were used to examine the association between energy-adjusted quartiles of vitamins A, C, E and change in PF, after adjustment for age, sex, race/ethnicity, SES, smoking, BMI, physical activity, depression and chronic conditions. **Results:** A low intake (first quartile) of vitamins C and E was associated with a greater decline in PF compared with the highest quartile, with an adjusted mean difference in change in PF of -1.29 (95%CI:-2.34,-0.25) for vitamin C and of -1.21 (95%CI:-2.24,-0.18) for vitamin E. PF decline was not significantly different in the lowest compared with the highest quartile of vitamin A (mean difference=-0.30,95%CI:-1.36,0.76). **Conclusions:** A low intake of vitamins E and C plays a role in PF decline with aging. These results support the idea that oxidative stress contributes to PF decline and may help inform the development of intervention strategies aimed at reducing this important clinical and public health problem.

### ASSOCIATION OF CHRONIC BACK PAIN AND BALANCE IMPAIRMENT WITH MOBILITY LIMITATION AND PHYSICAL ACTIVITY

K. Patel, *National Institute on Aging, Bethesda, Maryland*

**Background:** Chronic back pain and vestibular dysfunction are common, often disabling conditions in older adults; however, their

co-occurrence in the US population and association with functional outcomes are not well characterized. Methods: Cross-sectional data from the 2001-2004 National Health and Nutrition Examination Survey were analyzed. A total of 3,875 participants aged 50 years and older who completed a questionnaire on pain and physical function as well as a modified Romberg balance protocol (standing on a foam pad with eyes closed for 30 seconds) were included in the study. Gait speed was assessed in 2001-02 (n=1,860) and physical activity measured with accelerometers was collected in 2003-04 (n=1,699). Results: Chronic back pain and balance impairment co-occurred in 5.2% of participants, representing 3.4 million US adults. Each condition was independently associated with decreased physical function and activity, but there was also evidence suggesting synergism between these conditions. Compared to participants without either condition, the adjusted odds ratios (95%CI) for self-reported mobility limitation in those with chronic back pain only, balance impairment only, and both conditions were 3.28 (1.71-6.28), 1.83 (1.32-2.55), and 7.60 (5.55-10.42), respectively. The adjusted linear regression coefficients for gait speed in meters/second were  $b=0.01$  ( $p=0.76$ ),  $b=-0.05$  ( $p=0.001$ ),  $b=-0.13$  ( $p<0.001$ ), respectively. The adjusted linear regression coefficients for accelerometry counts/minute were  $b=-23.1$  ( $p=0.14$ ),  $b=-12.6$  ( $p=0.04$ ), and  $b=-49.2$  ( $p=0.003$ ), respectively. Conclusion: Adults aged 50 and older with chronic back pain and impaired balance have substantially reduced physical function and activity. Longitudinal studies are needed to understand risk for adverse outcomes in this vulnerable population.

#### PREDICTING ADL DEPENDENCE IN OLDER ADULTS TO IMPROVE ESTIMATES IN COMPARATIVE EFFECTIVENESS STUDIES

K.R. Faurot<sup>1,2</sup>, M.A. Brookhart<sup>1</sup>, M. Jonsson Funk<sup>1</sup>, V. Pate<sup>1</sup>, W. Camelo Castillo<sup>1</sup>, T. Stuermer<sup>1</sup>, 1. *UNC Gillings School of Global Public Health, Epidemiology, Chapel Hill, North Carolina*, 2. *UNC School of Medicine, Physical Medicine & Rehabilitation, Chapel Hill, North Carolina*

Background: Estimating intervention effectiveness among older adults is difficult: few clinical trials include sufficient numbers of older adults. Non-experimental, population-based studies using claims data may be biased by unmeasured factors, particularly frailty. To improve control for frailty, we sought to identify predictors of ADL dependence (ADL-D), as its proxy, in a representative sample of Medicare beneficiaries. Methods: We included community-dwelling respondents to the 2006 Medicare Current Beneficiary Survey,  $\geq 65$  years old, with Medicare (Parts A, B) claims 8 months prior to the fall interview. ADL-D was defined as needing help with bathing, eating, walking, dressing, toileting, or transferring. We tested as potential predictors demographic variables and high-risk conditions identified in claims (ICD-9 diagnosis codes). Odds ratios (OR) and 95% confidence intervals (CI) were estimated through multivariable logistic regression. Results: Of 6,035 respondents, 58% were female, 88% white, with average age 77 (SD: 7.3) years and ADL-D prevalence of 9.7% (N=590). Strong predictors of ADL-D were amputation (OR=12.8, CI: 4.9-34), aspiration pneumonia (OR=3.4, CI: 1.3-9.2) and paralysis (OR=3.3, CI: 1.7-6.2). Individuals with vertigo (OR=0.61) or screened for cancer (OR=0.45) had a lower likelihood of ADL-D. The final model included dementia, psychiatric illnesses, heart failure, fractures, bladder dysfunction, stroke, serious infection, and weakness/difficulty walking, as well as age and non-white race. The model c-statistic was 0.83, indicating good predictive capacity. Conclusions: We identified obvious and non-obvious variables in claims data that predicted ADL-D. Our finding has important implications for reducing bias in population-based, non-experimental studies of intervention effectiveness in older adults.

#### EMBEDDING BALANCE AND STRENGTH TRAINING IN DAILY LIFE ACTIVITY TO REDUCE FALLS AND IMPROVE FUNCTION: A NOVEL ALTERNATIVE TO TRADITIONAL EXERCISE

L.M. Clemson<sup>1</sup>, M.A. Fiatarone Singh<sup>2</sup>, A. Bundy<sup>2</sup>, R.G. Cumming<sup>3,4</sup>, 1. *Ageing, Health & Work Research Unit, University of Sydney, Lidcombe, New South Wales, Australia*, 2. *Faculty of Health Sciences, University of Sydney, Lidcombe, New South Wales, Australia*, 3. *Faculty of Medicine, University of Sydney, Sydney, New South Wales, Australia*, 4. *Centre for Education & Research on Ageing (CERA), Concord, New South Wales, Australia*

The LiFE program is a novel approach to reducing falls and improving function by embedding balance and strength training in daily life activities. LiFE teaches balance and strength principles matching these to tailored and individualised activities that are upgraded over five sessions with two booster visits. LiFE was implemented in older people's homes by both physical and occupational therapists. The effectiveness of LiFE has been established in a randomised trial. We present the findings, discuss the conceptual underpinning, and outline the intervention protocol. A sample of 317 community-dwelling persons 70 years and over, at high risk of falling, were randomly assigned to one of three groups: the LiFE program, a structured balance and strength exercise program, and a control group, who were given an unsupervised sham-gentle exercise program. There was a statistically significant 31% reduction in the rate of falls for the LiFE participants compared to the control gentle exercise group (RR 0.69 (95% CI 0.48 to 0.99),  $n=212$ ). There was a 19% reduction in rate of falls for the structured exercise group compared to controls, which was not significant (RR = 0.81 (95% CI 0.56 to 1.17),  $n=210$ ). There were clinically significant outcomes for the LiFE program for ankle strength, static and dynamic balance, and for balance efficacy, ADL function, energy levels and participation. Adherence over the 12 month follow-up was superior for LiFE. LiFE provides an alternate choice to traditional exercise. Functional tasks should be a focus for protection from falling and for improving functional capacity.

#### APPLICATION OF SPECIFICITY OF LEARNING HYPOTHESIS TO FALL-PREVENTION INTERVENTION

N. Rosenblatt, A. Skoirchet, M.D. Grabiner, *University of Illinois at Chicago, Chicago, Illinois*

Following large postural disturbances, compensatory steps are often needed to restore dynamic stability, i.e. a positive margin of stability (MOS), and avoid a fall. Training the rapid, high-impact compensatory stepping response (CSR) may reduce fall-risk up to 77%, far exceeding reductions associated with the slow, low-impact movements of Tai Chi (TC). This difference likely reflects the dissimilar dynamics, and in turn underlying muscular requirements, of each. Presently we compared strength and power requirements of TC and CSR. Nine healthy, young subjects performed: a) 20 modified single TC steps and b) 20 single-step CSRs following forward leans beyond the point which balance could be maintained. Here, recovery-step-initiation was delayed as long as subjectively possible. Steps were taken onto force plates and kinematics collected using motion capture. Dependent variables were peak stepping-limb knee extension moment and power, and MOS at step-initiation and completion. Subjects were dynamically stable at step-initiation for TC but not CSR, with dynamic stability restored at step-completion (MOS at step-initiation= $126.4 \pm 15.5$  vs.  $-346.1 \pm 52.7$  mm, MOS at step-completion= $460.7 \pm 78.1$  vs.  $49.9 \pm 35.2$  mm, TC vs. CSR, respectively). Knee moments and power were significantly larger during CSR ( $1.64 \pm 0.30$  vs.  $1.03 \pm 0.28$  Nm/kg,  $p<.001$ ;  $-6.13 \pm 3.27$  Nm/kg vs.  $0.36 \pm 0.15$  Nm/kg,  $p<.001$ ). TC required maintaining MOS $>0$

throughout single-limb support, which could improve strength and balance in some older adults. However, based upon the specificity of learning hypothesis, TC will not significantly improve recovery-step dynamics or likelihood of recovery following large postural disturbances. Practicing jointly with CSR could increase the fall prevention efficacy of TC.

### **FEAR OF FALLING IN OLDER PERSONS: INCIDENCE AND PROGRESSION OVER 3 YEARS**

N. Deshpande<sup>1</sup>, E. Metter<sup>2</sup>, J.M. Guralnik<sup>3</sup>, L. Ferrucci<sup>2</sup>, 1. *Queen's University, Kingston, Ontario, Canada*, 2. *National Institute on Aging, Washington, District of Columbia*, 3. *University of Maryland, College Park, Maryland*

Fear of falling (FF) is a serious and common concern in older persons. The present study identified sensorimotor, psychosocial and demographic determinants of 1. Incident fear of falling (InciFF) and 2. Persistence of pre-existing FF (PersisFF) over three years in older persons. FF was quantified in 653 community-living older participants (age  $\geq 65$ ) at baseline and 3-year follow-up using the Survey of Activities and Fear of Falling in the Elderly. Visual acuity, vibrotactile sensitivity, self-reported hearing impairment, standing balance (FICSIT), lower limb and grip strength, cognition (MMSE), depression (CESD), personal mastery (PSMS), social support, demographic characteristics (Age, sex, BMI and years of education) and history of fall/s in the previous year were recorded at baseline. Out of 334 participants who did not report FF at baseline 65 participants reported InciFF. In binary logistic regression analysis participants with impaired balance (FICSIT score  $\leq 19$ ), history of fall/s or significant depressive symptoms (CESD  $>16$ ) were 3 times more likely, those with severe hearing difficulty were 3.5 times more likely and women were twice more likely to develop InciFF. Out of 319 participants who had FF at baseline, 142 did not report FF at the follow-up. In binary logistic regression analysis, women or those having significant depressive symptoms were twice more likely to report PersisFF. Hearing impairment was the strongest risk factor for InciFF. Additionally, older women and elderly with impaired balance, history of fall/s or depression should be proactively monitored for FF.

### **SESSION 2300 (PAPER)**

#### **FAMILY AND INFORMAL CAREGIVER ISSUES AND RESPONSES TO OLDER ADULT CARE**

##### **WALKING ALONG A TREACHEROUS SEA: HOW CAREGIVERS UNDERSTAND SYMPTOMS OF ADVANCED HEART FAILURE**

H.C. Bursch, *Adult and Gerontological Nursing, College of Nursing, The University of Iowa, Iowa City, Iowa*

This study sought to illuminate how caregivers (CGs) experience the responsibility of symptom interpretation and management in advanced heart failure (AHF). Method: Seven older spouse CGs of care recipients (CRs) with NYHA II-IV heart failure each participated in 3 reflective interviews over a period of 2 months, followed by a phone call at the conclusion of the study 2-10 months later. Data were analyzed using a method based on Interpretive Theory by Paul Ricoeur and grounded in his Philosophy of Ethics. Findings: CGs articulated 3 themes with 9 subthemes: (1) ongoing attempts to view AHF as part of their CRs' entire illness presentation, (2) the heavy burden of feeling responsible for symptom interpretation, and (3) hopes and fears regarding symptom progression in the context of little information. The essence of their task was like a walk in the fog on a rocky shore along the sea. CGs wanted to partner with healthcare providers in symptom interpretation and management but were frequently excluded from the conversation and felt there were no choices regarding treatment preferences even in the hours surrounding death. Implications: Rather than focusing on AHF as a condition of fluid excess which can generally be treated,

HCPs should allow for understanding of the weakened heart, which ultimately cannot be treated in AHF. Understanding how CGs prioritize symptom management with multiple comorbidities can facilitate adherence and incorporate CR-CG preferences for care. More research is needed for management of breathlessness at home and implications of DNR status on treatment plans.

### **EFFECTIVENESS OF FAMILY CAREGIVERS FOR IDENTIFICATION OF DELIRIUM: THE FAMILY CONFUSION ASSESSMENT METHOD (FAM-CAM)**

M.R. Steis, L.K. Evans, K.B. Hirschman, A.L. Hanlon, D.M. Fick, N. Flanagan, S.K. Inouye, *Veterans Administration, Orlando, Florida*

Background/ Objectives: As the population ages, delirium superimposed on dementia is an increasing problem. Family caregivers may provide critical information to assist with early detection of mental status changes. The purpose of this study was to explore agreement between the Family Confusion Assessment Method (FAM-CAM) with interviewer-rated CAM ratings for identification of delirium. Design: Exploratory analysis of agreement. Setting: Community. Participants: 52 family caregivers and 52 elders with pre-existing cognitive impairment. Measurements: Family members completed the FAM-CAM via interview or electronically. Trained interviewers rated the CAM following cognitive assessment of the elder. Delirium was determined by fulfillment of the CAM algorithm. Results: The total sample included 52 paired CAM:FAM-CAM assessments completed across 52 dyads of elders with pre-existing cognitive impairment and family caregivers. The point prevalence of delirium was (7/52)13%. Characteristics did not differ significantly between the delirium and non-delirium groups. The FAM-CAM questions that mapped directly to the original four-item CAM algorithm had the best overall agreement with the interviewer-rated CAM, kappa=0.85 (95% confidence interval, CI 0.65-1.0), sensitivity 88% (CI 47-99%) and specificity 98% (CI 86-100%). Conclusion: In this preliminary study, the FAM-CAM appears to be a sensitive screening tool for detection of delirium in elders with cognitive impairment utilizing family caregivers, with relevance for both research and clinical practice.

### **DIGITAL DIVIDE AMONG INFORMAL CAREGIVERS OF INDIVIDUALS LIVING WITH DEMENTIA**

H. Kim, *University of Virginia, Greenville, North Carolina*

Introduction Although Internet-based information and resources are promising strategies to help ameliorate caregiving stress, there is limited information available on health-related Internet use among dementia caregivers. This study aimed to understand the digital divide among informal caregivers of individuals with dementia. Its three specific aims were to identify: (1) the prevalence, (2) predictors, and (3) user profiles for health-related Internet use in dementia caregivers. Method Based on Pearlin's Stress Process Model, this secondary data analysis used data provided in a 2009 survey conducted by the National Alliance for Caregiving. Telephone interviews with standardized questionnaires were used to collect self-reported sociodemographic and clinical information for dementia caregivers (n=450). Descriptive analyses and a hierarchical multiple regression analysis were performed using SPSS 19.0. Results/Findings Fifty-nine percent of dementia caregivers were identified as health-related Internet users. Increasing levels of health-related Internet use was associated with higher levels of emotional stress or financial hardship (P<.05). Compared to non-users, Internet users were likely to be younger, to be more educated, and to be care-recipient's children rather than spouses. Additionally, levels of income and caregiving role strain were important to determining the digital divide (P<.05). Discussion Our findings confirmed the significance of demographic factors on the digital divide in previous studies, but the predictive value of caregiver stress for health-related Internet use is a new addition. These findings will assist healthcare providers, researchers, and policy makers to know how Internet-based strategies should best

be designed, implemented, and distributed to meet the needs of dementia caregivers.

### **INTERNET USE IN CAREGIVING TRAJECTORY OF INFORMAL CAREGIVERS OF INDIVIDUALS WITH DEMENTIA**

H. Kim, *University of Virginia, Greenville, North Carolina*

**Introduction:** The Internet serves as a valuable resource for informal caregivers who are caring for individuals with dementia. However, little attention has been paid to health-related Internet use as a mediator in the context of caregiving. This study evaluated the impact of health-related Internet use on the relationship between caregiver stress and their perception of health status. **Method:** Based on stress process model, this secondary data analysis used data provided in a 2009 survey conducted by the National Alliance for Caregiving. Dementia caregivers reported sociodemographic and clinical information through telephone interviews (n=450). The statistical analysis was accomplished by structural equation modeling using Amos 19.0 and SPSS 19.0. **Results/Findings:** Overall, higher level of caregiver stress was associated with more health-related Internet use ( $\beta=0.131$ ,  $p<0.006$ ). Dementia caregivers with higher levels of stress perceived their health status as poor, with a strong direct effect ( $\beta=-0.270$ ,  $p<0.001$ ). However, indirect effect mediated through health-related Internet use was non-significant (0.008). Thus, Internet use did not provide any mediating or buffering effects in this relationship (total effect=-0.262). Additionally, advanced caregivers' age and racial minorities (Hispanic and African American) were significant covariates in this relationship ( $p<0.001$ ). **Discussion & Conclusions:** Although this study showed that health-related Internet use did not reduce the impact of caregiver stress on poor self-rated health in dementia caregivers, their strong interest in Internet use was identified. This study suggests that Internet-based approaches should be integrated with conventional healthcare services under a healthcare provider's thoughtful guidance to ensure the high quality of the Internet-based resources.

### **BEHAVIORAL PROBLEMS MEDIATE THE ASSOCIATION BETWEEN COGNITIVE IMPAIRMENT AMONG OLDER ADULTS AND DEPRESSION AMONG THEIR CAREGIVERS**

R. Malhotra<sup>1</sup>, A. Chan<sup>1,2</sup>, C. Chei<sup>1</sup>, D. Matchar<sup>1</sup>, *1. Health Services and Systems Research, Duke-NUS Graduate Medical School Singapore, Singapore, Singapore, 2. National University of Singapore, Singapore, Singapore*

Behavioral problems among older adults with cognitive impairment(CI) may contribute to depression among their caregivers. We assess the presence and extent of mediation of the association between older adult CI and clinically significant depressive symptoms(CSDS) among their caregivers by older adult behavioral problems. Data for 1,111 care recipient (aged 75+ with >1 activity of daily living limitation)-spouse/child caregiver dyads from a national survey from Singapore was used. Caregiver CSDS status (yes/no) was based on Centre for Epidemiological Studies Depression Scale score. Older adult CI status (yes/no) was based on Short Portable Mental Status Questionnaire score and if unavailable, on Revised Memory and Behavior Problems Checklist(RMBPC) memory-problem subscale score. Older adult behavioral problems were assessed using RMBPC disruptive behavior subscale score (8-items;range:0-32). Logistic regression models assessed the association between older adult CI and caregiver CSDS, with and without adjusting for behavioral problems. Sobel's test assessed for mediation of the association by behavioral problems. Caregivers of older adults with CI, versus without CI, had significantly higher odds (adjusted odds ratio 1.49 [95% CI 1.07,2.09]) of CSDS. However, the strength of the association became lower and non-significant (1.35[0.96,1.92]) after adjusting for behavioral problems. Mediation analysis confirmed that behavioral problems significantly, but partially, mediate (Sobel's test, $z=2.14$ , $p=0.02$ ;%mediated: 24.8%) the association between older

adult CI and caregiver CSDS. While caring for an older adult with CI is detrimental for the caregiver's mood, management of behavioral problems of such older adults has the potential to be especially helpful in reducing depression among their informal caregivers.

### **SESSION 2305 (PAPER)**

#### **GERIATRIC ASSESSMENT, CASE MANAGEMENT AND ISSUES WITH MEDICARE/MEDICAID**

##### **A SYSTEMATIC REVIEW OF THE USE OF GERIATRIC ASSESSMENT FOR OLDER ADULTS IN ONCOLOGY**

M. Puts<sup>1</sup>, J. Hardt<sup>1</sup>, J. Monette<sup>2</sup>, V. Girre<sup>3</sup>, E. Springall<sup>1</sup>, S.M. Alibhai<sup>1,4</sup>, *1. Lawrence S. Bloomberg Faculty of Nursing, University of Toronto, Toronto, Ontario, Canada, 2. Jewish General Hospital, Montreal, Quebec, Canada, 3. Centre Hospitalier Departemental, La Roche sur Yon, France, 4. University Health Centre, Toronto, Ontario, Canada*

The use of geriatric assessment is recommended for older adults in the oncology setting. So far, no systematic review of geriatric assessment has been conducted. **Aims of review:** 1) to provide an overview of all geriatric assessment (GA) instruments developed and/or in use in the oncology setting, including feasibility and psychometric properties. 2) To systematically evaluate their effectiveness in predicting outcomes from cancer and its treatment. **Methods:** Systematic review of literature published between January 1996 and November 16, 2010. Articles could be published in English, French, Dutch or German. **Data sources:** Medline, Embase, Psycinfo, Cinahl and the Cochrane Library. **Results:** 83 manuscripts reporting on 73 studies were identified. The quality of most studies was poor to moderate. Most studies showed that it was feasible to conduct a GA. The time needed to conduct a GA ranged between 10-120 min. Most often the GA was completed to describe the health and functional status of participants. Few studies examined the predictive validity of the GA; some showed GA predicted treatment complications and mortality, while others reported no impact. Few studies have shown their impact on treatment decisions or cancer outcomes but nevertheless the GA identified many undetected health and functional status issues. **Conclusion:** The evidence shows that it was feasible to conduct a GA but more evidence is needed with regard to the effectiveness of GA in the oncology setting using higher methodological quality studies.

##### **EVALUATION OF A HIGH RISK CASE MANAGEMENT PILOT PROGRAM FOR MEDICARE BENEFICIARIES WITH MEDIGAP COVERAGE**

K. Hawkins<sup>1</sup>, R.J. Ozminkowski<sup>1,2</sup>, G.R. Bhattarai<sup>1</sup>, P. Parker<sup>2</sup>, J. Huang<sup>1</sup>, T.S. Wells<sup>1</sup>, R.J. Migliori<sup>2</sup>, C.S. Yeh<sup>3</sup>, *1. Analytics and Data Management, OptumInsight, Ann Arbor, Michigan, 2. UnitedHealth Group Alliances, Minnetonka, Minnesota, 3. AARP Services, Inc., Washington, District of Columbia*

**Research Objective:** To evaluate the second year experience of a High Risk Case Management (HRCM) pilot program. **Methods:** Nurses and social workers provided in-person, telephonic, and mailed services to improve care coordination from 12/1/2008 to 12/31/2010. Adults (65+ years of age) who resided in one of five pilot states and who had a Hierarchical Condition Category score > 3.74, or were referred into the program were included in the analysis. This included 1,290 members who participated in the program, and 6,811 members who were qualified but did not participate. Regression analyses were used to estimate healthcare savings and differences in quality of care metrics between engaged program members and similar non-engaged members. Quality of care metrics related to reduced hospital readmissions as well as Evidence Based Medicine (EBM) metrics were evaluated. **Results:** Although not statistically significant, 63% of hospital readmission related metrics and 79% of EBM metrics showed engaged members received higher quality of care. The program showed an estimated savings of

\$1.5 million dollars, but was not statistically significant. Most of these savings were attributable to Medicare. Conclusions: This study focuses on hospital readmission related metrics for a HRCM program designed solely for Medicare members with Medigap coverage. The HRCM program was associated with higher quality of care; however, the decrease in costs was not statistically significant in the second year of the program.

#### **MEDICARE-BASED MULTIMORBIDITY INDEX FOR PROJECTING MORBIDITY AND MORTALITY AMONG OLDER ADULTS IN THE U.S**

I. Akushevich, J. Kravchenko, H. Whitson, H.J. Cohen, S.V. Ukraintseva, K.G. Arbee, A.I. Yashin, *Duke University, Durham, North Carolina*

The growing sector of older persons with multimorbidity merits special attention due to the rising costs of their medical services and long-term care. Medicare-based data allow for developing a tool for measuring multimorbidity that weights the relative health impact of chronic conditions in the Medicare population. This tool may improve the precision of prognoses for mortality in older adults comparing to the Charlson Comorbidity Index (CCI). Using SEER-Medicare data (1991-2005), a new Adjusted (for US elderly population) MultiMorbidity Index (AMMI) was developed by selecting the list of clusters of contributing diseases and calculating disease-specific weights. In AMMI diseases such as heart failure, myocardial infarction, stroke, respiratory diseases, and dementia had higher weights, and renal failure, chronic liver diseases, HIV/AIDS, carcinoma in situ, and solid cancers with effective screening had lower weights than there were in the original CCI (evaluated for 1980s general population). Further, a new model was constructed to predict dynamics of AMMI and evaluate the effect of AMMI on mortality. The properties of AMMI were studied empirically and in the population model of mortality and tested in sensitivity analysis. AMMI demonstrated better predictive power (AUC=0.90, i.e., approximately 90% of cases of next month survival status are predicted correctly) compared to CCI (AUC=0.84). The results were stable when alternative assumptions for model construction were applied. The novel multimorbidity index can be used to project morbidity and survival trends among older adults in US. It makes new advances in planning health services and medical expenditures.

#### **ASSESSING ENERGY EXPENDITURE DURING EATING IN VULNERABLE OLDER ADULTS**

L. Goldberg<sup>1</sup>, C.J. Heiss<sup>2</sup>, *1. Wichita State University, Wichita, Kansas, 2. Metropolitan State College of Denver, Denver, Colorado*

Reflecting the conference theme, Charting New Frontiers in Aging, this paper presents data on an innovative way to measure energy expenditure during eating in older adults with swallowing disorders (dysphagia). These older adults appear to fatigue during meals. This fatigue is thought to reflect their increased level of effort (energy expenditure) during eating. Optimal measurement of energy expenditure is documented through body heat output in an enclosed metabolic chamber, or indirect calorimetry in which the nose and mouth are masked and oxygen consumption is measured. Metabolic chambers are not readily available to healthcare providers and indirect calorimetry is not possible during eating. A portable computerized device, SenseWear, has been shown to have concurrent validity, when compared to indirect calorimetry, in measuring energy expenditure during activities such as running. A feasibility study of SenseWear and indirect calorimetry during simulated chewing in college students documented a statistically significant correlation ( $r = 0.49$ ,  $p < 0.05$ ) between the two measurement methods. SenseWear then was used to measure the energy expended by 20 self-reported healthy older adults who were residents of a Continuing Care Retirement Community as they ate a regular lunch. The mean energy expenditure was 61.90 ( $\pm 6.90$ ) kcal. This value was significantly greater than the expected 48 kcal for age- and weight-matched older adults documented through eating in a metabolic chamber. Although continued

refinement of the protocol is needed, results suggest that the use of SenseWear may be a clinically useful way to assess energy expenditure during eating in vulnerable older adults.

#### **IS THERE A CAUSAL RELATIONSHIP BETWEEN POOR SLEEP QUALITY AND FRAILITY IN OLDER WOMEN?**

Q. Xue<sup>1,2</sup>, J. Tian<sup>2</sup>, Y. Huang<sup>4</sup>, P.H. Chaves<sup>1,2</sup>, L.P. Fried<sup>3</sup>, *1. Johns Hopkins School of Medicine, Baltimore, Maryland, 2. Johns Hopkins Center on Aging and Health, Baltimore, Maryland, 3. Columbia University Mailman School of Public Health, New York, New York, 4. Cheng Kung University, Tainan, Taiwan*

Over half of the population aged 65 years and older report chronic sleep problems. Previous studies have shown consistent evidence that both longer sleep duration and sleep deprivation are associated with adverse health outcomes. Using a sample of 252 women from the Women's Health and Aging Study II with up to five measurements over 10 years, we estimated the causal effect of poor sleep quality by self-report (as a time-varying risk factor) on the development of pre-frailty or frailty in community-dwelling older women. Marginal structural models were used to adjust for time-dependent confounders, intermediate variables, and participant dropout. We found that 85% of the women who were non-frail at baseline became pre-frail or frail during the 10-year follow-up; and poor sleep quality was associated with almost three-fold increase in the risk of pre-frailty or frailty onset (hazard ratio=2.83, 95% confidence interval=1.61-4.95,  $p=0.012$ ) after adjusting for age, race, education, smoking status, comorbidity, cognition, depressive symptoms, body mass index, and physical activity, with the last three treated as time-dependent confounders. This study offers initial evidence that poor sleep quality may play a causal role in the development of frailty.

### **SESSION 2310 (PAPER)**

#### **REHABILITATIVE CARE & PHYSICAL THERAPY**

##### **POSTURAL RESPONSES ARE MODULATED WHEN SUPPORT SURFACE TILT IS COMBINED WITH VIRTUAL VISUAL FLOW IN HEALTHY ELDERLY AND ADULTS WITH STROKE**

J. Slaboda<sup>1</sup>, E. Keshner<sup>2</sup>, *1. Physical Therapy, University of Nevada, Las Vegas, Las Vegas, Nevada, 2. Temple University, Philadelphia, Pennsylvania*

The influence of optic flow was examined when responding to a postural disturbance, and on the subsequent postural realignment to vertical. Thirteen healthy older adults (50-80 yrs) and 13 adults with stroke (49-70 yrs) were categorized as visually dependent or independent through a Rod and Frame task. Postural responses were assessed while subjects stood quietly during 3 deg dorsiflexion tilt of the support surface combined with pitch rotations of a wide-field-of-view virtual reality visual field. Support surface tilt was held for 30 sec and then returned to neutral over a 30 sec period while the visual field continued to rotate. Segmental displacement and muscle EMG responses were recorded. An instantaneous mean frequency curve of muscle activity, center of mass, center of pressure, and ankle and hip angular excursion were used in a functional principal component analysis to measure changes over time. Results of these analyses indicated that both groups aligned their bodies to the visual flow during the pitch upwards rotation but adults with stroke produced much larger ankle responses than healthy older adults indicating a difference in postural strategy. Rod and Frame scores were correlated with lateral sway indicating that visually dependent individuals exhibited greater reliance on visual flow when it was matched to the velocity of the tilt perturbation.

## PRE FRACTURE MOBILITY LEVEL EVALUATED BY THE NEW MOBILITY SCORE PREDICTS LONG TERM REHABILITATION OUTCOMES

K.S. McGilton<sup>1</sup>, A.M. Davis<sup>2</sup>, G. Naglie<sup>3</sup>, S.C. Stewart<sup>4</sup>, 1. *Research, Toronto Rehabilitation Institute, Toronto, Ontario, Canada*, 2. *Toronto Western Research Institute, Toronto, Ontario, Canada*, 3. *Baycrest Centre for Geriatric Care, Toronto, Ontario, Canada*, 4. *Queens University, Kingston, Ontario, Canada*

**Purpose:** Clinicians need valid and easily applicable predictors of outcome in patients with hip fracture. To date, the potential of the New Mobility Scale (NMS), used to evaluate pre fracture mobility level, as a predictor of long-term rehabilitation outcomes has not been investigated. **Methods:** We studied 70 patients with a median age of 80 years who were consecutively enrolled in a study and admitted from their own homes post hip fracture to acute care hospitals (mean of 2.2 days) followed by a rehabilitation stay (mean of 7.0 days). The main outcome was the regain of independence in mobility, defined as independence in transferring to bed, toilet or tub, walking and climbing stairs, as measured by the Motor-FIM. Predictor variables were NMS mobility level before fracture, age, sex, and cognitive status, which was measured using the Mini-Mental State Examination. **Results:** In the multiple regression analysis, sex, cognitive status and NMS mobility level before fracture were significant at 3 months post discharge and accounted for 7%, 18% and 26% of the variance, respectively, in their mobility independence. At 6 months, cognitive status and NMS mobility level before fracture predicted 15% and 21%, respectively, of the variance in FIM-Mobility. Thus males with cognitive impairment and a low pre mobility NMS would be less likely to regain independence in mobility over time. **Discussion:** The NMS mobility level before fracture, sex, and cognitive status facilitate prediction of the rehabilitation outcomes at 3 and 6 months post hip fracture rehabilitation.

## THE ABSENCE OF ELECTROMAGNETIC FIELDS AND MIRROR THERAPY AS AN EFFECTIVE INTERVENTION COMBINATION STRATEGY FOR REDUCING PHANTOM LIMB PAIN IN VASCULAR AMPUTEES

H. Houston<sup>2,1</sup>, A. Dickerson<sup>1</sup>, 1. *Occupational Therapy, East Carolina University, Greenville, North Carolina*, 2. *Vidant Medical Center, Greenville, North Carolina*

This presentation will describe the results of a study to investigate the effectiveness of combining an intervention to eliminate electromagnetic fields and mirror therapy to decrease phantom limb pain. Fourteen adults with a unilateral vascular amputation (9 acute amputation) wore a Farabloc limb cover and performed mirror therapy exercises for four weeks. Measures were completed at three points (pre and post treatment and 4 weeks after the end of therapy) and included residual limb measures, pain, functional, and quality of life components. Results from ANOVAs showed a decrease in phantom limb pain for intensity ( $F(1,14)=8.83, p<.001$ ), frequency ( $F(1,14)=6.8, p<.001$ ), and duration ( $F(1,14)=2.1, p=.043$ ). Most significantly, wound healing and edema reduction (from pre to post  $F(1,14)=16.99, p<.001$ ) for acute amputees decreased time to prosthetic fitting from 12 to 8 weeks. Activities of daily living and quality of life variables also showed significant improvement (self care:  $F(1,14)=4.27, p<.001$ ; Walking:  $F(1,14)=2.6, p=.016$ ; Quality of life:  $F(1,14)=3.32, p=.004$ ). Prosthetic wearing times for previous amputees increased from 0-2 hours per day to 8-12 hours per day. Protocols and implications for function and quality of life will be discussed.

## MEDICAL INSTABILITY IS ASSOCIATED WITH POOR FUNCTIONAL RECOVERY IN SNF-BASED POST-ACUTE CARE

S.E. Hardy, S. Studenski, *Medicine/Geriatrics, University of Pittsburgh, Pittsburgh, Pennsylvania*

Older adults are being discharged from the hospital quicker and sicker, with the most vulnerable being discharged to skilled nursing

facilities (SNF) for post-acute care. Medical instability on admission to SNFs for PAC may limit the ability of older adults to regain their baseline functional status. We examined the association of markers of medical instability with return to baseline ADL function among 119 previously community-dwelling adults aged 65 or older admitted to a SNF for PAC. Our study population had a mean $\pm$ SD age of 81 $\pm$ 8 years, 72% were female, and 86% were white. On a scale ranging from 0 (no difficulty in any of 7 ADLs) to 14 (dependent in all 7 ADLs), they had mean functional scores of 2.3 $\pm$ 2.5 pre-hospital and 9.8 $\pm$ 3.7 on admission to PAC; 60 (50%) failed to regain their baseline function by discharge from rehab. Markers of instability associated with failure to regain baseline function were heart rate > 120 with minimal exertion (no 39%, unable to walk for reasons other than HR 56%, yes 67%;  $p=0.04$ ) and delirium (no symptoms 30%, symptoms without meeting CAM criteria 64%, delirium 60%,  $p=0.002$ ); abnormal oxygen saturation was also associated with failure to recover (no 40%, yes 63%), although this did not reach statistical significance ( $p=0.08$ ). Orthostatic changes, abnormal respiratory rate with minimal exertion, depressive symptoms, and pain were not associated with functional recovery. Early identification and treatment of vital sign abnormalities with minimal exertion has the potential to improve functional outcomes of SNF-based PAC.

## BALANCE AND FUNCTIONAL RESPONSES IN YOUNGER AND OLDER ADULTS: COMPARISON OF TWO TRAINING METHODS

S.J. Leach, *Physical Therapy, East Carolina University, Greenville, North Carolina*

Falls are a major health risk for older adults associated with increased mortality rates. Since the ability to take a step is an important component of fall prevention, one training method in this study utilized a rapid multi-directional stepping task (DATSAT) while the second method incorporated strength and endurance (SE) training. The purpose of this study was to determine balance and timed functional task responses in younger and older healthy adults comparing two different training methods. 30 healthy younger (HY) adults (18-29 y.o.) and 30 healthy older (HO) adults (65- 86 y.o.) were randomly assigned to either the DATSAT group or the SE group. For 18 training sessions the DATSAT group performed 12 sets of 8 trials of rapid multi-directional stepping in a divided-attention environment, while the SE group pedaled a stationary bike for 15 minutes at 60% max HR and completed 1 set of 8 repetitions of progressive bilateral leg strengthening exercises in 6 muscle groups. Test measures included maximum step length (MSL) in the forward, lateral, and backward directions, Timed Up and Go, the Berg Balance Scale and the following timed functional tasks: walk backward 3m; 5 x sit-to-stand; 5 x step up and down; floor-to-stand; kneel-to-stand. At pretest, the HY group had better balance and faster timed functional task responses than the HO group. Both groups demonstrated significant improvements from pretest to posttest and generally the HY and HO groups improved by similar amounts. The DATSAT group had greater improvements than the SE group in MSL.

## SESSION 2315 (SYMPOSIUM)

### ASSESSING THE NEEDS OF OLDER ADULTS IN NICARAGUA: A MULTI-DISCIPLINARY, CROSS-UNIVERSITY APPROACH

Chair: *K. Brown Wilson, Jessie F. Richardson Foundation, Clackamas, Oregon*

Discussant: *M.A. Perkinson, Saint Louis University, St. Louis, Missouri*

Populations worldwide are aging rapidly, and the opportunity to prepare for this global demographic shift is quickly diminishing, especially in developing nations, which, unlike developed nations today, "will grow old before they become rich." Early research on popula-

tion aging focused solely on more-developed countries; little information is available on the needs of older adults in the developing world. A coordinated effort to address this demographic imperative began in 2003, when the Jessie F. Richardson Foundation (JFR) – a charitable non-profit organization in Clackamas, Oregon – responded to a challenge from the Pan American Health Organization to broaden its mission to serve indigent elders to include addressing the needs of older adults in developing countries. Nicaragua was chosen as a beta site based on the paucity of in-country expertise in gerontology and geriatrics, the prevalence of severe poverty, relative political stability, and the ability to readily observe and measure change over time. With leadership from JFR, four universities in Oregon have developed programs in various disciplines focused on identifying needs and enhancing the health and well-being of older adults in Nicaragua. Models include a multidisciplinary service-learning program involving projects requested/guided by older Nicaraguans, including community-based elder needs assessments; a clinical program for students in allied health fields involving a health assessment of elders residing in homes for the elderly; a program for nursing students involving clinical needs assessments; and undergraduate field research. This symposium will detail the programs, describe key findings, outline future research needs, and discuss the applicability to other developing nations.

#### **ASSESSING THE HEALTH NEEDS OF COMMUNITY-RESIDING ELDERS IN NICARAGUA**

M.B. Neal, A. DeLaTorre, M. Cannon, *Portland State University, Portland, Oregon*

Portland State University (PSU) began developing service-learning and research projects in Nicaragua in 2003-04, when it became the first university to partner with the Jessie F. Richardson Foundation to begin to address the needs of indigent older Nicaraguans. Since then, each year from 9-18 undergraduate and graduate students from multiple disciplines throughout the university (e.g., public health, social work, business, biology, engineering) have taken an academic course concerning global aging and health, with a focus on Nicaragua, and then traveled with faculty to Nicaragua for 12-17 days to engage in a range of service and research projects. The data gathered have pertained to the health status and needs of urban and rural elders specifically in the state of Boaco, Nicaragua, and have included both quantitative and qualitative data. This presentation will detail the research findings to date and suggest directions for future research.

#### **ASSESSING ELDER HEALTH IN NICARAGUAN “HOGARES PARA LOS ANCIANOS” USING A COMMUNITY-BASED REHABILITATION APPROACH**

T. Boggis, A. Black, R. Reisch, K. Shaffer, *Pacific University, Hillsboro, Oregon*

In collaboration with the Jessie F. Richardson Foundation, other Oregon universities, and institutions located in Nicaragua, a team of allied health professional students and faculty from Pacific University have visited Nicaragua each year since 2007 with an aim to promote the health of marginalized elders. The program embraces an interdisciplinary, inter-collegial, Community-Based Rehabilitation (CBR) approach to guide research, service delivery and education. CBR is a participatory approach endorsed by the World Health Organization to facilitate sustainability of efforts. This presentation will detail the health concerns of Nicaraguan elders based on a needs assessment conducted within multiple regions of Nicaragua; the guiding principles of an interdisciplinary CBR approach and its outcomes in the promotion of sustainable research, education and services relevant to Nicaraguan elders; and how knowledge gained from this program informs practice in the development of similar initiatives.

#### **IMPROVING NURSING CARE OF ELDERS IN NICARAGUA THROUGH HEALTH ASSESSMENTS AND TRAINING PROGRAMS**

D. Bachand<sup>1</sup>, K. Brown Wilson<sup>2</sup>, *1. Concordia University, Portland, Oregon, 2. Jessie F. Richardson Foundation, Clackamas, Oregon*

Concordia University, in collaboration with the Jessie F. Richardson Foundation, initiated a program in 2010 to improve elder care in Jinotepe, Nicaragua. In the first year of the program, five nursing students, two nursing faculty, and one pre-med student participated by assessing and treating 350 older adults, as well as building indigenous capacity by training local healthcare professionals. In 2011, Concordia's director of nursing, a social work faculty, and two nursing students returned to Nicaragua to determine future projects in three cities, talked with the boards of directors of two nursing homes, and met with students and faculty at the University of Nicaragua-Managua to explore collaborative training opportunities. In May, 2012, nursing faculty, eight nursing students, and JFR staff will perform clinical work, education, and training of caregivers. This presentation will review the work of the program to date and share the findings of the health assessments conducted.

#### **SOCIAL FACTORS THAT CONTRIBUTE TO THE HEALTH OF OLDER NICARAGUANS IN BOACO**

C. Bolkan<sup>1</sup>, K. Tapia<sup>2</sup>, *1. Washington State University Vancouver, Vancouver, Oregon, 2. Portland State University, Portland, Oregon*

A native Nicaraguan undergraduate student who participated in the Portland State University (PSU) service-learning program to Nicaragua was accepted into the McNair Scholars program, which provides research training to underrepresented students who hope to pursue doctoral degrees. The student collaborated with a Washington State University Vancouver (WSU) professor on a research project intended to understand the social factors that contribute to the health of older adults in Boaco, Nicaragua. They analyzed exploratory data previously collected in the PSU program and then specifically targeted the collection of new data that examined how the behaviors and attitudes of older Nicaraguans affect their physical and mental health. This presentation will detail the results of that study, suggest interventions that may mitigate the identified behaviors and problems, and describe how undergraduate field research opportunities can benefit students and the community.

#### **SESSION 2320 (SYMPOSIUM)**

##### **ASSISTIVE TECHNOLOGY AND EMPLOYMENT AMONG OLDER AND YOUNGER PEOPLE WITH DISABILITIES**

Chair: *J. Wiener, Aging, Disability and Long-Term Care, RTI International, Washington, District of Columbia*

Discussant: *C. Harrington, University of California, San Francisco, San Francisco, California*

Two of the key issues among older and younger people with disabilities are the effectiveness of assistive technology and participation in the workforce. Providing human assistance to people with disabilities is expensive and workforce shortages in long-term care and the broader American workforce are almost certain to grow over time. In addition, informal caregivers are often not able to maintain regular paid employment while providing care to loved ones or friends. Some observers have suggested that assistive technologies might substitute for human workers in the provision of personal assistance services to promote care recipient and caregiver independence. Using the 2004 National Long-Term Care Survey, the first presentation will analyze whether this is the case. The findings suggest that the answer depends on the types of needs being met and whether the caregiver is paid to provide care. Closely related to the issue of assistive technology is what people with disabilities need to participate in the workforce. Current labor force participation rates among people with disabilities are extremely low. A second presentation will present an analysis of a sur-

vey of Medicaid home care beneficiaries in six states and the barriers to their working. A third presentation will assess a wide range of assistive technologies for people with Alzheimer's disease, finding that most are of limited utility. Most require too much executive function to be useful, although their role in monitoring safety may be more promising. Charlene Harrington, Director of the Center for Personal Assistance Services, will be the discussant.

### **WHICH WORKS BEST FOR ME? ASSISTIVE TECHNOLOGY, PERSONAL ASSISTANCE SERVICES OR BOTH?**

W.L. Anderson<sup>1</sup>, J. Wiener<sup>2</sup>, *1. Aging, Long-Term Care and Disability, RTI International, Research Triangle Park, North Carolina, 2. RTI International, Washington, DC, District of Columbia*

Disability and need for personal assistance services (PAS) has declined in recent years, while use of assistive technology (AT) has increased. Prior work has considered whether AT and PAS are complements or substitutes, but this relationship depends on contextual factors and analysis methods. This study assessed which of five ATs were substitutes or complements by decomposing PAS into total and formal care hours. Sample members were 2004 National Long-Term Care Survey community-dwelling respondents receiving assistance with activities of daily living. OLS on total PAS hours was estimated on the entire sample, and Logit and OLS models were estimated on the likelihood and hours of formal PAS, respectively. We found substitution effects on the use of total PAS for three types of AT, but complementary effects on the use of formal PAS for two types of AT. Understanding these relationships is important for near term fiscal implications and longer-term workforce policy.

### **WORK AND DESIRE TO WORK AMONG MEDICAID HOME AND COMMUNITY-BASED SERVICES BENEFICIARIES**

J. Wiener<sup>1</sup>, W.L. Anderson<sup>2</sup>, *1. Aging, Disability and Long-Term Care, RTI International, Washington, District of Columbia, 2. RTI International, Research Triangle Park, North Carolina*

Despite many policy initiatives to bring them into the labor force, most people with disabilities do not work, due to health problems and lack of supportive services, transportation and assistive technologies. Unemployment is a problem, especially for younger people with disabilities, because work is important for social participation and independence. This presentation reports on an analysis of a survey of Medicaid home and community-based services beneficiaries in six states. Medicaid home and community-based services waiver participants who are working are quite different from those who are not working. The Medicaid-enrolled working population with disabilities has better health status and is more likely to participate in education and training, and has better access to assistive technology and transportation than the non-working population. Despite better health status and lower ADLs, the working population receives more hours of home and community-based services. Strategies to increase labor participation will be discussed.

### **ASSISTIVE TECHNOLOGIES FOR PEOPLE WITH DEMENTIA AND THEIR CAREGIVERS AT HOME: WHAT MIGHT HELP?**

J. Maier, J. O'Keefe, *Aging, Long Term Care & Disability, RTI International, Waltham, Massachusetts*

This presentation provides an overview of assistive technology (AT) products that are designed for persons with dementia and their caregivers. Compared with AT products available to people with physical impairments, few products are available that can help compensate for the cognitive deficits common in persons with dementia. Failure to recognize the complexity of dementia results in the development of AT products designed to address a single deficit—memory impairment. These products are likely to be effective only for people with mild cog-

nitive impairment and are likely to be of little value to people whose executive function is impaired. Technology to facilitate monitoring and supervision by caregivers may have the potential to reduce caregiver burden, by reducing the need to constantly be with the person with dementia, but it cannot completely eliminate the risk.

## **SESSION 2325 (SYMPOSIUM)**

### **FINDINGS FROM THE NATIONAL POST-ACUTE CARE PAYMENT REFORM DEMONSTRATION**

Chair: *B. Gage, RTI International, Waltham, Massachusetts*

The purpose of this panel is to discuss RTI's work with the Centers for Medicare and Medicaid Services (CMS) in developing the Continuity and Assessment Record and Evaluation (CARE) tool, a set of standardized assessment items for post-acute care settings, and subsequent testing of items in a national demonstration. The panel will cover several facets of this work, including: an overview of the demonstration, measurement of functional change, findings of resource utilization across post-acute care settings, and the analysis of readmissions in post-acute care settings. Through this symposium, we will demonstrate the many advantages and uses of the CARE tool as the first comprehensive assessment tool designed to collect data from all types of post-acute care providers, including inpatient rehabilitation facilities, long-term care hospitals, home health agencies, and skilled nursing facilities, in four major domains: medical, functional, cognitive impairments and social/environmental factors.

### **30-DAY READMISSION RATES IN POST-ACUTE CARE SETTINGS**

M. Ingber, *RTI International, Waltham, Massachusetts*

Readmissions increase costs and can be an indicator of poor quality. Previously it has been difficult to compare outcomes and quality across post-acute care (PAC) settings due to differences in measures and data collection procedures. The study objective was to test whether patient risk for readmission is associated with the type of PAC setting used, after controlling for patient acuity. We looked at all-cause readmissions for PAC patients within 30 days of acute hospital discharge. After adjusting for patient characteristics, we found that LTCHs had lower rates of readmissions within 30 days of discharge in relation to SNFs. This could be because LTCHs are hospitals with a greater ability to treat higher severity patients, so fewer patients require readmission to acute hospitals. This study shows the utility of the CARE tool in studying risk adjusted readmission rates across PAC disciplines, which was previously difficult due to the lack of a standard tool.

### **RESOURCE UTILIZATION ACROSS POST-ACUTE CARE SETTINGS**

M. Morley, *RTI International, Waltham, Massachusetts*

A goal of the PAC-PRD was to examine patient-specific resource use in the four PAC settings (HHA, SNF, IRF, and LTCH). Staff time data were collected to quantify the time spent with individual patients. These data were stratified into groups with similar case-mix characteristics to look at whether different settings provide equal treatment intensity for similar patient types. Multivariate analyses examined the factors predicting routine nursing resource intensity across PAC settings. The results of the analyses demonstrate that routine resource intensity varies across settings. The results also indicate the potential for using one case-mix adjustment system for inpatient PAC settings and a separate model for home health given that resource use patterns differed significantly in HHA compared to the inpatient PAC settings.

### **FUNCTIONAL CHANGE OUTCOMES IN POST-ACUTE CARE SETTINGS**

A. Deutsch, *RTI International, Waltham, Massachusetts*

It is vital to understand patient outcomes when studying the effectiveness of treatments. Due to the previous lack of a consistent tool to

measure functional status across settings, the study of patient outcomes after post-acute care stays has been an interest of CMS. This study examined the change in self-care and mobility functioning from admission to discharge in post-acute care settings using items from the CARE tool in order to measure functional outcomes across these sites. After controlling for selected measures of patient acuity at admission, provider type was shown to be a statistically significant predictor in the models of change in self care functional ability but not for mobility functioning. The analysis did not attempt to control for non-clinical factors such as patient engagement, family involvement, or length of treatment which may vary between settings. While the findings are not definitive, they indicate potentially interesting results related to comparative outcomes.

## OVERVIEW OF THE POST-ACUTE CARE PAYMENT REFORM DEMONSTRATION

B. Gage, *RTI International, Waltham, Massachusetts*

In response to the lack of a standardized system of payment and assessment for post-acute care (PAC) providers, Congress authorized the Post-Acute Care Payment Reform Demonstration in 2005. RTI, in conjunction with CMS, created a standardized assessment, the Continuity Assessment Record and Evaluation (CARE) tool, and collected assessments and resource utilization data from PAC providers in eleven market areas. The tool assesses patient acuity, functional and cognitive impairment and social support. Selected results of this effort will be presented. The CARE tool has the capacity to improve data collection and enhance understanding of the patients receiving care in various PAC settings.

## SESSION 2330 (SYMPOSIUM)

### MAKING FAMILIES MATTER IN LONG-TERM CARE

Chair: *S. Zimmerman, Univ North Carolina Chapel Hill, Chapel Hill, North Carolina*

Discussant: *L.P. Gwyther, Duke University, Durham, North Carolina*

The majority of older adults who reside in nursing homes (NHs) and residential care/assisted living (RC/AL) received support from family members before they moved into the long-term care setting, and continue to receive support long after they move in. Family involvement is not always straightforward, however, as they may not have a clear role in care and may feel burdened by the role they do have. Similarly, the relations of staff with families may be conflicted. This symposium will report findings from an NIH-funded group randomized trial intended to promote family involvement in long-term care to improve resident quality of life and promote family and staff well-being, entitled Families Matter in Long-Term Care. Data from family (N=488) and staff (N=397) from 24 NHs and RC/AL settings will be presented to shed light in five areas: differences in staff and family well-being in NHs versus RC/AL; the role of dementia in family involvement and burden; staff burden in RC/AL; fidelity decision-making related to the long-term care intervention research; and results of the trial. Among other findings presented will be that Families Matter resulted in decreased family burden and better resident quality of life, but also more family guilt and conflict, while staff reported uniformly positive outcomes including less burnout, more of a sense of working in partnership with families, and that families were more empathic (all  $p < .05$ ). The discussant will consider the findings of all presentations in the context of promoting the well-being of residents, family, and staff in long-term care.

### DIFFERENCES IN STAFF AND FAMILY WELL-BEING IN NURSING HOMES AND ASSISTED LIVING

S. Zimmerman<sup>1</sup>, L.W. Cohen<sup>1</sup>, D.A. Reed<sup>1</sup>, L.P. Gwyther<sup>2</sup>, A.S. Beeber<sup>1</sup>, P.D. Sloane<sup>1</sup>, *1. Univ North Carolina Chapel Hill, Chapel Hill, North Carolina, 2. Duke University, Durham, North Carolina*

Across the country, staff and family provide care to almost 1.5 million nursing home and 1 million assisted living residents. Staff and family well-being is important, and considering that assisted living may care for residents who might otherwise be in nursing homes, it is helpful to understand whether the setting relates to differences in well-being. In models adjusted for resident and other differences, families (N=488) from 24 settings reported more guilt and depression but less burden ( $p < .05$ ) in nursing homes, but no differences in 11 other areas; staff (N=397) reported more uplifts, absenteeism, and were more likely to recommend the workplace in nursing homes ( $p < .05$ ), but no differences in 18 other areas. Taken together, it is important to note that family and staff well-being are substantially similar across settings, although there is cause to look more closely where there are differences to understand how the setting might better improve well-being.

### FAMILIES MATTER IN LONG-TERM CARE: RESULTS OF A GROUP RANDOMIZED TRIAL

S. Zimmerman<sup>1</sup>, L.W. Cohen<sup>1</sup>, L.P. Gwyther<sup>2</sup>, D.A. Reed<sup>1</sup>, T.R. Washington<sup>1</sup>, J.G. Cagle<sup>1</sup>, P.D. Sloane<sup>1</sup>, J. Preisser<sup>1</sup>, *1. Univ North Carolina Chapel Hill, Chapel Hill, North Carolina, 2. Duke University, Durham, North Carolina*

In light of the workforce shortages in long-term care and the presence of family who want to be involved after their relative moves there, this project helped families create a specific role for themselves (related to helping the resident do things, get around, look good, eat well) in six nursing homes and 18 assisted living settings. At six month follow-up in intervention sites compared to control sites, families (N=488) reported decreased burden and better resident quality of life, but also more guilt and conflict; staff (N=397) reported less burnout, more of a sense of working in partnership with families, and that families were more empathic (all  $p < .05$ ). Findings suggest a benefit to increasing family involvement – especially for residents and families – but attention must be paid to the reasons for and ways to alleviate family members' resulting guilt and conflict.

### FAMILY AND STAFF CAREGIVERS WEIGH IN ON ROLE OF DEMENTIA IN FAMILY INVOLVEMENT AND BURDEN

L.W. Cohen<sup>1</sup>, D.A. Reed<sup>1</sup>, L.P. Gwyther<sup>2</sup>, P.D. Sloane<sup>1</sup>, A.S. Beeber<sup>1</sup>, T.R. Washington<sup>1</sup>, S. Zimmerman<sup>1</sup>, *1. Univ North Carolina Chapel Hill, Chapel Hill, North Carolina, 2. Duke University, Durham, North Carolina*

Family involvement is important to the quality of life of long-term care residents, but may create family burden and do so differently when the resident has dementia. This study asked family and staff caregivers of 467 residents from 24 nursing homes and assisted living settings about the frequency and content of family visits and related burden. Although families of all residents reported similar visit frequency, content varied based on dementia. Families of residents with dementia spent more time supporting resident care, including discussing care with staff; attending to resident hygiene, nutrition, and physical function; and helping around the community ( $p < .05$ ). Staff reported similar patterns of family involvement, but less involvement in most areas, including visitation ( $p \leq .001$ ). Independent of dementia, involvement in four activities related to higher family burden. Because some activities are more likely to increase burden, all stakeholders should be thoughtful about how families should optimize visit time.

## HOW EQUAL IS THE BURDEN? CHARACTERISTICS AND ATTITUDES OF DIRECT CARE AND ADMINISTRATIVE STAFF IN ASSISTED LIVING

A.S. Beeber<sup>1</sup>, L.W. Cohen<sup>1</sup>, S. Zimmerman<sup>1</sup>, D.A. Reed<sup>1</sup>, L.P. Gwyther<sup>2</sup>, P.D. Sloane<sup>1</sup>, 1. *Univ North Carolina Chapel Hill, Chapel Hill, North Carolina*, 2. *Duke University, Durham, North Carolina*

Residential care/assisted living (RC/AL) differs from nursing homes by having less of a hierarchical nursing structure, a difference appreciated by proponents who contend that such a hierarchy negatively affects care provision. However, no research has examined the extent to which differences exist between direct care workers (DCWs) and administrative staff (AS) in RC/AL reflective of a hierarchical structure. This analysis compared the characteristics and attitudes of direct care workers (N=250) and administrative staff (N=30) from 18 settings, and also the extent to which they related to turnover. DCWs reported worse health despite being younger, and were more often minorities; they reported poorer attitudes in many areas, including burden, frustration, depersonalization, hassles, and relations with family; of these, burden related to increased likelihood of turnover (all  $p < .05$ ). These findings suggest that RC/AL staffing is of a hierarchical nature, and may benefit from attention to the burden and frustration experienced by DCWs.

## FIDELITY DECISION-MAKING IN LONG-TERM CARE INTERVENTION RESEARCH: A CASE EXAMPLE

T.R. Washington<sup>1</sup>, S. Zimmerman<sup>1</sup>, J.G. Cagle<sup>1</sup>, L.W. Cohen<sup>1</sup>, A.S. Beeber<sup>1</sup>, D.A. Reed<sup>1</sup>, L.P. Gwyther<sup>2</sup>, P.D. Sloane<sup>1</sup>, 1. *Univ North Carolina Chapel Hill, Chapel Hill, North Carolina*, 2. *Duke University, Durham, North Carolina*

Treatment fidelity, the extent to which an intervention is delivered as intended, continues to be a methodological challenge in social and behavioral intervention research. Treatment fidelity is a particularly thorny issue in long-term care, especially when there is hope that the intervention will be translated into actual care practices, due to staff turnover, resident attrition, regulatory changes, and limited resources and space. In light of these challenges, this paper presents a case example to describe fidelity decision-making when conducting a multifaceted family involvement intervention across 12 long-term settings, including decisions related to dosing and fidelity monitoring and promotion. Various strategies and the rationale for these decisions will be discussed, such as measuring dose by staff as well as family exposure; monitoring fidelity by family report as opposed to observation; and promoting fidelity by postcard reminders. The authors conclude with recommendations for fidelity enhancing strategies in long-term care intervention research.

## SESSION 2335 (SYMPOSIUM)

### NEIGHBORHOOD AND HEALTHY AGING: A MULTI-FACTORIAL AND MULTI-CITY PERSPECTIVE

Chair: *H. Chaudhury, Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

Co-Chair: *J. Norstrand, Boston College, Boston, Massachusetts* Co-Chair: *G. Luhr, Portland State University, Portland, Oregon*

Although research on neighborhood-based factors influencing healthy aging and aging-in-place is fast growing, there is much to be

examined in terms of influencing factors, their interrelationships, associated processes and variations across diverse geographic regions. This symposium presents five recent empirical studies that present a diverse set of issues and challenges in neighborhood environmental, social, physical aspects in influencing walkability, mobility, diet, social cohesion and depression. The first study presents relationship between neighborhood resources and mobility in older adults in Philadelphia. The second study continues this theme in the specific context of food environment's role on diet-health outcomes and food consumption in older adults in Montreal. The third study reports findings on the impact of higher traffic volume on walkability, air quality and objective health indicators in Vancouver. The fourth study looked at the association of neighborhood walkability, perceived safety and social cohesion with depression among older adults in New York City. The final study explored differences in sense of community and its influencing factors in rural and urban areas of Japan. The empirical findings of these studies make a rich addition to the domain of neighborhood and health relations, and make a strong case for continued research in understanding the complexity and multi-layered nature of neighborhood-health relationship. Moreover, the associations between neighborhood-level variables and both physical and mental health outcomes are further substantiated in these studies. Relevance of the issues in five diverse urban areas across three countries underscore the global nature of the importance of neighborhood in healthy aging.

### NEIGHBORHOOD RESOURCES AND MOBILITY OF OLDER ADULTS IN PHILADELPHIA, PA

A.L. Rosso<sup>1</sup>, T. Grubestic<sup>2</sup>, A. Auchincloss<sup>1</sup>, L. Tabb<sup>1</sup>, J. Taylor<sup>1</sup>, Y.L. Michael<sup>1</sup>, 1. *Epidemiology and Biostatistics, Drexel University School of Public Health, Philadelphia, Pennsylvania*, 2. *Drexel University College of Information Science and Technology, Philadelphia, Pennsylvania*

Diversity of resources in the immediate neighborhood may influence mobility of elders. We used GIS to evaluate access to 19 neighborhood resources among 675 community-dwelling older adults living in 275 Philadelphia neighborhoods (census tracts) in 2010. Resources included, for example, churches, grocery stores, senior centers and pharmacies. Mobility was measured by the Life-Space Assessment (LSA; range: 0-104, median = 52). ZIP code in which subjects spent the most time away from home was recorded. Adjusted associations between neighborhood resources and mobility stratified by travel patterns were calculated by generalized estimating equations. Among those who stayed in their home ZIP code, access to more diverse resources was positively associated with higher LSA scores (9.9 points, 95% confidence interval: 1.2, 18.6 for most compared to least diverse neighborhoods) after adjustment for demographic characteristics and individual and neighborhood socioeconomic status. Findings suggest that neighborhood access to diverse resources supports mobility of older adults.

### NEIGHBORHOOD CHARACTERISTICS AND DEPRESSION AMONG OLDER ADULTS IN NEW YORK CITY: THE ROLE OF NEIGHBORHOOD WALKABILITY, PERCEIVED SAFETY AND SOCIAL COHESION

T. Yan<sup>1</sup>, S. Merkin<sup>2</sup>, W. Gallo<sup>3</sup>, 1. *SCAN Health Plan, Long Beach, California*, 2. *University of California Los Angeles, Los Angeles, California*, 3. *City University of New York, New York, New York*

Objectives. To examine the associations between neighborhood characteristics and depression among older adults in New York City (NYC). Methods. Data are from the 2008 Health Indicators Project, a cross-sectional survey of 1,870 older adults attending 56 NYC senior centers. Neighborhood characteristics included walkability, perceived safety,

and social cohesion. Depression was assessed using the nine item depression scale of the Patient Health Questionnaire (PHQ-9). Generalized linear models with log transformation were conducted to examine the associations between neighborhood characteristics and depression. Results. Better neighborhood walkability ( $b=-0.07$ ,  $p<.0001$ ), perceived safety ( $b=-0.03$ ,  $p=.001$ ), and social cohesion ( $b=-0.04$ ,  $p<.001$ ) were associated with a lower level of depression among older adults, adjusting for individual sociodemographic, behavioral, and biological factors. Discussion. Improvement in physical and social neighborhood environments may contribute to better mental health among older adults.

#### **THE 2010 VANCOUVER OLYMPIC GAMES AND SUSTAINABILITY IN ACTION FOR SENIORS (2010 SAS): ENVIRONMENTAL IMPACTS OF MEGA-EVENTS ON OLDER ADULTS**

H. Stewart<sup>1,2</sup>, E. Hwang<sup>3</sup>, R. Allen<sup>4</sup>, C. Lim<sup>5</sup>, R. Savage<sup>1</sup>, 1. *Department of Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*, 2. *Brain Research Centre, The University of British Columbia, Vancouver, British Columbia, Canada*, 3. *Department of Family and Consumer Sciences, University of Tennessee Martin, Martin, Tennessee*, 4. *Faculty of Health Sciences, Simon Fraser University, Burnaby, British Columbia, Canada*, 5. *Department of Civil Engineering, University of British Columbia, Vancouver, British Columbia, Canada*

The 2010 Vancouver Winter Olympics provided an opportunity to study mega-event mediated measurable changes to the built environment and their impacts on residents of the host city, including older adults. An integrated transportation plan employed during the Games resulted in significant changes to pedestrian and vehicular volumes and routes in Vancouver including neighbourhoods with relatively higher densities of older adults. It was hypothesized that these changes would have measurable impacts on neighbourhood air quality, and downstream effects on older adult residents' physical activity levels, mobility, health and overall quality of life. We collected data on functional health, quality of life, respiratory function, and physical activity from older adults residing in 2 neighbourhoods experiencing traffic changes before, during and after the Games. During the same observation periods, we monitored neighborhood walkability and air quality and conducted clinical examinations of participants to assess health impacts. Study results will be discussed.

#### **BLENDING IN A COMMUNITY THROUGH SOCIAL PARTICIPATION: HOW TO CULTIVATE THE SENSE OF COMMUNITY IN JAPANESE URBAN SENIOR RESIDENTS**

K. Katagiri<sup>1</sup>, I. Sugawara<sup>2</sup>, 1. *Institute for Social Gerontology, Nipponkoa Welfare Foundation, Tokyo, Japan*, 2. *Institute of Gerontology, the University of Tokyo, Tokyo, Japan*

The number of elderly households is increasing, especially in Japanese urban cities. Most children of elderly people live away from them; thus, the latter must live in harmony with their neighbors so that they can continue living in their familiar environments. However, they seldom interact with their neighbors and do not get very involved in their communities. This study aims to explore differences in the sense of community and determines what can enhance this sense in rural and urban areas. A random sampling survey on Japanese people aged 50–60 years was conducted in urban and rural areas in 2008. Rural residents' sense of community was better than that of their urban counterparts. Multiple regression analyses on sense of community showed that engagement in social activities positively related; its coefficient was larger for urban residents. The result suggested that social participation effectively ensures "aging in place", especially in urban areas.

#### **ASSOCIATIONS BETWEEN THE FOOD ENVIRONMENT, DIET-HEALTH AWARENESS, AND OLDER ADULTS' DIET**

G. Mercille<sup>1,4</sup>, L. Richard<sup>1,2,7</sup>, L. Gauvin<sup>4,5,6</sup>, Y. Kestens<sup>5,4</sup>, B. Shatenstein<sup>7,3</sup>, M. Daniel<sup>8,5</sup>, H. Payette<sup>9,10</sup>, 1. *Institut de recherche en santé publique de l'Université de Montréal, Montréal, Québec, Canada*, 2. *Faculty of Nursing, Université de Montréal, Montréal, Québec, Canada*, 3. *Department of nutrition, Université de Montréal, Montréal, Québec, Canada*, 4. *Department of Social and Preventive Medicine, Université de Montréal, Montréal, Québec, Canada*, 5. *Centre de Recherche du Centre Hospitalier de l'Université de Montréal, Montréal, Québec, Canada*, 6. *Léa-Roback Research Centre on Social Inequalities of Health in Montréal, Montréal, Québec, Canada*, 7. *Institut Universitaire de Gériatrie de Montréal, Montréal, Québec, Canada*, 8. *Sansom Institute for Health Research, University of South Australia, Adelaide, South Australia, Australia*, 9. *Department of Community Health Sciences, University of Sherbrooke, Sherbrooke, Québec, Canada*, 10. *Research Center on Aging, Health and Social Services Center-University Institute of Geriatrics of Sherbrooke, Sherbrooke, Québec, Canada*

This study examined associations between exposure to neighborhood food sources, awareness of diet-health outcomes, and food consumption among seniors living in Montreal in 2004 ( $n=722$ ). Proportions of fast-food outlets (FFO) relative to all restaurants and proportions of healthful food stores (HFS) relative to all stores were estimated for 500m buffers around participants' homes with GIS data. Two dietary patterns were identified from food-frequency questionnaire data. Main and interactive effects of awareness levels and food-sources exposure on diet scores were tested using separate linear regression analyses for women and men, accounting for individual- (health and socio-demographic) and area-level (socioeconomic and ethnicity) covariates. In both sexes, lower diet-health awareness was associated with poorer food consumption. Negative effects of FFO on diet scores were more pronounced among women with lower levels of awareness. Environmental and individual level factors jointly influence food consumption in older women.

#### **SESSION 2340 (SYMPOSIUM)**

##### **RESEARCH STRATEGIES TO CREATE AN AGE-FRIENDLY WORLD ONE COMMUNITY AT A TIME**

Chair: *K. Fitzgerald, Center for Gerontology, University of Zurich, Zurich, Switzerland*, *Western Kentucky University, Bowling Green, Kentucky*

Co-Chair: *D.B. Bradley, Western Kentucky University, Bowling Green, Kentucky*

Discussant: *A.O. Pelham, San Francisco State University, San Francisco, California*

This symposium will examine the international movement to form age-friendly cities which encourages municipalities to transform themselves so that they become better places to live for older people. Characteristically, these initiatives involve multiple institutional sectors. A focus on community features is a departure from aging initiatives concerned with older people as individuals. In many developed nations, the vast majority of resources in public initiatives to support older people are invested in financial security, health care, and long-term care where the focus is on individual benefits. Community features that collectively benefit residents have received much less systematic attention. The call for age-friendly community features comes at a time when the public sector has little money for new initiatives. This means that the policy tools available to encourage age-friendly community initiatives do not include major direct financial incentives. Instead, the policy tools are more likely to involve public education, regulation, enforcement, and perhaps tax incentives. After an introduction of the age-friendly cities concept developed by the World Health Organization, five case studies will be presented showcasing a variety of public policy research strate-

gies and implementation venues in the United States. Bowling Green (KY), Des Moines (IA), Philadelphia (PA), Portland (OR), and New York City (NY) have each approached the research and program implementation process slightly differently and will provide the audience a detailed discussion about how each city is using gerontological research to create collaborations among local organizations and the city government to inform public policy while making the community age-friendly.

### **ENGAGING AGING IN THE COMMUNITY: THE DEVELOPMENT OF AGE-FRIENDLY CITIES**

K. Fitzgerald<sup>2,1</sup>, D.B. Bradley<sup>2</sup>, P.H. Blanchard<sup>3</sup>, U. Tokekar<sup>2</sup>, 1. *Center for Gerontology, University of Zurich, Affoltern am Albis, Switzerland*, 2. *Western Kentucky University - Center for Gerontology, Bowling Green, Kentucky*, 3. *AARP Kentucky, Bowling Green, Kentucky*

Research utilizing an active aging framework conducted for the World Health Organization (WHO) was the basis for the development of the WHO Global Network of Age-friendly Cities. This presentation describes an age-friendly city and discusses how the outcomes of focus groups conducted in 33 cities around the world were utilized to develop core features of an age-friendly city. The case of how a small southern city, Bowling Green (KY), implemented a civic engagement model to achieve the WHO Age-friendly City status is examined. Researchers from Western Kentucky University, AARP Kentucky and the City of Bowling Green convened a “gathering” of 45 organizations and employed an engagement model focusing on citizens, voices, common ground and knowledge. Results included a decision on common issues, a commitment to support a Senior Leadership program and renewed community partnerships aimed at improving policies and informing leaders about ways to enhance Bowling Green’s age friendliness.

### **WHAT AFFECTS YOUR ABILITY TO LIVE YOUR BEST LIFE IN YOUR COMMUNITY?**

Y. Shah<sup>1</sup>, K. Sovern<sup>2</sup>, J. Olah<sup>3</sup>, 1. *Des Moines University, Des Moines, Iowa*, 2. *AARP, Des Moines, Iowa*, 3. *Aging Resources of Central Iowa, Des Moines, Iowa*

This question framed the first phase of the research effort resulting in the City of Des Moines named a WHO age-friendly city (AFC) member. Des Moines consists of 58 neighborhood associations organized into 4 wards. In late 2011 the authors initiated series of community outreach and engagement meetings, utilizing the Meridia audience response system in each of Des Moines city wards. The meetings were designed to introduce the participants to the AFC project design. We will present our baseline data of participant responses confirming congruence or acceptance with some of the WHO AFC criteria. We followed up on this by implementing a household survey administered in the City of Des Moines. We will report the results of household surveys, designed to measure 50+ year old resident attitudes about the extent to which their community meets the WHO ‘age-friendly’ criteria.

### **INTEGRATING RESEARCH INTO POLICY: THE CASE OF AGE-FRIENDLY PHILADELPHIA**

A. Glicksman, K.O. Clark, L.N. Ring, C. Hoffman, *Research, Phila Corporation for Aging, Philadelphia, Pennsylvania*

While both researchers and policy makers are often committed to the same goals, it can be difficult to bring the two groups together in an effective collaboration. Age-friendly Philadelphia (AfP), an effort of the Philadelphia Corporation for Aging, has successfully blended research (statistics, Geographic Information Systems and qualitative methods) into a policy and planning agenda on environment and aging. This presentation will illustrate how M. Powell Lawton’s “Environmental Press” model has influenced research efforts to support public policy. The example that will be used will be findings from an NINR/NIH funded study of the impact that neighborhood environments have on health outcomes of low-income older adults, called Walkability’s Impact on Senior Health (WISH). We will examine how the findings are turned into policy initiatives designed to make the city more age-friendly.

### **AGE-FRIENDLY PORTLAND: TRANSLATING RESEARCH TO COMMUNITY ACTION**

A. DeLaTorre, M.B. Neal, *Institute on Aging, Portland State University, Portland, Oregon*

In 2006-07, the Institute on Aging (IOA) at Portland State University undertook a baseline assessment of Portland’s age friendliness as a participant in the World Health Organization’s (WHO) Age-friendly Cities project. Since then, IOA researchers have disseminated findings, facilitated the City’s membership in the WHO Global Network of Age-friendly Cities, and developed partnerships aimed at improving policies and informing leaders about ways to enhance Portland’s age friendliness. This presentation describes the progress made toward the creation of an Action Plan for an age-friendly Portland and specifically addresses several key aspects of the project, including: the formation of partnerships with university, public, private, and non-profit agencies; the creation of an advisory group; participation on the Mayor’s advisory task force and consultation with the Bureau of Planning and Sustainability on the development of the Portland Plan, including a provision for Action Plan development; and identification of indicators to monitor progress over time.

### **AGE-FRIENDLY NYC**

R. Finkelstein, S. Roher, *The New York Academy of Medicine, New York, New York*

The Age-friendly NYC Initiative, formed in 2007, conducts research and evaluation to identify key needs, inform priorities, and assess effectiveness of program components. Sixty community consultations were conducted with thousands of older adults to obtain their perspectives on NYC assets and challenges; focus groups with immigrant groups were conducted in five languages to ensure cultural diversity, and; special forums were held with LGBT older adults. Aging Improvement Districts, a new model of neighborhood development piloted in three diverse neighborhoods, have been evaluated in terms of outreach, inclusion, and impact on older adults and neighborhood stakeholders. The presentation will include a discussion of findings and the challenges of translating community-based gerontological research into program and policy initiatives. Objectives: After attending this activity, participants will be able 1.To describe original research conducted with older adults in New York City; 2.To analyze how gerontological research can inform policy changes.

## **SESSION 2345 (PAPER)**

### **HEALTH CARE SERVICE, ORGANIZATION, AND TRANSITION**

#### **30-DAY READMISSION AMONG SERIOUSLY ILL OLDER ADULTS: WHY DO THEY COME BACK?**

S. Enguidanos<sup>1</sup>, E. Vesper<sup>2</sup>, K. Lorenz<sup>3</sup>, 1. *Davis School of Gerontology, University of Southern California, Los Angeles, California*, 2. *Kaiser Permanente, Downey, California*, 3. *Veterans Administration, Los Angeles, California*

Background: Hospital readmissions among seriously ill patients are extremely costly and may not align with patient preferences for care. While numerous studies have examined factors associated with hospital readmission among general populations of older adults, little is known about factors associated with readmissions among seriously ill patients receiving palliative care consultations. Methods: Retrospective secondary analysis was conducted to investigate the factors associated with hospital readmissions among patients receiving a consultation from the inpatient palliative care team. Data from 408 managed care patients 65 years old and older were collected following an inpatient palliative care consultation and subsequent hospital discharge. Results: Among inpatient palliative care patients, 10% of those discharged from the hospital were readmitted within 30 days. Factors associated with hospital

readmission included being discharged from the hospital with no care in the home or to a nursing facility. There was a weak association for those who did not have an advance directive ( $p=.06$ ) having greater odds of hospital readmission. Having a close family member as primary emergency contact was marginally associated with lower odds of readmission compared with those with either a friend or distant relative or no emergency contact ( $p=.09$ ). Conclusions: Having hospice or home-based palliative care post-discharge was associated with significantly lower odds of hospital readmission, suggesting continuity of palliative care is an important factor in reducing hospital readmissions. Implications of these readmissions on quality and costs of care will be discussed along with need for future research on new models of care to improve continuity.

#### **HEALTH CARE EXPERIENCES OF MEDICARE/MEDICAID-ELIGIBLE OLDER ADULTS IN CONNECTICUT: A QUALITATIVE STUDY**

N. Shugrue<sup>1</sup>, P. Higgins<sup>1</sup>, K. Ruiz<sup>1</sup>, M. Price<sup>2</sup>, J. Robison<sup>1</sup>, 1. *University of Connecticut Center on Aging, Farmington, Connecticut*, 2. *Health Policy Matters, Newton, Massachusetts*

In 2011, the Centers for Medicare & Medicaid Services awarded “State Demonstration Grants to Fully Integrate Care for Dual Eligible Individuals” (Medicare and Medicaid) to 15 states, including Connecticut. To inform the design of an integrated health and social service demonstration program to better coordinate care for the state’s dually eligible individuals age 65 and older, researchers conducted eight focus groups with 71 individuals across the state: six with community-dwelling individuals age 65+, both healthy and with chronic disease or disability; one with nursing home residents; and one with family members of individuals with chronic disease or disability. One of the community-dwelling focus groups was conducted with Spanish-speaking individuals. Results from the wide range of experience and opinion were clustered in four domains: current experiences, care coordination, consumer protection, and elements of an ideal health care and service program. Findings concern satisfaction with and ability to find medical care, transition issues from hospitals and nursing homes, the significant role of pharmacists, care managers, and services coordinators, attitudes about healthcare, and the role of family. Significant issues noted include difficulty of finding providers who accept Medicare/Medicaid, confusion and anger around co-pays, missing services, age and racial/ethnic discrimination, lack of knowledge about patient rights and complaint procedures, and lack of care coordination. Desired elements of an improved or ideal system include greater choice in medical and home care providers, increased communication and coordination among providers and between medical and home care services, transportation options for medical care, and increased support to families.

#### **UNDERSTANDING LONG-TERM CONSEQUENCES OF SENTINEL INJURY: ACCOUNTING FOR DEATH**

Y. Shih<sup>1</sup>, F. Porell<sup>1</sup>, M. Carter<sup>2</sup>, 1. *Gerontology Department, University of Massachusetts Boston, Boston, Massachusetts*, 2. *Department of Health Science and Applied Gerontology Program, Towson University, Towson, Maryland*

Sentinel injury among older adults accounts for a large portion of Medicare service utilization and associated expenses in a longer run. Research to date has expanded its focus from event-specific outcomes to long-term consequences of injury. However, since longitudinal analyses of health outcomes other than mortality are commonly performed on data for a subset of survivors with complete data, health trajectories following injury may not fully reflect the health impacts of sentinel injury. To examine for the effects of death on health trajectories of older adults, longitudinal individual growth models of health outcomes were estimated with panel data from the Medicare Current Beneficiary Survey (1998-2005), adjusting for differences in socio-demographic factors, individual health behaviors, and prevalent comorbidities. The

impacts of sentinel injury were measured from discontinuities in estimated trajectories following injury. Health outcome scales for self-reported health and functional status outcomes containing values for decedents were developed from Markov transition models. Empirical findings suggest that health declines significantly over a year after sentinel injury compared with the pre-injured period. In addition, the rate of decline after injury is faster after accounting for deaths. The results suggest that for older persons there are substantial long-term health and functional status impacts of injury, and these impacts are underestimated when decedents are omitted from the analysis.

#### **COMING HOME: A RESEARCH PROJECT EXPLORING AND SUPPORTING OLDER ADULT TRANSITIONS FROM HOSPITAL TO HOME**

A.G. Zakrajsek<sup>1</sup>, E. Schuster<sup>1</sup>, J. Grosh<sup>4</sup>, L. Senawi<sup>2,4</sup>, 1. *School of Health Sciences, Eastern Michigan University, Ypsilanti, Michigan*, 2. *ChelseaCare Home Health, Chelsea, Michigan*, 3. *Saint Joseph Mercy Health System, Chelsea, Michigan*, 4. *Chelsea Community Hospital, Chelsea, Michigan*

With the combined realities of an aging population, greater incidence of people living longer with health issues, and increasing pressure on a healthcare system to provide cost-effective yet comprehensive care, more attention has been placed on older adults as they travel through the health care continuum. Transitioning from one healthcare service to another can raise specific challenges for older adults that impact their health and participation. The aim of this project was to explore transitions of older adults through the health care system, specifically from a hospital or sub-acute setting to home with rehabilitative services in order to develop transition supports. This project grew out of a partnership between university researchers and directors of older adult services at a local hospital and home health agency. Partners used a participatory action research approach to guide the project and employed qualitative research methods to target the aim of the work. Thirteen in-depth interviews and six in-home observations were conducted with older adults who had transitioned home and rehabilitation professionals working with older adults in their homes. Findings indicate key supports were critical to successful transitions, suggest choice and control for older adults as a mitigating factor to transitions, and have implications for changes in service provision in home health services as well as community services in order to improve older adults transitioning home from a hospital stay. Resources to support transitions based upon research findings through the project will be shared with participants during this presentation.

#### **CHRONIC KIDNEY DISEASE AND OLDER ADULTS: A REVIEW OF THE AGING LITERATURE**

T.R. Washington<sup>1</sup>, T. Hilliard<sup>2</sup>, 1. *Social Work, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 2. *Public Health, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

**PURPOSE:** Adults age 65 and older are the fastest growing segment of the chronic kidney disease (CKD) population, constituting over 40 percent of prevalent cases. In light of this, the authors reviewed ten years of publications to determine the extent that the aging literature contains research about older adults with CKD and offers implications for future research and practice. **METHODS:** Titles and abstracts of articles published between 2002 and 2011 in AgeLine were reviewed using “kidney”, “renal”, and “neph\*” as search terms. Publications were excluded if there was no apparent relevance to CKD. **RESULTS:** Using the search terms within this time period, the initial search yielded 310 publications. After imposing additional exclusion criteria (e.g., publication type), this number was reduced by 57 percent. Research topic areas included caregiving, end-of-life, cultural awareness, and decision making. **IMPLICATIONS:** There is a gap in research about older

adults with kidney disease. The aging literature should better inform research and practice with this high-risk and vulnerable population.

## SESSION 2350 (SYMPOSIUM)

### NEW FRONTIERS IN AGING RESEARCH: DOES THE HYPOTHALAMUS REGULATE AGING AND AGE-RELATED DISEASE?

Chair: C. Mobbs, Mount Sinai School of Medicine, New York, New York

Co-Chair: C. Mobbs, Mount Sinai School of Medicine, New York, New York  
Co-Chair: H. VanGuilder Starkey, Penn State College of Medicine, Hershey, Pennsylvania

This symposium is designed to introduce the audience to potentially new areas of aging research that have received little attention to date but may have the ability to profoundly change how we view and study aging. The proposed symposium for 2012 brings together speakers that are conducting research on hypothalamic POMC and AgRP neurons that have been shown to regulate feeding as well as insulin and glucose sensitivity through modulation of sympathetic neuronal activity. Modulation of these neurons early during the lifespan, in response to interventions that modulate aging and/or age-related disease, or later in life has the potential to influence both health-span and lifespan. This symposium will introduce this novel topic area to the audience and discuss opportunities for future research.

### NUTRIENT-SENSITIVE HYPOTHALAMIC NEURONS: ROLE IN AGING AND DIETARY RESTRICTION

C. Mobbs, Charles Mobbs, Charles Mobbs, New York, New York

The first function of hypothalamic neurons to be understood was the regulation of energy balance, since in humans and animal damage to the ventromedial hypothalamus produces profound obesity. Subsequently activity of hypothalamic neurons was shown to be regulated by glucose, insulin, and, more recently, leptin, all of which serve to indicate the availability of nutritional resources. Dietary restriction reduces these reporters of nutritional resources, suggesting a role for hypothalamic neurons in mediating protective effects of dietary restriction. The importance of hypothalamic neurons in regulating lifespan was also suggested by evidence that reducing pituitary activity (driven by hypothalamic activity) increases lifespan. Hypothalamic neurons also determine activity of insulin-like signaling, now known to regulate lifespan across the animal kingdom. Finally expression of hypothalamic creb-binding protein (Cbp) and associated transcription factors specifically in the hypothalamus predicts lifespan in mice, and inhibition of Cbp blocks protective effects of dietary restriction.

### HUNGER-PROMOTING HYPOTHALAMIC NEURONS REGULATE HIGHER BRAIN FUNCTIONS AND LIFESPAN

T. Horvath, M. Dietrich, Yael University, New Haven, Connecticut

Empirical evidence points to the hypothalamus as a critical regulator of the adaptation of the CNS to the changing environment in support of survival. This information, when analyzed didactically, leads to the conclusion that specific subsets of hypothalamic neurons are critical and mandatory upstream regulators of brain regions classically considered as master determinants of CNS function, such as the cortex and hippocampus. The regulatory role of the hypothalamus in cortical and hippocampal functions is asserted via classical neuronal pathways, and by the regulation of peripheral tissue output in the form of hormones and nutrients. When the hierarchical relationship between various brain regions and peripheral tissues are reconsidered, a new viewpoint on the brain, its functions and relationship to integrative physiology and disease becomes apparent. In this review, I argue that the approach of physiological and pathological aspects of brain and whole body functions from this new perspective will offer previously

unsuspected possibilities to better understand the etiologies of various brain disorders, degenerative processes as well as unresolved issues relating to aging.

### ROLE OF HYPOTHALAMIC NEUROCIRCUITS IN CONTROL OF METABOLISM

J.C. Bruening, Max Planck Institute for neurological research, Koeln, Germany

Hormonal signals such as leptin and insulin instruct the hypothalamus about energy availability in the periphery of the organism. Based on these signals hypothalamic neurons adapt their activity in order to provide output signals in control of food intake, energy homeostasis but also fuel partitioning in different peripheral organs. A major constituent of this circuitry comprises the melanocortin system. Here anorexigenic pro-opio melanocortin (POMC) expressing neurons increase their activity upon energy availability to release the neuropeptide  $\alpha$ -MSH. The action of POMC neurons is antagonized by neighbouring the Agouti-related peptide (AgRP) expressing neurons, which are activated upon fasting. We have recently demonstrated that insulin targets both AgRP and POMC neurons in order to efficiently suppress hepatic glucose production. Moreover, age-related and obesity-induced inhibition of insulin and leptin action in those neurons contributes to the development of type 2 diabetes mellitus. Collectively, these experiments indicate an important role for hypothalamic neurons in control of metabolic homeostasis and dysregulation of this circuitry contributes to the onset of age-related diseases such as type 2 diabetes mellitus.

### NEUROENDOCRINE REGULATION OF THE CALCINEURIN/CRTC1 LONGEVITY CIRCUIT IN C. ELEGANS AND MICE

C. Riera<sup>1,2</sup>, P. Follett<sup>1,2</sup>, M. Huising<sup>1</sup>, W. Mair<sup>1,2,3</sup>, A. Dillin<sup>1,2</sup>, 1. The Salk Institute for Biological Studies, La Jolla, California, 2. Howard Hughes Medical Institute, Chevy Chase, Maryland, 3. Harvard School of Public Health, Boston, Massachusetts

The CREB-regulated transcriptional coactivator CRTC1 is a central regulator of energy balance, ER homeostasis and longevity. However, insights into the molecular inputs into CRTC-1 regulation have been limited to the proximal AMPK and Calcineurin regulators, leaving distal, environmental regulators largely unknown. We have discovered that chemosensory-expressed transient receptor potential vanilloid (TRPV) receptors function upstream of Calcineurin to regulate the longevity output of CRTC1 in *C. elegans*. This indicates that a subset of chemosensory neurons utilizes a TRPV calcium signaling cascade to adjust the worm metabolism with environmental conditions by modulating CREB activity, resulting in altered lifespan. To address whether these signals of youth were also conserved in mammalian sensory circuits, we investigated whether the ion channel TRPV1, ortholog to worm TRPV channels, regulates metabolism and longevity in mice. TRPV1 is expressed in afferent sensory neurons of the spinal cord and dorsal root ganglia which provide innervation to viscera. Our data show that TRPV1 knockout mice have increased glucose tolerance and display a youthful metabolic profile at old age. In particular, TRPV1 sensory neurons regulate insulin secretory mechanisms in the pancreatic beta cells. The ongoing lifespan analysis already indicates a strong increased longevity of the TRPV1 knockout mice at 800 days. Taken together these findings show that TRPV channels function in sensory neurons as an evolutionary conserved system integrating multiple sensory inputs and transducing them into neuroendocrine signals that promote longevity by adjusting the metabolic activity through the Calcineurin/CRTC1 circuit. This study was funded by the Glenn Foundation, Howard Hughes Medical Institute and the Swiss National Foundation.

## SESSION 2355 (SYMPOSIUM)

### HOARDING DISORDER IN OLDER ADULTS: NEW DIRECTIONS IN INTERDISCIPLINARY RESEARCH

Chair: *M. Eckfield, UCSF School of Nursing, San Francisco, California*

Hoarding Disorder (HD) is defined as the acquisition of and failure to discard a large number of items to the extent that it limits use of one's home and causes functional impairment and distress. HD affects individuals of all ages, but research has shown that symptoms worsen as adults age and that older adults are disproportionately affected by HD. Research on HD has accelerated over the past two decades, but few of these studies have focused specifically on older adults. In this symposium, an interdisciplinary team of researchers will present findings that chart new directions in the understanding of HD in older adults. There are three presentations in this program. A Grounded Theory qualitative study of older adults with HD provides evidence that there may be at least two different types of hoarding behaviors with distinct patterns and characteristics. A study of neurocognitive functioning demonstrates there are variations among hoarding study participants, their unaffected family members, and healthy controls, and provides evidence that those with HD have difficulties with specific executive functions. Building on these findings, a treatment intervention designed to address and strengthen areas of cognitive dysfunction in older adults has been implemented, and initial findings from this intervention study are presented.

### PATTERNS OF HOARDING BEHAVIORS IN OLDER ADULTS

*M. Eckfield, M.I. Wallhagen, UCSF School of Nursing, San Francisco, California*

Few qualitative studies have been conducted to develop our understanding of hoarding disorder (HD) in older adults. The purpose of this Grounded Theory study was to describe the hoarding behaviors of older adults. Twenty-two participants with HD (age 65-91,  $M=74$ ) were interviewed and verbatim transcripts were analyzed using Atlas Ti software. Two patterns or types of hoarding emerged. One type ( $n=9$ ), the "Impulsive Acquirers", is characterized by a pattern of positively-reinforced, impulsive acquisition whereby individuals bring home large quantities of items. A second type ( $n=13$ ), the "Worried Keepers", is characterized by less acquisition and more worry about making mistakes, so items are retained rather than discarded. "Keeper" individuals described struggles with executive function tasks such as organizing and problem solving, and felt isolated and depressed as a result of living in crowded home environments. These two types suggest there are variations in psychiatric co-morbidities and neurocognitive performance.

### COGNITIVE REMEDIATION AND EXPOSURE BASED TREATMENT FOR GERIATRIC HOARDING DISORDER

*C. Ayers<sup>1,2</sup>, S. Saxena<sup>2</sup>, J. Wetherell<sup>1,2</sup>, 1. VA San Diego Healthcare System, San Diego, California, 2. UC San Diego, San Diego, California*

A recent investigation utilizing a newly developed approach combining cognitive rehabilitation and exposure therapy for hoarding has produced promising outcomes in geriatric hoarding patients (Ayers et al., unpublished). In an open label trial of 12 older adults with Hoarding Disorder (mean age 66.58), symptoms improved an average of 36% on the Savings Inventory- Revised (SI-R; Frost et al., 2004) and 40% on the UCLA Hoarding Severity Scale (UHSS; Saxena et al., 2007). Further, clinician global improvement (Guy, 1976) was rated "very much improved" for most participants. This is noteworthy given that older adults failed to respond to the standard, manualized cognitive-behavioral therapy protocol for hoarding (Steketee & Frost, 2007) improving only 19% on the UHSS and SI-R (Ayers et al., 2010). Specific modules of the treatment and directions for future research will be presented.

### EVIDENCE OF NEUROCOGNITIVE ABNORMALITIES IN OLDER ADULTS WITH HOARDING DISORDER

*C. Mathews<sup>2</sup>, R. Mackin<sup>2</sup>, M. Eckfield<sup>1</sup>, C. Egan<sup>2</sup>, S. Fekri<sup>2</sup>, 1. UCSF School of Nursing, San Francisco, California, 2. UCSF Department of Psychiatry, San Francisco, California*

Individuals with Hoarding Disorder (HD) exhibit difficulties with executive functioning, however HD-specific neurocognitive profiles have not yet been established. The purpose of this study was to compare neurocognitive functioning among individuals who hoard, their unaffected family members and healthy controls. ANOVA procedures were conducted to compare neurocognitive performance among individuals with HD ( $N=12$ , age 47-74,  $M=59$ ), unaffected family members ( $N=12$ , age 47-80,  $M=58$ ) and healthy controls ( $N=28$ , age 61-72,  $M=67$ ), controlling for age, education, and level of anxiety. Those with HD had significantly lower scores on measures of visual learning compared with family members and controls. Surprisingly, both HD and family participants showed significantly greater difficulty on measures of visual categorization and problem solving compared to controls. These findings support the conceptualization that visual learning and categorization/problem solving are core characteristics of HD and also suggest there may be an intermediate HD genetic phenotype.

## SESSION 2360 (SYMPOSIUM)

### HONORING THE CONTRIBUTIONS OF ELAINE BRODY: "WOMEN IN THE MIDDLE" REVISITED

Chair: *K. VanHaitma, Polisher Research Institute, North Wales, Pennsylvania*

Discussant: *E. Brody, Polisher Research Institute, North Wales, Pennsylvania*

Research on caregiving was spearheaded by Elaine Brody in the 1980's. Her ground breaking concept of "women in the middle" (Brody, 1981) examined women in midlife that were the primary caregivers for older relatives while coping with complicated lifestyles that may have included employment, housework and the care of dependent children. From this work, a huge body of research has evolved over the past 30 years. In keeping with the theme of GSA "Charting New Frontiers in Aging", the primary objective of this symposium is to honor the work of Ms. Brody and provide an overview of the knowledge base in the field her work inspired. Each presenter will examine a different aspect of caregiving research, providing an overview of what we have learned from past work in that area, what comprises the current state of the art, and what "new frontiers" remain to be explored by future generations of caregiving researchers and clinicians. Dr. Rachel Pruchno's presentation will provide an overview the knowledge base of basic caregiving research, including advancements in outcome measurement and innovative methodological approaches to research. Dr. Laura Gitlin's presentation will focus on a summary of evidence-based interventions related to caregiving. Ms. Avalie Saperstein's presentation will provide an overview of current state of the art in the translation of evidence-based practices in the context of social service agencies tasked with formally supporting caregivers. Finally, Dr. Steve Albert's presentation will focus on how employers have responded to issues related to caregiving by their workforce.

### CAREGIVING RESEARCH: PAST, PRESENT, & FUTURE

*R.A. Pruchno, New Jersey Institute for Successful Aging, University of Medicine & Dentistry School of Osteopathic Medicine, Stratford, New Jersey*

Caring for another person is the sine qua non of primary relationships, and in later life, caregiving relationships assume a variety of forms, including adult children caring for aging parents, spouses and adult siblings caring for one another, grandparents caring for grandchildren, and parents caring for adult children with physical or emotional disabilities. This presentation begins with an overview of what we know about the

physical and emotional health of caregivers and care recipients, highlighting the theories and findings developed since Brody's ground breaking work in 1981. It profiles today's caregivers, exploring changes in the caregiving experiences that have ensued during the recent decades and identifies new trends likely to develop during the next decades. It concludes by suggesting that the next generation of research requires paradigm shifts in the theories used to understand caregiving and the methodological designs employed to understand and ultimately improve the lives of caregiving families.

#### **WOMEN IN THE MIDDLE REVISITED: RESPONSIBILITIES TO CHILDREN, OLDER PARENTS, AND EMPLOYERS**

S.M. Albert, R. Schulz, *Behavioral & Community Health Sciences, University of Pittsburgh, Pittsburgh, Pennsylvania*

About 42 million Americans provide care to an older person with an ADL limitation. Half are employed, and 69% report a need to make accommodations at work because of caregiving responsibilities. In the MetLife Study of Working Caregivers and Employer Health Care Costs (2010), we examined the experience of 17,097 U.S. employees of a major multinational manufacturing corporation. Nearly 12% of these employees reported caregiving for an older person. Caregiving employees reported poorer health and more chronic disease than non-caregivers, leading to an 8% increase in health care costs and potentially costing U.S. employers an extra estimated \$13.4 billion per year. Younger women were particular at risk and reported more stress, less attention to their own health care, and greater impact on work performance. These findings suggest women are especially hard hit by childcare, eldercare, and work responsibilities.

#### **HOW CAN WE SUPPORT WOMEN-IN-THE MIDDLE? THE EVIDENCE AND NEXT STEPS**

L.N. Gitlin, *School of Nursing, Johns Hopkins University, Baltimore, Maryland*

Ms. Brody's ground breaking work in 1981 helped launch 30 years of critical caregiver intervention research. This paper reviews evidence from robust randomized trials and identifies new research needs. Effective interventions tend to be client-centered, and involve active engagement, multi-components, tailoring, longer or episodic exposure over duration of care, and match dose/intensity to risk profiles/needs. Despite their promise, most interventions have involved small sample sizes (<600), used non-probability sampling, are geographically limited and unrepresentative of diverse families, include limited outcomes, involve mostly dementia caregivers, and are not aligned with population-based evidence of caregiver needs. Also, societal-level interventions are limited. Most women-in-the-middle remain underserved, have unmet needs or receive non-evidence-based services from untrained health/human service professionals. Next generation of interventions must adopt a broader view of caregiving and care contexts to include care transitions, different chronic diseases and care needs across the continuum of care to fully embrace Ms. Brody's vision.

#### **CAREGIVER SUPPORT PROGRAMS: WHAT EXISTS AND FUTURE PROGRAM DESIGN**

A.R. Saperstein, *Consultant, Meadowbrook, Pennsylvania*

The pioneering caregiver research by Ms. Brody has been translated into a vast and diverse array of services addressing caregivers' multi-dimensional needs. This paper summarizes these programs by the services provided, the caregiver cohorts addressed and the sponsoring entities which include government, foundations, private organizations, religious institutions and major health and social services organizations. It highlights the National Family Caregiver Support program authorized by the Older American Act. Exemplary programs offering multiple services that are flexibly used to benefit caregivers' unique needs will be discussed. Recommendations will be offered as to programs for

the future including the role of the WEB and WEB 2.0 social networking.

### **SESSION 2365 (SYMPOSIUM)**

#### **HOW MAJOR LIFE EVENTS CHALLENGE OUR SELF-REGULATION SYSTEM**

Chair: F.J. Infurna, *Institute of Psychology, Humboldt University, Berlin, Germany, The Pennsylvania State University, University Park, Pennsylvania, DIW Berlin, Berlin, Germany*

Co-Chair: D. Gerstorf, *Institute of Psychology, Humboldt University, Berlin, Germany*

Developmental changes in well-being across the adult lifespan may not necessarily be tethered to chronological age, but best characterized vis-à-vis major life events such as bereavement, unemployment, disability, or death. Our objective is to bring together a collection of papers using prospective longitudinal data to examine how major life events challenge our self-regulatory system across the adult lifespan. Infurna and colleagues utilize data from the national Health and Retirement Study to investigate how depressive symptoms change with the experience of and adaptation to cancer diagnosis and illustrate the importance of adaptive capabilities as resources in the process. Wethington targets how life turning points are linked to perceived health and psychological distress in adulthood and reports that stressful life events experienced both in the recent and more extended past are independently associated with depressive symptoms. Lucas and colleagues use data from an Australian panel survey to examine how multiple well-being indicators change in relation to major life events and utilize propensity score matching procedures that allow for comparisons with control groups who have not experienced the event. Heckhausen and colleagues use data from a national German study to examine how perceived control acts as a resource people can draw upon when faced with a major challenge such as unemployment. The discussion by Ursula Staudinger integrates the four papers, highlights the potentials and limits of self-regulation in the context of major life events, and considers future routes of inquiry.

#### **THE NATURE AND CORRELATES OF CHANGE IN DEPRESSIVE SYMPTOMS WITH CANCER DIAGNOSIS: REACTION AND ADAPTATION**

F.J. Infurna<sup>2,1,3</sup>, D. Gerstorf<sup>1,2,3</sup>, N. Ram<sup>2,3,4</sup>, 1. *Institute of Psychology, Humboldt University, Berlin, Germany*, 2. *The Pennsylvania State University, University Park, Pennsylvania*, 3. *DIW Berlin, Berlin, Germany*, 4. *Max Planck Institute for Human Development, Berlin, Berlin, Germany*

Major life events, such as cancer diagnosis, may trigger change processes in well-being. Using longitudinal data from individuals in the Health and Retirement Study (N=2,848; Mage=69, 46%women) who dealt with cancer, we examine how depressive symptoms change in relation to the cancer diagnosis event and whether socio-demographic variables, cognitive and health resources, and cancer-specific mortality risks moderate event-related reaction and adaptation. On average, individuals experienced significant increases in depressive symptoms within two years of cancer diagnosis, still elevated levels two years post diagnosis, and smaller increases post-diagnosis relative to the increases observed pre-diagnosis. Better memory and lower cancer-specific mortality risks were protective against shorter-term reactive increases and associated with better long-term 'adaptation'. Results indicate that people often have the adaptive capabilities to adjust to the challenges accompanying cancer diagnosis and illustrate the utility of using natural experiments such as major life events as a paradigm for studying developmental change processes.

## LIFE TURNING POINTS, STRESSFUL LIFE EVENTS, AND PSYCHOLOGICAL HEALTH AMONG OLDER US ADULTS

E. Wethington, *Human Development, Cornell University, Ithaca, New York*

Using measures based on Wethington (2000), Sutin, Costa, Wethington and Eaton (2010) showed that perceptions of stressful life events as “life turning points” are associated with perceived health and psychological distress. In an independent national telephone sample of adults age 50-95, participants were asked to describe their most recent and “earliest” life turning points and to respond to a stressful life events list. Turning points were coded for negative, positive, mixed, and neutral content. Recent negative events that were perceived as life turning points were related more strongly to depressive symptoms than events not perceived as life turning points. Negative events and chronic stressors from childhood and adolescence that were perceived as life turning points were also significantly associated with depressive symptoms. Those who reported that their most recent life turning point was a positive event or transition reported fewer recent negative life events and more positive social relationships.

## CLARIFYING THE EFFECTS OF MAJOR LIFE EVENTS ON SUBJECTIVE WELL-BEING

R.E. Lucas, S.C. Yap, I. Anusic, *Psychology, Michigan State University, East Lansing, Michigan*

Previous research has used large-scale panel studies to examine how people react and adapt to major life events like marriage, widowhood, unemployment, and the onset of disability. The current study replicates and extends this work using an Australian panel study that allows for the investigation of a broader set of events and a broader range of well-being measures (life satisfaction, positive affect, and negative affect) than have previously been studied. In addition, we use analytic techniques that model nonlinear trajectories to get a more accurate picture of the changes that occur following these life events. Finally, we use propensity score matching procedures that allow for comparisons with comparable control groups who have not experienced the event. Although basic findings regarding changes that occur following major life events were replicated in this new sample, these new analytic procedures challenge some existing interpretations of the evidence for adaptation that has been found.

## PERCEIVED CONTROL FACILITATES ADJUSTMENT TO UNEMPLOYMENT: FINDINGS FROM THE GERMAN SOCIO-ECONOMIC PANEL STUDY (SOEP)

J. Heckhausen<sup>1</sup>, F.J. Infurna<sup>2,3,4</sup>, D. Gerstorf<sup>4,2,3</sup>, N. Ram<sup>2,3,4</sup>, J. Schupp<sup>3,6</sup>, G.G. Wagner<sup>3,5,7</sup>, *1. Psych & Soc Beh, UC Irvine, Irvine, California, 2. Pennsylvania State University, University Park, Pennsylvania, 3. German Institute for Economic Research (DIW), Berlin, Berlin, Germany, 4. Humboldt University, Berlin, Berlin, Germany, 5. Max Planck Institute for Human Development, Berlin, Berlin, Germany, 6. Free University of Berlin, Berlin, Berlin, Germany, 7. Berlin University of Technology (TUB), Berlin, Berlin, Germany*

Perceived control is important for guiding individuals' control striving towards opportunity-rich domains of life and a resource in the face of obstacles. Using data from the German Socio-Economic Panel Study (N = 413, M Age = 41, 48% women), we examine how perceived control changes with unemployment, explore between-person difference factors in moderating such change, and investigate whether levels of control prior to and unemployment-related control change predict post-unemployment outcomes. Results indicate that control remained, on average, relatively stable with unemployment, but there were sizeable between-person differences in such change. Women and participants with fewer years of education experienced stronger declines in control. Regarding life satisfaction, steeper unemployment-related control declines and low levels of control prior to unemployment were associated with lower levels of life satisfaction in the years following unem-

ployment. We discuss possible pathways by which control facilitates adjustment to unemployment and suggest routes for further more mechanism-oriented inquiry.

## SESSION 2370 (SYMPOSIUM)

### IMPACT OF AGE-RELATED VISION LOSS: INTERVENTION OPPORTUNITIES FOR OLDER ADULTS AND THEIR FAMILIES

Chair: *V. Cimarolli, Jewish Home Lifecare, New York, New York*  
Co-Chair: *G. Zijlstra, University of Maastricht, Maastricht, Netherlands*

Discussant: *A. Horowitz, Fordham University, New York, New York*

Low vision is a common age-related chronic condition associated with increased functional disability, depression, mobility problems, falls, and mortality risk. Community-based vision rehabilitation services/interventions are designed to alleviate these negative effects of vision loss and aim to enhance independence and quality of life. Studies evaluating the effectiveness of these services have produced mixed results because of a lack of standardized intervention protocols and use of RCTs. Furthermore, the role of caregivers in the process is understudied. The aim of the symposium is to present new data - from studies conducted in the Netherlands, Germany and the US - on the impact of low vision on older adults' quality of life, on outcomes of standardized vision rehabilitative interventions, and the role of family members in the vision rehabilitation process. First, data on the impact of low vision on health-related quality of life, including depression, anxiety and social support interactions of older adults will be presented. The second presenter will report on a RCT that tested the potential of problem-solving therapy for affecting depression and rehabilitation in older adults with vision impairment. The third paper will focus on the outcomes of a formative evaluation of a psychosocial consultation program. The final presentation will give results from a longitudinal study focusing on the effects of social support (instrumental support receipt and perceived overprotection) on vision rehabilitation service use among older adults and will discuss the role of family caregivers in the rehabilitation process. Our discussant will facilitate a discussion on-site.

### IMPACT OF LOW VISION ON OLDER ADULTS' HEALTH-RELATED QUALITY OF LIFE

G.I. Kempen<sup>1</sup>, J. Ballemans<sup>1</sup>, A.V. Ranchor<sup>2</sup>, G.H. van Rens<sup>3</sup>, G. Zijlstra<sup>1</sup>, *1. CAPHRI - Dept. of Health Services Research, Maastricht University, Maastricht, Netherlands, 2. University of Groningen, Groningen, Netherlands, 3. VU University Medical Center, Amsterdam, Netherlands*

The objective of this study was to examine the impact of low vision on health-related quality of life, including feelings of anxiety and social support, among community-living older adults seeking vision rehabilitation services. Differences of activities of daily living, symptoms of depression and feelings of anxiety and social support between 148 older persons  $\geq 57$  years with low vision and a reference population (N=4792) including eight patient groups with different chronic conditions were tested. Older persons with vision loss reported poorer functioning with respect to activities of daily living, symptoms of depression and feelings of anxiety as compared to the general older population as well as compared to older patients with different chronic conditions. In contrast, older persons with vision loss reported higher levels of social support. Professionals working at vision rehabilitation services may improve their quality of care as they take such information into account in their intervention work.

## TREATMENT OF DEPRESSION IN OLDER ADULTS WITH VISION IMPAIRMENT

J. Reinhardt<sup>1</sup>, A. Horowitz<sup>2</sup>, 1. *Research Institute on Aging, Jewish Home Lifecare, New York, New York*, 2. *Fordham University, New York, New York*

Depression is a major health problem strongly associated with disability among older adults, and affecting about one-third of those with age-related vision loss. This study describes a randomized trial comparing Problem Solving Treatment (PST) to a Social Contact intervention for 42 visually impaired older adults with subthreshold or mild major depression. While recruitment was difficult, those who did participate in the therapy completed their treatment schedule, and had very positive feedback. Data on depression diagnosis and symptoms were collected at baseline, 11-weeks later (following intervention), and 3 months post intervention. Results showed that controlling for baseline status, there was a significant change (decrease) in depression from T2 to T3, and trends for greater rehabilitation service use for the PST group compared to the control group. Implications of using PST to address depression are presented.

## EVALUATION OF A PSYCHOSOCIAL COUNSELING PROGRAM FOR VISUALLY IMPAIRED ELDERLY: INTRODUCING THE ASSESSMENT AND FIRST FINDINGS

I. Himmelsbach<sup>1</sup>, F. Oswald<sup>1</sup>, S. Driebold<sup>1</sup>, A. Franke<sup>1</sup>, F. Esch<sup>2</sup>, K. Metzler<sup>2</sup>, J. Nagel<sup>3</sup>, 1. *Interdisciplinary Ageing Research, Goethe University Frankfurt, Frankfurt, Germany*, 2. *Foundation for the Blind and Visually Impaired, Frankfurt, Germany*, 3. *Blindenstudienanstalt/German Institute for the Blind (blista), Marburg, Germany*

The program presented was developed and refined within a sequential qualitative process. It consists of intertwined segments of exploration of clients' needs and networks and individualized counseling. An outcome evaluation is in progress. The aims of this presentation are (1) to present the evaluation program and instruments and (2) to show subjective evaluations and objective effects of the program. The results presented are based on 50 participants; interviewed in a pre-post design at three measurement points with measures on e.g., adaptation to vision loss, quality of life, well-being, hope, and a subjective evaluation of the counseling program. Findings show small effects on objective impact, e.g., on stability of quality of life, but differentiated patterns of subjective evaluations by the participants including affective responses. Although objective effects remain low, subjective evaluations seem to fit well with individual needs and the impact of the program on emotional stability despite objective decline.

## FAMILY CAREGIVERS' ROLE IN THE VISION REHABILITATION PROCESS

V. Cimarolli<sup>1</sup>, J. Reinhardt<sup>1</sup>, A. Horowitz<sup>2</sup>, K. Boerner<sup>1</sup>, 1. *Jewish Home Lifecare, New York, New York*, 2. *Fordham University, New York, New York*

This longitudinal study involved in-person interviewing of 584 older adults with recent vision loss at baseline, at 6-months and at 12-months to determine the role of family caregivers in the utilization of vision rehabilitation services. Employing a Latent Growth Curve Methodology, results demonstrated that older adults initially high on instrumental support tended to receive more rehabilitation hours with family members present (covariance estimate = 3.02, SE = .51,  $t = 5.89$ ) whereas those initially high on perceived overprotection tended to receive more hours alone (covariance estimate = 3.71, SE = 1.75,  $t = 2.12$ ) between baseline and the 6-month follow-up. The findings illustrate the influence of family caregivers on the utilization mode (with or without family members present) of vision rehabilitation and underscore the importance of integrating family caregivers into the vision rehabilitation process. Specific intervention opportunities, such as psycho-educational caregiver support group programs will be discussed.

## SESSION 2375 (SYMPOSIUM)

### INTERGENERATIONAL RELATIONSHIPS IN GLOBAL CONTEXT

Chair: J. Fast, *Department of Human Ecology, University of Alberta, Edmonton, Alberta, Canada*

Co-Chair: H. Kendig, *University of Sydney, Sydney, New South Wales, Australia*

Discussant: J. Fast, *Department of Human Ecology, University of Alberta, Edmonton, Alberta, Canada*

In this symposium important aspects of intergenerational relations are explored from multi-disciplinary and multi-national perspectives. Kendig, et al, use national survey data to examine the Australian public's perceptions of older workers; of intergenerational equity in receipt of public benefits and relative influence in the public sphere; and of intergenerational conflict. Fast and colleagues rely on in-depth interviews with members of a Canadian intergenerational theatre company to explore outcomes in terms of intergenerational relationships and age-related stereotypes of seniors and young adults "playing" together in community-based, performer-driven theatre practice. Chivers will explore Justin Chadwick's film *The First Grader*, featuring 84 year old mau mau independence veteran Kimani N'gan'ga Maruge, which mirrors gerontological research about the role intergenerational relationships can play in challenging stereotypes. By bringing very different disciplinary traditions to bear in different cultural, social and policy contexts, collectively these studies reveal much about perceptions and practices that reinforce, or break down, stereotypes of aging and the aged.

### INTERGENERATIONAL EQUITY IN AUSTRALIA: ATTITUDES AND POLICIES

H. Kendig, K. O'Loughlin, K. Heese, *Ageing, Work & Health Research Unit, University of Sydney, Sydney, New South Wales, Australia*

This presentation examines Australian attitudes and policies concerning intergenerational equity. Data were collected in 2009 from a national survey and analyzed in terms of younger (18 to 39 years), middle (40 to 59 years) and older (60 years and over) age groups. Respondents (N=1526) were asked about the 'social treatment' of older compared to younger people in various life domains. Most respondents believed that employers treated older workers about the same as younger workers, but the perception was of more negative than positive treatment. All groups, but especially the older one, believed that older people contribute more than younger people to the workplace. The majority believed that older people receive less than their 'fair share' of government benefits and have too little influence and respect. Views varied considerably among age and gender groups. The findings are interpreted in terms of the changing economic prospects and policy treatment of age groups.

### THEY'RE JUST LIKE US: CONFRONTING AGE STEREOTYPES THROUGH INTERGENERATIONAL THEATRE

J. Fast<sup>1</sup>, S. Chivers<sup>2</sup>, J. Eales<sup>1</sup>, S. Anderson<sup>1</sup>, 1. *University of Alberta, Edmonton, Alberta, Canada*, 2. *Trent University, Peterborough, Ontario, Canada*

This paper reports on findings from a project titled *Health and Creative Aging: Theatre as a Pathway to Healthy Aging*. In-depth interviews were conducted with members of the community-based intergenerational theatre group *GeriActors and Friends*, based in Edmonton, Alberta, Canada. While the primary purpose of the project is to examine links between engagement in the arts and healthy aging, one of the main themes to emerge from the data revolves around the intergenerational nature of the company. Both seniors and younger (student) members comment extensively on the ways in which their style of theatre

(sharing and translating personal stories into a creative format and engaging together in a playful approach to performer-created theatre) develops trust, openness, mutual understanding and respect, ultimately breaking down negative stereotypes of, and the generational divide between, older adults and today's youth. As participants from both generations commented "They're just like us, only a different age."

### **EDUCATION FOR ALL: INTERGENERATIONAL RELATIONSHIPS AND MENTORSHIP IN THE FIRST GRADER**

S. Chivers, *Trent University, Peterborough, Ontario, Canada*

This paper focuses on the intergenerational elements of Justin Chadwick's *The First Grader* (UK, USA, Kenya; 2010). Based on a true story, the film features 84 year old Kimani N'gan'ga Maruge (Oliver Litondo), a Mau Mau independence veteran who is determined that the nation's new promise of "education for all" should apply to him just as it does to traditional-aged first grade students. In placing this older man in a first year classroom that is struggling for resources, the story upends the conventional notion of the older wise man as mentor. The film portrays a resourceful, multidimensional exchange of knowledges among the students, the young teacher, and Maruge. In the process, the film mirrors gerontological research about the role intergenerational relationships can play in challenging stereotypes. In particular, it shows the importance of reciprocity to productive interactions among generations.

## **SESSION 2380 (SYMPOSIUM)**

### **METHODOLOGICAL ISSUES IN RESEARCH ON HOME AND HEALTH IN OLD AGE**

Chair: *S. Iwarsson, Department of Health Sciences & Centre for Ageing and Supportive Environments (CASE), Lund University, Lund, Sweden*

Co-Chair: *ÅSE. Brandt, The National Resource Centre on Disability, Assistive Technology and Social Psychiatry, The National Board of Social Services, Odense, Denmark*

Discussant: *L. Gitlin, Department of Health Systems and Outcomes School of Nursing and Department of Psychiatry School of Medicine Director, Johns Hopkins University School of Nursing Center for Innovative Care in Aging, Baltimore, Maryland*

Research on home and health in old age is complex and requires multi-dimensional methodologies that pose many challenges. Based on longstanding experiences from national and cross-national research in different European countries, in this symposium we will present a set of studies that focus on methodological issues. The first presentation, accomplished in Denmark, will address challenges in studying accessibility problems for people with or without dependence on mobility devices when carrying out kitchen tasks in an experimental setting. Thereafter, we will present a novel method of housing planning and provision for the older population, based on simulation using empirically developed functional limitation profiles of groups of very old people. In this study, data collected with community-dwelling people in Sweden, Germany and Latvia were utilized. Next, we will turn to challenges in analysing cross-national qualitative data in different languages on home and health among very old people, exemplified by a Swedish-German endeavor. In the final presentation, we will give a comprehensive overview of challenges faced in conducting experimental controlled and explorative studies with frail community-dwelling older people. Based on the experiences from projects involving frail older people in Sweden, special attention will be given to challenges in anchoring interventions in organizations and to involve frail older people in research. Examples and findings from quantitative as well as qualitative designs and approaches will be discussed in the light of assets and challenges in interdisciplinary and cross-national research contexts.

### **METHODOLOGY FOR VALIDATION OF HOUSING STANDARDS – THE KITCHEN AS AN EXAMPLE**

T. Helle<sup>2,1</sup>, ÅSE. Brandt<sup>3,2</sup>, S. Iwarsson<sup>2</sup>, *1. University College Northern Jutland, Aalborg, Denmark, 2. Department of Health Sciences and Centre of Ageing and Supportive Environments (CASE), Lund University, Lund, Sweden, 3. The National Board of Social Services, Odense, Denmark*

We will present a novel methodology to validate housing standards. Person-environment fit among older persons with different levels of mobility device dependence was investigated during performance of everyday activities in realistic environments. Observational and self-report data were compared. Ten wheelchair users, ten rollator users and ten participants not using mobility devices prepared lunch in a kitchen designed according to standards while accessibility problems were observed followed by a structured interview. The total self-reported accessibility problem score was higher than the observational score. Overall, standards addressing door width, kitchen table height/depth, space requirements and upper base unit shelves did not cause severe accessibility problems, but thresholds, wall cupboards and lower base unit shelves did. Sample identification was challenging and participants had difficulties in rating accessibility problems. The actual use of mobility devices form part of the activity performance. Some standards are not defined properly to enable activity performance in realistic environments.

### **USING KNOWLEDGE ON COMBINATIONS OF FUNCTIONAL LIMITATIONS TO SUPPORT IMPROVED HOUSING ACCESSIBILITY**

B. Slaug<sup>1</sup>, O.K. Schilling<sup>2</sup>, S. Iwarsson<sup>1</sup>, G. Carlsson<sup>1</sup>, *1. Health Sciences, Lund University, Lund, Sweden, 2. University of Heidelberg, Heidelberg, Germany*

This presentation will address multiple health conditions in the older population, related to housing accessibility issues. We will present methods to identify groups characterized by their combinations of functional limitations (so called type profiles) and demonstrate its usefulness. Two datasets were analyzed from the SNAC-GÅS (N=371) and ENABLE-AGE (N=1,542) projects. Representing different phases in the aging process, 67-71 and 75-89 years respectively, the type profiles that were detected differed in frequency as well as in composition. Type profiles from both datasets were targeted for simulated accessibility analysis. In different housing environment scenarios, the severity of accessibility problems posed by physical barriers was ranked for each type profile. The different housing environment scenarios were selected to exemplify dwellings built before and after the introduction of current Swedish governmental directives on accessibility. These simulations showed varied patterns of barrier ranking between the type profiles, and considerable accessibility problems even in newer dwellings.

### **GLOBAL RESEARCH PARTNERSHIPS AND CHALLENGES IN QUALITATIVE ANALYSES**

C. Löfqvist<sup>1</sup>, I. Himmelsbach<sup>2</sup>, M. Granbom<sup>1</sup>, M. Haak<sup>1</sup>, *1. Department of Health Sciences & Centre for Ageing and Supportive Environments (CASE), Lund, Sweden, 2. Interdisciplinary Ageing Research, Faculty of Educational Sciences, Frankfurt, Germany*

We will present challenges in handling language differences in international qualitative research, i.e. how to analyze large qualitative datasets in different languages, and moreover, to make suggestions on the best course of action. Our experiences are based on the cross-national, interdisciplinary European ENABLE-AGE Project, which examines the home environment as a determinant for autonomy, participation, and well-being in very old age. Ten years ago, this extensive project involving five European countries initiated still ongoing research collaboration between Sweden and Germany. Forty in-depth interviews were performed in each country. The ATLAS.ti Scientific Software was utilized

for the cross-national analyses. We will give examples of how such software makes valid multi-lingual analyses possible and then recommend strategies to strengthen the methodological approach. That is, e.g. to stay as long as possible in the native languages during the analyses and moreover, the need for conceptualization and cultural sensitivity. After attending this activity, participants will be: Aware of some of the methodological challenges involved in cross-national qualitative research. Able to reflect upon the complexity in the analyses and considerations needed when dealing with large datasets in multiple languages in cross-national research collaborations.

### CHALLENGES IN PERFORMING COMPLEX INTERVENTION STUDIES IN HEALTH CARE ORGANIZATIONS

S. Dahlin-Ivanoff<sup>1,4</sup>, K. Wilhelmson<sup>2,4</sup>, A. Edberg<sup>3,4</sup>, 1. *Institute of Neuroscience and Physiology, Göteborg, Sweden*, 2. *Institute of Medicine, Göteborg, Sweden*, 3. *Department of Health and Society, Kristianstad, Sweden*, 4. *The Swedish Institute for Health Sciences, Lund, Sweden*

The presentation will focus on challenges faced by anchoring research in health care organizations, creating good collaborations with the professionals, and involving older adults in the planning and implementation of research. Methodological challenges faced when conducting research with community-living frail older people will also be communicated. The presentation will draw on experiences from two multidisciplinary and multi-dimensional intervention studies. The study, "Elderly people in the risk zone", was designed to evaluate whether educational senior meetings are more effective than preventive home visits, and if it is possible to prevent or delay deterioration. The study, "Continuum of care for frail older people", was designed to evaluate whether an intervention programme for frail older people can reduce the number of hospital visits, increase satisfaction with health and social care, and maintain functional abilities. The studies have both exploratory and experimental components to facilitate a multi-faceted knowledge production. After attending this activity, participants will be aware of some of the methodological challenges: to balance between on one side the demands and conditions of the health care organizations and on the other side scientific quality and conducting randomized interventions targeting older frail heterogeneous groups

### SESSION 2385 (SYMPOSIUM)

#### MILITARY SERVICE AND THE LIFE COURSE

Chair: *C.M. Aldwin, Human Dev. & Fam. Sci., Oregon State University, Corvallis, Oregon*

Discussant: *D. Alwin, Pennsylvania State University, University Park, Pennsylvania*

Military veterans are interesting samples for studying both optimal and impaired aging processes. Veterans are a select population, given enlistment requirements for good physical and mental health, and many of them may exhibit optimal aging. However, some have been exposed to hazardous and traumatic events which can accelerate their aging processes. The relative balance of optimal vs. impaired aging may vary by cohort, as the percentage of veterans exposed to different types of trauma varies by war. This symposium stems from NIA R24AG03943, Lifespan Outcomes of Military Service, whose purpose is to develop a research network on the effects of military service on aging. Spiro's presentation outlines the theoretical and practical implications of studying the aging process among veterans. He reviews the long-term positive and negative aspects military service on physical and psychosocial outcomes. The second paper, by Settersten et al., utilizes data on veterans from the Grant Study. Subjective appraisals of military service during World War II have strong but sometimes counterintuitive relationships with survival and indicators of well-being. In contrast, Hughes et al. examine PTSD and sleep disorders among female veterans. Many

linked their sleep problems to specific incidents in their military service; the average duration of these problems was 17 years. Finally, Wilmoth et al. examined the use of VA and DI disability benefits among disabled veterans, and found that very few utilized both sources of support. The discussant is Duane Alwin, Director of the Center for Life Course and Longitudinal Studies at Pennsylvania State University.

#### LIFESPAN OUTCOMES OF MILITARY SERVICE

A. Spiro, *Boston University & VA Boston, Boston, Massachusetts*

Today's soldiers are tomorrow's veterans, and for most, they will be veterans far longer than they were soldiers. We recognize the physical and mental injuries of those who return from deployment in OIF-OEF. But what are the long-term effects of military service among the aging veterans? Today's veterans tend to be older than the general civilian population, with about 2/3 over 55 years of age. While initially healthier than their peers, traumatic events and hazardous exposures resulting from military service can alter their health for the worse. Despite the advantages of military service in training and skills, for many the negatives can outweigh the positives for the remainder of their lives. We consider various aspects of military service and how they can affect health, well-being, and socioeconomic outcomes among America's aging veterans.

#### THE LEGACIES OF MILITARY SERVICE IN WORLD WAR II ON MEN'S HEALTH AND WELLBEING IN LATE LIFE

R.A. Settersten<sup>1</sup>, J. Day<sup>1</sup>, R.J. Waldinger<sup>2</sup>, G.H. Elder<sup>3,4</sup>, 1. *Social and Behavioral Health Sciences, Oregon State University, Corvallis, Oregon*, 2. *University of North Carolina, Chapel Hill, North Carolina*, 3. *Harvard University, Boston, Massachusetts*, 4. *Massachusetts General Hospital, Boston, Massachusetts*

Using data on veterans from the landmark Grant Study (N=241), we probe the effects of World War II service on men's health and wellbeing in late life. We analyze a measure of subjective appraisal of service in 1946, which is positively predicted by exposure to danger and duration of service. We examine its connection to survival at 60, 70, 80, and 86; indicators of social and psychological wellbeing at 70 and 80; and evaluations of military service, and its place in the life course, at 70. Even after controlling for midlife health, appraisal of service has a strong but surprisingly negative effect on survival, a weaker but positive effect on social wellbeing, and no effect on psychological wellbeing. There is a strong positive connection between postwar appraisals and appraisals made over 40 years later. We discuss these findings in light of the exceptionally positive aging experiences of the Grant men.

#### SLEEP PROBLEMS AND PROBABLE PTSD AMONGST OLDER FEMALE VETERANS

J. Hughes<sup>1</sup>, S. Jouldjian<sup>1</sup>, C. Alessi<sup>1,2</sup>, D.L. Washginton<sup>3,2</sup>, J.L. Martin<sup>1,2</sup>, 1. *Geriatric Research, Education, and Clinical Center, VA Greater Los Angeles Healthcare System, North Hills, California*, 2. *David Geffen School of Medicine at UCLA, Los Angeles, California*, 3. *VA Greater Los Angeles Healthcare System, Los Angeles, California*

There is growing awareness of insomnia and PTSD among women veterans returning from recent Iraq and Afghanistan conflicts, yet little is known about the negative effects of untreated insomnia and PTSD across the lifecourse. Within a larger cross-sectional study of insomnia in women veterans (n=107), 52% (n=39) were aged 55 or over. 18% identified a military-related stressor as the cause of their sleep problems with duration of problems averaging 17 years. 46% also had probable PTSD, which was related to more severe insomnia, greater sleep disturbance, and higher psychological distress (p's<0.001). There were no differences in PTSD prevalence between those over versus under age 55. There was a trend for longer military service to be associated with better sleep and less psychological distress. Further research is needed to explore how early-life military service impacts the development and

management of PTSD, insomnia and other psychiatric conditions over the lifecourse.

### **THE USE OF VA DISABILITY BENEFITS AND SOCIAL SECURITY DISABILITY INSURANCE AMONG VETERANS**

J. Wilmoth<sup>1</sup>, A.S. London<sup>1</sup>, C. Heflin<sup>2</sup>, 1. *Syracuse University, Syracuse, New York*, 2. *University of Missouri, Columbia, Missouri*

Although there is substantial functional limitation and disability among veterans of all ages, relatively little is known about veterans' use of Department of Veterans Affairs (VA) Disability Benefits and Social Security Disability Insurance (DI) across the life course. Reliance on DI may be different for veterans who do and do not qualify for VA disability benefits. We hypothesize that the extent to which VA benefit use supplements or supplants DI use depends on the age of the veteran and varies across cohorts who served in the military during different time periods. This project uses data from the 1992, 1993, 1996, 2001, and 2004 Survey of Income and Program Participation (SIPP) to examine veterans' participation in, and income received from, VA and DI programs. The results indicate that the rate of joint participation in these two programs is low and that there is variation in program use by age and cohort.

## **SESSION 2390 (SYMPOSIUM)**

### **NEW DEVELOPMENTS IN GERONTOLOGICAL RESEARCH: A TRIBUTE TO THE LIFE WORK OF GORDON STREIB**

Chair: *K.F. Ferraro, Purdue University, West Lafayette, Indiana*

Co-Chair: *A. Pienta, University of Michigan, Ann Arbor, Michigan*

Gordon Streib and his colleagues launched a trailblazing study of retirement in 1952 – the Cornell Study of Occupational Retirement. The longitudinal design of the project was rare for retirement research, allowing the investigators to follow a large sample of both men and women into their retirement years. During his 60+ year career, Gordon Streib wrote prolifically about many topics relating to this earlier retirement study. Most recently, he wrote about life in retirement communities. Gordon Streib's work was theoretically groundbreaking and methodologically sophisticated. Because of this, it has had a lasting impact on gerontological scholarship. This session discusses the present day relevance of the monograph, *Retirement in American Society*, resulting from the Cornell Study of Occupational Retirement (David Ekerdt and Phyllis Moen). Next, two of Gordon Streib's colleagues from the University of Florida will discuss contemporary research on retirement communities (Stephen Golant) and intergenerational relationships in the retirement years (John Henretta). Finally, the session will showcase Streib's historic data collection (Amy Pienta) and summarize the efforts of ICPSR in restoring the collection so it may be used by the research community.

### **FAMILY STRUCTURE AND INTERGENERATIONAL RELATIONS**

J.C. Henretta, *University of Florida, Gainesville, Florida*

Gordon Streib's essays on intergenerational relations noted the important role of family structure and functioning in determining intergenerational relationships. In this view, dyadic relations in a family take place within the family context that partly determines the nature of the dyadic relationship. Recent research on intergenerational relations has developed this insight by creating family-specific models that examine the degree to which intergenerational relations, such as assistance between generations, is a family characteristic affecting all family members in similar ways and to what degree these relationships vary between dyads in the same family. Moreover, this approach identifies the role of specific family structure characteristics in producing similarity among family members. This presentation discusses two recent examples of this approach that examine intergenerational assistance from adult children

to an elderly parent and from parents to their adult children. After attending, participants will understand methodological trends and substantive results in intergenerational research.

### **ACTIVE ADULT RETIREMENT COMMUNITIES: ACHIEVING BOTH RESIDENT COMFORT AND AUTONOMY**

S. Golant, *Geography, University of Florida, Gainesville, Florida*

One focus of Gordon Streib's research was on the autonomy of U.S. active adult retirement communities. He investigated the ability of both the owners and older residents to influence their day-to-day activities. His research reminds us that this residential environment appeals to older persons not just because of its material and social comforts, but also because it is congruent with their values of self-reliance and independence. Thus, even as their moves to these communities are want-based or amenity-oriented, they are also motivated by their needs for autonomy. We outline a holistic, emotion-based model of residential environment congruence that recognizes this multidimensionality. It theorizes that older persons achieve residential normalcy or occupy congruent residential environments when they are in their residential comfort zones and enjoy pleasurable, hassle-free, and memorable feelings; and when they are in their residential mastery zones and occupy places where they feel overall competent and in control.

### **A 40-YEAR APPRECIATION OF STREIB & SCHNEIDER'S "RETIREMENT IN AMERICAN SOCIETY"**

D. Ekerdt<sup>1</sup>, P. Moen<sup>2</sup>, 1. *Univ of Kansas, Lawrence, Kansas*, 2.

*University of Minnesota, Minneapolis, Minnesota*

This volume was a synthesis of findings from the pioneering Cornell Study of Occupational Retirement. After 40 years, the contents of "Streib & Schneider" seem all the more remarkable. The longitudinal design of the project, conducted across the 1950s, was rare for retirement research, allowing the investigators to follow a large sample of both men and women pre- to post-retirement. The main conclusion was that retirement did not have the broad negative consequences for individuals that role theory had predicted. Retirees tolerated the new status well. The authors also alerted the field to such issues as self-selection into retirement and the potential ambiguity of retirement transitions. They outlined the new institutionalization of retirement in American society as the 1960s dawned, and even endorsed civic engagement for retirees. Beyond the findings, this volume also mentored subsequent retirement research by exploring design issues (e.g., panel drop out) and sharing survey formats.

### **RETIREMENT IN THE 1950S: REBUILDING STREIB'S LONGITUDINAL DATABASE**

A. Pienta, J. Lyle, *University of Michigan, Ann Arbor, Michigan*

Gordon Streib conducted the Cornell Study of Occupational Retirement in 1952 with a sample of employed men and women (n=4,032). The study was designed to understand the transition from work to retirement. Follow-up interviews were conducted every 1-2 years. The study is an important piece of history because: (1) it is a longitudinal study pre-dating the Longitudinal Retirement History Study, (2) both men and women were interviewed, and (3) the data were never released. ICPSR is working to publicly release the data collection. The study also contains valuable health and biomarker data that has never been made publicly available to researchers. Future plans include release of these data as well. Given the Social Security policy changes of the 1950s, the study represents an unprecedented resource for understanding how retirement culture emerged during this landmark time period. It is an appreciation of Gordon Streib that these data will be made available.

## SESSION 2395 (SYMPOSIUM)

### SOCIAL INEQUALITY IN HEALTH IN LATER LIFE

Chair: I. Schöllgen, Mannheim Institute of Public Health, Social and Preventive Medicine, Mannheim, Germany

Discussant: C. Mendes De Leon, University of Michigan, School of Public Health, Ann Arbor, Michigan

A large body of research shows differences in health according to social status, important dimensions being race/ethnicity and socioeconomic status (SES). Rather recently, the study of social inequality in health has been extended to later life, initiating a discussion on the concept of social status and the indicators used for its measurement. In addition, there is an increasing interest in more proximal bio-behavioral outcomes as well as the role of psychosocial factors in health inequality. These issues will be addressed in this symposium. The first two speakers deal with race/ethnicity-related inequality, using data from the Health and Retirement Study. Quiñones and colleagues examine change in smoking, exercise, and alcohol intake behaviors after chronic illness diagnosis in whites, blacks, and Hispanics, finding substantial racial/ethnic variation in behavior change following disease incidence. Nicklett shows that the effects of disease-related support on type 2 diabetics' health outcomes vary by race/ethnicity as well as type of support. The final two papers deal with SES-related inequality in later life in European samples. The findings by Schöllgen and colleagues suggest a differential significance of subjective social status and wealth as predictors of cardiovascular disease and diabetes risk markers, indicated by metabolic syndrome components. Finally, Nilsson, Lund, and Avlund show that financial assets predict the onset of mobility-related fatigue. Mendes de Leon will serve as discussant. His expertise in research on the effects of racial background and socio-economic status in disease and disability will provide insights towards understanding the complexities of health inequality in later life.

### RACIAL AND ETHNIC DIFFERENCES IN HEALTH BEHAVIOR CHANGE AFTER CHRONIC ILLNESS DIAGNOSIS

A.R. Quinones<sup>1,2</sup>, C.L. Nagel<sup>1</sup>, N. Huguet<sup>3</sup>, J. Newsom<sup>3</sup>, M.S. Kaplan<sup>3</sup>, B. McFarland<sup>1</sup>, 1. Public Health & Preventive Medicine, Oregon Health & Science University, Portland, Oregon, 2. Veterans Affairs Medical Center, Portland, Oregon, 3. Portland State University, Portland, Oregon

Chronic disease morbidity disproportionately affects middle-aged and older minorities, particularly black Americans. Because engaging in healthy behaviors can reduce illness severity and improve physical functioning, it is important to understand race/ethnic differences in health behavior change after chronic condition onset. This research examines behaviors before and after heart disease (HD), diabetes, cancer, stroke, or lung disease diagnosis. Data came from 5696 HRS respondents (1992-2010) with incident chronic disease. Adjusted chi-squared tests and logistic models analyzed changes in behavior for white, black, and Hispanic respondents after diagnosis. Within race/ethnic groups, significant proportions of whites and blacks quit smoking after any diagnosis. Compared to whites, blacks were more likely to reduce their level of exercise post HD diagnosis and alcohol intake post cancer diagnosis. Hispanics were more likely than blacks to continue smoking after HD or diabetes diagnosis. These results suggest substantial race/ethnic variation in health behavior change following chronic illness diagnosis.

### ARE THERE RACIAL/ETHNIC VARIATIONS IN BENEFITS OF SUPPORT AMONG TYPE 2 DIABETICS? A LONGITUDINAL STUDY OF DISEASE-RELATED SUPPORT IN MID- AND LATE-LIFE

E. Nicklett, School of Social Work, University of Michigan, Ann Arbor, Michigan

To examine protective aspects of disease-related support against health decline and mortality by race/ethnicity, change in self-rated health

(SRH) and mortality hazards were assessed over time using ordinal logistic regression models and discrete-time analysis with longitudinal data from the Health and Retirement Study (2003-2010). Higher levels of support for following a meal plan, physical activity, and weight control at baseline predicted lower odds of health decline for Whites ( $p < .05$ ). Support for taking medicine, foot care, blood sugar testing, and appointments did not predict the odds of change in SRH. None of the disease-related support characteristics were predictors of SRH change for African Americans or Latinos. Baseline disease-related support was generally not predictive of 7-year mortality; however, among Latinos greater support for physical activity predicted reduced odds (0.57) of 7-year mortality. Support was therefore found to be protective against health decline and mortality in some characteristics and among certain groups only.

### SUBJECTIVE SOCIAL STATUS, WEALTH, AND COMPONENTS OF THE METABOLIC SYNDROME

I. Schöllgen<sup>1</sup>, J. Li<sup>1,2</sup>, A. Loerbroks<sup>1,3</sup>, J.A. Bosch<sup>4,1</sup>, 1. Mannheim Institute of Public Health, Social and Preventive Medicine, Mannheim Medical Faculty, Heidelberg University, Mannheim, Germany, 2. University of Duesseldorf, Department of Medical Sociology, Duesseldorf, Germany, 3. Heidelberg University, Cluster of Excellence "Asia and Europe in a Global Context", Heidelberg, Germany, 4. School of Sport and Exercise Sciences, CRUK Institute of Cancer Studies, University of Birmingham, Birmingham, United Kingdom

Subjective social status (SSS) and wealth have been suggested to be particularly useful indicators for research on social inequality in older adults. The present study examined concurrent and longitudinal associations of SSS and wealth with components of the metabolic syndrome (MetS). Data came from 1,561 respondents of the second (T1) and fourth wave (T2) of the English Longitudinal Study of Ageing. Multivariate linear regressions showed that wealth was concurrently and prospectively associated with waist circumference, systolic blood pressure (in men) as well as levels of triglycerides and HDL-cholesterol (in women). The longitudinal associations partly remained significant after adjusting for the respective MetS component at T1. SSS was related to HDL-cholesterol only, with the prospective association becoming non-significant after adjustment for T1 HDL-cholesterol. The findings suggest a differential significance of SSS and wealth as predictors of cardiovascular disease and diabetes risk markers in later life.

### SOCIAL INEQUALITY IN MOBILITY-RELATED FATIGUE AMONG OLDER DANES

C.J. Nilsson<sup>1,2</sup>, R. Lund<sup>1,2</sup>, K. Avlund<sup>1,2,3</sup>, 1. Section of Social Medicine, Department of Public Health, University of Copenhagen, Copenhagen, Denmark, 2. Center for Healthy Aging, University of Copenhagen, Copenhagen, Denmark, 3. Danish Aging Research Center, Universities of Southern Denmark, Aarhus and Copenhagen, Copenhagen, Denmark

Purpose: to investigate if there is social inequality in onset of and changes in mobility-related fatigue in old age, and if common predictors of fatigue and mobility limitations can explain any social inequality. Methods: Logistic regression analyses and multinomial logistic regression analyses were performed in a study population of 2,083 older adults from the Danish Intervention Study on Preventive Home Visits. Results: There was a financial asset gradient in onset of mobility-related fatigue at 3-year follow-up, which remained in fully adjusted analyses. Low financial assets might increase the odds of sustained fatigue but also the odds of improvement from fatigued to non-fatigued over a 4-year period. Conclusion: The study suggests social inequality in mobility-related fatigue, which is an early indicator of the aging process and a strong predictor of disease and disability in old age. Knowledge on social inequality should be integrated in the planning of preventive strategies.

## SESSION 2400 (SYMPOSIUM)

### SOCIAL NETWORK TYPOLOGIES AMONG OLDER ADULTS: CHARTING INFLUENCES ON HEALTH, WELL-BEING, AND MARITAL QUALITY

Chair: K. Abbott, *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

Discussant: H. Litwin, *The Hebrew University, Jerusalem, Israel*

An important aspect of personal or egocentric social network research is the value of defining the type of network individuals are embedded within and how those typologies (e.g. diverse, friend or community focused, family focused and restricted) influence a range of physical and mental health outcomes. This symposium will feature data from four studies examining typologies of older adults' social networks. First, a cluster analysis is presented for 95 White and 65 Black couples' network typologies. Race and gender differences in network types are explored along with the influence of network type on marital quality. Second, data will be presented from interviews with 192 residents from nine assisted living (AL) facilities in the metro Atlanta area. Cluster analysis finds variation in network types across facility locations, which are associated with variations in residents' education and income. AL residents in large diverse-supported networks, which include AL co-residents and staff, exhibit better health outcomes. Third, data from 50,000 older Europeans is presented showing the results of a K-Means cluster analysis producing a solution of eight network types which have statistically significant associations with well-being. Fourth, data presented from the Social Relations, Aging and Health Study of older adults (N=293) and their convoy members (N= 2101) explores age and health variations of network typologies of community dwelling individuals age 65 and over. This symposium highlights the multiple types of network typologies among the diverse and growing older population who are living in the community and receiving long-term services and supports.

### SOCIAL NETWORK TYPOLOGIES OF BLACK AND WHITE MARRIED COUPLES: IMPLICATIONS FOR POSITIVE AND NEGATIVE MARITAL QUALITY

K. Fiori<sup>1</sup>, K. Birditt<sup>2</sup>, E. Brown<sup>3</sup>, T.L. Orbuch<sup>2</sup>, *1. Gordon F. Derner Institute of Advanced Psychological Studies, Adelphi University, Garden City, New York, 2. University of Michigan, Ann Arbor, Michigan, 3. University of Connecticut, Storrs, Connecticut*

Although research shows that individuals' social networks and marital status have implications for well-being, little is known about the ways in which married couples organize their shared and separate network ties. Furthermore, the one known study looking at 'conjoint' networks and their implications for marital well-being was focused solely on Caucasians (Stein, Bush, Ross, & Ward, 1992). We used cluster analyses to create 'couple' network typologies of White (n = 95) and Black (n = 65) couples' reports of contact with family and friends in their 16th year of marriage (in their early 40s). We found several qualitatively distinct types of networks that had different implications for wives' and husband's reports of positive and negative marital quality. Although there were race differences in the frequencies of network types, there were no interactions between network type and race in predicting marital quality. Implications for network research are discussed.

### SOCIAL NETWORK TYPES AMONG ASSISTED LIVING RESIDENTS AND THEIR RELATION TO HEALTH

M. Perkins<sup>1</sup>, M. Ball<sup>2</sup>, C.L. Kemp<sup>2</sup>, *1. Division of Geriatric Medicine and Gerontology, Department of Medicine, Emory University School of Medicine, Atlanta, Georgia, 2. The Gerontology Institute, Georgia State University, Atlanta, Georgia*

We used cluster analysis to derive four social network types (diverse-supported; diverse-unsupported; family-focused-supported; and fam-

ily-focused-unsupported) among assisted living (AL) residents and examine their relation to residents' health. Data are from a 3-year mixed method NIA-funded project (1R01 AG030486-01) that uses Kahn and Antonucci's (1980) social convoy model as a conceptual and methodological framework to examine the relative importance of co-resident relationships and other network ties to residents' overall health and well-being. Data include structured face-to-face interviews and social network mapping conducted with 192 AL residents in nine AL facilities in metro Atlanta. Residents in large diverse-supported networks, which included co-residents and staff, tended to exhibit better health outcomes. Analysis showed some variation in network types across facility location, differences which are linked to variations in residents' education-level and income. Findings have implications for interventions to improve residents' health and quality of life and address potential health disparities that may exist.

### NETWORK TYPES AMONG OLDER EUROPEANS: FIRST RESULTS FROM THE SURVEY OF HEALTH, AGEING AND RETIREMENT IN EUROPE

K. Stoeckel, H. Litwin, *Hebrew University, Jerusalem, Israel*

The fourth wave of SHARE, executed in 2010-2011, implemented a name generating mechanism for the charting of respondents' personal networks. Data were collected on some 50,000 persons, aged 50 and older, in 15 countries. K-Means cluster analysis was applied to the data set using a set of seven compositional variables as the criterion values for differentiation. The optimal solution produced eight network types. About a third of the respondents were embedded in "family" networks comprised of spouse and two adult children. A quarter had a "diverse" network composed of spouse children and friends. About one fifth had an exclusive "spouse" network, and a tenth had a predominantly "friend" network. Other network types included "parent," "grandchildren," "sibling" and "formal helper" networks. Hierarchical regressions of the CASP-12 well being measure, adjusted for age, gender, ADL, mobility limitations and country, revealed that network type retained a significant independent association with the outcome measure.

### HETEROGENEITY IN SOCIAL NETWORK MEMBER TYPOLOGIES

N.J. Webster, T.C. Antonucci, *Life Course Development Program, Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Evidence suggests that characteristics and typologies of social networks influence the health of older adults. Building upon previous work documenting typologies of social network members, this study explores relationships between demographics, health and typologies of social network members within the social networks of older adults. Data include respondents age 65 and older (N=293) and their social network members (N=2101) from the regionally representative Social Relations, Aging and Health Study (2005). Regression analyses indicate younger and married respondents have a greater proportion of younger family members with whom they have less contact. Older respondents and those with less education reported more middle-aged, close family members with whom they have daily contact. Findings highlight diversity within and across the social networks of older adults often not captured when examining networks in aggregate. Heterogeneity in the latent structure and distribution of these typologies will also be explored.

## SESSION 2405 (SYMPOSIUM)

### SPIRITUAL DIMENSIONS OF LATER LIFE

Chair: M.L. Johnson, *University of Bristol, Bristol, United Kingdom, University of Bath, Bath, United Kingdom*

Co-Chair: J. Walker, *Diocese of Guildford, Guildford, United Kingdom*

The primary purpose of the symposium is to bring together a group of leading researchers and writers on spirituality and ageing; to distil

the latest advances in knowledge and thinking – and to engage in vigorous discussion about how we can interpret this learning for the benefit of older people and those who seek to serve them. Despite the involvement of gerontologists in a bewildering array of issues related to age and ageing, researchers – with a few honourable exceptions – have avoided both spirituality and death. Yet the increasing presence of finitude as we grow older is an inescapable fact. Life review and reflection about personal pasts and diminishing futures are both well known to students of later life. Nonetheless the pressing focus on positive ageing appears to have all but eclipsed study of the inner life, both religious and non-religious. So the literature on ageing and spirituality is still quite slender. Ageing, beliefs and the inner life are long established features of both academic psychology and the different worlds of clinical practice. Here the literature is much fuller; ranging from the detailed studies of religious belief and psychological wellbeing, religion as a cause of guilt and anguish and the theorists who have attempted to formulate models, patterns and stages to deal with the exigencies of life as it progresses through the lifecourse. Here scholars from different disciplines, perspectives and methodologies will contribute macro data, qualitative investigation, conceptual and theoretical insights in an attempt to illuminate the spiritual dimensions of later life.

### **SPIRITUALITY, BIOGRAPHICAL REVIEW AND BIOGRAPHICAL PAIN AT THE END OF LIFE IN OLD AGE**

M.L. Johnson, *1. University of Bristol, Bristol, United Kingdom, 2. University of Bath, Bath, United Kingdom*

It is well recognised that as individuals move into later life, they are less occupied by the demands of paid employment and consequently spend more time in reflection about the life lived. In part this is due to the onset of infirmities, as chronic diseases take their toll on mobility and autonomy. Unchosen solitude and the frustration of a failing body, both prompt recollections of more engaged times and draw attention to the deficits of old age. The evidence of my own biographical interviews indicates that the predominant self evaluation is of disappointment, unworthiness and having failed to ‘come up to expectation’. When it is accompanied by profound guilt, anger at the dishonesty, misuse and abuse of others and shame, there is reason to be deeply concerned. I have termed this condition Biographical Pain. This paper explores the conditions in which biographical pain arises and how it might be addressed.

### **STAGES OF THE SOUL : DREAMS AND THE COMING OF AGE**

H. Moody, *AARP, Washington, District of Columbia*

It has been said that “In our dreams we are always young.” But this is true only as long as we fail to look beneath the surface of our dreams. Our dream life can offer us compelling clues about what “conscious aging” might promise for the second half of life. Psychology for the most part has focused on the first half of life, while gerontology has largely focused on decline instead of positive images of age. Among dream researchers later life has not been a focus of attention. Here we consider dreams about aging, offering suggestions for how our dream life can give directions for a more positive vision of the second half of life. The first half of life is a time for “expeditions and adventures.” But there comes a time when deeper guidance is needed.

### **STABILITY AND CHANGE IN RELIGION AND SPIRITUALITY: DOES RELIGIOSITY INCREASE WITH AGE?**

V.L. Bengtson<sup>2</sup>, M. Silverstein<sup>1</sup>, J.P. Lendon<sup>1</sup>, J. Min<sup>1</sup>, N. Putney<sup>1</sup>, S. Harris<sup>1</sup>, *1. Davis School of Gerontology, University of Southern California, Los Angeles, California, 2. Roybal Institute on Aging, University of Southern California, Los Angeles, California*

Do individuals become more religious as they move into old age? Do members of different age groups, or birth cohorts, have qualitatively

different experiences of religion or spirituality because of their having been born in different historical contexts? In this paper we examine aging and cohort differences in religion and spirituality with data from the Longitudinal Study of Generations. Using a mixed-methods approach, we draw from quantitative survey data collected over 35 years from some 2,000 members of 358 multigenerational families, and in-depth interviews with 156 members of 25 four-generation families of diverse religious backgrounds selected from the original longitudinal panel. We see both aging and cohort effects in this multigenerational sample, while recognizing that there is considerable diversity both within and between age groups. We discuss these results in the context of the life course perspective and intergenerational solidarity theory.

### **RELIGIOUS RITUAL AND PRACTICE IN OLD AGE**

E. Idler, *Sociology, Emory University, Atlanta, Georgia*

All religions have a dimension of ritual, or practice, that defines them. Some, like repeating the rosary or a yoga mantra are primarily spoken; others, like receiving the Eucharist or fasting during Ramadan, may be mostly nonverbal. Some rituals, such as infant circumcision, are performed only once in a lifetime; others, such as the Muslim call to prayer, are performed every day. Over the lifespan, the number of times a ritual is performed and experienced becomes an unbroken thread that ties together the cycles of days, weeks, and years. Study of these experiences was a profound part of the thinking of the classical sociologists, but it vanished in the late 20th century. Recently, there has been a new burst of scholarship, although none of it has made the connection with aging and the life course. This paper articulates connections between new research, and existing literature on religion, aging, and health.

## **SESSION 2410 (SYMPOSIUM)**

### **THE COMPLEX NATURE OF SOCIAL RELATIONSHIPS: IMPLICATIONS FOR STRESS, HEALTH, AND WELL-BEING**

Chair: *K.E. Cichy, Human Development & Family Studies, Kent State University, Kent, Ohio*

Co-Chair: *R.S. Stawski, University of Michigan, Ann Arbor, Michigan*

Discussant: *T.C. Antonucci, University of Michigan, Ann Arbor, Michigan*

The current symposium features research examining the links between relationships, health, and well-being. Social ties represent a valuable resource that buffer individuals from the negative effects of stressful experiences. A growing body of work, however, also emphasizes the value of considering the negative implications of social relationships because social partners are not always caring and even supportive relationships are at times conflicted or demanding. This symposium will highlight work that considers both how relational experiences contribute directly to health and well-being as well as how relational experiences may indirectly contribute to health through mechanisms, such as health behaviors. Pitzer, Mroczek, and Fingerman examine whether adult survivors of childhood physical abuse experience heightened reactivity to daily stressful experiences. Martire and colleagues examine whether knee arthritis patients’ daily pain negatively impacts their spouse’s sleep quality. Next, Cichy, Stawski, and Almeida explore how engaging in negative health behaviors, such as smoking, exacerbate reactivity to daily stressful experiences involving family among African American and European American adults. Finally, Savla and colleagues examine the protective effects of health behaviors and activities on psychological and physiological reactions to stressors among older adult caregivers of partners with mild cognitive impairment. Together, these studies explore potential mechanisms that may

help to explain the pathways through which social relationships contribute to health and well-being. Toni Antonucci will reconcile the presentations and offer insights into how these studies expand our understanding of the links between relationships, health, and well-being.

#### **MAKING A BAD SITUATION WORSE: RACE, NEGATIVE HEALTH BEHAVIORS, AND REACTIVITY TO THE DAILY HASSLES OF FAMILY LIFE**

K.E. Cichy<sup>1</sup>, R.S. Stawski<sup>2</sup>, D. Almeida<sup>3</sup>, *1. Human Development & Family Studies, Kent State University, Kent, Ohio, 2. University of Michigan, Ann Arbor, Michigan, 3. The Pennsylvania State University, University Park, Pennsylvania*

In an effort to cope with family stressors, African Americans may compromise their health by engaging in negative health behaviors, such as smoking, further contributing to their health disadvantage. This study explored how engaging in negative health behaviors exacerbates reactivity to daily family stressors among 34-84 year old African Americans and European Americans ( $N = 1,931$ ) from the National Study of Daily Experiences (NSDE). During 8 days of telephone interviews, respondents reported on their daily stressors, health behaviors (number of cigarettes and alcoholic beverages), affect, and physical symptoms. Among smokers, African Americans' emotional reactivity to family arguments was exacerbated on days they smoked more cigarettes than usual ( $p < .01$ ). African Americans' emotional reactivity to family arguments was also exacerbated on days they drank more than usual ( $p < .001$ ), suggesting efforts to cope with the negative emotions elicited by family tensions by smoking or drinking further compromises health.

#### **THE IMPACT OF DAILY STRESS ON SURVIVORS OF CHILDHOOD PHYSICAL ABUSE: IS THERE HEIGHTENED REACTIVITY?**

L. Pitzer<sup>1</sup>, D. Mroczek<sup>2</sup>, K. Fingerma<sup>3</sup>, *1. University of Notre Dame, Notre Dame, Indiana, 2. Purdue University, West Lafayette, Indiana, 3. University of Texas, Austin, Texas*

Reactivity to daily stress may be more pronounced among adult survivors of childhood physical abuse. To investigate whether adults reporting such abuse are more sensitive to daily stressors, this study examined data from 514 adults (abused = 124; non-abused = 390) from the National Study of Daily Experiences. Multilevel mediation models showed daily stress as a significant mediator—experiencing childhood abuse increased levels of daily negative affect and the frequency of physical symptoms by increasing the perceived severity of daily stressors. Multilevel moderating analyses revealed that on days of high perceived stress, both victims and non-victims of childhood physical abuse reported higher levels of daily negative affect and higher frequency of physical symptoms than on days of lower perceived stress; however, this association was particularly exacerbated for survivors of abuse. Discussion focuses on how instability in the early family environment may ill-equip adults to negotiate the stressors of daily life.

#### **HEALTH BEHAVIORS MODERATE THE STRESSORS OF DAILY CARING FOR SPOUSES WITH MILD COGNITIVE IMPAIRMENT**

T. Savla<sup>1</sup>, K.A. Roberto<sup>1</sup>, R. Blieszner<sup>1</sup>, F.C. Gwazdauskas<sup>2</sup>, *1. Virginia Tech, Center for Gerontology & Dept. of Human Development, Blacksburg, Virginia, 2. Virginia Tech, Dept. of Dairy Science, Blacksburg, Virginia*

Early memory loss among older adults diagnosed with mild cognitive impairment (MCI) challenges spousal relationships because of remaining strengths yet emerging limitations in functioning. Decades of research have confirmed vulnerability factors (age, sex, personal dispositions) and resources (coping strategies, social support) that moderate the relationships of stressors with stress responses. We examine the protective effects of health behaviors and activities such as exercising and confiding to friends on psychological and physiological reactions

to stressors. We use 7 days of diary data and 4 days of saliva samples from 30 spousal care partners of persons with MCI. Multilevel models and lagged models with bootstrapped standard errors revealed that care partners with a sedentary lifestyle are more vulnerable than active care partners to the effects of daily exposure to stressors. These findings were confirmed by elevated physiological markers of stress reactivity. Confiding was not uniformly beneficial, however. Intervention strategies are discussed.

#### **THE IMPACT OF DAILY ARTHRITIS PAIN ON SPOUSAL SLEEP QUALITY**

L.M. Martire<sup>1</sup>, M.P. Stephens<sup>2</sup>, R. Schulz<sup>3</sup>, J. Mogle<sup>1</sup>, F. Keefe<sup>4</sup>, *1. HDFS, Penn State University, University Park, Pennsylvania, 2. Kent State University, Kent, Ohio, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, 4. Duke University, Durham, North Carolina*

The daily pain of arthritis is detrimental for patient sleep and may also affect spousal sleep quality. Using a sample of 140 knee arthritis patients and their spouse we tested the hypothesis that greater daily pain would be associated with poorer sleep quality for the spouse that evening. For 22 consecutive days, patients reported on their knee pain, negative mood, and sleep quality, and spouses reported on their sleep quality and negative mood. Multilevel lagged models indicated that greater knee pain at the end of the day was associated with spouses' poorer overall sleep quality (estimate =  $-.06$ ,  $p < .05$ ) and feeling less refreshed after sleep (estimate =  $-.15$ ,  $p < .01$ ), as reported the next morning. These analyses controlled for morning reports of spouse negative mood, patient pain, and patient sleep quality. Findings illustrate the social implications of chronic pain and a potential mechanism for reduced spouse support.

### **SESSION 2415 (SYMPOSIUM)**

#### **USING THE STRESS PROCESS MODEL TO UNDERSTAND THE ILLNESS EXPERIENCE OF INDIVIDUALS WITH DEMENTIA: IMPLICATIONS FOR THEORY AND DEVELOPMENT OF INTERVENTIONS**

Chair: *K. Judge, Cleveland State University, Cleveland, Ohio, Margaret Blenkner Research Institute, Cleveland, Ohio*

Discussant: *K. Judge, Cleveland State University, Cleveland, Ohio*

An emerging area of research has focused on understanding the illness experience of individuals with dementia (IWDs) from the individual's perspective rather than proxy-reports from family caregivers or clinicians. To date, few models have been proposed to examine how the myriad of symptoms may relate to one another and lead to negative outcomes. The Stress Process Model for Individuals with Dementia (SPM for IWDs) is a conceptual framework for studying the illness experience of IWDs and enables testing of specific hypotheses. The following symposium reports data from several projects that have examined the illness experience from the perspective of the individual using the SPM for IWDs. The first paper reports qualitative data from IWDs and the relationship with activities and pleasant events. Discussion will focus on the need to engage IWDs in cognitively stimulating activities and how this may offset negative outcomes. Using extracted themes from 5 questions, the second paper presents qualitative data from 114 IWDs about their illness experience. Results found congruence in participant's responses and domains of the model. The third paper examines quantitative data from 131 IWDs. Regression analyses were used to predict variables related to 3 outcomes: anxiety, depression, and quality of life. Discussion will focus on how this information can be used to target specific areas via interventions. The fourth paper will discuss results of several intervention studies for IWDs. Examples illustrating how intervention components directly target IWD's abilities in coping and managing with their symptoms will be discussed.

## **PREDICTORS OF SELF-REPORTED ANXIETY, DEPRESSION, AND QUALITY OF LIFE IN INDIVIDUALS WITH DEMENTIA**

N.T. Dawson<sup>1,2</sup>, S.M. Powers<sup>2,1</sup>, M. Krestar<sup>1,2</sup>, S. Yarry<sup>4</sup>, K. Judge<sup>1,3</sup>, 1. *Cleveland State University, Sagamore Hills, Ohio*, 2. *The University of Akron, Akron, Ohio*, 3. *Benjamin Rose Institute on Aging, Cleveland, Ohio*, 4. *VA Palo Alto Health Care System, Palo Alto, California*

Little is known about the illness experience from the perspective of individuals with dementia (IWDs), as most research has focused on IWDs' psychosocial issues from clinician or caregiver proxy reports. Anxiety, depression and quality of life (QoL) are common outcome measures used in this research as they are commonly linked to the IWDs' physical and psychological well-being. It is becoming more evident that older adults with cognitive impairment are able to participate in surveys and provide consistent and accurate responses to questions. Gaining insight regarding possible predictors of anxiety, depression and QoL from the perspective of the IWD is crucial to better understanding the illness experience and identifying areas amenable to psychosocial interventions. Using multiple regression, the authors were able to identify 3 unique and distinct predictions models for self-reported anxiety, depression, and QoL in our sample of IWDs. Theoretical and applied implications of these findings will be thoroughly discussed.

## **'I WISH THEY WOULD REMEMBER THAT I FORGET' - UNDERSTANDING THE ILLNESS EXPERIENCE OF INDIVIDUALS WITH DEMENTIA**

S.M. Powers<sup>1</sup>, N.T. Dawson<sup>2</sup>, M. Krestar<sup>2</sup>, K. Judge<sup>2</sup>, 1. *University of Akron, Akron, Ohio*, 2. *Cleveland State University, Cleveland, Ohio*

Research has found that individuals with dementia (IWDs) face a wide range of challenges in managing and coping with the cognitive and functional changes associated with dementia. In order to fully understand the illness experience it is imperative to understand IWD's subjective accounts about living with memory loss. Guided by the Stress Process Model for Individuals with Dementia (SPM-IWDs) and the use of grounded theory, 5 qualitative questions were analyzed to identify key themes representing the views expressed by 114 IWDs in the mild to moderate stages of dementia. The themes were then mapped onto the SPM-IWDs based on the interrelated concepts of primary stressors (e.g., forgetting), secondary strains (e.g., negative emotional impact), and potential mediators (e.g., strong support system). By utilizing this framework, the themes were used to highlight critical areas of IWD's illness experiences and identify key areas in need of further research and intervention development.

## **'I DON'T WANT TO BE USELESS': MEANINGFUL ACTIVITY FOR INDIVIDUALS WITH DEMENTIA**

H.L. Menne, C.J. Whitlatch, *Margaret Blenkner Research Institute, Benjamin Rose Institute on Aging, Cleveland, Ohio*

For the researchers, practitioners, and families who support individuals with dementia (IWDs), it is essential to recognize what is meaningful and important for IWDs. This presentation highlights results from two studies which rely on reports from IWDs to understand the subjective experience of living with dementia. The first study involved a semi-structured qualitative interview with 6 IWDs about their day-to-day experiences with dementia. Results reinforce the importance of continuity for IWDs, in their activities and in their values. The second study included a structured interview with open-ended responses of 267 IWDs about their current enjoyable activities. Results from this larger study focus on the activity categories that IWDs report enjoying and how these activities relate to well-being. Discussion will highlight the application of findings for expanding the Stress Process Model for IWDs and the implications for hypothesis testing and intervention design.

## **FROM RESEARCH LAB TO COMMUNITY IMPLEMENTATION: DEVELOPING A DYADIC INTERVENTION FOR INDIVIDUALS WITH EARLY-STAGE DEMENTIA AND THEIR FAMILY CAREGIVERS**

C.J. Whitlatch, *Benjamin Rose Institute on Aging, Cleveland, Ohio*

An increasing number of evidence-based programs are available to individuals with early-stage dementia (IWDs) and/or their family caregivers (CGs). These programs show great promise for alleviating stress and improving well-being for IWDs and CGs as they adapt to the unpredictable and long-term changes associated with memory loss. This presentation briefly describes the longitudinal program of research that informed the development of the SHARE intervention (Supporting Health, Activities, Resources, and Education). This early-stage intervention draws heavily upon the Stress Process Model and brings together both the IWD and family CG. SHARE is designed to improve communication, increase mutual understanding of each person's care values and preferences for care tasks, enhance well-being, and increase the IWD's participation in his/her own care. Preliminary, but promising results indicate SHARE's feasibility, acceptability, and positive impact. Discussion will highlight findings of particular importance for improving IWD outcomes

## **SESSION 2420 (SYMPOSIUM)**

### **WISDOM AS AN INTEGRATION OF AFFECT AND COGNITION: LIFE-SPAN DEVELOPMENTAL PERSPECTIVES**

Chair: *U. Kunzmann, University of Leipzig, Leipzig, Germany*

Co-Chair: *S. Thomas, University of Leipzig, Leipzig, Germany*

Discussant: *J. Glueck, University of Leipzig, Leipzig, Germany*

Many psychological approaches to wisdom have considered cognitive abilities as a main characteristic of wisdom, but the role of affective processes in wisdom is less clear. This symposium's goal is to contribute to a better understanding of the ways in which cognitive and affective functions interact across the adult life-span and together determine wisdom and its outcomes. Monika Ardelt adopts a wisdom-concept that encompasses affective, cognitive, and reflective components. She presents longitudinal evidence for the idea that the three facets are interrelated and together contribute to high subjective well-being in old age. Stefanie Thomas and Ute Kunzmann investigate the interplay between wisdom-related knowledge and empathic abilities when giving advice to couples who have a serious marital conflict. Results suggest that individuals with an integrative style, characterized by high scores on both wisdom-related knowledge and sympathy, provided the most useful advice to the couples. In two laboratory studies, Igor Grossmann and colleagues, who have conceptualized wisdom as excellence in reasoning about social dilemmas, find that not all affective functions facilitate wise reasoning; high self-focused emotional involvement in a problem may be a risk factor. Daniel Grün and Y. Cheng also demonstrate that self-focussed affective states, evoked through positive and negative performance-feedback, can hinder cognitive functioning, that is, a differentiated understanding of emotions, particularly in older adults. Judith Glück discusses the complex interactions between cognitive and affective aspects of wisdom across the life-span and concludes that only certain affective functions and processes (e.g., sympathy rather than self-focused negative feelings) facilitate wise cognition.

### **BOOSTING WISDOM VIA PSYCHOLOGICAL DISTANCE**

I. Grossmann, *Psychology, University of Waterloo, Waterloo, Ontario, Canada*

The last 20 years of psychological research on wisdom focused on what wisdom is, and how it varies across the lifespan and different personality profiles. Building on this research, my colleagues and I explored the experimental malleability of wisdom-related reasoning schemas (e.g. recognition of limits of knowledge, perspective-taking, dialecticism),

specifically when reasoning over issues that have profound personal implications. Two experiments demonstrate that cueing people to reason about personally meaningful issues (e.g. future career prospects for an unemployed) from a psychologically distanced perspective enhances wise reasoning and behavior (cooperation). Another set of studies extends these findings to the domain of interpersonal relationship conflict, showing that psychological distance has adaptive effects on reasoning and emotions after reflecting on a hypothetical transgression in close relationships. Theoretical and practical implications of these findings are discussed.

#### **DISENTANGLING THE RELATIONS BETWEEN WISDOM AND DIFFERENT TYPES OF WELL-BEING**

M. Ardelet, *Sociology and Criminology & Law, University of Florida, Gainesville, Florida*

This 10-month short-term longitudinal study attempted to determine the causal relations between old age wisdom and subjective, psychological, and physical well-being, using a sample of 123 older ( $M = 72$  years) white and African American community residents and cross-lagged structural equation models. Results showed that baseline wisdom, assessed by cognitive, reflective, and compassionate personality qualities, was significantly related to increases in subjective well-being, mastery, purpose in life, and physical well-being at Time 2, but only baseline physical well-being significantly affected Time 2 wisdom after controlling for baseline wisdom and well-being scores. A subsequent path model indicated that baseline wisdom directly and indirectly (mediated by Time 2 mastery) enhanced Time 2 subjective well-being and purpose in life. The findings corroborate the hypothesis that wisdom in old age can exert a beneficial impact on subjective, psychological, and physical well-being. Helping individuals grow wiser might pay dividends in later life.

#### **WISDOM-RELATED KNOWLEDGE AND SYMPATHY IN RESPONSE TO INTERPERSONAL CONFLICT**

S. Thomas, U. Kunzmann, *Leipzig University, Leipzig, Germany*

According to the Berlin wisdom model, wisdom has been defined as expert knowledge about fundamental life questions of fictitious persons. This study proceeded from the idea that, in real-life, wise advice-giving does not only require wisdom-related knowledge, but also emotional competencies such as the ability to sympathize with the advisee. To investigate this idea, 192 participants watched three films of couples as they discussed a serious marital conflict. After each clip, participants reported their sympathy with the spouses and gave advice to them. Four types of responding were created. The integrated type, characterized by high scores both on wisdom-related knowledge and sympathy, provided the best advice to the couples in that they suggested a richer repertoire of conflict management strategies than the other types (with high scores on either knowledge or sympathy or low scores on both aspects). These findings suggest that sympathy may be one factor that facilitates wisdom.

#### **EMOTIONAL COMPLEXITY IN VERBAL RESPONSES: THE IMPACT OF REJECTION**

D. Grün, Y. Cheng, *Psychology, NC State University, Raleigh, North Carolina*

From a cognitive-developmental perspective (Labouvie-Vief, Grün, & Studer, 2010), the efficiency and complexity of emotional representations depends on person and context characteristics. Person characteristics include age as a proxy for cognitive resources. Thus, older adults' emotional representations may easier be challenged due to limited resources. Certain contexts may also constrain or promote emotional representations. In the present study, we investigated the impact of positive and negative feedback on verbal responses. To do this, we asked young and older adults to participate in an online interview and to verbally respond to 15 questions. After every three questions, par-

ticipants got either positive (acceptance) or negative (rejection) feedback during the interview from the interviewer, who was a confederate. The verbal responses were coded for emotional complexity as well as for other personality aspects (e.g. self-esteem). The verbal responses were indeed influenced by the feedback condition. Findings are discussed from a cognitive-developmental perspective.

### **SESSION 2425 (PAPER)**

#### **IMAGES AND IDENTITY**

##### **SELF-PERCEPTIONS OF AGING PREDICT MAJOR HEALTH EVENTS IN OLDER ADULTS**

K.A. Sargent-Cox<sup>1</sup>, K.J. Anstey<sup>1</sup>, M.A. Luszcz<sup>2</sup>, 1. *Centre for Research in Ageing, Health & Wellbeing, Australian National University, Canberra, Australian Capital Territory, Australia*, 2. *Flinders University, Adelaide, South Australia, Australia*

Self-perceptions of aging (SPA), a measure of satisfaction with one's own aging, is hypothesised to reflect adaptation to age-related changes. SPA is predictive of all-cause mortality and mortality from respiratory causes in older adults. Our objective was to further understanding of the predictive quality of SPA in late-life by extending the investigation to other major health outcomes. We examined how baseline and time-varying change in SPA predicted occurrence of a cardiovascular event, transition from community dwelling to residential care, and all cause mortality in a large ( $N=1507$ ) representative sample of older adults (65+years) over 16 years (5 waves) in the Australian Longitudinal Study of Aging. Event occurrence models (including discrete and Cox regression) revealed poor SPA at baseline increased the risk of transition to residential care ( $OR=1.37$ ) and mortality ( $HR=1.21$ ), but not a CVD event over the 16 year period. Negative change in SPA increased the risk of a CVD event ( $OR=1.15$ ), residential care transition ( $OR=1.43$ ) and mortality ( $HR=1.26$ ). Adjusting models for other health risk factors including demographics, physical health, cognitive functioning and wellbeing explained the predictive relationship for CVD events, but not for residential care and mortality, indicating independent risk for poor SPA beyond these factors. The findings demonstrate that maintaining positive perceptions of aging in late-life may have important implications for healthy aging. Greater understanding of those who are able to maintain positive SPA may help us to appreciate the mechanisms surrounding healthy aging and inform interventions that assist with adaptation to age-related change in late-life.

##### **SHIFTING IMAGES OF AGING: AN ANALYSIS OF MODERN MATURITY/AARP MAGAZINE FROM 1960 TO 2010**

A. Barrett, *Florida State University, Tallahassee, Florida*

Sociocultural constructions of aging are shifting as Baby Boomers move from middle to later life; however, we know little about the images emerging in popular discourse. I address this issue by analyzing representations of aging reflected in a major periodical targeting older adults – Modern Maturity/AARP Magazine. Using a sample composed of two issues published in each year between 1960 and 2010, I analyze cover images and tables of contents. Analyses reveal shifts in images of aging centering on four themes: adapting to versus resisting aging; aging as an individual responsibility versus social issue; emphasis on historical events shared with age peers versus present or future experiences; and older adults' roles as producers versus consumers. I find that more recent images focus on resisting aging, which is constructed as an individual responsibility. They also focus on the present or future experiences of older adults and emphasize expanded roles in both production (e.g., paid and unpaid work) and consumption (e.g., travel, food). The study reveals the increasing prominence of the image of the super-successful ager, displaying high levels of physical or social activity and youthful appear-

ance. I discuss the implications of these patterns for individuals' experiences of aging.

### **THE NATURAL ECOLOGY OF SUBJECTIVE AGING EXPERIENCES: A DIARY STUDY OF COMMUNITY-RESIDING ADULTS BETWEEN THE AGES OF 70 AND 89 YEARS**

M. Miche<sup>1</sup>, H. Wahl<sup>1</sup>, F. Oswald<sup>2</sup>, R. Kaspar<sup>2</sup>, M.K. Diehl<sup>3</sup>, 1. *Department of Psychological Aging Research, Heidelberg University, Heidelberg, Germany*, 2. *Goethe University Frankfurt, Frankfurt, Germany*, 3. *Colorado State University, Fort Collins, Colorado*

Research has established a substantial link between subjective perceptions of aging and a broad range of developmental outcomes. However, traditional measures of subjective aging experiences, such as felt age, fail to acknowledge the multidimensionality inherent in subjective appraisals of aging, as well as the day-to-day experience of being aware of one's own age. The aim of this paper was to capture the natural ecology of subjective aging based on a daily diary approach. We analyzed 1,757 semi-structured diary entries in which participants described daily events and experiences reminding them of their own aging. These reports were collected from a sample of 225 community-residing adults aged 70 to 89 years and coded for domains of behavior and emotional valence (see Diehl & Wahl, 2010). Negative statements about physical functioning were most dominant. Experiences related to lifestyle and engagement, social-cognitive and social-emotional functioning, and interpersonal relations were mentioned by roughly every second person with subjective aging experiences. Cognitive functioning was least frequently mentioned. Frequency distributions and intensity of subjective aging experiences within domains and subdomains varied as a function of gender, age, socioeconomic status, and health status. Overall, results from this study suggest that more sophisticated measurements are helpful in capturing the multi-faceted nature of subjective aging experiences in the daily context. Future studies should extend this research by investigating the link between domain specific aging experiences and developmental outcomes, such as subjective well-being, and specific behaviors, such as preventive health behavior.

### **THE ASSOCIATION BETWEEN AGE IDENTITY AND SUBJECTIVE WELL-BEING AMONG CHINESE OLDER ADULTS**

K. Liang, *The University of Hong Kong, Hong Kong, China*

**Objective:** Although numerous studies have consistently documented that older adults with youthful age identities report higher levels of subjective well-being (SWB) in youth-oriented western societies, currently there is no evidence available from Chinese older adults and the relationship remains unclear in Chinese culture which has a tradition of respecting and valuing the elderly. The objective of this study is to determine the association between age identity and SWB among Chinese older adults. **Methods:** Data are from the 2006 Sample Survey on Aged Population in Urban/Rural China (SSAPUR), which consisted of 16,882 community-dwelling older adults aged 60 years and above. Dependent variables include life satisfaction and depression. Independent variables include sociodemographic control variables (i.e., age, gender, socioeconomic status), self-rated health, various aging markers (i.e., number of chronic conditions, retirement, widowhood), and age identity. **Results:** Over one fifth (21%) of the respondents reported that they did not feel old. Ordinary least regression analyses revealed that youthful age identity was significantly related to higher levels of life satisfaction ( $p < 0.01$ ) and to lower levels of depression ( $p < 0.001$ ), even when controlling for sociodemographic variables, self-rated health, and various aging markers. **Conclusions:** This study provides new evidence of the important role age identity can play in individual development in later life and demonstrates youthful age identities may have adaptive value for Chinese older adults and contribute to their successful aging.

## **SESSION 2430 (PAPER)**

### **PROMOTING OPTIMAL AGING THROUGH THE ARTS**

#### **WELL- AND ILL-BEING: RESULTS FROM VIDEO DATA ANALYSES OF AN INTERGENERATIONAL ART PROGRAM FOR PEOPLE WITH DEMENTIA**

P. Sauer, S.J. Hahn, K. Beanblossom, J.M. Kinney, E. Lokon, *Scripps Gerontology Center, Miami University, Oxford, Ohio*

Opening Minds through Art (OMA) is an intergenerational art program that is grounded in person-centered ethics (e.g., Kitwood, 1997, 1998). The overall goal of OMA is to promote social engagement, autonomy, and dignity by providing creative self-expression opportunities for people with dementia (i.e., "artists"). Weekly structured sessions lasting approximately 40 minutes pair each artist with a volunteer who facilitates her/his creation of original art. A total of 38 artists (with at least moderate dementia) and their volunteers were video-taped during their weekly sessions over an 18-month period at three long-term care facilities. Trained researchers coded the videotapes using a modified version of the Greater Cincinnati Chapter Well-Being Observation Tool (Kinney & Rentz, 2008). Each tape was divided into five-minute intervals, which were coded for the extent to which the artist demonstrated well-being (i.e., social interest, engagement, pleasure) and ill-being (i.e., disengagement, negative affect, sadness, confusion). After extensive training, inter-rater agreement based on one-third of the tapes was 94.08 percent. Results indicated that, out of the eight observational intervals in the initial session, the average number of intervals in which artists demonstrated well-being (i.e., engagement, social interest and pleasure) were 6.92, 6.68 and 5.63, respectively. Whereas all artists demonstrated multiple domains of well-being, ill-being was demonstrated by far fewer artists and for fewer intervals on average (means ranged from .82 intervals for disengagement to .08 intervals for sadness). Results demonstrate that it is possible to provide programming that promotes well-being among individuals in moderate to advanced stages of dementia.

#### **MUSIC-MAKING: A PROTECTIVE FACTOR AGAINST DEMENTIA**

A. Balbag<sup>1</sup>, N.L. Pedersen<sup>2,1</sup>, M. Gatz<sup>1,2</sup>, 1. *University of Southern California, Los Angeles, California*, 2. *Karolinska Institutet, Stockholm, Sweden*

Music-making is a uniquely complex process: Not only is it a form of art or entertainment, but also a prime example of multimodal integration. Although music processing has traditionally been attributed to the right hemisphere of the brain, it now appears that the brain is wired throughout for music. Recent research illustrates structural and functional brain differences between musicians and non-musicians, stimulating much interest in how music may benefit brain health and cognitive function. While playing an instrument is typically viewed as positively influencing cognition in youth, we ask if older adults also receive cognitive benefit from music-making throughout the life course. Using the Study of Dementia in Swedish Twins, we examined music's potential to protect against dementia. Dementia diagnoses were based on a complete clinical workup. Participation in music-making was taken from informant-based reports of twins' leisure activities. In twin pairs discordant for dementia ( $n = 123$ ) we find evidence that playing a musical instrument is protective against dementia. Compared to the twin who developed dementia or cognitive impairment, the twin who remained cognitively intact was more likely to have engaged in music-making ( $OR = 0.65$ ). Given music's universality, this evidence of its potential role as a non-pharmacological, non-invasive, and modifiable protective factor against dementia is particularly encouraging.

## **VOICEBOX: GIVING THE ELDER COMMUNITY A VOICE USING VIRTUAL PUPPETS AND PUPPETRY**

T.M. Witten<sup>1</sup>, S. Ryu<sup>2</sup>, 1. *Virginia Commonwealth University, Richmond, Virginia*, 2. *Center for the Study of Biological Complexity, Virginia Commonwealth University, Richmond, Virginia*

VOICEBOX is a multi-school, multi-disciplinary project between the VCU School of the Arts, the School of Life Sciences (CSBC), students from the School of Social Work and the College of Humanities and Arts, Department of Women's Studies. The VOICEBOX project explores the development of a creative, expressive and engaging storytelling platform for the senior population in Richmond and surrounds, using the ideas of a virtual (3D) interactive puppet performance. We posit that this software and hardware design can also be used in a therapeutic fashion to be used to mediate depression and loneliness. The project will commence by creating a simple immersive virtual environment for the puppeteer (we will now refer to the senior as the puppeteer) immersive storytelling process. Once it has been tested out and debugged, we will move to public theatre performance by senior volunteers who are willing to be public storytellers (personal or fictional) in public. The virtual 3D puppet will be projected on screen, controlled by the puppeteer via digital wireless technology. The puppeteer will face the virtual puppet from a long distance, speaking into wireless microphone, which will activate the virtual puppet's mouth in real time. Consequently, the virtual puppet lip-sync with the puppeteer's voice, speaking back his/her story as real time echoes. The puppeteer will be standing on a Nintendo WiiFit, transmitting his/her weight balance signal to the virtual puppet which then mirrors the puppeteer's body in a swaying motion. The puppeteer will use an interactive device and select items on screen which will activate pre-configured actions of the virtual puppet, on top of the puppeteer's realtime actions. The combination of these capabilities allows the puppeteer to choreograph visual narratives that will simultaneously inspire the audience and the puppeteer in a live performance. Using the facial tracking technology, the puppeteer's face will be tracked and captured by webcam. The face of live puppeteer will be superimposed on top of the virtual puppet face in the middle of the performance. The single puppeteer will play all characters in story, switching back and forth between multiple characters. By being a puppeteer using virtual puppet, the puppeteer will have an opportunity to tell his/her own personal story and review his/her own memory and history in a more accessible and expressive fashion, which can then be more appreciated, respected and shared with the public (including themselves), as special art forms full of wisdom and true knowledge. The user's live wireless spoken words will motivate the virtual body and will also encourage the realtime, visual and acoustical feedback of the virtual space, thereby creating an experiential and improvisational storytelling process in mixture of multiple realities (i.e., past/present/future, real/fantasy). The VOICEBOX system will help the senior to review and reveal their distant memory, feelings and hidden emotions from their oral storytelling process. It will also give the senior an opportunity to more deeply review their own internal oral history and to make the choice of sharing with their family (across generations) and if they desire, a wider more public audience.

## **PERCEIVED BENEFITS OF SINGING AND QUALITY OF LIFE IN OLDER COMMUNITY CHORAL SINGERS IN FINLAND**

J.K. Johnson<sup>1</sup>, J. Louhivuori<sup>2</sup>, P. Era<sup>2,3</sup>, L. Ross<sup>1</sup>, A. Stewart<sup>1</sup>, 1. *Institute for Health and Aging, University of California, San Francisco, San Francisco, California*, 2. *University of Jyväskylä, Jyväskylä, Finland*, 3. *GeroCenter Foundation for Research and Development, Kinkomaa, Finland*

Objective: Describe experiences of singing in community choirs and determine association with quality of life (QOL). Method: With older choir members in Finland (N=117), we assessed experiences associated with singing (e.g., relaxation, group support, and emotional experiences)

and QOL (WHOQOL-Bref). We describe these experiences and use linear regression to examine their association with QOL. Results: We found a mean of 92 (+11) (possible range 16-126) on the choral singing measure and moderately high QOL levels (means 16-17 on four domains, possible range 4-20). The choral score was significantly correlated with psychological, personal relationships, and environment domains of QOL as well as overall QOL, even after adjusting for age, gender and depressive symptoms. Discussion: Findings suggest a cross-sectional relationship between experiences in choir and QOL in older adults in Finland, which promotes lifelong involvement in music. Future studies should investigate whether choral singing can promote healthy aging (e.g., randomized controlled trials).

## **TOUCHING THE HEARTS OF YOUNG DOCTORS: RESEARCH-BASED READER'S THEATRE AS A CATALYST TO ENHANCE MEDICAL STUDENT EMPATHY AND UNDERSTANDING OF DEMENTIA PATIENTS AND THEIR FAMILY CAREGIVERS**

O. Morey, S.M. Gerik, *Educational Development, University of Texas Medical Branch, Galveston, Texas*

Humanism, compassion and empathy are essential characteristics of healthcare providers for older adults, yet the public often sees provider compassion as lacking. Medical education largely focuses on the scientific model of objective principles with little attention to the human side of care. This, combined with a minimal focus on geriatric education, gives students little understanding of the psycho-social and emotional issues of aging. Recent moves in research-informed theatre have allowed qualitative researcher/educators to use drama to make their research more significant and relevant to healthcare settings. Research-based reader's theatre about topics related to aging can significantly contribute to medical education by allowing students to reflect on their own emotions and the use of an imaginative perspective to develop insight into how best to convey compassion and empathy to older patients and their caregivers. This paper explains how a research-based reader's theatre production about people who care for a loved one with dementia was developed from a qualitative research study, offered to all first year medical students at the University of Texas Medical Branch, and then evaluated using qualitative research methods. Research findings on the impact of the research-based theatre production on medical students' empathy and understanding of the older patient/family caregiver/physician triad will be discussed.

## **SESSION 2435 (SYMPOSIUM)**

### **NAVIGATING THE MAZE OF PAIN AND OTHER SYMPTOMS DURING AND AFTER HOSPITALIZATION**

Chair: S.H. Kagan, *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

Despite marked attention given to pain management for chronically, seriously ill older adults, patients and their families are commonly unsatisfied with pain and symptom management during hospitalization and are often bewildered by discharge from the hospitalization. As a consequence, challenges persist in assuring adequate pain and symptom management and successful transition from hospital to home and to preventing readmission and iatrogenic events. This symposium, in acknowledging current major policy initiatives and evidence in transitional care aimed at reducing readmission and increasing patient and family-centered care, assumes a focal perspective on pain and symptoms in exploring trajectories from hospital to home. This focal perspective links research in pain management in intensive care, discharge teaching for pain management in general ward care, and home based primary care

to map out patient trajectories and explore novel solutions to address pain management and successful hospital discharge for chronically, seriously ill older adults. The first paper examines the influence of patient characteristics including age on pain management for mechanically ventilated ill adults. The second paper explores patient and family caregiver experiences of managing pain while receiving home health care after hospital discharge. The final paper examines representative cases of home-based primary care and symptom management as an avenue to improve patient outcomes and reduce hospitalization for patients in the Veterans' Administration program that will be tested by Medicare as "Independence at Home". The discussant – a senior nurse scientist – will offer insights into the evidence presented and the larger themes represented to launch interdisciplinary discussion.

### **PATIENTS' AND THEIR INFORMAL CAREGIVERS' EXPERIENCES OF PAIN MANAGEMENT AFTER HOSPITAL DISCHARGE**

J.B. Foust<sup>1</sup>, N.H. Vuckovic<sup>2</sup>, *1. University of Massachusetts, Boston, Massachusetts, 2. Intel Corporation, Beaverton, Oregon*

**Purpose.** To describe the experiences of home healthcare patients and informal caregivers managing pain after being hospitalized. **Methods.** In-depth qualitative interviews were conducted (N=40) with recently discharged home healthcare patients and their informal caregivers (N= 36). Qualitative content analyses were used. Selected medical record data were used to complement interview data. **Results.** Most patients (80%) experienced or had documented pain (N=32). Patients described pain patterns (e.g. intensity, triggers), health professionals' instructions and their responses to pain management strategies (e.g. expectations, medications). Informal caregivers (N=29) described how patients' pain affected them. Discrepancies occurred between pain reported by patients or caregivers and agency documentation (n=10). **Conclusion:** Recently discharged home healthcare patients frequently experienced pain and used diverse strategies to manage their pain. Informal caregivers were affected by patients' pain and provided support. Better identification, education and monitoring are needed to improve post-hospital pain management to address medication use, self-monitoring and promoting activity.

### **THE ASSOCIATION OF AGE AND OTHER PATIENT CHARACTERISTICS WITH PAIN MANAGEMENT IN THE ICU**

M. Happ, J. Lee, J.B. Seamon, M.P. House, S.M. Sereika, J.A. Tate, A. Barnato, *University of Pittsburgh, Pittsburgh, Pennsylvania*

**Purpose:** To explore the association of patient characteristics (age, race, gender, severity of illness) with pain management (days-in-pain; daily maximum pain scores) among mechanically ventilated (MV) patients in ICUs. **Sample/Setting:** Random sample of 30 patients (MV >2 days; awake >12-hours) from 6 ICUs (August-October, 2009) from electronic medical record database. **Method:** We abstracted demographic and clinical information to a 28-day maximum/patient: severity of illness (APACHEiii), highest daily pain rating (1-10 scale), and pain reported by nurse assessment. Data were analyzed using descriptive statistics and multiple linear regression. **Results:** Among 184 patients, aged 58.92+17.92 years, 50.0% were women; 20(10.9%) were black/AA, 160(87.0%) white; APACHEiii =70.27+17.59. Mean maximum daily pain scores=6.5+2.3 and % days-in-pain= 55.90+29.46. Older age was significantly associated with lower mean maximum daily pain rating (F=3.70, p=.057; b=-0.03) and fewer days-in-pain (F=16.15, p<.001; b=-0.55). **Conclusions:** Older MV patient age is associated with lower pain intensity assessments and fewer days-in-pain in ICU.

### **PATIENT EXPERIENCES OF INTERDISCIPLINARY SYMPTOM MANAGEMENT IN VA HOME BASED PRIMARY CARE**

N.H. Vuckovic<sup>1</sup>, T. Edes<sup>2</sup>, L.O. Nichols<sup>3</sup>, *1. Intel Corporation, Beaverton, Oregon, 2. U.S. Department of Veterans Affairs, Washington, District of Columbia, 3. Veterans Affairs Medical Center, Memphis, Tennessee*

**Purpose:** The VA's Home Based Primary Care (HBPC) program, which provides comprehensive interdisciplinary in-home care, has been shown to decrease inpatient utilization and improve patient outcomes. Veterans' experience of the program and resulting health improvements provide additional insights into the value of the program. Medicare is preparing to test this model of care as Independence at Home. **Methods:** We present case studies of two HBPC Veterans based on observations of HBPC staff and interviews with the Veterans and their family caregivers. **Results:** Clinician observations identified that care coordination enables a composite assessment of the Veteran's health needs. Veterans described positive changes in health and quality of life through comprehensive and thorough care. **Conclusions:** This interdisciplinary, team-based care delivery model results in care that is clinically effective and valued by Veterans. **Objectives:** Participants will be able to discuss how this type of care can benefit high cost, complex chronic disease patients.

## **SESSION 2440 (SYMPOSIUM)**

### **PHYSICAL ACTIVITY: A PATHWAY TO COGNITIVE AND FUNCTIONAL HEALTH**

Chair: *C.M. Germain, Center for Aging and the Study of Human Development, Duke University, Durham, North Carolina*

Discussant: *H.R. Romero, Center for Aging and the Study of Human Development, Duke University, Durham, North Carolina*

Dementia represents a diverse category of syndromes characterized by deficits in memory and other cognitive functions, as well as behavior. Symptoms associated with dementia appear to be distributed along a continuum, with even sub-clinical levels of impairment affecting the health and functional ability of older adults. With the continued increase in the aging population, identifying risk and protective factors that help to preserve the functional ability of older adults is of increasing importance. In recent years, investigators have considered a variety of lifestyle variables that may serve as protective factors against cognitive decline including physical health, the availability and presence of social networks, intellectual engagement and physical activity. Participation in physical activities in particular has been of increasing interest because it presents opportunities for non-pharmacological interventions as a method of improving health, functional and cognitive outcomes in late life. The current symposium will present research which examines the protective benefits of physical activity on late life cognition and functional status.

### **COGNITIVE IMPAIRMENT DUE TO VASCULAR DISEASE AMONG MEDICALLY UNDERSERVED OLDER ADULTS**

H.R. Romero, *Bryan Alzheimer Disease Research Center, Duke University Medical Center, Durham, North Carolina*

Medically underserved populations with vascular risk factors are at risk for cognitive impairment. Patients were referred to our free memory clinic by their community health clinic providers and were administered a brief neuropsychological screening. Participants (N=37) were predominantly African American (71%), as well as White (25%) and Hispanic (4%). Average age was 64.7 (47-85) and mean education level was 11 years (6-18). The majority had an annual income near the federal poverty level. Nearly half (46%) were diagnosed with cognitive impairment no dementia (CIND-vascular), primarily associated with cerebrovascular disease. Secondary contributions included substance

abuse, chronic pain, head injury, and depression. Less common diagnoses included Alzheimer's disease (AD), mild cognitive impairment (likely early AD), vascular dementia, and psychiatric disorders. Many participants did not endorse participation in the health center's walk group or vascular disease support group. The findings have important implications for preventing cognitive disorders among individuals with vascular disease.

#### **PHYSICAL ACTIVITY AND COGNITION IN OLDER AFRICAN AMERICANS**

A. Aiken Morgan<sup>1</sup>, K.E. Whitfield<sup>2</sup>, *1. Center for Aging, Duke University Medical Center, Durham, North Carolina, 2. Duke University, Durham, North Carolina*

Research shows that physical activity is related to many positive health outcomes, including lower cardiovascular risks, lower rates of depression, improved aerobic capacity, and improved functional capacity. There is also a growing body of literature showing a positive relationship between physical activity and cognitive function. The present study examined the association between physical activity and cognitive status in African Americans from the second wave of the Carolina African American Twin Study of Aging (CAATSA). Results revealed significant associations between physical activity and cognitive status ( $p < .01$ ). These findings suggest that physical activity is associated with better cognitive status in this sample of older African Americans, which has implications for physical and cognitive health disparities.

#### **LATE-LIFE LIFESTYLE ACTIVITY AS A BUFFER FOR COGNITIVE DECLINE AND FUNCTIONAL IMPAIRMENT**

J. Kuo<sup>1,2</sup>, J.M. Parisi<sup>3</sup>, R. Nahin<sup>3</sup>, A. Fitzpatrick<sup>4</sup>, S. Rapp<sup>5</sup>, O.L. Lopez<sup>6</sup>, B. Snitz<sup>6</sup>, M. Carlson<sup>1,2</sup>, *1. Johns Hopkins University Center on Aging and Health, Baltimore, Maryland, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. National Center for Complementary and Alternative Medicine, Bethesda, Maryland, 4. University of Washington, Seattle, Washington, 5. Wake Forest University School of Medicine, Winston-Salem, North Carolina, 6. University of Pittsburg, Pittsburg, Pennsylvania*

**Objective:** We examined whether baseline social, cognitive, or physical activity better predicted greater declines in cognitive function (3MSE, TMT-B) and functional independence (IADL). **Methods:** The study population consisted of 3,069 community volunteers aged 75 years or older in the Ginkgo Evaluation of Memory (GEM) study. Intellectual, social, and physical activities were measured using the Lifestyle Activity Questionnaire (LAQ; Carlson et al., 2012). Dementia was diagnosed using DSM, IV criteria. **Results:** Physical and intellectual activities were associated with better 3MSE performance, and intellectual activities were associated with better performance in the TMT at baseline. Greater physical activity was predictive of fewer 3MSE errors longitudinally, and increased survival time to incident IADL difficulty ( $p < .01$ ). **Conclusions:** Social and intellectual activities were not associated with reducing rates of cognitive decline. Physical activity was beneficial in buffering decline in the 3MSE and was associated with delayed onset of IADL difficulty, but not with incident dementia.

#### **PHYSICAL ACTIVITY AND COGNITIVE IMPAIRMENT NOT DEMENTIA (CIND) IN LATE LIFE**

C.M. Germain, B.L. Plassman, M. Kuchibhatla, *Center for Aging and the Study of Human Development, Duke University, Durham, North Carolina*

Research suggests that physical activity and exercise may help to delay or protect against cognitive decline and dementia in late life. Whether physical activity is protective against subclinical dementia is unclear. The current study examined the association between participation in vigorous physical activity and likelihood of being diagnosed as CIND. The current study used existing data from ADAMS (Aging, Demographics and Memory Study) which is a representative sample

of  $n = 856$  community dwelling adults over 70 years of age drawn from the Health and Retirement Study (HRS). Results suggest that participation in vigorous physical activity is associated with reduced likelihood of being diagnosed as CIND ( $p < .03$ ). Individuals who reported participating in vigorous physical activity at least 3 times per week were less likely to be diagnosed as CIND six years later than those who reported that they did not engage in vigorous physical activity.

### **SESSION 2445 (SYMPOSIUM)**

#### **THE GERONTOLOGICAL IMAGINATION: RESEARCH IN HEALTH AND AGING FROM THE FIRST COHORT OF DOCTORATES IN GERONTOLOGY**

Chair: *B. Kaskie, University of Iowa, Iowa City, Iowa*

Discussant: *R. Andel, University of South Florida, Tampa, Florida*

Discussant: *A. Watts, University of Kansas, Lawrence, Kansas*

In 1993 the USC Leonard Davis School of Gerontology conferred the world's first doctoral degree in Gerontology. The purpose of this symposium is to present research in health and aging currently being conducted by the first cohort of graduates from the USC program (1993-2012). These presenters will showcase how the PhD in gerontology has led them to ask a variety of interesting research questions using distinct methodological approaches. Valentine Villa, the first doctoral graduate in gerontology, presents findings from the California Health Interview Survey that reveal differences in health outcomes among U.S. born non-Hispanic white, U.S. born Mexican, naturalized Mexican and non-citizen Mexican immigrant baby boomers. Debra Sheets discusses an evaluation of how 14 family and informal caregiver programs impacted individual levels of depression and burden. Susan Stewart demonstrates how she used multiple data sets to depict trends in quality-adjusted life expectancy (QALE) for persons over 65. Adria Navarro examines the effectiveness of an elder abuse forensic center in increasing prosecution of financial abuse. Brian Kaskie reviews workplace wellness programs targeting aging faculty and staff at 187 academic institutions across the United States. The symposium will demonstrate how doctorates in gerontology have made unique contributions in advancing our understanding about the health of our aging population. The symposium also will provide an opportunity to consider the distinct career pathways that have been taken by doctorates in gerontology.

#### **DEVELOPMENTAL EVALUATION OF THE FAMILY AND INFORMAL CAREGIVER INITIATIVE**

D.J. Sheets, *School of Nursing, GEOTOP, Victoria, British Columbia, Canada*

**Background:** Between 2009-2012, The Weinberg Foundation awarded \$8 million in funding to 14 non-profit organizations aimed at developing evidence-based and innovative programs to support family and informal caregivers of older adults. An external evaluation of the initiative focused on outcomes that included caregiver risk, depression, and burden. **Methods:** A developmental evaluation design included process and outcome measures. Qualitative data monitored collaborative partnerships through narrative reports. Quantitative data from ~900 caregivers receiving direct services was gathered from pre- and post- surveys. **Results:** Key findings included the effectiveness of technologies to support caregivers as well as the importance of "no wrong door" approaches to serving caregivers and the need for collaborative partnerships to offer a comprehensive approach to addressing caregiver needs. **Conclusion:** Policies and programs that target caregivers early in the caregiving process are crucial to avert crises and support caregivers as the needs of the care recipient change and progress.

## QUALITY-ADJUSTED LIFE EXPECTANCY IN THE U.S. FROM 1987 TO 2008: TRENDS AND CONTRIBUTING FACTORS

S. Stewart<sup>1</sup>, D.M. Cutler<sup>2,1</sup>, A.B. Rosen<sup>3,1</sup>, 1. *National Bureau of Economic Research, Cambridge, Massachusetts*, 2. *Department of Economics, Harvard University, Cambridge, Massachusetts*, 3. *Department of Quantitative Health Sciences, University of Massachusetts Medical School, Worcester, Massachusetts*

**Background:** The wealth of data on impairments and symptoms collected by U.S. health surveys over time has not been used to systematically track overall health trends among older adults. **Methods:** Trends in quality-adjusted life expectancy (QALE) are measured and decomposed into contributing factors, using national mortality data and impairments and symptoms in the National Medical Expenditure Survey (1987), the National Health Interview Survey (1987, 1994-95, 1996) and the Medical Expenditure Panel Survey (2000-08). **Results:** QALE at age 65 increased by 1.7 years from 1987 to 2008, with gains driven by life expectancy increases (1.45 years) and reductions in most impairments and symptoms (0.50 years). Smoking declined while obesity increased, with a net effect of slowing QALE growth by 0.14 years. **Conclusion:** QALE has increased over the past two decades despite rising obesity and slight worsening of some impairments. Tracking population health with a detailed summary measure is key to informed health policy-making.

## HOLDING ABUSERS ACCOUNTABLE: AN ELDER ABUSE FORENSIC CENTER INCREASES CRIMINAL PROSECUTION OF FINANCIAL EXPLOITATION

A.E. Navarro<sup>1,2</sup>, Z.D. Gassoumis<sup>2</sup>, K. Wilber<sup>2</sup>, 1. *Azusa Pacific University, Azusa, California*, 2. *University of Southern California, Los Angeles, California*

**Purpose:** The aim of this study was to examine the effectiveness of an elder abuse forensic center compared with usual care to increase prosecution of elder financial exploitation. **Design and Methods:** Los Angeles County Elder Abuse Forensic Center cases (aged 65+), heard 2007 to 2009 (n=237), were matched to a population that received usual care from Adult Protective Services (APS). **Results:** Significantly more Forensic Center cases were submitted to the District Attorney's office (DA) for review (22%, n=51 vs. 3%, n=7 usual care, p<.001). Using logistic regression, the strongest predictor of case review and ultimate filing and conviction was whether the case was presented at the Forensic Center, with ten times greater odds of submission to the DA (OR=11.00, CI:4.66-25.98). **Implications:** Previous studies have not demonstrated that elder abuse interventions impact outcomes; this study breaks new ground by showing that an elder abuse multidisciplinary team increases rates of prosecution.

## WORKPLACE WELLNESS PROGRAMS FOR AGING ACADEMICS: A ROLE FOR GERONTOLOGISTS

B. Kaskie<sup>1</sup>, Z. Cong<sup>2</sup>, 1. *University of Iowa, Iowa City, Iowa*, 2. *Texas Tech University, Lubbock, Texas*

**Purpose:** Few colleges or universities have identified the challenges and opportunities presented by aging employees as a top priority. This research examined workplace wellness programs targeting aging faculty and staff at academic institutions. **Data/Methods:** A cross-sectional survey of 187 human resource specialists from a representative sample of academic institutions provided data on workplace wellness programs most relevant to aging employees (e.g., retirement counseling). These institutional wellness programs were regressed onto a mixed effect model featuring contextual, institutional and individual level constructs (e.g., location of institution, size of student body, background of HR specialist). **Results:** Wellness programming varied significantly across academic institutions and was related to two variables: the over-all size of the institution and whether the HR specialist had completed any training-in-aging. **Conclusion:** Implementing a formal effort to increase well-

ness programming for an aging academic workforce appears relatively straightforward, and is likely to generate individual and institutional benefits.

## HISPANIC BABY BOOMERS: HEALTH INEQUITIES LIKELY TO PERSIST IN OLD AGE

V.M. Villa<sup>1,2</sup>, S. Wallace<sup>1</sup>, S. Bagdasaryan<sup>2</sup>, M.P. Aranda<sup>3</sup>, 1. *Public Health, UCLA, Los Angeles, California*, 2. *CSULA, Los Angeles, California*, 3. *USC, Los Angeles, California*

**Purpose:** As the baby boom generation enters the ranks of the elderly, the U.S. will witness an unprecedented growth in racial/ethnic diversity. Hispanics will comprise 20% of the next generation of older adults, representing the largest minority population age 65+. **Data/Methods:** Utilizing data from the California Health Interview Survey 2007, logistic regression was used to test for differences in health among U.S. born non-Hispanic white, U.S. born Mexican, naturalized Mexican, and non-citizen Mexican immigrant baby boomers born between 1946 and 1964 (ages 43-61). **Results:** The Mexican origin disadvantage in health attenuates in part when controlling for socioeconomic status, but some disadvantages remain. **Conclusion:** Baby boomers of Mexican origin do not share the advantages of health, income, and educational attainment enjoyed by U.S. born non-Hispanic whites. As this cohort moves into old age, the cumulative disadvantage of existing disparities are likely to result in continued health disparities.

## SESSION 2450 (PAPER)

### EPIDEMIOLOGY: DISTRIBUTIONS AND PATTERNS OF OLDER ADULT HEALTH

#### INJURIES OCCURRING TO RURAL OLDER ADULTS

L.S. Edelman, L.J. Cook, L. Olson, *University of Utah, Salt Lake City, Utah*

Injury rates increase with age, with falls accounting for the majority of injuries occurring to older adults. Rural areas have increased proportions of older adults yet there is a paucity of research about injury circumstances, treatments and outcomes in this population. In this study we compared injuries occurring to rural and urban older adults in a Western state. **Method:** We probabilistically linked records from State emergency department, hospital discharge, and vital record databases to identify adults 65+ years of age with injury diagnoses codes during 2007-2008. Older adults living in counties with fewer than 100 individuals per square mile were considered rural. **Results:** Rural residents experienced 29% of the 32,437 injuries occurring to older adults; counties with the highest fatal and non-fatal injury rates were rural. Injured rural older adults were less likely to be female (57 vs. 61%, p<0.05) and to be hospitalized for the initial injury (17% vs. 20%, p<0.05) than urban older adults. Rural older adults were less likely to be injured from falling or motor vehicle collisions and more likely to be injured by machinery, other modes of transportation, natural/environmental injuries, being struck, or overexertion. During the study period, 12% of older adults died but only ¼ of deaths were due to injuries. **Conclusions:** Differences in rural and urban older adult injury rates are not as great as reported in younger adult populations. Differences in injury etiologies can be used to design injury prevention programs targeted to rural older adults.

## ASSOCIATION OF CHANGES IN WEIGHT WITH BODY COMPOSITION AND MORTALITY IN OLDER ADULTS: HEALTH ABC

R.A. Murphy<sup>1</sup>, K. Patel<sup>1</sup>, S.B. Kritchevsky<sup>2</sup>, D.K. Houston<sup>2</sup>, F.A. Tylavsky<sup>3</sup>, P.M. Cawthon<sup>4</sup>, A.B. Newman<sup>5</sup>, T.B. Harris<sup>1</sup>, *1. Epidemiology, Demography and Biometry, National Institute on Aging, Bethesda, Maryland, 2. Wake Forest University, Salem, North Carolina, 3. University of Tennessee Health Science Center, Memphis, Tennessee, 4. California Pacific Medical Center, San Francisco, California, 5. University of Pittsburgh, Pittsburgh, Pennsylvania*

Background: Aging is often accompanied by changes in weight and body composition that may indicate declining health. Methods: We examined the association of weight changes with body composition and mortality among 1,975 participants (53% women, 37% black) in Health ABC. Annual weight and DXA measurements from the first 5 years of Health ABC were analyzed with mortality follow-up for 8 subsequent years. A 5% weight change from year to year or from year 1 was used to define weight patterns as stable (n=664), loss (n=662), gain (321) or unstable (gain and loss of 5%, n=328). Results: At the end of the initial 5-year period, weight losers had the lowest weight, lean mass and fat mass. Weight unstable women tended to weigh less than weight stable women (p=0.06) which was due mainly to differences in fat mass (p=0.04) not lean mass (p=0.12). There were no significant differences in body composition between men with stable or unstable weight. Compared to participants with stable weight, those with weight loss or unstable weight had increased mortality risk; weight gainers did not have increased mortality risk. Adjusting for demographics, BMI, physical activity, smoking, multiple morbidities and physical performance, the hazard ratios (HR) (95% confidence interval) for weight loss in women and men were 1.53 (1.12-2.09) and 1.47 (1.14-1.91), respectively; for weight unstable women and men, the HRs were 1.71 (1.21-2.41) and 1.69 (1.23-2.32), respectively. Conclusions: Weight loss and cycling were strongly associated with increased mortality, underscoring the importance of monitoring weight history for geriatric care.

## GAIT SPEED AND DISABILITY IN ELDERLY: CHS, HEALTH ABC, HEPESE, INCHIANTI, MROS, PEP AND SOF STUDIES

S. Perera, K. Patel, C. Rosano, A.B. Newman, J.A. Cauley, J.M. Guralnik, L. Ferrucci, S. Studenski, *Division of Geriatric Medicine, University of Pittsburgh, Pittsburgh, Pennsylvania*

Background: Gait speed predicts future health outcomes, but absolute rates of disability and predictive accuracy estimates are needed to make individualized clinical decisions. Objective: To evaluate the relationship between gait speed and disability. Methods: Logistic regression analysis and synthesis of individual data from 7 large cohort studies of 27,432 adults aged 65+ with baseline 4-6m standing start gait speed, followed up for 3 years. Outcomes: Incident dependence in any activity of daily living (ADL) and bathing/dressing only; difficulty walking 2-3 blocks, climbing flight of stairs and in either one of them. Results: Participants had mean age 73.4 (5.3); gait speed 0.99 (0.22) m/s; and were 60% women. Gait speed predicted ADL dependence (age-adjusted pooled odds ratios per 0.1 m/s increase=0.71; p=0.0023), and risk decreased with gait speed across the full range. For 7 gait speed categories defined by 0.2 m/s intervals, the absolute percentages of 3-year incident ADL disability were 19%, 11%, 5%, 3%, 2%, 1% and 2%, and walking difficulty 35%, 21%, 13%, 7%, 7% and 3%. Area under ROC curve for ADL dependency increased from 0.766 to 0.804 when gait speed was added to a model with age, gender, disease history, BMI, blood pressure and prior hospitalization. Results were similar for other outcomes and when disability at interim assessments was considered. Conclusion: In this pooled analysis of individual data from 7 selected large cohorts, gait speed predicted incident disability in older adults.

## ASSOCIATION OF A MODIFIED PHYSIOLOGIC INDEX WITH MORTALITY AND INCIDENT DISABILITY

J. Sanders<sup>1</sup>, R. Boudreau<sup>1</sup>, B. Penninx<sup>2</sup>, E.M. Simonsick<sup>3,4</sup>, S.B. Kritchevsky<sup>5</sup>, S. Satterfield<sup>6</sup>, T.B. Harris<sup>4</sup>, A.B. Newman<sup>1</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. VU University Medical Center, Amsterdam, Netherlands, 3. Johns Hopkins School of Medicine, Baltimore, Maryland, 4. National Institute on Aging, Baltimore, Maryland, 5. Wake Forest University, Winston-Salem, North Carolina, 6. University of Tennessee, Memphis, Tennessee*

Background: Indexes constructed from components may identify individuals who age well across systems. We studied the associations of a Modified Physiologic Index (systolic blood pressure, forced vital capacity, Digit Symbol Substitution Test score, serum cystatin-C, serum fasting glucose) with mortality and incident disability. Methods: Data are from the Health, Aging, and Body Composition study on 2737 persons (51.2% women, 40.3% black) aged 70-79 at baseline and followed on average 9.3 (2.9) years. Components were graded 0 (healthiest), 1 (middle), or 2 (unhealthiest) by tertile or clinical cutpoints and summed to calculate a continuous index score (range 0-10). We used multivariate Cox proportional hazards regression to calculate risk of death or disability and determined accuracy predicting death using the area under the curve. Results: Mortality was 19% greater per index unit (P<0.05). Those with highest index scores (scores 7-10) had 3.53-fold greater mortality than those with lowest scores (scores 0-2). The unadjusted index (c-statistic=0.656, 95% CI 0.636-0.677, P<0.0001) predicted death better than age (c-statistic=0.591, 95% CI 0.568-0.613, P<0.0001) (P<0.0001 for comparison). The index attenuated the age association with mortality by 33%. A model including age and the index did not predict death better than the index alone (c-statistic=0.671). Prediction was improved with the addition of other markers of health (c-statistic=0.710, 95% CI 0.689-0.730). The index was associated with incident disability (aHR per index unit = 1.04, 95% CI 1.01-1.07). Conclusions: A simple index of available physiologic measurements was associated with mortality and incident disability and may prove useful for identifying persons who age well across systems.

## EFFECT OF GENE-ENVIRONMENT INTERACTIONS BETWEEN APOE $\epsilon$ 4 AND LIFETIME ALCOHOL CONSUMPTION ON COGNITION IN OLDER ADULTS

B. Downer<sup>1</sup>, F. Zanjani<sup>1</sup>, D. Fardo<sup>2</sup>, *1. University of Kentucky, Gerontology, Lexington, Kentucky, 2. University of Kentucky, Biostatistics, Lexington, Kentucky*

Background: Few studies have analyzed if the association between alcohol consumption and cognitive functioning is modified by APOE genotypes. Data from 475 participants of the Offspring Cohort of the Framingham Heart Study were used to examine if outcomes for immediate and delayed logical, paired associate and visual memory were affected by interactions between lifetime alcohol consumption and APOE  $\epsilon$ 4. Methods: Participants were dichotomized according to presence ( $\epsilon$ 4+) or absence ( $\epsilon$ 4-) of APOE  $\epsilon$ 4 alleles. Alcohol consumption data collected during clinical exams 1-7 were used to determine lifetime alcohol consumption status (abstainer, moderate or at risk consumer). Analysis of Covariance was used to compare adjusted mean cognitive scores according to alcohol consumption and APOE  $\epsilon$ 4 status. Results:  $\epsilon$ 4+ at risk consumers had lower cognitive scores compared to  $\epsilon$ 4- at risk consumers for delayed (p=0.035) and immediate (p=0.067) logical memory and immediate (p=0.041) and delayed (p=0.062) paired associate memory.  $\epsilon$ 4+ moderate consumers had a lower score for immediate logical memory compared to  $\epsilon$ 4- moderate consumers (p=0.039).  $\epsilon$ 4- at risk consumers had higher scores compared to  $\epsilon$ 4- moderate consumers for immediate (p=0.033) and delayed (p=0.023) logical memory and immediate paired associate memory (p=0.072). Visual memory was not modified by  $\epsilon$ 4 status in moderate or at risk consumers. APOE did not have an effect on any domains for abstainers. Conclusions: APOE status had the greatest effect on cogni-

tion in at risk alcohol consumers. Additionally, higher lifetime alcohol consumption may contribute to higher cognitive functioning in multiple domains for individuals with no APOE ε4 alleles.

## SESSION 2455 (PAPER)

### MENTAL HEALTH, DEPRESSION, AND ANXIETY IN OLDER ADULTS

#### GERIATRIC DEPRESSION AND THE ROLE OF DISABILITY IN HOME HEALTH CARE PATIENTS

D.V. Liebel, B. Powers, E. Hauenstein, *School of Nursing, University of Rochester, Rochester, New York*

**Background/Objective:** Psychological interventions alone or combined with antidepressant medication can effectively treat mild to moderate geriatric depression. However, most home healthcare patients with depression and disability do not receive these interventions. Moreover, relatively little is known about which psychological interventions used by home healthcare nurses and participants are helpful in negotiating and establishing depression management. Therefore the aim of this descriptive exploratory study was to provide a deeper understanding about how home healthcare participants' and nurses perceive and experience depression detection and evaluation and its impact on participants' mood and disability status. **Method:** The first phase of this qualitative study consisted of conducting 2 focus groups and 16 structured interviews with community nurses providing depression care to geriatric home healthcare participants. In the second phase 25 nurse home visits were observed with geriatric home healthcare participants who had depression and disability. **Findings:** Focus-group findings highlighted the role nurses play in depression detection and evaluation including the challenges and rewards of delivering depression care and nurses' efforts to advocate for patient services within the limitations of Medicare system. Observation visit findings demonstrated the process nurses engaged in while doing mental health promoting therapeutic work and elements of therapeutic nurse behavior (e.g. negotiating nurse-patient goals). **Conclusions:** Findings provided insight into therapeutic mechanisms used by nurses to facilitate good disability and depression care management during a homecare episode. Subsequently, these strategies can be used to create best practice for nurses' therapeutic work in routine homecare with potential to make it a reimbursable activity.

#### LATE-LIFE DEPRESSION AND ITS ASSOCIATION WITH BIOLOGICAL AND PHYSIOLOGICAL MARKERS OF INFLAMMATION

A. Iglewicz<sup>1</sup>, D. Kritz-Silverstein<sup>2</sup>, J. Bergstrom<sup>2</sup>, S. Zisook<sup>1</sup>, E. Barrett-Connor<sup>2</sup>, *1. University of California San Diego, Department of Psychiatry, San Diego, California, 2. University of California San Diego, Department of Family and Preventive Medicine, San Diego, California*

**Background:** Depression is associated with increased morbidity and mortality from cardiovascular disease and cancer—two of the leading causes of death in older adults. Understanding the mechanisms underlying this association may be key to preventing depression-related poor medical outcomes. This study examines one such possible mechanism, namely the association between depressive symptoms and selected biological and physiological markers of inflammation. **Methods:** Blood Interleukin (IL)-6 and C-reactive protein (CRP), systolic (SBP) and diastolic blood pressure (DBP), and depressive symptom levels were measured in 1513 community dwelling adults aged 55 years and over (average age 70.7) as part of the Rancho Bernardo Study, a longitudinal population-based study. Participants completed the Beck Depression Inventory (BDI), a validated measure of depressive symptoms. Associations between depression and the biological and physiological markers of inflammation were adjusted for age, gender and change in weight. **Results:** A significant association was found between depres-

sive symptoms and both SBP ( $p=0.0048$ ) and DBP ( $p=0.0172$ ) after adjusting for gender, but not after adjusting for age or weight change. Higher depressive scores were associated with higher levels of IL-6 ( $p=0.0018$ ) and CRP ( $p=0.0248$ ) before and after adjustment for gender, age, and weight change. **Conclusions:** Depressive symptoms in older adults are associated with biological and physiological markers of stress and inflammation. This may be the mechanism underlying the association of depressive symptoms with morbidity and might guide future clinical research aimed at preventing the physical sequelae of depression.

#### FINANCIAL SUPPORT AND DEPRESSION OUTCOMES AMONG OLDER ADULTS

M. Park<sup>1</sup>, D.L. Huang<sup>2</sup>, *1. University of Washington, Seattle, Washington, 2. Veterans Affairs Puget Sound Health Care System, Seattle, Washington*

**Objectives:** To examine the association between financial support and depression outcomes among community-dwelling U.S. older adults (age  $\geq 65$  years). **Methods:** Cross-sectional analysis of NHANES 2005-2008 data ( $N=2,745$ ). Descriptive analyses were used to characterize the study sample and stratified by sex. Bivariate and multivariate analyses were used to determine the association between risk for depression (defined as PHQ-9 score  $\geq 10$ ) and availability of financial support. Financial support was determined by participant response to a question asking about availability of financial support from another person (yes/no answer). We used adjusted Wald tests, logistic regression, and multivariate logistic regression to determine the association between late-life depression and financial support. **Results:** Approximately 22% of older adults reported having no financial support. (27% of older men v. 19% of older woman ( $P<0.001$ )). Disproportionate older adults with no financial support (39.0%) had depression compared to older adults with financial support (21.9%). Availability of financial support was associated with lower risk for depression (OR 0.52, 95% CI 0.33, 0.84) after controlling for race/ethnicity, level of education, sex, marital status, poverty status, and Charlson comorbidity score. **Conclusion:** Availability of financial support was associated with lower risk for late-life depression. Policy considerations may be needed for older adults who do not have additional sources of financial support.

#### CHARACTERIZING PRIMARY CARE HELPSEEKING FOR DEPRESSION AMONG DEPRESSED OLDER ADULT LATINOS

A. Izquierdo<sup>1</sup>, C. Sarkisian<sup>1,2</sup>, M. Miranda<sup>1</sup>, *1. University of California Los Angeles, Los Angeles, California, 2. VAMC Greater Los Angeles Geriatric Research Education and Clinical Center, Los Angeles, California*

Effective treatments for depression in older adults are available. Older adult Latinos, however, are less likely to be treated than older non-Latino whites. Using the largest qualitative dataset collected to date on older Latinos with a history of depression and primary care access, this study aims to characterize how and why this unique population uses primary care services for depression management. We used data from a qualitative sub-study at 10-year follow-up to the Partners in Care (PIC) study, which was a randomized controlled trial of quality-improvement programs for depression among people with depression and primary care access, to explore, using standard qualitative methods, the major themes and subthemes that emerged around older adult Latino participants' experiences with a recent primary care visit. Ninety-five older adult Latinos (77% response) completed at least one of three qualitative interviews over 12 months time (75% female, age range 50-88 years, 265 interviews). Certain themes like patient activation; patient awareness of depression as a disease; positive past experiences with depression care; perceived provider traits (e.g., empathy, willingness to listen); repeated provider-led outcomes assessment; and patient-provider ethnic/gender concordance, facilitated care. Other themes such

as mistrust of provider due to a negative experience and/or general beliefs; and absent provider-led outcomes tracking limited participants' helpseeking. By describing the major themes and subthemes that characterize primary care helpseeking for depression among older depressed Latino adults, our study may help inform the development of future interventions to improve depression care for older depressed Latinos and reduce mental health disparities.

#### **DEPRESSIVE LEVELS AND RETIREMENT: A STRESS-PROCESS MODEL APPROACH TO ASSESSING THE EFFECTS OF RETIREMENT IN MIDDLE-AGED ADULTS**

G. Hoffman, *Health Services, UCLA, Los Angeles, California*

**Background:** Retirement from work is an important transitional process during the life course. As this transition occurs, individuals experience changes in their roles and responsibilities. Such significant changes in identity and self-understanding as well as longer periods of time in retirement may correspond to changes in mental health. **Methods:** Using data for 4,998 middle-aged and older men and women from the 2004-2008 Health and Retirement Surveys (HRS) and the 2006 and 2008 HRS Psychosocial Surveys, this study assessed longitudinal changes in CES-D depressive symptom levels among recently retired (retired in 2008 but working in either 2004 or 2006) and consistently retired individuals (retired in each of 2004, 2006, and 2008) compared to current workers (working in 2008). **Results:** Recent retirement is associated with an increase in depression levels of 0.24 points, or nearly 17% of the mean depression score at follow-up in 2008 (1.38). Consistent retirement is associated with a .21 increase in depression levels (15% of the mean level) at follow-up. Compared to current working status, recent retirement was associated with twice the odds and consistent retirement was associated with slightly more than twice the odds of higher depressive symptoms. **Implications:** This study's findings thus underscore the need for particular attention to depressive symptoms among middle-aged and older adults who have been retired for more than several years. Accordingly, the issue of retirement may increasingly require the attention of public health experts in order to provide education and prevention efforts to help retiring and retired adults avoid poor long-term outcomes.

### **SESSION 2460 (SYMPOSIUM)**

#### **LINKING RESEARCH, EDUCATION AND PRACTICE: REALLY?**

**Chair:** R. Applebaum, *Scripps Gerontology Center, Miami University, Oxford, Ohio*

**Discussant:** R. Browdie, *Benjamin Rose Institute, Cleveland, Ohio*

For many years GSA has paid homage to linking research, education and practice. From annual conference themes and sessions, to publications, society-wide awards, and the standing Research Education and Practice (REP) committee of the society, GSA has made a commitment to this objective. These endeavors, in combination with a new emphasis on translational research, suggest that enhancing these linkages is a priority for the field. Despite these efforts, critics suggest that collaboration between the research, education and practice areas of gerontology has been limited. The gap between research and practice, research and education, and education and practice seems to occur in part because each area has differing goals, language, and reward structures making collaboration the exception rather than the rule. For example, researchers are typically driven by "the interesting question", while practitioners may be driven to solve a particular problem faced in day to day practice life. Educators have to balance the pressures of the University setting with the training needs of practice organizations. This symposium is designed to address three critical areas: First, we consider the barriers to creating a process that truly integrates research, education and practice in a meaningful way that results in changes to how we study, teach, and provide services. Second, we discuss models and strate-

gies that have succeeded in creating such linkages. Finally, we discuss how big a priority this should be in gerontology and if so what mechanisms can be put in place to advance the state of the art.

#### **RELEVANT RESEARCH AND INFORMED PRACTICE: STRATEGIES USED TO "WALK THE TALK" IN MENTAL HEALTH**

N.L. Wilson<sup>1,2,3</sup>, M.E. Kunik<sup>2,1</sup>, *1. Baylor College of Medicine,, Houston, Texas, 2. Houston Veterans Affairs Center of Excellence in Health Services Research, Houston, Texas, 3. Texas Consortium of Geriatric Education Centers, Houston, Texas*

Delivering effective mental health services to an increasingly diverse and growing population of older adults requires new developments within academic and practice environments. There is recognition that "evidence-based practice requires more practice-based evidence" (Green, L., 2008) and, therefore, researchers, policymakers and practitioners all need new approaches for collaboration. Preparing practitioners and scholars with skills to build bridges to each other and to policymakers is needed. In this presentation, program examples (the Partners in Dementia Care program [VA Medical Centers and Community Partners], Calmer Life anxiety treatment for African American elders, and Healthy IDEAS Depression Intervention for community agencies) highlight challenges and strategies used to generate practice-relevant and actionable research; and to support successful implementation of evidence within community agencies addressing depression, anxiety or dementia in older adults. Involvement of trainees in practice research and models of facilitation of community-academic partnerships will be discussed.

#### **RESEARCH, EDUCATION, AND PRACTICE: A POSTDOCTORAL APPROACH**

D.C. Carr<sup>1</sup>, L. Manning<sup>2</sup>, *1. Institute on Aging, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. Duke University, Durham, North Carolina*

In this presentation, we discuss how postdoctoral training programs explore, facilitate, and model linkages between research, education, and practice. We begin by discussing strategies that have been used to cultivate these linkages in our respective postdoctoral settings. We describe pressing issues emerging and junior investigators face in attempting to link research, education, and practice, and describe opportunities and challenges for more effectively engaging these three areas in a postdoctoral setting, especially as a means to facilitate "translational" linkages. We conclude by considering the purpose and value of postdoctoral training programs in providing a critical opportunity to train scholars to effectively link research, education, and practice, and to teach the value and purpose of aspiring to making the linkages in order to advance gerontological scholarship, and ways postdoctoral programs can foster these linkages in the future.

#### **THE ULTIMATE SWEET SPOT? RESEARCH AND EDUCATION IN THE REP INTERSECTION**

S.R. Kunkel, *Scripps Gerontology Center, Miami University, Oxford, Ohio*

Linkages between research and education seem natural and numerous. Education is enriched when it is discovery-based, rooted in current evidence, and provided by an educator with an active research agenda. Similarly, the quality and impact of research is enhanced when it is shaped in a lively educational environment of continuous examination of assumptions and emerging paradigms, and designed with a vigilant eye on textbook ideals of methodological rigor. However, this ultimate blending of research and education is not always possible, nor is it equally valued in all settings. This presentation will outline a continuum of research-education linkages, anchored at one end by lecture-based integration of research concepts to guided independent research

at the other. A summary of the constraints posed by different research environments and by differences in mission at educational institutions will provide the foundation for a discussion of what is possible and what is desirable for the field of gerontology.

## **USING EDUCATION TO BRIDGE RESEARCH AND PRACTICE**

T. Teasdale, 1. *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*, 2. *Veterans Affairs South Central MIRECC, Oklahoma City, Oklahoma*

Education is the bridge between research and practice. Done right, it is a two-way street informing both. Done wrong, it is a distraction for focused professionals. The educator's challenge is to create linkage between investigators and practitioners that both stimulate thinking and facilitate action. When educational mechanisms work, resulting bridge-work between colleagues underwrite the promise of translational research. But past failures abound. Simply bringing researchers and practitioners together hasn't often produced breakthrough, since dissimilarities in lingo and goals can stymie conversation. A more formidable barrier is that training programs for researchers and clinicians continue to stress specialization and focus; two traits that can keep research and practice separate. However, successful approaches exist which attend to how people learn, develop compelling incentives, and exploit gaps in knowledge that overlap distinct interests. Linking REP is a priority. These examples of how education science bridges the gap will be discussed.

## **SESSION 2465 (SYMPOSIUM)**

### **POLICY SERIES: CRITICAL AGING POLICY DISCUSSIONS FOR THE 113TH CONGRESS**

Chair: *B.W. Lindberg, National Academy on an Aging Society, Washington, District of Columbia*

Discussant: *D. Whitman, AARP, Washington, District of Columbia*

This session, sponsored by AARP and the GSA Public Policy Committee, will involve a discussion of key aging policy issues that the upcoming 113th Congress will need to address. It will also provide a perspective on how aging advocacy organizations develop their agendas, conduct and use research, and advocate on behalf of their members.

## **SESSION 2470 (SYMPOSIUM)**

### **RESIDENTIAL CARE FACILITIES: HEALTH AND FUNCTIONAL STATUS, SERVICE USE, AND MEDICAID**

Chair: *J. Wiener, Aging, Disability and Long-Term Care, RTI International, Washington, District of Columbia*

Discussant: *K. Polzer, National Center for Assisted Living, Washington, District of Columbia*

Residential care facilities (RCFs), including assisted living facilities, are an important component of the long-term care delivery system. In 2010, there were 31,100 facilities with 733,400 residents. Furthermore, about 139,000 RCF residents receive services through the Medicaid program. This symposium presents analyses of the newly available 2010 National Survey of Residential Care Facilities (NSRCF), the first nationally representative survey of RCFs. The first presentation will examine the relationship between the health and functional status of RCF residents and the services and staffing provided by the facilities. The analysis will also examine the health and functional profile of RCF and nursing home residents (using the Minimum Data Set). The second paper will compare functional limitations of the residential care population to the community-dwelling population. Using activities of daily living and Nagi measures from the National Health Interview Survey and the NSRCF, this study will assess whether physical functioning is a differentiating factor between the two populations. The third

presentation will compare facilities serving Medicaid residents to those which do not accept any residents on Medicaid; it will also present descriptive characteristics of RCF residents by their Medicaid status. The final paper will assess the extent to which residential care facilities participating in the Medicaid program are "community-based services" rather than "institutions." The Centers for Medicare & Medicaid Services is currently considering a proposed regulation that would impose standards on facilities that wish to participate in Medicaid home and community-based services waivers.

### **ASSISTED LIVING FACILITY RESIDENTS AND THE SERVICES THEY RECEIVE: ARE THEY A GOOD MATCH?**

G. Khatutsky, J. Wiener, A.M. Greene, R.E. Johnson, *Aging, Disability and Long-Term Care, RTI International, Washington, District of Columbia*

This study examines health status of residents in residential care facilities (RCFs) in relation to service receipt and availability. We also compare resident health/functional profiles in residential care and nursing facilities. This analysis uses data from the 2010 National Survey of Residential Care Facilities (NSRCF). Results show that while RCF residents represent a relatively impaired and frail population, their acuity levels are substantially lower compared to nursing facility residents. For example, 42% of RCF residents have Alzheimer's disease or other dementia, 31% report having limitations on all 5 IADLs, and 72% and 52% require assistance with bathing and dressing respectively. In contrast, 57% of nursing facility residents have Alzheimer's disease or other dementia, 98% require assistance with bathing and 92% with dressing. We also examine RCF residents' service receipt by their functional and cognitive status and RCF staffing ratio. Multivariate analysis examines factors predicting RCF direct care staffing ratio.

### **ARE THERE DIFFERENCES BETWEEN MEDICAID AND NON-MEDICAID RESIDENTIAL CARE FACILITIES?**

A.M. Greene, J. Wiener, G. Khatutsky, R.E. Johnson, *Aging, Disability and Long-Term Care, RTI International, Washington, District of Columbia*

Medicaid is an important source of financing for health and supportive services for low-income people living in residential care facilities. This study, which uses the National Survey of Residential Care Facilities, compares the characteristics of facilities where some of the residents have their long-term care services paid by Medicaid to facilities that do not. We also examine the differences in demographic characteristics, health, functional status and service use between Medicaid and non-Medicaid residents. Analyses show that about half of the facilities serve at least one resident whose services are paid by Medicaid; over half of Medicaid participating facilities are small (4-10 beds) and 26% of the facilities might be considered "high" Medicaid facilities (50% or more Medicaid residents). Residents whose services are covered by Medicaid are younger than non-Medicaid residents and a slightly higher proportion of the non-Medicaid residents than non-Medicaid residents has Alzheimer's disease.

### **ARE RESIDENTIAL CARE FACILITIES "COMMUNITY-BASED" SETTINGS OR INSTITUTIONS?**

J. Wiener<sup>1</sup>, G. Khatutsky<sup>1</sup>, A.M. Greene<sup>1</sup>, R.E. Johnson<sup>1</sup>, E. Rosenoff<sup>2</sup>, 1. *Aging, Disability and Long-Term Care, RTI International, Washington, District of Columbia*, 2. *Office of the Assistant Secretary for Planning and Evaluation/U.S. Department of Health and Human Services, Washington, District of Columbia*

Residential care facilities (RCFs) are like nursing homes in that they provide round-the-clock supervision and room and board, but many facilities seek to offer homelike settings that are "community-based." The Centers for Medicare & Medicaid Services (CMS) is considering regulations that would limit participation of RCFs in Medicaid home

and community-based services waivers to facilities that provided apartments, allow residents to age in place, and provide community integration. Analyses of the National Survey of Residential Care Facilities found that while facilities providing services to Medicaid beneficiaries are not too different from non-Medicaid residents, the industry as a whole does not meet the CMS proposed standards. For example, only a small minority of residential care facility residents live in apartments, and Medicaid beneficiaries are less likely to live in apartments than are non-Medicaid residents. We also examine RCF characteristics related to community integration.

## **SESSION 2475 (SYMPOSIUM)**

### **TAKING CARE? GLOBAL DISCOURSES ON INTERGENERATIONAL RELATIONSHIPS AND FAMILY SUPPORT**

Chair: *N. Keating, Human Ecology, Edmonton, Alberta, Canada*

Beliefs about family relationships and support in later life families have a powerful influence on the social policy, on the expectations of families as key supporters of older persons and ultimately on quality of life of older adults. Regional discourses differ considerably, with some drawing on themes of family solidarity and others on views of families as structurally fragile or uncaring. In this symposium we address these discourses with selected data on generational relationships in families of older adults in four world regions: Africa, Asia, Europe and North America. Presenters will discuss issues affecting families in societies undergoing rapid social transition in Asia; in the face of persistent poverty in sub-Saharan Africa; in welfare states in Europe; and in discourses about family solidarity in Mediterranean and North American cultures. Learning objectives are to increase understanding of regional differences in beliefs about family responsibility; and of extant knowledge on diversity in family structure and support. Discussion will focus on differences and similarities across these regions. Implications are considered for theoretical understandings of family solidarity, family structure and intergenerational ambivalence that highlight the need for theory construction to account for these global, contextual differences. An international agenda is proposed for bridging knowledge gaps and addressing key issues in family relationships of older adults. This symposium is presented under the auspices of the International Association of Gerontology and Geriatrics, Global Social Initiative on Ageing.

### **DISCOURSES ON FAMILIES AND CARE IN CHANGING EUROPE'S WELFARE STATES**

*T.G. van Tilburg, M. Broese Van Groenou, Dept. of Sociology, VU University Amsterdam, Amsterdam, Netherlands*

Many welfare states in Europe have extended financial support and public provision in the field of elderly care. However, these provisions are under pressure due to the financial crisis (requiring budget cuts), aging population (resulting in a smaller number of young carers and an increasing numbers to take care of), and increasing labor participation of women (who often are informal carers). There are various options to address these problems. For example, in southern Europe people in need of care hire migrants and in north-western European countries societal arrangements are effective offering options to pay family members for the care they provide. Empirical evidence for developments in various countries is presented and discussed. It is concluded that various options contribute to professionalization of family constellations replacing traditional intergenerational care.

### **FAMILY SUPPORT IN THE CONTEXT OF RAPID SOCIAL TRANSITION: THE EXPERIENCE OF CHINA**

*X. Pei, H. Luo, Tsinghua University, Beijing, China*

Decrease in family resources resulting from rapid urbanization and the development of social services, pushed by needs of a growing aged population, provide an opportunity to examine the impact of social tran-

sition on intergenerational support within Chinese families. This study intends to explore the expectations of family support for the aged and the reality of flows of care, resource allocation, sharing and obligations within Chinese families. Using selective national survey data, we illustrate current gaps between social beliefs in family care and the reality, and identify changes in the past two decades under the framework of intergenerational solidarity. The findings indicate increasing difficulties of maintaining close family ties, weakening of traditional beliefs in family care for aged members, and efforts to reconstruct intergenerational care under the impact of economic, social, and cultural transitions. Implications are discussed and an attempt is made to theorize family relations of societies experiencing rapid modernization.

### **FAMILY TIES IN THE US AND LEBANON: INTERGENERATIONAL RELATIONS**

*T. Antonucci<sup>1</sup>, K.J. Ajrouch<sup>2</sup>, S. Abdulrahim<sup>3</sup>, 1. Institute for Social Research, University of Michigan, Ann Arbor, Michigan, 2. Eastern Michigan University, Ypsilanti, Michigan, 3. American University of Beirut, Beirut, Lebanon*

Discourses about family solidarity and the strength of intergenerational ties differ considerably in Mediterranean and North American cultures. In this study we compare US and Lebanese reports of family ties and relationships. Drawing from identical measures of network structure and family support exchanges in both countries, we find that intergenerational family forms are similar in both countries but that some characteristics differ in the relationship experience. Lebanese report networks that are highly family focused, but much smaller than that of the U.S. However, data concerning actually or expected intergenerational instrumental exchanges are not very different. We compare and contrast reports of network structure, support type, and support quality by age with a focus on the intergenerational relationship.

### **CARE FOR OLDER ADULTS IN SUB-SAHARAN AFRICA: DISCOURSES AND REALITIES OF FAMILY SOLIDARITY**

*I. Aboderin<sup>1,2</sup>, J. Hoffman<sup>2</sup>, 1. African Population and Health Research Center, Nairobi, Kenya, 2. Oxford Institute of Ageing, University of Oxford, Oxford, United Kingdom*

The population of older persons in sub-Saharan Africa (SSA) is growing rapidly, with considerable functional impairment and care need. Most care is performed by families, typically within settings of poverty and infrastructural constraints. The families' exclusive role accords with a dominant policy discourse, which upholds the centrality of family support as an unassailable traditional African value and asset – in explicit contrast to 'individualistic' western approaches, which approve of formal care models. Drawing on evidence from policy analysis and quantitative and qualitative studies from Kenya, Nigeria and South Africa, we demarcate how the realities of family care for older persons in SSA relate to the official normative discourse. The paper frames its analysis in relation to theoretical ideas about family solidarity in societies undergoing 'modernization' and individualization and examines key implications for policy debates on the relative role that family, State or other sectors should play in care provision in SSA.

## **SESSION 2480 (SYMPOSIUM)**

### **THE NATIONAL PREVENTION STRATEGY: IMPLEMENTING AMERICA'S PLAN FOR BETTER HEALTH AND WELLNESS**

Chair: *D. Alley, University of Maryland, Baltimore, Maryland*  
Discussant: *L. Anderson, Centers for Disease Control, Atlanta, Georgia*

The National Prevention Council, established through the Affordable Care Act, provides a critical infrastructure to enhance cross-sector collaboration among federal agencies and to drive improvements in prevention and wellness. In June 2011, the Council released the National

Prevention Strategy, which adopts a health-in-all policies approach and lays out a framework for coordinating policies in areas such as environmental protection, community planning (housing, transportation, etc.), and public health and health care. This symposium highlights efforts to implement the Strategy across multiple sectors. Kathy Sykes, Environmental Protection Agency designee to the Council, will discuss EPA's involvement in the Council, current efforts to integrate prevention and environmental policy, and tools to incorporate health into decision-making. Mary Leary will present the Easter Seals' approach to building community coalitions that link transportation and prevention, emphasizing the importance of transportation in empowering older adults, creating healthy and safe environments, and facilitating access to preventive services. Tony Kuo will provide an overview of Los Angeles County's efforts to address senior health issues through the use of the Strategy's recommendations and will share lessons learned from local implementation. Finally, Steven Wallace will discuss the relevance of National Prevention Strategy outcome measures to the older population and highlight strategies for selecting interventions to increase the use of clinical preventive services. Taken together, these speakers represent a range of perspectives from government, nonprofit, and academic settings engaged in implementing the National Prevention Strategy's recommendations to address the needs of older adults.

#### **TOOLS AND STRATEGIES TO DESIGN HEALTHY COMMUNITIES FOR ALL AGES AND ABILITIES: MAKING IT EASY TO BE HEALTHY FOR A LIFETIME**

K.E. Sykes, *US EPA, Office of Research and Development, Washington, District of Columbia*

The National Prevention Strategy, authorized by the Affordable Care Act, will help transform the health care system by recognizing that in addition to personal choices and behaviors, quality of our environment contributes to good health. A growing body of evidence reveals numerous environments that affect health including the built environment, as well as food, natural, socio-economic, chemical and psycho-social factors. EPA is exploring a systems approach connects these interrelated environments, promoting health for persons of all ages and mitigating the inequities that create health disparities. The built environment can promote independence, social interactions and health. Communities that adopt policies that promote equitable development and smart growth principles are age-friendly. The National Environmental Policy Act's Environmental Impact Assessments, Health Impact Assessments, and a proposed Aging Impact Assessment are tools that examine the health consequences of proposed projects and policies to planners and decision-makers. Case studies focusing on elders will be presented.

#### **ADOPTING THE NATIONAL PREVENTION STRATEGY'S VISION LOCALLY: A PERSPECTIVE FROM LOS ANGELES COUNTY**

T. Kuo, *Los Angeles County Department of Health, Los Angeles, California*

Policy, system change, and environmental strategies can be cost-effective approaches for maintaining and/or improving older adults' health. The National Prevention Strategy, released in June 2011, provides a national vision and a useful framework for addressing several leading causes of disability and death in this population. The present review of local efforts discusses the various steps taken by the Los Angeles County Department of Public Health to address senior health issues through the use of the Strategy's recommendations. From promoting linkages between clinical care and community-based preventive services to the use of faith-based organizations for delivery of selected clinical preventive services to building the capacity for accommodating an age-friendlier environment (i.e., focusing on safer physical environments to prevent falls and to promote social interactions, or food procurement policies that address food insecurity/quality), lessons learned

about these local initiatives will be shared with the conference audience.

#### **DISCUSSANT**

L. Anderson, *CDC, Atlanta, Georgia*

This presentation will discuss the implications of the panel presentations.

#### **MEASURING OUTCOMES AND SELECTING EFFECTIVE INTERVENTIONS TO ADVANCE THE NATIONAL PREVENTION STRATEGY**

S. Wallace, *UCLA School of Public Health, Los Angeles, California*

The National Prevention Strategy (NPS) has the goal of increasing the number of Americans who are healthy at every stage of life through promoting prevention and wellness. Tracking progress towards meeting that goal requires information about progress towards the specific outcomes identified as indicators of meeting the goal. It also requires documenting the most effective strategies that are used to make that progress. The NPS lists a wide array of outcome measures, many of which are aligned with Healthy People 2020. This presentation will provide information about how these outcome measures can be relevant to the older population. It will then provide an overview of how to identify effective interventions that promote one of the NPS strategies – increasing the use of clinical preventive services. Using the RE-AIM framework, we will show how criteria in addition to effectiveness can enhance the selection of interventions that maximize clinically effective dissemination.

#### **EASTER SEALS PROJECT ACTION**

M. Leary, *Easter Seals, Washington, District of Columbia*

Wellness, prevention, and transportation are not three words we are used to seeing together. However, transportation resources that are available, easy to use, accessible, and affordable are increasingly recognized as essential community attributes to support older adults' ability to age in place. The National Prevention Strategy identifies empowered people, healthy & safe community environments, and clinical and community preventive services as three key Strategic Directions that are facilitated by access to transportation. The health-in-all-policies perspective suggests the importance of connecting transportation to prevention efforts. Easter Seals is engaged in ongoing work at the intersection between health/wellness and access to transportation. In this presentation, Easter Seals will describe our community assistance activities that field support for community coalition building efforts, best practices in coordinating transportation, and emerging models in mobility planning, as well as ways to assess impact through a health/transportation/prevention lens.

#### **SESSION 2485 (PAPER)**

#### **GENDER, RACE, AND DISCRIMINATIONS AMONG OLDER WORKERS**

#### **THE HOME CARE AIDE JOB: IDEAL WORK OR EXPLOITATION FOR OLDER, FEMALE WORKERS?**

S. Butler, *University of Maine, Orono, Maine*

The need for personal assistance services is increasing as our population ages and is expected to double in the first half of this century. People's preference for remaining at home has led to a particular demand for community-based care. Older women often fill these positions: nearly nine in ten home care aides are women and over 50 percent are age 45 and older. On one hand, this work could be seen as ideal for older workers as it is flexible and allows for active community engagement. On the other hand, the low wages and gendered nature of the work make it

fertile for exploitation of women, who have often spent years providing uncompensated family care. Through in-depth interviews with 31 home care aides (97.7% female) age 63 to 80, this study sought to better understand the costs and benefits of the personal care job from the perspective of the older worker. Interview transcripts were analyzed for recurring themes regarding lifetime employment, caregiving, financial security, and perspectives on personal care work as an older worker. Most study participants came to personal care work later in life after years of raising children and working a number of low-wage jobs. Many struggled to meet their basic needs, and a number received government assistance. They considered patience to be the most important quality needed to do personal assistance work and felt that older workers were more likely to have that quality. Study findings will be related to current workforce issues in long-term care.

#### **AGEISM AT WORK AND ITS IMPACT ON HEALTH, JOB SATISFACTION AND LABOR FORCE PARTICIPATION**

L.A. Marchiondo<sup>1</sup>, E. Gonzales<sup>2</sup>, *1. Psychology, University of Michigan, Ann Arbor, Michigan, 2. Washington University in St. Louis, St. Louis, Missouri*

**Objectives.** Researchers readily apply modern discrimination theory to studies of racism and sexism and their impact on employee health and behavior; its application to investigations of workplace age discrimination is scant. Given the burgeoning aging workforce, we examined how ageism undermines mental health, job satisfaction, and retirement expectations and behaviors. Selective incivility theory guided this investigation. **Methods.** Data were drawn from the Health and Retirement Study. We selected participants who worked full-time in 1998, participated in all six waves between 1998 and 2008, and completed all variables of interest: ageism, labor force status and expectations, job satisfaction, mental health, and control measures ( $N = 5,909$ ). We utilized cross-sectional linear regressions, bivariate analyses, and longitudinal fixed effects models. **Results.** Men, non-Caucasians, and less educated employees reported higher ageism at work. Workplace ageism strongly and positively related to indicators of impaired mental health, the global mental health measure (CESD), and job dissatisfaction. It also predicted plans to stop work completely, to reduce work hours, and to become self-employed (versus remaining employed full-time). Employees who experienced more ageism tended to change employment. **Implications.** Ageism's effects extend beyond outcomes such as decreased promotion, hiring, and training. Ageism damages targets' mental health and job satisfaction, and decreases labor force participation in later life. Interventions, such as stereotype education, are needed to reduce ageism at work. Such interventions may promote occupational health and, in turn, foster organizational commitment and inter-generational knowledge and relationships.

#### **RACIAL/ETHNIC INEQUALITY AMONG OLDER WORKERS: FOCUSING ON WHITES, BLACKS, AND LATINOS WITHIN THE CUMULATIVE ADVANTAGE/DISADVANTAGE FRAMEWORK**

E. Choi, *School of Social Work, University of Pittsburgh, Pittsburgh, Pennsylvania*

The experience of older minority workers may differ from that of older Whites because of the persistent racial/ethnic differences among older workers, especially in finance, health, career patterns, and education. However, our knowledge of older minority workers is, at best, fragmentary. Thus, this study aims to examine what contributes to older minorities' labor market participation and whether these factors differ from those of older Whites. Cumulative advantage/disadvantage (CAD) theory provides the conceptual framework, emphasizing the process by which the social system generates inequality and how unfavorable positions in early life influence the accumulation of disadvantages in later age. Using the 2004 and 2008 Health and Retirement Study datasets, this study uses the work status (working or retired) of individuals age

62 or over as the outcome. Variables of interest include financial status, health, education, and career patterns (employment stability and job types). Analytic plans include 1) stratifying the datasets into Whites, Blacks, and Latinos separately, 2) analyzing the data with probit analysis, and 3) comparing the factors among the racial groups. The results show stark differences in the factors by race. The three factors—health, the meaning of work, and employers' negative attitude toward older workers—which significantly predict Whites' labor market participation after age 62, are not significant to older Blacks and Latinos. Instead, to older minorities, employment stability (job tenure) is significantly and negatively related to their chance to work. To conclude, as CAD theory argues, minorities' staying in the labor market beyond age 62 does not simply result from individual preference per se but from social structures, which reflect underlying racial inequality within older workers.

#### **OLDER WOMEN AND FLEXIBLE EMPLOYMENT ACROSS THE LIFE COURSE: STEREOTYPES AND PRACTICES**

E.M. Brooke<sup>1</sup>, P. Taylor<sup>2</sup>, R. Williams<sup>3</sup>, E. Lynn<sup>4</sup>, *1. Business Work and Ageing Centre for Research, Swinburne University of Technology, Melbourne, Victoria, Australia, 2. Monash University, Churchill Campus, Victoria, Australia, 3. Monash University, Churchill Campus, Victoria, Australia, 4. Monash University, Churchill Campus, Victoria, Australia*

This paper is based on an analysis of qualitative data collected in an Australian Research Council research project, Retiring Women: Understanding older female work-life transitions. Structured key informant interviews were undertaken with a purposefully selected sample of 95 managers and key external stakeholders in three sectors: the tertiary education, state and emergency services and banking sectors. The paper aims to assess demographic, organisational and broader industry sector influences which pattern organisational flexibilities. Themes were drawn from a comparative review of responses of organisational stakeholders across sectors. The paper develops an organisational conceptual framework based on the intersections between age and gender stereotypes and flexibilities across three sectors. Age and gender stereotypical organisational responses were classified along an axis from 'age free' and 'gender free' practices to 'sleeper' attributions. 'Sleeper' stereotypes occurred within the state services and higher education sectors concerning expectations of retirement, physical work limitations, caring responsibilities and intergenerational conflict. Barriers of 'sleeper' age and gender stereotypes were predominant in tertiary education and state services sectors which exhibited lower engagement with the axis and dimension of collective 'welfarist' responses versus discretionary practices, as in the banking sector. In this sector rationalisation and control of flexibilities through discretionary practices were based in a business case and often coded as equity challenges. The framework classifies intersections between age, gender and organisational flexibilities utilising these axes. The findings indicate how workplace accommodations through flexibilities can provide support for the continued attachment of older women in their careers along the life course.

#### **EVERYDAY AGE DISCRIMINATION AT WORK: INCIDENCE AND EFFECTS ON PSYCHOLOGICAL WELL-BEING AND JOB SATISFACTION**

P. Taylor, C. McLoughlin, *Monash University, Churchill, Victoria, Australia*

The prominent public policy push in many developed nations focusing on increasing the labor force participation of older workers and prolongation of working lives raises questions about barriers to said participation. Ageism in employment is considered by many commentators to be a critical barrier. Building on a structural model configured from case study research completed with four organizations in 2008, this paper reports on the refinement and verification of a structural equation model using survey data drawn from a nationally representative

sample (n=3200), collected in 2011, describing the relationship between respondents' experiences of everyday age discrimination and reported psychological well-being and job satisfaction. Drawing on the learnings of organizational studies investigating the changing nature of racial discrimination in the workplace, a novel approach to the measurement of age discrimination manifested in subtle yet significant everyday behaviors offers a previously unexplored avenue to understanding agism, particularly in context of purported under-reporting of age discrimination, amongst other 'isms', in the workplace. This paper reports on differences in the experience of age discrimination across age groups and gender. To better understand how organizations' characteristics, including the provision of training and management communication, and individual characteristics, including perceived job insecurity and the meaningfulness of work interact to influence job satisfaction and psychological well-being, the relative importance of these and other factors were compared across age groups and gender. This statistically robust model provides justifications for nuanced organizational and public policy responses considering the age and gender of recipients of discriminatory attitudes.

## **SESSION 2490 (PAPER)**

### **HEALTH PROMOTION AND EFFECTS OF RACE/ETHNICITY AND INTERGENERATIONAL CORRELATES OF HEALTH**

#### **EFFECTS OF RACE/ETHNICITY ON HEALTH OUTCOMES AMONG OLDER AMERICANS**

C.E. Miyawaki, *School of Social Work, University of Washington, Seattle, Washington*

Social isolation has been found to be associated with negative health outcomes. However, it is unknown whether this association differs by race/ethnicity and age. This study aims to examine how the effects of social isolation on mental and physical health differ among black, Hispanic and white older adults in the United States. Building on the work of Cornwell and Waite (2009), the author used multi-stage survey data from a nationally-representative sample of 3,005 community-residing adults, aged 57-85 from the National Social Life, Health, and Aging Project. Tests for association were conducted on health indicators by age, gender, marital status, education, and race/ethnicity separately. Multivariate logistic regression models were used to test the effects of social isolation on mental and physical health exclusively and separately among black, Hispanic and white older adults. Results show that overall social isolation is a strong predictor of mental and physical health and differs by age, marital status, education, and race/ethnicity, and mental but not physical health by gender. Social isolation significantly influences mental and physical health among white older adults and is significant for physical and marginally significant for mental health for black older adults. Among Hispanic older adults, it has a marginally significant association with mental health but unrelated to physical health. These findings point to the need for further research on what may buffer Hispanic older adults from social isolation compared to the other racial groups. It also suggests some implications for practice, such as more targeted assessment and intervention by racial groups.

#### **BECOMING AMERICA'S HEALTHIEST HOMETOWN: FINDINGS FROM A POPULATION HEALTH SURVEY OF SENIORS LIVING IN THE VILLAGES, FLORIDA**

C. VandeWeerd, J. Corvin, D. Petersen, A.R. Williams, E. Sussman, *University of South Florida, Tampa, Florida*

With the rise of the Baby Boomers, the proportion of older adults in US has risen dramatically. While much of the literature focuses on negative aspects of aging and disease burden, attention to healthy aging is lacking. To shift attention to positive models of aging, USF Health, in partnership with The Villages, an active adult (55+) retirement com-

munity, launched a population-based needs assessment to develop a comprehensive understanding of the physical, mental, emotional, social and environmental health factors which affect health and wellness. This study employed a community-driven, mixed methods approach. During the formative research phase, 59 focus groups (n=491) were conducted with residents. Emergent themes relating to health and wellness informed the development of a comprehensive cross-sectional survey. This survey, administered to all Village residents (n=94,500), examined a series of broad, health related domains via well established, short, high salience instruments. Domains measured included mental health (MHI-5 & PHQ); health behaviors (such as drinking [AUDIT], smoking [ASSIST], medication compliance [SMAQ] and physical activity [IPAQ]); quality of life [WHOQOL]; access to services [BFRSS sub-scale]; and social support/cohesion [Sampson social cohesion scale]. Data was analyzed using SPSS, controlling for age, gender, race, to identify differences in health status and quality of life indicators, while assessing the role of social support and social cohesion. Findings yield important similarities in the aging process (i.e. rates of conditions), and indicate important differences between Village residents and samples nationally. Recommendations for change in public health policy and practice are suggested in light of study findings.

### **COMMUNITY-BASED INNOVATIONS TO INCREASE THE UPTAKE OF CLINICAL PREVENTIVE SERVICES BY OLDER ADULTS AND REDUCE HEALTH DISPARITIES**

K.G. Kietzman, S. Wallace, R. Leos, T. Sadegh-Nobari, A.V. Parks, *UCLA Center for Health Policy Research, Los Angeles, California*

Aging adults are at increasing risk of a number of diseases that can be prevented or treated early through clinical preventive services (CPS) such as influenza vaccinations and colorectal cancer screening. We analyzed data from the 2009 California Health Interview Survey (CHIS) to assess utilization rates of CPS by older adults and across different racial and ethnic groups. We also conducted 43 stakeholder interviews with providers from aging services, community health centers, public health agencies, and other community settings such as pharmacies and YMCAs to identify strategies that increase uptake of CPS by older adults. Program administrators, planners, and front line staff were asked about their involvement in the provision of CPS through engagement, delivery, and/or follow up activities. CHIS data revealed that among Californians aged 50 years and older, 50% had not received a flu shot within the past 12 months and 22% had never been screened for colorectal cancer. Furthermore, these utilization rates varied by race/ethnicity: 57% of African Americans and 53% of Latinos had not received the flu vaccine in the past year, as compared to 49% of Whites and 42% of Asians. Nearly twice as many Latinos (33%) than Whites (18%) reported they had never been screened for colon cancer. Community stakeholders identified 14 effective strategies for increasing CPS uptake, including cross-sector collaborations and expanded program efforts. Two case studies from California highlight promising practices. Extending the provision of CPS to community settings has the potential to increase uptake among older adults and reduce health disparities.

### **PERSONAL EMERGENCY RESPONSE SYSTEM AND FALLS EDUCATION: OUTCOMES FROM A COMBINED INTERVENTION**

L. Bakk<sup>1,2</sup>, A.T. Woodward<sup>1</sup>, J. McGuire<sup>3</sup>, 1. *Michigan State University, East Lansing, Michigan*, 2. *State University of New York, Brockport, Brockport, New York*, 3. *Area Agency on Aging 1-B, Southfield, Michigan*

While Older Americans Act (OAA) community care management programs can help foster independence and delay institutional placement, waitlists for services often exist because of insufficient funding. A technological response to help older adults live independently is a Personal Emergency Response System (PERS). While having a PERS

has been associated with positive outcomes, the program is often underutilized because of cost. Through alternative funding sources and collaboration with provider agencies, a southeast Michigan Area Agency on Aging provided a PERS at no cost for one year and falls prevention literature to low-income, community-based older adults (n=83) waiting to receive care management services. This longitudinal study examined how the provision of a PERS and basic falls prevention education can impact multiple outcomes. Data were collected via telephone interview at baseline, 6 and 12 months, and included measures of stress, anxiety, falls risk, and hospital admissions. Analysis was conducted using mixed regression models. Results indicated that respondents who maintained the PERS for one year and received the falls prevention materials were significantly less likely to report feelings of stress and anxiety over time. There was a significant improvement in the mean score tabulated from 14 falls risk measures. Additionally, hospitalizations due to falls decreased. This study has distinct implications for practice. Because of the demonstrated effectiveness in reducing stress, anxiety, falls risk, and hospitalizations, this combined intervention could be considered for at-risk older adults in need of care management services, particularly in our current economic climate where waitlists are more likely to exist.

### **INTERGENERATIONAL CORRELATIONS OF HEALTH AMONG OLDER ADULTS: EMPIRICAL EVIDENCE FROM INDONESIA**

Y. Kim<sup>1</sup>, B. Sikoki<sup>2</sup>, F. Witoelar<sup>3</sup>, J. Strauss<sup>1</sup>, 1. *Economics, Univ of Southern California, LOS ANGELES, California*, 2. *Survey Meter, D.I. Yogyakarta, Indonesia*, 3. *World Bank, Washington DC, District of Columbia*

It is widely believed that family background has a significant influence on children's life. The vast majority of the existent literature has focused on the relationship between parents' education and income and the education and income of their children. Surprisingly, however, much less work has been done on the intergenerational transmission, or correlations of health. The main objective of this paper is to examine the correlations of health across generations using the Indonesia Family Life Survey (IFLS). We take advantage of the richness of IFLS and examine several health measures of respondents, including self-reports and biomarkers. As measures of health of both parents, IFLS has information on whether they are dead at the time of the last wave in 2007, their general health status and whether they have difficulties with any ADLs at the time of the survey or just before death. The findings suggest strong intergenerational correlations between the measures of parental health, schooling, and the health of their adult children. We also examine how these intergenerational correlations might change for respondents born in the more developed parts of Indonesia compared to the less developed areas. Interestingly, these health associations are much lower for respondents who were born in Java or Bali. These are areas of Indonesia that have experienced the most rapid economic growth over the past 40 years. This suggests that being born and growing up in developed areas, which may have better health infrastructure, substitutes for the influence of parental health.

### **SESSION 2495 (PAPER)**

#### **INTERGENERATIONAL RELATIONS AND CAREGIVING**

#### **INTER-GENERATIONAL CONFLICT AMONG LATER LIFE CANADIAN PARENTS: THE FAMILY TIES THAT BIND AND DIVIDE**

B.A. Mitchell, Y. Lai, *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

Inter-generational conflict (IC) is commonly defined as the frequency, degree, and the severity of problems experienced within parent-child

relationships. High levels of IC are assumed to be particularly worrisome because of the potential to create a number of negative outcomes such as lowered family solidarity and a reduction in support exchanges. Previous studies have typically focused on younger-aged families, especially those with teenaged or adolescent children. Cultural variations have also not received much comparative analysis, despite continuing high levels of immigration to Canadian cities (especially from Asian societies). To fill these research gaps, the goal of this paper is to critically examine both predictors and subjective perceptions of IC in ethnically diverse aging families using a mixed-methods approach. Guided by a life course perspective (e.g., Elder, 1991; Hagestad, 2003; Marshall, 1997, Mitchell, 2007) and a generational stake hypothesis (Bengston, 1993), data are drawn from a study of 490 parents (with a mean age of 58) with at least one young adult child (between the ages of 18 and 35) living in Metro Vancouver, British Columbia. Respondents self-identify as primarily belonging to one of four ethnic groups: British-, Southern-European-, South Asian-, and Chinese-Canadian. Results reveal that a significant minority of parents report problematic levels of IC. Moreover, there is diversity in experiences by ethno-cultural heritage, immigration status, value congruence, and other family developmental and contextual factors. Findings are also discussed in relation to community-level issues and several practical applications are highlighted (i.e., for prevention and intervention initiatives).

#### **UNDERSTANDING FAMILY CAREGIVERS' USE OF ONLINE CAREGIVING INFORMATION**

H. Li, *School of Social Work, University of Illinois, Urbana, Illinois*

Internet is a powerful tool that people may use to gather health information. This study describes caregivers' use of online caregiving information and identifies caregiver factors related to their use of the information. Data used for this analysis were extracted from the 2009 Caregiving in the US survey (NAC & AARP, 2009). The sample of this study included 998 caregivers who took care of an older adult 60 years or older and lived outside of an institution. A logistic analysis was used to identify factors that related to caregivers' use of online caregiving information (users vs. non-users). In the sample, little over one half of the caregivers (52.2%) searched online for caregiving information. Caregivers looked at information about care receivers' conditions or treatments (77.0%), available services for care receivers (53.6%), or how to perform caregiving tasks (23.3%). Only 10 percent of caregivers looked at information about caregiver services. The results from a logistic regression analysis show that caregivers who received at least some college education (OR=3.23, p<.0001), reported a higher level of household income (OR=1.98, p<.0001), took primary caregiving responsibility (OR=1.5, p=.003), experienced higher levels of strain (OR=1.11, p<.0001), and were in need for community services (OR=2.45, p<.0001) were more likely to use online caregiving information. Compared to their unemployed counterparts, employed caregivers were less likely to use online caregiving information (OR=.64, p=.007). Study findings can be used by health care professionals and community service providers in developing and delivering online information and educational services to diverse caregivers.

#### **EMOTIONAL TIES BETWEEN OLDER PARENTS AND ADULT CHILDREN IN CHINESE IMMIGRANT FAMILIES: WHAT MATTERS FOR OLDER IMMIGRANTS?**

M. Guo<sup>1</sup>, J. Liu<sup>1</sup>, I. Chi<sup>2</sup>, 1. *University of Iowa, School of Social Work, Iowa City, Iowa*, 2. *University of Southern California, School of Social Work, Los Angeles, California*

Family relationships play a vital role in older immigrants' life given that family reunion is the main route to the U.S. for many older immigrants. Compared to the family lives of other older Americans, families of older immigrants are often characterized by closer geographically proximity and greater interdependence. Understanding what factors contribute to close family relationships among older immigrants appears

to be of key importance to promote the well-being of the rapidly increasing older minorities in the US. Focusing on older Chinese immigrants, one of the fastest growing older minority groups in the US, the present study explored the predictors of close parent-child relationships in a sample of 156 older Chinese immigrants and their 258 adult children in Los Angeles in 2010. The results of multilevel analyses showed that overall, older parents in the study felt closer to married children, but less close to the eldest child in the family. Although the actual monetary and instrumental support provided by the children were associated with closer parent-child relationships reported by the parents, perceived filial piety of the children, that is, parents' perception of their children being respectful and devoted to the parents, was the most significant predictor of their positive assessment of their relationship with the child. The finding remained the same when the parents' demographic characteristics and socioeconomic status were considered. The finding suggests that the maintenance of traditional cultural values in immigrant families seems to be central to close family relationships among older Chinese immigrants.

### **VOLUNTEERING AND CAREGIVING AMONG OLDER PEOPLE: INFLUENCES OF PERSONAL RESOURCES AND PERSONAL NETWORKS**

H. Shen, *University of Missouri-St. Louis, School of Social Work, St. Louis, Missouri*

Among various types of productive activities, volunteering and caregiving are both helping behaviors occurring within different social contexts. Existing studies have documented factors that predict older people's involvement in volunteering and caregiving. Little emphasis, however, has been placed on the dynamics between these two helping behaviors. With the theoretical guidance of the Resource and Strategic Mobilization model (RSM), the present study aims to elucidate the effects of personal resources (financial and physical) and personal networks (family and social) on whether an older adult volunteers, provides care, or performs both activities. Applying multinomial logistic regression models, findings from 8,332 community-dwelling older adults (55+) who performed at least one helping behavior in the 2004 Health and Retirement Study showed that (1) personal resources (income, assets, no functional limitations, no chronic health conditions and no cognitive conditions) and social networks (religious attendance and social visits) had no influence on whether people only volunteered or performed both helping behaviors. It was the increase of family demands (number of grandchildren, parents living nearby, and spouse with care needs) that raised older people's chances to take on the caregiving roles in addition to volunteering work. (2) Older people were more likely to perform both behaviors than to only provide care if their social networks were larger and if they had no functional limitations. As the RSM predicts, the diverse contexts of older persons, as indicated by personal resources and networks, matter. Further implementation of factors interacting with older people's helping behaviors will be discussed.

### **SESSION 2505 (SYMPOSIUM)**

#### **NUTRITIONAL INTERVENTIONS IN AGING: CALORIE RESTRICTION MIMETICS - PROMISE AND PITFALLS**

Chair: *D. Ingram, Pennington Biomedical Research Center, Baton Rouge*

Co-Chair: *D.A. Rivas, Tufts University, Boston, Massachusetts*

Caloric restriction (CR) has been a consistent and productive topic for many years at the annual meeting of the GSA. Considerable progress has been made in identifying possible mechanisms for the anti-aging benefits of CR. Interest in the model has generated long-term studies in long-living nonhuman primates and short-term studies in humans. Results emerging from these studies indicate potential health benefits and attenuation of many aging processes. However, application of a strict long-term regimen of CR as an intervention in humans would

likely not be feasible. To this end, a new field of CR mimetics is emerging for which pharmaceutical and nutraceutical interventions are targeted toward key signaling pathways involved in CR. The goal of this symposium will be to present the latest information on the development of CR mimetics, the promise and the pitfalls.

### **INHIBITION OF GROWTH SIGNALING PATHWAYS TO MIMIC FASTING IN DIFFERENTIAL STRESS RESISTANCE/SENSITIZATION**

V. Longo, *Gerontology, USC, Los Angeles, California*

Calorie restriction or inhibition of growth signaling pathways results in extended life span but also protection against a range of pathologies including cancer. In fact, a large portion of CR or growth hormone receptor (GHR) signaling deficient rodents die without developing obvious age-related diseases suggesting these interventions/mutations may promote similar protective responses. We have previously described the effect of the Tor/S6K and Ras/AC/PKA pathways in promoting aging and stress sensitization in yeast and their role in the anti-aging effects of calorie restriction. Here, we investigate the effect of fasting cycles and growth hormone receptor mutations, both of which result in severe IGF-I deficiency, on protection of mice and normal cells against, and sensitization of cancer cells to stress. Using various mouse models with altered IGF-I signaling we provide evidence for the role of reduced serum glucose and IGF-I in the differential protective/sensitizing effects of fasting. Drugs that block the GHR pathway have the potential to mimic the effect of fasting in this differential regulation of protection/sensitization in normal and malignant cells.

### **MEDICINES THAT MIMIC CALORIE RESTRICTION: HOW CLOSE ARE WE?**

A. Gomes<sup>1,2</sup>, N. Dioufa<sup>1</sup>, N. Price<sup>1</sup>, A. Rolo<sup>2</sup>, E. Mercken<sup>3</sup>, C. Palmeira<sup>2</sup>, R. De Cabo<sup>3</sup>, D.A. Sinclair<sup>1</sup>, *1. Pathology, Harvard Medical School, Boston, Massachusetts, 2. University of Coimbra, Coimbra, Portugal, 3. NIA/NIH, Bethesda, Maryland*

Advances in understanding the molecular pathways underlying the benefits of calorie restriction (CR) have led to the testing of molecules in animal models and in Phase II clinical trials in humans. Questions that remain unanswered include: Will the success in rodents translate to humans? Will fertility be negatively affected? Will CR mimetics be safe for long-term human consumption? How does resveratrol work? In this talk, I will present recent findings addressing these questions. These include a mechanism of action for SIRT1 activation, the effects of resveratrol in an adult-inducible SIRT1 knockout mouse, an update on SIRT1 activating compounds (STACs) in rodents and humans, and screens for new CR mimetics that promote health, fertility, and lifespan.

### **SESSION 2510 (SYMPOSIUM)**

#### **CONSTRUCTING MEANING IN LATER LIFE: QUALITATIVE RESEARCH THAT CELEBRATES, EXAMINES AND TEACHES LIFE LESSONS**

Chair: *J.R. Smith, Graduate School of Social Service, Fordham University, New York, New York*

Discussant: *P. Stafford, Indiana University, Bloomington, Indiana*

This symposium brings together qualitative research projects that examine meaning making in later life. We examine the narratives of African-American adults who are pursuing education in later life, the responses of graduate students to elders' immigration stories and the songs of nursing home residents. Through narrative analysis, grounded theory and ethnography, the panel demonstrates the ways in which qualitative methodologies elicit valuable forms of expression, revealing that elders continue to pursue meaningful lives through education, creative expression and dissemination to future generations. The discussant, an

anthropologist and gerontologist, has expertise in nursing home ethnography and the development of elder communities.

### **HOW ELDERLY CREATE MEANING THROUGH SONG AND SELF-PRESENTATION IN A NURSING HOME**

T.A. Allison, 1. *University of California, San Francisco, San Francisco, California*, 2. *San Francisco VA Medical Center, San Francisco, California*

This presentation examines how institutionalized elders create meaning in and present their lives through newly composed songs. In one highly rated nursing home, the resident elders' artistic output includes paintings, sculptures, concerts, needlework, and even a commercially released compact disc with an accompanying documentary. The CD, "An Island on a Hill," and film, "A 'Specially Wonderful Affair,'" serve as permanent legacy. The songs offer a narrative of the elders' lives, including their cultural heritage, holiday celebrations, important life events and reflections on their age. The September 11th attacks, occurring in the middle of the documentary production, dramatically framed these gentle reminiscences within the elders' visceral and intellectual reactions to the devastation around them. Through song and accompanying narrative, these works serve as a record of the ways in which institutionalized elders make meaning in their lives, continue to learn, and engage in the world around them.

### **I PUT MY FEARS BEHIND ME: AFRICAN AMERICAN PERSPECTIVES ON LEARNING OPPORTUNITIES LATER IN LIFE**

R.B. Meraz Lewis, *Leadership and Counseling, Eastern Michigan University, Ann Arbor, Michigan*

In this paper, the author explores the experiences of African Americans who have pursued education later in life. There is a growing body of literature on older adult learning; however, there is a dearth of research specifically focusing on the lifelong learning experiences of older minorities. Findings for this qualitative study were synthesized through thematic, narrative analysis of in-depth individual interviews with ten African American women and men who took part in both formal and informal learning experiences once they were over the age of 50. Participants in the study range in ages from 50 to 85 years old. The analysis reveals how aspects of the life stories participants tell about themselves provide insight into their sense of self (Kaufman, 1986) and how pursuing learning later in life helps individuals negotiate later life transitions as well as post retirement identities.

### **THIS IS WHAT I LEARNED FROM YOU**

T.M. Maschi, J.R. Smith, *Graduate School of Social Service, Fordham University, New York, New York*

This presentation examines how social work research students responded to the oral history interviews they conducted with older adults. The students (n=24) were trained by their instructor in the conducting of oral histories using a semi-structured interview guide about their experience before, during and after immigration. Students analyzed their individual findings using thematic analysis and presenting findings to the class (Padgett, 2008). Two trained qualitative researchers identified the collective themes that the students presented in response to the stories they collected from the older adults who had immigrated to this country. Preliminary results of the students' work showed how they were collectively affected by the older adults' relationship to their country of origin and the cultural sources of resilience they demonstrated in response to prejudice/discrimination. The paper illustrates how students' understandings of resilience can be framed by conducting narrative/oral analysis projects among older adults of diverse cultural backgrounds.

## **SESSION 2515 (SYMPOSIUM)**

### **HEALTH BEHAVIOR CLUSTERS: EVIDENCE AND OUTCOMES**

Chair: R.A. Pruchno, *New Jersey Institute for Successful Aging, University of Medicine & Dentistry School of Osteopathic Medicine, Stratford, New Jersey*

Discussant: T. Prohaska, *University of Illinois at Chicago, Chicago, Illinois*

Numerous studies reveal that adherence to individual health behaviors increases longevity and promotes better quality of life, yet the preponderance of evidence comes from studies examining individual health behaviors in isolation of one another. Although consistently research finds that physical inactivity, excessive alcohol use, cigarette smoking, and an unhealthy diet, are each linked with similar negative health outcomes, questions remain about the extent to which health behaviors cluster and whether they have additive or synergistic effects on outcomes. The extent to which health behaviors cluster has important implications for understanding the predictors of health behaviors as well as their outcomes, and begs development of new research questions, methods, and theory. Issues such as which behaviors cluster and for which segments of the population they cluster become salient. The extent to which health behaviors cluster also has implications for whether interventions should focus on multiple behaviors or single health behaviors to improve health outcomes. This symposium will address the following questions: (1) To what extent is there evidence of clustering of health behaviors among older adults? (2) Are people who adhere to multiple health behaviors more likely to experience better health outcomes than those who adhere to fewer health behaviors? and (3) Are some health behavior clusters more closely associated with better health outcomes than others? Discussion will focus on the implications of clustering for theory, methods, and intervention.

### **ADHERENCE TO CLUSTERS OF HEALTH BEHAVIORS AND SUCCESSFUL AGING**

R.A. Pruchno<sup>1</sup>, M. Wilson-Genderson<sup>2</sup>, 1. *New Jersey Institute for Successful Aging, University of Medicine & Dentistry School of Osteopathic Medicine, Stratford, New Jersey*, 2. *Virginia Commonwealth University-School of Medicine, Richmond, Virginia*

With evidence that genetic influences account for only 20% - 25% of individual variability in successful aging, attention has turned to identifying how modifiable behaviors with strong associations to morbidity, mortality and health care costs influence successful aging. Using data from 5,688 persons aged 50-74 we investigated the relationship between adherence to recommendations regarding five health behaviors (exercise, alcohol, smoking, diet, and BMI) and successful aging. Results indicated that 4.9% of panelists adhered to none of the recommended health behaviors; 2.8% adhered to all five. Most common was adherence to one (28.4%), two (31.4%) or three (22.1%) health behaviors. As the number of adherent behaviors increased so too did the likelihood of aging successfully, yet adherence to some health behavior clusters was more closely associated with successful aging than adherence to others. These findings suggest that there may be multiple mechanisms by which health behaviors influence successful aging.

### **RACIAL AND ETHNIC DIFFERENCES IN THE CORRESPONDENCE AMONG HEALTH BEHAVIORS**

J. Newsom<sup>1</sup>, N. Huguet<sup>2</sup>, A.R. Quinones<sup>3</sup>, C.L. Nagel<sup>3</sup>, M.S. Kaplan<sup>2</sup>, B. McFarland<sup>3</sup>, 1. *Institute on Aging, Portland State University, Portland, Oregon*, 2. *School of Community Health, Portland State University, Portland, Oregon*, 3. *Oregon Health & Science University, Portland, Oregon*

Prior work has suggested that health behaviors (i.e., smoking, exercise, and alcohol consumption) have low correspondence. Individuals

who engage in one healthy behavior are only slightly more likely to engage in another. Common social stressors, cultural influences, or socioeconomic factors may lead to greater clustering of healthy behaviors within race/ethnic groups. This hypothesis was investigated in the Health and Retirement Study among ages 50 and older (N=11,909). Correlations among behaviors were significant but small. Associations were slightly higher among African Americans (average  $r^2=.025$ ) and Latinos (average  $r^2=.025$ ), as compared to Whites (average  $r^2=.015$ ). Greater clustering was due primarily to a greater association between smoking and alcohol consumption among African Americans ( $r^2=.060$  vs.  $r^2=.017$ ,  $p<.05$ ) and between exercising and alcohol consumption among Latinos ( $r^2=.045$  vs.  $r^2=.012$ ,  $p<.05$ ). Results suggest only modest race/ethnic differences in clustering among health behaviors, which may be due to differences in social stressors or resources.

### **LONGITUDINAL ANALYSIS OF INDIVIDUAL, COMBINED, AND ADDITIVE EFFECTS OF LIFESTYLE BEHAVIORS ON COGNITION**

A. Eisenstein, T. Prohaska, *Center for Research on Health and Aging, University of Illinois at Chicago, Chicago, Illinois*

This paper examines individual, combined, and additive effects of lifestyle behaviors including physical, social, and mentally-stimulating activities, smoking, and alcohol consumption, on cognitive performance in a nationally representative sample of older adults. Bivariate and multivariate associations between the 5 lifestyle behaviors and cognitive measures were conducted. Multivariate analyses included a behavior clustered approach as well as a lifestyle-behavior index as the independent variables. Analyses were repeated with and without demographic and health-related covariates. At the bivariate level, mentally-stimulating activity, alcohol consumption, and the behavioral index had significant positive associations with cognitive performance 7-years later. In the combined model, when controlling for all behaviors, mentally-stimulating activity and moderate alcohol consumption remained significant positive predictors of cognitive performance both with and without the covariates. Findings suggest that cognitive activity and moderate alcohol consumption, more than any other behavior or a combination of behaviors, may result in promoting cognitive health over time.

### **SESSION 2520 (SYMPOSIUM)**

#### **LESSONS LEARNED: A RETROSPECTIVE LOOK AT CULTURE CHANGE**

Chair: G. Doll, *Kansas State University Center on Aging, Manhattan, Kansas*

Discussant: P. Reed, *Pioneer Network, Chicago, Illinois*

Culture change, or the movement to create person-centered care in nursing homes, has likely reached a tipping point with virtually every administrator at least recognizing the intent of the concept. Early adopters were motivated by intrinsic factors—they were leaders who felt passionately that person-centered care was a moral imperative. More recently, adoption has been also supported by extrinsic factors, such as the new MDS 3.0, various state initiatives to incentivize the adoption of culture change practices and code changes. This session provides information on the implementation of person-centered care practices gleaned from the work of five researchers who have been exploring the field for 10-15 years. They will examine contributing factors as well as barriers to the successful adoption of person-centered care. The first session will be an historical perspective of the roots of culture change, from initiatives like “untie our elderly” to beginnings in the SCU movement of the 1980’s to changes in other areas of healthcare. The second session is a ten-year longitudinal examination of deep change in a case study involving three nursing homes. The historical issues in organizational and environmental changes and the challenges with regulatory language comprise the third session. Believing that culture change has addressed the “three plagues” of nursing home life unevenly, the fourth

presenters propose a way of shifting the traditional frame of elders as “objects of care” to “human actors with expertise” in care. Change in the Pioneer Network values will be reviewed and current approaches will be highlighted.

### **THE PLAGUE OF HELPLESSNESS AND THE MEANING OF CARE IN LTC CULTURE CHANGE (CC) EFFORTS**

R.A. Siders, D. Dannefer, *Case Western Reserve University, Cleveland, Ohio*

The identification of the “three plagues” of NH life – boredom, helplessness, and loneliness – remains foundational to CC in LTC. Yet, even ambitious and thorough CC efforts have addressed these unevenly. Specifically, helplessness has received much less attention than have loneliness and boredom. Applying self-determination theory, each of the three plagues corresponds to the violation of a basic human need. For helplessness, the corresponding need is competence. We review the reasons for inattention to helplessness, and propose a way of addressing this undeveloped dimension by focusing on the structural constraints embedded in “role of the resident”, especially regarding the unexamined issue of how residents themselves define care. We depart from previous research by reframing the position of elders, not as “object of care” but as “human actors with expertise” in the matter of care, present data from 40 resident interviews focused on the meaning of care, and consider implications for CC.

### **THE ROAD BACK: A LONGITUDINAL LOOK AT THREE HOMES ENGAGED IN CULTURE CHANGE**

G. Doll, *Kansas State University Center on Aging, Manhattan, Kansas*

This longitudinal case study uses Schein’s model of culture to measure deep change in three homes, one traditional, one innovative and a third somewhere in between, as they attempted to adopt culture change practices. The study showed that the deepest level of culture (assumptions) told a different story than what was revealed by the superficial level of artifacts (the level typically used to measure culture change). Three main themes emerged: 1) Staff know what is best for residents. 2) Homes are guided by their perception of their role in the community. 3) Learning styles predict different types of culture change progress. A return to the three homes eight years later showed that while all three had made attempts to install culture change, only one was partially successful in maintaining deep change. Participants will learn how to measure deep change and identify the determinants of culture change success.

### **THE EMERGENCE OF A “NEW PLACE” IN LONG-TERM CARE**

M.L. Kaup, *ATID, Kansas State University, Manhattan, Kansas*

Nursing facilities must adhere to several layers of regulatory structure. Both traditional models of skilled care and newer “culture change” household models fall under the exact same guidelines. Many household models, however, have specifically re-designed their organizational structures and HH environments to abandon the previously held assumptions of the medical nursing home models of care. This raises the question about the continued “fit” between the regulations and these household models; a question that has not been ignored by regulators at the federal level. This presentation will highlight the outcomes of a case study of three long-term care settings that have organized under the concept of a “household.” The discussion focuses on how organizations and their environments have been redesigned, and how staff perception of their role within their place of work is impacted by highly structured rules, group dynamics, and environmental conditions operating around them.

## PERSON-CENTERED CARE: IT'S BEEN A LONG TIME A-COMING

M. Calkins, *IDEAS, Kirtland, Ohio*

While many organizations and publications refer to the “new” model of care variously known as culture change or person-centered care, it has clear roots in the Nursing Home Reform Act of OBRA '87 and the early special care unit movement for dementia care settings. This session traces the evolution of Person-Centered Care, relating it to change initiatives in other areas of health care, and making the argument that person-centered care principles, such as “know the person” and “put the person before the task”, are descendents of the therapeutic goals (e.g., “Continuity of Self”) articulated by early dementia care researchers. From a regulatory perspective, most of the new components of MDS 3.0 also reflect a continued evolution of the same principles.

## THE LANDSCAPE OF CULTURE CHANGE AND PERSON-CENTERED CARE: APPROACHES, PROGRESS AND NEW DIRECTIONS

P. Reed, *Pioneer Network, Carmichael, California*

For over 15 years, the culture change movement has pushed the field of long-term care to radically transform organizational values to return control over everyday life to residents. Truly engaging residents to promote choice and enhance quality of life requires more than a discrete clinical intervention, but rather must include fundamental changes to the entire system of care and everyday living. The Pioneer Network has served as a leading national voice for culture change, monitoring progress and assessing the range of emerging innovative approaches. While estimates show that only 3-10% of nursing homes have adopted deep transformational approaches to culture change, the concept is widely recognized and growing in adoption. This session will use available data to detail the current state of culture-change, describe key culture change values and highlight several national approaches, with a focus on resident and organizational outcomes.

## SESSION 2525 (SYMPOSIUM)

### LET'S GET PHYSICAL! SOCIOEMOTIONAL AND COGNITIVE PATHWAYS TO HEALTHY AGING THROUGH PHYSICAL ACTIVITY

Chair: *T. Sims, Psychology, Stanford University, Stanford, California*

Co-Chair: *N. Notthoff, Psychology, Stanford University, Stanford, California*

Discussant: *D. Park, University of Texas at Dallas, Dallas, Texas*

Few older adults meet the American Heart Association recommendations for physical activity, even though the health benefits of exercise are well-established, including improvements to physical health (e.g., reduced risk of cardiovascular disease), cognitive fitness (e.g., maintenance of cognitive function), and psychological health (e.g., greater emotional well-being). The aim of this session is to elucidate some specific mechanisms through which physical activity may promote healthy aging and the psychological factors that may influence its effectiveness. Voss and colleagues present evidence that in older adults, higher levels of physical fitness are associated with greater functional integration of subcortical and prefrontal structures with the collective brain network, which relates to enhanced cognitive performance. Puterman and colleagues discuss how physical activity in combination with emotion regulation and social connection predict longer leukocyte telomere length in heart disease patients, and how these factors mitigate depression-telomere length associations. Sims and colleagues present findings showing that the positive association between vigorous physical activity and emotion depends on the value people place on high arousal positive states. Finally, Notthoff and colleagues present evidence that amygdala activation when viewing emotionally-framed vs. neutral information about walking predicts increases in subsequent physical activity among older adults. Together, these studies suggest

that the path from physical activity to healthy aging is dependent on cognitive and emotional processes, including related neural networks, socioemotional functioning, and emotional goals. Ultimately, this research can enhance the effectiveness of interventions and policies aimed at optimizing physical activity levels and improve cognitive and affective functioning among older adults.

## THE RELATIONSHIP OF AEROBIC FITNESS TO BRAIN NETWORK ARCHITECTURE IN HEALTHY OLDER ADULTS

M.W. Voss<sup>1</sup>, C. Wong<sup>2</sup>, A.N. Szabo<sup>2</sup>, P.L. Baniqued<sup>2</sup>, J.H. Burdette<sup>3</sup>, E. McAuley<sup>2</sup>, P. Laurienti<sup>3</sup>, A. Kramer<sup>2</sup>, *1. Psychology, The University of Iowa, Iowa City, Iowa, 2. The University of Illinois at Urbana-Champaign, Urbana, Illinois, 3. Wake Forest University, Winston-Salem, North Carolina*

We have shown aerobic fitness is associated with enhanced Default Mode Network (DMN) connectivity in parietal, temporal, and frontal regions disconnected from the DMN with age. Here we used a data-driven approach combined with traditional methods to examine the association of fitness with brain connectivity in 44 older adults (mean 65.6 yrs). Greater aerobic fitness was associated with greater connectivity of the dorsal medial amygdala and anterior hippocampus with the posterior cingulate cortex ( $r=.28$  and  $.36$  respectively,  $p<.05$ ), a hub of the brain and the DMN, and with greater connectivity between the dorsal medial amygdala and dorsomedial thalamus ( $r=.43$ ,  $p<.05$ ), a relay station in cortico-limbic and executive function pathways. Results suggest fitness is associated with the amygdala playing a more central role in core brain networks. After attending this session, participants will have learned how functional connectivity methods with MRI can be used for modeling brain function and healthy aging.

## A MULTISYSTEM PROTECTIVE PROFILE MODERATES THE DEPRESSION – LEUKOCYTE TELOMERE LENGTH ASSOCIATION

E. Puterman<sup>1</sup>, E. Epel<sup>1</sup>, J. Lin<sup>1</sup>, E. Blackburn<sup>1</sup>, J. Gross<sup>3</sup>, M. Whooley<sup>1,2</sup>, B. Cohen<sup>1,2</sup>, *1. University of California, San Francisco, San Francisco, California, 2. San Francisco VA Medical Center, San Francisco, California, 3. Stanford University, Stanford, California*

Immune cell senescence, indexed by short leukocyte telomeres (LTL), is associated with major depressive disorder (MDD). Healthy emotion regulation, strong social connections, and high levels of physical activity have independently been associated with longer telomeres, but little is known about their combined effects, nor their potential to moderate the MDD-LTL association. LTL, using quantitative PCR assay, was measured in 954 patients with stable heart disease in the Heart and Soul Study. Principal component analysis revealed one factor for social connections (Cohen et al., 1985), physical activity (Krauss et al., 2010), and emotion expression (Gross & John, 2003). A high profile score predicted longer LTL ( $\beta = .09$ ,  $p = .003$ ), whereas each individual factor did not. The profile score moderated the MDD-LTL association, such that only at  $-1SD$  or lower, was MDD significantly related to LTL. MDD associations with biological outcomes should be examined within a psychosocial and behavioral context.

## EMOTIONALLY-SALIENT HEALTH MESSAGES INCREASE WALKING: EVIDENCE FROM NEUROIMAGING

N. Notthoff<sup>1</sup>, G.R. Samanez-Larkin<sup>2</sup>, L. Carstensen<sup>1</sup>, *1. Department of Psychology, Stanford, Stanford, California, 2. Vanderbilt University, Nashville, Tennessee*

Older adults are the most sedentary age group. Failure to effectively communicate health information may play a role. In two experiments ( $n_1=59$ ;  $n_2=86$ ), we observed that promoting the benefits of walking (positive framing) more effectively increased walking than emphasizing the negative consequences of not walking (negative framing) ( $t(58)=2.291, p<0.05$ ;  $t(2274)=15.548, p<0.01$ ). In a third study,

we examined the mechanisms through which these framing effects may operate. 22 younger adults, ages 22–35 (M=27) and 16 older adults, ages 65–83 (M=74) underwent fMRI while viewing information about walking. Amygdala activation when viewing emotionally-framed compared to neutral messages was greater in older compared to younger adults and was associated with increased walking in the following week in both age groups. These findings point to cognitive mechanisms through which subtle differences in communicating health information may influence health behaviors.

### **IS VIGOROUS ACTIVITY FOR EVERYONE? THE INFLUENCE OF IDEAL AFFECT ON THE EMOTIONAL BENEFITS OF PHYSICAL ACTIVITY ACROSS THE LIFE SPAN**

T. Sims, C.L. Lowdermilk, J.L. Tsai, *Psychology, Stanford University, Stanford, California*

National campaigns promoting healthy aging often focus on older adults engaging in energizing, invigorating activities. This may be partly due to the relationship between vigorous activity and emotional well-being. However, this association may depend on how much people want to feel energized, full of vigor, and other high arousal positive states (ideal HAP). In study 1, we surveyed approximately 500 people across the life span in which they reported their ideal HAP, how often they engaged in mild, moderate and strenuous activities, and how positive they typically felt. Across the life span, the positive association between activity intensity and positive affect was moderated by ideal HAP. In study 2, we followed a subsample of these participants using experience sampling. Within individuals, feeling activated during exercise was positively associated with feeling happy, which also depended on ideal HAP. We discuss implications of ideal affect in aging populations for healthy outcomes.

## **SESSION 2530 (SYMPOSIUM)**

### **LIFE COURSE PREDICTORS OF LATER LIFE WELL-BEING AND HEALTH**

Chair: M. Ardel, *Sociology and Criminology & Law, University of Florida, Gainesville, Florida*

Discussant: R. Settersten, *Oregon State University, Corvallis, Oregon*

This symposium investigates life course predictors of physical, psychological, and subjective well-being during the later years of life by analyzing several longitudinal or comparative samples. The first presentation examines college predictors of subjective well-being at midlife. Among members of the 1956 birth cohort from the Rochester Adult Longitudinal Study, college scores on autonomy, generativity, and ego integrity were most predictive of overall satisfaction in midlife, whereas identity and intimacy were more important predictors for the 1947 cohort. The second presentation compares three groups of older adults (N=430) who survived the Holocaust as children or young adults. Those who immigrated after the war to Israel tended to score highest on social capital, followed by immigrants to the US, and those living in Hungary. Staying in Hungary under continued threat of anti-Semitism had a negative impact on successful aging. The third presentation combines two longitudinal studies of 243 male Harvard graduates and 393 working-class men to analyze the long-term effects of childhood adversity. Experience of childhood adversity was negatively related to generativity in midlife. Generativity, in turn, tended to predict aging well. The last presentation explores antecedents of both dementia and sustained cognitive competence at age 90 of the 150 surviving men of the longitudinal Harvard study. Results show that apart from good vision and exercise, an excellent childhood relationship with mother predicted cognitive competence at age 90 and the absence of dementia. Overall, the studies indicate that earlier life events can have far reaching consequences for later life well-being and health.

### **A SEQUENTIAL ANALYSIS OF COLLEGE PREDICTORS OF MIDLIFE SATISFACTION AND SUBJECTIVE WELL-BEING**

S.K. Whitbourne, *Psychology, Univ. of Mass. Amherst, Amherst, Massachusetts*

Psychological well-being in midlife is typically studied using correlational cross-sectional data. Previous studies from the Rochester Adult Longitudinal Study investigating college predictors of well-being examined data from a 1947 birth cohort through the age of 54. The present paper will examine data from the 136 members of the 1956 birth cohort from the same college who were followed through age of 42 on measures of subjective well-being and life satisfaction. College scores on Autonomy vs. Shame and Doubt, Generativity vs. Stagnation, and Ego Integrity vs. Despair had the highest predictive relationships with overall satisfaction in mid-life in contrast to findings from the 1947 cohort, for whom identity and intimacy were more important predictors. In line with earlier investigations showing cohort/time of measurement differences between the 1947 and 1956 cohorts in psychosocial development, the present findings highlight the importance of replicating longitudinal analyses across cohorts.

### **TRAUMA AND THE LIFE COURSE IN A CROSS NATIONAL PERSPECTIVE**

E. Kahana<sup>1</sup>, B. Kahana<sup>2</sup>, L. Lovegreen<sup>1</sup>, *1. Case Western Reserve University, Cleveland, Ohio, 2. Cleveland State University, Cleveland, Ohio*

Holocaust survivors, who are alive today endured extreme trauma in childhood or young adulthood. How they fare as elders has been greatly impacted by the sociocultural milieu of their adult years along with attempts to craft meaningful lives after their victimization. We report data based on survivors who immigrated after the war to the US (n=150) or to Israel (n=150) and compare their life trajectories with survivors who continued to live in Hungary (n=120). Findings reveal that social capital and group identity differ greatly based on country of residence. Survivors living in Israel report greatest social capital followed by survivors in the US, with survivors living in Hungary a distant third. For the latter group, living under the cloud of antisemitism marred their adult years and impeded successful aging, manifesting in depressive symptoms during old age.

### **THE LONG-TERM EFFECTS OF CHILDHOOD ADVERSITY ON LATER LIFE WELL-BEING MODERATED BY GENERATIVITY**

S. Landes<sup>1</sup>, M. Ardel<sup>1</sup>, G.E. Vaillant<sup>2</sup>, *1. University of Florida, Gainesville, Florida, 2. Brigham and Women's Hospital, Harvard Medical School, Boston, Massachusetts*

Prior studies confirm that after experiencing childhood adversity, resilient adults can recover and engage in generative growth. Utilizing a sample of 636 men from the Harvard Sample and Inner City Cohort of the 60-year longitudinal Study of Adult Development, this research explores the long-term effects of childhood adversity on individuals who either achieved or failed to achieve Erikson's psychosocial developmental stage of generativity in midlife. Men from an adversarial childhood were less likely than men from a non-adversarial childhood to achieve generativity in mid life. Generative men from both adversarial and non-adversarial childhoods had increased enjoyment of life and better adjustment to aging. The achievement of generativity in men from an adversarial childhood was also associated with decreased abuse of both alcohol and drugs. Results confirm positive later life outcomes for resilient individuals from both an adversarial and non-adversarial childhood who subsequently engaged in psychosocial growth.

## ANTECEDENTS OF COGNITIVE COMPETENCE AND DEMENTIA AT AGE 90: A PROSPECTIVE STUDY

G.E. Vaillant, *Harvard Medical School, Boston, Massachusetts*

**Abstract** This presentation examines antecedents of both dementia and sustained cognitive competence at age 90, using a prospective, intensive, multidisciplinary study of 150 surviving white male college sophomores repeatedly assessed from age 19 to 90, with little attrition. Measures included numerous prospectively gathered variables including assessment of childhood, dominant personality traits, and objective mental and physical health over time, smoking history, alcohol abuse, and depression. Cognitive status was assessed at age 80, and 90. Questionnaires were obtained every two years and physical exams every five years. Results showed that apart from the absence or presence of vascular risk factors, there were virtually no antecedent environmental variables associated with either clear cognitive competence at age 90 ( $n = 39$ ) or probable dementia ( $n = 38$ ). An excellent childhood relationship with mother, good vision, and exercise were the three best predictors of cognitive competence at age 90 and the absence of dementia.

## SESSION 2535 (SYMPOSIUM)

### ORDER AMIDST THE CHAOS: UNDERSTANDING AUTONOMY IN ASSISTED LIVING

Chair: *A. Frankowski, UMBC, Baltimore, Maryland*

Co-Chair: *R. Rubinstein, UMBC, Baltimore, Maryland*

Discussant: *M.M. Perkins, Emory University, Atlanta, Georgia*

In this symposium we examine how autonomy is supported, challenged, and thwarted in two assisted living (AL) settings: a sixteen person “progressive” AL that incorporates a large adult day program and an “affordable” AL recently purchased by a nursing home and housing forty-eight residents. Three distinctive threads run through our data: (1) management philosophy; (2) social interaction between residents, families, friends, and staff; and (3) physical and social environment. Our symposium reflects these themes. In our presentations we examine how: (a) an AL’s philosophy of autonomy socializes staff to balance residents’ risky choices with safety; (b) lying to residents moving into a dementia care unit undermines or enhances their autonomy; (c) freedom and control impact the comfort and well-being of AL residents; and (d) the physical setting and use of space inhibits or encourages independence. We conclude our symposium with (e) a theoretical discussion of autonomy as seen within the broader framework of contested discourse. Data for this presentation are drawn from a multi-year, NIA-funded ethnographic study of autonomy. Fieldnotes and interviews with residents, their families of choice, staff, and directors were team coded and analyzed using Atlas-ti software and grounded theory. These papers will inform policy and practice on how implementing autonomy in everyday life results in better quality of life and care for residents in AL.

### BALANCING RISK AND AUTONOMY IN ASSISTED LIVING: THE INTERPLAY OF PHILOSOPHY, MANAGEMENT, AND STAKEHOLDERS’ INVOLVEMENT

M.C. Nemeć, A. Frankowski, R. Perez, M. Brazda, *Center for Aging Studies, University of Maryland, Baltimore County (UMBC), Baltimore, Maryland*

Autonomy, as experienced through choice and independence, is critical for residents’ adjustment to, and satisfaction with, assisted living (AL). Research has shown that the expression of autonomy is positively associated with health and sense of well-being. AL residents want to exert control over their everyday lives; affording residents this control, however, allows them to make both good and bad choices. This presents a challenge to AL staff who want to keep residents safe and healthy, but at the same time feel they must honor risky choices. In this paper we examine how one small progressive AL balances risk with autonomy. Preliminary findings indicate that autonomy is

enhanced through the interplay of this community’s philosophy and mission, management style, staff members’ attitudes, and residents’ actions.

### FREEDOM BEHIND LOCKED DOORS: MANAGING AUTONOMY IN ASSISTED LIVING

A. Frankowski, J.K. Eckert, M.C. Nemeć, R. Perez, R. Hrybyk, C.R. Bennett, *UMBC, Baltimore, Maryland*

Environment is both physical and social. It is architectural as well as interactional, and includes the design of space, ambiance, purposeful arrangements of people and self-defined cliques, i.e., all the ways in which it is used and adapted by individuals and groups. In assisted living (AL), this also includes modifications to enhance the life of its residents: handrails, elevators, and walk-in tubs and the use of public spaces, e.g., the dining room, reception area, and front porch. In this presentation we compare and contrast two AL settings, one bordering on a medical model and the other fostering independence by design. We examine how autonomy is managed on an everyday basis by both residents and staff, how the use of space inhibits or encourages independence, and how residents’ exert control over their lives while living behind locked doors. We conclude with a discussion of best practices culled from our fieldwork.

### THEORIES OF AUTONOMY, CONTESTED DISCOURSE, AND THE INDIVIDUAL IN ASSISTED LIVING

R. Rubinstein, M. Brazda, *UMBC, Baltimore, Maryland*

Autonomy in assisted living (AL) derives from three structuring features: (1) the rules and regulations put into place as absolute by the state and by the management of each specific AL setting; (2) each AL setting’s philosophy on the need for and limits to individual behavior; and (3) individuals’ reactions to and interpretation of the rules and philosophy, and their enactment of specific individual needs and desires. In this paper we examine the third feature and analyze data from two AL settings to show how discourse about autonomy and its manifestations may be contested as stakeholders – residents, family, and staff – attempt to present an argument for either organizational or individual privilege. We also explore how ALs manage individual needs and privileges without infringing on the defined rights of others and discuss how they decide on the significance of privileges and needs of others in relation to those of the individual.

### ENABLING ROUTINE AUTONOMY: IDENTIFYING BOUNDARIES FOR CHOICE IN COLLECTIVE LIVING

L. Morgan, J.K. Eckert, R. Hrybyk, R. Perez, *Sociology & Anthropology, UMBC, Baltimore, Maryland*

Enabling autonomy for individuals is challenging in a collective setting, where organizational, regulatory, staffing and diverse resident needs often constrain its realization. This paper uses extensive fieldnotes to describe an operational boundary for autonomy in a small, progressive AL, where life revolves around a large, common room and autonomy is integral to the philosophy. For example, this AL permits residents wide behavioral choice, including unusual sleeping patterns and dietary behavior. Accommodations are made to address individual preferences, an approach possible in a smaller setting. However, behaviors are constrained when they intrude upon the comfort or peace of others. Proactive staff behavior addressed one resident resistant to showers. Response was also required for an accusation of theft against another resident, involving police. In these instances behavior of one resident impinged upon one or more others in negative ways, suggesting that its philosophy of autonomy is active within limits in daily life.

## **IT'S JUST FOR A LITTLE WHILE: THE ROLE OF LIES IN THE TRANSITION TO DEMENTIA CARE**

A.D. Peebles<sup>1,2</sup>, A. Frankowski<sup>2</sup>, C.R. Bennett<sup>1,2</sup>, R. Perez<sup>2</sup>, 1. *Doctoral Program in Gerontology, UMBC/UMB, Baltimore, Maryland, 2. Center for Aging Studies, UMBC, Baltimore, Maryland*

Residents of assisted living (AL) settings are often subjected to lies told by family and staff. These lies can be large or small, outright or committed by omission. In some cases, the so-called "therapeutic" lie is used to assuage the fears or anxieties of one or more residents, while other lies seem to be told for the sake of simplicity. This presentation examines the ways in which lies told to AL residents enhance or undermine resident autonomy. We focus on residents with dementia, and discuss the contexts in which lies are used by families and care providers. In particular, we explore lies surrounding the transition into a dementia care unit or dementia-specific section of these AL settings; residents are often told that the move is only temporary, when in fact it is permanent. The origin, effects, and life course of these types of lies are also discussed.

## **SESSION 2540 (SYMPOSIUM)**

### **PARTICIPATORY RESEARCH AND TRANSLATION OF INTERVENTION TRIALS NEAR THE END OF LIFE**

Chair: R.S. Allen, *The University of Alabama, Tuscaloosa, Alabama*  
Discussant: R. Blieszner, *Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

This symposium presents data from the Legacy Intervention Family Enactment (LIFE) trial (R21NR011112). LIFE explored the experience and effectiveness of Retired Senior Volunteers in delivering a combination reminiscence and creative activity intervention called Legacy to palliative care patients and their family caregivers living in the community or residential care (i.e., assisted living or senior apartments). First, baseline data from 44 palliative care patients revealed the buffering influence of religious coping practices that involve "God" on the relation between physical symptoms and physical symptom burden as they influence symptoms of depression. Second, baseline dyadic concordance between palliative care patients and their family caregivers (N = 44) in the perception of physical and emotional symptoms and burden will be presented. Third, findings from a content analysis of qualitative data from a) focus groups (N = 3) regarding attractive and inhibiting aspects of the intervention as perceived by potential Retired Senior Volunteers, and b) individual interviews with volunteers (N = 6) who actively worked with LIFE intervention families will be described. Finally, outcome data regarding retention (64% of baseline participants at Time 1 and 86% of Time 1 participants at two-month follow-up) and success of retired senior volunteers as LIFE interventionists will be presented. In comparison with a contact control group, intervention patients experienced a decrease in emotional symptoms and burden and an increase in forgiveness while intervention caregivers experienced increased meaning in life. The discussant will address the potential for volunteer-driven psychosocial interventions in the community to advance translational science.

### **WITH OR WITHOUT GOD: THE BUFFERING EFFECT OF RELIGIOUS COPING STYLE ON DEPRESSION SYMPTOMS IN CHRONICALLY ILL OLDER ADULTS**

G. Harris, M.K. Eichorst, L. Miller, L.L. Dunn, P.A. Parmelee, R.S. Allen, *The University of Alabama, Tuscaloosa, Alabama*

The presence of a chronic illness in older adults often results in stress and other negative emotions. Hill's Biopsychosocial Model of Religious Involvement suggests that religious involvement mod-

erates the association between these stressful conditions and mental health. This study examines this relationship. Participants included 45 non-demented older adults with advanced, chronic illness. Eight regression analyses were conducted to examine one's religious coping style as a moderator of the effect of physical health on depression symptoms. Eight regression models were conducted with some model variation in religious coping style and inclusion of physical symptoms and physical symptom distress as indicators of physical health. Race/ethnicity was a covariate in each model. The results indicate that religious coping moderates the effect of physical symptom number and burden on depression symptoms and that greater engagement with religious coping styles that include involvement with God buffers the effect of physical health on one's depression symptoms.

### **PHYSICAL AND EMOTIONAL SYMPTOM BURDEN AND ADVANCED CHRONIC ILLNESS: DYADIC CONCORDANCE**

M.K. Eichorst<sup>1</sup>, R.S. Allen<sup>1</sup>, G. Harris<sup>1</sup>, C. Azuero<sup>1</sup>, L. Miller<sup>1</sup>, J.L. Shuster<sup>2</sup>, E. Kvale<sup>3</sup>, 1. *The University of Alabama, Tuscaloosa, Alabama, 2. Vanderbilt University, Nashville, Tennessee, 3. University of Alabama at Birmingham, Birmingham, Alabama*

For older adults with chronic conditions, a caregiver often acts as a health care advocate, reporting symptoms experienced by their loved one. While proxy reports are moderately accurate for physical symptoms, they are known to be poor for emotional symptoms, which account for some of the most frequently experienced symptoms at the end of life. Baseline dyadic concordance between palliative care patients and their family caregivers (N = 43; 58% Caucasian, 42% African American) in the perception of physical and emotional symptoms and burden was explored. When considering cognitive status and caregiver stress, palliative care patients and their caregivers were concordant in report of physical symptom number and burden. They also were concordant in report of number of emotional symptoms. However, patients reported significantly less bother from their emotional symptoms than did their caregivers. Discussion will consider caregiver stress as it relates to caregiver proxy report and the patient-caregiver relationship.

### **RETIRED SENIOR VOLUNTEER (RSVP) PERCEPTIONS OF COMMUNITY-BASED INTERVENTION IMPLEMENTATION WITH A CHRONICALLY ILL POPULATION AND THEIR CAREGIVERS**

C. Azuero<sup>1</sup>, E.L. Csikai<sup>1</sup>, E. Kvale<sup>2</sup>, P.A. Parmelee<sup>1</sup>, R.S. Allen<sup>1</sup>, 1. *The University of Alabama, Tuscaloosa, Alabama, 2. University of Alabama at Birmingham, Birmingham, Alabama*

One aspect of the LIFE study was to assess RSVPs' ability to implement a reminiscence and creative activity intervention with chronically-ill individuals and caregivers. Transcripts from pre-intervention focus groups and post-intervention interviews were analyzed using qualitative data techniques to understand RSVP's perceptions toward the intervention. Findings suggested the intervention was understood as a benefit to the care recipients and caregivers. RSVPs also expressed personal benefit from working with the families after implementation. At both time points, personal reflections from the RSVPs were noted and post-intervention reflections included desire for similar projects within their own families. Concerns about working with very sick individuals and going into strangers' homes were expressed but did not hinder involvement or enjoyment in the project. Volunteers provided recommendations for decreasing apprehension among future volunteers. These results suggested RSVPs can successfully implement an intervention, provide recommendations for improving its implementation and receive personal benefit from their efforts.

## PRELIMINARY EVIDENCE OF EFFICACY: THE LEGACY INTERVENTION FAMILY ENACTMENT (LIFE) TRANSLATION TRIAL

R.S. Allen<sup>1</sup>, E.L. Csikai<sup>1</sup>, L.L. Dunn<sup>1</sup>, J. DeCoster<sup>2</sup>, E. Kvale<sup>3</sup>, S. Qualls<sup>4</sup>, L. Burgio<sup>5</sup>, P.A. Parmelee<sup>1</sup>, 1. *The University of Alabama, Tuscaloosa, Alabama*, 2. *University of Virginia, Charlottesville, Virginia*, 3. *University of Alabama at Birmingham, Birmingham, Alabama*, 4. *University of Colorado at Colorado Springs, Colorado Springs, Colorado*, 5. *University of Michigan, Ann Arbor, Michigan*

LIFE explored the experience and effectiveness of Retired Senior Volunteers in delivering a combination reminiscence and creative activity intervention called Legacy to palliative care patients and their family caregivers living in the community or residential care (i.e., assisted living or senior apartments). Six Retired Senior Volunteers worked with intervention families; physical and emotional outcomes for these families were compared to a contact control group. Outcome data regarding retention (64% of baseline participants at Time 1; 86% of Time 1 participants at two-month follow-up) and success of retired senior volunteers as LIFE interventionists will be presented. In comparison with the control group, intervention patients experienced a decrease in emotional symptoms and burden and an increase in forgiveness while intervention caregivers experienced increased meaning in life. Moreover, this effective intervention showed preliminary evidence of successful translation as volunteer organizations facilitated the project and volunteers asked to work with more than one family.

## SESSION 2545 (SYMPOSIUM)

### SOCIAL SELF-REGULATION: MANAGING SOCIAL EXPERIENCES AND EMOTIONAL WELL-BEING IN OLDER ADULTHOOD

Chair: *S. Mejia, Human Development and Family Sciences, Oregon State University, Corvallis, Oregon*

Co-Chair: *H. Chui, Flinders University, Adelaide, South Australia, Australia*

Discussant: *M.K. Diehl, Colorado State University, Fort Collins, Colorado*

In older adulthood, maintaining emotional well-being is an essential component of healthy aging. Social relationships, which are actively constructed across the lifespan, scaffold emotional regulation efforts. However, inasmuch as social relationships are supportive, they can also negatively affect health and well-being through strain, which emphasizes the importance of maintaining an optimal social environment through ongoing regulation of self and others. Spanning distinct sampling intervals, measures of social interaction, and avenues for emotional regulation, this symposium brings together a collection of papers that investigate how older adults self-regulate through their social relations. Chui and Luszcz use data from the Australia Longitudinal Study of Ageing - Daily Life Time Sampling Study (ADuLTS) to investigate the link between neuroticism, social relations, and affect among the oldest old. Meji a and colleagues, using data from the 100-day Personal Understanding of Life and Social Experiences (PULSE) study, examine daily social contact satisfaction and response to perceived stress in the context of differing levels of neuroticism. Rohr and colleagues apply longitudinal data to investigate commonalities and differences between strategies to regulate the self through reciprocity, and regulate others through social support in response to stressful events. Hoppmann and colleagues consider relationship regulation across three generations in the Seattle Longitudinal Study, and investigate the degree to which parents and grandparents draw well-being from the developmental success of their adult offspring. The discussion by Manfred Diehl will integrate the four papers and focus on the ways in which the self and social relationships contribute to emotional well-being in later life.

### SOCIAL PARTNERS AND DAILY AFFECT IN THE OLDEST-OLD

H. Chui, M.A. Luszcz, *Psychology, Flinders University, Adelaide, South Australia, Australia*

Social relationships have major implications for individuals' psychological well-being. This study examined the associations between the presence of social partners and affective experience in the oldest-old in the Australian Longitudinal Study of Ageing - Daily Life Time Sampling Study (ADuLTS). Seventy-five individuals (M age = 88.65 years) were assessed for seven consecutive days. Presence of different social partners produced differential effects on positive (PA) and negative affect (NA). Presence of peripheral ties and other family members was associated with a higher level of PA. In contrast, the presence of a spouse or friends did not show any significant effect on affect. Individuals with a higher level of neuroticism reported a lower level of PA and a higher level of NA when they were with their spouses and other family members. Findings highlight the importance of the effects of situational and individual characteristics of relationships on affect in the oldest-old.

### PERSONALITY AND THE BENEFITS OF CLOSE RELATIONSHIPS: DAILY PERCEIVED STRESS, AFFECT, AND CONTACT SATISFACTION

S. Mejia<sup>1</sup>, S. Choun<sup>1</sup>, T. Pham<sup>2</sup>, R. Metoyer<sup>2</sup>, K. Hooker<sup>1</sup>, 1. *Human Development and Family Sciences, Oregon State University, Corvallis, Oregon*, 2. *School of Computer Science and Electrical Engineering, Oregon State University, Corvallis, Oregon*

Social interactions can both buffer or intensify the effects of stress on well-being. In older adulthood, where age-related vulnerabilities dampen stress response, maintaining positive relationships is an essential to sustain health and well-being. Older adults' social relationships are also expressions of personality, and the trait neuroticism is associated with higher levels of stress, and lower network satisfaction. Data from the 100-day Personal Understanding of Life and Social Experiences (PULSE) project was used to examine the interplay of personality on social relations and stress response. In this internet-based study, older adults reported daily social contact satisfaction, affect, and perceived stress. The effect of stress on affect varied significantly in the sample. Days of higher contact satisfaction attenuated the link between perceived stress and affect on that day. This effect was less present for individuals higher in neuroticism, suggesting that the benefits of social relations vary in part as a function personality.

### LEAN ON ME – OR ON OTHERS? THE INTERPLAY OF DAILY HASSLES, RELATIONSHIPS REGULATION, AND WELL-BEING

M.K. Rohr<sup>1</sup>, J. Wagner<sup>2</sup>, F.R. Lang<sup>1</sup>, 1. *Institut of Psychogerontology University Erlangen-Nuremberg, Erlangen, Germany*, 2. *Humboldt University, Berlin, Germany*

The experience and appraisal of adverse life events are embedded within one's social context. In the face of daily hassles and stressful events, social contacts may either serve as buffer or increase one's vulnerability which is why individuals proactively strive to mold their social world. The current study examines two exemplary regulatory efforts: On the one hand, it concentrates on perceived social support as a more other-focused strategy; on the other hand, general reciprocity is assessed to capture more self-focused regulatory efforts. Commonalities and differences between these two strategies and their consequences for health and well-being are examined. For that purpose a longitudinal web-based study was conducted encompassing three measurement points 7 weeks apart from each other (N = 390). Preliminary results point to differential trajectories of self- and other-focused regulation and highlight age-specific patterns. Results will be discussed on the background of theories on emotion- and relationship regulation.

## OFFSPRING SUCCESS IS ASSOCIATED WITH PARENTAL AND GRANDPARENTAL HAPPINESS: INTERGENERATIONAL EVIDENCE FROM THE SEATTLE LONGITUDINAL STUDY

C.A. Hoppmann<sup>1</sup>, D. Gerstorff<sup>2</sup>, S.L. Willis<sup>3</sup>, K. Schaie<sup>3</sup>, 1. *Univ. of British Columbia, Vancouver, British Columbia, Canada*, 2. *Humboldt University, Berlin, Germany, Germany*, 3. *University of Washington, Seattle, Washington*

Well-being is systematically linked between close others such as family members. Based on developmental notions of generativity, we examined the extent to which parents and grandparents draw happiness from seeing their adult offspring thrive. We used cross-sectional data obtained independently from three generations belonging to the same family as assessed in the Seattle Longitudinal Study (M ages: 32 years for children, 58 years for parents, and 89 years for grandparents). Results revealed that parents and grandparents whose offspring show high professional accomplishments (education, occupational prestige) reported increased levels of happiness, even after controlling for own age, income, education, and professional success. Our findings extend studies using individual data and are in line with research on generativity to suggest that parents and grandparents who perceive that they are leaving a lasting legacy by having fostered the developmental success of the next generations may benefit themselves in terms of greater happiness.

## SESSION 2550 (SYMPOSIUM)

### SOCIAL SUPPORT NETWORKS AND LONELINESS; TWO SIDES OF THE SAME COIN?

Chair: *M.J. Aartsen, Faculty of Social Sciences, VU-University, Amsterdam, Netherlands*

Co-Chair: *P. Martin, Iowa State University, Ames, Iowa*

Loneliness is a detrimental negative emotional feeling stemming from a mismatch between the social relationships one has and one wants to have. By providing support and/or by providing social bonding, the network contributes to well-being and reduced levels of loneliness. In the symposium we will address the question to what extent social support and loneliness are empirically or conceptually different concepts. This symposium brings together two recent studies on loneliness from the Longitudinal Aging Study Amsterdam (The Netherlands) and two recent studies of the Georgia Centenarian Study (USA). In the first presentation, cohort differences in loneliness after divorce are described for 55-65 year old Dutch people. The next presentation focuses on the Wenger typology of support networks and discusses whether a relation between loneliness and support differs across the different network types. Next, the question whether support and loneliness are conceptually different is assessed by conducting confirmatory factor analyses based upon the literature for known assessments of loneliness, social provisions, and depression. Further, the influence of Loneliness and Social Provisions on Life Satisfaction through Depression is examined.

### ASSOCIATIONS BETWEEN LONELINESS AND SUPPORT IN 5 TYPES OF SOCIAL NETWORKS: FINDINGS FROM LASA

M.J. Aartsen, T.G. van Tilburg, *Faculty of Social Sciences, VU-University, Amsterdam, Netherlands*

Social support and loneliness are often correlated, leading to the idea that support and loneliness may be two sides of the same coin. Some argue that it is not the amount but rather the quality of support that counts. In this presentation we will go one step further by taking into account the composition of the support network. With Latent Class Analyses, 5 types of network were distinguished in a subsample older adults with partner (N=1969), based on differences in network size and proportion of children, other family members, friends and neighbors. Correlations between amount of support and loneliness differed con-

siderably across the network types. Social loneliness is related to amount of instrumental and emotional support received, most notably for people with large, friend oriented networks. Emotional loneliness is correlated with emotional support only if there is a substantial proportion of non-kin, or if the network is small and consists mainly of children.

### LONELINESS AFTER DIVORCE: A COHORT COMPARISON AMONG 55-65-YEAR OLD DUTCH PEOPLE

T.G. van Tilburg<sup>1</sup>, M. Aartsen<sup>1</sup>, S. Van der Pas<sup>2</sup>, 1. *Dept. of Sociology, VU University Amsterdam, Amsterdam, Netherlands*, 2. *VU University Medical center, Amsterdam, Netherlands*

Divorced people have a high risk of loneliness. The stigma attached to divorce has declined over the past ten years, and societal norms and regulations have become more customized to divorce. Therefore, divorcees in recent birth cohorts may have better opportunities to realize satisfying relationships than divorcees in earlier cohorts. We test the hypothesis that intensity of loneliness among divorcees has decreased over time on data collected in 1992 and 2002. The study revealed that in 1992 divorcees were more emotionally and socially lonely than married respondents. In 2002 divorcees were less socially lonely than divorcees in 1992 and no longer differed from married respondents. Divorcees have improved their networks, which contributes to less loneliness. The social position of divorcees has changed which may lead to an increase in the societal acceptance of divorce.

### THE INFLUENCE OF LONELINESS AND SOCIAL PROVISIONS ON LIFE SATISFACTION MEDIATED THROUGH DEPRESSIVE SYMPTOMS: FINDINGS FROM THE GEORGIA CENTENARIAN STUDY

G. Randall<sup>1</sup>, P. Martin<sup>2</sup>, L. Poon<sup>3</sup>, 1. *Family & Consumer Sciences, Bradley University, Peoria, Illinois*, 2. *Iowa State University, Ames, Iowa*, 3. *University of Georgia, Athens, Georgia*

We tested a mediation model with four latent variables using cross-sectional data from 160 adults ages 98 to 100. Loneliness (LONE) and Social Provisions (SPS) predicted Life Satisfaction (LS) through Depressive Symptoms (DEP). Analyses controlled for residential status, education, functional health, and marital status. SEM analyses were conducted with Mplus Version 6.1; overall model fit was assessed by the MLM  $\chi^2$  statistic that is robust to non-normality of measures. Indirect effects (IE) were calculated using the bias-corrected bootstrap resampling method to produce point estimates and 95% Confidence Intervals. The model fit the data well,  $\chi^2(df=113) = 125.69, p = .20, CFI = .97, RMSEA = .03, and SRMR = .06$ , supporting mediation. One total IE was found for LONE on LS through DEP, 95% CI [-.58, -.10]. The IE from SPS to LS was not significant, 95% CI [-.23, .12]. The implications of the differential relationships of the predictors on LS are discussed.

### THE FACTOR STRUCTURE OF LONELINESS, SOCIAL PROVISIONS AND DEPRESSION: FINDINGS FROM THE GEORGIA CENTENARIAN STUDY

P. Martin<sup>1</sup>, G. Randall<sup>2</sup>, L. Poon<sup>3</sup>, 1. *Iowa State University, Ames, Iowa*, 2. *Bradley University, Peoria, Illinois*, 3. *University of Georgia, Athens, Georgia*

We tested a measurement model for Loneliness (LONE), Social Provisions (SPS), and Depression (DEP) in a sample of 160 very old adults ages 98 and older. SEM analyses were conducted with Mplus Version 6.1; the overall model fit was assessed by the MLM  $\chi^2$  statistic that is robust to non-normality of measures. One of the known six indicators for SPS did not load significantly on the latent factor (Opportunity for Nurturance) so it was deleted from further analyses. Second, a measurement model including the three correlated latent variables fit the data well:  $c2(df=41) = 46.87; p = .25; CFI = .98; RMSEA = .03; SRMR = .07$ ; all factor loadings were significant. The latent variable LONE correlated significantly with SPS ( $r = -.37, p \leq .001$ ) and DEP ( $r = -.68, p \leq .001$ )

but SPS did not correlate significantly with DEP ( $r = -.15$ ,  $p = .39$ ). Implications of the factor structure and the overall latent variable associations are discussed.

## SESSION 2555 (PAPER)

### DISCOVERY EXCHANGE: TRANSITIONS IN WORK AND RETIREMENT

#### GOING IT ALONE—SELF-EMPLOYMENT IN LATER LIFE

S.E. Rix, D. Baer, *Public Policy Institute, AARP, Washington, District of Columbia*

Recent surveys reveal a sizable proportion of pre-retirees expressing interest in working for themselves in retirement, which some policymakers and older worker advocates view as a way of fostering longer working lives to the benefit of the economy and future retirees. This can be especially important for the unemployed or those with insufficient retirement income, such as part-time workers. Using data from an AARP of 5,027 current and recent older workers and jobseekers, the American Community Survey, and other sources, this presentation will report on self-employment trends at upper ages; the role of self-employment in keeping older Americans in the workforce longer; and the characteristics of and employment experiences of self-employed older workers compared to their wage and salary counterparts. It will discuss survey findings on the role that self-employment played in getting older Americans back to work in the recent recession, as well as the current and anticipated retirement financial well-being of older self-employed workers. Although self-employment can be a response to job loss, the proportion of older workers who were self-employed fell during the recession and its recent aftermath. Yet, according to the AARP survey, some older workers reported going into business for themselves as a result of the recession. Implications of the findings for workers and policy will be discussed.

#### EMPLOYMENT EXPERIENCES OF OLDER WORKERS IN THE CONTEXT OF SHIFTS IN THE NATIONAL ECONOMY

K.E. Cahill<sup>1</sup>, M. Pitt-Catsouphes<sup>1</sup>, T.K. McNamara<sup>1</sup>, M. Valcour<sup>2</sup>, *1. Sloan Center on Aging and Work at Boston College, Chestnut Hill, Massachusetts, 2. EDHC Business School, Nice, France*

The existing literature on the determinants of employment experiences focuses on family, organization, and societal systems. The role of the broader macroeconomy as a driving force of employee experiences has largely been unexplored. This paper uses the Age and Generations (A&G) dataset, a survey of more than 2,000 employees from nine large organizations that, fortuitously, took place just prior to and immediate following the onset of the 2007-2009 recession. We examine the extent to which job satisfaction, employee engagement, and satisfaction with work-family balance are influenced by changes in the national macroeconomy, focusing on the experiences of older workers relative to others. We find that, across all workers, the state of the macroeconomy is a statistically significant determinant of job satisfaction and satisfaction with work-family balance. When the macroeconomy performs poorly employees tend to report lower levels of job satisfaction and higher levels of satisfaction with work-family balance, suggesting that employees' job- and family-related attitudes are influenced by factors beyond the immediate job and family domains. An examination of workers by age reveals that those aged 40-54 years and those aged 55 years and older report higher engagement scores compared with younger workers, regardless of the current state of the macroeconomy. Older workers' employment experiences are also less influenced by fluctuations in housing prices compared with younger workers. One implication of our findings is that the macroeconomy constitutes an influential context which may shape the effects of managerial decisions and policies on employees' attitudes toward work and the work-family interface.

### INSIGHTS INTO THE EXPERIENCES OF OLDER WORKERS AND CHANGE: THROUGH THE LENS OF SELECTION, OPTIMIZATION, AND COMPENSATION

C. Unson<sup>1</sup>, M. Richardson<sup>2</sup>, *1. Public Health, Southern Connecticut State University, New Haven, Connecticut, 2. Management School, University of Waikato, Hamilton, New Zealand*

**Purpose:** The study explored the lived experience of older workers in paid or unpaid employment performed in the second half of life. We examined their goals, the barriers they faced, and their optimization and compensation strategies. **Method:** Thirty open-ended interviews (12 in the US and 18 in New Zealand) were conducted, recorded, transcribed verbatim, and analyzed for themes. **Results:** Respondents' most frequently selected goals were to help others, to obtain work satisfaction, and acquire knowledge. Seventy-five per cent of respondents in paid employment had earning an income as a goal. Barriers to finding and maintaining work included difficult tasks, problems with co-workers and management, lack of self-confidence, health/physical limitations, ageism and stereotyping. The optimization strategies included drawing on past experience, assessing skills, seeking careers/organizations that fitted their values and a willingness to accept lower pay or unpaid work. Attitudinal strategies also included focus and persistence, optimism, and positive attitudes towards change. The compensation strategies they reported were on-the-job training, help from co-workers, clients/customers; friends and family social support, and professional networks. Management practices they considered helpful were flexible work schedules, supervisor's patience, and formal recognition of the value of older workers. **Conclusion:** This study sought to address this issue using the Selection-Optimization-Compensation framework to examine the experiences of encore workers and the strategies they employed to manage change, including the organizational practices that optimized their chances of doing so successfully.

#### TYPE AND DURATION OF WORKING-LIFE NON-EMPLOYMENT SPELLS PREDICT COGNITIVE FUNCTION IN OLD AGE

A.K. Leist<sup>1,2</sup>, M. Avendano<sup>2,3,4</sup>, F.J. van Lenthe<sup>2</sup>, M. Glymour<sup>4</sup>, J.P. Mackenbach<sup>2</sup>, *1. University of Luxembourg, Walferdange, Luxembourg, 2. Erasmus Medical Center, Rotterdam, Netherlands, 3. London School of Economics and Political Science, London, United Kingdom, 4. Harvard School of Public Health, Boston, Massachusetts*

**Background.** Non-employment periods during working life may hinder the development of cognitive reserve but may also provide time for engaging in cognitively stimulating non-work-related activities. This study examines whether different types of non-employment periods during working life predict cognitive function in old age. **Methods.** Cognitive function of 18,419 participants from 13 countries in the Survey of Health, Ageing, and Retirement in Europe (age 50-73) was assessed in 2004 and 2006. Type and duration of non-employment spells were derived from complete work histories reported in 2008. **Results.** Non-employment spells due to sickness, unemployment or homemaking predicted higher odds of cognitive impairment (for sickness: odds ratio (OR) = 1.73, 95 % confidence interval (CI) = 1.53 to 1.96), whereas spells due to training, retirement and maternity leave were associated with lower odds of cognitive impairment (for training: OR = 0.54, 95 % CI = 0.44 to 0.66). Longer non-employment periods in sickness were associated with higher odds of impairment, while longer non-employment periods in training were associated with lower odds of cognitive impairment. Adjustment for early life factors such as childhood socioeconomic status, school performance, and education attenuated but did not eliminate associations between non-employment spells and cognitive function. Late-life factors such as occupation, income, wealth, and health mediated part of the associations between non-employment spells and cognitive function. **Discussion.** The association between non-employ-

ment and later cognitive impairment varies according to the type of activity during periods of non-employment. Cognitively demanding activities such as training during non-employment periods might prevent cognitive impairment.

### **NARRATIVES ON THE EXPERIENCE OF RETIREMENT TRANSITION: PERSONAL CONTROL, SOCIAL RESOURCES AND CONTINUITY OF ‘SELF’**

M. Suzanne, B. Heaven, *Institute of Health & Society, Newcastle University, Newcastle upon Tyne, United Kingdom*

The once stable and predictable pattern associated with ageing and retirement is changing and it is argued that greater opportunities exist for people retiring today. Such options are, however, socially structured. In the UK and elsewhere, significant polarisation has emerged between affluent early retirees and disadvantaged older workers, those forced to retire early on grounds of ill-health and those working beyond state pension age resulting in increasing social and economic inequalities in later life. This qualitative study examined the factors influencing retirement transition experiences. Participants were 45 men and women aged 53-77 from manual and non-manual social classes living in urban and rural areas in North East England. Data were collected via focus groups and individual interviews and analysed thematically using the constant comparison method. Three inter-related categories influenced experiences of the transition into retirement. Firstly, mode of transition – the degree of control over the retirement transition was more important than whether the transition was planned, gradual or sudden. Secondly, individual, family and community resources – including finances, partner status, health status, community facilities – influenced quality of life and the extent to which individuals could remain engaged with society and maintain an ‘active retirement’. Thirdly, narratives emphasised the ways in which participants actively engaged in identity construction most strongly manifest by discourses around continuity of ‘self’ and meaningful social role(s). Conclusions: individuals constructed active and productive identities, but the extent to which they could do so successfully was structured by the level of resources available to them.

### **WORK-RETIREMENT DECISIONS: DO PEOPLE RETIRE IN COUPLES?**

P.H. Jensen, *Aalborg University, Aalborg, Denmark*

Most retirement studies examine the work-retirement transition as an outcome of an individual decision. Choices are highly influenced by the broader social context, however, and this paper analyses how the composition of the household and family relations impact retirement decisions. More specifically, the paper hypothesises that spouses synchronise their retirement. The study is based on unique Danish register data covering the entire national population. The data cover information (pertaining both to the retiree and their spouse) regarding age, health, socioeconomic position, education level, gross income, and the number of (own) children living in the household. The study covers all cohabiting women and men living in Denmark who were 59 years of age in 1996. This population is followed longitudinally until 2004. A total of 20,179 men and 20,064 women are included in the analysis. Cross tabulations and logistic regression analysis have been applied in the analysis. After attending this session, participants will be able to identify major contextual factors affecting decisions to leave the labour market. For instance, the study reveals how men with their own children living in the household tend to postpone retirement, while this factor is of no importance for women. Conversely, women are highly affected by their spouse’s gross income when retiring, whereas spousal income is of no importance to men when they are deciding when to retire.

## **SESSION 2560 (PAPER)**

### **PSYCHOLOGICAL WELL-BEING ACROSS THE LIFE COURSE**

#### **THE NATURE AND CORRELATES OF SELF-ESTEEM TRAJECTORIES IN LATE LIFE**

J. Wagner<sup>1</sup>, D. Gerstorff<sup>2</sup>, M.A. Luszcz<sup>2</sup>, 1. *Psychological Methods, Humboldt-University of Berlin, Berlin, Germany*, 2. *Flinders University, Adelaide, South Australia, Australia*

Is it possible to keep a positive view on the self up until very old age? Previous empirical research is inconsistent, supporting the theses of substantial self-esteem decrease in late life as well as the countertheses of relative stability well into old age. Based on longitudinal data of the Australian Longitudinal Study of Aging (N = 1,215; age 65 – 103, at first occasion; M = 78.8 yrs., SD = 5.9, 45% female) we explore intraindividual trajectories of self-esteem development across up to 18 years. In addition, we include conditional factors to explain interindividual differences in intraindividual change. Results illustrated an age-related and mortality-related (i.e., time-to-death) decrease of self-esteem; however, based on the standard deviations the amount of decrease appeared to be very small. In addition, self-esteem development illustrated substantial interindividual differences in initial levels and change trajectories. Particularly, individuals with lower subjective health and higher external control reported lower self-esteem. The authors discuss potential conditions and challenges for late-life changes in self-esteem.

#### **NATIONAL VARIATION IN COGNITIVE LIFE CYCLE DEVELOPMENT**

V. Skirbekk<sup>1,3</sup>, D. Weber<sup>1,3</sup>, V. Bordone<sup>1,2,3</sup>, 1. *World Population Program, International Institute for Applied Systems Analysis (IIASA), Laxenburg, Austria*, 2. *Research Institute Human Capital and Development, Vienna University of Economics and Business (WU), Vienna, Austria*, 3. *Wittgenstein Centre for Demography and Global Human Capital, Vienna, Austria*

Cognitive abilities are key determinants of productivity and well-being. This study highlights the importance of considering also national (and not only individual) influences on cognitive skill trajectories over the life course. We focus on the cognitive performance of the nationally representative cohorts born between 1944 and 1952 in eight countries: Belgium, England, France, Germany, Japan, the Netherlands, Sweden, and the United States. The cohorts are tested in their teens (with standardized tests from the International Association for the Evaluation of Educational Achievement (IEA)) and again when they are in their fifties (with harmonized tests from ELSA, HRS, JSTAR, and SHARE surveys). The results show substantial changes in the ranking of the countries over this 40-year period. For instance, Sweden and the USA are in a better ranking position at older ages compared to their performance in their teenage years, while Japan worsens its relative position in the country ranking.

#### **DOMAIN-SPECIFIC ENGAGEMENT: AGE-GRADED ADJUSTMENTS AND WOMEN’S SPECIAL INVOLVEMENT**

J. Shane, J. Heckhausen, *Psychology and Social Behavior, University of California, Irvine, Irvine, California*

The Motivational Theory of Life-Span Development (Heckhausen, Wrosch, & Schulz, 2010) addresses individual agency across the life span by investigating how individuals use primary and secondary control strategies to attain goals in important domains of life. Control opportunities in the major domains of life change across the adult life span. Also, individuals vary in their general and domain-specific primary (i.e., investment of thought and effort) and their general secondary control strategies (i.e., goal disengagement/adjustment and self-protection). The present study examines age-graded and gender differences in both

domain-general and domain-specific primary control strategies and general secondary control strategies, as well as these control strategies contribution to predicting important outcomes in the Midlife in the United States (MIDUS I and II) dataset. Domain-specific primary control strategies are examined in the health, work, marriage/close relationship, relations with children, contributions to others, finances, sexual aspects, and overall life domains. The results illustrate that age is positively associated with general secondary control strategies, including a shift away from domain-specific primary control strategies in work, sexual aspects, and relations with children, and toward domain-specific primary control strategies in marriage or close relationships, contributions to others, and life overall. Women report significantly more general secondary control strategies and significantly more primary control strategies for contributions to others, relations with children, work, finances, and life overall, while men report significantly more primary control strategies for sexual aspects. In addition, domain-specific primary control strategies play a significant and unique role in predicting the respective domain-specific outcomes.

### **ATTACHMENT STYLES OF YOUNG AND ELDERLY WOMEN IN RELATION TO HEALTH AND WELL BEING**

V. Cicirelli, *Psychological Sciences, Purdue University, West Lafayette, Indiana*

According to attachment theory, both late adolescence and old age are periods when life changes increase demands on the attachment system. Individuals may move to different locations, are separated from attachment figures, and face many new distressing situations and problems where they need security and comfort. The present study compared young and older women with secure and dismissing attachment styles. Hypotheses were that the young have better health and well being than the old; and those with secure attachment styles have better health and well being than those with dismissing styles. Participants were 165 young college women and 89 older women (mean age = 75.1 years) in independent living facilities; 142 had secure and 112 had dismissing attachment styles. A 2 (young, old) X 2 (secure, dismissing) MANOVA was used, with measures of health, stress, social support, and well being as dependent variables. Main effects of age group ( $p < .01$ ) and attachment style ( $p < .02$ ) were significant, but not their interaction. In univariate analyses, older women reported significantly ( $p < .05$ ) better physical health, less stress, greater social support, and less depression than the young. Participants with secure attachment styles reported significantly ( $p < .05$ ) better mental health, greater self esteem, and greater internality than those with dismissing styles. Although the hypothesis regarding secure attachment styles was supported, the hypothesis regarding age groups was not. Surprisingly, older women reported better physical health and well being than young women. Implications for theory and practice are drawn.

## **SESSION 2565 (PAPER)**

### **SPIRITUALITY AND WELLNESS**

#### **ASSESSING GENDER DIFFERENCES IN THE RELATIONSHIP BETWEEN NEGATIVE INTERACTION WITH THE CLERGY AND HEALTH AMONG OLDER MEXICAN AMERICANS**

N. Krause, *University of Michigan, Ann Arbor, Michigan*

A rapidly growing literature indicates that supportive social relationships are associated with better physical and mental health. However, this research further reveals that interaction with others may also be conflicted and unpleasant. The purpose of the current study was to evaluate negative interaction that arises within a social context of that is important to many older Mexican Americans (i.e., negative interaction with a member of the clergy). Findings from a nationwide survey of older Mexican Americans indicate that more frequent interpersonal

conflict with a member of the clergy is associated with less favorable self-rated health as well as more acute and chronic health conditions. However, these effects were observed among older Mexican American women but not among older Mexican American men.

### **DOES THE 'RELIGION-SOCIAL INTEGRATION PARADOX' APPLY TO OLDER ASIAN AMERICANS?**

K. Chee<sup>1</sup>, A.M. Blazek<sup>2</sup>, *1. Department of Sociology, Texas State University, San Marcos, Texas, 2. Sam Houston State University, Huntsville, Texas*

Objective: The religion-social integration paradox, according to Klineberg, refers to the pattern that religion increases ethnic minorities' integration in their own ethnic community while helping them to integrate into the larger society. This study examines whether or not this paradox applies to older Asian ethnics, who are known for being socially and culturally isolated. Method: Analysis used secondary data (Klineberg's Houston Area Survey, 1982-2007) that had a large number of Asian-origin respondents, including Vietnamese, Chinese, and Koreans. Those respondents aged 50 years or older (50-85 years) were selected for the current study (N=239). Religious preference, church attendance, and religious importance measured religion. Participation in an ethnic community organization meeting, participation in an ethnic cultural event, and making effort to teach youth about their ethnic background measured the levels of co-ethnic social integration. Having a close friend who is Anglo, Black, or Hispanic measured the extent of non-ethnic social integration. Results: More than half of the respondents indicated that religion is very important to their lives. Religious affiliation and church attendance are each significantly and positively associated with effort in co-ethnic teaching, but not with the other two co-ethnic community participation activities. Religious importance is significantly and positively associated with having a close friend who is Black, but not with having an Anglo or a Hispanic friend. Conclusion: These findings suggest that religion may facilitate older Asians' integration to both their own ethnic and non-ethnic communities, but with limited effects. Practical implications as well as directions for further research are discussed.

### **EXAMINING SOCIAL SUPPORT AS AN EXPLANATION FOR THE LINK BETWEEN RELIGIOUS ACTIVITY AND WELL-BEING**

J.D. Wilmoth<sup>1,2</sup>, C. Adams-Price<sup>1,2</sup>, J. Turner<sup>2,1</sup>, *1. School of Human Sciences, Mississippi State University, Mississippi State, Mississippi, 2. National Strategic, Planning, Analysis, and Research Center, Mississippi State, Mississippi*

Participation in religious activities consistently has been linked to various measures of well-being in older populations. A common explanation for this association is the social support derived from religious affiliations. The twofold purpose of this study is to (1) determine how much of the association between religious participation and well-being among a population of older adults can be explained by four other social support variables (visiting family, visiting friends, club or civic group participation, and volunteering) and (2) to explore whether these associations vary by age. Method: Data were collected through a random sample telephone survey of adults in Mississippi age 55 and older. The dependent variable for this study, a Quality of Life Index, is calculated from responses to four self-reported survey items that addressed overall life satisfaction and problems with boredom, depression, and loneliness. To examine the unique contribution of religious participation in the explanation of quality of life, a series of hierarchical multiple regression analyses was performed for the entire sample and then for subgroups aged 55-64, 65-74, 75-84, and 85 and older. In step 1, quality of life was the dependent variable and (a) volunteering, (b) club or civic group, (c) visiting family, and (d) visiting friends were the independent variables. In step 2, religious participation was entered into the step 1 equation. The contribution of religious participation, when controlling

for the social support variables, was significant ( $p < .01$ ) for the overall sample and for each subgroup except for those ages 75-84.

### RELIGIOUS INVOLVEMENT AND ALLOSTATIC LOAD

T. Hill<sup>1</sup>, S. Rote<sup>1</sup>, C. Ellison<sup>2</sup>, 1. *Sociology, Florida State University, Tallahassee, Florida*, 2. *University of Texas-San Antonio, San Antonio, Texas*

Building on previous studies of religious involvement and health, we use data collected from a large national sample of older adults to test the effects of religious involvement on several individual indicators of allostatic load, including dehydroepiandrosterone (DHEA), c-reactive protein (CRP), Epstein-Barr virus antibodies (EBV), glycosylated hemoglobin (HbA1c), body mass, diastolic blood pressure, systolic blood pressure, and pulse. We also examine an index of these factors (i.e., allostatic load). Our results show that religious attendance is associated with lower levels of body mass, diastolic blood pressure, CRP, EBV, and overall allostatic load. Our results confirm previous studies of blood pressure, CRP, and overall allostatic load. To the best of our knowledge, we are among the first to examine the association between religious involvement and EBV. Additional research is needed to test viable mediators of the association between religious involvement and allostatic load. It is also important to consider indicators of biological risk as mechanisms linking religious involvement to physical health and longevity.

### DOES RELIGIOSITY OR SPIRITUALITY REALLY CONTRIBUTE TO SUCCESSFUL AGEING IN THE GENERAL POPULATION?

R.A. Burns, K.J. Anstey, *Centre for Research on Ageing, Health and Wellbeing, The Australian National University, Canberra, Australian Capital Territory, Australia*

There is considerable evidence for the positive association between religious or spirituality dimensions and mental and physical health outcomes across cultures and religions. However, much of this evidence is based on cross-sectional designs and with samples that can not be claimed to be representative of the population. Our analysis of the Australian Personality and Total Health Through Life (PATH) study which includes participants ( $N = 2,551$ ) aged 60-64 at baseline, who were followed for 12 years, indicates that spirituality provides limited direct benefit to physical or mental health. Results from a Structural Equation Modeling Framework indicates rather that spirituality is associated to other lifestyle factors which are themselves related to better physical and mental health outcomes. Longitudinal analyses allow us to determine the extent to which health-related behaviors mediate and/or moderate the association between spirituality and health outcomes.

## SESSION 2570 (SYMPOSIUM)

### BO-DIDDLEY SYMPOSIUM WORKSHOP

Chair: *D.J. Sheets, University of Victoria, Victoria, British Columbia, Canada*

What is it about Cicero's insights about life experience in his classic "De Senectute" that makes the blues a fitting expression of maturity? The Bo Diddley track is GSA's annual exploration of this age-old, old-age question. The life story of an award-winning older minority blues singer will be shared at a special lecture. This session provides insight into the "real world" of minority aging, in a way that does not minimize the cumulative disadvantages of racism and poverty while simultaneously revealing the resilience that emerges in a dedication to the art of the blues. Hearing the Blues shouldn't be this much fun, but the music will get you jumping and hopping, laughing and crying right along with her. The great spirit, unrivaled vitality and energy, and enormous creativity of this blues musician are like nothing you've ever heard.

## SESSION 2575 (SYMPOSIUM)

### CHARTING NEW FRONTIERS: EXPLORING POST-GRADUATION OPPORTUNITIES ACROSS DISCIPLINES. INSIGHTS FROM EMERGING SCHOLARS

Chair: *C. Brown, Allied Health/Gerontology, Virginia Commonwealth University, Parker, Colorado*

Co-Chair: *K.S. Hall, Duke University, Durham, North Carolina*

Now, more than ever, junior scholars in the area of aging will pursue a vast array of professional opportunities following graduation. Such opportunities vary as a function of discipline, training, and personal preference. Recognizing the heterogeneity of the post-graduation experience, the ESPO, AGHE, and Task Force on Mentoring have collaborated to create a two-part professional development symposium that will explore 'new frontiers' as it relates to post-graduation career paths. Specifically, a group of emerging scholars have been assembled to speak to: 1) the different expectations and opportunities in working at teaching institutions; 2) identifying and pursuing industry positions as a second career; 3) collaboration opportunities between academia and public industry; and 4) professional opportunities for emerging scholars in government agencies. This session is designed to present GSA junior scholars with a new perspective of various careers in gerontology by identifying potential next steps following graduation and strategies for how best to prepare for such endeavors.

### NON-TRADITIONAL OPPORTUNITIES FOR GERONTOLOGISTS IN CONTEMPORARY HIGHER EDUCATION

K. Humber, 1. *Gerontology and Behavioral Sciences, University of Maryland University College, Adelphi, Maryland*, 2. *University of Maryland Baltimore County, Baltimore, Maryland*

Advances in technology have given rise to innovative modes of content delivery from which has emerged a new type of American learner. Older and more experienced, many of these non-traditional learners are generally more receptive to material infused with gerontological content. As teaching institutions grow, they increasingly rely on an adjunct workforce to deliver academic content. Part-time teaching, while not lucrative, provides young professionals in the field an opportunity to develop strong pedagogical and andragogical skills. In addition, as interdisciplinary scholars, gerontologists bring valuable insights to the classroom. The emergence of gerontology programs in recent decades has also created the need for administrators who are uniquely positioned to shape curricula and raise the visibility of the discipline across their respective campuses and communities. The rewards and challenges of instruction and administration of gerontology in modern higher education are discussed.

### THE ROLE OF GERONTOLOGY IN ENVIRONMENTAL DESIGN RESEARCH

T.D. Parr, *Graduate Center for Gerontology, University of Kentucky, Lexington, Kentucky*

Environmental design research is performed by professionals working in architecture, interior and landscape design, facility management and community planning. This specialized area of research captures the transactional relationship of people and their built and natural environments. An increased role in research is likely as communities realize they are ill prepared for their aging members, environmental barriers are associated with health outcomes, and stakeholders demand planning and design recommendations be evidence based. This presentation outlines gerontology's current involvement in the design industry and demonstrates an opportune time for gerontologists to develop increased contributions toward environmental design research. Increased collaboration in environmental design research provides gerontologists a vital role in sponsoring environments that are responsive to the needs of aging persons. After attending this session the participants will understand

gerontology's role in interdisciplinary research, planning and design of built environments.

### **TRANSFORMATIVE LEARNING THEORY: NON-TRADITIONAL FEMALE STUDENTS (40+) CHARTING NEW FRONTIERS IN ACADEMICS**

P.P. Brown<sup>1</sup>, C. Brown<sup>2</sup>, 1. *University of Central Missouri, Warrensburg, Missouri*, 2. *Virginia Commonwealth University, Richmond, Virginia*

Mezirow used transformative learning theoretical (TLT) processes while studying women who reentered academics during the 1970s. The current study entertains the three concepts put forth by Mezirow's TLT with women who obtained their undergraduate degree during the traditional student time of their life course and then later returned to complete their doctorate. Similar to Mezirow's original work, we identify "factors that impeded or facilitated" their progress. Each woman describes her first TLT phase, a disorienting dilemma, as an "Ah-ha" moment. The women critically reflect upon their disorienting dilemma, thereby fulfilling the second phase of TLT and explore a rational discourse, the third phase of TLT. Finally, the women discuss their options for new roles, relationships, and actions relative to their new status as a PhD. Their current work options and relocations are explored, relative to additional factors such as: retired partner/spouse, child/grandchild responsibilities, ageism, sexism, and past work life.

### **FINDING YOUR PATH AND WALKING IT: OPPORTUNITIES FOR GERONTOLOGY STUDENTS WHO ARE INTERESTED IN THE FIELD OF PUBLIC POLICY**

T. McMullen, *Doctoral Program in Gerontology, University of Maryland, Baltimore and Baltimore County, Baltimore, Maryland*

There are numerous professional opportunities for students within the field of gerontology and public policy. However at times, for a student, finding your path may prove difficult, as navigating the field is complicated. Whether it is a fellowship within a policy-related field, a governmental student placement program, or an internship with a policy-related focus, there are many paths that gerontology students can walk when attempting to find that ideal public policy position. This presentation will identify professional and training opportunities available to emerging scholars and professionals in the field of aging and policy. Information gathered for this presentation will draw upon the experiences and knowledge of many individuals who work within the field of public policy and aging. Moreover, this presentation will identify strategies that gerontology students may take in order to find that perfect placement in the field of policy.

## **SESSION 2580 (SYMPOSIUM)**

### **EDUCATING A WORKFORCE IN RURAL AMERICA: THE GERIATRIC SCHOLAR PROGRAM**

Chair: *S. Barczy, Wm. S. Middleton VA GRECC/ University of Wisconsin School of Medicine & Public Health, Madison, Wisconsin*  
Co-Chair: *B. Kramer, VA Greater Los Angeles Healthcare System GRECC/ David Geffen School of Medicine at UCLA, Los Angeles, California*

The Geriatric Scholar Program (GSP) within the Department of Veterans Affairs (VA) is a novel workforce development initiative for enhancing the geriatric skills of providers. It has successfully infused geriatrics competencies, practice behaviors, and practice-based learning in primary care to improve clinical care for older Veterans. This multimodal educational program is targeted to primary care providers and ancillary staff who work in VA's rural clinics and primary care clinics where the need for geriatric care is significant. GSP consists of didactic education in geriatrics and gerontology and in clinical microsystem quality improvement (QI). All scholars engage in an experiential learning plan to conduct a local QI project and participate in reinforcing

experiences of webinars, audio-conferences, clinical practica, mentoring and team training to reinforce the competencies learned during the didactic clinical education and QI portions of the program. Since 2008, 259 physicians, nurse practitioners, physician assistants, social workers and pharmacists have enrolled in this interdisciplinary training program. The speakers will review four components of the program ; 1) the quality improvement education, projects and mentoring, 2) the clinical practica- one week "mini-fellowships", 3) the rural interdisciplinary team training (RITT), and 4) the webinars, and discuss how each reinforces geriatric competencies and learner-identified goals and objectives. Furthermore, the extensive developed and exportable resources of the program will be highlighted and strategies for implementation of these products into other workforce development initiatives will be discussed. This work is sponsored by the Geriatric Research Education and Clinical Center (GRECC) program of the Veterans Affairs.

### **QUALITY IMPROVEMENT WORKSHOP, PROJECT DEVELOPMENT AND SCHOLAR COACHING: PRACTICING THE SKILLS OF HEALTHCARE IMPROVEMENT AT THE PATIENT LEVEL**

C. Callaway-Lane<sup>1,2</sup>, J. Hathaway<sup>1</sup>, T. Speroff<sup>1</sup>, 1. *GRECC, VA-Tennessee Valley Healthcare System, Nashville, Tennessee*, 2. *Vanderbilt University School of Nursing, Nashville, Tennessee*

Members of the VA-Tennessee Valley Healthcare System GRECC offer a one day workshop teaching the techniques of quality improvement using the Model for Improvement adopted by the Institute of Medicine (IOM). This workshop includes didactic sessions followed by team exercises and group interaction. The objective is for the Scholar to become activated in addressing clinic problems and gain self-efficacy in improving the health of elderly veterans. Upon completing the workshop, each scholar is charged with completing an improvement project within their clinical setting. Each scholar is guided by a quality improvement coach throughout the project. Results are demonstrated by a poster presentation of the Scholar's work showing competency for quality improvement methods and lessons learned. A selected group of presentations are chosen for the National GRECC Leadership conference. This session will review our course, coaching methods, and the tools we have developed to run an effective program for practice-based learning.

### **RURAL INTERDISCIPLINARY TEAM TRAINING FOR RURAL HEALTHCARE PROVIDERS: ENHANCING TEAM SKILLS TO IMPROVE CARE FOR OLDER VETERANS**

J.L. Howe<sup>1,2</sup>, J.L. Griffith<sup>1,2</sup>, 1. *Brookdale Department of Geriatrics & Palliative Medicine, Mount Sinai School of Medicine, New York, New York*, 2. *Geriatric Research Education & Clinical Center, James J. Peters VA Medical Center, Bronx, New York*

One component of the GSP is the Rural Interdisciplinary Team Training (RITT) Program. Piloted in FY 2011, the program aims to strengthen interprofessional teams at rural CBOCs. The RITT training program was piloted in the summer of 2011 at five CBOCs across the United States and moved into its implementation phase in FY 2012. RITT sites engage in 8 hours of team-based training to enhance communication, leadership, conflict resolution, and problem solving skills. All pilot site teams received enduring educational materials including a curriculum binder, resource kit, and DVDs. Each CBOC site is paired with a GRECC liaison who worked with the CBOC to implement the training participants completed pre and post self-assessments about working on an interprofessional team. Preliminary results of the process review indicate that team members are responsive to change and plan to implement changes in their practice to improve teamwork and teambuilding.

## **WEBINARS: A NEW APPROACH TO PROFESSIONAL EDUCATION**

R. Chernoff<sup>1</sup>, J.L. Howe<sup>2</sup>, 1. GRECC, Central Arkansas Veterans Healthcare System, Little Rock, Arkansas, 2. James J Peters VAMC, VISN 3 GRECC/Mount Sinai School of Medicine, New York, New York

The Geriatric Scholars (GS) program has performed extensive evaluations to establish the needs of primary care health professionals who provide service to veterans at rural community-based outpatient clinics. Of the issues identified by the GS, one was a need for professional development. To address this, the Arkansas Geriatric Education Center (AGEC) and the Consortium of New York Geriatric Education Center (CNYGEC), along with the Little Rock and New York GRECCs, developed a webinar series on professional development topics. Webinars were selected as the medium to maximize the availability to GS. Topics include peer-to-peer education; the adult learner; health literacy; leadership; managing team dynamics; use of technology in education; and quality improvement and clinical care. The process of developing each webinar and the enduring educational products resulting from this project will be discussed.

## **CLINICAL PRACTICA: REINFORCING SELF-EFFICACY WITH CLINICAL EXPERIENCES IN GERIATRIC MEDICINE**

S. Barczy, *Medicine/ Geriatrics, Wm. S. Middleton VA GRECC/ University of Wisconsin School of Medicine & Public Health, Madison, Wisconsin*

To supplement the didactic education, Scholars may select from a course list of clinical practica at six Geriatric Research, Education and Clinical Centers. Scholars are encouraged to select the programs which they consider most appropriate to enhancing their clinical skills, regardless of proximity to their home VA facility. The practica vary in foci on specific clinical areas, patient interactions (i.e., interactions with volunteer and simulated patients, observed patient care) and length of the experience (2 to 5 days). Although the content of the experiences differ based upon the site, all reinforce the GSP learning program objectives: scholars observe how geriatric clinicians conduct evidence-based assessments, engage in interdisciplinary care and incorporate VA and community resources in care planning. Local documentation templates and tools are shared. Furthermore Scholars are paired with clinical mentors who help them adapt these strategies and tools to their individual practice settings.

## **SESSION 2585 (SYMPOSIUM)**

### **EXAMINING A LIFE COURSE PERSPECTIVE IN NURSING RESEARCH WITH OLDER ADULTS**

Chair: J. Mentés, *Center for the Advancement of Gerontological Nursing Science University of California Los Angeles, Los Angeles, California*

Discussant: M. Ruiz, *School of Nursing University of California Los Angeles, Los Angeles, California*

Often due to an overwhelming focus on multiple physical co-morbidities associated with aging, we do not pay attention to the effect of crucial life course issues on older adults' health. A life course perspective emphasizes the powerful link between older persons' lives and the historical and socioeconomic context where these lives unfold, an important focus for gerontological nursing research. Although current trends in life course research emphasize the effect of early childhood trauma or deprivation and its effect on health across the lifespan; uncovering traumatic as well as supportive life events from an aging perspective can inform scholarly inquiry. This symposium will present different aspects of a life course perspective for nursing research with older adults. The first paper will explore the effects of life events on self care practices among older African Americans with diabetes. The second paper will focus on coping with

HIV/AIDS over the life course. The third paper will focus on life course pathways to homelessness in older adults. The last paper will explore recognizing generational caregiving expectations in African American caregivers.

## **EFFECTS OF LIFE COURSE EVENTS ON DIABETES SELF-CARE PRACTICES: A THEORETICAL EXPLORATION**

K. Skrine Jeffers, J. Mentés, L.R. Phillips, *UCLA, Los Angeles, California*

It is widely known that African American older adults experience among the highest rates of diabetes-related complications due to inadequate self-care behaviors, and a myriad of psychosocial factors. However, little is known about the underlying life course-related factors that may play a significant role in contributing to this growing problem. A fresh look at the life events that co-occurred during the school age, adolescent and young adult years of today's older African Americans is needed. Their psychosocial development was charred by one of the most turbulent racial times in U.S. history. This paper is a theoretical examination that may deepen nursing's understanding of African American older adults and their health behaviors, and inform the development of sustainable interventions that reduce the growing trend of preventable amputations, kidney failure and premature death within this population.

## **LIFE COURSE EFFECTS IN NEWLY DIAGNOSED OLDER WOMEN WITH HIV/AIDS**

A.M. Rankin, *University of California, Los Angeles, Los Angeles, California*

It is estimated that by the year 2015, over half of all HIV/AIDS cases will be in adults older than the age of 50. Two contributing factors to this increase in HIV infection in older adults are increased risky behaviors, such as unprotected sex and drug use; and a decreased perception of HIV risk by older persons and healthcare providers. Perception of risk and initiation of safe sex practices are lower in older women, compared to younger women. Because of this, many older women are not diagnosed with HIV/AIDS until later stages; leading to adverse health outcomes. Life course changes that have molded older adult's behaviors and increased HIV risk in older adulthood include: the discovery of HIV, the sexual revolution in the 1960's, and the advent of sexual stimulants. This presentation will explore the importance of life course effects in research with newly diagnosed older women with HIV/AIDS.

## **LIFE COURSE PATHWAYS TO HOMELESSNESS IN OLDER ADULTS**

N. Salem, J. Mentés, *UCLA, Los Angeles, California*

Homelessness is a major public health issue in the United States (U.S.). There are approximately 3.5 million homeless individuals living in the U.S., and between 60,000 to 400,000 are older homeless adults. By 2050 it is anticipated that the elderly homeless population will double due to the growth of the baby boomer population. The literature indicates that older homeless adults experience four times higher rates of morbidity and premature mortality when compared to the general population, specifically related to diabetes, hypertension, and cardiovascular disease. In order for nurses to effectively address the unique needs of older individuals who are homeless, it is imperative to understand the different pathways in which individuals enter into homelessness. This paper will examine homelessness in the elderly from a life course perspective, emphasizing the historical, sociodemographic, and structural factors influencing pathways into homelessness that should be included when conducting nursing research with older homeless adults.

## RECOGNIZING GENERATIONAL CAREGIVING EXPECTATIONS IN AFRICAN AMERICAN CAREGIVERS

E. Ume, 1. *College of Nursing and Health Care Innovation, Arizona State University, Phoenix, Arizona*, 2. *University of California Los Angeles, Los Angeles, Arizona*

African American caregivers (AACG) eschew institutionalization of elderly loved ones, providing informal care at home until their relatives die or it becomes impossible for caregivers to continue. This presentation describes findings of one qualitative theme from this mixed methods study exploring the post-caregiving transitions of 40 AACGs. Semi-structured individual interviews were used for qualitative data collection. Normative experiences and reflections of AACGs about life course events of generational caregiving after completion of the caregiving experience are presented. They describe it as a duty and an unavoidable responsibility based on collective cultural expectations and familial upbringing, that is accepted by individuals without question. Three emerging attributes of generational caregiving include reciprocity, role modeling, and an aversion to institutionalization. AACGs deny burden but express rewards of happiness, peace and blessings. AACGs see their role as important, culturally sanctioned, and expected, and do not “think twice” about accepting and carrying out that role.

## SESSION 498 (SYMPOSIUM)

### HIP FRACTURE RECOVERY RESEARCH NETWORK: A GLOBAL INITIATIVE TO ADDRESS METHODOLOGICAL CHALLENGES

Chair: *L.A. Beupre, University of Alberta, Edmonton, Alberta, Canada*

Discussant: *J. Magaziner, University of Maryland, Baltimore, Maryland*

The need to improve functional recovery after hip fracture is a global public health issue that will increase over the foreseeable future. The Global Hip Fracture Research Network seeks to enhance communication among interdisciplinary hip fracture researchers internationally, establish a network of sites for studies, set research priorities and address methodological research challenges in this vulnerable group. In this symposium, which will be of interest to healthcare professionals and investigators who study and care for older individuals with hip fracture, we will examine current research and methodological challenges in conducting studies in this group of patients. This series of presentations bring together a number of relevant topics regarding recovery following hip fracture. To better define the outcomes after hip fracture from a population perspective, age and sex-adjusted risk of mortality and institutionalization following hip fracture will be reported. As cognition deficits are prevalent in this patient population, we will examine the implications of using proxy respondents and identify characteristics to correct for discrepant patient-proxy responses. Multi-disciplinary rehabilitation is encouraged following hip fracture, but the evidence may be difficult to interpret and apply clinically. Recent updates from the Cochrane Collaboration and their clinical implications will be discussed. Finally, multi-site, complex exercise intervention studies following hip fracture are infrequently performed; strategies to address barriers to undertaking interventional research in multiple settings following a hip fracture will be reported.

### DISABILITY AND INSTITUTIONALISATION AFTER HIP FRACTURE

K. Rapp, C. Becker, *Gerontologic Rehabilitation Clinic, Robert-Bosch-Hospital, Stuttgart, Germany*

Hip fractures are dramatic events with far-reaching consequences in the biography of old people. Presented will be age- and sex-specific incidence rates of disability and institutionalisation after a hip fracture. These rates will be compared with rates after other reasons of hospitalisation like stroke or myocardial infarction.

### PROXY RESPONDENTS TO EVALUATE HEALTH STATUS IN PATIENTS WITH HIP FRACTURE: CHALLENGES, OPPORTUNITIES, AND LESSONS

M. Shardell<sup>1</sup>, A. Jones<sup>2</sup>, 1. *University of Maryland School of Medicine, Baltimore, Maryland*, 2. *University of Alberta, Edmonton, Alberta, Canada*

Measuring health status in studies of hip-fracture patients is challenging because cognitive deficits are highly prevalent in this population. Obtaining health information from proxy respondents helps to include patients with cognitive impairment and preserve external validity. While using proxies helps to avoid selection bias, factors affect proxy responses that may introduce bias caused by measurement error. Patient-proxy dyads from two studies, Baltimore Hip Studies (BHS) and the Edmonton Hip Fracture Study (EHFS) illustrate how agreement is influenced by the type of respondent, health measure, and time period during recovery. BHS followed 282 pairs of caregivers and patients over 12 months after fracture. EHFS followed 161 pairs of family caregivers and patients who were interviewed 4 times over the 6 months after surgery. We found the greatest dyadic discrepancies for unobservable dimensions of health such as depressive symptoms, and the best agreement for observable dimensions such as activities of daily living.

### UPDATES AND CLINICAL IMPLICATIONS OF COCHRANE COLLABORATION REVIEWS OF MULTIDISCIPLINARY REHABILITATION AFTER HIP FRACTURE

I.D. Cameron<sup>2</sup>, L.A. Beupre<sup>1</sup>, 1. *University of Alberta, Edmonton, Alberta, Canada*, 2. *University of Sydney, Sydney, New South Wales, Australia*

The Cochrane Collaboration has published systematic reviews of multidisciplinary rehabilitation after hip fracture over a long period. The conclusions have been tentative but positive. Surprisingly the summary estimates of effectiveness are not changing greatly despite increasing numbers of studies. This makes the evidence difficult to interpret. Factors influencing this situation include models of rehabilitation that differ greatly between countries, changes to treatment received by the control groups in the trials, and differences in organisation of orthopaedic surgical services and community care services. Updates of the current Reviews will be presented and these will be incorporated with the United Kingdom National Institute of Health and Clinical Excellence Hip Fracture Guidelines to provide a platform for discussion of the clinical implications of this research.

### STRATEGIES FOR UNDERTAKING COMPLEX INTERVENTIONS FOLLOWING HIP FRACTURE

K.K. Mangione<sup>1</sup>, L. Beupre<sup>2</sup>, D. Orwig<sup>3</sup>, 1. *Physical Therapy, Arcadia University, Glenside, Pennsylvania*, 2. *University of Alberta, Edmonton, Alberta, Canada*, 3. *University of Maryland, Baltimore, Maryland*

Phase III clinical trials are used to confirm effectiveness, and while this framework fits fairly straight forward with drug trials, its application in complex interventions, in which “multiple components may act both independently and inter-dependently” is less clear. Components include behaviors and their parameters (frequency/timing) and methods of organizing/delivering those behaviors (practitioner type(s), setting/location). Identifying active ingredients in these trials is complex, but replicating and validating interventions is essential. Using data from two trials—one in the development phase (non-randomized trial conducted in over 30 nursing homes) and the other a phase III multi-center RCT involving 300 community-dwelling participants, we will discuss the challenges in designing interventions and monitoring treatment fidelity in post hip-fracture settings. We will address strategies to monitor and to ensure replication of the intervention across sites throughout the trial.

**HEALTH CARE: DATA, INTERVENTIONS & COST STRUCTURES****SOCIAL INTEGRATION AND METABOLIC SYNDROME IN LATE LIFE**

Y. Yang<sup>1</sup>, Y. Ji<sup>2</sup>, T. Li<sup>1</sup>, 1. *Carolina Population Center, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 2. *Asia Research Institute, National University, Singapore*

Health and survival benefits of social embeddedness have been widely documented across social species, but the underlying biophysiological mechanisms are not fully elucidated. This study filled this gap by examining the impact of social integration on fat and glucose metabolism as one major physiological determinant of longevity. Using prospective data from the Health and Retirement Study of a nationally representative sample of older adults aged 50+ in the U.S., we examined the effects of social integration over 6 years (1998 – 2004) on status of metabolic syndrome (MetS) in 2006 (N = 3,127). Social integration was measured by marital status, contacts with parents, children, neighbors, and volunteer activity. We assessed six biomarkers: waist circumference, HDL and total cholesterol, HbA1c, systolic and diastolic blood pressures, and BMI, as well as a summary index of MetS. We estimated finite mixture models to characterize trajectories of social integration over time and logit and Poisson regression models to assess whether these trajectories predict MetS, adjusting for sociodemographic, behavioral, and other health factors. We found evidence for the protective effects of social integration against a number of metabolic disorders. A lower degree of social integration is significantly related to a 36% higher risk of abdominal obesity, a 55% higher risk of high systolic blood pressure, and a 67% higher risk of MetS. Those with increasing social integration exhibited lower risks of metabolic dysregulation than those with chronically low or decreasing social integration. There are sex differences in these effects with females benefiting more from social engagement.

**EFFECTS OF PREVENTIVE HOME VISIT PROGRAM ON HEALTH CARE COSTS IN AMBULATORY FRAIL ELDERLY**

A. Kono<sup>1</sup>, Y. Kanaya<sup>1</sup>, C. Tsumura<sup>2</sup>, L. Rubenstein<sup>3</sup>, 1. *School of Nursing, Osaka City University, Osaka, Japan*, 2. *Konan Women's University, Kobe, Japan*, 3. *the University of Oklahoma, Oklahoma, Oklahoma*

The aim of the present secondary analysis from a randomized controlled trial was to examine the effect on health care costs of a preventive home visit program for ambulatory frail elders living in three Japanese communities. Community health nurses and care managers provided structured preventive home visits to the intervention group subjects every six months over two years. From the enrolled subjects (n=323) randomly assigned to either the visit (n=161) or the control group (n=162), we analyzed those subjects (N=307) having health care insurance from the local government except medical welfare, which consisted of 154 people in the visit group and 153 people in the control group. The total of the health care costs, including costs for hospitalization or outpatient clinic, were documented over the two years. The total health care cost per month in the visit group was more likely to change to a lower value over the study period than that in the control group. Two-way repeated ANCOVA adjusting for a 1-month cost showed a significant difference (F=4.84, p=0.0278). The change in monthly health care cost for outpatient clinic did not differ between the two groups (NS). Hospitalization, which accounted for more than 1,000,000 yen per month (around US \$10,000), was more likely to occur in the control group subjects than in the visit group over the study period. These results suggest that a preventive home visit program can reduce the monthly health care cost, particularly for hospitalizations that cost the ambulatory frail elders a lot of money.

**ANALYZING LINKED DATA: HOSPITALIZATIONS AND DEATHS AMONG NON-INSTITUTIONALIZED FEE-FOR-SERVICE MEDICARE BENEFICIARIES (NATIONAL HEALTH INTERVIEW SURVEY, NATIONAL DEATH INDEX, MEDICARE CLAIMS)**

Y. Gorina, M.F. Owings, A.E. Simon, *National Center for Health Statistics, Hyattsville, Maryland*

From 2008 to 2009, about 10 million Medicare beneficiaries were admitted as hospital inpatients. For Medicare beneficiaries aged 65 and over, inpatient hospital care accounts for about 23% of total health care expenditures and 34% of Medicare spending. In 2010, CMS reported 30-day readmission rates of 18% for pneumonia, 20% for acute myocardial infarction, and 25% for heart failure. The Medicare claims data and death records linked to the National Health Interview Survey (NHIS) allowed us to analyze patient level information to examine the percentage of NHIS respondents that were hospitalized and readmitted during a 3 year period after the survey. Percentages were calculated by socio-demographic characteristics, self-perceived health status, and other characteristics. We used data for participants in the 1999-2003 NHIS who were linkage eligible fee-for-service Medicare beneficiaries aged 65 and over (n=27,329; 51% of the NHIS participants aged 65 and over). To obtain nationally-representative estimates we used SUDAAN to adjust NHIS survey weights for linkage ineligibility. Our preliminary results show that among study participants, 39.2% (SE 0.4%) were hospitalized (Range: 1 to 32 admissions) and 17.5% (SE 0.3%) were hospitalized and readmitted within 30 days of discharge at least once. Among those who were alive in three years since the NHIS interview, 34.0% (SE 0.4%) were hospitalized and 13.3% (SE 0.2%) were hospitalized and readmitted at least once. Among those who had died by three years after the NHIS interview, 72.7% (SE 0.8%) were hospitalized and 44.4% (SE 0.9%) were hospitalized and readmitted at least once.

**PATIENT AND PROVIDER PERSPECTIVES OF THE UNIQUE TRANSITIONAL CARE NEEDS OF REHOSPITALIZED VETERANS**

C. Stephens<sup>1,2</sup>, N. Sackett<sup>2</sup>, D.W. Schopfer<sup>1</sup>, G. Schmajak<sup>1,2</sup>, N. Moy<sup>1</sup>, R. Pierce<sup>1,2</sup>, M.I. Wallhagen<sup>2</sup>, S. Lee<sup>1,2</sup>, 1. *San Francisco VA Medical Center, San Francisco, California*, 2. *University of California, San Francisco, San Francisco, California*

Background: Readmissions to the hospital are common and costly, often resulting from poor care coordination. Despite the increased attention given to improving the quality and safety of care transitions, little is known about patient and provider perspectives of the unique transitional care needs of rehospitalized Veterans. Methods: Using hospital administrative/census data, a purposive sample of 25 medical/surgical patients were identified who had been readmitted to an urban VA medical center in the prior 90 days. Semi-structured interviews were conducted with patients and their care providers (inpatient/outpatient doctors, nurses, social workers, physical and occupational therapists) regarding their thoughts about the major challenges and etiologies related to readmission and post-discharge needs. Thorough field notes were compiled and analyzed for basic themes. Results: Core patient themes identified were: (1) Knowledge gaps and deferred power; (2) Difficulties navigating the health care system; and (3) Complex psychiatric and social needs. Core interdisciplinary provider themes were: (1) Substance abuse and mental illness; (2) Lack of Social or Financial Support/Homelessness; (3) Natural History of Medical Illness; and (4) Non-adherence with follow-up. Conclusions/Implications: Veterans at high risk for readmission have a complex profile of physical/mental/social needs and perceived transitional care challenges. Patient sense of deferred power may be attributed to the sociocultural context and hierarchical nature of serving in the military and receiving care in a VA hospital. Understanding the unique perspectives of Veteran's and their

providers will be critical to implementing effective evidence-based transitional care interventions to decrease hospital readmissions in VA settings.

## **MEDICARE: UNDERSTANDING THE CHOICES AND TRADEOFFS IN BENEFITS**

C. Matheis<sup>2</sup>, H. Moody<sup>1</sup>, *1. AARP, Washington, District of Columbia, 2. AARP, Washington, District of Columbia*

In partnership with the Center for Health Care Decisions AARP worked to develop an interactive simulation, which allows participants to choose benefits to be included in a hypothetical Medicare program within a budget. The exercise, known as CHAT<sup>®</sup> (Choosing Healthplans All Together), helps participants understand the relationship between the cost of healthcare and various elements of coverage. A computer-based small-group process, the Medicare CHAT exercise asks individuals and groups to make decisions about the components of a Medicare benefit package when there are more coverage options than available resources. The process also incorporates examples of patient-specific medical events, so participants get a realistic picture of the impact of their coverage decisions when a health care problem arises. These medical events illustrate for participants the specific types of medical problems that can surface and their cost consequences. The trade-offs that participants address commonly fall into five categories: the extent of individual cost sharing; the degree of provider choice; categories of coverage; the extent of coverage; and criteria for coverage, such as pre-authorizations or standards of effectiveness. Because each has an actuarial value, participants make cost-relevant choices. Since its development AARP has been testing and engaging small groups in this exercise. The purpose of this session will be to simulate portions of the CHAT exercise, share the experiences and learning from previous sessions and then discuss current proposals to change the Medicare benefit package and the challenges facing Medicare going forward from a beneficiary perspective.

## **SESSION 2600 (PAPER)**

### **ISSUES AFFECTING MORTALITY AND END OF LIFE DECISIONS, AND PROCESSES**

#### **ACHIEVING CONSENSUS ON PALLIATIVE CARE IN DEMENTIA AMONG AN INTERNATIONAL PANEL OF EXPERTS**

J.T. van der Steen<sup>1,2</sup>, M. de Boer<sup>1,2</sup>, C.M. Hertogh<sup>1,2</sup>, L. Volicer<sup>3,4</sup>, S. Juenger<sup>5</sup>, L. Radbruch<sup>5,6</sup>, O. the EAPC<sup>7</sup>, *1. VU University Medical Center, EMGO Institute for Health and Care Research, Amsterdam, Netherlands, 2. VU University Medical Center, Department of Nursing Home Medicine, Amsterdam, Netherlands, 3. Charles University 3rd Medical Faculty, Prague, Czech Republic, 4. School of Aging Studies, University of South Florida, Tampa, Florida, 5. Department of Palliative Medicine, University Hospital Bonn, Bonn, Germany, 6. Palliative Care Centre, Malteser Hospital Bonn/Rhein-Sieg, Bonn/Rhein-Sieg, Germany, 7. European Association for Palliative Care, Milano, Italy*

Palliative care in dementia is an ill-defined concept, and evidence of its effectiveness, as well as guidance on how to apply principles of palliative care in dementia is sparse. Therefore, achieving a broad consensus among experts and clinicians is important. We aimed at developing an agreed-upon set of recommendations about palliative care and treatment of older people with Alzheimer's disease and other progressive dementias based on evidence from research where available, and on consensus on best practices where not. In the first, qualitative phase of a Delphi study (2011), a team of twelve people with relevant expertise in medicine, nursing, social work and counselling, ethics, patient participation, epidemiology, and research methodology drafted a set of 57 recommendations covering eleven domains. The domains covered

a broad range of issues such as "applicability of palliative care," "societal and ethical issues," and "adequate treatment of symptoms and providing comfort." It also included appropriate goals of care across stages of dementia. Second, in spring 2012, over 80 experts from about 25 countries are being invited to complete an online survey to rate agreement with each of the recommendations on a five-point Likert scale, and importance of each of the domains on an 11-point numerical scale. Consensus is evaluated according to pre-defined criteria for (dis)agreement and importance. A set of recommendations on palliative care in dementia will be proposed based on the experts' consensus. Areas of disagreement will be highlighted and discussed.

#### **LIVE DISCHARGE FROM HOSPICE: A NATIONAL STUDY**

T.J. Christian, P.L. Gozalo, J.M. Teno, *Center for Gerontology and Health Care Research, Brown University, Providence, Rhode Island*

**Purpose:** Increasing numbers of hospice providers exceed their annual cap on allowable Medicare reimbursements. Live disenrollment rates are higher among hospices exceeding the limit, raising suspicions that ineligible patients are admitted and later discharged. The objective of this study is to determine whether the live discharge rate is influenced by the current total of Medicare funds which a hospice has received. **Sample:** First-time Medicare hospice beneficiaries ages 65+ discharged from hospice alive or through death during hospice fiscal years 2007-2008 (10% Medicare claims extract). **Methods:** Using within-hospice provider conditional logistical regression, at each month in the fiscal year we calculate the ratio of Medicare reimbursements received relative to the provider's reimbursement cap which we test as a risk factor for live discharge. Results are case-mix adjusted for age, gender, race, length of stay, service setting, primary diagnosis, and fiscal year and month of discharge. **Results:** Among 81,628 enrollments, 66,412 (81.4%; median LOS 11 days) ended with death and 15,216 (18.6%; median LOS 40 days) ended with live discharge. The providers in the top quintile of live discharges accounted for 56.2% of all live discharges. The risk of live discharge is 15% greater [95% CI 1.1-1.2] once a hospice collects 20% of allowable Medicare reimbursements and 39% greater [95% CI 1.2-1.6] once a hospice collects 75% of allowable Medicare. **Conclusion:** The results indicate that hospices discharge more patients alive as they near their cap limit. Hospice payment policy should be reformed to ameliorate this phenomenon which disrupts continuity of care.

#### **REFERRAL TO DEATH INTERVAL AND LOCATION OF DEATH OF PATIENTS REFERRED TO PALLIATIVE CARE IN AN ASIAN ONCOLOGY CENTRE**

Y. Do<sup>1</sup>, J. Poulouse<sup>1</sup>, P. Neo<sup>2</sup>, *1. Duke-NUS Graduate Medical School Singapore, Singapore, Singapore, 2. National Cancer Centre Singapore, Singapore, Singapore*

**Context:** Location of death and preferences for location of death of terminally ill patients can be influenced by a variety of factors. **Objectives:** To study the factors predicting location of death of patients referred to palliative care in Singapore. **Methods:** Retrospective analysis of data on patients referred to a hospital-based palliative care service during a one year period. Multinomial regression method was used for statistical analysis after stratifying the patients by gender. **Results:** Longer referral-to-death interval was associated with a higher likelihood of dying at home or in an in-patient hospice compared with hospital, for both males and females. For male patients, age at death being  $\geq 65$  years (OR 2.41, 95% CI 1.42-4.09), and being married (OR 2.01, 95% CI 1.07-3.76) were associated with a higher likelihood of dying at home, whereas for females, the corresponding associations were statistically insignificant. Malay men (OR 3.74, 95% CI 1.5-9.4) were more likely to die at home compared to Chinese men. A diagnosis of stomach cancer was independently associated with a higher likelihood of dying at home. **Conclusions:** Longer referral-to-death interval was associated with death outside the hospital setting, for both genders. For male

patients, socio-demographic factors were also found to have some influence on location of death, whereas for females; these factors did not show any statistically significant associations.

### **CAN WE DO BETTER THAN SELF-RATED HEALTH? IMPROVING MORTALITY PREDICTION WITH EXTERNAL HEALTH RATINGS**

M. Todd, N. Goldman, *Office of Population Research, Princeton University, Princeton, New Jersey*

A large literature on self-rated health (a single question that asks respondents to evaluate their overall health into one of four or five categories) has found a robust link between self-rated health (SRH) and subsequent mortality. The reasons for this link, however, remain poorly understood. Prior research compared the health ratings of survey respondents to those of interviewers and physicians, who were each asked to evaluate the respondents' health status with a question similar to SRH, and found that these three evaluators place different weights on particular health factors in their evaluations. This suggests that health assessments made by interviewers and physicians may contribute valuable additional information regarding a respondent's health, beyond what is incorporated in SRH. The contribution of this study is in determining whether this additional information from external health evaluators improves mortality prediction. Using data from the 2006 round of the Social Environment and Biomarkers of Aging Study (SEBAS) along with mortality data for the period from 2006 to 2011, we evaluate the predictive power of self, interviewer, and physician health assessments for subsequent mortality among approximately 1200 Taiwanese adults aged 53 and older. We find that interviewer health ratings outperform both physician and self-ratings in predicting mortality. The relationship between interviewer ratings and subsequent mortality is attenuated but remains large in magnitude and statistically significant after inclusion of a wide range of demographic and health covariates.

### **DESIGNATED DECISION-MAKERS AND HOSPICE ENROLLMENT OF NURSING HOME DECEDENTS: A TIME-SERIES ANALYSIS**

S.E. Rich<sup>1,2,3</sup>, S.C. Miller<sup>3</sup>, *1. Grand Rapids Medical Education Partners, Grand Rapids, Michigan, 2. Michigan State University College of Human Medicine, Grand Rapids, Michigan, 3. Alpert Medical School, Brown University, Providence, Rhode Island*

Background: Nursing home residents have increasingly enrolled in hospice care over the past 10 years, but the decision to enroll in hospice is often made by a surrogate decision-maker. Little is known about how decisions for end-of-life care differ by type of decision-maker. We examine the association between type of decision-maker and enrollment in hospice among Medicare nursing home decedents during 1999-2006, and how this association changed over time. Methods: Medicare claims and Minimum Data Set data are concatenated for all Medicare nursing home decedents in the 50 US states and DC during 1999-2006 (N=3,733,439). Multilevel logistic regression is used to examine the association between type of decision-maker indicated on the MDS closest to death and hospice enrollment in the nursing home by Medicare claims. Results: Use of durable powers of attorney for health care (DPA) increased from 27.0% to 31.9% in 1999-2006. Although hospice enrollment in nursing homes increased for decedents with every type of decision-makers, the prevalence of enrollment was significantly greater for those with DPA (OR 1.19, 95% CI (1.15-1.22)) or with guardians (1.08, (1.05-1.11)), compared to those with informal family decision-makers only. The rate of increasing hospice use was greatest for decedents with DPA (1.04 (1.02-1.05)). Conclusion: Formal surrogate decision-makers may be serving effectively as advocates to enroll nursing home residents in hospice at the end of life; alternatively, residents who have completed DPA may be more active in end-of-life care planning. Residents' end-of-life care may improve with the formalization of surrogate decision-maker status.

## **SESSION 2605 (PAPER)**

### **MOBILITY AND DISABILITY ISSUES: STRATEGIES FOR MOVING FORWARD**

#### **ARE WE MISSING THE OPPORTUNITY TO TREAT MODIFIABLE DISABILITY IN OLDER ADULTS SEEN IN PRIMARY CARE CLINICS?**

C.A. Ciro<sup>1</sup>, J.W. Mold<sup>2</sup>, *1. Rehabilitation Sciences, OUHSC, Oklahoma City, Oklahoma, 2. OUHSC: Family Medicine, Oklahoma City, Oklahoma*

Purpose: The goal of this study was to understand which activities older adults being seen in a primary care practice report as most meaningful to their happiness and to examine patterns of disability in their daily activities. Methods: Descriptive, cross-sectional survey of 143 consecutive adults  $\geq 65$  years seen in a primary care practice at an academic medical center. Participants were asked to report their most meaningful activities, personal/ environmental barriers to those activities, and medical diagnoses. Binary proportions with 95% confidence intervals (CI) were used to describe aggregate patterns of desired variables; chi-square analysis was used to examine differences in categorical variables. Results: Activities with the highest proportions of personal meaningfulness were: self-care (25%; 95% CI: 20.7-28.8), socialization (15%; 95% CI: 12.3-19.1), and movement (13%; 95% CI: 10-16.3). Seventy-one percent (71%; 95% CI: 66.3-81.2) reported disability in their meaningful activities. Of the individuals who reported disability, a significant percent (52.9%; 95% CI: 44-61.6) expressed that improvement in movement activities such as walking, would make the most difference in their happiness ( $p < .0001$ ). Factors that contribute most to disability are joint stiffness (42%; 95% CI: 33.8-50.1), fatigue (38.5%; 95% CI: 30.4-46.5) and weak legs (37%; 95% CI: 29.1-45.1). Ninety-one percent (91%) of the participants identified having at least one diagnosis that is Medicare-approved for rehabilitation services. Discussion: The prevalence of disability in meaningful activities is high and may be caused by modifiable impairments. While most are Medicare recipients, they are unlikely to qualify for rehabilitation without history of an acute medical event.

#### **PAIN CONTRIBUTES TO ONSET/WORSENING OF MOBILITY DIFFICULTY AND PERFORMANCE DECLINE IN OLDER ADULTS**

L. Eggermont<sup>1</sup>, L. Shi<sup>7</sup>, D.K. Kiely<sup>2</sup>, J.F. Bean<sup>6</sup>, J. Guralnik<sup>5</sup>, R.H. Shmerling<sup>4</sup>, R. Jones<sup>2,3</sup>, S.G. Leveille<sup>7</sup>, *1. VU University, Department of Neuropsychology, Amsterdam, Netherlands, 2. Institute for Aging Research, Hebrew SeniorLife, Department of Medicine, Harvard Medical School, Boston, Massachusetts, 3. Division of Medicine, Beth Israel Deaconess Medical Center, Harvard Medical School, Boston, Massachusetts, 4. Division of Rheumatology, Beth Israel Deaconess Medical Center, Harvard Medical School, Boston, Massachusetts, 5. Laboratory of Epidemiology, Demography and Biometry, National Institute on Aging, Bethesda, Maryland, 6. Department of Physical Medicine and Rehabilitation, Spaulding Rehabilitation Hospital, Harvard Medical School, Boston, Massachusetts, 7. College of Nursing and Health Sciences, University of Massachusetts Boston, Boston, Massachusetts*

BACKGROUND Chronic pain is associated with mobility limitations in older adults but few prospective studies have examined the impact of chronic pain on mobility. METHODS Participants were 765 older adults from the population-based MOBILIZE Boston Study. Chronic pain was classified according to location, severity, and pain interference. Mobility difficulty was assessed by self-report and by the Short Physical Performance Battery (SPPB). The relationship between baseline pain and onset or worsening of mobility difficulty or clinically meaningful decline in SPPB performance (1-point decrease), was

determined by relative risk (RRs) using multivariable Poisson regression models with robust error variances. **RESULTS** The onset of new/worsening mobility difficulty at 18-months according to number of joint pain sites was 11% (no sites), 21% (1 site), 27% (multisite) and 37% (widespread pain,  $p$ -value $<0.001$ ). Similarly, SPPB decline at 18-months was 32% (no sites), 46% (1 site), 36% (multisite), and 49% (widespread pain,  $p$ -value $<0.05$ ). In a multivariate model predicting new/worsening self-reported mobility difficulty, the RR=2.09 (95%CI, 1.28-3.42) for multisite pain and the RR=2.41 (95%CI, 1.40-4.13) for widespread pain versus no pain. For SPPB decline, the RR=1.21 (95%CI, 0.90-1.62) for multisite pain and RR=1.53 (95%CI, 1.14-2.07) for widespread pain versus no pain. Similar associations were found for other pain measures predicting declining mobility. **CONCLUSIONS** Chronic pain measured according to distribution, severity and interference is strongly associated with increased risk for developing new or worsening mobility difficulty and for clinically meaningful declines in mobility performance in older adults. Further research is needed to determine whether effective pain management strategies can prevent or limit mobility deterioration among older adults.

#### **AEROBIC TRAINING IN OLDER ADULTS WITH VASODEPRESSIVE CAROTID SINUS HYPERSENSITIVITY**

K. Madden, C. Lockhart, T. Potter, G.S. Meneilly, *University of British Columbia, Vancouver, British Columbia, Canada*

**BACKGROUND:** Vasodepressive carotid sinus hypersensitivity (V-CSH) is a common but incurable etiology for fainting in older adults, and this condition is diagnosed by carotid sinus massage (CSM). Aerobic exercise has been shown to be effective in other neuroautonomic etiologies of syncope (such as orthostatic hypotension) but the effectiveness of aerobic training in V-CSH remains unexamined. **OBJECTIVE:** We examined whether aerobic training could attenuate the vasodepressive response to carotid sinus massage (CSM) in older adults with V-CSH. **METHODS:** 45 older adults (mean age  $72.2 \pm 0.7$ ) with V-CSH were recruited. Subjects were randomized to each of 2 groups: an aerobic group (AT,  $n=20$ , 3 months vigorous aerobic exercise), and a non-aerobic (NA,  $n=25$ , no aerobic exercise) group. Exercise sessions were supervised by a certified exercise trainer 3 times per week, and utilized a combination of cycle ergometers and treadmills. The vasodepressive response (defined as the decrease in SBP during CSM) was measured before and after the training intervention using a Finometer (Finapres Medical Systems, Amsterdam, The Netherlands). **RESULTS:** After the 3-month intervention, all subjects continued to meet the criteria for V-CSM in both the AT and NA groups. There was no difference in the attenuation of the vasodepressive response with training between the AT and NA groups ( $-5.7 \pm 4.0$  versus  $-8.1 \pm 4.0$  mm Hg,  $p = 0.138$ , 2-way Analysis of Variance). **CONCLUSIONS:** Aerobic training has no effect on the SBP response to CSM in older adults with V-CSH. Unlike in other neuroautonomic etiologies for fainting, aerobic exercise is not effective as a treatment for V-CSH.

#### **ACCESSIBILITY AND PROXIMITY OF OUTDOOR RECREATIONAL FACILITIES AND PROGRESSION OF WALKING DIFFICULTIES**

J. Eronen, M. von Bonsdorff, M. Rantakokko, T. Rantanen, *Gerontology Research Center and Department of Health Sciences, University of Jyväskylä, Jyväskylä, Finland*

**Background:** Older people who report environmental barriers in their neighborhood have a higher risk for walking difficulties. However, the role of environmental factors that protect against walking difficulties is not well known. The aim of this study is to examine the relationship between the accessibility and proximity of outdoor recreational facilities and progression of walking difficulties in community-dwelling older people. **Methods:** The target population consisted of 75-81-year-old community-dwelling people. The inclusion criteria for this study were the ability to walk 0.5 km without difficulties, only moderately physi-

cally active or sedentary, no memory impairment, no medical contraindications and informed consent to participate. The final study group included 265 persons who were followed up for 3.5 years. Walking difficulties in 0.5 km at baseline and every six months during the follow-up were self-reported. The accessibility and proximity of outdoor recreational facilities were self-reported (outdoor recreational facilities and parks within a walking distance, suitability of the surrounding environment for physical activity and easy access to outdoors from participants' homes) and summed, range 0-5. **Results:** Of the participants, 46% developed walking difficulties during the follow-up. Accessibility and proximity of outdoor recreational facilities decreased the risk for progression of walking difficulties, hazard ratio per item 0.82, (95% confidence interval 0.70-0.97). **Conclusions:** Accessibility and proximity of outdoor recreational facilities protected against progression of walking difficulties. The results indicate that the mobility of older community-dwelling people may be promoted with outdoor recreational facilities that are easy to access and located within a walking distance from home.

#### **WHICH REHABILITATIVE IMPAIRMENTS ARE ASSOCIATED WITH FUNCTIONAL STATUS AMONG OLDER PRIMARY CARE PATIENTS? RESULTS FROM THE BOSTON REHABILITATIVE IMPAIRMENT STUDY OF THE ELDERLY (BOSTON RISE)**

J.F. Bean<sup>1,2</sup>, N. Latham<sup>3</sup>, P. Ni<sup>3</sup>, N.E. Holt<sup>1</sup>, S. Percac-Lima<sup>4</sup>, S.G. Leveille<sup>5</sup>, A. Jette<sup>3</sup>, *1. Spaulding Rehabilitation Hospital, Boston, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts, 3. Boston University, Boston, Massachusetts, 4. Massachusetts General Hospital, Boston, Massachusetts, 5. University of Massachusetts Boston, Boston, Massachusetts*

Rehabilitative care treats impairments that are amenable to care and underlie functional limitations. We have defined these as Rehabilitative Impairments (RI). In order to design parsimonious and effective rehabilitative treatment programs for functionally limited older adults, it is important to know which RI are most associated with functional status. However, there is controversy about which RI have the strongest functional association. The Boston Rehabilitative Impairment Study of the Elderly (Boston RISE) is a longitudinal cohort study among 430 primary care patients  $\geq 65$  years. We evaluated baseline data and sought to identify which of 10 RI were most associated with self reported functional status as measured by the Late Life Function and Disability Instrument (LLFDI-F) and observed physical performance as measured by the Short Physical Performance Battery (SPPB). Participants were 68% female, had mean age  $75.6 \pm 7$  years, mean LLFDI-F  $55.5 \pm 7.9$  and mean SPPB  $8.6 \pm 2.3$ . After eliminating variables to reduce collinearity, we constructed separate multivariable models predicting LLFDI-F and SPPB adjusting for age, gender, BMI and other impairments commonly encountered in primary care. Within the final model evaluating LLFDI-F, RI in leg strength, leg power and trunk muscle endurance were significant predictors ( $P < .001$ ). These RI were also significant within separate models evaluating LLFDI-F sub-scales that assess lower extremity function. These same 3 RI and limb speed were significant predictors of SPPB performance. Our findings highlight that RI in leg strength, leg power, trunk muscle endurance and limb speed are relevant to the functional status of older primary care patients.

#### **SESSION 2610 (SYMPOSIUM)**

##### **CAREGIVING STRESS AMONG CHINESE CAREGIVERS ACROSS CULTURES**

Chair: *T.Y. Lum, Social Work and Social Adm, The University of Hong Kong, Pokfulam, Hong Kong, Sau Po Centre on Ageing, Pokfulam, Hong Kong*

Frailelders in Chinese families depend mainly on their children for support and care. However, industrialization and urbanization have

weakened the traditional family care system. The four papers in this symposium will discuss how these changes affected the caregiving stress and burden among Chinese families across culture. In rural Mainland China, due to outward migration of women to coastal cities for manufacturing jobs, fewer women are available for caregiving. Guo, Chi and Silverstein reported a rise in sons' eldercare but a decrease in daughters' eldercare in rural China between 2001 and 2009. Such change in a gender pattern was mainly due to the availability of sons to live in the same village as their parents. Industrialization and urbanization also reshaped Chinese people's attitude toward filial responsibility. Funk and Chappell found that among Chinese caregivers in Hong Kong and Canada, a higher congruence between filial responsibility and behavior was associated with higher perceived caregiver burden. Also, in Chinese families, eldest sons are expected to bear the greatest filial responsibility toward their aging parents. Liu, Guo and Bern-Klug found that being an "oldest son" was associated with higher odds of reporting economic stress due to caregiving. In urban China, Lou and Kwan found that a higher intensity of caregiver was associated with higher number of depressive symptoms among caregiver. They also found that female, younger and non-married caregivers reported more depressive symptoms than their male, older and married counterparts.

#### **TRAJECTORY AND DETERMINANTS OF ELDERCARE IN RURAL CHINA OVER AN EIGHT-YEAR PERIOD: A TWO-LEVEL GROWTH APPROACH**

M. Guo<sup>1</sup>, I. Chi<sup>2</sup>, M. Silverstein<sup>3</sup>, 1. *School of Social Work, University of Iowa, Iowa City, Iowa*, 2. *University of Southern California, School of Social Work, Los Angeles, California*, 3. *University of Southern California, Davis School of Gerontology, Los Angeles, California*

This study examined the trajectory and determinants of the care provided by adult children to their parents aged 60 and older (N = 1,355) in rural Anhui province, China between 2001 and 2009. Two-level growth models were carried out to predict the trajectories of monthly care provided by each child to the parents over the eight years. The findings revealed an increase in sons' care but a decrease in daughters' care over time. Married sons provided less support than did unmarried sons. Having young children led to a decrease in the care provided by daughters. The eldercare was need-driven, as the functional impairment of parents attracted more care from both sons and daughters over time. Given that pension systems have not yet been extended to the countryside, the findings of this research is essential to help ensure the formulation of eldercare policies that meet the needs of all family types.

#### **FILIAL RESPONSIBILITY: DOES CONGRUENCE BETWEEN ATTITUDES AND BEHAVIOUR AFFECT CAREGIVER BURDEN?**

L. Funk<sup>1,2</sup>, N.L. Chappell<sup>2</sup>, 1. *University of Manitoba, Winnipeg, Manitoba, Canada*, 2. *University of Victoria, Victoria, British Columbia, Canada*

Research has shown that filial responsibility attitudes are not strongly associated with caregiving behaviours; whether they are at all is culturally specific. However, we do not know whether and how congruence between internalized normative beliefs about filial responsibility and caregiving behaviours is related to burden. The purpose of this study was to examine this question among filial caregivers from three cultural groups: Caucasian Canadian, Chinese Canadian, and Hong Kong Chinese (n=315). Data were collected in Hong Kong and Canada through in-person interviews. Dependent variables were dimensions of the Multidimensional Caregiver Burden Inventory. Multiple measures of congruence between attitudes and care behaviours were constructed. Controlling for other factors and examining findings between cultural groups, it appeared that in comparison to incongruence, congruent low scores were associated with lower reported burden, yet congruent high scores were associated with increased burden. Implications for the study and measurement of cognitive dissonance will be discussed.

#### **ECONOMIC STRESS AMONG YOUNG-OLD CHILDREN CARING FOR THE OLDEST-OLD IN CHINA: THE IMPORTANCE OF CONTEXTUAL FACTORS**

J. Liu, M. Guo, M. Bern-Klug, *School of Social Work, University of Iowa, Iowa City, Iowa*

The rapid increase in the oldest-old population in China exerts significant influences on both informal and formal caregiving systems. Guided by the stress process theory, this study used cross-sectional survey data collected from 721 pairs of Chinese young-old adult child caregivers aged 50 and older and their oldest old parents aged 80 and older to examine whether contextual factors of caregiving such as the health status, socioeconomic status, and other significant roles of the young-old children and parent-child relationships affect adult children's likelihood of experiencing economic stress in caring for the oldest-old parents. Logistic regression results indicate that young old who were oldest sons, who had lower income and poorer health status, were more likely to experience stress. The findings point to the need for culturally congruent social services and social policies designed to enhance the family's ability to care for elder members in China.

#### **FACTORS AFFECTING SHANGHAI FAMILY CAREGIVERS' DEPRESSIVE SYMPTOMS**

V. Lou<sup>1,2</sup>, C. Kwan<sup>3</sup>, 1. *Sau Po Centre on Ageing, The University of Hong Kong, Hong Kong, Hong Kong*, 2. *Department of Social Work & Social Administration, The University of Hong Kong, Hong Kong, Hong Kong*, 3. *Department of Statistics and Actuarial Science, The University of Hong Kong, Hong Kong, Hong Kong*

Objective: The study examines factors affecting depressive symptoms among Chinese family caregivers in Shanghai. Method: Sample of the study was recruited from 10 residential committees by multiple-stage sampling. The inclusion criteria were older adults aged 75 or above, with at least 2 Activity of Daily Living (ADL) impairment, and having at least one primary family caregiver. Standardized questionnaire was administered by trained interviewers via face-to-face interview. A total of 720 dyads (frail older adults and their family caregivers) were successfully interviewed, with mean age of 83.08 among frail older adults and 63.12 among family caregivers. Findings: Depressive symptoms of family caregivers were found to be greater when caregivers were female, younger, and not-married. Moreover, for those family caregivers who take care of frail elders with same care needs, the higher intensity of care was associated with greater risk of depressive symptoms. Acknowledgement: This study was supported by Research Grants Council of Hong Kong (Ref. 448009H)

#### **SESSION 2615 (SYMPOSIUM)**

#### **DESIGN, IMPACT AND LESSONS LEARNED FROM AN INNOVATIVE APPROACH TO NH PAY FOR PERFORMANCE**

Chair: *G. Arling, IU Center for Aging Research, Indiana University School of Medicine, Indianapolis, Indiana*

This symposium presents findings from our Agency for Healthcare Research and Quality (AHRQ)-sponsored Research and Demonstration study of Minnesota's Performance-Based Incentive Payment Program (PIPP), an innovative state-level model for funding grassroots, provider-initiated, evidence-based quality improvement projects. The symposium illustrates how program evaluation, improvement, and dissemination can happen in tandem. The symposium co-authors are a multidisciplinary team from nursing, medicine, and the social sciences, representing universities and the Minnesota Department of Human Services. The academic researchers and state agency staff have formed a strong partnership. They participate in overlapping workgroups (i.e.,

case study, dissemination, and quantitative analysis) that facilitate a continuous flow and cross-fertilization of ideas. Study findings about PIPP program processes and impact are shared among the research team, considered from multiple vantage points, and applied simultaneously to evaluation and dissemination. The research team is cognizant of the need for objectivity and balance. Program weaknesses as well as strengths need to be identified. Also, individuals from PIPP-funded projects and facilities need to be assured that information they provide during the study, particularly opinions about the program or sensitive information about their projects, will be kept in confidence and not shared with state staff on the research team. We describe (a) the design and implementation of the PIPP program as well as practical aspects of program administration; (b) the rich array of statewide quality measures that PIPP projects can use to track their performance; (c) impact of the program on quality of nursing home care, and (d) dissemination of PIPP findings.

### PIPP PROGRAM DESIGN AND IMPLEMENTATION

V. Cooke<sup>1</sup>, T. Lewis<sup>1,2</sup>, 1. MN Department of Human Services, Minneapolis, Indiana, 2. University of Minnesota School of Public Health, Minneapolis, Minnesota

The PIPP program represents a substantial investment by the state of Minnesota with funding of \$18 million annually that has supported 89 individual or collaborative projects involving 199 facilities. Unlike conventional pay-for-performance programs, nursing home providers design their own projects and work with the state in selecting outcome targets that are tailored to the intervention and will determine their incentive payments. Performance targets are tied to Minnesota Nursing Home Report Card measures such as the Minimum Data Set clinical quality indicators, resident quality of life and family satisfaction surveys, nursing staffing level and retention. Providers risk losing 20% of their incentive payment if they fail to meet performance targets. Providers are expected to sustain their improved outcomes beyond the project period through enhanced revenues or greater organizational effectiveness. We describe the program design, administrative issues, and its benefits of improved provider relationships and an industry-wide emphasis on quality improvement.

### ISSUES IN MEASURING CARE QUALITY

T. Lewis<sup>1,2</sup>, G. Arling<sup>3,4</sup>, K. Abrahamson<sup>5</sup>, V. Cooke<sup>2</sup>, 1. University of Minnesota School of Public Health, Minneapolis, Minnesota, 2. Minnesota Department of Human Services, Minneapolis, Minnesota, 3. Indiana University Center for Aging Research, Indianapolis, Indiana, 4. Regenstrief Institute, Indianapolis, Indiana, 5. Western Kentucky University, Bowling Green, Kentucky

Performance measurement is fundamental to quality improvement yet poses challenges. PIPP projects use unique measures from the Minnesota Nursing Home Report Card ([www.health.state.mn.us/nhreportcard](http://www.health.state.mn.us/nhreportcard)). These include 24 quarterly risk-adjusted clinical quality indicators; 14,000 annual resident quality of life and satisfaction interviews; annual state inspections and complaints; wage- and acuity-adjusted direct-care staffing, direct-care staff retention and temporary staffing; proportion of single-bed rooms; and measures in development including 17,000 annual family satisfaction surveys and appropriate community discharge and hospitalization rates. We highlight the diversity of outcomes across the wide variety of PIPP projects. These standardized measures are valid and reliable; available statewide, allowing peer comparison; include trends of two to eight years; and emphasize outcomes over processes. However, they also have limitations: some are general or insensitive to change (e.g. incontinence, pain); some are only available annually; and the move to a new MDS assessment has revision of indicators and risk adjusters.

### PIPP IMPACT ON CARE QUALITY

G. Arling<sup>1,2</sup>, T. Lewis<sup>3,4</sup>, K. Abrahamson<sup>5</sup>, A. Perkins<sup>1</sup>, M. Woodhouse<sup>3</sup>, 1. Indiana University Center for Aging Research, Indianapolis, Indiana, 2. Regenstrief Institute, Indianapolis, Indiana, 3. University of Minnesota School of Public Health, Minneapolis, Minnesota, 4. Minnesota Department of Human Services, Minneapolis, Minnesota, 5. Western Kentucky University, Bowling Green, Kentucky

We are assessing the impact of the PIPP program with an interrupted time series design that focuses on trends in quality measures (described above) for Minnesota's 380 nursing facilities between baseline (2005 - 2007) and PIPP implementation periods (2008-2010). Within the framework of a mixed-effect growth model, we examine trends in facility performance as a function of time (calendar quarter), PIPP project participation (time-varying indicator variable), interactions between time and PIPP participation, and facility characteristics. Baseline trends in nearly all of the facility performance measures were similar for PIPP and non-PIPP facilities. PIPP facilities showed significantly greater improvement in composite quality indicator and other performance measures after PIPP program implementation. Significant improvement occurred across different PIPP project types and performance areas. Certain projects stood out as having exceptional performance gains, whereas other projects showed only minimal improvement. Qualitative case studies are inquiring more deeply into keys to project success.

### DISSEMINATING PROJECT SUCCESSES AND RESEARCH FINDINGS

V. Cooke<sup>1</sup>, J. Gardard<sup>1</sup>, T. Lewis<sup>2,1</sup>, M.E. Lee<sup>3,4</sup>, H. Davila<sup>5</sup>, C. Mueller<sup>5</sup>, 1. Minnesota Department of Human Services, Minneapolis, Minnesota, 2. University of Minnesota School of Public Health, Minneapolis, Minnesota, 3. Indiana University Center for Aging Research, Indianapolis, Indiana, 4. Regenstrief Institute, Indianapolis, Indiana, 5. University of Minnesota School of Nursing, Minneapolis, Minnesota

The Minnesota Department of Human Services, a full and active partner in the AHRQ Research and Dissemination study, has taken the lead in PIPP program dissemination. Various methods are being used to diffuse the adoption of exemplar projects that have been well designed and highly successful in meeting their goals, e.g., falls prevention, creative therapies, culture change, and care transitions; and to promote new quality improvement methodologies such as root cause analysis that can be applied widely across facility settings. Dissemination occurs through multiple channels: annual PIPP Conference, social networking website, quarterly newsletter, PIPP tool kit, conference presentations, news stories and journal articles. In order to expand facility participation, the PIPP program sponsors information sessions, such as writers' workshops where facilities learn to prepare PIPP proposals. The program also has introduced a mentoring option where new PIPP applicants can team up with experienced facilities in designing and carrying out projects.

### SESSION 2620 (SYMPOSIUM)

#### INTERSECTIONALITY: THEORIZING HEALTH INEQUALITIES BY RACE, GENDER, INCOME, AND AGE

Chair: V.L. Bengtson, Roybal Institute on Aging, University of Southern California, Los Angeles, California

Co-Chair: W. Vega, Roybal Institute on Aging, University of Southern California, Los Angeles, California

An important concept that has emerged in the social sciences recently is intersectionality, the combination of social characteristics such as race/ethnicity, gender, poverty, and age that can produce inequalities in health care, physical and mental illness, and quality of life. We propose the theory of cumulative disadvantage and advantage as perhaps the most useful explanatory framework for understanding intersectionality. This theory explains the amazing variability within America's elderly

population in health outcomes as the culmination of a lifetime of disadvantages compared to individuals who have not suffered discrimination due to their race or ethnicity, economic status, or gender. This symposium brings together research on intersectionality and the cumulative disadvantage/advantage theory conducted by a research team at the Roybal Institute on Aging of the University of Southern California's School of Social Work. A major focus of research at the Roybal Institute concerns Intersectionality and its health consequences for elderly populations. The papers in this symposium illustrate various aspects of theory-driven investigation using intersectionality as a focus. The first paper, by Vern Bengtson, discusses three current theories of aging in the context of intersectionality. William Vega's paper reviews research findings from the EPESE multi-wave data on aging and chronic disease burden using an intersectionality lens. The paper by Karen Lincoln looks at the "obesity-depression paradox" from an intersectionality perspective using data from a nationally-representative study of African Americans, Black Caribbeans and non-Hispanic whites. Donald Lloyd's paper focuses on the cumulative advantage/disadvantage theory using data on cumulative stress exposure from 1502 Florida residents aged 45-93. Maria Aranda describes how the concept of intersectionalities can be usefully applied in clinical research and intervention, based on a qualitative study of older Latinos in long-term care.

### **CUMULATIVE ADVANTAGE/DISADVANTAGE AT THE INTERSECTION OF INEQUALITIES**

D.A. Lloyd, *Roybal Institute on Aging, University of Southern California, Los Angeles, California*

Cumulative advantage/disadvantage (CAD) is seen in a life-course trajectory along a path upon which one's history leads to a future of similar circumstances. This theory predicts that a life-course within the context of multiple disadvantaged statuses will lead to sustained disadvantages, and conversely advantaged outcomes in the context of advantaged social statuses. Two versions of CAD are a) the succession of roles and statuses that varies qualitatively across individuals and b) the accrual of experiences, whose valence is predicted by early statuses. This paper deals with how life-course accruals may be characterized both in form and in quantity, empirically illustrated using lifetime stress exposure in a community-residing sample of 1502 Florida residents aged 45-93. Both measures of cumulative disadvantage independently contribute to psychological health. The analysis incorporates social status characteristics as predictors of these two dimensions of cumulative disadvantage. Integration of the concept of intersectionality with CAD will be discussed.

### **SOCIOECONOMIC POSITION, OBESITY AND DEPRESSION: IS THERE AN OBESITY-DEPRESSION PARADOX?**

K. Lincoln, *University of Southern California, Los Angeles, California*

Morbidity rates for a wide range of physical health and mental health problems increase across generations and over the life span. These differences are accentuated for rates of obesity: recent cohorts are reaching a higher prevalence of obesity earlier in the life course, and thus experiencing a greater cumulative exposure to excess weight over their lifetimes. Obesity is most prevalent among Black women and raises their depression odds. Still, Black Americans have lower rates of depression despite greater exposure to life stressors and higher rates of psychological distress. Theories of intersectionality and cumulative advantage/disadvantage highlight how race, nationality and gender mutually construct one another over the lifespan and provide a framework for understanding the physical health and mental health status of Black Americans. This presentation exam-

ines the "obesity-depression" paradox; the seemingly counterintuitive relationship between depression and obesity among Black Americans. Data from the National Survey of American Life (N=6,082), a nationally representative study of African Americans, Black Caribbeans and non-Hispanic Whites, are used across three studies using multinomial logistic regression, latent class analysis and geomapping. Results indicate that it is essential to consider 1) the role of psychosocial stress and health behaviors to advance understanding of depression and obesity, 2) heterogeneity within and between racial/ethnic groups to understand the "obesity-depression" paradox and for targeting interventions to at-risk groups. Finally, geo mapping is a useful approach in survey research to spatially locate individuals who are identified as "at-risk" and has important public health, clinical and policy relevance beyond prevalence rates.

### **AGING AND CHRONIC DISEASE BURDEN USING AN INTERSECTIONALITY LENS**

W.A. Vega, *Roybal Institute on Aging, University of Southern California, Los Angeles, California*

An important issue in aging research is extending life and preserving its quality despite living with chronic diseases. Although we have succeeded in reducing life years lost to disease, rapid declines in health and high rates of disability are realities for aging Mexican Americans. Intersectional theory will be used to examine how social categories affect quality of life over time among individuals living with chronic disease, as expressed in declines in functional status and increased depression. The EPESE multi-wave data are used to determine how race/ethnicity, sex, and socioeconomic position are associated with functional status and depression since onset of chronic disease, and how outcomes are potentially modified by social support, onset of co-occurring medical conditions, and residence in immigrant enclaves. Intersectionality is used to formulate hypotheses based on the research literature about social categories and health, specify a longitudinal analysis using community survey data, and interpret findings.

### **DEPRESSION CARE FOR OLDER LATINOS: ADDRESSING INTERSECTIONALITIES IN CLINICAL RESEARCH**

M.P. Aranda, *Univ Southern California, Los Angeles, California*

Despite consensus that psychiatric illnesses are treatable, only half of depressed older adults receive attention from their primary care provider for mental health complaints, and fewer than 10% access specialty mental health care in a year. The consequences of untreated or undertreated late-life depression include disability, increased health care utilization, suicide risk, and even death. Barriers to quality mental health care for older adults span individual and organizational factors, and are accentuated in racial and ethnic minority older adults. Improving access to mental health services for older Latinos, who suffer elevated rates of depression, means integrating mental health into medical care as well as adapting services to their sociocultural realities. The Programa Mano Amiga study is a federally-funded randomized behavioral depression care program intended to eliminate disparities in geriatric Latino mental health services. Based on an iterative process of intervention development, we provided a socioculturally adapted psychosocial treatment to 100 medically-ill older Latinos in a community-based setting. The study addresses barriers to quality depression care which emanate from lifelong cumulative disadvantage due to multiple intersecting statuses (age, gender, national origin, immigration history, disability status, SES, etc.). Taken together, our study is guided by a theoretical framework that addresses known barriers to depression care, and sociocultural adaptations of psychosocial treatment that address the intersectionalities of aging from a Latino perspective.

## SESSION 2625 (SYMPOSIUM)

### NAVIGATING ETHICAL CONSIDERATIONS FOR TECHNOLOGY-BASED SERVICES FOR OLDER ADULTS

Chair: *C. Berridge, University of California, Berkeley, Berkeley, California*

Discussant: *H. Moody, AARP, Washington, District of Columbia*

Navigating the ethics of technologies for older adults is difficult and crucial work for gerontologists. The wide range of technologies used to support older adults' ability to live independently complicates our understanding of their ethical implications and justifications. From remote monitoring to social networking, these devices and their associated services are diverse in meaning and use, invoking different sets of ethical questions. Gerontologists in the U.S. have had relatively few opportunities to engage these ethical considerations. Drawing from knowledge and methodologies in the fields of ethics, technology and society studies, philosophy, sociology and neurology, the participants in this symposium will address a range of overlapping ethical issues. We will move beyond the matter of privacy to consider older adults' actual perceptions as end users, as well as ways in which nonagenarian technogenarians negotiate technologies to care for themselves and connect with others. We will discuss the ethical value of technology that supports cognitive and relational capacities. This symposium also addresses the ethics research, politics, value base, and legal frameworks for technologies for the care of older adults in the United Kingdom where the world's largest randomized controlled trial of telecare and telehealth was recently conducted. Finally, we will present case studies of design processes for robots and monitoring systems to define the ethical implications of the user representations employed by designers and engineers.

### IN-HOME MONITORING TECHNOLOGIES: PERCEPTIONS OF OLDER ADULTS

*K. Wild, Neurology, OHSU, Portland, Oregon*

As research and development regarding in-home technologies designed for health monitoring and/or maintenance of independence move ever closer to real-world settings, we need to better understand how the primary beneficiaries view these technologies. The successful application of assistive and monitoring technologies depends on the receptivity of potential users, in this case older adults. While a digital divide still exists between younger and older technology users, the idea of older adults as technophobes no longer appears to hold true; older adults have clear preferences in terms of usability, control, privacy, and confidentiality. These preferences cannot be assumed to be invariant, as attitudes have been shown to differ both within groups and within individuals depending on changing circumstances and needs. This paper will review recent research in older adults' perceptions, attitudes, and priorities regarding in-home technology, and the relevance of ethical guidelines to continued research in this arena.

### CONCEPTIONS OF THE GOOD IN USING ASSISTIVE TECHNOLOGIES IN COMMUNITY CARE SERVICES FOR OLDER ADULTS

*M. Dunn, The Ethox Centre, University of Oxford, Oxford, United Kingdom*

In the UK, policy-makers claim that assistive technology (AT) can enhance the well-being of older adults and promote equity within care services. Micro-level ethical issues have been identified in the ways that AT devices have been rolled out in different care contexts. However, it is also important to interrogate the values that lie at the heart of the broader conceptions of goodness and fairness within contemporary policy and practice around AT. In my presentation I will examine whether the ethical values that are claimed to undergird a good community care system stand up to scrutiny, and argue that it is unclear whether technological interventions will act to promote these values in ways that

are ethically defensible. After attending this presentation, participants will be aware of international perspectives in AT policy and practice, and will have a grasp of the ethical considerations in making judgments about the value of these technologies.

### ETHICAL ISSUES IN TECHNOLOGY & HOME-BASED CARE: MAXIMIZING THE COGNITIVE AND RELATIONAL ABILITIES OF OLDER PERSONS

*J.A. Parks, Philosophy, Loyola, Chicago, Illinois*

My paper will address the ethics of technology use in home-based care, focusing in particular on the ways in which technological interventions may assist in the repair of impaired or diminished cognitive capacities. While there has been some ethical attention to the use of expensive medical technologies to assist physical caregiving in home-based care, less attention has been paid to the possible uses of technology to shore up individuals' cognitive and relational capacities. By addressing advances in telemedicine and other technologies that are adaptable for home use, I intend to consider how new technologies are allowing persons with various stages of dementia to maximize the cognitive abilities that remain, as well as their abilities to interact and relate to others. While the hyper-valuation of autonomy in long term care should not be accepted uncritically, I will argue that relational values and virtues are nevertheless important for all of us, and that technological interventions may help to extend our relational capacities in ways that are ethically praiseworthy.

### BENEATH THE SHINY SURFACE: ETHICAL DIMENSIONS OF THE DESIGN OF TECHNOLOGIES FOR OLDER ADULTS

*L. Neven, 1. Utrecht University, Utrecht, Netherlands, 2. Lancaster University, Lancaster, United Kingdom*

This paper will explore the ethical dimensions of the way designers of technologies for older adults conceive of older adults. Drawing on three case studies, this presentation will show how older persons are represented as ill, frail and dependent, as reluctant and resistant to (technological) change, and as technologically illiterate people. Such negative stereotypical representations matter as they form the basis for design decisions and are subsequently embedded in technologies. As a result such gerontechnologies may for instance restrict choice, force certain actions or be used to gather information that leads to changes in care. These effects are not recognised as problematic as these technologies are quickly seen as neutral parts of the elders' lives, but also because there is a strong moral rhetoric surrounding these gerontechnologies which states that such technologies are advantageous for all involved parties, and consequently that developing these technologies is "the right thing to do".

### TECHNOGENARIANS: ETHNOGRAPHIC INSIGHTS

*M. Loe, Colgate University, Hamilton, New York*

Meika Loe analyzes nonagenarians' use of everyday technological tools to care for themselves in old age and construct meaning. Despite what we may expect, nonagenarian women and men can be and are "technogenarians" in their active use of everyday technologies to create meaningful lives and comfortable spaces. Specifically, these elders use and negotiate old and new technologies in the context of gendered repertoires to achieve goals such as self-efficacy, health, well-being, and connectedness. Nonagenarians can teach us how household technologies can become aging technologies; instruments of continuity, control and health; or just the opposite. In sum, the "oldest old" take responsibility for their own health, care, and well-being through designing user-friendly spaces and adapting everyday technologies to fit their needs.

**LONG TERM CARE FINANCING AND ADMINISTRATIVE SYSTEMS****PAY-FOR-PERFORMANCE IN FIVE STATES: LESSONS FOR THE NURSING HOME SECTOR**

E.A. Miller<sup>1</sup>, J. Doherty<sup>2</sup>, *1. Gerontology, Univ Mass Boston, Boston, Massachusetts, 2. L & M Policy Research, Washington, D.C., District of Columbia*

Pay-for-performance (P4P) directs higher reimbursement to providers that achieve desired outcomes. Little is known about the use of P4P in the nursing home sector, however. This study reports the results of in-depth case studies of nursing home P4P in five state Medicaid programs: Iowa, Minnesota, Oklahoma, Utah, and Vermont. Detailed summaries are provided, followed by a review of best practices and other lessons learned. Data derive from in-depth interviews with those responsible for implementing nursing home payment policy in each of the states studied. Data also derive from review of archival resources. Results highlight the importance of obtaining stakeholder input, both initially and on an ongoing basis. They also highlight providing opportunities for acceptance and learning by phasing in programs slowly, beginning with performance measurement, followed by public report cards, and, finally, by introduction to P4P incentives. Funding P4P using new appropriations, incorporating multiple quality measures and domains, and relying on existing data sources where possible were deemed critical for success; so too was allowing programs to evolve over time to account for changes and innovations in quality measurement. Believed especially important was bringing key stakeholders together to determine the underlying philosophy and principles that guide program design and implementation and subsequent refinement. Monitoring for potential unintended consequences and conducting annual assessments to document program successes and potential areas for improvement were deemed important as well.

**DOES MEDICAID PAY MORE TO A PROGRAM OF ALL-INCLUSIVE CARE FOR THE ELDERLY [PACE] THAN FOR FEE-FOR-SERVICE LONG-TERM CARE?**

G. Wieland<sup>1,2</sup>, B. Kinoshian<sup>3</sup>, P. Stallard<sup>4</sup>, R. Boland<sup>1</sup>, *1. Geriatrics Services, Palmetto Health Richland, Columbia, South Carolina, 2. University of South Carolina, Columbia, South Carolina, 3. University of Pennsylvania School of Medicine, Philadelphia, Pennsylvania, 4. Duke University, Durham, North Carolina*

In rebalancing from nursing homes [NHs], states are increasing access of NH-certified dually eligible (Medicare/Medicaid) patients to community waiver programs and PACE. Prior evaluations suggest Medicaid's [MA] PACE capitation exceeds its spending for comparable admissions in alternative care, although the latter expenditures may be underestimated. We test whether MA PACE payments are lower than predicted fee-for-service [FFS] outlays. Using grade-of-membership methods, we model health deficits for duals  $\geq 55$  admitted to waiver, PACE and NH in South Carolina ( $n=3,988$ ). Clinical types, membership vectors, and program type prevalences are estimated. We calculate a blend, fitting PACE between FFS cohorts whose post-admission one-year utilization was converted to attrition-adjusted outlays. PACE's capitation is compared to blend-based expenditure predictions. Four clinical types describe population health deficits/service needs. The waiver cohort is most represented in the least impaired type (1: 47.1%), NH entrants in the most disabled (4: 38.5%). PACE's highest prevalences were in Types 3 (32.7%) and 2 (32.3%). PACE's blend was: Waiver—0.5602; 95% c.i., 0.5472, 0.5732, and NH—0.4398; 0.4268, 0.4528. Average MA attrition-adjusted 1-year payments for waiver and NH were \$4,177 & \$77,945. The mean predicted cost for PACE patients in alternative LTC was \$36,620 (95% c.i.: \$35,662, \$37,580). PACE's MA capitation was \$27,648—28% below the lower limit of predicted

FFS payments. PACE's capitation was well under outlays for equivalent patients in alternative care—a substantial savings for Medicaid. Our methods provide a rate-setting element for PACE and other managed LTC.

**SERVICE AND FINANCING INTEGRATION OF MEDICAL CARE AND LONG TERM SERVICES AND SUPPORTS FOR THE ELDERLY: A SYSTEMATIC REVIEW**

A. Chattopadhyay<sup>1</sup>, S. Wang<sup>1</sup>, J. Stone<sup>2</sup>, A. Bindman<sup>1,2</sup>, *1. Medicine, University of California at San Francisco, San Francisco, California, 2. California Medicaid Research Institute, University of California, San Francisco, California*

In the United States, frail elders living in communities have high levels of medical and long-term care needs. Services are provided by many different agencies, leading to fragmentation and inefficiencies. We reviewed published literature and the grey literature in the form of program evaluation reports of state and federal agencies evaluating community-based programs that integrate long-term care and medical services to examine their efficacy and effectiveness across three metrics: health outcomes (mortality, functional status, mental health, and quality of life), rates of utilization of high cost services, and cost. Twenty four studies reporting evaluation of seventeen interventions are summarized. These studies were categorized along a continuum of integrating strategies at different levels: Clinical/Service Delivery Level, Organizational Level and Financing/Administrative Level. Results show that integrated care programs can improve certain health and cost outcomes for the elderly population with LTSS needs. Many of the interventions along the service and financing continuum showed improvements in at least one outcome, such as functional status and reduced utilization of nursing homes. Although cost savings were difficult to achieve, organizational level interventions seemed to have the most potential for improvements in costs. Variations in outcome could be attributable to variation in program design. Future research efforts should include randomized trials by which the efficacy of each of the structural features of integrated care can be examined by random assignment of subjects to multiple (program) design strategies.

**EXPECTATIONS OF NURSING HOME USE: DO THEY TRANSLATE INTO LONG-TERM CARE INSURANCE PURCHASE AND SAVINGS?**

J.C. Greenfield, T. McBride, S. Billiot, *Washington University, St. Louis, Missouri*

Models of life cycle behavior suggest that expectations about future events may affect savings, insurance, and retirement planning. The Health and Retirement Study (HRS) collects subjective expectations of nursing home use. Previous work explored whether individuals accurately predict lifetime nursing home use and found that women and men incorporate their subjective experience, personal characteristics, and health conditions, and that their expectations conform reasonably well to previous empirical literature about predictors of lifetime nursing home use. Since the HRS first introduced the expectations question there has not been any exploration of whether the individuals' expectations about future nursing home use translates into either purchases of long term care insurance (LTCI) or savings to coincide with their expectations about lifetime nursing home use. This paper explores this relationship using longitudinal data over an 18-year period in nine waves of the HRS. We find that individuals who report higher expectations of lifetime nursing home use do not invest more in savings accounts, nor are they more likely to purchase LTCI. The results suggest that other factors typically found to be predictors of investments in assets and LTCI are significant predictors in the HRS sample (e.g., education, income). The findings confirm that expectations, recorded long before respondents experienced a need for nursing home care, do not translate into planning for LTC utilization, especially under uncertainty, and may suggest the need for policy intervention to address this uncertainty.

## EVALUATING OHIO'S PACE PROGRAM: RECOMMENDATIONS FOR STATE POLICY MAKERS

S. Mehdizadeh, P.C. Faust, S. Kunkel, R. Applebaum, *Scripps Gerontology Center, Miami University, Oxford, Ohio*

In 2010 the Ohio Legislature was presented with conflicting recommendations about the state's Program of All Inclusive Care for the Elderly (PACE) initiative. With one stakeholder group recommending expansion of the program and another arguing that PACE was too costly to Medicaid, no policy action was agreed upon. However, an evaluation was authorized asking the researchers to provide policy recommendations for state officials. This paper presents findings from the evaluation and includes both process and outcome components. In the outcome analysis all PACE enrollees in 2007 (N=630) at the state's two sites were identified and followed over a five year time period. The same number of participants from the same regions of the state, enrolled in Ohio's home and community-based care Medicaid waiver program (PASSPORT), was selected via matching propensity score for comparison. Mortality rate, nursing home and hospital use, and retention in the program as well as overall Medicaid and Medicare per-member, per-month expenditures are compared, by group, over the 5 following years irrespective of their initial program affiliation. Outcome findings were supplemented by a process analysis that included interviews with an array of staff members at each of the PACE sites and interviews with state officials to discuss implementation barriers and successes. Evaluation results are presented in the context of the more than 10 previous studies of PACE using comparison group methodologies. The presentation will describe the final recommendations made to state policy makers using both the outcome and process components of the study.

## SESSION 2635 (PAPER)

### THE FUTURE OF LONG TERM CARE POLICY AND PRACTICE

#### PROJECTING OLDER CANADIANS' HOME SUPPORT NEEDS: FUTURE SCENARIOS OF DISABILITY AND SOCIAL SUPPORT

J. Keefe<sup>1</sup>, S. Vezina<sup>1</sup>, J. Légaré<sup>2</sup>, Y. Décarie<sup>3</sup>, *1. Mount Saint Vincent University, Halifax, Nova Scotia, Canada, 2. Université de Montréal, Montreal, Quebec, Canada, 3. Institut national de la recherche scientifique, Montreal, Quebec, Canada*

This research examines how different scenarios of disability and support network usage would affect older Canadians' home care assistance (weekly hours of support) up to 2031. The Canadian older population is projected using Statistics Canada's LifePaths microsimulation model. Using regression parameters, other characteristics are applied to the projected population (i.e., disability status, need for assistance, living arrangement, receipt of assistance, and source of assistance). Results from two scenarios are compared with the Baseline Scenario. The "recent-trend" Scenario assumes the changing disability rate observed between 1994/95 and 2000/01 will continue at the same pace up to 2031. The "cultural shift" Scenario assesses the impact of Baby Boomers turning to the marketplace to meet their care needs. The projected amount of assistance will increase from approximately 15 million hours in 2006 to 29 million in 2031. The "recent-trend" Scenario projects 27.6 million hours in 2031 resulting from a projected decline of the disability rate simultaneous to a rise in disability severity. The "cultural shift" Scenario results in a lower reliance on informal sources in 2031. The total projected need would increase by 2.4 times the Baseline scenario, and the number of hours delivered by the formal network would increase by nearly 3 times. Session participants will gain an understanding of how disability rates and support network usage may impact future home care assistance. This is an important policy concern given

the increasing size of the older Canadian population in the coming decades and the need to prepare to meet care demands.

#### HOW DO WE MEASURE UNMET NEED FOR SOCIAL CARE IN LATER LIFE?

A. Vlachantoni<sup>1,2,3</sup>, R. Shaw<sup>3</sup>, R.M. Willis<sup>1,3</sup>, M. Evandrou<sup>1,2,3</sup>, J.C. Falkingham<sup>2,1,3</sup>, R. Luff<sup>1,3</sup>, *1. Centre for Research on Ageing, University of Southampton, Southampton, United Kingdom, 2. ESRC Centre for Population Change, University of Southampton, Southampton, United Kingdom, 3. EPSRC The Care Life Cycle, University of Southampton, Southampton, United Kingdom*

Recent spending cuts in the area of adult social care raise policy concerns about the proportion of older people whose need for social care is not met. Such concerns are emphasised in the context of population ageing and other demographic changes, for example in the living arrangements of older people, which can place greater pressure on formal and informal systems of care and support provision. However, the concept of 'unmet need' is challenging in terms of its definition and measurement, as it can include objective notions of access and use of services, as well as subjective notions of expectations, satisfaction and want. This paper explores the concept of 'unmet need' and its operationalisation through national cross-sectional and longitudinal data from the General Household Survey and the English Longitudinal Study of Ageing. Following attendance of this presentation, participants will be enabled to: firstly, understand the link between literature in social policy and the concept of 'unmet need' in the British policy context; secondly, assess evidence from the GHS and the ELSA which illustrate patterns of unmet need for social care among older people and which explore the relative importance of demographic and socio-economic characteristics in such differentials; and thirdly, understand the policy implications of the findings in the context of significant demographic and policy change in the UK.

#### MEASUREMENT OF STATE LTSS SYSTEMS: THE EVALUATION OF EXISTING EFFORTS AND DEVELOPING NEW INDICATORS

L.J. Clark-Shirley, J. Howard, O. Urdapilleta, *IMPAQ International, Washington, District of Columbia*

As states continue to reform long-term supports and services (LTSS) systems, there is growing interest in benchmarking success in providing balance between home and community based services (HCBS) and institutional alternatives. Such systems assure optimal health, well-being, and functioning for people across the lifespan in the most integrated setting possible. The Centers for Medicare & Medicaid have supported the National Balancing Indicator (NBI) project in developing of a set of indicators that efficiently measure States' LTSS systems. One major task of the NBI was to identify and unify efforts of Federal agencies that measure certain aspects of LTSS, in order to develop a holistic view of a State's LTSS system. This presentation discusses our methodology for collecting, analyzing, rating, and incorporating these Federal efforts into the NBI-led set of national LTSS indicators, and evaluation criteria specific to LTSS measures created for this purpose. Collaboration with the Federal government revealed sources of potential LTSS indicators from six agencies. The NBI team gathered technical specifications of measures from each agency via a web-based survey. Evaluation criteria specific to LTSS indicators were developed, adapted from the National Quality Forum model. A panel of independent expert reviewers was then convened to evaluate each Federal measure using these criteria, focusing on importance/relevance to LTSS, scientific acceptability, usability, and feasibility. As Federal and State policies encourage HCBS, it is critical to have a sound metric with which to measure the characteristics of LTSS nationally. This presentation highlights a multi-faceted approach to achieving this goal.

## **LONG-TERM CARE: WHERE HAVE YOU GONE, WHERE ARE YOU GOING?**

R. Applebaum, S. Mehdizadeh, *Scripps Gerontology Center, Miami University, Oxford, Ohio*

From its name to the type and setting of care provided, the world of long-term services and supports has changed dramatically in the last two decades. Using 18 years of longitudinal data from the state of Ohio this presentation describes how the long-term services system is different from the one that existed in the early 1990's. Data come from nine biennial surveys of all Ohio nursing homes and residential care facilities and comprehensive resident and home care participant data on user characteristics and utilization rates. Findings show large changes in where services are provided and who receives care. For example, Ohio, as has most other states, has changed the ratio of its older population using Medicaid long-term care, going from 91% nursing home in 1993, to 58% nursing home in 2010. At the same time the sheer number of admissions to Ohio nursing homes increased from 70,000 to more than 200,000 painting a picture of today's nursing home as a short-term care provider. These massive changes indicate an industry in transition. What will this mean for the future of the home care and nursing home industries? What will tomorrow's system of long-term services and supports look like? Building on these two decades of findings the presentation will tackle the question of where long-term care has been, and where it is going.

## **MEETING LONG TERM SERVICES AND SUPPORTS THROUGH ADRCS: CONSUMER AND STAFF EXPERIENCES**

D.L. White, P. Carder, S. Elliott, A. Foucek Tresidder, G. Luhr, D. Truxillo, *Institute on Aging, Portland State University, Portland, Oregon*

Aging and Disability Resource Centers (ADRC) serve individuals and families facing or anticipating the need for long term services and supports. Information and assistance (I&A) and options counseling (OC) are among core ADRC services and emphasize informed decision making and support for self determination. This paper reports on the experiences of consumers and staff of three pilot ADRCs in Oregon. ADRCs were involved in developing common professional standards and the OC training program. Program structures varied according to the needs and resources of the parent organizations and communities served. Survey and focus group data from I&A and OC staff as well as qualitative and quantitative data from consumer satisfaction surveys (n=252) are presented. Most OC staff reported high levels of job satisfaction, naming flexibility as a key job feature. In agencies where I&A and OC staff work closely together, I&A workers also reported high job satisfaction. Both shared concerns about determining when OC services are needed. Time pressures were the major source for job stress, particularly for OCs with multiple job responsibilities and I&A workers with high call volumes. Consumer data indicate overall satisfaction; the majority reported being better off and better informed after contact with the ADRC and 85% reported that staff spent enough time with them to understand their concerns. At the same time, consumer data suggest that not all consumers in need of OC services are receiving them; 26% indicated they had concerns that the ADRC had not addressed. Implications for strengthening OC services will be discussed.

## **SESSION 2640 (SYMPOSIUM)**

### **CONNECTING THE DOTS: LINKING RESEARCH, CLINICAL AND MULTIDISCIPLINARY APPROACHES TO GRANDPARENT CAREGIVERS' HEALTH AND WELL-BEING**

Chair: *F. Conway, Psychology, Adelphi University, Garden City, New York*

Discussant: *B. Hayslip, University of North Texas, Denton, Texas*

The health of grandparent caregivers is examined within a unique matrix of cross disciplinary vantage points and mixed approaches. Bring-

ing together a multidisciplinary team of researchers, nurses, psychologists, social workers, both the psychological and physical health of grandparents are explored. The health of grandparent caregivers is an important predictor of grandparent's psychological wellbeing. In order for grandparents to care adequately and effectively care for their grandchildren, the integrity of their physical and psychological health status is paramount. For a variety of reasons including the role demand of caregiving, grandparent caregivers neglect their health. This symposium discusses psychological and physical health concerns of grandparent caregivers and methods used to intervene with grandparents' health. This symposium brings together varying theoretical perspectives to examine several dimensions of grandparent caregiver's health. This unique comprehensive examination of dimensions of grandparent caregivers' health includes an emphasis on physical, psychological, nutrition and other health aspects. Studies in the symposium examine psychological health of grandparent caregivers including a focus on physical health as a predictor of psychological distress in a large sample of African American custodial grandmothers, links between the mind and body connection in African American and Latino grandparent caregivers, the preventative public health concerns related to the grandparent caregivers' nutritional needs and the mechanisms through which caregiving impacts health. Implications for a holistic approach to health interventions with grandparent caregivers are discussed.

## **THE MIND AND BODY CONNECTION: FUNCTIONAL AND PHYSICAL HEALTH AS PREDICTORS OF PSYCHOLOGICAL HEALTH IN AFRICAN AMERICAN AND LATINO GRANDMOTHERS RAISING THEIR GRANDCHILDREN**

F. Conway<sup>1</sup>, S.C. Jones<sup>2</sup>, *1. Psychology, Adelphi University, Garden City, New York, 2. Long Island University, Brooklyn, New York*

Grandparent caregiving has been long associated with psychological stressors. Less understood is the role grandparent's physical health status plays in their psychological wellbeing. Seventy African American and Latino grandmothers who are raising their grandchildren were interviewed regarding their caregiving experience and administered measures regarding their demographics, psychological and physical health. Physical health was assessed using the physical health scales of the Comprehensive Assessment and Referral Evaluation Subscales and psychological wellbeing was assessed using the Brief Symptom Inventory. Regression analysis show health conditions affecting grandmother's level of activity (respiratory problems, arthritis, leg problems, vision disorder, ambulation problems) and total impaired health (somatic symptoms, heart disorder, respiratory problems, sleep disorder) predicted the severity of their psychological distress (R2Change=.001, p<0.01 and R2Change=.000 (p<0.01 respectively). Although there is heterotopy in grandparent caregivers' health, the impact on their psychological functioning tends to be consistently detrimental to their psychological health.

## **RACE/ETHNIC DIFFERENTIALS IN THE HEALTH CONSEQUENCES OF GRANDPARENTS CARING FOR GRANDCHILDREN**

F. Chen, C.A. Mair, L. Bao, *Dept. of Sociology, University of Maryland, College Park, Maryland*

Although Black and Hispanic grandparents are much more likely to coreside with grandchildren and to provide routine childcare for grandchildren than White grandparents, researchers have not fully investigated race/ethnic differentials in the health consequences of such caregiving for grandparents. Do the potential benefits of grandparenting (e.g., emotional reward and social support) outweigh the potential negative effects (e.g., stress, physical demand, and financial difficulty) or vice versa? Do minority grandparents' poorer health outcomes reflect their initial socioeconomic disadvantages, or does a lack of financial resources compound the stress of caregiving? Finally, could the strong

norm of familism and support of kinship network among Black and Hispanic grandparents act as a buffer and thus increase resiliency? To answer these questions, we analyze data from the Health and Retirement Study, a nationally representative, longitudinal panel study of older adults in the United States. We treat health as a cumulative process and examine the influence of grandparents' caregiving on health trajectories with multiple health indicators for different race/ethnic groups.

### **THE NUTRITIONAL NEEDS AND FOOD HABITS OF GRANDPARENT-HEADED FAMILIES**

M.L. Dolbin-MacNab, E. Serrano, K.A. Roberto, *Virginia Tech, Blacksburg, Virginia*

Adequate and proper nutrition is important to the health of custodial grandparents and their grandchildren. Unfortunately, little is known about the nutritional needs and food habits of grandparent-headed families, though previous research suggests that grandparents face barriers to obtaining healthy and nutritious foods. Using data from six focus groups with 59 professionals who work with custodial grandparents, this study examined professionals' experiences of grandparents' dietary quality and food security. Results of a qualitative analysis indicate that grandparent-headed families experience varying degrees of food insecurity. Poor dietary habits were also common, and were linked to grandparents' time and energy demands as well as a lack of financial resources. Limited information about the association of nutrition and health outcomes was also mentioned, along with relationship dynamics that resulted in problematic eating habits. Findings highlight opportunities to improve the dietary quality of custodial grandparents and grandchildren via professional collaborations, nutrition education, and nutrition assistance programs.

### **PSYCHOLOGICAL DISTRESS IN CUSTODIAL GRANDMOTHERS: THE ROLE OF PHYSICAL HEALTH, FAMILY RESOURCES, AND CHILD BEHAVIOR PROBLEMS**

S.J. Kelley, D.M. Whitley, P.E. Campos, *Georgia State University, Atlanta, Georgia*

Although grandmothers raising grandchildren demonstrate remarkable commitment, the comparatively high levels of depression found among custodial grandmothers raises concern for their quality of life and ability to provide care for grandchildren. The purpose of this study is to determine levels of psychological distress in African American custodial grandmothers and to identify factors associated with increased distress. The sample consisted of 516 African American custodial grandmothers with a mean age of 57 years. Thirty-eight percent of participants scored in the clinical range on psychological distress. Results of a hierarchical multiple regression analysis indicated that increased child behavior problems, poor physical health, and lack of resources were associated with increased psychological distress. The model predicted 33% of the variance in psychological distress. The extent of clinically elevated psychological distress found in this study raises considerable concern regarding the well-being of African-American custodial grandmothers. Implications for practice, policy, and research will be discussed.

## **SESSION 2645 (SYMPOSIUM)**

### **INFLUENCE OF CULTURE ON ELDERS' WELLBEING IN ASIA – CHINA, INDIA, SOUTH KOREA, AND TAIWAN**

Chair: *K. Chee, Department of Sociology, Texas State University, San Marcos, Texas*

This symposium addresses diverse cultural factors relevant to the wellbeing of older adults in different Asian societies. Results from four research projects on Chinese, Indian, South Korean, and Taiwanese elders demonstrate: a) how critical it is to understand these elders' wellbeing and actions in their specific cultural context, b) complex ways in which culture shapes their perceptions and actions, and c) implications of these findings for suggesting the directions of future research involv-

ing Asian elders. First, Liang describes how cultural beliefs such as filial piety, the virtue of moderation, and a naturalistic approach to health shape the spirituality of Chinese elders and ultimately their conceptualization of wellbeing. Second, Gupta reports on various relational, structural, and cultural factors that are intertwined with the psychosocial wellbeing of older care receivers and their caregivers in India. Third, Kim discusses how South Korean elders with religious affiliation are more likely to live with their children, but are less likely to transition to co-residence with or living close to their children when experiencing functional limitations. Finally, Wang presents findings from an ethnographic study in adult daycare centers in Taiwan to observe the notions of public and private selves among persons with dementia in the context of a collectivistic Taiwanese culture. The chair will lead a discussion on cultural similarities and differences among different Asian societies according to these findings and how a careful attention to the cultural context is crucial in understanding older adults' perceptions, actions, and wellbeing regardless of their health or disability status.

### **CULTURE, SPIRITUALITY AND WELLBEING AMONG CHINESE ELDERS: IMPLICATIONS FOR CROSS-CULTURAL AGING STUDIES**

J.J. Liang, K. Basnyat, H. Stohry, *MU, Ohio, Oxford, Ohio*

This study explores the influence of cultural beliefs and practices on spirituality and wellbeing among Chinese elders by drawing on relevant literature as well as qualitative data collected from face-to-face, semi-structured, in-depth interviews with 10 elders in Xi'an, China. Besides filial piety known for regulating caregiving experiences and intergenerational relationships, belief in the virtue of moderation indicative of another Confucian idea and a naturalistic approach to health reflective of Taoist thoughts are found to play a vital role in shaping Chinese elders' spirituality and formulating their conceptualization of wellbeing. We also find that non-adherence to formal religious beliefs does not exclude spiritual pursuits and thus argue that the difference between religiosity and spirituality must be recognized in cross-cultural aging studies. Thereby, we propose a more nuanced yet integrative understanding toward cultural traditions and the mechanisms that affect spirituality and wellbeing among elders in the Chinese society.

### **COMMUNITY-DWELLING OLDER ADULTS AND CAREGIVER DYADS: FINDINGS FROM ALLAHABAD, INDIA**

R. Gupta, M. Brown, *School of Social Work, San Francisco State University, San Francisco, CA, California*

Objective: The purpose of this study was to examine psychosocial wellbeing among community-dwelling caregiver and care receiver dyads in the Allahabad, India. Methods: We employed mixed methods to gather as much information as possible from 31 dyads. The questionnaire was translated from English to Hindi. Data were collected from community-dwelling older adults and their care receivers. Findings: The results indicate that 21 of the 31 caregivers were female (67.7%) and 19 of the 31 care receivers were also female (61.3%). Results from the qualitative data show the following themes: 1) relationship quality of the dyad prior to caregiving influences the relationship quality when caregiving becomes necessary, 2) lack of social or governmental resources increase caregiver burden, 3) norms of filial duty to provide care to elders in the home are eroding, leading to greater stress. Implications for services for elders in India are discussed.

### **HEALTH, RELIGIOUS AFFILIATION, AND TRANSITIONS IN LIVING ARRANGEMENTS AMONG KOREAN OLDER ADULTS**

B. Kim, J. Liang, *The University of Michigan, Ann Arbor, Michigan*

Objective: This study investigates the linkage between health and transitions in living arrangements among Korean older adults, and how religious affiliation affects this association. Method: Data came from

the two waves of the Korean Longitudinal Study of Ageing on individuals over the age of 65 years ( $n=3,874$ ), and multinomial logit regressions were used. Results: Functional limitations increased the probability of transitions to co-residence or to living near children as opposed to living alone. Those with religious affiliations, including Protestants, Catholics, and Buddhists, were more likely to live with their children than those without any religious affiliation. Interactions between religious affiliation and health were, however, negatively associated with transitions to co-residence. Conclusion: This suggests that the social resources provided by religious community enable older parents to live independently from their children when health problems occur. Implications include the significance of non-family resources for older adults in South Korea.

### THE DEMENTED SELF IN PUBLIC AND PRIVATE: AN ETHNOGRAPHY IN ADULT DAY CARE CENTERS IN TAIWAN

P. Wang, *National Taipei University, New Taipei City, Taiwan*

Prior studies of dementia are mostly concerned with care issues. The demented person may be deemed as being alienated from his/her own body because of the shortage of coherent memory. Such a way of knowledge production is, however, inadequate to inquire into an ethic of relatedness. This study sets out to inquire into the ways in which demented persons' subjectivities are mediated and constructed both publicly and privately in their daily lives. I used ethnographic methods to study three daycare centers in Taiwan from 2011 to 2012 (70 days in total). Each center has a mix of demented and non-demented elderly people. Findings reveal that all of the demented persons are able to establish their own public selves at the daycare, and that some of their public selves are quite different from their private selves at home. Collective dynamics and particularities of care arrangements in the Taiwanese culture are discussed.

## SESSION 2650 (SYMPOSIUM)

### LOOKING FORWARD TO IT!: MULTIPLE ROLES OF FUTURE TIME PERSPECTIVE ACROSS ADULTHOOD

Chair: B. Demiray Batur, *University of Zurich, Zurich, Switzerland*

Co-Chair: S. Bluck, *University of Florida, Gainesville, Florida*

Discussant: S.T. Charles, *University of California, Irvine, California*

Time is a critical dimension in disciplines as disparate as Physics and Philosophy, but social scientific research has not fully embraced time as a central construct. This is particularly perplexing in the adult development literature where the passage of time basically defines the central construct: aging. Chronological age (i.e., time since birth) is widely assessed, but is conceptually barren as it represents only numerical time. The current symposium revives classic conceptualizations of psychological time perspective as central to the aging process (e.g., Jung, 1933; Neugarten, 1996). Social selectivity theory (e.g., Carstensen, Isaacowitz, & Charles, 1999) has been useful as a contemporary framework for studying time perspective. This symposium builds on that pioneering work, highlighting the multiple ways that time perspective plays a role in adult development and aging. Such research examines not only chronological age, but individuals' sense of their location in 'life-time': their future time perspective in relation to views of their past. Presenters will address: (a) the relation between happiness, psychological health and future time perspective, (b) heterogeneity within older adults concerning how chronological age and future time perspective influence well-being, (c) how making meaning about one's past affects development of an optimistic future perspective in young and late adulthood, and (d) the link between a balanced time perspective (past, present, future) and narrative foreclosure. The discussant will bring together findings across the presentations to highlight our increasing sophistication in conceptualizing psychological time, and its role in development as individuals move, through time, across the lifespan.

### HAPPINESS, PSYCHOLOGICAL HEALTH, AND FUTURE TIME PERSPECTIVE

J.A. Hicks, *Texas A&M University, College Station, Texas*

Guided by Socioemotional Selectivity Theory (Carstensen et al., 1999), four studies tested the prediction that perceptions of time limitations amplify the relationship between happiness and psychological health. In Studies 1 and 2, adults indicated their perceived position in their life span. Results revealed state positive affect, whether naturally occurring or induced, was a stronger predictor of well-being for individuals who perceived themselves as having a limited amount of time left to live. In Studies 3 and 4, we tested whether eudaimonic happiness (e.g., authenticity) would similarly interact with time perceptions to predict well-being. Study 3 showed that authenticity was more strongly linked to well-being for individuals who reported a limited time perspective. In Study 4, we manipulated time perspective and showed that authenticity was a much stronger predictor of well-being for those in the limited time condition. Implications and future directions regarding the contributions of age related processes to psychological well-being are discussed.

### PERCEPTIONS ABOUT FUTURE TIME AND WELL-BEING IN OLD AGE: EVIDENCE FROM THE BERLIN AGING STUDY AND THE HEALTH AND RETIREMENT STUDY

C.A. Hoppmann<sup>1</sup>, D. Gerstorff<sup>2</sup>, F.J. Infurna<sup>2</sup>, N. Ram<sup>2</sup>, 1. *Univ. of British Columbia, Vancouver, British Columbia, Canada*, 2. *The Pennsylvania State University, University Park, Pennsylvania*, 3. *Humboldt University, Berlin, Germany*

Perceiving one's future time as limited has been linked with motivational shifts toward prioritizing socio-emotional goals and high well-being. To date, little attention has been paid to the heterogeneity in future time perceptions within the group of older adults. We used Berlin Aging Study (M age = 85 years) and Health and Retirement Study data (M age = 68 years) to examine associations between various indicators of perceptions about the future and well-being in old age. Contrary to expectations but consistent across studies, we found that people who perceived their time left as limited reported lower well-being (lower life satisfaction and positive affect, more negative affect and depressive symptoms), even after controlling for biological, cognitive, and social resources. We take these findings to extend past studies using age-comparison designs, highlight the multidimensional nature of the construct, and interpret them according to the model of Strength and Vulnerability Integration.

Perceiving one's future time as limited has been linked with motivational shifts toward prioritizing socio-emotional goals and high well-being. To date, little attention has been paid to the heterogeneity in future time perceptions within the group of older adults. ### USING THE PERSONAL PAST CREATES AN OPTIMISTIC FUTURE FOR OLDER BUT NOT YOUNGER ADULTS

N. Alea<sup>1</sup>, S. Bluck<sup>2</sup>, 1. *University of the West Indies, St. Augustine, Trinidad and Tobago*, 2. *University of Florida, Gainesville, Florida*

People reflect on the past and envision their future. We expected that adaptively using one's personal past would be related to an optimistic future time perspective, but that this may be moderated by age. Young ( $n = 89$ ;  $M$  age = 19.08) and older ( $n = 85$ ;  $M$  age = 73.09) men and women self-reported how often they use the personal past for two reasons: to search for meaning, and to direct future behavior. They also reported their future time perspective. Making meaning of the past and using the past to direct behavior were both related to a more open, optimistic future, only for older adults. Results are discussed in terms of how autobiographical memory can be used to create an optimistic sense of the future.

### A BALANCED TIME PERSPECTIVE AND NARRATIVE FORECLOSURE

J.D. Webster<sup>1</sup>, E.T. Bohlmeijer<sup>2</sup>, G.J. Westerhof<sup>2</sup>, 1. *Psychology, Langara College, Vancouver, British Columbia, Canada*, 2. *University of Twente, Enschede, Netherlands*

Time perspective and lifestyles are intimately connected and may have important links to well-being, yet little research in these areas

exists. This study investigated how a balanced time perspective, defined as positive perceptions about both one's past and future, is associated with an aspect of lifestories called Narrative Foreclosure (NF), a belief that one's lifestory is basically completed. Participants included 186 male and 326 female Dutch adults ranging in age from 17 – 92 ( $M = 46.46$ ,  $SD = 21.37$ ). Bivariate correlations showed expected negative correlations between NF and past and future subscales of the Balanced Time Perspective Scale (BTPS), and hierarchic regression analyses showed that time perspective accounted for additional variance in NF above and beyond demographic, physical health, and personality variables. ANOVA results indicated main effects for both age and time perspective whereby younger adults, and persons in the future and balanced time categories of the BTPS, scored lower in NF.

## SESSION 2660 (SYMPOSIUM)

### **RAISING THE GAF WITH THE SOCIAL FOCUS COHORT: AN INNOVATIVE CLINICAL PRACTICE TO IMPROVE THE OVERALL QUALITY OF LIFE FOR RESIDENTS IN LONG-TERM CARE WHO ARE BEHAVIORALLY CHALLENGING**

Chair: *E.S. Sutherland, Department of Geropsychiatry, San Francisco VA Medical Center, San Francisco, California, UCSF, San Francisco, California*

The Social Focus Cohort (SFC) was launched in 2007 at the San Francisco VA Medical Center (SFVAMC) Community Living Center (CLC) to improve the overall quality of life of veterans who are behaviorally challenging. After a thorough analysis of patient and provider data over a five year span (i.e., behavioral disturbances and duration, frequency of interdisciplinary team meetings) a relationship was discovered between these factors and suicidal ideation, homicidal ideation, and prevalence of Axis I and Axis II disorders. As a result, the SFC was developed and implemented in the CLC, which is a 120 bed skilled nursing facility and includes short-stay and long-term stay patients. The general purpose of the SFC is to provide specialized interdisciplinary expertise, comprehensive milieu-based therapy, and psychological/behavioral management to residents who can benefit from such a therapeutic environment. The SFC Team is comprised of a geropsychologist, medical providers, social worker, recreational therapy, occupational therapy, and all levels of nursing including a Clinical Nurse Specialist, Nurse Manager, MDS Coordinator, RN's, LVN's, and CNA's. The SFC Team assists residents in achieving the highest possible level of psychological, behavioral, cognitive, and social functioning within the least restrictive level of care and environment possible. This symposium will cover SFC development including implementation, inclusion/exclusion criteria and other considerations for admission; non-pharmacological interventions provided including community re-integration exercises for long-term care patients; and the importance of an Interdisciplinary Team in care of this nature. Implications include provision of a method of treatment for behaviorally challenging individuals in long-term care settings.

### **BEHAVIORAL ISSUES IN A SKILLED NURSING FACILITY? DEVELOPING AND IMPLEMENTING AN INNOVATIVE CLINICAL PROGRAM FOR RESIDENTS WHO ARE BEHAVIORALLY CHALLENGING**

*E.S. Sutherland, 1. Department of Geropsychiatry, San Francisco VA Medical Center, San Francisco, California, 2. UCSF, San Francisco, California*

Historically mental and behavioral problems are very prevalent in nursing home settings, difficult for staff to treat, and often times limit discharge options. The Social Focus Cohort (SFC) Team addresses complex problem behaviors by restructuring systems, implementing environmental interventions, creating a specialized team approach and increasing education and training. This individual symposium will highlight the process by which residents and providers are selected to be a member of the SFC as well as how this process was developed and

continues to be revised. Additional focus will be placed on resident outcomes for both those members who have successfully discharged back into the community and those who remain a life time member.

### **QUALITY OF LIFE IN A SKILLED NURSING FACILITY? IMPLEMENTING AND SUSTAINING A NON-PHARMACOLOGICAL INTERVENTION FOR RESIDENTS WHO ARE BEHAVIORALLY CHALLENGING**

*A. Stripling, Department of Geropsychiatry, San Francisco VA Medical Center, San Francisco, California*

Researchers have noted the benefits of non-pharmacological interventions and discuss the importance of social contact and structured activities in treatment addressing long-term care residents with behavioral issues. New to the Veterans Administration (VA) system, the Social Focus Cohort (SFC) is an innovative and effective program, which has resulted in a number of treatment outcomes including: lessening of symptom severity, reduction of specific target behaviors that impact resident's ability to function effectively, improving ability to relate to others, increasing perform activities of daily living and improving overall quality of life. Methods used, include but are not limited to: a variety of weekly therapeutic groups, VA wellness programs, individual therapy and/or neuropsychological evaluation which are provided as needed to foster independence and autonomy. This individual symposium will cover the facilitation and implementation of these interventions, as well as, veteran's reactions and responses.

### **WORKING TOGETHER IN A SKILLED NURSING FACILITY? THE IMPORTANCE OF A SPECIALIZED INTERDISCIPLINARY TEAM APPROACH WHEN CARING FOR RESIDENTS WHO ARE BEHAVIORALLY CHALLENGING**

*K.K. Jacobson, 1. Psychology, Department of Veteran Affairs San Francisco VA Medical Center, California, California, 2. John F. Kennedy University, Pleasant Hill, California*

Research has documented the benefits of collaborative team approaches, for both the care recipients (i.e. improved outcomes, more effective use of health resources) and providers (i.e. superior morale, coordination and problem-solving). As such, the Social Focused Cohort (SFC) Team utilizes members of various disciplines including geropsychologists, medical providers, social workers, recreational therapist, occupational therapist, and all levels of nursing. The SFC Team duties include: meeting to consider the appropriateness of new referrals, weekly team meetings with and without residents, and regularly scheduled Interdisciplinary Care Plan (ICP) meetings (i.e., initial, quarterly, and annual reviews). In order to provide fully comprehensive coverage, additional team rounds are conducted bi-weekly to check-in with residents and consultation occurs with staff members outside of the SFC team as needed. This individual symposium will cover the necessity of a team approach with residents who are behaviorally challenging, as well as, provider's reactions and responses to the SFC approach.

## SESSION 2665 (SYMPOSIUM)

### **STRESS, TRAUMA, AND RESILIENCE IN UNEXPECTED PLACES: A LIFE COURSE PERSPECTIVE**

Chair: *M. Aydin, UCLA Center for Health Policy Research, Los Angeles, California*

Co-Chair: *E.H. Davison, VA Boston HCS, Boston, Massachusetts*  
Discussant: *B.G. Knight, USC Davis School of Gerontology, Los Angeles, California*

Positive change following exposure to stressful events appears counterintuitive, but research has increasingly documented the concurrent socio-emotional growth that some post-trauma survivors experience alongside negative responses to the same trauma. More attention is needed to identify whether similar positive outcomes exist

among older populations and how different research methods can be used to appropriately capture post-traumatic responses across the life course. This symposium presents four unique papers that report on diverse older populations that have been exposed to trauma at some point in the life course. Takahashi looks at a sample of former Kamikaze pilots during World War II and reports on unexpected psychological outcomes later in life compared to their non-pilot counterparts. Similarly, Davison and colleagues present qualitative evidence of both stress and positive appraisal among a sample of women deployed for service during the Vietnam War. The Kahanas investigate meaning-making and resiliency among a sample of older Holocaust survivors living in Budapest, Hungary, and their adaptation to a society that was once the setting for their victimization. Finally, Carver and colleagues discuss the relationship between prior exposure and response to trauma and experiences of a separate future traumatic event. Specifically, the investigators present evidence of age and gender differences in coping with the Iraq War among post-9/11 witnesses. The life course perspective enables both clinicians and researchers to better understand not only post-trauma responses in diverse settings, but also the possible impact of future adversity on psychological well-being among the aging population.

#### **TO BE KAMIKAZE OR NOT TO BE KAMIKAZE: A COMPARISON OF PSYCHOSOCIAL PROFILES AND PERSONALITY TRAITS BETWEEN FORMER SUICIDE BOMBERS AND THEIR COUNTERPARTS**

M. Takahashi, *Psychology, Northeastern Illinois University, Chicago, Illinois*

A series of interviews were conducted to examine Eriksonian life strengths, depressive symptoms (Geriatric Depression Scale), and personality traits (NEO-FFI) among former Kamikaze pilots ( $n=24$ ; mean age=83.75) and their counterparts ( $n=33$ ; mean age=84.21). The former pilots are those who completed the training and were, at the end of the war, waiting for an order to fly out their first/final mission, while their counterparts consist of members from the same cohort who did not enlist. A possible long-term tendency toward posttraumatic symptomatology was also assessed in the former pilots who had volunteered for the suicide operation. The results indicate that, compared to the non-pilots, the former Kamikaze are less depressed, have more resources from which they were able to construe such psychosocial strengths as hope and purpose, and scored significantly higher on all Big Five personality characteristics except Neuroticism. Only one former pilot expressed a traumatic memory regarding the suicide operation.

#### **HEADING OFF TO WAR: POSTTRAUMATIC STRESS, AGE, AND PERSPECTIVES OF THE IRAQ WAR**

K.S. Carver, B. Hayslip, D. Holmes, *University of North Texas, Denton, Texas*

While older adults often develop effective coping skills from stress and adversity over the life course, we know little about how resilience influences later responses to trauma. We utilized questions from NIH's 9/11 Questionnaire to retrospectively assess posttraumatic stress following September 11, 2001, as well as difficulty coping with the Iraq War among 40 younger (ages 18-31) and 56 older (ages 60-86) adults. Analyses of variance indicated ( $p < .05$ ) the following: 1) younger persons and those with increased posttraumatic stress expressed more difficulty coping with the Iraq War, 2) younger individuals with less posttraumatic stress demonstrated more difficulty coping with the Iraq War, while among those with more posttraumatic stress, older adults expressed more difficulty, and 3) men with decreased posttraumatic stress and women with increased posttraumatic stress expressed more difficulty coping with the Iraq War.

#### **PSYCHOLOGICAL OUTCOMES AMONG OLDER WOMEN LINKED TO STRESSFUL AND POSITIVE NURSING EXPERIENCES IN VIETNAM**

E.H. Davison<sup>1,3</sup>, A. Pless Kaiser<sup>2,3</sup>, J. Wang<sup>1</sup>, J.M. Stellman<sup>4,5</sup>, *1. Women's Health Sciences Division, National Center for PTSD, VA Boston, Boston, Massachusetts, 2. Behavioral Science Division, National Center for PTSD, VA Boston, Boston, Massachusetts, 3. Boston University School of Medicine, Boston, Massachusetts, 4. Mailman School of Public Health, Columbia University, New York, New York, 5. SUNY-Downstate Medical Center, Brooklyn, New York*

The experience of female nurses who served in country during the Vietnam War has been described in the literature via interviews and anecdotal reports (e.g., Norman, 1986) but under examined in the empirical literature. As part of a larger study conducted in 1998-1999 in collaboration with the Vietnam Women's Memorial Project, this paper qualitatively examines responses to open-ended questions regarding stressful and positive experiences of approximately 1300 female military nurses and other women deployed to Southeast Asia. Stressful experiences included: negative living/working conditions; difficult interpersonal experiences; experiencing/worrying about war-related issues; having moral/ethical questions about the work engaged in. Positive themes that emerged included: helping others; patriotism; personal/professional growth; interpersonal relationships; travel and exposure to new cultures. We present the most prominent themes, and discuss differences based on pre-military trauma history, warzone exposures, and other sample characteristics. In addition, associations between various themes and current health are evaluated.

#### **RESILIENCE AND VULNERABILITY: AGING IN THE SHADOW OF SERIAL TRAUMA**

E. Kahana<sup>1</sup>, B. Kahana<sup>2</sup>, *1. Case Western Reserve University, Cleveland, Ohio, 2. Cleveland State University, Cleveland, Ohio*

We report insights offered by elderly Holocaust survivors about trauma survivorship while living among perpetrators. Individual interviews were conducted with 112 Holocaust survivors, living in Budapest Hungary. Respondents experienced serial trauma, enduring political upheavals during and after communism. They reported lack of current social supports from family and friends and high divorce rates (38% vs. 4% among US survivors). Depressive symptoms were prevalent. Nevertheless, survivors reported having goals and meaning in life, reflecting resilience. Work and leisure activities contributed to meaningfulness. Elderly survivors valued bearing witness and preserving memories of the Holocaust. Surprisingly, religious affiliation was a salient aspect of meaning-making for elders, who otherwise engaged in few religious practices. We note important interactions between the macro social context and individual adaptations among elderly survivors of man-made disasters who age in settings of victimization.

#### **SESSION 2670 (PAPER)**

#### **INTERNATIONAL PERSPECTIVES ON GRANDPARENTING**

#### **CONTEMPLATING OLD AGE AND THE GLOBAL CARE CHAIN: LESSONS FROM TRANSNATIONAL GRANDMOTHERS RAISING GRANDCHILDREN**

K.D. Kalaw, *Sociology & Gerontology, Miami University, Oxford, Ohio*

A growing issue on the provision of care for older residents besets the world's most developed nations. The caregiver's role is often highlighted as more research is undertaken to explain his/her well-being, which is crucial in the effective delivery of care services to older adults in developed nations. However, there has been less effort devoted to

elucidate the increasing involvement of grandmothers in the transnational migration scene. Important is the grandmothers' direct participation of care work and household maintenance among families and children in developing nations who are left behind by the transnational parents. The purpose of the current study was to better understand the critical role grandmothers in the Philippines play in the global care arena as they contemplate on their aging. The Philippines is a country with a high prevalence of migrant care workers sent abroad to provide care services elsewhere. Interviews with three grandmothers provide a picture on how they foresee themselves as they continue to be providers of care among their grandchildren. All three grandmothers saw their lives have changed significantly, and are living comfortable lives, however, each has her own perception as it relates to their aging and future. Related issues on migratory strategies emerged from their narratives and revealed how they address issues on economic challenges, solitude and family relationships. This preliminary study offers an exploratory investigation to consider the narratives of grandmothers, and their untold stories to fill in the missing junction that sustains global care among transnational families.

### **TAKING GRANDPARENT EMPOWERMENT TO TANZANIA: CROSS-CULTURAL CHALLENGES**

C. Cox, *Graduate School of Social Service, Fordham, New York, New York*

More than a decade ago, the author developed a grandparent empowerment program for custodial grandparents in the United States. The program has received national awards and been replicated in many sites. This paper reports on the author's experience of taking this program to a group of custodial grandparents in Tanzania. The program focuses on developing parenting skills as well as empowering grandparents in both the family and the community. The curriculum was modified, translated into Swahili, and presented by the author with the assistance of a translator to 15 grandparents in a small rural village near the Tanzanian capital. The group shared many similar problems with grandparents in the United States but their traditional roles as well as their child rearing techniques varied. In addition, most lived in extreme poverty. This paper reports on the grandparents' responses to the program and the challenges in presenting it and making it appropriate to their specific needs. The results suggest that empowerment training can be an important intervention for grandparents struggling to raise grandchildren but at the same time, it must be culturally sensitive. The program also reinforced the idea that personal empowerment can serve as an important component for empowerment in the community.

### **GRANDPARENTHOOD CERTAINTY PREDICTS GRANDPARENTING EFFORTS? : EVIDENCE IN RURAL CHINA**

Z. Cong<sup>1</sup>, M. Silverstein<sup>2</sup>, 1. *Human Development and Family Studies, Texas Tech Univ, Lubbock, Texas*, 2. *University of Southern California, Los Angeles, Texas*

**Purpose:** The grandparenthood certainty theory posits that the certainty of grandparenthood explained why maternal grandparents are more involved in their relationships with grandchildren. This paper examined this theory within the rural China context. **Data/Methods:** The sample included 1508 Chinese elders with 5105 corresponding children who lived with their spouses. Fixed effects model was used to examine whether contact between parents and children, a surrogate for grandparenthood certainty, was more important predictors for sons than for daughters in getting help with grandchildren care from their parents. **Results:** We found that elder parents' help with grandchildren care offered to daughters was not conditional on the contact between daughters and their parents, but the help with grandchildren care to sons was contextual to how much contact they had with their parents. **Conclusion:** The results were consistent with the grandparenthood certainty theory even in rural China, where son preference was strong and sons

received much more grandchildren care from their parents. This will provide insights to intergenerational relationships with sons and with daughters with a multidisciplinary perspective.

### **GRANDPARENTING IN EUROPE – THE ROLE OF FAMILY POLICY ENVIRONMENTS, CULTURES AND STRUCTURES ON GRANDPARENT CHILDCARE**

K.F. Glaser, G. Di Gessa, E. Ribe, A. Tinker, D. Price, *Institute of Gerontology, King's College London, London, United Kingdom*

Our aim is to investigate how different family policy environments, cultures and structures shape grandparent care across selected European countries (Denmark, The Netherlands, Germany, France, England, Spain, Italy). Ageing populations, and other demographic changes such as more mothers in the labour market and higher levels of relationship breakdown, indicate that grandparents are likely to play an increasingly significant role in family life. To date, there is a lack of evidence on drivers (and in particular, policy drivers) of different grandparenting patterns across Europe. Moreover, no one has considered the role of policies relating to work and care for both generations, i.e. grandparent and adult child. In addition, the role of family cultures and structures is also considered. Employing data for selected countries from the Survey of Health, Ageing and Retirement in Europe (SHARE) and the English Longitudinal Study of Ageing (ELSA) we used multilevel regression models to investigate how family policy environments, cultures, and structures are related to the involvement of grandparents with their grandchildren. Preliminary results suggest that countries cluster into regimes of grandparental care, reflecting different family cultures, national policies and other country-specific contexts.

## **SESSION 2675 (PAPER)**

### **RESILIENCE**

#### **THE ASSOCIATION OF RESILIENCE WITH MENTAL AND PHYSICAL HEALTH OUTCOMES AMONG OLDER AMERICAN INDIANS**

M. Schure, M. Odden, R. Goins, *Public Health, Oregon State University, Corvallis, Oregon*

Few studies have examined resilience among older American Indians (AIs). Understanding the role of resilience among this population is important as they have historically and contemporarily faced and adapted to adversity, and disproportionately suffer from poor physical and mental health outcomes. The aim of this study was to examine the association of resilience with measures of mental and physical health. Our data were derived from the Native Elder Care study, a cross-sectional study of community-dwelling AIs aged 55 and older, conducted between 2006 and 2008. From a randomly-selected subsample of 189 Native Elder Care Study participants, 185 responded to the previously validated 10-item version of the Connor-Davidson Resilience Scale. Of these respondents, 25% reported low, 41% medium, and 34% high resilience. Unadjusted analyses revealed significant associations between resilience and depressive symptomatology, anxiety, and pain although there was not an association between resilience and medical comorbidity. Regression models were estimated for depressive symptomatology, anxiety, and pain controlling for demographic characteristics and the other measures of mental and physical health. Results indicated that those who reported high resilience scores had significantly lower odds of experiencing depressive symptomatology compared to those who reported low resilience (OR = 0.02, 95% CI = 0.00, 0.15) and pain (OR = 0.36, 95% CI = 0.15, 0.89). Resilience scores were not associated with anxiety. These findings suggest that resilience among older AIs may have important implications for physical and mental health outcomes. We will discuss the potential positive impact of resilience promotion programs on older AI health.

## RISK AND RESILIENCE: THE IMPACT OF SOCIAL DETERMINANTS AND PSYCHOSOCIAL STRESSORS ON DEPRESSION IN AFRICAN-AMERICAN OLDER ADULTS

K. Wright<sup>1,2,3</sup>, G.A. Pepper<sup>1</sup>, 1. *The University of Utah School of Nursing Hartford Center of Geriatric Nursing Excellence, Salt Lake City, Utah*, 2. *John A. Hartford Building Academic Geriatric Nursing Capacity Scholar, New York, New York*, 3. *Substance Abuse and Mental Health Services Administration MFP at ANA Fellow, Washington, District of Columbia*

**Introduction:** By 2020, depression will rank second in disease burden to cardiovascular disease. A paradox exists between the number of risk factors and prevalence of depression in African-Americans (AA) as compared to Caucasians, though studies are inconsistent regarding extent of depressive symptoms by race. **Purpose:** The purpose of this literature synthesis is to clarify the social determinants, psychosocial stressors and paradox of increased risk of depression in AA older adults. **Evidence Acquisition:** Relevant articles were identified through PubMed, Psych-Info and Cumulative Index of Nursing and Allied Health (CINHAL) databases and ancestral search. Total of 1319 articles were reviewed; 1144 excluded based upon the abstract and title; 175 evaluated for inclusion criteria: >10% of sample African-American; mean age >50; depression outcome (vs. predictor) variable. Total sample was 35 articles. Henning model was used for synthesis. **Evidence Synthesis:** Social determinants of health were consistent: those who were of a low-income and lived in disadvantaged neighborhoods had greater depressive symptoms. Neighborhood cohesion was a buffer against neighborhood disadvantage in AA. Greater social contact did not confer protective benefits. Individual level stressors such as primary care of grandchildren, lack of social ties, stigma, and racism/discrimination negatively impacted AA older adults. Spirituality/religion and adequate social supports may explain the paradox of lower depressive symptoms for AA older adults as compared to Caucasians in the face of greater cumulative stressors over the life course. **Conclusion:** Learning from the strengths of AA older adults that may buffer depressive symptoms can benefit all older adults; not just AAs.

## EFFECTS OF SELF-EFFICACY ON SUBJECTIVE FUNCTIONING, ACTIVITY, AND AUTONOMY IN MULTIMORBID ADULTS

R. Schwarzer<sup>1</sup>, L.M. Warner<sup>1</sup>, B. Schüz<sup>3</sup>, C. Tesch-Roemer<sup>2</sup>, S. Wurm<sup>2</sup>, J.P. Ziegelmann<sup>1</sup>, 1. *Freie Universität Berlin, Berlin, Germany*, 2. *The German Centre of Gerontology, Berlin, Germany*, 3. *University of Tasmania, Hobart, Tasmania, Australia*

Multimorbidity poses a threat to autonomy in older adults in line with less activity and compromised functioning. This study examined effects of self-efficacy on three outcomes: subjective physical functioning, physical activity, and perceived autonomy. The longitudinal study was conducted with 309 multimorbid older adults (aged 65–85) including three measurement points over 6 months. First, subjective physical functioning was regressed on health-specific risk perception and general self-efficacy. The latter two factors interacted in a way that risk perception predicted physical functioning only for individuals with low self-efficacy. Second, received friend support as well as self-efficacy were specified as predictors of exercise frequency. Besides main effects of social support and self-efficacy, an interaction between them emerged. Persons with low support were less likely to be active even if they were highly self-efficacious. Third, we tested effects of perceived self-efficacy and instrumental received social support on autonomy. Low self-efficacy and low support were jointly associated with lack of autonomy. However, the relation of self-efficacy with autonomy was also moderated by received support. The combination of high self-efficacy and low support yielded the highest level of autonomy. This is explained with higher need of support in multimorbid older adults who need outside help and who are competent in mobilizing such help. Receiving social support bolstered autonomy in lower self-efficacious

individuals, but in highly self-efficacious individuals support threatened autonomy.

## HARDINESS AND PROBLEM SOLVING STRATEGIES OF OLDER ADULTS ENGAGED IN INTENSIVE VOLUNTEERING

C. Cheek<sup>1</sup>, K.W. Piercy<sup>2</sup>, M. Kohlenberg<sup>1</sup>, 1. *Human Development and Family Studies, Penn State, Mont Alto, PA, Pennsylvania*, 2. *Utah State University, Logan, Utah*

For older adults, engaging in problem solving is often among their chief tasks. Hardiness, or dispositional resilience, is the ability to withstand stressors, and is related to the ability to solve problems. Kobasa (1979) maintained that hardiness consists of deep commitment to the activities of one's life, a positive attitude that appreciates challenge and change, and a belief that one can control or influence the events in one's experience. These characteristics were exhibited by 19 men and 18 women over 50 years old who demonstrated the components of hardiness in creatively solving problems in challenging circumstances of humanitarian and disaster relief service. The Mormons, Mennonites, and Lutherans who participated in this intensive volunteering, or volunteering done on a 24-hour basis away from home, averaged 56.24 years old (SD = 6.22), were mostly married (86.8%), and served an average of 81.95 weeks (SD = 61.2). Using interpretative phenomenological analysis, we found that not only were challenge, control, and commitment involved in problem solving, but among older volunteers, the overlap of these three components created secondary components that contributed strongly to problem-solving abilities. These included the use of life experiences as reservoirs of strategies, an emphasis on meaningful experience, and the use of values and social support in decision-making. Based on this data analysis, we suggest a model that will aid older adults in problem solving, one that reflects the use of both the main and secondary components of hardiness.

## DO ONLY THE STRONG SURVIVE? EXPLORING ADVERSITY AND RESILIENCE IN LATER LIFE

L. Manning, *Center for Aging/Dept of Sociology, Duke University, Durham, North Carolina*

Movement across the lifecourse assures that an individual will encounter a multitude of life events, and for some individuals these life events will be sources of hardship, stress, or trauma. What determines whether people flourish, languish, thrive or survive when encountering these events (Sarkisian & Lachs, 1996)? What circumstances increase the likelihood of having resilience, or the capacity to maneuver through adversity in a manner that protects health and well-being? Examining resilience considers how individuals recover from distressing events and persist through extreme adversities, while negotiating everyday aspirations and challenges in life (Maluccio, 2002; Zrally & Nyirazinyoye, 2010). Aging and the experience of being an older adult reveal and expose such aspirations, challenges, and complexities. Although aging affords many opportunities for growth and advancement, growing older also presents inherent challenges. It is the resilient individuals who can effectively and efficiently navigate adversity. Using grounded theory, an analysis of 60 qualitative interviews with older adults age 65 and older was conducted. In this study, the key factors of resilience in later life are investigated. Findings indicate that resilient elders engage in five key behaviors when navigating hardship: adversity confrontation, problem re-framing, resource mapping, self-preservation, and embracing uncertainty. From these findings, a mechanistic typology or an emergent theory of resilience and its linkages to health and well-being has been created. This work contributes to resilience research by offering an interdisciplinary perspective that examines the dynamics of over the lifecourse. Implications for increasing and enhancing resilience in older adult populations are considered.

## SESSION 2680 (SYMPOSIUM)

### BIODEMOGRAPHY OF AGING AND LONGEVITY

Chair: *M. Engelman, University of Chicago, Chicago, Illinois*  
Discussant: *C.L. Seplaki, University of Rochester, Rochester, New York*  
Discussant: *R. Varadhan, Johns Hopkins University, Baltimore, Maryland*

Demographic models that include an exponential rise in mortality hazards in adulthood have been shown to accurately describe the age pattern associated with many individual causes of death as well as all-cause mortality. This apparent commonality in hazard trajectories — despite differences in the underlying physiological mechanisms that cause them — suggests that all age-related pathologies are potentially multistage processes reflecting multisystem physiological dysregulation with age. In this symposium, we consider the biodemography of aging and longevity, using methods from formal demography, epidemiology, and statistics to describe the age pattern of mortality and dysregulatory patterns in aging populations. The first paper (Engelman et al.) provides an overview of mortality hazards across the age spectrum from early life to very old ages, and focuses on estimating the hazard's inflection point — the age when cohort mortality begins to increase exponentially with each passing year and the population can be described as “aging” by multiple statistical and mechanical definitions. The second paper (Gavrilova and Gavrilov) focuses on mortality at very old ages, and uses data on humans and rodents to demonstrate the persistence of the exponential pattern of mortality into the very oldest ages. The third and fourth papers (Dusseault-Bé langer et al. and Cohen et al.) shift the focus more specifically to biomarkers of aging, using novel statistical methods and two uniquely detailed longitudinal studies to describe variation in biomarkers across populations and time. Taken together, the papers explore the consistency of biomarker patterns with age-related physiological changes and increasing mortality risks.

### BIODEMOGRAPHY OF OLD-AGE MORTALITY IN HUMANS AND RODENTS

*N.S. Gavrilova, L.A. Gavrilov, NORC and the University of Chicago, Chicago, Illinois*

The growing number of persons living beyond age 80 underscores the need for accurate measurement of mortality at advanced ages. Earlier studies suggested that the exponential growth of mortality with age (Gompertz law) is followed by a period of deceleration, with slower rates of mortality increase. This study challenges earlier conclusions with new data from the U.S. Social Security Administration's Death Master File and survival records for laboratory mice and rats. Analyses of human extinct birth cohorts (1890-1898) demonstrated that mortality deceleration is far less pronounced when it is measured over monthly (rather than yearly) age intervals, and in higher-quality data. Mortality deceleration is also challenged by recent rodent data. Simulations show that some estimates of mortality may produce spurious mortality deceleration, while the Sacher estimate turns out to be the most accurate estimate of hazard rate. Supported by the National Institute on Aging (R01 AG028620 grant).

### UNDERSTANDING THE AGING PROCESS USING PRINCIPAL COMPONENT ANALYSIS ON LONGITUDINAL BIOMARKERS SUITES: INCHIANTI

*F. Dusseault-Bé langer<sup>1</sup>, A.A. Cohen<sup>1</sup>, Q. Xue<sup>2</sup>, L.P. Fried<sup>3</sup>, L. Ferrucci<sup>4</sup>, 1. Université de Sherbrooke, Sherbrooke, Quebec, Canada, 2. John Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. Columbia University Mailman School of Public Health, New York, New York, 4. National Institute of Aging, Baltimore, Maryland*

Last year, we presented data showing that 69 biomarkers from the Women's Health and Aging Study II dataset could be used to generate 3 stable axes that explained about 20% of the total variation in biomarkers. However, it was not clear if these results would extend to other

populations. How universal (or not) these results are gives a strong indication of the stability of physiological associations across populations. Here, we compare our previous results to those from nearly 100 biomarkers from the Italian InCHIANTI database collected on young and old individuals. Using Principal Component Analysis (PCA) and bootstrap methods, we show that this dataset generates four stable axes explaining 29.14% of the variance. Generally speaking, we are able to identify some relatively stable axes between InCHIANTI and WHAS, though the axes do not always correspond to existing conceptions of physiology, and there are important differences between the datasets as well.

### MULTI-SYSTEM BIOMARKER ANALYSES IN TWO AGING POPULATIONS: SAME BIG PICTURE, DIFFERENT DETAILS FOR WHAS AND INCHIANTI

*A.A. Cohen<sup>2,1</sup>, F. Dusseault-Bé langer<sup>2</sup>, L.P. Fried<sup>3</sup>, L. Ferrucci<sup>4</sup>, 1. Groupe de Recherche PRIMUS, Centre Hospitalier Universitaire de Sherbrooke, Sherbrooke, Quebec, Canada, 2. University of Sherbrooke, Sherbrooke, Quebec, Canada, 3. Columbia University Mailman School of Public Health, New York, New York, 4. National Institute of Aging, Baltimore, Maryland*

Recent studies have used various methodologies to examine how multiple biomarkers from different physiological systems co-vary during the aging process. Here, we present a comparison of such results between the Women's Health and Aging Study II and InCHIANTI datasets. Broadly speaking, for methodologies including multivariate distribution analysis and principal components analysis, the two datasets produce similar qualitative results: clearly identifiable and stable patterns amid substantial complexity. However, the precise details of which biomarkers associate with which others and how biomarkers associate with aging differs substantially between these populations. We conclude that population-level characteristics such as culture and diet may have a substantial influence on at least some aspects of aging physiology.

### THE QUIESCENT PHASE IN HUMAN MORTALITY: WHEN DO POPULATION START TO AGE?

*M. Engelman<sup>1</sup>, R. Varadhan<sup>2</sup>, C.L. Seplaki<sup>3,2</sup>, 1. Sociology, University of Chicago, Chicago, Illinois, 2. University of Rochester, Rochester, New York, 3. Johns Hopkins University, Baltimore, Maryland*

We investigate the transition between the quiescent phase in human mortality — ages when the mortality hazard is lowest — to the Gompertz phase, when mortality risks increase exponentially with age. Using non-linear fitting methods and data for cohorts born 1800-1919, we estimate the parameters of the Siler model, describing mortality hazards across the full age spectrum. We then calculate inflection points in the hazard curve and characterize changes in the starting and ending ages of the quiescent phase, describing differences over time and between sexes. As overall survival improved over time, the quiescent phase has gotten longer, with an earlier beginning in early childhood and a later end at the conclusion of the reproductive years. Biomarker data provide a key avenue for testing the quiescent phase hypothesis, allowing us to chart age-related physiological changes and examine the consistency of such patterns with growing mortality risks.

## SESSION 2685 (SYMPOSIUM)

### BODY COMPOSITION AND FUNCTIONAL/METABOLIC CONSEQUENCES OF WEIGHT REGAIN FOLLOWING INTENTIONAL WEIGHT LOSS IN OLDER ADULTS

Chair: *B. Nicklas, Wake Forest School of Medicine, Winston-Salem, North Carolina*

Discussant: *A.B. Newman, University of Pittsburgh, Pittsburgh, PA, Pennsylvania*

The prevalence of obesity, and its metabolic consequences, is increasing among all age groups, including in older adults who are at height-

ened risk for sarcopenia and osteopenia/osteoporosis. Yet, in addition to fat loss, weight loss achieved through caloric restriction and/or exercise results in significant loss of skeletal muscle mass and bone mineral density, which could exacerbate aging-related loss of mobility, fracture incidence, or chronic disease. Furthermore, most individuals will regain their lost weight over time. Since the accretion of muscle and bone are impaired with aging, weight loss and subsequent weight regain may result in persistent muscle and BMD loss, perhaps leading to heightened disease risk, as shown by data from the intervention trials in this symposium. The results of these studies highlight the urgent need to identify novel strategies to minimize weight loss-induced decreases of muscle and bone in older, obese patients with medical or functional complications that will benefit from weight loss. The first presentation discusses the extent of weight regain following intentional weight loss in older adults with knee osteoarthritis. The next presentation illustrates that bone mineral density lost during weight reduction may not be fully recovered with weight regain in hormone-deficient, postmenopausal women. The third presentation shows body composition and cardiometabolic risk factors are worse one-year subsequent to a weight loss intervention, compared to baseline, in women who regained their lost weight. The final presentation shows that performing aerobic exercise during intentional weight loss may provide longer-term metabolic benefit despite weight regain in postmenopausal women

### **SKELETAL EFFECTS OF WEIGHT LOSS AND REGAIN IN POSTMENOPAUSAL WOMEN**

W.M. Kohrt, K. Villalon, *University of Colorado, Denver, Colorado*

There is a loss of bone mineral density (BMD) with weight loss, even when generated through exercise training. Whether this decline in BMD is recovered with weight regain was studied in postmenopausal women (n=23) who completed a 6-month exercise-based weight loss program and 18-month follow-up. Women (age=57±5 yr; BMI=29.6±4.0 kg/m<sup>2</sup>) lost 3.9±3.5 kg during the weight loss intervention. During follow-up, they regained 2.9±3.9 kg. Weight loss resulted in decreased hip (-0.1±3.5%; P=0.03) and lumbar spine (LS; -1.7±3.5%; P=0.002) BMD, and was accompanied by increased bone resorption (serum C-terminal telopeptide of type I collagen, CTX: 34±54%; P=0.08). However, weight regain did not generate increases in LS (0.05±3.8%; P=0.15) or hip (-0.6±3.0%; P=0.81) BMD or a decrease in bone resorption (CTX: -3±37%; P=0.73). The findings suggest that BMD lost during weight reduction may not be fully recovered with weight regain in hormone-deficient, postmenopausal women

### **WEIGHT REGAIN FOLLOWING AN 18-MONTH INTENTIONAL WEIGHT LOSS TRIAL IN OLDER OVERWEIGHT/OBSE ADULTS WITH KNEE OSTEOARTHRITIS: THE IDEA FOLLOW-UP PILOT STUDY**

D.P. Beavers<sup>1</sup>, B. Nicklas<sup>1</sup>, J. Newman<sup>2</sup>, S.P. Messier<sup>2</sup>, *1. Wake Forest School of Medicine, Winston-Salem, North Carolina, 2. Wake Forest University, Winston-Salem, North Carolina*

This study determined the extent of weight regain and changes in gait speed in older overweight/obese adults with knee OA within a minimum of 2 years following completion of an 18-month weight loss intervention, with and without exercise (WL; WL+EX). Mean weight loss was 8.9kg (9.5%) in the WL and 10.6kg (11.4%) in the WL+EX groups. The first 166 randomized participants that completed the study are being recalled for an extended follow-up visit. Of the 22 measured to date (mean age=68±5.5yrs), preliminary evidence indicates increases in weight (4.3±5.7kg) and BMI (1.6±2.1kg/m<sup>2</sup>) from trial completion. However, on average, these remain reduced from baseline (weight= -4.8±6.1kg, BMI= -1.9±2.2kg/m<sup>2</sup>), with 4 (18%) participants with follow-up BMI exceeding baseline BMI. Likewise, walking speed at long-term follow-up was decreased from the end of the trial (-0.1±0.2m/s), but still higher than baseline (0.1±0.2m/s), with 6 (27%) participants showing slower long-term walking speeds than at baseline

### **BODY COMPOSITION AND CARDIOMETABOLIC RISK FACTOR CHANGES WITH INTENTIONAL WEIGHT LOSS AND SUBSEQUENT WEIGHT REGAIN**

K.M. Beavers, D.P. Beavers, M.F. Lyles, B. Nicklas, *Wake Forest School of Medicine, Winston-Salem, North Carolina*

This study determined how body composition and cardiometabolic risk factors change in the year following a 12% intentional weight loss in postmenopausal women. Measurements were taken in 78 women before, immediately after, and 12-months after the weight loss interventions. DXA scans showed that fat was regained to a greater degree than lean mass in women who regained weight. All risk factors (blood pressure, total, HDL, and LDL cholesterol, triglycerides, fasting glucose and insulin, and HOMA-IR) significantly improved with weight loss, but regressed toward baseline during the year subsequent to weight loss. Increases in total cholesterol, triglycerides, glucose, insulin, and HOMA-IR during the post-intervention follow-up were significantly associated with magnitude of weight regain. Comparison of baseline and 1-year post-intervention risk factors showed worse total and LDL cholesterol, insulin, and HOMA-IR in regainers (p<0.05), suggesting that intentional weight loss followed by weight regain may worsen specific cardiometabolic risk factors in postmenopausal women

### **DOES THE ADDITION OF EXERCISE DURING INTENTIONAL WEIGHT LOSS IN OBSE POSTMENOPAUSAL WOMEN PROVIDE METABOLIC BENEFIT DURING SIX MONTH WEIGHT REGAIN?**

M. Serra, A. Ryan, A. Goldberg, *University of Maryland, Baltimore, Maryland*

Weight maintenance after weight loss is difficult and body fat regain may be site specific. This study determined regional body composition and metabolic factors 6 months after intentional weight loss alone (WL, n=28) and with aerobic exercise (AEX+WL, n=23) in obese sedentary postmenopausal women (age:6±1 yrs, BMI:34±1 kg/m<sup>2</sup>, VO<sub>2</sub>max:19±1 ml/kg/min, X±SEM). During the 6-mo follow-up period, all women were given the option of attending a monthly nutrition class and the AEX+WL group could use the exercise facility. Fat mass, fat-free mass, visceral and subcutaneous abdominal fat, and subcutaneous mid-thigh fat decreased significantly after WL and AEX+WL and remained significantly lower at one-year than at baseline despite a small, but significant, gain in body weight during follow-up (WL= +1.9%; AEX+WL= +1.8% weight regain). Improved glucose tolerance and reduced post-prandial hyperinsulinemia were maintained during follow-up in AEX+WL, but not WL, suggesting that exercise may have long-term metabolic benefit despite weight regain

## **SESSION 2690 (SYMPOSIUM)**

### **HUMANITIES AND ARTS CHARTING A NEW FRONTIER IN GERIATRIC EDUCATION**

Chair: *A. Sherman, National Center for Creative Aging, Washington, District of Columbia*

Discussant: *G.P. Hanna, National Center for Creative Aging, Washington, District of Columbia*

The humanities and arts in geriatric education centers offers a new frontier to enhancing person centered care, learner centered strategies and evaluation methodology. This symposium will present best practices from three geriatric education centers utilizing the humanities and the arts to provide holistic interprofessional education from multiple perspectives as educational tools to improve the professional development of healthcare providers; clinical intervention to improve the quality of healthcare of older people and as evaluation methodology. The New England GEC will present a new way to see older artists living and working in local communities as role models for healthy aging to change attitudes positively toward the potential of older people later in life. Texas GEC charts a new course in highlighting cutting edge

national evidence based humanities and arts programs in improving the quality of healthcare serving people with Alzheimer's and dementia. WAGECC is using humanities and arts to improve person centered care through learner centered interdisciplinary programs featuring the use of story/narrative. Each center incorporates many different kinds of arts modalities and work with the life experience of older people, their families and caregivers to create communities based on strength and satisfaction while addressing the signs and symptoms of health and illness in later life. Evaluation methodology additionally incorporates the humanities and arts to encourage healthy work environments where caregivers can be assured of a safe process for mapping new ways in patient care and chronic illness.

#### **ART IN AGING - LIVING ART LIVING WELL STUDIO, A MODEL FOR GERIATRIC EDUCATION**

J.A. Metcalfe<sup>1</sup>, C. Paolini<sup>2</sup>, 1. *National Center for Creative Aging, Washington, District of Columbia*, 2. *UNE Maine Geriatric Center, Portland, Maine*

The UNE-MGEC "Living Art Living Well Studio" is a 4 part studio series designed for health professionals, health professions faculty and students to improve awareness and knowledge regarding the impact of Art in aging and how creativity matters to the health of the body, mind and spirit of older adults. UNE-MGEC has partnered with the Maine Arts Commission and Cultural Resources to develop this model learning series. Each studio involves an elder Maine Master Artist and apprentice recruited from the 20 year old Maine Arts Commission's Traditional Arts Apprenticeship Program. Each studio is one and one half hours in length. The first part involves Master Artist and apprentice life review, facilitated by a folklorist. The second part explores the intersection of the role of art in aging as one grows older through the lens of the elder Master Artist and the importance of passing cherished legacy to the next generation.

#### **THE HUMANITIES AND ARTS ENHANCING PERSON CENTERED CARE IN GERIATRIC EDUCATION**

B. Lunsford, 1. *National Center for Creative Aging, Washington, District of Columbia*, 2. *Washington Area Geriatric Education Center consortia, Washington, District of Columbia*

WAGECC will describe two ways of using the humanities and creative arts to enhance ongoing professional development programs in geriatric education. First humanities and arts are used in teaching person centered care. Along with different arts forms, the use of story helps learners gain a more holistic perspective of older people and their families. This kind of education may use case studies and/or narratives that illustrate the lived experience around their health and illness, job, family, hobbies and existential dimensions. The second way the humanities and arts are used is to engage the learner more fully in the learning experience. This provides a more learner centered approach and models the value of person-centered interactions and relationship building for the caregiver. WAGECC is developing methodology for evaluating the use of humanities and arts as it is integrated throughout the inter-professional educational programs, which supports a culture of evaluation across settings.

#### **ARTS FOR PLEASURE, ARTS FOR THERAPY: LESSONS FROM GSA HUMANITIES AND ARTS IN GERIATRIC EDUCATION**

R. Roush, 1. *National Center for Creative Aging, Washington, District of Columbia*, 2. *Texas Consortium Of Geriatric Education Centers, Houston, Texas*

Nearly five million persons 71 y.o. and older (22%) have mild cognitive impairment without dementia that adversely affects memory and other executive functional capacities (Plassman 2007). For this group and the five million persons with Alzheimer's disease, creative approaches are needed to assist them and their caregivers cope with the

marked changes in their lives. The arts can be a helpful adjunct to traditional health care practices for those who now and who will have dementia. This presentation summarizes the 1) the relationship between the plasticity of the brain and the arts, 2) use of the literary device narrative medicine, 3) how exposure to great works of art evokes emotional memory among persons with AD; and 4) cases of persons with dementia whose engagement in the arts helped them cope. This presentation will make the case for more research to target an art form as the independent variable and measure in the hypothesizing change on the dependent one related to geriatric education..

### **SESSION 2695 (SYMPOSIUM)**

#### **METHODOLOGICAL ISSUES IN CONDUCTING RESEARCH WITH OLDER ADULTS: CHALLENGES FACED BY BAGNC ALUMNI**

Chair: *C.R. Shillam, Betty Irene Moore School of Nursing, University of California, Davis, Sacramento, California*

Discussant: *E.O. Siegel, Betty Irene Moore School of Nursing, University of California, Davis, Sacramento, California*

Increasing demand for adaptations in methodological approaches to research with older adult populations brings new and unexpected challenges in conducting such pioneering studies. This panel of Building Academic Geriatric Nursing Capacity (BAGNC) alumni will present a variety of issues experienced in their own innovative research approaches. First, electronic medical records in academic medical centers can serve as a valuable contribution to clinical research. However, these systems are designed for clinical use and challenges arise when attempting to retrieve data for research: poor data quality and difficulty with defining variables for data collection and analysis. Second, community based participatory research methods enhance the relevance of findings for researchers, participants, and the larger community. Identifying and establishing community partnerships when conducting research involving older adults can be difficult. Third, accessing caregivers of frail older adults for research is critical to understanding best practices for support of the caregiver-care recipient dyad. Recruiting caregivers while maintaining confidentiality of care recipients can be problematic. Fourth, conducting facility-based psychophysiologic research with older adults can be challenging. Analyzing field notes across these types of studies may provide clues for researchers about ways to improve the methodology for this type of research. This panel will present challenges researchers face when working with older adult populations. The discussant, Dr. Elena O. Siegel, will provide a synthesis of the issues presented and facilitate a discussion of strategies to successfully address these often-times difficult situations.

#### **METHODOLOGICAL COMPLEXITIES OF USING ELECTRONIC MEDICAL RECORDS AS A DATA COLLECTION TOOL**

*C.R. Shillam, Betty Irene Moore School of Nursing, University of California, Davis, Sacramento, California*

According to the National Institute of Health, the use of electronic medical records (EMR) in academic medical centers can serve as a valuable contribution to clinical research. However, these systems have been designed for clinical use and many challenges arise when attempting to use this data source for conducting research. Data collection of variables supported by the state of the science may not be possible based on the way in which the data are entered into the EMR. Additionally, the quality of the data is often inconsistent and acquiring adequate data for meeting statistical power requirements can be cumbersome. Having a well-balanced interprofessional team is one strategy for success with this approach to using EMR as a mechanism for data collection. Strong conceptual definitions of variables also aid in identifying how to capture data in a system designed for clinical use and not for research.

## **THE EXPERIENCE OF CARING FOR YOUR SPOUSE WITH ADVANCED HEART FAILURE: A RICOEURIAN PHENOMENOLOGY**

H.C. Bursch, *Adult and Gerontological Nursing, College of Nursing, The University of Iowa, Iowa City, Iowa*

Although not commonly used in the United States, Ricoeurian Phenomenology is a valuable qualitative method to study caregivers of older adults with advanced heart failure (AHF) because it is grounded in a philosophy that allows caregivers to consider their intention for how to be with their care recipients (CRs) at the end of life. However, the method requires deep reflection and has special implications for older adults. This study describes challenges encountered in recruiting caregivers as separate entities while protecting CR confidentiality. Recruiting AHF caregivers can be challenging when the prognosis of end-of-life is uncertain and healthcare providers are hesitant to introduce palliative care discussions. Valuable lessons-learned about both the methodology and the sampling techniques in this population of caregivers dealing with complex illness presentations at the end of life will be presented.

## **FINDING THE RIGHT RURAL COMMUNITY PARTNERS FOR INJURY RESEARCH IN OLDER ADULTS**

L.S. Edelman, *College of Nursing, University of Utah, Salt Lake City, Utah*

Rural populations are aging faster than urban populations. Rural older adults have injury risks influenced by individual health, social and economic factors, as well as community and environmental factors. It is, therefore, important to conduct research of individual and community perceptions of injury risks. When conducting community based participatory aging research in rural communities, researchers need to identify potential community partners who are: (a) knowledgeable about the older adult population; (b) concerned about their health status and quality of life; and (c) interested in partnering with aging researchers. Finding the right community partners can be daunting and time consuming for researchers new to the community. Networking with other researchers and community leaders, taking the time to meet with individuals and agencies working with older adults, and listening to community concerns are important when building and sustaining research partnerships that can impact injury risks in rural older adults.

## **CONDUCTING PSYCHOPHYSIOLOGIC RESEARCH IN NURSING FACILITIES: ISSUES AND CHALLENGES**

L. Nowak, J.E. Davis, *Wayne State University, Detroit, Michigan*

Conducting any form of research within nursing facilities can be challenging, but conducting psychophysiologic research can be particularly complicated. Contextual field data collected over the course of a study can provide a critical lens through which results can be examined and interpreted, and can provide important additional information necessary to strengthen the design of subsequent methodologically sound research studies. This study will utilize a descriptive qualitative design to examine the field diaries of three psychophysiologic studies conducted within the environment of nursing facilities. Results may identify issues specific to this type of research and setting. Further research to examine issues and challenges associated with conducting psychophysiologic research in nursing facilities are needed.

## **SESSION 2700 (SYMPOSIUM)**

### **PUBLIC AWARENESS AND FAMILY CAREGIVING: IMPROVING ACCESS TO INFORMATION AND SUPPORT**

Chair: *D.J. Sheets, School of Nursing, GEOTOP, Victoria, British Columbia, Canada*

Co-Chair: *M. Marcus, Weinberg Foundation, Owings Mills, Maryland*

Discussant: *S. Markwood, N4A, Washington, District of Columbia*

Family caregivers provide 80% of the long-term care services in the United States. While caregivers often take great satisfaction in their role, the demands can be extraordinary and can have significant adverse health impacts. The need for caregiver education and support to effectively

manage the caregiving role is well-recognized among professionals but raising public awareness of family caregiving needs remains challenging. Between 2009-2012, The Weinberg Foundation awarded \$8 million in funding to 14 non-profit organizations aimed at developing evidence-based and innovative programs to support family and informal caregivers for older adults. Three of the Weinberg projects discuss their strategies to improve public awareness about family caregiver challenges, to explicitly recognize the support family caregivers provide, and to increase access to education and supportive services. One panelist discusses methods for creating cultural acceptance of dementia and caregiving among Asian Americans in which multiple family members are often involved as caregivers. The second panelist presents findings from implementation of the Dementia Care Network model within a diverse Asian community in downtown Los Angeles which was effective in raising public awareness of dementia and the need for caregiver support. The final panelist describes the use of an innovative online caregiver self-assessment that has effectively reached caregivers, providing needed information about and connections to appropriate services earlier in the caregiving trajectory. Findings emphasize the importance of collaborative partnerships to ensure that culturally sensitive and context-specific approaches are used to reach caregivers with lessons drawn that inform other public awareness efforts.

## **ENGAGING FAMILY CAREGIVERS THROUGH COMMUNITY EDUCATION**

D.L. Yee<sup>1</sup>, L. Revilla<sup>1</sup>, L. Hinton<sup>2</sup>, E. Yau<sup>3</sup>, *1. Asian Community Center, Sacramento, California, 2. University of California Davis, Davis, California, 3. Alzheimers Association, Northern California, Mountain View, California*

Introductory skill-building presentations to inform family caregivers about dementia, brain health, and care management were developed by Bridge to Healthy Families (BHF): 84 sessions involving one to 208 family caregivers were conducted over 30 months. BHF aims to reach Asian American caregivers and improve access to appropriate supportive services. Community education can rely on one-time outreach efforts. BHF engaged diverse groups in its presentation to raise awareness and create cultural acceptance around dementia and caregiving. Multiple members of families were invited to multiple sessions: enlarging family dialogue and a language of caregiving. BHF broadens understanding of Asian American family caregiving, and how paid providers might collaborate with family caregivers to achieve shared objectives for quality care and quality of life.

## **AN INNOVATIVE APPROACH TO EARLY CAREGIVER INTERVENTION**

A. Kelly, *Share the Care, Inc., Orlando, Florida*

Family caregiving often becomes an explicit journey as the result of a caregiving crisis. One element that contributes to this burdensome, crisis-oriented reality is the fact that family caregivers identify themselves as caregivers late in the caregiving trajectory. CaregiverCentral.org is an online self-assessment tool designed to reach caregivers early using creative media and community-based marketing outlets. After answering questions about the caregiving situation, including some demographic details, caregivers receive a menu of information and specific appropriate services designed to meet their self-assessed needs. Two years of data show that the online self-assessment reaches family caregivers who are early in the journey and who are uninformed about available services.

## **DEMENCIA CARE NETWORKS: BUILDING CAREGIVER SERVICES THROUGH PARTNERSHIPS AND EDUCATION**

D. Cherry, S. Howland, *Alzheimer's Association, Los Angeles, California*

Asian Pacific Islanders are the fastest growing population of older adults in the United States. As a result of their aging population, they face a higher prevalence of Alzheimer's Disease and related disorders. The number of

Asian-Americans with Alzheimer's is expected to triple within in the next twenty years while for the Caucasian population the numbers are expected to double. These conditions are particularly stigmatized in many API cultures. This prevents families from seeking information and assistance. Dementia Care Networks are an inter-organizational model between mainstream aging service providers, like the Alzheimer's Association, and ethnically-focused health and social service agencies. The model relies upon inter-organizational learning, gradual establishment of trust, and joint community education to increase awareness of dementia and to develop supportive services for patients and their families. This presentation will focus on strategies and materials used in Los Angeles to raise public awareness and develop resources for API's living with dementia and for their families.

## SESSION 2705 (PAPER)

### HEALTH RISKS: CHRONIC AND ACUTE ISSUES

#### ARE RESPONDENTS IN PANEL SURVEYS CONSISTENT IN THEIR SELF-REPORT OF CHRONIC DISEASES?

C. Cigolle<sup>1,2,3</sup>, A.R. Quinones<sup>4,5</sup>, J.M. Bennett<sup>6</sup>, C. Blaum<sup>2,3</sup>, J. Liang<sup>6</sup>, 1. University of Michigan Department of Family Medicine, Ann Arbor, Michigan, 2. University of Michigan Department of Internal Medicine, Ann Arbor, Michigan, 3. VA Ann Arbor Geriatric Research, Education and Clinical Center (GRECC), Ann Arbor, Michigan, 4. Oregon Health & Science University Department of Public Health & Preventive Medicine, Portland, Oregon, 5. Portland VA Medical Center, Portland, Oregon, 6. University of Michigan School of Public Health, Ann Arbor, Michigan

Chronic disease data from longitudinal health interview surveys are frequently used in epidemiologic studies. Yet, these data may be limited by discrepancies in self-report by respondents across interview waves. We examined disease discrepancies in the Health and Retirement Study (HRS) and investigated a multi-step method of adjudicating discrepancies across waves. We hypothesized that discrepancies were associated with lower socioeconomic groups and varied by disease. We analyzed waves 1998-2006 of the HRS, a nationally-representative longitudinal health interview survey. Our study sample included adults  $\geq 51$  years ( $n=17,517$ ) who participated in  $\geq 1$  interview. Diseases included hypertension, heart, lung, diabetes, cancer, arthritis, and stroke. We used questions about the diseases (e.g., treatment) to formulate a 3-step adjudication method to resolve discrepancies in respondents' self-report of diseases across HRS waves. 20.1% of respondents had a discrepancy involving 1 disease; 5.4% had discrepancies involving  $\geq 2$  diseases. Hispanics and those with  $<12$  years of education were more likely to have discrepancies ( $p<.01$ ). Discrepancies were least frequent for hypertension and most for lung disease. By 2006, the absolute differences in disease prevalence between the original data and adjudicated data varied from 1.5% for cancer to 6.4% for arthritis. Some relative differences in prevalence were sizeable, e.g., lung disease, 31.0% (11.3% vs. 14.8%). Discrepancies in self-report of diseases across multiple waves of health interview surveys vary by ethnicity, education, and specific disease. Differences in disease prevalence between original and adjudicated data accumulate across succeeding waves, such that relative differences in prevalence may be substantial, with implications for research using these data.

#### TRAJECTORIES OF SELF-RATED HEALTH AMONG MIDDLE-AGED PERSONS WITH SELF-RATED POOR VISION

B. Steinman<sup>1</sup>, N. Kwan<sup>1</sup>, K.J. Johnson<sup>1</sup>, A. Chun<sup>2</sup>, 1. Institute for Community Inclusion, University of Massachusetts, Boston, Boston, Massachusetts, 2. University of Southern California, Los Angeles, California

There is growing interest in improving trajectories of decline often observed in various measures of health and functioning among older

adults with poor vision. Increasingly, self-rated health (SRH) is used as a measure of overall health due to its high correlation with more objective outcomes such as diagnosis of chronic diseases, depression and mortality. In the current study, we examined the contribution of socioeconomic status (SES) at midlife on SRH of aging persons with self-reported vision impairment. Using six waves (1998-2008) of data from the Health and Retirement Study, we compared the trajectories of SRH among 9,311 individuals ages 50 to 64 at baseline with poor, fair, and good self-rated vision. We assessed the degree to which SES among persons with vision impairment contributes to changes in SRH over a 10-year period. Individual growth models indicated SRH worsened over time for all vision groups. Compared with individuals with no vision impairment, individuals with fair and poor vision reported significantly worse SRH. However, the rate of deterioration in SRH for individuals with poor vision was slower even when demographics, SES, health behaviors, health status, and mortality were adjusted. These findings suggest that self-rated vision status is a significant component of SRH from midlife into older adulthood, even when disadvantages associated with SES are taken into account. In addition, slower decline of SRH for those with poor self-rated vision may reflect differences in strategies for adjusting to health problems and poor vision over time by this population.

#### INCONTINENCE AMONG OLDER PERSONS IN THE UNITED STATES

Y. Gorina, A. Bercovitz, S.M. Schappert, National Center for Health Statistics, Hyattsville, Maryland

Incontinence affects quality of life and is one of the functional decline predictors. It presents a significant financial and caregiver burden. We will use the National Health and Nutrition Examination Survey to present the estimates of incontinence among non-institutionalized persons aged 65 and over; National Survey of Residential Care Facilities for prevalence of incontinence in residential care facilities; Long Term Care Minimum Data Set for estimates among long-term care facilities residents; Medicare Current Beneficiary Survey to examine the trend in incontinence among Medicare beneficiaries aged 65 and over; National Ambulatory Medicare Care Survey and National Hospital Ambulatory Medicare Care Survey for ambulatory care visits with a diagnosis of incontinence; and National Home and Hospice Care Survey for estimates of incontinence among home health care and hospice patients. These estimates will be included in an upcoming National Center for Health Statistics report on incontinence. Our preliminary results show that among non-institutionalized persons aged 65 and over 43.0% (SE 2.10%) experienced bladder incontinence, twice as much women as men, while in the nursing home this percentage was about 70% both for men and women. The percentage with bowel incontinence was 14.8% (SE 1.0%) among non-institutionalized persons aged 65 and over, 20.8% (SE 1.0) among those in the residential care facilities, and 65.7% (SE 0.2%) in the nursing homes, about the same for men and women in all settings. We will describe definitions of incontinence in each data system and address the challenge of presenting the data from different sources.

#### NURSING HOME ACQUIRED UTI INFECTIONS

J. Engberg<sup>1</sup>, N. Castle<sup>2</sup>, J.C. Ferguson-Rome<sup>2</sup>, L. Wagner<sup>3</sup>, 1. RAND Corporation, Pittsburgh, Pennsylvania, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, 3. New York University, New York, New York

Our research examined the factors associated with acquiring a urinary tract infection (UTI) while a resident in a nursing home. We examined all nursing home residents in the United States on April 1, 2006 who did not have a UTI ( $n=1,138,418$ ). We followed these residents until they contracted a UTI (9.5%), died (8.3%), left the nursing home (33.2%) or the year ended (49.0%). We estimated a Cox proportional hazards model, controlling for resident and facility characteristics and

for the state of residence. We found that men were 63% as likely as women to get UTIs. African American and other minority residents were 72% and 84% as likely to get UTIs as white residents, respectively. Older residents were more likely to get a UTI. Many of the indicators of frail or declining health status, including low cognitive function, presence of physical restraints, inability to perform ADLs, depression, pressure ulcers, use of psychoactive drugs, trouble walking and haven recently fallen were associated with an increase in the likelihood of getting a UTI ranging from 5 to 25%. Not surprisingly, the largest associations were those with lack of bladder control (AOR=1.4) and having an indwelling catheter (AOR=3.3). Associations with facility characteristics including staffing levels (NA, LPN, RN), facility size, percent Medicaid residents, percent occupied, urban setting, for-profit and chain status were much smaller. The standard deviation in the AORs associated with state of residence was 0.17, suggesting large geographic variation. We discuss implications for cost and for infection control practice and policy.

## SESSION 2710 (PAPER)

### INTERVENTIONS AND APPROACHES TO SUCCESSFUL AGING

#### WILD BLUEBERRY HEALTH STUDY: TEN YEAR REPORT

A. Wetherell<sup>1</sup>, R. Schnoll<sup>2</sup>, H.A. Raphaelson<sup>3</sup>, A. Pruchnicki<sup>4</sup>, B.S. Kristal<sup>5</sup>, D. Doiron<sup>3</sup>, D.J. Burns<sup>3</sup>, R.J. Martin<sup>6</sup>, 1. *Defence Science & Technology Laboratory (Retired), London, United Kingdom*, 2. *Department of Health and Nutrition Sciences Brooklyn College, Brooklyn, New York*, 3. *Mansfield Senior Center, Mansfield, Connecticut*, 4. *St. Luke's Roosevelt Hospital, New York City, New York*, 5. *Kristal Center, Weymouth, Massachusetts*, 6. *MMT Corporation, Sherman, Connecticut*

Background: Inspired by the results of Joseph et al. (*J.Neurol*1999;19(18):8114-21) we began evaluating wild blueberry health effects via the Internet in 2002. Methods: Recruitment, parallel group/crossover design, repeated measurements, statistics and multivariate analysis are described at [Blueberrystudy.com](http://Blueberrystudy.com) and in patents 6,712,615 and 8,095,480. Results: Decision-speed improved 4.2% within one week and maintained this gain over four weeks [N=97; p=0.024]. Self-reported sharpness, energy, aches, peacefulness, mood, sleep quality and overall health each improved within four weeks [N=99; p for each<0.02]. Odds of long-term word recall score improvement vs. decline were 7 to 1. Year-after-year word recall scores generally improved by 0.5-1% per year until scores of 100% correct were obtained. The rate of year-after-year improvement was unrelated to the number of measurements each year. Individual participants were able to measure memory score changes as small as 0.5% per year within their personal data sets at 95% confidence by conducting 150 or more measurements/year. Glutathione-S-transferase, a detoxification enzyme related to resistance to Alzheimer's and Parkinson's diseases, was detectable in 0/12 participants before and 5/12 after two months of 1-cup/day blueberry consumption. Serum glutamic oxaloacetic transaminase also increased slightly while significant decreases (p<0.05 without correction for multiple comparisons) were observed for carcinoembryonic antigen, gamma-glutamyl transferase, interleukin-1 $\beta$ , total cholesterol and uric acid. Conclusions: Wild blueberries can be safely consumed each day for many years. Word recall scores for long-term participants improved steadily until reaching 100% correct. Internet measurements can be more precise than laboratory measurements because averaging scores over time removes good-day/bad-day effects.

### SPIRITUALITY, RELIGIOUS COPING, AND OVERALL LIFE SATISFACTION AMONG MIDDLE-AGED AND OLDER CARDIAC PATIENTS

L. Noel<sup>1</sup>, A.L. Ai<sup>1</sup>, F.P. Hopp<sup>2</sup>, 1. *College of Social Work, Florida State University, Tallahassee, Florida*, 2. *Wayne State University, Detroit, Michigan*

BACKGROUND: Cardiac surgery is a potentially life changing event, but most research studies have focused on pathology related outcomes. We explore enhanced spiritual connectedness as a dimension of life satisfaction (eudaemonic well-being) in aging and mental health research. Specifically, this prospective study examined the effects of preoperative faith factors on perceived spiritual support, an indicator of spiritual connectedness, 30-months following cardiac surgery. METHODS: A two-wave (preoperative and 30-month follow-up) survey (n=226). Measures included cardiac indices from the Society of Thoracic Surgeons' National Database, left ventricular ejection fraction, New York Heart Association Classification, baseline health (physical and mental), optimism, hope, religiousness, prayer coping, religious/spiritual coping, and demographics. RESULTS: hierarchical regression showed that preoperative prayer coping, subjective religiosity and internal control were positive predictors of perceived follow-up spiritual support. Negative religious coping predicted lower levels of perceived spiritual support. These effects were not eliminated by entering expected mediators (various health locus of control beliefs), though preoperative internal locus of control also predicted higher levels of perceived spiritual support. CONCLUSIONS: Spiritual, coping-related experiences before cardiac surgery may enhance perceived existential relatedness long after the event. Future research should investigate mechanisms underlying this association.

### CYSTATIN C AND TRAJECTORY OF LOWER EXTREMITY PERFORMANCE IN OLDER WOMEN: STUDY OF OSTEOPOROTIC FRACTURES (SOF)

K. Ensrud<sup>1</sup>, L. Lui<sup>2</sup>, P.M. Cawthon<sup>2</sup>, L. Fredman<sup>3</sup>, Y. Slinin<sup>1</sup>, T.A. Hillier<sup>4</sup>, J.A. Cauley<sup>5</sup>, 1. *VA Medical Center / University of Minnesota, Minneapolis, Minnesota*, 2. *California Pacific Medical Center Research Institute, San Francisco, California*, 3. *Boston University, Boston, Massachusetts*, 4. *Kaiser Permanente Northwest, Portland, Oregon*, 5. *University of Pittsburgh, Pittsburgh, Pennsylvania*

Serum cystatin C (cysC) is a biomarker of renal function; lower levels indicate better function. Lower cysC has been associated with better lower extremity performance score in older adults, but the longitudinal association between cysC and the trajectory of performance later in life is uncertain. To determine the association between cysC and the subsequent 10-year trajectory in lower extremity performance, we measured serum cysC in a random sample of 1295 women (mean age 79.5 years) who completed gait speed and five-chair-stands tests at the SOF Year 10 examination. These performance tests were repeated at Year 16 and Year 20 exams. A modified Short Physical Performance Battery (SPPB) summary score (range 0-8) based on gait speed and chair stand tests was created for each participant at each time point. Random effects regression was used to determine a SPPB slope for each participant (median -0.27, interquartile range -0.20 to -0.37) which was categorized as minimal decline (Q1, n=324), usual decline (Q2-Q3, n=648), and accelerated decline (Q4, n=323). After adjustment for age, education, health status, prior stroke, prevalent diabetes, and body mass index, each 1 SD decrease in cysC was associated with a higher odds of minimal SPPB decline vs. usual SPPB decline (OR 1.41, 95% CI 1.17-1.70) and a lower, albeit not significant, odds of accelerated SPPB decline vs. usual SPPB decline (OR 0.93, 95% CI 0.81-1.06). Among older women, lower cysC was associated with a higher likelihood of successful aging as manifested by a favorable 10-year trajectory of lower extremity performance.

## MOBILE DIABETES INTERVENTION FOR BLOOD GLUCOSE CONTROL: CHALLENGING AGE MISCONCEPTIONS

C.C. Quinn<sup>1</sup>, A.L. Gruber-Baldini<sup>1</sup>, M. Shardell<sup>1</sup>, M. Terrin<sup>1</sup>, E. Barr<sup>1</sup>, D. Park<sup>2</sup>, F. Shaikh<sup>2</sup>, M. Brazda<sup>1</sup>, 1. *University of Maryland School of Medicine, Baltimore, Maryland*, 2. *UMBC, Catonsville, Maryland*

**Objective:** To assess differences in effects of mobile phone diabetes coaching and web portal intervention on blood glucose (HbA1c) levels in younger and older patients with Type 2 diabetes. **Methods:** A cluster-randomized clinical trial conducted November 2007 to January 2010. Patients (n=118) of primary care practices in the Baltimore area were enrolled and randomly assigned into usual care (control) (n=56) and intervention (n=62) groups. The patient intervention was a mobile phone coaching system and access to individualized web portal. Intervention group providers received reports summarizing patient's glycemic control, diabetes medications, lifestyle behaviors, and treatment options. **Measurements:** Primary outcome for this analysis was 12-month change in blood glucose (HbA1c level). Participants were stratified by age into two groups: younger (<55 years; control n=29; intervention n=37) and older (≥55 years; control n=27; intervention n=25). Linear mixed effects models were used to assess whether the intervention affected HbA1c differently depending on age. **Results:** The intervention resulted in significantly greater 12-month declines in HbA1c, compared to control, for patients in both age groups (p=0.04). Among older participants, HbA1c declined by 1.7% in intervention group and 0.3% in controls. Among younger participants, HbA1c declined by 2.0% in intervention group and 1.1% control group. Treatment effect did not significantly differ by age (p=0.26). This result was not effected by controlling for duration of diabetes or baseline HbA1c levels. **Conclusion:** Mobile technology interventions can be effective in both younger and older diabetes patients. Assisting older adults to manage their diabetes using mobile health is effective.

## USING A SINGLE BODY-WORN SENSOR FOR EVALUATING MOBILITY AND SUB-TASKS OF THE TIMED UP AND GO IN COHORT STUDIES OF AGING

J. Hausdorff<sup>1,2</sup>, A. Weiss<sup>1</sup>, A. Mirelman<sup>1</sup>, A.S. Buchman<sup>3</sup>, D.A. Bennett<sup>3</sup>, 1. *Tel Aviv Sourasky Medical Center, Tel Aviv, Israel*, 2. *Tel Aviv University, Tel Aviv, Israel*, 3. *Rush Alzheimer's Disease Center, Rush University Medical Center, Chicago, Illinois*

**Objective:** The Timed Up and Go (TUG) test is widely used to assess mobility and fall risk among older adults using a stopwatch. The objectives of this study were to demonstrate that a body-worn sensor in the community-setting could be used to automatically quantify mobility, in lieu of a stopwatch, and augment conventional testing by measuring different TUG subtasks among older fallers and non-fallers. **Methods:** 327 participants (mean age 83.6±6.8 yrs, 76% female) were recruited from the Rush Memory and Aging Project, a community-based, longitudinal cohort study. As part of their annual testing in their home, subjects performed two TUG trials while wearing a small, light-weight sensor on a belt. The sensor measures both acceleration and angular velocity in 3 directions. Time to complete the task was automatically determined. We derived measures of overall TUG performance and 4 different subtasks: transitions (sit-to-stand, stand-to-sit), walking, and turning. Multivariate analysis identified differences between fallers and non-fallers. **Results:** Time to complete the TUG was not different between the fallers (N=82) and non-fallers (p=0.182), but TUG subtask measures derived from the body-worn sensor differed. Fallers had a higher step duration when walking (p=0.014), a higher pitch range during the stand-to-sit (p<0.001), and tended to take more time to complete the turn (p=0.051). **Conclusions:** A single body-worn sensor can be used in the community-setting to automatically quantify TUG duration and to assess specific TUG subtasks that complement the traditional measure of time to completion. This apparently facilitates the identification of individuals at risk of falling.

## SESSION 2715 (PAPER)

### MENTAL HEALTH AND ASSOCIATED BIOMARKERS

#### ON-LINE WEEKLY SELF-REPORT OF LOW MOOD IN OLDER ADULTS WITH MILD COGNITIVE IMPAIRMENT

J. Kaye<sup>1,3</sup>, N.C. Mattek<sup>1,3</sup>, S.M. Thielke<sup>2,3</sup>, K. Wild<sup>1,3</sup>, T. Hayes<sup>1,3</sup>, 1. *Oregon Health & Science University, Portland, Oregon*, 2. *University of Washington, Seattle, Washington*, 3. *Oregon Center for Aging & Technology, Portland, Oregon*

**Background:** Depression in Mild Cognitive Impairment (MCI) is associated with progression to dementia. Little is known about self-reported subsyndromal depression or low mood in older adults especially related to common life events. **Objectives:** To investigate the prevalence of self-reported low mood among older adults without depression and to compare reports of low mood between MCI and cognitively intact volunteers relative to life events. **Methods:** Participants were enrolled in a longitudinal aging study. They received a weekly online health questionnaire posing nine questions about mood ("During the last week, have you felt downhearted or blue for more than three days?"), health (e.g. falls, ER visits), and socialization. Cognitive impairment was defined using standardized cognitive assessments and pre-defined algorithms. **Results:** Of 208 participants, 38 (18%) were classified as MCI. Mean age was 83.4 yrs (SD: 5.3); 75% female. Median Geriatric Depression Scale at baseline was 0 (SD: 1.3). During two years of continuous weekly follow-up, relatively more MCI participants reported low mood at least once, 41% vs 23%, p=0.025. There were no self-report differences on the other eight questions. **Conclusions:** In a non-depressed cohort, MCI participants were more almost twice as likely to report low mood using a weekly online questionnaire. This frequent method of prospective data acquisition may be required to capture more subtle mood changes that by themselves suggest a vulnerability to cognitive decline regardless of progression to depression. Further longitudinal follow-up will identify the relationship of these low mood changes to other markers associated with susceptibility to MCI.

#### MODELING SENEESCENCE: MORTALITY PREDICTIONS USING CALCULATED RATES OF AGING

M.E. Levine, E. Crimmins, *Davis School of Gerontology, Univ Southern California, Los Angeles, California*

Aging affects nearly every biological system and has implications for morbidity and mortality. Nevertheless, the rate of inter-individual changes is variable, potentially as a result of environmental, behavioral and genetics differences. The aim of our study is to develop an index of "biological age" that, when contrasted with chronological age, can be used to identify accelerated or decelerated agers. Our sample included 9,213 persons aged 30-75 from NHANES III. Using sex-stratified models, eleven biomarkers were regressed on age to generate an equation from which to calculate expected biological age. To validate our measure of biological age, we compared predictions of twelve-year mortality for subjects aged 45-75 to those made by chronological age using Receiver Operating Characteristics. For both sexes, biological age was found to be a significantly better predictor of mortality compared to chronological age. Next, quintiles of differences between chronological age and model estimates of biological age were used to categorize subjects as accelerated or decelerated agers. Finally, differences in disease-specific mortality by aging-rate were evaluated using measures of relative risk. Results showed that, cardiovascular and cancer mortality were 3.6 and 5.5 times as high, respectively, for males in the highest versus the lowest aging-rate quintile, and 7.1 and 2.8 times as high, respectively, for females in the highest versus the lowest aging-rate quintile. The development and validation of an accelerated aging construct is valuable given its impact on our theoretical understanding of the aging process,

and the development of preventative interventions with implications for health and longevity.

### **SUICIDE IN OLDER ADULTS: RESULTS FROM THE NATIONAL POISON DATA SYSTEM, 2000-2009**

D.J. Cobaugh<sup>1</sup>, M.J. Miller<sup>2</sup>, T. Pham<sup>2</sup>, E.P. Krenzlok<sup>3</sup>, 1. *ASHP Research & Education Foundation, Bethesda, Maryland*, 2. *University of Oklahoma College of Pharmacy, Tulsa, Oklahoma*, 3. *University of Pittsburgh School of Pharmacy, Pittsburgh, Pennsylvania*

Research Objective: To describe attempted and completed suicide cases in older persons reported to U.S. poison centers over a 10-year observation period. Methods: Cross-sectional data reported to the National Poison Data System (NPDS) involving individuals > 60 years who had a reported exposure to a single pharmaceutical or non-pharmaceutical substance and suicide as the exposure reason were analyzed. Sample demographics, substance type implicated, and medical outcomes were reported. Major morbidity and death probabilities were calculated for both groups. Relative risk (RR) of major morbidity or death was calculated for the pharmaceutical and the non-pharmaceutical substance groups. Tests of proportions were used to identify significantly ( $\alpha=0.05$ ) elevated morbidity and death rates for individual pharmaceutical and non-pharmaceutical exposure types. Results: The analytical sample included 24,785 cases with 89.7% involving pharmaceuticals. Overall, 62.2% involved females. Females comprised 64.4% of pharmaceutical and 42.9% of non-pharmaceutical cases. The relative risk (RR) of a major morbidity following pharmaceutical exposures was significantly lower compared to non-pharmaceuticals [RR=0.54 (95% CI: 0.49–0.59)] as was death [RR=0.25 (95% CI: 0.20–0.30)]. Pharmaceuticals with the highest major morbidity and death rates were barbiturates and cyclic antidepressants. Non-pharmaceuticals with the highest major morbidity rates were automotive products and toilet bowl cleaners, respectively. Conclusions: In poison center cases, pharmaceutical agents are more likely to be used in suicide attempts by older adults. However, the relative risk of major morbidity or death is lower with pharmaceuticals when compared to non-pharmaceutical substances.

### **A LONGITUDINAL STUDY OF PSYCHIATRIC DISORDERS PREDICTING THE ONSET OF PHYSICAL HEALTH PROBLEMS**

M.J. Lyons<sup>1</sup>, M.D. Grant<sup>1</sup>, C.E. Franz<sup>2</sup>, M.S. Panizzon<sup>2</sup>, H. Xian<sup>3,4</sup>, R. Toomey<sup>1</sup>, W.S. Kremen<sup>5,2</sup>, 1. *Psychology Department, Boston University, Boston, Massachusetts*, 2. *Department of Psychiatry, University of California, San Diego, La Jolla, California*, 3. *St. Louis VA Healthcare System, St. Louis, Missouri*, 4. *Department of Psychiatry, Washington University, St. Louis, Missouri*, 5. *Center for Excellence, VA San Diego Healthcare System, La Jolla, California*

Considerable research has demonstrated comorbidity between psychiatric disorders and other types of medical conditions. However, these studies are typically cross-sectional and don't address the directions of causal relationships, if any, between disorders. Data were drawn from two studies of the Vietnam Era Twin Registry (VETR), a sample of male twins who served in the military between 1965 and 1975. Psychiatric disorders were assessed during 1992 in the Harvard Drug Study (HDS) when the average age of participants was 41.5 years (S.D. = 2.3; range = 36 to 46) using the Diagnostic Interview Schedule Version-III-Revised. Data about self-reported medical conditions were obtained from 1237 VETR members who participated in Vietnam Era Twin Study of Aging during which the average age of participants was 55 years (S.D. = 2.5; range = 51 to 60). We examined self-reported medical conditions with onset after participation in the HDS. Many significant relationships were observed between the 10 mental disorders and the 14 physical health problems, including, but not limited to: PTSD significantly predicted pulmonary disorders (asthma and bronchitis); depression also predicted pulmonary disorders as well as several cardiovascular disorders (angina and stroke); and conduct disorder symptoms before that age of 15 pre-

dicted gastrointestinal problems (ulcer and gastritis). Nicotine dependence was the psychiatric disorder that predicted the largest number of medical disorders. The finding that mental disorders earlier in life can predict the onset of medical disorders later in life suggests that mental disorders are a risk factor for the subsequent development of physical health problems.

### **EFFECTIVENESS OF AN ENHANCED, DEMENTIA-ADJUSTED TRAINING PROGRAM IN PATIENTS WITH DEMENTIA: TRANSLATIONAL MODEL OF GERIATRIC REHABILITATION**

K.A. Hauer, I. Dutzi, M. Schwenk, *Geriatric Research, Bethanien-Hospital at the University of Heidelberg, Heidelberg, Germany*

Background: Growing evidence is available for the trainability of patients with dementia in RCTs with highly selected participants. However, translational approaches for the use of effective programs in the therapeutic routine of clinical settings such as geriatric rehabilitation are lacking. Objective: To determine the effect of a dementia adjusted, standardized training program on motor status in frail, multi-morbid patients with dementia randomly allocated to 2 separated wards during geriatric rehabilitation (n=154). Methods: Motor status (primary endpoints: strength: 1RM leg-press; and function: 5 chair stand) were documented pre-post during a 3-week, geriatric ward rehabilitation. A dementia adjusted, progressive strength and functional training (intervention ward, IW) was compared to usual care in a control ward (CW). Patients of both wards received a comparable multiple rehab program including physiotherapy, functional training and group sessions. Results: The dementia adjusted training significantly improved primary study endpoints: maximal strength (Improvement 1RM: IW +52.6 (42.0)% vs. CW: +13.9 (52.9)%); p-value:<0.001; effect size:0.248) and functional performance (5-chair rise; IW: -19.5 (21.6)% vs. CW: -4.6 (31.3)%); p-value:0.021; effect size: 0.060. Effects were confirmed by most, but not all motor assessments. Participation and assessments were limited by impaired motor and overall health status resulting in floor effects in some measures. Conclusion: Study results demonstrate that an intensive, standardized dementia-adjusted training program improved motor status in frail, multimorbid, geriatric rehab patients with dementia. Assessments as well as training levels need to be adjusted hierarchically to the individual motor status in this vulnerable patient group.

## **SESSION 2720 (SYMPOSIUM)**

### **COMMUNITY INTEGRATION: THE ROLE OF HOUSING AND TRANSPORTATION IN LONG-TERM CARE SYSTEMS**

Chair: *J.L. Poey, IMPAQ International, LLC, Columbia, Maryland*  
Co-Chair: *J. Howard, IMPAQ International, LLC, Columbia, Maryland*

The purpose of this symposium is to discuss housing and transportation issues associated with aging in place and the ability to remain in the community. As demand increases for home and community based services (HCBS), states continue to shift their long-term supports and services (LTSS) systems toward meeting this need by increasing the availability of HCBS through programs and waivers. Such systems assure optimal health, well-being, and functioning for people across the lifespan in the most integrated setting possible. Central to the ability to remain in the community is the availability of affordable and accessible housing as well as transportation. In order to remain in the community, individuals must have a place to live. The definition of a home can vary, with many people with disabilities being moved into group homes. Older adults have different housing options available, such as assisted living facilities, although there is debate about whether this is considered community living. The ability to integrate into the community is also very dependent on mobility. Transportation services should allow individuals to go to doctors appointments, attend to personal needs (e.g., grocery shopping), and socialize or maintain employment in order

to most effectively integrate into the community. Without housing and transportation services, many older adults and people with disabilities may face institutionalization.

### **WORKING TOWARDS A FEDERAL DEFINITION OF THE QUALITIES OF LIFE THAT MAKE A HOME**

S. Terrell, *Office on Disability, Health and Human Services, Washington, District of Columbia*

Federal, state and local governments have developed HCBS for people with disabilities across the lifespan to promote community living and to avoid institutionalization. These agencies have different approaches in defining, funding and overseeing their respective HCBS programs. The variety of approaches and rules that govern myriad programs leave individuals to navigate a confusing maze of policies and bureaucracies which impedes timely access to needed services and contributes to fragmented services or duplicate efforts. Ideally, a comprehensive set of policies would apply to all agencies with responsibilities to provide, monitor, or oversee HCBS. This presentation will discuss the efforts of the HHS Office on Disability to convene a workgroup comprised of agencies across HHS to address key policy areas in HCBS, including defining the qualities of life associated with a home, community integration, and HCBS features such as person-centered planning, participant direction, and system-level structures as they relate to community living.

### **MEETING SUPPORTIVE TRANSPORTATION CHALLENGES TO ENABLE AGING-IN-PLACE**

N.M. Silverstein, *College of Public and Community Service, University of Massachusetts Boston, Boston, Massachusetts*

Paramount to the increased demand for home and community-based long-term supports and services (LTSS) is the ability of communities to address the supportive transportation challenges to enable aging-in-place. This qualitative study investigated the supportive mobility needs of community-residing older adults. The study explored the distinction between aging with disabilities and growing older and experiencing physical or cognitive limitations and how that distinction might impact transportation policy and service delivery. Key informant interviews were conducted with 30 policy leaders, transportation providers, and researchers. In addition, an expert gathering discussed major themes and identified areas of consensus as well as areas needing further research. Themes included levels of assistance provided/needed; the role of paid and volunteer escorts and special assistance related to persons with cognitive impairment. Several informants called for a national policy on senior mobility. Others presented the concept of person-centered or person-directed mobility.

### **DEVELOPING MEASURES TO ASSESS STATE EFFORTS IN PROVIDING COMMUNITY INTEGRATED LTSS THROUGH HOUSING AND TRANSPORTATION**

J.L. Poey, J. Howard, O. Urdapilleta, *IMPAQ International, LLC, Columbia, Maryland*

Despite efforts by states to provide person-driven long-term supports and services (LTSS) that meet the increased demand to age in place, there continues to be an absence of common indicators to assess state progress. One critical component of LTSS is the mechanisms to support community integration through transportation and housing. In order to assess the effectiveness of state LTSS systems in providing housing and transportation services that facilitate an individual's ability to remain in the community, measures must be developed that allow for comparison across states. Variation by state in the structure of housing and transportation services poses a challenge to developing measures to compare state systems and track state efforts. This presentation will discuss a CMS initiative to develop measures and challenges in developing feasible and comprehensive measures of states' progress in

providing affordable and accessible housing as well as transportation services.

## **SESSION 2725 (SYMPOSIUM)**

### **WHAT FUTURE FOR SOCIAL SECURITY?**

Chair: *H. Moody, AARP, Washington, District of Columbia*

Discussant: *C.L. Estes, Univ. of California-San Francisco, San Francisco, California*

Social Security is America's largest and, arguably, most successful program promoting public welfare. Social Security has made a major impact on reducing old age poverty while at the same time commanding enormous legitimacy and support from Americans of all ages. Yet the Social Security program faces an uncertain future. The payroll tax has temporarily been reduced at a time when most analysts agree that, after 2036, Social Security will not have sufficient revenues to pay full benefits. The finances of the Social Security Trust Fund have been brought into current debates about the federal deficit. And younger people, especially, are doubtful that Social Security will be there for them in the future. In this symposium we examine several dimensions of the challenge. Our first presenter (Achenbaum) describes the historical context for current concerns about Social Security, while another presenter (Polivka) identifies elements of the American political economy that have contributed to a broader combination of "fiscal crisis" and "legitimation crisis" (Habermas). Our third speaker (Reinhard) reports on results of AARP's 2012 listening initiative, "You've Earned a Say," which used a variety of methods to elicit opinions of AARP members and others concerned about the future of Social Security. In discussion, symposium members explore the implications of the recently completed 2012 elections and their impact on policy debates around Social Security. The Symposium will identify major barriers to better public understanding of social insurance programs and draw on experience in advocacy to suggest more effective methods of communication to Americans of all ages concerned to insure the sustainability of Social Security.

### **NEOLIBERALISM AND THE FUTURE OF SOCIAL SECURITY**

L. Polivka, *Claude Pepper Center, Florida State University, Tallahassee, Florida*

Debate over Social Security has occurred since its inception, included a failed initiative in 2005 to partially privatize the program. Collapse of the financial sector, the Great Recession, and the increase in the federal deficit have created an opportunity for well-funded critics of Social Security to launch a campaign to reform the program by cutting benefits. This presentation analyzes the latest effort to cut benefits in the context of changes in the U.S. and global political economies over several decades: namely, a neoliberal (conservative) political economy profoundly different from the neo-Keynesian economy of the post-war era. A major priority of neoliberal economists and pundits is diminution of public sector and taxes that support it. Social Security is the biggest single public program making it a major target of neoliberal critics. This is the larger context in which the struggle over the future of Social Security must be understood.

### **SOCIAL SECURITY: "YOU'VE EARNED A SAY"**

S.C. Reinhard, *AARP Public Policy Institute, Washington, District of Columbia*

In 2012, AARP released results of a national survey of 2000 respondents aged 52 to 70, in identifying areas of ignorance and misunderstanding about Social Security. Building on that survey, in 2012 AARP launched a new national listening initiative, "You've Earned A Say." This initiative was undertaken in response to widespread lack of confidence in how policy-makers in Washington at a time when all expenditures are under scrutiny. Both workers and beneficiaries perceive Social Security as an "earned benefit" but the AARP listening initiative revealed both factual uncertainty and differences of opinion about the most appropriate policy

steps to insure the integrity of the program into the future. "You've Earned a Say" in 2012 has provided an opportunity for civic engagement on a mass scale, and the lessons learned can be adopted by advocacy groups as we continue to debate the future of American social insurance programs.

### **SOCIAL SECURITY: VISIONS AND REVISIONS**

W. Achenbaum, *University of Houston, Houston, Texas*

One of the saddest ironies of U.S. social welfare history is that Social Security, the nation's greatest contribution to the well being of ordinary citizens (young and old), has been misunderstood from the day Franklin D. Roosevelt signed the omnibus legislation into law in 1935. Since 1935, conservative Republicans have sought to repeal Social Security as a "hoax," a "fraud," or to privatize old-age insurance. Democrats sometimes have acted equally irresponsibly in their willingness to use surpluses in Social Security trust funds to mask the costs of war or to claim that future deficits require cutbacks. This presentation argues that the so-called "vital center" has been too timid in extolling the benefits of Social Security to audiences deemed ignorant or hostile to the idea of "social insurance," and not sufficiently clear in disentangling misinformation about Medicare's prospects from fears of Social Security insolvency. As a result, sustaining our largest welfare network becomes problematic in a nation that too often ignores both its past and future for the sake present-day expediency.

### **SESSION 2730 (PAPER)**

#### **EMPLOYEE PERSPECTIVES ON OLDER WORKERS, TRAINING, AND HEALTH STATE ISSUES**

##### **KENTUCKY'S AGING WORKFORCE: A STUDY OF EMPLOYERS TO DETERMINE THEIR CHALLENGES, SOLUTIONS, AND BEST PRACTICES**

M. Wells-Lepley, L. Williams, J. Swanberg, A. Latimer, *Institute for Workplace Innovation, University of Kentucky, Lexington, Kentucky*

Individuals are working much longer than ever before, and most adults expect to work well past traditional retirement age. Unfortunately, employers are ill-prepared to accommodate the aging workforce. This study was designed to examine Kentucky employers' attitudes toward older workers, the challenges they face as the workforce ages, and solutions to help employers overcome them. Eighty-three Kentucky employers participated in 10 industry-specific focus groups and a survey. Results indicate that employers have a positive attitude toward older workers and believe there are 8 benefits to employing them (e.g., strong work ethic, good customer relations) which are presented in a model. However, the aging workforce presents 5 key challenges for employers. These challenges are presented in another model that includes 8 interdisciplinary solutions to overcome these challenges. Analyses indicate that organizations that have taken steps to ensure they are adequately staffed in the future already see the value of older workers and have established practices to attract, engage, and retain them. By providing solutions and best practices for each potential challenge of the aging workforce, this study is working to help older workers by informing business leaders how best to accommodate them. The results of this study have been shared with Kentucky business leaders and are guiding the development of an organizational multi-generational assessment and a toolkit to help employers meet the needs of the aging workforce.

#### **RETIREES RETURNING TO WORK: FINDINGS FROM THE HRS**

E. Gonzales, *Washington University, St. Louis, Missouri*

**OBJECTIVES:** To broaden our understanding of why retirees return to work, I examine not just the economic, but also the biopsychosocial factors that predict their return. I hypothesize that human and social capital is positively associated with returning; while retirement satisfaction is negatively associated. An exploratory approach was taken with assets

(wealth, income). Post-retirement work characteristics were also examined. **METHODS:** A sample of fully retired individuals 62+ were drawn from the Health and Retirement Study in 1998 and followed to 2008 (N=8,332). Bivariate analyses and logistic regressions were utilized. **RESULTS:** Average age was 74 (range 62-104). One out of ten retirees returned to work in subsequent waves. Factors predicting returning to work were gender (men more likely), age (younger), health (higher self-report and standardized measures), income, retirement dissatisfaction, and social capital of the household. Wealth, education, and years of work experience were insignificant. Retirees were more likely to return to professional, retail and business industries within the clerical/administrative support, professional, and sales occupations. **IMPLICATIONS:** While economic factors are important determinants of retirees returning to work, so are biopsychosocial factors. Retirees with work experience in physically demanding industries are less likely to return to work after retirement; re-tooling the human capital of this group to match labor sector needs and physical capabilities may enable them to return to work.

#### **CREDENTIAL ATTAINMENT AND OUTCOMES FOR OLDER PARTICIPANTS IN WORKFORCE INVESTMENT ACT PROGRAMS**

P. Cummins, *1. Sociology & Gerontology, Miami University, Oxford, Ohio, 2. Scripps Gerontology Center, Oxford, Ohio*

Policy experts advise that economic security in retirement and the solvency of social welfare programs are enhanced if Americans remain in the workforce later in life. Despite the desire of many older workers to do so, the economic downturn has resulted in historically high unemployment rates. When older adults become unemployed, it takes them longer than their younger counterparts to find new jobs. Unemployed older adults may not have the skills required for available jobs and may need to acquire new skills in order to become reemployed. For U.S. workers in general, and for older workers seeking employment, credential attainment is a significant trend. This study used secondary data obtained from the Department of Labor to examine outcomes for workers aged 55 to 74 who participated in training through the Workforce Investment Act Adult or Dislocated Worker Program between April 1, 2008 and September 30, 2010. Women were as likely as men to attain a credential whereas Hispanics and whites were more likely to attain a credential than were Asians or African Americans. Those who previously attained a credential, such a high school or college degree were more likely to attain a new credential. Those who attain a credential are more likely to become employed and remain employed, often at higher wages, compared to those who do not. Programs that encourage credential attainment by older workers will help improve economic security in retirement by allowing workers to remain in the workforce at older ages.

#### **LONGER WORK LIVES: WHAT WILL EMPLOYERS CONTRIBUTE?**

P. Taylor<sup>1</sup>, R. Williams<sup>1</sup>, E. Lynn<sup>1</sup>, E. Brooke<sup>2</sup>, *1. Monash University, Churchill, Victoria, Australia, 2. Swinburne University of Technology, Melbourne, Victoria, Australia*

While debate concerning extending working lives has primarily taken place at the macro level, the issue is being played out within employing organizations that are increasingly being drawn into the social sphere. Questions are being raised regarding the role employers should legitimately play in promoting 'age management'. This paper is based on analysis of qualitative data collected in an Australian Research Council research project, Retiring Women: Understanding Older Female Work-life Transitions. In-depth interviews were carried out with 56 Human Resource Managers across the finance, tertiary education, and

state and emergency services sectors in Australia. The findings demonstrate that despite external pressure, operational imperatives discouraged strong organizational support for older workers' continuing employment, even where relevant policy frameworks existed, thus disenfranchising employees and diluting the social role of the organization. In addition, employers were increasingly placing the onus on individual employees to be responsible for: i) their own awareness of HR policy and updates, ii) managing their ongoing professional development needs, iii) identifying opportunities for advancement, and iv) negotiating flexible work arrangements, thereby further diluting the social role of the organization. It is concluded that responsibility for the welfare of older workers by state and employers needs to be more clearly articulated; otherwise an increasingly important workforce segment will lack advocacy in the labor market.

### **BEST PRACTICES IN WORKPLACE ELDERCARE PROGRAMS**

D.L. Wagner<sup>1</sup>, G. Hunt<sup>2</sup>, A.E. Lindemer<sup>3</sup>, K. Niles-Yokum<sup>4</sup>, M. DeFreest<sup>5</sup>, 1. *College of Health and Social Services, New Mexico State University, Las Cruces, New Mexico*, 2. *National Alliance for Caregiving, Bethesda, Maryland*, 3. *UMASS/Boston, Boston, Massachusetts*, 4. *York College, York, Pennsylvania*, 5. *Self, Tacoma, Washington*

Employers have been offering some form of support for employees with eldercare responsibilities since 1985. Workplace programs have evolved since then and many innovations have been introduced by employers. This paper reports the findings of a "best practice" study of workplace eldercare conducted by the National Alliance for Caregiving and funded by an employer-based consortium (ReACT) designed to foster high quality programs. A snowball sample starting with the ReACT members resulted in 17 employer respondents. Employers ranged in workforce size from 35 employees to 118,000 employees. Respondents represented higher education, health care providers, the financial industry, insurance, manufacturing, media, the pharmaceutical industry, and IT firms. Although some research suggests that employers in the US have reduced program and benefits designed for employed caregivers during the current recession, one-third of our sample had begun their programs in the past three years. Innovations include models of paid time off, subsidized back-up home care services, a comprehensive planning initiative, and caregiving networks. Employers continue to experience low utilization of programs and only minimal evaluation efforts have been undertaken. Few employers conducted employee surveys to inform them of the needs of employees prior to starting programs. This paper outlines methodology, analysis and key findings of the study including new innovations, perceived employer benefits, recommendations for "best practice" modifications and the implications for public policy.

### **SESSION 2735 (PAPER)**

#### **MINORITY AGING; DIFFERENCES AND DISPARITIES**

##### **RACIAL DIFFERENCES IN THE MEASURE OF FUNCTIONAL DISABILITY FOR OLDER AMERICANS**

K.T. Chan<sup>1</sup>, T. Tran<sup>1</sup>, C. Stokes<sup>1</sup>, D. Kaplan<sup>2</sup>, 1. *Boston College, Chestnut Hill, Massachusetts*, 2. *Columbia University, New York, New York*

According to the US Census estimates in 2010, there are 40.5 million Americans aged 65 and older living in the United States. By 2050, this number is projected to exceed will 88.5 million people, or 20.1% of the total population. Population trends indicate that the racial composition of the US will drastically change, and that persons of Latino, Asian and African American descent will make up of over 41% of the total elderly population. This paper used data from the 2009 American Community Survey (ACS), collected annually by the US Census Bureau. Five functional disability items were included in the analysis. Reliability

and confirmatory factor analysis were conducted separately on the items for the aggregated race groups. The overall sample consisted of over 400 thousand individuals aged 65 and older. Separate CFA models were examined for each of the major race groups. Models with differing factor patterns yielded adequate goodness of fit results. Factor loadings for the items were somewhat similar, with the exception of Difficulty hearing, which was higher for the Asian and Hispanic samples. Results suggest that the five item scale for disability reasonably captures physical functioning for the overall older population. Public policy regarding funding for services should account for how physical functioning may be perceived differently among race groups due to inherent differences in culture and community resources. Future research should also establish a meaningful clinical cutoff score of physical functioning for both clinical services and interventions.

##### **CHARTING NEW FRONTIERS: MEASURING DISPARITIES IN MEDICARE HOME HEALTH PATIENTS' FUNCTIONAL STATUS**

J.K. Davitt, S. Chan, *School of Social Policy & Practice, University of Pennsylvania, Philadelphia, Pennsylvania*

Communities of color continue to experience differences in access, treatment, and quality of care in Medicare even after accounting for differences in age, education, and income. With increased emphasis on providing care in the least restrictive and most cost-effective manner, the demand for home health care is increasing. Thus, it is crucial to understand the interactions at play in this unique health care setting. Some studies have shown that access disparities exist in home health and others have demonstrated differences in outcomes by race/ethnicity. However, study limits prevent us from declaring these outcome differences to be indicative of a disparity. Understanding racial/ethnic disparities in the home health system is essential for advancing the overall health of the Medicare population, and reducing costs from morbidity and mortality. Utilizing existing Medicare data from the Outcome ASsessment Information Set (OASIS), and Provider of Services file for all home health assessments conducted in 2006, we tested the hypothesis that minority home care patients would have lower functional status at discharge compared to white patients. Multivariate regression procedures on composite measures of activities of daily living and instrumental activities of daily living employing Rasch modeling, demonstrated that minority home health recipients experienced greater deterioration in functional status during their home health episode relative to white patients. These results were significant for multiple minority groups. We discuss key strategies for modeling these trends including the use of Rasch models vs. Likert measures, and multilevel modeling procedures to account for clustering within agencies and neighborhoods.

##### **EXPLORING THE EFFECTS OF MEDICARE PART D ON RACIAL/ETHNIC DISPARITIES IN HEALTHCARE COST, HOSPITALIZATION, AND EMERGENCY VISITS**

E. Mahmoudi<sup>1,2</sup>, G.A. Jensen<sup>1,2</sup>, 1. *Institute of Gerontology, Detroit, Michigan*, 2. *Wayne State University - Institute of Gerontology, Detroit, Michigan*

Introduction. Medicare Part D, implemented in January 2006, provides affordable prescription drug coverage for all Medicare beneficiaries. This study evaluates effects of Part D on racial/ethnic disparities in healthcare cost, hospitalization, and emergency visits. Data. Medical Expenditure Panel Survey data covering 2002-2009 is used for the analysis of a nationally representative sample of White, African-American, and Hispanic Medicare beneficiaries. Seven measures of access and utilization of healthcare are examined: total healthcare cost, any hospitalization, number and cost of hospitalization, any emergency visits, number and cost of emergency visits. Methods. We evaluated the effects of Part D using a difference-in-differences methodology to compare the disparities in healthcare cost and utilization before and after implementation of the Part D. Our comparison group consists of the

near-elderly adults ages 55-63, and our treatment group consists of the Medicare beneficiaries ages 65 and older. We used a two-part generalized linear model to examine healthcare cost and utilization. Results. Part D had no effects on disparity in total healthcare cost. There were significant disparities in total healthcare cost prior and after Part D, with Whites spending significantly more in healthcare than minorities. Part D reduced hospitalization for all three sub-populations; it reduced disparities in number of emergency visits between Whites and minorities, and in number of hospitalizations between Whites and Hispanics. Conclusion. This study underlines the importance of access to affordable prescription drugs in reducing disparities in hospitalization and emergency visits.

### **RACIAL/ETHNIC VARIATION IN PAIN FOLLOWING INPATIENT PALLIATIVE CARE CONSULTS**

J. Laguna<sup>1</sup>, R.S. Goldstein<sup>2</sup>, S. Enguidanos<sup>1</sup>, 1. *Davis School of Gerontology, USC, Los Angeles, California*, 2. *Kaiser Permanente, Downey, California*

Studies have documented disparities in pain among hospitalized patients at end of life. In response, inpatient palliative care (IPC) teams have grown rapidly to manage pain among seriously ill patients. While research indicates that IPC teams effectively reduce and maintain control of patient pain, racial/ethnic differences in pain intensity following IPC consults remain unclear. This study examines pain trajectories following IPC consults among 385 seriously ill managed care white, black, and Latino/a patients ages 65 years or older. Using the 11-point NRS pain rating scale, patients were asked to rate their pain intensity at four time points during hospitalization (prior to IPC consult, two- and 24-hours following consult, and at hospital discharge). Analyses revealed no racial/ethnic differences in baseline pain. Although whites ( $F=16.528$ ), blacks ( $F=7.103$ ), and Latinos/as ( $F=10.902$ ) all experienced significant declines in pain following IPC consults ( $p<.05$ ), Latinos/as reported consistently higher levels of pain than other patients at 2 hours ( $F=4.029$ ;  $p<.05$ ), 24 hours ( $F=3.266$ ;  $p<.05$ ), and at discharge ( $F=7.256$ ;  $p<.05$ ). While all patients reported decreased pain following IPC consults, pain was significantly higher among Latinos/as at follow-up as compared with others. These findings, coupled with previous research on Mexican American beliefs about enduring suffering in later life, suggest that religious/cultural characteristics may contribute to pain differences following IPC consults and indicate a need for additional research to better understand and address the needs of this population.

### **SESSION 2745 (SYMPOSIUM)**

#### **CONTEXTS OF AGING: EXPLORING THE INTERSECTIONS OF GEOGRAPHY AND WELL-BEING AMONG OLDER ADULTS**

Chair: R. Oscarson, *South Dakota State University, Brookings, South Dakota*

Rural / urban disparities in access to health care and in well-being throughout life are well-documented. Past research has pointed to increased social isolation, increased poverty, and poorer health outcomes among some rural older adults. But rurality is diverse, and "rural" is not easily defined. For example, in some states, both the greatest wealth and the greatest poverty are located in rural areas. "Research 101" tells us that sample selection impacts research results, and that the distribution of data is as important as the mean. Further, one's theoretical perspective shapes research methods, and research methods impact data collection, which in turn impact the sample and results. Thus, research related to rural aging must go beyond rural/urban distinctions to include cultural beliefs, geographic disparities in access, and research methods tailored to the sample. By combining literature and research on diverse elders from diverse geographical contexts, we may gain a better picture of variations in rural aging and methods which might be used to better understand phenomena of "rural aging." Symposium presenters

represent rural contexts ranging from the upper Midwest to the deep South. Presentations examining older adults' beliefs and behaviors provide conceptual background from focus groups and the literature, descriptions of research methods used to study difficult to reach participants, and examples that illustrate variations in rural aging.

### **DO RURAL AND URBAN ELDERS DEFINE "HEALTH" DIFFERENTLY?**

C.E. Gessert, S.C. Waring, P. Conway, L. Bailey-Davis, M. Roberts, J.J. VanWormer, *Essentia Institute of Rural Health, Duluth, Minnesota*

Evidence from eight rural and urban focus groups conducted by one of us (CG) on end-of-life care preferences revealed that rural and urban participants often discussed "health" and "meaningful survival" differently. Rural participants were more likely to equate "health" with being able to function on one's own behalf, and to equate meaningful survival with being able to do so. A review of the literature suggests that rural elders tend to characterize good health as being able to "take care of what has to be done" and avoiding dependency. Rural elders assess their health on the basis of their ability to work and to reciprocate in social relationships. Rural concepts of health were reported to be closely associated with independence. Rural-urban differences in the definition of "health" present rich opportunities for research, as concepts of health affect self-description of health status, health behavior, and participation in health maintenance and preventive services.

### **ACTIVITY PARTICIPATION IN BLACK AND WHITE MISSISSIPPIANS FROM URBAN, MICROPOLITAN, AND RURAL CONTEXTS**

C. Adams-Price<sup>1,2</sup>, J. Turner<sup>2</sup>, S.T. Warren<sup>3,2</sup>, J.D. Wilmoth<sup>4,2</sup>, 1. *Department of Psychology, Mississippi State, Mississippi*, 2. *NSPARC Mississippi State U, Starkville, Mississippi*, 3. *Dept. of Ed Psych and Counselor Ed, Mississippi State, Mississippi*, 4. *School of Human Sciences Mississippi State U, Starkville, Mississippi*

There is strong interest at present in the relationship between activities and subjective well-being of older adults. This paper examines activity participation in a random telephone sample of 142 older black and 491 white Mississippians living in urban, micropolitan, and rural areas. Overall, activity participation among whites did not vary a great deal across the three settings. Hobby participation, volunteering, exercise, church, and visiting family and friends were frequent activities. Club participation, travel, and eating out were common, but less frequent. Rural older blacks seldom ate out or participated in clubs, but urban older blacks did so frequently. Participation in religious activities was high for all groups, but a sizable percentage of rural blacks saw family member infrequently. The link between activity participation and access to transportation, as well as ways to increase activities in rural communities is also explored.

### **VOICES FROM THE POOREST RURAL TOWN IN THE US: A CBPE PROJECT ON HEALTH ISSUES AND NEEDS**

K. Kopera-Frye<sup>1</sup>, P. Higgins Saulsberry<sup>2</sup>, D. Ndunda<sup>3</sup>, S. Robinson<sup>2</sup>, L. Henderson<sup>2</sup>, R. Coleman<sup>2</sup>, S. Morgan<sup>2</sup>, J. Oliver<sup>2</sup>, 1. *Gerontology, University of Louisiana at Monroe/ Institute of Gerontology, West Monroe, Louisiana*, 2. *University of Louisiana at Monroe- Social Work Dept., Monroe, Louisiana*, 3. *University of Louisiana at Monroe- Pharmacy School, Monroe, Louisiana*

Lake Providence, in northeast Louisiana, has experienced challenges of high poverty, a divided population in terms of income and education, lack of businesses, housing and employment shortages, decreased population because scant jobs, and limited rural healthcare. According to the 2000 Census, the population was approximately 5,000, with 80% African American, and about 1/3 of the residents being older adults. Currently, it is considered the poorest town in the US. A community-based participatory evaluation (CBPE) approach to needs assessment was utilized to discern the concerns and issues facing the residents

through their eyes and voices. Resident surveys (n = 466) revealed significant concerns of poor healthcare, no jobs, and high crime rates; these concerns varied by age group. Strengths of the community and strategic improvements were suggested by the residents. Lessons learned from this community in rural US will be shared in order to inform professionals working in such small towns.

## SESSION 2750 (SYMPOSIUM)

### INTERCONNECTIONS AMONG ACTIVITIES AND HEALTH AND WELLBEING FOUND IN THE WELL ELDERLY TRIAL

Chair: C. Vigen, *Occupational Science and Occupational Therapy, University of Southern California, Los Angeles, California*

An older adult's health and well-being are influenced by engagement in activity, stress, coping, and declining health. Therefore in an effort to support an older adult's well-being and quality of life, it is essential to support engagement in meaningful activity. The Well Elderly II Study, a randomized clinical trial, tested the effectiveness of a manualized intervention led by licensed occupational therapists which focused on facilitative lifestyle changes to support increased activity participation. It was hypothesized that this occupational therapy intervention would result in increased activity participation which would improve coping strategies, levels of stress, and quality of life measures (e.g. depression, life satisfaction). This RCT included 460 ethnically diverse participants aged 60-95 years, and is charting new frontiers in the area of occupational therapy preventative interventions among community-dwelling and ethnically diverse older adults. This symposium will present five papers highlighting results of this RCT including an overview of activity participation and engagement, participants' perceptions of the interconnections between their activities and their health and well-being, and how measures of well-being may be related to baseline measures of salivary biomarkers (cortisol, DHEA and alpha amylase) usually associated with stress. This symposium will then present findings on the relationships between the trial intervention, measures of stress, well-being, quality of life, and activity participation. The results of the Well Elderly Study provide important insights into the covariates of well-being among older adults, and our experiences with this trial illustrate the variety of analytic tools necessary to shed light on complex research questions.

### MEANINGFUL ACTIVITY PARTICIPATION IN INDEPENDENT-LIVING OLDER ADULTS

C. Vigen, F.A. Clark, M. Carlson, *Occupational Science and Occupational Therapy, University of Southern California, Los Angeles, California*

The Well Elderly Study collected data on participants using the Meaningful Activity Participation Assessment (MAPA) questionnaire, which asks participants to rate their participation over the last few months in 29 different activities. Additionally, 13 well-established instruments were used to assess well-being in various domains. Total activity and individual item activity differed considerably by demographic characteristics. Statistically significant differences by gender in individual item frequencies were generally consistent with gender stereotypes. Total activity frequency was significantly associated with better well-being in 12 of the 13 measures ( $p < .0001$  for each), but wide variety of relationships existed between individual item activities and measures of well-being. Exploratory factor analysis identified 3 activity factors, which we characterized as cultural, cognitive and social. All three factors were highly correlated with total activity frequency. After adjustment for total activity, cognitive and social activities were more highly associated with well-being. Possible interpretations for these results will be explored.

### ASSOCIATIONS AMONG CORTISOL, DHEA, ALPHA AMYLASE AND DEPRESSIVE SYMPTOMS IN OLDER ADULTS

R. Wilcox, *Psychology, University of Southern California, Los Angeles, California*

This study examined the association among salivary cortisol, dehydroepiandrosterone (DHEA) and alpha amylase, as well as how these biomarkers are associated with a measure of depressive symptoms. Modern robust methods for dealing with curvature, outliers, heteroscedasticity and skewness revealed complex associations not found using standard techniques. In particular, cortisol is found to moderate the association between depression and DHEA in a manner poorly reflected by the usual regression model for interactions.

### OLDER ADULTS' PERCEPTIONS OF RELATIONSHIPS AMONG PSYCHOSOCIAL CONSTRUCTS AND WELL-BEING INDICATORS

J. Blanchard, *Occupational Science and Occupational Therapy, University of Southern California, Los Angeles, California*

Maintaining well-being is important for older adults as they face health problems and other declines. Much of the research on elders has been quantitative. However, use of mixed methods can reveal important nuanced individual perspectives. This study explored, using qualitative interviews, how older adults perceived, within their own lives, the interconnections of health and well-being with healthy activity, active coping, social support/social networks, perceived control, stress, and positive reinterpretation-based coping. Participants (N=22) were selected from the USC Well Elderly 2 Study sample using intensity and stratified purposeful sampling. The interview data were classified into codes using modified analytic induction. In general, participants perceived that their health, well-being, and cognition were impacted by a variety of considerations including healthy activity, social support, social network size, perceived control, positive reinterpretation-based coping, stress, physical and social environments, transportation, routines, and issues surrounding death. These findings can inform intervention development for older adults.

### RELATIONSHIP OF GLOBAL SELF-EVALUATIONS OF ACTIVITY TO PSYCHOSOCIAL AND HEALTH-RELATED AGING OUTCOMES

M. Carlson<sup>1</sup>, A. Kuo<sup>1</sup>, C. Chou<sup>2</sup>, F.A. Clark<sup>1</sup>, *1. Division of Occupational Science and Occupational Therapy, University of Southern California, Los Angeles, California, 2. University of Southern California, Los Angeles, California*

We obtained older adults' self-rated judgments about their activity engagement considered as a whole (global activity evaluation) and, using cross-sectional survey data, tested the ability of such judgments to predict aging outcomes. Participants were 460 community-dwelling elders who responded to (a) a set of global activity evaluation items, (b) measures of participation frequency in specific activities, and (c) indices of life satisfaction, depression, and physical and mental health-related quality of life. Regression analyses indicated that global activity evaluation items produced stronger correlations with life satisfaction, depression, and mental health-related quality of life than did participation frequency ratings. However, participation frequency ratings and global activity evaluations were approximately equal in their ability to predict physical health-related quality of life. Overall, the results suggest that global activity evaluation is a viable, top-down measurement approach which complements ratings of specific activities, and should be incorporated in future research on activity in older adults.

## SESSION 2755 (SYMPOSIUM)

### IT TAKES TWO! UNDERSTANDING DYADIC RELATIONSHIPS IN ADULTHOOD AND OLDER ADULTHOOD

Chair: *A.M. Reamy, Human Development and Family Studies, The Pennsylvania State University, State College, Pennsylvania*

Co-Chair: *J. Lee, Human Development and Family Studies, The Pennsylvania State University, State College, Pennsylvania*

Discussant: *C.A. Berg, The University of Utah, Salt Lake City, Utah*

As adults age or become afflicted with chronic illness, they become increasingly dependent on others for support. In particular, family members (i.e., spouses, adult children) often step in to provide support in a dyadic context. Despite their inherent interdependent context, however, dyadic relationships have been traditionally examined by looking at reports from a single informant. More sophisticated data analysis techniques offer new perspectives on how dyadic issues can be examined using perspectives from both partners or family members. This symposium will, therefore, examine four distinct dyadic contexts and issues in adulthood that utilize statistical methods that account for the nesting of data within families or couples. A. M. Reamy will examine the discrepancy between individuals with mild to moderate dementia and their family caregivers' reports on individuals' with dementia values and preferences in daily care over time. J. E. Lee will present on couples' coping profiles utilizing data from a psychosocial intervention study. S. J. Wilson will discuss the role of spouses' other-orientation in understanding the relationship between shared possible selves and subjective health in couples where a spouse has prostate cancer. And, Y-P. Cheng will explore the similarities between support provided by middle-aged adults to their aging parents and support provided by young adults to their middle-aged parents. While each presentation will capture a unique interpretation of dyadic issues in adulthood, C. Berg will subsequently integrate cross-cutting issues of interdependence between dyadic members and potential implications for both individuals, while underscoring important future directions for dyadic research.

### DYADIC REPORTS OF VALUES AND PREFERENCES OVER TIME: INDIVIDUALS WITH DEMENTIA AND FAMILY CAREGIVERS

A.M. Reamy<sup>1</sup>, K. Kim<sup>1</sup>, S.H. Zarit<sup>1</sup>, C.J. Whitlatch<sup>2</sup>, *1. Human Development and Family Studies, The Pennsylvania State University, State College, Pennsylvania, 2. Benjamin Rose Institute on Aging, Cleveland, Ohio*

Family caregivers often become surrogate decision-makers for individuals with dementia (IWDs); yet, little is known about how caregivers' and IWDs' perspectives align over time. Using dyadic growth-curve modeling, we concurrently investigated the linear pattern of change in 198 dyads' (i.e., caregivers and IWDs with mild to moderate dementia) reports of IWDs' values and preferences in daily care over four years. Results indicate that, while IWDs' self-reports remain stable, caregivers' reports of importance of IWDs' values and preferences significantly decrease over time. After controlling for IWD characteristics and values, we found that changes in caregivers' reports are associated with greater discrepancy at baseline, IWDs' quality of life over time, and caregivers' perception of how involved the IWD is in care decision-making over time. These findings highlight the complexity and importance of accounting for the dyadic context when considering an IWD's care values and preferences.

### PROFILES OF COPING AMONG COUPLES DEALING WITH ARTHRITIS

J. Lee, L.M. Martire, S.H. Zarit, *Human Development and Family Studies, Penn State University, Solon, Ohio*

Recent dyadic coping literature has addressed the need to consider both patients and their spouses' appraisals on multiple stressors and resources. Using a psychosocial intervention study with arthritis patients and their spouses (n=220 dyads), we explore dyadic coping profiles of

couples dealing with arthritis. Latent profile analysis was applied to variables reflecting the domains of health, marital relationship, caregiving activities (total numbers of IADL), and perceived social support. A four-profile solution provided the best fit to the data. A large group of couples (56%) scored favorably across multiple domains. A small group of couples who were experiencing problems in marital relationships and/or caregiving activities were identified. Spouses were substantially similar in the patterns of their profile of aging. Profiles of dyadic coping discriminated on several measures of well-being (i.e., depressive symptoms, perceived stress, and mastery). Findings from the current study emphasize the importance of multidimensional coping among dyads dealing with chronic illness.

### SHARED POSSIBLE SELVES OF COUPLES WITH PROSTATE CANCER: SIGNIFICANCE OF EACH PARTNER'S CONTRIBUTIONS

S.J. Wilson<sup>1</sup>, M. Barrineau<sup>1</sup>, C.A. Berg<sup>2</sup>, *1. Human Development & Family Studies, Penn State University, University Park, Pennsylvania, 2. University of Utah, Salt Lake City, Utah*

Schindler and colleagues (2010) demonstrated the importance of couples' shared possible selves, or common goals, for both partners' subjective well-being. We examined how each partner's focus on the other contributes to shared selves and whether concordance in partners' other orientation predicted subjective health. Sixty-one men diagnosed with prostate cancer and their wives rated subjective physical health and listed possible selves. Possible selves were coded for being shared by the couple and orientation toward others. Multilevel modeling revealed that only wives' other orientation explained variance in shared selves (B=0.28, S.E.=0.12, p<.05). An interaction between partners' other orientation predicted husbands' subjective health (B=7.11, S.E.=2.5, p<.01), such that husbands reported better health when both partners were highly other-oriented. For wives, neither partner's other orientation was associated with better health. Sharing possible selves may be driven by the focus of wives' goals on their husbands, consistent with women's broader other orientation and caregiving role.

### INTERGENERATIONAL EXCHANGES AMONG THREE GENERATIONS

Y. Cheng, K. Fingerma, *University of Texas at Austin, Austin, Texas*

Intergenerational exchanges often occur among three generations. We examined whether upward support young adults provide their parents is similar to support parents provide grandparents; and whether the transmission of intergenerational exchange is evident for downward support to offspring. Older parents (G1, N = 337), middle-aged adults (G2, N = 633), and adult offspring (G3, N = 592) participated. Participants reported intangible (e.g., emotional) and tangible (e.g., financial) support provided. Multilevel models showed positive associations between intangible support provided from G2 to G1 and intangible support from G3 to G2. However, tangible support and downward intangible support from G1 to G2 were not associated with support from G2 to G3. Young adults may not model tangible support parents give to grandparents because they have limited resources. Transmission of downward support is not evident to individual children, but future research should examine total downward help to multiple children of the same family.

## SESSION 2760 (SYMPOSIUM)

### MULTIDISCIPLINARY EXAMINATION OF SOCIAL CAPITAL TO FURTHER ADVANCE ENVIRONMENTAL GERONTOLOGY

Chair: *J. Norstrand, Boston College, Chestnut Hill, Massachusetts*

Discussant: *G.D. Rowles, University of Kentucky, Lexington, Kentucky*

Environmental gerontology, which focuses on describing, explaining and modifying/optimizing the relationship between the aging person and the physical / social environment (at the neighborhood, state or

country level) has gained increased attention as we recognize the importance of the environment on aging. This symposium examines social capital from perspective of 4 disciplines, (i.e. anthropology, psychology, public health and social work), to achieve a more meaningful understanding of the person-environment exchange. This will be demonstrated through four papers: Kaspar and colleagues, from the perspective of psychology, will look at the relationship between social capital and healthy aging in relation to the living environment (e.g., urban identity), and engagement in the community (e.g., social participation). Norstrand, from the perspective of social work, will examine the relationship between multiple indicators of social capital with physical and mental health outcomes at the individual level; and will use hierarchical linear modeling, at the township level, to examine contextual effects. Rosso and colleagues, from the perspective of public health, will examine social capital and mobility in relation to the size of geographic area. Finally, Stafford, from the perspective of anthropology, will provide a theoretical discussion of ways of understanding the social environment in order to better understand the person/environment interaction. As explanation of behavior remains a major challenge, it is hoped these papers will further advance environmental gerontology by providing a deeper understanding of social capital and its role in terms of the person-environment exchange.

#### **SOCIAL CAPITAL AND OLDER ADULT'S MOBILITY – THE MODIFIABLE AREAL UNIT PROBLEM**

A.L. Rosso<sup>1</sup>, A. Auchincloss<sup>1</sup>, L. Tabb<sup>1</sup>, T. Grubestic<sup>2</sup>, J. Taylor<sup>1</sup>, Y.L. Michael<sup>1</sup>, 1. *Epidemiology and Biostatistics, Drexel University School of Public Health, Philadelphia, Pennsylvania*, 2. *Drexel University College of Information Science and Technology, Philadelphia, Pennsylvania*

Social capital can enhance health of individuals but the geographic area over which it acts for specific outcomes is unclear. We used data from 675 adults aged 65 years and older participating in a community-based survey conducted in Philadelphia in 2010. Social capital was aggregated at the neighborhood level from individual responses on trust, neighborliness and volunteerism. Generalized estimating equations adjusted for demographic characteristics and individual- and neighborhood-level socioeconomics were used to assess associations of individual-level mobility (Life-Space Assessment, range 0-104) with social capital using two neighborhood definitions: 45 locally-defined neighborhoods (census tract clusters) and 378 census tracts. There was no association at the locally-defined neighborhood level. An increase in mobility (5.8 points (95% confidence interval: 1.0, 10.5)) was observed for highest compared to lowest tertile of social capital at the census tract level. Social capital may act over smaller geographic distances in relation to mobility in the elderly.

#### **CONCEPTUALIZATION OF SOCIAL CAPITAL FROM SOCIAL WORK PERSPECTIVE: BUILDING ON ENVIRONMENTAL GERONTOLOGY**

J. Norstrand, *Boston College, Chestnut Hil, Massachusetts*

Introduction: Social capital may be a particularly useful concept for environmental gerontology. Yet social capital remains conceptually confusing. Goal: Relationship between social capital and health is examined to build on the conceptual understanding of the person-environment fit. Method: Logistic regressions with 5 social capital measures (trust neighbors, sense of belonging, neighbors willing to help, talk to friends/relatives, participation) are examined in relation to 5 health outcomes (self-rated health, ADL, IADL, depression and stress) for community dwelling older adults (N=2,334). Hierarchical linear modeling, at township level, is carried out to examine contextual effects. Results: Subjective measures of social capital (i.e. trust neighbors, sense of belonging and neighbors willing to help) may be more important for health than objective measures (i.e. participation and talk to friends/relatives). Preliminary analyses showed significant level of variance is

explained at contextual level for health. Conclusion: Social capital may provide useful tool for advancing environmental gerontology.

#### **MEANS AND MEANINGS OF NEIGHBORHOOD FOR HEALTHY AGING**

R. Kaspar, F. Oswald, U. Frenzel-Erkert, *Interdisciplinary Ageing Research, Faculty of Educational Sciences, Goethe University Frankfurt, Frankfurt am Main, Germany*

Environmental gerontology has adopted both a social cohesion and exchange perspective on social capital. This paper will discuss potentials for charting the relationship between social capital and healthy aging by focusing on the role of mediating concepts that may indicate relevance of the living environment (e.g., urban identity), as well as processes of engagement in the community (e.g., social participation). Individuals' perceptions of neighborhood characteristics are juxtaposed with geographical data to allow for a valid mapping of person-environment references. Preliminary results from an ongoing survey with targeted 600 community-dwelling urban citizens (Frankfurt am Main, Germany) stratified by age (70-79 vs. 80-89) and household composition (living alone vs. with partner) indicate that neighborhoods that exert a high degree of informal social control may hamper positive effects of social participation on healthy aging. The consequences of agency and belonging components of social capital for healthy aging in urban neighborhoods are revisited.

#### **FROM SENIOR SPACES TO HUMAN PLACES: SOCIABILITY AND SOCIAL HEALTH IN LATER LIFE**

P.B. Stafford, *Indiana Institute on Disability and Community, Indiana University, Bloomington, Indiana*

As a metaphor for environmental gerontology, an "exchange" model of person/environment interaction suggests a one/two, back and forth, stimulus/response process that can be described by vectors and forces. Alternatively, an interpretive, phenomenological model, as might be drawn from certain quarters in anthropology and sociology suggests that the "reality" of the person/environment relationship is an intersubjective, jointly constructed phenomenon. This echoes theory in communication studies, where the former model sees communication as an exchange of messages and the latter as the joint creation of meaning. This paper explores the concept of sociability, an attribute of social environments created by many, many elders worldwide. As a meaningful source of civic engagement and belongingness for elders, sociability contributes to social health, but can't be programmed by professionals. Can it be enabled? Perhaps yes, and the answer to that question is the central focus of the proposed paper.

#### **SESSION 2765 (SYMPOSIUM)**

##### **STEPFAMILIES IN LATER LIFE**

Chair: *S. van der Pas, Epidemiology and Biostatistics, EMGO Institute for Health and Care Research, Amsterdam, Netherlands*  
Co-Chair: *T.G. van Tilburg, VU University Amsterdam, Amsterdam, Netherlands*

Discussant: *M. Silverstein, USC Davis school of Gerontology, Los Angeles, California*

Background. The vast increase in divorce and remarriage rates are one of the main demographic changes over the last decades. Marital histories of older people are becoming increasingly complex; there are more older people who have been divorced and the number of later-life cohabiting relationships, remarriages and stepfamilies are likely to increase further as the baby boom generation reach retirement age. Objectives. The past decade's research has already shown the diversity and complexity of remarried families and stepfamilies.

Still much remains to be learned about the dynamics of contemporary remarriage of older adults and the complexity of stepfamily relationships. Using new data and novel approaches this symposium will enhance our understanding of how processes within remarriages and stepfamilies unfold over time. Also, the symposium will give insight in caregiving within the steprelationship. Papers. The first presentation focuses on the changes in ties of co-residence and proximity of stepmothers and stepchildren (Seltzer, Bianchi & Yahirun). Next, an overview will be given of cohort differences in the identification and contact with adult stepchildren (Suanet, Van Tilburg & Van der Pas). The third presentation will investigate the role of (step)children in the decision-making process of (step)parents for living-apart-together or for sharing a new household (Gierveld). The fourth presentation focuses on the structure and composition of remarried caregiver's social relations (Sherman, Webster & Antonucci). The last presentation will investigate the impact of repartnering and stepparenting on the availability of family members to provide care of older people (Glaser, Gjonca & Tomassini).

#### **WHO IS IN AND WHO IS OUT? IMPLICATIONS OF FAMILY STRUCTURE FOR BOUNDARY AMBIGUITY AMONG OLDER PARENTS WITH REGARD TO THEIR STEPCHILDREN IN 1992 AND 2009**

B. Suanet<sup>1</sup>, T.G. van Tilburg<sup>1</sup>, S. van der Pas<sup>2</sup>, *1. Sociology, VU University Amsterdam, Amsterdam, Netherlands, 2. EMGO Institute for Health and Care Research, Amsterdam, Netherlands*

Abstract Guided by the trends of increased prevalence, normalization and social acceptance of stepfamilies, we argue that the occurrence of older parents' boundary ambiguity with regard to their adult (step)children has become less prevalent across subsequent birth cohorts. Using data of 136 older parents aged between 55 and 64 years (birth cohorts 1928-1937 versus 1938-1947) from the 1992 wave of the 'Living Arrangements and Social Networks of Older Adults' study and the 2002 wave of the consecutive 'Longitudinal Aging Study Amsterdam', we determine whether the identification of stepchildren by Dutch older parents differs between 1992 and 2002. Our main finding is that the identification of stepchildren has increased between 1992 and 2002. Identification of stepchildren is much more likely by remarried respondents than by respondents having stepchildren from cohabiting or living-apart together relationships. The increase in identification of stepchildren among respondents in 2002 might have positive effects for the future care giving potential of (step)families.

#### **(STEP)CHILDREN AFFECTING PARENTS IN THEIR DECISION MAKING AT THE START OF A NEW PARTNER RELATIONSHIP**

J. Gierveld, E. Merz, *Social Demography, NIDI, The Hague, Netherlands*

Using the Netherlands Kinship Panel Study, this study investigates the process of repartnering of divorced and widowed adults, among which the determinants of starting lat relationships or remarriage/ cohabitation. Data showed that parents more frequently than childless adults opt for lat relationships. Additionally, based on in-depth interviewing of a selection of the parents (n = 46), parents' considerations behind the decision for lat or for sharing a new composite household were investigated. Data showed that a large majority of (step)children are involved in 'boundary work': (step)children try, verbally and via rebellious behavior, to guarantee the continuation of the family they are currently involved in. Many children were successful in that parents did refrain from sharing a household with the new partner. Conclusion: parents use a prudent approach in opting for continuation of the bonds with their children and 'adapting' their preferences and decision making.

#### **CAREGIVING IN THE CONTEXT OF LATER LIFE REMARRIAGE: STRUCTURE AND COMPOSITION OF SUPPORT NETWORKS**

C.W. Sherman, N.J. Webster, T.C. Antonucci, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Research has not accounted for Americans' increasingly diverse and complex marital and family histories with respect to care-specific social support. This paper reports on a mixed methods study of dementia caregiving and support among later-life remarried wives (N=61). We examined the structure and composition of caregivers' social relations networks, as well as their positive (e.g., emotional, instrumental) and negative (e.g., failure to assist, intrusive) caregiving support networks. Positive support was typically received from own family, friends, and professionals, with minimal support from stepfamily members. Negative caregiving networks predominantly included stepfamily members. All three networks were significantly associated with key demographic and well-being variables. Inclusion of both social relations and caregiving-specific networks highlights unique aspects of support in the remarried context. Discussion will address implications of latent and activated support networks to well-being of older remarried adults facing health and caregiving challenges and potential interventions that can address their unique needs.

#### **PARTNERSHIP DISRUPTION, STEPFAMILIES AND ONSET OF FIRST USE OF CARE AT OLDER AGES IN ENGLAND**

K.F. Glaser<sup>1</sup>, E. Gjonca<sup>1</sup>, C. Tomassini<sup>2</sup>, *1. Institute of Gerontology, King's College London, London, United Kingdom, 2. Università del Molise, Campobasso, Italy*

As the majority of care is provided by family members, partnership disruption (including repartnering and stepfamily formation) is likely to impact on the availability and propensity of family members to provide care. However, we know surprisingly little about the impact of partnership disruption on care transitions among older people. Employing data from the English Longitudinal Study of Ageing (ELSA), we investigated the association between various measures of partnership disruption and first use of care (both informal and formal) at older ages. We used discrete-time multinomial logistic regression models with time dependent covariates to model data across all three waves. Our results showed a significant association between partnership disruption, step family formation (when at least one child was a minor), and the onset of care even when health and socio-economic factors were taken into account. As expected, health status and changes in health status, showed the strongest associations with care transitions.

#### **CO-RESIDENCE AND GEOGRAPHIC PROXIMITY OF MOTHERS AND ADULT CHILDREN IN INTACT AND STEP FAMILIES**

J.A. Seltzer, S.M. Bianchi, J.J. Yahirun, *Sociology, UCLA, Los Angeles, California*

Children who live with or near a parent provide more care and receive more help from parents than geographically distant children. Parents and adult stepchildren are less likely to live together than parents and biological children, but we know little about the proximity of step and biological kin. We use data from the Health and Retirement Study to describe differences in co-residence and proximity and the factors associated with change in co-residence and proximity as mothers age. We find that stepchildren and stepmothers are less likely to live together than biological children and mothers. If they do live together, stepchildren and mothers are more likely to end co-residence by moving farther apart from each other. Among those who live far apart, stepchildren are less likely than biological children to move closer to their mother. We interpret these findings in light of children's competing obligations to biological and stepparents.

### STRESSOR ACCUMULATION, HEALTH AND WELL-BEING: THE EFFECTS OF ADVERSE, ADDITIVE LIFE EXPERIENCES

Chair: J.R. Piazza, *California State University, Fullerton, Fullerton, California, Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania*  
Discussant: D. Almeida, *Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania*

Research has long revealed age-related changes in cognitive, psychological, and physiological aspects of functioning. Yet, there is considerable variability across each of these domains. This symposium brings together research indicating that stressor accumulation may contribute to age-related variability in cognitive, psychological, and physiological functioning. Mogle and colleagues present research indicating that major life events are associated with prospective and retrospective memory failures at the daily level. Stawski and colleagues demonstrate that recent life events and chronic ongoing stressors are associated with low levels of both global and daily psychological well-being. Piazza and colleagues focus on the centrality of daily stressors, revealing that people are more reactive to daily stressors if they also experience chronic levels of strain in the same domain. Importantly, however, this association is moderated by age. Diehl and Schilling present findings from a 30-day diary study showing how adults' reactivity to stress pile-up is moderated by risk (i.e., self-concept incoherence) and resilience factors (i.e., control beliefs). They also present findings showing to what extent the influences of these risk and resilience factors vary by age. Finally, Gruenewald and colleagues examine the physiological ramifications of stressor accumulation. Their study identifies factors that confer increased risk of allostatic load (i.e., cumulative physiological dysregulation) among people reporting differing levels of lifetime socioeconomic adversity. The discussant, David Almeida, will conclude the presentation by integrating the five papers and identifying how research linking multiple stressor domains can contribute to our understanding of age differences in well-being across various aspects of functioning.

### MAJOR CHANGES IN LIFE ROUTINES IMPACT DAILY COGNITIVE FUNCTIONING

J. Mogle, M. Sliwinski, J. Smyth, *Center for Healthy Aging, Penn State University, State College, Pennsylvania*

Previous research suggests that the negative impact of major life events and not the raw number of events is an important predictor of objective cognitive performance (Klein & Boals, 2001). Less is known about how major life events affect everyday cognition. In the current study, participants ( $n = 142$ ,  $Mage = 49$ , range 20-80) reported on major life events from the past 12 months as well as daily memory failures for 7 consecutive days. Reporting more life events significantly predicted greater daily reports of both prospective and retrospective memory failures. These effects did not differ with age nor by the severity of the life events. Sensitivity analyses suggested these effects were due to events that led to major changes in one's daily routine, regardless of how negatively they were perceived by individuals. Discussion will focus on the role of the environment in daily cognitive functioning.

### THE IMPACT OF STRESSFUL LIFE EVENTS ON GLOBAL AND EXPERIENCED WELLBEING IN OLD AGE: FINDINGS FROM THE ROBUST STUDY

R.S. Stawski, T.L. Queen, L.H. Ryan, J. Smith, *University of Michigan, Ann Arbor, Michigan*

Research on wellbeing has noted the importance of distinguishing global evaluations of wellbeing from discrete emotional experiences. Stressful life events are well known predictors of poorer global well-

being; however, it is unclear whether these stressful life events also influence emotional experiences emanating from daily activities. The current study examined the impact of stressful experiences, including lifetime traumas, chronic stressors and recent life events on global and experienced wellbeing in old age. Data include a sample of 968 older adults ( $Mage=69$ ,  $SD=11$ ,  $Range=50-97$ ; 56% Women) who participated in a study of wellbeing and time use (ROBUST). Preliminary results indicate that stressful life events, particularly recent life events and chronic ongoing stressors, are uniquely associated with both lower levels of global and experienced positive affect, and higher levels of global and experienced negative affect. Discussion will focus on the role stressful experiences play in shaping older adults' overall and experienced wellbeing.

### CHRONIC STRAINS AND DAILY STRESSORS: THE IMPACT OF EVENT CENTRALITY ON DAILY WELL-BEING

J.R. Piazza<sup>1,2</sup>, S.H. Zarit<sup>2</sup>, D. Almeida<sup>2</sup>, 1. *Health Science, California State University, Fullerton, Fullerton, California*, 2. *Pennsylvania State University, University Park, Pennsylvania*

People react differently to the daily stressors they encounter: Whereas some people appear to take daily stressors in stride, others are much more reactive. One reason for these differences may be the extent to which daily stressors are related to ongoing, chronic strains. The current study tested this hypothesis by examining how people reporting differing levels of chronic interpersonal strain react to daily interpersonal tensions. Results revealed that people who reported higher levels of interpersonal strain were more reactive to daily stressors involving interpersonal tensions ( $\beta = .05$ ,  $p < .001$ ). However, these results were qualified by a significant age interaction, indicating that among people who reported high levels of chronic interpersonal strain, daily interpersonal tensions were more costly to younger adults' well-being compared to older adults' well-being. No age differences emerged for people who reported low levels of chronic interpersonal strain ( $\beta = -.003$ ,  $p < .01$ ).

### MODELING REACTIVITY TO STRESS PILE-UP: THE ROLE OF RISK AND RESILIENCE FACTORS

M.K. Diehl<sup>2</sup>, O.K. Schilling<sup>1</sup>, 1. *Department of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany*, 2. *Colorado State University, Fort Collins, Colorado*

This study presents findings on the effects of risk (i.e., self-concept incoherence-SCI) and resilience factors (i.e., age and beliefs of control) on adults' reactivity to stress pile-up, as assessed in terms of negative affect (NA), using data from a 30-day study with 289 adults (age 18-89 years). Stress pile-up was modeled over a 7-day period. Multilevel modeling showed that stress pile-up had a significant effect on daily NA above and beyond concurrent daily stress. The between-person variables age and SCI showed significant interactions with stress pile-up. A higher age decreased reactivity in NA, whereas higher SCI increased reactivity in NA to stress pile-up. The within-person variable of beliefs of control also significantly interacted with stress pile-up. Stronger beliefs of daily control reduced reactivity in NA. Findings provide an illustration of how daily stress unfolds over time and how this process is moderated by risk and resilience factors.

### LIFETIME SOCIOECONOMIC ADVERSITY AND ALLOSTATIC LOAD: EXPLORING VULNERABILITY IN THE OFF-DIAGONALS

T.L. Gruenewald<sup>1</sup>, M. Lachman<sup>2</sup>, T. Seeman<sup>3</sup>, 1. *Davis School of Gerontology, University of Southern California, Los Angeles, California*, 2. *Brandeis University, Boston, Massachusetts*, 3. *University of California, Los Angeles, Los Angeles, California*

Greater lifetime socioeconomic status (SES) adversity has been linked to higher levels of allostatic load (AL), a multi-system index of

physiological dysregulation. However, not all those with high lifetime SES adversity develop high AL, nor do all those of SES advantage escape poor outcomes. We explored the demographic, behavioral and psychosocial factors that predicted membership in such 'off-diagonal' groups in participants from the Study of Midlife in the U.S. Biomarker Substudy (analytic n=646). Among those with high lifetime SES advantage, being Black, higher levels of multi-domain stress in adulthood, smoking, and higher perceived mastery and constraints predicted discrepant (high) AL ( $p < .05$ ). Among those with high lifetime SES adversity, multi-domain adult stress also predicted lower likelihood of discrepant (low) AL ( $p < .05$ ). Moderate alcohol consumption played a protective role in both groups. Results indicate common and unique factors that may confer vulnerability to AL development at different ends of the SES spectrum.

## **SESSION 2775 (PAPER)**

### **INFORMAL FAMILY CAREGIVING**

#### **PSYCHOMETRIC PROPERTIES OF THE CAREGIVER REACTION ASSESSMENT SCALE AMONG INFORMAL CAREGIVERS FOR OLDER SINGAPOREANS**

R. Malhotra<sup>1</sup>, C. Malhotra<sup>1</sup>, A. Chan<sup>1,2</sup>, T. Ostbye<sup>1,3</sup>, 1. *Duke-NUS Graduate Medical School Singapore, Singapore*, 2. *National University of Singapore, Singapore, Singapore*, 3. *Duke University, Durham, North Carolina*

Psychometric properties of the 24-item Caregiver Reaction Assessment (CRA) scale, capturing caregiver reaction in five domains (schedule/finances/family support/health/esteem) have not been assessed among in Singapore. We assess the scale's validity and reliability among informal caregivers of older Singaporeans, and its measurement equivalence/invariance (ME/I) across language of administration. Data for 1,190 care recipient (aged 75+ with >1 activity of daily living limitation)-caregiver dyads was utilized. Measurement properties of constituent items of each domain of the 'original' CRA were assessed. Confirmatory factor analysis (CFA) was conducted on one half of the sample to test the fit of the 'original' five-factor model and the other half was subjected to exploratory factor analysis (EFA). The CRA was then modified and re-subjected to CFA. Construct validity of the domains of the 'modified CRA' and its ME/I across language of administration (Chinese/English/Malay) was assessed. CFA results conveyed a poor fit of the 'original' five-factor model. Instead, EFA suggested the presence of four factors, three items to have neither sufficient nor unique factor loadings and items on the schedule and health domains to load on a single factor. CFA of the 'modified' 21-item CRA, with four domains (schedule and health/finances/family support/esteem) supported the four-factor model. Construct validity of the 'modified' CRA was also supported. ME/I analysis demonstrated partial invariance of the 'modified' CRA across language of administration. The CRA scale, with the suggested modifications, can be used to assess the caregiver reaction in a multidimensional fashion among informal caregivers of older persons in Singapore.

#### **WHAT AFFECTS DEPRESSIVE SYMPTOMS AMONG SPOUSES TRANSITIONING TO CAREGIVING?**

R. Dunkle<sup>1</sup>, A.J. Lehning<sup>1</sup>, S. Feld<sup>1</sup>, H. Kim<sup>1</sup>, H. Shen<sup>2</sup>, M. Kim<sup>1</sup>, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *University of Missouri St. Louis, St. Louis, Missouri*

Previous research indicates that those providing care to a spouse have more depressive symptoms than their non-caregiving counterparts. Few studies, however, explore spouses transitioning into caregiving and what factors contribute to their depressive symptoms. This study builds on our previous work, which documented that older adults from a representative sample who transitioned to spousal caregiving, but not those who continued caregiving, exhibited more depressive symptoms than

those who remained non-caregivers. Using data from 1,117 community-dwelling respondents in the 2000-2006 waves of the Health and Retirement Study who became spousal caregivers for ADLs and/or IADLs during a two-year period, we examined the relationship between factors from the Pearlin Stress Process Model and scores on the 8-item Center for Epidemiologic Studies Depression scale (CES-D). Findings from hierarchical regression models indicated background and contextual characteristics (i.e., gender, age, education, and respondent's baseline health and depressive symptoms) and secondary stressors (change in the caregiver's ADL limitations) were significantly associated with more depressive symptoms. Primary stressors reflecting intensity of care (i.e., hours of care and provision of ADL/IADL care) were no longer significant predictors once we added social and financial resources (i.e. caregiver employment, other caregivers, and wealth) to the model. Consistent with the Stress Process Model, findings suggest that these resources reduce the effects of primary stressors on new caregivers' depressive symptoms. Interventions aimed at alleviating depression among new spousal caregivers could benefit from focusing on increasing caregivers' access to social and financial support, as well as attention to improving their own functional limitations.

#### **IN SICKNESS AND IN HEALTH: COUPLES COPING WITH STROKE ACROSS THE LIFESPAN**

M. McCarthy, *University of Cincinnati, Cincinnati, Ohio*

Stroke survivors and their spouses experience an array of physical, social, and psychological consequences from stroke. Models of coping with chronic illness suggest that couples' experiences may be different depending upon partners' ages and the developmental stage of their relationship. Stroke may be distinctly disruptive to couple's anticipated life course depending on when in life it occurs. The theory of "biographical disruption" (Bury, 1982) has been articulated as a conceptual framework with which the experience of chronic illness may be investigated. Chronic illness leads to biographical disruption with three main aspects: disruptions to taken-for-granted assumptions and behaviors, disruptions to explanatory frameworks, and mobilization of resources. Few studies have investigated disruption from chronic illness from a dyadic perspective or focused on how illness impacts couple's relationships across the lifespan. We conducted semi-structured, in-depth interviews with 32 survivor-spouse dyads (N = 64) ranging in age from 21 to 90 years old and coping with the after-effects of stroke. Constant comparative analysis was used to identify aspects of biographical disruption unique to the experiences of couples at different developmental stages. We identified numerous, often modifiable, features of disruption not described in the prevailing, individually-oriented coping literature. Emergent themes included: instrumental and psychological challenges couples face, relationship challenges, unexpected changes in couple's anticipated life course, and marshaling of existing relationship strengths. Findings from this study contribute to our understanding of how chronic illness affects couples differently according to life stage and they may lead to more developmentally appropriate interventions for couples coping with stroke.

#### **FORMAL CAREGIVING LANGUAGE: LACK OF KNOWLEDGE BY ELDER MALE CAREGIVERS RESULTS IN DISCRIMINATION**

B. Torgusen, *Harbor, Port Lavaca, Texas*

A qualitative study of elder male caregivers of wives diagnosed with dementia suggests that the failure to know the language of caregiving results in caregivers being discriminated against by formal support networks. The caregivers in this study reside within both rural and small urban geographic regions of coastal Texas and are educated and successful in their given career paths. However, they relate unsuccessful attempts to navigate the formal networks of caregiving support due to language barriers, not knowing local resources and what questions to ask. While much has been written on the language of both formal and

informal caregiving across cultures, ethnicities, regions and societies (LaPointe, 2011; Graycar & Morgan, 2002; and Valle, 1999) little has been done to share this language with elder male caregivers, thus it is this author's contention that elder male caregivers are discriminated against when it comes to the use of caregiving language. Kramer and Thompson (2002) discussed two studies: Kramer & Lambert (1999) delineated the detrimental changes in the social integration of elder male caregivers in their informal settings and Coe and Neufeld (1999) spoke of formal supports used only during crisis. The language of caregiving is a barrier to receiving formal support and will continue to do so as and until these elder male caregivers strive to learn and integrate this new language.

### **THE OLDER SPOUSAL CAREGIVERS' MULTIPLE POSITIONS IN THEIR EVERYDAY LIFE**

P. Eskola<sup>1</sup>, E. Latvala<sup>2</sup>, T. Lyyra<sup>1</sup>, T. Rantanen<sup>1</sup>, *1. Health Sciences, Jyväskylä University, Jyväskylä, Finland, 2. University of Applied Science, Jyväskylä, Finland*

The purpose of this research was to describe the multiple positions that older spousal caregivers have in their everyday lives. The qualitative data was gathered by 25 semi-structured interviews. Participants were 12 women and 5 men aged 68-87 years, who took care of their spouses with dementia. Discourse analysis techniques have been used to analyze the data. The participants constructed their everyday life by positioning themselves in multiple ways. The participants described themselves as spouses and not necessarily care providers. Being a keeper of everyday routines included tasks such as performing basic activities necessary in everyday life. Being a social agent included acting as a contact person between the spouse and other people. Being a trustee included, among other things, defending the spouse's right to good formal care, as well as dealing with financial affairs. Being a leisure instructor included managing visits and trips outside the home. Older spousal caregivers carry multiple positions in caring for their spouse describing themselves as spouses rather than care providers with past years together forming the basis of their current relationship. Knowledge of the various positions older spousal caregivers have in their everyday life may help the formal care providers to better plan how to support spousal caregivers in their positions as care providers, keepers of everyday routines, agents, trustees and leisure instructors, all of which require different approaches.

## **SESSION 2780 (PAPER)**

### **RETIREMENT DECISIONS**

#### **OLDER WORKERS & RESILIENCE: FINDING THEIR WAY BACK ON THE JOB**

H.L. Sterns<sup>1</sup>, N. Dawson<sup>2</sup>, *1. The University of Akron, Akron, Ohio, 2. Cleveland State University, Cleveland, Ohio*

Although improved health and longevity are allowing older adults the option to remain in the workforce longer and postpone retirement, several sources including both AARP and the Sloan Center for Aging & Work report one of the greatest policy issues for older adults is the rising length of unemployment. Long-term unemployment, defined by unemployment greater than 27 weeks, is greater in older adults than younger workers. Older job seekers have a more difficult time than younger job seekers in returning to the workforce following a job loss primarily due to differences in job search technique and discrepancies in vocational retraining. Returning to employment, whether it is following an injury or because of financial reasons, requires a great deal of resilience on the part of the older worker in response to growing levels of workplace demand and adversity. These issues can include conditions of either the physical work environment, such as location, climate, or job demands, and/or the psychosocial work environment which may include attitudes of managers or co-workers towards older work-

ers. Four patterns of resilience discussed by Polk are considered including dispositional, relational, situational, and philosophical. Lifespan theory and approaches to developmental change are discussed in the context of resilience and challenges faced by older workers when attempting a return to work in later life. Changes in work demands, health, injury and disability, skills and abilities needed, training and retraining, organizational culture, as well as, worker purpose and fulfillment are included in this overview.

### **RETIREMENT CAREER PLANNING**

A.M. Woehrmann, J. Deller, *SMARD, Leuphana University Lueneburg, Lueneburg, Germany*

Due to demographic change many organizations are beginning to experience skill shortages. One option to act is to encourage employees to provide their knowledge and experience beyond regulatory retirement age. Research has shown that many retirees are already working to some extent, but little is known about retirement career planning of employees. However, career planning models exist, although for career entry. The purpose of this study was therefore to examine the applicability of Social Cognitive Career Theory's (SCCT) Choice Model (Lent, Brown, & Hackett, 1994) to planning the career exit phase, namely occupation-related activities in retirement. Survey results from 212 employees aged 50 to 65 years of a German aerospace company (mainly engineers) were used to test the applicability of the SCCT's choice model in this context. Results suggest that the model fits the data well (Chi-squared(3) = 3.64,  $p = 0.30$ ; RMSEA = 0.03; CFI = 1.00). Occupational self-efficacy and outcome expectations both had an indirect effect on the intention to engage in occupation-related activities in retirement through interest as mediator. Outcome expectations, but not self-efficacy, were also directly related to intention, which in turn was directly linked to retirement career planning activities. The results extend research on the process of retirement career planning through the application of SCCT. Especially the rewards expected from post-retirement activities seem to be highly influential. The results therefore provide valuable starting points for organizational interventions to strengthen employees' intentions to stay in the workforce, such as information events on working possibilities in retirement.

### **TRAJECTORIES OF RETIREMENT AND THE RISK OF POOR HEALTH AMONGST OLDER AMERICANS**

M. Hyde, H. Westerlund, *Stress Research Institute, Stockholm, Sweden*

Retirement represents a potential turning point in a person's life. Yet the relationship between health and retirement remains relatively under-researched and the existing evidence is ambiguous. One reason for this is that different retirement trajectories are often not examined separately. This presentation will present findings on the impact of different retirement trajectories on health amongst older Americans. Data are taken from all 10 waves of the Health and Retirement Study. This produced 70,946 person-measurement observations for 8,815 participants from 1992 to 2010. Generalized estimating equations (GEE) were used to model trajectories of self-rated health over 6 waves before and after retirement for different retirement routes: full-time work to full retirement; part-time work to full retirement; full-time work to partial retirement and part-time work to partial retirement. The analyses were controlled for age at retirement, sex, education and race/ethnicity. The results show that the prevalence of suboptimal health increased with age. For all retirement routes this increase was substantially steeper before retirement than after. The increase was particularly pronounced in the years immediately preceding retirement in all but the route from full-time work to part-time retirement. This suggests that retirement in the US is largely driven by poor health. Moreover retiring does not confer any great improvement in health for the average American retiree. However there is a substantial reduction in the incidence of new cases of suboptimal health following retirement.

## IMPACT OF RETIREMENT WORRY ON INFORMATION PROCESSING USING THE EMOTIONAL STROOP TASK

H.C. Gutierrez, D.A. Hershey, *Psychology, Oklahoma State University, Stillwater, Oklahoma*

Most American working adults are not saving enough to ensure a worry-free retirement (EBRI, 2010). In this study, individuals' financially-linked retirement worries were explored using a well-established cognitive information processing paradigm called the Emotional Stroop Task (EST). Rather than presenting color words (e.g., "RED") in a non-red color of ink and asking individuals to identify that ink color (i.e., the standard Stroop interference paradigm), the EST uses retirement "threat" words (e.g., "POVERTY;" "SAVINGS") and non-retirement "neutral" words ("SAIL-BOAT;" "TABLE"), each of which is presented in one of four ink colors. In the present study, individuals with retirement-linked fears ( $n = 32$ ) were expected to identify ink colors for threat words more slowly than neutral words, due to the occurrence of an emotionally-based interference effect for the former. No comparable interference effect was anticipated among low retirement-fear individuals ( $n = 28$ ). Millisecond-level timing revealed support for the hypothesized interaction. Among high-fear individuals, threat word responses took 808 milliseconds to identify on average, and neutral words took 790 milliseconds (an 18 millisecond difference;  $t[31] = 2.21$ ,  $p = 0.02$ , one-tailed). Among low-fear individuals, however, a 0 millisecond difference in identification speed was observed across word types (both threat and neutral means = 780 ms;  $t[27] = 0.04$ , ns). The interaction effect observed in this investigation may help researchers understand why individuals with retirement-related fears have difficulties planning and saving for retirement. It could be that negative emotional content associated with LTM-based retirement concepts disrupt processing among those with strong, financially-linked fears.

## EXPLAINING TRANSITIONS INTO SELF-EMPLOYMENT AFTER (EARLY) RETIREMENT IN THE NETHERLANDS

H. Van Solinge, K. Henkens, *Netherlands Interdisciplinary Demographic Institute (NIDI), The Hague, Netherlands*

A NIDI panel study among older workers in the Netherlands revealed that one in every three retirees re-entered the labor market after (early) retirement. Post-career transitions into self-employment are increasingly common. In this paper we explore the various trajectories older adults may choose in their pathway into full retirement. How common is the transition into self-employment after (early) retirement? What motives drives this transition? To what extent is the decision to become self-employed determined by the lack of opportunities for paid employment offered by employers. Self-employment in particular, may be an instrument in postponing the age at which workers finally leave the labour market. It remains to be seen whether self-employment is a 'solution' for different groups/types of workers. Is it as attractive for low skilled workers as for high skilled workers? Does it offer equal opportunities for women and for men?

## SESSION 2785 (SYMPOSIUM)

### AGING AND ORAL HEALTH IN THE U.S

Chair: *B. Wu, School of Nursing, Duke University, Durham, North Carolina*

This symposium aims to address oral health disparities among older adults in the U.S., and it also provides insight on the improvement of oral health among this segment of the population. Using data from the Behavioral Risk Factor Surveillance System (BRFSS), the first paper examined regional variation in the level of and improvement in the rates of significant tooth loss (6 teeth and above) between 1999 and 2010. Findings from this paper suggest there are persistent, or even rising, regional disparities in oral health outcomes. Using clinical examination data from participants age 50+ in the National

Health and Nutrition Examination Survey (NHANES) III and NHANES 1999-2004, the second paper found that oral health has improved in the past two decades. The number of decayed and missing teeth decreased over time while the number of filled teeth increased. Data came from repeated observations of 810 dentate individuals aged 65 years and over in North Carolina from 1988 to 1994. The study found that social stratification (i.e., age, gender, race, education, and household income) was significantly associated with the levels of both attachment loss and pocket depth but not their rates of change. The fourth paper used principles from the Diffusion of Innovation framework and implemented an interprofessional program of research based on data from a quality improvement program in oral care in a long-term care unit to inform the development of future implementation science protocols.

## REGIONAL VARIATION IN SIGNIFICANT TOOTH LOSS AMONG OLDER ADULTS IN THE U.S. (1999-2010)

M.M. Gorsuch<sup>2</sup>, S. Sanders<sup>3</sup>, B. Wu<sup>1</sup>, *1. Duke University School of Nursing and Center for the Study of Aging and Human Development, Durham, North Carolina, 2. Duke University Sanford School of Public Policy, Durham, North Carolina, 3. Duke University Sanford School of Public Policy and Population Research Institute, Durham, North Carolina*

Using data from the Behavioral Risk Factor Surveillance System (BRFSS), we examined regional variation in the level and improvement in the rates of significant tooth loss (6 teeth+). Between 1999 and 2010, the rate of tooth loss for those 65+ declined from 52.6% to 39.8%. Improvement in tooth retention in the East South Central region (61.9% in 1999 and 52.8% in 2010) and Appalachia (58.8% in 1999 and 51.2% in 2010) lag significantly behind the nation. This suggests persistent, or even rising, regional disparities in oral health outcomes. Moreover, we estimate the contribution of well water to these regional disparities in tooth loss. Controlling for demographic variables, fluoride of well water, well water usage, and availability of dentists explains 5.2 percentage points of the disparity in tooth loss in Appalachia in 2010. 6.4% of this explained difference is due to fluoride levels of well water and well water usage.

## IMPROVING ORAL HYGIENE IN LONG-TERM CARE RESIDENTS: IMPLEMENTATION SCIENCE PERSPECTIVES

E.S. McConnell<sup>1,2</sup>, C. Downey<sup>1,2</sup>, K. Lee<sup>2</sup>, M.V. Spainhour<sup>1</sup>, *1. Geriatric Research, Education and Clinical Center, Durham VA Medical Center, Durham, North Carolina, 2. Duke University, Durham, North Carolina*

Numerous studies indicate serious gaps in oral hygiene care for long-term care residents. Using principles from the Diffusion of Innovation framework, we launched an interprofessional program of research (nursing and dentistry) that uses a quality improvement program in oral care within a Department of Veterans Affairs long-term care unit to inform development of implementation science protocols. Interprofessional review of evidence-based practices for oral care, (frequency and duration of toothbrushing, flossing, techniques for managing resistance to care), resulted in specific, novel modifications to the oral care program to increase likelihood of staff adoption of new care techniques. Modifications targeted improving staff perception of the relative advantage of routine oral care, enhancing the visibility of oral care practices, and increasing compatibility of oral care with existing unit-level routines. Implementation science methods combined with quality improvement approaches represents a promising strategy to accelerate translation of evidence-based oral hygiene practices into routine care.

## **TRAJECTORIES OF PERIODONTAL DISEASE AMONG OLDER AMERICANS. DOES SOCIAL STRATIFICATION MATTER?**

J. Liang<sup>1</sup>, B. Wu<sup>2</sup>, B.L. Plassman<sup>2,1</sup>, J.M. Bennett<sup>1</sup>, J. Beck<sup>3</sup>, *1. Health Management & Policy, University of Michigan, Ann Arbor, Michigan, 2. Duke University, Durham, North Carolina, 3. University of North Carolina, Chapel Hill, North Carolina*

This study charted the trajectories of periodontal disease among older Americans and analyzed how they are related to social stratification. Data came from repeated observations of 810 dentate individuals aged 65 and over in North Carolina from 1988 to 1994. Attachment loss (AL  $\geq 4$ mm) and pocket depth (PD  $\geq 3$ ) were assessed through dental examination. Over time, the risk for AL increased, while the odds of PD decreased in an accelerated fashion. Social stratification (i.e., age, gender, race, education, and household income) was significantly associated with the levels of both AL and PD but not their rates of change. For both AL and PD, a lower risk was associated with female gender, being white, higher education, and income. In contrast, the risk of AL increased with age, whereas the odds of PD decreased as one became older. Supported by NIH/NIDCR (1R01DE019110)

## **TREND OF DENTAL CARIES EXPERIENCES: ANALYSIS OF NATIONAL HEALTH AND NUTRITION EXAMINATION SURVEY (NHANES) (1988-1994) AND NHANES (1999-2004)**

B. Wu<sup>1</sup>, C. Hybels<sup>2</sup>, J. Liang<sup>3</sup>, B.L. Plassman<sup>4</sup>, L.R. Landerman<sup>2</sup>, *1. Duke University School of Nursing and Center for the Study of Aging and Human Development, Durham, North Carolina, 2. Duke University Center for the Study of Aging and Human Development, Durham, North Carolina, 3. University of Michigan School of Public Health, Ann Arbor, Michigan, 4. Duke University Department of Psychiatry, Durham, North Carolina*

Using clinical examination data from participants age 50+ in the NHANES III and NHANES 1999-2004, we found through trend analyses that oral health trends improved over time. The number of decayed and missing teeth decreased over time while the number of filled teeth increased. Older age was associated with more missing teeth and fewer filled teeth across time, while women had fewer decayed and more filled teeth. Non-whites had more decayed and missing teeth and fewer filled teeth compared to whites. More years of education and higher income were associated with fewer decayed and missing teeth and more filled teeth. Older age was associated with a greater decrease in decayed and filled teeth over time but a sharper increase in missing teeth. Higher income was associated with a sharper decrease in the number of missing teeth, but a less steep increase in filled teeth. Supported by NIH/NIDCR (R01DE019110)

## **SESSION 2790 (SYMPOSIUM)**

### **CHANGING THE FACE OF BEST PRACTICES IN GERONTOLOGICAL NURSING RESEARCH**

Chair: *D.L. Woods, Center for the Advancement of Gerontological Nursing Science, School of Nursing, University of California, Los Angeles, Los Angeles, California*

Discussant: *E. Beattie, Queensland University of Technology, Brisbane, Queensland, Australia*

It is well known that the number of older adults is increasing and will continue to increase dramatically in the next 20 years. We also know that as persons age there is greater heterogeneity. This heterogeneity, including ethnic diversity, requires specific considerations in gerontological research and nursing research. Moreover, older adults remain in the workforce for longer. There remains a paucity of gerontological nursing research that addresses issues on which best practices and policy can be based. Are we asking the right questions? This symposium will present perspectives on issues in gerontological nursing research. The first paper will examine best practices for interviewing methods

with ethnic elders in qualitative research. The second paper will discuss the inclusion of intraindividual variability in longitudinal studies such that a phenomenon can be characterized with a view to guide research and person centered practice. The third paper will examine the effect of direct care staff's ethnicity and social interaction on behavioral symptoms of Korean American older adults with dementia. The final paper will examine important factors to include such as job satisfaction, work environment and health when conducting research with older workers.

### **NURSING BEST PRACTICES FOR INTERVIEWING ETHNIC ELDERLY IN QUALITATIVE NURSING RESEARCH**

L. Williams, L.R. Phillips, *UCLA, Los Angeles, California*

Qualitative methods are often used to explore and characterize a phenomenon that is not well known. However, there are special considerations when dealing with older adults as research participants, especially those of diverse ethnic backgrounds. Best practices for interviewing methods must take into account the historical context of how elders grew up, their expectations of the interaction taking place, and intergenerational differences within the ethnic groups. Nurse researchers must also recognize how those interactions may change depending on political factors such as immigration status. Visual, cognitive, and hearing changes may alter the parameters of an interview and subsequently the participants' understanding of interview questions. Lastly, researchers must critically appraise their use of incentives in a population that may have scarce resources, as their use may alter research responses.

### **INTRA-INDIVIDUAL VARIABILITY IN LONGITUDINAL RESEARCH ON AGING**

M. Yefimova, D.L. Woods, *University of California, Los Angeles, Los Angeles, California*

In research with older adults, a key objective is to understand and predict change in events that occur over time. While age-related trajectories result from changes accumulated during an individual's lifetime, intra-individual variability of measures is manifested as fluctuations on short time scales, such as minutes, hours or days. This variability captures a person's dynamic characteristics, or capacity for change and adaptation. It is important to detect these traits in the heterogeneous population of older adults in order to develop person-centered interventions. Many longitudinal studies focus on trajectories over long periods of time that use aggregated data, discarding short term variability as measurement error or "noise". In this paper we argue that intra-individual variability should be included as an independent measure of change and discuss methodological considerations for incorporating these measures into longitudinal study design. Implications for gerontological nursing research are highlighted, with examples from studies of cognition and behavior.

### **CERTIFIED-NURSING ASSISTANTS' SOCIAL INTERACTION AND BEHAVIOR OF KOREAN-AMERICANS WITH DEMENTIA**

H. Kim, D.L. Woods, J. Mentis, J.L. Martin, A. Moon, L.R. Phillips, *UCLA, Los Angeles, California*

Few studies examine the association between behavioral symptoms of dementia (BSD) and social interaction. Certified-Nursing Assistants (CNAs) social interaction, whose ethnic background is different from the residents, may contribute to BSD. This study examined non-Korean CNAs' social interaction and BSD in Korean-American (KA) older adults with dementia. We recruited 29 CNAs and 20 KA residents from an ethno-specific NH. Research assistants observed and recorded CNAs' and residents' behavior simultaneously during routine care for 3 days. CNAs' dementia competent social interaction was significantly inversely associated with BSD when cultural competence was lower in the morning. In the afternoon, CNAs' dementia competence was significantly inversely associated with BSD. BSD decreased further as cultural com-

petence increased. This association was more prominent among those with high intensity BSD. The findings suggest that dementia competent care is critical to decrease BSD. The proportion of culturally competence influences the degree to which dementia competence impacts BSD.

### **OLDER WORKERS THE FINAL FRONTIER? SUCCESSFUL AGING, WORK ENVIRONMENT AND JOB SATISFACTION**

M. Wargo-Sugleris, *Nursing, Agoura Hills, California*

Michele Wargo-Sugleris RN, PHN University of California, Los Angeles, California, United States Successful aging is the ability to manage chronic conditions, maintain optimal cognitive and physical function and remain engaged in life. With the first baby boomers turning 65 in 2011 and one turning 65 every 7 seconds, almost all baby boomers will be in the 55-years and older age group by 2018. Older workers were the only group in 2008 to significantly increase. Several factors contribute to this increase in older workers such as people living longer and healthier lives, in addition to changes in Social Security legislation that increase the retirement age. The work environment also plays an important part in maintaining the health of older workers physically and psychologically which in turn contributes to enhanced job satisfaction. Many studies are aimed at 55-65 year olds. There is a lack of research on older workers, those over 65 years still in the workforce. This paper will discuss factors important to job satisfaction and the work environment in this group such that these older workers, representing important resources-Older Experienced Workers, can be retained.

## **SESSION 2795 (SYMPOSIUM)**

### **INTEGRATING THE ARTS AND HUMANITIES IN TEACHING GERONTOLOGY**

Chair: *H.Q. Kivnick, School of Social Work, University of Minnesota, Saint Paul, Minnesota*

Co-Chair: *D.J. Sheets, University of Victoria, Vancouver, British Columbia, Canada*

Discussant: *K. de Medeiros, Miami University, Oxford, Ohio*

**OVERVIEW:** This symposium will illustrate diverse ways the arts and humanities are taking an important role in facilitating empathy, stimulating new modes of thinking and intervention, and breaking down prejudice (e.g. ageism; raising critical consciousness; increasing individual and cultural competency) among nursing, social work, human services, and lifelong learning students. **OBJECTIVES:** (1) The symposium will familiarize participants with strategies and approaches for utilizing the arts and humanities in teaching diverse students, across disciplines, across the life cycle, and across educational settings. (2) Participants will learn what emerging approaches show promise with which groups of students. **PARTICIPANTS:** The symposium includes presentations by leading scholars, across disciplines and educational settings, discussing research, programs, and teaching examples from health care and social services university programs, human services taught at the community college level, and lifelong learning -continuing education in community-based institutions: Debra Sheets, Ph.D., MSN, RN-BC, CNE, Associate Professor, University of Victoria, BC Canada; Former Chair, GSA Committee for Humanities and the Arts; Helen Kivnick, Ph.D., L.P., Professor of Social Work, University of Minnesota; The Gerontologist Associate Editor for Humanities and the Arts; Pamela Braverman Schmidt, M.Ed, LMHC, Professor and Coordinator, Human Services, Bunker Hill Community College, Boston, MA; visual artist; Jan Maier, DEGREES AND LICENSES; PROFESSIONAL TITLE AND INSTITUTION; Community Education and Lifelong Learning; vocal recording artist. **DISCUSSANT:** Kate deMedeiros, Ph.D., Assistant Professor of Gerontology and Scripps Fellow in the Department of Sociology and Gerontology at Miami University in Oxford, Ohio; Immediate Past-Chair, GSA Committee for Humanities and the Arts.

### **SHIFTING PERCEPTIONS AND DISCOURSE ON AGE AMONG NURSING STUDENTS**

D.J. Sheets, *School of Nursing, Univ of Victoria, Victoria, British Columbia, Canada*

An ageist lens is common among undergraduate nursing students and reinforced by societal discourse and negative attitudes and beliefs about aging. Mezirow's theory of transformative learning forms the basis for challenging the assumptions of nursing students by Integrating humanities and arts perspectives on aging into teaching. Aging as represented in music, poems, paintings and new media (e.g. blogs, media, YouTube) was integrated into a gerontological nursing course. Rational as well as affective activities designed to foster discourse allowed students to assess their beliefs, feelings, and values about aging. Findings assess the extent to which perceptions can be shifted using the humanities and arts to transform static perceptions of aging into a more dynamic and realistic representation that reflects the heterogeneity and diversity of older adults. The implications for infusing a humanities and arts perspective into gerontological nursing curriculum to alter perceptions and discourse about aging are considered.

### **HUMANITIES AND ARTS STRENGTHEN SOCIAL WORK EDUCATION IN GERONTOLOGY**

H.Q. Kivnick, *School of Social Work, University of Minnesota, Saint Paul, Minnesota*

The social work profession expresses commitment to dismantling oppression, discrimination, and disadvantage by creating positive change at the levels of both person and society. Demographic shifts indicate that in the coming four decades, a large majority of social workers will find themselves working with elder clients and their families. Nonetheless, few social work students receive gerontological training as part of BSW or MSW degree programs. Enduring attitudes of ageism and lack of personal contact with elders contribute to a paucity of gerontological curriculum available to and selected by students. Within a general MSW curriculum, arts and humanities activities have demonstrated effectiveness in deeply engaging social work students in aging content in which they had been previously uninterested. To illustrate the value of arts and humanities in strengthening gerontological social work education, this presentation will highlight examples of innovations in programming and in teaching at the MSW level.

### **PRACTICUM IN HUMAN SERVICES: THE USE OF SELF-PORTRAITURE TO EXAMINE AGE BIAS AND DISPOSITIONAL INFERENCES**

P.B. Schmidt, *Human Services, Bunker Hill Community College, Salem, Massachusetts*

Individuals make snap judgments about others based on first impressions. How accurate are these dispositional inferences and how might they impact on human services delivery systems involving older adults? A growing body of evidence suggests that these split second assumptions are triggered by implicit associations or unconscious biases. These distorted social cognitive responses can adversely impact access to real-world services by older, marginalized populations. This presentation examines a stylistically varied series of self-portraits by Van Gogh, da Vinci, Titian, and Rembrandt that were analyzed and discussed by human services community college students to heighten their awareness of age bias related to dispositional inferences. Implications for using the arts in human services courses to tap into hidden, or automatic, stereotypes and prejudices that circumvent conscious control are discussed

### **SOMEWHERE BETWEEN MOZART AND PROZAC: OLDER ADULTS AND COMMUNITY-BASED ARTS ACTIVITIES**

J. Maier, *RTI International, Waltham, Massachusetts*

The rewards of participation in arts-based activities extend into lifelong learning and community education arenas. A variety of arts classes are frequently available in these venues, and research is beginning to

substantiate benefits such as improved mood, social bonds, and quality of life. These activities offer a rich environment for potential growth in social engagement, a sense of mastery, multicultural awareness, and involvement with the larger community through performance. An alternative to caregiver respite, some group-oriented arts activities involving family dyads can provide a rare opportunity for pleasurable normative social experiences and the potential to strengthen relationships and respect within the dyad, within the group, and with the larger community. The session will focus on models and benefits of community-based group singing in diverse older populations such as well elders, multigenerational groups, and family dyads. A participatory experience will demonstrate the more immediate social and neurobiological effects of group music-making.

## SESSION 2800 (SYMPOSIUM)

---

### NEUROHORMONAL BLOCKADE AND OUTCOMES IN OLDER ADULTS WITH HEART FAILURE AND PRESERVED EJECTION FRACTION

Chair: *A. Ahmed, University of Alabama at Birmingham, Birmingham, Alabama, Birmingham VA Medical Center, Birmingham, Alabama*

Discussant: *D. Forman, Harvard Medical School, Boston, Massachusetts*  
Discussant: *G. Gambassi, Catholic University of the Sacred Heart, Rome, Italy*

The majority of older heart failure (HF) patients have HF with preserved ejection fraction (HF-PEF). Although drugs that block neurohormones, such as ACE inhibitors (ACEIs) or angiotensin receptor blocker (ARBs), beta-blockers (BBs) and aldosterone antagonists (AldoAs) improve outcomes in patients with HF and reduced ejection fraction (HF-REF), there is no such evidence of their benefit in older HF-PEF patients. Clinical effectiveness of these drugs in older HF-PEF patients were examined in four propensity-matched studies in an R01 project entitled "Neurohormonal Blockade and Outcomes in Diastolic Heart Failure" (Source of funding: American Recovery & Reinvestment Act; Sponsor: National Heart, Lung, and Blood Institute; PI: Ahmed A). Of the 48,612 OPTIMIZE-HF hospitalizations occurring during 2003-2004 in 259 U.S. hospitals, 20,839 were due to HF-PEF (EF  $\geq 40\%$ ). These patients were linked to the Medicare national claims data through December 31, 2008 for outcomes. Findings based on those studies were presented at the annual scientific sessions of the American Heart Association 2010 (ACEIs), American College of Cardiology 2011 (BBs), Heart Failure Society of America 2011 (ARBs) and American Heart Association 2011 (AldoAs). Updated results based on those four studies will be presented and discussed.

### ACE INHIBITORS AND OUTCOMES IN OLDER HF-PEF PATIENTS

*A. Ahmed, UAB and VAMC, Birmingham, Alabama*

Of the 48,612 OPTIMIZE-HF hospitalizations occurring during 2003-2004 in 259 U.S. hospitals, 20,839 were due to HF-PEF (EF  $\geq 40\%$ ). Of these, 13,270 hospitalizations could be linked to Medicare national claims data through December 31, 2008 and of these, 10,570 were unique patients age 65 years or older discharged alive. Patients with contraindications to ACEIs, those with prior use of ACEIs, prior use of ARBs, and those receiving a discharge prescription for ARBs were excluded. From the remaining cohort a balanced cohort assembled based on propensity scores for the receipt of a new discharge prescription for ACEIs. Clinical effectiveness of ACEIs on outcomes in this balanced cohort will be presented.

### ANGIOTENSIN RECEPTOR BLOCKERS AND OUTCOMES IN OLDER HF-PEF PATIENTS

*K. Patel, University of Alabama at Birmingham, Birmingham, Alabama*

Of the 48,612 OPTIMIZE-HF hospitalizations occurring during 2003-2004 in 259 U.S. hospitals, 20,839 were due to HF-PEF (EF  $\geq 40\%$ ). Of these, 13,270 hospitalizations could be linked to Medicare national claims data through December 31, 2008 and of these, 10,570 were unique patients age 65 years or older discharged alive. Patients with prior use of ARBs, prior use of ACEIs, and those receiving a discharge prescription for ACEIs were excluded. From the remaining cohort a balanced cohort assembled based on propensity scores for the receipt of a new discharge prescription for ARBs. Clinical effectiveness of ARBs on outcomes in this balanced cohort will be presented.

### BETA-BLOCKERS AND OUTCOMES IN OLDER HF-PEF PATIENTS

*A. Ahmed, UAB and VAMC, Birmingham, Alabama*

Of the 48,612 OPTIMIZE-HF hospitalizations occurring during 2003-2004 in 259 U.S. hospitals, 20,839 were due to HF-PEF (EF  $\geq 40\%$ ). Of these, 13,270 hospitalizations could be linked to Medicare national claims data through December 31, 2008 and of these, 10,570 were unique patients age 65 years or older discharged alive. Patients with contraindications to BBs and those with prior use of BBs were excluded. From the remaining cohort a balanced cohort assembled based on propensity scores for the receipt of a new discharge prescription for BBs. Clinical effectiveness of BBs on outcomes in this balanced cohort will be presented.

### ALDOSTERONE ANTAGONISTS AND OUTCOMES IN OLDER HF-PEF PATIENTS

*K. Patel, University of Alabama at Birmingham, Birmingham, Alabama*

Of the 48,612 OPTIMIZE-HF hospitalizations occurring during 2003-2004 in 259 U.S. hospitals, 20,839 were due to HF-PEF (EF  $\geq 40\%$ ). Of these, 13,270 hospitalizations could be linked to Medicare national claims data through December 31, 2008 and of these, 10,570 were unique patients age 65 years or older discharged alive. Patients with renal insufficiency (serum creatinine levels  $>2.5$  mg/dl for men and  $>2$  mg/dl for women), advanced chronic kidney disease (estimated glomerular filtration rate  $\leq 30$  ml/min/1.73 m.sq.), receiving combination therapy with ACEIs and ARBs, either during admission or discharge, and those with prior use of AldoAs were excluded. From the remaining cohort a balanced cohort assembled based on propensity scores for the receipt of a new discharge prescription for AldoAs. Clinical effectiveness of AldoAs on outcomes in this balanced cohort will be presented.

## SESSION 2805 (SYMPOSIUM)

---

### NUTRITIONAL RISK AMONG OLDER ADULTS RESIDING IN THE COMMUNITY: HEALTH SERVICE UTILIZATION, MORTALITY, AND INTERVENTIONS

Chair: *J.L. Locher, Medicine, UAB, Birmingham, Alabama*

Discussant: *C.W. Bales, Duke University, Durham, North Carolina*

The Institute of Medicine held a Workshop sponsored in part by the National Institute on Aging on "Nutrition and Healthy Aging in the Community" in October of 2011. Participants concluded that demographic and economic imperatives highlight the reality that nutritional matters are too costly to ignore in our rapidly aging society. This is especially true in consideration of two important policy-related developments. First, there are increasing efforts directed toward improving transitions of care linking hospital and home health services with community-based services in order to reduce preventable healthcare utilization—especially, repeat hospitalizations. Research has demonstrated that nutrition-

related illnesses and complications are among those most likely to contribute to patients' re-hospitalization. Second, increasing initiatives emanating from both the federal and state levels to rebalance long-term care so that older adults can remain active and healthy in the community for as long as possible versus having to enter a nursing home prematurely repeatedly find that nutritional support and services are lacking at multiple potential points of intervention, particularly for those who are most vulnerable. Finally, there are rising rates of overweight and obese Baby Boomers who are entering into older adulthood with concomitant obesity-related comorbidities and disabilities present. This presents additional and pressing complicating challenges to trends in aging policy that have not been well-addressed. This symposium presents findings from three separate studies supported by the National Institute on Aging focused on community-dwelling older adults, nutritional risk, and health outcomes.

#### **A RANDOMIZED CONTROLLED TRIAL OF A THEORETICALLY BASED BEHAVIORAL NUTRITION INTERVENTION FOR HIGH-RISK OLDER ADULTS: THE B-NICE TRIAL**

J.L. Locher<sup>1</sup>, K.S. Vickers<sup>2</sup>, D.R. Buys<sup>1</sup>, A. Ellis<sup>1</sup>, J. Lawrence<sup>3</sup>, L. Newton<sup>1</sup>, D.L. Roth<sup>4</sup>, C. Ritchie<sup>5</sup>, 1. *Medicine, UAB, Birmingham, Alabama*, 2. *Mayo Clinic, Rochester, Minnesota*, 3. *University of Alabama, Tuscaloosa, Alabama*, 4. *John Hopkins University, Baltimore, Maryland*, 5. *University of California at San Francisco, San Francisco, California*

Objective: Older adults with multiple co-morbidities are often undernourished or at high risk for becoming so, especially following a recent hospitalization. The purpose of this study was to evaluate the efficacy and feasibility of a multi-level self-management intervention to improve nutritional status in a group of high-risk older adults. Methods: The Behavioral Nutrition Intervention for Community Elders (R21AG027560, PI: Locher) trial used a prospective randomized controlled design to determine whether the intervention, compared to standard care, increased caloric intake and stabilized body weight (BW). Participants were Medicare-eligible, >65 years old, homebound, and were consuming insufficient calories and/or had a history of BW loss > 5% over 6 months; they were randomly assigned to either standard care or the intervention. Results: The intervention had mixed results. Conclusions: Opportunities exist to refine and develop randomized controlled trials of effective, innovative interventions to support evidence-based approaches for solving nutritional problems in this population.

#### **NUTRITIONAL RISK PREDICTS HEALTH SERVICES UTILIZATION AND MORTALITY IN OLDER ADULTS PARTICIPATING IN THE UNIVERSITY OF ALABAMA AT BIRMINGHAM (UAB) STUDY OF AGING**

D.R. Buys<sup>1</sup>, C. Ritchie<sup>2</sup>, D.L. Roth<sup>3</sup>, P. Sawyer<sup>1</sup>, R.M. Allman<sup>1</sup>, J.L. Locher<sup>1</sup>, 1. *Geriatrics, University of Alabama at Birmingham, Birmingham, Alabama*, 2. *University of California, San Francisco, San Francisco, California*, 3. *Johns Hopkins University, Baltimore, Maryland*

Objective: This study examines the relationship between nutritional risk and subsequent health services utilization and mortality. Methods: We report on 1000 community-dwelling older adults aged 65 and older enrolled in the UAB Study of Aging (R01AG015062, PI: Allman), a longitudinal observational study of mobility among older black and white participants residing in Alabama. Nutrition risk was assessed using the 10-item DETERMINE checklist. Survival analyses were conducted to assess risk of hospitalization and death. Covariates included race, gender, marital status, educational level, rural vs. urban living status, body mass index, comorbidity, and life-space mobility. Results: Findings reveal that nutrition risk is associated with hospitalization ( $p=0.013$ ), mortality ( $p=0.0481$ ) and, specifically, non-surgical hospitalizations ( $p<0.0001$ ). Conclusions: This paper contributes to a growing body of research pointing to the need for increased attention directed toward

nutritional assessment, interventions, and services for older adults residing in the community who may be experiencing undetected nutritional risk.

#### **NUTRITIONAL RISK AT BASELINE PREDICTS HEALTH SERVICES UTILIZATION AND MORTALITY OVER A ONE-YEAR PERIOD IN OLDER ADULTS RECEIVING MEDICARE HOME HEALTH SERVICES**

Y. Yang<sup>1</sup>, C.J. Brown<sup>2,3</sup>, K.L. Burgio<sup>2,3</sup>, M. Kilgore<sup>3,4</sup>, C. Ritchie<sup>2,3</sup>, D.L. Roth<sup>3,5</sup>, D. West<sup>6</sup>, J.L. Locher<sup>2,4</sup>, 1. *Nutrition Sciences, University of Alabama at Birmingham, Birmingham, Alabama*, 2. *Birmingham/Atlanta Veterans Affairs Geriatric Research, Education and Clinical Center, Birmingham, Alabama*, 3. *Department of Medicine, Birmingham, Alabama*, 4. *Department of Health Care Organization and Policy, Birmingham, Alabama*, 5. *Department of Biostatistics, Birmingham, Alabama*, 6. *Department of Health Behavior, Little Rock, Arkansas*

Objective: The association between baseline nutritional status and subsequent health service utilization and mortality in older adults receiving Medicare home health services was evaluated. Methods: A longitudinal study (K01AG00994, PI: Locher) using questionnaires and anthropometric measures was conducted with 198 participants to assess nutritional status (Mini-Nutritional Assessment [MNA]) at baseline and health services utilization and mortality status at six- and twelve-months. Results: 63.0% of participants were Malnourished or At Risk for Malnourishment. 8.1% of participants were underweight and 28.8% were obese. Using binary logistic regression, participants who were Malnourished or At Risk for Malnourishment were more likely to experience subsequent hospitalization, emergency room visits, home health aide use, and mortality for the entire sample and hospitalization and nursing home stay for overweight and obese participants. Conclusions: Opportunities exist to address nutritional risk in patients receiving home health services, including those who are overweight or obese, to prevent adverse health outcomes.

#### **MEDICATION MANAGEMENT FOR OLDER ADULTS**

#### **ANTIPSYCHOTIC MEDICATION USE AMONG DEMENTIA PATIENTS IN NURSING HOMES: RESULTS FROM THE SHELTER STUDY**

A. Foebe<sup>1,2</sup>, R. Liperoti<sup>2</sup>, G. Onder<sup>2</sup>, G. Gambassi<sup>2</sup>, F. Landi<sup>2</sup>, R. Bernabei<sup>2</sup>, 1. *School of Public Health & Health Systems, University of Waterloo, Waterloo, Ontario, Canada*, 2. *Universita Cattolica del Sacro Cuore, Rome, Lazio, Italy*

Background: Recently, the use of both conventional and atypical antipsychotic (AP) medications has been associated with increased risk of stroke and death in patients with dementia, prompting recommendations to avoid their use in this population. Nonetheless, AP medications are often used off-label for the treatment of behavioural and psychological symptoms of dementia. Purpose: This study aimed to determine the prevalence of use of AP agents, as well as potential correlates of this use, among older individuals with dementia in nursing homes (NH) in 7 European countries and Israel. Methods: This cross-sectional study utilized the SHELTER database. Comprehensive resident information on 2,091 individuals with dementia in 57 NH was collected using interRAI's Long-Term Care Facility (LTCF) instrument, which collects detailed demographic and clinical information about residents. Using multivariate logistic regression, demographic and clinical correlates of atypical versus conventional AP use were explored. Results: The prevalence of AP use was 31.7%, with use being highest in the Czech Republic (60.2%) and lowest in Israel (18.0%). Use of atypical agents (22.9%) was higher than that of conventional agents (11.9%), with relevant differences across countries. Anti-cholinesterase

use (OR=2.58; 95% CI=1.09, 6.09), Anti-Parkinson medication use (OR=3.75; 95% CI=1.05, 13.37), and presence of a pharmacist (OR=3.50, 95% CI=1.16, 10.54) or geriatrician (OR=2.13, 95% CI=1.03, 4.42) in the NH were associated with atypical AP use. Conclusions: Current care practices show that AP medications are widely used in dementia patients in nursing homes despite recommendations to avoid such use.

### BURDEN OF MEDICATIONS WITH ANTICHOLINERGIC EFFECTS AMONG NURSING HOME RESIDENTS WITH DEMENTIA

G.B. Rattinger, S.K. Dutcher, P.T. Chhabra, I.H. Zuckerman, P. Langenberg, L. Simoni-Wastila, L.D. Walker, *University of Maryland, Baltimore, Maryland*

Medications with anticholinergic properties are commonly prescribed and negatively affect cognition. We describe use of medications with anticholinergic properties (MAP), including changes in use over time, among nursing home (NH) residents with dementia. We used a retrospective cohort design with three years (2006-2008) of Medicare administrative and assessment data to identify and follow residents with dementia. The Anticholinergic Cognitive Burden (ACB) scale was applied to quantify anticholinergic effects based on the sum of each drug's anticholinergic activity. We report the proportion of NH residents receiving MAP and mean ACB, overall and by sex and race. ACB over time was modeled using a repeated measures generalized linear model with a Poisson distribution. NH residents with dementia (n=18,950) were predominantly female (75%), white (86%), aged  $\geq 75$  (86%) and averaged 3 comorbid conditions. At first assessment, mean ACB was 2.7 points ( $\pm 2.6$ , range 0-19). Women were more likely than men to receive MAP (79% vs. 72%,  $p < 0.0001$ ). Among residents receiving MAP, women had a higher mean ACB than men (3.5 vs. 3.1 points,  $p < 0.0001$ ). MAP use was higher among whites (79%) compared with blacks (71%), Hispanics (70%), and other races (69%) ( $p < 0.0001$ ). ACB increased over time at a rate of 1.22 points (99%CI 1.18-1.26) per year. A majority of NH residents with dementia are prescribed medications with anticholinergic properties, and this burden increases over time. The impact of these medications on cognition and function among NH dementia residents requires further study to facilitate their safe and effective use in this population.

### VARIATIONS IN MEDICATION USE PATTERNS AMONG DEMENTIA PATIENTS ACROSS CARE-SETTINGS

M. Burcu, G.B. Rattinger, M. Luong, S.K. Dutcher, I.H. Zuckerman, L. Simoni-Wastila, C.S. Franey, *University of Maryland, Baltimore, Maryland*

Psychopharmacological medications (PPM) used in the management of dementia have been associated with poor outcomes in older adults. Our objective was to characterize population-based patterns of PPM use across care-settings among Medicare beneficiaries with dementia. In a one-year (2008) cross-sectional study, we identified 52,754 dementia patients from a 5% random sample of Medicare beneficiaries and estimated use of cognitive-enhancers (acetylcholinesterase inhibitors/memantine) and PPM [antidepressants, antipsychotics, and mood-stabilizers (valproic acid/carbamazepine/oxcarbazepine)]. Multiple regression models were used to report adjusted prevalence ratios (PR) and 99% confidence intervals (CI) of individual drug classes across care-settings [community(NH-none), partial nursing home(NH-partial), full NH(NH-full)] adjusting for sociodemographic and clinical characteristics. Among PPM users, we estimated the adjusted-PR of multiple PPM-use compared with single PPM-use across care settings. Patients were predominantly female (79%), white (83%), aged  $\geq 75$  (87%) with  $> 1$  comorbid condition (52%). Care-setting distribution was 41% NH-none, 42% NH-partial, and 16% NH-full. Annual drug class prevalence was 9% mood-stabilizers; 34% antipsychotics; 56% antidepressants;

57% cognitive-enhancers. Compared to NH-none, NH-partial and NH-full had lower adjusted-PRs of cognitive-enhancers and higher adjusted-PRs of antidepressants, antipsychotics and mood-stabilizers. Among PPM users, adjusted-PR of multiple PPM-use compared with single PPM-use was significantly higher in NH-full (PR 1.57; 99%CI 1.47, 1.67) and NH-partial (PR 1.44; 99%CI 1.36, 1.53) residents relative to NH-none. Among a nationally representative sample of Medicare beneficiaries, PPM-use is higher among dementia patients with NH stays compared to those without NH stays. Increased use of PPM in NHs warrants careful monitoring to assure safe and effective utilization.

### RIVASTIGMINE AND COGNITIVE REHABILITATION IMPROVES MULTIDIMENSIONAL PROGNOSTIC INDEX IN AD OLDER PATIENTS

G. D'Onofrio<sup>1</sup>, F. Ciccone<sup>1</sup>, D. Sancarlo<sup>1</sup>, S. Bazzano<sup>2</sup>, G. Paroni<sup>1</sup>, F. Panza<sup>1</sup>, D. Seripa<sup>1</sup>, A. Pilotto<sup>1,2</sup>, *1. Geriatrics, I.R.C.C.S. Casa Sollievo della Sofferenza, San Giovanni Rotondo, Italy, 2. Azienda ULSS 16 Padova, S. Antonio Hospital, Padova, Italy*

In the present study we evaluate in a randomized clinical trial the efficacy of an integrated treatment with Rivastigmine Transdermal Patch (RTP) and Cognitive Rehabilitation (CR) in older patients with sporadic Alzheimer's disease (AD) patients at six-months of follow-up. We enrolled 90 patients (42 males, 48 females, mean age  $78.19 \pm 4.79$  years) consecutively admitted to the Alzheimer's Evaluation Unit with a clinical diagnosis of AD according to the NINCDS-ADRDA criteria. Patients were randomized according to treatment in RTP+CR (Group 1) or RTP alone (Group 2). All patients were evaluated at baseline and after 6-months with the Mini Mental State Examination (MMSE), Clinical Dementia Rating (CDR), Hamilton Rating Scale for Depression (HAM-D), Geriatric Depression Scale (GDS), Neuropsychiatric Inventory (NPI). Moreover a standardized 8-domain Comprehensive Geriatric Assessment (CGA) including information on functional (ADL, IADL), cognitive (SPMSQ), nutrition (MNA), Exton-Smith scale (ESS), Comorbidity (CIRS), drug use and social status was carried-out to calculate the Multidimensional Prognostic Index (MPI), a validated index for mortality. At baseline no significant differences between the two groups were observed in mean age, educational level, MMSE, CDR, HAM-D, GDS, NPI and MPI scores. After six-months, Group-1 patients showed a significant higher improvement in MMSE (6.39% vs 2.69%;  $p = 0.020$ ), CDR (6.92% vs 1.54%;  $p = 0.005$ ), HamD-21 (+60.7% vs -45.8%;  $p < 0.0001$ ), GDS (-60.9% vs -7.3%;  $p < 0.0001$ ), NPI (-55.2% vs -32.7%;  $p < 0.0001$ ), ADL (+13.88% vs +5.95%;  $p = 0.001$ ), IADL (+67.59% vs +18.28%;  $p < 0.0001$ ), MNA (+12.02% vs +5.91%;  $p = 0.019$ ), ESS (+3.35% vs +2.49%;  $p = 0.044$ ) and the MPI (-29.03% vs -12.90%;  $p < 0.0001$ ) than Group-2 patients. Integrated treatment with RTP and CR for six months is more effective than RTP alone to improve the cognitive, emotional, behavioral aspects and the mortality risk in AD patients.

### QUALITY OF PSYCHOPHARMACOLOGICAL MEDICATION USE IN NURSING HOME RESIDENTS

L. Simoni-Wastila, M. Luong, Y. Wei, C.S. Franey, G.B. Rattinger, T. Huang, I.H. Zuckerman, N. Brandt, *School of Pharmacy, University of Maryland, Baltimore, Maryland*

Suboptimal prescribing of psychopharmacological medications (PPM) in nursing homes (NHs) adversely influences morbidity and mortality. Using the Centers for Medicare & Medicaid Services Unnecessary Medication Guidance (UMG) for NH residents, this study provides national estimates of PPM prevalence, treatment patterns, and quality of prescribing. Using 2006-2007 Medicare data (Parts A, B, and D) linked to Minimum Data Set files, we developed a national cohort of continuously-enrolled Medicare beneficiaries in NHs for  $\geq 100$  days (n=69,832). Dependent measures included: 1) prevalence of PPM use (antipsychotics, antidepressants, anxiolytics, sedative-hypnotics); 2)

prevalence of PPM polypharmacy; and 3) appropriateness of use by indication, duration, and dose. Research team clinicians operationalized the UMG using geriatric prescribing compendia and practice guidelines. In 2007, 72.1% of Medicare NH residents used  $\geq 1$  PPM, with the highest proportions of residents using antidepressants (59.4%) and antipsychotics (31.5%), and less documented use of sedative-hypnotics (20.6%) and anxiolytics (8.1%). Among PPM users, 54.2% used  $\geq 2$  PPM classes. Prevalent PPM poly-use patterns involved antidepressants+antipsychotics (40.3%) and antidepressants+sedative-hypnotics (20.0%). Although 94.3% of PPM users had appropriate indications for use, indication appropriateness varied by class (sedative-hypnotics=59.4%, antidepressants=80.4%, anxiolytics=84.4%, antipsychotics=93.3%). Among appropriate antipsychotic users, mean duration of use was 216 ( $\pm 117$ ) days; 17.5% exceeded the maximum recommended geriatric dose. PPM use among Medicare NH residents remains high. Variability in appropriateness by indication by PPM class suggests providers have increased awareness of antipsychotic risks but not of other PPMs. Additional findings focusing on the associations of PPM dose, duration, and quality with falls, hospitalization, and mortality, will be presented.

## SESSION 2815 (PAPER)

### RESEARCH AND INTERVENTIONS TO FOSTER ASIAN AND ASIAN-AMERICAN OLDER ADULT HEALTH

#### THE ASSOCIATION BETWEEN SERUM OMEGA-3 FATTY ACIDS AND COGNITIVE FUNCTIONS AMONG THE OLDEST OLD IN OKINAWA, JAPAN: KOCOA PROJECT

H.H. Dodge<sup>1,2</sup>, G. Bowman<sup>1</sup>, Y. Katsumata<sup>1</sup>, Y. Ohya<sup>3</sup>, S. Yasura<sup>4</sup>, J. Kaye<sup>1,5</sup>, H. Todoriki<sup>3</sup>, 1. Oregon Health & Science University, Portland, Oregon, 2. University of Michigan, Ann Arbor, Michigan, 3. University of the Ryukyus, Okinawa, Japan, 4. Okinawa International University, Okinawa, Japan, 5. Portland VA Medical Center, Portland, Oregon

Background: The oldest old segment of the population in most developed countries is growing dramatically and they face a high risk of developing dementia. Identification of modifiable lifestyle factors associated with healthy cognitive aging could aid in designing effective strategies to prevent dementia. Studies have shown dietary intake of fatty fish and circulating omega-3 fatty acid levels were associated with reduced risk for cognitive decline, but the relationship in the oldest old is unknown. We examined the relationship between fasting serum phospholipid eicosapentaenoic (EPA), docosahexaenoic (DHA) and arachidonic acid (AA)/DHA ratio and cognitive function in the oldest old living in Okinawa, Japan. Methods: Sixty non-demented (CDR $<1.0$ ) elderly aged 85 and older who were participating in the ongoing longitudinal cohort study (the KOCOA project) were included in the cross sectional analysis using linear regression models. Fatty acids are expressed as percentages of total fatty acids. Results: Higher fasting serum DHA was associated with better global cognitive function measured by Japanese MMSE (J-MMSE) ( $p=0.04$ ), and a lower ratio of AA-to-DHA was associated with better memory function measured by the Scenery Picture Memory Test (SPMT) ( $p=0.03$ ), all analysis controlled for age, sex and education. Conclusions: Despite the small sample size, we found that higher serum DHA and lower omega 6 to omega 3 ratio represented by AA/DHA is associated with better cognitive function among community-dwelling oldest old. The combination of higher intake of seafood and limiting red meat consumption may promote cognitive function, even in the relatively healthy oldest old population.

### INCREASED MORTALITY RATE, LENGTH OF STAY AND AGGREGATE COST AMONG OLDER CHINESE INPATIENTS WITH CARDIOVASCULAR DISEASES COMPARED WITH THEIR YOUNGER COUNTERPARTS

B. Xu, H. Liu, G. Yu, L. Zhao, *Peking University, Beijing, China*

Cardiovascular diseases remain the leading cause of morbidity and mortality among older adults in recent decades. This study aimed to compare mortality, length of stay, and cost between older and younger inpatients from 3 teaching hospitals in Beijing, China. Data were obtained from the inpatient Electronic Medical Records summary report in these hospitals between 2006 and 2010. The ICD-10 codes (I 00-99) were used to select inpatients with cardiovascular diseases. Differences in mortality, length of stay and cost were compared between older ( $\geq 65$  years old,  $n=28,949$ ) and younger (30 to  $<65$  years old,  $n=36,243$ ) inpatients. Older inpatients had a higher mortality rate, longer length of hospital stay, more secondary diagnosis, higher aggregate cost of a single admission and lower daily cost than younger inpatients ( $P<0.001$ ). Daily costs for surgeries, exams and others were significantly lower for older inpatients than for younger inpatients ( $P<0.001$ ), while older inpatients had a higher daily cost for drug than younger inpatients ( $P<0.001$ ). However, aggregate costs for all surgeries, exams, drugs and others were significantly higher among older inpatients than among younger inpatients ( $P<0.001$ ). Monthly variation of mortality of cardiovascular diseases was more marked among older inpatients compared to younger inpatients. In conclusion, older inpatients with cardiovascular diseases show particular hospitalization patterns as compared to younger inpatients. The differences of the hospitalization patterns advance the understanding of cardiovascular Chinese inpatients with different ages and help establish effective strategies to improve quality and inpatient safety in hospitals.

### ADVANCE CARE PLANNING AMONG JAPANESE-AMERICAN MEN AGED 89-108 YEARS: THE HONOLULU-ASIA AGING STUDY

C.L. Bell<sup>1</sup>, B.K. Tamura<sup>1</sup>, M. Inaba<sup>1</sup>, H. Petrovitch<sup>3,2</sup>, G. Ross<sup>3</sup>, K. Masaki<sup>1,2</sup>, 1. The John A. Hartford Center of Excellence in Geriatrics, Department of Geriatric Medicine, John A. Burns School of Medicine, University of Hawaii, Honolulu, Hawaii, 2. Kuakini Medical Center, Honolulu, Hawaii, 3. Veterans Affairs Pacific Islands Health Care System, Honolulu, Hawaii

Background: Men aged  $>85$  years have high mortality risk. Advance care planning (ACP) is critical. We examined prevalence and factors associated with ACP. Methods: At the 47-year longitudinal Honolulu Heart Program/Honolulu Asia-Aging Study 11th exam (2009-10), closest relatives or caregivers (proxy) reported 380 participants' (ages 89-108, mean=92.1) ACP status. Surveillance identified cancer, COPD, diabetes, CHD, stroke, and Parkinson's disease; 62.1% participants had  $\geq 1$  chronic disease. Questionnaires elicited functional status, the cognitive abilities screening instrument (CASI) assessed cognitive function. Multiple logistic regression models analyzed factors associated with ACP discussion (ACPdiscuss) and written advance directives (AdvDir). Results: Of 380 men's proxies, 59.7% reported ACPdiscuss, 29.7% reported none, and 10.5% were unsure. While 71.8% men had AdvDir, 13.2% had none and 15.0% were unsure. Care preferred on AdvDir was comfort-focused (84.1%) vs. life-prolonging (intubation/resuscitation) (16.0%); no tube-feeding (71.2%) vs. tube-feeding acceptable (28.8%); no nursing home (NH) care (37.4%) vs. NH (62.6%). ACPdiscuss, AdvDir, comfort care, no tube-feeding and no NH were not different by prevalent chronic disease. Difficulty toileting was associated with increased likelihood of ACPdiscuss (OR=2.31, 95%CI=1.02-5.22,  $p=0.04$ ), after controlling for age, marriage, education, difficulty walking  $\frac{1}{2}$  mile, CASI and chronic disease. Controlling for covariates, difficulty toileting increased the likelihood of AdvDir (OR=3.72, 95%CI=1.11-12.43,  $p=0.03$ ); being married

decreased the likelihood of AdvDir (OR=0.44,95%CI=0.22-0.89,p=0.02). Conclusion: Among elderly Japanese-American men aged 89-108, ACP prevalence was surprisingly low despite presence of serious chronic diseases. Difficulty toileting best correlated with ACP discussions and advance directives. Clinicians should proactively engage elderly patients, especially with chronic diseases, and families, for ACP discussion.

#### **ASSOCIATION BETWEEN STEP LENGTH AND INDIVIDUAL COGNITIVE DOMAIN OF MMSE IN A GENERAL POPULATION OF OLDER JAPANESE**

Y. Taniguchi, M. Nishi, H. Murayama, H. Yoshida, Y. Fujiwara, S. Shinkai, *Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, Itabashi-ku, Tokyo, Japan*

**Background:** We have recently reported that step length is a better predictor for cognitive decline (MMSE) than overall gait speed (J Gerontol Med Sci, in press). However, it remains to be determined which cognitive domains contributed to such association between step length and cognition. This cross-sectional study aimed to address this issue. **Methods:** In a sample of 1,315 adults aged 65 years or older (mean age, 72.3 [SD 5.8] years; men, 52.5%), cognitive function (MMSE, TMT-A and B, and 10-words recall test), gait performance (gait speed and step length at usual pace), and potential confounders (demographics and biomarkers) were measured. The MMSE score was broken into each score of five domains, i.e., orientation, registration, calculation, recall, and language. **Results:** Among the five domains, orientation, calculation, recall and language performances were significantly correlated with gait speed and step length. After controlling for confounders with multiple regression analysis, only step length had significant associations with orientation ( $\beta=.084$ ,  $SE=.002$ ,  $p<0.05$ ), calculation ( $\beta=.111$ ,  $SE=.003$ ,  $p<0.01$ ) and recall ( $\beta=.104$ ,  $SE=.003$ ,  $p<0.01$ ). Step length showed similar associations with TMT-A ( $\beta=-.155$ ,  $SE=.107$ ,  $p<0.01$ ), TMT-B ( $\beta=-.132$ ,  $SE=.294$ ,  $p<0.01$ ), and 10-words recall test ( $\beta=.108$ ,  $SE=.005$ ,  $p<0.01$ ). By contrast, gait speed had a significant association with recall only ( $\beta=.068$ ,  $SE=.087$ ,  $p<0.05$ ). **Conclusions:** Step length showed specific associations with orientation, calculation and recall domains within MMSE, which was in line with its positive relations with TMT and 10-words recall test.

#### **THE CHANGING RELATIONSHIP OF OBESITY AND DISABILITY IN OLDER ADULTS:1997 AND 2006 CHINA HEALTH AND NUTRITION SURVEYS**

K. Chou, *Social Work and Social Administration, Univ Hong Kong, Hong Kong, Hong Kong*

The objective of the study is to determine whether the association between obesity (BMI  $\geq 25.0$ ) and disability has changed over time in Chinese population by using data from two cross-sectional studies, namely 1997 and 2006 China Health and Nutrition Surveys. 1,766 and 3,181 community-dwelling older adults aged 55 and older were interviewed in 1997 and 2006, respectively. The disability in five activities of daily living (dressing, walking, toileting, eating, and bathing), body mass index, age, sex, education, five medical conditions, smoking, and availability of health insurance were measured. The prevalence of ADL impairment decreased from 5.1% (95% CI=4.1%-6.1%) in 1997 to 3.8% (95% CI=3.1%-4.5%) in 2006, but obesity increased from 23.6% (95% CI=21.6%-25.6%) to 29.9% (95% CI=28.3%-31.5%). The link between obesity and ADL impairment went from significant and positive in 1997 to non-significant in 2006. The disparity between obese and normal-weight individuals has decreased over time. The prevalence of disability in the obese population decreased over time. The health improvements of obese older adults might be due to primary prevention efforts to reduce the burden of disease in old age. Future studies must be undertaken to examine the mechanism underlying the reduction in the association of obesity and disability.

## **SESSION 2820 (SYMPOSIUM)**

### **EXPANDING THE HORIZONS OF RESEARCH ON CIVIC ENGAGEMENT IN LATER LIFE**

Chair: *E.A. Greenfield, Rutgers, The State University of NJ, New Brunswick, New Jersey*

Co-Chair: *A. Cohen-Callow, University of Maryland Baltimore, Baltimore, Maryland*

Discussant: *N. Morrow-Howell, Washington University in St. Louis, St. Louis, Missouri*

Civic engagement has developed as a major paradigm shift in gerontology over the past decade. This shift emphasizes older adults not only as recipients of care, but also as contributors to others' well-being. Previous scholarship has highlighted the importance for additional research to address social institutions that can promote diverse forms of civic engagement in later life. This symposium seeks to advance this research by presenting papers that explore how older adults' civic engagement can be facilitated across nontraditional settings (i.e., beyond volunteer organizations) and through nontraditional ways (i.e., beyond formal volunteering). The first two papers present research on efforts to promote older adults' civic engagement within organizations that traditionally have focused on providing services to older adults: adult day health centers and community aging-in-place initiatives. The second two papers present research on foundation-funded programs that aim to empower older adults as community organizers and volunteer leaders. Implications for the future of research, practice, and theory development on civic engagement in later life are discussed.

### **BEYOND CARE RECIPIENT: A NATIONAL SNAPSHOT OF CIVIC ENGAGEMENT IN NORC PROGRAMS AND VILLAGES**

E.A. Greenfield<sup>1</sup>, A.E. Scharlach<sup>2</sup>, J.K. Davitt<sup>3</sup>, *1. Rutgers, The State University of NJ, New Brunswick, New Jersey, 2. University of California Berkeley, Berkeley, California, 3. University of Pennsylvania, Philadelphia, Pennsylvania*

NORC programs and Villages are leading national models for community aging-in-place initiatives. Although the models emphasize enhancing older adults' access to services, both models also focus on providing opportunities for older adults to become civically engaged and to develop meaningful roles within their neighborhoods and communities. This paper presents results from a 2012 national organizational survey of more than 60 NORC programs and Villages, which aimed to provide a national "snapshot" regarding how these initiatives have been implemented in practice. Findings demonstrate that NORC programs and Villages promote older adults' civic engagement in a variety of ways, such as by providing older adults opportunities to lead the initiatives, facilitating older adults' exchanges of support to each other, and, in some cases, organizing older adults to advocate for broader community-level changes. Results suggest that NORC programs and Villages are contemporary vehicles for promoting diverse forms of civic engagement in later life.

### **LEADERSHIP DEVELOPMENT AMONG RURAL OLDER ADULT VOLUNTEERS: PERCEPTIONS AND PATHWAYS INTO CITIZEN LEADERSHIP**

J. Crittenden, L.W. Kaye, D.C. Whiry, *University of Maine Center on Aging, Bangor, Maine*

There is scarce research on how rural older adults view, define, and execute leadership through volunteerism. Encore Leadership Corps (ENCORPS) is a statewide volunteer leadership initiative for older Mainers. Participants self-select into this program presenting a unique opportunity to understand motivational factors behind civic engagement and self-prescribed views of citizen leadership. Utilizing Vandenberg et al.'s model of community leadership, this presentation examines how participants define leadership, execute it locally, and reflect the attributes

that facilitate personal empowerment. Based on structured surveys and semi-structured interviews with program participants (N=62), leadership development is not a key motivational factor that drew older adults into ENCorps (28% reported this as influential) but it does emerge as a prominent benefit of participation over time (61% reported growth in leadership capacity). The lack of fit between traditional pathways to volunteer leadership and older adults' operational definitions of leadership has implications for future research and practice.

### **DRIVING COMMUNITY CHANGE: LEVERAGING BABY BOOMERS IN NON-TRADITIONAL VOLUNTEER ACTIVITIES**

A. Cohen-Callow, A.L. Jones, *University of Maryland The Founding Campus, Baltimore, Maryland*

Unlike traditional volunteer positions that address specific pre-defined needs, this study engages citizens 50+ in unique community capacity building opportunities driven by volunteers. Baby boomers are leveraged through knowledge, skills and leadership development to shape community change meant to strengthen social capital and initiate a cyclical process of community development. The study examined active "boomers" volunteering in three urban communities integrating concepts from three theories to explain civic engagement activities. Semi-structured interviews were conducted with 8 community volunteers in a variety of roles. Volunteer longevity varied from newly-engaged to long-term. Thematic analysis revealed four themes: 1) interest in building better communities through civic engagement, 2) reasons for participation, 3) challenges participating, and 4) support for participation. Findings contribute to knowledge regarding theory development and the role policy makers and human service staff can play to facilitate volunteer efforts in non-traditional civic engagement activities.

### **CIVIC ENGAGEMENT FOR OLDER ADULTS WITH LIMITATIONS: MOVING TOWARD INCLUSION**

K.A. Anderson, H. Dabelko-Schoeny, *College of Social Work, The Ohio State University, Columbus, Ohio*

Civic engagement initiatives for older adults have, until recently, focused almost exclusively on "well" older adults – those individuals without significant functional limitations. Older adults with physical and cognitive limitations have largely been cast as a group that receives services rather than a group that has something to offer to others. This presentation will focus on the issue of disabilityism within past efforts to understand and promote civic engagement in older adults. Specifically, the researchers will present the findings from a study of a civic engagement intervention for older adults (N = 43) attending adult day. Results suggest that civic engagement programs for older adults with cognitive and physical limitations can be feasible and sustainable, as well as effective in promoting purpose in life, self-esteem, and perceived well-being. Implications for larger scale efforts to include older adults with limitations in civic engagement programs and to challenge disabilityism will also be discussed.

## **SESSION 2825 (SYMPOSIUM)**

### **HEALTH RELATED QUALITY OF LIFE AMONG LONG-TERM SERVICES AND SUPPORT RECIPIENTS: A LONGITUDINAL ANALYSIS**

Chair: *K. Abbott, School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

Discussant: *W. Satariano, University of California at Berkeley, Berkeley, California*

For older adults receiving long term services and support (LTSS), health related quality of life (HRQoL) has emerged as a critical construct in assessing domains that are most meaningful to the recipients of care. A National Institute of Aging/National Institute of Nursing

Research supported (R01AG025524) prospective, longitudinal design was used to examine the natural history of changes in multiple domains of HRQoL among 470 English and Spanish speaking older adults who, at the time of enrollment, were new recipients of LTSS. Additionally, this study was designed to compare the patterns of change in each of these domains among a matched sample of older adults who receive LTSS in their homes (H&CBS), assisted living facilities (ALF) or nursing homes (NH). The goals of this symposium are to: 1) provide an overview of the conceptualization and design of the primary study; 2) examine major methodological considerations and analytical challenges in the conduct of this study; and, 3) report findings related to three key domains (emotional health, physical health, and quality of life) for a subgroup of 286 older adults through one year following enrollment. Study findings will advance knowledge related to measurement of HRQoL among the growing population of frail older adults and inform relevant delivery system change and health and LTSS policies.

### **CHANGES IN EMOTIONAL HEALTH AMONG LONG-TERM SERVICES AND SUPPORT RECIPIENTS: A KEY HEALTH RELATED QUALITY OF LIFE DOMAIN**

C. Zubritsky<sup>1</sup>, M. Toles<sup>2</sup>, J.H. Van Cleave<sup>3</sup>, L. Schnolis<sup>1</sup>, M.D. Naylor<sup>1</sup>, *1. School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania, 2. Duke University, Durham, North Carolina, 3. New York University, New York, New York*

Linear mixed effects models and generalize estimating equations were used to assess changes in emotional health over time. Emotional health was assessed using a composite score for mental health (SF-12 MCS, continuous variable) and depression (GDS-Short Form; dichotomous variable: 0-4 vs. 5-15). Significant independent predictors of lower overall mental health include increased physical and depressive symptoms, greater cognitive impairment, being younger, reporting less emotional/informational support, and receiving LTSS in ALF. Greater depressive symptoms were associated with more physical symptoms. Fewer depressive symptoms were associated with higher overall mental and physical health ratings, and higher ratings of quality of life. Higher levels of social support over time were associated with decreased depressive symptoms. The odds of having more depressive symptoms increased by 19% among older adults in ALF while depressive symptoms remained constant for those in NHs or H&CBS. Service delivery and policy implications of findings will be discussed.

### **CHANGES IN PHYSICAL HEALTH AND QUALITY OF LIFE: TWO KEY HEALTH RELATED QUALITY OF LIFE DOMAINS**

K.B. Hirschman<sup>1</sup>, S. Shah<sup>2</sup>, K.H. Bowles<sup>1</sup>, M.D. Naylor<sup>1</sup>, *1. School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania, 2. Visiting Nurse Service of New York, New York, New York*

Linear mixed effects models were used to assess changes in physical health (SF-12 physical composite score) and quality of life (QoL; single item) over time. Significant independent predictors of lower ratings of physical health included having more bothersome symptoms and less cognitive impairment. Larger decreases in physical health ratings over time were associated with larger increases in depressive symptoms. Significant independent predictors of higher QoL included fewer depressive symptoms, less cognitive impairment, younger age, higher ratings of mental and physical health and having more emotional/informational support. Larger increases in QoL ratings over time were associated with better cognitive function (i.e., less cognitive impairment). The overall decrease in QoL over time tended to be steeper for men than women. Non-Hispanics also had higher ratings of QoL than Hispanics. Future directions for research and the implications of these findings will be discussed.

## CONCEPTUALIZATION AND DESIGN OF HEALTH RELATED QUALITY OF LIFE AMONG LONG-TERM SERVICES AND SUPPORT RECIPIENTS

M.D. Naylor<sup>1</sup>, K.H. Bowles<sup>1</sup>, J.B. Foust<sup>2</sup>, K. Abbott<sup>1</sup>, K.B. Hirschman<sup>1</sup>, C. Zubritsky<sup>1</sup>, 1. *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*, 2. *UMass Boston, Boston, Massachusetts*

This session will provide an overview of the conceptualization, design and goals of the primary study. Examination of theoretical constructs and indicators of HRQoL among older adults receiving LTSS led an interdisciplinary team of scholars to the multidimensional conceptual framework proposed by Wilson and Cleary (1995). The team adapted this model to expand concepts related to cognition and behavior and to enable examination of environmental characteristics. The refined model allowed for measurement of a mix of structural, process and outcomes that may influence multiple domains of HRQoL for new recipients of LTSS (both cognitively intact and impaired) across a range of contexts. The prospective, longitudinal design enabled a study which focused directly on the perspectives of older adults throughout major transitions in health over a two year period. Service delivery and policy implications of study findings will be explored.

## METHODOLOGICAL CONSIDERATIONS FOR MEASURING HEALTH RELATED QUALITY OF LIFE

A.L. Hanlon<sup>1</sup>, K. Abbott<sup>1</sup>, C. Tocchi<sup>2</sup>, M.D. Naylor<sup>1</sup>, 1. *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*, 2. *Yale University, New Haven, Connecticut*

To advance the rigor involved in collecting data and analyzing changes in multiple HRQoL domains among frail older adults, this session will focus on important methodological considerations and challenges arising from the nature and complexity of frail older adults' needs, the diversity of these older adults and the range of services and settings designed to meet this population's needs. This presentation will highlight the challenges associated with observational studies, including missing data issues and multiple sources of data collection (e.g., interviews with cognitively intact and impaired LTSS recipients, proxy interviews for older adults with significant impairment, medical chart reviews). The challenges associated with the use of linear mixed effects models and generalized estimating equations to determine changes in HRQoL domains over time and propensity modeling to estimate unbiased effects associated with type of LTSS (e.g., ALF vs. NH) will be discussed.

## SESSION 2830 (SYMPOSIUM)

### USING A FINANCIAL EXPLOITATION MEASURE IN COMMUNITY BASED SETTINGS IN THE US AND CANADA

Chair: *M. Iris, Research, CJE SeniorLife, Chicago, Illinois*

Co-Chair: *K. Conrad, Chestnut Health Systems, Bloomington, Illinois*

Elder mistreatment and financial exploitation (FE) continue to be under-reported, resulting in inaccurate prevalence and incidence statistics, and increased suffering of older adults. In particular, FE can have devastating effects on victims, including loss of assets and financial security, loss of self-esteem, and a breakdown in the family support system. Furthermore, there are significant costs to society due to the potential impoverishment of older adults and increased opportunities for Medicare and Medicaid fraud. For example, one MetLife study reported that the annual financial loss by victims of elder financial abuse is estimated to be at least \$2.6 billion. Valid assessment is foundational for research and intervention for FE, but to date, there has been a dearth of progress in the development of assessment procedures to screen for FE, conduct comprehensive assessments, and support intervention. This symposium describes advances in the development of a screening and assessment tool for FE, and presents results of field tests using the OAMA (Older Adult Mistreatment Assessment) in multiple commu-

nity-based settings. The presentations will focus use of the FE screener as well as the long and short forms of the OAMA FE. Researchers from Illinois, California, Oklahoma and Ontario, Canada, will each discuss their use of the FE assessment measure and an overview of combined results will be presented. The symposium will include time for audience discussion of the research studies and results.

### USE OF THE OAFEM IN A COMMUNITY BASED SAMPLE

S. Wood<sup>1</sup>, P. Liu<sup>2</sup>, 1. *psychology, Scripps College, Claremont Ca, California*, 2. *Claremont Graduate University, Claremont, California*

The Older Adult Financial Exploitation Measure (OAFEM; Conrad et al., 2010) is a client self-report measure. In order to ascertain the viability of using the OAFEM in a community sample versus a sample of substantiated cases of financial exploitation, a pilot study was conducted including 93 older adults (aged 59–93) using the 30-item short form. Results indicated that significant and measurable acts of elder exploitation were present. Over half of the community sample endorsed at least 1 item on the short form of the OAFEM, with a mean of 1.52 items endorsed. In addition, multiple regression analysis revealed that retirement saving tendencies and financial risk tolerance together predicted FE ( $F=3.89, p<.05$ ). Higher financial risk tolerance ( $\beta=.07, p=.05$ ) and lower retirement saving tendencies ( $\beta=-.05, p<.05$ ) are risk factors of FE. This pilot data demonstrates that use of the OAFEM is potentially a useful measure to examine risk for FE.

### ESTABLISHING CUT SCORES ON THE OLDER ADULT FINANCIAL EXPLOITATION MEASURE (OAFEM)

K. Conrad<sup>1,2</sup>, J. Mazza<sup>1,2</sup>, M. Iris<sup>3</sup>, 1. *Chestnut Health Systems, Normal, Illinois*, 2. *Health Policy and Administration, Univ of Illinois at Chicago, Chicago, IL, Illinois*, 3. *CJE SeniorLife, Chicago, Illinois*

Based on diverse community-based samples of over 500 older adults (Illinois,  $N=227$ ; California,  $N=92$ ; Canada,  $N=128$ ; Oklahoma,  $N=100$ ), this paper presents a rationale and strategy for setting cut scores on the Older Adult Financial Exploitation Measure (OAFEM). The rationale recognizes that cut scores are never perfect and that setting cut scores involves informed judgment as well as statistical comparisons. The strategy uses the Rasch measurement model to develop an item hierarchy of FE severity. This strategy uses: 1) community samples to establish a baseline of no or low severity and, 2) a sample of substantiated victims of financial exploitation to establish a range from moderate to high severity. Additionally, theory-based variables are used to test the construct validity of the cut scores. For the OAFEM to be most useful in the community and in making decisions about services, it is important to suggest cut scores as decisional guidelines.

### TITLE: DEVELOPING A PARTNERSHIP TO UNDERSTAND FINANCIAL EXPLOITATION AMONG AFRICAN AMERICAN ELDERS

K.L. Jackson, J.S. Wilson, *Nursing, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Evidence suggests that African American older adults are disproportionately affected by financial exploitation (FE) and FE has not been explored from the African American perspective utilizing adequate samples. In this study Community Based Participatory Research (CBPR) principles were used to establish a relationship between an African American faith-based community healthcare collaborative and academic researchers. Discussions with seminar organizers from two churches identified a need for financial exploitation information and FE risk factor identification. The 25-item Older Adult Financial Exploitation Measure (OAFEM) was used to identify risks, raise awareness, and provide data. In this presentation we discuss the importance of considering community needs and historical reluctance to participate in research prior to conducting research with a vulnerable minority population. CBPR principles, the OAFE, and shared cultural identity promoted the desire

to establish and maintain a trusting relationship between researchers and the community studied.

### USING A FINANCIAL EXPLOITATION MEASURE IN COMMUNITY BASED SETTINGS IN CANADA

L. McDonald<sup>1</sup>, A. Wilson<sup>2</sup>, 1. *Institute for Life Course and Aging, University of Toronto, Toronto, Ontario, Canada*, 2. *National Initiative for the Care of the Elderly (NICE), Toronto, Ontario, Canada*

The objective of this research was to conduct a pilot study of the Older Adult Financial Exploitation Measure (Conrad et al., 2010) in a community sample (N=82) of low income (Low Income Cut-offs, Canada), older women aged 55-81 in Canada. The 25-item short form was self-administered by the women who attended two-day financial literacy workshops across Canada. The findings indicated that 53.9 percent endorsed at least one question with a mean of 2.34 questions endorsed. The most frequent forms of exploitation reported or suspected were borrowing money with no payback (17.1 percent); felt entitled to use the older person's money for themselves (8.5 percent) and lied about how they were spending the older person's money (7.3 percent). Unattached, retired, immigrant woman were more likely to be exploited financially. The data suggest that the OAFEM has promise in identifying risk for financial exploitation amongst low-income women.

## SESSION 2835 (PAPER)

### NURSING HOME QUALITY OF CARE, SAFETY REGULATIONS, AND STAFF TURNOVER

#### IS THERE SUBSTITUTION OF CHEMICAL RESTRAINTS FOR PHYSICAL RESTRAINTS IN NURSING HOMES?

J. Engberg<sup>1</sup>, N. Castle<sup>2</sup>, 1. *RAND Corporation, Pittsburgh, Pennsylvania*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*

In this research, we examine whether restrictions on physical restraints have led to increases in chemical restraints. We focus on 2006-07, a period during which nursing homes were under pressure to reduce physical restraints but had not yet come under scrutiny regarding chemical restraints. During this time physical restraint use decreased from 5.6% to 4.2% and chemical restraint use decreased from 23.2% to 22.6%. Our first analysis is at the facility level using MDS records from the first quarter of 2006 and the last quarter of 2007. Facilities that reduce their physical restraint use are more likely to reduce their chemical restraint use (N=15,503 facilities weighted by average number of residents, correlation=0.10, p-value<0.001). This does not suggest substitution, but could be confounded by changes in resident composition. Our second analysis uses the first two MDS assessments for all US nursing home residents that are approximately 3 months apart (N=193,855 residents). We find very little switching between only physical restraints and only chemical restraints (0.07% of the sample). When individuals who are in both types of restraints also are included, we find that the increase in the percentage of residents in chemical restraints (22.3% to 23.7%) is only slightly higher than the increase in physical restraints (4.9% to 5.9%). This analysis suggests very little substitution at the individual resident level, but instead a

gradual increase in restraint use of both types with longer stays. We also present findings for both measures of substitution disaggregated by facility characteristics.

### CRIMINAL OFFENDERS IN OHIO NURSING HOMES: FACILITY PRACTICES, PREVALENCE AND PROBLEMS

J. Straker<sup>1</sup>, P.P. Brown<sup>2</sup>, 1. *Scripps Gerontology Center, Oxford, Ohio*, 2. *University of Central Missouri, Warrensburg, Missouri*

In recent years, occasional violent incidents in nursing homes have drawn attention to the small population of residents with criminal backgrounds who currently reside in long-term care settings. This presentation takes an initial look at the prevalence of residents with criminal backgrounds in Ohio nursing homes, practices that facilities undertake to protect their residents, and the extent to which facilities have experienced violent incidents among their residents. In 2010, all 973 Ohio nursing homes were sent an invitation to the Biennial Survey of Long-Term Care Facilities. 871 facilities responded to at least some of the questions on criminal offenders. Fewer than 1 in 10 (57 facilities—7%) of facilities reported housing a resident with a criminal background. Over one-quarter (28%) were unsure whether they had residents with a criminal background. Most facilities learned about their resident's backgrounds from family or law enforcement. Regardless of criminal background, nearly 9 in 10 (86%) assess the aggression risk of prospective residents, and over three-quarters (78%) would deny admission to residents with a high risk of aggression. Fifty-three facilities had called the police in the previous year, regarding resident-to-resident sexual abuse or aggression. Most facilities (64.8%) have trained all of their staff in behavior management for aggressive residents. Our results show that the majority of facilities are addressing this issue to some extent. Nursing homes are challenged in their need to protect current residents, while providing care to all kinds of residents who need it. Implications for policy and practice will be discussed.

### THE NATURE OF NEGLECT IN NURSING HOMES: PATTERNS OF RELATED DEFICIENCY CITATIONS

K. Hansen<sup>1</sup>, A.A. Holup<sup>1</sup>, K. Hyer<sup>1</sup>, I.C. Freeman<sup>2</sup>, 1. *School of Aging Studies, University of South Florida, Tampa, Florida*, 2. *William Mitchell College of Law, St. Paul, Minnesota*

This study examines neglect in nursing homes, indicated by a facility receiving a citation for neglect (F-Tag 224), and the pattern of deficiency citations associated with its issuance. Related deficiencies include physical and chemical restraints (F-221 and F-222), residents receiving necessary care (F-309, F-310, and F-312), accidents and supervision (F-323), and medication errors (F-332 and F-333). Using Online Survey Certification and Reporting (OSCAR) data from 2002 – 2008 (N = 16,491), we created a nursing home longitudinal panel data set to analyze neglect and its related deficiencies. To model observations of the same facilities over time, we employed marginal models (e.g., generalized estimating equations (GEE) with a logit link) to estimate the probability of mutually exclusive events (e.g., citation or no citation). Facility-level control variables included profit status, chain membership, and total number of beds. Results indicate that all eight of the selected deficiencies were associated with the issuance of a neglect deficiency citation (p < .001). Odds ratios reveal when a citation for chemical restraints (F-222) is issued, it is three times as likely that F-224 will be issued, and twice as likely that F-224 will be issued when either F-309 or F-310 are issued (p < .001). Given the large sample size and controlling for intrafacility variation over time, a more comprehensive approach to analyzing the nature of neglect in nursing homes can be developed, including additional guidance provided to surveyors and facilities in the survey guidelines. Policy and practice implications are also considered and discussed.

## COMPETITION AND NURSING HOME STAFF TURNOVER

R. Pradhan<sup>1</sup>, R. Weech-Maldonado<sup>1</sup>, J. Epane<sup>1</sup>, K.S. Thomas<sup>3</sup>, K. Hyer<sup>2</sup>, 1. *Health Services Administration, University of Alabama at Birmingham, Birmingham, Alabama*, 2. *University of South Florida, Tampa, Florida*, 3. *Brown University, Providence, Rhode Island*

Nursing home direct care workers include either certified nursing assistants (CNAs) or licensed nurses (licensed practical nurses (LPNs) and registered nurses (RNs)). Limited career opportunities and low wages have led to high turnover rates especially for CNAs. The purpose of this study is to understand how market competition may affect turnover for CNAs and licensed nurses. Secondary data from the Online Survey Certification and Reporting dataset, Florida Nursing Home Staffing Reports, and Area Resource File are combined to construct a longitudinal dataset for the study period 2002-2007 in the state of Florida (n=3400). The study is organized as panel data regression with random effects with year level fixed effects. Dependent variables consist of licensed nursing (LPN/RN) and CNA turnover rates while competition is measured by two variables: Herfindahl-Hirschman index (HHI) and excess capacity. We control for organizational and market factors as well as supply for CNAs and licensed nurses. For licensed nurses, each 1% increase in competition as measured by HHI increases turnover by 3% ( $p < .01$ ); however, there is no significant influence of competition on CNA turnover. Excess capacity is non-significant. Results suggest that increased competition is associated with higher licensed nursing turnover, but this relationship is not maintained in the case of CNAs. Licensed nurses may be able to take advantage of more competitive markets because of their better educational qualifications and licensed status. Our results affirm that even in case of high competition, CNAs have limited job mobility and corresponding negotiating power with employers.

## EVALUATION OF THE EFFECTIVENESS OF GOLD STAMP INTERVENTIONS FOR PRESSURE ULCER REDUCTION

Y. Young<sup>1</sup>, A. Zendell<sup>1</sup>, T. O'Grady<sup>1</sup>, A. Winans<sup>2</sup>, J. Pappalardi<sup>2</sup>, 1. *University at Albany, Albany, New York*, 2. *New York State Department of Health, Albany, New York*

**Introduction:** This study evaluates the impact of the Gold STAMP (Success Through Assessment, Management and Prevention) intervention on reducing pressure ulcers (PUs) in four collaboratives across New York State. **Methods:** Forty-two nursing home (NHs) and home health agencies (HHAs) were invited to participate in a one-year study from September 2011 to August 2012. Assessment, care practice, communication, and collaborative interventions were provided to the case group (12/11 – 03/12). Clinical information was obtained from MDS, OASIS, and SPARCS secondary data, and nonclinical data collected through surveys mailed to NH and HHA medical directors (MDs) and directors of nursing (DONs). Survey questions focus on determinants of hospitalization, measures to avoid hospitalization, and care practices. Mixed-effects models will be used to compare effectiveness of Gold STAMP between case and control groups on PU reduction, and determine risk factors associated with PUs and hospital length of stay. **Results:** Preliminary data shows MDs/DONs agree that resident preference and family preference are the most important factors for hospitalization (mean = 4.55, 4.62 out of 5 respectively). Added treatment cost is the least important factor for hospitalization (mean = 1.79 out of 5). **Discussion:** Education on PU risk, prevention and management is frequently but not always being provided to residents and family members. Future intervention should focus on patient and family education.

**GSA SIXTY-FIFTH ANNUAL SCIENTIFIC MEETING** NOVEMBER 14-18, 2012  
SAN DIEGO, CALIFORNIA

# 2012 Late Breaker Poster Sessions

**Organized by the Biological Sciences and Health Sciences Sections,  
and the Research, Education and Practice Committee**

## 2012 Late Breaker Poster Sessions

The Late Breaker Poster Sessions are jointly sponsored by GSA's Biological Sciences and Health Sciences Sections, and the AGHE/GSA Research Education and Practice Committee. These sessions are a forum for the presentation of the newest, most pressing, and previously unreported results in aging research.

Participating posters will be grouped together in a special Late Breaker section of the hall and are easily identified by the "LB" in front of the poster number on each board. Late Breaker sessions will take place outside Exhibit Hall B, directly adjacent to Exhibit Hall A, GSA's Exhibit Hall in the San Diego Convention Center. The "LB" number on each board corresponds to the "LB" number in front of an abstract in this program.

Posters will be displayed during the times listed below.\* Presenters will be at their boards during the Face-to-Face Time for each session.

### **Wednesday, November 14**

6:00 PM to 8:00 PM

Face-to-Face Time: 6:00 PM - 7:00 PM

### **Thursday, November 15**

12:00 PM to 3:00 PM

Face-to-Face Time: 12:00 PM - 1:00 PM

### **Friday, November 16**

10:00 AM to 1:00 PM

Face-to-Face Time: 10:00 AM to 11:00 AM

### **Saturday, November 17**

11:45 AM to 2:45 PM

Face-to-Face Time: 11:45 AM – 12:45 PM

\*Presenters: Posters can be put up anytime the day of your presentation. All posters must be removed by the end of the day.

**Wednesday, November 14**

***Health Sciences Section***

**LB1. A Mixed Methods Study Exploring the Nurse Work Environment and Perceived Quality of Geriatric Care in Rural Hospitals**

**Daniel Cline**, University of Colorado College of Nursing Anschutz Medical Campus; **Elizabeth Capezuti**, New York University College of Nursing; **Christine Kovner**, New York University College of Nursing; **Victoria Vaughan Dickson**, New York University College of Nursing

**BACKGROUND:** The rapidly aging population and their frequent use of hospital services will create substantial quality challenges in the near future, especially in rural hospitals due to limited resources and health care providers. Redesigning hospital work environments is key to improving the quality of geriatric care, but a lack of research on rural hospital work environments and the quality of geriatric care limits effective redesigns.

**PURPOSE:** To explore how the nurse work environment influences perceived of quality of geriatric care in rural hospitals.

**METHODS:** A concurrent, embedded mixed methods research design, with emphasis on the qualitative data (in-depth, semi-structured interviews). Thirty-one RNs from three hospitals located in rural counties of Northern New York State participated in the study.

**RESULTS:** RNs identified several work environment factors that influence the quality of geriatric care in rural hospitals. Strong, collegial-RN relationships strengthen the quality of geriatric care, while deficiencies in geriatric specific education, inefficient and cumbersome technology, undesirable interactions with physicians, and poor use and shortages of nursing aides diminish the quality of geriatric care.

**CONCLUSION:** This study is innovative in its use of a mixed method research design to identify how the work environment influences the quality of geriatric care in rural hospitals. Rural hospital work environments are not optimized to facilitate the delivery of quality geriatric care. Targeted interventions by administrators are needed to improve the quality of geriatric care.

**LB2. A Multiple Mediation Model Examining the Relationship Between Confidence In Manual Wheelchair Users and Participation**

**Brodie Sakakibara**, University of British Columbia; **William Miller**, University of British Columbia; **Francois Routhier**, Centre interdisciplinaire de recherche en réadaptation et intégration sociale (CIRRS) Institut de réadaptation en déficience physique de Québec (IRDPOQ); **Catherine Backman**, University of British Columbia; **Janice Eng**, University of British Columbia

**Objectives:** Confidence with using a wheelchair is conceptualized as the belief individuals have in their ability to use a wheelchair. It is a novel construct for which evidence has only recently been published.

To advance our knowledge in this area of study, we hypothesized that in accordance with Social Cognitive Theory, confidence is a significant determinant of participation after examining for important interacting and confounding variables, and that the relationship is mediated by depression, pain, functional ability, wheelchair skills, and mobility.

**Methods:** This cross-sectional study included 118 community-living wheelchair-users (59% male), who were >50 years of age (mean=60 years). The Late Life Disability Instrument, and the Wheelchair-Use Confidence Scale measured participation, and confidence. Mediating variables were measured with the Hospital Anxiety and Depression Scale, Wheelchair User Shoulder Pain Index, Barthel Index, Wheelchair Skills Test, and Life Space Assessment.

**Results:** The final adjusted multiple regression model (R-squared=0.36) included confidence ( $\beta=0.48$ , 95% CI=0.14–0.26), number of health conditions ( $\beta=-0.17$ , 95% CI=-1.05–0.04), and social support ( $\beta=0.19$ , 95% CI=0.08–0.62), and had equivalent control of confounding relative to other models while providing greater precision in estimating confidence. Further analysis revealed a significant total indirect effect of confidence through the hypothesized mediating variables (point estimate=0.09, 95% bias corrected bootstrap CI=0.00–0.18).

**Conclusion:** Our results indicate that the important relationship between confidence in wheelchair-users and participation is mediated by a combination of depression, pain, functional ability, wheelchair skills, and mobility. Because prevalence studies indicate low confidence is common among older wheelchair-users, confidence-enhancing interventions are warranted.

### **LB3. Association of Inflammatory Markers with Socioeconomic Status in Older Adults: Does Race/Ethnicity Matter?**

**JiHyun Cho**, Department of Epidemiology, School of Public Health, University of Michigan, Ann Arbor; **Jennifer Weuve**, Rush Institute for Healthy Aging, Department of Internal Medicine, Rush University Medical Center; **Lisa L. Barnes**, Rush Alzheimer's Disease Center, Department of Neurological Sciences and Department of Behavioral Sciences; **Denis A. Evans**, Rush Institute for Healthy Aging, Department of Internal Medicine, Rush University Medical Center; **Carlos F. Mendes de Leon**, Department of Epidemiology, School of Public Health, University of Michigan

**Background:** Inflammatory processes are one of downstream biological pathways by which socioeconomic status (SES) affects disease risk. Studies have demonstrated that chronic health conditions are associated with elevated inflammatory marker levels. SES differences may persist or widen with age, leading to greater chronic disease risk in those of lower SES. Given the SES differences among subpopulations of different racial backgrounds, it is important to examine how SES is associated with inflammation within specific racial groups.

**Method:** A cross sectional analysis was conducted for a sample from the Chicago Healthy Aging Project (CHAP) separately for black and non-black population (n=3618, aged 65 or older). The participants' CRP and IL-6 levels were measured and assayed. Their SES as well as behavioral variables and medication status were obtained.

Results: The pattern of the association between inflammation and SES varied across different racial groups. Among blacks, lower-SES groups had higher CRP and IL-6 compared to the highest-SES group, although the inverse gradient was not perfectly linear. The association between CRP and income demonstrates only a marginally significant inverse gradient between low- and middle-income groups. Among whites, there was a significant inverse gradient of association between income and IL-6, but not between education and both CRP and IL-6. Compared to the highest-income group, low-income whites were more likely to have higher CRP.

Conclusion: Distinct SES gradient of inflammatory marker levels in blacks and whites suggest that well-targeted interventions are necessary to solve both racial and SES disparities altogether.

#### **LB4. Determinants of Retention for Regulated Staff in Low-Turnover Long Term Care Facilities.**

**Veronique Boscart**, Schlegel Research Institute of Aging, University of Waterloo and Conestoga College; **Katherine McGilton**, Toronto Rehabilitation Institute; **Barbara Bowers**, Institute on Aging, University of Wisconsin-Madison

An adequate supply of nursing staff in Long-Term Care (LTC) facilities is essential to provide stable and high quality care. Therefore, current turnover rates of up to 30% of regulated nursing staff have raised great concern. Implications of high turnover include staff shortages and dissatisfaction with quality health services for resident care. In addition, unregulated staff depend largely on the regulated nursing staff for leadership and support. Knowing which factors retain regulated nurses within LTC is crucial. This study explored administrations' views of what keeps their regulated nursing staff in LTC. Semi-structured interviews with 15 administrators at low-turnover facilities were conducted. Factors discussed included building a community of leaders, personal recognition, actively lived mission and values, administrative and managerial support, strong staff relationships, and deliberate team building. Findings of this study provide administrators and policy makers with an understanding of what factors affect regulated staff retention in LTC and will be used to develop evidence-based strategies to retain nurses in these positions.

#### **LB5. Effects of Lower Body Positive Pressure Treadmill Training on Balance, Mobility and Lower Extremity Strength of Community-Dwelling Older Adults**

**Rolando Lazaro**, Associate Professor, Samuel Merritt University; **Gaye Raymond**, Assistant Professor, Samuel Merritt University

Purpose/Hypothesis: There is growing evidence that confirms the benefits of partially supporting a person's body weight during exercise. Lower body positive pressure (LBPP) unweighting is a new method of providing partial body weight support. This is achieved by using the AlterGTM, a treadmill device with a pressurized chamber that unloads the lower extremities while a person exercises. Currently there are no published studies detailing the benefits of LBPP treadmill training in the geriatric population. This study aims to investigate the effect of LBPP treadmill training on balance, mobility and lower extremity strength in community-dwelling older adults. Subjects: Ten community-dwelling

individuals (ages 60-85 years) with no neurological conditions or musculoskeletal injuries within the past year participated.

**Methods and Materials:** The subjects participated in twice weekly treadmill training sessions using LBPP at 80% of body weight. They exercised using their self-selected speed and incline for twenty minutes each session for eight weeks. Blood pressure and heart rate were taken before, after 10 minutes and at the conclusion of each training session. Pre- and post-test measures included Performance Oriented Mobility Assessment (POMA), 10 meter walk test (10MW), Computerized Dynamic Posturography (CDP), modified Timed Up and Go (mTUG) and lower extremity dynamometry. **Results:** All 10 participants were female. Wilcoxon signed ranks test results showed statistically significant improvement in POMA ( $p=.024$ ), composite score of the CDP ( $p=.025$ ), the sit-to-stand split of the mTUG ( $p=.005$ ), and lower extremity strength ( $p=.008$  to  $.015$ ). Average self-selected speed more than doubled from 1.92 to 3.90 mph (mean=2.44). All subjects exercised within their safe limits, with no unsafe increases in blood pressure or heart rate, and no complaints of extremity pain or muscle soreness throughout the entire training period.

**Conclusions:** In a sample of community-dwelling older adults, an eight-week regimen of treadmill exercise with LBPP unweighing resulted in improvements in balance, mobility and lower extremity strength. All participants exercised within safe limits, and reported no adverse effects from the training.

**Clinical Relevance:** The study provides preliminary support for safe and effective use of LBPP treadmill training in community-dwelling older adults. The positive effects of LBPP in minimizing biomechanical risks, decreasing pain while weight-bearing and facilitating mobility are of benefit in geriatric populations.

#### **LB6. Income Inequality and Self-rated Health: Race and Gender Matter**

**Amanda Sonnega**, Institute for Social Research/University of Michigan; **Jessica Faul**, Institute for Social Research/University of Michigan; **Beth Simmert**, Wayne State University

Progress has been made in explaining the well-documented socioeconomic status (SES)-health gradient, yet much remains to be done. The social causation model is the most common framework for investigating explanatory variables. This model posits that a host of social conditions put poorer individuals at risk of illness. Increasingly, researchers are considering contextual variables as risk factors. Thus, for example, an individual's lower personal income may put her at risk of illness, but her wider economic context may be an additional risk. This study investigated income inequality as a contextual risk factor for self-reported health status. Data from the Health and Retirement Study (HRS), a large nationally representative sample of older U.S. households, were linked at the individual level with the county-level Gini Index from the U.S. Census Bureau's American Community Survey (ACS). The matched sample from 2006 is 16,290 respondents. The Gini Index ranges from 0 to 1, where 0 is perfectly evenly distributed income and 1 is complete inequality. Stepwise logistic regression analysis was used to evaluate the contribution of 1) Gini, gender, age, education, 2) plus natural log income, natural log wealth, natural log median county income, 3) plus race on self-reported health. Gini remained a significant risk factor for poor self-reported health in all three models. A second set of models stratified

by gender found Gini to be a significant risk for men only. Models stratified by race found the index to be a highly significant risk for non-Hispanic whites but slightly protective for non-Hispanic blacks.

#### **LB7. Incontinence Prevalence by Race and Ethnicity of Older Adults Admitted to Nursing Homes**

**Donna Bliss**, University of Minnesota; **Susan Harms**, University of Minnesota; **Judith Garrard**, University of Minnesota; **Kay Savik**, University of Minnesota; **Olga Gurvich**, University of Minnesota; **Christine Mueller**, University of Minnesota; **Jean Wyman**, University of Minnesota; **Lynn Eberly**, University of Minnesota

Racial/ethnic disparities in incontinence prevalence have been reported in community-living residents (of which 46% are estimated to seek nursing home (NH) care), in health problems that are risks for incontinence, and by US region. Little is known about incontinence in NH admissions by race/ethnicity. Admission is a critical time for NHs to be aware of disparities in order to identify and manage health problems and resources to achieve better resident health outcomes. This cross-sectional analysis of Minimum Data Set (2000-2002) and 2000 US Census data described incontinence prevalence among new admissions to NHs by race/ethnicity at three levels: resident, NH, and national. There were 111,640 admissions aged  $\geq 65$  years to 457 NHs of a national, for-profit chain in 31 states and all 9 Census divisions. Incontinence outcomes were: Any Incontinence, Any Urinary Incontinence (UI), Any Fecal Incontinence, Dual Incontinence, Only UI, and Only Fecal Incontinence. Asians (67%), Blacks (66%), and Hispanics (58%) had a higher prevalence of Any Incontinence compared to Whites (48%) and American Indians (46%). Among NHs, the greater the percentage of White admissions, the lower the incontinence prevalence was for all outcomes (except Only UI). Nationally, prevalence of all incontinence outcomes (except Only UI) was lowest in the two Census divisions with the highest percentage of White NH admissions. In conclusion, incontinence prevalence was associated with the race/ethnicity of NH admissions at resident, NH, and national levels, which may further disadvantage NHs with a concentration of minority residents, fewer resources, and lower care quality.

#### **LB8. Long Term Outcome Of Frailty Indicators And ADL Following “Continuum Of Care For Frail Elderly People”**

**Kajsa Eklund**, 1.Vårdalinstitutet, The Swedish Institute for Health Sciences, University of Gothenburg and Lund, Sweden Department of Clinical Neuroscience and Rehabilitation, The Sahlgrenska Academy at University of Gothenburg, Gothenburg, Sweden; **Katarina Wilhelmson**, Vårdalinstitutet, The Swedish Institute for Health Sciences, University of Gothenburg and Lund, Sweden Department of Public Health and Community Medicine/Social Medicine. Institute of Medicine The Sahlgrenska Academy at University of Gothenburg, Gothenburg, Sweden; **Helena Gustafsson**, Sahlgrenska University Hospital, **Sten Landahl**; Vårdalinstitutet, The Swedish Institute for Health Sciences, University of Gothenburg and Lund, Sweden; **Synneve Dahlin-Ivanoff**, Vårdalinstitutet, The Swedish Institute for Health Sciences, University of Gothenburg and Lund, Sweden Department of Clinical Neuroscience and Rehabilitation, The Sahlgrenska Academy at University of Gothenburg, Gothenburg, Sweden

The current trend in Western societies facing a growing proportion of older people is to support frail older persons to remain in their homes as long as possible, so-called ageing in place. Older persons

comprise a group whose reserve of strength is decreasing, and whose activity and participation levels will deteriorate with increasing frailty, often leading to dependence in daily activities. Frail older persons need integrated care from different caregivers at different care levels with multi-professional competences. An intervention study for frail community-dwelling older people was designed, creating a continuum of care from the hospital through and back to their own homes. Objectives were to evaluate its effects on activities of daily living (ADL) and frailty up to one year.

The study design was a RCT with participants randomized to either the intervention or a control group with follow-ups at three-, six- and 12 months. The study group includes 161 older people who sought care at the emergency department at Mölndal hospital, Sweden, and discharged to their own homes. Inclusion criteria were age 80 and older or 65 to 79 with at least one chronic disease and dependent in ADL. Frailty was measured as a sum of eight core frailty indicators and ADL with the ADL staircase. The analyses were made on the basis of the intention-to-treat principle. At both three- and twelve-month follow-up the intervention group had a higher OR in improved number of ADL managed independently. There were no significant differences between the groups regarding frailty.

#### **LB9. Novel Approaches to Evaluating the Cost-Effectiveness of a Nonpharmacological Depression Intervention for Older African Americans: Results from the Beat the Blues Trial**

**Laura Pizzi**, Thomas Jefferson University; **Eric Jutkowitz**, University of Minnesota, Division of Health Policy and Management; **Kevin Frick**, Johns Hopkins Bloomberg School of Public Health, Department of Health Policy and Management; **Dong-Churl Suh**, Department of Pharmacy Practice and Administration, Ernest Mario School of Pharmacy, Rutgers University; **Katherine Prioli**, Thomas Jefferson University; **Laura Gitlin**, Johns Hopkins University School of Nursing Center for Innovative Care in Aging, Johns Hopkins University

**BACKGROUND:** In older African Americans, depression is often underdetected and undertreated. Beat the Blues (BTB) is a novel nonpharmacological intervention that employs trained licensed social workers who engage participants through behavioral activation, assist in care management, make referrals/linkages, provide depression education, and teach stress reduction. **METHODS:** BTB was tested using a prospective two group randomized trial. Subjects were assessed at baseline and 4 months on depression severity (PHQ-9). The cost-effectiveness analysis (CEA) was conducted alongside the trial. Intervention costs, depression healthcare use, and health utility were captured. CEA effectiveness measures were: 1) quality-adjusted life years (QALYs) obtained from the EQ-5D and HUI-3, 2), percent experiencing clinically significant improvement in PHQ-9 score, and 3) percent experiencing depression remission. For each measure, an incremental cost-effectiveness ratio (ICER) was calculated (difference in cost between BTB and control divided by difference in effectiveness between BTB and control). **RESULTS:** BTB cost \$584 to deliver over the 4 months. The cost difference between BTB and control was \$491. BTB participants experienced an incremental QALY gain of 0.0076 (EQ-5D) and 0.0133 (HUI-3). In addition, versus control, 14% more in the BTB group experienced clinically significant depression improvement, and 16% more had remission. The ICERs were \$64,896 (EQ-5D); \$36,874 (HUI-3); \$3,507 (clinically significant improvement); \$2,906 (clinical remission of symptoms). **CONCLUSIONS:** BTB cost-utility ratios fall within acceptable societal thresholds. However, choice of outcome significantly impacts

the ICER. Including multiple outcome measures when reporting CEAs helps provide a robust range of estimates for nonpharmacological programs.

#### **LB10. Nurse Home Visits With Or Without Alert Buttons Versus Usual Care In The Frail Elderly: A Randomized Controlled Trial.**

**Carmen Garcia-Peña**, Instituto Mexicano del Seguro Social; **Jesus Favela**, Centro de Investigación Científica y de Educación Superior; **Luis A Castro**, Centro de Investigación Científica y de Educación Superior de Ensenada, Baja California, México; **Julia Mora**, Instituto Mexicano del Seguro Social; **Francisco Franco-Marina**, Instituto Nacional de Enfermedades Respiratorias; **Marcela D Rodriguez**, Facultad de Ingeniería, Universidad Autónoma de Baja California

Design Randomized, controlled trial, unblinded

Setting Insured population covered by the Mexican Institute of Social Security (IMSS) living in the city of Ensenada, Baja California, Mexico

Participants Older than 60 years with a score on the frailty index higher than 0.14.

Intervention After screening and informed consent, participants were randomly allocated to the CG, IA or IB groups. Primary outcome was the frailty score nine months later. Quality of life, depression, comorbidities, health status and health service utilization were also considered.

Results. Framing sample included 819 patients. Of those, 591 were not located because they did not have a land line/telephone (341), they had died (107), they were ill (50 cases), or they were not currently living in the city (28 cases). A screening interview was applied to 228 participants, and 57 had a score  $\leq 0.14$ ; 171 had  $\geq 0.14$ , and 16 refused to complete the baseline questionnaire. A home visit was scheduled for 155 patients; however, 22 did not complete the baseline questionnaire. The final 133 subjects were randomized into the IA (n=45), IB (n=45) and CG (n=44) groups. There were no statistically significant differences in the baseline characteristics. The mean age overall was 76.3 years (SD 4.7) and 54% were women. At the baseline, 61.65% were classified as frail, and 57.39% were in the final phase. The IA intervention reduced the final frailty percentage from 57.78% to 43.59%.

Conclusion An intervention based on nurse home visits plus alert buttons seems to have a positive effect on frailty scores.

#### **LB11. Preferences for information feedback and privacy for a wrist-worn physiological monitoring device.**

**Ryan Best**, Florida State University; **Neil Charness**, Florida State University

Younger (n=30, mean age 19.77, SD 1.45), middle (n=27, mean age 56.11, SD 7.56), and older adult (n=35, mean age 75.69, SD 6.35) participants answered questions pertaining to their preferences for information feedback and privacy related to a hypothetical wrist-worn physiological monitoring device. An exploratory factor analysis resulted in the measure items loading onto four factors. These included

preferences for the accessibility of recorded health information to medical professionals and family members, the display and functionality of the device, concerns about leakage of health information to unauthorized recipients, and accessibility of recorded health information to the government and insurance companies. After controlling for gender, age significantly predicted the factors associated with concerns about leakage of health information to unauthorized recipients and accessibility of recorded health information to the government and insurance companies. These age differences trended towards older adults indicating less concern related to the leakage of health information and greater comfort with accessibility of recorded health information by the government and insurance companies. There were no observable age differences in preferences for the accessibility of recorded health information to medical professionals and family members and the display and functionality of the device. These results provide further support to previous focus group findings indicating that younger adults are more concerned with privacy of information than older adults (Kwasney, Caine, Fisk & Rogers, 2008), including information related to health.

### **LB12. Profiles of Comorbid Illnesses Predict Inpatient Length of Stay and Costs for Older Adults Hospitalized with Heart Failure**

**Julie T. Bidwell**, Oregon Health and Science University School of Nursing; **Quin E. Denfeld**, Oregon Health and Science University School of Nursing; **Christopher S. Lee**, Oregon Health and Science University School of Nursing

**Introduction:** Heart failure (HF) is the number one cause of hospitalization for adults >65 years and is projected to cost \$94 billion by 2030 in the U.S. As older adults with HF often have significant comorbid burden, we hypothesized that patterns of comorbidities could predict inpatient costs and length of stay (LOS).

**Methods:** We analyzed HF hospitalizations of adults  $\geq 65$  years from the 2009 Agency of Healthcare Research and Quality National Inpatient Sample ( $n=236,109$ ). Using latent-class mixture modeling, we identified distinct profiles of comorbid conditions, each labeled by dominant comorbidities. Generalized linear modeling was used to quantify inpatient costs and LOS by profile, adjusting for age, gender, race, median income, payer, weekend admission, hospital size/control, urban/rural location, and teaching status.

**Results:** Four profiles (entropy=0.68, LMRT=22,836, all  $p<0.0001$ ) were identified: “common variations” (48.2%; patients with few, diffuse comorbidities), “renal/endocrine” (28.4%; greatest proportion of renal disease, anemia, electrolyte imbalances, complicated diabetes, and hypothyroidism), “lifestyle/COPD” (17.8%; greatest proportion of uncomplicated diabetes, hypertension, chronic lung disease, and obesity), and “vascular/ischemic/neuro” (5.6%; greatest proportion of cerebrovascular disease, paralysis, myocardial infarction, peripheral vascular disease, and neurological disorders). In comparison to patients within the “common variations” profile, patients within the remaining profiles had a significant relative increase in costs (“renal/endocrine”=20%, 95%CI=18-21%; “lifestyle/COPD”=11%, 95%CI=10-12%; and “vascular/ischemic/neuro”=22%, 95%CI=19-25%) and longer LOS

(“renal/endocrine”=25%, 95%CI=24%-26%; “lifestyle/COPD”=14%, 95%CI=13-15%; and “vascular/ischemic/neuro”=23%, 95%=21-25%) (all  $p < 0.0001$ ).

Conclusions: In older adults admitted for HF, comorbid illness profiles may be helpful in predicting patients at higher risk of greater inpatient costs and LOS.

### **LB13. Sales of Health-Promoting Foods Have Grown Faster than Candy and Cereal Sales at This Blue Zones Supermarket**

**Rolf Martin**, MMT Corporation; **Michael May**, Albert Lea Hy-Vee; **Amy Pleimling**, Albert Lea Hy-Vee

**BACKGROUND:** The Blue Zones Project (Bluezones.com) focuses on community engineering to make healthy lifestyles more attractive and thereby increase the healthspan of those who participate in the Blue Zones initiative. Actual longevity increases and long-term maintenance of healthier lifestyles have not, to our knowledge, been documented in the scientific literature. We therefore analyzed sales of healthful and other food groups in a large supermarket in Albert Lea, Minnesota, the first city to become a Blue Zones pilot community, to determine if consumption of health-promoting foods increased and whether this increase has been maintained.

**METHODS:** We queried the Albert Lea Hy-Vee Supermarket database to obtain 8,709 sales totals for selected healthy foods, candy and cereals for six months before the Blue Zones project began in 2010, for a six-month period after implementation, and for the most recent six months ending August 31, 2012. Sales total ratios for items sold during consecutive time periods were computed and converted to log values to approximate normal distributions for statistical analysis.

**RESULTS:** Sales increased most for healthy foods compared to candies and cereals. Ratios for the health market category were 30.2% higher compared to candies and 49.1% higher compared to cereals (parametric t-test p values and also nonparametric Kolmogorov-Smirnov p values were below 0.001 for each comparison).

**CONCLUSION:** Relatively large increases in sales of health-promoting foods suggest that the Blue Zones initiative has the potential to significantly improve community health. Sales totals from neighboring businesses are needed before general conclusions can be reached.

### **LB14. Screening of Patients with Obstructive Sleep Apnea/ Hypopnea Syndrome by Subjective and Objective Indicators**

**Li Li**, Dept of Medical & Surgical Nursing, School of Nursing, Peking University, Beijing, China ; **Su ZHANG**, Peking University People's Hospital, Beijing, China.

**Objetives:** To evaluate the sensitivity and specificity of the Epworth sleepiness scale (ESS) for predicting a diagnosis of OSAHS, in patients suffering from Obstructive Sleep Apnea/Hypopnea Syndrome (OSAHS), and to construct a screening system for OSAHS combined subjective and objective factors.

Methods: 104 participants completed the questionnaire regarding the body mass index grade, Epworth Sleepiness Scale, and visual analog scale for snoring which all obtained prior to polysomnography (PSG). Sensitivity and specificity were determined for the Epworth sleepiness scale (ESS). Patient data were subjected to multivariate stepwise discriminant analysis to propose a screening system based on the Fisher's linear classification equation. Results were cross-validated by PSG findings.

Results: Neither sensitivity (0.364) nor specificity (0.615), the single tools of ESS were lower for predicting a diagnosis of OSAHS ( $AHI \geq 5$ ). When applied case-wise to the study population, this equation correctly predicted 79.3 percent of diagnoses.

Conclusions: By combined subjective and objective factors into a single predictive equation, sensitivity and specificity were maximized for diagnosing OSAHS, and 79.3 percent of diagnoses were accurately predicted.

### **LB15. The Effect of Physical Function on the Relationship between Gerotranscendence and Subjective Well-being**

**Takeshi Nakagawa**, Osaka University; **Yukie Masui**, Tokyo Metropolitan Institute of Gerontology; **Kei Kamide**, Osaka University; **Kazunori Ikebe**, Osaka University; **Yasumichi Arai**, Keio University; **Megumi Tabuchi**, Kwansai Gakuin University; **Yasuyuki Gondo**, Osaka University; **Ryutaro Takahashi**, Tokyo Metropolitan Institute of Gerontology

The theory of Gerotranscendence has been proposed as a developmental theory of positive aging, and the concept is defined as a shift in meta-perspective from a materialistic and pragmatic viewpoint to a more cosmic and transcendent one. Gerotranscendence is hypothesized to increase subjective well-being among frail older adults. Nevertheless, only a few empirical studies examined gerotranscendence. The study aims to test hypothesis that low physical function enhance the positive influence of gerotranscendence on subjective well-being.

Participants were 1,000 septuagenarians and 973 octogenarians living in Japan. A questionnaire survey was conducted to assess gerotranscendence and subjective well-being that included life satisfaction, positive affect, and negative affect. Gerotranscendence was measured by using the Japanese Gerotranscendence Scale consisting of 8 sub-factors. A short physical performance battery was conducted to evaluate physical function.

Six sub-factors of gerotranscendence were positively related with subjective well-being, but one of them was considered to conceptually overlap subjective well-being. So, five sub-factors of gerotranscendence were chosen as independent variables. The results of hierarchical multiple regression analyses showed that the interaction of 2 sub-factors of gerotranscendence and physical function only on positive affect was significant. Lower physical function enhanced the positive influence of "Release from the social self" on positive affect. However, lower physical function reduced the positive influence of "Awareness of "arigatasa" and "okage"" on positive affect.

The study indicates that the self dimension of gerotranscendence increases positive affect among frail older adults. However, frailty could diminish the positive influence of the cosmic dimension of gerotranscendence on positive affect.

### ***Research, Education, and Practice Committee***

#### **LB16. “Are You Crazy? Not in My Lifetime”: An Exploratory Study on Older Adults’ and Their Family Members’ Attitude Towards Institutional Care in Bangladesh**

**Syeda Jesmin**, University of North Texas at Dallas; **Iftekhhar Amin**, University of North Texas at Dallas

In many low-income countries although the elderly people solely depend on their families for care until death, providing eldercare has become quite a challenge for the family members. We examine whether older adults and their caregivers in Bangladesh consider nursing home or institutional care as an option. The objectives of our study are to understand: What is the Bangladeshi older adults’ and their family members’ attitude toward nursing homes? Is there a need for nursing homes? How is their need for long-term care met? Are nursing homes culturally appropriate living arrangements for elders in Bangladesh? Using snow-ball sampling technique we collected data from a sample of 18 elders and 50 caregivers. We found a strong negative attitude towards relocation of older adults in nursing homes. However, while western style of institutional care for elderly people is culturally not acceptable yet, the living arrangements of many older adults are not much different from the concepts of ‘independent living’ and ‘assisted living.’ We found an association of family income and attitudes towards nursing home placement, and reported caregiver burden. Community and informal networks play an important role for the low-income families. Among the upper class an emerging trend is the hiring of professional help for eldercare. For middle class families the discussion of nursing home placement is a taboo and considered synonymous with abandoning the close ones. Findings of this study highlight the need for developing culturally sensitive long-term care options for older adults in Bangladesh.

#### **LB17. A Personalized Medicine Observational Study Using a Gene Expression Test to Evaluate Patients $\geq 65$ Years Old Presenting with Symptoms of Suspected Obstructive Coronary Artery Disease**

**Michael Conlin**, Johns Creek Primary Care; **Lee Herman**, Johns Creek Primary Care; **Mark Mouton**, Mouton Clinic; **Larry Wilson**, Wake Forest Family Physicians; **Rakesh Patel**, Arizona Sun Family Medicine; **May Yau**, CardioDx, Inc; **Michael Elashoff**, CardioDx, Inc; **Mark Monane**, CardioDx, Inc

The GES is a validated diagnostic test, measuring expression levels of 23 genes to determine the likelihood of a patient having at least one coronary artery with  $\geq 50\%$  stenosis. Of the 317 patients without a history of CAD presenting to 4 primary care clinics with symptoms of suspected CAD from January 2011 to September 2011 in our retrospective study, there were 98 stable patients that were 65 years or older. Each patient had a peripheral blood sample sent to a central reference laboratory for gene expression testing. The GES was reported to the physician within 3 days on average. The median patient age was 72 years, and 52% were female. There were 15 (15%) patients with low GES (mean=12) and 83 (85%) with elevated GES (mean=28). A total of 49/98 (50%) patients were referred to cardiology: only 1/15 low GES patients (7%) were referred on to cardiology, whereas 48/83 (58%) of elevated scores

are referred (OR 0.09,  $p=0.04$  adjusted for age, sex, practice and symptoms). Among the 71 (72%) patients with average follow-up of 180 days, there were no major adverse cardiac events noted. Thus the GES was incorporated into clinical practice to rule out CAD and showed clinical utility in the elderly population by helping the physicians to manage the geriatric patient in the primary care setting, thus optimizing the delivery of care.

### **LB18. Community Needs Assessments: An Effective Tool for the Planning of Aging Services in Rural Communities**

**Patricia Huffman-Oh**, University of Massachusetts, Boston; **Hayley Gravette**, University of Massachusetts Boston

Rural communities across the United States are not immune to the coming 'age wave' and are expected to see continued growth in their older adult populations. Increased life expectancy, aging of the Baby Boomers, relocation of retirees to rural destinations, and older adults' preference to age in place all contribute to the growth in the percentage of the rural population that is over age 65. Community needs assessments of aging services offer a practical tool for rural communities preparing for the aging of their population. Many towns are using needs assessments to identify the physical, financial, environmental and social supports needed to make their community more aging-friendly and to determine how they can prepare to assist an aging population without the resources and funds of urban areas. In response to these objectives and in partnership with a small town in mid-coast Maine, this study offers a narrative exploration of what older and Boomer-age adults in one community envisioned for the future of the town's aging services. Four focus groups with 32 community members were conducted in July of 2012. Identified themes described residents' perception of aging in place and their anticipated, as well as current, service needs. Suggestions for developing partnerships between formal social services and community-based supports to meet the needs of an aging rural population were highlighted. A key practice implication includes gaining a better understanding of the differing social service interventions required by rural-dwelling in-migrant retirees and long-term residents.

### **LB19. Family Support for Aging in Place: How Women Differ from Men**

**Emma Quach**, University of Massachusetts, Boston

Although aging in place is desirable from the perspectives of public policy and older individuals, aging in place is predicated on marshalling available supports to counteract declines in independence. Recent research indeed demonstrates the importance of social support and social integration as personal attributes in contributing to aging in place expectations. Yet, it is unknown whether the relationship between social support and aging in place expectations is moderated by gender. In addition, do some sources of support facilitate aging in place more so than others?

A sample of 1487 adults 50 years of age or older from the 2004 Health and Retirement Survey was used in a cross-sectional analysis of older adults' relocation expectations, which were defined as having a 20% or higher probability of moving in the next two years. Logistic regression results show that persons with higher social support had significantly higher odds of expecting to age in place (or lower odds of

expecting to relocate). Furthermore, support from children significantly increased the odds of women's aging in place expectations whereas support from relatives was significant to men's expectations of aging in place, after controlling for key factors such as health and homeownership. These results suggest that men and women tap into different family sources for assistance to age in place. Therefore, services that promote aging in place, such as family support services, may need to target both immediate and extended kin of older adults at risk of relocation.

#### **LB20. Food Deserts and Healthy Living for Older Adults with Diabetes**

**Anna Faul**, Kent School of Social Work, University of Louisville; **Joseph D'Ambrosio**, Kent School of Social Work, University of Louisville; **Pamela Yankeelov**, Kent School of Social Work, University of Louisville, **Barbara Gordon**, Kipda Area Agency on Aging

To understand the influences the food environment have on the health of rural older adults with Type 2 diabetes, a food desert study was executed in three rural counties using the methodology from Subramanian et.al. (2006). With GIS software (ArcMap10), food resources in the counties were geo-coded within census tracts and grouped into fast food outlets, convenient stores, independent grocers, and chain supermarkets. The home addresses of 320 older diabetic patients living in these three counties were geo-coded to determine in which census tracts they reside. The outcome variable was a count of health indicators (A1C, blood pressure, blood cholesterol) that were in the acceptable range for diabetic patients as reported by their primary health care professionals. We controlled for individual poverty levels, educational attainment, age and ethnicity. Census tract level control variables were the proportion of the population living below poverty, the median income, the proportion of the population 65 and older, the population size, and the proportion of the population with some college. Analysis was done using multilevel modeling, with the individuals nested in 23 census tracts. Results indicated a significant impact of the availability of the different food resources on the health of diabetic patients. The control variables were significant in the predictor model, indicating that they were important indicators to consider in creating healthy communities. However, even after these variables were controlled for, the availability of healthy food resources was still a strong predictor of the health status of older adults with diabetes.

#### **LB21. Gambling Motivation and Psychosocial Outcomes for Older Adults: A multi-groups analysis based on impact of age and gender**

**Irene Garrick**, University of Rochester; **Margaret Warner**, Graduate School of Education

With gambling identified as one of the most popular social activities among older adults, and aging baby boomers representing a sharp increase in the number of adults older than 65 years of age, there will likely be a concomitant increase, in the coming years, in the number of older persons counting themselves among those who gamble. Due to the recent emphasis on the marketing of gambling toward senior citizens, newer research has focused on motivation behind gaming activities of older adults and the concern that they may develop a pathological gambling disorder. The majority of studies begin with the assumption that older adults are vulnerable and are thus at-risk for developing pathological or problem gambling due to factors common to later life such as illness, frequent and

multiple loss, boredom, loneliness, and cognitive vulnerabilities such as Alzheimer's disease and other types of dementia. This study challenges the assumption that gambling is inevitably a negative force in older persons' lives and shows that there are some instances when gambling may not be associated with negative outcomes. Results based on an analysis of a secondary dataset using self-determination theory as a framework and Structural Equation Modeling as a quantitative method suggest a strong association between gambling for extrinsic reasons and relationship difficulties and emotional problems for all adults (ages 18+) as well as a lower occurrence of relationship difficulties for older adults (65+) and women who gamble for intrinsic reasons.

## **LB22. Health-Related Quality of Life and Future Care Planning Among Older Adults: Exploring the Role of Hope as a Moderator**

**Jodi Southerland**, Department of Community & Behavioral Health College of Public Health East Tennessee State University; **Jameson K. Hirsch**, Department of Psychology East Tennessee State University; **Deborah L. Slawson**, Department of Community & Behavioral Health College of Public Health East Tennessee State University; **Robert Pack**, College of Public Health East Tennessee State University; **Jeffrey M. Lyness**, University of Rochester Medical Center School of Medicine and Dentistry; **Silvia Sörensen**, School of Medicine and Dentistry University of Rochester Medical Center

Older adults are at increased risk for chronic medical problems and functional impairment, factors which may intensify the need for daily assistance. As such, planning for long-term care needs is an important component of healthy aging. Yet, perhaps due to differences in intrapersonal characteristics, many older adults fail to engage in advanced planning.

We examined the moderating effects of trait hope on the relationship between health-related quality of life (HRQoL) and preparation for future care needs (PFCN), in a sample of 66 older adult primary care patients. Participants completed an assessment of PFCN processes, including awareness, information gathering, decision making, and concrete planning; the SF-36v1 Health Survey; and, the Adult Trait Hope Scale.

At the bivariate level, social, physical, and emotion-based role functioning were inversely related to PFCN and positively related to hope. Multivariate moderation models, covarying age, sex, race, education, illness burden, and functional impairment, indicated that hopefulness, particularly agentic thinking or goal identification, moderated the relationship between those three HRQoL dimensions and PFCN behaviors.

Among those with greater emotion-based role limitations, lower hope was associated with more awareness of risk and information gathering, and less concrete decision making; whereas, among individuals with fewer role limitations and better social and physical functioning, higher levels of hopefulness were associated with increased decision making.

Our results may have implications for both clinical and public health practice. For instance, health professionals should consider patients' intrapersonal characteristics, particularly ability to identify and enact meaningful health goals, when encouraging and developing future care plans.

### **LB23. Interprofessional (IP) Chief Resident Immersion Training (IP-CRIT): Supporting the Triple Aim**

**Jane Mohler**, Arizona Center on Aging; **Conrad Clemens**, University of Arizona College of Medicine; **Amy Waer**, University of Arizona College of Medicine; **Vicki Began**, University of Arizona College of Nursing; **Lisa O'Neill**, Arizona Center on Aging; **Karen D'Huyvetter**, Arizona Center on Aging; **Rebecca Mandel**, Arizona Center on Aging; **Mindy Fain**, Arizona Center on Aging

**Background/Rationale:** The national Chief Resident (CR) Immersion Training Program in the Care of Elders (developed by Sharon Levine, MD and supported by Hartford Foundation, ADGAP and the Hearst Foundation) is targeted to incoming CRs because of their key role in: ensuring safe, high quality care; medical student and resident training; and working with faculty, interprofessional (IP) staff, and patients. A year-long quality improvement (QI) capstone project is part of this curriculum.

**Objectives:** Our objectives were to: 1) make this training interprofessional (IP), and 2) systematically integrate the Institute of Healthcare Improvement's "triple aim" (better health, better healthcare, and lower cost), QI components, and cross-disciplinary collaboration into the CRIT curriculum.

**Methods:** Using an interprofessional (medicine, nursing, pharmacy, social work, quality improvement (QI) and public health) faculty, we: 1) Reviewed all curricular components, building to IP competencies and integrating the triple aim; 2) Used IP faculty as small group facilitators in case-based discussions and mini-lectures; 3) Incorporated our Integrated Health System's QI priorities into CR QI project planning; and 4) Invited key institutional leaders to deliver inspirational talks, embodying the triple aim.

**Conclusions:** Evaluations were positive. We educated CRs about value-based cost-conscious care, and linked them to key interprofessional staff to build team-based care. Together they addressed QI issues identified as important by the Network. Chiefs are now better prepared to train medical students and residents using a team-based, patient-centered approach, and a culture of continual quality improvement. QI projects will continue over the year, and will be evaluated at year's end.

### **LB24. Profit and Performance in Medicare Home Health: Research Results**

**William Cabin**, City University of New York Public Health Doctoral Student

There have been no studies of the relationship of ownership, profitability, and mandated quality outcomes in Medicare home health since the new prospective payment system began in 2000. The present study merges two public Medicare databases with a sample of over 8,000 agencies to address the relationship of ownership to profitability, cost, and quality. Using bivariate analyses, the study finds proprietary agencies are more costly and more profitable than non-profits while producing lower quality.

## **LB25. Seniors in Maryland Adapting Local Communities in New Ways to be in Charge of Their Aging Process**

**Priyanthi Silva**, Westat; **Carol Cober**, Westat; **Cynthia Thomas**, Westat

Baby boomers and other seniors as they age often prefer to continue living within their home community in the environment they are accustomed to. We examined different neighborhoods in Maryland, where the 65+ population has increased by 18.2 percentage points from 2000 to 2010. Seniors in at least 14 different neighborhoods have developed or are in the process of developing “village” programs to provide services and supports to neighbors to enable residents to remain at home despite increasing levels of frailty. Half of these Maryland villages have been in existence for 5 years or less. Village groups within suburban, small town and urban sites have tailored their programs to meet the unique needs of each community. Using telephone and face-to-face interviews with village leaders, we identified factors that help to build and sustain these efforts to age in place. Our initial examination found many similarities as well as differences in the size of areas served, for establishing membership criteria, sources of funding, and range of services offered. The dedicated efforts of strong, leadership many with diverse professional backgrounds and extensive time invested by founders and volunteer board members were critical factors maintaining villages. We developed an initial typology to identify the types of village models. Although the types of resources available in each village varied, all have managed so far to provide social support and promote self-efficacy, and have capitalized on community partnerships.

## **LB26. Standardizing Antibiotic Use in Long-Term Care Settings: The SAUL Study**

**Darcy McMaughan Moudouni**, Texas A&M Health Science Center School of Rural Public Health; **Obioma Nwaiwu**, Texas A&M Health Science Center School of Rural Public Health; **Hongwei Zhao**, Texas A&M Health Science Center School of Rural Public Health; **David Mehr**, University of Missouri Health System School of Medicine; **Elizabeth Frentzel**, American Institutes for Research; **Steven Garfinkel**, American Institutes for Research; **Charles Phillips**, Texas A&M Health Science Center School of Rural Public Health

**OBJECTIVES:** To determine if the Communication and Order Form (Form) for suspected UTIs reduced antibiotic use in nursing homes.

**DESIGN:** A pre- and post-test design with two intervention (Form plus more training, Form plus less training) and one comparison group with post-intervention process evaluations.

**SETTING:** 12 nursing homes in central Texas.

**PARTICIPANTS:** Residents who received an antibiotic for a suspected UTI during the 12 month study period (intervention). Nursing home administrators and staff in the study homes (process evaluation).

**MEASUREMENTS:** Rates of antibiotic prescriptions for suspected ASB and odds of a prescription being written for ASB given resident and home characteristics. Data were modeled using mixed-effect models by intent-to-treat and fidelity.

**RESULTS:** Seventy percent of UTI prescriptions were written in the absence of symptoms (suspected ASB). Resident characteristics did not affect the likelihood that a prescription was written for ASB. Implementation was challenging for intervention nursing homes. When implemented, the Form reduced the number of prescriptions written for ASB (OR = 0.35, 95% CI = 0.16–0.76). The effect was not sustained.

**CONCLUSIONS:** The Form significantly reduced antibiotic prescriptions in study homes that implemented it. Although the intervention reduced unnecessary antibiotic use during the study, it did not become embedded in the everyday operations of the nursing homes and the favorable impact on antibiotic stewardship was not sustained. Without a consistent reason to use the Form, such as a staff champion, nursing home policies, or state regulations, the homes that implemented the Form did not continue to use it.

#### **LB27. The Research and Analysis of Sleep Quality and Influences of Senile Population in Wuhan Area**

**Ling-Yun Wu**, Renmin Hospital of Wuhan University; **Xu Xu**, Renmin Hospital of Wuhan University; **Hong-Mei Ma**, Renmin Hospital of Wuhan University

[Objective] To research about sleep quality of senile population in Wuhan area and analyze the influencing factors. In this research, we may provide some evidences for nursing intervention and health education for the improvement of sleep quality among senile population. [Methods] Using cluster sampling method, we sampled 138 senile individuals to complete the PSQI scale. [Results] The PSQI score of Wuhan senile sample is  $8.78 \pm 4.61$ , in which, 55.80% of the sample ( $n=77$ ) has poor sleep quality. Factors that are significant in affecting the sleep quality include dreams, major life events, medical expanses, etc ( $P < 0.05$ ). [Conclusions] The total state of sleep quality among senile individuals in Wuhan area is low. nurse should intervene on physical and mental health, unhealthy habits in order to promote the target population's sleep quality.

#### **LB28. The Significance of Ethnicity in Saving for Retirement**

**Roberta Adami**, Westminster Business School; **Andrea Carosi**, Bologna University; **Orla Gough**, Westminster Business School; **Anita Sharma**, Westminster Business School

This article investigates savings over the life-cycle of ethnic minorities in the UK. Using data from the Family Resources Survey (FRS) for 1994-2008, the paper analyses the saving profiles of ethnic minorities by gender and age cohorts, starting from the age of 16. A number of socio-economic variables, such as education, income and employment status, are used to better understand saving patterns of ethnic minorities.

When we apply the life-cycle model to the different ethnic groups we find significant heterogeneity between and within groups in terms of socio-economic characteristics and saving accumulation during the working life as well as in retirement. While Indian respondents show socio-economic characteristics and saving patterns similar to our control group (the white population), Bangladeshi and Pakistani respondents are experiencing a significant disadvantage in terms of employment and ability to save.

Gender and ethnicity are important determinants of financial well-being. Asian women, particularly Bangladeshi, exhibit the greatest financial difficulties amongst all groups examined, these are often consequences of low full time employment rates and low incomes.

We find that, for all ethnic groups and both genders, education is a crucial factor in determining saving behaviour. We find evidence that generational differences and demographic factors play a crucial role in ethnic minorities' economic conditions and saving profiles.

The importance of our results lies in determining whether the risk of poverty in retirement is significantly higher for those of ethnic minority background and in assessing specific socio-economic and cultural reasons leading to poverty in later life.

#### **LB29. Trends in Full- and Part-Time Work in Adults 60 and Older**

**Sandra Reynolds**, University of South Florida School of Aging Studies

In light of increasing financial uncertainty, policymakers and financial planners need to have an appreciation for trends in the labor force participation of older workers. In this study, we use 17 years of the Current Population Surveys (1994-2011) to examine trends in both full- and part-time work among adults age 60 and older. Time trends are used to indicate the average annual change ( $n=17$ ) in the proportion of working for men, women, and specific sub-populations (race/ethnicity, education, and income). Individual level analysis, which controls for change in the population composition, is conducted to estimate the probability of working full-time or part-time, compared to not working ( $n=334,844$ ). Results indicate that the proportion of men and women working full-time has significantly increased over the period; significant increases in working part-time are largely found in women age 65 and older. There are similar trends in working full-time for all subgroups, although the trends are strongest in those with high income, and high education; subpopulation trends in working part-time are less consistent than those for working full-time. Individual level analysis confirms that the probability of working full- or part-time increases over time and decreases with age; it also suggests that older Hispanics and adults with high education or high income are the most likely to be working full- or part-time. These findings suggest that retirement policies and retirement planning should both acknowledge and support the desire and, in many cases, need for older adults to stay in the labor force.

#### **LB30. Where Does Self-Efficacy Weigh in?: Diabetes Self-Management and BMI in Middle-Aged and Older Adults**

**Tomorrow Wilson**, West Virginia University; **Julie Hicks Patrick**, West Virginia University

Up to 70% of adults 60 years and older in the United States are considered overweight or obese — an important risk factor for type 2 diabetes (T2D). Given the increase in fat mass, redistribution of body fat, and height shrinkage with older age, middle-aged and older adults are at an increased risk for development of T2D and diabetes complications (Biggs et al., 2010). It has been well established that self-efficacy is positively associated with self-management of T2D. Middle-aged and older adults ( $N = 53$ ) aged 40-66 ( $M = 51$ ,  $SD = 6.7$ ) with T2D were recruited to examine factors related to self-management of

T2D in middle-aged and older adults. Of the sample 24.6% ( $n = 16$ ) were considered overweight and 20% ( $n = 13$ ) were found to be moderately obese. Additionally, results revealed that BMI was associated with self-efficacy ( $r = -.35$ ) and diabetes self-management ( $r = -.41$ ). Lastly, it was found that self-efficacy mediated the relation between BMI and diabetes self-management as confirmed by a Sobel test [ $z = -1.92$ ,  $p = .05$ ]. Results suggest that those with a higher BMI may have lower self-efficacy to manage their diabetes due to perceived inability to maintain a healthy diet or exercise regimen; thus, lower perceived ability and motivation may result in poorer self-management in the future (Bandura, 1982; 2005). Conversely, lower self-efficacy may lead to poorer diabetes self-management and in turn results in higher BMI. Understanding the relation between self-efficacy and BMI has important implications for diabetes self-management interventions.

***Biological Sciences Section***

**LB1. A Murine Model of Acute Pancreatitis Exhibiting Age-dependent Mortality, Inflammation and Thrombosis**

**Hiroshi Saito**, University of Kentucky; **Marlene Starr**, University of Kentucky; **Eun Lee**, University of Kentucky; **Arnold Stromberg**, University of Kentucky; **B. Mark Evers**, University of Kentucky; **Daiki Okamura**, University of Kentucky

Acute pancreatitis is a common inflammatory disease affecting >200,000 people annually in the US.

Although the severity and mortality rates of AP are significantly elevated in the elderly population, the underlying mechanisms for this age-dependent vulnerability is largely unknown mainly due to a lack of appropriate animal models. In the present study, we used a murine model of AP and identified pathophysiologies that are distinctive of the aged with AP. AP was induced in young (4-5 months), middle-aged (12-13 months), and aged (23-25 months) C57BL/6 mice by repeated injection of caerulein, a homologue of the gastrointestinal hormone cholecystokinin. Approximately 10% of aged mice died during AP while young and middle-aged mice showed no mortality. Although both young and aged mice exhibited early signs of edema and inflammation in the pancreas, kidney, and lung, young mice showed signs of recovery within 24 h while aged mice exhibited increasingly severe tissue damage and cell death. There was a significant age-dependent increase in pancreatic neutrophil activation and systemic inflammation as assessed by pancreatic myeloperoxidase and plasma interleukin-6 concentration, respectively. Importantly, aged but not young mice with AP showed significantly elevated thrombosis in the lung and kidney as well as a marked increase in plasma concentration of plasminogen activator inhibitor-1, a primary inhibitor of the fibrinolytic system. These results demonstrate that aging is associated with increased severity of AP characterized by augmented and prolonged pancreatic inflammation and also increased cell death and thrombosis in multiple extra-pancreatic organs.

**LB2. Acetaminophen Induced Hepatotoxicity in Male Fischer 344 Rats: The Effect of Aging on Inflammation and Death Associated Proteins**

**John Mach**, University of Sydney and Kolling Institute of Medical Research; **Aniko Huizer-Pajkos**, Royal North Shore Hospital and Kolling Institute of Medical Research; **Alice Kane**, University of Sydney and Kolling Institute of Medical Research; **Brett Jones**, Royal North Shore Hospital, University of Sydney and Kolling Institute of Medical Research; **Victoria Cogger**, Centre for Education and Research on Ageing, University of Sydney and Anzac Research Institute; **David Le Couteur**, Centre for Education and Research on Ageing, Anzac Research Institute, Concord Hospital and University of Sydney; **Sarah Hilmer**, Royal North Shore Hospital, University of Sydney and Kolling Institute of Medical Research

Acetaminophen (APAP)-induced hepatotoxicity is associated with inflammation and opening of mitochondrial membrane permeability transition pores through the intrinsic cell death pathway. We assessed effects of old age on these responses to APAP toxicity. Young (6±1 months) and old (26±2

months) adult male Fisher 344 rats were treated with 800mg/kg APAP (young n=9, old n=9) or saline (young n=8, old n=5) intraperitoneally four hours before euthanasia. Serum alanine aminotransferase (ALT) indicated degree of hepatotoxicity. Serum inflammatory markers (RANTES, IL-6, IL-10, TNF-alpha, MIP1-alpha, GRO-KC, INF-gamma, IL-1b, IL-4, GM-CSF) were measured using Multiplex assays. Kupffer cells were counted on liver sections, and phagocytic activity assessed by recovery of 500nm microspheres after single pass hepatic perfusion. Hepatic expression of intrinsic cell death pathway proteins (BAX, BID) was assessed by immunoblot. Amongst APAP treated rats, despite higher serum APAP concentrations, serum ALT was significantly lower in old than young ( $p < 0.05$ ). Increased hepatocyte survival after APAP toxicity in old age was confirmed in primary hepatocyte culture (young  $54 \pm 12\%$ , old  $83 \pm 3\%$ ). Compared with other groups, APAP treated old rats had higher serum IL-10 ( $p < 0.005$ ). Kupffer cell numbers were higher in old than young controls, but did not differ with treatment. No difference in phagocytic function was observed with age or treatment. Cytosolic BAX and BID were  $>2$  times lower in old than young rats regardless of treatment ( $p < 0.005$ ). Preliminary results suggest that compared to young rats, older rats have decreased susceptibility to APAP-induced hepatotoxicity, a greater anti-inflammatory response and reduced expression of the intrinsic cell death pathway.

### **LB3. CuZnSOD Gene Deletion Targeted to Skeletal Muscle Leads to Loss of Contractile Force But Does Not Cause Muscle Atrophy in Adult Mice.**

**Yiqiang Zhang**, Barshop Institute, The University of Texas Health Science Center at San Antonio; **Susan Brooks**, Institute of Gerontology, The University of Michigan; **Carol Davis**, The University of Michigan; **Anna Kayani**, University of Liverpool; **Yun Shi**, The University of Texas HSC at San Antonio; **Arunabh Bhattacharya**, The University of Texas HSC at San Antonio; **Arlan Richardson**, The University of Texas HSC at San Antonio; **Holly Van Remmen**, The University of Texas HSC at San Antonio

Previous studies from our group have shown that loss of the superoxide scavenger CuZnSOD in mice leads to accelerated loss of muscle mass and contractile force with aging that is associated with elevated oxidative stress, mitochondrial dysfunction, degeneration of the neuromuscular junction and loss of innervation. To dissect the relative role of muscle and neurons in this process, we established a skeletal muscle specific Sod1 knockout (mKO) mouse model with a nearly complete ablation of CuZnSOD protein expression and enzymatic activity restricted solely to skeletal muscle. Although mice lacking Sod1<sup>-/-</sup> in all tissues show significant muscle loss as early as 3 months of age, the mKO mice did not exhibit any muscle loss up to 8 months of age. However, the muscle of mKO mice shows abnormal fiber morphology, with a significant increase in the number of muscle fibers with centrally located nuclei, suggesting increased fiber regeneration. Although there is no muscle loss, muscle function was significantly reduced in the mKO mice as indicated by a decrease in maximum isometric specific force and a reduction in treadmill endurance. Surprisingly, the mKO mice did not have increases in global measures of oxidative stress, elevated ROS production, or induction of adaptive stress responses as reported for muscles of Sod1<sup>-/-</sup> mice. In summary, our data show that lack of CuZnSOD restricted to skeletal muscle does not lead to muscle atrophy, but does significantly impair muscle function in young adult mice. In addition, our data suggest loss of CuZnSOD may potentiate muscle regenerative pathways.

#### **LB4. Impaired Myelin Proteostasis in Diabetes, a Potential Oxidative Stress-Dependent Mechanism of Demyelination**

**Ryan Hamilton**, University of Texas Health Science Center at San Antonio, Departments of Cellular and Structural Biology, Sam and Ann Barshop Institute for Longevity and Aging Studies; **Mike Walsh**, University of Texas Health Science Center at San Antonio, Departments of Cellular and Structural Biology, Sam and Ann Barshop Institute for Longevity and Aging Studies; **Yun Shi**, University of Texas Health Science Center at San Antonio, Departments of Cellular and Structural Biology, Sam and Ann Barshop Institute for Longevity and Aging Studies; **Rochelle Wei**, University of Texas Health Science Center at San Antonio, Departments of Cellular and Structural Biology, Sam and Ann Barshop Institute for Longevity and Aging Studies; **Yiqiang Zhang**, University of Texas Health Science Center at San Antonio, Departments of Cellular and Structural Biology, Sam and Ann Barshop Institute for Longevity and Aging Studies; **Karl Rodriguez**, University of Texas Health Science Center at San Antonio, Sam and Ann Barshop Institute for Longevity and Aging Studies, Departments of Physiology; **Arunabh Bhattacharya**, University of Texas Health Science Center at San Antonio, Departments of Cellular and Structural Biology, Sam and Ann Barshop Institute for Longevity and Aging Studies; **Holly VanRemmen**, University of Texas Health Science Center at San Antonio, Departments of Cellular and Structural Biology, Sam and Ann Barshop Institute for Longevity and Aging Studies, Physiology, Geriatric Research Education and Clinical Center, South Texas Veterans Hea

Diabetic peripheral polyneuropathy is associated with demyelination, reduced nerve conduction velocity and muscle atrophy. Oxidative stress is considered an important contributor to diabetic neuropathy, however, the mechanisms leading to diabetic demyelination are poorly understood. We hypothesize that imbalanced protein homeostasis (elevated protein oxidation and misfolding, impairment of protein degradation, and aberrant aggregation of key myelin proteins) is linked to impaired myelin structure and function in diabetic neuropathy. To test this, we used diabetic leptin receptor deficient mice (dbdb) that display significant decrements in motor/sensory nerve conduction and myelin structure as well as the superoxide dismutase 1 knockout (Sod1<sup>-/-</sup>) mouse model of in vivo oxidative stress. We measured protein carbonyl levels, exposed hydrophobic pockets, aggregated proteins and proteasome/autophagy mediated degradation in sciatic nerves. Both animal models exhibited significant global increases in protein carbonyls and alteration in surface hydrophobic domain exposure in proteins. Also two critical myelination proteins, myelin basic protein (MBP) and peripheral myelinating protein 22 (PMP22) demonstrated elevation of protein carbonyl and formation of higher order aggregates. Sequence-driven hydropathy plot analysis and an in vitro oxidation of PMP22 and MBP support this differential propensity for aggregation and insolubility in dbdb mice. Compromised autophagy and ubiquitin-proteasome pathways likely contribute to this accrual of protein damage and aggregated protein complexes. Taken together, these data strongly suggest that imbalanced maintenance of protein quality control might play a causative role in the impairment of myelin structure and nerve conduction in diabetic peripheral polyneuropathy.

## **LB5. Lower Physical Function is Associated with Brain Network Fragmentation in Older Adults.**

**Christina Hugenschmidt**, Wake Forest School of Medicine, Section on Gerontology & Geriatric Medicine; **Paul Laurienti**, Wake Forest School of Medicine, Department of Radiology; **Satoru Hayasaka**, Wake Forest School of Medicine, Department of Biostatistical Sciences; **Stephen Kritchevsky**, Wake Forest School of Medicine, Section on Gerontology & Geriatric Medicine; **Jeff Williamson**, Wake Forest School of Medicine, Section on Gerontology & Geriatric Medicine; **Chris Wyatt**, Virginia Tech – Wake Forest University, Department of Electrical and Computer Engineering; **Jonathan Burdette**, Wake Forest School of Medicine, Department of Radiology; ,

Older adults with better physical function tend to have better cognitive function as well. However, the neural basis for this relationship is not known. The neurobiology of mobility is highly integrative; regions of the brain involved in planning, movement, and multiple different senses are all involved. Using network science to examine the relationship between physical function and cognition has great promise, as this novel technique provides unique insights into the functional architecture of brain networks. In this analysis, older (n = 48, age ≥ 65) and younger adults (n=26, ages 18-35) from two studies of physical function and cognition completed the Short Physical Performance Battery (SPPB). Older adults were stratified into high (SPPB score: 11-12) and low (SPPB score: 7-9) performers. A modularity analysis was performed on resting functional magnetic resonance imaging data to analyze communities of highly connected brain areas in each group. Two communities were examined: a somatosensory/motor module, important for physical movement, and default mode network module, important for cognitive function. For both modules, it is clear that younger adults exhibit a highly reliable network. Overall, the same network observed in younger adults is evident in high-scoring older adults. However, older adults with low SPPB scores show fragmentation of networks important for both cognition and movement. In addition, maps of network hubs and Global Efficiency (long-range connectivity) were consistently altered in older adults with lower physical function. Network analysis is a new imaging tool with promise to elucidate shifts in functional network architecture associated with physical decline.

## **LB6. Polygenic Risk for Obesity and Early Mortality: A Possible Molecular Signature for Predisposition to Accelerated Aging**

**Daniel Belsky**, Duke University

**BACKGROUND:** Rates of physical decline in aging are highly variable within birth cohorts. Family studies show that these differences are heritable, i.e. influenced by genetics, but molecular genetic signatures of accelerated aging remain elusive. In a life-course developmental perspective, an accelerated aging phenotype emerges early in life as rapid growth during childhood leading to early reproductive maturity; continues in middle life with the early onset of age-related disease; and culminates in later life with early mortality. Adiposity is a critical mediator of these developmental phenotypes, and we have previously shown that a GWAS-derived genetic profile of risk for adult obesity also predicts rapid childhood growth. Therefore, we here investigate this genetic profile as a possible molecular signature of predisposition to accelerated aging.

**OBJECTIVE:** To test whether genetic risks for obesity predict accelerated aging across the life course.

**METHOD:** Atherosclerosis Risk in Communities Cohort (n=15,792) data were used to test genetic associations with timing of reproductive maturity, development of heart disease and diabetes, and early mortality.

**RESULTS:** Cohort members at higher genetic risk exhibited developmental phenotypes of accelerated aging. Women at higher genetic risk reached menarche earlier in adolescence and reached natural menopause earlier in middle life. Cohort-wide, individuals at higher genetic risk more often developed heart disease and diabetes and experienced early mortality. Associations were only partially accounted for by adiposity phenotypes.

**CONCLUSIONS:** We report preliminary evidence for a genetic risk profile derived from GWAS of obesity phenotypes as a molecular signature of predisposition to accelerated aging.

### **LB7. Proposed Wild Blueberry Health Study 7-Tier Protocol to Delay Aging and Alzheimer's**

**Rolf Martin**, MMT Corporation

**BACKGROUND:** The National Institute on Aging Interventions Testing Program now has a number of longevity-extending “hits” in mice that appear ready for evaluation in human trials, including several widely prescribed medicines that have long safety records when administered by personal physicians. Many other published reports of short-term reversals suggest other interventions that appear ready for human trials, with appropriate precautions. Concurrent interventions aimed at seven hierarchic levels appear especially promising.

**METHODS:** Several hundred machine learning algorithms will be used to merge physicians and scientists insight with metabolomics, proteomics and other OMICs data sets and personal cognitive performance results before and after blueberry consumption [cf. patents 6,712,615 and 8,095,480]. With these informatics methods we can vigorously pursue at least some of the health objectives selected by participants and their personal physicians. Our primary 2012-2013 goals are to maximize short- and long-term benefits provided by high polyphenol, high-antioxidant wild blueberries by evaluating different daily amounts and consumption schedules. Following the evaluation of blueberries and positive control interventions (oranges and vitamin C), concurrent interventions to be tested will address changes in (i) key signaling and redox-active ions, (ii) biochemical metabolites (e.g., those related to redox balance, energy metabolism, macromolecular damage and repair), (iii) misfolded hypoactive and also hyperactive and aggregated proteins (by increasing turnover and consuming vitamins and other cofactors to snap at least some proteins back into their active catalytic conformations), (iv) maintenance of organelle functional regions such as lipid rafts, possibly with medium chain length lipids, (iv) damaged organelles (via increased autophagy), (v) the activity of batteries of protective and repair genes (e.g. Nrf2), (vi) the prevalence of senescent cells that by hypothesis drain resources and damage their neighbors, and (vii) inter-organ communication (to optimize circadian rhythms and reduce damaging metabolic pathways e.g. via melatonin, amylin, acarbose).

**RESULTS:** Results to date are those obtained by 2002-2012 Wild Blueberry Health Study participants whose decision speed and memory scores increased significantly (see reports at BlueberryStudy.com). High-intensity cognitive measurements and collection of saliva and serum samples for OMICs analysis has started with a new set of participants who are maintaining power standards set since we began in 2002. Initial funding has been provided by our wild blueberry study budget and donations.

**CONCLUSIONS:** It is now possible at relatively low cost to merge many different OMICs data sets with physicians and scientists insight and to employ megadimensional artificial intelligence methods to achieve personal health goals. Physicians, scientists, businesses and new study participants are invited to contact BlueberryStudy@gmail.com.

#### **LB8. Quantification of Frailty Using Frailty Indices Based On Clinical and Behavioural Data in Ageing Mice: Comparisons with the Frailty Index in Humans**

**Susan Howlett**, Dalhousie University Departments of Pharmacology and Medicine; **Jocelyne Whitehead**, Dalhousie University, Department of Pharmacology; **Barbara Hildebrand**, Dalhousie University, Carleton Animal Care Facility; **Michael Rockwood**, Dalhousie University, Department of Medicine (Geriatric Medicine); **Kenneth Rockwood**, Dalhousie University, Department of Medicine (Geriatric Medicine)

Frailty can be quantified in humans with a frailty index (FI), in which an individual's deficits in health are counted and divided by the total number of items measured. Our objectives were to: 1) develop a novel FI based on the clinical assessment of deficits in ageing mice and compare it with our earlier FI and; 2) compare the relationship between the FI and age in mice and humans. Frailty was quantified in C57Bl/6J mice (6-28 mos) with a behavioural FI (open-field activity levels) and a clinical FI (assessment of 31 physical signs, symptoms and diseases). Both the behavioural and clinical FIs increased markedly with age. Values for the mean clinical FI score increased from  $0.02 \pm 0.02$  in 6 month-old mice to  $0.33 \pm 0.05$  in 28 month-old mice ( $n=10/\text{group}$ ). Similar results were obtained with the behavioural FI ( $0.07 \pm 0.04$  at 6 mos vs.  $0.27 \pm 0.09$  at 28 mos;  $n=10/\text{group}$ ). Human FI scores, calculated from 70 self-report items in the Survey of Health, Ageing and Retirement in Europe were plotted as function of age ( $n=30,025$  people). We normalized age as a percentage of maximum lifespan and plotted FI (natural logarithm) vs. age to quantify the rate of deficit accumulation. The slopes of these lines were virtually identical ( $0.034$  in mice,  $r^2=0.80$  vs.  $0.033$  in humans,  $r^2=0.97$ ). Thus an FI based on clinical measures can be used to quantify frailty in ageing mice. This novel clinical FI exhibits key features of the FI established for use in humans.

#### **LB9. Smaller Myonuclear Domain in Aged Muscle is Associated with Elevated RNA Degradation**

**Esther Dupont-Versteegden**, Div. Physical Therapy, Dept. Rehabilitation Sciences, College of Health Sciences, University of Kentucky; **Aman Shah**, College of Arts and Sciences, University of Kentucky; **Jena Richards-White**, Dept. Rehabilitation Sciences, College of Health Sciences, University of Kentucky; **Amy Confides**, Dept. Rehabilitation Sciences, College of Health Sciences, University of Kentucky

Skeletal muscle mass is decreased with age and with disuse. It is currently unknown whether RNA degradation and changes in nuclear number are associated with muscle atrophy in general, but

particularly in the aged. Therefore, the goal of our study was to investigate whether changes in nuclear number in muscle of aged rats were associated with differences in RNA degradation rates under ambulatory and disuse conditions. Soleus and gastrocnemius muscles of ambulatory and hind limb suspended (disuse) Fisher344/Brown Norway rats, 6 or 32 months, were used to determine nuclear number and RNA degradation rates. Nuclear number was determined by counting nuclei on muscle cross sections, as well as single fibers of soleus; RNA degradation was measured in vitro using the cytosolic fraction of gastrocnemius muscles on RNA from tibialis anterior. Results showed that nuclear number was elevated in aged muscle and did not change with disuse despite a decrease in cross sectional area, resulting in a smaller myonuclear domain in aged as well as disused muscle. Simultaneously, total RNA decay rate was elevated 1.9-fold and total RNA half life was decreased by 49% in muscle of aged rats, while atrophy induced by disuse did not affect RNA degradation rate. These data indicate that a higher nuclear number is associated with an increase in RNA degradation in aged muscle, but not with disuse. Therefore, in aged, but not acutely atrophied, muscle a smaller myonuclear domain may be driven by increased rates of RNA degradation. Supported by APS undergraduate fellowship and AG028925.

#### **LB10. The Transcription Factor Sp1 Is A Master Regulator For The Senescence-associated Functional Nuclear Barrier**

**Sung Young Kim**, Lee Gil Ya Cancer and Diabetes Institute, Gachon University

Hyporesponsiveness to external signals such as growth factors and apoptotic stimuli is one of the cardinal features of the cellular senescence. For which, we have previously reported that aging dependent vast reduction of the nucleocytoplasmic trafficking related (NCT) genes could be responsible. In search of the mechanism, we identified the transcription factor Sp1 as one of the common regulators for control of NCT genes, including various nucleoporins, importins, exportins and Ran GTPase cycle-related genes. The role of Sp1 in control of those genes has been illustrated by reduction of those genes through its knockdown in young human diploid fibroblast cells (HDF), and also by induction of those genes through its overexpression in senescent cells. In addition, the nuclear translocation of p-ERK1/2 as well as Elk-1 phosphorylation on epidermal growth factor stimulation was severely impaired by Sp1 depletion in young HDFs, while Sp1 overexpression restored the nuclear translocation of p-ERK1/2 in senescent HDFs. Furthermore, we observed that Sp1 protein levels were decreased in senescent cells and the treatment of H<sub>2</sub>O<sub>2</sub> decreased Sp1 levels in a proteasome-dependent manner. In addition, O-GlcNAcylation of Sp1 was decreased in senescent cells as well as in H<sub>2</sub>O<sub>2</sub>-treated cells. Taken together, these results suggest that Sp1 could be a key regulator for control of NCT genes and that reactive oxygen species-mediated alteration in Sp1 stability would be responsible for the generalized repression of those genes, leading to formation of the senescence-dependent functional nuclear barrier, resulting in the subsequent hyporesponsiveness to external signals.

## **Health Sciences Section**

### **LB11. Alterations in Gait Patterns in the Frail Elderly During Multitasking**

**Pooja Rajguru**, University of Arizona/Undergraduate Student; **Michael Schwenk**, University of Arizona; **Karen D'Huyvetter**, University of Arizona/AZ Center on Aging; **Jane Mohler**, University of Arizona, AZ Center on Aging; **Maria Garcia**, University of Arizona; **Daniel Badillo**, University of Arizona; **David Armstrong**, University of Arizona/Department of Surgery; **Bijan Najafi**, University of Arizona/Department of Surgery

Background: Gait alterations are associated with frailty and increased fall risk. Body-worn-sensor technology advances gait assessment from extensive laboratory equipment to portable, every day evaluation. Dual-task conditions amplify gait changes and may be useful in frailty screening. This pilot study aimed to detect gait changes related to Fried frailty phenotype, Mini-Mental State Examination (MMSE) and activities of daily living (ADL) functional status.

Methods: Three elderly subjects(ages  $86 \pm 5$  years) were assessed within the patient's homes using validated wearable sensor technology (LEGSys™) during single and dual task conditions. Based on Fried criteria, MMSE, and ADL Barthel Index, subjects were ranked as subject 1: frail, low ADL/MMSE, subject 2: frail, moderate ADL/MMSE, subject 3: pre-frail.

Results: Results show steps for gait initiation (GI), stride velocity (SV), and stride length (SL) as three most important of ten tested gait parameters. GI increased by 300% for subject 1 during dual task. Other parameters showed similar tendency with lower effect size for dual task. GI increased on average 85.7%, SV decreased 21.7%, and SL decreased 8.4% between single and dual task.

Conclusion: Dual task conditions amplify changes in gait, especially within the novel parameter of gait initiation steps. The dramatic dual-task related increase in gait initiation steps might be due to difficulties establishing balance, and/or cognitive deficits associated with frailty. A larger study incorporating patients across frailty, cognitive and functional conditions should be conducted to validate these preliminary findings.

### **LB12. Alzheimer's Patients' and Caregivers' Needs and Preferences for Decision Support Interventions**

**Aubri Hoffman**, Dartmouth Centers for Health and Aging; **Daniel Bateman**, Dartmouth Centers for Health and Aging; **Stephen Bartels**, Dartmouth Centers for Health and Aging; **Robert Santulli**, Dartmouth Centers for Health and Aging; **Kesstan Blandin**, Alzheimer's Association, Massachusetts/New Hampshire Chapter; **Hannah Lee**, Dartmouth Centers for Health and Aging; **Emma Tang**, Dartmouth Centers for Health and Aging

BACKGROUND: Over 5.4 million individuals with Alzheimer's disease and their 14.9 million unpaid caregivers face a series of challenging decisions. These decisions must incorporate both short- and long-term needs; clinical and community services; and personal and familial preferences. As cognition declines, caregivers state that uncertainty about decisions is one of their primary burdens, increasing their anxiety, distress, and depressive symptoms. In over 100 randomized controlled trials, patients'

decision aids have been shown to improve informed decision making and communication. However, few decision aids have been developed for the unique challenges of Alzheimer's families. Therefore, this project sought to survey the needs and preferences of Alzheimer's patients and caregivers across the early, mid, and late stages of disease. **METHODS:** We administered a 14-item questionnaire to 60 care providers, 10 early-stage patients, and 40 caregivers across all stages. Data analyses tabulated the distribution of responses in terms of which decisions are the most difficult at each stage, preferred venue, preferred medium, and preferred resources. **RESULTS:** Patients and caregivers stated that decisions about screening and long term care were most difficult, while providers focused on decisions about end-of-life. Patients preferred brochures and worksheets available at the clinic, while caregivers preferred worksheets and websites that were at home and the senior centers. **CONCLUSIONS:** Differences were observed in the stated needs and preferences of patients and caregivers, suggesting that decision support interventions should be tailored and person-centered.

### **LB13. Do Physical Exposures in Work-life Affect Hand-Grip Strength in Late Midlife?**

**Anne Moeller**, Department of Occupational Medicine, Køge Sygehus. Research Unit for General Practice, Copenhagen. The National Research Centre for the Working Environment

**Aim:** Hand-grip strength (HGS) predicts survival in older populations. Little is known about the influence of physical exposures in work-life on HGS. Some studies have shown a strengthening effect and others a deteriorating effect of manual work on muscle strength. The aim is to study associations between physical exposures in work-life and HGS in late midlife. **Methods:** A population-based retrospective cohort study (The Copenhagen Aging and Midlife Biobank) includes information about job histories and a cross-sectional measurement of HGS in 3843 Danes. Individual job histories were assigned physical exposures from a job exposure matrix containing expert judgments of hours of standing, kilos of lifting and numbers of heavy lifts per day in specific job-groups. Linear regression models were used to examine the effect of a summation of years of exposure (standing-years, ton-years and lifting-years) on late midlife HGS. Relevant confounders (age, height, weight, education, social class, psychosocial work environment, physical activity, alcohol consumption, and smoking) were included in multiple regression models. **Results:** Mean age was 58.91 years (53-64) and 79.2% were males. Handgrip strength was 49.19 kg (SD 8.42) in men and 30.61 kg (SD 5.49) in women. In women no association between physical exposures in work-life and HGS was seen. In men lifting-years were associated with lower HGS but after adjusting for height this association disappeared. In multivariate analyses there were no associations between a summation of physical exposures and HGS. **Conclusion:** This study did not provide evidence that manual work affects hand-grip strength in late midlife.

### **LB14. Educational Interventions to Increase Osteoporosis Knowledge, Health Beliefs, Self-efficacy, Dietary Calcium and Vitamin D Intakes for Prevention.**

**Alexa Evenson**, North Dakota State University; **Jennifer Erickson**, College of Saint Benedict

**Participants:** Undergraduate adults (n=154) ages 18-35, enrolled in an introductory nutrition course participated in the study.

Methods: A Quasi-experimental, pre-post survey design to assess osteoporosis knowledge, health beliefs and self-efficacy was conducted. Three day food diaries were collected to assess dietary calcium and vitamin D intakes.

Analysis: Descriptive statistics, regression analysis and a 3 X 2 repeated measures analysis of variance (ANOVA) were used to analyze the data.

Results: Mean osteoporosis knowledge total scores increased from 56% to 72% in both treatment groups. Increases in osteoporosis related knowledge [ $F(1,149)=110.05$ ,  $p<.000$ ] and health beliefs [ $F(1,149)=11.71$ ,  $p<.001$ ] were significant. Self-efficacy was not significantly different [ $F(1,149)=1.47$ ,  $p<.227$ ]; [ $F(2,149)=2.87$ ,  $p>0.06$ ]. Average dietary calcium and vitamin D intakes were approximately 1060 mg per day and 225 IUs per day.

Osteoporosis health beliefs were a significant predictor of dietary calcium intake ( $p<.044$ ) and vitamin D intake ( $p<.047$ ) which accounted for approximately 11.2% and 10.1% respectively. Self-efficacy was a significant predictor of vitamin D intake ( $p<.01$ ) which accounted for the approximately 7.3% of the variance, however it was not a significant predictor of calcium intake ( $p>.187$ ).

Conclusion: The interventions increased knowledge overall. Both interventions increased osteoporosis health beliefs but did not increase self-efficacy. Current or future nutrition, nursing or health classes that focus on osteoporosis prevention can incorporate either delivery method. Educators can also prepare or enhance prevention programs with either delivery method. Both interventions did not alter behavior significantly perhaps due to calcium requirements already being met and the limited availability of vitamin D containing foods.

#### **LB15. Factors Related to Gerotranscendence in Community-Dwelling Japanese Older Adults: Is Gerotranscendence the Normal Aging Process?**

**Yukie Masui**, Tokyo Metropolitan Institute of Gerontology; **Yasuyuki Gondo**, Osaka University; **Takeshi Nakagawa**, Osaka University; **Madoka Ogawa**, Tokyo Metropolitan Institute of Gerontology; **Yoshiko Ishioka**, Osaka University; **Yukiko Tatsuhira**, Osaka University; **Megumi Tabuchi**, Kwansei Gakuin University; **Hiroki Inagaki**, Tokyo Metropolitan Institute of Gerontology

The theory of gerotranscendence proposes that gerotranscendence is a shift in meta perspective from a materialistic and rational view of the world to a more cosmic and transcendent one that occurs in old age. It is hypothesized that gerotranscendence may be developed by the experience of life crises; however, individuals may experience the development towards gerotranscendence fundamentally in the normal aging process. This study examines whether age or crises in old age, such as deterioration of physical function and contracting diseases, are related to the higher degree of gerotranscendence. A questionnaire survey was administered to assess gerotranscendence using the Japanese Gerotranscendence Scale (JGS) to 1,000 septuagenarians and 973 octogenarians living in Japan. We included the presence of four major chronic diseases, instrumental activities of daily living (IADL), grip strength, and walking speed as physical functioning variables. Regression analysis was conducted using the eight subordinate factors of the JGS as objective variables, and age and the four physical functioning

variables as explanatory variables, while controlling for gender, living situation, socioeconomic status, and interactions with friends and neighbors. The results revealed that age was significantly associated with all the subordinate factors. In six out of eight subordinate factors, age had the most significant impact than any other variables. The impact of the factors related to physical functioning was observed only in limited subordinate factors. These findings are consistent with hypothesis that the development towards gerotranscendence is promoted by the normal aging process, rather than incident impact factors such as diseases and crises.

#### **LB16. Occupational History and Markers of Inflammation in Postmenopausal Women**

**Jolene Lee Masters Pedersen**, University of Copenhagen; **Yuko You**, UCLA; **Igor Burstyn**, Drexel University, **Candyce Kroenke**, Kaiser Permanente Division of Research; **Lorena Garcia**, UC Davis; **Anneclaire J. DeRoos**, Fred Hutchinson Cancer Research Center; **Simin Liu**, UCLA; **Yvonne Michael**, Drexel University

Background: Some studies suggest that unfavorable work conditions are associated with adverse health outcomes; however the mechanisms are not well understood, particularly in women.

Aim: This study explored the relation between types of occupation and markers of inflammation in women aged 50-79 years.

Methods: We analyzed data from the controls in a nested case-control study of the Women's Health Initiative. Five markers of inflammation, C-reactive protein (CRP), interleukin-6 (IL-6), tumor necrosis factor (TNF- $\alpha$ ), soluble intercellular adhesion molecule-1 (sICAM-1), and vascular cell adhesion molecule-1 (VCAM-1) were measured in 2,198 randomly selected women free from diabetes and CVD.

Multivariable linear regression was used to test the association of occupation in four categories (managers/professionals, technical/sales/administration, service/labor, homemaker) with inflammatory markers adjusting for age, marital status and education.

Results: We found that occupations in tech/sales/administration (28%), service/labor (20%), and homemaking (11%) were associated with higher markers of inflammation compared with the manager/professional group (42%) however this was most pronounced among homemakers. Not having paid employment outside the home was significantly and adversely associated with TNF- $\alpha$  ( $p=0.02$ ), sICAM-1 ( $p=0.01$ ) and VCAM-1 ( $p=0.05$ ) but the associations with IL-6 and CRP were insignificant.

Conclusion: Primary occupation as a homemaker was associated with higher levels of TNF- $\alpha$ , sICAM-1 and VCAM-1. While this may suggest that healthy women are selected into the labor force it may also indicate that being a homemaker is associated with exposure to health hazards due to psychosocial or physical demands. The possibility that inflammation mediates unfavorable work conditions and adverse health outcomes merits further investigation.

### **LB17. Relationship of Depressive Symptoms to Aspects of Sexual Health in Older Adults: Impact of Age and Gender**

**Vicki Wang**, Department of Psychiatry, University of California, San Diego and San Diego, Veterans Medical Research Foundation; **Jennifer Ceglowski**, Department of Psychiatry, University of California, San Diego; **Colin Depp**, Department of Psychiatry, University of California, San Diego; San Diego, Veterans Administration Health Care System; **Dilip Jeste**, Department of Psychiatry, University of California, San Diego; San Diego, Veterans Administration Health Care System

**Background:** Many older adults are sexually active and regard sexual activity as an important aspect of life. Depressive symptoms negatively impact sexual health including associations with activity, satisfaction, and dysfunction. Nonetheless, it is unclear which aspects of sexual health are most affected by depressive symptoms and if these associations differ by gender or age.

**Methods:** The Successful Aging Evaluation study of 1,006 community-dwelling adults aged 50-99 included a mail-in survey, with measures of sexual health from the Quality of Sexual Life Questionnaire (QLSQ) and depressive symptoms from the Patient Health Questionnaire. Based on these data, we examined the relationship of sexual health and depression among participants who endorsed having a current partner.

**Results:** A total of 606 participants reported having a current partner. Mean age was 75.1 years (12.2). Severity of depressive symptoms was related to all QLSQ items; strongest associations were with poor relationship quality, low desire, and rejecting overtures. Older, compared to younger, individuals showed lower desire, frequency, and less discussion of sex. Women reported lower desire and higher frequency of rejecting sexual overtures than men. The relationship of depression and sexual health did not generally differ by age or gender, except that depression was more related to rejection of sexual overtures among men ( $r(357)=0.16$ ) than women ( $r(129)=0.06$ ).

**Conclusion:** Sexual health was strongly and broadly related to depressive symptoms, and these associations were largely consistent across ages and gender. Depression was most associated with poor relationship quality, low desire, and rejecting overtures, the latter particularly among men.

### **LB18. Talking about Childhood: Past Patterns of Discourse Predict Current Coping Strategies & Weight**

**Anne Bichteler**, Department of Human Development & Family Sciences, The University of Texas at Austin; **Deborah Jacobvitz**, Professor and Chair, Department of Human Development & Family Sciences, The University of Texas at Austin

This study analyzed whether features of adults' speech describing their childhood experiences predicted current health behaviors and outcomes 18 years later. We hypothesized that people who tended to minimize past painful experiences by discounting their importance, idealizing their parents, and claiming highly independent and normal childhoods (i.e. dismissing speakers) would endorse using approach-type coping strategies because of a tendency to emphasize personal strength but would show worse health effects and overweight across their lifespan because of a propensity to avoid their stressors.

The 47 primarily white, middle-class women are currently aged 39-62, and part of the eighth wave of an ongoing longitudinal study of 104 first-time parents begun in 1994, when their speech was assessed using the semi-structured Adult Attachment Interview (Main, Goldwyn, & Hesse, 2003). The current follow-up survey includes self-reported coping strategies on the Brief C.O.P.E (Carver, 1997), height, weight, waist circumference, and hip circumference. The weight outcome was the product of subjects' waist-to-hip ratio and BMI (WHO, 2008).

As expected, active coping ( $b=-1.74, p<.05$ ) and acceptance coping ( $b=-1.65, p<.01$ ) are associated with decreased weight. Unexpected was the finding that dismissing speakers (vs. secure speakers) do not endorse these approach-type strategies ( $b=-.87, p<.05$  and  $b=-1.70, p<.001$ , respectively). In fact, they endorse less coping overall ( $b=-10.45, p<.01$ ). When the dismissing classification is interacted with total stressful life events, the variation in weight explained is large ( $b=1.2, p<.05, r^2=.43$ ). We theorize that dismissing adults do not have an expectation that problem-focused coping is effective. Rather, when bad things happen, they turn to food.

#### **LB19. Trajectories of Fatigue – the Predictive Value for Ischemic Heart Disease in Older Adults**

**Anette Ekman**, Section of Social Medicine, Department of Public Health, University of Copenhagen, Denmark Danish Aging Research Centre (DARC), University of Aarhus, Odense and Copenhagen, Denmark; **Minna Mänty**, Section of Social Medicine, Department of Public Health, University of Copenhagen, Denmark Centre for Healthy Aging (CESA), Faculty of Health and Medical Sciences, University of Copenhagen, Denmark; **Kaare Christensen**, Danish Aging Research Centre (DARC), University of Aarhus, Odense and Copenhagen, Denmark Unit of Epidemiology, The Danish Twin Registry, University of Southern Denmark, Odense, Denmark Department of Clinical Genetics, Odense University Hospital, Odense C; **Kirsten Avlund**, Section of Social Medicine, Department of Public Health, University of Copenhagen, Denmark Danish Aging Research Centre (DARC), University of Aarhus, Odense and Copenhagen, Denmark Centre for Healthy Aging (CESA), Faculty of Health and Medical Sciences, U

Fatigue measured at one point in time has been shown predictive of ischemic heart disease (IHD) in healthy middle-aged men and older adults. The purpose of this study was to study the predictive value of both intermittent and sustained fatigue for IHD in older adults.

In total 1681 older adults aged 70+ years, who at intake had no indication of heart diseases and mobility disabilities were followed for 10-16 years. Depending on loss to follow-up, fatigue was measured at 1-3 successive study waves. Following the last study wave of participation, incident IHD was tracked through registers. Cox Proportional Hazard Models were used to estimate the predictive value of fatigue for IHD in groups who participated in one or two study waves. Within the group attending all three study waves the predictive value of both intermittent and sustained fatigue for IHD was estimated.

Both intermittent and sustained fatigue was predictive of IHD among participants who attended all three study waves with indication of sustained fatigue being a stronger predictor of IHD than intermittent fatigue (HR=2.24 95%CI: 1.11-4.51 and HR=1.40 95%CI: 0.97-2.02, respectively). Fatigue predicted IHD in participants attending two study waves (HR=2.20 95%CI: 1.09-4.46), however, fatigue did not predict IHD among participants who only attended one study wave (HR=1.19 95%CI: 0.59-2.41).

It is suggested that both intermittent and sustained fatigue is predictive of subsequent IHD and may be a useful screening tool for identification of individuals at risk of ischemic heart disease.

#### **LB20. Using EMG Frequency Analysis and fNIRS to Assess the Cortical Demand of Walking In Older Adults**

**David Clark**, Malcom Randall VA Medical Center and University of Florida; **Evangelos Christou**, University of Florida

Control of coordinated motor tasks, including walking, becomes less automatic with old age. There is increased use of cortical processing resources, which may threaten the safety of walking due to competition between the demands of motor tasks and the demands of other information processing tasks. This is particularly true during community ambulation in which walking conditions are often challenging. We use two approaches to quantify cortical demand during walking: frequency-based analysis of surface electromyography (EMG) and functional near infrared spectroscopy (fNIRS). With EMG, synchronous activity in the 30-60Hz frequency band is indicative of the corticospinal contribution to muscle activation. With fNIRS, modulation of oxygenated hemoglobin is associated with cortical activation. Seventeen healthy older adults participated in our study. Each individual performed four different walking tasks: normal walking, fast walking, cognitive dual-task walking, and walking plus taking occasional longer steps. EMG was recorded from soleus and gastrocnemius. In a subset of participants, fNIRS was recorded over the left and right pre-frontal cortex. EMG synchrony revealed that corticospinal drive was reduced during dual-tasking, unchanged during fast walking and increased when walking with long steps. fNIRS revealed that pre-frontal cortical activity was heightened during dual-task walking but unchanged during fast and long step walking. The results of this study demonstrate the utility of non-invasive recordings of physiological signals to assess the cortical demands of different walking tasks in older adults. Our future research will assess how cortical demand during challenging walking tasks affects community ambulatory function with aging.

#### ***Research, Education, and Practice Committee***

#### **LB21. A Profile of Successful Aging, Brain Health Knowledge, Depression and Social Support in Assisted Living Residents**

**Meredith Troutman-Jordan**, University of North Carolina, Charlotte; **Mary Nies**, Idaho State University

Impaired functionality, decreased independence, and multiple medical problems, place older adults in assisted living communities (ALCs) at risk for decreased participation in health promotion activities, poorer social support and unsuccessful aging. Little research exists exploring successful aging in ALC residents. This study examined features of well-being-successful aging, brain health knowledge, depressive symptoms, and social support among residents of eight ALCs. Participants completed a demographic form, the Brain Health Questionnaire, the Centers for Epidemiologic Studies Depression Scale, the Successful Aging Inventory, and the Lubben Social Network Scale. Brain Health Questionnaire scores ranged 0 to 17 ( $\mu=13.07$ ,  $SD=2.22$ ). CESD scores ranged from 0 to 48 ( $\mu 12.02$ ,  $SD = 8.84$ ). Brain health knowledge findings revealed a difference between races exposing a significantly lower ( $p < .019$ )

brain health score in Black participants ( $\mu=12.38$ ,  $SD=2.95$ ) compared to their Whites ( $\mu= 13.29$ ,  $SD=1.92$ ). Scores for depressive symptoms in White participants was 11.89 ( $SD=11.89$ ), and for Black, 12.43 ( $SD= 8.10$ ). There was no significant difference in income levels ( $p\leq .626$ ), education ( $p< 0.897$ ), or depressive symptoms ( $p < 0.732$ ) between races. The mean SAI score was 64.05 (s.d.10.79), and SAI scores ranged from 30-80. There were no significant racial SAI differences. The mean LSNS-R score for all participants was 30.44 with no significant differences observed among subgroups classified by age, race, gender, or health status. Higher levels of social support were positively correlated with higher levels of successful aging. The sample tended to have high scores on successful aging, low scores on depression (few depressive symptoms).

### **LB22. An Interdisciplinary Educational Approach to Oral Health Care in the Geriatric Population Improves Knowledge and Leads to Change in Patient Care.**

**Patricia Bonwell**, Virginia Commonwealth University School of Dentistry Dental Hygiene Program, Department of Oral Health Promotion and Community Outreach; **Pam Parsons**, Virginia Commonwealth University, School of Medicine, Department of Internal Medicine; **Al Best**, Virginia Commonwealth University, School of Dentistry, Faculty Research Development; **Sabrina Hise**, Virginia Commonwealth University, School of Dentistry, Dental Hygiene Program, Department of Oral Health Promotion and Community Outreach

Five in-service training sessions and one half-day seminar, yielded results that support the use of an interdisciplinary educational approach to oral health care in the geriatric population. The target population consisted of students and professionals from: nursing, occupational therapy, medicine, dietitians, dentistry, pharmacy and nursing home administration.

At the five in-service training sessions and the half-day educational seminar, 5 speakers presented: 1) Periodontist focused on the basic concepts of the oral-systemic relationship, 2) Oral pathologist covered basics of what and how to look for unusual oral pathology, 3) Dentist with a pharmacology background addressed the basics of the oral health-pharmacological link, 4) Dietitian addressed the oral health-dietary link, and 5) Occupational therapist provided instruction on the provision of proper oral hygiene care and how to practice proper oral hygiene techniques.

From the five in-service sessions, t-test results revealed a significant improvement in post-test scores for all sessions except the session presented by the Occupational Therapist. Eighty-eight percent of the participants indicated that they would make a change in their practice.

From the half-day seminar, t-test results revealed a significant improvement in post-test scores. Seventy-nine percent of the participants indicated that they would make a change in their practice. Participants in the live-webinar of the half-day seminar revealed a higher post-test score average.

Results indicate that the in-service training sessions and in-person seminar/live webinar supported development of the geriatric work force by utilizing a multidisciplinary approach which will assist in meeting the oral health care needs of the geriatric population.

### **LB23. Cognitive function among elderly of West Bengal, India**

**Moumita Maity**, Calcutta University, Ph.D. student; **Barun Mukhopadhyay**, Indian Statistical Institute, Kolkata. Professor

A substantial proportion of the world's elderly population resides in the developing countries. It is noted that there has been an increase in longevity for these elderly and as a consequence their health profiles have changed, including higher prevalence of age related neurological disorder like dementia. In India, community based studies on cognitive impairment and associated lifestyle factors are very few and such studies in the eastern part of the country is virtually lacking.

In view of the above, a comparative profile of cognitive function between urban and rural elderly of West Bengal, India, has been reported in the present study. The study has also been purported to identify the role of socio-demographic factors on cognitive function.

Mini Mental State Examination (MMSE) was canvassed for collection of data on cognitive function from a sample of urban and a rural elderly population. The study sample includes 381 elderly of both sexes, taken from both urban (176) and rural (205) settings in the Indian State of West Bengal with an age range of 65 to 79 years (mean age 70.6 years).

Results of the study indicate that the cognitive impairment is significantly higher among the rural elderly than their urban counterparts, irrespective of sex. The results also demonstrate that more adversities in cognitive function occur in female gender, irrespective of area of residence. Logistic regression model reveal that sex, family size, family earning, total number of children and occupation are the significant predictors of cognitive impairment in the study population.

### **LB24. Disclosure of Depression Diagnosis among Latino Older Adults**

**Dahlia Fuentes**, School of Social Work, University of Southern California; **Maria Aranda**, School of Social Work, University of Southern California

Although the disclosure of mental illness to family or friends is positively related to social support, self esteem, and quality of life, nondisclosure (concealment) is prevalent. Stigma has long been attributed to concealment of mental illness. However, not all mentally ill persons internalize stigma. Thus decisions to conceal or disclose may be influenced by other factors. This study aims to: (1) identify what influences older Latinos' decision to disclose or conceal their depression diagnosis; and (2) examine their process of disclosure. Semi-structured interviews were conducted with 35 older Latinos (60+ years) participating in a randomized behavioral trial to treat severe depression. Participants were asked to identify what influenced their decision to disclose or conceal their depression to individuals that provide them with social support, and to describe how they disclosed their depression. Recordings and transcripts were analyzed using grounded theory approach. The fear of burdening or worrying others emerged as a prominent reason for depression concealment, and stigma was described primarily by male participants. Disclosure occurred to help others going through similar experiences (altruism), to feel desahogo (relief, catharsis), and to garner support. The disclosure of depression involved direct and indirect processes.

Depression was primarily disclosed through description of symptoms and round-about conversations about doctor visits and depression medications. Some relied on communication between members of their support network. Research incorporating the emic perspective can inform the development of culturally-sensitive strategies, which can be used in various care settings to support older Latinos faced with the dilemma of depression disclosure.

#### **LB25. Exploring the Experience of Nostalgia at a Miami Cuban American Event**

**Rose M. Perez**, Fordham University

Although the U.S. is a country of immigrants, the experience of leaving a homeland has not been studied extensively. Cuban American exiles began arriving in the U.S. after the 1959 revolution, presumably temporarily until Cuba's unstable political situation settled. Yet, over 50 years later, they remain in exile mourning their lost homeland. The 2011 Cuba Nostalgia annual event in Miami, FL, where thousands of primarily older Cubans congregate to relive aspects of pre-1959 Cuba, served as the setting for a study of the experience of leaving Cuba and of their incessant nostalgia. Using a phenomenological framework, 10 older adults (65+) who left Cuba between 1959 and 1979 were recruited at the event and interviewed for 60+ minutes at the Miami Expo Center, where the event took place, or in their homes, depending on their preference. The exploration of themes about leaving the island and adapting to life in exile reveal ever-present memories of Fidel Castro's betrayal, hardships and pain of a necessary but not desirable departure (e.g. family separation, material and other cultural loss) and a persistent irresolvable longing to recapture countless aspects of an idyllic lost paradise. Although participants showed a generally positive adaptation to U.S. life and gratitude to their host country, they also felt betrayed by the Kennedy Administration during the Bay of Pigs fiasco. This study advances an understanding of enduring nostalgia and reminiscences of a lost homeland that can inform work with other displaced populations. Implications for practice and research based on findings are discussed.

#### **LB26. Gender Satisfaction Among Women Aging With Paralytic Polio**

**Janiece Walker**, The University of Texas at Austin, School of Nursing; **Tracie Harrison**, The University of Texas at Austin, School of Nursing, 2011-12 APSA Health and Aging Policy Fellow

Doing gender is theorized to occur when a person performs to society's role expectations as a male or female. Researchers have shown that satisfaction with gendered outcomes among women improve after age 55. However, chronic disabling conditions may alter women's interpretation of their ability to perform their gender in previously effective ways, which may lessen their satisfaction with their gendered performance. The first step in our investigation of how women perceive the impact of disability on doing gender in the context of older age was to develop a tool to measure the construct.

**Purpose:** The investigators developed and psychometrically tested the Gendered Outcome Scale among older women aging with the effects of paralytic polio.

**Sample:** The sample consisted of 286 women ranging in age from 55-83 years, 76% of the women had children, 86% were never married, and 68% were non-Hispanic White.

Analysis: Descriptive statistics, Pearson's Correlations, and reliability tests were used.

Findings: The Cronbach alpha for the newly developed five-item scale was .89. There was a significant relationship between age and functional limitations with gendered outcomes. The younger women in this sample had higher satisfaction with gendered outcomes

[ $r(284) = -.185, p < .01$ ], however an increase in functional limitations was indicative of less satisfaction with gendered outcomes [ $r(284) = .169, p < .01$ ].

Conclusion: Data suggest that the Gendered Outcome Scale is valid and reliable. The scale performed as hypothesized. Further work is needed to test the model using a diverse aging population of both men and women.

### **LB27. Monitoring Dementia with SCRABBLE: An Autogerontological Experiment**

**Merle Broberg**, Associate Professor, Emeritus, Graduate School of Social Work and Social Research, Bryn Mawr College, Bryn Mawr, PA; **Dolores Broberg, PhD**, University of New England of Osteopathy, Standardized Patient

**PURPOSE:** This self-study explores the use of SCRABBLE (Selchow and Righter, 1948, now a HASBRO Product) to monitor maintenance of cognitive capability in an individual with mixed dementia (vascular and Alzheimer's). **METHODS:** Features of scores chosen, by long play experience, to represent Luck of the Board (wins) and Cognitive Skills (average spread between player scores) were charted and examined. It was posited that Luck of the Board would take random shape and that change in Cognitive Skills would exhibit direction. **RESULTS:** Charted wins fluctuated randomly, as expected. The pattern of spread between player scores seemed influenced by Learning the Game, a Cognitive Skills variable. The charted curve indicated that both players learned. **IMPLICATIONS:** SCRABBLE may provide a longitudinal measure for monitoring cognitive capability in a person with dementia. It may help detect changes, signaling the need to modify medication and/or other support services. Stimulation and empowerment may be additional therapeutic benefits of play. This demonstration of self-study by the author is a sequel to his editorial in THE GERONTOLOGIST suggesting that autogerontology can be a productive activity for aging gerontologists (XXX, 12:3, Autumn, 1972). **Key Words:** Alzheimer's, dementia, autogerontology; monitoring; longitudinal measurement.

### **LB28. Piloting a Usability Evaluation for Healthcare Providers**

**Kimberly Shea**, University of Arizona, College of Nursing

Assistance for older adults is often connected with the use of technology. Well-meaning healthcare providers may recommend this type of assistance, however, physical and/or experiential limitations can cause the older user to become quickly frustrated, discontinue use or experience unintended consequences. A usability evaluation that guides the provider to appraise an interaction between technology and user is an important step in successful goal achievement. Usability evaluations are

commonly performed on prototypes prior to manufacturing or marketing. Unfortunately the evaluation does not include all types and ages of users so many items are put on the market and approved that may be incompetent or even deleterious for certain users. This presentation will display a piloted 6-step usability evaluation for healthcare providers that are based on principles used by design engineers with additional incorporation of healthcare and geriatric individualization knowledge. Use of the evaluation affords the healthcare provider a basis for determining if the technical application will be usable in its present form, need adaptation, or not work for the older adult to obtain a desirable goal. Pilot results from 40 entry-level nursing students (9 groups) at the University of Arizona, College of Nursing find that a medication administration device designed to assist older adults is not only unusable but potentially dangerous with certain limitations. Pilot results, recommendations and clinical uses will be discussed.

### **LB29. Prevalence Rates of Quantitative Measures: A Content Analysis of Trends in Social Gerontological Research**

**Melinda Heinz**, Iowa State University; **Peter Martin**, Iowa State University

This study assessed which quantitative measures were most popular in gerontology research published in the *Journal of Gerontology, Social Sciences* by conducting a content analysis over a five year period (2007-2011). A total of 183 articles were analyzed and 635 quantitative measures were used in those articles. The most popular measurement categories included older adult functional status and health. Surprisingly, many measures were self-constructed by the authors and were not well established measures in the field. However, two “gold standard” measures did emerge from this study and were used most frequently in their respective domains. The Center for Epidemiologic Depression Scale (CES-D, Radloff, 1977) emerged as a “gold standard” in the depression domain and the Personal Mastery Scale (Pearlin & Schooler, 1978) emerged in the psychological well-being domain. Future research should assess other published gerontology research in order to understand whether or not these findings are an accurate representation of popular quantitative research measures.

### **LB30. Self-Esteem Mediates the Relationship between Volunteering and Depression for African American Caregivers**

**Huei-Wern Shen**, School of Social Work, University of Missouri - St. Louis; **Joseph Pickard**, School of Social Work, University of Missouri - St. Louis; **Sharon D. Johnson**, School of Social Work, University of Missouri - St. Louis

**Background:** Previous research on caregivers of older people indicates that volunteering can serve as a buffer for depression. However, it is unclear if this relationship holds for African American caregivers. This study is guided by Role Accumulation Theory, and we hypothesize that for African American caregivers there will be 1) a negative relationship between volunteering and depression, and 2) that self-esteem mediates the relationship between volunteering and depression.

**Methods:** Data are from the 2002 Black Rural and Urban Caregivers Mental Health and Functioning study, a cross-sectional study of 521 mid-western African American female family caregivers. Using scores on the 20-item Center for Epidemiologic Studies Depression scale (CES-D) as the dependent

variable, we perform a series of OLS multiple regressions to determine if volunteering has a direct effect on depression and whether self-esteem mediates the relationship of volunteering to depression.

Results: Regression results indicate that those who volunteer have significantly less depressive symptoms ( $p=.05$ ), and volunteering is associated with self-esteem ( $p=.006$ ). However, the relationship of volunteering to depression is not significant when self-esteem is added to the model ( $p=0.33$ ) signifying that self-esteem may mediate the relationship between volunteering and depression.

Discussion: Both hypotheses are supported, adding clarity to the relationships among volunteering, self-esteem, and depression for African American female caregivers. Increasing caregivers' self-esteem through volunteering could be helpful for reducing depression. In addition to the support services that are already available for care providers, policy makers are encouraged to consider the role of volunteering in efforts to further promote mental well-being.

### **LB31. The Predictive Relationship of Emotional Intelligence to Late Life Depression in the Independent Community Living Elderly**

**Patricia Inglese**, Walden University

Depression is a leading contributor to global disability and a significant public health concern. While the hallmark symptom of depression is sadness, depression in older adults, called late life depression (LLD), frequently presents without sadness. The distinct symptomology, in addition to the common challenges of aging, hinder identification and treatment of LLD. Emotional Intelligence (EI) refers to the capacity to identify, use, understand and manage emotional information to enhance life outcomes. While research suggests that lower EI is related to higher levels of depression, the elderly are significantly underrepresented in these studies. Based on a theoretical framework consisting of emotional intelligence theories, and cognitive theories of depression, it was hypothesized that EI would significantly predict LLD. A sample of 106 independent community living Americans from 65 to 90 years old completed the Mayer Salovey Caruso Emotional Intelligence Test (MSCEIT), the Trait Emotional Intelligence Questionnaire – Short Form (TEIQue), ability and trait EI measures, and the Geriatric Depression Scale (GDS). Pearson correlations revealed significant relationships between trait and ability EI, medical comorbidity, age and depression. Regression analysis indicated that EI significantly predicted LLD beyond age and medical comorbidity, with the TEIQue accounting for an additional 12% of sample variance and the Emotional Reasoning area of the MSCEIT (MSCEIT-RA) accounting for an additional 5% of sample variance. EI can help in identifying elderly at risk for LLD and provide the foundation for a non-pharmacological treatment option for LLD, which could help stem the burgeoning healthcare crisis due to the aging baby boomers generation.

**LB1. Aging-induced Changes in Angiotensin II: Induced vasomotor responses and AT1 -receptor expression**

**Zoltan Vamos**, Department of Pathophysiology and Gerontology, University of Pecs; **Peter Cseplo**, Department of Pathophysiology and Gerontology, University of Pecs; **Ivan Ivic**, Department of Pathophysiology and Gerontology, University of Pecs; **Peter Toth**, Reynolds Oklahoma Center on Aging, Department of Geriatric Medicine, University of Oklahoma Health Sciences Center, Oklahoma City, OK; **Zoltan Ungvari**, Reynolds Oklahoma Center on Aging, Department of Geriatric Medicine, University of Oklahoma Health Sciences Center, ; **Akos Koller**, Department of Pathophysiology and Gerontology, University of Pecs, Departemtn of Physiology, New York Medical College

Angiotensin II (Ang II) plays an important role in the regulation of vascular resistance and blood pressure, yet aged-dependent changes of the vascular renin-angiotensin system are less clear. We hypothesized that aging augments the constrictor responses to Ang II due to increased AT1 receptor signaling.

Contraction of carotid arteries isolated from newborn (8 days: 8d), young (12 month: 12m) and old (30m) rats were measured to administration of Ang II. Administration of Ang II was repeated to characterize tachyphylaxis (decreasing magnitude) of the vasomotor response. To assess the expression of AT1 receptors mRNA level was determined by real time RT-PCR.

The Ang II-induced constriction increased ( $p < 0.05$ ) from 8d to 12m, than it decreased to 30m. The second administration of Ang II showed similar pattern. Compared to the first administration, the constriction to 2nd administration of Ang II decreased as a function of age. In line with the functional observations, AT1-receptor expression increased from 8d to 12m than it decreased to 30m. Ang II-induced vasomotor responses showed age-dependent changes, exhibiting an inverse "U shape": constriction increased in young, then decreased in vessels of old animals. Tachyphylaxis of vasomotor responses to Ang II increased with age.

Thus we propose that these functional changes are in part, due to age-dependent changes of AT1-receptor expression.

**LB2. Chaperone-facilitated Protection Of Proteasome Function In The Long-lived Naked Mole-rat**

**Karl Rodriguez**, Sam and Ann Barshop Institute for Longevity and Aging Studies/University of Texas Health Science Center, San Antonio; **Anson Pierce**, University of Texas Medical Branch Galveston/Mitchell Center for Neurodegenerative Diseases, Department of Biochemistry and Molecular Biology; **Pawel Osmulski**, University of Texas Health Science Center San Antonio/Barshop Institute for

Longevity and Aging Studies, Department of Molecular Medicine; **Maria Gaczynska**, University of Texas Health Science Center San Antonio/Barshop Institute for Longevity and Aging Studies, Department of Molecular Medicine; **Rochelle Buffenstein**, University of Texas Health Science Center San Antonio/Barshop Institute for Longevity and Aging Studies, Department of Cellular and Structural Biology, Department of Physiology

Proteasome-mediated proteolysis in liver homogenates is three-fold higher in the long-lived (32yr) naked mole-rat (NMR). This rodent exhibits a markedly attenuated aging profile and pronounced resistance to endogenous (i.e. ROS) and environmental (i.e. pesticides) stressors when compared to that of short-lived mice. Moreover, the NMR proteasome is also resistant to common proteasome inhibitors, requiring 15 to 20 times higher concentrations than do mouse samples in order to completely ablate chymotrypsin-like activity. These traits may facilitate effective maintenance of protein homeostasis in the longer-lived rodent. We therefore questioned if these observations reflect inherent properties of the NMR proteasome or the cellular microenvironment. After partially purifying both mouse and NMR proteasomes we swapped the supernatant from each species and evaluated proteasome activity and resistance to inhibitors. NMR supernatant conferred inhibition resistance on mouse proteasomes, while mouse supernatant reduced NMR proteasome activity. Furthermore, NMR supernatants had markedly higher protein levels of several heat-shock proteins (HSPs). In particular, HSP70, as part of a high molecular weight complex, was shown to be strongly associated with the inhibition resistance phenotype, possibly binding to the 26S proteasome itself. This elevated HSP profile may contribute to the observed interspecies differences in proteasome function, better protein quality control, and ultimately sustained good health in old age. Molecular chaperone networks likely play a key role in stress resistance and proteins homeostasis of long-lived animals and may contribute to protracted good health and extended longevity.

### **LB3. Effects Of Macronutrient Balance On Cardiovascular Health And Aging**

**Aisling McMahon**, ANZAC Research Institute, University of Sydney, Centre for Education and Research on Ageing, University of Sydney, Charles Perkins Centre, University of Sydney; **Samantha Solon**, ANZAC Research Institute, University of Sydney, Centre for Education and Research on Ageing, University of Sydney, Charles Perkins Centre, University of Sydney, School of Biological Sciences, University of Sydney; **J William Ballard**, School of Biotechnology and Biomolecular Sciences, University of New South Wales, **David Raubenheimer**, Institute of Natural Sciences, Massey University, Albany, New Zealand; **Stephen Simpson**, Charles Perkins Centre, University of Sydney, School of Biological Sciences, University of Sydney; **David Le Couteur**, ANZAC Research Institute, University of Sydney, Centre for Education and Research on Ageing, University of Sydney, Charles Perkins Centre, University of Sydney

Caloric restriction (CR) has been reported to extend lifespan in a number of species. We report here the effects of dietary energy and macronutrient manipulation and show that low energy diets had an adverse effect on lifespan in ad libitum fed mice. Using the 'Geometric Framework', a 3D experimental design, we evaluated the effects of 25 different diets of low (L), medium (M) and high (H) energy densities with fixed protein: carbohydrate: fat (P:C:F) ratios in a large scale longevity study.

Analysis of individual macronutrient intake showed that protein intake was tightly regulated across the groups at ~ 10 kJ/d. Prioritization of protein intake resulted in over- or under-consumption of carbohydrate and fat, regardless of total energy intake. Mice fed low-energy diets displayed a significant increase in systolic blood pressure at age 12 months (L:125±11, M:115±9, H:111±9 mmHg;  $p < 0.0001$ ) and had poor survival at age 24 months, despite consuming 30% less energy than mice receiving H diets and 15% less energy than those receiving M diets. Furthermore, when median lifespan was analyzed according to P:C ratio, it revealed an inverse correlation. This suggests that CR by dietary dilution does not extend lifespan, and that P:C ratio might be a more important determinant of longevity.

Long term CR is not feasible for the majority of humans, however, manipulating the balance of macronutrients without necessitating a reduction in calories may be a more successful strategy to target metabolic syndrome and aging.

#### **LB4. Late-life treatment with rapamycin, but not intermittent feeding (IF), maintains soleus muscle mass in aged rats.**

**Christy Carter**, University of Florida; **Stephanie Wohlgemuth**, University of Florida; **Andrew Judge**, University of Florida; **Christiaan Leeuwenburgh**, University of Florida

Rapamycin treatment is perhaps the most robust longevity-inducing calorie restriction mimetic studied to date; however the impact on health-span is less well understood. The purpose of this pilot study was to assess the timing of IF vs. rapamycin treatment on skeletal muscle mass in adult (10 month) and aged (24 month) rats.

At each age, male Fischer x Brown Norway rats were randomized to receive either IF feeding (ad libitum access to food every other day) or an every other day injection of rapamycin (1 mg/kg, i.p.) for four weeks. Percent change in food intake and body weight were calculated across the experimental timeline. At the end of the study, the extensor digitorum longus (edl) and soleus muscles were dissected and weighed.

There was a treatment x age interaction for % change in body mass ( $p = 0.019$ ). Older animals, whether treated with IF or rapamycin lost a similar amount (11-13%); whereas IF treated adults lost significantly more than those receiving rapamycin (16 vs 11 %, respectively).

We observed a main effect of age such that older animals had larger muscle mass than adult (soleus:  $p = 0.015$ ; edl:  $p = 0.04$ ). There was a main effect of treatment in soleus ( $p = 0.038$ ) but not edl muscle ( $p = 0.28$ ). Specifically, both treated adult groups maintained muscle mass, although the IF animals experienced greater weight loss. In the older animals, IF and rapamycin-treated animals demonstrated equivalent body weight loss yet the rapamycin animals maintained a larger muscle mass relative to IF and controls.

We conclude that IF is more detrimental to skeletal muscle mass loss in older animals and rapamycin is protective in the context of weight loss. Potential metabolic adaptations are discussed.

## **LB5. Life History Of Cognate Antigen Exposure Indicates Skewing Of Mucosal B and T Cell Populations During Aging**

**Samrat Moitra**, School of Biological Sciences, Illinois State University; **Byron Heidenreich**, Department of Psychology, Illinois State University; **Laura Vogel**, School of Biological Sciences, Illinois State University

The impact of aging on mucosal immune responses, particularly IgA production, is controversial. Many previous studies have failed to separate the effects of the aged microenvironment (dysfunctional aged T cells or homing molecule expression on lymphoid tissues) from intrinsic B cell defects. We hypothesized that life-history of cognate antigen exposure influences antibody production and distribution of mucosal B cell populations during aging. These studies used immunoglobulin transgenic mice, whose cognate antigen nitrophenyl (NP) is not naturally encountered. Mice were immunized orally with cholera toxin (CT) alone, NP-OVA (a T cell-dependent antigen) or NP-Ficoll (a T cell-independent antigen) every 5 months. Two months after the last injection, intestines were analyzed for relative abundance, size, and cellular composition of Peyer's Patches (PP) and isolated lymphoid follicles (ILF). Whole mount immunohistochemistry and light microscopy results revealed significantly more ILF in the distal region of aged mice (18 months) when compared to young (3 months). Comparing immunized (NP-OVA and NP-Ficoll) and control mice, flow cytometry data reveals significant decrease in percentages of transgenic B-cells for both PP and ILF, CD4 T cells for ILF and CD8 T cells for PP in aged NP-Ficoll immunized mice, however there was significant decrease of transgenic B-cell percentage in only aged NP-OVA immunized mice for both PP and ILF in comparison to their younger counterparts. Hence, preliminary data suggests significant role of cognate antigen exposure in disrupting adaptive response in aged, providing a possible answer behind deterioration of immune response in the elderly

## **LB6. Novel Mice Models of Oxidative Stress for the Study Glutathione Homeostasis and Mitochondrial Biology in Neurodegenerative Diseases**

**Xingjun Fan**, Case Western Reserve University; **Mariana Rosca**, Case Western Reserve University; **Sandra Siedlak**, Case Western Reserve University; **Hyoung-Gon Lee**, Case Western Reserve University; **Pingfu Feng**, Case Western Reserve University; **Vincent Monnier**, Case Western Reserve University

The mammalian brain is much more sensitive to oxidative stress compared to other organs mainly due to its high O<sub>2</sub> consumption. Mitochondria are believed the major source of ROS, and their dysfunction appears to contribute to neurodegeneration and aging. Glutathione (GSH) is the most prevalent and important intracellular non-protein thiol/sulfhydryl compound in mammalian cells. Importantly, mitochondria GSH pool is believed to be playing a key role in maintaining the mitochondrial redox state. GSH has been reported to decline in the aging brain and many neurodegenerative diseases. To test the hypothesis, we created a conditional knockout mouse of glutamate cysteine ligase, catalytic subunit (Gclc) at desired location of CNS. CNS pan-neuronal (NEGSKO) and an inducible forebrain neuronal (FIGSKO) conditional knockout mice models were created by breeding with Thy1-cre and CamKII-Ert2-cre mouse respectively. NEGSKO mice, with 40-65% reduced GSH level in brain and spinal cord develops ALS-like phenotype, i.e. motor neurodegeneration, muscle atrophy, denervation, TDP-43 fragmentation and miss-translocation into cytoplasm that colocalizes with elevated ubiquitination. In FIGSKO mice,

induction of Gclc deletion started with tamoxifen at 6mos triggered hippocampal and cortical neuron degeneration over time. FIGSKO mice demonstrate clear brain atrophy, hippocampal neuron loss 5mos after tamoxifen induction, with cognition impairment and disturbed nesting behaviors. Importantly, further mechanistic characterization indicates that mitochondrial GSH level was significantly reduced (~40% vs. wt), and mitochondrial function was impaired in both NEGSKO and FIGSKO mice. NEGSKO and FIGSKO mice, with impaired GSH synthesis, will serve as novel platform to study the link between aging, oxidation, mitochondrial function and neurodegeneration.

#### **LB7. Pleiotropic Effects of Genes May Explain the Link between Melanoma and Brain Metastases: The Results of Analyses of the LLFS Data**

**Anatoliy Yashin**, Duke University; **Deqing Wu**, Duke University; **Konstantin Arbeev**, Duke University, **Svetlana Ukraintseva**, Duke University; **Eric Stallard**, Duke University; **Alexandr Kulminski**, Duke University; **Ingrid Borecki**, Washington University, School of Medicine; **Kaare Christensen**, University of Southern Denmark

**Background.** Brain metastases develop in nearly half of patients with advanced melanoma and is a major cause of mortality in these patients. It was suggested that factors compromising the permeability of the BBB can promote tumor cell extravasation into the brain. We hypothesize that some germ line mutations increasing the risk of melanoma will also be involved in regulating the BBB permeability.

**Data and Methods.** A number of germ line mutations involved in the development of melanoma and its metastases were previously found in genes located on chromosome 7. This indicates a possibility that there may be other (yet unidentified) genes on this chromosome that influence the risk of this condition. Using the LLFS data, we performed genetic association study of melanoma with tag SNPs located on chromosome 7. Then we reviewed current evidence on the role of detected variants in the BBB permeability.

**Results and Discussion.** We found that a minor allele of the rs208353 SNP located in the intronic area of GNA12 gene is significantly associated with melanoma ( $p < 7.07E-6$ ). This gene plays a critical role in regulating tight junction, an intercellular junction that regulates epithelial and endothelial permeability, and is an essential component of the BBB. The loss of endothelial tight-junction function is an important event in the disruption of BBB and promoting tumor metastases.

**Conclusions.** Our findings indicate that GNA12 is a gene with pleiotropic action which is involved in melanoma development and increases vulnerability to brain metastasizing through a disruption of the BBB permeability.

#### **LB8. Rapamycin Activates a Caloric Restriction Responsive Pathway in Adipose Tissue**

**Porsha Howell**, University of Wisconsin-Madison Department of Nutritional Sciences; **Michael Polewski**, University of Wisconsin-Madison, Department of Medicine; **Karl Miller**, University of Wisconsin-Madison, Department of Nutritional Sciences; **Lauren Willoughby**, University of Wisconsin-Madison; **Sabrina Van Roekel**, University of Michigan; **Richard Miller**, University of Michigan, Nathan Shock

Center in the Biology of Aging; **Rozalyn Anderson**, University of Wisconsin-Madison, Department of Medicine - Institute of Aging

Caloric Restriction (CR), a dietary regimen that extends lifespan in mice, induces a remodeling of white adipose tissue that may be important in its ability to delay the onset of age-associated diseases. Lifespan is also extended by treatment with the mTOR inhibitor rapamycin, but it is unclear whether both interventions share a common mechanism. Here we show that rapamycin treatment activates a CR-responsive pathway involved in the regulation of metabolism. Like CR, rapamycin treatment increases levels of the mitochondrial regulator PGC-1 $\alpha$  in adipose tissue in mice. In addition, inhibitory phosphorylation of GSK3 $\beta$ , a key factor in PGC-1 $\alpha$  turnover, is enhanced. This is confirmed by reduced phosphorylation of mTOR target S6K. We next asked whether the effect of rapamycin on PGC-1 $\alpha$  and GSK3 $\beta$  were due to a change in signaling within adipocytes. We demonstrate that GSK3 $\beta$  and PGC-1 $\alpha$  regulation during differentiation, which is inhibited by rapamycin, is disrupted in rapamycin-treated cells. Our data suggest that inappropriate stabilization of PGC-1 $\alpha$  through GSK3 $\beta$  inhibition prevents fat storage in maturing adipocytes. Consistent with this, impaired fat storage was also observed in adipocytes overexpressing the PGC-1 $\alpha$  gene. In preadipocytes, rapamycin increases PGC-1 $\alpha$  protein levels within hours of treatment. Rapamycin induces changes in PGC1 $\alpha$  dependent processes including mitochondrial membrane potential and cell adhesion. These data confirm that PGC-1 $\alpha$  is a downstream effector in rapamycin mediated mTOR inhibition. We propose that the PGC-1 $\alpha$  pathway is a shared mechanism of enhanced longevity by inhibition of mTOR with rapamycin and CR.

#### **LB9. Synergistic Effect of Muscle and Motor Neuron Sod1 on the Maintenance of Neuromuscular Junction Structure and Function**

**Yun Shi**, University of Texas Health Science Center at San Antonio/Barshop Institute; **Michael Walsh**, University of Texas Health Science Center at San Antonio/Barshop Institute; **Daniel Pulliam**, University of Texas Health Science Center at San Antonio; **Ryan Hamilton**, University of Texas Health Science Center at San Antonio/Barshop Institute; **Yuhong Liu**, University of Texas Health Science Center at San Antonio/Barshop Institute; **Yiqiang Zhang**, University of Texas Health Science Center at San Antonio/Barshop Institute; **Carlos Jaramillo**, University of Texas Health Science Center at San Antonio; **Holly Van Remmen**, University of Texas Health Science Center at San Antonio/Barshop Institute

Electrophysiological studies of the motor nerve in CuZnSOD knockout mice (KO) demonstrate prolonged distal motor latency, reduced sciatic motor conduction velocity and pathological decrement (>10%) in compound muscle action potential (CMAP) amplitude with low frequency (3-10Hz) repetitive nerve stimulation (RNS). These changes are indicative of axonopathy and a reduced safety factor at the NMJ. Additionally acute administration of 3,4-diaminopyridine, a potassium channel blocker was able to lessen the CMAP decrement in KO mice. To test the second aim, we utilized tissue specific knockout and transgenic mice of SOD1. Neuron-specific SOD1 knockout mice (NKO) developed a moderate reduction in muscle mass by 8 month of age, while muscle-specific SOD1 knockout mice (MKO) up to 18 month showed no muscle atrophy. Neither NKO nor MKO mice exhibited alterations in RNS, suggesting that the NMJ deficits seen in whole body KO mice may be a synergistic effect from both cell types. However, MKO mice displayed multiple characteristics of myopathy including denervation potentials (EMG),

central nuclei and increased muscle damage upon exercise. These data suggests that CuZnSOD plays an essential role in maintaining skeletal muscle integrity. Meanwhile, neuronal SOD1 overexpression rescued muscle atrophy and aberrant CMAP parameters in the KO mice. In conclusion, the complete neuromuscular phenotype in KO mice is likely caused by deficiency of CuZnSOD in both muscle and neurons. Our data indicate that muscle atrophy in these mice may be secondary to this neuronal defect rather than an intrinsic muscle CuZnSOD deficiency.

#### **LB10. Whole-Genome DNA Methylation Changes in Human Skeletal Muscle Associated with Aging**

**Artem Zykovich**, Buck Institute for Research on Aging; **Alan Hubbard**, University of California Berkeley; **Brittany Garrett**, Buck Institute for Research on Aging, **Mark Tornopolsky**, McMaster University; **Sean Mooney**, Buck Institute for Research on Aging; **Simon Melov**, Buck Institute for Research on Aging

Aging is accompanied by the reduction of muscle mass and function, and leads to a decrease in mobility (termed sarcopenia). Though numerous different pathways have been found to be linked with sarcopenia, their mechanisms and relative importance are mostly unknown. Several studies have investigated gene expression changes that occur in skeletal muscle during aging. In addition to gene expression, epigenetic methylation of cytosine plays an important role in many processes, including differentiation and cellular senescence. Dysregulation of DNA methylation has also been observed in age-associated disorders such as Alzheimer's Disease and cancer.

Here we report for the first time a genome-wide study of DNA methylation dynamics in skeletal muscle derived from healthy individuals during normal human aging. We predominantly observed hypermethylation with age. Differentially methylated CpG (dmCpG) nucleotides tend to arise inside of genes. Structurally, dmCpG are underrepresented in promoters and are overrepresented in the middle and 3' end of genes. dmCpG are prone to be in CpG islands (CGI) and CGI shores, but only if they are located within a gene body and not overlapping with a promoter, unless the promoter has no CGI and GC skew. We did not observe a correlation between gene expression and methylation changes with age. Finally, we identified over 200 biomarkers that near perfectly predict human biological age.

#### ***Health Sciences Section***

#### **LB11. A Community-Based Model for Recruitment of African Americans Into Alzheimer's Research**

**David Ruvolo**, The Charles F. and Joanne Knight Alzheimer's Disease Research Center, Washington University School of Medicine; **Dorothy Edwards**, Chair & Professor, Department of Kinesiology, University of Madison Wisconsin & Wisconsin Alzheimer's Disease Research Center; **Douglas Brown**, Department of Surgery, Washington University School of Medicine; **Monique Williams**, School of Medicine, Health and Sciences Center, Texas Tech University

African Americans are at increased risk for developing Alzheimer's disease (AD), and yet, recruitment of African Americans continues to be a tremendous hurdle in AD research. Underrepresentation of African Americans is attributed to many barriers such as health disparities, fear, lack of trust, and mistreatment. Focus group transcripts from Williams et al., (2010; n=70), which documented African-American

participants' attitudes and perceptions towards research participation, were analyzed in accordance with Grounded Theory. Using Open Coding analysis, participant responses yielded four core aspects of community-based recruitment. Participants stated researchers must (a) display Community Focus by demonstrating cultural competency, (b) develop accessible Education programs about AD research, (c) create Methodology that is ethnically sensitive, and (d) emphasize Altruism by establishing how volunteerism benefits the entire community. Axial Coding led to the formation of a community-based recruitment model and suggests that a systematic approach for implementing strategies aligned with the four core aspects would be most effective. Community-based recruitment strategies are designed to tackle logistical elements (e.g., assessing community needs, developing community-specific materials, etc.) and potential barriers (e.g., skepticism, fear, mistrust, etc.). Results suggest that researchers must implement these strategies in order to form a strong partnership between the research center and the community. The model would help researchers establish trust within the community, develop effective recruitment strategies, and increase retention rates. Future studies will utilize a mixed methods design to examine the effectiveness of this model for recruiting older African Americans at risk for AD.

#### **LB12. A Home-Based Functional Exercise Program Extended the Benefits of Hip Fracture Rehabilitation**

**Nancy Latham**, Boston University School of Public Health; **Bette Ann Harris**, MGH Institute of Health Professions; **Jonathan Bean**, Spaulding Cambridge Rehabilitation Center; **Tim Heeren**, Department of Biostatistics, Boston University School of Public Health; **Christine Goodyear**, Health and Disability Research Institute, Boston University School of Public Health; **Diane Heislein**, College of Health and Rehabilitation Sciences: Sargent College, Boston University; **Jabed Mustafa**, Health and Disability Research Institute, Boston University School of Public Health; **Alan Jette**, Health and Disability Research Institute, Boston University School of Public Health

**Background:** For many older people, long-term functional limitations persist after formal hip fracture rehabilitation has ended. Intensive, highly supervised exercise programs have been shown to extend the benefits of hip fracture rehabilitation; however, the efficacy of a home exercise program with minimal supervision has not been established. The Aim of this randomized controlled trial was to determine the efficacy of a 6-month home exercise program to improve function after formal hip fracture rehabilitation ended. **Methods:** 232 functionally limited older adults with recent hip fracture were randomized to exercise or attention control. Functionally-oriented exercises were taught in 3-4 home visits by a physical therapist and performed independently over 6 months. Exercise intensity was progressed using therabands, weighted vests and steps of varying height. Physical function was assessed at baseline and 6 months by blinded assessors using the Short Physical Performance Battery (SPPB) and Activity Measure for Post-Acute Care (AMPAC). All analyses were by intention-to-treat. **Results:** There were no significant between-group baseline differences or adverse events related to the intervention. Loss to follow-up was 15.9%. As hypothesized, the exercise group showed significant improvement relative to the control group in functional mobility and daily activity functioning at 6 months for all primary endpoints (adjusted analyses (for age, gender and baseline scores): SPPB,  $P < 0.001$ ; AM-PAC Mobility Function  $P = 0.03$ ; AMPAC Daily Activity Function  $P = 0.026$ ). SPPB and AMPAC Daily Activity function scores exceeded minimum clinically important differences. **Conclusion:** Home-based

functionally-oriented exercises successfully extended the functional recovery of older adults who had completed their hip fracture rehabilitation.

### **LB13. Emergency Department Use By Oldest-old Patients Between 2005 And 2010 In A Swiss University Hospital**

**Hélène Jaccard Ruedin**, Service of Geriatric Medicine and Geriatric Rehabilitation, Department of Medicine, University of Lausanne Medical Center (CHUV); **Sarah Vilpert**, Swiss Health Observatory; **Lionel Trueb**, Department of Medicine, University of Lausanne Medical Center (CHUV), **Stefanie Monod-Zorzi**, Service of Geriatric Medicine and Geriatric Rehabilitation, Department of Medicine, University of Lausanne Medical Center (CHUV); **Yersin Bertrand**, Department of Medicine, University of Lausanne Medical Center (CHUV); **Christophe Büla**, Service of Geriatric Medicine and Geriatric Rehabilitation, Department of Medicine, University of Lausanne Medical Center (CHUV)

**Introduction:** Population ageing challenges Emergency Departments (ED) with a population shift toward higher age groups. Patients aged 85+, represent the fastest growing segment, leading to more prevalent complex situations within ED.

**Method:** Retrospective analysis of 56'162 ED visits of patients at the University of Lausanne Medical Center (CHUV), from 2005 to 2010.

**Results:** ED visits of 65+ patients increased from 8'228 to 10'390/year, representing 6 patients/day more (+26%). 85+ Patients increased by +46% vs +20% for the 65-84 (+20% ED visits of people 18-64y). Median age of the 65+ ED patients increased from 78.7 to 79.3 years. 85+ patients were more likely than 65-84y patients to come from a NH setting (13% vs 4%) and to be hospitalised (70% vs 59%). Median length of stay difference between both age groups extended from 2 hours 08 min in 2005 to 2 hours 45 min in 2010.

**First reason to visit ED** was fall/injury for 85+ patients (27%; 65-84: 18%) and a cardiovascular disorder for patients aged 65-84y (18%; 85+: 16%). Part of high degree of emergency cases (42%) and readmission to ED within 30 days (8%) were similar for both age classes (similar proportions in 2005 and 2010 for these 3 issues).

**Conclusion:** Patients aged 85+ are the fastest growing group admitted to ED. Compared to younger counterparts, they use more ED resources and the differences are increasing overtime. ED addressing specific needs of geriatric patients would improve their care and lead to a better use of available resources.

### **LB14. Health-Related Quality of Life in Older US Adults: A Regional Comparison**

**Diana Kachan**, University of Miami Miller School of Medicine; **Laura McClure**, University of Miami Miller School of Medicine; **William G. LeBlanc**, University of Miami Miller School of Medicine, **Tainya C. Clarke**, University of Miami Miller School of Medicine; **Stacey Tannenbaum**, University of Miami Miller School of Medicine; **Jenelle Lin**, University of Miami Miller School of Medicine; **Cristina Fernandez**, University of Miami Miller School of Medicine; **David J. Lee**, University of Miami Miller School of Medicine

Objective: Compare the health-related quality of life (HRQL) among adults aged 65+ across states and geographical regions of the US using the Health and Activities Limitation utility index (HALex).

Methods: We analyzed pooled, survey-weighted data from the 1997-2010 National Health Interview Survey participants aged 65+. HALex scores were calculated combining information about an individual's perceived health and activity limitations, with scores ranging from 0.00-1.00 (lower scores reflect poorer HRQL). We ranked US states by mean HALex, and performed multivariable logistic regression analyses comparing low HALex scores (defined as HALex  $\leq$  0.2) in Florida to the other US regions (i.e., Rest of South, West, Midwest, Northeast), with adjustment for sociodemographic variables, health behaviors, and survey design.

Results: Older residents of Alaska, Alabama, West Virginia, Mississippi, and Arkansas had the lowest mean HRQL scores (range: 0.62-0.68), whereas residents of Vermont, Wisconsin, Delaware, Nevada, and New Hampshire ranked the highest (range: 0.78-0.79). Floridians were less likely to have a low HRQL than residents of other Southern states (OR= 0.79; [95% Confidence Interval =0.67-0.94]), but more likely than residents of the Northeast (1.25; [1.02-1.52]) and the Midwest (1.28; [1.06-1.55]). When stratified by place of birth, US-born Floridians were less likely to have a low HRQL than US-born residents in all other states combined (0.66; [0.46-0.94]).

Conclusions: Significant regional differences exist in the HRQL of older individuals within the US. Future research examining the factors accounting for regional differences in HRQL levels could provide policy-makers with pertinent information on methods for improving the quality of life of older Americans.

#### **LB15. Improvements in Insulin Resistance and Glucose Homeostasis are Dependent on Changes in Body Composition Mediated Through High Intensity Progressive Resistance Training in Older Adults With Type 2 Diabetes. Interim Results From the GREAT2DO study.**

**Yorgi Mavros**, Exercise Health and Performance Faculty Research Group, Faculty of Health Sciences, University of Sydney; **Shelley Kay**, Exercise Health and Performance Faculty Research Group, Faculty of Health Sciences, University of Sydney; **Kylie Anderberg**, Exercise Health and Performance Faculty Research Group, Faculty of Health Sciences, University of Sydney; **Yi Wang**, Department of Medicine and the Diabetes Center, University of California; **Michael Baker**, School of Exercise and Health Science, Edith Cowan University; **Jacinda Meiklejohn**, Exercise Health and Performance Faculty Research Group, Faculty of Health Sciences, University of Sydney; **Kieron Rooney**, Exercise Health and Performance Faculty Research Group, Faculty of Health Sciences, University of Sydney; **Maria Fiatarone Singh**, Exercise Health and Performance Faculty Research Group, Faculty of Health Sciences, University of Sydney

Objective: To determine the relationship between changes in body composition, and improvements in insulin resistance and glucose homeostasis in a randomized sham-exercise controlled trial of progressive resistance training in older adults with type 2 diabetes.

Methods: 103 older adults (67.9 $\pm$ 5.5 years) with type 2 diabetes were recruited for this study. Participants were randomized into either a progressive resistance training group (PRT), or a sham-

exercise control group (SHAM), for 12 months. Insulin resistance was assessed via the Homeostatic Model of Assessment 2 index (HOMA2-IR); glycosylated hemoglobin was used for glucose homeostasis. Skeletal muscle mass and fat mass were estimated using bioelectrical impedance assessment, while mid-thigh intramyocellular lipid was quantified using computed tomography.

Results: No group x time interaction was seen for changes in HOMA2-IR, HbA1c, skeletal muscle mass, total fat mass ( $p>0.05$ ), while significant reductions in intramyocellular lipid were present the PRT group vs. the control group ( $p<0.05$ ). Univariate regression analyses showed that changes in HOMA2-IR were directly related to reductions in total fat mass ( $r^2=0.17$ ,  $p=0.02$ ), and inversely related to increases in skeletal muscle mass ( $r^2=0.14$ ,  $p=0.04$ ) in the PRT group only. These relationships were not present in the SHAM group ( $p>0.05$ ). Furthermore, changes in HbA1c were directly related to changes in intramyocellular lipid ( $r^2=0.33$ ,  $p<0.0001$ ) in the PRT group only.

Conclusion: Increases in skeletal muscle mass, or reductions in total fat mass or intramyocellular lipid achieved through high intensity PRT improved insulin resistance and glucose homeostasis in a cohort of older adults with type 2 diabetes.

#### **LB16. Influence of Diagnostic Criteria on the Prevalence of Mild Cognitive Impairment (MCI) in the Berlin Aging Study II**

**Nina Bucholtz**, Charité - Research Group Geriatrics; **Christina Tegeler**, Charité - Research Group Geriatrics; **Ilja Demuth**, Charité - Research Group Geriatrics; **Elisabeth Steinhagen-Thiessen**, Charité - Research Group Geriatrics

The consideration of Mild Cognitive Impairment (MCI), that can be a prodromal stage of dementia, has become one main focus in neuropsychological research. However, this transitional stage between normal cognitive ageing and dementia is a heterogeneous syndrome that has been described distinctly in various concepts. Accordingly, studies regarding the epidemiology of MCI have shown great variability in prevalence. Thus, Winblad et al. (2004) have introduced a model that describes four subtypes of MCI: They distinguish a) amnestic (aMCI) and nonamnestic subtypes (naMCI) and b) if cognitive capacity is impaired in one or multiple domains. Even so, there is still no consensus in how to operationalize cognitive impairment. Especially neuropsychological aspects as the choice of tests and cut-offs are insufficiently defined. Therefore, the aim of this study is to demonstrate the impact of neuropsychological criteria on prevalence rates of MCI.

725 participants of the Berlin Ageing Study II were assessed using the test battery of Consortium to Establish a Registry for Alzheimer's Disease. Based on different cut-off criteria (1.0/1.5 standard deviations below norm) and number of test parameters indicating an impairment in a domain (one vs. two or more parameters), prevalence of MCI varies from 1.7% to 84.1%, whereas the amnestic subtypes vary from 1.7% to 14.9% (single aMCI) and 0.0% to 44.6% (multiple aMCI) respectively.

The results confirm that neuropsychological operationalization has a significant influence on obtained prevalence rates of MCI. Therefore, the analysis and definition of neuropsychological criteria is crucial for further studies regarding epidemiology and etiology of MCI.

### **LB17. Life Space, Mobility Performance, Total Daily Activity and Cognitive Decline**

**Bryan James**, Rush Alzheimer's Disease Center; **Aron Buchman**, Rush Alzheimer's Disease Center; **David Bennett**, Rush Alzheimer's Disease Center

In a series of papers, our group has shown that motor impairments, lower total daily activity, and constriction of life space—the extent of movement through the environment beyond the home—all precede declines in cognitive abilities. In this longitudinal analysis, we examined the independent associations of each of these mobility-related constructs with cognitive function and decline in 912 participants of the Memory and Aging Project. Life space (ranging from home to out of town) in the previous week was measured through self-report. A composite mobility performance score was based on four performance tasks including an 8 foot walk. Total daily activity was measured through an actigraphy device worn continuously on the wrist for 10 days. Composite scores for global cognitive function and 5 separate cognitive domains were derived from a battery of 19 cognitive tests. In mixed regression models adjusted for age, sex, and education, better mobility performance and higher total daily activity were associated with higher levels of cognitive function and less cognitive decline; a larger life space was associated with less cognitive decline. In a combined model, larger life space ( $\beta=0.012$ ,  $SE=0.003$ ,  $p<0.001$ ) and better mobility performance ( $\beta=0.052$ ,  $SE=0.016$ ,  $p=0.001$ ) were independently associated with a lower rate of cognitive decline. In summary, multiple indicators of late-life mobility were independently associated with subsequent decline in cognition in community-based older adults.

### **LB18. Marital History and Bone Mineral Density: Findings from The Midlife in the U.S. Study**

**Dana Miller-Martinez**, Division of Geriatrics, David Geffen School of Medicine at University of California, Los Angeles; **Arun Karlamangla**, Division of Geriatrics, David Geffen School of Medicine at University of California, Los Angeles; **Teresa Seeman**, Division of Geriatrics, David Geffen School of Medicine at University of California, Los Angeles; **Neil Binkley**, University of Wisconsin-Madison Osteoporosis Clinical Center and Research Program; **Carolyn Crandall**, Division of General Internal Medicine, David Geffen School of Medicine at University of California, Los Angeles

Bone mass in midlife is determined by acquisition in childhood, maintenance in young adulthood, and decline in later years, all of which may be influenced by stressors over the life course. Previous studies have shown associations between socioeconomic conditions in childhood and adult bone mass. Here, we examine the association between marital life history and bone mineral density (BMD), net childhood and adult socioeconomic indicators, and other health and behavioral factors known to influence bone mass. Because marriage and social support appear to have differing effects on health for men versus women in previous studies, we sought evidence for a differential effect of marital life history on adult BMD.

We used data from 729 adult participants in the Midlife in the United States Study, and employed multivariable linear regression, stratified by gender, and adjusted for age, weight, women's menopause

status, medication use, childhood socioeconomic advantage, adult financial advantage, education, physical activity over the lifecourse, lifetime smoking history, and alcohol consumption.

Marital life history was independently associated with lumbar spine BMD only in men, and not in women. Married men, never previously divorced, widowed, or separated had 0.44 SD higher BMD than never-married men. However, early first marriage was associated with lower BMD: Every year decrement in age at first marriage (under age 25) was associated with 0.08 SD decrement in BMD.

Our findings suggest that while a lasting marriage may be protective, early age of first marriage (possibly because of associated financial stresses) may be deleterious to bone health in men.

#### **LB19. Personality and Risk of Alzheimer's Disease: New Data and Meta-Analysis**

**Antonio Terracciano**, College of Medicine, Florida State University; **Angelina R Sutin**, College of Medicine, Florida State University; **Yang An**, NIA; **Richard J O'Brien**, Department of Neurology, Johns Hopkins University; **Luigi Ferrucci**, National Institute on Aging, National Institutes of Health; **Alan B Zonderman**, National Institute on Aging, National Institutes of Health; **Susan M Resnick**, National Institute on Aging, National Institutes of Health

**Background:** We examine whether broad factors and specific facets of personality are associated with increased risk of incident Alzheimer's disease (AD) in a long-run longitudinal study and perform a meta-analysis of published studies.

**Methods:** Participants from the Baltimore Longitudinal Study of Aging (N = 1671; incident AD = 90) were followed for up to 22 years from a baseline personality assessment. The meta-analysis pooled results from up to 5 prospective studies (N = 5054; incident AD = 607).

**Results:** In Cox-regression analyses adjusting for age, sex, education, and ethnicity, those with scores in the top quartile of neuroticism (HR = 3.1; 95%CI = 1.6-6.0) or the lowest quartile of conscientiousness (HR = 3.3; 95%CI = 1.4-7.4) had a three-fold increased risk of incident AD. The estimated population attributable risk was 13% for neuroticism and 11% for conscientiousness. The meta-analysis confirmed the associations of neuroticism ( $p = 2 \times 10^{-9}$ ) and conscientiousness ( $p = 2 \times 10^{-6}$ ), along with weaker effects for openness and agreeableness ( $p < 0.05$ ), with no evidence of heterogeneity from the pooled studies.

**Conclusion:** The current study and meta-analysis indicate that personality traits are associated with increased risk of AD, with effect sizes similar to those of well-established clinical and lifestyle risk factors.

#### **LB20. The Impact of Age on Cancer Survivors' Psycho-social Distress. Results from A 25-item Distress Screening Tool in a Community Sample of Cancer Survivors**

**Christopher Gayer**, Cancer Support Community- Research and Training Institute and University of Kentucky-Graduate Center for Gerontology; **Joanne Buzaglo**, Cancer Support Community- Research and Training Institute; **Anne Morris**, Cancer Support Community- Research and Training Institute; **Melissa**

**Miller**, Cancer Support Community- Research and Training Institute; **Victoria Kennedy**, Cancer Support Community; **Mitch Golant**, Cancer Support Community- Research and Training Institute

Cancer incidence dramatically increases with age, with 61% of diagnoses in individuals over 65 (SEER, 2006). Psychosocial problems created or exacerbated by cancer can decrease quality of life, weaken adherence to treatment regimens, and threaten older patients' ability to maximize recovery (IOM, 2008). Moreover, many older adults have complex comorbidities, impacting quality of life and health outcomes (Hewitt et al., 2003).

While over 40% of cancer patients report significant levels of distress, little is known about how age impacts distress and associated desire for support.

Cancer survivors (n=262) recruited across 10 community-based Cancer Support Community affiliates completed the 25-item web-based distress screener CancerSupportSource™. Participants rated 25 biopsychosocial concerns using a 5-point scale and indicated if they wanted to talk with a team member, receive print information or information online. Participants were grouped by age into categories (45-54, 55-64, 65+).

Regression analyses showed that patients aged 45-54 were more likely than those age 65+ to identify: changes to work, school or home life (OR=3.44; p=0.003), feeling sad or depressed (OR=2.70; p=), preparing for a treatment decision (OR=2.93; p=0.030), money worries (OR=3.77; p=0.007), and relationship problems with spouse (OR=3.05; p=0.033) as a problem. Additionally, patients aged 45-54 were more likely to request: overall assistance for distress (OR=3.76; p=0.020), online assistance (OR=2.81; p=0.017), and written assistance (OR=3.24; p=0.010) than those age 65+.

The results suggest age significantly impacts the way cancer patients experience and request assistance for distress and can be used to help tailor interventions to appropriate age groups in the community.

#### **LB21. Under Reporting of Pressure Ulcers During Inpatient Rehabilitation**

**Amit Kumar**, University of Texas Medical Branch Galveston; **Phillip Hoverstadt**, University of Texas Medical Branch; **Amol Karmarkar**, University of Texas Medical Branch; **James Graham**, Division of Rehabilitation Sciences, University of Texas Medical Branch; **Kenneth Ottenbacher**, Division of Rehabilitation Sciences

University of Texas Medical Branch

**Study Design:** A retrospective secondary analysis was conducted using data from the Centers for Medicare and Medicaid Services. We linked data for this cohort from the Inpatient Rehabilitation Facilities Patient Assessment Instrument (IRF-PAI) to their Medicare Provider Analysis and Review (MEDPAR) records. The revised version of ICD-9 codes was used to construct the algorithm to identify patients with pressure ulcers from both the MEDPAR and IRF-PAI data files. The facility reported pressure ulcers were the number of pressure ulcers identified by the facilities at the time of discharge.

Sample: Patients with both traumatic and non-traumatic SCI and patients with stroke admitted from acute to inpatient rehabilitation facilities in 2008 and 2009, and on Medicare fee-for-service plan were selected.

Result: The final study sample comprised of 102,316 patients with stroke and 22,411 patients with SCI. The number of facility reported pressure ulcers in stroke impairment group were 986 (0.96%) compared to 3,909 (3.82%) identified by our algorithm. Our algorithm detected 3.08 % of pressure ulcers from the comorbidities listed under IRF-PAI file, and 2.68 % from the comorbidities listed under MEDPAR data file in stroke population. In SCI group, the number of facility reported pressure ulcers was 383 (1.7%) compared to 1,771 (7.9%) patients with pressure ulcers listed as comorbidities: 6.4% in IRF-PAI and 5.8% in MedPAR.

Conclusion: The findings from our study demonstrate inconsistency in facility reported pressure ulcers and those identified by our algorithm in both impairment groups.

### ***Research, Education, and Practice Committee***

#### **LB22. A Study of Domestic Violence among Older Couples in Japan: Factors Affecting Continuation of Domestic Violence**

**Asako Katsumata**, Shukutoku University Graduate School of Integrated Human and Social Welfare Studies; **Noriko Tsukada**, Nihon University

Since Japan's enactment of the Elder Abuse Prevention and Caregiver Support Act in 2005, research on elder abuse has grown tremendously; however, little remains known about continuation of domestic violence (DV) among older couples. The main purpose of this study is to explore factors related to the existence of continuation of DV among Japanese older couples. The data used in this study is Japan's first nationwide survey of Certified Social Workers (CSWs) who were assigned to 4,042 Community Comprehensive Support Centers (CCSCs) throughout the country. The survey was conducted in August of 2010. Structured questionnaires were sent to randomly selected 1,282 CCSCs. Respondents were CSWs at each CCSC. A total of 621 responses were obtained (a response rate of 48.4%). Out of the 621 respondents, 379 (61.0%) reported that the most recent case of DV they dealt with was a situation of DV among an older couple. Bivariate analyses revealed that there were statistically significant relationships between the existence of continuation DV among older couples and factors, such as gender, age, degree of care burden, having dementia, nature of abuses, and cause of abuses. That is, victims being female, being younger age, having lower degrees of care burden, not having dementia, and experiencing psychological abuse were more likely to face a situation of continuation of DV in their later life. It was also found that personality issues on both abusers' and victims' sides and relationships between abusers and victims were statistically significantly related to continuation of DV among older couples.

#### **LB23. Baby-boomer Matters: Exploring the issues that draw aging baby-boomers into counseling**

**Deborah O'Connor**, University of British Columbia; **Heather Whiteford**, Family Services of Greater Vancouver; **Elizabeth Kelson**, University of British Columbia

The face of aging is changing as the baby-boomer generation begins to enter old age. What are their service needs? This study compares the needs and experiences of baby-boomers (roughly defined as those between 55 and 65) and those over 65 seeking counseling (individual or group) in a Community Centre. In addition to survey data and an audio-taped, indepth personal interview with the support counselor, telephone interviews were conducted with 23 older adults who sought personal counseling at a local Community Centre. This late-breaking poster offers a look at the emerging findings. Specifically, reasons for seeking intervention for boomers could be collapsed into three main categories: family care issues including care of aging parents and more frequently, difficulties with adult children including recognizing (and naming) situations of abuse; partnering issues including learning to live single and negotiating a changing dating scene; and issues related to body image, sexuality and physical abilities. Given the focus on 'aging well' aspects of aging that limited one's ability to continue live like before, could be interpreted as personal failures. Implications for findings include: the need to develop sexual health programs aimed at this generation; the importance of providing the space for boomers to examine their relationships with adult children as a step toward preventing elder abuse; proactive steps to challenge ageist societal beliefs about personal appearance and the individual level; and the importance of groups for dealing with issues of loss and age-related changes. The importance of offering support in Community Centre rather than specialized mental health clinics was repeatedly identified as important for normalizing help-seeking.

#### **LB24. Changing Perspectives Through Intergenerational Learning: The Experiences of Students and Seniors in a Leisure and Aging Class**

**M. Rebecca Genoe**, University of Regina; **Chloe Lewis**, University of Regina; **Brady Johnson**, University of Regina, **Victoria Sutherland**, University of Regina

This late-breaking research poster will present qualitative data collected and analyzed within the past month from students and senior volunteers regarding their experiences with intergenerational learning in a second year university course focused on leisure and aging. Students and volunteers participated in weekly, 50-minute, student led intergenerational seminars on a variety of topics, including physical activity in later life, recreation in long term care, community based programming, and diversity. Two senior volunteers were assigned to each seminar group to provide their personal perspectives and experiences each week. In order to better understand the experiences and perspectives of participating in intergenerational seminars, we conducted one on one interviews with students (n=6) and senior volunteers (n=6). Data were analyzed using thematic analysis. This presentation will focus on the meaning of intergenerational interactions among both the students and the volunteers. For both groups, intergenerational interactions led to changing perspectives on aging and learning from each other. Through discussion of leisure in later life, students reported changes in attitudes about aging and older adults, while seniors reported feelings of connection to their community as they mentored the students. Objectives: Readers will be able to (1) identify at least three benefits of participating in intergenerational learning seminars for student (2) identify at least three benefits of participating in intergenerational learning seminars for senior volunteers; and (3) identify at least three ways in which discussions about leisure specifically can change ageist stereotypes among university students.

## **LB25. Community-Partnered Health Promotion “On The Move:”**

### **Engaging Media to Improve the Health and Quality of Life of Older Adults**

**Scott Kaiser**, VA Greater Los Angeles Healthcare System / UCLA; **Allan Muir**, LA Cityview Channel 35; **Brenda Vazquez**, Partners in Care Foundation; **Laura Trejo**, City of Los Angeles Department of Aging; **Catherine Sarkisian**, Division of Geriatrics, Department of Medicine David Geffen School of Medicine at UCLA; **Ivy Lee**, Division of Geriatric Medicine, David Geffen School of Medicine at UCLA

**Objective:** To develop a theoretically-grounded broadcast media intervention to improve the health and quality of life of older adults. Specifically, to work in partnership with Los Angeles area community aging services agencies to develop a television series promoting the adoption and maintenance of regular physical activity as a critical element of healthy aging.

**Methods:** A project of the Los Angeles Community Academic Partnership for Research in Aging, UCLA medical investigators joined forces with the City of Los Angeles Department of Aging, Partners in Care Foundation, and LA Cityview 35 to produce a series promoting physical activity in an older adult population.

“On The Move” engages a multi-faceted theoretical approach—grounded in an attributional model of achievement motivation, transtheoretical model, behavioral affective associations model, and social cognitive theory—as formerly sedentary older adults compete to become active. Contestants are exposed to activities included in evidence-based programs and wear Fitbit accelerometer units to track progress.

**Results:** A series of six 30–minute episodes, “On The Move” demonstrates significant transformation in 12 individuals as they increase average daily physical activity to approach or exceed a 10,000 daily step goal. The series was initially broadcast on LA CityView Channel 35 June - August 2012 and is now available online.

**Conclusions:** “On The Move” exists as an innovative approach to utilizing media as a health promotion tool within the context of community-partnered efforts to support healthy aging. Future directions must include a rigorous evaluation of the impact of this programming on specific viewers.

## **LB26. Complicated Grief In Older Adults: A Randomized Controlled Trial Of Complicated Grief Group Therapy**

**Katherine Supiano**, University of Utah-College of Nursing

This randomized controlled trial evaluated the efficacy of complicated grief group therapy (CGGT) in the treatment of older adults meeting clinical criteria for complicated grief (CG) as compared to a sample of older adults receiving modified grief support group-treatment as usual (TAU). The CGGT intervention was an adaptation of complicated grief therapy (Shear, 2003, Liberty Version; Shear, Frank, Houck & Reynolds, 2005) administered as group therapy. Twenty-six participants completed the 16 week intervention; CGGT n = 12, TAU n = 14. Primary outcome measures included the Prolonged Grief

Disorder Scale (PG-13; Prigerson & Maciejewski, 2009), the Brief Grief Questionnaire (BGQ; Shear & Essock, 2002), and the Clinical Global Impressions Scale (CGI; Guy, 1976). Participants in both groups showed improvement, but those receiving CGGT realized significantly greater improvement ( $F = 11.52(3, 22)$ ,  $p < .001$ ,  $d = 1.34$  [95% CI = .483, 2.187]). More importantly, when complicated grief was measured on PG-13, nearly half of CGGT participants realized clinically significant improvement defined as 50% reduction in score. On the BGQ, all 12 of the CGGT completers had follow up scores in the normal range, suggesting a return to a normative grief process. This high level of clinical significance suggests that those in the CGGT group were effectively treated for complicated grief, and supports prior research recommending specialized treatment for persons with complicated grief. CGGT brings the additional advantages of group therapy, addressing the social isolation and disenfranchised status of those whose grief experience is profound.

### **LB27. Courtship and the “Young-Old”**

**Nicole Graves**, South Dakota State University; **Gregory Sanders**, North Dakota State University

As people are enjoying healthier and longer lives, many older adults are seeking meaningful relationships well into their later years. While there are a few studies that have focused on dating and courtship patterns in later life much of what we know about dating preferences is based on samples of young or middle-aged adults. Information about young adult dating cannot be adequately generalized to explain the unique experience of older adults. The current study examined transition to marriage of individuals between ages 55-75 (“young-old”). Eleven individuals (seven females and four males) who had been married five or fewer years participated in semi-structured interviews that were designed to allow the participants to share their stories of re-partnering. Open-ended questions encouraged participants to reflect on four main areas of their current relationship: a) the relationship prior to marriage, (b) factors associated with the decision to marry, (c) influence of others, (d) the marital relationship. The findings shared here focus on the relationship prior to marriage and thus will outline themes that emerged related to courtship. Qualitative analysis of the data resulted in the identification of four courtship themes: importance of compatibility, influence of past relationships, role of age, and role of technology.

### **LB28. Effectiveness of policy change on staff perception and knowledge of restraint use in a general community hospital.**

**Nancy Pearce**, Grand River Hospital; **Susan Edgar**, Grand River Hospital

**Introduction:** While significant effort has been made to decrease restraint use in long-term care, less attention has been paid to this issue in acute care. A 500-bed general community hospital instituted a new “Least Restraints” policy to decrease use of physical restraints.

**Objectives:** To evaluate the impact of the implementation of a “Least Restraint” policy on nursing and therapy staff knowledge and perception of restraint use in a general community hospital.

Method: All in-patient nursing and therapy staff were emailed a link to an on-line survey consisting of the Perception of Restraint Use Questionnaire (Evans & Stumpf, 1986) and the Physical Restraint Questionnaire (Janelli, Stamps & Delles, 2006) pre and post policy implementation.

Results: 227 and 142 respondents respectively completed the pre and post survey. Staff knowledge increased significantly on a number of items post implementation. Staff were more aware of the need for a physician's order ( $p < 0.05$ ), types of restraints ( $p < 0.01$ ); and assessment parameters ( $p = 0.01$ ). Staff reported being more willing to try alternative measures ( $p < 0.05$ ) such as a bed alarm ( $p = 0.001$ ) and to work collaboratively ( $p < 0.01$ ). Fewer staff believed that restraints were an important safety measure to prevent falls ( $p < 0.001$ ) and unsafe ambulation ( $p < 0.05$ ).

Conclusions: The implementation of a "Least Restraints" policy positively affected staff knowledge and perceptions. Further research is needed to determine the effect on practice.

#### **LB29. Neighborhood Effects on the Self-rated Health of Older Adults from Four Racial/Ethnic Groups**

**Jung Eun Ko**, School of Aging Studies, University of South Florida; **Yuri Jang**, School of Social Work, The University of Texas at Austin; **Nan Sook Park**, School of Social Work, University of South Florida; **Sung Han Rhew**, School of Aging Studies, University of South Florida; **David Chiriboga**, Department of Child and Family Studies, University of South Florida

This study of older adults examined the association of self-rated health with neighborhood characteristics using older adult samples of: Whites ( $n = 488$ ), Blacks ( $n = 345$ ), Cubans ( $n = 319$ ), and non-Cuban Latinos ( $n = 230$ ). The census-derived neighborhood characteristics included (1) the proportion of individuals aged 65 and older, (2) the proportion of individuals below poverty rate, and (3) the proportion of individuals from the same racial/ethnic background. The samples were drawn from the 2004-5 Survey of Older Floridians (SOF). Using the reported residential address, each participant was linked to the 2000 Census at block group level to retrieve neighborhood characteristics. Hierarchical linear models estimated self-rated health as a function of individual and neighborhood characteristics. Results indicated that neighborhood poverty rate was consistently associated with poorer health ratings across all groups. The proportion of older adults in the neighborhood was positively associated with self-rated health only among Cubans, and the proportion of individuals from the same racial/ethnic background was associated only among Whites. Findings support the importance of neighborhood context in the health of diverse older populations and suggest intervention strategies. Given that neighborhood characteristics had different implication for the racial/ethnic groups, the race/ethnicity composition of targeted geographic areas should be considered when developing health interventions for older adults.

### **LB30. The contextual specificity of adult age differences in decisions about sunk costs: Time matters more to the old**

**Nipat Pichayayothin**, West Virginia University; **JoNell Strough**, West Virginia University

The sunk-cost fallacy occurs when an irretrievable prior investment (sunk cost) influences a decision even when that investment is irrelevant to the outcome and should be ignored. Prior research demonstrates that older adults are less subject to the sunk-cost fallacy compared to younger adults. This study investigated if age differences depended on the type of prior investment (money or time) and the emotional meaningfulness of decisions. Young ( $M = 19.15$  years,  $N = 52$ ) and older adults ( $M = 76.18$  years,  $N = 53$ ) made decisions about hypothetical sunk costs of money and time that were emotionally meaningful or not (randomly assigned). MANOVA indicated older adults were significantly less likely to demonstrate the fallacy when money had been invested (replicating prior research), but were more likely to demonstrate the fallacy when time had been invested ( $p < .01$ ). Both older and younger adults were more subject to the fallacy when time had been invested in an emotionally meaningful activity (compared to a control group). After controlling for relevant covariates (need for cognition, action orientation, and numeracy), age differences in the fallacy remained significant for money investments, but not for time investments. The importance of features of the decision context (the type of investment and its emotional meaningfulness) for understanding age differences and similarities in decisions is discussed.

**Saturday, November 17**

**LB1. A Cross- Sectional Study on Religiosity of Community-Dwelling Chinese Older Adults in Chicago**

**Chengyue Li**, Rush Institute for Health Aging; **E-Shien Chang**, Rush Institute for Healthy Aging; **Esther Wong**, Chinese American Service League; **Melissa Simon**, Feinberg School of Medicine, Northwestern University; **XinQi Dong**, Rush Institute of Healthy Aging

Background: Empirical studies have shown that religious commitment is associated with better mental and physical health. However, the role of religiosity in health and aging among elderly population is understudied. We aimed to examine the participation in religious activities and general religiosity in a US Chinese aging population. Method: This is a cross-sectional study with Chinese older adults over the age of 60 in the greater Chicago area. In the survey interview, we administered a 3-question religious scale to explore the importance of religion in their lives, attendance to organized religious service and attendance to home religious service. Result: Among surveyed participants (N=2,199), the mean age was 73.7 and 62% were women. Concerning self-rated religiosity, 63.7% of the surveyed participants perceived religion as not much important or not at all important, whereas 10% reported religion played a very important role in their lives. Regarding attendance to organized religious services, 76.9% participants reported they have never attended any services, 16.9% stated that they attended at least once every three months. Regarding religious services at home, 36.3% participants attended at least once every three months. Conclusion: Although a large portion of participants did not perceived religion as an important factor in their lives, the findings needs to be examined and interpreted in the unique cultural and historical contexts of Chinese immigrants. Further investigation needs to examine the relationship between religiosity and physical and psychological health and among the Chinese older adults.

**LB2. Cognitive Functioning, Family Support and Depression among Older Adults in Rural China: Comparing Two Age Groups (60-74 & 75+)**

**Yura Lee**, University of Southern California/School of Social Work/PhD student; **Iris Chi**, University of Southern California/School of Social Work/Professor

Background: Depression among older adults is becoming important public health problem. Older adults with limited cognitive functioning and depression are more likely to develop dementia. Additionally, deficit in social support is a great risk factor for depression in late life; family support (compared to friends or others) being considered the most crucial in Asian culture. As older adults live longer, it is time to examine depression in different phases of old age. The purpose of this study is to understand the impact of cognitive functioning and family support on depression among older adults in rural China comparing two age groups.

Method: 1,391 Chinese older adults were recruited in 2003 in Anhui Province, China. Multivariate regression model was conducted controlling for age, gender, income, education, marital status, perceived health status, ADLs, and IADLs.

Results: For age (60-74), cognitive functioning ( $b=-.19$ ,  $p<.05$ ) and emotional support from sons ( $b=-.37$ ,  $p<.001$ ) and daughters ( $b=-.23$ ,  $p<.001$ ) were significantly associated with depression while cognitive functioning ( $b=-.29$ ,  $p<.01$ ) and emotional support only from sons ( $b=-.64$ ,  $p<.001$ ) were significant for age (75+). Financial support was not significantly related with depression for both age groups. Marital status, perceived health, ADLs, and IADLs were significantly related with depression for (60-74) group while gender, perceived health, and ADLs were found significant for (75+) group.

Discussion: The findings have important implications to design age-specific depression intervention for older adults in rural China. Also, early screening for cognitive impairment and provision of auxiliary support for those who lack family support will be necessary.

### **LB3. Education Moderates Genetic and Environmental Influences on Body Mass Index – Findings from the Consortium on Interplay of Genes and Environment across Multiple Studies (IGEMS)**

**Wendy Johnson**, Centre for Cognitive Ageing and Cognitive Epidemiology and Department of Psychology, University of Edinburgh; **Anna Dahl**, Department of Medical Epidemiology and Biostatistics, Karolinska Institutet

Obesity is a world-wide health problem with important consequences for aging. Twin studies have increased our understanding of the origins of obesity by quantifying the overall contributions of genetic and environmental factors to individual differences in body mass index (BMI). Yet rather than being constant, other variables may moderate the magnitudes of genetic and environmental influences on BMI. For example, rates of obesity tend to be higher in those with less education, and in a previous study of Danish adult twins, variance in BMI attributable to genetic and familial and individual-specific environmental influences was moderated by education so that it was greater in those with less education. Using eight twin studies in different age groups (two U.S., four Swedish, and two Danish) in aggregate, including 15,797 individuals (mean age 64 years, range 25-102), we replicated some but not all of these moderating effects. There were differences in average BMI and level of education across studies, age, and sex, as well as differences in degree of association between education and BMI. For example, correlations between education and BMI ranged from  $-.05$  in middle-aged American men to  $-.19$  in middle-aged Danish men and  $-.07$  in younger Swedish women to  $-.18$  in the oldest sample of Swedish women. These differences impacted how education moderated the genetic and environmental influences. Overall, education should be considered in developing strategies to reduce obesity, but appropriateness of specific strategies may vary with local educational and health care conditions as well as with age.

#### **LB4. Environmental and Person Factors Associated with Participant Attrition in the Chronic Disease Self-Management Program**

**Margaret Moran, MPH**, University of Illinois at Chicago; **Thomas Prohaska, PhD**, University of Illinois at Chicago/George Mason University; **Amy Eisenstein, PhD**, University of Illinois at Chicago

Eighty percent of older adults have at least one chronic disease. These diseases contribute to 75% of US health care costs. In order to address this pressing issue, the Chronic Disease Self-Management Program (CDSMP) was developed. Despite its positive impact, participant attrition is a barrier to its success. The purpose of this study was to explore factors related to program attrition, with particular attention to the environmental influences that may be associated with CDSMP participant retention. Data was collected from 2604 participants who completed CDSMP workshops at 201 sites throughout Illinois. Using GIS and statistical analysis, workshop completers were compared to non-completers across variables related to individual, program, and environmental characteristics. 735 participants (28%) completed three or less of the six class sessions. Significant differences between completers and non-completers were seen in age ( $p=.008$ ), class size ( $p=.001$ ), number of chronic conditions ( $p=.002$ ), living arrangement ( $p<.001$ ), income ( $p=.039$ ), and distance traveled to class ( $p=0.16$ ) – greater commutes to CDSMP site were significantly associated with greater likelihood of program completion. Sex, race, rurality, and neighborhood walkability were not significant predictors of completion. These results indicate that person or workshop factors may be more significant to completion than external factors, and participants who sign up for the class are motivated enough to move beyond physical barriers that typically impact access. These findings may be relevant to clinicians when targeting patients for self-management interventions. Further, understanding reasons for attrition can lead to better program design, recruitment strategy, increased participation and retention rates, and increased cost-effectiveness.

#### **LB5. Gambling Behavior and Problems among Community-dwelling Chinese Older Adults—A Cross-Sectional Study**

**E-Shien Chang**, Rush Institute for Healthy Aging; **Melissa Simon**, Feinberg School of Medicine, Northwestern University; **Esther Wong**, Chinese American Service League; **XinQi Dong**, Rush Institute of Healthy Aging

Background: With a rapidly increasing number of older adults participating in gambling, research remains limited regarding the prevalence, risk and protective factors of excessive gambling behavior. Less is known about Chinese older adults' gambling behavior in US. Methods: This is a cross-sectional study with community-dwelling Chinese older adults over the age of 60. A total of 2,199 participants were enrolled in the study through multi-method recruitment. We administered Problem Gambling Severity Index to identify gamblers. We also investigated senior's self-reported gambling frequency and behavior. Results: Among surveyed participants, the mean age was 73.7 yrs old. Sixty-two percent were women. Betting on mah-jong is the most popular gambling activity following by gambling in casino and purchasing state lottery. A total of 16.6% participants played mah-jong at least once per two year, in which 10% played at least once a week. Including all types of gambling, 15.2% have gambled at least

once last year. Among them, 8.6% reported they have been told by others that they had a gambling problem, 6.8% have tried to go back another day to try to win back the money they lost, 4.8 % felt they might have a problem with gambling. Conclusion: Gambling behaviors are common part of Chinese older adult's lives. Future research is needed to explore risk/protective factors as well consequences association with gambling behaviors and gambling disorders.

#### **LB6. Inpatient Rehabilitation Outcomes in Medicare Hip Fracture Patients**

**Michael Cary**, Duke University; **Elizabeth Merwin**, Duke University; **Norman Oliver**, University of Virginia; Center on Health Disparities, **Marianne Baernholdt**, University of Virginia School of Nursing; **Ishan Williams**, University of Virginia School of Nursing

Hip fractures among older adults are associated with significant loss of function, disability and mortality. Little is known about rehabilitation outcomes for older adults with hip fractures, particularly among vulnerable groups including racial and ethnic minorities.

Patients (N=34,984) admitted to Medicare certified Inpatient Rehabilitation Facilities (IRFs N=1112) in 2009 were examined. Hierarchical multiple regression analyses were performed to assess the relationship of motor functioning and functional status at discharge to predisposing, enabling, need and use variables using Andersen's health service use model. A logistic regression was performed to assess the contribution of predisposing, enabling, need, and use variables associated with being discharged home.

The majority (88%) of older adults was non-Hispanic White individuals, and 71% were female. The average age was 81.4 (7.4 SD) years. This study found that individuals who were younger, female, living alone prior to admission, those with higher functional status at admission, fewer comorbidities, and longer lengths of stay had both higher motor functioning and functional status at discharge. Individuals from a minority group had lower motor functioning and functional status at discharge. Individuals who were younger, Black, Asian or Hispanic, female, lived with someone prior to admission, had less need for care, and longer lengths of stay were more likely to be discharged home.

This study highlights several disparities to consider when examining rehabilitation outcomes. As the number of older adults from racial or ethnic minority backgrounds increase, a greater understanding of the sources of these differences may reduce disparities among hip fracture patients.

#### **LB7. Measurement Invariance of the COPE Inventory Across Racially and Ethnically Diverse Older Adults**

**Nicholas Pisca**, University of Southern California; **Bob Knight**, University of Southern California

Although the Coping Orientations to Problems Experienced Inventory (COPE) has been frequently used to assess a broad range of coping responses, its measurement and invariance properties are not well documented in older adults from diverse racial and ethnic backgrounds. We examined these issues using a multi-group confirmatory factor analysis (CFA) framework across groups from an ethnically diverse sample of 446 older adults (range 60-95 years) from the Well Elderly Study.

The active and avoidant coping styles usually identified in younger adults and in caregiving studies, were not a good fit to this data. Our analyses revealed 3 factors that supported previous findings on positive religious coping style in an elderly and predominately White sample (Pargament, Koenig, Tarakeshwar, & Hahn, 2004). Factors included positive religious coping (“I put my trust in God”), positive interpretation and appraisal, (“I tried to see it in a different light, to make it seem more positive”), and acceptance, (“I accepted that this had happened and that it couldn’t be changed”). We then examined the measurement invariance of these factors across Whites (n = 185), Blacks (n = 158), and Latinos (n = 103). Multi-group CFA revealed configural and metric measurement invariance (equivalency) across Whites, Blacks, and Latinos. Results suggest that positive religious coping style characterizes coping styles in this urban sample of community dwelling older adults regardless of race or ethnicity. This highlights the need for further research on religious forms of coping among older adults, as this may be an overlooked method of coping with stress in this population.

#### **LB8. Opioid Use During the Last Year of Life Among Older Adults with Advanced Illnesses**

**Susan Lowey**, University of Rochester; **Joyce Smith**, University of Rochester; **Ying Xue**, University of Rochester; **Bethel Powers**, University of Rochester

Opioids have been found to decrease dyspnea intensity among persons with life-limiting illnesses yet remain infrequently used in older adults with non-cancer illnesses, such as heart failure and chronic obstructive pulmonary disease. Previous research with patients enrolled in hospice care has found better symptom management for dyspnea, which often includes the use of opioids.

In a retrospective cohort study, we examined differences in opioid use among 213,042 Medicare beneficiaries with heart failure, COPD, or lung cancer who died between January 1, 2009 and December 31, 2009 using data obtained from the Chronic Condition Warehouse (CCW). Data was analyzed using SAS 9.2. Descriptive analyses were conducted in addition to Chi square tests for categorical variables that examined opioid and hospice use among the diagnosis groups.

The majority of beneficiaries had heart failure alone (32%) or heart failure and COPD (24%) Thirty-eight percent of beneficiaries had at least one opioid prescription. Patients with lung cancer alone or with another diagnosis were more likely to enroll in hospice care and more likely to use opioids. Patients with lung cancer and COPD, with or without coexisting CHF, were more likely to be given opioids than patients with other diagnoses.

Opioid use was more prevalent among beneficiaries enrolled in hospice, which occurs more in patients with a lung cancer diagnosis. Future research should be aimed at exploring more specific opioids, such as morphine, and respected dosages for management of terminal dyspnea in patients with heart failure and COPD and their relationship to healthcare utilization.

#### **LB9. Positive Self-Perceptions of Aging: Are They Always Beneficial for Older Adults?**

**Julia K. Wolff**, German Centre of Gerontology; **Lisa M. Warner**, Free University of Berlin; **Susanne Wurm**, German Centre of Gerontology

Positive self-perceptions of aging (PSPA) are known to be related to favorable health and well-being outcomes as well as longevity. However, for older adults PSPA might be stretched to their limits when they are too optimistic, especially if one considers less stable well-being characteristics such as affect. For example, underestimating the risks of age-related physical losses may have adverse instead of beneficial effects on negative affect (NA) in face of a serious health event (SHE). Older individuals may overestimate their physical abilities and may be disappointed because they are not reaching their goals. Therefore, we investigated longitudinally if the relationship between PSPA (i.e., the view that aging is associated with only little physical losses) and NA is moderated by the occurrence of a SHE in older adults. 309 persons over 65 participated in two measurement occasions over time and reported their SPA, NA and the occurrence of SHE. Individuals who had more PSPA and a SHE reported more NA six months later ( $b = .46, p = .009$ ). The finding suggests that persons with PSPA might be more likely to set goals that they are not able to reach, resulting in NA. Also, the result could be explainable with an increase in coping effort after a SHE that may be more exhausting (and thereby eliciting NA) in older persons with PSPA. Future research should follow up this idea and investigate if this negative effect of PSPA is only present over a short time-period or if this persists on the long-term.

#### **LB10. Prevalence and correlates of Restless Legs Syndrome (RLS) in an Appalachian Primary Care Population**

**Kim Innes**, West Virginia University; **Terry Selfe**, West Virginia University; **Kathryn Flack**, West Virginia University; **Parul Agarwal**, West Virginia University

**BACKGROUND:** RLS is a distressing sensorimotor disorder, common in older adults. We investigated RLS prevalence, and its association to demographic factors, sleep, and mood disorders, in an Appalachian primary care population.

**METHODS:** Participants of this anonymous sleep survey study were community-dwelling adults ( $\geq 18$  years) visiting one of 4 West Virginia primary care clinics. Data gathered included detailed information on sleep patterns, RLS, demographic characteristics, and health/medical history. Sixty-eight percent of eligible adults completed surveys ( $N=1424/2087$ ). Pregnant women ( $N=65$ ) and those with missing data on key variables ( $N=142$ ) were excluded from the analyses.

**RESULTS:** Of the 1217 participants included in the final analytic sample, 20.6% met the 4 IRLSSG diagnostic criteria and/or reported a physician diagnosis of RLS, with 15% reporting RLS symptoms  $\geq$ once/week and 10.3% indicating  $\geq 3$  times/week. After adjustment for demographic and other factors, prevalence of RLS increased with age ( $p$  for trend=0.03) and those with RLS remained significantly more likely to report: a history of depression (adjusted odds ratio (OR)=1.8 (95% confidence interval=1.3, 2.5) and anxiety (OR=1.7 (1.2, 2.3)), sleep impairment both 4 (OR=2.4 (1.6, 3.7)) and 7 days/week (OR=1.8 (1.4, 2.5)), and a mean sleep duration of  $\leq 5$  hours/night (OR=1.7 (1.3, 2.3)). These associations increased in both strength and magnitude with increasing symptom frequency ( $p$ 's for trend  $\leq 0.004$ ).

**CONCLUSIONS:** Findings of this preliminary survey study suggest that RLS prevalence is high in this Appalachian primary care population and that RLS is associated with age and significant burden in terms of mood and sleep impairment.

## **LB11. Relationship Between Cognitive Function and Positive Health Behaviors in a Sample of Aging Community-Dwelling Veterans**

**Christina Vair**, VISN 2 Center for Integrated Healthcare, Department of Veterans Affairs; **Laura Wray**, VISN 2 Center for Integrated Healthcare, Department of Veterans Affairs

Literature supporting the benefits of regular participation in moderate physical activity and mental and socially stimulating leisure activities has led to encouraging recommendations for older adults in slowing or delaying cognitive decline. The present study examined the relationship between performance on a brief cognitive screen (Blessed Orientation-Memory-Concentration test; BOMC) and recommended levels of engagement in such activities in a sample of community-dwelling older veterans. Veterans 70+ with an upcoming primary care (PC) appointment were identified and screened by telephone for heart and brain health, with those ( $N = 428$ ; age  $M = 82.39$ ,  $SD = 4.92$ ) who scored below the cut-off for probable cognitive impairment (range = 0 to 10,  $M = 3.92$ ,  $SD = 3.37$ ) assessed on positive health behaviors. Less than 23% of the sample met the weekly recommended level of physical activity, while most reported engaging in daily mentally stimulating activity (88%) and social activity (72%) several times per week. Scores on the BOMC were not significantly related to either physical or social activity level independently; there was a significant difference in scores between those engaging in daily mentally stimulating activities ( $M = 3.73$ ,  $SD = 3.28$ ) and those not engaging in daily practice ( $M = 5.40$ ,  $SD = 3.60$ ;  $t(421) = 3.35$ ,  $p = .001$ ). BOMC scores were also significantly correlated with the total overall number of health behavior recommendations met ( $r = .16$ ,  $p < .01$ ). Findings suggest participation in frequent mentally stimulating activities together with regular physical and social engagement supports cognitive function.

## **LB12. Social Status, Leisure Activity, and Health at Midlife and Older Age**

**Po-Ju Chang**, The Department of Recreation, Park and Tourism Management, The Pennsylvania State University; **Linda Wray**, Department of Biobehavioral Health, The Pennsylvania State University

Although links between social status and health outcomes are well-established, few studies have examined the contribution of leisure activities in that link. The objective of this study is to examine how different types of leisure activities influence health in midlife and older age and the role that social status plays. Using the 2006, 2008, and 2010 waves of nationally representative Health and Retirement Study data and path analyses, we examine how four types of leisure activities (mental, social, physical, and productive) are associated with mental health (CESD depressive symptoms) in midlife and older adults, and if the relationships differ by ascribed (age, gender) and achieved (education, marital status), controlling on baseline CESD. Results indicated that all types of leisure activities significantly predicted CESD and that ascribed and achieved social status variables played differing roles. For example, for older adults and women, being involved in mental and physical activities predicted better mental health; and for those who were married/partnered or had more than high school education, being involved in mental and social activities predicted better mental health.

Based on the findings, researchers can design targeted leisure activity interventions for middle-aged and older adults to improve their mental health. The study should be considered late breaking since the

leisure activity data are relatively new in the HRS, so these analyses were previously not possible. In addition, the contribution of leisure for health in middle-aged older adults is getting increasing attention, and this study adds to the literature on that topic.

### **LB13. Statin Use and Clinical Outcomes in Older Men: a Prospective Population-based Study**

**Danijela Gnjdic**, University of Sydney, Centre for Education and Research on Ageing and Royal North Shore Hospital; **David Le Couteur**, Centre for Education and Research on Ageing, University of Sydney, Concord Hospital, Anzac Research Institute; **Fiona Blyth**, Centre for Education and Research on Ageing and University of Sydney; **Tom Trivison**, Boston University; **Kris Rogers**, The Sax Institute; **Vasi Naganathan**, Centre for Education and Research on Ageing, University of Sydney and Concord Hospital; **Robert Cumming**, Centre for Education and Research on Ageing, University of Sydney; **Sarah Hilmer**, Royal North Shore Hospital, University of Sydney and Kolling Institute of Medical Research

**Background:** We aimed to investigate the relationship of statins (HMG-CoA reductase inhibitors) with institutionalization and death in older men living in the community, accounting for frailty.

**Methods:** Men aged 70 years and over (n=1665) enrolled in the Concord Health and Ageing in Men Project, Sydney, Australia were studied. Data were obtained from baseline (2005- 2007) and follow-up (maximum 6.79 years) assessments. Information regarding statin use was captured at baseline. Cox proportional hazards regression analyses were conducted to estimate the risk of institutionalization and death according to statin use (exposure, duration and dose) and frailty status, with adjustment for socio-demographics, medical diagnoses, and other clinically relevant factors. A secondary analysis used propensity score matching to replicate covariate adjustment in regression models.

**Results:** At baseline, 43% of participants reported taking statins. In the adjusted models, current statin use was not statistically associated with increased risk of institutionalization (hazard ratios [HR] =1.60; 95% confidence intervals [CI]: 0.98-2.63) or death (HR=0.88; 95%CI: 0.66-1.18). There was no significant association of duration of use or dose of statins with either outcome. Propensity scoring yielded similar findings. Compared to non-frail participants not prescribed statins, the adjusted HR for institutionalization for non-frail participants prescribed statins was 1.43 (95%CI: 0.81-2.51), for frail participants not prescribed statins was 2.07 (95%CI: 1.11-3.86) and for frail participants prescribed statins was 4.34 (95%CI: 2.02-9.33).

**Conclusions:** These data imply no independent association between statin use and institutionalization or death in community-dwelling older men.

### **LB14. The Effects of Transcranial Magnetic Stimulation on Mobility in an Older Adult with Cerebellar Ataxia: A Case-Study**

**Brad Manor**, Harvard Medical School; **Faranak Farzan**, Harvard Medical School; **Yunfen Wu**, Beth Israel Deaconess Medical Center; **Elana Anastasio**, Beth Israel Deaconess Medical Center; **Vera Novak**, Harvard Medical School; **Alvaro Pascual-Leone**, Harvard Medical School

Spinocerebellar ataxia (SCA) is an age-related degenerative disease characterized by marked muscle coordination and movement disturbances. While there is no definitive treatment or cure, transcranial magnetic stimulation (TMS) can target the dysfunctional brain circuit known to be affected by SCA and therefore, may modulate its function and lead to mobility gains in these patients. The purpose of this case study was to determine the effects of a three-week cerebellar TMS intervention on gait and posture in a 72-year-old female patient with diagnosed Type 3 Sporadic SCA. Repetitive TMS was delivered daily to multiple cerebellar regions at 100% of maximum stimulator output with a 14cm circular coil. Baseline and follow-up assessments included 1) the timed up-and-go test, 2) 4m walk speed, 3) postural control as assessed by center-of-pressure fluctuations while standing on a force plate, and 4) gait kinematics and lower-extremity muscle co-activation during a 90sec walk. The TMS protocol was well-tolerated. Following the intervention, the patient completed the up-and-go test 9% faster and increased 4m walk speed by 45%. Postural control and gait also improved. During standing, average speed and area of center-of-pressure fluctuations decreased by 21% and 31%. The patient covered 15% more distance in the 90sec walk, while producing more rhythmic muscle co-contraction patterns and reducing both stride duration variability and time spent in double support. The results of this study provide first-of-its-kind evidence that chronic modulation of neuronal activity in the cerebellum can result in enhancement of the functional impairments associated with SCA in older adults.

#### **LB15. The Trajectory of Depressive Symptoms Across the Adult Lifespan**

**Angelina Sutin**, Florida State University College of Medicine; **Antonio Terracciano**, Florida State University College of Medicine; **Yuri Milaneschi**, VU University, **Yang An**, National Institute on Aging; **Luigi Ferrucci**, National Institute on Aging; **Alan Zonderman**, National Institute on Aging

Longitudinal studies are needed to delineate the trajectory of depressive symptoms across adulthood and to individuate factors that may contribute to increases in depressive symptoms in older adulthood. The present research uses a long-run longitudinal study to estimate the trajectory of depressive symptoms across adulthood, test demographic moderators of this trajectory, and test whether disease burden, functional limitations, and proximity to death explain the increase in depressive symptoms in old age. Participants were drawn from the Baltimore Longitudinal Study of Aging (N=2,320; 47% female; mean age at baseline=58.10 years, SD=17.05; range 19-95 years). We modeled the trajectory of depressive symptoms from 10,982 assessments (M assessments per participant=4.73, SD=3.63, range=1-21) of the Center for Epidemiological Studies Depression scale and three subscales (depressed affect, somatic complaints, and interpersonal problems). Both the linear ( $\gamma_{10}=.52$ ,  $p<.01$ ) and quadratic ( $\gamma_{20}=.43$ ,  $p<.01$ ) terms were significant, which indicated that depressive symptoms were highest in young adulthood, decreased across middle adulthood, and increased again in older adulthood. The subscales followed a similar pattern. Women reported more depressed affect at younger ages, but an interaction with age suggested that this gap disappeared in old age. Accounting for comorbidity, functional limitations, and impending death slightly reduced, but did not eliminate, the uptick in depressive symptoms in old age. These findings suggest that symptoms of depression follow a U-shaped pattern across adulthood and that the increase in distress in later life is not due solely to declines in physical health or approaching death.

## ***Research, Education, and Practice Committee***

### **LB16. “Mental Illness in Older Adults: Factors that Impact Treatment Trajectories”**

**Samuel Asante**, University of Utah College of Social Work; **Marilyn Luptak**, University of Utah College of Social Work; **Frances Wilby**, University of Utah College of Social Work; **Cherie Brunner**, University of Utah School of Medicine; **Michael Lowry**, University of Utah College of Medicine

Prevalence of mental health problems of older adults is often overlooked in this country. Difficulty in accessing care in the community, disparities in access and utilization of services, and individual and systemic barriers to care exist for this population. This community based participatory research study utilized record reviews, standardized instruments, focus groups and semi-structured interviews to examine the trajectory of 36 older adults discharged from inpatient psychiatric care.

Quantitative measures included the Mini Mental Status Exam, The World Health Organization Quality of Life Survey, and The Medical Outcomes Study Short Form General Health Survey. Qualitative measures included semi-structured interviews with the older adults two month post-discharge and focus groups with providers which were audio taped, transcribed, and entered into the QSR NVivo 9 software program for coding and thematic analysis. Quantitative data was used to further validate the themes and categories developed from the qualitative data. Demographic data included gender, marital status, method of payment, primary diagnosis, co-morbid diagnoses, medications, functional status, employment status, religion, readmission rates, and race.

Qualitative analysis of patient interviews and provider focus group interviews suggest that quality of social support impacts both in-patient treatment outcomes and discharge outcomes. Positive social support is related to quality of insurance coverage and ability of patients to follow-through on discharge referrals. Other results point to problems with assessment and diagnosis related to inadequate physician preparation, stigma associated with mental health diagnoses, and attitudes and beliefs of older adults towards mental illness.

### **LB17. A Hospice Education Program for Students and their Parents.**

**Joseph Budny**, Youngstown State University; **Daniel Van Dussen**, Youngstown State University; **Kathryn Moran**, Youngstown State University

The underutilization of hospice services as an option for end-of-life care within the United States is staggering. One reason for the poor usage of these services is due to the negative stigma that is attached to it. The lack of knowledge by medical doctors to make referrals and within the general public about hospice and the services they offer also contributes to this as well. The main objective of this research project is to find a new and innovative way to educate the general public about hospice care and the services they offer. This intervention used local high school students (n=205) from three northeastern Ohio counties. During the intervention a lesson on hospice care was taught to students within their high school health classes to increase their knowledge of hospice. The second objective was to determine if their parents (n=199) learned more about hospice services through their children using a

social learning approach. The current research was completed over a four-week period and data were collected using paper and pencil pretests, posttests and surveys that the students and their parents took during the project. Data obtained from the project indicated a significant increase of 3.455 points ( $\alpha \leq .000$ ) in the posttest for the students and a 1.473 points ( $\alpha \leq .000$ ) increase in the parental posttest scores (possible range 0-15). The statistically significant increase in test scores indicated a successful intervention aimed at increasing the general knowledge about hospice within both students and their parents.

#### **LB18. Access to Telecommunication Technologies Among Rural Elders**

**Gohar Azhar**, Reynolds Dept of Geriatrics And Institute on Aging University of Arkansas for Medical Sciences; **Hongtu Chen**, Harvard Medical School; **Lucy Lu**, Environment and Health Group; **Sue Levkoff**, College of Social Work University of South Carolina

**Introduction:** Despite the increasingly available information about penetration of telecommunication technologies, little is known about technology access in rural areas. This survey assessed access and usage of major communication technologies among rural elders who visited primary care clinics.

**Methods:** A clinical sample of elderly primary care patients (N = 142, aged 60+) were surveyed at the University of Arkansas Medical School. The survey questionnaire includes a total of 15 forced-choice questions and takes 5-10 minutes to complete. Main questions about technology access are adapted from several existing surveys such as the Internet Use and American Life Project (Pew Research Center, 2010) and the E-Health and the Elderly survey (Kaiser Family Foundation, 2005). The questionnaire has been designed and revised with the input of health service researchers, senior computer class instructors, and geriatric clinicians, to ensure the instrument's face validity, clarity, and ease of use.

**Results:** About 82% elders have a landline phone, 80~88% have a cellphone, and 64-75% of elderly people have a computer at home. Among those who do not have a computer at home, though majority (75%) used to use a computer, less than 10% of them plan on getting one.

Age is reversely correlated with use of telecommunication tools, but still over 81% of elders visit websites and read about health issues on the internet, and 50-95% of rural elders use email. More than half of them check emails everyday. **Conclusion:** Email and cell phone are highly accessible means for communication with rural elders.

#### **LB19. Community Education in Geriatric Palliative Care- Train the trainer program**

**Masil George**, University of Arkansas for Medical Sciences; **Kimberly Curseen**, University of Arkansas for Medical Sciences

**Background:** Geriatric palliative care is specialized medical care for older adults with serious illnesses focusing mainly on providing them with relief from stress and painful symptoms associated with serious illness. Studies have shown that there is a low use of palliative care services and advance care planning in African American and Latino American communities; consequently, resulting in a greater use of aggressive measures at the end of life. One reason may be the lack of knowledge about these services.

**Methods:** Community Education in Geriatric Palliative Care- Train the trainer program is a novel approach as it offers information about palliative care and the importance of advance care planning among community dwelling older adults. The program is offered by partnering with community organizations; recruiting volunteer community dwelling older adults, particularly those among the minority community who can educate their peers, so older adults and their families have the information to help understand the benefits of palliative care, advanced care measures, and hospice services.

**Results:** The program was conducted successfully among community dwelling trainers in May 2012. Thirteen trainees participated in the program. The course content was designed for the lay audience, so that the information was easily understood and shared with the peers by the trainees. The training was divided into two different sessions. The first session covered topics such as advanced directives and advanced care planning including Medicare beneficiaries and the hospice benefits. The second session covered topics such as advanced dementia and caregiver stress. A post-training evaluation showed that over 90% of participants were extremely satisfied with the course content. In the following year, we plan to assess the number of community dwelling older adults these trainees were able to reach out to and train, thereby, further disseminating the educational program.

**Conclusion:** Thirteen community dwelling trainees were certified as Geriatric Palliative Care Community Educators. We anticipate that the program will assist in reaching the community dwelling older adults and empower them with the knowledge regarding palliative care services and advanced care planning. Hence, we anticipate greater utilization of appropriate palliative care services in this segment of the population.

#### **LB20. Factors Associated with 30-Day Hospital Readmission Among Nursing Home Residents.**

**Gotaro Kojima**, The John A. Hartford Foundation Center of Excellence in Geriatrics, Department of Geriatric Medicine, John A. Burns School of Medicine, University of Hawaii; **James Davis**, Department of Complementary and Alternative Medicine and Office of Public Health Studies, John A. Burns School of Medicine, University of Hawaii; **Kamal Masaki**, The John A. Hartford Foundation Center of Excellence in Geriatrics, Department of Geriatric Medicine, John A. Burns School of Medicine, University of Hawaii; **Christina Bell**, The John A. Hartford Foundation Center of Excellence in Geriatrics, Department of Geriatric Medicine, John A. Burns School of Medicine, University of Hawaii

**Background:** Hospital readmissions within 30 days are increasingly targeted as a quality parameter. Frail nursing home patients are at high risk for hospitalization. The purpose of this study was to examine baseline prevalent chronic diseases associated with hospital readmission within 30 days.

**Methods:** We collected data on demographics and prevalent diseases for all patients admitted to one hospital-affiliated nursing home between January 2003 and December 2006, with follow-up data on pneumonia episodes and hospitalizations through June 2011. Multivariable logistic regression models

identified baseline prevalent chronic diseases associated with hospital readmission within 30 days of nursing home admission.

Results: Of 238 patients (mean age 83.4, range 45-103) admitted to the nursing home, 156 (65.5%) originally came from hospitals, 54.6% were female, 92.4% were Asian, 43.6% were on Medicaid, and 76.5% were first admitted for intermediate care and 23.5% for skilled nursing care. Although recent pneumonia was the factor most strongly associated with hospital readmission (OR=14.5,  $p<0.0001$ ), in the model without pneumonia, chronic diseases associated with 30-day hospital readmission included pulmonary disease (OR=2.2, 95%CI=1.1-4.3,  $p=0.019$ ) and congestive heart failure (OR=1.8, 95%CI=1.0-3.4,  $p=0.055$ ). There were no significant associations between hospital readmission and myocardial infarction, stroke, cancer, diabetes, and dementia.

Conclusions: Among nursing home patients, although recent pneumonia was the strongest risk factor for 30-day hospital readmission, those with baseline chronic pulmonary disease and congestive heart failure were at especially high risk for hospital readmission within 30 days of nursing home admission. These patients may benefit from care focused on preventing hospital readmissions.

#### **LB21. Historical and Political Factors Influencing the Development of Options Counseling**

**Sheryl Elliott**, Portland State University Institute on Aging; **Paula Carder, Ph. D.**, Portland State University, Institute on Aging; **Diana White**, Portland State University/Institute on Aging

Options counseling represents a new model of publicly funded long-term planning support available in the United States under the Older American's Act. It is intended to be a person-centered, decision-support process offered through Aging and Disability Resource Centers (ADRC) where consumers and family members can obtain information regarding long-term services and supports (AoA, 2011). Options counselors are trained to respond to the consumer's needs, preferences, values, and individual circumstances (AoA, 2011). This poster reports on the perspectives and experiences of experts (e.g., policymakers, advocates) about the development of options counseling within ADRCs. These are compared and contrasted with experiences and perspectives of Area Agency on Aging supervisors who are making adjustments to the concept to meet the needs of their communities. Fourteen qualitative interviews were conducted and analyzed using grounded theory methods. Analysis situates options counseling in a theoretical, political, and historical context of the relationship between individuals and society, (especially in regard to political and socio-cultural beliefs about individual and societal responsibility). Current research findings on policy successes and failures in person-centered care models are reviewed to determine the standards most likely to serve consumers effectively and efficiently. By examining the foundations upon which options counseling is built, this study seeks to inform research about the effectiveness of existing practice, increase understanding of best practices, and clarify whether this emerging service is accomplishing its original goals.

#### **LB22. International Exchange of a Training Program for End-of-Life Care for Older Adults: Development of the End-of-Life Nursing Education Consortium Japanese Geriatric Training Program (ELNEC-JG)**

**Hiroki Fukahori**, Tokyo Medical and Dental University; **Miyoko Kuwata**, Oume Keiyu Hospital; **Minori Tokui**, Himeji St. Mary's Hospital; **Sachiko Yoshioka**, Matsue City Hospital; **Midori Nishiyama**, Kobe

Kaisei Hospital; **Sanae Takanashi**, Nishi Kobe Medical Center; **Sachiko Matsumoto**, Mastudo Nissei Seirei Clinic; **Kaori Takamichi**, National Center for Geriatrics and Gerontology

Background: Japanese advanced practice registered nurse and nursing researchers developed the End-of-Life Nursing Education Consortium Japanese Geriatric Training Program (ELNEC-JG) in 2011. This program is based on the ELNEC-core training program developed in the US, which promotes enhanced end-of-life/palliative care. The first pilot training course was held in Shimane prefecture, Japan, in August 2012.

Objectives: To evaluate the explicitness/usefulness of and participant satisfaction with the newly developed program

Methods: Questionnaires were distributed to 60 nurses who had participated in the program. Questionnaire items covered the explicitness/usefulness of and overall satisfaction with the program, along with open-ended questions on the positives of the program. The items on explicitness/usefulness and positives were developed with respect to the 9 modules of the ELNEC-JG. Items were scored using 5-point Likert scales. Descriptive statistics were calculated for quantitative data, and content analyses were conducted for qualitative data. The study was approved by an institutional review board and funded by the Sasagawa Memorial Health Foundation.

Results: All participants returned the questionnaires. The modules with high usefulness were “Ensuring Quality EOL Care” and “Communication” (mean satisfaction scores: 4.7 and 4.6, respectively). The modules with high explicitness were “Cultural/Spiritual Considerations in EOL Care” and “Ensuring Quality EOL Care” (mean scores: 4.8 and 4.7, respectively). The overall satisfaction for the program was relatively high (mean score: 4.8), a finding supported by almost all qualitative data.

Conclusion: The ELNEC-JG can aid Japanese nurses in improving the quality of the EOL/palliative care they provide to Japanese older adults.

### **LB23. Late-Breaking Findings from the Canadian Coalition for Seniors' Mental Health Late-Life Suicide Prevention Knowledge Transition Study**

**Marnin Heisel**, The University of Western Ontario; **Jordan Bowman**, The University of Western Ontario; **Sharon Moore**, Athabasca University; **Kimberley Wilson**, The University of Guelph

Older adults have high suicide rates, necessitating enhanced provider education in working with at-risk individuals (Heisel & Duberstein, 2005). We conducted a knowledge translation (KT) study assessing knowledge transfer and attitudinal change among healthcare and social service providers attending half-day late-life suicide prevention training workshops incorporating a set of KT tools developed by the Canadian Coalition for Seniors' Mental Health (CCSMH).

**METHODS:** We developed and validated research scales assessing provider knowledge and attitudes towards working with at-risk older adults, incorporating expert input, a provider focus group, and online data collection with CCSMH members. We have been employing these scales to assess pre-post knowledge and attitudinal change of workshop participants regarding working with at-risk older adults.

**RESULTS:** Psychometric findings of our online study (N=284; 208 women, M=45.1 years, SD=11.3) supported the internal consistency ( $\alpha=.96$ ) of our attitudes scales, the validity of our respective knowledge and attitudes scales compared with existing knowledge (Expanded and Revised Facts on Suicide Quiz;  $r=.59$ ,  $p<.0001$ ) and attitudes measures (Understanding Suicidal Patients Questionnaire;  $r=-.81$ ,  $p<.0001$ ), and divergence from social desirability (Marlowe-Crowne scale;  $r=-.02$ ;  $r=.19$ ).

Preliminary findings from five training workshops demonstrated significant increases in participant knowledge ( $t(df=62)=11.89$ ,  $p<.01$ ) and attitudes, including enhanced perceived competence in working with at-risk older adults.

**CONCLUSIONS:** Findings indicate acceptable psychometric properties for our KT tools and promise for our training workshops. These findings, along with those of our final study workshops, will be presented and discussed in the context of public health imperatives for late-life suicide prevention.

#### **LB24. Life Satisfaction and its Determinants of Older Adults: Evidence from Beijing**

**Lan Liu**, Institute of Population Research, Peking University; **Gong Chen**, Institute of Population Research, Peking University; **Liangshu Qi**, Tsinghua University School of Economics and Management; **Iris Chi**, University of Southern California School of Social Work

**Background and Purpose:** In the process of population aging accompanied by rapid economic growth, urbanization and social transition, the well-being of older adults has become an important policy issue in China, particularly in more developed cities. In this study, we aim to (1) reveal the status of older adults' life satisfaction in Beijing; and (2) explore the determinants of life satisfaction of older adults living in Beijing.

**Method:** The data from "Sampling Survey on Aging Population in Urban and Rural China" conducted by China Research Center on Aging in 2010 was adopted in this study. Life satisfaction was measured with five ordered-categories. Then the descriptive analysis and the ordered-probit model have been used to reveal the status of older adults' life satisfaction and examine relationship between life satisfaction and the independent variables involving individual and family characteristics. In particular, the marginal effects of each category have been estimated. With these results, we might explore the determinants of older adults' life satisfaction.

**Results:** We found that older Beijing people's life satisfaction was significantly and positively affected by education, income, number of children, house property, social pension and medical insurance, whereas the Beijing elders were more likely to report worse life satisfaction if they were not physically independent or needed daily care.

**Conclusions and Implications:** Our findings suggested that individual economic characteristics, structure of family support and social security have played active roles, whereas individual health status has negative roles in determining the life satisfaction of older adults in Beijing.

## **LB25. Online Dating in Later Life: Relational Goals and Expectations**

**Josephine Menkin**, University of California- Los Angeles; **Theodore Robles**, University of California- Los Angeles; **Gian Gonzaga**, eHarmony

Few studies address the growing phenomenon of dating in later life. Online dating sites offer an exciting data collection avenue to explore new relationship formation in mid- and later life. In fact, adults over 50 currently represent the largest demographic using online dating sites. Utilizing data from an eHarmony.com relationship questionnaire completed by all new users, the present research determines whether older and younger users look for different qualities in a new romantic relationship. Additional data collected from undergraduates on their expectations about younger versus older adults' goals were used to investigate age stereotypes. Older users valued characteristics associated with passionate, sexual love less than younger users. While younger female users valued companionate, friendship-based love more than male users, older male and female ratings converged to the mean. Overall, older users valued companionate love compared to passionate love relatively more than younger users. These age differences were small, but robust. Undergraduates' expectations reflect kernels of truth but exaggerate them. For example, they expected much larger declines in passionate love in later life than exist. Strikingly, older users were much less interested in marriage, but undergraduates expected them to be especially marriage-minded. Young people in a position to facilitate new romantic relationships among older adults, such as formal or informal matchmakers, should take into account this shift in relational goals and may need to correct biased assumptions. Future research will examine whether people internalize the asexual age stereotype and whether older adults shift their interests in line with cultural expectations.

## **LB26. Psychometric Properties of the Liebowitz Social Anxiety Scale (LSAS) among Community-Dwelling Older Adults**

**Katie Hackney**, West Virginia University; **Lindsay Gerolimos**, West Virginia University; **Caroline Ciliberti**, West Virginia University; **Barry Edelstein**, West Virginia University

Social anxiety disorder (i.e., social phobia) is one of the most common psychological disorders among older adults, and is characterized by fear and avoidance of social situations. The present study examined the usefulness of the Liebowitz Social Anxiety Scale (LSAS) to assess social anxiety in a sample of community-dwelling older adults. Although no studies have researched the psychometric properties of this measure with older adults, the LSAS may be a valuable tool for use with this population. One-hundred-two community-dwelling older adults (69% female, 87% Caucasian) completed several paper-and-pencil surveys, including the LSAS. Mean age of participants was 72.54 years (SD=8.09, range 60 to 94 years). The mean LSAS total score was 33.85 (SD=24.83). Mean scores for the Fear subscale and Avoidance subscale were 17.69 (SD=12.79) and 16.16 (SD=12.72), respectively. Cronbach's alpha coefficients, as measures of internal consistency for the LSAS total score ( $\alpha = .97$ ), Fear subscale ( $\alpha = .94$ ), and Avoidance subscale ( $\alpha = .93$ ), were excellent. LSAS total scores were strongly correlated with scores on two measures of social anxiety ( $r_s = .74$  and  $.77$ ), providing evidence for construct validity. LSAS total scores were moderately correlated with general anxiety ( $r = .43$ ), depression, ( $r = .55$ ), and

overall mental health ( $r = .43$ ), providing evidence for discriminant validity. LSAS total scores were weakly correlated with physical health ( $r = -.20$ ) and age ( $r = .17$ ), providing additional evidence for discriminant validity. These results suggest that the LSAS may be a useful tool for assessing social anxiety among older adults.

#### **LB27. Retirement Needs of the Baby Boomers: Perspectives of Boomers and Providers**

**Jeff Spears**, University of Utah; **Marilyn Luptak**, University of Utah; **Frances Wilby**, University of Utah

The United States is facing a demographic revolution with 8,000-10,000 baby boomers turning 65 every day. Thus it is imperative to plan carefully for the needs of new retirees so limited budgets can be spent most effectively. Although, it is likely that this population will be relying on government services to meet some of their needs, less than one-half of America's cities have begun to address these needs (Scharlach, 2009).

This qualitative study utilized focus groups to examine the anticipated retirement needs of baby boomers and their families in a metropolitan area in a western state. Focus groups included: English-speaking consumers, Spanish-speaking consumers, members of a coalition of for-profit, nonprofit, public and private agencies that serve older adults, caregivers, key personnel from local Housing and Transportation agencies, Senior Center Advisory Board Members, and staff of the local Area Agency on Aging .

Questions addressed working habits and volunteerism during retirement, where respondents would look for services, the types of services needed, impressions of existing aging services in the community, the impact of the Internet on services, and the challenges of providers in meeting those needs.

Findings reinforce the need to reconceptualize aging policy and services as boomers enter retirement. Focus group participants raised concerns related to medical coverage, financial planning, and end-of-life issues. Boomers and providers both raised concerns with transportation, visitability within senior housing, and the burden of meeting the needs of the "tsunami" of boomers entering retirement.

#### **LB28. Teams and Quality of Care in Nursing Homes**

**Anders Kvale Havig**, Norwegian Social Research; **Anders Skogstad**, Faculty of Psychology, University of Bergen; **Marijke Veenstra**, Norwegian Social Research; **Tor Inge Romomren**, Centre for Care Research, Gjøvik University College

Background: Use of teams has shown to be an important factor for organizational performance. Despite this support for teams, however, we have not been able to find any European studies that have investigated the relationship between team presence and quality of care in nursing homes.

Methods: Five sources of data were utilised to test our research question: self-report questionnaires to 444 employees, interviews with and questionnaires to 40 ward managers, telephone interviews with 378 relatives and 900 hours of field observations in 40 nursing home wards. Team presence was

assessed by field observations and by interviews with ward managers, and quality of care was assessed by relatives, staff and field observations. Multilevel analysis was used to assess the relationships.

Results: The analyses showed that team presence was significantly positively related to quality of care when controlled for ward size, days of sick leave and care level. Explained variance was 34%, 25% and 44% in the models with quality of care assessed by relatives, staff and field observations, respectively.

Conclusion: The results suggest that team presence is important for quality of care in nursing homes, and we propose that nursing homes should strive for building teams within their wards. However, the study shows that there is a substantial difference between real teams and quasi teams, the latter having a significantly lower effect on quality of care. Hence, nursing home managers and directors should be emphasizing to lay the groundwork for, direct and support the development of real teams.

### **LB29. Yoga Offers Similar Functional Benefits As Stretching-Strengthening Exercises: A Pilot RCT**

**Neha Gothe**, University of Illinois at Urbana Champaign; **Edward McAuley**, University of Illinois at Urbana Champaign

Despite yoga's popularity, few clinical trials have employed rigorous methodology to systematically explore and compare its functional benefits with more established forms of exercise. The objective of this study was to compare the functional benefits of yoga with stretching-strengthening exercises for adults as recommended by the CDC. Sedentary healthy adults ( $n=27$ ;  $Mage=61.81$ ) participated in an 8 week (3x/week for 1 hour) pilot-RCT which consisted of a Hatha yoga group ( $n=13$ ) and a stretching-strengthening exercise group ( $n=14$ ). Functional fitness tests assessing balance, strength, flexibility and mobility were administered at baseline and post-intervention. A repeated measures MANOVA showed a significant time effect for balance [ $F(3,18)=4.88$ ,  $p<.01$ , partial  $\eta^2 =.45$ ], strength [ $F(2,19)=15.37$ ,  $p<.001$ , partial  $\eta^2 =.62$ ], flexibility [ $F(4,17)=8.86$ ,  $p<.001$ , partial  $\eta^2 =.68$ ] and mobility [ $F(2,19)=8.54$ ,  $p<.002$ , partial  $\eta^2 =.47$ ]. Both groups showed significant improvements on measures of balance (left-right leg, four square step test); strength (chair stands, arm-curls); flexibility (back-scratch, sit and reach) and mobility (gait speed, 8-feet up and go) with partial  $\eta^2$  ranging from .12 to .54. These data suggest that regular yoga practice is just as effective as stretching-strengthening exercises in improving functional fitness. To our knowledge this is the first study to examine functional benefits of yoga in a sedentary but healthy community dwelling adults. These findings could have clinical implications as yoga is a more amenable form of exercise than strengthening exercises. It requires minimal equipment, can be adapted for individuals with lower levels of functioning and disabilities and is being increasingly integrated in rehabilitation programs for clinical populations.

**GSA SIXTY-FIFTH ANNUAL SCIENTIFIC MEETING** NOVEMBER 14-18, 2012  
SAN DIEGO, CALIFORNIA

**2012 Late Breaker Poster Sessions:  
Aging, the Central Nervous System,  
and Mobility in Older Adults**

**Wednesday, November 14, 2012  
6:00-8:00 p.m.**

#### 204. **Cognitive Status and Mobility in Low and Middle-Income Countries: Evidence from the Study on Ageing and Adult Health (SAGE)**

**Benjamin Capistrant**, Carolina Population Center, University of North Carolina; **M. Maria Glymour**, Department of Society, Human Development, and Health, Harvard School of Public Health

Background Associations between cognitive and physical function have been studied almost exclusively in high income countries. It is not known if similar relations also prevail in low and middle-income countries (LMICs).

Methods Cross-sectional data from Study of Ageing and Adult Health (SAGE) respondents aged 50+ were used to assess the relation of an immediate 10-word list recall (WR) and verbal fluency (VF) measure with mobility (walking speed, normal paced 4-meter walk) in China, India, Russia, South Africa, Ghana, and Mexico (total n=32,281). Cognitive measures were standardized with the country mean. Walking speed was regressed on cognitive function in linear models, adjusted for height, demographics, socioeconomic status, and CVD risk factors. Cross-country differences were estimated with an f-test (chi-square, 5 df).

Results Better WR was positively associated with gait speed, independent of covariates. The magnitude of association differed between countries (f-test,  $p < 0.05$ ), ranging from  $b = 0.02\text{m/s}$  in Mexico and Ghana ( $p > 0.05$ ) to  $b = 0.18\text{m/s}$  in South Africa ( $p < 0.001$ ) associated with a 1-SD difference in WR. These differences in magnitude across countries were statistically significant. There were similar patterns in magnitude and significance for VF, including cross-country differences ( $p < 0.001$ ). The model fit (adjusted r-squared) was similar for both cognitive measures.

Conclusions The size of the cognition-mobility association varied significantly across six LMICs and the estimated magnitude of associations in India, China, Russia and South Africa were much larger than those typical in U.S. populations. Cross-national comparisons of cognition-mobility associations are needed to assess the universality of patterns observed in high income settings.

#### 205. **The Association Between Aggregate Cardiovascular Risk And Regional Brain Volume Changes In Older Adults**

**Yi-Fang Chuang**, Department of Mental Health, Johns Hopkins Bloomberg School of Public Health; **Vijay Varma**, Department of Mental Health, Johns Hopkins Bloomberg School of Public Health; **Greg Harris**, The Johns Hopkins Center on Aging and Health; **Marylin Albert**, Department of Neurology, Johns Hopkins University School of Medicine; **Linda P. Fried**, Mailman School of Public Health, Columbia University; **George Rebok**, Department of Mental Health, Johns Hopkins Bloomberg School of Public Health; **Qian-Li Xue**, The Johns Hopkins Center on Aging and Health; **Michelle C. Carlson**, The Johns Hopkins Center on Aging and Health

Background: Individual cardiovascular (CV) risk factor such as hypertension, diabetes, hyperlipidemia and obesity has been associated with cognitive decline and dementia in older adults. However, cardiovascular risk factors rarely exist alone in older adults and probably exert additive or synergistic effect on the development of cognitive impairment, dementia and brain changes.

**Methods:** Seventy-five older adults from the Brain Health Study (BHS), a nested study in Baltimore Experience Corps® Trial, underwent T1-weighted MRI images at baseline and 1-year follow-up. Cortical and subcortical regional brain volumes were obtained using Freesurfer (v5.1). Aggregate cardiovascular risk was measured by the Framingham General Cardiovascular Risk Profile (FGCRP). The relationship between aggregate CV risk and regional brain volumes and 1-year atrophy rate were examined. The correlations between individual components of the FGCRP (age, cholesterol, blood pressure, smoking status, and type 2 diabetes) and regional brain volume changes were also examined.

**Results:** Participants were mostly African American (92%) and the majority of them were female (70.7%). The mean FGCRP was  $20 \pm 12.2$ . Individual components of the FGCRP were not associated with changes of any brain volume measures. Higher overall FGCRP was associated with decreased volumes of lateral temporal lobe, medial temporal lobe and central region (precentral, postcentral and paracentral cortex) cross-sectionally. Longitudinally, higher baseline FGCRP predicted greater atrophy in the thalamus and pallium.

**Conclusions:** Aggregate CV risk, but not individual CV risk, is associated with decreased brain volume in regions which are more susceptible to cerebral hypoperfusion. These results suggest that interventions should target multiple CV risk factors.

## 206. **Fabp Expression Rescues Amyloid-beta Induced Sleep Fragmentation in Drosophila**

**Jason Gerstner**, University of Pennsylvania; **May Chan**, University of Pennsylvania; **Cory Pfeiffenberger**, University of Pennsylvania; **Olivia Lenz**, University of Pennsylvania; **Allan Pack**, University of Pennsylvania

Sleep amount and quality are known to decline with age. This effect is even more pronounced in Alzheimer's disease (AD), and is a major contributing factor for institutionalization. Amyloid-beta ( $A\beta$ ) aggregation increases during AD, and is associated with disruption of sleep. Sleep/wake disturbances may also accelerate the neurodegenerative process. Therefore, identifying changes in sleep prior to clinical onset may serve as a prodromal marker to facilitate interventions that delay AD progression. Molecular mechanisms which contribute to disturbed sleep in AD are not known and therefore present a challenge for development of therapeutic strategies. Fatty-acid binding proteins (Fabp) are small chaperones that shuttle long-chain fatty-acids such as docosahexaenoic acid, a lipid known to reduce  $A\beta$  plaque burden and restore cognitive deficits in AD mouse models. Fabp expression cycles based on time-of-day, has been implicated sleep and memory processes, and is reduced at synapses following aging. Here, we were interested in characterizing the effects of Fabp expression on sleep in a Drosophila AD model. Transgenic flies which express  $A\beta$  are syndromal to human AD, and have progressive cognitive deficits,  $A\beta$  accumulation and neurodegeneration. We observed  $A\beta$  flies have significantly reduced sleep in both daytime and night-time at ages which precede memory loss and neurodegeneration. The reduction in sleep observed in  $A\beta$  flies is rescued with a Drosophila Fabp transgene. These data suggest that sleep can serve as a prodromal marker in an AD animal model, and that Fabp may be a novel therapeutic target for the treatment of AD symptoms.

## 207. Virtual Reality - An Objective and Safe Tool For Early Diagnosis Of Peripheral Neuropathy

**Gurtej Grewal**, University of Arizona, Department of Surgery, iCAMP; **Rashad Sayeed**, Rosalind Franklin University of Medicine & Science. CLEAR; **Manish Bharara**, University of Arizona, Department of Surgery, SALSA; **Talal Talal**, Hamad Medical Corporation; **Robert Menzies**, Hamad Medical Corporation; **Jane Mohler**, University of Arizona, Arizona Center on Aging; **David Armstrong**, University of Arizona College of Medicine; **Bijan Najafi**, University of Arizona, Department of Surgery, iCAMP

**Background:** Peripheral neuropathy (PN) is one of the most common complications among older patients in particular with diabetes. PN patients experience high incidence of fall and injuries during walking. Impaired judgment of joint position, mainly due to diminishing proprioceptive feedback can cause obstacle collision. Subtle, early findings that are indicative of postural instability are difficult to accurately assess from a clinical examination. Also the available gait laboratory assessments are not feasible; therefore, many patients go undiagnosed.

**Methods:** An innovative virtual-reality obstacle crossing (VOC) paradigm using wearable sensors was developed in attempts to detect lower extremity nerve damage from PN. Sixty-eight participants including diabetes with varying severity of neuropathy and age-matched healthy controls were recruited. Severity of neuropathy was quantified using vibration perception threshold (VPT). Perception of lower extremity was quantified by obstacle crossing success rate (OCS), reaction time (TR), and toe-obstacle clearance for different obstacle heights.

**Results:** The finding suggests that VOC test allows separating between groups. All proposed parameters significantly deteriorated with increase in neuropathy severity ( $p < 0.05$ ). A significant correlation between TR and VPT score ( $r = 0.5$ ,  $p < 10^{-5}$ ). Additionally, significant deterioration in balance due to diabetes, irrespective of neuropathy severity ( $p < 0.05$ ) was also observed.

**Conclusions:** The results propose the benefit of VOC as an objective tool for detecting peripheral neuropathy at an early stage based on the reasoning that lower extremity proprioception decreases with increasing nerve damage. The proposed VOC tool offers a feasible and safe alternative compared to paradigms using real obstacles.

## 208. The Impact of Cerebral Vasoreactivity on Gait Speed in Older Adults With and Without Type 2 Diabetes Mellitus

**Azizah Jor'dan**, Harvard Medical School/Beth Israel Deaconess Medical Center; **Bradley Manor**, Harvard Medical School/Beth Israel Deaconess Medical Center; **Vera Noval**, Harvard Medical School/Beth Israel Deaconess Medical Center

Gait speed is an important predictor of health that is negatively affected by cognitive decline and brain atrophy in older adults, particularly those suffering from type 2 diabetes mellitus (DM). In these populations, both cognitive impairment and brain atrophy have been linked to altered regulation of cerebral blood flow in response to stressors. We therefore hypothesized that cerebral vasoreactivity is an important predictor of gait speed in older adults. To test this hypothesis, we studied 31 healthy older adults ( $68 \pm 8$  years) and 34 DM patients ( $66 \pm 8$  years). Gait speed was calculated during a 75m walk at

preferred speed. Regional cerebral vasoreactivity was quantified using an established CO<sub>2</sub> rebreathing protocol during Continuous Arterial Spin Labeling MRI. Our results indicated that gait speed did not differ between groups. DM participants had exaggerated cerebral vasoreactivity within the cerebellum ( $p < 0.01$ ), but no other brain region. Linear models revealed that in DM patients, but not in healthy controls, those with better cerebral vasoreactivity within the frontal lobe had faster preferred walking speed ( $p = 0.036$ ). This relationship was independent of age and other important confounders of cerebral perfusion (i.e., hematocrit concentration). No other significant relationships were observed between regional vasoreactivity and gait speed. These results indicate that preferred gait speed is not mediated by regional cerebral vasoreactivity in healthy older adults. The observed link between gait speed and frontal lobe vasoreactivity in DM patients, however, suggests that in this population, functional outcomes may be dependent upon the capacity to regulate blood flow within the brain.

### **209. Visual-Somatosensory Integration in Aging: Linking RT Facilitation to Balance.**

**Jeannette Mahoney**, Albert Einstein College of Medicine, Department of Neurology; **Roe Holtzer**, Albert Einstein College of Medicine, Department of Neurology; **Joe Verghese**, Albert Einstein College of Medicine, Department of Neurology

Individuals are constantly bombarded by sensory stimuli that must be integrated efficiently. There is a paucity of research detailing multisensory integration (MSI) in aging; however, we have demonstrated that older adults reveal the greatest reaction time (RT) benefit when presented with simultaneous visual-somatosensory (VS) stimuli. However, to our knowledge, the relationship between VS integration (VSI) and balance has not been well-established in the elderly. 43 older adults (M=74 years; 25 female) with normal gait participated in the current study. Participants were determined to be non-demented and without any medical or psychiatric conditions that may affect their performance. Participants received three randomly presented conditions (unisensory visual, unisensory somatosensory, and multisensory VS) using E-prime software and were instructed to make speeded foot-pedal responses as soon as they detected any stimulation. Balance control was assessed using maximum unipedal stance time. Results revealed that RTs to the VS multisensory condition were significantly faster than those elicited by the constituent unisensory conditions ( $p < 0.005$ ). Probability models showed that RT facilitation across the multisensory condition could not be accounted for by simple probability summation alone. Results from linear regression revealed that VS RT facilitation was associated with unipedal stance time ( $p < 0.05$ ); suggesting that people requiring less VSI (i.e., those behaving more like young adults) maintain better balance control. The relationship between VSI and balance was further moderated by age ( $p < 0.05$ ). Results from this study provide confirmatory evidence for significant VSI in aging, while also demonstrating a significant association between VSI and balance in the elderly.

### **210. Gait Velocity and Cognitive Function in Older Hispanic Americans and Adults in Vietnam: A Cross-Cultural Study**

**Ha Nguyen**, Department of Family and Community Medicine Wake Forest School of Medicine; **Steven Zarit**, Pennsylvania State University; **Chuong Hoang**, The National Technical College of Medicine No II, **Thomas Arcury**, Department of Family and Community Medicine Wake Forest School of Medicine

As life expectancy across countries continues to rise, poor cognitive function and dementia have become a major health and social issue. It has been reported that slowing of gait may precede development of cognitive impairment. However, the link between gait and cognitive function in other racial/ethnic groups is not established. The goal of this study is to determine the relationship of gait velocity with cognitive function in non-demented older Hispanic Americans and elderly adults living in Vietnam. This study includes 300 individuals from the Hispanic Aging Survey (HAS) and 600 participants from the Vietnam Aging Survey (VAS). The two studies were designed to overlap to identify factors that affect health and disability across cultures. The mean age for the HAS sample was 67.6, and 70.3 for VAS. Walking speed was assessed at participants' self-selected walking pace using a 3-Meter Walk Test. The Mini-Mental State Examination (MMSE) was used as the primary cognitive measure. Separate multiple linear regressions were run for HAS and VAS samples to confirm results. Results of both analyses showed that slower walking speed was associated with poorer cognitive function ( $p < .001$ ), adjusted for age, gender, education, body mass index, depressive symptoms, self-reported diabetes, heart disease, stroke, lung disease, and hypertension. Our study suggests a close relationship between gait and cognition in ageing that is generally consistent across geographic regions and in different racial/ethnic groups. These findings may have important implications for understanding motoric manifestations of early dementia stages.

### 211. Sensor-Derived Physical Activity Parameters Predict Future Falls In Individuals With Dementia

**Michael Schwenk**, University of Arizona, interdisciplinary Consortium for Advanced Motion Performance (iCAMP), Department of Surgery.; **Klaus Hauer**, Bethanien-Hospital/ Geriatric Center of the University of Heidelberg.; **Tania Zieschang**, Bethanien-Hospital/ Geriatric Center of the University of Heidelberg., **Jane Mohler**, University of Arizona, Arizona Center on Aging; **Bijan Najafi**, University of Arizona, interdisciplinary Consortium on Advanced Motion Performance (iCAMP), Department of Surgery, University of Arizona

**Background:** Individuals with dementia have a 3-fold risk of falling compared to cognitively intact subjects. When falling, they have a 3 to 4-fold risk of severe fall-related injuries. To our knowledge, there is no method based on body-worn-sensors which predicts falls in this high risk population. The aim of this study was to discriminate between fallers and non-fallers by using objective physical activity (PA) parameters as well as performance-based measures.

**Methods:** In 76 patients with confirmed dementia PA was quantified by a motion-sensor during a 24-hours period. PA parameters (percentage of walking, standing, sitting, lying; number and duration of postural transitions; step number; duration of single walking and standing episodes; step velocity; step variability) were extracted by specific algorithms. Functional performance was measured by the Timed-Up-and-Go, Performance-Oriented-Mobility-Assessment, and 5-chair-stand. Descriptive variables (age, ADL-status, depression, comorbidities) were obtained by standardized assessment. Falls were quantified prospectively by calendars during a 3-month period. Discriminative validity of each independent parameter was obtained by analysis of variance.

**Results:** Surprisingly, fallers and non-falls did not differ in descriptive variables, level of cognitive impairment, and functional tests ( $p = .349-.910$ ). Interestingly, several PA parameters (duration of single

walking and standing episodes, duration of longest walking episodes, maximum continuous step number) were significantly different between groups ( $p=.001-.027$ ).

Discussion: Results demonstrate for the first time that sensor-derived PA parameters are more sensitive to discriminate between fallers and no-fallers compared to established performance based tests. Our findings highlight the potential of telemonitoring/mHealth technology for estimating future fall risk in subjects with dementia.

## **212. Overweight in Adolescence is Associated with Later Life Functional Limitations**

**Sarinnapha Vasunilashorn**, Princeton University; **Melissa Martinson**, University of Washington

Early life conditions have been associated with a number of later life health outcomes. A growing body of evidence has reported on the relationship between childhood obesity with outcomes and indicators of the cardiovascular and metabolic systems; however, the functional consequences of adolescent body weight have received less attention. We use the Wisconsin Longitudinal Study to characterize the relationship of standardized relative body mass ascertained from high school photograph portraits in 1957 to self-reported functional limitations in 2004. Compared to individuals with normal body mass, those who were overweight in high school had poorer later life physical function, with observed gender differences. Women with normal adolescent body mass had better functioning in older adulthood than their low body mass counterpart. This relationship, however, was not found among men. These findings suggest the long-term influence of being overweight earlier in life on the disadvantages conferred relative to late life functional limitations.

## **213. Animal Frolics: Acceptability and Benefits In a US Sample**

**Lan Yao**, College of Nursing Michigan State University; **Jann Nestell**, C. Weaver Physical Therapy, Inc.

Tai Chi is a well-known slow and gentle exercise that is suitable for older adults with chronic illness. Animal Frolics is the exercise from which Tai Chi evolved. It is one of the National Fitness Programs recommended by the General Administration of Sport in China. Somewhat different from the Tai Chi form, Animal Frolics movements are fun to play and more intuitive. However, the acceptability and utility of Animal Frolics among older adults in the US are under studied. This poster reported questionnaire data from 13 adults (mean age=58.2  $\pm$ 8.0, range 46-72, female=10) who attended a full-day (9am-5pm) community-based Animal Frolics workshop provided by a Physical Therapist who is a certified Tai Chi and Qigong instructor. Sixty-two percent of the participants had chronic illness, including fibromyalgia (n=3), arthritis (n=4), and dyslexia (n=1). Participants feedback showed that Animal Frolics was fun (100%), easy to follow (69%), and was better than other types of exercises that they had previously performed (54%). One-hundred percent of the participants reported that they planned to continue to practice Animal Frolics after the workshop ended. Additional health benefits of the Animal Frolics movements and narrative feedback on those which were the most difficult or the easiest to practice were reported. Animal movements are easier to memorize, due partially to the familiarity with and natural bonding between human and animals. It may be a promising adjunct activity option for older adults, including those with physical or cognitive impairment.
